The description and quantities of merchandise which constitute the chief basis of the exchanges between Denmark and foreign countries, for any one year of average commercial activity, will furnish the most accurate standard by which to judge of the present or prospective importance of the trade between that kingdom and the United States. Data from which to calculate, even approximately, the value of importations, are not at hand. A valuation based upon such data as are possessed may, however, be attempted. We find that the duties levied on importations for the year 1847 reached as high as \$2,685,654, or, in round numbers, \$2,590,000. Allowing 12 per cent. on the imports as the amount of duties, we have as their value for that year over \$20,000,000. The value of the exports, as registered in the Danish custom-houses, is more accessible, and will be found under its proper head in the following tables.

Of the \$2,685,654 which is found under the column of duties on imports, the portion received in the custom-houses of Denmark Proper, amounted to \$1,806,246, and that which was levied in the duchies reached \$879,408. While this latter sum is less than 50 per cent. of that received in Denmark Proper, we must not infer that importation into the duchies was in the same proportion. On the contrary, the table which follows will show that, in general, they import more—in some cases 100 per cent. more—than the kingdom proper. The disproportion in the amount of duties results from the operation of different tariffs; that of Denmark Proper being much higher than the tariff applicable to the Duchies of Schleswig and Holstein. Altona, in the Duchy of Holstein, the most important commercial city in Denmark next to Copenhagen, is a free port; and all goods may be landed and stored without any other charges than port dues.

L. I.

GENERAL STATEMENT OF IMPORTS INTO DENMARK AND DEPENDENCIES IN 1847, WITH AMOUNT OF DUTIES.

Description of Merchandise.	Measure or quantity.	Total.	Amount of
			duties.
Cottons	Kilogs.....	1,088,000	\$323,563
Sugar and syrups	".....	16,074,000	291,090
Woolens	".....	556,000	203,578
Wood	Cubic feet.....	8,454,000	208,028
Coffee	Kilogs.....	6,678,000	129,538
Iron, unmanufactured and manufactured	".....	20,582,000	156,175
Wines	".....	81,000	124,434
Salt	Hectolitres.....	16,000,000	88,888
Brandy and other spirits	".....	22,000	59,596
Tobacco	Tons.....	8,815,000	77,378
Coal	".....	614,000	51,336
Cloths, linen	".....	612,000	49,478
" silks	".....	37,000	48,888
Cotton, raw and spun	".....	1,874,000	89,060

Hemp and flax	".....	2,555,000	23,994
Rice	".....	2,362,000	13,228
Fratts	".....	1,288,000	16,740
Paper	".....	384,000	18,090
Skins and hides tanned	".....	680,000	9,114
Yarn, cotton	".....	122,000	8,184
" woolen	".....	55,000	8,948
Other articles	".....	580,890
Total duties collected	".....	2,685,654

The hectolitre is equal to 26-4178 gallons.

The authorities from which the preceding table is compiled omit the countries from which the different articles were exported. The United States' Treasury Report for 1847, however, furnishes data to supply the omission as respects the United States. From that document the following statements are derived:

American tonnage, entered from Denmark	none.
" cleared from the U. S. for Denmark	216 tons.
Foreign tonnage, entered from Denmark	717 "
" cleared from the U. S. for Denmark	2,274 "

Total tonnage entered and cleared 1847 .. 3,207 tons.

The trade of the United States with Denmark is shown by the following exhibit of exports from and imports into the United States.

	Exports.	Imports.	Total.
1838	\$245,370	\$403,354	\$648,724
1836	285,955	48,871	334,826
1846	121,249	1,818	123,067
1856	227,715	1,130	228,845

The total exports of domestic produce to Denmark from the United States for the fiscal year ending June, 1856, were,

In American vessels	\$158,004
In foreign vessels	85,863

Total	\$243,867
And foreign produce	81,758

Total for the year

EXPORTS FROM THE UNITED STATES TO DENMARK FOR THE YEARS ENDING JUNE 30, 1847 AND 1856.

Description of merchandise.	1847.		1856.
	Quantity.	Value.	
Dye woods	\$210	81,758
Tobacco	2,119
Spirits of turpentine, galles, &c.	7,754	9,708
Rice	5,629	115,523	40,652
Cotton (raw)	660,782	62,609	127,790
Rye and other grates	6,000
Flour	17	181
Rosin and turpentine	155	455
Whale & other fish oil, gls.	89,830	11,939
Sundries	5,019	8,816
Drugs and medicines	15,202
Total	208,890	227,718

It appears that the United States supplied Denmark in 1847 with all the rice imported into that country, and a large share of the raw cotton, spirits of turpentine, fish-oil, grains, etc. Wines and spirits are chiefly imported from France, either direct or by way of Hamburg, and cottons almost exclusively from England, but in 1855-6, the exportation of tobacco, grain, flour, oils, and turpentine, had ceased.

The following table exhibits the value of exports from Denmark and the duchies to all foreign countries during the years designated. The values are given in francs, each equal to 18-6 cents.

Description of merchandise.	1845.	1846.	1847.
Cereals.....	41,855,000	46,618,000	55,714,000
Live animals.....	13,498,000	11,780,000	11,664,000
Butter.....	5,800,000	11,708,000	9,954,000
Racon, etc.....	1,922,000	1,802,000	1,870,000
Hides and skins.....	3,710,000	1,730,000	1,815,000
Seeds.....	1,188,000	1,065,000	1,393,000
Wool (raw).....	773,000	586,000	1,674,000
Salted provisions.....	698,000	451,000	780,000
Bones.....	850,000	263,000	807,000
Total France.....	70,405,000	76,178,000	84,745,000

The following suggestion is found in a commercial report recently issued under the direction of the French government, which may be found useful to others besides the French merchants engaged in the trade with the countries of northern Europe:

"In the northern nations, especially Denmark, Sweden, and Norway, there is an active demand for a beverage extensively used in those countries, which our merchants engaged in supplying them with *liqueurs*, might advantageously imitate. It is a mixture known among the northern people as *gammel Frank vin* (old French wine), and composed of white wine, rum, syrup, and spices. This kind of *negus* is highly esteemed by a people who have no relish for liquors, unless they are highly sweetened."

In 1850 there was published, by order of the Danish government, a statistical report of the commerce and navigation of Denmark Proper for the year 1848. From this publication, it appears that though Denmark was involved in difficulties with the German Confederation during the year 1848, the general commerce of the kingdom suffered no sensible diminution. This was mainly owing to the geographical position, as well as to the military marine of Denmark, by means of which she was enabled to blockade most of the German ports, and thus give free scope to her own merchant flag. Cut off from the German markets, from which she usually draws her supplies of articles of first necessity for her manufactures, she sought for new channels through which to supply her wants; and at once found England already waiting to avail herself of the difficulties in which she was embroiled. Hence, the principal foreign trade of Denmark during this year, was carried on with England.

The number of vessel employed in the foreign trade of Denmark in 1848 was as follows:

Entered.....	Vessels	Tonnage	339,747
Cleared.....	"	"	356,882
Total.....	14,819	"	692,579

The tonnage of merchandise was 400,240 tons.

From North and South America there entered, during the same year, 61 vessels of 12,820 tons; while there cleared 67 vessels of 15,968 tons, of which there were 18 vessels of 3,736 tons under a foreign flag.

The value of the imports and exports from all countries, in 1848, as compared with 1847, was as follows:

1848.—Imports.....	\$13,021,800
Exports.....	8,076,675
Total trade in 1848.....	\$21,098,538
1847.—Imports.....	\$13,597,718
Exports.....	7,015,362
Total trade in 1847.....	20,613,378
Increase in 1848.....	485,160

Of the above figures, the trade of Copenhagen alone absorbed:

1848.—Imports.....	\$9,508,324
Exports.....	4,483,202
Total trade of Copenhagen in 1848.....	\$11,971,756
1847.—Imports.....	\$9,009,360
Exports.....	1,815,360
Total trade of Copenhagen in 1847.....	10,824,720
Increase in 1848.....	\$1,147,036

See *Commercial Relations of the U. S., 1857.*

The following table exhibits the trade between the United States and Denmark during the year 1848

NAVIGATION AND COMMERCE.

Entered the United States from Denmark.....	1,494 tons.
Cleared from the United States for Denmark.....	3,438 "
Imports from Denmark.....	\$19,617
Exports to Denmark.....	131,918
Of the general exports from Denmark during 1848, England received 50 per cent.; and of grains, as high as 65 per cent.; while in 1847 the proportion exported to Great Britain was only 36 per cent. of the whole. The exports to the United States were,	
Woolen and worsted yarns.....	\$856
Hosiery.....	662
Bristles, 8,188 lbs.....	1,110
Rags, 53,290 lbs.....	1,614
Coal, 96 tons.....	419
Unenumerated, paying a duty of 6 per cent.....	0,457
" " " 80 ".....	2,094
" " " 80 ".....	241
Sundries.....	2,778
Total.....	\$19,617

Copenhagen, as already remarked, absorbs about 80 per cent. of the entire trade of Denmark. In 1851 there entered at this port 821 steam-vessels, propelled by engines of 44,865 horse-power aggregate, and floating 4,700 tons aggregate of merchandise, viz.:

From France.....	520 tons.
" England.....	973 "
" Lubec.....	1,685 "
" Weimar.....	1,098 "
" Elsewhere.....	506 "

The chief imports into Copenhagen from foreign countries in 1851, were iron, coal, cabinetmakers' and other wood, fire-wood, and heavy merchandise. From the United States and Cuba there entered 15 vessels, of 3,158 tons' measurement, and with 2,884 tons of merchandise; and from the Danish West Indies, 34 vessels, of 8,670 tons' measurement, and with 8,632 tons' merchandise. The imports of sugar were as follows:

From Danish West Indies.....	kilogrammes, 5,500,000
" Brazil.....	" 1,500,000
" Cuba.....	" 2,750,000
" Java.....	" 650,000
" Entrepots of Europe.....	" 100,000
Total.....	10,500,000

Imports of coffee were from Brazil, Hayti, and European entrepots, 5,250,000 kilogrammes; of which there were exported from Copenhagen 500,000 kilogrammes, leaving 4,750,000 kilogrammes for consumption.

The value of the foreign commerce of Denmark for 1853 and 1854 is exhibited in the subjoined table:

COMMERCE OF DENMARK AND THE DUCHIES OF SCHLESWIG AND HOLSTEIN FOR THE YEARS 1853 AND 1854.

Country.	1853.		1854.

The Danish merchants no longer import tobacco from the countries of its production. In 1848 there were 2,032,375 kilogrammes imported, at a value of about \$497,660 20, principally from Holland, Bremen, and Ham-burg, where select cargoes can at all times be purchased. These markets are supplied chiefly from the United States. From Cuba Denmark imports annually about 12,250 kilogrammes—say 27,000 lbs. of segars. There are no restrictions of any kind on the sale of tobacco in Denmark; and under the moderate duty [leaf or unmanufactured, 89¢ cents per 110½ lbs.; manufactured, \$3 15 per 110½ lbs.], direct importations from the United States could not fail to be profitable.

In the article of cigars, at least, there is no reason why the United States could not successfully compete with Cuba. The quantities of tobacco exported direct from the United States to Denmark during the four years specified, were as follows:

1852—Unmanufactured.....	15	hds.; value, \$1,150
Manufactured.....	8,085	lbs. " 539
1853—Unmanufactured.....	none	" " " "
Manufactured.....	9,243	lbs. " 1,404
1854—Unmanufactured.....	18	hds. " 1,263
Manufactured.....	800	lbs. " 166
1855—Unmanufactured.....	none	" " " "
Manufactured.....	11,723	lbs. " 1,741

So long, however, as any duty is imposed in Denmark higher than that levied or similar merchandise in Hamburg and the other Hanseatic towns, viz., from ½ to ⅔ of 1 per cent., they will continue, more especially Hamburg, to be the entrepots from which Denmark will have to draw her supplies of such colonial produce as her own islands in the West Indies can not furnish. Cereal produce constitutes the leading staple of Danish exports, and forms the chief basis of her exchanges with foreign countries. Indeed, Denmark may be considered an exclusively agricultural and maritime country. Such, at least, is the predominant feature of her national character. In 1851 the entire exports of the kingdom amounted to upward of \$7,500,000. Of this sum, cereals appropriated \$4,500,000. The commerce of the kingdom and the duchies for the year 1852, imports and exports, reached the sum of \$42,450,810 90; and the proportion of cereals in the export trade was about equal to that of the preceding year. During the past 10 or 12 years, however, manufactures have made considerable progress in the kingdom and the duchies; and, were the obstacles removed, with which this branch of national industry

has to contend, the most oppressive of which are royal and privileged monopolies, and heavy consumption duties, that progress would be still more encouraging, and its influence more perceptibly felt in the augmented wealth and increased commercial prosperity of Denmark. The following brief summary of the present state of manufactures in this kingdom is condensed from recent Danish official publications, and is given for the purpose of showing the extent to which Denmark must rely on the workshops of other nations for the necessary supplies for her 2,500,000 subjects.

Woolens.—The woolen manufactures of Denmark are coarse, and of a very inferior quality. The chief factories are those of Neumunster, in the duchy of Holstein. The proportion which these manufactures bear to the quantity annually consumed in the kingdom may be seen from the following statement :

	1846.	1847.
Foreign woolens consumed.....	95,900 lbs.	145,000 lbs.
Neumunster woolens consumed	86,700 "	55,000 "

Besides these woolen cloths, Denmark consumes large quantities of other manufactures of wool, particularly such as are suitable for women's apparel. These are all important. During the 2 years above-named, this class of imports reached as high as 320,000 lbs. each year, yielding a revenue to the government of nearly \$10,000.

Cottons.—The manufacture of cottons was introduced into Denmark about 40 years back, but its progress was slow and inconsiderable until within the past 10 years. At Copenhagen there were manufactured from 1835 to 1840 about 800,000 Danish ells (about 2·26 feet each) per annum from cotton twists supplied from English markets. Since 1840, the custom-house declarations indicate a large augmentation in the quantity of spun cotton (twist) imported. In 1844 it reached as high as 911,000 Danish livres. The Danish livre is a fraction over 1 lb. avoirdupois. The manufacture of printed cottons has been attempted, but the experiment has but indifferently succeeded; indeed, its present continuance is owing to high protective duties. The chief cotton manufactures may, therefore, be said to consist of old-fashioned, heavy, coarse pieces, brought through the loom by a process at once slow and expensive. There is but one factory in the kingdom—that at Nyhavn—where modern improvements are introduced. The success which has so far attended the operations at this factory may eventually create an extensive demand in Denmark for American cotton.

How far these factories fall short of the demands for home consumption may be gathered from the following figures :

COTTON CLOTHS IMPORTED INTO DENMARK PROPER, FROM			
	1846 to 1850.		
1846....	1,120,000 lbs.	1849....	1,160,000 lbs.
1847....	1,010,000 "	1850....	1,200,000 "
1848....	780,000 "		

These importations were destined for the kingdom proper. The quantities imported for consumption in the duchies can not be ascertained; but their relative consumption of such manufactures considerably exceeds that of the kingdom proper.

Paper.—At Strandmollen and Silkeborg there are several flourishing paper-mills; but the prices run so high, that, despite the protective duties, paper figures largely in the imports from foreign countries. In 1850 there were imported 217,563 kilogrammes, valued at \$58,139 88.

Sugar.—Sugar refineries have reached a high state of prosperity in Denmark. Of upward of 12,000,000 lbs. of refined sugar consumed in the kingdom, or exported, but little is imported from foreign countries. Raw sugars, however, constitute an important item in the importations of the country; indeed, it is known, that if we except England, there is more sugar consumed in Denmark, in proportion to its population, than in any other country in the world. In 1850 raw

sugar imported reached 18,186,283 kilogrammes, valued at \$1,615,931 65. Of this, there were imported direct from the United States only 77,258 lbs., valued at \$8,192.

Porcelain.—There is a factory at Copenhagen, under government monopoly, for manufactures of this description. It contributes but little, however, either to the revenues of the country or the wants of the people. The manufactures are of beautiful fabrication and brilliant colors, but they are not considered durable. Notwithstanding a high protective duty, the markets of Denmark are supplied with manufactures of porcelain from France. In 1850 there were about 40,000 lbs. imported.

Distilleries.—This is the most flourishing branch of manufactures, both in the kingdom and in the duchies. Nearly all the spirits produced in these establishments are from grain. The excise duty, or impost, derived from the distilleries, forms a large item in the revenue of Denmark. In 1850 they produced 21,262,678 Danish cans (over 1 quart each) of spirituous liquors. During the same year, 2,492 gallons of spirits from molasses were imported direct from the United States, at a value in the home market of \$1,009.

Breweries.—The number in Denmark is not known, officially; but they can not add much to the internal wealth of the kingdom, as their annual consumption of malt does not exceed 700,000 lbs. In 1850 there were imported direct from the United States 14,617 lbs. of hops, valued at \$385.

Glass-works.—There are 7 establishments in the kingdom, 4 in Schleswig, and 1 in Holstein. They are chiefly devoted to the manufacture of bottles, of which they produce, annually, upward of 3,000,000.

Ship-building.—The principal ship-yards in the kingdom are at Copenhagen and Elsinore, and are chiefly used in the repair of vessels. At Apenrade, a capacious port opening into the Little Belt, vessels of the largest class are built. In 1846 12 vessels, and in 1847, 15 were built at this place. In the former year, 30 large class vessels, belonging to this port, entered the harbors of Rio de Janeiro and Montevideo.

Founderies.—Prior to the separation of Norway, Denmark drew all her supplies of iron from that country. Since that event, the efforts to obtain sufficient supplies, even for maritime purposes, have not been crowned with success. The geological formation of the country is not such as to furnish minerals; hence, with the exception of building materials, but little is left for the miner to develop. There are, however, founderies at Garshytte, near Rendsburg, which employ upward of 250 hands, and produce, annually, 200,000 lbs. of iron; one at Copenhagen, of about equal annual produce, from which considerable quantities of anchors, chains, etc., are obtained; and several others, distributed throughout the duchies, at Altona, Kiel, Flensburg, and Ottenen. Near Elsinore there is a foundery for the manufacture of fire-arms, which produces, annually, about 2,000 muskets. Besides the manufacturing establishments above enumerated, there are in the kingdom 200 tan-yards, and 60 tan-mills, yielding annually, the latter 2,500,000 lbs. of ground tan, and the former 8,080,000 tanned hides. In addition to these, there are 88 currying establishments, in which 164,000 lbs. of skins are annually prepared for hosiery and other uses. At Altona 600,000 lbs. of candles are manufactured each year; 100,000 lbs. of refined wax are annually produced in the kingdom and duchies; soap, oils, chemicals, gunpowder, etc., but the manufacture of these last-named articles is so inconsiderable as scarcely to affect importations from foreign countries.

The only manufactures in Denmark which yield a supply equal, or nearly equal, to the home consumption, are those of refined sugars and tobacco. The former is fully adequate to meet the demands of the home market; and the latter, augmented to some ex-

tent by imports from the United States and Cuba, equally so. The quantities annually imported from these countries have already been given. Altona counts 28 tobacco factories, employing 488 hands, and producing, annually, 1,062,068 lbs. of tobacco, 106,487 lbs. of snuff, and 12,000,000 segars. At Copenhagen 425 workmen are employed, and the annual produce reaches 1,000,000 lbs. of tobacco, and 10,000,000 segars. Besides these, there are other tobacco factories, at Flensburg in Schleswig, and Kiel in Holstein, which contribute largely toward the national supply. It has been already shown whence Denmark obtains her supplies of unmanufactured tobacco, and why her manufacturers are forced to purchase it at second hand in the neighboring entrepôts, instead of importing direct from the countries of production.

It will be easily seen, from the preceding summary, how much Denmark still depends on foreign countries for the supply of her most essential wants. Since she has been induced to profit by the example of England, and other neighboring countries, in abolishing the duty on raw cotton, her spindles have multiplied, and she is now learning to depend on her own capital and industry for the spun cottons which she has heretofore derived, and which, to a great extent, she still derives, from the English spinning-factories. A similar modi-

fication in her tariff in respect to unmanufactured tobacco, and other raw material not grown on her soil, would tend not only to augment the importations of such produce from the producing countries, but would eminently contribute to attract investments of her own capitalists, multiply her manufactured productions, and enable her to become an exporter of the same descriptions of merchandises which have so long been an annual drain upon the wealth of the kingdom, and a heavy drawback upon the industry of the people. A more apposite illustration of this truth can not be found than that which the general returns of trade, for any one year, will furnish. Her average annual imports are about \$15,000,000 in value, a large portion of which sum is absorbed by manufactured articles, or articles half-manufactured, such as cotton twists, etc.; while her annual exports scarcely cover half that sum (say \$7,000,000), two thirds of which are derived from cereals and other agricultural produce. Until the manufacturing industry of Denmark receives greater encouragement from the government, the heavy disproportion between imports and exports which the above figures exhibit, or, in other words, the ruinous balance of trade against Denmark, in her commercial relations with foreign countries, must continue to exist.—*Com. Rel. U. S.*

Danish West India Colonies.—Prior to the year 1833, the trade between the United States and St. Croix was not regulated by any law or act of the Danish government. The inhabitants were at first allowed, by the local authorities, a limited quantity of sugar or molasses from their estates, to exchange for provisions. Afterward they were permitted to purchase one half of their supplies in this way; and, finally, the privilege was extended so as to enable them to purchase from foreigners all they needed for the supplies of their plantations. St. Thomas was at the same time opened as a free port for the trade of all countries, and, in consequence, became the emporium of an extensive commerce. The duties upon imports and exports are moderate, not exceeding $\frac{1}{2}$ per cent. ad valorem; and port charges do not exceed 19 cents per ton. This does not apply to vessels from European ports, which pay 45 cents per ton. The distinction is, probably, made to encourage the introduction of provisions rather than the fancy articles and liquors introduced from Europe. At St. Croix, however, vessels employed in the foreign trade, even if they do not take a pilot on board, are compelled to pay half-pilotage. The full charge is \$1 per foot of the vessel's draught, in and out. In 1832 an ordinance of the King of Denmark, dated at Copenhagen, prescribed regulations for foreign navigation and commerce with St. Croix. This was superseded by an ordinance of June 30th, 1850, published at St. Croix 15th of August of the same year, and which is now in force.

Section 1 provides that all vessels, native or foreign, both from national and foreign ports, may trade to St. Croix, and there discharge and load at the two ports of entry, Christianssted and Frederiksted. Section 2. Vessels belonging to the Danish West India Islands, trading between Denmark and

the colonies, shall enjoy, in future, the same rights and privileges as vessels belonging to the mother country. Section 3. Every vessel is to pay tonnage dues according to its tonnage, both on entering and leaving, at the following rates: If the vessel discharge or load to the amount of one half its tonnage, and above, per commercial last 30 cents; if it discharge or load from one quarter to one half of its tonnage, per commercial last 20 cents; if it discharge or load less than one quarter of its tonnage, per commercial last 10 cents. All vessels not discharging or loading are exempt from tonnage dues, as well as vessels belonging to the Danish West India Islands, when trading between St. Croix and the other two islands.

If tonnage dues are paid at one of the custom-houses of this island, or at St. Thomas, additional tonnage dues are to be paid only in case the vessel should again discharge or load, during the same voyage, goods to such an amount that, together with the previous amount discharged or loaded, it shall reach a quantity on which a higher tonnage due is fixed. At Christianssted, vessels are further to pay one half the amount of tonnage dues, at the above rate, for keeping the harbor, with wharves and other appurtenances, in repair. The 5th section provides that, within 24 hours after the vessel has been brought to anchor, the whole cargo, whether intended to be discharged or not, shall be entered at the custom-house, specified, and in writing. If the whole cargo is not to be discharged, the remainder shall, on the vessel's clearing out, be entered for export in the same manner. For duties on imports and exports, articles free of duty, and regulations relative to the trade of St. Croix, reference is made to the tariff, in its proper place. (Part II.) For the descriptions of merchandise entering into the trade between the United States and the Danish West India Islands, see Consular Returns, "St. Croix, 14th June, 1854," Part III. The vessels of the United States arriving

Netherlands. In the negotiations which concluded then, the Dutch and Swedish plenipotentiaries demanded free navigation through the Sound for all nations. The Danish plenipotentiaries contended that the Sound was a 'Danish canal,' and that the tolls collected were of a similar character to those exacted at the mouths of certain rivers in Germany and Holland. France, acting as a mediator, held the question under consideration, till she decided at a more convenient period; and subsequently she sustained the interests of Denmark, for which she was rewarded by the bestowal of the same advantages to her fleet as had been bestowed upon the Netherlands, and without any limit as to duration. In 1654 Great Britain concluded a treaty with Denmark, which was renewed in 1670, by which all the advantages were to be enjoyed by her which had been conferred upon the Netherlands. Previous to 1720 (from 1647), Denmark fixed the toll, in her treaties with other countries, 'in conformity to the terms granted to the Netherlands; but after that time she placed them upon the footing of 'the most favored nations.' Sweden, in consideration of the restoration of her provinces which had been conquered by Denmark, stipulated to pay, in future, by the treaty of Fredericksburg of June 3, 1720, the same rate of Sound dues that were collected upon the ships and cargoes of the most favored nations, reserving to herself the right to establish a commissary at Elsinore, to prevent impositions upon her navigation and commerce. These conditions and obligations (although several treaties have been made between the two nations since) continue to be observed. During the 18th century, Sweden having been quieted, the Sound tolls seem to have been submitted to by other powers and states without opposition. Denmark concluded several new treaties, but none of them contained provisions prohibitory of the exaction of the dues demanded at Elsinore.

"This was the condition in which Denmark was found when the Congress of Vienna assembled. It was quite naturally expected, at that time, that the Danish Sound tolls would present a legitimate subject for the deliberations of that body, and that, in the settlement of the affairs of Europe, they would be entirely abrogated. But Frederic VI. of Denmark was present at Vienna, and the object of compassion with the representatives of the sovereign most interested, on account of the bombardment of Copenhagen and the destruction of his fleet a few years before; and out of tenderness to him, as it is reasonable to suppose, this question was permitted to remain *in statu quo*. Vague intimations, it is stated, have occasionally been given at Copenhagen, that the Sound tolls were granted to Denmark by the Congress of Vienna, as an indemnity for the surrender of Norway to Sweden. Admitting the truth of this, and that every European government was irrevocably bound by such proceedings, the United States were not a party to it in any way, and no obligation is imposed upon them to respect the arrangement. Nothing has been more remote from the purpose of our government, from the day on which it was ushered into existence, than that of surrendering to any power its right of using the ocean as the highway of commerce. This right it claims, and will use all proper means to secure to itself the full enjoyment of it in every quarter of the globe.

"The fact is notorious, that the Sound dues affect us more sensibly than any European nation. Under their operation, Great Britain has a decided advantage over us, as concerns our chief staple. Raw cotton, according to the most reliable statements before the Department, is charged with about three per cent. *ad valorem* in its transit through the Sound; while cotton twist, of which Great Britain ships from 50,000,000 to 50,000,000 lbs. to ports of the Baltic, pays only one per cent. *ad valorem*! If we quietly submit to such a

tax upon the raw material of our fields, Great Britain, as a matter of profit, can well afford to consent to the comparatively moderate one upon the article manufactured from it, because she can not fail to perceive that, were the dues abolished, we should as certainly gain markets for the raw product, as she should lose them for the manufactures of her spinners. For the five years terminating the 31st December, 1848, 264 American vessels entered the Baltic, upon the tonnage and cargoes of which the Sound tolls amounted to 570,473 Danish bank rixdollars. Since then, no tabular statements have been received of our vessels passing Elsinore, nor the sums annually paid. The Sound toll levied upon our chief products, which find a market in the countries bordering upon the Baltic and beyond them, according to the most reliable information on the subject, is as follows:

Raw cotton, per 100 lbs.....	20 cents.
Rice; per 100 lbs.....	11 "
Paddy rice in husks, per 100 lbs.....	31 "
Raw tobacco, per 100 lbs.....	174 "
Whale oil, per bbl.....	64 "

"Consequently a cargo of 2,000 bales of cotton pays a tax of about \$1,720; a cargo of 500 hhds. of tobacco, \$1,400; a cargo of 1,000 tierces of rice, \$700. In addition to the toll on tonnage, the cost of pilotage for a ship drawing 18 feet of water, from Drago to Elsinore, varies, according to the season of the year, from \$20 to \$30."

The following statement exhibits the number of American vessels that passed the Sound at Elsinore, to and from the Baltic Sea, from 1837 to 1843, inclusive:

1812.....	2,475	1846.....	18,710

If we divide the preceding table into periods, we have the following annual average number of vessels for each period :

Years.	Average annual number.	Years.	Average annual number.
1750.....	4,500	1811-1820.....	7,949
1768-1770.....	6,880	1821-1830.....	11,502
1777-1780.....	8,295	1831-1840.....	12,713
1781-1790.....	8,545	1841-1843.....	14,583
1791-1800.....	10,204	1844-1846.....	17,333
1801-1810.....	8,237		

From various authorities, the number of vessels that passed the Sound down to 1853 is compiled, as follows :

Years.	From the North Sea.	From the Baltic Sea.	Total.
1841.....	10,675	10,812	21,487
1845.....	8,525	8,214	16,739
1849.....	10,043	8,696	18,739
1850.....	9,451	9,676	19,127
1851.....	9,930	9,976	19,906
1852.....	8,949	8,736	17,545
1853.....	10,662	10,550	21,212
Annual average number from 1847 to 1853.....			19,284

The official reports relative to the navigation of the Sound, in possession of the Department of State, do not come down to a later period than 1853. The annual returns of the foreign commerce of the Hianse towns for 1854, compared with the two preceding years, are, however, at hand; and from these it appears that the number of Hianse vessels which passed the Sound was as follows :

	1854.	1853.	1852.
Hamburg.....	65	83	49
Bremen.....	7	37	24
Lubeck.....	109	136	135
Total.....	151	256	208

The late war, of which the Baltic was one of the chief theatres, will explain the diminution in 1854.

The amount of Sound dues paid by the Hianse towns, in the years specified, was as follows :

	France.	1848.	France.
1851.....	109,150	1848.....	61,600
1850.....	66,422	1847.....	93,984
1849.....	94,608	1846.....	110,190
Total, 471,856 francs, equal to \$90,557 23; an annual average of 184,829 francs, or \$14,998 21.			

If we are further informed as to the assessment and the bases on which Denmark proposes to raise her revenues under the scheme of capitalization, it would seem quite evident that she has at least taken care of "her own interests" as implicated in this question; and our government, in rejecting the compromise thus tendered, accompanied as it was with the entanglements of the "balance of power in Europe," under whose shield Denmark wishes to place these exactions, pursued the true policy of the country by avoiding any such "dangerous complicity," as Mr. Marey terms it. The offer of the United States to share liberally in compensating Denmark for her expenditures at Elsinore in the interests of commerce ought, as it seems to us, to satisfy any reasonable demand which she can urge upon our own country or the countries of Europe; and, if all combine to pay a "fair equivalent" for the advantages derived by their commerce from the outlets of Denmark, it should be accepted by her without further delay or protest, and, instead of making the antiquity of her exaction the plea for its continuance, should rather acknowledge the equity of those governments which are willing to meet all her just claims in the future without seeking any indemnity for the past.

The following table exhibits the number of vessels of all nations that have passed the Danish Sound during the years 1854-55 :

Nation.	From the North Sea.	From the Baltic.	Total, 1854.	Total, 1855.	Incr's, 1855.	Decr's, 1855.
Prussia.....	1,412	1,448	2,864	3,005	231
Denmark.....	900	721	1,621	1,888	277

Total.....	7,950	7,798	15,747	16,968	891	1,312
Increase.....						821
Decrease in 1855.....						581

It will be seen that the total number of vessels that passed the Sound in 1853 exceeds that of the preceding year by 3,967 vessels. Of the whole number, 18,166 were laden, and 9,346 were in ballast. The countries which contributed most to this augmentation are Prussia, Great Britain, Denmark, Mecklenburg, and Russia. The following table will show the nation, and the number of vessels from each nation, in 1853 :

Nation.	No. of vessels.	Nation.	No. of vessels.
England.....	4,665	Mecklenburg.....	1,067
Prussia.....	3,472	Hanover.....	743
Norway.....	3,411	France.....	343
Denmark.....	2,084	Oldenburg.....	191
Sweden.....	1,296	Lubeck.....	158
Holland.....	1,874	United States.....	96
Russia.....	1,202

clay, and occasionally it is enlivened by verdant isles or oases, which serve as resting-places for the caravans that traverse these dismal regions. But for these oases, indeed, the Sahara would be wholly impassable. It presents, says Malte Brun, no traces of a beaten path, and the caravans that traverse it, directing their way by the polar star, describe a tortuous road in order to profit by the oases, which are represented as brilliant with vegetation, but which probably owe a great part of their reputation to the contrast they form with the absolute barrenness of the desert.

The great deserts of Africa are only separated from those of Asia by the valley of the river Nile, and the Red Sea. But upon this subject we can not refrain from transferring to our columns the remarks of Dr. Traill, who has sketched with a masterly hand the grand outlines of the Asiatic deserts. "Soon after quitting the Nile, the traveler by the route of Suez encounters sand, which is continued into the centre of Arabia, where it forms the desert of Nedsjed, extending to the valley of the Euphrates. The sandy zone then inclines northward, enters Persia, and forms the saline deserts of Adjem, Kerman, and Mekran; it is turned north-east by the valley of the Indus, passes through Caubul and Little Bukharia, till it joins the vast deserts of Cobi and Shamoo, which occupy so large a portion of Central Asia between the Altaian and Mustag chains, and reach to the confines of China. The sandy zone, thus traced throughout the breadth of the ancient continent from western Africa to the 120° of east longitude, has been computed to cover an area of 6,500,000 square miles; but the Asiatic portion of this tract includes many chains of mountains and fertile valleys. It is characterized by the occurrence of arid wastes of sand or clay, sometimes with saline incrustations on the surface, and is remarkably deficient in considerable rivers: except the Nile, the Euphrates, the Indus, and the Oxus, there are no large rivers in a region which embraces almost a fourth part of both Africa and Asia. This portion of Central Asia forms a series of elevated plains, 6,000 miles in length from east to west. Some of these plains, says Humboldt, are covered with herbage; others produce only evergreen saliferous plants, with fleshy and jointed stems; but a great number glitter from afar with a saline efflorescence that crystallizes in the semblance of lichens, and covers the clayey soil with scattered patches like new-fallen snow." Under the head **MIRAGE** will be found some account of the so-called singular optical illusion so often seen in the desert.

In Scripture, the term desert bears a wholly different interpretation from that usually attached to it in profane writings. It has been fully shown by Ireland (*Palest.* l. i. p. 375) that the Hebrew **מדבר** (*midbar*), the *ἐρημος* of the Greeks, and the *desertum* or *solitudo* of the Latins, bear no analogy to each other; the first being appropriated almost exclusively to those thinly-peopled districts of the Holy Land which yielded pasturage for cattle, and were remarkable at once for their beauty and the luxuriance of their vegetation.

"The arid plains and deserts, as well as high mountain ranges, have, it may well be supposed, an influence upon the movements of the great aerial ocean, as shoals and other obstructions have upon the channels of circulation in the sea. The deserts of Asia, for instance, produce a disturbance upon the grand system of atmospheric circulation, which, in summer and autumn, is felt in Europe, in Liberia, and away out upon the Indian Ocean, as far to the south as the equinoctial line. There is an indraught from all these regions toward these deserts. These indraughts are known as monsoons at sea; on the land, as the prevailing winds of the season.

"We perceive how a desert land spreads its influence through the distance upon the winds. The first effects of heating up the plains are necessarily felt by the air nearest at hand, and by that further off at a

later period, so that the south-west monsoon influence is in this part of the ocean propagated from the land out upon the sea at the rate before stated. Of course, the vast plains of Asia are not brought up to monsoon heat *per saltum*, or in a day. They require time both to be heated up to this point and to be cooled down again. The monsoon season may be always known by referring to the causes which produce these winds. Thus, by recollecting where the thirsty and overheated plains are which cause the monsoons, we know at once that these winds are rushing with greatest force toward these plains at the time that it is the hottest season of the year upon them. The influence of these heated plains upon the winds at sea is felt for a thousand miles or more. Thus, though the desert of Cobi and the sun-burned plains of Asia are, for the most part, north of latitude 90°, their influence in making monsoons is felt south of the equator. So, too, with the great desert of Sahara and the African monsoons of the Atlantic; also, with the Salt Lake country and the Mexican monsoons on one side, and those of Central America in the Pacific on the other. The influence of the deserts of Arabia upon the winds is felt in Austria and other parts of Europe, as the observations of Krieh, Lamont, and others show."—MADRY'S *Physical Geog. of the Sea*.

Desertion by a Seaman. "Desertion from the ship without just cause, and *animò non revertendi*, or the justifiable discharge of a seaman by the master for bad conduct, will work a forfeiture of the wages previously earned; and this is a rule of justice and of policy which generally pervades the ordinances of the maritime nations. By the English statute law, and by the act of Congress, desertion is accompanied with a forfeiture of all the wages that are due, and an absence of forty-eight hours without leave, is made conclusive evidence of desertion; and whatever unjustifiable conduct will warrant the act of the master in discharging a seaman during the voyage, will equally deprive the seaman of his wages. But the forfeiture is saved if the seaman repents, makes compensation or offer of amends, and is restored to his duty. Public policy and private justice here move together, and the maritime ordinances unite in this conclusion. The master has power to remit a forfeiture, and the penalty of forfeiture is not applied to slight faults, either of neglect or disobedience. There must be either an *habitual* neglect, or disobedience, or drunkenness, or else a single act of gross dishonesty, or some other act of a heinous and aggravated nature, to justify the discharging a seaman in a foreign port, or the forfeiture of wages; nor will the admiralty courts, except in cases of great atrocity, visit the offenses of a seaman with the cumulated load of forfeiture of wages and compensation in damages. They *allow* the forfeiture of the wages antecedently earned, and in the application of the forfeiture, the advanced wages are made a charge on the forfeited wages, but the hospital money is apportioned ratably on the wages for the whole voyage. In these regulations the moderation of the courts, and the solicitude which the peculiar condition and character of seamen excite, are equally manifest. So, if the seaman quits the ship involuntarily, or is driven ashore from necessity, from want of provisions, or by reason of cruel usage and for personal safety, the wages are not forfeited, and he will be entitled to receive them in full to the prosperous termination of the voyage. On the other hand, it is the duty of the seaman to abide by the vessel as long as reasonable hope remains; and if they desert the ship under circumstances of danger or distress from the perils of the sea, when their presence and exertions might have prevented damage, or restored the ship to safety, they forfeit their wages, and are answerable in damages. And even when a seaman might well have been discharged in the course of the voyage for gross misbehavior, if the master refuses to discharge him, and

leaves him in case, he is entitled to the United States of imprisonment. There are, however, instances, when his ship in a with clearness. Story holds that she arrives at a moored, though tion afterward a partial forfeiture duty.—*Ibid.*

leaves him in imprisonment abroad, he will, in that case, be entitled to his wages until his return to the United States after deducting from the claim his time of imprisonment."—*Kerr's Commentaries*, Lect. xlv. There are, however, at times, extenuating circumstances, which will in part authorize a sailor to leave his ship in a foreign port. This subject is discussed with clearness in the work above-mentioned. Judge Story holds that the voyage of a ship is ended when she arrives at her port of destination, and is safely moored, though her cargo be not delivered; and desertion afterward does not forfeit the wages entire, but a partial forfeiture only as compensation for breach of duty.—*Ibid.* See DISCHARGE OF SEAMEN.

Design (Fr. *dessin*, from Lat. *designo*), a scheme or plan; purpose, intention; a representation of a thing by an outline or sketch, etc. *Design*, in the manufactures, expresses the figures with which the workman enriches his stuff or silk, and which he copies after some pattern. *Design* in *Painting*, is the first idea of a large work, drawn roughly, to be afterward carefully executed and finished.

Design, Schools of, are establishments for instructing pupils in the art of drawing. In some the instruction is confined to what is subservient to the fine arts, but in others, especially in the very admirable establishment at Edinburg, under the Board of Trustees of Arts and Manufactures, not only is attention paid to the instruction of the painter and the sculptor, but design is taught, to perfect the mechanic in the principles of his art, wherever ornamental pattern is required. Such schools have been long opened in France and various parts of Germany, from which important benefit has been conferred on the manufacturing industry of those countries. The Edinburg School of Design appears to have been the first established in Britain for the express improvement of manufacturing industry. It is most ably conducted, and has found its pupils in demand for the chief seats of English manufacturing art. In England, besides the establishment at Somerset House, London, there is a branch school of design in Spitalfields that is well attended. Similar schools are now established in Birmingham, Manchester, Coventry, Nottingham, Leeds, York, Huddersfield, Sheffield, Norwich, Stoke-on-Trent, Newcastle-on-Tyne, Hanley, Glasgow, and Paisley. Several have been established in the cities of New York and Boston, and other portions of the United States, and their utility is clearly demonstrated.—*BUNDE'S Enc.*

De-silvering Lead. Nearly all lead ore contains a little silver; and Mr. Pattinson of Newcastle, England, has devised an ingenious and beautiful mode of separating it. His discovery has rendered many lead mines workable which must otherwise have been abandoned. The chief ore whence lead is extracted is galena, a sulphuret of the metal, containing on an average about 80 per cent. of lead and a minute portion of silver; and this silver treasure often determines the working or non-working of the mine. Until recently, 30 ounces of silver to a ton of lead were the least that would pay for the expense of separating; but Mr. Pattinson has enabled the lead smelter to realize a profit from so small a ratio as 3 or 4 ounces to the ton. The lead-smelting at the Allenhead mines, and at the Wanlock lead hills in Dumfriesshire, are both founded on Pattinson's process.

This process is not only scientific in the principle on which it is based, but it is really beautiful to witness. After the ore has been smelted, and the lead run off into the form of blocks or "pigs," these pigs are slowly re-melted in large cast-iron open vessels. The molten lead, while gradually cooling, is stirred uninterruptedly with an iron rod, and crystals of lead gradually form. These crystals, being denser and heavier than the rest of the lead, fall to the bottom, and are thence removed by the aid of a colander or perforated ladle. Now these crystals contain less silver than an equal weight

of the uncrystallized lead; and here we begin at once to see the rationale of the process; since none of the silver is actually gone, that which has left the crystals has tended to enrich the remaining portion of the lead. Again are the crystals melted, to get more and more silver out of them; again is the richer lead melted, to increase its richness at the expense of the newly-formed crystals; and thus do the double processes advance until almost every atom of silver is obtained from the lead. But this requires another kind of operation. The very rich lead is brought to an intense heat in a peculiar furnace, and a blast of air is driven upon it; the lead combines with the oxygen of the air to form litharge, while the silver sinks to the bottom in a pure state, forming a slab of delicate silver. A very beautiful appearance presents itself during the process: the molten silver absorbs much oxygen, which escapes again as the metal solidifies; bursting through the gradually hardening surface of the mass, the bubbles of gas force along with them portions of the fluid metal from below. It really affords a very close representation of a volcano; for the same chemical laws are in operation in both cases. This escape of oxygen leaves the surface covered with beautiful and fantastical concretions of pure and brilliant silver—silvery mountains and valleys, formed by a process bearing much analogy with that by which our earth mountains were probably formed. In the recent London Exhibition there was a cake of silver weighing no less than 8000 ounces, obtained from lead in Mr. Beaumont's mines in Northumberland.—*Novelties and Inventions.*

Detroit, a city and port of entry of the United States, capital of the county of Wayne, Michigan, situated on the west bank of the Detroit Strait or River, which connects Lakes Huron, St. Clair, and Erie. Lat. 42° 2' N., long. 83° 2' W. The city extends along the river for more than a mile and a half, its central point being 7 miles from Lake St. Clair, and 18 from Lake Erie. The river is here about five eighths of a mile in width; and its depth varies from 12 to 48 feet. The descent from Lake St. Clair to Lake Erie is about 6 feet, or 3 inches per mile; and the velocity of the current at the deepest part, opposite the city, is 2½ miles per hour. Its shores on both sides are highly cultivated; and from its outlet into Lake Erie to its origin at Lake Huron resemble a continuous village, with fine farms, pleasant villas, groves, gardens, and excellent roads. The town is well and regularly built, extending in the form of a rectangle for about 1200 feet from the river, and afterward terminating in a triangle. Some of the principal streets are 200, others 120, and others 60 feet wide. These generally cross each other at right angles. The houses are mostly of wood, but many of them are of brick. The principal of the public buildings are—the old State House, the United States' Buildings (of polished limestone), the State buildings for the supreme court, public offices, county court-house, county jail, city-hall, and market, the new Catholic cathedral, and the cathedral of St. Anne. Detroit is well supplied with water from the river, by means of hydraulic machinery in the upper part of the town. Ship and boat building is a large and important branch of business; and there are several large steam saw-mills, iron founderies, etc. Detroit has a very extensive trade, for which it enjoys many advantages. The harbor is capacious and secure. It is connected by the Michigan Central Railroad with Chicago via New Buffalo and Michigan City, a distance of 258 miles, and by the Pontiac with the town of that name, 20 miles distant. The Great Western Railroad, constructed through Canada, brings it into direct communication with the New York and other eastern routes. The population in 1801 was only 770, and in 1830, 2222; in 1840 it amounted to 9199, and 1850 to 21,000, while in the summer of 1853 it was 34,400. This, however, includes only those within the corporate limits, beyond which there is a numerous popula-

tion, whose entire occupation and interests are in the city.

Dials. Invented by Anaximander, 550 B. C.—*Pliny*. The first dial of the sun seen at Rome, was placed on the temple of Quirinus by L. Papirius Cursor when time was divided into hours, 293 B. C.—*Blair*. In the times of the emperors, almost every palace and public building had a sun-dial. They were first set up in churches in A. D. 613.—*Langlet*.

Diamond (Ger. Du. Da. and Fr. *Diamant*; Sw. *Demant*, *Diamante*; It. Sp. and Port. *Diamante*; Rus. *Almas*; Pol. *Dymant*; Lat. *Adamas*; Hind. *Hira*), a precious stone which has been known from the remotest ages. *Pliny* has described it (*Hist. Nat.*, lib. 37, § 4); but his account is, in many respects, inaccurate. It is found in different parts of India, and in Borneo; it is also found in Brazil, on which, indeed, Europe may be said to be at present entirely dependent for supplies of diamonds. Hitherto, however, it has not been met with anywhere except within the tropics. It is the most beautiful and most valuable of precious stones. Its most common colors are white and gray, of various shades. It occurs also red, blue, brown, yellow, and green. The colors are commonly pale. It is always crystallized, but sometimes so imperfectly that it might pass for amorphous. It is the hardest body in nature. External, lustre from splendid to glimmering; internal, always splendid. It is brittle; its specific gravity is 3.5. When rubbed it becomes positively electric, even before it has been cut by the lapidary, which is not the case with any other gem.—*Thomson's Chemistry*.

Diamonds were first brought to Europe from the East where the mine of Sumbulpour was the first known; and where the mines of Golconda were discovered 1584. This district may be termed the realm of diamonds. The mines of Brazil were discovered in 1728. From these last a diamond, weighing 1680 carats, or 14 ounces, was sent to the court of Portugal, and was valued by M. Romeo de l'Isle at the extravagant sum of 224,000,000 reals; by others it was valued at 56,000,000. Its value was next stated to be 3,500,000; but its true value is £400,000. The diamond called the "mountain of light," which belonged to the king of Cabul, was the most superb gem ever seen. It was of the finest water, and the size of an egg, and was also valued at 3,500,000. The great diamond of the emperor of Russia weighs 193 carats, or 1 oz. 12 dwt. 4 gr., troy. The empress Catharine II. offered for it £104,166, besides an annuity for life to the owner, of £1041, which was refused; but it was afterward sold to Catharine's favorite, count Orloff, for the first mentioned sum, without the annuity, and was by him presented to the empress on her birth-day, 1772. It is now in the sceptre of Russia. The Pitt diamond weighed 136 carats, and, after cutting, 106 carats. It was sold to the king of France for £100,000 in 1720.—*Huydn*.

According to Mr. Millour (*Orient. Com.*), the color should be perfectly crystalline, resembling a drop of clear spring water, in the middle of which you will perceive a strong light playing with a great deal of spirit. If the coat be smooth and bright, with a little tincture of green in it, it is not the worse, and seldom proves bad; but if there be a mixture of yellow with the green, then beware of it—it is a soft greasy stone, and will prove bad.

Test of Diamonds. Cutting, &c.—To ascertain whether any specimen is a true diamond, or not, a fine file may be used; and if the surface of the stone be the least abraded or scratched by its action, it is not a diamond. The difference will also appear upon close examination without this instrument: the rays of light easily pass through other gems, but in the diamond they are reflected to the surface, which occasions its superior brilliancy. If the specimen under examination be very minute, it may be placed between two half-

crowns, or other flat metallic surfaces, and pressed with the thumb and finger: if a diamond, it will not be injured; but if otherwise, it will break and fall to powder. On account of the extreme hardness of the diamond, the art of cutting and polishing it was for a long time unknown in Europe. But, in 1456, a young man of the name of Louis Berghen, a native of Bruges, is said to have constructed a polishing wheel for the purpose, which was fed with diamond powder instead of corundum, which the Chinese and Hindoos had been long accustomed to employ. Berghen was led to this discovery by observing the action produced by rubbing two rough diamonds together. Diamonds are cut into brilliants and rose diamonds; the former being, for the most part, made out of the octahedral crystals, and the latter from the spheroidal varieties.—*Joyce's Practical Mineralogy*; *Kress's Cyclopaedia, &c.*

Commercial Value of Diamonds.—In the great or wholesale trade there is but little fluctuation in the price of those diamonds which may be termed *stones in general demand*. I will begin with brilliants from one grain to 2½ grains each. Such brilliants double cut, and what may be termed fine, are worth from £7 to £8 per carat. Needy sellers may take 10 per cent. less for cash; but this is the general average price for a lot of 10, 20, or 50 carats of well-made stones, if the quality be good. Brilliants, from two grains to three, may be bought in lots at from £7 7s. to £8 per carat. It is to be understood, that diamonds in a lot are never all quite free from faults; hence there may arise a difference of 10 per cent. in the price. Stones of 3 grains, if fine and perfect, are always in demand at £8 to £9 per carat. Brilliants from 3 grains to 4, if very fine and well proportioned, are worth from £8 to £9 per carat. Those of a carat each, if very fine and well selected, are worth £9 to £10. Three years ago I offered £12 each for 8, and could not obtain them. Brilliants from 5 grains to 6, if pure, are worth, from £13 to £14; if perfectly fine, and of the full weight of 6 grains, they are worth from £17 to £18 each. I have for such paid £20. Brilliants of 2 carats each, are worth from £27 to £30. Stones of this weight, if well proportioned, are considered of a fine size, and well calculated for pins, or the centre of clusters; indeed, well proportioned diamonds, from 6 grains to 2 carats each, are always in demand, and are retailed at £20 to £35 each, according to their degree of perfection, or as the retailer may think fit to charge them. For brilliants of 3 carats, if fine and well formed, from £70 to £80 may be obtained. Stones of this size, and larger, are more liable to capricious fluctuations of price than the smaller ones before named, being chiefly required for the centre stone of salable necklaces. Brilliants of 4 carats, if fine, are worth from £100 to £130. I have sold stones, single cut, a little off color, of this weight, at 80 guineas. I possessed one of 17 grains, perfectly white, having a surface large as that of a 7 carat stone ought to be; it was, consequently, very thin, but being much in request, on account of its great spread or surface, it was sold for £160. Brilliants of 5 carats are not frequently met with in general trade, and are valuable in price: as the dealers exact more if they know that such stones are wanted than they would in the regular course of business. The prices may be said to vary from £180 to £200.

Brilliants of 6 carats, as before stated, are not common; they are suitable for centre stones of expensive necklaces and single stone rings. If perfect and well shaped, they sell for £230 to £250, or more. For estimating the value of peculiarly fine diamonds there is no fixed standard. Rough diamonds, selected as fine, and well formed for cutting, may be estimated as follows: Square the weight of the stone, multiply the product by 2, and the result will be the value in pounds sterling. Brilliants, if fine, may be estimated by squaring the weight in carats, and multiplying the product by 8, which will give the amount in pounds ster-

ling. As a very large property, both in Great Britain and in other countries of Europe, is vested in diamonds, it may be interesting to be informed, that not only the price of these gems has for several years been, upon the whole, gradually rising, but that it is likely to continue on the advance. At the present time, indeed, and for the last few years, there has been a dull sale of diamonds in England, nor did the coronation occasion a demand worth notice; but on the Continent the trade has been steady, and rough diamonds have been constantly rising in price. That this advance will be progressive may be assumed from the fact, that the best diamond ground now known, the Serro do Frio in Brazil, has assuredly passed the zenith of its prosperity. I went over the greater part of what is yet reserved, and still remains to be worked, and I conceive that there would be no difficulty in calculating the length of time in which the present number of working may reduce it to a state of exhaustion, like that of the famous Golconda. The average annual produce of future years may be estimated by the amount obtained from that portion which has been already worked. Brazil may be said to furnish Europe with 25,000 or 30,000 carats per annum of rough diamonds, which, if reduced to brilliants, may make an influx into the market of 8000 or 9000 carats annually.—MAWE'S *Treatise on Diamonds*, 2d ed. pp. 9-14, and p. 60.

The rule stated by Mr. Mawe, and adopted by the jewelers, for estimating the value of diamonds (multiply the square of the weight in carats by 2, and the product is the value in pounds sterling), can only hold in the case of those that are of a small size, or do not weigh more than 20 carats. The value of the largest diamonds, which are exceedingly rare (*non nisi regibus etis admodum paucis cognitis*, Pliny), can, it is clear, depend upon nothing but the competition of the purchasers. The diamond belonging to the emperor of Brazil is the largest in the world. It is still uncut, and weighs 1680 carats; so that, according to the jewelers' rule, it must be worth the enormous sum of £3,644,800! It may, however, be doubted whether his imperial majesty would have any disinclination to part with it for the odd sum of £644,800. The famous diamond belonging to the emperor of Russia, which the jewelers tell us is worth £4,804,000 did not cost £150,000.

Diamonds are not used exclusively as articles of ornament or luxury. They are frequently employed with great advantage in the arts. "Bad, discolored diamonds," says Mr. Mawe, "are said to break into powder, and may be said to have more extensive sale than brilliants, with all their captivating beauty. In many operations of art they are indispensable; the fine cameo and intaglio owe their perfection to the diamond, with which alone they can be engraved. The beauty of the onyx would yet remain dormant, had not the unrivaled power of the diamond been called forth to the artist's assistance. The carnelian, the agate, or cairngorm, can not be engraved by any other substance. Every crest or letter cut upon hard stone is indebted to the diamond. This is not all; for without it blocks of crystal could not be cut into slices for spectacles, agate for snuff-boxes, etc." The carat grain used in weighing diamonds is different from the troy grain, 5 diamond grains being only equal to 4 troy grains. See *Westminster Rev.*, xxi., p. 297; HUNT'S *Magazine*, xv., p. 600; FRAZER, xv. (by CARLISLE); *Bankers' Magazine*, N. Y., vol. v., 270, 369.

Diaper. (Ger. *Dreil*; Du. *Dreil*; Fr. *Linge-courré*; It. *Tela tessuta e opere*; Sp. *Mantiles alemanicas*; Rus. *Salfetotschnie*), a sort of fine flowered linen, commonly used for table-cloths, napkins, etc., brought to the highest perfection in the manufactories in the north of Ireland, in Germany, and Scotland. It sometimes resembles an inferior kind of damask. It is said to have been originally manufactured at Ypres, in Flanders; whence the term d'Ypres, corrupted into diaper.

Dice (Ger. *Wurfel*; Du. *Taaringen*; Fr. *Des* (*à jouer*); It. *Dadi*; Sp. *Dados*; Rus. *Kosti*), cubical pieces of bone or ivory, marked with lots on each of their sides from 1 to 6, according to the number of the face. They are used in various games of chance, by being thrown from a box.

Dicker (probably from *deka*, ten), in our old writers, is used to denote the number or quantity of ten, particularly ten hides or skins, of which twenty made a last; and is sometimes applied to other things, as a dicker of gloves or ten pairs, a dicker of iron or ten bars, etc.

Dictionary, in its original acceptation, is the arranging of all the words of a language according to the order of the alphabet, and annexing a definition or explanation to each word. When arts and sciences began to be improved and extended, the multiplicity of technical terms rendered it necessary to compile dictionaries, either of science in general, or of particular sciences, according to the views of the compiler. Hence dictionaries may be said to be of two sorts, of words, and of facts or things; in the former sense, the term *dictionary* being equivalent to *lexicon*, in the latter, to *encyclopedia*. A standard dictionary of the Chinese language containing about 40,000 characters, most of them hieroglyphic, or rude representations, somewhat like our signs of the zodiac, was perfected by Pa-out-she, who lived about 1100 B. C.—*Morrison*. Cyclopedias were compiled in the fifteenth and sixteenth centuries. The first dictionary of celebrity, perhaps the first, is by Ambrose Calepini, a Venetian friar, in Latin; he wrote one in eight languages, about A. D. 1500.—*Niceron*. The *Lexicon Hepuototon* was published by Edmund Castell, in 1659. Bayle's dictionary was published in 1696, "the first work of the kind in which a man may learn to think."—*Voltaire*. Chambers' Cyclopaedia, the first dictionary of the circle of the arts, sciences, etc., was published in 1728. The great dictionary of the English language, by Samuel Johnson, appeared in 1755. Francis Grasse's Dictionary of the Vulgar Tongue, was compiled in 1768; and from this period numerous dictionaries have been added to our store of literature. Noah Webster's great American Dictionary of the English language, in two quarto volumes, was first published at New Haven in 1828. It was reprinted in London in 1832. Numerous abridgments and new editions of the whole work have since been published in London and New York.—*Haydn*.

Die (Fr. *dé*), in coinage, is the instrument by which the impressions are given upon the various denominations of coin. The following is an outline of the *die manufacture*: The engraver selects a forged plug of the best cast steel of proper dimensions for his intended work; and having carefully annealed it, and turned its surfaces smooth in the lathe, proceeds to engrave upon it the intended device for the coin. When this is perfect the letters are put in, and the circularity and size duly adjusted; it is then hardened, and is termed a *matrix*. Another plug of soft steel is now selected; and the matrix being carefully adjusted upon it, they are placed under a very powerful fly-press, and two or three blows so directed as to commence an impression of the matrix upon the plug; this is then annealed, and the operation repeated till the plug receives a perfect impression of the work upon the matrix. This impression is of course in *relief*, the original work upon the matrix being indented, and produces what is termed the *punch*. This, being duly shaped in the lathe, is hardened, and is employed in the production of impressions in soft steel or *die*, which, being properly turned or hardened, are exact *fac-similes* of the original matrix, and are used in the process of *coinage*. When a pair of dies are made of good steel, duly hardened and tempered, and are carefully used, they will sometimes yield from two to three hundred thousand impressions before they become so

tems of government, supremacy, concession, retention, equilibrium, centralization, confederacy, etc., that may be brought into operation. 8. The art of composing diplomatic despatches. To this multifarious information the diplomatist should unite the powers of calculation and application peculiar to strong minds—the “tact des convenances,” which may be felt, but can not be expressed—circumspection, address, and perfect integrity. The combination of these various qualities will procure for the diplomatist such a character for sagacity, rectitude, and straightforwardness, and will, sooner or later, obtain for him an ascendancy over the minds of others, and give great weight to his opinions.

It must be remembered that the diplomacy of every nation is more or less within the range of casualties; being subject to the versatility inseparable from human affairs, the fickleness and passions of man, and the uncertainty of events—an unlooked-for death, a change of ministry, treacherous designs, undue influence from any quarter, a false calculation, corruption—each of these causes may change the policy or course of a government; and this will more or less affect every other government, in proportion to the extent of its influence. In addition to these numerous causes of variation, if ambitious projects be entertained by any great power, diplomacy becomes still more intricate and difficult. Every state desires to be protected against the storm which its rulers imagine they can prognosticate, and of whose bursting they are apprehensive. Again, we must remark, that the schemes of a government, how admirably soever contrived, have often miscarried, either from subordinate persons or those intrusted with putting them in execution having misapprehended or misunderstood the instructions of their superiors.

From what has been said, it will be easily understood, that in diplomacy, false estimates are frequently formed of the merits of original plans or designs from looking at their results only. The diplomatist is, of course, exempted from all responsibility in regard to operations mixed up with the events of war—he is answerable only for the success of his projects under the conditions on which he proposed them.

A diplomatist of moderate capacity, if favored by circumstances, may accomplish much more than the man of genius who has to contend with adverse fortune; but this difference of success makes no change in their relative ability, and those acquainted with the circumstances readily discriminate between sagacity and accident.

Diplomacy has been practiced in substance ever since mankind have been formed into independent states, though it is difficult to ascertain the precise period at which the term came into use. The system, however, of the regular and uninterrupted residence of foreign ministers during peace at the European courts, as at present practiced, is said to have originated with the Cardinal de Richelieu. Before that time embassies had been only sent on special occasions, but attended with much greater show and retinue than has been the fashion in modern times; while the substantial business of states at the neighboring courts was transacted by agents of a lower stamp and character. Diplomatic agents are now ranked, in Europe, in the following order, according to the regulations of the Congress of Vienna:—1. Ambassadors; 2. Envoy extraordinary and ministers plenipotentiary; 3. Ministers resident; 4. Chargés des affaires; 5. Secretaries of legation and attachés; the latter, however, have no precise diplomatic character, and are only considered by courtesy as attached to the legation.

Among the best works on this important subject are the *Traité complet de Diplomatique, ou Théorie générale des Relations extérieures des Puissances de l'Europe*, par M. le COMTE DE GARDEN (Paris, 1833), 3 vols. 8vo.; and *De Wicquefort's Ambassadeur et ses Fonctions* (Léid.

Opt.) 1746, 12 vols., 4to. See also the *Manuel Diplomatique*, by VON MARTEN (Paris, 1825); FLASSAN'S *Hist. Gen et Raisonné de la Diplom. Française*, 7 vols. (Paris, 1811), and VON MARTEN'S (senior) *Grundriss einer Diplom. Geschichte der Europ. Staatshandel*, etc., (Hamburg, 8vo.) BRANDE'S *Enc. See N. A. Rev.*, xxxix. 802 (by E. EVERETT); xxiv., p. 82 (by T. PITKIN); *U. S. Lit. Gaz.*, v., p. 1 (by C. CUSHING); FRASER'S *Magazine*, xli., p. 605; *Foreign Quarterly*, xliii., p. 1.

Discharge of Seamen. Whenever a ship or vessel belonging to a citizen of the United States is sold in a foreign country, and her company discharged, or when a seaman or mariner, a citizen of the United States, is with his own consent discharged in a foreign country, it is the duty of the master or commander to produce to the consular officer the certified list of his ship's company, and pay to such consular officer for every seaman or mariner so discharged, being designated on such list as a citizen of the United States, three months' pay, over and above the wages which may then be due to such mariner or seaman, two thirds thereof to be paid by such consular officer to each seaman or mariner so discharged, upon his engagement on board of any vessel to return to the United States, and the other remaining third to be retained for the purpose of creating a fund for the payment of the passages of seamen or mariners, citizens of the United States, who may be desirous of returning to the United States, and for the maintenance of American seamen who may be destitute, and may be in such foreign port. The several sums retained for the seamen's fund are to be accounted for to the Treasury Department by the consular officers receiving the same.—*Statutes at Large*, U. S. See HUNT'S *Mag.*, xi., p. 344; *Ibid.*, p. 230; KENT'S *Commentaries*; PARSONS'S *Seaman's Law*.

According to the laws of the United States, consular officers are not to discharge a seaman for slight or venial offenses, and certainly not for a single offense unless of a very aggravated character. If the charge be negligence, drunkenness, disobedience, or dishonesty, the question should be, whether the misconduct was of such a degree as to show a habitual inattention to or unfitness for duty, having always in view the particular station of the party and the nature of his duty. If the allegation be that the seaman is a dangerous person, from a spirit of insubordination, or hostility to the master, it has been held that the master must show that the danger is such as would affect the mind of a man of ordinary firmness. But even in cases of aggravated offenses, or of a continued course of conduct which would justify the discharge of a seaman, if he repents and offers amends, the principle which is always operating in his favor against all kinds of forfeiture, with very rare exceptions, intervenes to restore him to his rights, and he is ordinarily entitled to be received again on board. To deprive a mariner of the benefit of this rule, it should appear that the misconduct amounts to a radical disqualification, as dishonesty and habitual drunkenness in a steward; or that the party is really dangerous to the peace and safety of the ship. These principles receive additional force from the general policy of the laws of the United States, which discountenance the discharge of seamen in foreign ports. The various enactments in respect to destitute seamen sufficiently show the paternal solicitude of the government for the preservation and protection of the seamen of the country.—*Manual for Consuls*. See DESCRIPTION OF SEAMEN.

“The right of the seaman to be brought back to his own home, is very jealously guarded by our laws. The master should always present his shipping articles to the consul, or commercial agent of the United States, at every foreign port which he visits, but does not seem to be required by law to do this, unless the consul desires it. He must, however, present them to the first boarding officer on his arrival at a home port.

of farms, \$1,780,460; and the value of implements and machinery, \$40,820.

Live Stock.—Horses, 824; asses and mules, 57; milk cows, 818; working oxen, 104; other cattle, 123; sheep, 150; swine, 1,685; value of live stock, \$71,643.

Agricultural Products, etc.—Wheat, 17,870 bushels; rye, 5,509; Indian corn, 65,280; oats, 3,184; barley, 75; buckwheat, 378; peas and beans, 7,784; potatoes, 29,292; sweet potatoes, 3,487. Products of the orchard, \$14,343. Produce of market gardens, \$67,222. Pounds of butter made, 14,872; of cheese, 1,500 pounds. Hay, 2,279 tons. Tobacco, 7,800 pounds; wool, 525. Clover seed, 3 bushels. Hops, 15 pounds; beeswax and honey, 550. Wine, 803 gallons. Value of home-made manufactures, \$2,075; and the value of slaughtered animals, \$9,093.

Georgetown is the principal port, and is a port of entry, situated at the head of the Potomac navigation, 120 miles from the sea, and is divided from Washington by Rock Creek. It is built on a range of hills, and com-

mends a magnificent landscape. The city is one of the handsomest in the country, and the seat of several well-known educational establishments, and is the residence of many persons of distinction. Its manufactures are increasing, and perhaps no other place is so celebrated for its fisheries of shad and herring, thousands of barrels of which are packed in the fishing season. The Alexandria branch of the Chesapeake and Ohio Canal here crosses the Potomac on a magnificent aqueduct, 1,446 feet long, and 86 feet above the ordinary tide. The tonnage of Georgetown in 1856, was 20,966 tons.

Alexandria, formerly in the District of Columbia, is situated 6 miles below Washington. It has a good harbor, and considerable trade in flour and coal. Since 1850 the commerce has nearly doubled. The tonnage in 1856 was 7,221 tons.

The foreign commerce of the District has been decreasing since 1831, and is now confined to the imports of West India produce.

FOREIGN COMMERCE OF THE DISTRICT OF COLUMBIA, FROM OCTOBER 1, 1830, TO JULY 1, 1856. INCLUDING ALEXANDRIA TO JUNE 30, 1846.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Distillation (Lat.), the evaporation and subsequent condensation of liquids by means of a still and refrigerator, or a retort and receiver. The discovery of the art of distillation is generally ascribed to the alchemists; but it was doubtless known in more remote ages to the Arabians, and by them probably derived from nations further east. The process of distillation, though in continual use in the chemical and pharmaceutical laboratory, is carried on upon the most extensive scale for the production of ardent spirits in the distilleries. Under the words ALCOHOL, BRANDY, FERMENTATION, WINE, etc., will be found some details bearing upon the nature, sources, and production of spirituous liquors; in the present article, therefore, we shall limit ourselves to an outline of the different processes which are conducted in the distillery. There are two distinct operations in the production of ardent

spirits: the one is the conversion of certain vegetable principles into alcohol; and the other, the separation of the alcohol from the other substances with which it is necessarily blended during its production. The vegetable principle which is essential to the formation of alcohol is *sugar*; and this is sometimes used directly, as where molasses and analogous saccharine products are subjected to immediate fermentation; or it is indirectly obtained by subjecting amylaceous grains to certain processes, by which the starch they contain is first converted into sugar, and then that sugar afterward alcoholized.

In many distilleries the latter alternative is adopted; and various kinds of grain, but chiefly barley, wheat, and rye, with more or less malt, are subjected to the operation of *mashing*. For this purpose the ground grain and the bruised malt are duly mixed, and infused

under constant agitation in a proper quantity of hot water in the *mash-tun*; the wort is then run off, and fresh water added, till the soluble materials of the grain are extracted. In this way the mixed wort or *wash* is obtained, which is afterward to be subjected to fermentation. When the wash is adjusted as to density, it is run into the fermenting-vats, where, mixed with a small quantity of yeast, it is subjected to the process of fermentation, which continues from 6 to 10 or 12 days—the time required for its completion varying. The *proof spirit* of commerce, and that of the Pharmacopœia, is generally stated to be of the specific gravity of 0.920 at 62° and is considered as a mixture of equal weights of absolute alcohol at the specific gravity of 0.791 at 60° and of water. The rectified spirit of commerce, or rather that of the Pharmacopœia, is directed to be of the specific gravity of 0.833 at 60°, and may be regarded as a mixture of about 82 parts of absolute alcohol and 18 of water.—BRANDER'S *Cyclo.* See also *Ency. Brit.*, 8th edition.

Divan (Arabic *divan*), among the Arabs, Persians, and Turks, is a word that bears very various significations. It primarily denoted a book of accounts, a muster-roll of troops, etc.; and hence came to be applied to a collection of lyric poems (called *gazelles*) arranged in a kind of alphabetical order. Thus we have the *Divan of Sa'î*, the *Divan of Hafiz*, etc.; a practice which has been imitated by Goethe in his *Westwâlcher Lieder*, a collection of poems in the Oriental style. The word among the Orientals denotes also a council-chamber, a tribunal of justice, and in like manner is applied to the general council of state. Under the khaliffs of Bagdad, the *divan* was a court of justice over which the khaliff presided in person. At Constantinople in the present day the term is used to denote the great council of the empire. It is also a common application among the Turks for a saloon or chamber of recreation, or in which business is transacted, or used in place of occasional repose. The *divan* more properly is a kind of stage, raised about a foot above the floor of the saloon, covered with rich tapestry, and furnished with a number of embroidered cushions leaning against the wall; and on this the master of the house is seated when he receives visitors. Hence the word is frequently applied by other nations to a kind of public coffee-room, furnished in a manner somewhat similar.—E. B.

Divi Divi, the commercial name of the pod of the *Casalpinia coriaria*, a leguminous plant, found in low marshy situations on the north coast of South America, and in some parts of the West Indies. It is used both for dyeing and tanning, but chiefly for the latter purpose. The pod is from 2 to 3 inches in length by $\frac{1}{2}$ inch in breadth, and when in perfection is of a rich brown color. It contains a few small seeds; but the only valuable portion is a resinous matter, of a bright yellow color, easily pulverized, which lies betwixt the outer skin and the husk that incloses the seed, and contains a large quantity of tannin. About 9-10ths of the imports into England come to Liverpool, where the following quantities were received during the last four years, viz.: In 1849, 3669 tons; 1850, 2700 tons; 1851, 2280 tons; 1852, 2030 tons. It might be supposed from this statement that the article was going out of favor; but such is not the case. When, however, the price in England is under £10 per ton, the imports decrease; and it has latterly been below this limit. Recently, however, its price has risen considerably; and with this rise the imports may be expected to increase. Maracibo, Rio de la Hache, and Savanilla are almost the only places whence this article is imported. That brought from Maracibo is the best, that from Savanilla the most inferior. During the last 4 years prices have ranged between £8 10s. and £14 per ton for Rio Hache and Maracibo, and £7 and £10 15s. for Savanilla, the highest quotations being now current (September, 1853). *Divi Divi* is used by dyers, not for the coloring principle which it contains, but for its strong

astringent qualities as a mordant. For this purpose it is at present used, to some extent, instead of sumach, which is scarce and dear; and hence the recent high price of the article. In tanning, it accelerates the process, and imparts to the leather a clean and healthy appearance.

Dividend, in commerce, is a word which has two very distinct meanings. In its more general employment it is understood to express the money which is divided, *pro rata*, among the creditors of a bankrupt's estate, out of the amount realized from his assets. The other meaning attached to the word dividend signifies the periodical division of profits among shareholders of insurance, railroad, bank, and other corporations.

Diving-bell. First mentioned, though obscurely, by Aristotle, 325 B. C. The diving-bell was first used in Europe A. D. 1509. It is said to have been used on the coast of Mull, in searching for the wreck of part of the Spanish Armada, before A. D. 1668. Malley greatly improved this machine, and was, it is said, the first who, by means of a diving-bell, set his foot on dry ground at the bottom of the sea. Smaton applied the condensing-pump to force down air. Mr. Spalding and his assistants going down in a diving-bell in Ireland were drowned, June 1, 1783. The *Royal George* man-of-war, which was sunk off Portsmouth in 1782, was first surveyed, by means of a diving-bell, in May, 1817. Lately, and particularly in 1840, it has been employed in sub-marine surveys. The first diving-belle was the wife of Captain Morris, at Plymouth, who descended in one a few years ago.—HAYDN. It is an apparatus by means of which persons are let down and enabled to remain under water, and execute various operations: such as leveling or clearing the bottom of harbors, preparing a foundation for buildings, bringing up sunken materials, etc. The principle of the diving-bell depends on the impenetrability of atmospheric air, and may be illustrated by a very familiar experiment. Bring the edge of an inverted tumbler, or any close vessel, to the surface of the water, and, keeping the mouth horizontal, press it down in the water. It will be seen that, though some portions of water ascend into the tumbler, the greater part of the space remains empty, or only filled with air; and any object placed in this space, though surrounded on all sides with water, would remain perfectly dry. In fact, the quantity of air remains the same, but is compressed into a smaller volume, in proportion to the depth to which it is made to descend. Now, if we conceive a vessel of wood or iron, sufficiently capacious to hold several men, to be suspended by a chain, and lowered, by means of weights attached to it, to any moderate depth under water, it is evident that they may remain there for a considerable time, and perform any operation that could be executed on land in the same confined space. The machine, however, as thus described, is liable to two great defects, which must be obviated by other contrivances before any great advantages can be derived from it. In the first place, as the air by its compressibility allows the water to enter the lower part of the bell, the dry space is not only diminished, but the bottom on which the bell rests, and where the operations are to be carried on, is also covered with water to a proportional depth. In the second place, the air within the bell, by the repeated respiration, soon becomes mephitic, and unfit to support life; so that it is necessary to elevate the apparatus after short intervals to admit a fresh supply.

It is not known at what period the diving-bell was invented. Boeckman, in his "History of Invention," mentions that at Toledo, in the 16th century, two Greeks, in the presence of the emperor Charles V. and several thousand spectators, let themselves down under water in a large inverted kettle, with a burning light, and rose again without being wet. George Sinclair, the author of "Satan's Invisible World Displayed," in his work entitled "Ars Nova et Magna Gravitatis et Le-

vitatis," the year treasurer went to brides, employed. Have all little use means of der water air to escape as having feet in its whose dis tom 5. could sink its bottom direction. the light had been caused a be cased w having a as the air let it out a low. An is, that if come upon from the bo could be giviated by Spalding o of being un uneven bot which to es rope passing, other weigh that they ce as soon as tained susp of the bell weight is in tom; and as the divers, h in their pow or, by allow Another c He divided above the o

vitatis," mentions some attempts that were made about the year 1665 to raise, by means of a diving-bell, the treasure from the ships of the Invincible Armada that went to the bottom near the Tale of Mull, in the Hebrides, and describes the kind of bell that was employed. But on account of the defects to which we have alluded, the diving-bell continued to be of very little use till the time of Dr. Halley, who contrived a means of introducing fresh air into the bell while under water, and of allowing the mephitic or breathed air to escape. The bell he made use of he describes as having been of wood, containing about 60 cubic feet in its cavity, and of the form of a truncated cone, whose diameter at the top was 3 feet, and at the bottom 5. This was coated with lead, so heavy that it could sink empty, and the weight so distributed about its bottom that it could only descend in a perpendicular direction. In the top a clear glass was fixed, to let in the light from above, and a cock to let out the air that had been breathed. To supply the air to the bell, he caused a couple of barrels, of about 30 gallons each, to be cased with lead, so as to sink empty, each of them having a bung-hole in its lower part, to let in the water as the air in them condensed on their descent, and to let it out again when they were drawn up full from below. To a hole in the uppermost part of the barrels a frank or hose was fixed, long enough to fall below the bung-hole, and kept down by a weight, so that no air could escape by the hose till its end was raised up. The barrels thus prepared were let down by the side of the bell. A man stationed on a stage suspended from the bell was ready to take up the hose; and as soon as their ends were brought to the surface of the water in the barrels, all the air that was included in the upper parts of them, was blown with great violence into the bell, while the water entered at the bung-holes below and filled the barrels. By means of this contrivance the air was not only kept fresh, but another great advantage was gained, namely, that by admitting a sufficient quantity of it the whole of the water was expelled from the inside of the bell, and the bottom of the sea laid dry.

By means of this contrivance for the admission of fresh air, it was now possible to remain for any length of time under water; but the use of the apparatus was still found to be attended with some inconveniences, and even considerable danger. The divers within the bell having no power over it, its rising or sinking depends entirely upon the people at the surface of the water; and as the bell, even when in the water, has considerable weight, there is always a possibility of the chain by which it is raised breaking, which would inevitably be attended with the destruction of the divers. Another danger, still more to be apprehended, is, that if the mouth of the bell, in its descent, should come upon a sunken ship, or a rock projecting abruptly from the bottom, it might be overset before any signal could be given to those above. These defects were obviated by the very ingenious contrivances of Mr. Spalding of Edinburgh. In order to avoid the risk of being upset when the bell descends on a rocky or uneven bottom, he suspended a considerable weight, which he called a *balance-weight*, below the bell, by a rope passing over a pulley fixed in the inside; and the other weights attached to the bell being so adjusted that they could not sink it without the balance-weight, as soon as the latter rested on the ground the bell remained suspended in the water. In case of the mouth of the bell being caught by any obstacle, the balance-weight is immediately lowered, till it rests on the bottom; and as the bell, when thus relieved, is buoyant, the divers, having disengaged it from the rock, have it in their power either to descend, by pulling in the rope, or, by allowing it to run, to ascend to the surface. Another contrivance of Mr. Spalding deserves mention. He divided the bell into two compartments, the one above the other, and communicating by means of a

stop-cock. The divers are stationed in the lower one, and the weights are so adjusted that when the cavity above is empty, the bell is buoyant; when it is filled with water, the bell sinks. Immediately above the partition are some slits in the sides of the bell; and at the top is an orifice, which can be opened or shut at pleasure. Suppose, now, this orifice being open, the bell is required to be lowered; as it descends, the water enters at the slits, and the air escapes by the orifice. When the apparatus is entirely under water, and the cavity consequently completely filled, let the orifice be shut. The bell will now continue to descend; but if the stop-cock communicating with the upper compartment be opened, the air will rush from the under to the upper, and displace a quantity of the water, and the apparatus will be lightened by the whole of the water so displaced. The divers have it thus in their power to regulate the descent or rise as they please. By admitting a certain quantity of air into the upper cavity, the descent of the bell is arrested; by admitting a greater quantity, it becomes buoyant, and rises to the top. This method of constructing the diving-bell has not, however, been adopted.

The greatest improvement on the diving-bell, since that of Halley, was made by the celebrated Mr. Smeaton, and consists in forcing down a continued stream of air, by means of an air-pump, through a flexible tube; and this plan is now always adopted. In the year 1788, Smeaton constructed a diving-bell, to be used in the operations then contemplated at Ramsgate harbor, on a new and improved plan. Instead of a bell-shaped vessel sunk by weights, his apparatus consisted of a square chest of cast-iron, $4\frac{1}{2}$ feet long, $4\frac{1}{2}$ feet high, and 3 feet wide, affording sufficient room for 2 men under it. It was cast of such a thickness that its own weight was sufficient to sink it; and its thickness was greater near the mouth or lower part, to prevent it from being easily overset. This construction of the diving-bell gave the men within it no power of raising or sinking it; but as the apparatus was made to be used at a place where the nature of the bottom was known, this disadvantage was not considered of great consequence; and, in fact, it is found by experience that it is better to leave the bell to be entirely guided from above. On account of the facility with which water conveys sound, the strokes of a hammer on the inside of the bell can be heard at a great distance; and the sound coming through the water has a peculiar character, which can not be mistaken. By previous arrangement, any directions can be given in this manner. For instance, 1 blow may denote more air; 2, stand fast; 3, heave up; 4, lower down, and so on. With these successive improvements, the diving-bell is found to be a most important machine in all the great operations to be performed under water. It was used with great advantage by Mr. Rennie in the construction of the various harbors he projected; and it has recently been successfully employed in deepening the Clyde between Glasgow and Greenock, and improving the navigation of the river. See the article DIVING-BELL, in the new edition of the *Encyclopedia Britannica*. See *Am. Jour. Science*, xxii., p. 825; *Blackwood*, xvii., 336; *LITTLELL'S Museum*, vi., p. 515.

Djidda, a town of Arabia, on the Red Sea, about 21 miles from Mecca, of which it is the seaport, in lat. $21^{\circ} 29' N.$, long. $39^{\circ} 14' E.$ It is well built. The streets are unpaved, but spacious and airy; the houses high, and constructed, for the most part, of madreporas and other marine fossils. The supply of water is scanty, and its quality indifferent. Small vessels approach close to the quays; but large vessels are obliged to anchor in the roads, about 2 miles off, loading and unloading by means of lighters. The entrance to the roads is difficult, and should not be attempted without a pilot. Djidda is a place of considerable commercial importance. It is the *entrepôt* in which is centered the greater part of the commerce between India, Egypt,

and Arabia. Many of its merchants possess large capitals: some of them as much as from £150,000 to £200,000. The trade in coffee brought from Mocha and other ports in Yemen, is the most considerable, but it is said also to be the most hazardous. The returns are principally made in cash. The trade with India and the Gulf of Persia is safer than the coffee trade, and is very considerable. Djidda has also a good deal of intercourse with the ports of Cossair, Souakin, and Massouah, on the opposite coast of the Red Sea. The imports from the last two principally consist of slaves, gold, tobacco, dhourra or barley, hides, butter (of which immense quantities are made use of in Arabia), mats, &c.; in return for which the Africans receive Indian goods suitable for their markets, dresses and ornaments for their women, dates (which are not produced in any part of Nubia), iron, &c. The principal article of import from Cossair is wheat; and not only Djidda, but the whole Hedjaz, or Holy Land of Arabia, is almost entirely dependent upon Egypt for corn. Coffee is the principal article sent in return. Business is transacted at Djidda with ease and expedition. The number of ships belonging to the port is estimated at 250. Owing to the scarcity of timber, none of them are built at Djidda—those belonging to it being either purchased at Bombay or Muscat, or at Mocha, Hoddeida, or Suez. For a considerable period each year, before and after the feast of Ramadhan, when pilgrims come from all quarters to visit Mecca, the town is thronged with strangers, and a great deal of mercantile business is transacted. Djidda is at present, and has been for a number of years, under the government of the Pacha of Egypt. The *moneys, weights, and measures* of the latter country (for which see ALEXANDRIA) are now generally used in Djidda, the commerce of which has been much improved and extended in consequence of its comparative security and good order enforced by the pacha.—BURCKHARDT, *Travels in Arabia*, v. l. i, pp. 1-100.

Dock, an inclosed place for the reception of ships, either for their security or for the convenience of building or giving them repairs. This word has been derived by some, absurdly enough, from the Greek *deyxat*, to receive. That we had it, along with almost the whole of our sea terms, from the northern continental nations, is sufficiently obvious. Thus, in Flemish, it is *dok*; Teutonic, *dock*; Swedish, *docka*; Sulo-Gothic, *docka*; perhaps originally from *dekken*, to cover, protect, secure, inclose. The *dock* for inclosing the prisoner in a court of justice is evidently from the same origin.

Docks for the reception of ships are of two kinds, *wet* and *dry*. A *wet-dock* may either have gates to retain the water in it, so that ships shall constantly remain afloat, or be left open for the tide to flow into and ebb out of it at pleasure, either leaving it dry at low water, or with a certain depth of water remaining in it, according to its construction and situation with regard to the low-water mark, and to the ebbing of the sea at spring or neap tides. A *wet-dock* without gates is generally distinguished by the name of a *basin*, which, however, is sometimes indiscriminately applied to a *wet-dock*, whether with or without gates. A *dry-dock* either becomes dry by the ebbing of the tide when the gates are left open, or by shutting the gates at low water, and pumping out whatever water may remain in it at that time, by the power of men, horses, wind, or by the steam-engine.

Wet-docks.—A *wet-dock* may be defined to be “a basin of water, in which ships may be kept afloat at all times of the tide;” a *dry-dock*, a “receptacle in which every part of a ship can be examined, and its defects repaired.” Ships may also be conveniently built in *dry-docks*, and floated out by opening the gates; though in all dockyards there are places set apart for this purpose, under the name of *slips*. A *wet-dock* is called by the French *un bassin*; a *dry-dock*,

une forme; and a *slip*, *une calle*. The digging out the earth, and building the surrounding walls of masonry to prevent the sides falling in, and the preparation of the mortar and puzzolana, in the construction of a *wet-dock*, are attended with great labor and expense. The two *wet-docks* or basins of Cherbourg (see BREAK-WATER), which are among the finest specimens that exist in the world, are estimated to have cost £3,000,000 sterling. The labor of excavation may sometimes be spared, and a series of *wet-docks* or basins conveniently made, by turning the course of a tide-river through an isthmus, and placing a pair of gates at each end of the old channel. In this way, were the new docks of Bristol constructed out of the bed of the Avon. *Wet-docks* are an improvement in navigation and commerce of the utmost importance, but of very modern date in this country; indeed, they owe their introduction entirely to a spirit of individual enterprise in commercial speculation. Liverpool might still have remained a poor fishing-village but for its convenient docks, which not only produce to the town and corporation a large revenue, but insure to the merchant every possible facility in refitting, loading, and discharging his ships, whatever their burden or their cargo may be, without being exposed to the risk of losing both ship and cargo in a rapid tide-river; and at all events, to an unavoidable delay, occasioned by distance, the weather, or the state of the tides.

London, though unquestionably the first city in the world for its opulence, its commerce, and public spirit, and possessing within itself the powerful internal means of supporting docks, and all other conveniences that trade and shipping may require on the most extensive plans; London was the last to try the experiment of docks, except in the case of two spirited individuals, Mr. Perry, at Blackwall, and Mr. Wells, at Greenland Dock, both private ship-builders. Notwithstanding the total inadequacy of legal quays, which subjected the merchants to incalculable losses and delays, and in many cases proved absolutely ruinous; notwithstanding the effect of the heavy, expensive, and fatal embarrassments experienced regularly on the arrival of the West India fleets, and the annual losses, by plunder in the river, on West India produce, which alone were calculated to amount to £150,000 to the proprietor, and £50,000 to the revenue, and no more than the double of those sums, including other branches of commerce; it was not till the year 1799 that prejudices and private interests were so far removed as to enable the merchants concerned in the West India trade to obtain an act of Parliament to carry into execution a plan of docks, quays, and warehouses, for the convenience of that trade on the Isle of Dogs. Since that time the London Docks, St. Katharine Docks, and various others, have been completed, to the incalculable benefit of the shipping interest and the commerce of the metropolis.

The docks of Liverpool were the first of the kind that were constructed in this kingdom, by virtue of an act of Parliament, passed in 1708; and from that period the town of Liverpool has rapidly raised itself from a poor fishing-village, and a port for coasting-vessels, to be the second commercial town and port in the empire; and the improvements carried out for the enlargement and better arrangement of the docks, rendered it, for convenience and appearance, in this respect the very first, not even London excepted.

It appears from a statement, apparently authentic, that in the ten years ending with 1808 the number of ships which entered those docks was 48,497, tonnage 4,954,204; and the dock duties received, £329,566; and that in the following ten years, ending in 1818, the number of ships was 60,200, the tonnage 6,375,560, and the amount of duties, £669,438; while for a single year, ending June, 1853, no less than 20,490 vessels entered the docks, the tonnage of which was 3,889,981, and the amount of duties, £256,702—the

It may also be observed, that this extraordinary increase has taken place since the abolition of the slave-trade, which, it was formerly asserted, would be the ruin of Liverpool.

The *West India Docks*, on the River Thames, were commenced in February, 1800, and opened in August, 1802. They consist of an outward and a homeward-bound dock, and communicate by means of locks with a basin of five or six acres on the end next to Blackwall, and with another of more than two acres at the end next to Limehouse, both of which basins communicate with the Thames. The outward-bound dock is about 870 yards in length, by 135 in width, containing consequently an area of more than 24 acres; the homeward-bound dock is of the same length, and 165 yards in width, its area being little short of 30 acres; and the two together will contain with ease at least 500 vessels of from 250 to 500 tons. The whole are surrounded with a high wall, and, as a security against fire, the moment that a ship enters the dock the crews are discharged, and no person whatever is allowed to remain on board, or within the premises, the gates of which are closed at a certain hour. They are surrounded by immense warehouses, which are estimated to contain nearly 10,000 hogshheads of sugar, and an immense quantity of rum. The sum authorized by Parliament to be raised for completing these docks and warehouses was £1,200,000, and the total expense was probably not far short of £1,500,000; yet on this capital the subscribers have been receiving from a very short period after their opening, 10 per cent., which, by the terms of the act, is not to be exceeded, and the term granted is limited to 21 years; but, like most other property, these docks have been greatly depreciated in value, and at present barely pay 8 per cent.

The next set of docks that were undertaken for the advantage of the trade of the capital were the *London Docks*. These docks are situated in Wapping, and are appropriated for the reception of all ships arriving in the port of London with wine, spirits, tobacco, and rice on board, but not exclusively, ships having on board other cargoes being admitted on the payment of certain fees. The act of Parliament for incorporating the Dock Company was passed in 1800, authorizing them to raise a capital of £1,200,000; but such was the number of houses to be purchased (we believe not less than 1200) occupying the site of the dock, that this capital, by subsequent acts, was extended to £2,200,000, the dividends on which are limited, as in the *West India Docks*, to 10 per cent. The great dock is 420 yards in length, and 230 yards in width, covering an area of 20 acres. A basin of 3 acres nearly, connects it with the river. The warehouses are very magnificent; and the tobacco warehouse is the grandest and most spacious building of its kind in the world, being capable of containing 25,000 hogshheads of tobacco, and the vaults underneath as many pipes of wine. This single building, under one roof, is said to occupy upward of 4 acres of ground. These docks were opened in February, 1805.

The *East India Docks*, for the exclusive reception and accommodation of the East India ships, were the last in succession. The act for the incorporation of the company was passed in July, 1803, authorizing

them to raise a capital of £200,000, which was afterward increased to £600,000, the dividend, as in the case of the two others, to be limited to 10 per cent. These docks are situated at Blackwall. That for the reception of homeward-bound ships is 470 yards in length by 187 in width, containing a surface of rather more than 18 acres; the outward-bound dock is 260 by 173 yards, and is consequently something more than 9 acres. An entrance-basin of 3 acres nearly, and a spacious lock, connect them with the Thames.

Besides these there are the London Docks, the St. Katharine's Docks, and the Victoria Docks, in course of construction; of these, detailed accounts will be found under the article, LONDON.

In other portions of England and Scotland, there have been costly docks constructed of late years, viz.: *Hull* has 5 docks, occupying, with their basins, a water area of 49½ acres. A timber-pond of 9 acres was constructed in 1853. The tonnage of shipping in 1852 was 799,866 sailing-vessels, and 305,021 steam-vessels; the amount of dock dues, £433,755. *Southampton*, the station for the West India mail and Lieben and Alexandria steamers, is now constructing extensive docks and quays to accommodate their great and increasing traffic. *Grimsby Harbor* has lately been greatly improved. Wet and dry docks have lately been constructed, on the most approved principles, at the expense of £250,000, and a canal cut into the Humber calculated to admit vessels of 1,000 tons' burden. *Hartlepool* has also been of late years greatly enlarging its harbor and dock accommodation. *Sunderland* has new docks of 18 acres' extent, which were opened in 1850, and which can accommodate 300 sail. *Dundee* has lately immensely improved her harbor and docks; besides two smaller docks, the wet-dock now constructing will occupy 14½ acres, the lock of which will be 60 feet broad. *Aberdeen* has a wet-dock, where the largest vessels may float in safety; it covers nearly 40 acres, with quay room of about 9,000 feet. *Leith*, the port of Edinburgh, has 3 wet-docks, containing about 15 acres of water room. *Detailed accounts of these docks will be given under the names of the respective ports.*

The naval dry-docks of the United States are among the most stupendous mechanical enterprises of the country; they are constructed at the navy-yards of New York, Charleston, Norfolk, &c. By far the most extensive and magnificent of these structures is the granite dry-dock at Brooklyn; 80,000 tons of stone have been used in its construction; the masonry foundations are 400 feet in length, and 120 in breadth. The main chamber is 286 feet long, and 30 feet broad on the bottom; 307 feet long, and 98 feet broad at the top within the folding-gates; the height of the wall is 36 feet. The work was commenced in 1841, and took 10 years to complete it; the aggregate expenditure was above \$2,100,000.

Dry-docks.—A dry-dock, requiring to be perfectly water-tight, demands the greatest care in its construction. It is sometimes lined all around with wood, but more generally with masonry, mostly of hewn granite. The expense is very considerable, as the foundation, by means of piles or otherwise, must be well secured, all leakage prevented, and the culvers or drains properly constructed, to let in and carry off the water without its undermining the quays or piers. The cost of a complete dry-dock will vary probably from £20,000 to £100,000, according to the size of the ships it is intended to admit, and the nature of the ground on which it is to be constructed. A dry-dock may be single, or made to contain only one ship; or double, to contain two ships; but the former is the most common, because most convenient. As it is of the utmost importance to preserve the water in a wet-dock, and to keep it out of a dry-dock, it may be proper to describe the different kinds of gates which are in use for this purpose.

Dock Gates.—The most common, and on the whole perhaps the best and most convenient, are swinging-gates, which open in the middle, and lie flat, one part against each wharf or side-wall of the passage leading into the dock or basin. This kind of dock-gate requires to be made of great strength, with sound timber and good iron, and the gudgeons on which the hinges turn to be well secured into the stone abutments. Care also must be taken to make the bottom of the passage and the bottom of the gates perfectly plane and parallel, to prevent leakage, and give facility to their opening and shutting, which is usually assisted by rollers fixed in a groove, and performed by means of a small capstan on each pier. Attached to the top of the gates is usually a foot-bridge with railing, which, separating in the middle, opens and shuts with the gates.

The most simple but by no means the most effective contrivance for keeping out the water, is the wicket-gate. It consists of three parts, which when opened are removed separately. This gate is rarely made use of unless where the abutments are not sufficiently strong, or their foundation sufficiently secure, to bear the weight of a pair of swinging-gates.

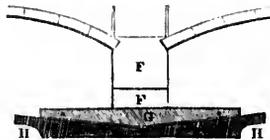

A third kind of gate consists of a floating-dam or caisson, first introduced into this country by General Bentham, and first applied to the great new basin in Portsmouth dockyard. They are built somewhat in the shape of a Greenland fishing-boat, sharp at the two ends, narrow, and deep in proportion to the depth of water at the entrance of the dock. The keel fits into a groove at the bottom of the passage, and the two slanting ends rise and fall in corresponding grooves cut into the two abutments. By letting in the water, the caisson sinks in the grooves, and acts as a closed gate; and by pumping out the water, or letting it out to a certain depth, the dam floats as the tide rises, and the narrow part, rising to the top, is readily disengaged from the grooves, and easily floated away as a boat. The advantages of these floating-dams, as stated by General Bentham, are, that they are cheaper of construction than the gates heretofore in use for closing docks or basins; that they occupy less space, are more easily repaired, and one and the same dam is capable of being used, as need may require, in different places at different times. These caissons have also the advantage of serving as bridges of communication for loaded carriages across the entrances they close, and they require much less labor than gates in opening or shutting up passages into docks or basins, since their occasional buoyancy may be obtained without pumping water or unloading ballast.

Docking a Ship.—When a ship is brought into a dry or graving dock, she gradually subsides as the water flows out, till her keel rests upon the line of square blocks which are placed to receive it along the middle for the whole length; and on these blocks she is kept steady and upright by a number of shores or poles on each side, one of their ends being placed on the *altars* or steps of the dock, the other under the ship's bends and bottom. As a ship under repair generally requires something to be done to the main or false keel, or at any rate these parts require to be inspected, sometimes to shift the main keel, or to add to the whole length of the false keel, it was always found necessary in such cases to remove the blocks, in order to get at the bottom of the ship; but this operation could not be performed without the more serious one of first *lifting* bodily the ship clear of all the blocks, and suspending her as it were in the air. This process was performed by driving wedges simultaneously under the ends of all the shores that supported the ship; an operation that required from four to five hundred men to enable them to suspend a ship of the first rate. When the *San Josef*, a large three-decker, required her bottom to be examined in 1800, the assistance of almost every artificer in the dockyard was found necessary to per-

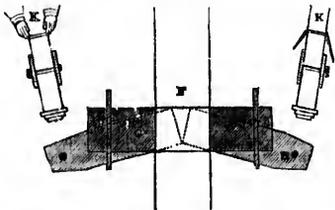

form this process of lifting her; nor was this the only inconvenience; the ship, thus suspended, suffered very material injury by the pressure of her own enormous weight against the ends of the shores that supported her, such as forcing in her sides, straining the knees and all her fastenings, breaking the treenails, &c.

To remedy these glaring inconveniences and very serious injuries that ships thus placed were apt to sustain, and to effect a saving of time and expence in the operation, Mr. (afterward Sir Robert) Seppings, then master shipwright, and afterward surveyor of the navy, contrived, several years ago, an improvement, as ingenious as it is simple, by which twenty men will suspend the largest ship in the navy, or rather, which amounts to the same thing, will disengage any one block that may be required, in the space of two or three minutes, without the necessity of suspending her at all; and, as a first rate in dock sits upon about fifty blocks, these twenty men will clear her of the whole of these blocks in about two hours; and as the saving of a day in completing the repairs of a ship is frequently the saving of a whole spring-tide, the docking and undocking of a ship may make, and frequently has made, by this new method the difference of a fortnight in the time of equipping her for sea.

The block of Mr. Seppings, instead of being one solid piece, consisted of three wedges, or, more properly speaking, of one obtuse wedge and two inclined planes, which, when put together and placed under the ship's keel, appear as under, when viewed in the direc-

tion or line of the keel, where G is the wedge on which the keel rests, having its obtuse angle equal to 170° , and H and I are the two inclined planes, each having an acute angle of 5° . The wedge is of hard wood, having its two sides lined with iron; the two inclined planes are of cast iron. When one of these blocks is to be disengaged from under a ship's bottom, nothing more is required than a few smart blows alternately on the two sides of the two inclined planes, when they fly out, and the middle part or wedge drops; and the facility of thus disengaging any of the blocks is in proportion to the quantity of pressure upon that block. The strokes are usually given by a kind of catapult or battering-ram, being a thick spar or pole moving on a pair of wheels, as KK. This simple contrivance to get

at any part of a ship's bottom by removing in succession all the blocks, without the necessity of lifting the ship, which the removal of any one block required to be done by the old method, is now universally adopted in all the dockyards; and the lords of the admiralty marked their sense of the great utility of the improvement, by bestowing on Mr. Seppings a reward of £1000 for the invention.

basins, nor

ment introduced is that of covering the dry-docks and building slips with roofs. The rapid decay of ships of war by that species of disease known by the name of the *dry rot*, attracted very general attention; its effects were well known, but a variety of opinions were entertained as to its causes and its cure. It was quite obvious, however, that exclusion of air and moisture were the two great operating causes in giving activity to the progress of the disease (see DRY ROT); and that a ship in dock, stripped of her planking, and open to the weather in every part, alternately exposed to frost, rain, wind, and sunshine, must at least have her timbers differently affected, some swelled and water-soaked, others shrunk with heat, and others rifted with the wind and frost; and, if closed up with planking in this state, might be expected, at no great distance of time, to exhibit symptoms of decay. The workmen, too, in the open docks or slips, suffered from the vicissitudes of the weather no less than the ships, and their labor was frequently suspended, to the great detriment of the naval service. The measure of roofing over the docks and slips had long and repeatedly been suggested, but, either from prejudice or a false economy, it was only of late years carried into practice, but is now universal in all the yards. These roofs are generally constructed so as to be capable of having the slides and ends occasionally closed, according to the quarter from which the wind may blow; and by this contrivance the timber is prevented from rifting, as it is liable to do, by the action of a thorough draught of wind, and the health of the artificer is prevented from injury. The light is admitted through numerous windows placed in the roof. These roofs are in general supported on a row of pillars, and covered with plates of iron. The same roof, with little or no repair, serves as a covering for eight or ten different ships in succession. General Bentham, who, in his statement of *Services rendered in the Civil Department of the Navy*, seems to claim to himself all the inventions and improvements which have been introduced into the dockyards for the last forty years, carries his invention beyond a mere covering, and proposes to house over the docks and ships so completely as to afford "means of heating, warming, ventilating, and artificially lighting the interior at pleasure; the introduction of boilers or steam-kilns for bending the planks within the inclosure; the introduction of machinery for assisting in various operations, particularly the more laborious ones; the providing room for carrying on all the shipwright's work within the building; besides a variety of lesser works, such as it is found very inconvenient during the building or repairing of a ship to have executed, for example, in a smith's or carpenter's shop at a distance." Such buildings would not only be enormously expensive, but, in the present crowded state of the dockyards, utterly impracticable. With regard to the invention of covered docks and slips, they have been used in Venice from time immemorial; and it appeared from the evidence given by Mr. Strange, the British consul at that port in the year 1792, before the commissioners of land revenue, that two-and-twenty large ships had been under covered slips, some of them for sixty years nearly. At Carlserona, also, there are several covered docks, and both are strongly recommended for the building of ships under cover.

Hauling up Ships.—Among other experiments which were made in the dockyards for facilitating and expediting the repairs of ships, one may be mentioned, of which many persons were sanguine enough to think that the successful result was likely to be attended with most important benefits to the naval service. It was that of hauling up ships of war, of any dimensions, on building slips, instead of taking them into docks. It is no uncommon practice, at various ports of this kingdom, where there are neither artificial basins, nor natural harbors, to haul vessels of the bur-

den of fifty to two hundred tons, or probably larger, upon the beach, by means of capstans, to give them repairs; in like manner, most of the large fishing smacks are hauled up for security in tempestuous weather; but the practicability of hauling up ships of war, especially of the larger classes, was a matter of some doubt. Several frigates had, at various times, been hauled upon slips, when the docks were all occupied; and the ease with which the operation was performed induced the officers of the dockyard to propose the hauling up of a line-of-battle ship. The *Kent* of 74 guns was selected for this purpose. It was necessary, in the first place, to take her into a dock, to have proper bilgeways prepared, and to be stripped, so as to be made as light as possible; her weight being, according to a calculation made from the water she displaced when afloat, about fourteen hundred tons. To heave up this weight fourteen capstans were employed, and the number of men to work these were as under:

Nine men to each bar and swifter.....	1,512
Eight men to hold on at each.....	112
Three men to each capstan, to attend the fall.....	42
Men on board the ship, and employed in other operations.....	450
Total of men employed.....	2,116

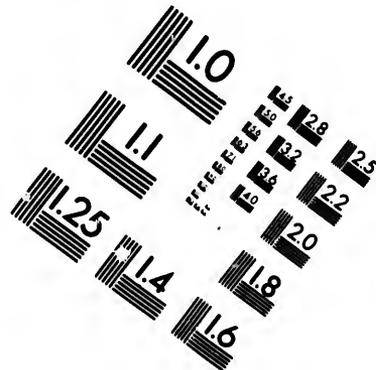

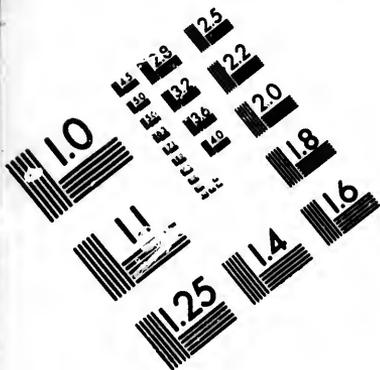

The time occupied in hauling her up, after all the purchases were brought to bear, was forty minutes. The expense of preparing her, and the loss and wear and tear of the materials, was estimated at somewhere about £2,000.

The advantages which slips are supposed to possess over dry-docks are many and important. They can be constructed at one twentieth part of the expense; they occupy less space; they can be constructed on a steep or a shelving shore; and ships can be hauled upon them either in spring or neap tides; whereas a dry-dock can only be made in particular situations, and, when made, ships can only be docked and undocked in certain states of the tides; from which circumstance a considerable delay and inconvenience are frequently experienced. It should be recollected, however, that a large ship must necessarily go into a dock preparatory to her being hauled up on a slip.

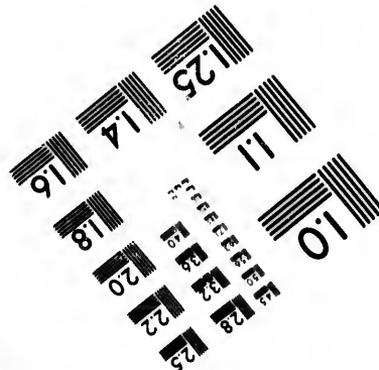

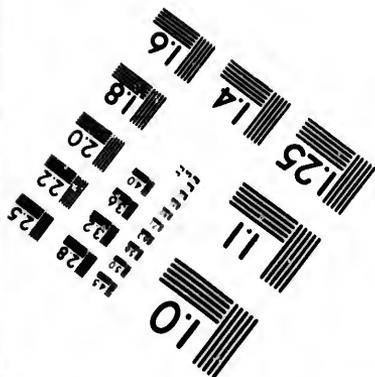

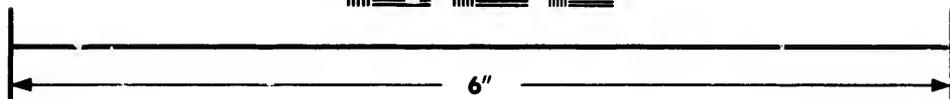

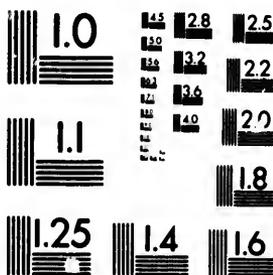

It has been considered as not at all impossible, as was suggested some time ago by Mr. Perriou, then the ingenious clerk of the check in Plymouth dockyard, that the whole ordinary might hereafter be laid up on slips, which, if housed over, would unquestionably be the best means of increasing their durability, and preserving them from partial decay. Nor is it certain that in the end it would not be the most economical mode of preserving them. The expense, as appears from the *Estimates of the Ordinary of the Navy* for the year 1817, is £187,000 for harbor victuals, harbor moorings and riggings, etc., besides £135,000 for wages; the chief part of both which sums is on account of ships of war laid up in ordinary, none of which would be required by placing them on slips. It would indeed form a singular revolution in naval management, if ships hereafter should be laid up in ordinary on dry land, while the timber of which they are built was considered to be the best preserved under salt water; a process which, from some experiments recently made, promises fair to be the most effectual prevention of, and a probable cure for, the dry rot. (See DRY ROT.) This method of preserving timber has long been practiced at Brest, Carthage, and several other places on the continent; and the only objection to it in some of our ports appears to be the attack of the worm known to naturalists by the name of *Teredo navalis*, whose bite is almost as destructive as the dry rot.

On the other hand, there are very many and serious objections, even were the measure practicable, of hauling up ships of the line in particular, to be laid in ordinary on slips. In the first place, the length of seaboard which would be required is greater than probably all the dockyards in the kingdom could furnish. Sec-

only, the three warrant officers who are now employed in each ship, and who are the best men in the service, being no longer necessary, would be turned adrift, and, in all probability, utterly lost to the navy. Thirdly, no large ship could be hauled on the slips without being previously taken into a dock to have her bilgeways fitted, and her bottom prepared for placing her on the slip. The time taken for this purpose must necessarily interfere with the other works of the yard; and after taking her out, the preparations for heaving her up, the capstans, blocks, purchase-falls, chains, and a variety of other articles, amount to a very large expense, not less, with the expense of the roof to cover the ship, than £10,000 for each ship so hauled up.

Dockyards.—Previously to the reign of Henry VIII. the kings of England had neither navy arsenals nor dockyards, nor any regular establishment of civil or naval officers to provide ships of war, or to fight them. They had admirals, however, possessing a high jurisdiction and very great power. And it would appear, from a very curious poem in *Hackluit's Collection*, called *The Poetic of Keeping the Sea*, that Henry V. had both ships, officers, and men exclusively appropriated to his service, and independently of those which the Cinque Ports were bound, and the other ports were occasionally called upon to furnish, on any emergency. By this poem it also appears that Little Hampton, until as it now is, was the port at which Henry built

his great *Dromions*

Which passed other great shippes of the commons.

But what these *dromions* were no one can now tell; nor is it easy to conceive how the building and repairing of the Great Harry, which in the reign of Henry VII. was launched at Portsmouth, and cost £15,000, was managed, considering the very rapid strides made at once from the small Cinque Port vessels, manned with 21 men and a boy, to this enormous floating castle. At that time it is well known that they had no docks, nor even substitutes for them.

The foundation of a regular navy, by the establishment of dockyards, and the formation of a board, consisting of certain commissioners for the management of its affairs, was first laid by Henry VIII. and the first dockyard erected under his reign was that of Woolwich. Those of Portsmouth, Deptford, Chatham, and Sheerness, followed in succession; and the last, excepting the new and unfinished yard of Pembroke, was Plymouth, which was founded by William III.

From the first establishment of the dockyards to the present time, most of them have gradually been enlarged and improved by a succession of expedients and make-shifts, which answered the purposes of the moment; but the best of them possess not those conveniences and advantages which might be obtained from a dockyard systematically laid out on a uniform and consistent plan, with its wharfs, basins, docks, slips, magazines, and workshops, arranged according to certain fixed principles, calculated to produce convenience, economy, and despatch.

Neither at the time when dockyards were first established, nor any subsequent periods of their enlargement: as the necessities of the service demanded, could it have been foreseen what incalculable advantages would one day be derived from the substitution of machinery for human labor; and without a reference to this vast improvement in all mechanical operations, it could not be expected that any provision would be made for its future introduction; on the contrary, the docks and slips, the workshops and storehouses, were successively built at random, and placed wherever a vacant space would most conveniently admit them, and in such manner as in most cases to render the subsequent introduction of machinery and iron railways, and those various contrivances found in the large manufacturing establishments of private individuals, quite impossible, even in the most commodious and roomy dockyards.

The perfection of a dockyard, independently of the advantages of machinery, which are but contingent, may be considered to depend upon one or more extensive basins, surrounded by spacious wharfs or quays. By means of these a prodigious saving of time, labor, and expense may be saved, in every stage of the progress of fitting out a ship for sea, from the moment she is launched from the slip, or taken out of a dock, as well as in dismantling a ship on returning to port to be paid off and repaired, or laid up in ordinary. For this purpose the docks and slips should occupy one of the sides of the basin, with working-sheds for carpenters and joiners, smiths' shops, saw-pits, and seasoning-sheds between them. The ship, when completed on the slip and launched into the basin, may then be taken immediately into the adjoining dock to be coppered. From this she proceeds to the second side of the basin, in the corner of which is the ballast-wharf. The remainder of the side will probably be occupied by the victualing department, with appropriate stores in the rear for various kinds of provisions, and behind these the bakery, brewery, and slaughter-houses; on the wharf the iron tanks for holding water, now universally used for the ground tier in lieu of wooden casks. These are taken on board next after the ballast, and, together with the superincumbent casks, would be filled in the ship's hold by means of flexible pipes to convey the water into them. The provisions would at the same time be taken on board at the same wharf, in front of the victualing stores. The third side might be appropriated to the ordnance department, with the gun-wharf extending along the whole side, and the gun-carriage storehouses, magazines, etc., in the rear. The fourth side would be occupied as the anchor wharf, with the cable storehouses, the sail-lofts and stores, rigging-loft, and magazines for various stores, in the rear. Behind these, again, on the first side, containing the dry-docks, and building-slips, the ground would be appropriated to the reception, berthing and converting of timber, from whence iron railways would lead to the saw-mills, saw-pits, and workshops, all of which would be placed on that side. On the second side a pond or basin for the victualing lighters and craft, with wharfs communicating with the manufactories and storehouses; the same on the ordnance or third side; and on the fourth side might be placed the ropery, hemp storehouses, tar-houses, with a basin for hemp-vessels, lighters, and the like. Communicating with the great basin on the building side, and also with the river or harbor on the shore of which the dockyard is to be formed, should be a mast-pond, with a lock for the storing of spars. In front the mast-houses, top-houses, capstan-houses, and a slip to launch the masts into the pond. Here also might be placed the boat-houses and boat-pond.

A Systematic Dockyard.—A peninsular situation, having at least three fourths of its shore surrounded with deep water, is peculiarly favorable for some such arrangement as is here mentioned, as any number of locks and canals might be made to communicate with the river, so that ships coming into the basin might not interfere with those going out, nor the lighters and other craft bringing their several species of stores, with either or with one another. By such an arrangement a ship would be equipped for sea at half the present expense, and within half the usual time. A ship fitting out for an anchorage distant from the dockyard, is liable to every inconvenience and delay, as all her guns, stores, provisions, and water, must be carried to her in dockyard lighters and other craft, into which and out of which they must be hoisted and re-hoisted; liable to delay from bad weather and contrary winds; to be stove alongside the ship, to the total loss or damaging of their cargoes. Added to which is the loss of time in going backward and forward, especially to the artificers; the desertion of the men; the accidents from the upsetting of boats; and many other evils, of a

magnitude not easily to be calculated, and exceeded only by the disappointment and vexation that unavoidably occur when ships are preparing for some particular and pressing service; all of which, when ships are fitted out in a basin for sea, are avoided. Here no delay, no embezzlement, no desertion can take place. A ship in returning from sea may be docked and undocked into the basin with all her stores on board; and if to be paid off, instead of keeping the crew on board for weeks, till all the stores have been delivered into the dockyard, the ship, by the proposed plan of basins, would remain securely in the basin, to be stripped at leisure by the riggers and laborers of the yard, and the crew become immediately available for other ships.

Portsmouth Dockyard.—Portsmouth dockyard will always be considered as the grand naval arsenal of England, and the headquarters or general rendezvous of the British fleet. The dockyard, accordingly, is by far the most capacious; and the safe and extensive harbor, the noble anchorage at Spithead, the central situation with respect to the English Channel and the opposite coast of France, and particularly with regard to the naval arsenal at Cherbourg, render Portsmouth of the very first importance as a naval station; and in this view of it, every possible attention appears to have been paid to the extension and improvement of its dockyard. The noble steam-basin, which was opened by the Queen, in May, 1848, with great ceremony, is one of the most important of the recent improvements. The sea wharf-wall of this yard, extending in the direction of north and south, along the western shore of the harbor, is about 3,900 feet in length, and the mean depth may be 2,000 feet; and it incloses an area of more than 100 acres.

In the centre of the wharf-wall, facing the harbor, is the entrance into the great basin, whose dimensions are 380 by 260 feet, and its area $2\frac{1}{2}$ acres. Into this basin open 4 excellent dry-docks, and on each of its sides is a dry-dock opening into the harbor; and all of these 6 docks are capable of receiving ships of the largest class. Besides these, is a double dock for frigates, the stern dock communicating, through a lock, with the harbor, and the head dock with another basin about 250 feet square. There is also a chamber, with a wharf-wall on each side, 600 feet in length, and of sufficient width to admit of transports and merchant-ships bringing stores to the dockyard. In the same face of the yard are 8 building-slips, capable of receiving the largest ships, and a small one for sloops, besides 2 building-slips for frigates on the northern face of the yard, and a smaller slip for sloops. The range of storehouses on the north-east side, and the rigging-house and sail-loft on the south-west side of the chamber, are magnificent buildings, the former occupying nearly 600 feet in length, exclusive of the two intermediate spaces, and nearly 60 feet in width, and the two latter 400 feet. The two hemp-houses and the two ess-stores houses occupy a line of building which, with the three narrow openings between them, of 25 feet each, extend 800 feet. The rope-house, tarring-house, and other appendages of the ropery, are on the same scale. The two sets of quadrangular storehouses, and the two corresponding buildings, with the intervening timber-berths and saw-pits, at the head of the dry-docks, issuing from the great basin, are all excellent, and conveniently placed. The smithery is on a large scale, and contiguous to it is an iron-mill, a copper-mill, and a copper-refinery, at which is re-melted and rolled all the old copper which is taken from ships' bottoms; and here, also, are cast bolts, gudgeons, and various articles of copper used in the navy. The number of sheets manufactured in one year of the war, amounted to about 800,000, weighing above 12,000 tons; on which it has been calculated that a saving of at least £20,000 was effected for the public, besides obtaining a good, pure article. Most of these were constructed under the direction of General Bentham.

(Bentham's Services.) At the head of the north dock are the wood-mills, at which every article of turnery, rabbling, etc., is performed for the use of the navy, from boring the chamber of a pump to the turning of a button for a chest of drawers. But the principal part of these mills is the machinery for making blocks, contrived by that ingenious artist, Mr. Brunell (see TRUSSARD'S CAREENING), which can not be regarded without exciting the highest respect for the talents and skill of the inventor.

The northern extremity of the dockyard is chiefly occupied with seasoning-sheds, saw-pits, and timber-berths, the working boat-house, and boat storehouse. On the eastern extremity are situated the houses and gardens of the superintendent and principal officers of the yard, the chapel, and the royal naval college.

Capacity of a Dockyard.—The capacity of a dockyard for building, repairing, and refitting ships of war, depends upon so many circumstances that it scarcely admits of calculation; chiefly, however, on the facilities afforded by a suitable arrangement of dry-docks, building-slips, and basins, and on the number of shipwrights and other artificers borne on the strength of the yard. In building new ships, where the materials are at hand, and no interruptions occur, the capacity may be ascertained to a tolerable degree of accuracy. To complete the building of a 74-gun ship, it is calculated that the labor of one man would be required for 18,000 days, or of 18 men for 1,000 days, or about 64 men to finish her in the space of one year. A dockyard, therefore, with 500 good shipwrights, might be expected to launch from 8 to 10 74-gun ships every year, if the conveniences of the yard admitted them all to be employed on the building; but this kind of ship is now supplanted by ships of 120 and 180 guns, requiring a relative increase of hands. With regard to repairs, they are so various and so uncertain, that it would be next to impossible to form any calculation that should at all approach to the truth. A writer well versed in naval matters, in attempting to prove the sufficiency of our dockyards, without having recourse to private merchant-yards during war, has stated, that by a uniform system of management, "the annual regeneration of ships-of-the-line may be safely reckoned at *twelve sail*, and that of frigates, at *eight sail*; and that, besides, there might be docked for casual repairs, in the course of one year, *two hundred and sixty-seven sail* of ships and vessels of war." —Letter to Lord Melville on the General State of the British Navy.—E. B.

The Brooklyn Navy Yard is the most extensive naval dépôt in the United States, situated on the south side of Wallabout Bay, at the north-eastern part of the city, and contains 45 acres of land. It is inclosed by a substantial brick wall on the land side, and on the left hand, as you enter its gate, there is a flower-garden most tastefully arranged.

This spacious yard affords sufficient room for the residence of the officers, machine-shops, storehouses, etc. The most conspicuous buildings are two large edifices, 250 feet long by 125 feet wide, and 120 feet high, capable of containing the largest ships of war while being built. In time of peace several national vessels are usually to be seen here, either laid up or undergoing repairs. A vast amount of cannon, cannon-balls, bombs, and all kinds of munitions of war, is always on hand at this dépôt. The Brooklyn dry-dock is located at the Navy Yard, and is capable of receiving the largest ships of war. This is a magnificent work, unequalled by any of the kind in America, and scarcely surpassed by any in the world. The foundation is 400 feet long by 120 wide, and the main chamber or basin is 286 feet long by 30 wide at the bottom, and 307 feet long and 98 wide at the top. The weight of the iron folding-gates is 150 tons; the pumps discharge 40,000 gallons per minute. The engine-house is a fire-proof building, containing machinery of

the most perfect kind. The whole occupied 16 years in the course of construction. See APPLETON'S *Dictionary of Mechanics*.

Dogwood (*Cornus Florida*). The wood of this tree is hard, compact, heavy, and fine-grained, and is susceptible of a brilliant polish, from which circumstance it may be substituted for numerous purposes to which boxwood is applied. The esp-wood is perfectly white, and the heart-wood is of the color of chocolate. In the United States, it enters into the construction of many articles, both for utility and ornament; such as the handles of light tools; mallets, toys, etc. It is sometimes used by farmers for harrow teeth, for the hames of horse-collars, and also for shoeing the runners of sleds; but to whatever purpose it is applied, being liable to split, it should never be wrought till it is perfectly seasoned. The shoots, when three or four years old, are found suitable for the light hoops of small casks, and in the Middle States, the cogs of mill-wheels are made of them, and the forked branches are converted into the yokes which are put upon the necks of swine, to prevent them from breaking into inclosed fields. In the parts of the country where it abounds, it serves for excellent fuel. The inner bark of this tree is extremely bitter, and is used as a good substitute for the Peruvian bark. The bark also may be substituted for galls in the manufacture of ink, and from the bark of more fibrous roots, the American Indians obtain a scarlet dye. An infusion of the flowers of this tree is also used by them in the cure of intermit-tents. The fruit is sometimes taken as a tonic, in the form of a spirituous impregnation, and it likewise forms a favorite repast for various species of birds. In England the sole use of this species is an ornamental shrub, and from its large, white flowers, "emulous of the purity of snow," which finely contrast with the "forest green," it richly deserves a place in every collection where it will thrive.—BUONVISE'S *Trees of America*.

Doldrums. Seafaring people have, as if by common consent, divided the ocean off into regions, and characterized them according to the winds; *e. g.*, there are the "trade-wind regions," the "variables," the "horse latitudes," the "doldrums," etc. The "equatorial doldrums" is another of these calm places. Besides being a region of calms and baffling winds, it is a region noted for its rains and clouds, which make it one of the most oppressive and disagreeable places at sea. The emigrant ships from Europe for Australia, have to cross it. They are often baffled in it for two or three weeks; then the children and the passengers who are of delicate health suffer most. It is a frightful grave-yard on the way-side to that golden land.—MAURY'S *Phys. Geog. of the Sea*, p. 209.

Dollar, the name of a silver coin of Spain and of the United States; worth 100 cents. The dollar appears to have been originally a German coin; and in various parts of Germany there are coins of different values so called. This word corresponds to the German *thaler*, the Low-German *dahler*, the Daalsh *daler*, the Italian *talero*. All these words, together with our *dollar*, are derived from the name of the Bohemian town *Joachims-Thal* (Joachim's Valley), where, in 1518, the Count of Schlick coined silver pieces of an ounce weight. These, indeed, were not the first of the kind coined; yet, as they were numerous and very good they became generally known by the name of *Joachim's-thaler*, which is the German adjective of *Joachim's-thal*, and also Schlickenthaler from the name of the Counts. As these coins were in good repute, *thalers* were also coined in other countries, but of different value; thus originated the *land-thaler* (leaf-dollar), *Phillips thaler*, the Swedish copper dollar etc. In Russia, a dollar is called *jephimock*, from *Joachim*.—E. A. See COIN.

Dolphin, in nautical language, a rope or strap fastened round the mast of a ship to give support to

the *puddening* (a mass of yarn or oakum used to prevent chafing), where the lower yards rest on the slings. *Dolphin* is also applied to a spar or buoy furnished with a large ring, and anchored, to which a vessel may bend its cable.

Domestic. In regard to the states not Christian, not only the Mohammedan states, but all the rest, the true rule appears to be, that contracts of citizens of the United States in general, and especially the contract of marriage, are not subject to the *lex loci*, but must be governed by the law of the domicile; and that, therefore, in such countries, a valid contract of marriage may be solemnized, and the contract authenticated, not only by an ambassador, but by a consul of the United States. The English authorities come to substantially the same conclusion, for similar reasons. "Nobody can suppose," says Lord Stowell, "that while the Mogul empire existed, an Englishman (in Hindostan) was bound to consult the Koran for the celebration of his marriage." In most of the Asiatic and African countries, indeed, law is personal, not local, as it was in many parts of modern Europe in the formative period of its present organization. Hence, in British India, Hindoos, Parsees, Jews, Mohammedans, Christians, all marry according to the law of their religion. The ecclesiastical law of England goes further than this, for it recognizes the marriage of Englishmen, celebrated according to the English law, that is, by a clergyman, in British factories abroad, though situated in Christian countries, but countries of the Roman Catholic or Greek religion.—*Manual for Consuls, U. S.*

Merchants.—The national character of merchants residing in Europe and America, is derived from that of the country in which they reside. In the eastern parts of the world, European persons, trading under the shelter and protection of the factories founded there, take their national character from that association under which they live and carry on their trade. This distinction arises from the nature and habits of the countries. In the western parts of the world, alien merchants mix in the society of the natives; access and intermixture are permitted; and they become incorporated to nearly the full extent. But, in the East, from almost the oldest times, an immiscible character has been kept up; foreigners are not admitted into the general body and mass of the nation; they continue strangers and sojourners, as all their fathers were. Thus, with respect to establishments in Turkey, the British courts of prize, during war with Holland, determined that a merchant carrying on trade at Smyrna, under the protection of the Dutch consul, was to be considered a Dutchman, and condemned his property as belonging to an enemy. And thus in China, and generally throughout the East, persons admitted into a factory, are not known in their own peculiar national character; and not being permitted to assume the character of the country, are considered only in the character of that association or factory.

But these principles are considered not to be applicable to the vast territories occupied by the British in Hindostan; because, as Sir W. Scott observes, "though the sovereignty of the Mogul is occasionally brought forward for the purpose of policy, it hardly exalts otherwise than as a phantom; it is not applied in any way for the regulation of their establishments. Great Britain exercises the power of declaring war and peace, which is among the strongest marks of actual sovereignty; and if the high and empyrean sovereignty of the Mogul is sometimes brought down from the clouds, as it were, for the purposes of policy, it by no means interferes with the actual authority which that country, and the East India Company—a creature of that country—exercise there with full effect. Merchants residing there, are hence considered British subjects."—WHEATON'S *International Law*, Part IV., ch. 1, p. 408.

Dominica, one of the Leeward group of islands in the West Indies, belonging to Britain, and lying between the French islands of Martinique and Guadeloupe, 24 miles north of the former, and about the same distance south of the latter. Dominica was so named by Columbus from his having discovered it on a Sunday (in 1493). It was ceded to England by the peace of Paris, in 1763, but was taken by the French in 1778. At the peace of 1783 it was restored to England, in whose possession it has since remained. Dominica is 29 miles in length from north to south, and 16 in breadth, and has an area of about 186,436 acres. The principal town Roseau, situated on the S.W. side of the island, is in lat. 16° 19' N., long. 61° 28' W. The surface is generally rugged and mountainous, interspersed with fertile and well-watered valleys. The highest point is 5,814 feet above the level of the sea. The origin of this island is volcanic, and sulphur and other volcanic products are abundant. The soil is light and well adapted for the growth of coffee. The hills are covered with valuable timber trees of the kinds commonly found in the West Indies. Game is abundant, and the fisheries on the coast are very productive. The principal productions are sugar, molasses, rum, coffee, cocoa, and oranges. The cultivation of cotton has lately been introduced to a small extent, and has been found to answer very well, particularly on land near the sea-coast. The principal staple products exported in the years ending 6th January, 1852, and 6th January, 1853, were as follows:

	1852.	1853.
Sugar.....	62,169 cwts.	65,788 cwts.
Rum.....	30,927 galls.	35,794 galls.
Molasses.....	95,600 "	81,016 "
Coffee.....	58,063 lbs.	67,394 lbs.
Cocoa.....	33,834 "	69,399 "
Lime juice.....	4,250 galls.	5,962 galls.
Arrow root.....	5,944 lbs.	8,225 lbs.
Oranges.....	1,019,500	1,354,020
Cotton Wool.....	2,000 lbs.	3,250 lbs.

The value of exports and imports, and the revenue for the years 1849, 1850, and 1851, were as follows:

	1849.	1850.	1851.
Imports.....	£20,616	£27,656	£27,329
Exports.....	48,070	68,295	62,627
Revenue.....	5,919	10,275	12,901

The population in 1844 was 22,200, of whom 11,604 were females. The principal harbors are Roseau and Prince Rupert's Bay.—E. H.

Dornock is a species of figured linen of stout fabric, which derives its name from a town in Scotland, where it was first manufactured for table-cloths. It is the most simple pattern of all the varieties of the diaper or damask style, and therefore the goods are usually of coarse quality for common household wear. It receives the figure by reversing the finishing of the warp and woof at certain intervals, so as to form squares or oblong rectangles upon the cloth. The most simple of these is a succession of alternate squares, forming an imitation of a checker board or mosaic work. The coarsest kinds are generally woven as tweels of three leaves, where every thread floats over two, and is intersected by the third in succession. Some of the finer are tweels of four or five leaves, but few of more; for the six or seven leaf tweels are seldom or never used, and the eight leaf tweel is confined almost exclusively to damask.

Dort, or **Dordrecht**, an important commercial city of Holland, capital of a cognominal district in the province of South Holland, 10 miles south-east of Rotterdam. It is situated on an island of the Meuse, said to have been separated from the mainland in 1421, by an inundation which swept away 79 villages, and about 100,000 inhabitants. This is one of the oldest cities of Holland, but the period of its rise is uncertain. It was surrounded by walls in 1281 by Florent IV., Count of Holland, who made it his residence, and granted it many important privileges. In 1457, almost the entire town, including the church of Notre Dame, founded in 1366, and other public buildings, was destroyed by fire. It was one of the first towns to embrace the Re-

formed religion, and to throw off the yoke of the Spanish king. In 1572 a meeting of deputies was held here, when the independence of the United Provinces was first declared; and in 1618 and 1810 sat the celebrated Synod of Dort. The town-hall is a handsome building; and the principal church is an old Gothic structure 800 feet long by 125 feet wide, with a heavy square tower, and numerous monumental stones, some of great antiquity. The hall in which the synod was held is now a public house. The houses are generally of an antique fashion, with the gables turned outward, and many of them date from the period of the Spanish occupation. Dort possesses a good harbor, from which two canals lead to the centre of the town, and thus facilitate the conveyance of goods to the warehouses. It carries on an extensive trade in corn, flax, salt fish, train oil, and timber, brought down the Rhine; and has ship-building docks, saw-mills, sugar and salt refineries, tobacco factories, linen-bleaching and white-lead works. Dort is the birthplace of the brothers De Witt. Population (1850), 20,878.

Doubling, in navigation, the act of sailing round or passing beyond a cape or promontory.

Doublon, or **Doblon**, a Spanish and Portuguese coin, being the double of a pistole.—E. B. See COINS.

Dover, **Strait's** of, the narrow channel between Dover and Calais, which separates Great Britain from the French coast. Britain is supposed by many to have been once a peninsula—the present straits occupying the site of the Isthmus which joined it to Gaul.

"The correspondence of strata," says Mr. Pennant, in his *Arct. Zoology*, "on part of the opposite shores of Britain and France, leaves no room to doubt that they were once united. The chalky cliffs of Blancnez, between Calais and Boulogne, and those to the westward of Dover, exactly tally. The last are vast and continued; the former short, and the termination of the immense bed. Between Boulogne and Folkestone (about 6 miles from the latter) is another memorial of the junction of the two countries: a narrow submarine hill, called the *Rip-raps*, about a quarter of a mile broad, and 10 miles long, extending eastward toward the Goodwin Sands. Its materials are boulder-stones, adventitious to many strata. The depth of water on it, in very low spring-tides, is only 14 feet. The fishermen from Folkestone have often touched it with a 15-foot oar, so that it is strictly the dread of navigators. Many a tall ship has struck on it, and sunk instantly into 21 fathoms of water." In July, 1782, the *Belleville*, of 64 guns, struck, and lay on it during three hours, but by starting her beer and water, got clear off. These celebrated straits are only 21 miles wide in the narrowest part; from the pier of Dover to that of Calais, 24 miles. It is said that their breadth is diminishing, and that they are two miles narrower than they were in ancient times. An accurate observer for 50 years, remarks that the increased height of water, from a decrease of breadth, has been apparent, even in that space. The depth of the channel, at a medium, in the highest spring-tides, is about 25 fathoms; the bottom is either coarse sand or rugged senes, which have, for ages unknown, retarded the attrition of the currents.—E. A.

Dow (Ger. *Dunen*, *Flaumsfedern*; Du. *Dons*; Fr. *Duvel*; It. *Penna matta*, *Piumini*; Sp. *Flojel*, *Plumazo*; Rus. *Puck*; Lat. *Pluma*), the fine feathers from the breasts of several birds, particularly those of the duck kind. That of the elder duck is the most valuable. These birds pluck it from their breasts, and line their nests with it. Mr. Pennant says that it is so very elastic, that a quantity of it weighing only $\frac{1}{4}$ of an ounce, more than fills the crown of the largest hat. That found in the nest is most valued, and termed *live down*; it is much more elastic than that plucked from the dead bird, which is comparatively little esteemed. The elder duck is found on the western islands of Scotland, but the down is principally imported from Norway and Ireland.

Downs, a bank or elevation of sand, which the seagathers and forms along its shores, and which serves it as a barrier. The word is formed from the French *dune*, or the Celtic *dun*, a mountain. Charles de Viseh (*Compend. Chronolog. Exord. et Progress. Abbat. Clarias. B. Marie, de Dunis*) says, *Vallem reperit arenarum collibus, quos incolæ Duynen vocant, undique cinctam*. It is also applied to a large open plain, primarily on elevated land.

Downs is particularly applied to a famous roadstead for ships along the eastern coast of the county of Kent, from Dover to the North Foreland, where both outward and homeward-bound ships frequently make some stay, and squadrons of men-of-war rendezvous in time of war. It affords excellent anchorage, and is defended by the castles of Deal, Dover, and Sandwich.

Dragoman, or **Drogueman**, an interpreter; a term of general use in the Levant and throughout the East. There are dragomans attached to the embassies and consulates of Christian nations residing at the Porte. The word is formed from the Arabic *targeman* or *targiman*, of the verb *targem*, "he has interpreted." From *dragoman* the Italians formed *dragomanno*, and, with a nearer relation to its Arabic etymology, *turciman*; whence comes *trucheman*, as well as *dragoman* and *drogueman*. See *TURKEY*.

Dragon's Blood (*Sang draco*, Fr.; *Drachenblut*, Germ.) is a resinous substance, which comes to us sometimes in small balls about the size of a pigeon's egg, sometimes in rods like the finger, and sometimes like irregular cakes. Its color, in lump, is dark brown-red; in powder, bright red; friable; of a shining fracture; sp. grav., 1.196. It contains a little benzoic acid, is insoluble in water, but dissolves readily in alcohol, ether, and oils. It is brought from the East Indies, Africa, South America, as the produce of several trees, the *Dracena draco*, the *Pterocarpus santalinus*, *Pterocarpus draco*, and the *Calamus rotang*. Dragon's blood is used chiefly for tinging spirit and turpentine varnishes, for preparing gold lacquer, for tooth tinctures and powders, for staining marble, &c. According to Herberger, it consists of 9.07 parts of red resin, 2 of fat oil, 3 of benzoic acid, 1.6 of oxalate, and 3.7 of phosphate of lime.

Drake, Sir Francis, a celebrated English admiral, was born near Tavistock, Devonshire, in 1545. His father, who had been bred a sailor, obtained a naval chaplaincy from Queen Elizabeth, and was afterward vicar of Upnor church, on the Medway. Young Drake was educated at the expense and under the care of Sir John Hawkins, who was his kinsman; and, at the age of eighteen, he had risen to be purser of a ship trading to Biscay. At twenty he made a voyage to Guinea; and at twenty-two he was made captain of the *Judith*. In that capacity he was in the harbor of San Juan d'Ulloa, in the Gulf of Mexico, where he behaved most gallantly in the actions under Sir John Hawkins, and returned with him to England, having acquired great reputation, though with the loss of all the money which he had embarked in the expedition. Having next projected an attack against the Spaniards in the West Indies, to indemnify himself for his former losses, he set sail in 1572, with two small ships named the *Pasha* and the *Swan*. He was afterward joined by another vessel; and with this small squadron he took and plundered the Spanish town of Nombre de Dios. With his men he penetrated across the Isthmus of Panama, and committed great havoc among the Spanish shipping. In these expeditions he was much assisted by a nation of Indians, who were then engaged in a desultory warfare with the Spaniards. Having embarked his men and filled his ships with plunder, he bore away for England, where he arrived in August, 1578.

In 1580, Sir Francis Drake commanded the fleet sent to restore Don Antonio, King of Portugal, the land forces being under the orders of Sir John Norris; but

they had hardly put to sea when the commanders differed, and thus the attempt proved abortive. But as the war with Spain continued, a more formidable expedition was fitted out, under Sir John Hawkins and Sir Francis Drake, against their settlements in the West Indies, than had hitherto been undertaken during the whole course of it. Here, however, the commanders again disagreed about the plan; and the result, in like manner, disappointed public expectation. These disasters were keenly felt by Drake, and were the principal cause of his death, which took place on board his own ship, near the town of Nombre de Dios, in the West Indies, January 28th, 1595.—E. B. See *Edinb. Rev.*, lxxx., 197; *Dublin Univ.*, xxiii., p. 551; *N. Am. Rev.* [FRABODY], lix., p. 70; *LITTELL'S Living Age*, iii., p. 289.

Drawback, a term used in commerce to signify the remitting or paying back of the duties previously paid on a commodity on its being exported. A drawback is a device resorted to for enabling a commodity affected by taxes to be exported and sold in the foreign market on the same terms as if it had not been taxed at all. It differs in this from a bounty, that the latter enables a commodity to be sold abroad for less than its natural cost, whereas a drawback enables it to be sold exactly at its natural cost. Drawbacks, as Dr. Smith has observed, "do not occasion the exportation of a greater quantity of goods than would have been exported had no duty been imposed. They do not tend to turn toward any particular employment a greater share of the capital of the country than would go to that employment of its own accord, but only to hinder the duty from driving away any part of that share to other employments. They tend not to overturn that balance which naturally establishes itself among all the various employments of the society, but to hinder it from being overturned by the duty. They tend not to destroy, but to preserve, what it is in most cases advantageous to preserve—the natural division and distribution of labor in the society." Were it not for the system of drawbacks, it would be impossible, unless when a country enjoyed some very peculiar facilities of production, to export any commodity that was more heavily taxed at home than abroad. But the drawback obviates this difficulty, and enables merchants to export commodities loaded at home with heavy duties, and to sell them in the foreign market on the same terms as those fetched from countries where they are not taxed. Most foreign articles imported into this country may be warehoused for subsequent exportation. In this case they pay no duties on being imported, and, of course, get no drawback on their subsequent exportation. Sometimes a drawback exceeds the duty or duties laid on the article; and in such cases the excess forms a real bounty of that amount, and should be so considered.

Dredging Machine. A machine for clearing out or deepening the beds of navigable rivers, harbors, canals, &c., by the removal of deposited matter.

Dresden China. The fine porcelain ware known as Dresden china was discovered by M. Böttcher, who was at the time an apothecary's boy, 1700. Services of this ware have cost many thousands of pounds each. A costly service, each piece exquisitely painted, and the battles represented, and subjects all different, was presented to the Duke of Wellington by the King of Prussia, in 1816, and is the finest in England.

Dressing. A term applied to gun, starch, and other articles used in stiffening or preparing silk, linen, and other fabrics.

Drift, in navigation, the angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the wind and waves, and is not governed by the helm. It also implies the distance which the ship drives on that line. *Drift*, in mining, a passage cut between shaft and shaft, or a way wrought under the earth.

Drift of Bottles. It is a custom often practiced by seafaring people to throw a bottle overboard, with a paper, stating the time and place at which it is done. In the absence of other information as to currents, that afforded by these mute little navigators is of great value. They leave no tracks behind them, it is true, and their route can not be ascertained. But knowing where they were cast, and seeing where they are found, some idea may be formed as to their course. Straight lines may at least be drawn, showing the shortest distance from the beginning to the end of their voyage, with the time elapsed. Admiral Boscawen, R. N., has prepared a chart, representing, in this way, the tracks of more than 100 bottles. From it it appears that the waters from every quarter of the Atlantic tend toward the Gulf of Mexico and its stream. Bottles cast into the sea midway between the Old and New Worlds, near the coasts of Europe, Africa, and America; at the extreme north, or further south, have been found either in the West Indies or the British isles, or within the well-known range of Gulf Stream waters. Of two cast out together in south latitude on the coast of Africa, one was found on the island of Trinidad, the other on Guernsey, in the English Channel. In the absence of positive information on the subject, the circumstantial evidence that the latter performed the tour of the Gulf is all but conclusive. And there is reason to suppose that some of the bottles of the admiral's chart were also performed the tour of the Gulf Stream; then, without being cast ashore, have returned with the drift along the coast of Africa into the inter-tropical region; thence through the Caribbean Sea, and so on with the Gulf Stream again. Another bottle thrown over Cape Horn by an American master in 1837, has been recently picked up on the coast of Ireland. An inspection of the chart, and of the drift of the other bottles, seems to force the conclusion that this bottle too went even from that remote region to the so-called higher level of the Gulf Stream reservoir.—MADRY, *Phys. Geog. of the Sea.*

Drift-sail, a sail used under water, veered out right a-head by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to prevent her driving too fast in a current.

Drift-wood, trees or timber carried out to sea by rivers when in flood; timber drifted or floated by water.

Driving, in sea language, is said of a ship when her anchor fails to hold her fast, and she floats away with the wind or tide. A vessel is also said to drive when she scuds before a gale.

Droits of Admiralty. The perquisites resulting chiefly from the seizure of the property of an enemy at the commencement of a war, and attached to the office of Lord-high-admiral, or to the crown when that office is vacant. These perquisites were originally vested in the sovereign, to enable him to provide for the expense of defending the realm, and clearing the sea of pirates; and their value and importance will be at once perceived from the following brief statement. In 1798, one ship which had been captured brought £85,000; in 1800, another brought £65,000; in 1804, one captured ship was worth £105,000; and in 1806, several taken at once netted £155,000. During the last war, also, the Dutch ships at one seizure brought £1,030,000; the Spanish ships, £2,200,000; and so large were the sums made at one and the same moment in this rich fund, that the crown one year, after paying many hundreds of thousands to captors, and large sums to different branches of the royal family, gave a million out of the residue to the public service. (*Edinb. Rev.*, vol. xxxiii., p. 482.) By the civil list, introduced on the accession of William IV., it was arranged that all droits of admiralty which might accrue during his reign should be paid into the exchequer for the benefit of the public service; and the civil list of her present majesty has made no alteration in that arrangement.—BRANDE.

Drowned Persons. *Directions for Restoring Persons Apparently Drowned.* From K. B. FORBES, Esq., of Boston, an officer of the Massachusetts Humane Society.—Convey the body to the nearest house, with head raised. Strip, and rub dry; wrap in blankets; inflate the lungs by closing the nostrils with thumb and finger, and blowing into the mouth forcibly, then pressing with hand on the chest. Again blow in the mouth and press on the chest, and so on for TEN MINUTES, or until he breathes. Keep the body warm, extremities also. Continue rubbing. Do not give up as long as there is any chance of success.

Drugs, Inspection of. By an act of Congress, passed June 26, 1848, to prevent the importation of adulterated and spurious drugs and medicines, it was provided, that all drugs and medicines, medicinal preparations, including medicinal essential oils and chemical preparations used wholly or in part as medicine, imported into the United States from abroad, shall, before passing the custom-house, be examined and approved, as well in reference to their quality, purity, and fitness for medicinal purposes as to their value and identity specified in the invoice.

Also, that all medicinal preparations, whether chemical or otherwise, usually imported with the name of the manufacturer, shall have the true name of the manufacturer, and the place where they are prepared, permanently and legibly affixed to each parcel, by stamp, label, or otherwise; and all such medicinal preparations imported without such names, affixed as aforesaid, shall be adjudged to be forfeited.

That if, on examination, any drugs, medicines, medicinal preparations, whether chemical or otherwise, including medicinal essential oils, are found, in the opinion of the examiner, to be so far adulterated, or in any manner deteriorated, as to render them in strength and purity inferior to the standard established by the United States, Edinburg, London, France, and German pharmacopœias and dispensaries, and thereby improper, unsafe, or dangerous to be used for medicinal purposes, a return to that effect shall be made upon the invoice; and the articles so noted shall not pass the custom-house, unless, on re-examination of a strictly analytical character, called for by the owner or consignee, the return of the examiner shall be found erroneous; and it shall be declared as the result of such analysis, that the said articles may properly, safely, and without danger, be used for medicinal purposes.

That the owner or consignee shall at all times, when dissatisfied with the examiner's return, have the privilege of calling, at his own expense, for a re-examination; and depositing with the collector such sum as the latter may deem sufficient to defray such expense, it shall be the duty of that officer to procure some competent analytical chemist possessing the confidence of the medical profession, as well as of the colleges of medicine and pharmacy, if any such institutions exist in the State in which the collection district is situated, a careful analysis of the articles included in said return, and a report upon the same, under oath; and in case the report, which shall be final, shall declare the return of the examiner to be erroneous, and the said articles to be of the requisite strength and purity, according to the standards referred to in the next preceding section of this act, the entire invoice shall be passed without reservation, on payment of the customary duties; but in case the examiner's return shall be sustained by the analysis and report, the said articles shall remain in charge of the collector, and the owner or consignee, on payment of the charges of storage and other expenses necessarily incurred by the United States, and on giving of bond, with sureties satisfactory to the collector, to land said articles out of the limits of the United States, shall have the privilege of re-exporting them at any time within the period of six months after the report of the analysis; but if the said articles shall not be sent out of the United States within the time specified, it

shall be the duty of the collector, at the expiration of the said time, to cause the same to be destroyed, holding the owner or consignee responsible to the United States for payment of all charges, in the same manner as if said articles had been re-exported.

Drugget, a coarse and flimsy woolen texture, chiefly used for covering carpets. It was formerly extensively employed as an article of clothing among the poorer classes, more especially of females; but this and similar fabrics are now almost wholly superseded by cotton goods, which induce greater cleanliness.

Drummond Light. The three angles of the enormous triangles by which a topographical survey is primarily conducted, sometimes 80 or 100 miles asunder, must be visible one from another; but how to produce the visibility? In the earlier surveys, where such daring distances were not attempted, a signal light was in some cases obtained by reflecting the light of the sun from a well-adjusted surface of polished tin, or by Bengal lights being fired at night, or by a powerful Argand lamp being placed behind a lens or before a parabolic reflector; but Lieutenant Drummond, during the progress of the Irish survey, made a happy suggestion which eclipsed in efficiency all others. In what is called the *Drummond or Lima Light*, a small ball of lime is exposed to the action of a spirit-flame fed by pure oxygen gas; the flame, in a highly-vivid state, heats the lime to an intense degree, and in its heated state, it emits a light of surprising brilliancy, far exceeding that of any flames yet seen. So beautifully was Drummond's apparatus constructed, that the lamp fed itself with spirit and with oxygen, supplied itself with balls of lime as each one slowly wasted, and reflected its surpassing light from an exquisitely-polished parabolic surface of silvered copper. It was not merely figuratively but literally true, that a piece of lime, not bigger than a boy's marble, emitted a light at Londonderry which was visible at Belfast—a distance in a direct line of nearly seventy miles. On a later occasion Colonel Colby made a lime-light signal visible from Antrim in Ireland to Ben Lomond in Scotland, a straight-line distance of 95 miles. See LIGHT-HOUSES.

Dry Distillation. This term is applied to the distillation of substances *per se*, or without the addition of water: thus if we put wood into a retort or other distillatory apparatus, and subject it to heat, it yields tar, vinegar, water, and various gaseous and other matters. See DISTILLATION.

Drying Machines. The drying process, by centrifugal agency, is of very wide application. Bleachers, dyers, and calico-printers use it. The wet mass of cloth or yarn is put into a hollow cylinder; this cylinder is made to revolve from 1 to 2 thousand times in a minute; the moisture is driven from the cloth with great violence; openings are left to afford an exit for this water into an outer vessel, and in a few seconds the cloth is nearly dry. Nothing but actually witnessing the process, can convey an adequate idea of the rapidity of this drying process. In some of the baths and laundries now established, machines of this kind are employed to supersede the hard necessity of "wringing" the wet linen—a great boon to the poor women who avail themselves of these advantages.

Dry Rot. A most destructive, and apparently infectious disease in timber, which, by decomposing the fibres, deprives it of all strength, and in no great length of time, reduces it to a mass of dry dust; a circumstance from which it seems to have derived its name, which, perhaps, would be better expressed by that of *sap rot*.

Though this disease must from its nature have been co-existent with the timber-trees, it would not seem to have excited much attention, and perhaps was not known, certainly not by its present name, before the middle of the last century; at some period, we

rather think, of Sir John Pringle's presidency of the Royal Society of London. But for a long time after this little notice appears to have been taken of it; its ravages being, in all probability, inconsiderable, in comparison with what they have been of late years. E. on now, the disease is, in fact, chiefly confined to modern-built houses and modern-built ships, and more particularly to the ships of the navy. The proximate cause of it has, therefore, rightly enough, as it would seem, been ascribed to the unseasonable state of the timber, when placed in certain situations, and under particular circumstances. It could not fail, in the course of the late long-protracted war, to become a matter of general observation, that a more rapid decay than usual had become almost universal throughout the fleet, and especially among the newest and most recently repaired ships. Many anxious inquiries were instituted, and experiments made, with the view of ascertaining the real cause of a decay, the further prevention of which was so highly important to the national welfare and security. The alarm was greatly increased when, in 1810, the *Queen Charlotte*, a first rate ship of war, shortly afterward launched at Deptford, was discovered, after a close examination, to have all her upper works infected with the *dry rot*; or, in other words, the ends of most of the beams, carlings, and ledges, the joinings of the planks, etc., were observed to be covered with a moldy, fibrous, and reticulated crust, and the parts of the timber so covered to be perfectly rotten. All the newspapers and journals of the day were filled with this alarming fact, and, in consequence thereof, a multitude of *dry rot* doctors proffered their assistance: one having a nostrum for eradicating the disease where it had made its appearance, and another for preventing its further approach. Some of these specifics were expensive and inconvenient, many of them impracticable of application, and most of them futile and objectionable in one way or another. These doctors, in fact, like the physicians for the human body, when the seat of the disease is unknown, were laboring altogether in the dark, having no other guide to direct them than their own whims and fancies, each being ignorant of the effect of the respective experiments which they wished to try on this diseased machine.

Process of the Common Rot.—Authors are at variance among themselves, whether the *common rot* in timber, or the *dry rot*, be not one and the same disease. A little reflection, however, will, we conceive, lead us to consider them as essentially different, both in the symptoms, the progress, and the causes, though the effect of destroying the fibre of the wood is pretty nearly the same. If a post of wood, for instance, be driven into the ground, seasoned, or unseasoned, it will speedily begin to decay just at the surface of the ground, or, as it were, between the earth and the air; if driven into the earth through water, as in a pond, the decay will commence at the surface of the water, or, as it is technically expressed, between wind and water, while all above water, and all that is constantly immersed in the water, as well as the part in the earth, will remain sound. Thus, also, a beam of wood let into a damp wall, will begin to rot just where it enters the wall; so will wooden banners when they are let through the top and foot-rails. In these, and similar cases, the rot begins externally, and its progress is inward, and is more or less accelerated by the alternate action of wind, heat, and moisture, being greatest when the alternatives of exposure to wet and drought are most frequent, and least when constantly immersed in water, or constantly preserved in a dry atmosphere. Such we believe to be the usual process of the *common rot* in wood, and it is evidently occasioned by alternate exposure to the vicissitudes of the weather, to moisture and dryness, to heat and cold.

or varnish, or tar, no such effect will be produced *externally*, the coating being sufficient to protect it against the action of the weather; but if it should happen to be a green, or unseasoned piece of wood so tarred or painted, in no great length of time the wood will be found to have begun to decay *internally*, while the outer surface appears uninjured, but at length it will also yield to the disease. If this piece of wood had been placed in a warm cellar or close room, where there is little or no circulation of air, and more particularly if the room or cellar were damp, there would be perceived, in no great length of time, a fine mouldy coating spread over its surface, of a brownish yellow or dirty white; and shortly afterward it would be found, on examination, to resemble in its form and structure some of the beautifully ramified *algæ*, or sea weeds: which, in process of time would become more compact, the interstices being so completely filled up as to give the whole mass the appearance and consistence of leather. "At first," says one writer, "its appearance is that of fine fibres running on the surface in endless ramifications, resembling the nervous fibres of leaves; presently the interstices are filled up with a spongy or leather-like substance, assuming the character of cryptogamous plants distinguished by the name of *fungus*."

By Mr. Wade, the general symptoms of *dry rot* are thus described: "The wood at first swells; after some time it changes its color, then emits gases which have a mouldy or musty smell." In the more advanced stages of the mass rises, and cracks in transverse directions. Lastly, it becomes pulverulent, and forms vegetable earth; and, generally, in some of these stages of decay, the different species of fungus are found to vegetate, on the mass."—*Treatise on the Dry Rot in Timber*, by THOMAS WADE.

These appearances do not invariably take place, the surface of the diseased timber sometimes remaining unchanged, while the process of rotting is going on within; they are, however, pretty constant. But however sound the surface may be, it will appear, on examining the piece of wood, placed in a situation similar to those above mentioned, that the whole of the interior fibres are decomposed, and become a mass of dust inclosed within a thin external shell. No charring of the surface, no paint, tar, or varnish, will prevent this process from taking place, when the seeds of the *dry rot* exist, and are placed in a situation favorable for their growth, though they may prevent the external character of mouldiness from taking place on the surface.

Characteristic Difference of the two Rots.—The symptomatic difference, then, between the common rot and the *dry rot* may perhaps be thus defined: *Common rot* is a disease in timber, occasioned by the alterations of the weather acting on its surface, and destroying its fibres externally inward. *Dry rot* is a disease in timber, occasioned by being shut up in warm, close, and moist situations, the effect of which is to destroy its fibres by a process acting internally outward.

Causes of the Dry Rot.—Without stopping to inquire in what manner, and by what agency, chemical or mechanical, or both, the common rot acts on the external fibres of the wood, the effect of alternate exposure to the weather is too well known to require any further proof as to its being the immediate cause. The immediate cause of the *dry rot* is equally obvious; but the predisposing state of the timber to contract the disease is not so clear a problem. Accordingly, theories without end have been hatched to explain the phenomenon. A writer in a public journal, who has slightly touched on the subject, thus explains it: "It is well known," he observes, "that if a piece of green wood be laid across a fire, the air within, expanded by the heat, will drive out at each extremity a viscous fluid, possessing the property of disposing itself on the surface in retic-

ulated filaments. The same appearance of nervous foliation is not uncommon in the intermediate spaces of the concentric layers of the *albumen* of wood; and the core or heart of trees, and particularly of the pitch-pine, after its passage in the heated hold of a ship, is often enveloped with a membranous corticle, like that which lies immediately beneath the bark. All these appearances are certain indications of the *dry rot*; and they point out, with sufficient clearness, that the *sap*, or principle of vegetation, brought into activity, is the cause of the disease; the effect, though infinitely more rapid, is the same as that of the common rot. It is still a problem, in what manner this sap circulates; but there is no doubt that the tubes and cells of the albumen, or sap-wood, are filled with it in the spring of the year, and that they are empty in the winter; that it is organized matter, developing itself by heat in all the various forms of new bark, leaves, and branches. The stem of a tree cut down, will, on the return of summer, make an effort to push out leaves; a more feeble effort of this organized sap ends in the production of *fungus* only."—*Quarterly Review*, No. xv.

The real efficient cause of the *dry rot*, is that of the juices of the timber being brought into a state of putrefaction, occasioned generally by exposure to a moderate degree of heat and moisture in a stagnant atmosphere. "To favor this process," says Mr. Wade, "as much as possible, the air and water should not be renewed, as they undergo a decomposition, which takes place very slowly." From the structure of timber being composed longitudinally of an assemblage of pipes or tubes, it is only necessary that one end of a log of wood should be placed in a damp or wet situation, to occasion the moisture to be conveyed to the opposite end by capillary attraction; and hence arises the infectious nature of the disease, which will always spread wherever the moisture finds its way; and even where there is no moisture, it will be created by the filaments of the fungi working their way through the tubes of the dry wood and carrying it with them. Hence, also, the rapid decay in ships of war, from the great internal heat occasioned by the number of men, the moisture, and the close air. Hence, also, in houses, the *dry rot* always first appears in the lower apartments, where the floors, partitions, skirting-boards, etc., are supplied with moisture from the wet walls on the ground. In the London houses there is generally a room on the basement story, called the house-keeper's room, which is boarded, and carefully covered over with an oiled floor-cloth. In such a room the *dry rot* is sure to make its appearance. The wood absorbs the aqueous vapor which the oil-cloth will not allow to escape, and being assisted by the heat of the air in such apartments, the decay goes on most rapidly; and, as Mr. Wade observes, "if the seed of fungus be present, the plant is developed in all the superfluity of vigor exhibited in a hot-house, where the same means are resorted to, namely, an atmosphere scientifically and artificially heated, and highly charged with aqueous vapor." Timber may, in fact, have the seeds of *dry rot* within it, and yet by proper treatment be kept sound for a great length of time. Thus, ships laden with particular cargoes, afford remarkable instances of the effects of such cargoes on their duration. The warm moisture created by a cargo of hemp is communicated to the timber, and promotes a rapid putrefaction. Mr. Chapman says, that the ship *Brothers*, built at Whitby, of green timber, proceeded to Petersburg for a cargo of hemp. The next year it was found, on examination, that her timbers were rotten, and all the planking, excepting a thin external skin. A lading of cotton is always injurious to the ship, and even teak is affected by a cargo of pepper. The timber which is brought from America in the heated hold of a ship, is invariably covered over, on being landed, with a complete coating of fungus. It was the too general use of this timber in ships of the royal navy that at one time

increased the disease to such an alarming degree. Those ships, on the contrary, which are employed constantly in the coal and lime-trade, are very durable, and have been known to last for a century. These effects are obviously to be ascribed to the exclusion of air in the one case from, and the free admission of it in the other, to the interior surface of the ship, assisted in the latter instance by the absorption of moisture by the coals and lime from the timber and planking.

Prevention of Dry Rot.—If we arrive at the right conclusion as to the cause of dry-rot in timber, we can be at no loss with regard to the mode of treatment for the prevention of the disease. The experiments for this purpose have been very numerous, but may be classed under three general heads; desiccation or seasoning; immersion in earth, sand, or water; and impregnation with some foreign matter, which will resist putrefaction.

The most simple and common mode of preventing the decomposition of vegetable matter, is by depriving it of moisture. Various schemes have been put in practice for drying the juices in large logs of timber. Time alone will do it when the wood is placed in favorable situations, that is to say, in a dry atmosphere, and constantly exposed to a free circulation of air; but time will also produce the rot in timber when piled up in stacks in the open air, imbibing moisture from the earth, and exposed to the vicissitudes of the seasons, and the alternatives of weather; scorched at one time by the heat of the sun, at another drenched with rain, and rent and split in every possible way by the freezing of the water which has insinuated itself into the pores and crevices of the wood. It was formerly, and, indeed, till very lately, the practice to let ships of war remain on the stocks in frame for two, three, or four years, to season, as it was called; but there never was so mistaken a notion. "When a ship," says Mr. Wade, "is built, exposed to the weather, the lower part forms a grand reservoir for all the rain that falls; and as the timbers in that part are placed as close together as possible, the wet escapes very slowly. Those timbers are always soaked with moisture, and, to some distance from the keel, exhibit a green appearance; their green matter, when viewed through a microscope, is found to be a beautiful and completely formed moss, which vegetates at the expense of the timber. If to season timber be only to dry it, the sooner it is dried the better; and when completely dry, it can not too soon be employed in ship-building, when it should be kept dry. It can not answer any end to have seven years' wear out of a ship on the stocks." At length our shipwrights are convinced of this truth, and the plan now generally adopted in ship-building is to protect the vessel by a roofed structure, with the sides open to admit a free current of air, but to exclude all moisture, as well as the rays of the sun (see DOCK-YARDS); a practice which we have tardily adopted from the Swedes and the Venetians. A new system seems also to have been adopted in the piling of the timber stacks. Instead of their being placed on old, useless, and often rotten logs of timber resting on the ground, they are now insulated from the earth on stone or iron pillars; and in place of their surfaces coming in contact with each other, pieces of wood are placed between them so as to admit of a circulation of air. Nothing further appears to be wanting but to protect the tops and the ends of the stocks or piles from the effects of the weather.

Of the various modes of artificial and rapid desiccation, that of charring is perhaps the best; but it is liable to two objections; the first is, that if the surface be completely charred, it diminishes very much the strength of the timber; and, secondly, it the more readily attracts moisture. The juices of timber may be drawn off or hardened by kiln-drying; but this also disturbs the arrangement of the fibres, and deprives the wood of a great part of its strength.

Experiments—Seasoning Timber.—The experiments made by Mr. Lukin for the rapid seasoning of green oak timber, promised at one time much success, but ended in disappointment. He conceived, that if the acid and the watery particles were driven out of a piece of oak timber by some process which should prevent the surface from splitting; the fibres would be brought closer into contact, and whilst the log lost in weight it would gain in strength. With this view he buried a piece of wood in pulverized charcoal, in a heated oven. The log wore a promising appearance; the surface was close and compact; it had lost in its weight and dimensions; but when divided with the saw, the fibres were discovered to have started from each other, exhibiting a piece of fine network, resembling the inner bark of a tree.

The bad effects of applying artificial heat to the seasoning of green timber, were strongly exemplified by a practice introduced very generally into our ships of war which had exhibited indications of the dry rot, particularly in the *Queen Charlotte*. Enormous fires were made in stoves placed in various parts of the ship, and the heat led in tubes to the cavities between the timbers, etc. The consequence of which was, as might be expected, an increase of the mischief they were intended to prevent. Every part of the ship was converted into a hot-house, and every part where the seeds of fungi had been deposited began to throw out a luxuriant crop of mushrooms; and where these did not appear, the juices of the wood were thrown into a state of fermentation, and, in the course of a twelve-month, a great part of her upper works became a mass of rottenness. After staving the powder magazines of some of the ships, there appeared under their floors, which are contiguous to much moisture, numbers of large excrescences of a leathery consistence, of the size and shape of a quart glass-decanter; and in all such parts where two surfaces of the wood were imperfectly brought into contact, were whole masses of fungi.

Winter-felled Timber.—Another mode, of very ancient standing, was practiced for getting rid of the juices of timber. This was supposed to be effected by felling the tree in the winter season, when the sap had descended and the vessels were empty. By this practice the bark of the oak, so valuable in the process of tanning, was lost, as it will strip only from the wood in the spring of the year, when the sap is said to be rising. The supposed superior quality of the wood, when winter-felled, and the general practice of felling oak timber at that season, may be inferred from a statute of James I., by which it is enacted, that no person or persons shall fell, or cause to be felled, any oaken trees meet to be barked, when bark is worth 2s. a cart-load (timber for the needful building and reparation of houses, ships, or mills, only excepted), but between the first day of April and the last day of June, not even for the king's use, out of barking-time, except for building or repairing his majesty's houses or ships.

The *Sovereign of the Seas* is the standing example generally quoted to prove the beneficial effects of winter-felled timber. We are informed by one writer that, when taken in pieces, after 47 years' service, the old timber was still so hard that it was no easy matter to drive a nail into it, and all future writers have taken it for granted that this was owing to its being winter-felled. Mr. Pett, however, who built her, takes no notice of any such circumstance. He merely says he was commanded by the king, on the 14th of May, 1685, to hasten into the north to procure the frame-timbers, plank, and treenails, for the great new ship at Woolwich. But he left his son behind to ship the moulds, provisions, and workmen, in a hired ship, to transport them to Newcastle; that the frame, as it was got ready, was sent in colliers from Newcastle and Sunderland; and that, on the 21st December, in the same year, the keel was laid in the dock; and in less than two years after this she was launched. the middle of May before Mr. Pett received his majesty's commands to procure timber for this ship, and as she was on the stocks the same year, it is not very probable that the timber procured and sent in colliers from Newcastle to Woolwich, was felled in the winter; much less could it have been "stripped of its bark in the spring, and felled the second succeeding autumn," as Mr. Wade has it.

Neither is there the least proof of the old *Royal William*, recently broken up, when a century old, being built of winter-felled timber. The fact is, that she was rebuilt half a dozen times, and the only old and original timber remaining in her was in the lowest part of her hull, always immersed in the salt-water externally, and washed with the bilge-water internally; and the wood from this part of her, when broken up, was perfectly sound, but quite black, having the appearance of being charred.

As far as experiments have been made, there is no reason to conclude that timber felled in the winter is at all more durable than that which is felled at the usual time. In the year 1793, the *Hawke*, sloop-of-war, was ordered to be built, one side being of timber that had been barked in the spring and felled in the winter, and the other side with timber felled at the usual time. In 1808 she was reported to be in so bad a state of rottenness, that she was ordered to be taken in pieces, when no difficulty whatever could be discovered in the state of the timbers of the two sides. It is said, however, in Derrak's *Memoirs of the Navy*, "that the timber had been stripped in the spring of 1787, and not felled until the autumn of 1790," and this is given as an explanation of the failure. Why the barking in the spring should add to the durability of timber, is not easily conceived, if the object be to fell the timber when all the sap-vessels are empty, as, if the sap descends at all, which is doubtful, it might be expected to descend more freely when the bark is on than off the tree. This subject has not escaped the attention of the commissioners of the royal woods and forests, and various experiments have been made with a view to throw more light on a subject so vitally important to the British Navy. In France, so long ago as 1668, a royal ordinance limited the felling of timber from the 1st October to the 15th April; and the conservators of the forests directed that the trees should be felled when the "wind was at north," and "in the wane of the moon;" and we find an instruction of Bonaparte, that "as ships built of timber felled at the moment of vegetation must be liable to rapid decay, and require immediate repairs, from the effect of the fermentation of the sap in those pieces which had not been felled at the proper season;" the agents of the forests should abridge the time for felling naval timber, which should take place "in the decrease of the moon, from the 1st November to the 15th March."

Inmersion in Earth, Sand, or Water.—The facts are so numerous and so strong in favor of the durability of timber when steeped in water, or buried in earth or sand, that no doubt whatever can be entertained of the efficacy of such a practice. At Brest, all the timber used in ship-building is deposited in the narrow creek of the harbor which runs through the middle of the dock-yard, and it is said that the Brest-built ships never had the dry rot. The same practice prevailed at Cadiz and Carthagena. Indeed there is reason to think that steeping in fresh water is a preventive of dry rot, probably by dissolving the juices of the timber. It was an ancient practice, and we believe it is still followed in some parts of England, to place the timber intended for threshing-floors in the midst of a stream of water to *harden it*; and all the oak planks intended for the wainscoting of the old mansions were previously steeped in running water.

It is said, and there seems to be no reason for doubting the fact, that the planks of ships near the bows, which are obliged to be boiled in water or steam in

order to harden them, are never infected with the dry-rot; if the water in which they are boiled be strongly impregnated with salt, the effects would probably be more durable and decisive.

In a lecture read by Mr. Ogg, a salt-refiner, to the Plymouth Institution, on the prevention and cure of dry rot in ships of war, common salt is strongly recommended, for its cheapness, its wholesomeness, and its easy application; but he proposes a saturated solution of salt, in which he would steep not only single logs or planks, but the whole frame of a ship, or even the ship itself. "Let every ship in the navy," says the salt-refiner, "be immersed a sufficient time in this fluid, and let every new ship be prepared in the same way, and dry rot would be heard of no more. But how is this to be accomplished? I answer, provide a dock or docks sufficiently capacious to receive five, ten or twenty ships, and the work is done." As common sea-water will answer the purpose equally well, the apparatus of extensive docks and water saturated with salt are wholly unnecessary. But Mr. Ogg, like Mr. Bowden, appears to mistake the real cause of dry rot. "I affirm," says he, "that dry rot is occasioned by the vegetative principle; brine will destroy this principle; then sink the ship in brine." The experiments in the case of the *Resistance* and the *Eden* show that brine is not necessary.

The Dutch having observed that their busses, in which the herrings were caught and stowed away in pickle, lasted longer than any other craft, adopted the practice of filling up the vacancies between the timbers and planks of ships with salt, and of boring holes in the large timbers and crenaming them full of salt. The Americans also found, that the chips employed in carrying out salt for their fisheries and domestic purposes, were the most durable; and both they and the Dutch are glad to get a cargo of salt into a new ship, as the surest means of preserving her. The carpenter of the *Franklin*, an American 74 gun ship, when at Spithead, told some of her visitors, that at the junction of the beams, and at the butt end of the timbers, pieces were cut, and the hollow part filled with salt, and covered with felt, for the purpose of preserving those parts where two surfaces are imperfectly brought together, from the dry rot, where it is always most prevalent.

There are, however, very serious objections to the immersion of ships in a strong solution of salt, and the practice of inserting salt in the vacant space between the timbers, which may not, perhaps, apply with equal force to their immersion in sea-water. It is observed by a writer in the *Quarterly Review* for October, 1814, that "the attraction for moisture which salts and acids possess, would keep the whole interior of the ship dripping wet; which would not only destroy the ship with the wet rot, but the ship's company also, whose health, experience has proved, is best preserved by keeping the ship as dry as possible; and thus the remedy would be worse than the disease." These bad effects have unquestionably been experienced, the muriate of magnesia, which exists in sea-water, being one of the most deliquescent salts; but whether the abstraction of moisture from the atmosphere be of long duration, is a fact which remains to be proved. In corroboration of the injurious effects above described, Mr. Strange in his *Evidences*, observes, "that the practice at Venice of the fresh cut timber being thrown into salt water prevents its ever becoming dry in the ships, and that the salt water rusted and corroded the iron bolts." Mr. Chapman also observes that "the *Florida*, a 20 gun ship, taken from the Americans, and subsequently commissioned in the British service, had been salt-seasoned; and the result was, that in damp weather every thing became moist, the iron-work was rusted, and the health of the crew was impaired; in fine," he adds, "vessels so circumstanced are perfect hygrometers; being as sensible to changes of the

moisture in the atmosphere as lumps of rock salt, or slips of fuel, or the plaster of inside walls where sea-sand has been used."

Mr. Chapman, however, is of opinion, that vessels impregnated with bay-salt, or the large grained salt of Limington or of Liverpool, (being pure muriate of soda, without admixture with the lither deliquescent salts), will possess decided advantages, as would also vessels laden with saltpetre, if it has been dispersed among their timbers; and Mr. Ogg sees no difficulty in refining salt so as to deprive it of its deliquescent quality. But if a very weak solution of salt, or even fresh water, shall be found to answer the purpose, the objection against immersing timber in sea-water seems to be got rid of. That it will immediately destroy all vegetable life in the delicate fibres of the fungus, and also prevent its future growth, is quite clear; and if it shall be found to prevent also the putrefactive process, it may be considered the most advisable way to prepare timber for all purposes of house carpentry, and ship-building.

Impregnation of Timber with Foreign Substances.—A great variety of substances besides common salt, indeed almost any salt or acid, will destroy and prevent the growth of fungus. Sir Humphrey Davy recommends a weak solution of the corrosive sublimate as the most efficient. A solution of sulphate of iron or copperas, is much used in Sweden for hardening and preserving wood for wheel-carriages, etc. It is boiled in this solution for three or four hours, and then kept in a warm place to dry, by which process it is said to become so hard and compact that moisture can not penetrate it. "The wooden vessels," says Mr. Chapman, "in which the sulpho-ferruginous solution is finally placed for the copperas to crystallize, become exceedingly hard and not subject to decay." A solution of alum has been recommended; but Mr. Chapman seems to think that its earthy basis would become a nidus of putrefaction. The wood, however, which is used about alum works, becomes hard and durable, and resists fire in an extraordinary manner. All timber, in fact, when completely saturated with saline matter, is more or less indestructible, and absolutely incombustible. A solution of arsenic has not been found to prevent the dry rot. With regard to the impregnation of oils, there are various opinions, some thinking them beneficial, and others injurious to the durability of timber. It is known, however, that ships in the Greenland trade have their timber and planks preserved as high up as they are impregnated with whale oil from the blubber; and Mr. Chapman says, that one of the masters of a Greenland ship having payed her upper works with twelve or more successive coats of whale oil in hot weather, they became covered with a thin varnish, much harder and more compact than if filled with successive coats of turpentine. Resinous substances, however, are probably better than oil.

After a variety of experiments and sensible observations, Mr. Chapman sums up the three great operations by which timber may be brought to resist the tendency to dry rot. 1. To deprive the timber of its mucilage, which is very liable to fermentation. 2. To impregnate timber with any strongly antiseptic and non-deliquescent matter. 3. To dry timber progressively by the sun and wind, or by the latter alone; and then to close its pores completely with any substance impervious to air and moisture, and at the same time highly repellant to putrescency.

Mr. Wade recommends the impregnation of timber with sulphates of copper, zinc, or iron, rejecting deliquescent salts, as they corrode metals, and will destroy the bolts and metal fastenings of a ship. He observes, that timber impregnated with saline matter is no longer capable of fermentation, and that, of course, the gases necessary for the nutriment of fungi are not evolved. Selenite is recommended as being

insoluble, or nearly so, and not liable to any alteration in the ordinary temperature of the atmosphere; but all salts, he observes, composed of barytes, should be rejected, because, though they are plentiful, cheap, and have some qualities eminently fitting them to be employed for this purpose, yet they are, without any exception, very poisonous.

From all experiments that have been made, it appears that the most effectual method of preventing the dry rot, and of giving durability to timber, is that of depriving the sap of its mucilage, more especially in the alburnum, where it most abounds; for though seasoning in the dry way will coagulate and harden the extractive matter of timber, yet when exposed to heat, moisture, and a stagnant air, the process of putrefaction will commence, and all the symptoms of dry rot will speedily make their appearance. It will be preferable, therefore, that such timber as is likely to be exposed to the vicissitudes of weather, should be seasoned by immersion or impregnation, rather than by the dry way.

Cure of the Dry Rot.—In this disease, as in those incidental to animal life, prevention is much asier than cure. In fact, there is no other cure for the part affected than excision, and the sooner it is done the better, as the disease spreads most rapidly when fungi are propagated, throwing their minute fibres into the tubes of the contiguous sound wood, and producing that moisture which is a condition absolutely necessary to the putrefactive process. If, however, the fibre of the wood is still sound, and the roots of the fungi extend not beyond the alburnum near to the surface, immersion in sea-water, as in cases of the *Resistance* and *Eden*, or impregnation with some of the solutions above mentioned, may stop the progress of the disease; but the only safe cure, we apprehend, is that of cutting out the infected part. The sinking of the *Royal George* at her moorings has not been the means of preserving her timbers. On being visited in the diving-bell, her oaken sides were broken down into a confused mass of timber and black mud; having, no doubt, been too far gone in decay, when the fatal accident happened; but her fir deck appeared as sound as the day when she sunk.

Miscellaneous Observations.—It is a great mistake to suppose that the ancients were unacquainted with the dry rot or premature decay of timber. Pliny has a number of valuable observations on the preservation of timber, and on its decay occasioned by the juices; and, among other things, recommends that a tree should be cut to the heart all round, in order to let the juices escape, and that it should not be felled until the whole had run out. He knew that the sappy part of oak was more subject to rot, and advised that it should be cut away in squaring. He knew, too, that resinous and oleaginous matter in wood preserved it; observing, that the more odoriferous a piece of timber is, the more durable. He knew that much depended on the close texture of timber, and that box, ebony, cypress, and cedar might almost be considered as indestructible. We also know that cedar, teak, and mahogany, are very durable woods.

The felling of timber while young and full of vigor, making use of the sap-wood or alburnum, and applying it to ships and buildings in an unseasoned state, have, no doubt, contributed to make the disease of dry rot infinitely more common and extensive than it was in former times, when our ships were "hearts of oak," and when in our large mansions the wind was suffered to blow freely through them, and a current of air to circulate through the wide space left between the pannelled wainscot and the wall. In these old mansions which yet remain, and in the ancient cathedrals, we find nothing like the dry rot, though perhaps

perforated sore
And drill'd in holes, the solid oak is found
By worms voracious eaten through and through.

Numerous examples of the extraordinary duration of timber may be produced, both from complete desiccation and exposure to the air, and from the complete exclusion of air and immersion in earth or water. Without adducing the curdbrand of Iceland, covered with several strata of solid rock, or the logs of wood dug out of peat-moss, the antiquity of which is more conjecture, we may instance the mummy-cases of Egypt as being in all probability the most ancient timber in existence that has been worked by the hand of man. When Belzoni entered the splendid tomb of the kings of Thebes, in which was the transparent sarcophagus of gypsum, he found two human figures larger than life sculptured in wood, in as good preservation as if it had been worked in his own time; but the sockets of the eye, which had been copper, were entirely wasted away. We are told by Pliny, that the image of Diana at Ephesus, supposed to be of ebony, remained entire and unchanged, though the temple itself was ruined and rebuilt seven times. He adds that, in his own time, the image of Jupiter in the capitol, made of cypress wood, was still fresh and beautiful, though set up in the year after the foundation of Rome 551, nearly three hundred years before. He further says that there was a temple of Apollo at Utica, the timbers of which, being of Numidian cedar, are said to have stood 1188 years. The roof of Westminster Hall, which is constructed of oak, has stood for more than three hundred years, and is probably better now than when newly erected. Similar instances of the long duration of timber have occurred in situations where the atmospheric air has been excluded. In the Leverian Museum was a post said to be dug out of Fleet Ditch, charred at the lower end, having the name of Julius Caesar cut into it. The foundation on which the stone piers of London Bridge are laid consist of huge piles of timber driven close to one another, on the top of which is a floor of planks ten inches thick, strongly bolted together; on these the stone piers rest, at above nine feet above the bed of the river, and, at low water, may be seen or felt at a very few inches below the surface. These piles have been driven upward of six hundred years, and, from the solidity of the superincumbent weight, it may be concluded that they are perfectly sound. In the old city wall of London, timber is frequently dug out as sound and perfect as when first deposited there. As the last instance of the extraordinary preservation of timber, we may mention that in digging away the foundation of the Old Savoy Palace, which was built about six hundred and fifty years ago, the whole of the piles, consisting of oak, elm, beech, and chestnut, were found in a state of perfect soundness, without the least appearance of rotteness in any part of them, and the plank which covered the pile-heads was equally sound. Some of the beech, however, after being exposed a few weeks to the air, but under cover, had a coating of fungus spread over the surface; which affords a striking proof of the immense length of time that the seeds of this parasite will remain dormant, without parting with the principle of vegetable life, which is called into activity from the moment that they are deposited in a situation favorable to their growth. In this instance we have only to suppose that the indurated juices of the wood became dissolved by its exposure to the moist atmosphere, and the phenomenon of fungous vegetation is capable of receiving a satisfactory explanation.* Communicated to the

* The process termed *pyrolyzing* is similar to that already noticed, as proposed by Sir Humphrey Davy—namely, steeping the timber in a solution of corrosive sublimate. This appears to be one of the best preservatives of wood in so far as dry rot is produced by a fungus. Mr. Bethell's method of preparing wood for fences, railway sleepers, piles, and other wood-work submerged in water, and for various similar purposes, is said to render timber of any description much tougher, and greatly to promote its durability. The process is as follows: The timber is placed in a strong close iron tank, which is filled with oil of tar and other bituminous matters

Encyclopedia Britannica, by Sir John Barrow, Bart. See *Am. Jour. Sc.*, II., p. 114, xxxiv., p. 169; *Westminster Rev.*, x., p. 414; *London Quar.*, xli., p. 227, xxx., 216; *Monthly Rev.*, lxxxvi., 361, xc., 387; *Univ's Dict. Arts*.

Dubber, or **Dupper**, a leathern vessel, bottle, or jar, used in India to hold oil, ghee, etc. Barrels, as already observed, are entirely a European invention. Liquids, in eastern countries, are for the most part packed for exportation in leathern vessels. Dubbers are made of thin untanned goat skins; and are of all sizes, from a quart up to nearly a barrel.

Dublin, the metropolis of Ireland, in the county to which it gives name, and province of Leinster, ranking in importance as the second city in the United Kingdom. It is distant 292 miles W.N.W. from London, 138 miles west from Liverpool, and 60 miles west from Holyhead, in lat. 53° 40' 38" N., and long 6° 7' 18" W., agreeably situate in the great central limestone district which reaches across the island from the Irish Sea to the Atlantic Ocean on the River Liffey, and extending to the junction of that river with the Bay of Dublin, the waters of which was its suburban shores.

The population of the city of Dublin was estimated by Rutter, in 1753, at 161,068; in 1796, by Whiteclaw, at 182,037, and was ascertained by the census of 1821 to amount at that period to 185,881, and by the census of 1831 to 204,155. The population of the city, according to the most recent enumerations, in 1841 was 232,726, and in 1851 it was 256,961.

In order still further to promote the commercial interests of Dublin, an association was formed about thirty years ago, under the name of the Chamber of Commerce, which soon decayed; but the idea was revived in 1820, when a number of merchants formed themselves into a society under the same name, which still exists. Its objects are the protection and promotion of the manufacturing and commercial interests of Dublin, and of the country in general. The business is transacted by a president, vice-presidents, and committee, instructed to communicate with the officers of government on the subjects of the association. Their office is held in the Commercial Buildings. The Ouzel Gulley is another voluntary association of merchants for determining commercial differences by arbitration. It takes its name from that of a vessel, which was the occasion of a complicated and protracted suit, that was ultimately adjusted in an amicable manner by the interference of some of the most respectable merchants in Dublin. The effect of steam navigation on the cross-channel trade has produced a great alteration in the state of commerce in Dublin.

The Bank of Ireland was formed in 1783 in order to give security to commerce. It was opened at first in some old houses in Mary's Abbey, with a capital of £600,000, which was afterward increased to £3,000,000. In the year 1802 the parliament house was purchased by the directors, and adapted to its present destination. This edifice was erected in 1729; and notwithstanding the changes made in it since it was diverted from its original purpose, the exterior has been but little altered. It consists of three fronts. The principal, toward Collejo Green, a colonnade of the Ionic order, formed of a façade and two projecting wings, is much admired for the noble simplicity of its elevation. The western front, a portico of four Ionic columns, was connected with the other by a colonnade of the same order, forming

containing creosote, and with pyrolytic oil of iron; the air is then exhausted by powerful air-pumps; after which more of the saturating fluid is forced in by hydraulic pumps. When the wood has been subjected for six or seven hours to a pressure of from 100 to 150 pounds on the square inch, the process is complete, and the wood is found to weigh from 8 to 12 pounds per cubic foot heavier than before. It also preserves iron bolts driven into it from corrosion. Wood thus prepared has been used for sleepers on several of the great English railroads, and is said to have proved extremely durable. (See *Univ's Dict. of Arts*, etc., vol. II., p. 903.)

ing the quadrant of a circle. The eastern front, which was the entrance of the House of Lords, was, by their special order, a colonnade of the Corinthian order, which the architect found great difficulty in uniting with the other parts. The apartment for the lords, a fine room, was hung with tapestry. That of the commons having been burned in 1792 (whether by accident or design has never been fully ascertained), was reconstructed after a more elegant design, in the form of a circle surrounded by pillars, between which was a gallery for hearers. This fine hall was taken down by the bank directors, and converted into a square room, now the cash-office.

The commerce of the port of Dublin had increased so much toward the close of the last century that the accommodation afforded in the river for shipping was found insufficient, and the Irish parliament granted £15,000 for forming docks on both sides of it. The floating and graving docks, communicating with the grand canal on the south side, including a basin covering 40 statute acres, with a fine quay and store frontage of 7,500 feet, were opened in 1796; and St. George's, the latest of the custom-house docks, in 1821. These latter cover an area of 8 acres, having 16 feet depth of water, and 1200 yards of quay; they are capable of accommodating 40,000 tons of shipping, and the stores have space for 8000 casks of sugar and tobacco, and 20,000 chests of tea, with cellars for 12,000 pipes of wine. The docks on the south side afford commodious wharves for 100 sail of merchantmen and cellars, exclusive of that supplied by the river quays. The formation of the asylum-harbor at Kingstown, then Duncleary, which was commenced in 1817, gave additional aid to the commerce of the port, by the increased protection it afforded to shipping. The improvements made on the bar, in the erection of the great northern wall or breakwater, and the steam dredging of the bed of the Liffey by the ballast board, by rendering the channel sufficiently deep for the navigation of vessels of 1400 tons, has also contributed greatly to the same effect.

There were in 1852 belonging to the port, including steamers, 454 vessels, of every size, from 15 to 1200 tons; the registered burden amounting to 89,814 tons. Most of those vessels were employed in the coasting or cross-channel trade, there having been but 6 or 8 in that of the West Indies, the same number in that of France and the Spanish Peninsula, and 20 or 30 in the North American timber trade. The amount of customs collected averages about £950,000, and has not varied much during the last twelve years, the reduction of duties having more than balanced the increase in the quantity of articles imported.

"First impressions of Dublin," says Inglis, "are decidedly favorable. Dublin, for its size, is a handsomer city than London. Sackville-street will compare with any street in Europe; Merrion Square and St. Stephen's Green surpass the extent any of the squares in the British metropolis. There are points of view in Dublin, the quays, and some of the finest public edifices, more striking, I think, than any that are to be found in London; and although the Irish capital can boast of no St. Paul's, yet, in the architectural beauty of some of her public buildings, she has just reason for pride. I need but name the Custom House, and the Bank of Ireland with its magnificent yet classically chaste colonnades, in proof of this assertion." There is much truth in this description, yet the chief advantage which Dublin has in picturesque beauty lies in the concentration of the objects of interest within a small compass, and further examination does not confirm the first favorable impression. Sir John Forbes, who visited Ireland in 1852, says: "I own myself to have been a good deal disappointed with Dublin as a city. To say nothing of its extent, it is greatly inferior in many other respects, not only to London, but to several towns in England, and some in Scotland. Its site is flat and monotonous, and its streets and

squares possess no architectural beauty. The former, to be sure, are often very wide, and some of the latter, as Merrion Square and Stephen's Green, are of immense extent, but there is throughout a general want of elegance and grandeur. Most of the streets seem to want dignity, and the majority of the houses are common-looking, and even mean and dingy. While denying both beauty and grandeur to Dublin as a city, I must join in the universal judgment as to the splendor of many of its public buildings, as the Bank of Ireland—formerly the Parliament House, the Custom House, the Post Office, the Royal Exchange," etc. Few cities present a more striking picture of the extremes of splendor and destitution than Dublin. A line drawn from the King's Inns in the north of Dublin, directly south, through Capel-street, the castle, and Aungier-street, will, together with the line of the Liffey, divide the whole area into four districts, materially different from each other in appearance and character. The south-eastern district, which comprehends three of the great squares, and the north-eastern, which includes the two remaining squares, are chiefly inhabited by the nobility, the landed gentry, and the liberal professions. These two districts present many symptoms of affluence and luxury. But on proceeding westward the scene suddenly changes. A considerable portion of the south-western district, which included the liberties of St. Sepulchre's and Thomas Court, and was formerly the seat of the silk and woollen manufactures, and also of the north-western portion of the city, are in a state of almost hopeless decay. The squalid misery visible in the ruinous portions of the city is relieved to the eye by the beauty of the environs of the city; and in its immediate vicinity is the Phoenix Park, of which the citizens are justly proud. It comprises an area of 1753 acres, within which are contained the Viceregal Lodge, the usual residence of the lord-lieutenant, with 160 acres of demesne and gardens, the chief and under secretary's lodges, and the lodges of the park rangers and their assistants, with their respective inclosed grounds, the Hibernian school for soldiers' children, the military magazine, the military infirmary, the zoological gardens, the constabulary barracks, etc. Inglis, a good authority on such subjects, pronounced this park as superior, both in extent and diversity of surface, to any public park, promenade, prater, or Prado, belonging to any other European city. (WHITZLAW and WALSH'S *History of Dublin*; THOMAS'S *Irish Almanac*; GILBERT'S *History of the City of Dublin*, 1854.)—E. B. *Dublin Unit. Mag.*, viii., xvi., iii., iv., v., vii.

Ducat, a foreign coin, either of gold or silver, struck in the dominions of a duke. The ducat was first coined by Longinus, governor of Italy, who revolted against the Emperor Justin the Younger, and made himself duke of Ravenna, calling himself *Ecarcho*, that is, *without lord or ruler*; and he struck pieces of money, of very pure gold, with his own stamp, which, as Procopius relates, were called *ducati*, *ducats*. According to Du Cange, ducats were coined by Roger, King of Sicily, in the year 1240. The Venetian ducat was first struck by John Dandolo, in 1280, and inscribed with this legend:

"SI TIBI, CHRISTE, DATUS, QUEM TU REGIS ISTO DUCATUS."

Ducato (Cape), the modern name of the ancient Leucate, a promontory at the south end of Santa Maura, one of the Ionian Islands; celebrated as the rock from which Sappho precipitated herself into the sea.

Ducatoon, a silver coin, struck chiefly in Italy, particularly at Milan, Venice, Florence, Genoa, Lucas, Mantua, and Parma; though there are, also, Dutch and Flemish ducatons.

Dundee, a seaport town of Scotland, county of Forfar, 42 miles N.N.E. from Edinburgh; N. lat. 56° 2' ; W. long. 8° 2'. It is situated on the north side of the River Tay, about 12 miles from its mouth. Population (1855) 78,931; and as a considerable increase

from being injured in the event of her becoming leaky. A ship is not reckoned seaworthy unless she be provided with proper and sufficient dunnage.—FALCONER'S *Marine Dictionary*; ABBOTT (Lord Tentarden) in the *Law of Shipping*, Part III., c. 3.

Duplicate, a copy or transcript of any thing; as of a deed, letter, bill of exchange, etc. Duplication, the act of doubling; the multiplication of a number by 2. Also a folding; a fold.

Dupondius, in antiquity, a weight of 2 pounds, or money of the value of 2 asses.

Dust, or **Dustee**, a river of Persia, flowing from the interior through the province of Mekran, from the southern shore of which it falls into the Indian Ocean. Its course is supposed to extend, under different appellations, about 1,000 miles.

Dutch Gold, the commercial name of a coarse imitation of gold leaf, made of copper, of brass, or of bronze. It is chiefly used for ornamenting toys.

Dyeing (*Teinture*, Fr.; *Färberet*, Germ.) is the art of impregnating wool, silk, cotton, hair, and skins, with colors not removable by washing, or the ordinary usage to which these fibrous bodies are exposed, when worked up into articles of furniture or raiment. We shall here consider the general principles of the art, referring for the particular dyes, and peculiar treatment of the stuffs to be dyed, to the different tinctorial substances in their alphabetical places; such as cochineal, indigo, madder, etc. Dyeing is altogether a chemical process, and requires for its due explanation and practice an acquaintance with the properties of the elementary bodies, and the laws which regulate their combinations. It is true that many operations of this, as of other chemical arts, have been practiced from the most ancient times, long before any just views were entertained of the nature of the changes that took place. Mankind, equally in the rudest and most refined state, have always sought to gratify the love of distinction by staining their dress, sometimes even their skin with gaudy colors. Moses speaks of raiment dyed blue, and purple, and scarlet, and of sheepskins dyed red—circumstances which indicate no small degree of tinctorial skill. He enjoins purple stuffs for the works of the tabernacle and the vestments of the high priest. The ancient Egyptians cultivated this art with some degree of scientific precision, since they knew the use of mordants, or those substances which, though they impart no color themselves, yet enable white robes (*caudita vela*) to absorb coloring drugs (*colorem sorbentibus medicamentis*). Tyre, however, was the nation of antiquity which made dyeing its chief occupation and the staple of its commerce. There is little doubt that purple, the sacred symbol of royal and sacerdotal dignity, was a color discovered in that city; and that it contributed to its opulence and grandeur. Homer marks no less the value than the antiquity of this dye, by describing his heroes as arrayed in purple robes. Purple habits are mentioned among the presents made to Hiebon by the Israelites from the spoils of the kings of Midian.

The juice employed for communicating this dye was obtained from two different kinds of shell-fish, described by Pliny under the names of *purpura* and *Buccinum*; and was extracted from a small vessel, or sac, in their throats, to the amount of only one drop from each animal. A darker and inferior color was also procured by crushing the whole substance of the Buccinum. A certain quantity of the juice, collected from a vast number of shells, being treated with sea-salt, was allowed to ripen for three days; after which it was diluted with 5 times its bulk of water, kept at a moderate heat for 6 days more, occasionally skimmed to separate the animal membranes, and when thus clarified, was applied directly as a dye to white wool, previously prepared for this purpose by the action of lime-water, or of a species of lichen called fucus. Two operations were requisite to communicate the finest

Tyrian purple: the 1st consisted in plunging the wool into the juice of the purpura; the 2d, into that of the Buccinum. 50 drachms of wool required 100 of the former liquor, and 200 of the latter. Sometimes preliminary tint was given with cocco—the kermes of the present day—and the cloth received merely a finish from the precious animal juice. The colors, though probably not nearly so brilliant as those producible by our cochineal, seem to have been very durable, for Plutarch says, in his *Life of Alexander* (chap. 86), that the Greeks found in the treasury of the King of Persia a large quantity of purple cloth, which was as beautiful as at first, though it was 190 years old. The difficulty of collecting the purple juice, and the tedious complication of the dyeing process, made the purple wool of Tyre so expensive at Rome, that in the time of Augustus a pound of it cost nearly £90 of English money. Notwithstanding this enormous price, such was the wealth accumulated in that capital, that many of the leading citizens decorated themselves in purple attire, till the emperors arrogated to themselves the privilege of wearing purple, and prohibited its use to every other person. This prohibition operated so much to discourage this curious art as eventually to occasion its extinction, first in the western, and then in the eastern empire, where, however, it existed in certain imperial manufactories till the eleventh century.

Dyeing was little cultivated in ancient Greece; the people of Athens wore generally woollen dresses of the natural color. But the Romans made have bestowed some pains upon this art. In the games of the circus, parties were distinguished by colors. Four of these are described by Pliny—the green, the orange, the gray, and the white. The following ingredients were used by their dyers. A crude native alum mixed with copperas, copperas itself, blue vitriol, alkaneil, lichen rocclaus, or archil, broom, madder, wood, nut-galls, the seed of pomegranate, and of an Egyptian acacia.

But the vast superiority of our dyes over those of former times must be ascribed principally to the use of pure alum and solution of tin as mordants, either alone or mixed with other bases; substances which give to our common dye-stuffs remarkable depth, durability, and lustre. Another improvement in dyeing, of more recent date, is the application to textile substances of metallic compounds, such as Prussian blue, chrome yellow, manganese brown, etc.

The compound or mixed colors, are such as result from the combination of two different colored dye-stuffs, or from dyeing stuffs with one color and then with another. The simple colors of the dyer are red, yellow, blue, and black, with which, when skillfully blended, he can produce every variety of tint. Perhaps the dun or fawn color might be added to the above, as it is directly obtained from a great many vegetable substances.

1. Red with yellow, produces orange; a color which, upon wool, is given usually with the spent scarlet bath. To this shade may be referred flame color, pomegranate, capuchin, prawn, Jonquil, caudata, chamois, *café au lait*, aurora, marigold, orange peel, *marjolaine*, cinnamon, gold, etc. Saff, chestnut, nut, and other shades are produced by substituting walnut peels or sumach for bright yellow. If a little blue be added to orange, an olive is obtained. The only direct orange dyes are anatto and subcarbonate of lead.

2. Red with blue produces purple, violet, lilac, pigeon's neck, mallow, peach blossom, *bleu de roi*, lili-blossom, amaranth.

3. Red with black; brown, chocolate, marone, etc.

4. Yellow with blue; green of a great variety of shades, such as nascent green, gay green, grass green, spring green, laurel green, sea green, edison green, parrot green, cabbage green, apple green, duck green.

5. Mixtures of colors, 3 and 3, and 4 and 4, produce an indefinite diversity of tints; thus red, yellow, and blue, form brown olive and greenish gray; in which the blue dye ought always to be first given, lest the indigo vat should be soiled by other colors. Red, yellow, and gray (which is a gradation of black) give the dead-leaf tint, as well as dark

orange, snuff color, etc. Red, blue, and gray, give a vast variety of shades; as lead gray, slate gray, wood-pigeon gray, and other colors, too numerous to specify.

The following list of dyes, and the coloring substances which produce them, may prove useful:

Red. Cochineal, kermes, lac, madder, arcbill, carthamus or safflower, brazil wood, logwood, peroxide of mercury, alkant.

Yellow. Quercitron, weld, fustic (yellow wood), annatto, sawwort, dyer's broom, turmeric, fustic (*Rhus cotinus*), Persian and Avignon berries (*Rhamnus infectoria*), willow, peroxide of iron; chromate of lead (chrome yellow), sulphuret of arsenic, hydro-sulphuret of antimony; nitric acid on silk.

Blue. Indigo, woad or pastel, Prussian blue, ternssole or litmus, logwood with a salt of copper.

Black. Galls, sumach, logwood, walnut peels, and other vegetables which contain tannin and gallic acid, along with ferruginous mordants; as the anacardium of India.

Green. These are produced by the blue and yellow dyes skillfully combined; with the exception of the chrome green, and perhaps the copper green of Schwefelfurt.

Orange. Annatto, and mixtures of red and yellow dyes; subchromate of lead.

Fawn, Dun, or Root. Walnut peels, sumach, birch-tree, henna, sandal wood.—*Usser's Dict. of Arts.*

Indigo and Cochineal.—In 1548 neither of these important dye-stuffs had made their way into Europe. Pliny mentions indigo under the name of *indicum*; but it appears to have been used by the Greeks and Romans only as a paint; yet there can be little doubt that in India it had been employed from time immemorial as a dyestuff. Cochineal could not be known till after the discovery of America. It was used by the Mexicans as a dyestuff. In 1523 Cortez received orders from the court of Spain to multiply this precious insect, to collect it and send it to Spain. Cochineal by itself gives only a crimson color; it dyes scarlet when mixed with a solution of tin. This fact was discovered accidentally by Cornelius Drebbel about the year 1630. He communicated his observation to his son-in-law Kuffler, who was a dyer at Leyden. He soon brought the process to perfection, kept it a secret, and brought the scarlet color into fashion. Soon after, the same process was discovered by a German chemist called Keffler, who carried his secret to London in 1643. A Flemish dyer called John Kloeck got information of the process in 1647, and it gradually made its way through every country of Europe. Indigo, though a much more important dye-stuff than cochineal, did not make its way into general use without the greatest difficulty. The use of it was prohibited in England during the reign of Elizabeth; and the prohibition was not taken

off till the time of Charles II. It was equally prohibited in Saxony, where it was styled in the prohibition a corrosive substance, and called food for the devil. Restrictions on the use of indigo in dyeing were imposed also in France, though it was not altogether prohibited, as it had been in England and Saxony. See BENTHOLLET, on *Dyeing*; HANCROFT, on *Colors*.

There has been much speculation among philosophical dyers respecting the nature of the coloring matters, and the way in which the different colors are induced by dyeing; but these speculations have not led to any information of much value. There is reason for believing that the coloring matters employed as dyestuffs are all transparent, and that the color is produced by their action on the light transmitted through them from the white fibres of the cloth. Those coloring matters that transmit all the rays equally leave the cloth white; if the blue ray be transmitted and the rest absorbed, the color of the cloth will be blue, and so on. This is all that we know about the mechanical nature of the dyestuffs.

With respect to the aptitude of being dyed, and the brilliancy of the colors thus communicated, there is found to be very great difference in different tissues. Animal substances are much more easily dyed than vegetable substances. Of animal substances, silk receives color, and the shades given are brighter and more beautiful than those which can be imbibed by any other tissue. Woolen cloth is also very fit for being dyed, and receives very brilliant colors with avidity; though in this respect it is inferior to silk. Cotton and linen are much more difficult to dye, and can not be made to imbibe such brilliant colors as silk or woolen. Thus the rich scarlet given to cloth by the combined action of cochineal and the oxyd of tin, has never been communicated to cotton cloth or linen. The Turkey-red dye, which is by far the finest and most permanent red that has ever been communicated to cotton cloth, is a crimson, or rather a crimson with a shade of brown. It has not the least approach to a scarlet.—E. B.

Dyke, or Dike. When a mass of unstratified or igneous rock, such as granite, trap, or lava, appears as if injected into rents and fissures in the stratified rock, so as to intersect the strata, it is called a *dyke*. *Dyke* is also the name given to a mound of earth, stones, or other materials, intended to prevent low land from being inundated by the sea, etc.; as the dykes of Holland.

E.

Eagle, in numismatics, a sort of base money which was current in Ireland in the early part of the reign of Edward I., that is, about the year 1272. There were also lions, roses, and many other coins of the same sort, named according to the figures with which they were impressed. The current coin of the kingdom at that time was a composition of copper and silver, in determinate proportions; but these were so much inferior to the standard of that time, that they were not worth, intrinsically, half so much as the others. They were imported from France and other foreign countries. When Edward had been a few years established on the throne, he set up mints in Ireland for coining good money, and then prohibited the use of eagles, and other kinds of base coin—making it death, with confiscation of effects, to import any more of them into the kingdom. Eagle is the designation of the principal gold coin of the United States—value equal to 10 dollars.

Earing, in nautical language, a rope attached to the cringle of a sail, by means of which it is bent or reefed.

Earnest, in commercial law, is the sum advanced by the buyer of goods in order to bind the seller to the

terms of the agreement. It is enacted by the 17th section of the famous Statute of Frauds, 29 Charles II., c. 3, that "no contract for the sale of any goods, wares, and merchandises, for the prices of £10 sterling, or upward, shall be allowed to be good, except the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the bargain, or in part payment, or that some note or memorandum in writing of the said bargain be made and signed by the parties to be charged by such contract, or their agents thereunto lawfully authorised." As to what amounts to sufficient earnest, Blackstone lays it down, that "if any part of the price is paid down, if it is but a penny, or any portion of the goods is delivered by way of earnest, it is binding." To constitute earnest, the thing must be given as a token of ratification of the contract, and it should be expressly stated so by the giver.—CURRY'S *Commercial Law*, vol. iii., p. 289.

Ear-ring, an ornament worn at the ear; a pendant or jewel suspended by means of a ring or a hook passing through the pendulous lobe of the ear. The use of this kind of ornament dates from the remotest antiquity, since the first mention of ear-rings occurs in the

book of Genesis.—Ear-rings of certain kinds were anciently, and still are, in the East, instruments or appendages of idolatry and superstition—being regarded as talismans and amulets. Such, probably, were the ear-rings of Jacob's family, which he buried with the strange gods at Bethel. This somewhat barbarous species of adornment was used (as it still is in some countries) by both sexes among many Oriental nations; especially by the Lydians, Persians, Babylonians, Libyans, and Carthaginians, as may be gathered from various ancient authors. Among the Hebrews and the Egyptians, their use appears to have been confined to women; but that they were extensively used by the men of various other nations is sufficiently proved by the Egyptian monuments. Among the Greeks and Romans ear-rings were worn only by females, and were sometimes of enormous value. It is a curious fact that the ears of the Venus de Medici, and of some other female statues, are pierced, as if for the purpose of bearing these appendages.

Earth, Figure of the. The determination of the figure and dimensions of the earth is a problem of very great importance in astronomy, inasmuch as it is in reference to the earth's diameter that the distances of the planets from the sun and from each other are estimated. It is also a problem of very great interest and curiosity; and has accordingly attracted the attention of mankind since the earliest dawn of civilization. There are two points of view under which this great question may be considered. The figure of the earth may be regarded as a fact to be determined by investigation and experience, like any other phenomena or law of nature; in which case it is necessary to find, by the actual measurement and comparison of different portions of the terrestrial surface, the nature of its curvature, and the magnitude of its diameters. Under the second point of view, the question is one of pure theory. The earth may be regarded as a congeries of material particles, attracting each other with forces reciprocally proportional to their mutual distances, and endowed with a rotatory motion about a fixed axis; and the problem is to determine the form the whole mass would assume in virtue of the attractive and centrifugal forces by which the particles are impelled. Viewed in this light, the actual figure of the earth becomes one of the series of consequences resulting from the universal gravitation of matter, and depending on the same laws which regulate its motion in its orbit about the sun.

It would be a waste of time to inquire what were the notions of the figure of the earth, which were or might have been entertained by its earliest and most ignorant inhabitants. A very slight attention to the most common phenomena renders the fact of its general roundness almost palpable to the senses. The uniform level appearance of the sensible horizon in every situation in which a spectator can be placed—the depression of the circum-polar stars as he advances toward the south, and their elevation as he proceeds in a contrary direction—the disappearance of a ship standing out to sea—the projection of the earth as seen in a lunar eclipse, and a number of other familiar appearances—put the globular figure of our planet beyond all manner of doubt. Reasoning from such appearances, the earliest astronomers universally regarded the earth as a sphere; and their attention was solely directed, in their various measurements and computations, to ascertain its dimensions. Modern science has discovered that its figure deviates slightly from that of a sphere, being compressed or flattened at the extremities of its axis of rotation; and the object of the astronomer, at the present time, is to determine not only its dimensions, but also the exact amount of its compression.

Attempts to estimate the magnitude of the earth were made at a very early date; for Aristotle relates

that the mathematicians prior to his time had found the circumference to be 400,000 stadia. But Eratosthenes appears to have been the first who entertained an accurate idea of the principles on which the determination of the figure of the earth really depends, and attempted to reduce these principles to practice. His results, in consequence of the imperfect data from which they were deduced, were very inaccurate; but his method is the same as that which is followed at the present day, depending, in fact, on the comparison of a line actually measured on the surface of the earth with the corresponding celestial arc. He had remarked, or been informed, that at Syene in Upper Egypt, on the day of the summer solstice, at noon, objects cast no shadows; whence he concluded that the sun was exactly in the zenith at mid-day. On the same day, at Alexandria, he observed the sun's meridional distance from the zenith to be $7^{\circ} 12'$, or a 50th part of the circumference. Then, assuming Syene to be exactly under the meridian of Alexandria (the error in this assumption was about 8°), and the distance between the two places, measured in a straight line, to be 5,000 stadia, he had $5,000 \times 50 = 250,000$ stadia for the whole circumference of the earth. It is easy to see how very imperfect this operation must have been. Without mentioning smaller errors, the neglect of the solar diameter would alone occasion an uncertainty as to the sun's declination, and consequently as to the length of the celestial arc, amounting to half a degree on the observation at Syene; and there is no reason to suppose that that at Alexandria was more exact. The terrestrial distance between the two places was assumed on equally, or probably still more loose and inaccurate determinations.

The next attempt to ascertain the dimensions of the earth was made by Posidonius. This astronomer adopted a method which differed from that of Eratosthenes only in determining the celestial arc by means of the altitude of a star, instead of the sun's zenith distance. At Rhodes, the bright star Canopus, when on the meridian, barely appears above the horizon. At Alexandria the same star was observed to have a meridional altitude of $\frac{1}{2}$ of a sign, or $7\frac{1}{2}$ degrees, which, therefore, was the celestial arc intercepted between the zenith of Alexandria and Rhodes. The terrestrial distance between the two places was estimated, like that between Alexandria and Syene, at 5,000 stadia, and they were both supposed to be under the same meridian. Hence, since $7\frac{1}{2}$ degrees is the 48th of the circumference, we have $5000 \times 48 = 240,000$ stadia, for the whole circumference of the globe.

It is impossible to form any correct opinion of the degree of approximation attained in these ancient measures, as the length of the stadium is not known with any certainty. That it varied in different places, and at different times, is sufficiently obvious from the statement of Ptolemy, who, in his work on geography, assigns the length of the degree at 600 stadia, and consequently the whole circumference at 180,000, differing from the determination of Posidonius in the proportion of 3 to 4, and still more from that of Eratosthenes. Ptolemy remarked that it was not necessary that the line measured should lie exactly in the meridian; it was sufficient to know its inclination to the meridian, or the azimuthal angle, together with the latitudes of its extreme points, in order to compare it with the meridional arc. The determination of the azimuth is, however, an operation of considerable difficulty; and Ptolemy has given no details of the method by which he proposed to estimate it. He has been equally silent in respect of the means by which the mean length of a degree was ascertained to be 500 stadia, so that the result which he has recorded is still less satisfactory than those of the two more ancient astronomers.

omy, did not overlook the measure of the earth. The Caliph Almamoun, who began his reign in the year 814, ordered a company of astronomers to measure a degree on the level plain of Mesopotamia. Dividing themselves into two parties, the one proceeded northward, and the other southward, in the direction of the meridian, through a degree of latitude, and measured with rods the itinerary distance as they proceeded. The perfect agreement of their conclusion with that of Ptolemy, throws it open to great suspicion; and when it is considered that their operation was repeated at a different place, with exactly the same result, there can be no doubt that they blindly adopted the statement of the Greek astronomer, either from inability to execute the task assigned to them, or because they had no confidence in their own determination.

From the time of Almamoun, the problem of determining the dimensions of the earth was neglected, till the revival of astronomy with general learning in Europe. The first attempt to solve it was made by Fernel, who, about the middle of the 16th century, measured the distance from Paris to Amiens, along the high road, by observing the number of revolutions made by his coach-wheel in the journey between these two cities. Supposing them to be under the same meridian, which is nearly true, and having ascertained the difference of their latitudes, Fernel found by this means the length of the degree to be 57,070 French toises, or about 364,960 English feet. A degree was measured long afterward at the same place by Lacaille, in a far more adequate and scientific manner, and he found it to be 57,074 toises. This agreement is rendered the less extraordinary by the circumstance that the toise of Fernel was not exactly of the same length of that of Lacaille. After all, it must be allowed that Fernel made a fortunate guess. (DE-LAMBARD, *Astronomie*, tom. II., chap. xxxv.)

But the first who had the merit of attempting to execute the geodetic operations that are indispensably necessary to effect the accurate measurement of a long line on the surface of the earth, was Willebrord Snell, a native of Holland, and a teacher of mathematics. Having established a chain of triangles between Alkmaar and Bergen-op-Zoom, and observed the angles of each triangle, by means of a quadrant of $5\frac{1}{2}$ feet radius, he measured a base on the frozen surface of the meadows between Leyden and the village of Soeterwood, and determined the distance between the two places by trigonometrical computation. The length of the degree which he found was 28,500 Rynland perches, or about 55,020 toises, which is about 2050 toises too small. This result was published by Muschenbroek, who in fact revised or calculated the observations from the original papers a century after the death of Snell.

Norwood, in the year 1635, attempted to measure a degree in England nearly in the same manner as Fernel. He measured the distance between London and York along the public road, taking the bearings and reducing the direction to the meridian in a rough way. The difference of latitudes he found by observations of the solstice to be $2^{\circ} 28'$, and thence concluded the length of the degree to be 367,176 English feet. Like the measurement of Fernel, this has been found to be a much nearer approximation than the method employed would have led us to expect.

The application of the telescope to circular instruments gave a far higher degree of precision to geodetic operations. Picard, to whom practical astronomy is indebted for this capital improvement, was the first who measured the arc of the meridian with such precautions and care as the delicate nature of the operation requires. He twice measured with wooden perches a base of nearly seven English miles in length; and observed the angles of his triangles with a quadrant, having a telescope adapted to it with cross wires in its focus. He even calculated the error pro-

duced by the instrument being placed out of the centre of the station, and determined the zenith distance of a star in the constellation Cassiopeia with a sector, for the purpose of obtaining the differences of latitude. The distance between Amiens and Malvoisine was found to be 78,850 toises, and the difference of latitude $1^{\circ} 23' 55''$, whence the result gave for the degree at Amiens 57,060 toises; but as the aberration and nutation were unknown at that time, and the refraction was not taken into account—causes of error to which it is indispensably necessary to have regard—a determination which agrees so nearly with the results of recent measures could only have arisen from a fortunate compensation of errors. In fact, his toise was somewhat shorter than that which has since been adopted as the standard; and the error occasioned by this circumstance nearly compensated that which was committed in determining the celestial arc; so that in recalculating all the observations, the degree is found to be very nearly the same as was found by Picard.

French Experiments.—Hitherto geodetic operations had been confined to the determination of the magnitude of the earth; but a discovery made by Richer turned the attention of mathematicians to its deviation from the spherical form. This astronomer having been sent, by the Academy of Sciences of Paris, to the island of Cayenne in South America, for the purpose of determining the amount of terrestrial refraction and other astronomical objects, observed that his clock, which had been regulated at Paris to beat seconds, lost about $2\frac{1}{2}$ minutes daily at Cayenne, and that, in order to bring it to measure mean solar time, it was necessary to shorten the pendulum by more than a line. This fact, which appeared exceedingly curious, and was scarcely credited till it had been confirmed by the subsequent observations of Varin and Deshayes, was first explained in the third book of the *Principia*, by Newton, who showed that it could only be referred to a diminution of gravity arising from one of two causes—a protuberance of the equatorial parts of the earth, and consequent increase of the distance from the centre, or from the counteracting effect of the centrifugal force, occasioned by the rotation of the earth. The former could not, on any reasonable supposition regarding the figure of the earth, be regarded as adequate to produce the effect; but the latter, which would produce a retardation of the pendulum at Cayenne in the ratio of the square of the sine of 6° to that of 40° (the respective latitudes of Cayenne and Paris), might amount to 146 seconds. This was the first direct proof of the diurnal rotation of the earth.

From this time the exact determination of the figure of the earth began to assume a degree of importance which had not formerly attached to it. The centrifugal force arising from the diurnal rotation completely set aside the idea of perfect sphericity. Newton, assuming that the earth had been originally fluid, and supposing its density to be the same throughout the whole mass, and supposing, moreover, that its constituent molecules attract one another in proportion to the inverse square of the distance, demonstrated that it would assume, in consequence of the rotation, the form of a spheroid flattened at the poles; and that the proportion of its equatorial to its polar axis would be 230 to 231. But the supposition of the equal density of the earth is obviously very improbable, and consequently the ratio of the equatorial and polar diameters must be different from that now mentioned. Newton erroneously concluded that if the density is greater in the interior of the earth than at the centre, the compression would be greater than in the case of a spheroid of equal density. This mistake was pointed out by Huygens, who, in order to determine the amount of the compression from theory, reasoned in this way. Suppose two tubes to be united at the centre of the earth, forming a right angle with each other at that point, and extending to the surface, one in the plane

of the equator, and the other along the polar axis, and filled with a homogeneous fluid. Now the fluid contained in the polar branch exerts a pressure on the centre equal to the whole of its weight, while the pressure of that in the other tube will be diminished by the centrifugal force. The second column; therefore, if of the same length, will be less heavy than the first; and in order to restore the equilibrium, it is necessary that the equatorial tube shall have gained as much in length as it has lost in weight through the effect of rotation. Hence the sea in the equatorial regions must be higher, or at a greater distance from the centre, than the polar sea, and consequently the earth must have a flattened form. Calculating from the supposition that the density increases regularly from the surface to the centre, where it is infinite, Huygens found the ratio of the diameters to be that of 578 to 579. This investigation is given in his work *De Causa Gravitatis*, published in 1690.

French Theory.—The theoretical determinations of the form of the earth by Newton and Huygens were at variance with the results of geodetic operations that had been carried on in France under the superintendence of the first Cassini, from 1690 till 1716, for the purpose of making a geometrical survey of that country. Cassini found the degree of the meridian to the south of Paris to be 57,092 toises, while on the north of that city it was only 56,960 toises. This result led to the conclusion that the earth is a protracted spheroid, or elongated at the poles; a conclusion entirely inconsistent with the principles of hydrostatic equilibrium, and the deductions of Newton and Huygens. The question, however, was of too great importance to astronomy to be allowed to remain undecided. Accordingly, the Academy of Sciences of Paris determined to apply a decisive test, by the measurement of arcs at a great distance from each other. For this purpose, some of the most distinguished members of their body undertook the measurement of two meridional arcs, one in the neighborhood of the equator, and the other in a high latitude. In 1735, Godin, Bouguer, and La Condamine, proceeded to Peru, where they were joined by two Spanish officers, Don Georges Juan, and Antonio d'Ulloa, and, after ten years of laborious exertion, they measured an arc of above 3 degrees, between the parallels of $2^{\circ} 31'$ north, and $3^{\circ} 4' 32''$ south latitude. The other party, consisting of Meupertuis, Clairaut, Camus, Lémonnier, Outhier, and Celsius, were in some respects more fortunate, inasmuch as they completed the measurement of an arc near the polar circle, of 57 minutes, and returned to Europe within 16 months from the period of their departure. The measurement of Bouguer was executed with great care; and, on account of the locality (the extremities being on different sides of the equator), as well as the excellent manner in which all the details were conducted, it has always been regarded as a most valuable determination. The original base was determined twice, and the difference between the two measures was scarcely $2\frac{1}{2}$ inches.

About the middle of the last century several arcs of meridian were measured in various countries, which, though of inferior importance in comparison of the more extensive surveys which have since been undertaken, are nevertheless deserving of enumeration. In 1751 Lacaille measured an arc at the Cape of Good Hope, whither he had gone for the purpose of determining the lunar parallax, and making other astronomical observations. At the latitude of $33^{\circ} 18\frac{1}{2}'$ he found the degree of the meridian to be 57,037 toises. This result was nearly the same as had been obtained in France, 10° further from the equator; and clearly proved either the existence of great local irregularities in the form of the earth, or the dissimilarity of the two terrestrial hemispheres. As theory recognized no such abnormal condition of figure, and on the other hand, Lacaille's observations, all the details of which had

been preserved, appeared to have been carefully made and correctly computed, the result which they gave was for some generations a very *rezata questio* among all geodesists. After the lapse, however, of nearly a century, the arc has been lately remeasured under the auspices of the British government, with all the modern improved means and appliances; and an approximate calculation of the observations shows, that the greater part of Lacaille's anomaly was produced by *mountain attraction* on his plumb-line. (1855).

In 1751 the measurement of a terrestrial arc was undertaken in the Roman states, by the Jesuits Maire and Boscovich. It extended nearly two degrees between Rome and Rimini, and it was found that the degree of meridian between these parallels, namely, 42° and 44° , contained 56,973 toises. The details are given at length by Boscovich, in a work of great elegance, and entitled *De Litteraria Expeditione per Pontificiam ditionem*, etc. Roma, 1755.

Liesganig, a Jesuit in 1762 also executed two measures of a meridional degree, one in Hungary and the other in the Austrian states; but it has been shown by Baron Zach, in his *Correspondence Astronomique*, vol. vii., that the results merit no confidence, and, in fact, would lead to certain error if employed as elements in determining the figure of the earth.

About the same time, in 1764, an arc of meridian was measured in North America, on the peninsula between the Chesapeake and Delaware bays, by two Englishmen, Charles Mason and Jeremiah Dixon. They employed no triangulation but measured the line with deal-logs along the whole extent of the arc, the mean latitude of which was $39^{\circ} 12'$. Their rods were afterwards compared with the five-foot brass rods made by Bird. The latitudes were determined with a zenith sector. The length of the degree, after the necessary corrections and reductions were made, was found to be 60,026 English fathoms, or 56,888 toises. There is no doubt that great care was bestowed on this operation; it is, however, easy to see that the measurement of so long a line by means of rods is liable to many causes of error from which the method of triangulation is exempt.

In 1762 Beccaria undertook to measure a degree in the plains of Piedmont. He found the degree of the meridian at the latitude of $44^{\circ} 44'$ to contain 57,468 toises; but great uncertainty remained respecting the correctness of the latitudes, the extreme points of the arc being in the near neighborhood of immense ranges of mountains, which could not fall to produce a very considerable deviation of the plumb-line. It was supposed that as both ends of the arc were terminated by mountain ranges, whereas Boscovich's arc had been carried across the Apennines and terminated at the sea coast, the errors of the two measures occasioned by the local attraction, being of opposite kinds, would neutralize each other, and give a correct mean result.

Amid the rapid advances of mathematical science toward the end of the last century, the determination of the figure of the earth was not overlooked. In the year 1783 a memorial was presented to the British government by Cassini de Thury, stating the important advantages that would result to astronomy and navigation, from having the difference of longitude of the Greenwich and Paris observatories determined by a geodetic measurement. Fortunately this proposal was agreed to. The English operations were placed under the superintendence of General Roy, who to active and indefatigable zeal united great skill and experience in practical astronomy and surveying. In the summer of 1784 a base of rather more than five miles was measured on Hounslow Heath. In the measurement of this base, deal-logs were first employed; but as these were found to warp, and be affected with the variations of the hygrometrical state of the atmosphere, glass tubes were substituted; and, in 1791, the same base was measured with a steel chain

carefully made by Ramsden, yet the difference from the former measure was found to be only three ir inches. The mean result was 27,404.2 feet reduced to the level of the sea, and the scale being taken at the temperature of 62° of Fahrenheit. A chain of 32 triangles, in connection with this base, extended over the country to Dover and Hastings; and two more, stretching across the Channel, connected them with the French signals on the opposite side. The instruments employed in this survey were of the most excellent description, and far superior to any that had ever been employed in similar operations. The angles of each triangle were measured by a large theodolite constructed by Ramsden; and it was this splendid instrument that first exhibited the *spherical excess*, or the minute quantity by which, on account of the sphericity of the earth, the sum of the three angles of a triangle on the earth's surface exceeds 180° .

The French part of this great operation was conducted with equal ability by Cassini (the fourth of that name), Mechain, and Delambre. The angles were measured with the repeating circle of Borda; an instrument of a very different description from the theodolite, but which in geodetic operations may fairly be allowed to give, if not equally, at least sufficiently correct results, while in practice it is much more commodious. The result of the combined measures showed the meridian of Paris to be $2^{\circ} 19' 51''$ east of Greenwich, or $9'$ less than had been determined by Dr. Maskelyne.

Soon after this time, a series of geodetic measurements both in France and England, [and also in the United States, in 1805, for an account of which, see *COAST SURVEY*,] which, in point of extent, as well as minute accuracy, far surpassed all the operations which had yet been undertaken with a view to determine the figure of the earth. In 1791 the National Convention of France having agreed to remodel the system of weights and measures, determined to adopt a standard taken from nature, which might be universally applicable in all countries, and capable of being restored at any future age, if by accident it should happen to be lost. Two such standards were proposed, namely, the length of the pendulum, which makes a given number of vibrations in a given latitude; and the quadrant of the terrestrial meridian. Of these, the pendulum is by far the most easy to be determined; but it was objected, that as the length of the pendulum varies at different latitudes, and also depends in some degree on the geological character of the country where it is measured, its length, if it should happen to be lost, could not be recovered, without knowing the precise place at which it had formerly been determined. The length of the quadrant of the meridian is, however, invariable, and, if the earth is a regular spheroid of revolution, must be the same at all places. Accordingly the Convention chose the ten millionth part of the meridian from the equator to the pole as the unit of their new scale; and in order that this unit might be determined with the greatest possible precision, it was resolved to remeasure the meridian of the arc of Paris, and to extend it from Dunkirk to Barcelona, a distance comprehending altogether an arc of about nine degrees. The practical execution of this undertaking was confided to two astronomers of distinguished ability, Delambre and Mechain, by whom the requisite operations were carried on during the years 1792, 1793, and 1794, amid all the dangers and difficulties arising from the disorganized state of the country, with a resolution and courage of which the annals of science afford few examples. The triangles amounted to 115 in number. Each of the three angles of every triangle was separately observed with the repeating circle. The different observations, with the original registers and remarks of the observers, were compared by commissioners, among whom were some of the ablest men in France. A form was drawn up, after which all the

calculations were made. The calculations of the triangles, as well as of the azimuths, were examined by Tralles, Van Swinden, Legendre, and Delambre himself. The triangles were connected in the neighborhood of Paris with a base of upward of seven miles in length, being 6075.9 toises, at the temperature $16\frac{1}{2}$ centigrade, or $61\frac{1}{2}$ of Fahrenheit. A base of verification of 6006.25 toises was measured by Mechain, near Perpignan, at the southern extremity of the arc; and the measured length was found to differ by less than a foot from the length deduced by calculation from the first base, though the distance was more than 436 miles. A line of this length, measured with extreme precision, is obviously quite sufficient to enable us to infer, with all the requisite exactness, the length of the quadrantal arc; but the French astronomers resolved to extend the triangulation still further. Accordingly, Mechain repaired again to Spain, and in the year 1805 continued the chain of triangles from Barcelona to Tortosa, on the coast of the Mediterranean. At this place his labors were prematurely terminated by an epidemic fever. The prolongation of the arc was, however, committed to two philosophers of distinguished reputation, Biot and Arago. An immense triangle, one of the sides of which exceeded 100 miles, connected the coast of Valentia with the island of Iviza, which was joined by another triangle with Formentera, distant no less than $12^{\circ} 22' 13''$ from Dunkirk, the northern extremity of the arc. The result of the whole gave a value of the quadrantal arc, differing somewhat from that determined by Delambre and Mechain, but so little that the length of the metre would be scarcely affected by four times the millionth part of itself. The details of this magnificent operation are given at length in the four volumes of the *Dase Metrique*.

The English survey, which had been interrupted by the death of General Roy, in 1790, was resumed in 1793 under the direction of Colonel Mudge. The original triangles between Greenwich and Dover were extended along the coast to Dunmore in the Isle of Wight, and thence through Devonshire and Wiltshire, and connected with a base of verification measured on Salisbury plain. The length of this base was found, after the proper reductions, to be 3657.4 feet, differing scarcely one inch from the length deduced by calculation from the base on Hounslow Heath. So near a coincidence, though probably owing in some degree to a compensation of errors, affords a convincing proof of the extreme accuracy with which every part of the operation had been conducted. In 1802 the triangulation was carried into Yorkshire, and a meridian arc measured from Dunmore to Clifton. The latitudes at the terminal points were determined with Ramsden's zenith sector. The arc was afterward extended to Burleigh Moor, and has since been carried to the Shetlands. It may be remarked that both the French and English arcs present this singular anomaly, that when portions of them at particular places, are considered separately, the length of the degree appears to increase on going southward.

The survey has been continued, up to the present time, and the triangulation has been carried to the remotest parts of Scotland, and a considerable part of Ireland. In the course of the operations, several important improvements, both in respect of the instruments employed, and in the method of conducting geodetic measurements in general, have been introduced into practice. A base of upward of seven miles has been measured near Londonderry; and it now only remains to determine the latitudes of some stations, to give us the elements of a new and greatly prolonged arc.

In the years 1801, 1802, and 1803, Maupertuis's Swedish arc was remeasured by Svanberg, and extended nearly $40'$ in amplitude. The methods were the same as had been employed by Delambre. The extremities

of the new arc were at Mallörn and Pahtawara. The distance was found to be 87,778 toises, and the difference of the latitudes $1^{\circ} 37' 20'' \cdot 8$; whence $1^{\circ} = 57,196$ toises. This agrees much better than the result of Maupertuis (57,422 toises) with other measurements; but the difference, which implies an error of $12''$ in the latitude of Kittis as determined by the French academicians, has not been satisfactorily accounted for; so that there is still some doubt about the length of a degree in that latitude. See SVANBERG'S *Exposition des Operations faites en Laponnie*, etc. Stockholm, 1805.

Since the beginning of the present century, two arcs of meridian have been surveyed in India. The first was in the neighborhood of Madras, and comprehended only $1^{\circ} 35'$. The second, however, is the longest which has yet been measured. The first, and a large part of the second, was accomplished under the direction of Colonel Lambton; and the instruments and methods of observation and calculation were exactly the same as those that had been employed by Colonel Mudge in the English survey. The south extremity of the second arc was at Punnar, near Cape Comorin, latitude $8^{\circ} 9' 32'' \cdot 61$; and the northern at Daumergidda, latitude $18^{\circ} 8' 16'' \cdot 07$. The amplitude is consequently $9^{\circ} 53' 43'' \cdot 56$, and the distance between the extremities was found to be 598,629.98 fathoms (about 680 miles), giving 60,495 fathoms, or 362,970 feet, for the length of the degree. Several bases were measured, and the whole of the operations appear to have been conducted with great skill and accuracy. This arc has since been extended by Captain Everest to Kaliana, latitude $29^{\circ} 30' 48'' \cdot 8$; so that the whole length now includes more than 21° . The details of Colonel Lambton's operations are given in the different volumes of the *Asiatic Researches* (see vols. i. ii., x., xii.), and those of Captain Everest, in his "*Account of the Measurement of an Arc of the Meridian between the Parallels of $18^{\circ} 8'$ and $29^{\circ} 7'$* ," printed at the expense of the East India Company.

Various geodetic operations on a less extensive scale have been recently executed, which are better adapted, perhaps, to give information respecting the local curvature than the general form of the earth. Beccaria's arc has been remeasured by Plans and Carlini: the results clearly demonstrate the existence of some errors in the original measurement, but they are not yet altogether satisfactory, and the country is very unfavorable. The distance between Göttingen and Altona has been measured by Gauss; and the amplitude of the corresponding celestial arc is known with the utmost precision, from observations of the latitude made at the respective observatories of the two places. The amplitude, however, is only about two degrees, and there is some doubt about the exact length of the iron bars with which the base was measured. A more extensive arc has been measured in Russia by Struve. It extends at present to three and a half degrees, and it is understood that it is in contemplation to prolong it still further. Many new methods have been employed in this measurement; and it acquires additional value from its high latitude, and the acknowledged skill and accuracy of the observer.

The above are the principal arcs of meridian, but some arcs of parallel have also been measured. Theoretically speaking, the figure of the earth may be determined from the measurement of arcs of parallel, as readily as from meridional arcs; and the geodetical operations in the one case differ in no respect from those in the other. But the great, and, we fear, insurmountable difficulty, is to determine with sufficient precision the difference of astronomical longitudes. In a subsequent part of this article we shall have again occasion to mention Cassini's measurement of an arc of parallel across the mouth of the Rhone; of the English arc between Beachy Head and Dunnose; and that recently made from Marennes to Padua.

TABLE SHOWING THE LENGTH OF A DEGREE OF LONGITUDE FOR EVERY DEGREE OF LATITUDE, IN GEOGRAPHICAL AND IN ENGLISH MILES.

Our limits do not permit us to enter into details respecting the numerous experiments that have been made of late years to determine the figure of the earth by measuring the variations of gravity at different places by means of the pendulum. The most valuable series of observations of this kind we yet possess, are those of Captain Foster, reduced under the direction of Mr. Baily, and published in the *Memoirs of the Royal Astronomical Society*, vol. vii. But a discovery recently made by Bessel proves that less accuracy has been obtained by this method than was supposed. It has been found, that a pendulum, when vibrating, drags along with it a portion of air, the precise effect of which can be ascertained in no other way than by actual experiment in vacuo with each individual pendulum. The probable correction which it would be necessary to apply to the results that have already been found, can not be satisfactorily determined.

The mean of the pendulum experiments gives rather a higher value of the ellipticity than the results of geodetic measures; but there are many elements, particularly the irregular constitution of the exterior crust of the earth, and the density of the strata surrounding the station, which can scarcely be determined, and which yet affect materially the results of the experiments.

Besides the methods which have now been alluded to, physical astronomy furnishes other means of arriving at a knowledge of the figure of the earth. The precession of the equinoxes, the nutation of the earth's axis, are phenomena depending on the compression of the earth; and as their amount is now ascertained, from astronomical observations, with the utmost accuracy, we can reciprocally deduce from them a knowledge of the compression. They do not, however, give us an absolute value of the amount of compression, but they make known the limits within which it must necessarily be confined. These limits are 1-279 and 1-578. But a more delicate measure of the same element is furnished by some irregularities in the moon's motion to which it gives rise; and as the lunar theory has now attained a very high state of perfection, and as the small irregularities which cause so much perplexity in geodetical measures here entirely disappear, this is perhaps, the most satisfactory method of all of determining the ellipticity of the earth. The equations into which the irregularity question enters, were discovered by Laplace; and the ellipticity necessary to produce the observed effect was found, on calculation,

tion, to be 1-804; confirming, in a most remarkable manner, the deductions from the measurement of arcs and the observations of the pendulum.

The Surface of the Earth, and its General Divisions.—The surface of the earth contains about 196,663,400 square miles. By much the larger portion of this space is water, which is, indeed, more than twice the extent of the land. The surface of the land is exceedingly diversified, almost everywhere rising into hills and mountains, or sinking into valleys, and sometimes stretching out into plains of great extent. Among the most extensive plains, are the sandy deserts of Arabia and Africa, the interal part of European Russia, and a tract of considerable extent in Prussian Poland. But the most remarkable extent of level ground is the vast table-plain of Thibet, in Asia, which is the most elevated tract of level ground on the globe. The principal mountain ridges are the Alps and Pyrenees, in Europe, the Altai and Himalaya Mountains, in Asia, the mountains of Atlas, in Africa, and the Andes or Cordilleras, in South America. The greatest concavities of the globe are those which are occupied by the waters of the ocean; and of those, by far the largest forms the bed of the Pacific Ocean, which, stretching from the eastern shore of Asia and of New Holland to the western coast of America, covers nearly half the globe. The concavity next in extent is that which forms the bed of the Atlantic Ocean, extending between the new and the old world; and a third concavity is occupied by the Indian Ocean. The Arctic and Antarctic Oceans fill up the remaining concavities.

Smaller collections of water which communicate freely with the oceans, are called *seas*; and of these, the principal are the Mediterranean, the Baltic, the Euxine or Black Sea, and the White Sea. Seas sometimes take their names from the countries near which they flow; as the Irish Sea, the German Ocean. Some large collections of water, though they have no immediate connection with the great body of waters, being on all sides surrounded by land, are yet called seas; as the Caspian Sea. A part of the sea running up into the land, so as to form a large hollow, is called a *bay* or *gulf*, as the Bay of Biscay, the Gulf of Mexico; but if the hollow be small, it is called a *creek*, a *road*, a *harbour*. When two large bodies of water communicate by a narrow pass between two adjacent lands, the pass is called a *strait* or *straits*, as the Straits of Gibraltar, the Straits of Dover, the Straits of Babelmandel. A channel is a wider kind of strait. The water usually flows through a strait with considerable force and velocity, forming what is called a *current*; and frequently this current, as in the case of the Straits of Gibraltar, flows continually in the same direction.

A body of fresh water entirely surrounded by land, is called a *lake*; as the Lake of Genova, Lake Champlain. A considerable stream of water rising inland, and draining a portion of country more or less extensive, discharging its waters into the sea, is called a *river*; a smaller stream of the same kind is called a *riulet* or *brook*.

Of the land, which forms the rest of the surface of the globe, two portions, of vast extent, are called *continents*: the one the eastern continent, or the old world, comprehending Europe, Asia, and Africa; the other, the western continent, or new world, comprehending North and South America. New Holland is a third portion of land, however, which has by some been also reckoned a continent on account of its great extent.

A portion of land of comparatively small dimensions entirely surrounded by water, is called an *island*; as Britain, Ireland, Jamaica, Madagascar. New Holland is the largest portion of land which is called an island. When a number of small islands lie near each other, they are said to form a *group* of islands. A portion of land which is almost entirely surrounded by water, is called a *peninsula*; as the Peninsula of Malacca, the Morea or Grecian Peloponnesus, etc. The

term peninsula is often applied to a large extent of country. Thus we speak of Spain as a peninsula. The narrow neck of land which joins a peninsula to the mainland, or which connects two tracts of country together, is called an *isthmus*. The most remarkable isthmuses in the world are the Isthmus of Suez, which joins Africa and Asia, and the Isthmus of Darica, which connects the continent of North and South America. A narrow tract of land stretching out into the sea, and appearing to terminate in a point, is called a *cape*. The most remarkable capes are, the Cape of Good Hope, at the southern extremity of Africa; Cape Horn, at the southern extremity of South America; and the North Cape, at the northern extremity of Europe. A large portion of land jutting out into the sea is called a *promontory*.

Until of late, in systems of geography, the earth used to be considered as divided into four quarters; Europe, Asia, Africa, and America. A classification in which the whole world is arranged under seven divisions has now, however, been very generally adopted. These divisions are, Europe, Asia, Africa, North America, South America, Australasia, and Polynesia. With regard to the last two, the one, Australasia, or South Asia, comprehends certain of the great islands, particularly New Holland, which are usually considered as belonging to Asia; and the other, Polynesia, signifying many islands, comprehends all the smaller islands which are scattered over the great expanse of the Pacific Ocean. This classification of the parts of the earth's surface is founded on the most obvious points of distinction. We shall now explain two divisions employed by the ancients, which are founded upon different principles; that into zones, and that into climates.

The divisions into zones is suggested by the different degrees of temperature which prevail in different regions of the earth. The temperature of a country depends on a variety of circumstances; but of these, one of the most obvious is the position of the sun with regard to the zenith. The more nearly his rays are received vertically, the higher will be the temperature; and, on the contrary, the more obliquely they fall, the less effect will they produce in raising the temperature. Now to every point of the earth's surface between the tropics the sun is vertical twice in the year. It is in this region, then, that the highest temperature will prevail. Again, within the polar circles the sun's rays at all times fall very obliquely; and for a length of time they do not reach these two regions of the globe at all. Here, then, the temperature must be lower than anywhere else, as all other places enjoy more of the sun's genial influence. In the two regions between the tropics and the polar circles, a medium temperature is found, increasing as we approach the former, and diminishing as we approach the latter. Thus is the earth's surface divided, by the two tropics and two polar circles, into five zones, distinguished from one another by the prevailing temperature in each. That between the tropics is called the *torrid zone*, because there the heat is understood to be extreme. This region, which has the equator passing through the middle of it, the ancients, indeed, considered as uninhabitable. The two regions comprehended within the arctic and antarctic polar circles, are called the northern and southern *frigid zones*, on account of the severity of the cold which there prevails. The two regions situated between the tropics and the polar circles, the one in the northern hemisphere, bounded by the tropic of cancer and the arctic circle, the other in the southern hemisphere, bounded by the tropic of capricorn and the antarctic circle, are called the northern and southern *temperate zones*, because there neither the heat nor cold is excessive; but the heat reaches the highest temperature of summer, and the cold sinks to the lowest temperature of winter, without either becoming extreme.

The division of the earth's surface into climates was employed by the ancients for ascertaining the situation of places. They supposed the northern and southern hemispheres to be each divided into small zones, to which they gave the name of *climates*, the breadth of each zone being such as to make half an hour of difference in the length of the longest day at the two parallels of latitude by which the climate was bounded. Proceeding from the equator, where the length of the day is always 12 hours, they thus divided the space between it and each polar circle into 24 climates. Having reached the polar circles northward and southward, where the longest day is 24 hours, they divided the space between each polar circle in such a manner as to make the difference in the length of the longest day at the beginning and termination of each climate, one month. Hence, as the poles are alternately illuminated for six months, there were just six climates within each polar circle.

Earthenware (Ger. *Irrene Waaren*; Du. *Aardgoed*; Fr. *Vaisselle de terre Poterie*; It. *Stoviglie, Terraglie*; Sp. *Loza de barro*; Rus. *Gorshetchnûnè possodâ*; Pol. *Gliniana naczylnia*), or crockery, as it is sometimes termed, comprises every sort of household utensils made of clay hardened in the fire. Its manufacture is, in England, of very considerable importance, and the improvements that have been made in it since the middle of the last century have contributed powerfully to its extension, and have added greatly to the comfort and convenience of all classes. "There is scarcely any manufacture which is so interesting to contemplate in its gradual improvement and extension as that of earthenware, presenting, as it does, so beautiful a union of science and art, in furnishing us with the comforts and ornaments of civilized life. Chemistry administers her part, by investigating the several species of earths, and ascertaining, as well their most appropriate combinations as the respective degrees of heat which the several compositions require. Art has studied the designs of antiquity, and produced from them vessels even more exquisite in form than the models by which they have been suggested. The ware has been provided in such gradations of quality as to suit every station, from the highest to the lowest. It is to be seen in every country, and almost in every house, through the whole extent of America, in many

parts of Asia, and in most of the countries of Europe. At home it has superseded the less cleanly vessels of pewter and of wood, and, by its cheapness, has been brought within the means of our poorest house-keepers. Formed from substances originally of no value, the fabrication has induced labor of such various classes, and created skill of such various degrees, that nearly the whole value of the annual produce may be considered as an addition made to the mass of national wealth. The abundance of the ware exhibited in every dwelling-house is sufficient evidence of the vast augmentation of the manufacture, which is also demonstrated by the rapid increase of the population in the districts where the potteries have been established."—*London Quar. Rev.*

For the great and rapid extension of the manufacture, the English are chiefly indebted to the late Mr. Josiah Wedgwood, whose original and inventive genius enabled him to make many most important discoveries in the art; and who was equally successful in bringing his inventions into use. The principal seat of the manufacture is in Staffordshire, where there is a district denominated the Potteries, comprising a number of villages, and a population which is supposed to amount, at this moment, to above 85,000, by far the greater portion of which is engaged in the manufacture. There are no authentic accounts of the population of this district in 1760, when Mr. Wedgwood began his discoveries; but the general opinion is, that it did not at that time exceed 20,000. The village of Etruria, in the Potteries, was built by Mr. Wedgwood. The manufacture has been carried on at Burslem, in the same district, for several centuries.

East Indies (French). See FRANCE.

East India Company, a famous association, originally established for prosecuting the trade between England and India, which they acquired a right to carry on exclusively. Since the middle of last century, however, the Company's political have become of more importance than their commercial concerns. East Indies, a popular geographical term not very well defined, but generally understood to signify the continents and islands to the east and south of the River Indus, as far as the borders of China, including Timor and the Moluccas, but excluding the Philippine Islands, New Guinea, and New Holland. China and the Philippine Islands were, however, included within the limits of the East India Company's peculiar privileges. See INDIA.

I. EAST INDIA COMPANY (HISTORICAL SKETCH OF).—The persevering efforts of the Portuguese to discover a route to India, by sailing round Africa, were crowned with success in 1497. And it may appear singular, that, notwithstanding the exaggerated accounts that had been prevalent in Europe, from the remotest antiquity, with respect to the wealth of India, and the importance to which the commerce with it had raised the Phenicians and Egyptians in antiquity, the Venetians in the middle ages, and which it was then seen to confer on the Portuguese, the latter should have been allowed to monopolize it for nearly a century after it had been turned into a channel accessible to every nation. But the prejudices by which the people of most European states were actuated in the sixteenth century, and the peculiar circumstances under which they were placed, hindered them from embarking with that alacrity and ardor that might have been expected in this new commercial career. Soon after the Portuguese began to prosecute their discoveries along the coast of Africa, they applied to the pope for a bull, securing to them the exclusive right to and possession of all countries occupied by Infidels, they either had discovered, or might discover, to the south of Cape Non, on the west coast of Africa, in 27° 54' north latitude: and the pontiff, desirous to display, and at the

same time to extend, his power, immediately issued a bull to this effect. Nor, preposterous as a proceeding of this sort would now appear, did any one then doubt that the pope had a right to issue such a bull, and that all states and empires were bound to obey it. In consequence, the Portuguese were, for a lengthened period, allowed to prosecute their conquests in India without the interference of any other European power. And it was not till a considerable period after the beginning of the war, which the blind and brutal bigotry of Philip II. kindled in the Low Countries, that the Dutch navigators began to display their flag on the Eastern Ocean, and laid the foundations of their Indian empire.

The desire to comply with the injunctions in the pope's bull, and to avoid coming into collision, first with the Portuguese, and subsequently with the Spaniards, who had conquered Portugal in 1580, seems to have been the principal cause that led the English to make repeated attempts, in the reigns of Henry VIII. and Edward VI., and the early part of the reign of Elizabeth, to discover a route to India by a north-west or north-east passage; channels from which the Portuguese would have had no pretence for excluding them. But these attempts having proved unsuccessful, and the pope's bull having ceased to be of any effect in this country, the English merchants and navigators resolved to be no longer deterred by the imaginary rights of the Portuguese from directly entering upon what was then reckoned by far the most lucrative and advantageous branch of commerce. Captain Stephens, who performed the voyage in 1582, was the first Englishman who sailed to India by the Cape of Good Hope. The voyage of the famous Sir Francis Drake contributed greatly to diffuse a spirit of naval enterprise, and to render the English better acquainted with the newly-opened route to India. But the voyage of the celebrated Mr. Thomas Cavendish was, in the latter respect, the most important. Cavendish sailed from England in a little squadron, fitted out at his own expense, in July, 1586; and having explored the greater part of the Indian Ocean, as far as the Philippine Islands, and carefully observed the most important and characteristic features of the people and countries which he visited, returned to England after a prosperous navigation, in September, 1588. Perhaps, however, nothing contributed so much to inspire the English with a desire to embark in the Indian trade, as the captures that were made about this period from the Spaniards. A Portuguese East India ship, or carack, captured by Sir Francis Drake, during his expedition to the coast of Spain, inflamed the cupidity of the merchants by the richness of her cargo, at the same time that the papers found on board gave specific information respecting the traffic in which she had been engaged. A still more important capture, of the same sort, was made in 1593. An armament, fitted out for the East Indies by Sir Walter Raleigh, and commanded by Sir John Burroughs, fell in, near the Azores, with the largest of all the Portuguese caracks, a ship of 1600 tons' burden, carrying 700 men and 36 brass cannon; and, after an obstinate conflict, carried her into Dartmouth. She was the largest vessel that had been seen in England; and her cargo, consisting of gold, spices, calicoes, silks, pearls, drugs, porcelain, ivory, &c., excited the ardor of the English to engage in so open a commerce.

In consequence of these and other concurring causes, an association was formed in London, in 1599, for prosecuting the trade to India. The adventurers applied to the queen for a charter of incorporation, and also for power to exclude all other English subjects, who had not obtained a license from them, from carrying on any species of traffic beyond the Cape of Good Hope or the Straits of Magellan. As exclusive companies were then very generally looked upon as the best instruments for prosecuting most branches of commerce and

industry, the adventurers seem to have had little difficulty in obtaining their charter, which was dated the 31st of December, 1600. The corporation was entitled "The Governor and Company of Merchants of London trading to the East Indies;" the first governor (Thomas Smythe, Esq.) and 24 directors were nominated in the charter; but power was given to the Company to elect a deputy governor, and, in future, to elect their governor and directors, and such other office-bearers as they might think fit to appoint. They were empowered to make by-law; to inflict punishments, either corporal or pecuniary, provided such punishments were in accordance with the laws of England; to export all sorts of goods free of duty for 4 years; and to export foreign coin, or bullion, to the amount of £30,000 a year, £6,000 of the same being previously coined at the mint; but they were obliged to import, within 6 months after the completion of every voyage, except the first, the same quantity of silver, gold, and foreign coin that they had exported. The duration of the charter was limited to a period of 15 years; but with and under the condition that, if it were not found for the public advantage, it might be canceled at any time upon 2 years' notice being given. Such was the origin of the British East India Company—the most celebrated commercial association of ancient or modern times, and which has now extended its sway over the whole of the Mogul empire.

It might have been expected that, after the charter was obtained, considerable eagerness would have been manifested to engage in the trade. But such was not the case. Notwithstanding the earnest calls and threats of the directors, many of the adventurers could not be induced to come forward to pay their proportion of the charges incident to the fitting out of the first expedition. And as the directors seem either to have wanted power to enforce their resolutions, or thought it better not to exercise it, they formed a subordinate association, consisting of such members of the Company as were really willing to defray the cost of the voyage, and to bear all the risks and losses attending it, on condition of their having the exclusive right to whatever profits might arise from it. And it was by such subordinate associations that the trade was conducted during the first 13 years of the Company's existence.

The first expedition to India, the cost of which amounted, ships and cargoes included, to £69,091, consisted of five ships, the largest being 600 and the smallest 130 tons' burden. The goods put on board were, principally bullion, iron, tin, broad-cloths, cutlery, glass, &c. The chief command was entrusted to Captain James Lancaster, who had already been in India. They set sail from Torbay on the 15th of February, 1601. Being very imperfectly acquainted with the seas and countries they were to visit, they did not arrive at their destination, Acheen, in Sumatra, till the 5th of June, 1602. But though tedious, the voyage was, on the whole, uncommonly prosperous. Lancaster entered into commercial treaties with the kings of Acheen and Bantam; and having taken on board a valuable cargo of pepper and other produce, he was fortunate enough, in his way home, to fall in with and capture, in concert with a Dutch vessel, a Portuguese carack of 980 tons' burden, richly laden. Lancaster returned to the Downs on the 11th of September, 1603. — *Modern Universal History*, vol. x., p. 16; MACPHERSON'S *Commerce of the European Powers with India*, p. 81. But notwithstanding the favorable result of this voyage, the expeditions fitted out in the years immediately following, though sometimes consisting of larger ships, were not, on an average, materially increased. In 1612, Captain Best obtained from the court at Delhi several considerable privileges; and, among others, that of establishing a factory at Surat; which city was, henceforth, looked upon as the principal British station in the west of India, till the acquisition of Bombay.

In establishing factories in India, the English only followed the examples of the Portuguese and Dutch. It was contended that they were necessary to serve as *dépôts* for the goods collected in the country for exportation to Europe, as well as for those imported into India, in the event of their not meeting with a ready market at the arrival of the ships. Such establishments, it was admitted, are not required in civilized countries; but the peculiar and unsettled state of India was said to render them indispensable there. Whatever weight may be attached to this statement, it is obvious that factories formed for such purposes could hardly fall of speedily degenerating into a species of forts. The security of the valuable property deposited in them, furnished a specious pretext for putting them in condition to withstand an attack; while the agents, clerks, warehousemen, etc., formed a sort of garrison. Possessing such strong-holds, the Europeans were early emboldened to act in a manner quite inconsistent with their character as merchants, and but a very short time elapsed before they began to form schemes for monopolizing the commerce of particular districts, and acquiring territorial dominion.

Though the Company met with several heavy losses during the early part of their traffic with India, from shipwrecks and other unforeseen accidents, and still more from the hostility of the Dutch, yet, on the whole, the trade was decidedly profitable. There can, however, be little doubt, that their gains, at this early period, have been very much exaggerated. During the first 13 years, they are said to have amounted to 132 per cent. But then it should be borne in mind, as Mr. Grant has justly stated, that the voyages were seldom accomplished in less than 30 months, and sometimes extended to 3 or 4 years; and it should further be remarked that, on the arrival of the ships at home, the cargoes were disposed of at long credits of 18 months or 2 years; and that it was frequently even 6 or 7 years before the concerns of a single voyage were finally adjusted.—*Sketch of the History of the Company*, p. 13. When these circumstances are taken into view, it will be immediately seen that the Company's profits were not, really, by any means so great as has been represented. It may not, however, be uninteresting to remark, that the principal complaint that was then made against the Company, did not proceed so much on the circumstance of its charter excluding the public from any share in an advantageous traffic, as in its authorizing the Company to export gold and silver of the value of £30,000. It is true that the charter stipulated that the Company should import an equal quantity of gold and silver within 6 months of the termination of every voyage; but the enemies of the Company contended that this condition was not complied with; and that it was, besides, highly injurious to the public interest, and *contrary to all principle*, to allow gold and silver to be sent out of the kingdom. The merchants and others interested in the support of the Company, could not controvert the reasoning of their opponents without openly impugning the ancient policy of absolutely preventing the exportation of the precious metals. They did not, however, venture to contend, if the idea really occurred to them, that the exportation of bullion to the East was advantageous, on the broad ground of the commodities purchased by it being of greater value in England. But they contended that the exportation of bullion to India was advantageous, because the commodities thence imported were chiefly re-exported to other countries from which a much greater quantity of bullion was obtained than had been required to pay for them in India. Mr. Thomas Mun, a director of the East India Company, and the ablest of its early advocates, ingeniously compares the operations of the merchant in conducting a trade carried on by the exportation of gold and silver to the seed-time and harvest of agriculture. "If we only behold," says

he, "the actions of the husbandman in the seed-time, when he casteth away much good corn into the ground, we shall account him rather a madman than a husbandman. But when we consider his labors in the harvest, which is the end of his endeavors, we find the worth and plentiful increase of his actions."—*Treasure by Foreign Trade*, p. 50, edition of 1664.

We may here remark, that what has been called the mercantile system of political economy, or that system which measures the progress of a country in the career of wealth by the supposed balance of payments in its favor, or by the estimated excess of the value of its exports over that of its imports, appears to have originated in the excuses now set up for the exportation of bullion. Previously to this epoch, the policy of prohibiting the exportation of bullion had been universally admitted; but it now began to be pretty generally allowed, that its exportation might be productive of advantage, provided it occasioned the subsequent exportation of a greater amount of raw or manufactured products to countries whence bullion was obtained for them. This, when compared with the previously existing prejudice—for it hardly deserves the name of system—which wholly interdicted the exportation of gold and silver, must be allowed to be a considerable step in the progress to sounder opinions. The maxim, *ce n'est que le premier pas qui coûte*, was strikingly verified on this occasion. The advocates of the East India Company began gradually to assume a higher tone, and, at length, boldly contended that bullion was nothing but a commodity, and that its exportation should be rendered as free as that of any thing else. Nor were these opinions confined to the partners of the East India Company. They were gradually communicated to others; and many eminent merchants were taught to look with suspicion on several of the previously received dogmas with respect to commerce, and were, in consequence, led to acquire more correct and comprehensive views. The new ideas ultimately made their way into the House of Commons; and, in 1663, the statutes prohibiting the exportation of foreign coin and bullion were repealed, and full liberty given to the East India Company and to private traders to export them in unlimited quantities.

But the objection to the East India Company, or rather the East India trade, on the ground of its causing the exportation of gold and silver, admitted of a more direct and conclusive, if not a more ingenious reply. How commendable soever the ancient intercourse with India by the Red Sea and the Mediterranean, it was unavoidably attended with a good deal of expense. The productions of the remote parts of Asia, brought to Ceylon, or the ports on the Malabar coast, by the natives, were there put on board the ships which arrived from the Arabic gulf. At Berenice they were landed, and carried by camels 250 miles to the banks of the Nile. They were there again embarked, and conveyed down the river to Alexandria, whence they were despatched to different markets. The addition to the price of goods by such a multiplicity of operations must have been considerable; more especially as the price charged on each operation was fixed by monopolists, subject to no competition or control. Pliny says, that the cost of the Arabian and Indian products brought to Rome when he flourished (A.D. 70), was increased a hundredfold by the expenses of transit—(*Hist. Nat.*, lib. vi., c. 23); but there can be little or no doubt that this is to be regarded as a rhetorical exaggeration. There are good grounds for thinking that the less bulky sorts of Eastern products, such as silks, spices, balsams, precious stones, etc., which were those principally made use of at Rome, might, supposing there were no political obstacles in the way, be conveyed from most parts of India to the ports on the Mediterranean by way of Egypt, at a de-

elledly cheaper rate than they could be conveyed to them by the Cape of Good Hope.

But at the period when the latter route to India began to be frequented, Syria, Egypt, etc., were occupied by Turks and Mamelukes; barbarians who despised commerce and navigation, and were, at the same time, extremely jealous of strangers, especially of Christians or infidels. The price of the commodities obtained through the intervention of such persons was necessarily very much enhanced; and the discovery of the route by the Cape of Good Hope was, consequently, of the utmost importance; for, by putting an end to the monopoly enjoyed by the Turks and Mamelukes, it introduced, for the first time, something like competition into the Indian trade, and enabled the western parts of Europe to obtain supplies of Indian products for about a third part of what they had previously cost. Mr. Mun, in a tract published in 1621, estimates the quantity of Indian commodities imported into Europe, and their cost when bought in Aleppo, and in India, as follows:

COST OF INDIAN COMMODITIES CONSUMED IN EUROPE WHEN BOUGHT IN ALEPPO (OR ALEXANDRIA).

	£	s.	d.
6,000,000 lbs. pepper cost, with charges, etc., at Aleppo 2s. per lb.	600,000	0	0
450,000 lbs. cloves, at 4s. 9d.	108,575	10	0
150,000 lbs. mace, at 8s.	25,000	0	0
400,000 lbs. nutmegs, at 2. 4d.	46,686	2	4
350,000 lbs. Indigo, at 4s. 4d.	75,838	6	8
1,000,000 lbs. Persian raw silk, at 2s.	600,000	0	0
Total	£1,465,000	19	0

But the same quantities of the same commodities cost, when bought in the East Indies, according to Mr. Mun, as follows:

	£	s.	d.
6,000,000 lbs. pepper, at 9d. per lb.	62,500	0	0
450,000 lbs. cloves, at 9d.	16,875	0	0
150,000 lbs. mace, at 8d.	5,000	0	0
400,000 lbs. nutmegs, at 4s.	8,966	18	4
350,000 lbs. Indigo, at 1s. 9d.	20,418	13	4
1,000,000 lbs. raw silk, at 8s.	400,000	0	0
Total	£511,468	5	8

Which, being deducted from the former, leaves a balance of £953,542 13s. 4d. And supposing that the statements made by Mr. Mun are correct, and that allowance is made for the difference between the freight from Aleppo and India, the result would indicate the saving which the discovery of the route by the Cape of Good Hope occasioned in the purchase of the above-mentioned articles.—*A Discourse of Trade from England to the East Indies*, by T. M., original ed. p. 10. (This tract, which is very scarce, is reprinted in Purchas's Pilgrims).

In the same publication (p. 37), Mr. Mun informs us that from the beginning of the Company's trade, to July, 1620, they had sent 79 ships to India; of which 34 had come home safely, and richly laden; 4 had been worn out by long service in India; 2 had been lost in careening; 6 had been lost by the perils of the sea, and 12 had been captured by the Dutch. Mr. Mun further states, that the exports to India since the formation of the Company had amounted to £840,376; that the produce brought from India had cost £356,288, and had produced here the enormous sum of £1,914,600; and that the quarrels with the Dutch had occasioned a loss of £84,068; and that the stock of the Company, in ships, goods in India, etc., amounted to £400,000.

The hostility of the Dutch, to which Mr. Mun has here alluded, was long a very formidable obstacle to the Company's success. The Dutch early endeavored to obtain the exclusive possession of the spice trade, and were not at all scrupulous about the means by which they attempted to bring about this their favorite object; the English, on their part, naturally exerted themselves to obtain a share of so valuable a commerce; and as neither party was disposed to abandon its views and pretensions, the most violent animosities grew up between them. In this state of things, it would be ridiculous to suppose that unjustifiable acts

were not committed by the one party as well as the other; though the worst act of the English appears venial, when compared with the conduct of the Dutch in the massacre of Amboyna, in 1623. While, however, the Dutch Company was vigorously supported by the government at home, the English Company met with no efficient assistance from the feeble and vacillating policy of James and Charles. The Dutch either despised their remonstrances, or defeated them by an apparent compliance; so that no real reparation was obtained for the outrages they had committed. During the civil war, Indian affairs were necessarily lost sight of; and the Dutch continued, until the ascendancy of the republican party had been established, to reign triumphant in the East, where the English commerce was nearly annihilated.

But notwithstanding their depressed condition, the Company's servants in India laid the foundation, during the period in question, of the settlements at Madras and in Bengal. Permission to build Fort St. George was obtained from the native authorities in 1640. In 1658, Madras was raised to the station of a presidency. In 1645, the Company began to establish factories in Bengal; the principal of which was at Hooghly. These were, for a lengthened period, subordinate to the presidency of Madras.

No sooner, however, had the civil wars terminated than the armies and councils of Cromwell retrieved the situation of our affairs in India. The war which broke out between the long Parliament and the Dutch in 1652 was eminently injurious to the latter. In the treaty of peace, concluded in 1654, it was stipulated that indemnification should be made by the Dutch for the losses and injuries sustained by the English merchants and factors in India. The 27th article bears, "that the lords, the states-general of the United Provinces, shall take care that justice be done upon those who were partakers or accomplices in the massacre of the English at Amboyna, as the republic of England is pleased to term the fact, provided any of them be living." A commission was at the same time appointed, conformably to another article of the treaty, to inquire into the reciprocal claims which the subjects of the contracting parties had upon each other for losses sustained in India, Brazil, etc.; and upon their decision, the Dutch paid the sum of £85,000 to the East India Company, and £3615 to the heirs or executors of the sufferers at Amboyna.—*Bruce's Annals*, vol. 1. p. 489.

The charter under which the East India Company prosecuted their exclusive trade to India being merely a grant from the crown, and not ratified by any act of Parliament, was understood by the merchants to be at an end when Charles I. was deposed. They were confirmed in this view of the matter, from the circumstance of Charles having himself granted, in 1635, a charter to Sir William Courten and others, authorizing them to trade with those parts of India with which the Company had not established any regular intercourse. The reasons alleged in justification of this measure, by the crown, were, that "the East India Company had neglected to establish fortified factories, or seats of trade, to which the king's subjects could resort with safety; that they had consulted their own interests only, without any regard to the king's revenue; and in general, that they had broken the condition on which their charter and exclusive privileges had been granted to them."—*Rim. Federa*, vol. xx., p. 146.

Courten's association, for the foundation of which such satisfactory reasons has been assigned, continued to trade with India during the remainder of Charles's reign; and no sooner had the arms of the Commonwealth forced the Dutch to desist from their depredations, and to make reparation for the injuries they had inflicted on the English in India, than private adventurers engaged in great numbers in the India trade, and carried it on with a zeal, economy, and success,

that monopoly can never expect to rival. It is stated in a little work, entitled "Britannia Languens," published in 1680, the author of which has evidently been a well-informed and intelligent person, that during the years 1653, 1654, 1655, and 1656, when the trade to India was open, the private traders imported East India commodities in such large quantities, and sold them at such reduced prices; that they not only fully supplied the British markets, but had even come into successful competition with the Dutch in the market of Amsterdam, "and very much sunk the actions (shares) of the Dutch East India Company."—(p. 122.) This circumstance naturally excited the greatest apprehensions on the part of the Dutch Company; for besides the danger that they now ran of being deprived, by the active competition of the English merchants, of a considerable part of the trade which they had previously enjoyed, they could hardly expect that, if the trade were thrown open in England, the monopoly would be allowed to continue in Holland. A striking proof of what is now stated is to be found in a letter in the third volume of "Thurlow's State Papers," dated at the Hague, the 15th of January, 1654, where it is said, that "the merchants of Amsterdam have advised that the Lord Protector intends to dissolve the East India Company at London, and to declare the navigation and commerce of the East Indies free and open: which doth cause great jealousy at Amsterdam, as a thing that will very much prejudice the East India Company in Holland."

Feeling that it was impossible to contend with the private adventurers under a system of fair competition, the moment the treaty with the Dutch had been concluded, the Company began to solicit a renewal of their charter; but in this they were not only opposed by the free traders, but by a part of themselves. To understand how this happened, it may be proper to mention that Courten's association, the origin of which has been already noticed, had begun, in 1648, to found a colony in Asuada, an island near Madagascar. The Company, alarmed at this project, applied to the Council of State to prevent its being carried into effect; and the council, without entering on the question of either party's rights, recommended them to form a union; which was accordingly effected in 1649. But the union was, for a considerable time, rather nominal than real; and when the Dutch war had been put an end to, most of those holders of the Company's stock who had belonged to Courten's association joined in petitioning the Council of State that the trade might in future be carried on, not by a joint-stock, but by a regulated company; so that each individual engaging in it might be allowed to employ his own stock, servants, and shipping, in whatever way he might conceive most for his own advantage.—*Petition of Adventurers*, 17th of Nov., 1656; *Bruce's Annals*, vol. i., p. 518.

This proposal was obviously most reasonable. The Company had always founded their claim to a monopoly of the trade on the alleged ground of its being necessary to maintain forts, factories, and ships of war in India; and that as this was not done by government, it could only be done by a company. But, by forming the traders with India into a regular company, they might have been subjected to whatever rules were considered most advisable; and such special duties might have been laid on the commodities they exported and imported as would have sufficed to defray the public expenses required for carrying on the trade, at the same time that the inestimable advantages of free competition would have been secured; each individual trader being left at liberty to conduct his enterprises, subject only to a few general regulations, in his own way and for his own advantage. See COMPANIES.

But notwithstanding the efforts of the petitioners, and the success that was clearly proved to have attended the operations of the private traders, the Company

succeeded in obtaining a renewal of their charter from Cromwell in 1657. Charles II. confirmed this charter in 1661; and at the same time conferred on them the power of making peace or war with any power or people not of the Christian religion; of establishing fortifications, garrisons, and colonies; of exporting ammunition and stores to their settlements duty free; of seizing and sending to England such British subjects as should be found trading to India without their leave; and of exercising civil and criminal jurisdiction in their settlements, according to the laws of England. Still, however, as this charter was not fully confirmed by any act of Parliament, it did not prevent traders, or interlopers as they were termed, from appearing within the limits of the Company's territories. The energy of private commerce, which, to use the words of Mr. Orme, "sees its drift with eagles' eyes," formed associations at the risk of trying the consequence at law, being safe at the outset, and during the voyage, since the Company were not authorized to stop or seize the ships of those who thus attempted to come into competition with them. Hence their monopoly was by no means complete; and it was not till after the Revolution, and when a free system of government had been established at home, that, by a singular contradiction, the authority of Parliament was interposed to enable the Company wholly to engross the trade with the East.

In addition to the losses arising from this source, the Company's trade suffered severely, during the reign of Charles II., from the hostilities that were then waged with the Dutch, and from the confusion and disorders caused by contests among the native princes; but in 1668 the Company obtained a very valuable acquisition in the island of Bombay. Charles II. acquired this island as a part of the marriage portion of his wife, Catharine of Portugal; and it was now made over to the Company, on condition of their not selling or alienating it to any persons whatever, except such as were subjects of the British crown. They were allowed to legislate for their new possession; but it was enjoined that their laws should be consonant with reason, and, "as near as might be," agreeable to the practice of England. They were authorized to maintain their dominion by force of arms; and the natives of Bombay were declared to have the same liberties as natural-born subjects. The Company's western presidency was soon after transferred from Surat to Bombay.

In 1664, the French East India Company was formed; and 10 years afterward they laid the foundation of their settlement at Pondicherry.

But the reign of Charles II. is chiefly memorable in the Company's annals, from its being the era of the commencement of the tea trade. The first notice of tea in the Company's records is found in a despatch, addressed to their agent at Bantam, dated 24th of January, 1667-8, in which he is desired to send home 100 lbs. of tea—"the best he can get." (*Baxter's Annals*, vol. ii., p. 210.) Such was the late and feeble beginning of the tea trade, a branch of commerce that has long been of vast importance to the British nation, and without which it is more than probable that the East India Company would long since have ceased to exist, at least as a mercantile body.

In 1677 the Company obtained a fresh renewal of their charter; receiving at the same time an indemnity for all past misuse of their privileges, and authority to establish a mint at Bombay.

During the greater part of the reigns of Charles II. and James II., the Company's affairs at home were principally managed by the celebrated Sir Josiah Child, the ablest commercial writer of the time; and in India, by his brother, Sir John Child. In 1681, Sir Josiah published an apology for the Company, under the signature of Φιλοπατρις—"A Friend-wherein is Demonstrated that the East India Trade

is the most beneficial besides the objection of an account it appears that the tons, etc. India, a customs £60,000 "in lead of the amount." Josiah secured the income fore directly pro raw silk, would ot proved no admitted a still low.

is the most National of all Foreign Trades"—in which, besides endeavoring to vindicate the Company from the objections that had been made against it, he gives an account of its state at the time. From this account it appears that the Company consisted of 566 partners; that they had from 35 to 36 ships, of from 775 to 100 tons, employed in the trade between England and India, and from port to port in India (p. 23); that the customs duties upon the trade amounted to about £60,000 a year; and that the value of the exports, "in lead, tin, cloth, and stuffs, and other commodities of the production and manufacture of England," amounted to about £60,000 or £70,000 a year. Sir Josiah seems to have been struck, as he well might, by the inconsiderable amount of the trade; and he therefore dwells on the advantages of which it was indirectly productive, in enabling us to obtain supplies of raw silk, pepper, etc., at a much lower price than they would otherwise have fetched. But this, though true, proved nothing in favor of the Company—it being an admitted fact, that those articles were furnished at a still lower price by the Interlopers or private traders.

Sir Josiah Child was one of the first who projected the formation of a territorial empire in India. But the expedition fitted out in 1686, in the view of accomplishing this purpose, proved unsuccessful; and the Company were glad to accept peace on the terms offered by the Mogul. Sir John Child, having died during the course of these transactions, was succeeded in the principal management of the Company's affairs in India by Mr. Vaux. On the appointment of the latter, Sir Josiah Child, to whom he owed his advancement, exhorted him to act with vigor, and to carry whatever instructions he might receive from home into immediate effect. Mr. Vaux returned for answer, that he should endeavor to acquit himself with integrity and justice, and that he would make the laws of his country the rule of his conduct. Sir Josiah Child's answer to this letter is curious: "He told Mr. Vaux roundly that he expected his orders were to be his rules, and not the laws of England, which were a heap of nonsense, compiled by a few ignorant country gentlemen, who hardly knew how to make laws for the good government of their own private families, much less for the regulating of companies and foreign commerce." (HAMILTON'S *New Account of the East Indies*, vol. 1, p. 232.)

During the latter part of the reign of Charles II. and that of his successor, the number of private adventurers, or interlopers, in the Indian trade, increased in an unusual degree. The Company vigorously exerted themselves in defense of what they conceived to be their rights; and the question with respect to the validity of the powers conferred on them by their charter was at length brought to issue, by a prosecution carried on at their instance against Mr. Thomas Sandys, for trading to the East Indies without their license. Judgment was given in favor of the Company in 1685. But this decision was ascribed to corrupt influence; and instead of allaying, only served to increase the clamor against them. The meeting of the Convention Parliament gave the Company's opponents hopes of a successful issue to their efforts; and had they been united, they might probably have succeeded. Their opinions were, however, divided—part being for throwing the trade open, and part for the formation of a new company on a more liberal footing. The latter being formed into a body, and acting in unison, the struggle against the Company was chiefly carried on by them. The proceedings that took place on this occasion are among the most disgraceful in the history of the country. The most open and unblushing corruption was practiced by all parties. "It was, in fact, a trial which should bribe the highest; public authority inclining to one or other as the irresistible force of gold directed." (*Modern Universal History*, vol. x., p. 127.) Government appears, on the whole, to have

been favorable to the Company; and they obtained a fresh charter from the crown in 1699. But in the following year the trade was virtually laid open by a vote of the House of Commons, "that all the subjects of England had an equal right to trade to the East Indies, unless prohibited by act of Parliament." Matters continued on this footing till 1698. The pecuniary difficulties in which government was then involved, induced them to apply to the Company for a loan of £2,000,000, for which they offered 8 per cent. interest. The Company offered to advance £700,000 at 4 per cent.; but the credit of government was at the time so low, that they preferred accepting an offer from the associated merchants, who had previously opposed the Company, of the £2,000,000, at 8 per cent., on condition of their being formed into a new and exclusive company. While this project was in agitation, the advocates of free trade were not idle, but exerted themselves to show that, instead of establishing a new company, the old one ought to be abolished. But, however conclusive, their arguments, having no adventurous recommendations in their favor, failed of making any impression. The new company was established by authority of the legislature; and as the charter of the old company was not yet expired, the novel spectacle was exhibited of two legally constituted bodies, each claiming an exclusive right to the trade of the same possessions!

Notwithstanding all the pretensions set up by those who had obtained the new charter, during their struggle with the old company, it was immediately seen that they were as anxious as the latter to suppress every thing like free trade. They had not, it was obvious, been actuated by any enlarged views, but merely by a wish to grasp at the monopoly, which they believed would redound to their own individual interest. The public, in consequence, became equally disgusted with both parties; or, if there were any difference, it is probable that the new company was looked upon with the greatest aversion, inasmuch as we are naturally more exasperated by what we conceive to be duplicity and bad faith, than by fair undisguised hostility.

At first the mutual hatred of the rival associations knew no bounds. But they were not long in perceiving that such conduct would infallibly end in their ruin; and that while one was laboring to destroy the other, the friends of free trade might step in and procure the dissolution of both. In consequence, they became gradually reconciled; and in 1709, having adjusted their differences, they resolved to form themselves into one company, entitled *The United Company of Merchants of England trading to the East Indies*.

The authority of Parliament was soon after interposed to give effect to this agreement.

The United Company engaged to advance £1,200,000 to government without interest, which, as a previous advance had been made of £2,000,000 at 8 per cent., made the total sum due to them by the public £3,200,000, bearing interest at 5 per cent.; and government agreed to ratify the terms of their agreement, and extend the charter to the 25th of March, 1726, with 3 years' notice.

While these important matters were transacting at home, the Company had acquired some additional possessions in India. In 1692, the Bengal agency was transferred from Hooghly to Calcutta. In 1698, the Company acquired a grant from one of the grandsons of Aurengzebe, of Calcutta and 2 adjoining villages; with leave to exercise judicary powers over the inhabitants, and to erect fortifications. These were soon after constructed, and received, in compliment to William III., then king of England, the name of Fort William. The agency at Bengal, which had hitherto been subsidiary only, was now raised to the rank of a presidency.

The vigorous competition that had been carried on

for some years before the coalition of the old and new Companies, between them and the private traders, had occasioned a great additional importation of Indian silks, piece goods, and other products, and a great reduction of their price. These circumstances occasioned the most vehement complaints among the home manufacturers, who resorted to the arguments invariably made use of on such occasions by those who wish to exclude foreign competition; affirming that manufactured India goods had been largely substituted for those of England; that the English manufacturers had been reduced to the cruel necessity either of selling nothing, or of selling their commodities at such a price as left them no profit; that great numbers of their workmen had been thrown out of employment; and, last of all, that Indian goods were not bought by British goods, but by gold and silver, the exportation of which had caused the general impoverishment of the kingdom! The merchants and others interested in the India trade could not, as had previously happened to them in the controversy with respect to the exportation of bullion, meet these statements without attacking the principles on which they rested, and maintaining, in opposition to them, that it was for the advantage of every people to buy the products they wanted in the cheapest market. This just and sound principle was, in consequence, enforced in several petitions presented to Parliament by the importers of Indian goods; and it was also enforced in several able publications that appeared at the time. But these arguments, how unanswerable soever they may now appear, had then but little influence; and, in 1701, an act was passed, prohibiting the importation of Indian manufactured goods for home consumption.

For some years after the re-establishment of the Company, it continued to prosecute its efforts to consolidate and extend its commerce. But the unsettled state of the Mogul empire, coupled with the determination of the Company to establish factories in every convenient situation, exposed their affairs to perpetual vicissitudes. In 1715, it was resolved to send an embassy to Delhi, to solicit from Furruksur, an unworthy descendant of Aurengzebe, an extension and confirmation of the Company's territory and privileges. Address, accident, and the proper application of presents, conspired to insure the success of the embassy. The grants or patents solicited by the Company, were issued in 1717. They were in all 34. The substance of the privileges they conferred was, that English vessels wrecked on the coasts of the empire should be exempt from plunder; that the annual payment of a stipulated sum to the government of Surat should free the English trade at that port from all duties and exactions; that those villages contiguous to Madras formerly granted and afterward refused by the government of Arcot, should be restored to the Company; that the island of Diu, near the port of Masulpatan, should belong to the Company, paying for it a fixed rent; that in Bengal, all persons, whether European or native, indebted or accountable to the Company, should be delivered up to the presidency on demand; that goods of export or import, belonging to the English, might, under a *distress* or passport from the president of Calcutta, be conveyed duty free through the Bengal provinces; and that the English should be at liberty to purchase the lordship of 37 towns contiguous to Calcutta, and, in fact, commanding both banks of the river for 10 miles south of that city.—GRANT'S *Sketch of the History of the East India Company*, p. 128.

The important privileges thus granted were long regarded as constituting the great charter of the English in India. Some of them, however, were not fully conceded; but were withheld or modified by the influence of the Emperor's lieutenants, or *soubahdars*.

In 1717, the Company found themselves in danger from a new competitor. In the course of that year

some ships appeared in India, fitted out by private adventurers from Ostend. Their success encouraged others to engage in the same line; and in 1722, the adventurers were formed into a company under a charter from his Imperial Majesty. The Dutch and English Companies, who had so long been hostile to each other, at once laid aside their animosities, and joined heartily in an attempt to crush their new competitors. Remonstrances being found ineffectual, force was resorted to; and the vessels of the Ostend Company were captured, under the most frivolous pretenses, in the open seas and on the coasts of Brazil. The British and Dutch governments abetted the selfish spirit of hostility displayed by their respective Companies. And the emperor was, in the end, glad to purchase the support of Great Britain and Holland to the pragmatic sanction, by the sacrifice of the Company at Ostend.

Though the Company's trade had increased, it was still inconsiderable, and it is very difficult, indeed, when one examines the accounts that have from time to time been published of the Company's mercantile affairs, to imagine how the idea ever came to be entertained that their commerce was of any considerable, much less paramount, importance. At an average of the 10 years ending with 1724, the total value of the British manufactures and other products annually exported to India, amounted to only £92,410 12s. 6d. The average value of the bullion annually exported, during the same period, amounted to £518,102 11s. 0d., making the total annual average export £617,513 3s. 10d.; a truly pitiful sum, when we consider the wealth, population, and industry of the countries between which the Company's commerce was carried on; and affording, by its smallness, a strong presumptive proof of the effect of the monopoly in preventing the growth of the trade.

At this period (1773) the total number of proprietors of East India stock, with their qualifications as they stood in the Company's book, were as follows:

	Proprietors.	Stock.
Englishmen, possessing stock and upward.....	487	£1,018,398
Foreigners, possessing stock and upward.....	325	890,940
Englishmen, possessing £500 stock and upward.....	1,246	684,464
Foreigners, possessing £500 stock and upward.....	95	50,226
Total.....	2,153	£2,504,029

Notwithstanding the vast extension of the Company's territories, their trade continued to be apparently insignificant. During the 3 years ending with 1773, the value of the entire exports of British produce and manufactures, including military stores, exported by the Company to India and China, amounted to £1,469,411, being at the rate of £489,803 a year; the annual exports of bullion during the same period being only £84,933. During the same 3 years, 23 ships sailed annually for India. The truth, indeed, seems to be, that, but for the increased consumption of tea in Great Britain, the Company would have entirely ceased to carry on any branch of trade with the East; and that the monopoly would have excluded us as effectually from the markets of India and China as if the trade had reverted to its ancient channels, and the route by the Cape of Good Hope been relinquished.

In 1781, the exclusive privileges of the Company were extended to 1791, with three years' notice; the dividend on the Company's stock was fixed at 8 per cent.; three fourths of their surplus revenues, after paying the dividend, and the sum of £100,000 payable to government, was to be applied to the public service, and the remaining fourth to the Company's own use. In 1780, the value of British produce and manufactures exported by the Company to India and China amounted to only £386,152; the bullion exported during the same year was £15,011. The total value of the exports during the same year was £12,648,616; showing that

the East India trade formed only *one thirty-second* part of the entire foreign trade of the empire!

The administration of Mr. Hastings was one continued scene of war, negotiation, and intrigue. The state of the country, instead of being improved, became worse; so much so, that in a council minute by Marquis Cornwallis, dated the 18th of September, 1789, it is distinctly stated, "*that one third part of the Company's territory is now a jungle for wild beasts.*" Some abuses in the conduct of their servants were, indeed, rectified; but, notwithstanding, the nett revenue of Bengal, Bahar, and Orissa, which, in 1772, had amounted to £2,126,766, declined, in 1785, to £2,072,968. This exhaustion of the country, and the expenses incurred in the war with Hyder Ali and France, involved the Company in fresh difficulties; and being unable to meet them, they were obliged, in 1788, to present a petition to Parliament, setting forth their inability to pay the stipulated sum of £400,000 a year to the public, and praying to be excused from that payment and to be supported by a loan of £900,000.

During the administration of Marquis Cornwallis, who succeeded Mr. Hastings, Tippee Saib, the son of Hyder Ali, was stripped of nearly half his dominions; the Company's territorial revenue was, in consequence, greatly increased; at the same time that the permanent settlement was carried into effect in Bengal, and other important changes accomplished. Opinion has been long divided as to the influence of these changes. On the whole, however, we are inclined to think that they have been decidedly advantageous. Lord Cornwallis was, beyond all question, a sincere friend to the people of India; and labored earnestly, if not always successfully, to promote their interests, which he well knew were identified with those of the British nation. During the 3 years ending with 1793, the value of the Company's exports of British produce and manufactures fluctuated from £928,789 to £1,031,262. But this increase is wholly to be ascribed to the reduction of the duty on tea in 1784, and the vast increase that, consequently, took place in its consumption. (See article TEA.) Had the consumption of tea continued stationary, there appear no grounds for thinking that the Company's exports in 1793 would have been greater than in 1780, unless an increase had taken place in the quantity of military stores exported.

In 1793, the Company's charter was prolonged till the 1st of March, 1814. In the act for this purpose, a species of provision was made for opening the trade to India to private individuals. All his majesty's subjects, residing in any part of his European dominions, were allowed to export to India any article of the produce or manufacture of the British dominions, except military stores, ammunition, masts, spars, cordage, pitch, tar, and copper; and the Company's civil servants in India, and the free merchants resident there, were allowed to ship, on their own account and risk, all kinds of Indian goods, except calicoes, diuinities, muslins, and other piece goods. But neither the merchants in England, nor the Company's servants or merchants in India, were allowed to export or import except in Company's ships. And in order to insure such conveyance, it was enacted that the Company should annually appropriate 3,000 tons of shipping for the use of private traders; it being stipulated that they were to pay, in time of peace, £5 outward, and £15 homeward, for every ton occupied by them in the Company's ships; and that this freight might be raised in time of war, with the approbation of the Board of Control.

It might have been, and, indeed, most probably was, foreseen that very few British merchants or manufacturers would be inclined to avail themselves of the privilege of sending out goods in Company's ships; or of engaging in a trade fettered on all sides by the jealousy of powerful monopolists, and where, consequently, their superior judgment and economy would have

availed almost nothing. As far, therefore, as they were concerned, the relaxation was more apparent than real, and did not produce any useful results. It was, however, made use of to a considerable extent by private merchants in India; and also by the Company's servants returning from India, many of whom invested a part, and some the whole, of their fortunes, in produce fit for the European markets.

Notwithstanding the vast additions made to their territories, the Company's commerce with them continued to be very inconsiderable. During the 5 years ending with 1811, the exports to India by the Company, exclusive of those made on account of individuals in their ships, were as under:

1807.....	£352,418	1810.....	£1,010,815
1808.....	219,544	1811.....	1,088,518
1809.....	586,158		

The exports by the private trade, and the *privileges* trade, that is, the commanders and officers of the Company's ships, during the above-mentioned years, were about as large. During the 5 years ending with 1807-8, the annual average imports into India by British private traders only, amounted to £805,496.—*Papers published by the East India Company in 1813, 4to. p. 56.*

The Company's exports include the value of the military stores sent from Great Britain to India. The ships employed in the trade to India and China, during the same 5 years, varied from 44 to 53, and their burden from 36,671 to 45,342 tons.

For some years previously to the termination of the Company's charter in 1813, the conviction had been gaining ground among all classes, that the trade to the East was capable of being very greatly extended; and that it was solely owing to the want of enterprise and competition, occasioned by its being subjected to a monopoly, that it was confined within such narrow limits. Very great efforts were, consequently, made by the manufacturing and commercial interests to have the monopoly set aside, and the trade to the East thrown open. The Company vigorously resisted these pretensions; and had interest enough to procure a prolongation of the privilege of carrying on an exclusive trade to China to the 10th of April, 1831, with 3 years' notice; the government of India being continued in their hands for the same period. Fortunately, however, the trade to India was opened under certain conditions to the public. The principal of these conditions were, that private individuals should trade, directly only, with the presidencies of Calcutta, Madras, and Bombay, and the port of Penang; that the vessels fitted out by them should not be under 350 tons' burden; and that they should abstain, unless permitted by the Company, or the Board of Control, from engaging in the carrying trade of India, or in the trade between India and China. And yet, despite these disadvantages, such is the energy of individual enterprise as compared with monopoly, that the private traders gained an almost immediate ascendancy over the East India Company, and in a very short time more than *trebled* our trade with India!

But besides being injurious to the private trader, and to the public generally, both in India and England, this trade was of no advantage to the East India Company. How indeed, could it be otherwise? A Company that maintained armies and retained tea, that carried a sword in the one hand and a ledger in the other, was a contradiction; and, had she traded with success, would have been a prodigy. It was impossible for her to pay that attention to details that is indispensable to the carrying on of commerce with advantage. She may have gained something by the monopoly of the tea trade, though even that is questionable; but it is admitted on all hands that she lost heavily by her trade to India. When, therefore, the question as to the renewal of the charter came to be discussed in 1832, the Company had no reasonable

objection to urge against their being deprived of the privilege of trading. And the act 8 and 4 Will. 4. c. 85, for continuing the charter till 1854, terminated the Company's commercial character; by enacting, that the Company's trade to China was to cease on the 22d of April, 1854, and that the Company was as soon as possible after that date to dispose of their stocks on hand, and close their commercial business. And the wonderful increase that has since taken place in the trade with the East is the best proof of the sagacity and soundness of the opinions of those by whose efforts the incubus of monopoly was removed.

II. EAST INDIA COMPANY (CONSTITUTION OF).—At present the functions of the East India Company are wholly political. She is said to govern India, with the concurrence and under the supervision of the Board of Control, nearly on the plan laid down in Mr. Pitt's act. But, in point of fact, the government is substantially vested in the latter; the Company's directors acting, except on some rare occasions, rather as a council to the President of the Board of Control, than as exercising an independent, or co-equal authority. All the real and personal property belonging to the Company on the 22d of April, 1854, was vested in the crown, and is held or managed by the Company in trust for the same, subject of course to all claims, debts, contracts, &c., already in existence, or that may hereafter be brought into existence by competent authority. The Company's debts and liabilities are all charged on India. The dividend, which is 104 per cent., is paid in England out of the revenues of India; and provision is made for the establishment of a security fund for its discharge. The dividend may be redeemed by Parliament, on payment of £200 for £100 stock, any time after April, 1874; but it was provided, in the event of the Company being deprived of the government of India in 1854, that they might claim redemption of the dividend any time thereafter, upon three years' notice.—(3 & 4 Will. 4. c. 85.)—J. R. McCULLOCH.

East, (Germ. Ost.) The point of the horizon at which the sun rises at the time of the equinoxes; or the point determined by a perpendicular to the meridian drawn toward the quarter of sunrise. The east is one of the four cardinal points of the compass.

East India. See INDIA.

East River communicates with the Hudson in the Bay of New York, and is formed by the narrowing of Long Island Sound, which opens with a broad mouth at the eastern end into, and receives a strong impulse from the tides in the Atlantic. This channel is so called in contradistinction to the North River (the Hudson). As the Sound contracts, to the west of the broad expanse in front of New Haven, and forms what is called *East River*, the oceanic currents act with a force that increases with the diminishing width of the stream; and this causes higher tides here than at any other place around the island, arriving at New York about three quarters of an hour earlier than those by the Narrows. This current drives upward along the east shore of the Hudson many miles in advance of the other, on the west; and thus the Hudson has two tides, which hardly unite their action till they have passed Tappan and Haverstraw bays, Horrl-Gate, Hell-Gate, or Hurl-Gate, a dangerous and very crooked strait in East River, eight miles N. E. of New York, was called by the Dutch *Horrl-Gatt*, signifying *whirlpool*. The strait is formed by projecting rocks that confine the water to a narrow and crooked channel, occasioning strong eddy currents. There is a sufficient depth of water for any vessels, but the passage of large ships should only be attempted with skillful pilots.—E. A.

Eau de Cologne. This well-known perfume is a solution of different volatile oils in pure strong spirit. The principal condition for the preparation of a fine water is the employment of a spirit quite devoid

of fual-oil (oil of grain), and of all foreign odor. In respect to the proportion and kind of oils employed, we have numerous formulae. It is of importance that these oils, which are usually purchased of the druggists of the south of France, should be of the finest quality; and that no oil should be used in sufficient quantity to allow of its peculiar odor being recognizable in the mixture. The oils are to be dissolved in spirit, and the mixture allowed to stand for some weeks (or still better for some months), to improve its odor. Distillation does not affect this; on the contrary a fresh distilled water requires to be kept a much longer time. Distillation is indeed objectionable; for on account of the great volatility of the spirit, the oils in part remain behind in the still. Distillation can improve the odor only when the less volatile oil has been used in too great a quantity, and we wish to obtain a better proportion. Before all things, we should employ a pure, old, strong spirit, and not too much of, nor too strongly smelling oil. The different sorts of volatile oil which are obtained from varieties of citrons, oranges, and lemons, in different states of maturity, are the most important; and, therefore, it is most important to ascertain their purity and goodness. Forster gives the following formula for the preparation of fine eau de Cologne: Take of rectified spirit 82 per cent., of Tralles (=ap. gr. 0.855), 6 (wine) quarts; essence of orange, essence of bergamot, essence of citron, essence of limette, and essences of petits grains, of each, ʒ ij; essence of cedru, essence of sedrat essence de Portugal, and essence de neroli, of each ʒ ss; oil of rosemary, ʒ ij; and oil of thyme, ʒ j.

Otto gives the following formula for a good eau de Cologne: Rectified spirit of 86 per cent.; of Tralles (=0.846 sp. gr.), 200 (wine) quarts; oil of citrons, ℥ iv; oil of bergamot, ℥ ij; oil of neroli ℥ ℥; oil of lavender, ℥ ss; oil of rosemary, ʒ ℥; and spirit of ammonia, ʒ ss. Mix: don't distill.

This preparation has long possessed great celebrity, in consequence chiefly of the numerous virtues ascribed to it by its vendors; and is resorted to by many votaries of fashion as a panacea against ailments of every kind. It is, however, nothing more than aromatized alcohol, and as such an agreeable companion for the toilet. Numerous fictitious recipes have been offered for preparing eau de Cologne; the following may be reckoned authentic, having been imparted by Farina himself to a friend.

Take 60 gallons of silout brandy; sage, and thyme, each ʒ vi; balm-mint and spearmint, each ʒ xij; calamus aromaticus, ʒ iv; root of angelica, ʒ ij; camphor, ʒ j; petals of roses and violets, each ʒ iv; flowers of lavender, ʒ ij; flowers of orange, ʒ iv; wormwood, ʒ j; nutmegs, cloves, cassia, lignea, and mace, each ʒ iv; 2 oranges and 2 lemons, cut in pieces. Allow the whole to macerate in the spirit during 24 hours, then distill off 40 gallons by the heat of a water bath. Add to the product; essence of lemons, of cedrat, of lula-mint, and of lavender, each ʒ xij; neroli and the essence of the seed of anthos, each ʒ iv; essence of jasmin, ʒ j; of bergamot, ʒ xij. Filter, and preserve for use.

Cadet de Gassicourt has proposed to prepare eau de Cologne by the following recipe: Take alcohol at 32° ℔, 2 quarts; neroli, essence of cedrat, of orange, of lemon, of bergamot, of rosemary, each 24 drops; add ʒ ij of the seeds of lesser cardamoms; distill by the heat of a water bath a pint and a half. When prepared as thus by simple mixture of essences, without distillation, it is never so good. There is a curious contest in Germany concerning the veritable Farina, who makes the celebrated eau de Cologne. The contest was carried even into the Crystal Palace, where there were four John Maria Farinas, all claiming to be the original. It appears that speculation is carried to so high a pitch in Cologne, that any child entitled to the surname of Farina is bargained for as soon as

born, and christened, is even anticipated.

Eau de Indescented, and ro-mastic and bil-remedy in India.

born, and christened Jean Maria. At times this event is even anticipated.

Eau de Luce. A strong solution of ammonia, scented, and rendered milky by the addition of a little mastic and oil of amber. It is considered an effective remedy in India against the bite of poisonous snakes.

Ebony (Ger. *Ebenholz*; Dn. *Ebbenut*; Fr. *Ebène*; It. *Ebano*; Rus. *Ebenovoederewo*; Lat. *Ebenus*), a species of wood brought principally from the East. It is exceedingly hard and heavy, of great durability, susceptible of a very fine polish, and on that account used in mosaic and other inlaid work. There are many species of ebony. The best is that which is jet black, free from veins and rind, very compact, astringent, and of an acrid pungent taste. This species (denominated by botanists *Diospyrus Ebenus*) is found principally in Madagascar, the Mauritius, and Ceylon. The centre only of the tree is said to be valuable. In 1837, 2160 cwt. of ebony, of the estimated value of £1275 were exported from the Mauritius. Besides the black, there are red, green, and yellow ebony; but the latter are not so much esteemed as the former. Cabinet-makers are in the habit of substituting pear-tree and other woods dyed black, in the place of genuine ebony; these however, want its polish and lustre, though they hold glue better. The price of ebony varies in the London market from £5 to £20 a ton. The quantities imported are but inconsiderable.

Ecuador. See EQUADOR.

Eddy (Sax. *ed*, water, and *ea*, backward), is the water of a stream or tide which, in consequence of striking against some obstacle, is thrown backward, and runs in a direction opposite to that of the general current. More frequently, however, the term is used to denote the whirling or circular motion caused by the meeting of two opposite currents; and in this sense it is also applied to a similar motion of atmosphere.

Eel (*Anguilla mænea* of Linnaeus), a fish, the appearance of which is too well known to require any description. It is a native of almost all the waters of Europe, frequenting not only rivers but stagnant pools. Eels are, in many places, extremely abundant, particularly in Holland and Jutland. Several ponds are appropriated in England to the raising of eels; and considerable numbers are taken in the Thames and other rivers. But a large portion of the eels used in England are furnished by Holland. Indeed, very few except Dutch eels are ever seen in London; and even Hampton and Richmond are principally supplied by them. The trade is carried on by Dutch traders, who employ in it several small vessels, by means of which the market is regularly and amply provided for.

Efferescence (Lat. *effervesco*). The escape of gaseous matter from liquids, as in the act of fermentation. All liquids from which bubbles of gas rapidly escape, so as to resemble boiling, are said to efferescence.

Efflorescence (Lat. *effloresco*, I flower). The spontaneous crumbling down of transparent crystals, in consequence of the loss of water.

Eggs (Fr. *Œufs*; Lat. *Ova*), are too well known to require to be described. They differ in size, color, taste, &c., according to the different species of birds that lay them. The eggs of poultry are those most commonly used as food; and form an article of very considerable importance in a commercial point of view. The eggs of plovers are esteemed a great delicacy, and make, indeed, a perpetually recurring dish at fashionable dinners.

Egypt, a country situated at the north-eastern extremity of Africa, between N. lat. 31° 37' and 24° 1', and E. long. 27° 13' and 84° 12'; bounded on the north by the Mediterranean Sea, on the south by Nubia, on the east by Palestine, Arabia, and the Red Sea, and on the west by the Great Desert. The chief

field-produce is wheat (which is more grown than any other kind of corn), barley, several sorts of millet, maize, rice, oats, clover, peas, the sugar-cane, roses, two species of the tobacco-plant, and cotton. The sugar-cane is extensively cultivated, and excellent sugar is manufactured from it. There are fields of roses in the Feiyoum, which supply the market with rose-water. The tobacco produced in Egypt is coarse and strong compared with that which is used by the middle and upper classes, and imported from Syria and Turkey. That of Syria is considered the best. Of textile plants, the principal are hemp, cotton, and flax; and of plants used for dyeing, bastard, saffron, madder, woad, and the indigo-plant. The intoxicating hasheesh, which some smoke in a kind of water-pipe, formed of a cocoa-nut, two tubes, and a bowl, seldom used for any other narcotic, is not, as has been erroneously supposed, opium, but hemp. The effect is most baneful. The leaves of the himb-plant, grown in abundance, are used to tinge, of a bright-red color, the palms of the hands, the soles of the feet, and the nails of both hands and feet, of women and children, the hair of old ladies, and the tails of horses. Indigo is very extensively employed to dye the shirts of the natives, of the poorer classes, and is, when very dark, the color of mourning; therefore women, at funerals, and generally after a death, smear themselves with it. Oil is extracted from the seeds of the cotton-plant, hemp, colewort, the poppy, the castor-oil plant, sesame, and flax. The high, coarse grass, called hal'eh (*Poa cynosuroides*) grows in great quantity in waste places and among ancient ruins.

Mr. Lane (1834) estimates the population of Egypt at less than 2,000,000, and gives the following numbers as nearly those of the several classes of which it is mainly composed:

Moslem Egyptians (fellâhœn or peasants, and townspeople)	1,750,000
Christian Egyptians (Copts)	150,000
Osmans, or Turks	10,000
Syrians	5,000
Greeks	5,000
Armenians	2,000
Jews	5,000

and the remainder, exclusive of the Arabs of the desert, about 70,000.

Sir Gardner Wilkinson (1843) computes the total at about 1,800,000; but Clot-Bey (1840), not always an impartial writer, places it much higher, upward of 3,000,000. The following result of the government census, taken in 1847-8, is remarkable as showing the system of falsifying statistics for state purposes. It is copied from an official return:

Middle Egypt... 591,294	El-Kuseyr..... 8,495

Since the conclusion of the Syrian war, until the present struggle, the navy has been totally inactive. At the former period, it numbered 11 ships of the line, 6 frigates (one moved by steam-power), 5 corvettes, 3 brigs (3 being steamers), and 2 cutters. Some of these were constructed in the naval yard at Alexandria, but the larger number were contracted for in Europe. Great care was bestowed on the formation of the navy, and the establishments connected with it at Alexandria, but the Egyptians do not seem to be a maritime people, or, at any rate, their men-of-war have none of the tautness and neatness of European ships of the class.—E B.

The trade with Europe is carried on through Alexandria. The traffic with the interior of Africa is carried on by means of caravans, which bring, in exchange for European and Egyptian products, ivory, gold-dust,

skins, wool, gum, ostrich-feathers, and metals. The chief commercial relations with Arabia and India are carried on by Cosseir and Suez. Since the establishment of regular steam-packets in the Mediterranean and the Indian Ocean, Egypt has become the route to India for all the correspondence of Europe, as well as for the greater portion of travelers. The principal means of communication at present are the Nile, which is traversed by steam-packets, and the canals, many of which have been repaired by Mehemet Ali; but even the best of them are often unnavigable during a great part of the year. The route from Cairo to Suez (180 miles) is traversed by horses and vans, and the mail is conveyed in 19 hours. The project of uniting the Mediterranean with the Red Sea, by re-opening the ancient canal, has been recently revived, but it is surrounded with difficulties, and not likely to be carried into effect. The more practicable and safe plan of a railroad communication between Cairo and Suez has been resolved on, and a portion of it built. This may again render Egypt the principal entrepôt of commerce between the eastern and the western worlds.

Commerce.—The general commerce of Egypt in 1851, reached a total of 144,609,000 francs, or, in round numbers, \$28,902,000; which shows an increase, when compared with 1841, of 44,000,000 francs, or nearly \$9,000,000.

It is difficult to obtain any accurate returns of the commercial movements of Egypt, except such as are prepared by the foreign consuls residing at the different ports of that country, and transmitted to their respective governments. From such sources the following table is compiled, showing the export trade of Egypt, and vessels employed, during a period of 11 years, ending with 1851:

Years.	Piastres.	Dollars.	Vessels.
1841.....	198,270,150	9,918,507	1,280
1842.....	180,446,600	9,022,330	1,250
1843.....	191,588,400	9,576,930	1,370
1844.....	167,868,490	8,398,421	1,207
1845.....	135,782,200	6,289,110	1,097
1846.....	187,341,080	9,367,054	1,221
1847.....	301,943,800	15,067,175	1,815
1848.....	157,236,546	7,861,827	1,068
1849.....	208,056,282	10,152,811	1,600
1850.....	315,827,800	15,767,880	1,650
1851.....	325,804,695	16,290,234	1,793

The value of the piastre varies. That of Alexandria is reckoned at 5 cents United States' currency; that of Turkey generally is equivalent to 4 cents.

The import trade in 1841, the first year given in the table, reached 187,000,000 piastres—\$9,350,000, and ascended in 1851, the last year, to 230,000,000 piastres, or about \$11,500,000. The articles which diminished in the import returns during the period, were sugar, linens, certain kinds of silks, and rum; and the diminution was about equal to the increased production of those articles in Egypt. The importation increased in woollens, cottons, French silks, and articles of fashion.

The English flag occupies the first rank in the returns from which the preceding figures are taken, though, since the repeal of the navigation laws of Great Britain in 1850, the importations under the flags of other countries of northern Europe have largely increased.

Alexandria.—The trade of this port has increased rapidly since the opening of the canal which communicates between Alexandria and the Nile at Atfeh. This communication has taken away from the ports of Damietta and Rosetta the extensive commerce formerly enjoyed by them, and for which, from their po-

sition on the two mouths of the Nile, they possessed great advantages. The total trade of Alexandria in 1840, amounted in value to \$11,997,145, of which there were for imports \$6,636,980, and for exports \$6,860,165. This trade in 1842 reached in value \$21,000,000, an increase over 1840 of over \$9,000,000. The treaty of 1838, placing foreign commerce on a more secure basis than had previously existed, and the tranquillity which followed the settlement of the difficulties of 1840, were the causes of this great augmentation in the trade of 1842. Among the exports of this year, raw cotton reached in value \$1,800,000, of which Austria received upward of \$1,000,000 in value. The trade of 1843 exhibits a falling off from that of the preceding year, aggregating only (imports and exports united) about \$19,000,000, of which raw cotton reached in value about \$2,000,000. In 1844 the total trade of this port fell again to about \$13,000,000; and in 1846 the totals reached nearly \$18,000,000, of which, for cotton, there were \$2,000,000. In 1849 the foreign trade of Alexandria reached \$16,000,000, of which for imports, there were \$7,500,000, and for exports, \$8,500,000. The raw cotton exported this year reached in quantity 258,000 quintals (the quintal, or cantar, is estimated at 100 lbs.), or 25,800,000 lbs., valued at \$2,775,000. The tranquillity which prevailed in Egypt during the ten years anterior to 1850, was highly favorable to the development of its foreign commerce. The treaty of 1838, guarantying the unrestricted circulation through Egypt of European merchandise, and its freedom from the vexatious taxes to which it was subjected before that period, contributed in like manner to the prosperity of this port in 1850. The total trade exceeded in value \$19,000,000, a figure which it had never before reached, excepting in the year 1842, when the large augmentation was brought about by causes purely accidental. Of this sum, imports reached nearly \$8,000,000, and exports about 11,000,000. Of the latter, raw cotton amounted in quantity to 82,084,500 lbs., and in value to \$4,200,000.

The establishment of a national bank in Alexandria, under the title of Bank of Egypt, has already, though not in operation, commenced a revolution in the ideas of the fellahs, or cultivators of the soil, with respect to money matters. It is well known that the fellahs have hitherto hoarded or buried the cash they have received for their produce. Since they have been paid by drafts on the Bank of Egypt, and they find the mode in which those drafts are cashed is so satisfactory, some of the more wealthy have opened accounts with the bank, and deposited their savings there for safe keeping. Should this practice become general, and the many millions which are known to be hoarded by the fellahs be brought into circulation and laid out in profitable investments, it must produce an enormous effect on the prosperity of the country in general.

It is worthy of notice, that, in the voluminous reports from which the preceding statements of the trade, both of Egypt and its principal port, Alexandria, are extracted, the United States does not once appear. A despatch to the State Department, dated Alexandria, May 1, 1856, states that "the increase in foreign traders is very perceptible, but there are few branches of American houses among them." England, France, and Austria, seem to have been the principal foreign countries which participated in this trade. The total trade of 1851 reached \$29,000,000, and that of 1852 ascended to upward of \$31,000,000, of which a large share is assigned to Turkey and Syria. The quantity of raw cotton exported the latter year was 718,655 quintals, valued at \$6,960,249. The whole of this cotton was sent to England, France, and Austria, in the following proportions: to England, 426,118 quintals; to Austria, 159,300 quintals; and to France, 128,930 quintals. These figures, as well as those cu-

ployed throughout from French office on those of Egypt over, are deemed

* The cantar of Egypt is estimated at 100 pounds.

† The ardeb equals 5 bushels.

During the same year, an English house at Alexandria sent two vessels to New York, and an Austrian house two more to the same destination, loaded chiefly with gums, resins, etc. There is no doubt that a profitable trade might be established between the United States and the port of Alexandria, by sending out such merchandise as usually finds a market in Egypt, and receiving in return the rich and varied exports of that extensive emporium.

Cotton.—The cotton culture of Egypt commenced in 1818, and exportation to England in 1823. The seed is said to have been imported by the pacha "from America, the Mediterranean, and Brazil;" and these different kinds of cotton may, therefore, be met in cultivation. The attempt to cultivate the sea island cotton is pronounced a failure—the quality deteriorating rapidly after the first crop—although the best Egyptian cotton, called *Maha* (so called from Maho-Bey, in whose garden, at Cairo, the plant was first discovered, having, probably, been introduced from the Isle of Bourbon during the French invasion), is ranked next to sea island in length of staple. The comparative tabular statement subjoined, made up from consular returns (the bale being estimated at 300 lbs.), shows the quantities of cotton exported at the port of Alexandria, and the countries to which exported, respectively, during a period of three years. The quantity exported in 1852 is stated to have been as follows: to Great Britain, 57,623,400 lbs.; to France, 12,350,100 lbs.; to Austria, 11,429,700 lbs.; elsewhere, 359,100 lbs.; presenting an aggregate of 81,422,300 lbs., and far exceeding that of either of the three ensuing years, as given in the following table:

POUNDS OF COTTON EXPORTED FROM ALEXANDRIA, 1852—1855.

Countries.	1852.	1854.	1855.
	Pounds.	Pounds.	Pounds.

Total.....	43,885,200	43,546,500	56,874,300

If to the aggregate exported, be added from five to six millions pounds consumed in the country, a liberal estimate of the annual amount of cotton produced in Egypt—between fifty and sixty million pounds—will have been made. The factories established by Mohamed Ali are, it is stated, going rapidly to ruin. The cotton goods manufactured are coarse "capotas," or soldiers' "nizam" uniform. Much cotton is used also in making up divans, the usual furniture in Egypt.—*Com. Relations U. S.* See article ALEXANDRIA.

The Egyptian measures are, the "fitr," or space measured by the extension of the thumb and first finger; the "shibr," or span; the common cubit=22½ inches, the cubit of about 25 inches, used principally for Indian goods, and the cubit of about 26½ inches, used for European cloth. Of the measures of land, the feddan was equal to about one English acre and one tenth; it is now less than an acre. It is divided into "keerats," or 24ths, and consists of 333¼ kasabehs or rods. The kasabeh is 22 "kabalals," and the kabalah, about 6½ inches, or the measure of a man's fist with the thumb erect. The Egyptian league varies in Upper and Lower Egypt, and is stated to be, in the

former, equal to a journey of an hour and a half, and in the latter, to one hour's journey. The "ardeb" is equal to very nearly five bushels, and consists of six "weybehs," and each weybeh of four "rubas."

Weights.—The weights are the "kamshah" (or grain of wheat), the 64th of a "dirhem," and 4th of a "keerat." It is equal to about ½ of an English grain. The "habbeh" (or grain of barley) is the 48th of a dirhem and 3d of a keerat, and=127-128th English grain. The keerat, or carat, is the 24th of a "mitkal;" and=from 2 125-128ths to 3 English grains. The dirhem =47 5-8ths to 48 English grains. The mitkal=weight of a deenar=from 71 7-16ths to 72 English grains. The "wukeeyeh," or ounce=from 571½ to 576 English grains. The "ratl," or pound=from 1 lb. 2 oz. 5½ dwt. to about 1 lb. 2 oz. 8 dwt. troy. The "wukkah," or oke=from 3 lb. 3 oz. 13½ dwt. to 3 lb. 4 oz. troy. The "cantar," or 100 weight=from 98 lbs., less 200 grs., to about 98 lb. avoirdupois.

Money.—European sovereigns and dollars are current in Egypt, the former being now equivalent to about 100 piastres, the latter, if French, to about 20 piastres, and if Spanish (pillar-dollars), to about 22 piastres; but the value of these coins is constantly changing. The Spanish doubloon, and Venetian sequin are also current, and so are Constantinople coins. Of native coin, the "faddah," or para, is equal to 6-25ths of a farthing, and there are pieces of 5, 10, and 20 faddahs. The "kirsh," or Egyptian piastre, contains 40 faddahs, and is equal to 2 and 2-5ths pence. These coins are of silver and copper. Of gold coins, there are the "kheyreeyeh," of 4 piastres, and the kheyreeyeh of 9 piastres (but the value of these coins has recently depreciated), and pieces of 5, 10, 20, and 100 piastres. The "ryal beleda," or native dollar, is equal to 90 paras, but is only a nominal money, as is the "kees," or purse, which contains 500 piastres, and the "khazneh," or treasury of 1,000 purses. For the weights, measures, and money, we are indebted to the *Modern Egyptians*.—E. B. See ALEXANDRIA.

Eider-duck. The species of duck so-called is one of the largest and most valuable of the *Anatide*, and, from certain modifications of the beak and sternum, constitutes the type of a subgenus, called *Somateria*. The common eider (*Somateria mollissima*) frequents, in great numbers, the Orkneys, Hebrides, and Shetland isles. It is defended from the cold of the dreary northern coasts by the development of an unusual quantity of the finest down beneath its dense exterior plumage, which is equally well adapted to form an impenetrable barrier to the wet. The down of the eider constitutes its chief value, as it combines with its peculiar softness, fineness, and lightness, so great a degree of elasticity that the quantity of this material which might be compressed and concealed between two hands will serve to stuff a coverlet. As the female plucks from her own body a quantity of her finest down to line her nest, the Oreadians avail themselves of this instinct, and take an early opportunity to rob the nest of both eggs and down. She then begins to lay afresh, and envelopes her eggs with another layer of down; and if this be removed, the male is said to contribute his own down, when the female can afford no more. Lastly, when the brood of ducklings is hatched, the nest is again visited and

the down removed. Thus a considerable quantity of the valuable material furnished by the eider-duck is obtained independently of that which is plucked from the slaughtered birds. Besides the down and eggs, the slanders turn the skins and flesh of the elders to profit; while these birds cost them no expense, as they feed entirely on sea-weed and other natural productions of the ocean.

Elastic Banda. (*Tissus Elastiques*, Fr.; *Federharszeige*, Germ.) The manufacture of braces and garters, with threads of caoutchouc, either naked or covered, seems to have originated, some time ago, in Vienna, whence it was a few years since imported into Paris, and thence into this country. At first, the pear-shaped bottle of the Indian rubber was cut into long narrow strips by the scissors; a single operative turning off only about 100 yards in a day, by cutting the pear in a spiral direction. He succeeded next in separating with a pair of pinners the several layers of which the bottle was composed. Another mode of obtaining fine threads was to cut them out of a bottle which had been rendered thin by inflation with a forcing pump. All these operations are facilitated by previously steeping the caoutchouc in boiling water, in its moderately inflated state. More recently, machines have been successfully employed for cutting out these filaments, but for this purpose the bottle of caoutchouc is transformed into a disc of equal thickness in all its parts, and perfectly circular. This preliminary operation is executed as follows: 1. The bottle, softened in hot water, is squeezed between the two plates of a press, the neck having been removed beforehand, as useless in this point of view; 2. The bottle is then cut into two equal parts, and is allowed to consolidate by cooling, before subjecting it to the cutting instrument. When the bottle is strong enough, and of variable thickness in its different points, each half is submitted to powerful pressure in a very strong cylindrical mold of metal, into which a metallic plunger descends, which forces the caoutchouc to take the form of a flat cylinder with a circular base. The mold is plunged into hot water during the compression. A stem or rod of iron, which goes across the hollow mold and piston, retains the latter in its place, notwithstanding the resilience of the caoutchouc, when the mold is taken from the press. The mold being then cooled in water, the caoutchouc is withdrawn.

The transformation of the disc of caoutchouc into fine threads is performed by two machines; the first of which cuts it into a ribbon of equal thickness in its whole extent, running in a spiral direction from the circumference to the centre; the second subdivides this ribbon lengthwise into several parallel filaments much narrower but equally thick.—*Ure's Dict.*

Elba, called *Hea* by the Romans, and *Etholia* by the Greeks, an island in the Mediterranean Sea lying off the promontory of Populonium, at equal distances from Corsica and the Italian mainland, though somewhat nearer the latter. Its outline is extremely irregular, and its sides are indented by numerous inlets and arms of the sea, reducing its breadth in some places to about 3 miles. The extreme length of the island is about 18 miles; its extreme breadth about 12 miles; and its area about 150 miles. The whole length of the island is occupied by a mountain range, one peak of which (that of Capanna) rises to the height of about 3500 feet above the sea. The mountains of this range, though themselves barren, inclose valleys of considerable fertility. Vines, olives, and mulberries, grow in large quantities in this island, which also produces wheat, Indian corn, and vegetables in abundance. Some of the wine produced in Elba is of excellent quality, and a considerable quantity of it is annually exported. The smaller domestic animals thrive well and are very numerous in the island; but the larger

kinds, such as oxen and horses, are somewhat scarce. The fisheries off the coast are important.

The iron mines of Elba, in modern, as in ancient times, are extremely valuable. The great facility with which the metal is worked, and the abundance in which it is found, render these mines among the most valuable of their kind in the world. The ore is dug from a hill, 500 feet high and nearly 2 miles in circumference, which is itself almost entirely one mass of ore. When smelted, it is found to contain on an average about 60 per cent. of pure iron. Fuel on the island is very scarce; and the ore is consequently conveyed on shipboard to the adjoining mainland to be smelted. The total quantity of iron ore annually extracted amounts to nearly 20,000 tons, giving employment to 130 miners. The salt mines of Elba are hardly inferior in celebrity to the iron ones. About 4,000,000 pounds are annually produced, giving employment to about 100 workmen. Besides Porto Ferrajo, the capital, and the town of Porto Longone, Elba contains no town of any size or importance. Campo, Capo Liveri, Marciana, and Rlo are mere villages or fishing stations. In ancient history, the name of Elba very rarely occurs; and in modern times it is chiefly memorable as having been the residence of the Emperor Napoleon, after his first abdication, from May 1814 till February 1815. From that time till the present, Elba has been an appanage of the Grand Duchy of Tuscany. Pop. (1854) 21,569.

Elbe (the *Albis* of the ancients), a large river of Germany, which rises in the *Rieser Gebirge*, or Giant's Mountains, between Silesia and Bohemia, and is known at its source by the Slavonic name of *Labbe*. Its principal sources are the White Fountain, at the base of the *Schnee-Kuppe*, and the 11 fountains of the Elbe in the Navarian meadow. To the number of streams which descend into Bohemia from the neighboring mountains it owes its early increase. After its junction with the river Eger, it becomes navigable; and, entering Saxony, it passes successively Dresden, Meissen, Torgau, and Wittenberg. In its course, which is northerly, it receives as tributaries the Muldau and the Saale; and running through the territory of Magdeburg and the duchies of Mecklenburg and Lauenburg, it discharges itself at last into the German Ocean, about 70 miles below Hamburg, after a course of 500 miles. The Elbe has always been an important river in a military point of view. With respect to commerce, it is of inestimable value to the countries of north-west and central Germany, being the channel by which they export their surplus products, and receive their imports from abroad. It gives to Hamburg its command of the navigation far into the interior, although the voyage is difficult on account of the numerous sand-banks with which the estuary and the rivers are encumbered. It communicates with the Havel by the canal of Plauen, in the territory of Magdeburg; and at Hamburg it is connected in like manner with the Trave at Lubeck. It is also joined to the Weser by a canal running between Vegesack and Stade. By the railway from Leitmeritz to Vienna it communicates with the Danube; and the other railways that touch upon other quarters of the river supply channels for distributing merchandise through the various district, which they traverse. About 40 miles from its source, the elevation of the river above the level of the sea, is only 658 feet; at Schandau it is 341 feet; at Dresden, 279 feet; and at Arneburg in Brandenburg, only 178 feet.

Formerly its entrepôts (Pirna, Dresden, and Magdeburg), and 35 tolls, and numerous corporations of privileged watermen, opposed almost insurmountable difficulties to the navigation: the Austrians and the Saxons could alone navigate the Upper Elbe, that is, from Magdeburg to where it ceases to be navigable, and the Prussians and Hamburgers had the sole privilege of navigating the Lower Elbe. But the naviga-

tion of the river was concluded on the bordering states, over, Denmark, Grand Duchy of Mecklenburg, the principalities of Anhalt, the principle of chart, to whatever with his own voyage were reduced to 3 upon goods of the which are paid, either for the ship was bound to be passed through the every thing injur. But notwithstanding still exposed to Wood, stones, principal articles the salt, and colonies which are carried the duties are led to the abolishment ordinary port charges.

El Dorado

name given by the Spaniards, supposed in the interior of South America, and Amazon, and gold and all manner of Spanish conquests aggregated accounts newly acquired territory. A new region of wealth and splendor for the purpose such attempts persistence continued of last century.

language of poet land of boundless Elysium or the M article on "Sir the *Edin. Review* speculations the subject.

line engraving, electro-copper of familiar process, lines of the engraving, the deposit distinctly—so compared with can produce. In the processes, those that a large copied. The plate of copper, and electro deposit, from the plate, pro and cavities in film is employed turn, immersed a second deposit to continue undisturbed; and this film, is seen to be grained plate firm semblance, that an inked impression from one print experienced judgment all respects.

tion of the river was definitely regulated by a convention concluded on the 18th June, 1831, between all the bordering states, viz., Austria, Saxony, Prussia, Hanover, Denmark (for Holstein and Lauenburg), the grand duchy of Mecklenburg-Schwerin, and the three principalities of Anhalt. This convention established the principle of free navigation, allowing every merchant, to whatever bordering state he might belong, with his own vessel and crew to navigate the whole course of the river without interruption; the 35 tolls were reduced to 14; the heavy dues which were levied upon goods of the first necessity were reduced to those which are paid, one for the cargo (*Elbe Toll*), and the other for the ship (*Recognitionengebühr*); and each state was bound to watch over the portion of river which passed through their territories, and to preserve it from every thing injurious to the commerce or navigation. But notwithstanding these regulations, merchants are still exposed to vexatious burdens and interruptions. Wood, stones, fruits, and earthenware, are the principal articles that are brought down the Elbe. Corn, salt, and colonial produce are the principal articles which are carried up, and on these the greater part of the duties are levied. For a later ordinance relating to the abolishment of all tolls on the Elbe except the ordinary port charges, see article HAMBURG.

Ei Dorado (Span. *the golden region*). The name given by the Spaniards to an imaginary country, supposed in the 16th century to be situated in the interior of South America, between the Rivers Orinoco and Amazon, and, as the name implied, abounding in gold and all manner of precious stones. After the Spanish conquest of Mexico and Peru, the most exaggerated accounts of the wealth and riches of the newly acquired territory were circulated and believed. A new region was fabled to exist far surpassing the wealth and splendor of Peru; expeditions were fitted out for the purpose of discovering it; and though all such attempts proved abortive, the rumors of its existence continued to be believed down to the beginning of last century. The term has now passed into the language of poetry, in which it is used to express a land of boundless wealth and felicity, like the ancient Elysium or the Mohammedan Paradise. See a learned article on "Sir Walter Raleigh," in vol. lxxii., of the *Edin. Review*, which contains a *résumé* of all the speculations that have been entertained upon this subject.

Electrography. The copying of an exquisite line engraving, from a copper or steel plate to an electro-copper deposit, although now become a very familiar process, is really a wonderful one; for, let the lines of the engraving be as fine and minute as they may, the deposited atoms of copper mark them all distinctly—so infinitely small is each atom or particle compared with any magnitude which human hands can produce. Like many other wonderful and beautiful processes, this is a very simple one. Let us suppose that a large steel or copper engraving is to be so copied. The plate is immersed in a chemical solution of copper, and a thick film is precipitated on it by electro deposit. This film may be easily loosened from the plate, and its surface then presents a reverse to the plate, protuberances instead of engraved lines, and cavities instead of plain or raised portions. The film is employed as a sort of mold; for it is in its turn, immersed in the solution, and made the basis for a second deposition. This second deposition is allowed to continue until a plate as thick as the original is produced; and this plate, when separated from its parent film, is seen to be an exact counterpart of the engraved plate first operated upon. So perfect is the resemblance, that, if the electro-plate be made with care, an inked impression printed from it can be detected from one printed from the original plate only by an experienced judge; to ordinary eyes they are equal in all respects.

To M. Jacobi—almost simultaneously with Mr. Spencer—we are indebted for one of the simplest and most elegant applications of electricity—the galvanoplastic art, or Volatypé. In this, advantage is taken of the perfectly metallic state in which the base of a metallic salt is deposited at the negative pole of a voltaic combination. In the case, for example, of the decomposition of sulphate of copper, the sulphuric acid unites with the positive wire, or remains unexpanded, while the metallic copper is slowly and homogeneously deposited on the surface of any object (rendered conducting by the application of black lead or otherwise), of which it forms a perfect mold, from which a fresh cast or *fac-simile* in metal of the original object may be obtained by a repetition of the process. To see the veins of a leaf, or the delicate wing of an insect thus metallized, is certainly an astonishing thing; and the applications to the useful arts are far too numerous to be noticed here. Daniel's invention of the Constant Battery evidently suggested the Volatypé.

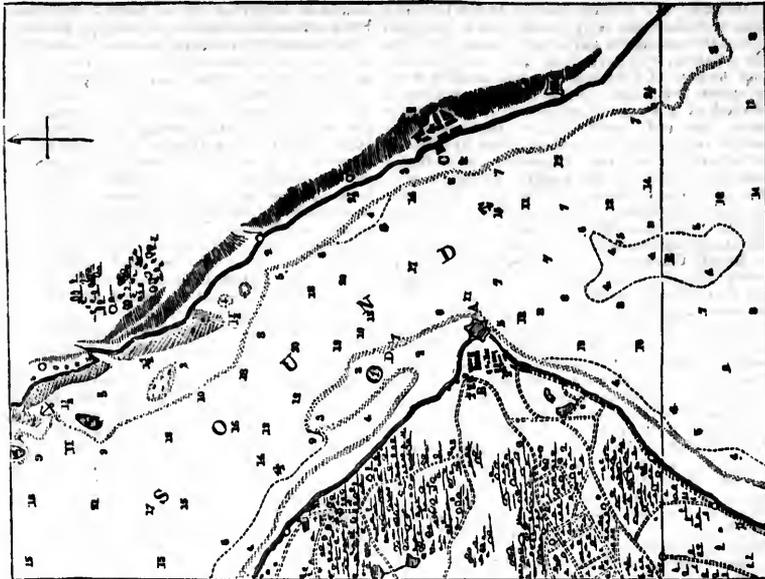

Elemi, a resin obtained from the *Amyris elemifera*, a tree growing in different parts of America, Turkey, etc. It is obtained by wounding the bark in dry weather, the juice being left to thicken in the sun. It is of a pale yellow color, semi-transparent—at first softish, but it hardens by keeping. Its taste is slightly bitter and warm. Its smell, which is, at first, strong and fragrant, gradually diminishes. It used to be imported in long roundish cakes, wrapped in flag-leaves, but it is now usually imported in mats and chests.—THOMSON'S *Chemistry*.

Elixir (Arab), a term applied in old pharmacy to certain essences or tinctures; a mixture of an aromatic tincture with sulphuric acid was called *elixir of vitriol*. The alchemists applied the term *elixir* to various solutions employed in the art of transmutation.

Ell (Lat. *Ulna*), a measure used chiefly for cloth, and varying in length in different countries. The English and Flemish ells were those most in use in Great Britain. The English ell is 45 inches, while the Flemish ell is only 27 inches or $\frac{3}{4}$ of a yard. In Scotland the ell is 37 1-5 English inches.

Elm (*Ulmus*), a forest tree of which there are several varieties. It attains to a great size, and lives to a great age. Its trunk is often rugged and crooked, and it is of slow growth. The color of the heart-wood of elm is generally darker than that of oak, and of a redder brown. The sap-wood is of a yellowish or brownish white, with pores inclined to red. It is in general porous and cross-grained, sometimes coarsely-grained, and has no large saps. It has a peculiar odor. It twists and warps much in drying, and shrinks very much both in length and breadth. It is difficult to work, but is not liable to split, and bears the driving of bolts and nails better than any other timber. In Scotland, chairs and other articles of household furniture are frequently made of elm wood; but in England, where the wood is inferior, it is chiefly used in the manufacture of coffins, casks, pumps, pipes, etc. It is appropriated to these purposes because of its great durability in water, which also occasions its extensive use as piles, and planking for wet foundations. The naves of wheels are frequently made of elm; those of the heavy wagons and drays are made of oak, which supports a heavier weight, but does not hold the spokes so firmly. Elm is said to bear transplanting better than any other large tree.—TREDGOLD'S *Principles of Carpentry*.

The wood of the *Ulmus Americana*, like that of the European elm, is of a dark brown color, and is liable to decay when exposed to the alternations of moisture and dryness; and when cut transversely or obliquely to the longitudinal fibres, it exhibits the same numerous and fine undulations; but it splits more easily and has less compactness, hardness, and strength—weighing, when perfectly dry, only 33 pounds to a

When a pilot is taken on board at Dragoe to carry a ship to Eslineur, the charge is the same as that given under the first head of the above column. (*Archives de Commerce*, tome II, p. 145.) The *Moneys, Weights, and Measures* of Eslineur are the same as those of Copenhagen (which see), except that the rixdollar is divided into 4 *orts* instead of 6 *marcs*: thus 24 skillings make 1 *ort*; and 4 *orts* 1 rixdollar. The Sound duties are, however, levied and paid in specie rixdollars of 48 *stivers*, $\frac{9}{16}$ such specie rixdollars constituting 1 *marc* fine silver, Cologne weight. Taking silver at 5s. 2d. an ounce, the value of the specie rixdollar is 4s. 6 $\frac{1}{2}$ d., and taking it at 5s. an ounce, it is worth 52 7d., or 4s. 4 $\frac{1}{2}$ d. nearly. In either case the value of the silver may be taken at 1:1d. See SOUND DUKES.

Small Enbrant. This name, which seems to mean "shaded enamel," has been given by the Baron du Tremblay to a manufacture by which articles are produced, remarkable alike for cheapness, for novel and agreeable effect, and for the ingenuity of the process whereby they are produced. It consists in flooding colored but transparent glazes over designs stamped upon the surfaces of porcelain vessels. A plain surface is thus produced, in which the cavities of the stamped design appear as shadows of various depths—the parts in highest relief coming nearest to the surface of the glaze, and thus having the effect of the lights of a picture. It has been said that "perhaps there is no other process in the ceramic art by which, at so cheap a rate, designs of high artistic merit can be reproduced in the most harmonious tinting, for dessert or table services, and for other useful domestic purposes."

Embalming (Lat. *balsamum*, balm), a process adopted by the ancient Egyptians, chiefly for the preservation of dead bodies from putrefaction. The term is derived from the use of balsamic substances in the operation; in addition to these, saline substances and tanning materials seem also to have been used.

Embargo, a restraint or prohibition imposed by the public authorities of a country on merchant vessels or other ships, to prevent their leaving its ports. Embargoes are usually imposed only in time of war, or in apprehension of an invasion; in which cases the government employs the ships under embargo in armaments, expeditions, and transportation of troops, etc. When it is found necessary to stop the communication of intelligence between any two places, an embargo is laid upon all ships, both foreign and under the national flag. In England, this power is invested in the crown, but it is rarely exercised except in extreme cases, and sometimes as a prelude to war. The most memorable instances of embargo were those for the prevention of corn going out of the kingdom in 1766; and for the detention of all Russian, Danish, and Swedish ships in the several ports of the kingdom, owing to the Armed Neutrality, January 14, 1801. See ARMED NEUTRALITY.

Embargo in the United States.—Embargo on all vessels in the ports of the United States, passed by Congress with reference to the quarrel with Great Britain after the attack on the United States' frigate *Chesapeake*, 1807. Repealed, and non-intercourse act passed, 1809. Embargo again laid for 90 days, April, 1812. War declared June 19, 1812. An insurance against loss by reason of the acts of one's own government, as an arrest or embargo, is valid. There is no distinction on this point between a foreign and domestic embargo; and if the embargo intervene after the commencement of the risk, it suspends, but does not dissolve, the contract of insurance, and the insured may abandon and claim a total loss. The same principle is incorporated into the new French commercial code, and it pervades universally the law of insurance. It is no objection to the right of recovery by the insured, that the loss happened by the act of the government of his own country, though he and the

insurer are subjects of different states.—Kent's *Com. See also Panson's on Mercantile Contracts*, p. 366.

Embassador, or Ambassador, a word of disputed origin, but probably adopted into the English language from the French, means, in its general sense, a minister authorized by any state to represent it in some other. In its distinctive sense, as indicating a particular kind of minister so appointed, it means the highest class; and by authority as well as practice, there are states which may be represented at others; yet are understood not to be entitled to appoint so high a representative as an ambassador. Messages require to be interchanged by all moderately civilized nations, unless those which, like the Chinese or the Japanese, peculiarly isolate themselves. Hence such messages, and the manner in which they were sent and received, are familiar occurrences in all histories. Some understanding that the persons who undertook such a function should enjoy freedom and safety in the state to which they were sent was absolutely necessary for its performance. The Romans adopted strict rules for the safety of ambassadors; but the less definite provisions of other nations were liable to be affected by momentary impulses, and many incidents of ancient warfare arose out of insults or injuries committed on ambassadors. It was on the ground of an insult offered to his ambassadors that Alexander destroyed Tyre. The Persian invasions of Greece were stimulated by the slaughter of the ambassadors of Darius—who, however, demanding earth and water as tokens of dependence, were rather messengers of hostility than ambassadors, in any thing like the modern sense of the term. Ambassadors now communicate privately with sovereigns or official persons, not with legislative bodies. In Greece, however, ambassadors sometimes pleaded the cause of their state in the public assemblies, and in Rome they were formally received by the senate. The *legatus* of the Romans answered pretty nearly to our ambassador extraordinary; but the term was also used to mean another and totally different officer who accompanied the consul or governor of a province, and was more like a colonial secretary. It became the practice to give honorary legations of this kind on account of the privileges which they conferred on the holder in the province to which he was accredited. There is, however, a distinction of a generic and very characteristic kind between the ambassador of modern diplomacy and any ancient representatives of states. The ambassador of old was chosen for a particular message or negotiation, and a permanent resident representative of one state within another was unknown, at least as a system. It is not yet intelligible to nations beyond the circle of European diplomacy. The Turks had the inveterate practice, on going to war with a state, of committing its representative to the seven towers; and though the reason assigned for the practice was the safety of the person of the ambassador from outrage, even this, if it were sincere, showed that the feelings of hatred indulged against a member of a hostile state would break out too strongly to be controlled even by that despotic government. The Chinese, and their neighbors nearer Hindostan, can look on an ambassador or diplomatic agent as merely a dignified spy, to whose presence nothing but necessity compels them to submit. Nor are they entirely wrong, since the European embassies may be counted a mutually tolerated system of espionage. Even Wickefort calls the ambassador an honorable spy, protected by the law of nations; and La Bruyère says epigrammatically, that the ambassador's function is to cheat without being cheated. The understanding that an ambassador was a person ever ready to do whatever he could with safety to the advantage of his own country, and the injury of that to which he was accredited, became a standing object of sarcasm with the wits of the seventeenth century. when asked to write something in an album at Augsburg, could not resist a sarcasm on the same subject, and spoke of an ambassador as a person sent abroad to lie for the good of his country. In its English form, his apothegm generally involves a pun or equivocal in the words "lie abroad," of which the original Latin is, however, not susceptible. Scioppius published it as a declaration of the morality of English diplomacy, and brought Wotton under temporary disgrace with King James; to whom the jest seemed the more dangerous that it announced that false and treacherous system of diplomacy on which he, with most of the sovereigns of the age, acted when it was safe to do so.

Permanent embassies, with the eminent personal privileges conceded to ambassadors, have existed in feudal Europe from an early time. To find the origin of an institution seemingly so much at variance with the selfish and ravenous national habits am'd which arose, we must look to the peculiar sacredness claimed for their persons by the great community of European monarchs. The privileges of the ambassador did not arise from principles of jurisprudence founded on general public utility, but from the practice of the sovereign investing his representative with his own sacredness, and the acknowledgment on the part of the brother sovereign of the sufficiency of the investiture. Thus in ages when international law was rude and little respected, ambassadors claimed privileges which would in the present day be deemed preposterous; such as total exemption from liability to the laws, civil or criminal, of the country to which they were accredited, and the right to have their official places of residence respected, as sanctuaries for criminals fleeing from justice. Ambassadors of old, in fact, thus received concessions which, though claimed by them as belonging properly to their masters as sovereign princes, and descending to themselves only as substitutes, would not practically have been enjoyed by sovereign princes though theoretically conceded to them. The advantage obtained over a state by seizing the person of the sovereign, would have rendered it unsafe for the principal to trust to privileges which, in the less available person of his representative, were scrupulously respected.

It has always been difficult in countries not despotic to preserve the sacredness of embassies when circumstances have made them offensive to the people. Thus it was difficult to keep Gondomar the celebrated Spanish ambassador in James the First's reign from violence by the London mob for introducing sedan-chairs, which they called a device for enslaving Englishmen and making them do the work of beasts. In the anti-Popery riots of 1780 the chapels of the Bavarian and Sardinian embassies were burned. It has ever been usual to exact high satisfaction for injuries offered to ambassadors, and despotic courts have had no difficulty in conceding the demand where this was rendered prudent by the power of the offended party. Diplomatic difficulties of a serious kind have often occurred, however, in constitutional countries where the asserted privileges of the foreign ambassador were found to clash with the undoubted rights of the home citizen. In 1668 the Portuguese minister was imprisoned for debt in Holland, and in 1708 a similar event produced a serious diplomatic difficulty in England. The Russian ambassador, having had his audience of leave, was arrested for debt by some tradesmen in the open streets of London. Deeming that he was attacked by braves, he defended himself, and was not secured without suffering much violence and indignity. The Czar immediately demanded the infliction of capital punishment on those who had been guilty of the outrage. Much parade was made about instituting prosecutions against all the parties concerned in the affair; but it was impossible for the government ultimately to treat it otherwise than as a matter for which unfortunately the law made no provision. All that could be

done was to pass an act to remedy the defect; and to soothe the Czar its preamble denounced in very angry terms the unparalleled wickedness of those turbulent and disorderly persons who had outrageously insulted the person of his excellency the ambassador extraordinary of his Czarish majesty, emperor of Great Russia, to whom a copy of the act was sent with distinguished pomp. The diplomatic body in general, discontented with the haughty tone of the English court, took up the question. When the bill was passing they objected to some parts of it, and particularly to a condition of the protection of ambassadors' retinues, that their names should be recorded with the Secretary of State and the sheriffs of London; but Parliament, then exulting in the continental triumphs of Marlborough, received their demands with haughty silence.

It has been usual since the Congress of Vienna to divide representatives into three great classes—ambassadors, envoys, and residents or *chargés des affaires*. The first and second are accredited from the head of the government, and communicate with the head; the third class have instructions from the foreign department of their own government, and communicate with that of the state they are sent to. The term ambassador extraordinary having been applied to those sent on temporary missions of high importance, the term ambassadors at the courts of the great powers, as it was deemed desirable that no diplomatic rank should be deemed higher than theirs.

The custom of admitting resident ministers at each sovereign's court, was an important improvement in the security and facility of national intercourse; and this led to the settlement of a great question, which was very frequently discussed in the 15th and 16th centuries, concerning the inviolability of ambassadors. It became at last a definite principle of public law, that ambassadors were exempted from all local jurisdiction, civil and criminal; though Lord Coke considered the law in his day to be, that if an ambassador committed any crime which was not merely *malum prohibitum*, he lost his privileged dignity as an ambassador, and might be punished as any other private alien, and that he was even bound to answer civilly for his contracts that were good, *jure gentium*.—KENT'S *Com.*, vol. 1, p. 15.

It sometimes becomes a grave question, in national discussions, how far the sovereign is bound by the act of his minister. This will depend upon the nature and terms of his authority. It is now the usual course for every government to reserve to itself the right to ratify or dissent from the treaty agreed to by its ambassador. A general letter of credence is the ordinary letter of attorney, or credential of the minister; and it is not understood to confer a power upon the minister to bind his sovereign conclusively. To do so important an act would require, at least, a distinct and special power, containing an express authority to bind the principal definitely, without the right of review, or the necessity of ratification on his part. This is not the ordinary or prudent course of business. Ministers always act under instructions which are confidential, and which, it is admitted, they are not bound to disclose; and it is a well-grounded custom, as Vattel observes, that any engagement which the minister shall enter into, is of no force among sovereigns, unless ratified by his principal. This is now the usage, although the treaty may have been signed by plenipotentiaries.—KENT'S *Com.*, vol. 1, p. 48.

A safe conduct or passport contains a pledge of the public faith, that it shall be duly respected, and the observance of this duty is essential to the character of the government which grants it. The statute law of the United States has provided, in furtherance of the general sanction of public law, that if any person shall violate any safe conduct or passport, granted under the authority of the United States, he shall, on con-

viction, be imprisoned not exceeding 3 years, and fined at the discretion of the court.

The same punishment is inflicted upon those persons who infringe the law of nations, by offering violence to the persons of ambassadors and other public ministers, or by being concerned in prosecuting or arresting them or their domestic servants. This is an offense highly injurious to a free and liberal communication between different governments, and mischievous in its consequences to the dignity and well-being of the nation. It tends to provoke the resentment of the sovereign whom the ambassador represents, and to bring upon the state the calamities of war. The English Parliament, under an impression of the danger to the community from violation of the rights of embassy, and urged by the spur of a particular occasion, carried the provisions of the statute of 7 Anne, c. 12, to a dangerous extent. That statute prostrated all the safeguards to life, liberty, and property, which the wisdom of the English common law had established. It declared that any person convicted of suing out or executing civil process, upon an ambassador or his domestic servants, by the oath of the party, or of one witness, before the lord chancellor and the two chief justices, or any two of them, might have such penalties and corporeal punishments inflicted upon him as the judges should think fit. The preamble to the statute contains a special and inflamed recital of the breach of the law of nations which produced it, by the arrest of the Russian minister.

The Congress of the United States, during the American war, discovered great solicitude to maintain inviolate the obligations of the law of nations, and to have infractions of it punished in the only way that was then lawful—by the exercise of the authority of the legislatures of the several States. They recommended to the States to provide expeditious, exemplary, and adequate punishment for the violation of safe conducts or passports, granted under the authority of Congress, to the subjects of a foreign power in time of war; and for the commission of acts of hostility against persons in amity or league with the United States; and for the infractions of treaties and conventions to which the United States were a party; and for infractions of immunities of ambassadors and other public ministers.—*KENT'S Com.*, vol. 1, p. 186.

A marriage, celebrated in any given place, must be celebrated according to the law of the place, and by a person whom the laws designate, unless the person by whom, or the premises in which, it is celebrated, possess the privileges of extraterritoriality. Therefore it may be, according to the opinion of Lord Stowell, that the presence of a foreign sovereign sojourning in a friendly country, or that of his minister plenipotentiary, or the act of a clergyman in the chapel or hotel of such sovereign or his ambassador, may give legality to marriage between subjects of his, or members of his suite. According to the American view, the courtesy between the United States and foreign nations, in mutually exempting from duty articles imported by certain of their public officers resident abroad, does not extend beyond ministers or *chargés des affaires*, representing their respective governments, and clothed with diplomatic powers and privileges, and does not comprehend attachés or persons belonging to the minister's suite, nor consular officers.—*Manual for Consuls U. S.*, pp. 238, 275.

From the moment a public minister enters the territory of the state to which he is sent, during the time of his residence, and until he leaves the country, he is entitled to an entire exemption from the local jurisdiction, both civil and criminal. Representing the rights, interests, and dignity of the sovereign or state by whom he is delegated, his person is sacred and inviolable. To give a more lively idea of this complete exemption from the local jurisdiction, the fiction of extraterritoriality has been invented, by which the

minister, though actually in a foreign country, is supposed still to remain within the territory of his own sovereign. He continues still subject to the laws of his own country, which govern his personal status and rights of property, whether derived from contract, inheritance, or testament. His children born abroad are considered as natives. This exemption from the local laws and jurisdiction is founded upon mutual utility, growing out of the necessity that public ministers should be entirely independent of the local authority, in order to fulfill the duties of their mission. The act of sending the minister, on the one hand, and of receiving him, on the other, amounts to a tacit compact between the two States, that he shall be subject only to the authority of his own nation. The passports or safe conducts granted by his own government, in time of peace, or by the government to which he is sent, in time of war, are sufficient evidence of his public character for this purpose.—*WHEATON'S International Law*, p. 283.

Embezzlement, in law, is a felony, consisting of the same class of acts which would in any other case amount to larceny, when committed by one employed as a clerk or servant, and by virtue of his office, on the goods and chattels of his employer.

Embezzlement by Seamen.—Mariners are bound to contribute out of their wages for embezzlements of the cargo, or injuries produced by the misconduct of any of the crew. But the circumstances must be such as to fix the wrong upon some of the crew; and then, if the individual be unknown, those of the crew upon whom the presumption of guilt rests, stand as sureties for each other, and they must contribute ratably to the loss. Some of the cases in the books have established a general contribution from all the crew for such embezzlement, even when some of them were in a situation to repel every presumption of guilt; but neither public policy nor principles of justice extend the contribution or forfeiture of wages for such embezzlements, beyond the parties immediately *in delicto*.—*KENT'S Com.*, vol. III, sect. 252.

As carriers by water were liable at common law to the same extent as land carriers, and as their responsibility was more extensive, and their risk greater, from the facilities for the commission of acts of fraud and violence upon the water, it was deemed in England a proper case for legislative interference, to a guarded and limited extent. The statute of 7 George II., ch. 15, and 26 George III., ch. 86, and 53 George III., ch. 159, exempted owners of vessels from responsibility, as common carriers, for losses by fire, and provided further that the owner should not be liable for the loss of gold, silver, diamonds, watches, jewels, or precious stones, by robbery or embezzlement, unless the shipper inserted in the bill of lading, or otherwise declared in writing to the master or owner of the vessel, the nature, quality and value of the articles; nor should he be liable for embezzlements, or loss or damage to the goods arising from any act or neglect, without his fault or privity, beyond the value of the ship and freight.—*KENT'S Com.*, vol. II., p. 789.

Embossing, the forming of works in relief upon any substance, whether by cutting, stamping, casting, or any other method. In sculpture particularly, according as the figures are more or less prominent, they are said to be in alto, mezzo, or basso-relievo; or high, intermediate, or low relief.

Embossing of Leather. Beautiful ornaments in basso-relievo for decorating the exteriors or interiors of buildings, medallions, picture-frames, cabinet work, etc., have been recently made by the pressure of metallic blocks and dies, for which invention a patent was obtained in June, 1839, by M. Claude Schroth. The dies are made of type-metal, or of the fusible alloy with bismuth, called d'Arce's. The leather is beaten

soft in water, then wrung, pressed, rolled and felled as it were, by working it with the hands till it becomes thicker, and quite supple. In this state it is laid on the mold, and forced into all its cavities by means of a wooden, bone, or copper tool. In other cases the embossing is performed by the force of a press. The leather, when it has become dry, is easily taken off of the mold, however deeply it may be inserted into its crevices, by virtue of its elasticity. A full detail of all the processes is given in NEWTON'S *Journal*, vol. xi., p. 122.

Embossing Wood (*Rossage*, Fr.; *Erhabenheit*, Ger.), raised figures upon wood, such as are employed in picture-frames and other articles of ornamental cabinet work, are usually produced by means of carving, or by casting the pattern in plaster of Paris or other composition, and cementing or otherwise fixing it on the surface of the wood. The former mode is expensive; the latter is inapplicable on many occasions. The invention of Mr. Streaker may be used either by itself, or in aid of carving; and depends on the fact, that if a depression be made by a blunt instrument on the surface of the wood, such depressed part will again rise to its original level by subsequent immersion in the water. The wood to be ornamented having been first worked out to its proposed shape, is in a state to receive the drawing of the pattern; this being put on, a blunt steel tool, or burnisher, or die, is to be applied successively to all those parts of the pattern intended to be in relief, and, at the same time, is to be driven very cautiously, without breaking the grain of the wood, till the depth of the depression is equal to the intended prominence of the figure. The ground is then to be reduced by planing or filing to the level of the depressed part; after which, the piece of wood being placed in water, either hot or cold, the part previously depressed will rise to its former height, and will then form an embossed pattern, which may be finished by the usual operations of carving.

Embouchure (Fr.), signifies the mouth of a river: it is used also for the mouth-piece of a musical instrument.

Embroidering Machine. (*Machine à broder*, Fr.; *Stückmaschine*, Ger.) This art has been till of late merely a handicraft employment, cultivated on account of its elegance by ladies of rank. But a few years ago M. Heilmann, of Mulhouse, invented a machine of a most ingenious kind, which enables a female to embroider any design with 80 or 100 needles as accurately and expeditiously as she formerly could do with one. A brief account of this remarkable invention will, therefore, be acceptable to many readers. It was displayed at the national exposition of the products of industry in Paris for 1834, and was unquestionably the object which stood highest in public esteem; for whether at rest or in motion, it was always surrounded with a crowd of curious visitors, admiring the figures which it had formed, or inspecting its movements and investigating its mechanism. Iso needles were occupied in copying the same pattern with perfect regularity, all set in motion by one person.—*Ure's Dictionary of Arts.*

Embroidery is the name given to the art of working figures on stuffs or muslin with a needle and thread. All embroidery may be divided into two sorts, embroidery on *stuffs* and on *muslin*: the former is used chiefly in church vestments, housings, stand ards, articles of furniture, &c., and is executed with silk, cotton, wool, gold and silver threads, and sometimes ornamented with spangles, real or mock pearls, precious or imitation stones, &c. The latter is employed mostly in articles of female apparel, as caps, collars, &c., and is performed only with cotton. In Germany this division is indicated by the expression *weisse* (white or muslin), and *bunte Stickerei* (colored or cloth) embroidery. The embroidery of *stuffs* is per-

formed on a kind of loom or frame; that of *muslin* by stretching it on a pattern already designed. The modes of embroidering stuffs or muslins with the common needle are extremely various; but a minute description of these processes would be as difficult as it would be uninteresting to the general reader. They consist for the most part of a combination of ordinary *stitches*; but no limit can be assigned to their number or variety. The art of embroidery was well known to the ancients. As early as the time of Moses we find it practiced successfully by the Hebrews; and long before the Trojan war the women of Sidon had acquired celebrity for their skill in embroidery. At a later period, this art was introduced into Greece, probably by the Phrygians (by some considered as the inventors); and to such a degree of skill did the Grecian women attain in it, that their performances were said to rival the finest paintings. In our own times, the art of embroidery has been cultivated with great success, more especially in Germany and France; and though for a long period it was practiced only by the ladies of these countries as an elegant accomplishment, it is now regarded as a staple of traffic, and furnishes employment for a large portion of the population. In England also it appears to have taken deep root, as it now forms an accomplishment of which almost every lady is in possession. About seven years ago a great impetus was given to the cultivation of this art, both on the Continent and in England, by the invention of a machine which enables a female to execute the most complex patterns with 130 needles, all in motion at once, as accurately as she could formerly do with one. But as no account of this remarkable invention which we might give could be intelligible without the aid of illustrations, which would be out of place in this work, we must refer the reader to Dr. Ure's *Dictionary of Arts*, &c., for full information respecting it. One such machine, with 130 needles, is estimated to perform daily the work of 15 hand embroiderers employed in the ordinary way. Many of them are now mounted in Germany, France, and Switzerland; and in Manchester there is one factory where they do beautiful work. See the *Art of Needlework*, edited by the Countess of Wilton. London, 1840.—BUANDE, *Ency.*

There is one branch of manufacture connected with cotton embroideries to which it would be wrong not to particularly allude, and that is the embroidering of muslins, better known under the common designation of "sewed muslins." This is comparatively a new manufacture, having only being first started in Scotland about the year 1825. At that period there were only two or three persons engaged in the manufacture; now there are fifty or sixty. The importance of this branch may in some measure be estimated from the fact that it gives employment to a vast number of females in the rural districts, for whom no other useful work is provided in the intervals of field labor. In Ireland alone, where it is practiced from the Giant's Causeway to Cape Clear, and from St. George's Channel to the Achill and other remote islands, it is a source of great comfort to the female population, as it enables them to add to the food and clothing of their families without entailing on them any of the evils of the factory system, the work being supplied to them by agents of the large manufacturers scattered over all the country, and executed entirely at their own firesides. As the workers are only engaged a portion of their time at this species of industry, it is impossible to estimate their numbers; but it is computed that the amount paid in the western counties of Scotland and in Ireland, reaches no less a sum than three quarters of a million sterling annually. Like all other fancy trades, it has been subject to its periods of depression, but its progress has been regular, from a total produce of a few thousand pounds a year paid for labor in 1825 to the

amount above stated, the greatest increase having, however, taken place since 1845.

Emerald (Fr. *Émeraude*; Germ. *Smaragd*; It. *Smeraldo*; Lat. *Smaragdus*; Sp. *Esmeralda*), a precious stone in high estimation. It is distinguished from all other gems by its peculiar emerald green lustre, varying in intensity from the palest possible tinge to a full and deep color, than which, as Pliny has truly stated, nothing can be more beautiful and pleasing; *nullius coloris aspectus jucundior est*. "It emulates," he continues, "if it does not surpass, the verdure of the spring; and the eye satiated by the dazzling glare of the more brilliant gems, or wearied by intense application, is refreshed and strengthened by the quiet enlivening green of the emerald." In Pliny's time the best came from Scythia. Those met with in modern times do not often exceed the size of a walnut. Some of a much larger size, and perfect, have been found, but they are extremely rare. Nero used one as an eye-glass in surveying the combats of the gladiators. Hitherto it has always been found crystallized. Specific gravity from 2.6 to 2.77.—PLINY'S *Hist. Nat.*, lib. xxxvii, chap. 5; THOMSON'S *Chemistry*.

For the last two centuries and more, the only country known to yield emeralds is Peru, where they occur in Santa Fé, and in the valley of Tunca. Several large stones have appeared in Europe. About two years ago I cut one, exceeding two ounces in weight, for the Emperor of Morocco, but it was full of imperfections. The largest specimen known is a hexagonal crystal, nearly six inches long, and about two in diameter. This gem, however small, is so rarely seen perfect that "an emerald without a flaw" has passed into a proverb. A fine stone of four carats may be valued at £40 or £50, or even more, if very pure. Inferior stones of one or two carats are sold at from 40s. to 70s. per carat; and if smaller, and defective, at 10s. or 15s. per carat. Fine emeralds are rare, and in such demand, that a particular suit has been known to have passed into the possession of a series of purchasers, and to have made the tour of Europe in the course of half a century.—MAYNE on *Diamonds*, 2d ed., p. 104.

Emeril (Fr. *Emeril*, *Emeri*; Germ. *Smirgel*; It. *Smeriglio*, *Smeriglio*; Sp. *Esmeril*; Rus. *Nashdak*; Lat. *Smiris*). This mineral was long regarded as an ore of iron; and was called by Haüy *fer oxidé quartifère*. It is very abundant in the island of Naxos, at Cape Emeri, whence it is imported in large quantities. It occurs also in the islands of Jersey and Guernsey, at Almaden, in Poland, Saxony, Sweden, Persia, etc. Its color varies from red brown to dark brown; its specific gravity is about 4.000. It is so hard as to scratch quartz and many precious stones. By Mr. Tennant's analysis, it consists of alumina, 80; silica, 3; iron, 4. Another inferior kind yields 32 of iron, and only 50 of alumina. We have recent accounts of emery discoveries in Minnesota; but nearly all that is used at present in the arts comes from Turkey, near ancient Smyrna. Dr. Lawrence Smith, the American geologist, made a discovery of a deposit of emery while residing in Smyrna, and he made an examination of the locality in 1847. Dr. Smith having reported his discoveries to the Turkish government, a commission of inquiry was instituted, and the business soon assumed a mercantile form. The monopoly of the emery of Turkey was sold to a mercantile house in Smyrna, and since then the price has diminished in the market. The mining of the emery is of the simplest character. The natural decomposition of the rock in which it occurs facilitates its extraction. The rock decomposes into an earth, in which the emery is found embedded. The quantity procured under those circumstances is so great that it is rarely necessary to explore the rock. The earth in the neighborhood of the block is almost always of a red color, and serves as an indication to those who are in search of the mineral. Sometimes, before beginning to excavate, the

spots are sounded by an iron rod with a steel point, and when any resistance is met with, the rod is rubbed in contact with the resisting body, and the effect produced on the point enables a practiced eye to decide whether it has been done by emery or not. The blocks which are of a convenient size are transported in their natural state, but are frequently broken by large hammers. When they resist the action of the hammer, they are subjected to the action of fire for several hours, and on cooling they most commonly yield to blows. It sometimes happens that large masses are abandoned from the impossibility of breaking them into pieces of a convenient size.

Emery paper is prepared by brushing the paper over with thin glue, and dusting the emery-powder over it from a sieve. There are about six degrees of coarseness. Sieves with 30 and 90 meshes per linear inch, are in general the coarsest and finest sizes employed. When used by artizans, the emery-paper is commonly wrapped around a file or slip of wood, and applied just like a file, with or without oil, according to circumstances. The emery-paper cuts more smoothly with oil, but leaves the work dull.

Emery-cloth only differs from emery-paper in the use of thin cotton cloth instead of paper, as the material upon which the emery is fixed by means of glue. The emery-cloth, when folded around a file, does not ply so readily to it as emery-paper, and is apt to unroll. Hence smiths, engineers, and others prefer emery-paper and emery-sticks; but for household and other purposes, where the hand alone is used, the greater durability of the cloth is advantageous.

Emery-sticks are rods of board, about 8 or 12 inches long, planed up square; or with one side rounded like a half-rounded file. Nails are driven into each end of the stick as temporary handles; they are then brushed over, one at a time, with thin glue, and dabbed at all parts in a heap of emery-powder, and knocked at one end to shake off the excess. Two coats of glue and emery are generally used. The emery-sticks are much more economical than emery-paper wrapped on a file, which is liable to be torn.

Emery-cake consists of emery mixed with a little beeswax, so as to constitute a solid lump, with which to dress the edges of buff and glaze wheels. The ingredients should be thoroughly incorporated by stirring the mixture while fluid, after which it is frequently poured into water, and thoroughly kneaded with the hands, and rolled into lumps before it has time to cool. The emery-cake is sometimes applied to the wheels while they are revolving; but the more usual course is, to stop the wheel, and rub in the emery-cake by the hand. It is afterward smoothed down by the thumb.

Emery-paper, or patent razor-strop paper, an article in which fine emery and glass are mixed with paper pulp, and made into sheets, as in making ordinary paper; the emery and glass are said to constitute together 60 per cent. of the weight of the paper, which resembles drawing-paper, except that it has a delicate fawn color. The emery-paper is directed to be pasted or glued upon a piece of wood, and when rubbed with a little oil, to be used as razor-strop. See URK'S *Dictionary of Arts*.

Emigration is the act of leaving the country or place in which one has previously resided, in the view of residing in some other country or place. Persons so leaving the place of their residence are called emigrants; and latterly the term immigrants has been employed to designate persons arriving from a distance in some place or country with the intention of settling in it. Persons leaving a country for awhile, to which they intend to return, are not reckoned emigrants. This term is appropriated to those who leave their present habitations to establish themselves permanently elsewhere. The motives which lead to emigration are various in the extreme; but, whatever its immediate cause

may be, a considerable number of the natives, which he increase he easily made all ages the flocks and began to be it was an of encip land the tribe to affords a st The herds of so greatly i them both, e Whereupon land before t me. may be, all emigrants expect either to avoid some considerable evil, or to improve or amend their situation. The natural multiplication of man and of the animals which he domesticates, and the tendency of both to increase beyond such means of subsistence as may be easily made available for their support, have been in all ages the great cause of emigrations. When the flocks and herds of the occupiers of particular districts began to be so numerous that pasture became deficient, it was an obvious resource, in the event of any unoccupied lands being in their vicinity, for a portion of the tribe to emigrate to them. The Book of Genesis affords a striking illustration of what is now stated. The herds of Abraham and Lot, it is there stated, had so greatly increased, that, there not being room for them both, contests took place between their servants. Whereupon Abraham said to Lot, "Is not the whole land before thee? Separate thyself, I pray thee, from me. If thou wilt take the left hand, then I will go to the right; or if thou depart to the right hand, then I will go to the left. Then Lot chose him all the plain of Jordan, and Lot journeyed east; and they separated themselves, the one from the other." (Chap. xiii. 8-11.)

Female Emigrants.—Owing to causes which are too obvious to need being pointed out, the greater number of emigrants, especially of those who go to new settlements, consist of males; and the want of a proper proportion of females is often productive of the worst consequences. Inasmuch, too, as the female portion of the population in old settled countries is generally that which is most in excess, it is plain that every facility and encouragement should be given to the emigration of women. Nothing, therefore, can be more consistent with sound policy than the efforts which have recently been made by government, and by private individuals, to send out well-conducted females to Australia; and it is to be hoped that they will not relax in their benevolent labors till the wide disproportion which now (1857) exists between the sexes in that continent be materially reduced.

The application of steam to the propulsion of vessels and the other improvements that have been made in the art of navigation, have greatly diminished the cost, risk, and time spent in distant voyages, and have given a proportional extension to emigration. Notwithstanding their great distance, the emigration from Europe to America and Australia, but especially the former, has latterly attained to a magnitude which, previously to the employment of steam in navigation, would not have been conceived possible. For a lengthened period the United Kingdom has furnished the largest supply of transatlantic emigrants; but of late years the emigration from Germany has become very extensive, and promises at no distant period to equal, if it do not surpass, that which is carried on from Great Britain. The vast majority of the German emigrants are destined for the United States, where they occupy extensive districts, and have established themselves in great numbers. The States have also become, since 1835, the principal resort of the emigrants from the United Kingdom, more particularly of those from Ireland; though large numbers of the English and Scotch emigrants, with a smaller number of Irish, continue to resort in preference to Canada. Since the discovery of the gold fields of Australia, great numbers of emigrants have gone to that continent. But its much greater distance, and the consequent length and cost of the voyage, make it difficult for the poorer classes to find, without assistance, their way to this new El Dorado. And we may add, that to the natural difficulties in the way of emigration to Australia have been superadded those which arise from an extravagant minimum price of five dollars an acre having been set on all waste land in that continent, even though it should require three, four, or five acres to pasture a single sheep.

Next to the United Kingdom and Germany, China furnishes the greater number of over-sea emigrants. A Chinese population has long been settled in large numbers in many parts of the Eastern Archipelago, where they are distinguished by their industry and good order; and recently many thousands of them have found their way to California and Australia. We subjoin an account of the number of emigrants from the United Kingdom in each year from 1815 to 1853, both inclusive, specifying the countries for which they sailed, and the numbers that sailed for each:

Year.	North American colonies.	United States.	Australian colonies and New Zealand.	All other places.	Total.
1815	690	1,209	192	2,091
1816	8,870	9,092	118	12,510

Average annual emigration from the United Kingdom:
From 1815 to 1853, 97,209
For the five years ending 1853, 323,002

Emigration to America. Report from the State Department. Department of State, 1856.—In compliance with the act of Congress of March 26, 1819, regarding passenger ships and vessels, I have the honor to communicate herewith the annual statement of the number and designation of passengers arriving in the United States by sea from foreign countries, during the year ending December 31, 1855, compiled from returns made to this Department by collectors of customs pursuant to provisions of said act.

The measures adopted by the Department in 1853 with a view to obviate the previous absence of uniformity, and to secure accuracy in the returns of collectors, on which the statement is based, and which were referred to in the letter that accompanied the last annual statement, and in that which accompanied the preceding one, have produced most favorably to the desired end.

Previously to the statement of 1851 but two recaptulations were appended to the returns, namely, one embracing the "arrivals" in each State during the year; the other the number of passengers belonging to each "country." The statement now submitted will be found to embrace recaptulations exhibiting the following facts:

1. Arrival of passengers in 1855.
2. Country where born.
3. Country where they mean to reside.

4. Age and sex.
5. Occupation.
6. Died on the voyage.
7. Comparative statement showing the countries in which were born passengers arriving in the United States from foreign countries, from December 31, 1852, to December 31, 1855.
8. Comparative statement showing the age and sex of passengers arriving in the United States from foreign countries, from December 31, 1852, to December 31, 1855.
9. Comparative statement showing the occupation of passengers arriving in the United States from foreign countries, from December 31, 1852, to December 31, 1855.
10. Comparative statement of the number of passengers arriving in the United States, by sea, from foreign countries, from September 30, 1843, to December 31, 1855.

Attention is once more invited to the fact, that by the act of Congress of 1819, requiring immigration returns, passengers "arriving by sea" seem alone con-

templated, and that an amendment of that act, so as to embrace also those arriving by land, seems to be demanded. The attention of collectors at frontier custom-houses, especially on the northern border, has been directed to such immigration by this Department, and the result has been returns from the collector at Oswego, embracing the arrivals of 5,072 passengers during the last three quarters of the year.

Although the returns of collectors of customs of the passengers arriving within their districts have been characterized by greater precision during the past year than heretofore, there is still room for improvement, and the present statement will, like its predecessors for the last two years, be transmitted to them with a view to aid them in causing their returns to conform to the requirements of law.

I have the honor to be sir, your obedient servant,
W. L. MARY.

Hon. N. P. Banks, Jr., Speaker of the House of Representatives.

Subjoined are the more important tables accompanying the Secretary's letter:

In addition to this government table here—which begins at September, 1843, and does not give the means of comparison between calendar years till 1850, we insert one prepared from the original authorities in a form somewhat more available:

UNITED STATES' RETURN OF ARRIVALS FROM ABROAD.

Years.	Americans and Foreigners.	Of whom were Foreigners.
1820-1830.....	206,979
1830-1840.....	782,869
July, 1840-July, 1843.....	83,504
1843.....	101,107
1844.....	75,107
Jan. 1--Dec. 31, 1844.....	93,367
1845.....	180,759
1846.....	178,695
1847.....	238,970
1848.....	242,190
1849.....	298,548
1850.....	826,451	294,604
1851.....	408,928	379,461
1852.....	808,470	873,725
1853.....	400,777	808,648
1854.....	460,474	427,833
1855.....	230,476	200,577

We also add the following table, which shows the rapid advance of the German emigration to the United States. Up to 1851, it is from a paper by Dr. Gaebler in Hlubner's Statistik; and includes only those who sailed from German ports. The years 1852 and 1853 are from our government returns, and include all arrivals. There is a considerable business done in

bringing German emigrants to England for them to take passage thence to America; others sail from Antwerp and Havre. Gaebler's Statistics after 1846 are made up from the returns of different sea-ports:

EMIGRANTS TO THE UNITED STATES FROM GERMANY.

1819.....	4,700	1838.....	20,000
1820.....	2,200	1839.....	38,000
1821.....	2,400	1840.....	28,000
1822.....	2,600	1841.....	22,000
1823.....	2,700	1842.....	29,000

1826.....	11,000	1845.....	67,209
1827.....	9,600	1846.....	106,682
1828.....	8,000	1847.....	110,434
1829.....	15,000	1848.....	68,511
1830.....	no return.	1849.....	85,127
1831.....	15,100	1850.....	98,333
1832.....	24,200	1851.....	118,199
1833.....	20,000	From U. S. Reports.
1834.....	24,000	1852.....	144,894
1835.....	17,000	1853.....	141,928
1836.....	24,000	1854.....	216,000
1837.....	38,000	1855.....	71,293

The arrivals from Germany and Prussia in the government tables are here added together.

Ages of Emigrants.—The following table, which was among those sent to Congress by the State Department a few days since, has not till now been published. It gives the details of a matter which has been a good deal discussed, the age and chance of life of the foreigners who arrive here:

COMPARATIVE STATEMENT SHOWING THE AGE AND SEX OF PASSENGERS ARRIVING IN THE UNITED STATES FROM FOREIGN COUNTRIES, FROM DEC. 31, 1852, TO DEC. 31, 1855.

Age.	1852.			1854.			1855.

The following table shows the immigration at New York for the last four years, with monthly comparisons:

Months.	1852.	1854.	1855.	1856.
January.....	4,901	15,514	7,485	2,344
February.....	11,054	4,445	6,229	2,224
March.....	9,685	8,758	2,069	4,684
April.....	23,283	81,148	10,195	8,295
May.....	30,212	54,078	24,177	10,066
June.....	45,678	26,807	19,428	20,924
July.....	22,808	85,247	15,710	15,440
August.....	39,892	89,416	91,880	17,258
September.....	30,288	25,759	11,706	14,078
October.....	23,201	38,378	19,342	16,086
November.....	81,485	20,276	7,451	16,746
December.....	17,824	25,300	9,860	4,287
Total.....	284,945	819,228	336,233	141,673

The proportion of Irish and Germans arrived during the year 1856 appears from the following table:

Months.	Irish.	Germans.	Total.
January.....	584	548	2,344
February.....	220	414	2,224
March.....	1,040	1,205	4,584
April.....	8,297	2,220	8,295
May.....	6,516	6,969	10,069
June.....	6,015	6,045	20,924
July.....	5,968	5,005	15,446
August.....	5,080	7,789	17,253
September.....	4,286	8,241	14,078
October.....	5,091	7,515	16,086
November.....	6,201	7,344	16,743
December.....	1,838	2,441	4,287
Total.....	48,996	58,546	141,673

Last year there was an unusually small amount of emigration, owing to the war, the drafts for the army and navy, increased employment at home, and the check given to emigration to the United States by the stringent American regulations and the political objections to Catholics and the Irish, and to naturalization,

which had before been freely granted. The employment of many large steamers now disengaged from the transport service and reduced fares, coupled with the prosperous state of Canada and Australia, will lead to an increased emigration in 1857.

Statistics of Emigration to the United States.—The emigration of the past year shows an increase as compared with that of the year 1855, but is much less than any other year since 1848. The following are the figures:

From 1800-1810.....	70,081	1851.....	239,601
" 1810-1820.....	114,006	1852.....	300,922
" 1820-1830.....	185,086	1853.....	234,945
" 1830-1840.....	570,000	1854.....	319,223
" 1840-1850.....	1,675,388	1855.....	336,233
		1856.....	141,615

The tide of emigration during the year 1856 did not set in steadily until June and July.

The following shows the number of arrivals and the proportion of emigrants:

Countries.	Arrivals.	Countries.	Arrivals.
Ireland.....	441,090	Portugal.....	20
Germany.....	58,851	Belgium.....	385
England.....	23,681	West Indies.....	235
Scotland.....	4,678	Nova Scotia.....	30
Wales.....	1,875	Sardinia.....	420
France.....	2,891	South America.....	131
Spain.....	324	Canada.....	67
Switzerland.....	2,758	China.....	8
Holland.....	8,137	Italy.....	10
Norway.....	498	Mexico.....	57
Sweden.....	918	Russia.....	18
Denmark.....	471	Turkey.....	4
Italy.....	690	Greece.....	3

From the want of coal, Ireland is ill-fitted for manufacturing industry; and from the nature of its soil and climate, it is much better suited to pasturage than to tillage. In 1854 the further reduction of its population by one or two millions, by emigration, was considered favorable to its well-being.

Months.	Citizens.	Emigrants.	Total.
January.....	3,002	2,844	4,846
February.....	2,908	2,944	4,907
March.....	2,576	4,584	7,154
April.....	4,184	8,285	12,479
May.....	6,051	19,096	25,557

The total number of arrivals during the year is about six thousand more than the previous year, and the proportion of cash means to each passenger is con-

siderable larger than during the last five months of 1855. The account of cash means was not kept until after the first seven months of 1855. The number of vessels bringing emigrants last year was 579, from 21 different ports of Europe, and not one serious accident has occurred during the disembarkation. Some emigrants, ill-advised by interested parties, have declined to avail themselves of the facilities afforded by the Commissioners of Emigration, and have consequently been plundered in various ways, sometimes irretrievably. The governments of Hamburg and Bremen have made it a penal offense to solicit or book emigrants for inland travel in foreign countries, and it is to be hoped that other European governments will follow their example.

Since the 22d of August last a system of aiding destitute emigrants has been established, which has proved highly beneficial. Since that date in 1855, 210 families were assisted to the amount of \$2,309 25; in 158 the advances have already been repaid, amounting to \$1,456 25.

The following is a list of arrivals during two weeks of January, 1857, only.

Date.	Vessel.	Where from.	Number of passengers.
Jan. 1.....	Henry Clay.....	Liverpool.....	219
" 2.....	Victoria.....	London.....	323

Total of the Free States and Territories.....	162,451	\$5,208,480 51

Of late years (1853-1857) there has been more immigration to the State of Texas than formerly, especially by Germans, who have formed large settlements in several counties in the western portions of the State, where land can be had at 50 cents to \$1 per a. c., and where the climate and soil are favorable.

EMIGRATION AND IMMIGRATION.—The following from HUBNER'S "Jahrbucher" for 1854, gives the destinations of natives of Germany embarking from the ports of Hamburg and Bremen:

Destination.	1847.	1848.	1849.	1850.	1851.	1852.

Total.....	842,598	1,686,467	59.55	204,385	40,820	2,624,070

Whether the foreign immigration can be kept up very long at its present high figure must be doubted. The wars in Europe, which it was thought would check the tide, have, however, had no effect as yet. The number arrived in New York for the quarter ending March 31st, 1854, was 29,023, against 29,657 in the corresponding quarter of 1853.

The following table shows the occupations of the emigrants from England in 1854 and '55 :

	1854.	1855.
Blacksmiths and farriers.....	1,574	381
Brazers, tinsmiths, and whitesmiths.....	813	148
Drick and tile makers, potters, etc.....	111	82
Bricklayers, masons, plasterers and slaters.....	3,984	1,814
Builders.....	69	85
Cabinet-makers and upholsterers.....	189	81
Carpenters and joiners.....	5,185	2,544
Carvers and gliders.....	65	64
Coach-makers, etc.....	50	25
Coal miners.....	177	69
Coopers.....	369	171
Engineers.....	617	288
Millwrights.....	96	10
Miners and quarrymen.....	4,119	1,678
Palaters, plumbers, paper-hangers and glaziers.....	697	601
Sawyers.....	213	141
Shipwrights.....	61	15
Smiths (general).....	216	258
Surveyors.....	27	22
Turners.....	45	25
Wheelwrights.....	196	106
Mechanics not before specified.....	3,898	2,545
Total.....	21,347	11,155

To this statement the following remarks are subjoined: The total number of such adults who emi-

grated in the two years having been respectively 134,789 and 65,363, it follows that the mechanics and skilled workmen connected with the building and constructive trades, who leave the country, form the proportion of about one sixth of the whole number. Farmers, agricultural and general laborers, and those identified with land, constitute one half of the bulk of emigrants.

The number of foreigners who arrived in the United States, since 1790, may be stated as follows; the arrivals from 1790 to 1820 are given on the authority of Professor Tucker; those subsequent to that period, are obtained from the custom-house reports.

ARRIVALS OF FOREIGNERS IN THE UNITED STATES.

Law in Regard to Emigrants.—By the law of the State of New York, passed April, 1857, it is provided that,

No person shall, in any city of this State, solicit emigrant passengers or their luggage for emigrant boarding-houses, passenger-offices, forwarding transportation lines, or for steamers, ships or vessels bound or about to proceed to any port not within this State; or for any person or for any company selling, or offering for sale, passage-tickets, or contracting or offering to contract for passage in any such steamer, ship or

vessel without a license for that purpose, which shall expire at the end of one year from its date; such license may be issued and revoked in the discretion of the Mayor of the city where such license may have been granted, except in the city of New York, in which such license may be issued or revoked only by and in the discretion of the Commissioners of Emigration. Such persons receiving such license shall pay the sum of \$20, and give a bond, with two sufficient sureties, in the penalty of \$500, conditioned for the good behavior and the observance to him of the provisions this act, to the Mayor of the city issuing the same, or to the Commissioners of Emi-

eration, as the case may be. The money thus received or collected on said bonds shall be for the benefit of said city, or of the emigrant fund. Every person so licensed shall wear in a conspicuous place about his person a badge or plate, of such character and in such time and manner as said Mayor, in the city of New York, as such Commissioners shall prescribe, with the words, "Licensed Emigrant Runner" inscribed thereon, with his name and the number of his license. No person who is not of approved good moral character shall be licensed as such runner. Every person who shall solicit alien emigrant passengers or others, for the benefit of boarding-houses, passenger-offices, or forwarding or transportation lines, or for any steamer, ship or vessel bound or about to proceed to any port not within the State of New York, or for any person or company selling or offering for sale passage-tickets, or contracting or offering to contract for passage in any such steam-ship or vessel, upon any street, lane, alley, or upon any dock, pier or public highway, or in any other place within the corporate bounds of any city in this State, or upon any waters adjacent thereto, over which any of said cities may have jurisdiction, without such license, shall be deemed guilty of a misdemeanor, and shall be punished by imprisonment in the county prison or jail not less than three months, nor exceeding one year.

The bonds mentioned in the foregoing sections may be sued by and in the name of the Mayor of the city in which such license may have been issued, and in the city of New York by and in the name of the Commissioners of Emigration in any court having cognizance thereof; and in case of a breach, the Mayor, or the said Commissioners, shall recover the full penalty of said bond.

All personal baggage of emigrant passengers arriving at the port of and destined for the city of New York, shall be landed at the place or pier designated as the landing-place in said city for emigrant passengers; and the captain, owners, and consignees of every ship or vessel arriving at said port with emigrant passengers destined for said city, shall be jointly and severally subject and liable to a penalty of \$50 for each and every emigrant passenger, or his personal baggage, landed at any place or pier other than the place or pier aforesaid; which penalty shall be a lien upon such ship or vessel, and may be enforced and recovered by and in the name of the Commissioners of Emigration, either by an action or by warrant of attachment, under and pursuant to article first of title eighth of chapter eighth of the first part of the Revised Statutes.

The Health Officer shall give notice in writing to the owner or owners, consignee or consignees, master, commander or person having charge of every vessel having emigrant passengers on board of such vessel, destined for the city of New York, to land such passengers and their personal baggage, at such pier or place in the said city of New York as has been or may at any time be designated specially by the Commissioners of Emigration for the landing of emigrant passengers and their personal baggage; and it shall not be lawful to land such passengers or their personal baggage at any other pier or place; and the owner and master of any vessel, from which passengers or their personal baggage shall be landed, in violation of the provisions of this section, shall be subject to a penalty of \$50 for each and every person or his baggage so landed in violation thereof; which penalty shall be forthwith a lien on such ship or vessel, and may be immediately, upon such violation, sued for, enforced and recovered, with costs of suit, in the name of and by the Commissioners of Emigration, either by an action in any court having cognizance thereof, or by an attachment under and pursuant to article first of title eighth, chapter eighth, of the first part of the Revised Statutes, for which purpose the said Commissioners of Emigration shall forthwith be creditors of such ship or vessel, and having a direct lien on such ship or vessel, for said penalty; the said penalty, when recovered, to be applied and used by the said Commissioners for the purposes for which said Commissioners are constituted.

Eminent Domain. The right of the State to its public property or domain is *absolute*, and excludes that of its own subjects as well as other nations. The national proprietary right in respect to those things belonging to private individuals, or bodies corporate, within its territorial limits, is *absolute*, so far as it excludes that of other nations; but in respect to the numbers of the State, it is *paramount* only, and forms what is called the eminent domain; that is, the right, in case of necessity or for the public safety, of disposing of all the property of every kind within the limits of the State.—*WHEAT, Inter. Law.* See *Correa*, between Mr. WEBSTER and Lord ASHURTON, Dec. 1837.

Empire (Lat. Imperium). Originally the territory or extent of land under the command and jurisdiction of an emperor. The dominions under the sway of ancient Rome were the first to which the term empire was applied; they consisted of two grand divisions—the Empire of the East, or, as it was afterward called, the Lower Empire; and the Empire of the West. The former admitted of various subdivisions in reference to the different dynasties to which it was subject; and the latter became, about the end of the 9th century, the German or Holy Roman Empire. In all these cases, the sovereign, or chief person in the empire, was named the emperor. But the term empire has in several instances been employed to designate a *large extent of dominion*, without reference to the title of the ruler or sovereign of a country; thus we hear of the empire of Persia, Hindostan, etc. The dominions of the Queen of England are invariably designated the British Empire; and the epithet "imperial" is officially prefixed to the Parliament of the United Kingdom. The term empire was applied from 1800 to 1814 to the dominions of France, including all the countries then incorporated with it by the conquests of Napoleon.

Emporium, in a general sense, signifies a city or a place where extensive commercial transactions are carried on; but it is more particularly applied to the commercial centre of a country, or the place to which buyers and sellers, from various countries, resort.

Empyreuma (Gr. *εμπυρευμα*, *I kindle*). A burned odor; hence, the oils obtained by distilling various organic substances at high temperatures, are called *empyreumatic oils*.

Enamel (Fr. *email*) a semi-transparent or opaque vitrified substance, of the nature of glass, but differing from it by possessing a greater degree of fusibility and opacity. The compound which serves as a basis to most kinds of enamel is formed by the fusion of a pure crystal glass or frit, ground up with a fine calyx of lead and tin, in certain proportions; to which is usually added white salt of tartar. The different kinds of enamel are made by the addition of coloring substances, and melting or incorporating the whole by fusion. For white enamel, *Neri (De Arte Vitriar.)* directs calyx manganese to be added to the matter which constitutes the basis; for azure, zaffer mixed with calyx of brass; for green, calyx of brass with scales of iron, or with crocus martis; for black, zaffer with manganese or with crocus martis, or manganese with tartar; for red, manganese, or calyx of copper and crude tartar; for purple, manganese with calyx of brass; for yellow, tartar and manganese; and for violet-colored enamel, manganese with three-calcedined brass; in making these enamels great nicety is requisite. The general way of making the colored enamel is this: Powder, sift, and grind all the colors very nicely, and first mix them with one another, and then with the common matter of enamels; next set them in pots in a furnace, and when they are well mixed and incorporated, cast them into water; when dry, set them in a furnace again to melt; and when melted, take a proof of the enamel. If too deep-colored, add more of the common matter of enamels; and if too pale, add more of the colors.

Enameling, the art of laying enamel upon metals, as gold, silver, copper, etc. Enamel ornaments for trinkets, in almost endless variety, may be produced by the aid of the blowpipe. The enamel is usually first drawn out into threads, or reduced to thin laminae, to facilitate the process of fusion; and by the same means the enamel may be laid upon metals. Very elegant ornamental work may be thus produced. Enameling also signifies to paint in enamel.

Enamel Painting is performed on plates of gold or of copper, but seldom on silver, as this metal is apt to occasion imperfections in the surface of the enamel. Copper is the metal most generally used for this pur-

pose, enameled being executed in fire, where they of glass. This for its peculiar moment, the force effaced or sullied continuing always workman's hand entirely confined liable to certain perfect kind of gold, the other instance, sometimes silver turns the ing of the enamel the round or occasionally common enamel on both metal from swell serves for the step is to draw it with red vitriol, parts of the design, the colors oil of spike sometimes being given to the different pose it is necessary. When the gently dried over the colors are a with the enamel, as enamels use.

Enchasing, making figures on other metals. works, such as design having by the metal, the punches introduced proceeds to incision of the design; small chisels and skillful artist is with admirable

Encyclopædia (*instruction*), a term DIA, but sometimes being etymologically as it has been just the instruction of Cy preposition determined in a circle." Vol observes, "that but *Encyclopædia*

England, the division of Britain and the north to 55° 45' N. The extent of coast indented, and from cept along a wide The adjacent sea St. George's Channel on the fortunately situated is sufficient for its position not only aggrandizement, dering a great naval ability branch from the five branch from countries of the Its superficial

pose, enameled with the white enamel, on which painting is executed with colors which are melted in the fire, where they take a brightness and luster like that of glass. This kind of painting is particularly prized for its peculiar brightness and vivacity, which is permanent, the force of its colors not being liable to be effaced or sullied with time, as in other painting, and continuing always as fresh as when it came out of the workman's hands. This method of painting is almost entirely confined to miniature; larger works being liable to certain accidents in the operation. The most perfect kind of enameling is practiced on plates of gold, the other metals being less pure. Copper, for instance, sometimes scales with the application; and silver turns the yellow white. To obviate the cracking of the enamel, the plates are generally made a little round or oval and rather thin. The operation is usually commenced by laying on a couch of white enamel on both sides of the plate, which prevents the metal from swelling and blistering; and this first layer serves for the ground of all the other colors. The next step is to draw out exactly the subject to be painted with red vitriol, mixed with oil of spike, marking all parts of the design very lightly with a pencil. After this, the colors (very finely ground, and mixed with oil of spike somewhat thick), are to be laid on, attention being given to the mixtures and colors which agree to the different parts of the subject; for which purpose it is necessary to understand painting in miniature. When the colors are all laid, the painting is to be gently dried over a slow fire to evaporate the oil, and the colors are afterward melted to incorporate them with the enamel, making the plate red-hot in a fire such as enamellers use.

Enchasing, or Chasing, the art of embossing or making figures in low relief upon gold, silver, and other metals. It is practiced only on hollow thin works, such as watch-cases, tankards, cups, &c. The design having been traced on the exterior surface of the metal, the work is hammered upon steel blocks or punches introduced within; and thus the workman proceeds to indent the metal by the successive application of the block and hammer to the several parts of the design; after which the work is cleared with small chisels and graters. In this simple manner a skillful artist is able to represent foliages, figures, &c., with admirable precision.

Encyclopædia (*ἐν, ἰν, κύκλος, a circle, παιδεία, instruction*), a term nearly synonymous with **CYCLOPEDIA**, but sometimes adopted in preference to it, as being etymologically more definite and complete. For, as it has been justly remarked—*Cyclopædia* may denote "the instruction of a circle," as *Cyropædia* is "the instruction of Cyrus;" whereas in *Encyclopædia*, the preposition determines the meaning to be "instruction in a circle." Voësius, in his book *De l'itit Sermonis*, observes, "that *Cyclopædia* is used by some authors, but *Encyclopædia* by the best." See **CYCLOPEDIA**.

England, the southern, and by far the most fertile division of Britain, corresponds in latitude with Holland and the north of Germany, extending from 50° to 55° 45' N. Its figure is nearly triangular, and its extent of coast is very great, both from being much indented, and from the sea bounding it on all sides except along a width of 70 miles on the Scottish border. The adjacent seas are the German Ocean on the east, St. George's Channel on the west, and the English Channel on the south. No country can be more fortunately situated; its climate is temperate; its extent is sufficient for its political security; while its insular position not only presents the greatest capabilities of aggrandizement in a commercial sense, but has, by rendering a great military force unnecessary, in all probability been the chief cause of preventing the executive branch from usurping absolute power, as in the countries of the Continent.

Its superficial extent had long been a question of

considerable doubt, and the different estimates varied no less than 10,000,000 of acres. Mr. Pitt, on the authority of Arthur Young, assumed, in 1798, the superficial extent of England and Wales to be nearly 47,000,000 of acres; a later calculation by Dr. Beoke, approaching more to accuracy than any preceding one, fixed it at 38,500,000 acres. But according to the census of 1851, the area of the great territorial subdivisions of Great Britain is as follows, viz.: England, 50,922 square miles; Scotland, 81,324; Wales, 7398; and the Islands in the British Seas, 894 square miles; making the area of England and Wales 58,320 square miles, or 87,324,015 Imperial acres. The forms of the islands are irregular, and do not approach simple geometrical figures, if we except England, which was not inaptly compared by the ancients to a triangle. The area of Great Britain is equal to a square of 299 miles to the side; England to a square of 226 miles to the side; Scotland to a square of 177 miles to the side; Wales to a square of 86 miles to the side; the Islands in the British Seas to a square of 20 miles to the side. While the area is in the ratio of these squares, or as 51, 31, 7, and 4-10, the population is nearly as 17, 3, 1, and 1-7; England has, on an average, to a square mile 322 persons, Wales 136, Scotland only 92, the Islands in the British Seas 363 persons. While about 21,200,000 acres of territory lie north, and 36,400,000 acres south of 55° of north latitude; the populations on the north and south side of the line are respectively about 3,173,000 and 17,787,000.

Harbors.—Portsmouth, Milford Haven, and Plymouth, are the finest harbors in England, and are surpassed by few, if any, in the world. Of these, Portsmouth is entitled to the pre-eminence. This noble harbor is about as wide as its mouth as the Thames is at Westminster Bridge, expanding within into a capacious basin, almost sufficient to contain the whole navy of Great Britain. Its entrance is unobstructed by any bar or shallow; and it has throughout water adequate to float the largest man-of-war at the lowest tides. The anchorage-ground is excellent, and it is entirely free from sunken rocks, sand-banks, or any similar obstructions. The western side of the harbor is formed by the island of Portsea; and on its southwestern extremity, at the entrance to the harbor, is situated the town of Portsmouth, and its large and important suburb of Portsea. Here are docks and other establishments for the building, repair, and outfit of ships of war, constructed upon a very large scale, and furnished with every convenience. II. Portsmouth harbor has the additional and important advantage of opening into the celebrated road of Spithead, lying between the Hampshire coast and the Isle of Wight, and forming a safe and convenient retreat for the largest fleets. III. Milford Haven deeply indents the southern part of Pembrokeshire. It is of great extent, and has within it many bays, creeks, and roads. The water is deep, and the anchorage-ground excellent; and being completely land-locked, ships lie as safely in it as if they were in dock. IV. Plymouth, which, after Portsmouth, is the principal naval dépôt of England, has an admirable double harbor. The roadstead in Plymouth Sound has been much improved by the construction, at a vast expense, of a stupendous breakwater more than 1,700 yards in length. This bulwark protects the ships lying inside from the effects of the heavy swell thrown into the Sound by southerly and south-easterly winds.

London stands at the head of the river ports of Great Britain. Considering the limited course of the Thames, there is probably no river that is navigable for large ships to so great a distance from the sea, or whose mouth is less obstructed by banks. London is mainly indebted for the unrivaled magnitude of her commerce to her favorable situation on this noble river; which not only gives her all the advantages of an excellent port, accessible at all times to the largest

ships, but renders her the emporium of the extensive, rich, and populous country comprised in the basin of the Thames. The port of London extends from London Bridge to a little below Blackwall, and is divided into the Pool, Limehouse Reach, Greenwich Reach, Blackwall Reach, and Bugby's Reach. The coasting trade of London is greater than that of any port in the world, and gives it superiority over Liverpool.

Liverpool, the principal seaport of England, lat. 53° 25' N., long. 2° 6' W., is situated on the eastern bank of the Mersey river, while on the west side are the docks, warehouses, and other commercial buildings. The area of the wet docks is about 185 acres, and of the dry docks 20 acres. The entrance of the Mersey is impeded by shoals, but at high water may be entered by the largest ships. The docks are the finest in the world, and in connection with its situation and inland communication, give it the position it holds, of the first port in England, and having, next to New York, the largest commercial marine. The Mersey, now the second commercial river in the empire, is more incommoded with banks than the Thames, and is in all respects inferior, as a channel of navigation, to the latter. Still, however, it gives to Liverpool very great advantages; and the new channel which has recently been discovered in the banks promises to be of much importance in facilitating the access to and from the port.

Bristol and Hull are both river ports. Owing to the extraordinary rise in the Bristol channel, the former is accessible even to the largest ships. The Humber is a good deal impeded by banks; but it also is navigable as far as Hull by very large vessels. The Tyne admits vessels of very considerable burden as far as Newcastle, which is one of the most important shipping ports in the empire.

Statistics.—The total length of railways in England and Wales open for traffic at 31st December, 1853, was 5,811 miles. The number of passengers conveyed in that year was 84,222,961, of whom considerably more than one half were first and second class passengers. The receipts from the goods traffic somewhat exceed those from the passenger traffic. The length of lines in course of construction at 30th June, 1853, was 491, while the length authorised was 2,969 miles, nearly 2,500 miles being neither open nor in course of construction. The total amount of capital and loans authorised to be raised by railway companies in the United Kingdom previous to 31st December, 1852 (after deducting amounts proposed for lines subsequently abandoned), was £386,610,456, of which £264,165,690 had been raised; the amount raised in 1852 was £16,899,098. The number of passengers that traveled by railway in the half year ended 30th June, 1854, was 45,080,816; the amount of receipts from passengers was £4,092,661; from horses, carriages, luggage, and mails, £806,118; from general merchandise, cattle, minerals, etc., £4,828,825; total for six months, £9,494,602. See RAILROADS.

Electric Telegraph.—Connected with the railways is the electric telegraph, which is now stretched along thousands of miles across the length and breadth of the land, or sunk in the depths of the ocean, conveying intelligence between distant points with the rapidity of lightning. In 1848, an association under the title of the Electric Telegraph Company, obtained an act of incorporation, and having bought up the various patents for electric telegraphs, they secured the exclusive right of sending intelligence through the kingdom by this means. Since then they have been extending their operations in all directions; but great as are the advantages conferred on the country by this invention, there is reason to expect that they will be vastly increased and extended, as the instrument is capable of still greater improvements; and when the charges for the conveyance of intelligence are reduced to their

proper level, the electric telegraph will be much more generally used.

Canals.—The canals of England are extremely numerous; in fact no country except Holland can enter into competition with her in this respect. The English canals are of moderate size, being from 25 to 30, 35, and 40 feet in width, and, in general, from 5 to 6 feet in depth; the barges navigating them are very long, frequently 70 or 80 feet, on a width of 10, 12, or 14 feet; but in many cases their dimensions, at least their width, are necessarily smaller, the less frequented canals being narrower than those we have mentioned. Could the application of steam to navigation have been foreseen, the canals of England would probably have been made wider. For full details with respect to the canals of England, and the recent improvements in their construction, and in traveling by them, the reader is referred to the article CANALS.

Bridges.—The principal bridges in the kingdom are the railway bridges across the Tweed and the Tyne, and the seven erected across the Thames, at London, four of which have been opened since 1817. Of these, two, the Southwark and Vauxhall, are of cast-iron, the one being of three very large arches, and the other of nine arches, each of 78 feet span. The first example of an iron bridge on a large scale, either in England or any other country, was that erected in 1796, at Wearmouth in Durham, the span of which was 216 feet. The chain bridge over the Menai Straits, and the tubular bridge over the same place, are wonderful examples of engineering skill. See article BRIDGES, etc.

The principal crops cultivated in England and Wales are wheat, oats and beans, barley and rye, turnips and potatoes, with clover, hops, flax, etc. It is to be regretted that no estimate, derived from authentic returns, has been formed on which much reliance can be placed, either of the extent of land under different crops, or of the average product per acre. Mr. Caird, in his work on *English Agriculture*, p. 522, gives the following estimate as the result of his survey of England in 1850-51 of the extent of land under the different species of crops, and in fallow, in England:

	Acres.
Wheat.....	8,416,750
Barley and rye.....	1,416,750
Oats and rye.....	2,000,000
Beans and peas.....	1,139,000
Clover.....	2,377,750
Roots (turnips, mangold, potatoes, etc.)..	2,116,750
Hops, gardens of all sorts, etc.....	150,000
Fallow and rape.....	1,800,000
	18,817,000

Mines—Quarries—Iron, Copper, Tin, and Salt Works.

—In regard to minerals, England does not yield to any country in Europe in natural abundance, and takes the lead of all in the extent to which these rude treasures have been converted to purposes of utility. England's great superiority lies in her coal mines, which are not only more productive, but more advantageously situated, than those of the Continent. To the mines along the coast a ready conveyance is afforded by her insular position, and to those in the interior by her inland navigation. The consumption of coal in England for domestic use has been estimated at 20,000,000 tons annually. Large as this quantity is, and larger as it must be when we add to it the vast consumption of manufactories, such as iron-works, copper-works, salt-works, glass-works, and the like, there is no reason to apprehend the exhaustion of this precious mineral; the depth of the coal-beds being very great, and the extent of ground containing them amounting to many hundred thousand acres. The principal coal-beds lie in Northumberland, Durham, Derbyshire, Staffordshire, and Glamorganshire. The ports for shipping coal in large quantities are Newcastle, Sunderland, and Hartlepool. The motive of the tax on coal exported to foreign countries was thus neither an

apprehension of eventual scarcity, nor even a calculation of revenue, so much as a dread of giving her Continental neighbors the means of rivaling her manufactures. Coal is not wanting in France and Germany, but the mines are at a distance from water-carriage, and as yet very imperfectly wrought; while for the purpose of domestic fuel the inhabitants give a preference to wood. After various changes, the export duty on coal was totally abolished in 1850.

According to the census of 1861 the total number of persons engaged in the coal trade is 230,469.

In 1858 the exports of coal to foreign countries, according to the real or declared value, amounted to £1,602,762. See article COAL.

In quarries, whether of stone or slate, England is not rich, particularly the eastern half of the kingdom; and hence the almost universal use of brick in ordinary buildings. It is not till the traveler reaches Durham that he finds stone commonly used. In the northern counties quarries occur frequently; in the southern, those of Portland and Bath are the most considerable. Still the annual profits of the whole are small.

No branch of industry has increased more rapidly in the present age than iron-works. A century ago it was computed that England required an annual importation of 20,000 tons of foreign iron; an importation, which, for many years, seems to have been on the increase, so as, after the middle of last century, to carry the quantity required to 80,000, 40,000, and even to 50,000 tons. This supply was brought from Sweden and Russia, and, though burdened with duty, it was in quantity more than double the native produce. But fortunately, after the year 1780, discoveries were made which increased greatly the supply at home. Bar iron had been manufactured in England as on the Continent, with charcoal fuel only, coal being deemed inapplicable to that purpose. Under that impression, the rapid consumption of the wood in the neighborhood of the different iron-works had necessitated a removal, at a great expense, of materials from one spot to another, and was on the point of causing an alarming decay in the business, when the iron-masters, after long perseverance, succeeded in applying coal to their manufacture. They had to contend with various prejudices, particularly the supposed inferiority of iron so made; but, in the course of years, the manufacture acquired such an extent that there were, in 1805, 220 blast-furnaces, making 250,000 tons of pig iron.

The transition from war to peace did a good deal of injury to some branches of the iron trade; but the effect of the change was not of long duration, and the production of iron in England has since been astonishingly increased. In 1820 the produce was calculated at 400,000 tons. The excitement and speculation of 1824 and 1825 had a wonderful influence on this department. According to careful inquiries made at the time, the furnaces at work in England and Wales in 1827, with their produce, were as under:

Furnaces	Tons.
Staffordshire.....	95
Shropshire.....	81
South Wales.....	90

Owing to the failure of various railroad and other projects set on foot in 1825 and 1826, the supply of iron seems to have greatly exceeded the demand; and there was a very heavy fall of prices in 1828, 1829, and 1830, and again in 1850 and 1851. But within the last two years prices have again risen; and the iron trade is, at this moment, in a state of great activity. The produce of the various furnaces of England and Wales, may be estimated at nearly 2,000,000 tons.

The quantity of iron of all kinds manufactured and unmanufactured, exported in 1852, amounted to 1,035,884 tons, besides 25,289 tons of cutlery of the declared value of £2,691,697. Now that the railways are nearly completed, it might have been expected that this would have caused a stagnation in its manufacture; but iron is now so extensively used in the construction of steam-vessels, that the demand has been maintained. For more ample details, the reader is referred to the article IRON.

Copper-mines have long been known in England, but they were wrought with very little skill or effect until toward the year 1700. Even at that time the annual produce, after smelting the metal from the ore, was only a few hundred tons of copper; and it hardly exceeded 1000 tons annually, down to the middle of last century. From that time forward, the increase became considerable, as well in Cornwall as in Devon, North Wales, and Derbyshire; in all of which, copper-mines were discovered and wrought. In North Wales, there were two mines, Parys and Mona, which, for some time after the year 1780, yielded annually a large quantity of ore, but they are no longer so productive; the mines of Devon and Derbyshire continue to be wrought, but the great product is from Cornwall; the mines of Cornwall and Devon in 1853 yielded 181,969 tons of copper ore, the metal obtained from which, at the rate of 6½ per 100, produced 11,823 tons of standard copper, which, at the average rate of £140 per ton, amounted to £1,655,220. It is the Welsh collieries which afford to Cornwall, as to Devonshire, the means of smelting; and as the ore is less heavy than the coal required for this operation (1 ton of ore requiring from 2 to 2½ tons of coal), the practice is to convey the ore in vast quantities to Wales, particularly to Swansea. In this, as in other minerals, France is greatly behind England. She has various copper-mines, but her coal-mines, at least those hitherto wrought, are at too great a distance to make such undertakings profitable; and she consequently requires an annual importation from England.

In 1854 there were exported of brass and copper manufactures 1,851,689 cwt., of the value of £1,761,878.

Cornwall is also the great seat of the tin-mines of England. A century ago, the average produce of the tin-mines hardly exceeded 1500 tons; it may now be estimated at 5000 tons a year. From abroad England receives tin principally from her Indian possessions, Holland, and the United States. Of this, was imported in 1853, 49,740 cwt. The value of tin unwrought, and in plates, exported in 1854, was £1,307,246.

The lead-mines of England are principally in Cumberland, Northumberland, Derbyshire, Flintshire, and Salop. In 1852 England and Wales produced 80,790 tons of lead ore, and 57,621 tons of lead. Black lead is found in Cumberland, in the romantic district of Borrowdale. The mine was formerly opened only periodically, in order that the market might not be overstocked, but for a considerable number of years past, it has been constantly open.

There is no country better supplied than England,

both with brine-springs and beds of fossil, or rock-salt. The brine-springs are found in Cheshire, in the southern part of the county, in places contiguous to the river Weaver, and at Droitwich, in Worcestershire. The beds of rock-salt, which are of great thickness, were discovered in the vicinity of Northwich and Lawton. The greater part of the salt produced is obtained from the brine-springs. Formerly considerable quantities were produced by the evaporation of sea-water, but since the abolition of the duties most of the works appropriated to this manufacture have been abandoned. From the brine-springs it is obtained at the rate of one gallon of solid salt from four gallons of liquid, while common sea-water does not yield above one in twenty-eight. The consumption of salt is immense. Necker estimated its consumption in those provinces of France which had purchased an exemption from the gabelle (*paye, France redimée*) at about 194 lbs. (Eng.) for each individual.—*Administration des Finances*, tome II., p. 12. From all that we have been able to learn on the subject, we believe that the consumption of the people of Great Britain may be estimated a little higher, or at 22 lbs.; the difference in food and habits, as compared with those of the French, fully accounting for this increased allowance. On this supposition, and taking the population of Great Britain at 21,000,000, the entire consumption will amount to 462,000,000 lbs., or 206,250 tons.

Exclusive of this immense home-consumption, England annually exports about 18,000,000 bushels, which, at 56 lbs. a bushel, are equivalent to 857,143 tons. The Americans are the largest consumers of British salt.

The cheapness of this important necessary of life is not less remarkable than its diffusion. Its present cost may be estimated, at a medium, at from 14s. to 16s. a ton.

Salt has been at all times a favorite subject of taxation. It was first taxed in the reign of William III. In 1798 the duties amounted to 5s. a bushel, but they were subsequently increased to 15s. a bushel, or about forty times the cost of the salt. So exorbitant a duty was productive of the worst effects, and, in particular, occasioned a great deal of smuggling. The duty having, in consequence, become exceedingly unpopular, was finally repealed in 1823.

Fisheries.—At present our space allows no more than a brief notice of the principal branches of the fisheries.

The mackerel fishery is carried on with great vigor on the coast of Kent and Sussex, in May, June, and July. Large as the supply is, it would still admit of augmentation; and herrings also might be caught in vast quantities on the coast of Kent in October and November. The desideratum with the fishermen is not so much a high price as a certain market; and the most effectual way to procure that is, to quicken, by every possible means, the conveyance to London, which has been accomplished by the employment of steamboats and railways.

The pilchard fishery takes place chiefly on the coast of Devonshire and Cornwall, and, though subject to great fluctuations, as well from the seasons as from England's political situation relative to the continent, forms on the whole an important branch, employing a number of seamen both in catching the fish and in carrying it to foreign markets. Its season is generally from June to September.

The herring, the most important of all the fisheries, is happily now in a state of rapid extension. It formed, during the 17th century, the great employment of the Dutch seamen, and was contemplated by their neighbors with very jealous eyes. Accordingly, in the reign of Charles II., particularly after the rupture with Holland in 1672, several acts were passed for the encouragement of the fishermen, and in a spirit of hostility to the Dutch. The subsequent accession of William to the throne, and the long friendship between

the two countries, relaxed the exertions of the government; and it was not till after the peace of 1748, that a large bounty was given on the tonnage of the busses, or masted vessels, so employed. Still English fishermen were unable to compete with the experience and patient perseverance of the Dutch, and it was found necessary to raise the bounty from 80s. to 50s. per ton. This had the desired effect, and the number of busses increased; but the additional 20s. being withdrawn in 1771, the fishery again declined. The American war, and, subsequently, the wars of the French revolution, proved extremely adverse to its extension. At last, in 1808, an act was passed carrying the bounty to £3 a ton on the busses, with a further grant of 2s. per barrel on all herrings caught, whether in busses or boats. This act was further confirmed in 1815, and the bounty per barrel raised to 4s., with the qualification that the herrings should be gutted before curing.

In consequence of the encouragement thus afforded, the fishery was materially extended; but this was effected at a great expense, and had, besides, several bad consequences. The bounties given by government tempted persons without capital or skill to enter into the business, to the great injury of the regular fishermen; and so that notwithstanding the extension of the business, it was found, as is invariably the case with all departments carried on by means of a bounty, to be in a very unhealthy state. In consequence partly of the circumstances now stated, and partly in consideration of the real and substantial relief given to the fishery by the abolition of the duties on salt, it was resolved gradually to withdraw the bounty, which totally ceased in 1830. And it may be stated, that though the fishery fell off while the bounty was in the course of being withdrawn, it has since been materially increased, and is now in a better situation than at any former period. From the year 1811 to 1830, the year when the bounty ceased, the greatest number of barrels cured in Great Britain was 442,195; and in the year ending December, 1853, they amounted to 778,039, the largest number cured in any previous year. The quantities cured in each year vary considerably, according to the abundance of the shoals that appear upon the coasts in different seasons; but since 1833, the annual quantity cured has never fallen below 500,000 barrels, while for the 25 previous years they would scarcely average 300,000. In 1851 there were exported 239,390 barrels of the declared value of £228,835.

The cod fishery is next in importance to that of the herring. It is carried on in a great variety of places contiguous to the British shores. The finest fish is caught round the edges of the Dogger Bank, but within these few years London has been principally supplied with cod taken between Yarmouth and the Nore. The fisheries in the neighborhood of the Shetland and Orkney Islands, are productive and valuable, but the great bank of Newfoundland is the principal station of the distant cod fishery. About 2,000 men are employed in the sole fishery.

Salmon are rarely caught except in estuaries or rivers, which in most instances are private property. It is found in most English rivers, but in such small quantities as to make the fishing an object of little consequence.

England is chiefly supplied from the fisheries in the Scotch and Irish rivers, but from some cause or other there is a growing scarcity in this fish, probably from the weirs or salmon-traps placed in the rivers and estuaries in the way of the fish when ascending the rivers to spawn.

Greenland was first discovered by the English; but in this, as in other branches of navigation she long allowed the Dutch to take a lead. It was not till after 1750 that, the government having granted a bounty of 40s. a ton on every vessel employed in the

whale fishery at this branch.

In 1756, they were 1760, they were 1763 this fishery employed 96. The number in 1782 was 1784 they were long continued half the number of 16,119 to

whole fishery, a considerable increase took place in this branch.

In 1750, the vessels employed were only 19; in 1756, they had increased to 67. The war soon caused a decrease of one half; but at the return of peace in 1763 this fishery revived, and in 1770 the vessels employed amounted to 50; in 1773, to 55; in 1775, to 96. The American war again caused a decrease, and in 1782 the vessels so employed were only 38. In 1784 they increased to 89, and in 1785 to 140. After this, they exceeded 200 annually till 1793; but the long continuance of the late wars reduced them below half the number employed previously. In 1852, the whole fishery employed ships, of the aggregate burden of 16,113 tons.

The Newfoundland fishery has been considerable for fully a century past. As a nursery for seamen, it is accounted of such consequence as to have formed the object of a specific article in most of the treaties of peace. The fish caught, particularly in time of peace, is sent less to Britain than to the Catholic countries in the south of Europe; a market subject to all the interruptions attendant on a change of political relations. The number of vessels employed in this fishery at different times was as follows:

In 1781.....	70
1784.....	140
1774.....	254

The American war caused a diminution; but

In 1784 the number was.....	296
1785 " ".....	292

At this rate the fishery continued until the war of 1793, after which, particularly after the rupture with Spain in 1797, it fell off greatly; the fishing-vessels in 1798 being only 140.

The continuance of war, and the aggrandizement of the French in Italy, occasioned additional depression; so that in 1810 the number of English vessels employed at Newfoundland did not exceed 92. The peace seemed to promise a revival of this important nursery of seamen; and in the year 1816 the number of vessels which arrived in Newfoundland was 795, manned by 6,000 seamen; but the trade, both then and in 1817 and 1818, proved unprofitable, in consequence of indifferent seasons, of the high duty imposed on fish imported in British vessels into Naples, and of the competition of the French fishermen, supported by a high bounty from their government. The total value of fish exported from the British colonies in North America in 1851, was £827,738.

It is a matter of surprise to foreigners that a maritime nation should not have more effectually cultivated this great means of facilitating the support of the people. The ample supply which might have been afforded by the Nymph Bank, on the south-east coast of Ireland, has been avowedly neglected; and it was only in 1818 that the discovery of a bank of almost equal productiveness in the vicinity of Orkney, was made.

Fish is little known to the mass of the people in the inland counties, though the facilities of transport afforded by the railways is gradually distributing it in larger quantities. London has always been amply supplied. Mr. Mayhew, in his pamphlet on "London Labor and the London Poor," estimates the weight of fish annually consumed in London at above 450,000,000 pounds, besides an enormous quantity of shell-fish. Calculating the fish of all kinds at 3d. per lb. on an average, the amount would exceed £5,000,000 sterling. See the article FISHERIES.

Manufactures.—In this great department of English productive industry, we begin with woollens, which, although no longer the largest of these manufactures in point of exportation, nor even in the value annually made, is entitled to the first place from the priority of its establishment, as well as from the substantial basis on which it rests. England, from the extent of her pastures, abounded in wool from a very remote age,

and the inhabitants were doubtless capable of manufacturing it into rude clothing; each weaver working in his separate cottage, and with very little aid from machinery. In the 12th and 13th centuries she appears to have had only the most humble fabrics, and to have imported all cloth of finer texture; sending abroad her wool in quantities to Flanders, a country the inhabitants of which were at that period much further advanced than the rest of Europe, with the exception of Italy. It was in the middle of the 14th century that a better system was introduced. Flemish manufacturers were invited over to England, and improved greatly the quality of her home-made woollens. The seats of this branch of industry appear at that time to have been Kent and Essex; afterward Gloucestershire, and subsequently the West Riding of Yorkshire. It occupied at first the southern and more improved districts, and spread afterward to the northward, on account of the cheapness of labor, the abundance of coal, and the convenience of water-falls for the machinery. The general character of the woollen manufacture of England has been that of slow progress, but of little fluctuation; the latter evidently a consequence of its depending more on home-consumption than on exportation. In the long period from 1700 to 1780, the exports experienced a regular, but not rapid rise, amounting in the latter years to about £3,500,000, while the home-consumption increased in proportion to her augmenting numbers. More recently the manufacture has been materially improved by the adoption of various important mechanical inventions in the spinning, weaving, and dressing departments. On the whole, however, improvement has been much less rapid in it than in the cotton manufacture; so that while her exports of cotton stuffs and yarn have increased beyond all precedent, those of woollens have been comparatively stationary.

As we shall enter fully, in the article WOOLEN MANUFACTURE, into the details connected with its history, progress, and present state, it would be useless, even if our limits permitted, to anticipate these here. We shall only observe, therefore, that the entire value of the manufacture is estimated at about £25,000,000. According to the census of 1851, there were employed in the various branches of the woollen manufactures 176,131 males, and 118,642 females. By far the largest proportion of the raw material of the manufacture is the produce of her own flocks; but for many years past she has imported large quantities. Previously to 1800 the average imports did not exceed 3,000,000 lbs., mostly brought from Spain, the wool of which long maintained a high character. In 1800 the imports increased to 9,000,000 lbs. Since then they have gone on increasing, till, in 1852, they reached 93,761,458 lbs., of which 49,197,901 lbs. came from her own dependencies in Australia. In 1831 the exports of woollen manufactures amounted to £5,232,013. Since then they have annually increased, till, in 1852, they reached £8,730,934. For an account of the prices and qualities of wool, etc., the reader is referred to article WOOL.

The cotton manufacture of England is entitled to the greatest attention on different accounts. Of all her manufactures, it affords the largest export, and exhibits the most rapid improvements in machinery. Its introduction, though not remote, is less recent than is commonly supposed. It appears to have taken place early in the 17th century, when it was established at Manchester; but it was long conducted upon a very limited scale. The raw material, imported at first only from the Levant, in particular from Smyrna, began, after 1660, to be supplied by her West India colonies. The quantity imported amounted, about the year 1700, to 3,500 bales; but, increasing with the extended cultivation of her colonies, it averaged, about the year 1720, something more than 7,000 bales. From the colonial conquests of the war of 1756 her import of

cotton received further augmentation; but the manufacture increased very slowly, a great part of her cotton being re-exported to Holland, for the supply of Dutch and German weavers. It was not till after the peace of 1763, and the invention first of the carding machine, and next of the spinning-jenny, that this manufacture became considerably extended. In 1775, the average import of cotton approached 19,000 bales. A variety of inventions, unequalled in the history of manufacturing industry, were now made (see article on the COTTON MANUFACTURE), which gave an astonishing stimulus to the business. Fine calicoes and muslins were introduced; the workmen were withdrawn from their detached dwellings, and collected into large factories; and the price of the finished article experienced a reduction, notwithstanding a rise in the raw material, and in the wages of labor. The period which followed the peace of 1783 is perhaps unexampled for the reduction of price, and the consequent extension of sale that took place in regard to cotton goods. The commencement of hostilities in 1793 gave a pretty severe shock to the business; but the improvements in machinery continuing, the manufacture soon recovered, and has gone on increasing, under many vicissitudes, with a rapidity unparalleled by any other business, either in that or any other country. Neither does there seem to be any ground for fearing that this progress will be speedily checked. On the contrary, her superiority in the majority of what contributes to the advancement of the manufacture is so very decided, that, provided the public tranquillity be preserved unimpaired, she need not fear from the competition of others.

The reader is referred to the article "COTTON MANUFACTURE" in this work for an account of the rise and progress of this great branch of national industry, and for tabular statements, exhibiting the present magnitude and importance of the trade, the sources whence the raw cotton is derived, and the foreign markets for the raw material and manufactured articles.

Hardware.—We have already noticed the surprising increase in the produce of the iron mines of England since 1780. This increase of the raw material, joined in some cases to the command of coal in the vicinity, and in all to a facility of conveyance of coal and iron by canals and railroads, has, in the last 50 years, given a great extension to her hardware manufacture. In no department has the subdivision of employment been carried to so great a length; in none are its effects in cheapening production so conspicuous. Birmingham and Sheffield are the two great workshops for English hardware; the latter is confined to iron and steel, while in the former not only iron and steel, but copper and brass, constitute the materials of labor. Sheffield fabricates articles which are less for ornament than utility, and which possess in general a certain bulk, such as grates, spades, sickles, files, knives, fenders, fire-irons; while in Birmingham there is, in addition to articles of solidity, a surprising variety of toys, fancy goods, and petty manufactures; each trifling, when considered separately, but the whole forming an aggregate of great value. The most insignificant of these, such as a brass cock or a button shank, passes through a number of hands, and each artisan performs only a single operation. He thus acquires an extraordinary dexterity in his limited department, and in the course of a day despatches several hundred, perhaps even a thousand articles, through his particular stage; the result of all which is, that the price, when sold in quantities, is incredibly low. Another and very interesting feature in the situation of Birmingham, is the populousness of its neighborhood. Yet in none of the large towns of England is living less expensive; an advantage owing partly to the abundance of coal, partly to the ready supply of milk and vegetables from the wide space occupied by the population.

Nails.—The nail trade is carried on, not in the

town of Birmingham, but in a part of the surrounding district. It is computed, by the census of 1851, to employ, in England and Wales, 16,965 males, and 9976 females, of whom 7625 are under 20 years of age; for even this heavy article admits of subdivision of employment, which lightens the labor, and enables the workman to avail himself of the aid of his family. Of the two towns, Sheffield is by much the more ancient; the command of coal and iron in the same neighborhood having rendered it, so far back as the 13th or 14th century, a place for the fabrication of the homely articles used in those days by our ancestors. It is about a century since its razors, knives, and files began to take a more delicate shape. Birmingham, however, embraced a wider range, and advanced with much greater rapidity; but Sheffield also has its adjacent district, inhabited by manufacturers, though to a much less extent than the vicinity of Birmingham. This district, called Hallamshire, extends six or seven miles to the west of Sheffield.

Hardware is made in several other places, such as Dilston, Wolverhampton, Dudley, and Walsall. Each of these towns is situated in Staffordshire, and, in point of manufacture, is small only in comparison with Birmingham or Sheffield. Articles apparently very trifling are manufactured to a surprising extent in different places, such as pins at Gloucester, needles at Red-ditch in Worcestershire, watch-movements and main-springs at Prescott in Lancashire. The total value of articles of iron, steel, brass, and copper, including the manufacture from its earliest to its most finished stage, is necessarily fluctuating, but may be computed at £30,000,000 annually; two thirds of which appear to be consumed at home, while the other third is exported to two great markets—the Continent of Europe and the United States of America. The number of persons employed in the hardware manufacture in England in 1851 was about 465,000. In the United States, iron and coal are found, where land and provisions are certainly much cheaper than in Britain; but the scattered state of American population must, during several ages, oppose serious obstacles to the division of employment necessary in all the steepest branches of the hardware manufacture; particularly as the ease with which the Mississippi and Ohio are navigated by steam opens even the Western States to the importation of British goods. Upon the whole, therefore, we look on English hardware manufactures as resting on a solid basis, because in them are combined several advantages:—the raw material, the command of cheap fuel, and the use of machinery, which the more it is adopted, will bring a greater proportion of the work within the compass of women and boys, and thus lessen the proportion borne by wages in the cost of the finished article.

Linen Trade.—Linen has never formed one of the staple manufactures of England, flax having been less cultivated there than on the opposite shore of the Netherlands; a country which, in the 13th and 15th centuries, supplied the rest of Europe with the finest linens and woadens. When England subsequently advanced in manufacturing arts, the abundant supply of wool pointed out the most suitable branch; and she was contented to continue her imports of linen from the Netherlands, from France, and from Germany, or to favor the manufacture of the sister island in a department which did not excite her jealousy. In Ireland, the linen manufacture dates about two centuries ago, and is said to have owed much of its extension to the measures of the unfortunate Wentworth, in the reign of Charles I. The annual consumption of linen in England a century ago was probably not far below that of her double population at present, owing to the very general substitution in our time of cotton articles. At that time the linen manufacture of England was established chiefly in Lancashire and Cumberland, and in a county very remote from these, namely, Dorset-

shire. In the parts of Great Britain, the exportation of linen was 18d. per yard, or 18s. per cent. of the value of the raw material. The manufacture of linen in Scotland was infinitely superior to that in England, and its machinery, ending in 1825, was not less than 100 times that of England, and its value, at that time, was 18s. per yard, or 18s. per cent. of the value of the raw material, in 1830.

The market for West Riding and its neighborhood, and Ireland, is superior to some of the more extensive

The export of linen from Great Britain in 1851 amounted to 1,851,000 yards, or 18s. per yard, or 18s. per cent. of the value of the raw material.

Silk Manufacture.—The silk manufacture in England is in opposition to that in Italy; the raw material attempted to be expected from higher classes of the population. The silk being the vanity end of the raw silk being and the addition by men who of the edifice thus constructed, which general use. This gave which it had not continued within the policy unit. From the England of the 17th century, was thus a small monopoly, the super their aid the manu regulation. In consequence, indeed, was that in 1

shire. In 1745, government, apprised of the extension of the manufacture of coarse linen in Silesia and other parts of Germany, and actuated by the fallacious notion of making a monopoly of all kinds of productive industry, granted a bounty of 1½d. per yard on the exportation of all British linen of a value from 6d. to 18d. per yard; in other words, a premium of 20 or 25 per cent. on the prime cost of all inferior qualities exported. So large a grant soon augmented the manufacture of osanburgs and other coarse cloths, particularly in Scotland, although the ratio of increase was infinitely smaller than in the case of cotton, where there was no premium, but a rapid improvement of machinery. The demand for bounty in the ten years ending in 1785, was about £88,000 annually. More recently these impolitic issues were greatly increased, but at length the impolicy of forcing a manufacture in this way having become obvious to every one, the bounties, after being gradually reduced, ceased finally in 1850.

The manufacture is principally carried on in the West Riding of Yorkshire, its chief seat being in Leeds and its neighborhood, and in Lancashire, Dorset, Durham, and Salop.

Ireland and Scotland, particularly Dundee, are both superior to England in the manufacture of linen. But some of the flax mills established at Hull are on a more extensive scale than any other in the empire.

	1841.	1842.
The exports of linen manufactures from Great Britain and Ireland in 1841 and 1852 were of the declared value of.....	£8,522,935	£8,872,491

	£9,358,522	£10,863,351

Silk Manufacture.—In the silk manufacture, as in the linen, England has had to contend with a formidable opposition in other countries, particularly in France and Italy; and she has also had to import the whole of the raw material. It would therefore hardly have been attempted by her countrymen, but for the great profits expected from an article of general use among the higher classes. Its introduction goes back to the 15th century. About the beginning of the 17th it seems to have been carried to a considerable extent, owing certainly not to the luxury of the age, nor to any great proportion of affluent persons in the community, but to silk being almost the only article of apparel in which the vanity of dress could display itself. Toward the end of the reign of Charles II., about the year 1680, raw silk began to be imported in quantities from India; and the English manufacture received a substantial addition by the numbers and ingenuity of the Frenchmen who settled in that country after the revocation of the edict of Nantes in 1683. Various circumstances thus contributed to preserve and extend the manufacture, which continued rather upon the increase till the general substitution of cottons for silks about 1790. This gave a serious shock to the manufacture, from which it recovered only by slow degrees. Its situation had not indeed been at any time prosperous; and the continued complaints of the manufacturers occasioned within these few years a fundamental change in the policy under which it had previously been conducted.

From the first introduction of the manufacture into England down to 1825, foreign silks were either positively or virtually excluded. But the monopoly which was thus secured to the manufacturers produced, what all monopolies invariably do, an indifference to improvement. Instead of trusting to the ingenuity or the superior skill which they might have owed to their aid for preserving their ascendancy in the market, the manufacturers depended upon the custom-house regulations, and additional penalties on smuggling. In consequence, invention was quite at a stand. Such, indeed, was the influence of the system in this respect, that in 1826 the member for Coventry (Mr. Edward

Ellis) affirmed in his place in the House of Commons that the improved silk looms in use in various parts of the Continent enabled the workman to execute five times as much work as he could do in England; while in every business not protected by a monopoly the result was precisely opposite. At length, after a great deal of discussion, it was resolved to adopt a more liberal system. In 1825, a bill was in consequence passed, allowing the importation of foreign silks on payment of an *ad valorem* duty of 30 per cent., accompanied, however, by the effectual reduction of the singularly oppressive duties which had previously been imposed on the imports of raw and thrown silk. This measure, though vehemently opposed at the time, has proved most successful. We think that the silk trade has made more progress since 1826, when the new system was introduced, than it did during the whole of the preceding century. The following quantities of the raw and thrown silk were imported into the United Kingdom in

Year.	lbs.	Year.	lbs.
1822.....	2,650,568	1850.....	5,411,894
1832.....	4,224,897	1851.....	5,020,979
1840.....	5,006,249	1852.....	7,309,917

This table shows conclusively that the manufacture has increased nearly 200 per cent. since the adoption of those sound and liberal measures which have been the theme of so much ignorant lucretive. It is of importance, too, to observe, that not only the imports of raw silk, but also the exports of manufactured silk goods, are rapidly increasing. The following table shows this:

1822.....	£381,708	1851.....	£1,326,778
1832.....	690,090	1852.....	1,531,806
1850.....	4,225,041	1853.....	3,644,912

It is plain, therefore, that the manufacture is not increasing merely by reason of an increased demand in the home market, but because England is rapidly gaining on her rivals in the markets of foreign countries. This affords unquestionable evidence of the improvement as well as the extension of the manufacture. In 1852 her exports of wrought silks to France amounted to \$257,555, and to the United States to £164,590.

Leather, however little it may figure as an article of export, is necessarily one of extensive home consumption in every civilized country, particularly in such a climate as that of England, and where there are so many rich and sumptuous equipages. It is matter of regret that there are so very few data, official or otherwise, on which to form an estimate of the export or import of hides in former ages. Such an estimate would possess interest, as indicating the extent of her pasturage and the number of her cattle in comparison with her population. Whatever may have been the case at a remote date, the custom-house returns, for many years past, show, by the annual imports, that the demand for leather has greatly exceeded the home supply of hides. For a long time this importation took place from the Continent of Europe, and from the least civilized quarters; from countries such as Lithuania and Poland, where the quantity of hides furnished by the cattle materially exceeds that of the leather required by the inhabitants. But since the opening of the trade to South America, it has been found more advantageous to import hides from that continent, where the herds of wild cattle are so numerous as to meet the eye of the traveler in almost every point of the horizon.

On an average, there are imported annually about 2,000,000 hides, tanned and untanned. The quantity of leather annually made in England and Wales may be estimated at about 50,000,000 lbs. The largest tanneries are at Hermonby, in Southwark; but there are also very extensive establishments of the kind in the country, as in Cheshire, Lancashire, Westmoreland, Cumberland, and also in Lincolnshire. The late war, by its long continuance, and the magnitude of her army and navy, produced great orders from gov-

ormment for her leather manufacture. Shoes were and still are made wholesale in several towns of Staffordshire, Cheshire, and Northamptonshire; but those made in London, by the principal dealers, are, though expensive, by far the best.

Of the annual value of the leather manufactured into shoes, boots, harness, saddlery, etc., there are no means of forming a correct estimate; but we have merely to consider the population of England, and the unavoidable extent of their wants, to be satisfied that from £10,000,000 to £12,000,000 are rather below than above the mark. But while her home consumption is so considerable, her export is comparatively small—in ordinary years not exceeding £800,000; but in 1853 the exports of manufactured leather rose to £1,578,595. This large increase was probably occasioned by the reckless commitment to Australia. The leather shipped to Ireland is merely tanned; to other countries the exports are in a manufactured shape. The duty on leather was wholly abolished in 1830.

Connected with the general manufacture of leather is the glove trade, a branch of no inconsiderable extent, being carried on in several of the midland and western counties, viz., at Woodstock, Worcester, Ludlow, Hereford, Yeovil in Somersetshire, etc. This branch of industry enjoyed for a lengthened period the protection of monopoly, which, however, was abolished in 1825. Many contradictory statements have been made as to the effects of this measure. We believe, however, that the depression so much complained of has not been produced by it, but by the substitution

of cotton gloves for those of leather; and we have no doubt that, had it not been for the greater cheapness and improved quality of leather gloves, caused by the abolition of the monopoly, this substitution would have been carried much farther than it has been. The increased imports of the lamb and kid skins, used in the manufacture, show conclusively that it is not declining.

The manufacture of paper, and the trades connected with it, such as printing, bookselling, bookbinding, etc., give occupation to between 60,000 and 70,000 persons. From the excise returns, it appears that the quantity of paper of all kinds manufactured in England in 1852 was 114,521,304 lbs.; and the duty, which is at the rate of 1½d. per lb., plus 5 per cent., amounted to £751,546. It is difficult to say what portion of this was used in printing books, and how much was consumed by the newspapers; but the quantity used by some of the latter is so great, that a single newspaper, *The Times*, is said to consume about 50 tons a week.

We come next to a branch of industry of a very different description, namely, the brewery, the amount of capital and labor invested in brewing establishments in England is very large, and particularly striking to those who have lived on the Continent, and have contrasted the situation of England with that of the wine countries of the south of Europe. It is only in Flanders and Germany that breweries are numerous; and in the latter, from the limited capital, and the scattered state of their population, there are hardly any of these large establishments which exist in London.

AN ACCOUNT OF THE TOTAL NUMBER OF QUARTERS OF MALT MADE BETWEEN THE 5TH DAY OF JANUARY, 1852 AND THE 5TH DAY OF JANUARY, 1853, IN THE UNITED KINGDOM; DISTINGUISHING THE QUANTITY MADE IN EACH COUNTY, AND THE QUANTITY USED BY BREWERS AND VICTUALERS, AND BY RETAIL BREWERS; AND SIMILAR ACCOUNT FOR THE YEAR ENDING THE 5TH DAY OF JANUARY, 1854.

Quantities of spirits charged with excise duties in the United Kingdom in

1850	Oalloes.
1851	23,901,432
1852	24,690,693
1853	25,270,262

The quantity of beer brewed in England in 1830 was 4,678,428 barrels. The duty on beer having ceased on the 10th of October, 1830, there are no subsequent accounts of the quantities brewed. There can be no doubt, however, from the increased quantity of malt, that the production of beer has likewise greatly increased.

Spirituous liquors.—Spirituous liquors form one of the branches of manufacture in which England is dependent on her neighbors, as she imports an annual supply of corn spirit from Scotland and Ireland, rum from the West Indies, and brandy from France. It has been generally supposed that the consumption of gin has increased materially in England since 1825, when the duties were reduced. We are, however, inclined to doubt whether such be really the case, and are disposed to believe that the effect is more apparent than real; in fact, that it has resulted rather from a diminution of smuggling than from a positive increase of consumption. That such has been the case in Scotland and Ireland is beyond all question; and there seem no reason to conclude that it is otherwise in England. For tables of the quantity of malt used in 1853, and of the quantities of spirit charged with excise duties in 1850, 1851, 1852, see article BREWING.

To the remaining manufactures the limits allow of little space, though several of them would be accounted of great importance in any other country than England. The extent to which such articles as soap and paper

are made in England is amply shown by the excise returns; but the list of her exports is of more consequence to the political economist, not from the vulgar notion that it is by export only that national profit is realized, but as indicative of those commodities for which she possesses, in her soil, her climate, or her colonial possessions—advantages that give them a superiority over their neighbors. Thus, in the case of glass, the abundance and cheapness of her coal enables her to make an annual export of above £500,000. In the manufacture of hats, likewise, her command of wool for the coarser kind, and of furs from her North American colonies for beaver hats, enables her to ship to an extent of nearly 45,000 dozen, or £44,000 a year. In earthenware England has the advantage of clay, of fuel, and of ready communication by canals. These, joined to the taste and ingenuity of individuals engaged in the manufacture, carried it, in the course of the 18th century, to an extent which has rendered it a national object—a tract of 7 or 8 miles in Staffordshire, called the Pottery District, being almost entirely appropriated to it. The population of this tract is about 60,000. The great outlet is Liverpool, and the shipments take place partly to the United States—partly to the continent of Europe. Exports (comprising porcelain) in 1853 reached £1,337,911 in real value.

The stocking manufacture is carried on chiefly in the counties of Nottingham, Derby, and Leicester. It formerly employed great numbers of women in knitting; but in this, as in most other branches, machinery has greatly superseded manual labor. Lace is made in vast quantities in the midland counties; and here also machinery is extensively applied. And so

extraordinary has been the progress of invention in this department, that British lace at present commands a ready sale in all foreign markets, and is largely smuggled over into France.

Commerce and Shipping.—With Ireland the intercourse of England is very great—that country sending them grain, salted and fresh provisions, live cattle, butter, etc., to the amount of £6,000,000 or £7,000,000 annually, and taking largely in return her manufactures, particularly cotton, woolen, and hardware.

North of Europe.—From Russia her chief imports are tallow, hemp, flax, corn, linen, timber, pitch, etc.; from the Swedish dominions, iron and timber; from Poland, wheat, timber, and potash; from Prussia, wheat, timber, and flax. All these countries take her cottons, hardware, and colonial produce.

Central part of Europe.—From Holland her imports are not foreign merchandise, as in the 17th century, when the Dutch were the carriers of Europe, but agricultural produce, as oats, wheat, acorns, hemp, cheese, butter; also gin; the whole to a large amount; in return for which the Dutch take her hardware, cottons, and woollens. From France her imports have long been burdened with heavy duties, but still they are large and increasing, consisting chiefly of wine and brandy, silk, lace, gloves, etc. With Germany, her chief intercourse is through the medium of Holland and Hamburg. With these countries her exports are large, particularly in cottons, hardware, and colonial produce. Her imports are also very various and

large, consisting of wool, corn, flax, timber, linen, and wine, from the vicinity of the Rhine.

South of Europe.—Here we enter on countries of much less industry. From Portugal England takes wine in very large, and fruit in smaller quantities, in return for her cottons, her woollens, and her hardware. From Spain she receives wool, wine, brandy, oil, fruits, barilla, etc. Italy, without any commercial treaty, takes a large quantity of her manufactures, and gives in return silk, oil, and fruit. With the Levant her traffic is similar—consisting of an export of manufactures, particularly printed cottons and hardware, and of an import of silk, fruit, and drugs.

The United States are, notwithstanding their tariff, her best customers, receiving from England manufactures of almost every kind to a great amount, and sending her in return vast quantities of cotton, tobacco, rice, and flour; but the merchandise received from the United States being far inferior to the value of English exports, the difference is paid by remittances in money from the continent of Europe, arising from American merchandise sold there. With South America a wide field of commercial intercourse has been opened; at present, however, the chief articles received from that vast region are bullion, hides, skins, indigo, and cochineal. The trade is, and will long be subject to the various disadvantages of a newly-settled country, bare of capital, deficient in industry, and possessing but a small number of consumers of European commodities in proportion to its extent and fertility.

For a more extended account of the commerce of England, as well as of Great Britain, see GREAT BRITAIN.

From Asia England imports tea, indigo, cotton, coffee, sugar, piece goods, ivory, drugs, etc. Her principal article of export is cotton goods, for which, how singular soever it may appear, India has, since the opening of the trade in 1814, become one of the very best markets. Besides cotton stuffs and yarn,

she sends to Asia woolen goods, copper, and a great variety of other articles.

From Africa England imports drugs, ivory, teak wood, hides, etc. Her exports are but inconsiderable, consisting principally of cotton and linen manufactures. The hopes so frequently entertained, of opening an advantageous trade with the interior of Africa, have hitherto been altogether disappointed, and it is not supposed they will be more successful in future.

The recent discovery of the gold fields in Australia, and the consequent influx of immigrants into that country, have made it an important market for England's produce and manufactures. The declared value of her home produce and manufactures exported to the Australian colonies, including Van Dieman's Land and New Zealand, in 1850, was £1,574,145, while in 1851, 1852, and 1853 it respectively amounted to £2,807,356, £4,222,205, and £14,506,532. The number of ships that cleared from the United Kingdom for the various Australian colonies was 272 in 1851, 568 in 1852, and 1201 in 1853. A return of the exports and imports to the Australian colonies for 1851, 1852, and 1853, shows some curious results. The exports for 1853 exhibit in some instances an extinction, and in almost every article a decline, except wool, and of course gold, which is not noticed in the return; thus tanners' bark, of which 85,804 cwts. were exported in 1852, was reduced to 4776 cwts. in 1853; and tanned hides, of which 642,198 lbs. were exported in 1852, only amounted to 9842 lbs. in 1853; while untanned hides rose from 20,243 cwts. in 1852, to 41,987 in 1853. Flax and hemp, guano, wine, timber, tortoise-shell, whale-fins, etc., all declined or disappeared from the return. So did copper and lead ore; but copper, partly wrought, that is, in bars, rods, or ingots, increased from 873 tons in 1852, to 686 tons in 1853. Quicksilver fell from 14,631 lbs. in 1852, to 6933 lbs. in 1853; and wool rose from 48,197,301 lbs. in 1852, to 47,075,963 lbs. in 1853.

The amount of exports in 1851 being doubled in 1852, and quintupled in 1853, and probably increased still more in 1854, could not fail to cause a glut in the market, which has produced great embarrassment in the colony, and entailed heavy losses on the speculators.—E. B. For complete statistics of Great Britain, see article GREAT BRITAIN.

English Channel (called by the French *la manche*), is that part of the Atlantic Ocean which lies between the north-west coast of France and the southern coast of England. Its eastern extremity is connected with the German Ocean by the Strait of Calais, and on the west it is imperceptibly confounded with the Atlantic Ocean. It lies between lat. 38° 48' and 51° north, and long. 1° 20' east and 5° 43' west. At its termination—on a line drawn from Land's End to the extreme easterly point of the department of Finis-terre, in France, it is about 40 leagues wide. On the French coast it forms three considerable bays; the most westerly receives the Severne; the second receives the Seine and several smaller rivers; the third and largest lies on the south-west of the peninsula of Cotentin. On the English coast is Mount Bay, between Lizard Point and Land's End. Between Lizard Point and Start Point is a large gulf, on which are situated Talmonth and Plymouth; the Gulf of Exeter lies to the east of Start Point. The principal islands in the English Channel are, the Isle of Wight, on the English coast, and the Norman Islands, lying on the French coast, the principal of which are Guernsey and Jersey. The prevailing winds are from the west. The Channel, being shallow and confined, is subject, from its communication with the Atlantic, to high and impetuous tides. Its waters contain many fish, of which the most important are the mackerel and the herring. The oysters of Concar are also famous.

Engraving (*Sax. grafan, to dig*). The art of producing by incision or corrosion designs upon blocks of wood, plates of metal, or other materials, from which impressions or prints upon paper or other soft substances are obtained by pressure. Engraving, as an art, seems to have nearly the same relation to design and painting as typography bears to written language; and its utility and great importance must be obvious to every one from its capability of giving a boundless circulation to representations of the most valuable

examples of the arts and of objects connected with science. By some authors it is placed among the representations called monochromes (*μονοχρόμαροι*). Xylography, or wood engraving, was the earliest method practiced; but its origin is involved in obscurity. If we might rely on Du Halde (*Description, etc., de l'Empire de la Chine*, 4to. 1785), it is possible that it was known in China 1120 years before Christ; though we think its invention is of a much later period, as the Chinese were not acquainted with the art of making paper till 95 b.c. It has been stated that this art was introduced into Europe from China through the intercourse of the Venetian merchants with its inhabitants; for it is proved that engraving on wood had been practiced in that part of Italy which borders on the Adriatic as early as the 13th century. The first wood engravings in Europe of which any thing is known with certainty were executed in 1265, by a brother and sister of a noble family of the name of Cunio. They represent the actions of Alexander; and though doubts of their authenticity are expressed by Heineken, Mr. William Young Outley, the author of the elegant and learned *History of Engraving*, to which we are much indebted, thinks otherwise. But for the accidental discovery by a Venetian architect of the name of Temanza of a decree of the magistracy of Venice, in 1441, we might have been without positive proof of the practice of the art in Italy previous to 1467, and the Germans might still have continued to claim the honor of its introduction into Europe. This decree, dated 11th October, 1441, states in substance that the art and mystery of making carls and pointed figures had fallen to decay owing to their extensive importation; and in order that the native artists might find encouragement rather than foreigners, it was ordered that no work of the said art, printed and painted on cloth or paper—viz., altar pieces, or images, and playing-cards, and whatever other work of the said art is done with a brush and printed—should be allowed to be brought into the city, on pain of forfeiting the works, besides a pecuniary penalty. This decree plainly indicates that wood engraving was practiced in Venice as early as the commencement of the fifteenth century. In Germany and the Low Countries, the early block books seem to have existed as early as 1420, and to have given Guttenberg the hint for using movable types. At Rome, in 1367, a work entitled *Meditationes Johannis de Turresmatina*, issued from the press of Ulrich Han, embellished with wood engravings, in which the design and execution of an Italian artist are evident. The decorations of the work of Valturibus by Matteo Pasti, of Verona, published five years afterward, exhibit considerable spirit and accuracy; and before the end of the fifteenth century the art had been carried to great perfection, as may be proved by the delicacy and purity with which the designs are engraved in the celebrated *Hypnerotomachia* of Colonna. At this period, however, the discovery of copper-plate engraving had been made, and to this the more ancient art yielded place. Maso Finiguerra, a goldsmith and sculptor of Florence, and pupil of Masaccio, about the middle of the fifteenth century, seems from the most authentic accounts to have been the person to whom the world is indebted for the discovery. In his time, and for a considerable period previously, it was the practice to decorate church and other plate with works in *niello*, which were designs hatched with a steel point upon gold or silver, then engraved with the burin, and run in, while hot, with a composition called *niello*—a compound of silver, lead, copper, sulphur, and borax, which was more easily fusible than silver, and of a black color. The superfluous part of this *niello* which remained above the surface of the plate was then rubbed off with scrapers, and cleaned away with pumice-stone, leaving the engraved design on the plate with all the effect of a print. serve copies of their designs, the artists were in the habit before filling the design with the niello to take impressions of the plates with earth, over which liquid sulphur was poured, and from which, when cold, the earth was removed. But Fliniguerra carried his practice beyond this; for with a mixture of soot and oil he filled the cavities of the engraving, and by pressing damp paper upon it with a roller, obtained impressions on the paper, having, as Vasari says, all the appearance of drawings done with a pen, "venivano come disignate di penna."

Engraving on Wood, or Xylography.—In this branch of the art the material used is a block of box or pear-tree wood, cut at right angles to the direction of the fibres, its thickness being regulated by the size of the print to be executed. The subject is drawn on the block with a black-lead pencil, or with a pen and Indian ink, taking care that the whole effect is represented in the lines so drawn. The wood of the block is then cut away, except where the lines are drawn, which are left as raised parts; in which point it is that this mode of engraving differs essentially from copper-plate engraving, wherein the lines are cut out or sunk in the metal, instead of being raised from it. The impressions from wood blocks are taken in the same manner as from printing types.

Engraving on Copper is performed by cutting lines representing the subject on a copper-plate by means of a steel instrument ending in an unequal-sided pyramidal point, such instrument being called a graver or burin, without the use of aquafortis; which mode will be seen below under the art. *ETCHING*. Besides the graver there are other instruments used in the process; viz., a scraper, a burnisher, an oil-stone, and a cushion for supporting the plate. In cutting the lines on the copper the graver is pushed forward in the direction required, being held in the hand at a small inclination to the plane of the copper. The use of the burnisher is to soften down lines that are cut too deep, and for burnishing out scratches in the copper: it is about three inches long. The scraper, like the last, is of steel, with three sharp edges to it, and about six inches long, tapering toward the end. Its use is to scrape off the burr, raised by the action of the graver. To show the appearance of the work during its progress, and to polish off the burr, engravers use a roll of woolen or felt called a rubber, which is put in action with a little olive oil. The cushion, which is a leather bag about nine inches diameter filled with sand for laying the plate on, is now rarely used except by writing engravers. For architectural subjects, or in skies, where a series of parallel lines are wanted, an ingenious machine was invented by the late Mr. Wilson Lowry, called a ruling machine, the accuracy of whose operation is exceedingly perfect. This is made to act on an etching ground by a point or knife, connected with the apparatus, and bit in with aquafortis in the ordinary way.

Etching is a species of engraving on copper or other metals with a sharp-pointed instrument called an etching-needle. The plate is covered with a ground or varnish capable of resisting the action of aquafortis. The usual method is to draw the design on paper with a black-lead pencil; the paper being damped and laid upon the plate, prepared as above, with the drawing next the etching ground, is passed through the rolling press, and thus the design is transferred from the paper to the ground. The needle then scratches out the lines of the design; and aquafortis being poured over the plate, which is bordered round with wax, it is allowed to remain on it long enough to corrode or bite in the lines which the etching needle has made. Etching with a dry point, as it is called, is performed entirely with the point without any ground, the burr raised being taken off by the scraper. Etching with a soft ground is used to imitate chalk or black-lead drawings. For this purpose the ground is mixed with a portion of

tallow or lard, according to the temperature of the air. A piece of thin paper being attached to the plate at the four corners by some turner's pitch and lying over the ground, the drawing is made on the paper and shadowed with the black-lead pencil. The action of the pencil thus detaches the ground which adheres to the paper, according to the degree to which the finishing is carried; the paper being then removed, the work is bit in the ordinary way. *Stippling* is also executed on the etching ground by dots instead of lines made with the etching-needle, which, according to the intensity of the shadow to be represented are made thicker and closer. The work is then bit in. *Etching on Steel* is executed much in the same way as in the process on copper. The plate is bedded on common glazier's putty, and a ground of Brunswick black is laid in the usual way, through which the needle scratches. It is then bit in, in the way above described.

Mezzotinto Engraving.—In this species of engraving the artist, with a knife or instrument made for the purpose, roughs over the whole surface of the copper in every direction, so as to make it susceptible of delivering a uniform black, smooth, or flat tint. After this process the outline is traced with an etching-needle, and the lightest parts are scraped out, then the middle tints so as to leave a greater portion of the ground, and so on according to the depth required in the several parts of the work.

Aquatinta Engraving, whose effect somewhat resembles that of an Indian-ink drawing. The mode of effecting this (the design being already etched) to cover the plate with a ground made of resin and Burgundy pitch or mastic dissolved in rectified spirit of wine, which is poured over the plate lying in an inclined position. The spirit of wine, from its rapid evaporation, leaves the rest of the composition with a granulated texture over the whole of the plate, by which means a grain is produced by the aquafortis on the parts left open by the evaporation of the spirit of wine. The margin of the plate is of course protected in the usual way. After the aquafortis has bitten the lighter parts they are *stopt out*, and the aquafortis is again applied, and so on as often as any parts continue to require more depth. Formerly the grain used to be produced by covering the copper with a powder or some substance which took a granulated form, instead of using the compound above mentioned; but this process was found to be both uncertain and imperfect. In the compound the grain is rendered finer or coarser, in proportion to the quantity of resin introduced. This mode of engraving was invented by a Frenchman of the name of St. Non, about 1662. He communicated it to Jean Baptiste le Prince, who died in 1781, from whom it was acquired by Paul Sandby, who introduced it through the medium of Mr. Jukes into England. It has been practiced in this country with much greater success than elsewhere.

Etching on Glass.—The glass is covered with a thin ground of bees-wax; and the design being drawn with the etching-needle, it is subjected to the action of sulphuric acid sprinkled over with powdered flour or Derbyshire spar. After four or five hours this is removed, and the glass cleaned off with oil of turpentine, leaving the parts covered with the bees-wax untouched. This operation may be inverted by drawing the design on the glass with a solution of bees-wax and turpentine, and subjecting the ground to the action of the acid.

Engraving on Stone, or Lithography (λίθος, a stone, and γραφειν, to write or draw).—A modern invention, by means whereof impressions may be taken from drawings made on stone. The merit of this discovery belongs to Alois Senefelder, a musical performer of the theatre at Munich about the year 1800. The following are the principles on which the art of lithography depends: First, the facility with which calcareous stones imbibe water; second, the great disposition they

have to adhere to resinous and oily substances; third, the affinity between each other of oily and resinous substances, and the power they possess of repelling water or a body moistened with water. Hence, when drawings are made on a polished surface of calcareous stone with a resinous or oily medium, they are so adhesive that nothing short of mechanical means can effect their separation from it, and while the other parts of the stone take in the water poured upon them, the resinous or oily parts repel it. Lastly, when over a stone prepared in this manner a colored oily or resinous substance is passed, it will adhere to the drawings made as above, and not to the watery parts of the stone. It was formerly thought that England did not possess a sort of stone like that of Germany suitable to the purposes of lithography; this, however, is now known to be erroneous, as the neighborhood of Bath abounds with it, being the white *lias*, which lies immediately under the blue. It is also found in Scotland. The ink and chalk used in lithography are of a saponaceous quality: the former is prepared in Germany from a compound of tallow soap, pure white wax, a small quantity of tallow, and a portion of lamp-black, all boiled together, and when cool dissolved in distilled water. The chalk for the crayons used in drawing on the stone is a composition consisting of the ingredients above mentioned, but to it is added when boiling a small quantity of potash. After the drawing on the stone has been executed, and is perfectly dry, a very weak solution of vitriolic acid is poured upon the stone, which not only takes up the alkali from the chalk or ink, as the case may be, leaving an insoluble substance behind it, but it lowers in a very small degree that part of the surface of the stone not drawn upon, and prepares it for absorbing water with greater freedom. Weak gum water is then applied to the stone, to close its pores and keep it moist. The stone is now washed with water, and the daubing ink applied with balls as in printing; after which it is passed in the usual way through the press, the process of watering and daubing being applied for every impression.

There is a mode of transferring drawings made with the chemical ink on paper prepared with a solution of size or gum tragacanth, which being laid on the stone and passed through the press leaves the drawing on the stone, and the process above described for preparing the stone and taking the impressions is carried into effect. In Germany many engravings are made on stone with the burin, in the same way as on copper; but the very great inferiority of these to copper engravings makes it improbable that this method will ever come into general use. Perhaps one of the greatest advantages of the art of lithography is the extraordinary number of copies that may be taken from a block. As many as 70,000 copies or prints have been taken from one block, and the last of them nearly as good as the first. Expedition is also gained, inasmuch as a fifth more copies can be taken in the same time than from a copper-plate: and as regards economy the advantage over every other species of engraving is very great.

Zincography.—This art, which is of very recent introduction in this country (so much so, indeed, that but few specimens are as yet to be seen), is similar in principle to lithography, the surface of the plates of zinc on which it is executed being bit away, leaving the design prominent, or in relief. We have seen some beautiful examples of this art, but varying little in their appearance from those of stone engraving.—**BRANDE'S Dict. of Science.**

Engrossing, is "the buying up of corn and other dead victuals, with intent to sell them again."—*Blackstone*, book iv. cap. 42. It has been shown how absurd it is to suppose that this practice should have any injurious influence. But, for a long time, most scarcities that occurred were either entirely ascribed to the

influence of engrossers and forestallers, or, at least, were supposed to be materially aggravated by their proceedings. In consequence, however, of the prevalence of more just and enlarged views upon such subjects, the statutes that had been made for the suppression and punishment of engrossing, forestalling, etc., were repealed in 1772, in Great Britain. But notwithstanding this repeal, engrossing continues to be an indictable offense, punishable at common law, by fine and imprisonment; though it is not at all likely, were an attempt made, that any jury would now be found ignorant or prejudiced enough to convict any one on such a charge.

Entrepot (French), in *Commerce*, a warehouse or magazine for goods; and hence used to designate a seaport or commercial town which exports the productions of a considerable adjacent territory, and imports foreign goods for its supply.

Envoy (Fr. *envoyer, to send*), a person deputed to negotiate a treaty, or to transact other business with a foreign prince or government. Envoys belong to the second order of diplomatic ministers; ranking below ambassadors properly so called.

Epaulette (Fr. *épaule, a shoulder*), a kind of shoulder-knot or ornamental badge worn on the shoulder by military men. Officers, both naval and military, wear epaulettes on one shoulder or on both, according to their rank in the service.

Equador, or Ecuador, an independent state of South America, lying under the equator, from which it takes its name. It corresponds, with a trifling difference, to the old Spanish province or intendancy of Quito; but formed anciently the northern portion of the empire of the Incas of Peru, and latterly the southwestern province of the now dissolved republic of Columbia. It is situated between S. lat. 6° and N. lat. 2°, and W. long. from Greenwich 70° and 82°—being about 830 miles in length from east to west, and 560 in breadth from north to south—and only contains an area of about 320,000 English square miles. It is bounded on the south by the state of Peru, on the north by New Granada, on the east by Brazil, and on the west by the Pacific Ocean; but the boundaries of the eastern portion of the state are not yet very well defined.

Vegetable Productions.—In the low countries that flank the base of the Andes, the banana, ceycas, plantain, cacao, jatropha which produces cassava and manioc, the cotton-tree, indigo, coffee, and the sugar-cane abound; beneath the elevation of 4000 feet, the plants chiefly cultivated for food are the sweet potato, mandioc, yam, and banana, with rice, maize, and some legumes; but above 3100 feet most of these become rare, and thrive only in particular situations. The sugar-cane, however, has been grown so far up as 7500 feet. In some of the valleys are extensive plantations of sugar-cane, cotton, tobacco, and cocoa. The valley of Guayaquil is particularly fertile; the soil is alluvial, and there are few spots even between the tropics which can vie with it in richness and variety of vegetation. It is covered with groves of every kind of tropical fruit, either wild or cultivated, as the pineapple, pomegranate, shaddock, orange, lime, lemon, peach, apricot, cherimoyer, pulita, grandilla, tuna, and pacay. In the same region are found the olive, pepper plant, tomatas, and sweet potatoes, gum copal, copaiba balsam, carana, dragon's blood, sarsaparilla, and vanilla. To these succeed, in the humid and shaded clefts on the slopes of the mountains, tree-ferns and cinchona or Peruvian bark, the finest kind of which is obtained about 8 to 12 miles south of Loja among the mountains of Uritusinga, Villanaco, and Itumusitana, where the trees that yield it grow in a soil resting on mica-slate and gneiss, at the moderate elevation of 5756 to 7673 feet above the level of the sea. Between the elevations of 6000 to 9000 feet is the region best suited for the European cereals. Wheat

will not form the ear lower than at 4500 feet, or ripen higher than at 10,000 feet; but barley and rye grow at an elevation 2500 feet still higher. To these may be added the guinea, a most useful production for domestic purposes. In this region also, and a little above it, grow the potato and its congeners, all of which are extensively used as food; the chick-pea, broad-bean, cabbage, and other European vegetables, are likewise abundant. Within the cereal limits are found the oak, elm, ash, and beech, which never descend lower than 5500 feet, and are seldom found higher than 9200 feet above the level of the sea. Higher up, the larger forest trees, except the pine, begin to disappear; and on the mountains of Quito the escalonia mark the highest limit of trees at an elevation 11,600 feet. The bejarías, the highest of shrubs, terminate at 13,400 feet, above which, in rich and beautiful verdure, rises the zone of the grasses. Above these, among the trachyte rocks, only lichen, lecidias, and the brightly-colored dust-like lepraria are met with; and to these, succeed the region of perpetual snow.

Animals.—In some parts of the low country the air swarms with mosquitoes and other flies still more tormenting, while the ground teems with snakes, centipedes, and other reptiles. The banks of the great rivers are crowded with caimans or alligators. Bats are exceedingly numerous, and of great size; the forests of the warmer regions abound with armadillos, monkeys, and cavy; and everywhere are found the jaguar, the puma, the ounce, the ocelot, and several varieties of the wild cat. The peccari and deer are likewise common, as well as that singular animal the ant-eater. The characteristic animals of the Andes are the llama, the guanaco, the vicuña, and the paco or alpaca, some of which are trained as beasts of burden, while others, particularly the vicuñas, run wild among the mountains, where they are hunted by the Indians. Sheep and cattle are reared in great numbers, especially the former, in the valleys of the Andes, and on the declivities of the mountains. Horses, asses, and mules, are reared in sufficient numbers to be articles of export. The chief of the birds is the condor, which is found all along the Andes southward as far as the Strait of Magellan, but nowhere to the north of the equator. The turkey, vulture, and gallinago, are frequently met with, together with many kinds of smaller birds. In some districts, particularly along the coasts, considerable quantities of beeswax are collected; and higher up there are spots in which the cochineal insect is reared. Along the rivers of the great plain turtles are numerous; and their fat, called *mantecca* butter, forms a considerable article of trade. Fishing is carried on to some extent along the coasts, and a good deal of salt-fish is prepared. A murex is also found which yields a juice used in dyeing purple.

Mineral Productions.—Equador is less rich in minerals, especially in the precious metals, than any other of the South American states. There are, indeed, several mines of gold and silver, but the yearly produce is inconsiderable. In some places are found lead and quicksilver, but the latter is found, as usual, in combination with sulphur, in the form of cinnabar. Near Azogue, 15 miles north-east by east of Cuenca, the ore is found in an immensely thick bed of quartzose sandstone, containing fossil wood and asphalt. Sulphur is prepared in considerable quantities; gold has been washed from the sands of some of the rivers; and salt is obtained from sea-water along the coasts.

Population.—The settled population is composed of Spanish creoles of pure descent, mestizos, mulattoes, and negroes, the greater part of them being agriculturists, graziers, and growers of cocoa. These form about a half of the population. The other half are native Indians, of whom those that live among the mountains are mostly agriculturists, cultivating their

lands with much care, and making for themselves coarse stuffs of wool and cotton. The Indians who inhabit the eastern plains are in a much lower degree of civilization. They cultivate only small patches of ground, and apply themselves chiefly to hunting and fishing. Three fourths of the population dwell in the western or mountainous part of the state; and the total number is now estimated at about 800,000.

Manufactures.—The manufactures are unimportant, consisting chiefly of coarse woolen and cotton cloths and other necessary articles. The foreign trade is almost confined to Guayaquil, and is so trifling as scarcely to deserve notice.

Political Condition.—Till 1812, Equador remained a portion of the Spanish Empire of the Indies. It then threw off the yoke of Spain, and in 1821 became a part of the newly constituted republic of Columbia. This union, however, lasted only till 1831, when Equador became an independent state. It has gone through several revolutions; and by the last (1852-3) the democratic party has gained the ascendancy, and shown a tendency to adopt the United States of North America as their political model. The state has, in consequence, received a new and more liberal constitution; the Jesuits have been expelled; and laws have been made for the abolition of slavery. The government is vested in a president, with a vice-president and two chambers, all elective; but the constitution is still notably complicated by what has always been its principal characteristic, a predominating mixture of military despotism, the president being always the master of the state. More, perhaps, than any other country of South America, Equador has been slow in the development of her resources and national industry. Frequent revolutions have paralyzed its trade, and prevented the regulation of its finances. No interest has been paid on its public debt since 1826. It is emphatically the country of natural convulsions and political revolutions.

For administrative purposes, the state is divided into the three departments of Equador, Guayaquil, and Asuay; and these are subdivided into the seven provinces, of Quito, Riobamba, Ibarra, Guayaquil, Babahoyo, Cuenca, Loja, or Loxa (Loh-ho), and Jaen de Bracamor. The state likewise claims the sovereignty of the *Islas de los Galapagos*, or islands of land turtles, lying under the equator at a distance of 700 to 900 miles from the mainland. The chief towns are Quito, with from 50,000 to 80,000 inhabitants; Guayaquil, 25,000; Cuenca, 20,000; Riobamba, 15,000; Loja, Babahoyo, and Ibarra, about 10,000 each. Quito is beautifully situated in the elevated plain to which it gives its name; and Guayaquil on the banks of a navigable river, opening into the spacious bay, to which it gives its name.

The foreign commerce of Equador is chiefly carried on at the port of Guayaquil, which, with the ports of Manta and San Lorenzo, is open for general importation and the exportation of national produce. The ports open for exportation only are Santa Elena, Caliao, Bahia de Caracas, Loja, and Ibarra. Guayaquil is the only port of general deposit for re-exportation to foreign ports. The principal articles of export of this republic are cocoa, hides, cattio, tobacco, wool, straw-hats, coffee, orchilla, bark, India-rubber, and an inferior description of cotton. Cocoa is the leading staple, the quantity annually exported reaching over 15,000,000 pounds. The total value of the foreign trade of Equador may be stated at \$4,000,000. The countries which participate in this trade are the United States, Mexico, Guatemala, Chili, and Peru, in America; and England, Spain, France, and Hamburg, in Europe.

The commercial relations of the United States with Equador are regulated by treaty and the local legislation of that republic. The treaty with the United States was ratified April 9, 1842, and stipulates for

perfect equality and entire reciprocity of navigation and commerce, both in the direct and indirect trade. The third article has this stipulation: "That whereas, by a law of Equator, March 21, 1837, vessels built in the dock-yard of Guayaquil shall be exempted from various charges; therefore vessels of the United States can not claim this privilege, but shall enjoy it if it should be granted to vessels belonging to Spain or Mexico and to the other Hispano-American republics." The following translation of the decree conferring special privileges on vessels constructed at Guayaquil, bearing date August 23, 1845, is made from *El Comercio de Lima*, October 6, 1846:

"The provisional government considering that the ship-yards of Guayaquil, by reason of its favorable position, and in view of the interests of commerce and of the republic, merit special attention; therefore, in order to advance these interests, and to encourage the construction of ships, it is decreed: Art. 1. Vessels constructed at Guayaquil, and retaining the national flag, shall be exempt from tonnage, anchorage, and other port dues. Art. 2. Such vessels shall be entitled to a reduction of three per cent. on all produce, merchandise, etc., imported into any of the ports of the republic for consumption."

The commerce between the United States and Ecuador is very limited, owing mainly to the fact that the two great staples of the latter country, cocoa and

straw-hats, find but little demand in the United States—the former being of limited consumption, and the latter subject to a duty of 80 per cent. Before the treaty between Spain and Ecuador, in 1843, United States' vessels carried flour and domestic manufactures direct to the port of Guayaquil, and were generally chartered to transport cargoes of cocoa to Spain. Since that period, however, the high duties on cocoa in Spain, when imported in foreign vessels, have been equivalent to a prohibition. This, together with the annually increasing importation of flour from Chili, has produced a depressing effect on American trade with that republic. The following table will exhibit the condition of this trade during a period of eleven successive years. But little improvement can be expected, it is thought, so long as the present tariff regulations of the United States continue in force. The duties on navigation in the ports of Ecuador are—tonnage duties, 25 cents per ton; light dues, 4 cents per ton. When pilots are employed, the fees are \$2 50 per foot of the vessel's depth. See *Com. Relations U. S.*, 1856-7.

Ecuador, which once formed part of the empire of the Incas, was discovered by Pizarro in 1526, and was held under the Spanish crown until the year 1812, when a revolution occurred, which ended in the establishment of a separate republic. In 1821 Ecuador disconnected itself with New Granada.

COMPARATIVE STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH ECUADOR, EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY, DURING THE YEARS DESIGNATED.

YEARS.	COMMERCE.			NAVIGATION.			
	VALUE OF EXPORTS.			VALUE OF IMPORTS.	AMERICAN TONNAGE.		FOREIGN TONNAGE.

1854.....	57,534	1,981	1,011	192
1855.....	60,092	60,092	12,553	277

The following summary statements of the commerce of Guayaquil, condensed from the official reports for the years designated, will convey a general idea of the foreign commerce of Ecuador, the port of Guayaquil being the principal port of that republic:

TRADE OF GUAYAQUIL FOR 1845.

Countries.	Imports.	Exports.	Total.
Peru.....	\$665,140	\$110,770	\$775,910
Chili.....	143,930	170,510	314,440
Spain.....	37,620	190,000	227,620
Hamburg.....	177,270	177,270
France.....	24,320	99,700	124,020
Mexico.....	75,620	75,620
Central America.....	35,910	35,910
New Granada.....	5,130	14,530	19,660
England.....	6,270	6,270
Total.....	816,140	881,080	1,697,220

The United States does not appear in the list of countries for 1845. Indeed, the foreign trade of Ecuador is conducted chiefly with the ports of Lima and Valparaiso, the two principal entrepôts for the trade of South America. The following statement affords a description of the merchandise, with its values, imported in 1845, and the countries of origin:

Description of merchandise.	Values.	Countries of origin.
Textiles of cotton.....	\$140,300	Peru.
" wool.....	94,590	"
" silk.....	81,540	"
Wine.....	79,420	Peru, Spain, France.
Spirits.....	76,760	Peru, Chili, France.
Flour.....	42,170	Peru, Chili.
Haberdashery.....	31,710	"
Provisions.....	31,710	Peru, Chili, Spain, France.
Hardware.....	28,760	Peru, Chili.
Paper.....	21,320	"
Musical instruments and furniture.....	18,050	"
Pottery and glass-ware.....	10,720	Chili, Peru, France.

Description of merchandise.	Values.	Whither.
Cocoa.....	\$568,590	Spain, Hamburg, France.
Straw hats.....	79,990	Chili, Peru.
Sole leather.....	22,220	Peru.
Cotton.....	19,820	Chili.

The following tabular statement exhibits the description of merchandise exported from the port of Guayaquil in the year 1855, with the quantity of each article, respectively:

Exports of merchandise.	Quantities.
Cocoa.....	15,089,753 pounds
Straw hats.....	93,773 dozen
Tanned hides.....	26,246 skins
Tobacco.....	8,659 quintals
Sarsaparilla.....	637 " "
Tanned hides.....	699 " "
Coffee.....	776 " "
Op'ra.....	4,900 " "
Barley.....	7,739 " "
Timber.....	2,985 logs
Cases.....	75,551 pieces
Mary jels.....	5,660 " "
India-rubber.....	765 quintals

The countries to which the cocoa specified in the above statement was sent, together with the quantity to each, is exhibited as follows. Each carga equals 81 lbs.:

	Cargas.	lbs.
Spain.....	80,82	23
Hamburg.....	86,132	26
France.....	17,214	62
Peru.....	11,606	13
Chili.....	15,607	39
United States.....	7,544	64
Central America.....	5,463	69
Mexico.....	5,410	39
Papama.....	4,922	75
Total.....	186,208	20

The following table exhibits the quantities, in pounds, of cocoa, exported from Guayaquil during a

period of ten years, from 1846 to 1855, both years inclusive:

	Pounds.		Pounds.
1846.....	11,302,003	1851.....	9,867,660
1847.....	12,073,615	1852.....	13,966,543
1848.....	21,007,395	1853.....	13,243,024
1849.....	14,294,734	1854.....	10,992,151
1850.....	11,066,050	1855.....	15,059,759

The navigation returns of Guayaquil for 1849, the latest period for which they are at hand, complete, exhibit a total of 169 vessels entered and cleared, with an aggregate tonnage of 46,838 tons, distributed as follows:

Countries.	ENTERED.		CLEARED.	
	Vessels.	Tons.	Vessels.	Tons.
England.....	26	14,310	23	12,905

S. American Republics.....	35	5,306	39	4,200
Total.....	84	24,905	85	22,033

The only commercial legislation in this republic, of recent date, is embodied in a decree given at the capital, Quito, August 15, 1855, by the President, José María Urbina, imposing an export duty on bark and India-rubber. The United States' consul at Guayaquil, in communicating this decree, under date of September 30, 1855, says: "Against this injudicious measure of the executive, strong representations will be made to the present Congress by the commercial and industrial classes, as unlawful, and injurious to the present increasing commercial prosperity of the country; and it is probable that it will be modified into renting or selling the lands, or done away with altogether."

A translation of this decree is subjoined: "Considering that the natural productions met with in the uncultivated lands of the republic make part of the national riches, and that that the India-rubber and bark discovered and extracted from said lands are becoming objects of speculation to many persons, and should be made to yield a revenue to the country; therefore, be it decreed: Art. 1. In the ports of the republic where custom-houses are established, there shall be exacted a duty of two dollars on ordinary, and three dollars on refined India-rubber, on every 100 lbs. exported to foreign markets. Art. 2. The bark taken from government lands, and exported to foreign countries, shall pay a duty of two dollars for every 100 lbs. on yellow, three on Callesaya, and eight on red. Art. 3. Those persons who export India-rubber and bark without presenting the same at the custom-house, or place appointed for the collection of the duties specified in the previous articles, with the intent of avoiding the payment of said duties, shall be judged according to the process detailed in the law of the 21st November, 1853. Art. 4. Every citizen who proposes extracting India-rubber or bark from national lands, shall present himself to the respective governor, who, after hearing his proposal, and satisfying himself that the land is actually government property, shall give to the parties applying the required permission in writing. Art. 5. Those engaged in the collection of India-rubber must not cut down the tree; but, to obtain their object, should bore a small hole in the trunk, at the height of about half a yard from the ground, penetrating the greater part of the thickness of the tree, taking care not to bore through it. Art. 6. Those who are found taking India-rubber or bark from national lands without having complied with the condition prescribed in articles 4 and 5, shall be treated as smugglers, and the substance collected taken from them and confiscated. Art. 7. The governors of provinces in the lands under their jurisdiction will take all possible measures to discover and apprehend all parties who endeavor to infringe the preceding dispositions. Art. 8. Article 6 applies, also, to those individuals who do not comply with the dispositions of articles 4 and 5, under the pretext that they are collecting the aforesaid

substances from their own lands, should it be discovered that the said lands are national property. Art. 9. Those persons who collect India-rubber and bark from their own property, are not subject to any of the duties imposed in the present decree. Art. 10. The Secretary of the Treasury is charged with the due execution of this present decree, of which it is his duty to inform the Congress next ensuing."—*Com. Relations, U. S. See GUAYAQUIL.*

Equator (*Equare*, to make equal), in astronomy and geography, a great circle of the sphere, equally distant from the two poles of the world, or having the same poles as the world. It is called equator because when the sun is in it the days and nights are equal; whence also it is denominated the *equinoctial*; and when drawn on maps, planispheres, or globes, it is called the *equinoctial line*, or simply the *line*. Every point in the equator is 90 degrees, or a quadrant's distance from the poles of the world; and hence the equator divides the sphere into two equal hemispheres, in one of which is the northern, and in the other the southern pole. Terrestrial longitudes are measured on the equator, or some one of its parallel circles; commencing from some arbitrary point, which different nations assume variously, most of them adopting the meridian which passes through their capital city or principal observatory. Latitudes are counted from the equator along the meridian.

Equinox (*Lat. æquis and nox*, night), in astronomy, is the time at which the sun passes through the equator in one of the equinoctial points. When the sun is in the equator, the days and nights are of equal length all over the world, whence the derivation of the term. This happens twice every year, namely, about the 21st of March, and the 22d of September; the former is called the *vernal*, and the latter the *autumnal* equinox. The equinoxes do not divide the year into portions of equal length; for in consequence of the sun being at his greatest distance from the earth during the summer months, and his angular motion in his orbit being consequently slower, the interval from the vernal to the autumnal equinox is greater than that from the autumnal to the vernal. In other words, the sun continues longer on the northern than on the southern side of the equator. At the beginning of the present century, the difference amounted to 7 days 16 hours and 51 minutes. The summer in the northern hemisphere is constantly longer than in the southern by this quantity; and to this circumstance some meteorologists ascribe, in part at least, the higher temperature that is found to prevail in the northern hemisphere under the same parallel of latitude.

Erie (lake), situated north of New York, Pennsylvania, and Ohio, and constitutes a part of the boundary between the United States and Canada. It is 240 miles long, and 60 broad, in its widest part. It receives the waters of Superior, Michigan, and Huron lakes, through Detroit River, and discharges its waters through Niagara River into Lake Ontario. Its surface is elevated 565 feet above tide-water in the Hudson River at Albany. The soundings by the U. S. Engineers show the lake to be divided into three sections of unequal depth, viz., one extends from the head down to Point Pelée Island, and the bottom presents a general level, with a depth of 30 feet in the average. The second is of much larger extent, and stretches to Long Point; is also a level, with a depth of 60 to 70 feet. The third section extends to Niagara River, and is an uneven bottom, with various depths of water, ranging from 60 to 240 feet. The business done on this lake is immense, and increasing. The licensed tonnage of the lake is 138,352 tons, of which a large and increasing proportion is of steam-vessels. The estimated value of the commerce amounts to \$220,000,000 annually. There are 26 light-houses and beacons on the American side, and 10 on the Canadian side. A battle was fought near its west end Septem-

quantities, in
quill during a

ber 10th, 1818, between the American fleet, under Commodore Perry, and the English fleet, in which the letter was captured. See LAKES, *Commerce of*.

Ermine (Ger. *Hermelin*; Fr. *Hermine*, *Ermine*; Rus. *Gornostai*), a species of weasel (*Mustela candida*, Lin.), abundant in all cold countries, particularly Russia, Norway, Lapland, etc., and producing a most valuable species of fur. In summer the ermine is of a brown color, and is called the *stoat*. It is in winter only that the fur has that beautiful snowy whiteness and consistence so much admired. See FURS.

Esparto, a species of rush, the *stipa tenacissima* of botanists. It is found in the southern provinces of Spain; and is particularly abundant on all the sterile, uncultivated, and mountainous districts of Valencia. BRECKMANN (*Hist. of Invent.*, vol. II., p. 288, Eng. ed.) supposes, apparently with good reason, that the *stipa tenacissima* is the plant described by Pliny under the name of *Sparta*, who ascribes its application to useful purposes to the Carthaginians.—*Hist. Nat.*, lib. xix., c. 2. It is still used for the same purposes as in antiquity, being manufactured into cordage, shoes, matting, baskets, nets, mattresses, sacks, etc. Cables made of esparto are said to be excellent; being light, they float on the surface of the water, and are not, therefore, so liable as hempen cables to be cut or injured by a foul bottom. They are exclusively made use of in the Spanish navy. Esparto is largely consumed in the manufacture of *alpergates*. These are light shoes worn by the Valencian peasantry, having plated soles made either of esparto or hemp, but principally of the former. They are extremely cheap and commodious in hot climates; and besides being in extensive demand at home, used to be exported in immense quantities to both Indies; but since the emancipation of Spanish America, this trade has greatly fallen off. The Spanish peasantry have attained to wonderful dexterity in the manufacture of esparto. "After having soaked the rush in water, the women and children, without either wheel or spindle, contrive to twist two threads at the same time. This they do by rubbing them between the palma of their hands, in the same manner as a shoemaker forms a thread upon his knees, with this difference, that one motion gives the twist to each thread, and, at the same time, unites them. To keep the threads asunder, the thumb of the right hand is interposed between them; and when that is wanted for other purposes, the left thumb supplies its place. Two threads being thus twisted into one of the bigness of a large crow-quill, 46 yards are sold for little more than $\frac{1}{4}$ d., the materials being worth about a fifth part of the price."—TOWNSEND'S *Travels in Spain*, vol. iii., p. 177; see also p. 129; FISCHER'S *Picture of Valencia*, Eng. ed., p. 92, and p. 57, etc.

Essence D'Orient, the name of a pearly-looking matter procured from the blay or bleak, a fish of the genus *cyprinus*. This substance, which is for principally at the base of the scales, is used in the manufacture of artificial pearls. A large quantity of the scales being scraped into water in a tub, are there rubbed between the hands to separate the shining stuff which subsides on repose. The first water being decanted, more is added with agitation till the essence is thoroughly washed from all impurities; when the whole is thrown upon a sieve; the substance passes through, but the scales are retained. The water being decanted off, the essence is procured in a viscid state, of a bluish-white color, and a pearly aspect. The intestines of the same fish are also covered with this beautiful, glistening matter. Several other fish yield it, but in smaller proportion. When well prepared, it presents exactly the appearance and reflections of the real pearls, or the finest mother of pearl; properties which are probably owing to the interposition of some portions of this same substance, between the laminae of these shelly concretions. Its chemical

nature has not been investigated; it putrefies readily when kept moist, an accident which may, however, be counteracted by water of ammonia. See PEARLS.

Essential Oils, or Volatile Oils. Under this term are included all those peculiar compounds obtained by distilling vegetable substances with water, and which pass over along with the steam, and are afterward condensed in the liquid or solid form. They appear to constitute the *odoriferous* principles of vegetables. Their specific gravity fluctuates on either side that of water; they are very sparingly soluble in water, and these solutions constitute the *medicated waters*; rose, peppermint, and other waters being such solutions of the respective essential oils. They dissolve in alcohol and form *essences*, many of which are used as perfumes. When these oils are pure, they evaporate from paper when held before the fire; but if adulterated with fixed oils, they leave a greasy stain, and seldom dissolve perfectly in alcohol. The more expensive of these oils are frequently adulterated with the cheaper ones, and this fraud can only be detected by an experienced nose. Their chief use is in perfumery, on account of their odor, and in medicine they form valuable stimulants. They are inflammable, and are, with few exceptions, compounds of hydrogen, oxygen, and carbon. The essence of turpentine, of lemons, and a few others, are *hydrocarbons*.

Establishment of the Port, a term used by writers on the tides, to denote the interval between the time of high water at any given port and the time of the moon's transit immediately preceding the time of high water, when the moon is in syzygy; that is, at the new or full moon. This interval is influenced by local circumstances, and consequently different at different places. See TIDES.

Estrich, or Estridge (Fr. *Ducet d'astruche*; It. *Penna natta di strozzo*; Sp. *Plumazo de ostruz*; Lat. *Strathionunn pluma molliore*), is the fine, soft down which lies immediately under the feathers of the ostrich. The finest is used as a substitute for beaver in the manufacture of hats, and the coarser or stronger sort is employed in the fabrication of a stuff which resembles fine woolen cloth. Estridge is brought from the Levant, Italy, and other parts of the Mediterranean.

Ether (Gr. *athyr*). In chemistry this term is applied to a highly volatile, fragrant, inflammable, and intoxicating liquid, produced by distilling a mixture of equal weights of sulphuric acid and alcohol. When these liquids mutually act on each other, a series of complicated changes ensue, which terminate in the conversion of alcohol into ether.

Euphorbium (Ger. *Euphorbiengummi*; Lat. *Euphorbium*; Fr. *Euphorbe*; Arab. *Akal-safzah*), the produce of a perennial plant, a native of Africa, and of many parts of India, etc. It is a concrete gum resin; is inodorous; when first chewed has little taste, but it soon gives a very acrid, burning impression to the tongue, palate, and throat, which is very permanent, and almost insupportable. It is imported in serons, containing from 100 to 150 lbs. It is in small, hollow, forked pieces, often mixed with seeds and other impurities.—TROTTER'S *Dispensatory*.

Euphrates, the most considerable river of western Asia, is formed by the junction of two great streams rising in the mountains of Armenia, the Euphrates of Erzeroum, and uniting in about N. lat. 39°, E. long. 39°. The Frat or northern branch has its principal sources about 20 miles north-east of the town of Erzeroum; and the Murad, on the north declivity of the Arghi-dagh mountains, 45 miles north-east from the nearest point of Lake Van. The Euphrates flows first to the south, but, being driven westward by the Anti-Taurus and Taurus mountains, it works its circuitous way through narrow passes and over cataracts, until, breaking through a defile formed by the eastern extremity of Mons Amanus (Alma-dagh) and the north-western extremity of Mons Taurus, it reaches the

plain country between Syria, and length, after the Gulf. In rich, alluvial flows or is fertility on the Euphrates near to the distance of 300 miles. Although the Euphrates distance of 300 miles from the point of confluence with the Tigris; from 24 to 100 miles from 3 to 4 miles distance between the mountains, as it forces its way through barriers, it is at several points low enough in autumn, upper portions of the range high brushwood succession of towns on its banks, Bir, Ghaber, Hit, Millah, scenery also greatly heightened by the frequent irrigation which are a when fire-wood and prove the thickly inhabited to Babylon; the only kind is cultivated and interspersed with frequent the above, the of which they are 30 miles below villages, situated toward Lemnir; irrigation both banks and fringed with of luxuriant the Gulf. At on wania is the erto majestic lower; and 9 arates into two that of Danial dating the century Lemnir marsh with June. Below the Euphrates and turning to Tigris, thence name of the S in this last part

plain country not far from Samosata (Sumeisat). It then winds south and south-east, passing the north of Syria, and the north-east of Arabia Deserta, and at length, after many windings, unites with the Tigris, and thus united, finds its termination in the Persian Gulf. In conjunction with the Tigris, it forms the rich, alluvial lands of Mesopotamia, over which it flows or is carried by canals, and thus diffuses abroad fertility and beauty. At Baghdad and Hillah (Babylon) the Euphrates and Tigris approach comparatively near to each other, but separate again, forming a kind of ample basin, till they finally become one at Kurna. Although occasionally much more, the breadth of the Euphrates varies between 200 and 400 yards, but for a distance of 60 miles through the Lemlun marshes, the main stream narrows to about 80 yards. The general depth of the Upper Euphrates exceeds 8 feet. In point of current it is for the most part a sluggish stream; for, except in the height of the flooded season, when its flow approaches 5 miles an hour, it varies from 2½ to 8½, with a much larger portion of its course under 3 than above. Its general description for some distance below Erzingan, is that of a river of the first order, struggling through high hills, or rather low mountains, making an exceedingly tortuous course, as it forces its way over a pebbly bed, from one natural barrier to another. As it winds round its numerous barriers, it carries occasionally toward each of the cardinal points a considerable body of water; and is shallow enough in some places for loaded camels to pass in autumn, the water rising to about 4½ feet. The upper portion of the river is inclosed between two parallel ranges of hills, covered for the most part with high brushwood and timber of moderate size, having a succession of long, narrow islands. The principal towns on its banks are Samsat, Haaroum, Romkala, Bir, Ghabar, Deir, Rava, Anah, Hadisa, El Oes, Jibba, Hit, Hillah, Lemlun, Kurmah, and Basrah. The scenery above Hit, in itself very picturesque, is greatly heightened by the frequent recurrence of ancient irrigating aqueducts, beautiful specimens of art, which are attributed by the Arabs to the Persians when fire-worshippers; they literally cover both banks, and prove that the borders of the Euphrates were once thickly inhabited by a highly civilized people. From Hit to Babylon the black tent of the Bedouin is almost the only kind of habitation to be seen. This distance is cultivated only in part; the rest is desert, occasionally interspersed with clusters of date-trees. In descending, the irrigating cuts and canals become more frequent. Babylon is encircled by two streams, one above, the other below the principal ruins; beyond which they unite and produce abundance. For about 30 miles below Hillah both banks have numerous mud villages, shaded by date-trees: to these succeed huts formed of bundles of reeds. The country lower down toward Lemlun, is level and little elevated above the river; irrigation is therefore easy; in consequence, both banks are covered with productive cultivation, and fringed with a double and nearly continuous belt of luxuriant date-trees, extending down to the Persian Gulf. At one mile and a half above the town of Dewania is the first considerable offshoot from this hitherto majestic river; another takes place 22 miles lower; and 9 miles further, at Lemlun, it again separates into two branches, forming a delta not unlike that of Damietta, and when the river is swollen, inundating the country for a space of about 60 miles in width, with a shallow sheet of water, forming the Lemlun marshes, nearly the whole of which is covered with rice and other grain, when the river recedes in June. Below Lemlun the Tigris sends a branch to the Euphrates, which is thus increased in its volume; and turning to the east, receives the chief branch of the Tigris, thence running in a single stream, under the name of the Shat-el-Arab, as far as the Persian Gulf. In this last part the river has a depth of from 3 to 5

fathoms; varies in breadth from 500 to 900 yards, and presents banks covered with villages and cultivation, having an appearance at once imposing and majestic. The length of the entire stream is 1,400 miles. It is very abundant in fish. The water is somewhat turbid, but when purified, is pleasant and salubrious. The Arabians set a high value on it, and name it Morad Sou; that is, Water of Desire or Longing. The river begins to rise in March, and continues rising till the latter end of May. The consequent increase of its volume and rapidity is attributable to the early rains, which, falling in the Armenian mountains, swell its mountain tributaries; and also to the melting of the winter snows in those lofty regions. About the middle of October the Euphrates has reached its lower ebb, and ceasing to decrease, becomes tranquil and sluggish.

The expedition sent out by the British government under the direction of Colonel Chesney, navigated the Euphrates in 1830 from Bireh-jik to its estuary, a distance of 1,117 miles; and besides throwing much light on a country then very imperfectly known to Europeans, proved that there exist no serious obstacles to the navigation of that river by moderate-sized steamers thus far; and even for 88 miles above Bireh-jik to Beles, an important station in a commercial point of view.—E. B.

Europe, one of the great divisions of the globe. On a first view Europe appears to be less favored by nature than the other quarters of the globe over which it has obtained so great an ascendancy. It is much smaller in extent; its rocky and mountainous surface does not admit of those noble rivers, like inland seas, which lay open the remotest regions of Asia and of America to the commerce of the world. Its vegetable productions are neither so various nor so exuberant; and it is poorly supplied with the precious metals, and with many of those commodities on which mankind set the greatest value. On the other hand, the climate of Europe, if it nourishes a less luxuriant vegetation, is of an equal and temperate kind, well adapted to preserve the human frame in that state of health and vigor which fits it for labor, and promotes the development of the intellectual and moral powers. The mountains that intersect its surface are barriers which enabled infant communities to protect themselves from violence, and to lay the foundation of arts, knowledge, and civilization. If it has few large navigable rivers, its inland seas and bays are, from their position and extent, the finest in the world, and have been the means of creating and nourishing that commercial spirit which has been one great source of its improvement. Though comparatively deficient in gold and silver, it is abundantly supplied with those useful metals and minerals which minister still more essentially to the wants of civilized life. Its apparent defects have become the source of real benefits, and the foundation of its grandeur. The disadvantages of its soil and climate have excited the industry of its inhabitants, given them clearer ideas of property, kindled a resolute spirit to defend their rights, and called into existence that skill and enterprise, which those innumerable arts and inventions, which have enabled the inhabitants of this apparently barren and rocky pronouncement to command the riches and luxuries of all the most favored regions of the globe. It is only in Europe that knowledge and the arts seem to be indigenous. Though they have appeared at times among some of the nations of Asia, they have either stopped short after advancing a few steps, or they have speedily retrograded and perished, like something foreign to the genius of the people. In Europe, on the contrary, they have sprung up at distant periods, and in a variety of situations; they have risen spontaneously and rapidly, and declined slowly; and when they disappeared, it was evident they were but crushed for the time by external violence, to rise again when the

pressure had subsided. It is only in Europe, and among colonies of Europeans, that the powers of the human mind, breaking through the slavish attachment to ancient usages and institutions, have developed that principle of progressive improvement of which it is impossible to calculate the final results. The rudest tribe in Europe, in which this principle has taken root, has a certain source of superiority over the most improved nations of Asia and Africa, where society remains perfectly stationary. If these nations are ever destined to advance in civilization, they must borrow from Europe those arts which she has invented, and which belong to civilized life in every climate. But the tenacious adherence of rude nations to the customs and superstitions of their ancestors, will not allow us to hope that the benefits of civilization will be rapidly diffused in this way. It is more probable that colonies from the older states of Europe will multiply as the population becomes more and more redundant; and that these colonies will carry the arts and knowledge, the language and manners, of Europe with them, to the other quarters of the world. From prejudices on both sides, it is found that two races, in very different stages of civilization, do not readily amalgamate; and it is therefore probable that the feeble inhabitants of these countries, like the American Indians, will be gradually displaced by the continual encroachments of the more energetic races of Europe.

Europe is bounded on the N. and W. by the Arctic and Atlantic Oceans; on the S. by the Mediterranean, the Black Sea, and Mount Caucasus; on the E. by the Caspian Sea, the river Ural, and the Uralian Mountains. The greatest length of the continent is from Cape St. Vincent to the Sea of Kara, in the direction of N. E. and S. W., and is 3490 English miles. Its greatest extent from N. to S. is from Cape Matapan to Cape North, 2420 miles. The superficies of Europe, including the Azores, Iceland, Nova Zembla, and all its other islands, is 3,700,000 English, or 2,800,000 geographical square miles; and the length of its coast line is about 16,000 miles.

Climate.—The climate of Europe is distinguished by two peculiarities. It enjoys a higher mean temperature than any of the other great divisions of the world in the corresponding latitudes; and it is not subject to such violent extremes of heat and cold. These advantages it owes chiefly to its numerous seas, inland bays, and lakes, which render its temperature similar to that of islands; and partly also, according to Humboldt, to its situation at the western extremity of the greatest range of dry land on the surface of the globe; the western sides of all continents being warmer than the eastern. Europe lies almost entirely within the temperate zone, not more than one fourteenth part of its surface being within the arctic circle. Only a very small part of it is uninhabitable from cold, and it nowhere suffers from excessive heat. The mean temperature at its southern extremity, in the latitude of 36°, is about 66° of Fahrenheit; and at Cape North, in the latitude of 71°, where the mean temperature is 32°, the cold is not greater than in the latitudes of 55° or 56° on the east coasts of Asia and America. Hence Europe is habitable at a higher latitude by 12° or 14° than either of these continents.

Temperature.—There is a difference of the same kind between the temperature of the sea-coasts of Europe and the interior. In islands, and on the sea-coast, the mean temperature of the year is higher, and the heat is more equally distributed through the different seasons. As we advance from the coast eastward the mean annual temperature diminishes, but the heat of summer and the cold of winter increase. Thus London has the same mean annual temperature as Vienna, but it has the summer of St. Petersburg, and the winter is warmer than at Milan. The Mediterranean, the Baltic, and inland lakes, produce the same effect as the ocean, in an inferior degree. The following table

shows, I. The temperature of the year, and the various seasons, in places having the same latitude; II. The different distribution of heat through the various seasons in places having the same mean annual temperature.

The mountains of Europe are more numerous in proportion to its extent than those of the other great continents, but they are of less elevation than the mountains of America and Asia. The highest and the most extensive chains in Europe run generally in the direction of east and west, and are placed near its southern shores. The central mass of the Alps, with which all the other mountains in the south of Europe are connected, forms the summit of the continent, and determines the position of the surface and the courses of most of the rivers.

Rivers.—Europe is well watered. Its rivers, but they are mere brooks compared with the mighty streams of Asia and America, and, from the unevenness of the surface, afford in general no great extent of inland navigation. The Danube, the largest river that is entirely in Europe, is about 1500 miles in length, and drains an area of 370,000 square miles. But the Amazon, though only twice the length of the Danube, drains a surface seven times as large, and equal to four fifths of the continent of Europe; and, as the quantity of rain that falls in tropical countries is much greater than in northern latitudes, it is probable, notwithstanding the increased evaporation there, that the Amazon conveys more water than all the rivers of Europe put together. If we divide the length of the Danube into a hundred parts, the length of the principal rivers of Europe, expressed in these parts, will be as follows: Danube 100; Volga, 130; Dnieper, 72; Don, 69; Rhine, 49; Elbe, 42; Vistula, 41; Loire, 37; Tagus, 32; Oder, 31; Rhone, 30; Seine, 23; Po, 21; Tiber, 10; Thames, 9.

The courses of the great rivers show the fall of the country through which they flow, but it would be absurd to take the average of the fall per mile from the measurements of their whole lengths, for, with the exception of the Volga, and other rivers of Russia, the early parts of their respective courses are among mountains, or in elevated valleys, where, and from which, the fall is very rapid; and it is only when taken from the points where they leave their mountain cradles and reach the plains, that such an average will truly indicate the extent and degree of the general slope of the continent. The source of the Volga is only about 560 feet above the level of the Caspian Sea, into which it flows, and the length of its course being at least 2000 miles, without any serious rapids, the average of its fall is consequently very regular, and little more than three inches a mile; but, the direct distance being only 900 miles, the slope of the country exceeds seven inches a mile. The source of the Danube, in Svanbia, is about 2176 feet above the level of the Black Sea; but its fall is in several places very rapid, particularly between Passau and Vienna, and at the *Irongate*, through which it passes from the plains of Hungary to the low level of Wallachia. The average fall, therefore, of such a river would be a most fallacious index of the configuration of the whole length of country through which it flows. Its course is indeed through a series of terraces, separated by deep falls. The sources of the Rhine, in the heart of Switzerland, have an elevation of more than 7000 feet,

but when ready fall it leaves and even nosity, fall burg, a dis over, of its about one nen, or sou but the riv that, after Bohemia, is 280 feet. is less than of the Oden fallen to 37 its course is tion of the to learn, but Cracow, to the same as Few of t ance as me Volga becom its source, a tance of mo the river. so many as stream; but it is of no u than the pro around the The Volg rivers and la interrupted Sea, the Hla course of 900 nowhere navi The Dnieper, course of 100 to Kiel; but, with rocks a navigable co inland provin cut off. but when it reaches the Lake of Constance it has already fallen to 1300. From that lake to Basle, where it leaves the mountains, it falls more than 500 feet, and even further down it still flows with great impetuosity, falling 400 feet more before it reaches Strasburg, a distance of only 70 miles. The average, however, of its fall from the latter city to the sea is only about one foot a mile. The elevation of the *Eldbrunnen*, or sources of the Elbe, in Bohemia, is 4200 feet, but the river falls so rapidly, within a short distance, that, after passing the northern mountain border of Bohemia, its elevation is found to be, at Dresden, only 280 feet. The average fall from that point to the sea is less than a foot a mile. The elevation of the source of the Oder is 1705 feet, but at Breslau it has already fallen to 370, and the average fall of the remainder of its course is likewise about a foot a mile. The elevation of the source of the Vistula we have not been able to learn, but as it is navigable from Podgorze, near Cracow, to the sea, its average fall is probably much the same as that of the Elbe or the Oder.

Few of the rivers of Europe are of much importance as means of communication and transit. The Volga becomes navigable at Rief, about 70 miles from its source, and so continues to the Caspian Sea, a distance of more than 2000 miles, following the course of the river. It is the great highway of Central Russia, so many as 5000 loaded boats annually descending its stream; but as it ends unfortunately in an inland lake, it is of no use for the transport of other foreign wares than the produce of the sandy and barren regions that surround the Caspian.

The Volga is so connected with the other great rivers and lakes of Russia by canals, that there is uninterrupted navigation from the Baltic to the White Sea, the Black Sea, and the Caspian. The Don has a course of 900 miles, but has so many shallows as to be nowhere navigable for large or sharp-bottomed vessels. The Dnieper, the next largest river of Russia, has a course of 1000 miles, and is navigable from Smolensk to Kiev; but, further down, its channel is so obstructed with rocks and falls, for a space of 150 miles, that navigable communication between the sea and the inland provinces through which it flows is completely cut off. The Danube becomes navigable at Ulm, 1500 miles from its mouth; but between Passau and Vienna, it flows among mountains, and navigation is rendered difficult by the rapidity of the stream, and the frequent occurrence of rocks, shoals, eddies, and whirlpools; and, in leaving Hungary, through a narrow gorge of 60 miles in length, which it has cut for itself across the mountains that inclose that country, it falls in a series of rapids, the lowest of which is the famous Irongate, through which the stream rushes with great rapidity in a narrow channel, between stupentous rocks, ending in a series of whirlpools, eddies, and smaller falls. Here navigation was considered to be effectually stopped; but we have just learned (January, 1855) that steamboats have at last been constructed so as to be considered capable of passing these rapids in safety, and that they will be immediately put upon the river. It is also proposed to cut a channel through the rocks 1200 yards long, 40 feet wide, and 6 feet deep, which will give plenty of additional depth for the steamers and other loaded vessels. The number of workmen to be employed in this gigantic undertaking is 2000, and the work will extend over a period of 6 years, at a cost of 2,000,000 of florins. So numerous, besides, are the windings of the Danube through the comparatively level plains of Hungary, that between Presburg and the Black Sea, a direct distance of 650 miles, the course of the river actually measures 1200. The Rhine is navigable above the lake of Constance, but the navigation is stopped by the Rheinfall near Schaffhausen. From that point to Basle it is not very easy or always practicable; to Strasburg it is not free from danger; but

further down the river becomes a fine navigable stream, not quite free indeed from difficulty and risk, particularly in the deep and narrow gorge which it passes through between Bingen and Coblentz; but below Coblentz the channel is uninterrupted and free from danger. Between the Rhine and the Danube there is a navigable communication by means of the rivers Meyn and Altmuhl, which are connected by the Ludwig's canal in Bavaria. The Elbe, and its tributary, the Moldau, are both navigable even in Bohemia, and from their confluence to the sea there is no serious interruption. The Oder is navigable downward from Silesia, and is of the utmost importance as the channel of conveyance for the productions of that country to the sea. Breslau, Frankfurt, and Stettin, three of the principal commercial towns of Prussia, stand on its banks, and it is connected by canals with the Vistula, the Havel, and the Spree. The Vistula is, like the Oder, the principal channel of transit between the Baltic Sea and the Polish provinces of Austria, Russia, and Prussia, and begins to be navigable at Podgorze, near Cracow.

These are the only rivers that seem to require notice as navigable streams in a general survey of Europe, although there are many others of great importance to the several countries in which they are found, as the Thames, the Tyne, the Clyde, the Rhone, the Po, etc.

The islands of Europe, including Nova Zembla and Iceland, occupy a space equal to 280,000 square miles, or 1-11th part of the surface of the continent; and of this space the area of the British Isles amounts to rather less than $\frac{1}{4}$. The Black Sea is the only large sea connected with Europe in which there are no islands worthy of notice.

Seas.—The Mediterranean, the noblest inland sea in the world, forms the southern boundary of Europe, separating it from Africa, and partly also from Asia. It may be considered as the bottom of a vast basin formed by the Pyrenees, Alps, Balkans, Taurus, Libanus, and Atlas. These mountains are everywhere near its shores, which are consequently narrow and much inclined. Hence there are no such extensive plains as Hungary or Poland near the coast of this sea, and hence, also, no very large rivers fall into it except the Nile; and altogether it receives a smaller quantity of water from rivers than the Black Sea or the Baltic, though six times larger than either. Its length is about 2350 miles, its breadth is extremely various, and its surface (exclusive of the Black Sea) is nearly equal to 1,000,000 of square English miles, or something less than $\frac{1}{4}$ part of the continent of Europe. It is generally of great depth; and its numerous islands, which have uniformly a rocky surface, appear to be the summits of marine mountains.

Baltic.—The Baltic, the greatest inland sea that is entirely in Europe, is about 1200 miles long, of very unequal breadth, and presents a surface of 175,000 square miles, exclusive of islands. It occupies the bottom of another large basin, 850 miles in breadth, and 1400 in length, extending from the Norwegian mountains on the north and west, to the Carpathians on the south, and to the high lands on which the Dnieper, the Don, and the Volga rise, on the east. This basin, equal to $\frac{1}{4}$ of the surface of Europe, has a very different character from that of the Mediterranean. The mountains are not very elevated, and are so placed as to leave a large tract of land, very little inclined, between them and the Baltic, over which, especially on the south side, many considerable rivers flow with a gentle current. Hence the country round the Baltic is much more level than round the Mediterranean; lakes are numerous in the low grounds, from the want of declivity; the sea itself is comparatively shallow, and receiving a much greater quantity of river water, it is much less salt. The commerce of the Baltic is annually interrupted by the ice, which endures 4 months in the gulfs of Bothnia and Finland

The whole of this inland sea has sometimes been frozen over for a short time, but this is of rare occurrence. See BALTIC.

Black Sea.—The Black Sea, which belongs only partly to Europe, is 700 miles long and 380 miles broad, and, including the Sea of Azof, presents a surface of 170,000 square miles, being almost of the same magnitude as the Baltic. It derives 4-5ths of its water from Europe, and is curiously distinguished from the other seas of this quarter of the globe, by its being almost totally destitute of islands.

White Sea.—The White Sea is 450 miles in length, of a very irregular figure, and occupies a space equal to 35,000 square miles. It receives some considerable rivers, but is frozen during six months of the year.

Lakes.—The lakes of Europe are numerous, and are of two kinds: those which lie in cavities at the foot of high mountains, and which are generally deep, such as the lakes in the Alps, on the east side of the Norwegian mountains, and among the mountains of England and Scotland; and those which are formed in level countries from the want of a sufficient declivity to carry off the water, such as the lakes in Finland, Poland, and Brandenburg. 4-5ths of the lakes of Europe are in the country round the Baltic.

Vegetable Productions.—The soil of Europe has not the extremes of luxuriance or sterility which belong to the soil of the other great continents. If it does not yield the rich fruits of tropical climates, it is not deformed by burning sands like Africa, or by pestilential swamps like America. It does not pour forth its riches spontaneously, but, soliciting the care and the labor of man, it requires his industry with what is necessary to supply his wants; and, by exercising and sharpening his powers of mind, has given birth to those arts which place the productions of the most favored climates at his disposal. Many of the plants which have been domesticated in Europe are natives of distant countries. The vine, the olive, and the mulberry are said to have been brought from Syria by the Greeks; the Arabians introduced cotton; malze was received from the Indian tribes of America; the walnut and the peach come from Persia; the apricot from Aruensis, and the sugar-cane and orange from China. There are not very many plants belonging to the tropical regions that absolutely refuse to grow in Europe, but an enlightened economy finds other productions more profitable. Besides sugar and cotton, the banana, the orange, citron, fig, pomegranate and date, grow in the south of Europe. But the more delicate fruits are confined to southern latitudes, and disappear one by one as we advance northward. And it is worthy of remark, that the zones in which they grow generally follow the lines of equal summer heat,

and run obliquely across the continent in the direction of south-west and north-east. If a line be drawn on the map from Hrest to Konigsberg, skirting the southern shores of the English Channel and the Baltic, the zones that limit the growth of different plants will run nearly parallel with this line. This holds generally in the south and middle of Europe; but in the extreme northern parts, and especially with regard to plants that require a moderate heat continued for a considerable time, the lines that limit the growth of certain vegetables seem to follow a different course, and decline toward the south as we advance eastward, in consequence of the increasing severity and length of the winter. It is scarcely necessary to say that the zones traced as proper for different plants, only mark the limits within which their cultivation is found advantageous. Most of them will grow beyond these limits; but they either require some peculiar advantages of soil and situation, or they are less profitable than other kinds of produce.

The sugar cane, one of the most desirable tropical plants, grows in Sicily and the south of Spain, in the latitude of 37° and 38°. The culture of it,

which was once extensive in the latter country, has not yet been entirely abandoned, even since sugar was procured from the West Indies. Cotton is cultivated in the south of Spain on a small scale; to a greater extent in Sicily, the south-east angle of Italy, and in Greece and its isles, as high as the latitude of 41°; we find it again at Astracan, in the latitude of 46°. The orange and the lemon come to perfection in the west of Europe, only in the countries to the south of the Pyrenees and Apennines, within the latitude 43° in Spain, and 44° in Italy. The olive does not succeed on the west coast of France in the latitude of 43°, but grows as far north as 44° or 45° on the east of France, and in Italy. Attempts to raise it at Astracan, in latitude 46°, have not succeeded, on account of the rigor of the winter. The fig and the pomegranate, which accompany the olive in the west of Europe, are found in the Crimea in the east, at the latitude of 46°, where the olive will not grow, a proof that these trees bear the winter cold better. The climate proper for malze is found to terminate on the west coast of France at 45½°; on the Rhine at 49°; on the Elbe at 50° or 51°. Rice has nearly the same geographical range, but requires a peculiar soil and situation. The culture of the vine extends as far north as the latitude of 47½° on the Atlantic coast; on the Rhine to 50½°; and on the Oder to 52°. In Russia it grows as far north nearly as 52°, but is not cultivated beyond 50°. The mulberry generally accompanies the vine. The limits of the culture of the common cerealia are not so well defined, as the necessities of man oblige him to raise corn under the most unfavorable circumstances. In a general point of view, however, the parallel of 57° or 58° may be regarded as the northern limit of the cultivation of wheat in Europe. It is raised as far north as 60° or 61° in Finland, but only in some favored spots. In Russia, generally, it is chiefly confined to the provinces under the latitude of 57°. The hardier cerealia, rye, oats, and barley, are cultivated in some sheltered situations on the coast of Norway, as high as the latitude 69° 55'. But on the east side of the Norwegian mountains these grains scarcely ripen in the latitude of 67° or 68°; and farther east, in Russia, it has been found impossible to carry cultivation of any kind beyond the latitude of 60° or 62°. Barley, which accommodates itself better than any other grain to these high latitudes, by shortening the period of its growth, is sown and reaped within the space of seven or eight weeks. But the introduction of potatoes promises to be of vast advantage in these cold regions, as this plant thrives and yields a produce of 30 or 50 fold in places where grain often will not ripen. Peaches and apricots succeed with much care as far north only as the latitude of 50° in Russia; melons as far as 52°. The plum and the cherry grow wild as far north as 55°, but are carried farther by cultivation. Fruit trees and the oak terminate in Sweden, at Gelle, in the latitude of 61°; but the pine and the birch advance within the arctic circle; and the former grows to the height of 60 feet in the latitude of 70°. The blackberry and the whortleberry grow in Lapland, and the gooseberry even in Greenland. Tobacco is extensively cultivated over the greater part of the continent of Europe, from Sicily to Sweden. Flax and hemp have as extensive a range as corn, but they are raised in the greatest perfection between the latitudes of 45° and 60°.

We have stated that the superficial extent of Europe is about 3,700,000 square miles. If we draw a curved line from a point in the Uralian mountains, about the latitude of 60° or 61°, to the west coast of Norway, in the latitude of 69°, passing through the Lake Onega, and a little to the northward of the Gulf of Bothnia, this line will mark the extreme limits of cultivation, and will cut off a space equal to 550,000 square miles, or nearly 1-7th of Europe. The space

cut off, however, is not entirely useless, as a part of it produces pasturage and wood. The cultivation of rye, oats, and barley, is confined to the regions south of this line, and includes more than 5-6ths of Europe; but in the northern parts of this zone only a very small proportion of the land will bear corn. The region adapted to the cultivation of wheat comprehends about 4-7ths of Europe, and includes all the densely-peopled parts. The region of the vine extends over 3-7ths of Europe.

Minerals.—Europe, in proportion to its extent, is probably richer in mineral wealth than the other quarters of the globe. It contains all the metals except platinum; and though it affords gold and silver only in limited quantities, iron, copper, lead, with coal and salt, commodities of greater value to society, are abundantly and widely distributed. The mountains, consisting of primary and transition rocks, are the great depositories of these mineral treasures. Iron is found in all the chains of mountains in Europe. The richest mines are in the Dovrefield, or Scandinavian Alps. But rich mines are also found in the Alps of Styria, Carinthia, and Bavaria; in the Pyrenees, the Vosges, the Cevennes, the coal districts of Britain, the Urals, the Carpathians, the Hartz, and many other places. Copper is also widely distributed, though less abundant than iron. The richest mines are in Hungary, in the Carpathian mountains. It abounds also in the Saxon and Bohemian mountains, in the Dovrefield, the Urals, the north of England, and the Alps; and it is found in the Vosges, the Pyrenees, and other mountains of Spain, in the north of Germany, and in Tuscany.

Lead exists in the Alps, Carpathians, Pyrenees, Cevennes, Vosges, the British mountains, and the Uralian chain. Tin is found only in a few places in Europe. The richest mines are in Cornwall; next to these the mines in the Erzgebirge. It is also found in Hungary and Spanish Galicia. Mercury, like tin, is confined to a few places. The mines of Idria, in Austria, which yield 8000 or 10,000 quintals per annum, are the most productive in Europe. There are also considerable mines at Deux Ponts, in the Palatinate, in the Spanish province of La Mancha, and in Transylvania. Gold is widely diffused through Europe, but generally in such quantities as not to repay the expense of working. It is wrought, however, in the Carpathians, the Urals, the Dovrefield, and the Alps. Anciently there were rich mines of gold in Spain and Greece. Silver is more abundant than gold, though less widely distributed. There are productive mines of this metal in the Erzgebirge, the Carpathians, the Urals, the Norwegian Dovrefield, and in Sardinia. It is found also in the Alps, the Vosges, and the Sierra Morena.

Of coal, the richest mines are found in the north and west of England. It abounds also on both sides of the middle region of Scotland; in Ireland; in the Netherlands; in one fourth part of the French territory; and occurs more sparingly in Saxony, Hanover, Denmark, Sweden, Russia, Hungary, Holandia, Moravia, Silesia, Bavaria, Austria, Franconia, Westphalia, Swabia, Catalonia, and some other parts of Spain, in Portugal, and in Sardinia. After Britain, France and Belgium are the countries in Europe best supplied with this mineral.

Salt is procured from the waters of the ocean, and in the interior of Europe, from numerous salt mines and salt springs. The most productive salt mines in Europe are those in Poland, on the north side of the Carpathians, and those in Salzburg, on the north side of the Alps, both of which belong to Austria. There are also extensive depositories of mineral salt in Transylvania and Hungary; in Valencia, Navarre, and Catalonia, in Spain; in Cheshire, in England; and in Bavaria, in Switzerland. Salt springs are numerous along the sides of primitive mountains in most coun-

tries of Europe. The most extensive salt mines of Russia are in Asia; but very large quantities of salt are collected from the *tuzlas*, or salt lakes in the Crimea.

Antimony, cobalt, zinc, manganese, sulphur, alum, and a great variety of other mineral productions, are found in Europe; but it is unnecessary to specify their localities. It is observed that the Alps, Pyrenees, Carpathians, and other mountain chains which run east and west, are richest in metals on the south side; while the Dofrines, Urals, and others which run north and south, are richest on the east side. Of the mountain chains of Europe, the Apennines are the poorest in metals, the Carpathians probably the richest.

The progress of improvement tends to level all distinctions among states, but those founded on the extent of their natural resources. Capital, skill, intelligence, and all acquired advantages, tend to an equilibrium. When Europe was overrun with barbarism, the city of Venice, by its commercial wealth, was a counterpoise to two or three of the great monarchies of the Continent. The discovery of America, and of a passage by sea to the East Indies, gave a new direction to commerce, and undermined the greatness of that city. The Dutch Republic rose by its freedom and industry, and was able, in the time of Charles II., to dispute the empire of the sea with the combined powers of England and France. But England increased her commerce, and improved her constitution; and having a larger and more fertile territory, as well as a greater population, she obtained at length the ascendancy over Holland, deprived her of the empire of the sea, and stripped her of most of her colonies. At the beginning of the 17th century, Spain and Turkey were the first powers in the west and east of Europe, and inspired their neighbors with the dread of conquest. Sweden ruled with undisputed sway in the north; and Russia, now so formidable, was scarcely known. Spain, under a better government, might recover a part of her influence; but the Turkish empire seems near its dissolution; and the importance of Sweden and Holland is gone irrevocably, in consequence of the growing strength of the neighboring powers. The extent of territory and the immense natural resources of Russia must, in the end, render her highly dangerous to all the other powers of Europe, if the empire do not fall to pieces from its own weight, or get into discord from the vices of its government, or the barbarism, ignorance, and corruption of its people.—E. B.

By means of steam-vessels, communication between all the maritime regions of Europe has been rendered easy and certain, while the seaboard has been connected with the inland regions by railways running in all directions. During the latter half of the last century, and the earlier part of the present, England was covered with a net-work of canals, forming navigable communication between all her principal towns and rivers. Belgium and Holland have long been famous for their canals. In France, likewise, the great rivers were connected in the same way; and the great canal of Languedoc formed a navigable communication between the Bay of Biscay and the Mediterranean Sea. In Prussia, likewise, and in Russia, the great rivers have been connected by canals; and in Sweden, the Gotha Canal extends from the Cattegat, at Gottenburg, to the Baltic, near Stockholm, through the lakes Wener and Wetter. These very useful means of transport have now, however, been very much, if not entirely superseded by railways. Of these, England is covered with a net-work, as she was with canals; and uninterrupted lines of communication extend from near the Land's End, through Scotland, to the Moray Firth. In Scotland, Ireland, France, and Germany, the principal cities and towns are connected by railways; and in Russia, we understand that one is forming to connect St. Petersburg with Moscow and the Black Sea. In Italy, Milan and Venice are con-

standing armies. Russia, safe from foreign invasion, has long been preparing large armaments for purposes of aggression on her weaker neighbors, and of domination over all the rest; and at last her overt acts of aggression on Turkey have provoked a war with Great Britain and France, who [1854] armed in defense of their ancient ally, the Sultan, and with the view of not only maintaining the balance of power in Europe, but of effectually checking the undigressed attempts of the czars of Russia at universal dominion. In these circumstances, with all Europe arming, or beginning to arm, any numerical statements of their military forces, however approximately correct when written, may have become quite erroneous by the time they are published. The following table, therefore, contains only the declared numbers respectively of the peace and war establishments of the Continental armies, with the exception of those of France, which gives the actual number of men on foot, as stated in the emperor's address to his Legislative Council in December, 1854.

The maritime powers that maintain efficient navies worth notice are, Britain, France, Russia, Austria, Turkey, Sardinia, Netherlands, Denmark, Sweden, and Norway. In December, 1854, the British fleet in commission and actual service, consisted of 142 steamers, and 104 sailing ships, with 63,000 men; that of France, of nearly the same number of vessels altogether, though not so many steamers, with 62,000 men. The Russian fleet, in the spring of 1854 consisted of 52 line-of-battle ships, 48 frigates, and 84 smaller vessels (besides gun-boats), with 9090 guns, and 62,000 men. Austria possessed 104 vessels carrying 712 guns; Turkey, 70 vessels, with 34,000 seamen and 4000 marines; Sardinia, 19 vessels, with 359 guns; the Netherlands, 88 vessels, with 2000 guns and 6180 men; Denmark, 120 vessels, with 883 guns, and 2000 men; Sweden, 74 vessels besides gun-boats; Norway, 19 ships besides gun-boats, with 500 men.

In Europe there are two great national confederacies, the Germanic and the Swiss; but in neither of them is there so close a union of the sovereignties that compose it as there is in the United States of North America. In Germany, indeed, there is no principle of fusing of unity among either princes or people, and their confederation, as such, enjoys neither influence nor respect at home or abroad. In Switzerland, on the contrary, recent circumstances seem to have produced a closer and more intimate union, and given to the federative assembly the authority indispensable to the efficient working of a central government.—E. H.

Exchange, Principles of, by JOHN RAMSAY McCLELLAN, Esq.

In commercial economy, the term "Exchange" is commonly employed to designate that description of mercantile transactions by which the debts of individuals residing at a distance from each other are liquidated without the intervention of money.

The object of this article is to explain the nature of these transactions, and the principles on which they depend. This will be best effected by treating, first, of the exchange between different parts of the same country; and, secondly, of that between different and independent countries.

I. ISLAND EXCHANGE.—Suppose a merchant of London orders his agent in Glasgow to send him a thousand pounds' worth of cottons, and that it does not suit the agent to commission goods of equal value from his London correspondent, the latter may, notwithstanding, be under no necessity of remitting cash to Glasgow in discharge of his debt. Among countries or cities having a considerable intercourse together, the debts mutually due by each other are found, in ordinary cases, to be nearly equal. The Glasgow agent, who has shipped the cottons for London, does not, therefore, transmit the bill drawn by him on his correspondent for their price to London to be cashed, as that would subject him to the expense of conveying the money home to Glasgow; but he gets its value from some other party in Glasgow, who has a payment to make in London on account of tea or some other article bought in that city, and who, unless he could procure such a bill, would be obliged to remit its price in money. The bill on account of the cotton is, therefore, either drawn in favor of the party in London who furnished the tea, or it is drawn in favor of the tea-dealer in Glasgow, and indorsed by him to the former, who, on presenting it to the purchaser of the cottons, receives its value and consequently the price of the cottons, and the price (or part of the price) of his tea, at the same moment. This simple contrivance obviates the expense and risk attending the transmission, first, of money from London to Glasgow, to pay the cottons; and, second, of money from Glasgow to London to pay the tea. The debtor in one is changed for the debtor in the other; and both accounts are settled without the intervention of a single farthing.

The bill drawn and negotiated in such a transaction as this, is termed an *inland* bill of exchange. If the transaction had taken place between London or Glasgow and a *foreign* city, it would have been termed a *foreign* bill of exchange. A bill of exchange may, therefore, be defined to be, "an order addressed to some person residing at a distance, directing him to pay a certain specified sum to the person in whose favor the bill is drawn, or his order."*

The price of bills fluctuates according to their abundance or scarcity compared with the demand. If the debts reciprocally due by London and Glasgow be equal, whether they amount to £100,000, £500,000, or any other sum, they may be discharged without the intervention of money, and the price of bills of exchange will be at par; that is, a sum of £100 or £1000 in Glasgow will purchase a bill for £100 or £1000 payable in London, and vice versa. But if these cities be not mutually indebted in equal sums, then the price of bills will be increased in the city which has the greatest number of payments to make, and reduced in that which has the fewest. If Glasgow owe London £100,000, while the latter only owes the former £90,000, it is clear, inasmuch as Glasgow has a larger sum to remit to London than London has to remit to Glasgow, that the price of bills on London will rise in Glasgow because of the increased demand, and that the price of bills on Glasgow will fall in London, because of the diminished demand. A larger sum would, consequently, be required to discharge a debt due by Glas-

* In mercantile phraseology, the person who draws a bill is termed the *drawer*; the person in whose favor it is drawn, the *resmitter*; the person on whom it is drawn, the *drawee*, and after he has accepted, the *acceptor*. Those persons into whose hands the bill may pass previously to its being paid, are, from their writing their names on it, called *indorsers*; and the person in whose possession the bill is at any given period, is termed the *holder* or *possessor*.

gow to London, and a less sum to discharge an equal debt due by the latter to the former; or, which is the same thing, the exchange would be in favor of London, and against Glasgow. Bills on London would sell in Glasgow at a premium, and bills on Glasgow would sell in London at a discount; the premium in the one case being equal to the discount in the other.

On the supposition that the balance of £10,000, due by Glasgow, depresses the exchange on London one per cent., it appears at first sight that it will cost Glasgow £101,000 to discharge her debt of £100,000 due to London; and that, on the other hand, £80,100 would be sufficient to discharge the debt of London to Glasgow. But a very little consideration will serve to show that this would not be the case. Exchange transactions can not take place between different cities until debtors and creditors of the one reside in the other. And hence, when the exchange became unfavorable to Glasgow, the premium paid by its merchants for bills on London would not go into the pockets of their creditors in the latter, but into those of their neighbors in Glasgow to whom London was indebted, and from whom the bills were purchased. The loss to Glasgow would, therefore, be limited to the premium paid on the balance of £10,000. Thus, supposing that A, of Glasgow, owes B, of London £100,000, and that C, of London, owes B, of Glasgow £90,000, A will pay to B £91,000 for a bill or order on C to pay D £90,000. In this way the £90,000 of London debt at Glasgow will be cleared off; the premium, which is lost by the debtor to London in Glasgow, being gained by its creditor in the same place. If the business had been transacted in London, C, with £89,100, would have purchased of D a bill for £90,000, payable by A; so that, in this case, the gain would have fallen to the share of the debtor C, and the loss to that of the creditor D, both of London. The complexity of real transactions does not affect the principles on which they are founded. And whatever may be the amount of the debts reciprocally due by different places, the only disadvantage under which any of them could be placed by a fall of the exchange would be the unavoidable one of paying the expense of remitting the balance of debt.

The expense of transmitting money from one place to another limits the fluctuations in the exchange between them. If 20s. sufficed to cover the expense and risk attending the transmission of £100 from Glasgow to London, it would be indifferent to a merchant, in the event of the exchange becoming unfavorable to the former, whether he paid one per cent. premium for a bill on London, or remitted money direct to the latter. If the premium were less than one per cent., it would be clearly his interest to make his payments by means of bills rather than by remittances; and that it could not exceed one per cent. is obvious, for every individual would rather directly remit money than incur an unnecessary expense by purchasing bills on London at a greater premium than would suffice to cover the expense of a money remittance. If, owing to the badness of roads, disturbances in the country, or any other cause, the expense of remitting money from Glasgow to London were increased, the difference in the rate of exchange between them might also be proportionally increased. But in every case the extent to which this difference could attain would be limited by, and could not for any considerable period exceed, the cost of remitting cash.

Exchange transactions become more complex when one place, as is often the case, discharges its debts to another by means of bills drawn on a third place. Thus, though London should owe nothing to Glasgow, yet if Glasgow be indebted to London, London to Manchester, and Manchester to Glasgow, the latter may wholly or partially discharge her debt to London by remitting bills on Manchester. She may wholly discharge it, provided the debt due to her by Man-

chester exceed or is equal to the debt due by her to London. If, however, it be not equal to the latter, Glasgow will either have to remit money to London to pay the balance of debt, or bills on some other place indebted to her.

Transactions in inland bills of exchange are almost entirely conducted by bankers, who charge a certain rate per cent. for their trouble, and who, by means of their credit and connections, are able on all occasions to supply the demands of their customers. London, because of its extensive correspondence with other parts of the country, occasioned partly by its immense commerce, partly by its being the seat of government and the place to which the revenue is remitted, and partly by its currency consisting of Bank of England paper, for which the notes of the country banks are rendered exchangeable, has become the grand focus in which the money transactions of the United Kingdom centre, and in which they are all ultimately adjusted. These circumstances, but especially the demand for bills on London to remit revenue, and the far superior value of Bank of England paper, render the exchange between London and other parts of the country invariably in her favor. Bills on London drawn in Edinburgh and Glasgow were formerly made payable at 40 days' date, which was equivalent to a premium of about $\frac{1}{2}$ per cent.; but, owing to the greater facility of communication, this premium is now reduced to 20 days' interest, or to about $\frac{1}{4}$ per cent. Bills for remitting the revenue from Scotland are now drawn at thirty days; previously to 1819, they were drawn at 60 days.

These statements are sufficient to show that, how well soever bills of exchange may be fitted for facilitating the operations of commerce, and saving the trouble and expense attending the transportation of money, mercantile transactions can not be adjusted by their means except in so far as they mutually balance each other. A real bill of exchange is merely an order entitling the holder to receive payment of a debt due by the person on whom it is drawn. It is essential to the existence of such bill that an equivalent amount of debt should be contracted. And hence, as the amount of the real bills of exchange drawn on any number of merchants can not exceed the amount of their debts, if a greater sum be owing to them than they owe to others, the balance must either be paid in money or by the delivery of some sort of commodities. If, as in the case referred to, Glasgow owe London £100,000, while London only owes Glasgow £90,000, a reciprocal transfer of debts may be made to the extent of £90,000. But the Glasgow merchant can not discharge the additional £10,000 by means of bills on London; for, by the supposition, London only owed them £90,000, and they have drawn for its amount. This balance must therefore be discharged by an actual money payment, or by the delivery of some species of produce, or by bills on some third party indebted to Glasgow.

It is not meant by this to insinuate that fictitious bills of exchange, or bills drawn on persons who are not really indebted to the drawer, are either unknown or very rare. In commercial countries bills of this description are always to be met with; but they are a device for obtaining loans, and can not transfer real debts. A bill of London may form a connection with that of Glasgow, and draw bills upon him payable a certain number of days after date, which the latter may retire by selling bills upon A. The merchants who purchase, or the bankers who discount these bills, advance their value to the drawers, who, by means of this system of drawing and redrawing, command a borrowed capital equal to the amount of the fictitious paper in circulation. It is clear, however, that the negotiation of such bills can not assist in transferring and settling the *bona fide* debts of two or more places. Fictitious bills mutually balance each other. Those drawn by London on Glasgow equal those drawn by Glasgow on

London, for the one act is drawn to pay the other—the second destroys the first, and the result is nothing.

The raising of money by means of fictitious bills has been severely censured by Adam Smith, who says it entails a ruinous expense on those engaged in it, and is resorted to only by projectors, or persons of suspicious credit. When fictitious bills are drawn at two months' date, it is common to charge, in addition to the ordinary interest, a commission of half or quarter per cent., which must be paid every time the bill is discounted, or, at least, *six* times a year. The total expense of money raised in this way could not, therefore, supposing the transaction to be always on account of the same individual, and interest 4 per cent., be estimated at less than 54 or 7 per cent. per annum, *ex stamps*; and the payment of so high an interest on borrowed capital, in a country where the ordinary rate of mercantile profit is not supposed to average more than *six* to *eight* per cent., could not fall to be frequently productive of ruin to the borrower. But it seldom happens that, in the negotiation of fictitious bills, the charge for commission falls on one individual only. Loans obtained in this way are usually on account of two or more parties. At one time a fictitious bill is drawn by A of London on B of Glasgow; and, in this case, the latter will, before the bill becomes due, draw upon A for its amount, including interest and commission. At another time, the transaction will be on account of B, who in that case has to pay commission to his friend in London; so that each party may, on the whole, as Mr. Thornton has observed, gain about as much as he pays in the shape of commission.

It is often extremely difficult to distinguish fictitious bills from those which have arisen out of real transactions. Neither does it seem to be of any very material importance. The character and credit of the parties whose names are attached to bills, are the only criteria by which merchants or bankers can judge whether they ought to negotiate them. The circumstances of an individual offering accommodation paper for discount, ought unquestionably, if it be known, to excite suspicions of his credit. But unless in so far as the drawing of fictitious bills may be held to be indicative of overtrading, or of a deficiency of capital to carry on the business in which the party is engaged, there does not appear to be any very good reason for refusing to discount them.

Within the last few years, it has been the practice to grant money orders, payable on presentation at the different post-offices, for sums of £5 and under. These orders cost 3d. for sums of £2 and under, and 6d. for sums between £2 and £5 inclusive; and as they are not paid unless the parties in whose favor they are drawn, or other parties well known to the postmasters by whom they are payable, appear to receive payment, there is no risk of the money getting into improper hands. This system has been found to be a very great accommodation to the public, especially to those having small sums to remit, and has been very extensively resorted to. In 1850, 4,439,713 money orders were issued in the United Kingdom; the aggregate sum transferred by their agency being £8,494,498.

These observations will, perhaps, suffice to explain the manner in which transactions between different parts of the same country are settled by means of bills of exchange. They are, in general, extremely simple. The uniform value of the currency of a single country renders unnecessary any comparison between the value of money at the place where the bill is drawn and negotiated, with its value where it is to be paid; while the constant intercourse maintained among different parts of the same kingdom, and the usual absence of those occurrences by which the intercourse between distant and independent countries is always subject to be interrupted, prevent those sudden fluctuations which frequently arise in the prices of foreign bills of

exchange. We shall, therefore, leave this part of our subject, and proceed to investigate the circumstances which influence the course of exchange between different and independent countries.

II. FOREIGN EXCHANGE.—The price of foreign bills of exchange depends on two circumstances: *first*, On the value of the currency of the place where they are made payable, compared with the value of the currency of the place where they are drawn; and, *secondly*, On the relation which the supply of bills in the market bears to the demand.

If the value of the different coins and moneys which circulate in nations having dealings with each other were invariable, the exchange would be exclusively influenced by circumstances affecting the supply and demand for bills. But, in addition to variations in its cost in particular countries, the weight and fineness of the bullion contained in their coins are liable to all sorts of variations. And it is almost needless to say that the price of bills, as of every thing else, necessarily varies with these variations, increasing when the value of the money in which they are estimated falls, and falling when it increases. But these, it is plain, are merely nominal or numerical variations. They grow out of changes in the standard employed to measure values, and not in the values themselves. It is otherwise, however, with variations of price occasioned by changes in the supply of bills, or in the demand for them; that is, by changes in the payments a country has to make compared with those it has to receive. These are real, not nominal variations, for they affect the values in bills, and not the money in which these values are expressed. And hence the distinctions of *nominal*, *real*, and *computed* exchange. The *first* depends on alterations in the value of the currencies compared together; the *second* depends on the supply of bills in the market compared with the demand; and the *third*, or *computed* exchange, depends on the combined effects of the other two. For the sake of perspicuity we shall treat of these separately.*

III. NOMINAL EXCHANGE.—Bullion being everywhere recognized as the standard currency of the commercial world, the comparative value of the currencies of particular countries depends—*first*, On the value of bullion in those countries; and, *secondly*, On the quantity of bullion contained in their coins, or on the quantity of bullion for which their paper money, or other circulating media, will exchange.

The value of freely produced commodities being commonly proportioned to the cost of their production, including therein the cost of their conveyance from where they have been produced to where they are to be made use of, it follows, were the trade in the precious metals perfectly open, and the commodities produced in different countries about equally well fitted for exportation, that the value of bullion in one, compared with its value in another, would be chiefly determined by their respective distances from the mines. Thus, on the supposition that neither England nor Poland had any article except corn to exchange with the Americans or Australians for bullion, it is evident that the precious metals would be more valuable in Poland than in England, because of the greater expense of sending so bulky a commodity as corn the more distant voyage, and also of the somewhat greater expense of conveying the gold to Poland. Had Poland succeeded in carrying her manufactures to a higher pitch of improvement than England, her merchants might be able, notwithstanding the disadvantage of distance, by exporting commodities possessed of great value in small bulk, the freight of which would be comparatively trifling, to buy bullion on cheaper terms

* Supposing every country to be in possession of its proper supply of bullion, the exchange may be said to be *nominally* affected by the amount of the difference between the market and mint price of bullion, and to be *really* affected by any deviation from par exceeding or falling short of that difference.

than those of England. But when, as is actually the case, the advantages of skill and machinery are on the side of England, another reason is added to that derived from our less distance from the mines, why gold and silver should be less valuable here than in Poland, and why the money price of commodities should be higher.*

Hence, among nations which have attained to different degrees of excellence in manufacturing industry, the value of bullion does not wholly depend on their distance from the mines. But, whatever variations a different progress in the arts may occasion in its value in different countries, it is always less valuable in those into which it is imported than in those in which it is produced. Like every thing else, it is exported to find, not to destroy, its level. And unless its value in Europe exceeded its value in America and Australia by a sum sufficient to cover the expense of its importation, including ordinary profits to the importers, we should not, though the mines in these quarters were infinitely more productive, import from them a single ounce of bullion in the ordinary course of trade. It is obviously incorrect, therefore, to lay it down as a general proposition, "that the par of exchange between two countries is that sum of the currency of either of the two, which, in point of intrinsic worth, is precisely equal to a given sum of the other; that is, contains precisely an equal weight of gold and silver of the same fineness."† For a given quantity of gold and silver is not always, as is here assumed, of the same intrinsic value in different countries. It may differ but little among nations bordering upon or near each other, and which are all destitute of mines. But though, to use a familiar illustration, the value of sugar approaches nearly to a level in the great trading cities of Europe, it can not surely be maintained that its value in the West Indies is as great as in Bordeaux or Liverpool, or that the exchange would be really at par, if a bill, which cost a hundred hogsheds of sugar in London, only brought a hundred in Jamaica. Now, in respect of principle, this is precisely the case with bullion. Though the values of gold and silver, compared with corn, labor, etc., may, and indeed must, vary very considerably among different nations, these variations are only the necessary result of their different progress in industry, and of the different quality of their cultivated lands, etc. Such differences of price are in the natural order of things; and bullion has not found its proper level till a quantity has been introduced into those countries which excel in manufactures, sufficient to raise the price of their corn and labor. These variations have, therefore, no influence over the exchange. Notwithstanding this difference of price, an ounce of bullion in one country, owing to the facility of intercourse, is very nearly equivalent to an ounce of bullion in another; and supposing the trade in the precious metals to be perfectly free, the exchange will be at true par when bills are negotiated on this footing. But when we compare the values of these metals in distant countries, especially in those where they are produced, with those into which they are imported, there are very considerable differences. Gold and silver, like iron, coal, tin, etc., are necessarily cheaper in countries possessed only of extraordinarily productive mines, than in those possessed only of mines of a secondary degree of fertility, or where they have to be entirely brought from abroad. And the exchange between such places is not a true par, unless adequate allowance be made for this difference of value. Thus if, because of the expense of carriage, the value of bullion in Great Britain be 5 per cent. greater than in San Francisco, 100 ounces of pure gold in the latter would not be worth 100 ounces of pure gold in London, but 5 per

cent. less; and the exchange would be at true par when bills for 105 ounces standard bullion, payable in San Francisco, sold in London for 100 ounces.

The different values of the precious metals in different countries do not depend alone on their respective distances from the mines, or on their greater or less progress in the arts. The opinion formerly so very prevalent, that gold and silver were the only real wealth, led most nations to fetter and restrain their exportation, and to adopt a variety of measures intended to facilitate their importation. But these, even, when most vigorously enforced, were singularly ineffectual. The great value and small bulk of the precious metals rendered it not only advantageous, but comparatively easy, clandestinely to export them, whenever their relative value declined.

"When," says Adam Smith, "the quantity of gold and silver imported into any country exceeds the effectual demand, no vigilance of government can prevent their exportation. All the sanguinary laws of Spain and Portugal are not able to keep their gold and silver at home. The continual importations from Peru and Brazil exceed the effectual demand of those countries, and sink the price of those metals there below that in the neighboring countries. If, on the contrary, in any particular country, their quantity fell short of the effectual demand, so as to raise their price above that of the neighboring countries the government would have no occasion to take any pains to import them. If it were even to take the pains to prevent their importation, it would not be able to effectuate it. Those metals, when the Spartans had got wherewithal to purchase them, broke through all the barriers which the laws of Lycurgus opposed to their entrance into Lacedaemon. All the sanguinary laws of the customs are not able to prevent the importation of the teas of the Dutch and Gottenburg East India Companies, because somewhat cheaper than those of the British Company. A pound of tea, however, is about a hundred times the bulk of one of the highest prices, 16s., that is commonly paid for it in silver, and more than two thousand times the bulk of the same price in gold, and, consequently, just so many times more difficult to smuggle."—*Wealth of Nations*, p. 190.

But though ineffectual to prevent their egress, the restrictions on the exportation of the precious metals have, nevertheless, contributed to occasion some slight variations in their value in different countries. The risk formerly incurred by the clandestine exporters of bullion from Spain, is supposed to have been equivalent to about two per cent.; or, which is the same thing, it is supposed that the restrictions maintained such an excess of gold and silver in that country as to sink them two per cent. below their value in countries having a free trade in bullion. In calculating the true par of exchange between different countries, circumstances of this kind must be taken into account. For, to whatever extent bullion in one country may be sunk below its value in those with which it maintains an intercourse, the nominal exchange will necessarily be unfavorable to that extent. All restraints on the exportation of the precious metals was abolished in Great Britain in 1819. Their effect for many years previously could not be estimated at above one fourth per cent.

It consequently results, that whatever occasions a rise or fall in the value of the precious metals in one country affects to the same extent its nominal exchange with other countries. If more coin, or convertible paper, circulated in Great Britain, compared with the business it has to perform, than in other countries, its relative value would be proportionally less. Foreign bills would sell for a premium, the amount of which would measure the excess of the value of the precious metals in the foreign market, caused by their redundancy in the home market. And, on the other hand, in the event of our currency becoming

relatively deficient, its value would be proportionally increased; bills drawn on foreign countries would sell at a discount, the amount of which would equal the excess of the value of our currency over that of other countries.

IV. PAR OF EXCHANGE.—In estimating the quantities of bullion contained in the coins of different countries, a particular coin of one is selected for a standard by which to compare the others, and the proportion between it and them, supposing them to be all of their standard weight and fineness, is ascertained by experiment. A par of exchange is thus established, or rather it is ascertained that a certain amount of the standard currency of one country contains as much gold or silver of the same fineness, as is contained in the coin or integer with which it has been compared. This relation, or *par*, as it is technically termed, is considered invariable; and allowance is made for subsequent variations in the coins of countries trading together, by rating the exchange at so much above or below par. In mercantile language, that country, by a comparison with one or other of whose coins the *par* of exchange has been established, is said to give the *certain* for the *uncertain*, and conversely. Thus in the exchange between London and Paris, London and Hamburg, etc., London gives the *certain*, or the pound sterling, for an *uncertain* or variable number of francs, florins, etc. Hence, the higher the exchange between any two countries, the more is it in favor of that which gives it the *certain*; and the lower, the more is it in favor of that which gives the *uncertain*.

On the supposition that 25 francs contain the same quantity of standard bullion as a pound sterling (25 fr. 57 cent. is about the exact par), and supposing, also, that the value of bullion is the same in both countries, the exchange between London and Paris will be at par when a bill drawn in the one on the other sells at that rate; that is, when a bill of exchange for 2500, or 25,000 francs, payable in Paris, sells in London for £100 or £1000, and *vice versa*. It is but seldom, however, that the coins of any country correspond exactly with their mint standard. Unless when newly issued, they are either more or less worn; and whenever this defect becomes sensible, an allowance corresponding to the difference between their actual value and their mint value is made in estimating "the sum of the existing currency of either of two countries which contains precisely the same quantity of bullion as is contained in a given sum of the other." Thus, if our pound sterling were so worn, clipped, or rubbed, as not to contain so much bullion as 25 fr., but 10 per cent. less, the exchange between London and Paris would be at real par when it was nominally 10 per cent. against London; * and if, on the other hand, the pound sterling were equal to its mint standard, while the franc was 10 per cent. less, it would be at par when it was nominally 10 per cent. against Paris and in favor of London. If the currencies of both countries were equally reduced below the standard of their respective mints, there would obviously be no variation of the par; but whenever the currency of countries trading together is unequally depreciated, the exchange is nominally in favor of that country whose currency is least, and nominally against that whose currency is most depreciated.

It is almost unnecessary to refer to examples to show the practical operation of this principle; and we shall content ourselves with selecting the following,

* It is necessary to observe, that it is here supposed that the clipped or degraded money exists in such a degree of abundance as only to pass current at its bullion value. If the quantity of clipped money were sufficiently limited, it might, notwithstanding the diminution of weight, pass current at its mint value; and then the par would have to be estimated, not by its relative weight to foreign money, but by the mint price of bullion. This principle must be constantly kept in view.

from an infinite number of equally conclusive instances.

Previously to the great recoinage in the reign of William III., silver being at the time legal tender, the exchange between England and Holland, calculated by the standard of their respective mints, was nominally 25 per cent. against England. Inasmuch, however, as English silver coins were then, owing to rubbing and clipping, depreciated more than 25 per cent. below their mint value, the real exchange was probably at the time in our favor. And the circumstance of the nominal exchange having become favorable to us as soon as the new coin was issued, tends to confirm this conjecture.*

The guinea was so much worn and degraded, previously to the gold recoinage in 1773, as to be from two to three per cent. under its standard weight. Inasmuch, however, as the coins then circulating in France were nearly of their standard weight and purity, the exchange between London and Paris was nominally from two to three per cent. against the former. We say *nominally*, for as soon as guineas of full weight were issued, the exchange rose to par.

The Turkish government, during the past century, has made successive reductions in the value of its coin. Before the first of these in 1770, the *piastre* contained nearly as much silver as the English *half-crown*; and, in exchange, the par was estimated at eight piastres to the pound sterling. But, in the interval, the degradation in the value of the piastre has been such that it is now worth only about 2½d.; and the exchange is said to be at par when Constantinople gives about 100 piastres for £1 sterling. It is needless, almost, to say, that the nominal exchange, estimated by the old par of eight piastres to £1, became more and more unfavorable to Turkey with every successive enfeeblement of the coin, though it is doubtful whether the real exchange, or that depending on the balance of payments, was not all the while in her favor.

When one country uses gold as the standard of its currency, and another silver, the par of exchange between them is effected by variations in the relative values of these metals. When gold rises as compared with silver, the exchange becomes nominally favorable to the country which has the gold standard, and *vice versa*. And hence, in estimating the par of exchange between countries using different standards, it is always necessary to inquire into the comparative values of the metal selected as standards.

"For example," to use the words of Mr. Mushet, "if 34 schillings 11½ grotes of Hamburg currency be equal in value to a pound sterling, or 20-21 of a guinea, when silver is at 5s. 2d. per oz., they can no longer be so when silver falls to 5s. 1d. or 5s. an oz., or when it rises to 5s. 3d. or 5s. 4d.; because a pound sterling in gold being then worth more or less silver, is also worth more or less Hamburg currency. To find the real par, therefore, we must ascertain what was the relative value of gold and silver when the par was fixed at 34s. 11½g. Hamburg currency, and what is their relative value at the time we wish to calculate it. For example, if the price of standard gold was £3 17s. 10½d. per oz., and silver 5s. 2d., an ounce of gold would then be worth 15-07 ounces of silver, and 20 of our standard schillings would then contain as much pure silver as 35s. 11½ grotes of Hamburg currency. But if the ounce of gold were £3 17s. 10½d., and silver 5s. (which it was on 2d January, 1798), the ounce of gold would then be worth 15-57 ounces of silver. If £1 sterling at par, therefore, be worth 15-07 ounces of silver, then at 15-57 it would be at three per cent. premium; and three per cent. premium on 34s. 11½d. is 1 schilling 1 grote and 9-10, so that the par, when gold is to silver as 15-57 to 1, will be 36 schillings 1 grote and 1-10. The above calculation will be more easily

* *Wealth of Nations*, p. 210.

made by stating, as 15:07 : 84-12½ :: 15:07 : 86-1 1-10.*

As it is their intrinsic worth in bullion which determines the value of coins in exchange transactions, those of equal weight and of purity are reckoned equivalent to each other, though some of them may have been coined at the expense of the state, and others charged with a duty or recoinage on their coinage. The latter may, if not issued in excess, pass current in the country in which they are coined for their value in bullion plus the duty; but they will not pass anywhere else, except at their bullion value.†

But the principal source of fluctuations in the nominal price of bills of exchange, is to be found in the varying value of the paper currency of commercial countries. The disorders which arose in remote ages from diminishing the bullion contained in coins of the same denomination have also been produced in another form, and often to a still greater extent, in the depreciation of paper currency.

V. INFLUENCE OF DEPRECIATED PAPER CURRENCY ON THE EXCHANGE.—The impossibility of retaining a comparatively large quantity of coin or bullion, or of paper convertible into coin, in a particular country, limited the issues of the Bank of England previously to the Restriction Act of 1797; and it has equally limited them since the resumption of specie payments in 1821, and sustained the value of the currency on a level with gold. When the bank starves the circulation, or issues less paper than is necessary, bullion is imported, sent to the mint to be coined, and thrown upon the market. And when, on the other hand, the bank issues too much paper, and thereby depresses its value relatively to gold, it becomes profitable to demand payment of its notes, and to export the specie thus obtained either as coin or as bullion. In this way the vacuum is filled up when bank-notes are deficient, the excess removed when they are redundant, and the value of the currency preserved nearly equal. But, from 1797 down to 1821, this principle was suspended. During that period, the bank was relieved from the obligation to pay her notes in gold; while, owing to their being made legal tender, their circulation was insured. Hence, their value exclusively depended on the extent to which they were issued compared with the demand. There is no difference, in its influence over the exchange, between a degraded metallic and a depreciated paper currency. And when a country with either the one or the other, has any dealings with another whose currency is of its full value, the exchange is nominally against her to the extent of the degradation or depreciation. The nominal exchange between any two or more places is, in fact, always adjusted according to the values of their currencies, being most favorable to that whose currency approaches nearest to its standard, and most unfavorable to that whose currency is most degraded or depreciated. The intercourse between Great Britain and Ireland subsequently to the restriction on cash payment in 1797, furnishes some striking proofs of the effect which inordinate issues of paper have in depressing the exchange. The nominal value of the Irish shilling being raised in 1689 from 12s. to 13s.,‡ £108

6s. 8d. Irish money became equal to only £100 of British money, so that the exchange between Great Britain and Ireland was said to be at par when it was nominally 8½ per cent. against the latter. In the eight years previous to 1797, when the paper currency of both countries was convertible into gold, the exchange between London and Dublin fluctuated from 7½ to 9 per cent., that is from 5-6 per cent. in favor of Dublin to 3 per cent. against it. In September, 1797, it was at 6 per cent., or 2½ per cent. in favor of Dublin. The amount of Bank of Ireland notes in circulation in January, 1797, was only £621,917; whereas in April, 1801, they had increased to £2,286,471, and the exchange was then at 14 per cent., or 5½ per cent. against Dublin. In 1803, the Bank of Ireland notes in circulation averaged £2,707,956, and in October of that year the exchange was quoted at 17 per cent., that is, 8½ per cent. against Dublin!

The fact of the exchange between London and Dublin having fluctuated so little from par for the eight years previously to the restriction, shows that the circulating medium of Great Britain and Ireland had then been adjusted nearly according to the wants of the two countries. But, in these circumstances, it was evidently impracticable, supposing the value of British currency to remain nearly stationary, that the amount of Irish bank-paper could be more than quadrupled in the short space of six years, without rendering the currency of Ireland redundant, and sinking its value below that of England. Had the Bank of England increased its notes in something like the same ratio as the Bank of Ireland, then, as the currency of both countries would have been equally depreciated, the exchange between London and Dublin would have continued at par. While, however, the notes of the Bank of Ireland were increased from £621,917 to £2,707,956, or in the proportion of 1 to 4.3, those of the Bank of England were only increased from £9,181,843 (their number on the 7th January, 1797), to £16,505,272, or in the proportion of 1 to 1.8. But for this addition to its issues by the Bank of England, the exchange, it is plain, would have been still more unfavorable to Dublin.

In the debates on the Bullion Report, it was contended that the increase of Bank of Ireland paper could not have been the cause of the unfavorable exchange upon Dublin, seeing that it had again become favorable after the issues of the Bank of Ireland had been still further increased. But to give this reasoning the least weight, it should have been shown that the currency of Great Britain retained its value in the interim, or that it had not been depreciated to the same extent as that of Ireland. For it is obvious that the depreciation of Irish bank-paper might go on subsequently to 1804, and yet if English bank-paper were depreciated still more rapidly, the exchange would become more in favor of Dublin. This is merely supposing the circumstances which took place in the first six years of the restriction to be reversed in the second six. Let us inquire how the fact stands.

We have seen that, in 1803, when the exchange was nominally 10 per cent. against Dublin, the issues of the Bank of England amounted to £16,505,272, and those of the Bank of Ireland to £2,707,956. And by referring to the accounts of the issues of the latter from 1797 to 1819, published by authority, it is seen that in 1805-1808 they were rather diminished; and that in 1810 they amounted to only £3,251,750, being an increase of not more than £543,794 in the space of seven years, or at the rate of 2 and 6-7 per cent. per annum; but in the same period (from 1803 to 1810) the issues of the Bank of England were increased from £16,505,272 to £22,541,523, or at the rate of 5 per cent. per annum. And this is not all. According to Mr. Wakefield, there were 50 registered bankers in Ireland in 1804, and only 33 in 1810, of which 14 were new houses, 31 of the old establishments having dis-

* An Inquiry into the effects produced on the National Currency by the Bank Restriction Bill, etc., 2d ed., p. 94.

† Previously to 1817, no seigniorage had for a very long period been deducted from either the gold or silver coins of Great Britain; but in the great recoinage of that year, the value of silver was raised from 5s. 7d. to 5s. 6d. an ounce, or nearly in the proportion of 61 per cent. The gold coins, however, are still coined free of expense, and no variation has been made in their standard. The proportion of silver to gold in the coins is now as 14 287-1000 to 1; but their proportion to each other, according to their mint valuation, is as 15 299-1000 to 1.

‡ By a proclamation of James II. The arrangement was continued by the revolutionary government, and was confirmed by proclamation, 30th September, 1737. But in 1625 the currencies of Great Britain and Ireland were assimilated.

appeared; and "I believe," says Mr. Wakefield "for the most part failed." This extraordinary diminution of the country paper of Ireland, for the reduction of the issues was at least proportional to the reduction in the number of banks, could not fail greatly to raise its value, and to countervail a corresponding increase in the issues of the national bank. Now, the reverse of all this took place in Britain. In 1800 there were 386 country banks in this country; and in 1810, this number, instead of being diminished as in Ireland, had increased to 721, having at least three times the number of notes in circulation in the latter as in the former period. It appears, therefore, that when, in the period between 1790 and 1804, the amount of paper in circulation in Ireland was increased, and its value depressed, faster than in England, the exchange between London and Dublin became proportionally unfavorable to the latter; and, on the other hand, it appears, that when, in the six years subsequent to 1804, the paper currency of England was increased more rapidly than that of Ireland, its relative value was diminished, and the nominal exchange became more favorable to Dublin.

This is sufficiently conclusive. But there is still better evidence to show that the unfavorable exchange of Dublin upon London, 1802, 1803, 1804, etc., was entirely owing to the comparative redundancy or depreciation of Irish bank-paper. The linen manufacturers and weavers, with the majority of the other inhabitants of a few counties in Ulster, being at the period of the restriction strongly disaffected toward government, very generally refused to receive bank-notes in payment either of commodities or wages. The landlords having also stipulated for the payment of their rents in specie, a gold currency was maintained in the northern long after it had been banished from the southern parts of Ireland. If, therefore, the depression of the exchange between London and Dublin had been occasioned, as many contended, by an unfavorable balance of trade between Ireland and Great Britain, or by remittances from the former on account of absentees, it would have been equally depressed between London and the commercial towns in the northern counties. But so far was this from being the case, that in December, 1803, when the exchange of Dublin on London was at 16½ per cent., that of Belfast on London was at 5½; or, in other words, at the very time that the exchange between Dublin, which had a paper currency, and London, was about 8 per cent. against Ireland, the exchange between Belfast, which had a gold currency, and London, was about 3 per cent. in its favor. And this is not all; for while there was a difference of 11 per cent. in the rate of exchange between Dublin and London, and Belfast and London, the inland exchange between Dublin and Belfast was about 10 per cent. in favor of the latter; that is, bills drawn in Dublin, and payable in the gold currency of Belfast, brought a premium of 10 per cent., while bills drawn in Belfast, and payable in the paper currency of Dublin, sold at 10 per cent. discount!*

It is unnecessary to refer to the history of the French assignats, or of the paper currency of the continental powers generally, and of the United States, to corroborate what has been advanced. Such of our readers as wish for further information upon these points may have recourse to the fourth volume of the "Cours d'Economie Politique" of M. Storch,† where they will find an instructive account of the influence of inordinate issues of paper on the price of bullion and the exchange, in almost every country of Europe.

* Further information on this subject may be obtained from the Report, 1804, of the Committee of the House of Commons upon the state of the circulating paper in Ireland, its specie, etc., from St. Henry Parnell's pamphlet on the same subject; and from the pamphlets of Lord King, Huskisson, etc.

† Paris, 1823, 4 vols. 8vo.

They are, in every case, similar to those now stated. It only remains to determine the influence of fluctuations in the nominal exchange over exports and imports.

VI. INFLUENCE OF FLUCTUATIONS OF EXCHANGE OVER IMPORTS AND EXPORTS.—When the exchange is at par, the operations of the merchant are regulated entirely by the difference between foreign prices and home prices. The imports such commodities as sell at home for so much more than they cost abroad as will indemnify him for freight, insurance, etc., and yields, besides, an adequate remuneration for his trouble, and for the capital employed in the business; and he exports those whose price abroad is sufficient to cover all expenses, and to afford a similar profit. But when the nominal exchange becomes unfavorable to a country, the premium which its merchants receive on foreign bills has been said to enable them to export with profit, in cases where the difference between the price of the exported commodities at home and abroad might not be such as to permit their exportation with the exchange at par. Thus, if the nominal exchange were 10 per cent. against this country, a merchant who had consigned goods to his agent abroad, would receive a premium of 10 per cent. on the sale of the bill; and if we suppose freight, insurance, mercantile profit, etc., to amount to 6 or 7 per cent., it would at first sight appear as if we might, in such circumstances, export commodities, although their price at home was 3 or 4 per cent. higher than in other countries. On the other hand, the nominal exchange were also in favor, or if bills on this country sold at a premium, it would appear as if foreigners would then be able to consign goods to our merchants, or the latter to order goods from abroad, when the difference of exchange would not of itself lead to an importation.

But a very little consideration will suffice to show that the fluctuations in the nominal exchange have no such effects. That fall in the value of the currency which renders the exchange unfavorable, and causes foreign bills to sell at a premium, equally increases the price of commodities. And hence, however great, the premium which exporters gain by selling bills on their correspondents abroad, merely indemnifies them for the enhanced price of the goods exported. In such cases, mercantile operations are conducted precisely as they would be were the exchange really at par; that is, by a comparison of real prices at home and abroad, meaning by real prices, the prices at which commodities would be sold provided there were no depreciation of the currency. If these admit of exportation or importation with a profit, the circumstance of the nominal exchange being favorable or unfavorable will make no difference whatever on the transaction.

"Suppose," says Mr. Blake, who has very successfully illustrated this part of the theory of exchange, "the currencies of Hamburg and London being in their due proportions, and therefore, the nominal exchange at par, that sugar, which, from its abundance, in London sold at £50 per hogshead, from its scarcity at Hamburg would sell at £100. The merchant in this case would immediately export. Upon the sale of his sugar, he would draw a bill upon his correspondent abroad for £100, which he could at once convert into cash by selling it in the bill market at home, deriving from this transaction a profit of £50, under deduction of the expenses of freight, insurance, commission, etc. Now, suppose no alteration in the scarcity or abundance of sugar in London or Hamburg, and that the same transaction were to take place after the currency in England had been so much increased that the prices were doubled, and, consequently, the nominal exchange 100 per cent. in favor of Hamburg, the hogshead of sugar would then cost £100, leaving apparently no profit whatever to the exporter. He would, however, as before, draw his bill on his correspondent for £100; and, as foreign bills

would bear a premium of 100 per cent. he would sell this bill in the English market for £200, *z. d.* thus derive a profit from the transaction of £100 depreciated, or £50, estimated in undepreciated currency—deducting, as in the former instance, the expense of freight, insurance, commission, etc.

"The case would be precisely similar, *mutatis mutandis*, with the importing merchant. The unfavorable nominal exchange would appear to occasion a loss amounting to the premium on the foreign bill which he must give in order to pay his correspondent abroad. But if the difference of real prices in the home and foreign markets were such as to admit of a profit upon the importation of produce, the merchant would continue to import, notwithstanding the premium; for that would be repaid to him in the advanced nominal price at which the imported produce would be sold in the home market.

"Suppose, for instance, the currencies of Hamburg and London, being in their due proportions, and therefore the nominal exchange at par, that linen which can be bought at Hamburg for £50 will sell here at £100. The importer immediately orders his correspondent abroad to send the linen for the payment of which he purchases at £50 a foreign bill in the English market; and on the sale of the consignment for £100, he will derive a profit amounting to the difference between £50 and the expense attending the import.

"Now, suppose the same transaction to take place without any alteration in the scarcity or abundance of linen at Hamburg and London, but that the currency of England has been so augmented as to be depreciated to half its value, the nominal exchange will then be 100 per cent. against England, and the importer will not be able to purchase a £50 foreign bill for less than £100. But as the prices of commodities here will have risen in the same proportion as the money has been depreciated, he will sell linen to the English customer for £200, and will, as before, derive a profit amounting to the difference between £100 depreciated, and £50 estimated in undepreciated money, and the expense attending the import.

"The same instances might be put in the case of a favorable exchange; and it would be seen, in the same manner, that nominal prices and the nominal exchange being alike dependent on the depreciation of currency, whatever apparent advantage might be derived from the former, would be counterbalanced by a loss on the latter, and *vice versa*."

It appears, therefore, that fluctuations in the nominal exchange have no effect on trade. A fall in the exchange obliges the country to which it is unfavorable to expend a greater nominal sum in discharging a foreign debt than would otherwise be necessary; but it does not oblige it to expend a greater real value. The depression of the nominal exchange can neither exceed nor fall short of the comparative depreciation of the currency. If British currency were depreciated 10 or 15 per cent., the nominal exchange would be 10 or 15 per cent. against us; and we should be compelled, in all transactions with foreigners, to give them 22s. or 23s. for what might otherwise have been procured for 20s. But as neither 22s. nor 23s. of such depreciated paper is more valuable than 20s. of paper undepreciated, payment of a foreign debt would, it is evident, be as easily made in the one currency as in the other; and mercantile transactions would, in such circumstances, be conducted exactly as they would have been had there been no depreciation, and the nominal exchange at par.

VII. REAL EXCHANGE.—Having thus endeavored to trace the influence which variations in the value of currencies have over the exchange, we proceed to consider how far it is influenced by *fluctuations in the sup-*

ply and demand for bills. To facilitate this inquiry, we shall exclude all consideration of changes in the value of money, and suppose the currencies of the different countries having an intercourse together to be equal in weight and purity to their mint standards, and that each has its proper supply of bullion. When two nations trade together, and each purchases of the other commodities of the same value, their debts and credits are equal, and the real exchange is, of course, at par. But it rarely happens that the debts reciprocally due by any two countries are equal. There is almost always a balance owing on one side or other, which affects the exchange. If, for example, the debts due by London to Paris exceed those due by the former to the latter, the demand in London for bills on Paris will be greater than the demand in Paris for bills on London; and the real exchange will, consequently, be in favor of Paris, and against London.

The expense of transferring bullion from one country to another, limits the range within which the rise and fall of the real exchange between them is confined. In this respect, as in most others, transactions between foreign countries depend on the same principles which govern those between different parts of the same country. We have already seen that the fluctuations in the real exchange between London and Glasgow can not exceed the expense of transmitting money between those cities. And this principle holds universally. Whatever may be the expense of transmitting bullion, which is the money of the commercial world, between London and Paris, London and Hamburg, New York, etc., the real exchange of the one on the other, can not for any considerable period, be depressed to a greater extent. No merchant will pay a higher premium for a bill to discharge a debt abroad, than will suffice to cover the expense of transmitting bullion to his creditor.

Hence it appears that whatever obstructs or fetters the intercourse among different countries, proportionally widens the limits within which fluctuations in the real exchange may extend. And hence the reason why it varies so much more in war than in peace. The amount of the bills drawn on a country engaged in hostilities is liable, from various causes, to be suddenly increased; though, whatever may be the amounts thus thrown upon the market, the depression of the exchange can not, for any length of time, exceed the expense of conveying bullion from the debtor to the creditor country. But during war this expense, which consists of freight, insurance, etc., is sometimes much augmented. The evidence annexed to the *Report of the Bullion Committee* shows that the cost of conveying gold from London to Hamburg, which, prior to the Revolutionary war, amounted to 2 or 2½, had increased, in the latter part of 1809, to about 7 per cent.; so that the limits within which fluctuations in the real exchange might range in 1809 were about three times as great as those within which they were confined in 1793. Owing to our having the complete command of the sea, and our commerce not being subjected even to the depredations of privateers, the cost of freight and the conveyance of bullion between this country and others, has not been affected by the war in which we are now (1855) unluckily engaged. The real exchange between neighboring countries is generally, on the principle now explained, less likely to fluctuate than that between distant countries. It costs considerably less to transmit bullion from London to Dublin or Paris, than to New York or Canton. And, as fluctuations in the real exchange are limited by its cost, they may evidently extend proportionally further between distant places than between such as are contiguous. We have next to investigate the circumstances which give rise to a favorable or an unfavorable balance of payments, and to appreciate their effects on the real exchange, and on trade in general.

* Paris, 1823, 4 vols, 8vo.

VIII. BALANCE OF PAYMENTS.—A very great, if not the principal, source of the errors into which merchants, and the majority of writers on exchange, have been betrayed in regard to the balance of payments, appears to have originated in their confounding the sum which imported commodities fetch in the home market, with their cost abroad. It is obviously, however, by the amount of the latter only, that the balance of payments, and consequently the real exchange, is influenced. A cargo of corn, for example, which cost £3000 free on board at Odessa, may be worth £4500 when imported into England; but the foreign merchant would not, unless he sent hither the corn, be entitled to draw on London for more than its original cost, or £3000. It is clear, therefore, on the slightest consideration, that the fact of the imports being more valuable than the exports, does not authorize the conclusion that the balance of payments is against us. A favorable or an unfavorable balance depends entirely on the sum due to foreigners for commodities bought from them being less or more than the sum due by them for commodities bought from us. It has nothing to do with the prices eventually obtained for the imported or exported commodities.

The mercantile system of commercial policy, which continues to preserve a powerful influence in most countries, had for its grand object the creation of a favorable balance of payments, by facilitating exportation and restricting importation. It is foreign to our purpose to make any inquiry in regard to the principles of this system, except in so far as they are connected with exchanges. But it may be easily shown, in opposition to the commonly received opinions, that under ordinary circumstances the value of the imports into commercial countries always exceeds the value of their exports; and that this excess or balance has not, speaking generally, any tendency to render the real exchange unfavorable.

It is the business of the merchant to carry the products of different countries from those places where their value is least, to those places where it is greatest; or, which is the same thing, to distribute them according to the effective demand. There could, however, be no motive to export any article, unless that which was to be imported in its stead were more valuable. When an English merchant orders a quantity of Polish wheat, he supposes it will sell for so much more than its price in Poland as will suffice to pay the cost of freight, insurance, etc., and to yield, besides, the ordinary rate of profit on the capital employed in the transfer. If the wheat did not sell for this much, its importation would be productive of loss. Merchants never export but in the view of importing articles of greater value. Instead of an excess of exports over imports being any criterion of an advantageous commerce, it is quite the reverse. And the truth is, notwithstanding all that has been said and written to the contrary, that unless the value of the imports exceeded that of the exports, foreign trade could not be carried on. Were this not the case—were the value of the exports always greater than that of the imports, there would be a loss on every transaction with foreigners, and the trade with them would either not be undertaken, or, if begun, would be speedily relinquished.

In England, the rates at which exports and imports are officially valued were fixed so far back as 1696. The very great alteration which has since taken place in the value of money, and in the cost of the greater number of the commodities of this and other countries, has rendered this official valuation, though valuable as a means of determining their quantity, of no use whatever as a criterion of the true value of the imports and exports. To obviate this defect, accounts of the real or declared value of the exports, prepared from the declarations of the merchants, are annually laid before parliament. There is, however, no such

account of the imports; and it is, perhaps, impossible to frame one with any thing like accuracy. It has also been alleged, and apparently with some foundation, that merchants have frequently exaggerated the value of articles entitled to drawbacks. But the extension and improvement of the warehousing system, and the decrease in the number of drawbacks, has very materially lessened whatever fraud or inaccuracy may have arisen from that score. The declared value of the exports may now be considered as pretty near the truth, at least sufficiently so for all practical purposes.

If perfectly accurate accounts could be obtained of the value of the exports and imports, there can be no manner of doubt that in all ordinary years the latter would considerably exceed the former. The value of an exported commodity is estimated when it is shipped, before its value is increased by the expense incurred in transporting it to the place of destination; whereas the value of the commodity imported in its stead is estimated after it has arrived at its destination, and been enhanced by the charges on account of freight, insurance, importer's profits, etc.

It is of little importance, in so far as least as the interests of commerce are concerned, whether a nation carries its own imports and exports, or employs other. A carrying nation appears to derive a comparatively large profit from its commercial transactions. But this excess of profit is seldom more than a fair remuneration for the capital it employs, and the risk it incurs, in transporting commodities. Were the trade between this country and France wholly carried on in British bottoms, our merchants, in addition to the value of the exports, would also receive the cost of their carriage to France. This, however, would be no loss to the French. They must pay the freight of the commodities they import. And if English ships sail on cheaper terms than those of their own country, there is no good commercial reason, though there may be others of a different kind, why they should not employ them in preference.

In the United States, the value of the imports, deducted from the custom-house returns, almost always exceeds the value of the exports. And though we have been accustomed to consider the excess of exports over imports as the only sure criterion of an advantageous commerce, the practical politicians of America early discovered "that the real gain of the United States has been nearly in proportion as their imports have exceeded their exports."* The great excess of imports in the Union is in part occasioned by the Americans generally exporting their own surplus produce, and receiving from foreigners not only an equivalent for the exports, but also for the cost of their conveyance to their markets. "In 1811," says the author just quoted, "flour sold in America for \$9 50 per barrel, and in Spain for £15. The value of the cargo of a vessel carrying 5000 barrels of flour would, therefore, be estimated, at the period of its exportation, at \$47,500; but as this flour would, because of freight, insurance, exporter's profits, etc., sell in Spain for \$75,000, the American merchant would be entitled to draw on his agent in Spain for \$27,500 more than the flour cost in America, or than the sum for which he could have drawn had the flour been exported on account of a Spanish merchant. But the transaction would not end here; the \$75,000 would be vested in some species of Spanish or other European goods fit for the American market; and the freight, insurance, etc., on account of the return cargo would, perhaps, increase its value to \$100,000; so that, in all, the American merchant might have imported commodities worth \$52,500 more than the flour originally sent to Spain." It is as impossible to doubt that this transaction is advantageous, as it is to doubt that its advantage consists in the value of the imports exceeding that of the

* Pitkin on the Commerce of the United States, 2d ed., p. 280.

exports. And it is clear that America might have the balance of the payments in her favor, though such transactions as the above were multiplied to any conceivable extent.

Instead, therefore, of endeavoring to limit the trade with countries from which the imports exceed the exports, we should give it every possible facility. Every man considers that market as the best in which he obtains the highest price for his goods. Why then exclude him from it? Why compel a merchant to sell a cargo of muslins, iron, &c., for \$10,500, rather than \$11,000 or \$12,000? The wealth of a state is made up of the wealth of individuals. And what more effectual method of increasing individual wealth can be devised than to permit buying in the cheapest and selling in the dearest markets?

It would be difficult to estimate the mischief which absurd notions relative to the balance of trade have occasioned in most commercial countries. They have been particularly injurious to Great Britain. The restrictions imposed on the trade in France originated in the prevalence of prejudices to which they gave rise. The great, or rather the only, argument insisted on by those who prevailed on the legislature to declare the French trade a *monopole*,* was founded on the alleged fact, that the value of the imports from France considerably exceed the value of the exports to her. The balance was termed a tribute paid by England; and it was sagaciously asked, what had we done that we should be obliged to pay so much money to our natural enemy? Those considerate and patriotic persons seem to have supposed that our merchants brought commodities from France for no better reason than that they were French, or to oblige that ingenious people. But they were not quite so disinterested. They imported French wines, silks, and so forth, for the same reasons that they imported the sugar of the West Indies, the teas and spices of the East, and the timber of the Baltic; that is, because there was a demand for them, and because they were worth more in our markets than the native products exported in their stead. The reason assigned for prohibiting the trade affords a conclusive proof of its having been advantageous. There can not, indeed, be a doubt, that an unlimited freedom of intercourse between the two countries would be of great service to both. Supposing it to be so arranged, does any one imagine that we should export or import any commodity to or from France, provided we could either sell or buy it on better terms anywhere else? If restrictions on the trade with any particular country be not injurious, that is, if it be either a losing or a less advantageous trade than that with other countries, we may be assured that the throwing it completely open would not make a single individual engage in it.

Every body knows that these conclusions are not only theoretically true, but have been practically verified. The abolition of the discriminating duty on French wines, the reduction of the exorbitant duty on brandy, the repeal of the prohibition against importing silks, and the opening of our ports to French corn and flour, have all been advantageous. And though it be true that the prejudices of the French, and the high duties which they continue to impose on most articles of British produce, confine the trade within comparatively narrow limits, they have not made it unprofitable, and are more injurious to themselves than to us. It is a curious fact, that notwithstanding the great amount of our imports from France, and our expenditure in that country on account of absentees, the state of the exchanges shows that the balance of payments is usually in our favor. But the partisans of the exclusive or mercantile system may perhaps say, that they do not mean to contend that it is profitable to export more than is imported; but that, by exporting an access of raw and manufactured produce, the balance

* Prohibition Act, 1st William and Mary.

of payment is rendered favorable, and this balance (which they regard as representing the entire net profit made by the country on its transactions with foreigners) is always paid in bullion. It may, however, be easily shown that this statement is altogether erroneous; that a balance, whether on the one side or the other, is seldom or never cancelled by means of bullion; and that it is not a measure, and has, indeed, nothing to do with the profit or loss attending foreign commercial transactions.

If the premium on foreign bills, in a country with an unfavorable real exchange, be less than the cost of sending bullion abroad, it would be contradictory to suppose that it should be exported. And though the premium on such bills were to increase, till it became equal to, for it can not exceed, the cost of exporting the precious metals, it does not follow that they will then be exported. That would depend on whether bullion were, at the time, the cheapest exportable commodity; or, in other words, whether a remittance of bullion was the most advantageous way in which a debt might be discharged. If a London merchant owes £1000, or other sum, in Paris, he endeavors to find out the cheapest method of paying it. On the supposition that the real exchange is 2 per cent. below par, and that the expense of remitting bullion is also 2 per cent., it will be indifferent to him whether he pays £20 of premium for a bill of £1000, payable in Paris, or incur an expense of £20 in remitting a £1000 worth of bullion direct to that city. If the price of cloth in Paris and London be such that it would require £1030 to purchase and send as much cloth to Paris as would sell for £1000, he would no doubt prefer buying a bill or exporting bullion. But if, by incurring an expense of £1010 the debtor may send as much hardware or cotton to Paris as would sell for £1000, he would as certainly prefer paying his debt by exporting the one or the other. It would save him 1 per cent. more than if he had bought a foreign bill or remitted bullion, and 2 per cent. more than if he exported cloth. Had there been any other commodity which might have been exported with more advantage, he would have used it in preference.

It is obvious, therefore, that the trade in bullion is governed by the same principles which govern the trade in other things. It is exported when its exportation is advantageous; that is, when it is less valuable at home, and more valuable abroad, than any thing else; and it will not otherwise be exported. The balance of payments might be twenty or thirty millions against a country, without depriving it of a single ounce of bullion. No merchant would remit a £1000 worth of gold or silver from England to discharge a debt in Paris: if he could invest £970, £980, £990, or any sum under £1000, in any other species of merchandise which, exclusive of expense, would sell in France for that amount. Those who deal in the precious metals are as much alive to their interests as those who deal in coffee, or sugar, or indigo. But who would attempt to discharge a foreign debt by exporting coffee which cost £100, if he could effect the same object by exporting indigo which cost only £95? No bullion will ever be exported unless its value be less in the exporting country than in that to which it is sent; and unless it be, at the same time, the most advantageous article of export.

2. It is in vain to contend that an unrestricted freedom of trade might render some unfortunate country indebted to another so happily situated that it had no demand for any sort of ordinary merchandise, and would only accept of cash or bullion in exchange for its exports. A case of this sort never did, and never will, occur. It is not even possible. A nation which is in want of money must be in want of other things; for men desire money only because it is the readiest means of increasing their command over necessaries and enjoyments. soils and climates—in the machinery, skill, and industry of the people of different countries—occasion extraordinary differences in their products and prices. Some articles of the highest utility are peculiar to certain districts. And there will ever be a demand, not only for such articles, but also for those which, though they may be produced at home, may be imported of a better quality, or at a lower price. Nor, till the passion of accumulation be banished from the human breast, will there cease to be a desire to send commodities from places where their exchangeable value is least, to those where it is greatest.

3. In treating of the nominal exchange, we endeavored to show that no single country can continue for any length of time to import or export a greater amount of bullion than may be necessary to preserve the precious metals in it in their proper relation to those of other countries; or, which is the same thing, to have the real exchange either permanently favorable or unfavorable. But though this principle be strictly true in reference to its aggregate exchange, it may be incorrect if its exchange with one country only be considered. Great Britain, for example, may generally have the exchange in her favor with America, provided she have it generally, and to a nearly equal extent, against her with the East Indies, or some other country. "She may," to use the words of Mr. Ricardo, "be importing from the north the bullion which she is exporting to the south. She may be collecting it from countries where it is relatively abundant, for others where it is relatively scarce, or where, from some particular causes, it is in great demand. Spain, who is the great importer of bullion from America, can never have an unfavorable exchange with her colonies; and as she must distribute the bullion she receives among the different nations of the world, she can seldom have a favorable exchange with the countries with which she trades." See Reply to Mr. Bosquer's Observations on the Report of the Bullion Committee, p. 17.

On this principle, Lord King successfully accounted for the favorable exchange between this country and Hamburg from 1770 to 1799. He showed that the importation of bullion from Hamburg and other parts was not more than equivalent to the exports to the East Indies and the home consumption; that the demand corresponded to the supply; and that its value remained pretty stationary. The extraordinary influx of bullion into this country from the Continent at the era of the bank restriction in 1797, and the favorable state of the exchange, were undoubtedly owing to the reduction in the issues of bank paper, and to the diminution of the gold currency, caused by the hoarding of guineas. In 1797 and 1798, above 5,000,000 of guineas were coined at the mint; and this extraordinary demand for gold is of itself abundantly sufficient to account for the very favorable exchange of that period, and for the length of time during which it continued. But, at the same time that the demand for gold bullion for the mint was thus increased, the demand for silver bullion, for exports to India, was proportionally augmented.

	Ounces.
In 1795, the quantity exported by the East India Company and private parties amounted to	151,795
In 1796 to	290,777
1797	602,880
1798	2,252,091
1799	1,287,327

From this period the exportation rapidly declined; and in the years in which the exchange was most unfavorable, little or no silver was sent to India.

Instead, therefore, of the extraordinary importation of bullion from Hamburg in 1797 and 1798 affording, as Mr. Hosaquet and others supposed, a practical proof of the fallacy of the opinion of those who contend that it is impossible, for any length of time, to subvert the natural equality in the value of bullion in different countries, it is a striking example of its truth. With

out this influx, bullion in this country could not have maintained its proper comparative value. We imported it, because the reduction of the paper currency, and the increased exports of the East India Company, rendered its value higher here than on the Continent, and made it advantageous for the Continental merchants to send it to us, in the same manner as they would have sent corn, or any thing else for which we had an unusual demand. For, however favorable the real exchange between Hamburg and London might have been to the latter, we should not have imported an ounce of bullion, had it not been, at the time, the article with which Hamburg could most advantageously discharge her debt to London.

4. In the absence of other arguments, it would be sufficient to state, that it is physically impossible that the excess of exports over imports, as indicated by the custom-house returns, should be paid in bullion. Every country, with the exception of the United States, has its apparently favorable balance; and, of course, if they really existed, they would have to be paid by an influx of bullion from the mines correspondent to their aggregate amount. It is certain, however, that; previously to the discoveries in California and Australia, the entire produce of the mines, though it had been increased in a ten fold proportion, would have been insufficient for this purpose! This fact is decisive of the degree of credit which ought to be attached to the commonly-received opinions on this subject.

5. In the last place, the profit on transactions with foreigners does not consist in the quantity of bullion imported from abroad, but in "the excess of the value of the imports over the value of the exports." If, in return for exported commodities worth 10 or 20 millions, we import such as are worth 15 or 30, we shall gain 50 per cent. by the transaction, though the exports should consist entirely of bullion, and the imports of corn, sugar, coffee, etc. It is a ridiculous prejudice that would make bullion be imported rather than any other article. But whatever the partisans of the exclusive system may say about its being a preferable product, a *merchandise par excellence*, we may be assured that it will seldom appear in the list of exports or imports, while there is any other thing with which to carry on trade that will yield a larger profit. Thus it appears that the excess of exports over imports, instead of being any proof of an advantageous commerce, is distinctly and completely the reverse; that the value of the imports into commercial countries may, and almost always does, exceed the value of their exports, without rendering them indebted to foreigners; and that when a balance of debt has been contracted, that is, when the sum payable to foreigners for imports is greater than the sum receivable from them for exports, bullion will not be sent from the debtor to the creditor country, unless it be at the time the most profitable article of export.

IX. EFFECTS OF REAL EXCHANGE UPON IMPORTS AND EXPORTS.—We have shown that fluctuations in the nominal exchange do not influence foreign trade. When the currency is depreciated, the premium which an exporter derives from the sale of bills on his correspondent abroad, is barely equivalent to the increase in the price of the exports, occasioned by the depreciation. But when the premium on foreign bills is not caused by a fall in the value of money, but by a deficient supply of bills, there is no rise of prices, and then the unfavorable exchange undoubtedly operates as a stimulus to exportation. As soon as the real exchange diverges from par, the mere inspection of price currents is no longer enough to guide the operations of the merchant. If it be unfavorable, the premium which the exporters receive on the sale of bills must be included in the estimate of the profit they are likely to derive from the transaction. The greater that premium, the less will be the difference of prices necessary to make them export. An unfavorable real

he had made, and from the accounts on the table, he was convinced that a greater and more sudden reduction of the circulating medium had never taken place in any country than had occurred since the peace of this country, with the exception of those reductions that had taken place in France after the Mississippi scheme, and after the destruction of the assignats. The reduction of the currency had originated in the previous fall of the prices of agricultural produce. That fall had produced a destruction of country-bank paper to an extent which would not have been thought possible, without more ruin than had actually ensued. The Bank of England had also restricted its issues. As appears by the accounts recently presented, the average amount of its currency was not, during the last year, more than between £25,000,000 and £26,000,000; while two years ago it had been nearer £29,000,000, and at one time even amounted to £31,000,000. But, without looking to the diminution of Bank of England paper, the reduction of the country paper was enough to account for the rise which had taken place in the exchange.* Hence it appears that the rise of the exchange in 1815 and 1816 had nothing, or but little, to do with the cessation of hostilities, and was entirely, or mainly, a consequence of the increased value of the currency, caused by the reduction of its quantity. Instead of being at variance with the principles we have been endeavoring to elucidate, this fact affords a strong confirmation of their correctness. And having been sanctioned by the fullest experience, may be considered as beyond the reach of cavil and dispute. An objection of a different sort has been made, to another part of the theory maintained in this section, which it may be proper to notice.

When the exchange becomes unfavorable, the premium, procured by the sale of the bill drawn on a foreign merchant to whom bullion has been consigned, is no greater than would be obtained by consigning to him an equivalent amount of coffee, tea, sugar, indigo, etc. An unfavorable real exchange permits a merchant to export commodities which could not be exported were it at par, or favorable. But the advantage still remains of exporting those commodities in preference, whose price in the country from which they are sent, compared with their price in that to which they are exported, is lowest. Suppose, for example, that the expense of transmitting bullion from this country to France is 3 per cent., that the real exchange is 4 per cent. against us, that the price of bullion is the same in both countries, and that coffee exclusive of the expenses of carriage, is really worth 4 per cent. more in France than in England. In such a case, it is obvious that the exporters of bullion would realize a profit of only 1 per cent., while the exporters of coffee would realize, inclusive of the premium on the sale of the foreign bill, a profit of 7 per cent. And hence the opinion maintained by Colonel Torrens,* that when the exchange becomes unfavorable, those commodities which contain the greatest value in the smallest bulk, or on which the expense of carriage is least, are exported in preference, appears to have no good foundation. The prices of the commodities which nations trading together are in the habit of exporting and importing, are regulated not merely by the cost of their production, but also by the expense of their carriage from where they are produced to where they are consumed. If Great Britain were in the habit of supplying France with cottons and bullion, the average price of cottons in France, because of the expense required to convey them there, would probably be from 5 to 6 per cent. higher than in Britain; while, because of the comparative facility with which bullion may be transported from the one to the other, its value in Paris would not, perhaps, exceed its value here more than 1 per cent. Now, suppose that when the prices of cot-

tons and bullion in England and France are adjusted according to their natural proportions, the real exchange, becomes unfavorable to us, it is clear that its fall gives no greater advantage to the exporters of bullion than to those of cottons. This rise in the price of foreign bills does not increase the expense of exporting the one or the other. It leaves the cost of their reduction and transportation exactly where it found it. During the depression of the exchange, the exporters of both articles get the premium on the bills drawn on their correspondents. But there is no inducement to export bullion in preference to cottons, unless the price of bullion increase more rapidly in France, or decline more rapidly in Great Britain, than that of cottons.

Whatever, therefore, may be the depression of the exchange, the merchant selects those commodities for exportation which, exclusive of the premium, yield the greatest profit on their sale. If bullion be one of these, it will of course be exported; if not, not. But of all commodities, bullion is that of which the value approaches nearest to an equality in different countries, so that it is the least likely to be exported during an unfavorable exchange. The demand for it is comparatively steady, and no great surplus quantity could be imported into one country without reducing, or exported from another, without raising its value so as to unfit it either for exportation or importation. In most cases a small part only of an unfavorable balance is paid in bullion. The operations of the bullion merchants are confined chiefly to the distribution of the fresh supplies obtained from the mines, in proportion to the wants of different countries.

X. COMPUTED EXCHANGE.—Having thus endeavored to point out the manner in which variations in the values of the currencies of nations trading together, and in the supply and demand for bills, separately affect the exchange, it now only remains to ascertain their combined effect, or the computed or actual course of exchange. From what has been already stated, it is obvious, that when the nominal and real exchange are both favorable or both unfavorable, the *computed* exchange will express their *sum*; and that when one is favorable and the other unfavorable, it will express their *difference*. When, for example, the currency of Great Britain is of the mint standard and purity, while that of France is 5 per cent. degraded, the *nominal* exchange will be 5 per cent. in our favor. But the *real* exchange may, at the same time, be either favorable or unfavorable. If it be, also, favorable to the extent of 1, 2, 3, etc., per cent., the *computed* exchange will be 6, 7, 8, etc., per cent. in our favor. And, on the other hand, if it be unfavorable to the extent of 1, 2, 3, etc., per cent., the *computed* exchange will be only 4, 3, 2, etc., per cent. in our favor. When the *real* exchange is in favor of one country, and the *nominal* exchange equally against it, the *computed* exchange is at par, and *vice versa*.

A comparison of the market with the mint price of bullion affords the best and readiest means by which to ascertain the state of the exchange. When there are no restrictions on the trade in the precious metals, the excess of the market over the mint price of bullion affords an accurate measure of the depreciation of the currency. If the market and mint price of bullion at Paris and London exactly corresponded, then, inasmuch as the real value of bullion must be very nearly the same in both countries, the *nominal* exchange would be at par; and whatever fluctuations the *computed* exchange might exhibit, must, in such cases, be traced to fluctuations in the *real* exchange, or in the supply and demand for bills. If, when the market price of bullion in Paris is equal to its mint price, it exceeds it 2 per cent. in London, it is a proof that our currency is 2 per cent. depreciated, and consequently the *nominal* exchange between Paris and London must be 2 per cent. against the latter. Instead, however,

* *Comparative Estimate, etc.*

of the *computed* or actual course of exchange being 2 per cent. against London, it may be against it to a greater or less extent, or in its favor. It will be more against it provided the *real* exchange be also unfavorable; it will be less against it provided the *real* exchange be in favor of London, though to a less extent than the adverse *nominal* exchange; and it will be in favor of London, should the favorable *real* exceed the unfavorable *nominal* exchange. Thus, if, while British currency is 5 per cent. depreciated, and French currency at par, the *computed* or actual course of exchange between Paris and London were 10 or 12 per cent. against the latter, it would show that the *real* exchange was also against this country to the extent of 5 or 7 per cent. And if, on the other hand, the *computed* exchange were only 2 or 3 per cent. against London, it would show that the *real* exchange was 3 or 4 per cent. in its favor, and so on.

It has been already shown, that in so far at least as the question of exchange is involved, the differences in the value of bullion in different countries are limited by the expense of its transit from one to another. And hence, by ascertaining whether a particular country exports or imports bullion to or from other countries, we may determine its comparative value in these countries. Suppose, for example, that the expense of conveying bullion from this country to France, including the profits of the bullion dealer, is 1 per cent.; it is clear, inasmuch as bullion is exported only to find its level, that whenever our merchants begin to export it to France, its value there must be at least 1 per cent. greater than in England; and, on the contrary, when they import bullion from France, its value here must be, at least 1 per cent. greater than in France. In judging of the exchange between any two countries, this circumstance should always be attended to. If no bullion be passing from the one to the other, we may conclude that its value is nearly the same in both; or, at all events, that the difference of its value is not more than the expense of transit. On the supposition that the entire expense, including profit, of conveying bullion from San Francisco to London is 5 per cent., and that London is importing bullion, it is clear, provided the *real* exchange be at par, and the currency of both cities at their mint standards, that the *nominal*, or, which in this case is the same thing, the *computed* exchange, will be 5 per cent. in favor of London, but if the currency of London be 5 per cent. depreciated, or, in other words, if the market price of bullion at London be 5 per cent. above its mint price, the *computed* exchange between it and San Francisco, supposing the *real* exchange to continue at par, will obviously be at par. It may therefore be laid down as a general rule, that when bullion begins to pass from one country to another, the expense of transit, provided the mint and market price of bullion in the exporting country correspond, will indicate how much the value of bullion in it is below its value in the country into which it is imported, and will be identical with its unfavorable *nominal* exchange; and that when the market exceeds the mint price of bullion in the exporting country, the expense of transit added to this excess will give the total comparative reduction of the value of the precious metals in that country. The converse of this takes place in the country importing bullion. When its currency is of the mint standard, the expense of transit is the measure of its favorable *nominal* exchange; but when its currency is relatively redundant or degraded, the difference between the expense of transit and the excess of the market above the mint price of bullion, will measure the extent of the favorable or unfavorable *nominal* exchange. It will be favorable when the depreciation is less than the expense of transit, and unfavorable when it is greater.

From 1809 to 1815 inclusive, Great Britain continued to export gold and silver to the Continent. During this period, therefore, we must add the expense of its

export to the excess of the market over the mint price of bullion, to get at the true relative value of British currency, and the state of the *real* exchange. Mr. Goldsmid stated to the bullion committee that, during the last five or six months of 1809, the expense of transporting gold to Holland and Hamburg, including freight, insurance, exporter's profits, etc., varied from 4 to 7 per cent. But at the time that the relative value of bullion in Britain was at 5½ (medium of 4 and 7) per cent. below its value in Hamburg, the market price of gold bullion exceeded its mint price 16 or 20 per cent., or 18 per cent. at an average; so that the currency of this country, as compared with that of Hamburg, which differed very little from its mint standard, was depreciated to the extent of about 23½ per cent. Now, as the *computed* or actual course of exchange varied, during the same period, from 19 to 21 per cent. against London, it is plain the *real* exchange could not be far from par. Had the *computed* exchange been less unfavorable, it would have shown that the *real* exchange was in favor of London; had it been more unfavorable, it would, on the contrary, have shown that the *real* exchange was against London.

Provided an accurate account could be obtained of the expense attending the transit of bullion from this country to the Continent during the subsequent years of the war, it would most likely be found, notwithstanding the extraordinary depression of the *nominal*, that the *real* exchange varied but little from par; and that the exportation of gold and silver was not a consequence of the balance of payments being against us, but of its being advantageous to export bullion, because of its being more valuable on the Continent. None will contend that, in 1809, 1810, etc., gold and silver were so redundant in this country as to sink their relative value. Any such supposition is out of the question. During the period referred to, they were sent abroad, because the depreciation of paper exceeded the cost of the transit of bullion; and it was every body's interest to pay their debts in the depreciated currency, and to export that which was undepreciated to countries where it passed at its full value as coin, or in which bullion was in greater demand. Had our paper currency been sufficiently reduced, the supply of gold in the kingdom in 1809, 1810, etc., compared with the demand which must, under such circumstances, have been experienced, was so very small, that instead of exporting, we should have imported the precious metals from all parts of the world.

The extraordinary exportation of British goods to the Continent during the latter years of the war, has been very generally supposed to have been in great measure owing to the depression of the exchange. But, in so far as this depression was occasioned by the redundancy or depreciation of the currency, it could have no such effect. It is impossible, indeed, to form any opinion as to the influence of fluctuations in the *computed* exchange on export and import trade, without previously ascertaining whether they are a consequence of fluctuations in the *real* or *nominal* exchange. It is only by an unfavorable *real* exchange that exportation is facilitated; and it may be favorable when the *computed* exchange is unfavorable. "Suppose," to use an example given by Mr. Blake, "the *computed* exchange between Hamburg and London to be 1 per cent. against this country, and that this arises from the *real* exchange which is favorable to the amount of 4 per cent., and a *nominal* exchange unfavorable to the extent of 5 per cent.; let the real price of bullion at Hamburg and London be precisely the same, and, consequently, the *nominal* prices different by the amount of the *nominal* exchange, or 5 per cent.; now, if the expenses of freight, insurance, etc., on the transit of bullion from Hamburg are 3 per cent., it is evident that a profit would be derived from the import of that article, notwithstanding the *computed* exchange was 1

per cent. against us. In this case, the merchant must pay a premium of 1 per cent. for the foreign bill, to pay for the bullion; £100 worth of bullion at Hamburg would therefore cost him £101, and the charges of importation would increase the sum to £104. Upon the subsequent sale, then, for £105 of depreciated currency in the home market, he would derive from the transaction a profit of £1. This sum is precisely the difference between the *real* exchange and the expenses of transit, that part of the *computed* exchange which depends on the *nominal* producing no effect; since whatever is lost by its unfavorable state is counterbalanced by a corresponding inequality of *nominal* prices.* In the same manner it may be shown that, though the *computed* be favorable, the *real* exchange may be unfavorable; and that, consequently, it may be really advantageous to export when it is apparently advantageous to import. But it would be tedious to multiply instances, which, as the intelligent reader will readily conceive, may be infinitely varied, and which have been sufficiently explained in the foregoing sections.

The real cause of the extraordinary importation of British produce into the Continent, in 1809, 1810, 1811, etc., notwithstanding the anti-commercial system of Napoleon, is to be found in the annihilation of the neutral trade, and our monopoly of the commerce of the world. The entire produce of the East and West was at our disposal. The Continental nations could neither procure colonial products, nor raw cotton for the purpose of manufacturing, except from England. British merchandise was thus almost indispensable; and to this our immense exportation, in spite of all prohibitions to the contrary, is to be ascribed.

XI. HISTORY AND INFLUENCE OF BILLS OF EXCHANGE.—It is not easy to discover the era when bills of exchange were first employed to transfer and adjust the mutual claims and obligations of merchants. Their invention has been ascribed to the Arabians and Jews of the Middle Ages. But it seems certain that they were in use in remote antiquity. Isocrates states that a stranger who brought some cargoes of corn to Athens, furnished a merchant of the name of Stratocles with an order or bill of exchange on a town on the Euxine, where money was owing to him; and, because the person who had drawn the bill had no fixed domicile, Stratocles was to have recourse on a merchant in Athens, in the event of its being protested. The merchant, says Isocrates, who procured this order found it extremely advantageous, inasmuch as it enabled him to avoid risking his fortune on seas covered with pirates, and the hostile squadrons of the Lacedemonians.—*De Paww Recherches sur les Grées*, i., 258.

There is also good evidence to show that the method of transferring and canceling the debts of parties residing at a distance by means of letters of credit, which are in effect the same as bills of exchange, was not unknown to the Romans. Cicero, in one of his epistles to Atticus, † inquires whether his son must carry cash to defray the expense of his studies with him to Athens, or whether he might not save this trouble and risk by obtaining an assignment for an equivalent sum from a creditor in Rome on his debtor in Athens. It is evident, from a subsequent epistle of Cicero, that the latter method had been preferred, and that the transference of the money had, in consequence, been rendered unnecessary. ‡

Macpherson states§ that the first mention of bills of

exchange in modern history occurs in 1255. The pope, having quarreled with Manfred, King of Sicily, engaged, on Henry III. of England agreeing to indemnify him for the expense, to depose Manfred, and raise Henry's second son, Edmund, to the Sicilian throne. The enterprise misgave. But the merchants of Siena and Florence, who originally advanced the money to carry it into effect, or rather to gratify the pope's rapacity, were paid by bills drawn on the prelates of England, who, although they protested that they knew nothing at all about the transaction, were nevertheless compelled, under pain of excommunication, to pay the bills and interest!*

Capmany, in his "Memoirs" respecting the commerce, etc., of Barcelona, gives a copy of an ordinance of the magistracy, dated in 1394, enacting that bills should be accepted within twenty-four hours after their presentation; a sufficient proof that they were in general use in the end of the fourteenth century.

But whatever be the era of the introduction of bills of exchange, few inventions have redounded more to the public advantage. Without this simple and ingenious contrivance, commerce could have made no great progress. Had there been no means of adjusting the mutual claims of debtors and creditors otherwise than by the intervention of metallic money (for bank paper is only another species of bills of exchange), a very large portion of that capital which is setting productive labor in motion in every quarter of the globe, and ministering to the wants and enjoyments of mankind, must have been employed in effecting those exchanges which are much better effected by the agency of a few quires of paper. Instead of a perpetual importation and exportation of gold and silver, necessarily attended with an immensity of trouble and expense, bills, possessing little or no intrinsic worth, and which are transferred with the utmost facility, suffice to adjust the most extensive and complicated transactions. But the mere setting free of an immense productive power, engaged in a comparatively unprofitable employment, is only one of the many benefits we owe to the use of bills. By cheapening the instruments by which commerce is carried on, they have materially reduced the prices of most articles; and have, in consequence, increased the command of all classes over necessities and luxuries, and accelerated the progress of civilization, by occasioning a more extensive intercourse and intimate connection between different and independent countries than would otherwise have taken place.

In a political point of view their effects have been equally salutary. They enable individuals imperceptibly to transfer their fortune to other countries, and to preserve it safe alike from the rapacity of their own governments and the hostile attacks of others. The security of property has, in consequence, been vastly augmented. And though we should concede to the satirist that paper credit has "lent corruption lighter wings," it has, at the same time, powerfully contributed to render subjects less dependent on the policy, and less liable to be injuriously affected by the injudicious measures of their rulers. In countries in a low stage of civilization the inhabitants endeavor, by burying all the gold and silver they can collect, to preserve a part of their property from the despots by whom they are alternately plundered and oppressed. This was universally the case in the Middle Ages; and in Turkey, India, Persia, and other eastern, and also in some European countries, the practice is still carried on to a greater or less extent. Some economists have endeavored to account for the long-continued importation and high value of the precious metals in India, by the loss which necessarily attends the practice of hoarding; and undoubtedly this locking-up of capital, while it evinces an extreme degree of insecurity, is a

* Observations, etc., p. 91.

† Epist. ad Atticum, lib. 2.

‡ Epist. ad Atticum, lib. 27. "De Cicero, ut scribis, ita faciam: ipse permittam de tempore; numerorum quantum opus erit ut permittatur tu videbis." In his notes on a parallel passage, Grævius remarks, "Permittatur: est quod nunc barbarè ambigit, dicitur."—Epist. ad Atticum, lib. 24.

§ Annals of Commerce, t. 406.

* Hume's England, cap. 12.

main cause of the poverty of these countries. But the security afforded by bills of exchange is infinitely greater than any which can be derived from the barbarous expedient of trusting property to the bosom of the earth. "Pregnant with thousands flits the scrap unseen," and in a moment places the largest fortune beyond the reach of danger. Mr. Harris was therefore right in saying, "that the introduction of bills of exchange was the greatest security to merchants, both as to their persons and effects, and consequently the greatest encouragement to commerce, and the greatest blow to despotism, of any thing that ever was invented."

Its extensive commerce, the wealth and punctuality of its merchants, and their intimate connection with all the other great trading cities of the world, made Amsterdam, previously to the peace of 1763, the chief place where the accounts of commercial countries were balanced and adjusted. But the loss of foreign trade, and the other vexations to which Holland was subjected during the ascendancy of the French, nearly divested Amsterdam of all share in this business; and it has not since recovered its former superiority. London is now the trading metropolis of Europe and the world, *universi orbis terrarum emporium*. The vast extent of its commercial dealings necessarily renders it the great mart for bills of exchange. Its bill-merchants, a class of men remarkable for their shrewdness and generally possessed of large capitals, assist in trimming and adjusting the balance of debt and credit between the most remote countries. They buy up bills where they are cheap, and sell them where they are dear, and, by the extent of their correspondence and the magnitude of their transactions, give a steadiness to the exchange to which it could not otherwise attain.

The following is a statement of the usance and days of grace for bills drawn at London upon some of the principal commercial cities:

London on	Usance.	Days of grace.
Amsterdam	1 m. d.*	0
Rotterdam	1 m. d.	0
Antwerp	1 m. d.	0

Dublin	21 d. s.	8
New York	60 d. s.	8

* m. d., m. s., d. d., s. d., a., respectively denote months after date, months after sight, days after date, days after sight, days after acceptance.

In France, days of grace were suppressed by the *Loi de Commerce*, article 132. In Austria, bills payable at sight or on demand, or at less than 7 days after sight or date, are not allowed any days of grace. In Petersburg, bills after date are allowed 10 days' grace, but after sight only 8 days' do.

In the dating of bills, the new style is used in every country of Europe, with the exception of Russia. A proclamation is now before the Russian government for the adoption of the Gregorian calendar, and London bills of exchange are bought and sold by bankers who go out to the principal merchants

and discover whether they are buyers or sellers of bills. A few of the brokers, of most influence, after ascertaining the state of the relative supply and demand for bills, suggest a price at which the greater part of the transactions of the day are settled, with such deviations as particular bills, from their being in a very high or low credit, may be subject to. The price fixed by the brokers is that which is published in Wittenhall's List; but the first houses generally negotiate their bills on 3, 1, 1½, and 2 per cent. better terms than those quoted. In London and other great commercial cities, a class of middlemen speculate largely on the rise and fall of the exchange; buying bills when they expect a rise, and selling them when a fall is anticipated.

It is usual, in drawing foreign bills of exchange, to draw them in sets, or duplicates, lest the first should be lost or miscarry. When bills are drawn in sets, each must contain a condition that it shall be payable only while the others remain unpaid; thus, the first is payable only, "second and third unpaid;" the second, "first and third unpaid;" and the third, "first and second unpaid."

Bills of exchange purporting to be drawn at any place out of the United Kingdom are to be deemed to be liable to the stamp-duty on such bills, though they may, in fact, have been drawn in the United Kingdom. (§ 4.) The holders of foreign bills, or bills drawn out of the United Kingdom, are to affix proper adhesive stamps to the same before negotiating them, under a penalty of £50. (§ 5.)

No one acquainted with the fundamental rules of arithmetic can have any difficulty whatever in estimating how much a sum of money in one country is worth in another, according to the state of exchange at the time. The common arithmetical books abound in examples of such computations. But, in conducting the business of exchange, a direct remittance is not always preferred. When a merchant in London, for example, means to discharge a debt due by him in Paris, it is his business to ascertain not only the state of the direct exchange between London and Paris, and, consequently, the sum which he must pay in London for a bill on Paris equivalent to his debt, but also the state of the exchange between London and Hamburg, Hamburg and Paris, etc.; for it frequently happens that it may be more advantageous for him to buy a bill on Hamburg, Amsterdam, or Lisbon, and to direct his agent to invest the proceeds in a bill on Paris, rather than remit directly to the latter. This is termed the *AMITTATION* of exchange. An example or two will suffice to show the principle on which it is conducted.

Thus, if the exchange between London and Amsterdam be 35s. Flemish (old coinage) per pound sterling, and between Paris and Amsterdam 1s. 6d. Flemish per franc, then, in order to ascertain whether a direct or indirect remittance to Paris would be most advantageous, we must calculate what would be the value of the franc in English money if the remittance were made through Holland; for it be less than that resulting from the direct exchange, it will obviously be the preferable mode of remitting. This is determined by stating, as 35s. Flemish (the Amsterdam currency in a pound sterling): 1s. 6d. Flemish (Amsterdam currency in a franc): £1: 10d. the proportion or arbitrated value of the franc. Hence, if the English money, or bill of exchange, to pay a debt in Paris, were remitted by Amsterdam, it would require 10d. to discharge a debt of a franc, or £1 to discharge a debt of 24 francs; and, therefore, if the exchange between London and Paris were at 24, it would be indifferent to the English merchant whether he remitted directly to Paris, or indirectly via Amsterdam; but if the exchange between London and Paris were above 24, then a direct remittance would be preferable; while, if, on the other hand, the direct exchange were less than 24,

the indirect remittance ought as plainly to be preferred.

"Suppose," to borrow an example from Kelly (*Universal Cambist*, vol. II., p. 137), "the exchange of London and Lisbon to be at 68d. per milree, and that of Lisbon on Madrid 500 rees per dollar, the arbitrated price between London and Madrid is 34d. sterling per dollar; for, as 1000 rees: 68d.: : 500 rees: 34d. But, if the direct exchange of London on Madrid be 35d. sterling per dollar, then London, by remitting directly to Madrid, must pay 35d. for every dollar; whereas, by remitting through Lisbon, he will pay only 34d.; it is, therefore, the interest of London to remit indirectly to Madrid through Lisbon. On the other hand, if London draws directly on Madrid, he will receive 35d. sterling per dollar; whereas, by drawing indirectly through Lisbon, he would receive only 34d.; it is, therefore, the interest of London to draw directly on Madrid. Hence, the following rules:

"1. Where the certain price is given, draw through the place which produces the lowest arbitrated price, and remit through that which produces the highest.

"2. Where the uncertain price is given, draw through that place which produces the highest arbitrated price, and remit through that which produces the lowest." In compound arbitration, "or when more than three places are concerned, then, in order to find how much a remittance passing through them all will amount to in the last place, or, which is the same thing, to find the arbitrated price between the first and the last, we have only to repeat the different statements in the same manner as in the foregoing examples. Thus, if the exchange between London and Amsterdam be 35s. Flemish for £1 sterling; between Amsterdam and Lisbon 42d. Flemish for 1 old crusade; and between Lisbon and Paris 480 rees for 3 francs; what is the arbitrated price between London and Paris? In the first place, as 35s. Flemish: £1 :: 42d. Flemish: 2s. sterling = 1 old crusade.

Second, as 1 old crusade, or 400 rees: 2s. sterling :: 480 rees: 2s. 4 8d. sterling = 3 francs.

Third, as 2s. 4 8d. sterling: 3 francs :: £1 sterling: 25 francs, the arbitrated price of the pound sterling between London and Paris.

This operation may be abridged as follows:

£1 sterling	=	35s. Flemish.
34s. Flem.	=	1 old crusade.
1 old crusade	=	400 rees.
480 rees	=	3 francs.

$$\text{Hence } \frac{85 \times 400 \times 3}{480 \times 34} = 25 \text{ francs.}$$

This abridged operation evidently consists in arranging the terms, so that those which would form the divisors in continued statements in the Rule of Three,

TABLE SPECIFYING THE VALUE OF THE MONIES OF ACCOUNT OF THE PRINCIPAL PLACES WITH WHICH ENGLAND HAS EXCHANGE TRANSACTIONS, TAKING SILVER AT 5s. AN OUNCE, AND SPECIFYING ALSO THE PAR OF EXCHANGE WITH SUCH PLACES ON THIS HYPOTHESIS.*

* Abstracted from *Tute's Modern Cambist*, to which the reader is referred for further explanations.

It is easy from this table to calculate the value of any of the above coins, taking silver at 5s. 2d., 5s. 6d. an oz., or any other price, and thence to deduce the par of exchange at such rates. The preceding article on Principles of Exchange, is from the pen of J. R.

are multiplied together or for a common divisor, and the other terms for a common dividend. The ordinary arithmetical books abound with examples of such operations.

The following account of the manner in which a very large transaction was actually conducted by indirect remittances, will sufficiently illustrate the principles we have been endeavoring to explain. In 1804, Spain was bound to pay to France a large subsidy; and, in order to do this, three distinct methods presented themselves: 1. To send dollars to Paris by land. 2. To remit bills of exchange directly to Paris. 3. To authorize Paris to draw directly on Spain. The first of these methods was tried, but it was found too slow and expensive; and the second and third plans were considered likely to turn the exchange against Spain. The following method by the indirect or circular exchange was therefore adopted.

A merchant or *banquier* at Paris was appointed to manage the operation, which he thus conducted: He chose London, Amsterdam, Hamburg, Cadiz, Madrid, and Paris, as the principal hinges on which the operation was to turn; and he engaged correspondents in each of these cities to support the circulation. Madrid and Cadiz were the places in Spain from whence remittances were to be made; and dollars were, of course, to be sent to where they bore the highest price, for which bills were to be procured on Paris, or on any other places that might be deemed more advantageous. The principle being thus established, it only remained to regulate the extent of the operation, so as not to issue too much paper on Spain, and to give the circulation as much support as possible from real business. With this view, London was chosen as a place to which the operation might be chiefly directed, as the price of dollars was then high in England; a circumstance which rendered the proportional exchange advantageous to Spain.

This business was commenced at Paris, where the negotiation of drafts issued on Hamburg and Amsterdam served to answer the immediate demands of the state; and orders were transmitted to these places to draw for the reimbursements on London, Madrid, or Cadiz, according as the course of exchange was most favorable. The proceedings were all conducted with judgment, and attended with complete success. At the commencement of the operation, the course of exchange of Cadiz on London was 36d.; but by the plan adopted, Spain got 39d., or above 8 per cent. by the remittance of dollars to London, and considerable advantages were also gained by the circulation of bills through the several places on the continent.—*KELLY'S Cambist*, vol. II., p. 168; *Dunoir's Elements of Commerce*, 2d ed., p. 228. See *Bills of Exchange*.

McCULLOCH, in the last edition *Ency. Brit.* See *Bills of Exchange*.

Exchange signifies a place in most considerable trading cities where merchants, agents, bankers, brokers, interpreters, and other persons concerned in com-

merce, assemble on certain days, at a fixed hour, to confer together in regard to matters relating to exchanges, remittances, payments, assurances, freights, etc. In Flanders, Holland, and France, these places are called *Bourses*, or *Places de Change*; and in the Hanse towns, *Borsehallen*. The most considerable exchanges in Europe are those of London, Paris, and Amsterdam. The ancient Romans had places for merchants to meet in most of the considerable cities of their empire. That which is said to have been built at Rome in the year B.C. 493, was called *Collegium Mercatorum*, of which it is alleged there are still some remains, called by the modern Romans *Loggia*, the Lodge or place of St. George.

Exchequer Bills are bills of credit issued by authority of Parliament. They are for various sums, and bear interest (generally from 1½d. to 2½d. per diem, per £100) according to the usual rate at the time. The advances of the bank to government are made upon exchequer bills; and the daily transactions between the bank and government are principally carried on through their intervention. Notice of the time at which outstanding exchequer bills are to be paid off is given by public advertisement. Bankers prefer vesting in exchequer bills to any other species of stock, even though the interest be for the most part comparatively low; because the capital may be received at the treasury at the rate originally paid for it, the holders being exempted from any risk of fluctuation, except in the amount of the premium or discount at which they may have bought the bills. Exchequer bills were first issued in 1696, and have been annually issued ever since. The subject is an account of the unfunded debt in exchequer bills, and of the annual charge thereon, on the 5th of January, 1817, and the 5th of January every subsequent year down to 1855.

In 1853, *exchequer bonds* were issued bearing interest at 2½ per cent. for ten years, and thereafter 3½ per cent. for thirty years, or to 1894, to such holders of South Sea, and three per cent. stock as chose to accept the same, a bond for £100 being given for every £100 stock subscribed (16th and 17th Vict., cap. 23). But only a very small sum (£50000) has been invested in such bonds.

This description of temporary loan is unknown in this country, but is a favorite investment by British capitalists. The treasury has the power, by act of Parliament, to issue ways and means bills, or in other words, exchequer bills, to the aid of the ways and means of the year, by issuing them in any one quarter, payable out of the revenues of the following quarter. Independent of these bills of supply, issues are made in exchequer bills to the paymaster-general for the ordinary service, to be sold in the market to meet the public demand. The bills are signed either by the comptroller or by the assistant-comptroller, and every means have been suggested to prevent forgery. Sometimes the bills are issued to the paymaster-general, and sometimes to the bank; and the bank either carries the amount of money for which it has contracted with the government, to the paymaster's account, or to the exchequer account. Then the credit is issued from the exchequer account for the public accountant. About 1500 bills are prepared in one day, and they are signed in even quantities. There are constitutional reasons against the treasury having the issue of exchequer bills. The Constitution of England is founded on a jealousy of the executive government, and therefore checks are required in dealing with the action of the government, which a commercial company like the Bank of England may not in any respect require.

From the 1st of January, 1842, to 15th June, 1847, there were signed by the comptroller-general, and by the assistant-comptroller, 186,707 exchequer bills, for the amount of £197,983,423. From the 1st January, 1845, to 15th June, 1847, there were examined and

controlled by the comptroller-general and assistant-comptroller, 288 royal orders of the amount of £92,861,730, and 900 treasury warrants of it a value of £293,681,258. From the first of January, 1845, to 10th June, 1847, there were issued and supplied to the paymaster, 90,109 bills of the amount of £54,604,900. The preparation of exchequer bills costs the public for paper-making, £4000; superintendence of ditto, £30; engraving and printing, £180; superintendent, £30; and counterfeits, £10—total, £650. During 1855, there were signed 1455 credits, 1228 acquittances, 427 Irish transfers, 3842 Irish acquittances, 32,444 exchequer bills of £31,827,117, and controlled 214 royal orders of £91,811,111, and 869 treasury warrants of £178,981,985. In 1854, there were signed 22,654 exchequer bonds of £8,009,400.

1855	17,183,000	815,518

The interest paid within each year is given in the column of charge, which interest has accrued upon the capital stated in the preceding year.

The interest paid upon the £16,029,600, and upon £11,500,000 of bills issued in April 1854, will be paid in 1855.

The interest upon the £17,183,000, will not be payable till 1856, *i. e.* year ending January 5, 1857.

Excise, the name given to the duties or taxes laid on certain articles produced and consumed at home; but, exclusive of these, the duties on licenses and post-horses are also placed under the management of the excise, and are consequently included in the excise duties. The excise system was established in England by the Long Parliament; was continued under Cromwell and Charles II.; and was organized as at present in the Walpole administration. It was first collected and an office opened in 1613, and was arbitrarily levied upon liquors and provisions to support the parliamentary forces against Charles I. The excise-office was built on the site of Gresham College, in 1771. The officers of excise and customs were deprived of their votes for members of Parliament in 1762.—*Hydra*.

Excise duties had been from an early period established in Holland, and the large revenue which they afforded pointed them out to the leaders of the popular party in the great civil war, as the most likely

means by which they could raise funds to carry on the great contest in which they had embarked. They were consequently introduced by a parliamentary ordinance in 1648; being then laid on the makers and vendors of ale, beer, cider, and perry. The royalists soon after followed the example of the republicans; both sides declaring that the excise should be continued no longer than the termination of the war. But it was found too productive a source of revenue to be again relinquished; and when the nation had been accustomed to it for a few years, the Parliament declared, in 1649, that the "impost of excise was the most easy and indifferent levy that could be laid upon the people." It was placed on a new footing at the Restoration; and, notwithstanding Mr. Justice Blackstone says that "from its first original to the present time its very name has been odious to the people of England" (*Com. book l. c. 3*), it has continued progressively to gain ground; and is at this moment imposed on various important articles, and furnishes a large share of the public revenue of the kingdom.

Exhibition (*exhibere*, to exhibit, furnish, maintain, etc.), a showing or presenting to view; a display. In law, delivery of writings in proof of facts; a bill of discovery. In our old writers it is also used for an allowance of meat and drink, a pension or salary; and it is now applied to a benefaction settled for the maintenance of scholars in English universities, not depending on the foundation. In 'his sense the term is analogous to the Scottish *bursary*. Among physicians, exhibition is a standard and convenient term to express the administering of a medicine.

Exhibitions of Works of Fine Art.—A collection of works of fine art, arranged in some suitable place for public inspection, is styled an exhibition. It is organized on a different principle from that of a national gallery or museum; for the works are not permanently preserved, but contributed for a limited period annually, new examples being provided for every successive exhibition.

Exhibitions are comparatively of modern institution. In former times artists were chiefly patronized by the church or the government; and the edifices in which their productions were placed were patent to the public; but now artists rely mainly on private patronage, and generally obtain the sanction of those for whom they execute works to exhibit them publicly for a limited period as specimens of their skill; or if executed for sale, these exhibitions afford an opportunity of disposing of their works, while they themselves are improved in their art by the opportunity of comparing their own efforts with those of other artists.

The members of the Academy of the Fine Arts, founded at Rome in 1593, probably on particular occasions exhibited their works collectively to the public; but it was in France, in 1737, that the members of the Royal Academy of Painting and Sculpture (founded in 1648) first regularly instituted annual exhibitions. These were made biennial in 1745, and were from their commencement confined to works executed by members of the academy; but during the Revolution (by a decree in 1791) all artists, French or foreign, were allowed to participate in the exhibition, which in 1796 was again made annual.

The earliest attempt at an exhibition in England was in 1760; and the efforts of the artists were at length united in the Royal Academy's exhibitions, the first

of which was opened in 1769. Since then they have been continued with increasing energy. In 1769, the number of works exhibited was 130, contributed by 69 artists; in 1855 there were 1558 works, contributed by 918 exhibitors. The annual revenue of the academy arises from a fee of one shilling from each visitor, and now exceeds £8000.

The Royal Scottish Academy's exhibition is the second in importance in the United Kingdom. Though, according to its present constitution, it only dates from 1826, those who instituted it had previously organized exhibitions in Edinburgh, which had been annually continued, with some few interruptions, since 1808. At the first exhibition, 178 works were sent in by 27 contributors; at the exhibition in 1855, 789 works were contributed by 287 exhibitors. The annual revenue exceeds £2000. Exhibitions are annually opened in Dublin by the Royal Hibernian Academy. These are the only fine-art corporations in Great Britain aided by government, the two first mentioned being accommodated in public galleries, and the last receiving an annual money grant. Besides the above mentioned, the following societies in London have also exhibitions, namely, the British Institution, founded in 1806; the Society of British Artists, in 1824; the National Institution, in 1850; the Society of Paintors in Water Colors, in 1805; and the New Society of Painters in Water Colors, in 1835. There are also annual exhibitions in Manchester, Liverpool, Glasgow, Birmingham, Cork, Newcastle, etc. But with the exception of those in London and the Royal Scottish and Hibernian Academies, they are mainly composed of works collected all over the kingdom, but principally in London.

Exhibition of 1851.—The great Exhibition of Works of Industry of all Nations, held in the British metropolis, was publicly announced in October, 1850. Prince Albert, as president of the Society of Arts, offered himself to the public as their leader in the undertaking; and her Majesty's proclamation appointing a commission to promote the project was issued January 3, 1850. The amount of public subscriptions to the Crystal Palace was £67,399 3s. 10d. After much discussion relative to the site proposed, a vast structure was erected on the south side of Hyde Park, from a design of Mr. (afterward Sir Joseph) Paxton. This building (usually called the Crystal Palace from the material of which it was chiefly composed) resembled, upon a great scale, the Victoria Regia plant-house, erected at Chatsworth, after Mr. Paxton's own design. The contract with Messrs. Fox and Henderson was for £79,800—a sum afterward somewhat increased by additions to the plan; or for £150,000, if the building was permanently retained. The exhibition was opened by her Majesty in state, May 1, 1851; and it remained open to the public till 11th October, shortly after which time the Crystal Palace was taken down.

This gigantic structure occupied an area of 21 acres, and was composed entirely of large sheets of glass set in frame-work of iron, except near the ground, where it was boarded. Its length was 1851 feet (a number corresponding to the year of the exhibition); and its width, in the broadest part, 456 feet; the transept intersecting the building at right angles in the middle, was 408 feet long, 108 high, and 72 wide. The entire structure consisted of three tiers of elevation, the central portion being 64 feet high, the adjacent side portions 44 feet, and the outer sides 24 feet high. The materials employed were as follows: 896,000 superficial feet of glass, weighing 400 tons; wrought-iron, 550 tons; cast-iron, 3500 tons; wood, including flooring, 600,000 cubic feet; nearly 2300 cast-iron girders, and 358 wrought-iron trusses for supporting the roof and the galleries (which extended nearly a mile in length); 30 miles of gutters; 202 miles of sash-bars, and 3380 cast-iron columns. The number of exhibitors was about 17,000; of prize medals awarded,

2018; of council medals, 170. The greatest number of visitors in one week was in that ending 11th October, when the number of persons paying at the doors was 478,773. The total amount of entrance fees during the season was £124,418 15s.

The Great Exhibition of 1851 was altogether novel in principle, and unparalleled in magnitude and magnificence; comprehending under one roof, in almost endless variety, specimens of the industrial productions, not only of Great Britain, but of the European states generally, together with those of nearly every part of the habitable globe. An account of these, as well as of the peculiar mode of construction of the Crystal Palace, may be found in the official descriptive and illustrated catalogues and reports of the juries.

Our limits preclude our entering into the history of national industrial exhibitions, or to make more than a passing reference to the various local exhibitions of works of industry which have taken place from time to time in the United Kingdom; such as those at Cork, Sheffield, Plymouth, and Salisbury in 1852, Dublin in 1853, and in Birmingham in 1849. Similar exhibitions were organized in Belgium in 1830, in the United States in 1853, at Munich in 1854, and especially in France in 1798, 1801, 1802, 1806, 1819, 1844, and on a large scale in 1855. This last is constituted on an entirely different basis from the English Exhibition of 1851; being set on foot by the capital of a commercial company formed for the purpose, and on the prospect of remunerative profits; but the State also takes a distinct and positive share in the risks of the enterprise, as it does with railways and other works of public utility. A certain percentage to the holders of stock is guaranteed by the government; and in right thereof an imperial commission is appointed which exercises supreme control. By this arrangement the proprietors are to receive whatever surplus may remain after all expenses are paid; whereas the £170,000 derived from the prices of admission to the London Exhibition stands over as a public trust fund, under royal charter, to be applied to objects in harmony with those for which the exhibition was held.

The French Exhibition is not contained under one roof, nor of the several buildings are all intended to be of a temporary character. The buildings, in the aggregate, will probably include a greater area than the Crystal Palace at Hyde Park. The main building is the Palais de l'Industrie, a permanent edifice of rectangular form, and with considerable pretensions to architectural effect. In this will be exhibited all the higher productions of manufacturing industry. There is also the "Annexe," a shed 4000 feet long, parallel to the Seine, for the exhibition of machinery and raw produce. According to the plan, these two structures are connected by a gallery running across the Champs Elysées, and having in its centre a fine circular space, which is appropriated to the productions of Sévres, and the other national establishments; and, in addition, there is an extra shed for the exhibition of carriages and other articles of great bulk.—E. B.

The British government, in order to secure an adequate representation of British art and industry in Paris, corresponding to the efforts which the French government had made in 1851, granted £50,000 by a parliamentary vote. The assistance of public associations and local committees was also obtained for the purpose, and special reports were by them published. The number of exhibitors from the United Kingdom was 1555, and from the British colonies 1070. The total number of exhibitors was 26,339, viz.: 10,691 from the French empire, and 10,148 from foreign States, viz.: France, 9790; Algeria, 724; French colonies, 177; the Duchy of Anhalt, 15; the Argentine Confederation, 6; Austria, 1296; Grand Duchy of Baden, 83; Bavaria, 172; Belgium, 686; Brazil, 4; Duchy of Brunswick, 16; Republic of Costa Rica, 4;

Danmark, 90; St. Domingo, 1; Egypt, 6; Frankfort-on-the-Maine, 24; Great Britain and Ireland, 1589; British colonies, 985; Greece, 131; Republic of Guatemala, 7; Kingdom of Hanover, 18; Hanse Towns, 89; Grand Duchy of Hesse, 74; Electorate of Hesse, 14; Principality of Lippe-Desmeid, 2; Grand Duchy of Luxemburg, 23; Mexico, 107; Duchy of Nassau, 59; Netherlands, 411; New Granada, 13; Grand Duchy of Oldenburg, 13; Ottoman Empire, 2; Sandwich Islands, 5; Papal States, 71; Portugal (including colonies), 443; Prussia, 1313; Principalities of Reuss (Elder and Younger Branches), 2; Sardinia, 198; Saxony, 96; Duchy of Saxe-Altenburg, 2; Duchy of Saxe-Coburg, 6; Duchy of Saxe-Coburg-Gotha, 11; Duchy of Saxe-Meiningen, 3; Grand Duchy of Saxe-Weimar, 1; Principality of Schaumburg-Lippe, 2; Principality of Schwarzburg-Rudolstadt, 1; Spain, 568; Sweden and Norway, 538; Switzerland, 408; Grand Duchy of Tuscany, 197; Tunis, 1; United States, 130; Wurtemberg, 207. Total, 10,148.

New York Exhibition of the Industry of all Nations.—Although America achieved some of the most signal and permanently valuable results which were brought to the knowledge of mankind by the Exhibition in Hyde Park; still there was probably no American who saw our contributions in London that did not feel some regret that they were not a more just and equally sustained exponent of our resources, industry, and arts. But stronger and more controlling than this sentiment was the desire excited to afford the masses in America an opportunity to see the grand total of the world's industry, and the manifold productions and applications of the arts of design brought in one comparative view. It was seen, that while no motive but a proper regard for our own position in the great family of nations could have induced us, as a people, to send our industrial products to Europe, where we find a market only for our great staple raw materials, that the fact of our becoming more and more every day the great purchasers of the products of European skill and labor, expended, perhaps, upon our own products, would induce all the manufacturing states of the old world to embrace, eagerly, an opportunity to expose their products in the New York Crystal Palace. This conviction, strengthened by the sentiments before alluded to, led a few public-spirited citizens of the United States, early in 1859, to contemplate the organization of the effort whose results we see. It was not designed or desired to reproduce the London Exhibition, which, from the very nature of the case, must ever remain unexampled; but to draw forth such a representation of the world's industry and resources as would enable us to measure the strength and value of our own, while it indicated new aims for our enterprise and skill.

There is no humiliation in the acknowledgment, that America has more to gain from such a comparison than any other nation in Christendom—and we believe she is also more willing to avail herself of the suggestions it offers. It was obvious in the outset, that numerous difficulties would embarrass the successful organization of an exhibition of industry in the United States, which should at once be universal in its scope, and devoid of the imputation of local or sectional influence. These difficulties were inherent in the nature of our political institutions. In England, the suggestion of Prince Albert to the Society of Arts was received with enthusiasm, and enlisted not only the cordial support of the queen, but every member of a numerous and wealthy aristocracy joined his hand in setting forward the royal project. The government, however backward and lukewarm they might have been at first, could not resist an influence with which, as men, they were identified. Then the almost supreme power of the London journals came in to swell and direct the popular sentiment, and to make every Englishman feel that he had an immediate personal stake in the suc-

cess—the triumph of an enterprise of the nation.

Under the universal in itself in our names are locusts, and o. heading the in considering, colossal achievements, the Statistical Societies and engineers—and

The countenance government was a

cess—the triumphant and overwhelming success—of an enterprise to which the honor of his sovereign, and of the nation, stood pledged before all mankind.

Under the stimulus of such powerful motives, the universal intellect of the United Kingdom organized itself in councils, committees, and juries. Men whose names are identified with the halls of science, of literature, and of art, left their tripods, and were found heading the various corps of hard-working volunteers in considering or perfecting the several details of the colossal scheme. The rooms of the Royal, the Geological, the Geographical, the Ethnological, and the Statistical Societies, of the Institutions of Civil Engineers and Architects, of the Museum of Economic Geology—and even of the staid and conservative Universities, were for a time deserted to furnish men and mind for the emergency. In looking over the long catalogue of councilmen and chairmen, of commissioners, associates, and jurymen, whose names are connected with the administration of the London Exhibition, it is astonishing to see what an array of talent and learning was gathered to secure its success. Nor was this peculiar to Great Britain; but from all parts of the world, we find in its published lists men whose names are the guaranty of eminent success, not only in their own departments, but in whatever they may undertake. Such was the animus of the London Exhibition. Compared with this royal espousal, and enormous personal influence brought to sustain and carry forward the exhibition of 1851, the simple machinery and resources of an association of private gentlemen, however enterprising, might seem utterly inadequate. Let the results decide. Such an association was formed, and stands committed to the successful prosecution of the plan. All the world has been invited to co-operate in sustaining the effort, and the appeal has met a response as cordial as the design is liberal and catholic.

New York was selected as the locality of the exhibition, because of its great advantages as a commercial centre, and as the chief entrepôt of European goods. Had it been proposed to limit the exhibition to the products of American industry, some place more central, as Washington, Philadelphia, or Cincinnati, might have been justly preferred, but in view of the foreign department of the scheme. New York seemed the only place at all suited for the purpose. The municipal authorities of the city of New York, on the 3d of January, 1852, moved by an enlightened regard for the prosperity of the city, and the interests of its inhabitants, granted a lease for five years of Reservoir-square for this purpose upon two conditions: one, that the building should be constructed of glass and iron, and the other, that no single entrance fee should exceed 50 cents. The Legislature of the State of New York, upon application, granted, on the 11th of March, 1852, the charter under which the Association for the Exhibition of the Industry of all Nations has been organized and carried forward. The act clothed the directors with all the powers needed to carry out its plans, and the Legislature have since that time extended its privileges, so that it can issue stock to the amount of \$500,000, in place of the original limitation to \$300,000. The Board of Directors met on the 17th of March, 1852, and organized by the election of Theodore Sedgwick, Esq., President, and William Whetten, Esq., as Secretary. No time was lost in publishing and circulating a general statement of the objects of the enterprise. A call for subscriptions to the stock was met in due time by about 150 persons and firms coming forward to take up the first \$200,000. This wide distribution of the interest in a large number of hands completely avoided the obnoxious charge, that the undertaking was a speculation designed for the benefit of a few.

The countenance and co-operation of the general government was sought with a view to the introduc-

tion of foreign goods into the Exhibition duty free. And official assurances were given by Mr. Maxwell, the collector of the port of New York, that the building of the association would be made a bonded warehouse, thus entitling the association to receive the goods free of duty while on exhibition. The influence of the general government was also most cheerfully extended on behalf of the association through the kind offices of Mr. Webster, then Secretary of State, who wrote to the representatives of the United States at the principal courts of Europe, stating to them his sense of the importance of the enterprise, and the numerous reasons why in his view they should give to the association all the aid and support in their power. The ministers of foreign powers resident in the United States had previously responded, in terms of entire cordiality, to the general circular of the association which had been addressed to them, stating its plans, and soliciting the co-operation of European nations. They all expressed their convictions that their respective governments would look with favor upon the proposed exposition, and unite in sending to New York their most valued and characteristic objects of industry. The leading foreign newspapers also manifested a most friendly desire to sustain the success of the undertaking, and the records of their zealous support; while the daily journals in foreign languages in the United States were prominent in lending their services to the cause.

The organization of the foreign relations of the association was effected by the appointment of Mr. Charles Buschek, of London, as its general agent, through whom details were arranged. This delicate and important trust, involving the greatest responsibility, required talents, knowledge, and experience. The association was truly fortunate in finding these qualities combined in one person. Mr. Buschek was the Austrian commissioner at the London Exhibition of 1851, and through him the co-operation of the European manufacturers has been secured to an unexpected extent. At a later period in the history of the enterprise, it was thought to be expedient to send out to Europe Colonel G. W. Hughes, of Maryland, to co-operate with Mr. Buschek in carrying out the plans of the association. This gentleman added to the weight of his official commission the influence of personal qualities, fitting him, in a remarkable manner, for his delicate task of soliciting or directing the countenance and support of European governments in favor of the objects of the New York Exhibition. The result of his labors was the securing from various governments important contributions, which would otherwise have remained unknown in the United States.

Although the "New York Exhibition of the Industry of all Nations" was, as a financial scheme, unsuccessful, yet its effects upon the industry and inventive powers of the country were unquestionably important. These effects will be felt for a century to come, and should confer honor upon those enterprising citizens of the metropolis and State who conceived and carried into effect the plan now described. The exhibition was closed in the year 1855.

Exotic. (Gr. *ἐξωτικός*, foreign.) Any thing introduced to one country from some other country. In gardening it is sometimes applied to plants which require protection in winter, or to plants in general which are not natives.

Expectation of life. See **INSURANCE.**

Exploring Expedition (U. S.) consisting of the *Vincennes*, sloop of war; *Peacock*, do.; *Porpoise*, *Relief*, *Flying Fish*, and *Sea Gull*, smaller vessels, under Lieutenant Wilkes, U. S. N., sailed from Hampton Roads, Va., August 19th, 1838. Antarctic continent discovered, July 19, 1839. Attack on the *Fejees* for murdering two of the officers, July 25, 1840. The *Peacock* lost on the bar of Columbia River, July 1841

The *Vincennes* (flag-ship) returned to New York, after an absence of nearly four years, June 11, 1842. Captain Wilkes's Narrative of the Expedition, in 6 vols. imp. 8vo. and quarto, was published in 1846. The scientific reports of the expedition form about 20 quarto or folio volumes.

Exportation, in Commerce, the act of sending or carrying commodities from one country to another.—See IMPORTATION and EXPORTATION.

Express. There is no branch of business in this country more extensive and important than the express service. The ever-busy handmaid of trade, agriculture, and the useful arts, there is no community so small as not to be susceptible to its usefulness. Yet, while agriculture, art, and trade are world-old, the express is comparatively only a thing of to-day. England had no part in creating it. Europe has done nothing to establish it; and twenty years ago it was not dreamed of even in America, where it is now so indispensable. Peculiarly American in its origin and characteristics, it has become so thoroughly interwoven with the daily business of the country, that it seems to constitute an inseparable portion of its muscle and sinew.

The inquiry naturally arises, "If the express service is so indispensable an institution now, how did the American people do without it prior to its creation?" The fact is, that the "expressman" is only an improvement (a great improvement, it is true) upon the "common carrier" of olden times. It was not a very rare thing, at an earlier period, to hear of a special express run for a temporary purpose, such as the transit of news of intense public interest, or intelligence of great private moment. In those cases the enterprise employed one or more riders, with the necessary relays of fleet horses at intervals upon the road. Browning's fine poem, "How they brought the good news from Ghent to Aix," vividly describes an express of this kind, bearing news of peace and safety to that beleaguered city.

But the express service, properly so called, does not date back beyond the origin of American railroads. Prior to that epoch, stage-drivers had performed duties similar to those now discharged by expressmen; and "baggage-seasons" (so called, though they carried merchandise as well) served instead of freight-trains. With the innovation of railways, the stage-drivers and wagoners found, like Othello, their "occupation gone." The loss of their services seriously incommoded the public; but the railroad offered no remedy. Years passed; trade and intercommunication between town and country suffering, in the mean while, from this cause. At length, hardly realizing what an improvement he was about to effect, William F. Harnden, then a conductor upon the Boston and Worcester Railroad, started the express business. It was in the spring of 1839. The idea was not original with him; but to him is due the honor of having been the first to put it into execution.

The only through route from Boston to New York at that time (March, 1839) was by railroad to Providence, and thence to this city, by the steamboat *J. W. Richmond*. The Old Line of steamboats ran from Stonington to New York. Harnden had no paid agent in this city at the outset. The messengers (called, during the first year or two, *conductors*) attended to all the business. Harnden himself acted in that capacity, usually making the trip in the *J. W. Richmond*, and carrying his entire express in an ordinary valise. Upon his arrival in New York or Boston he would hasten to deliver the parcels intrusted to him by his customers, who were mostly booksellers and brokers.

The express was run by Harnden some time before he made a contract with the Old Line of boats from Stonington to New York. His messenger paid regular fare, and carried all the packages in a carpet-bag and trunk. After the lapse of six months or a year, he

made a contract with the Old Company and the Stonington and Providence Railroad Company to run a car through. Each messenger then carried a season ticket—obtained by holding a few shares of the company's stock. According to the terms of that contract, the Boston and Providence Railroad Company were entitled to one third of the gross receipts of the express for freight; and the Providence and Stonington Railroad Company (including, we presume, the boats) were to receive one third; the residue to be Harnden's. His first contract with the owners of the *J. W. Richmond* was to convey a car or crate for him between Providence and New York. He took five or six shares of the stock, which entitled him or his messenger to a free passage.

The first opposition express was run on the 4th of May, 1840. Alvin Adams made an effort to contract, in its behalf, for privileges on the Norwich and Worcester route from Boston to New York; but Harnden being at that time better known, the directors gave his "well-established express" the preference; so that he was like to have the monopoly of the facilities on both routes. As Adams was not to be defeated in that way, he went to Major Handy, agent for the Stonington line, and purchased two season tickets for himself and partner, to run as often as they pleased between Boston and New York, until January, 1841; with no other privilege, however, than to carry a trunk and valise.

In the spring of 1841, the only express routes in the world were those between New York and Boston; but, with a successful rival competing for the business of those cities, Harnden & Co. thought it due to their own credit, as pioneers, to take another stride or two, and extend their line south to Philadelphia, and west to Albany, in this State.

An express was established 23d April, 1841, between Boston and Albany, and another between Albany and New York, by Harnden & Co.

About that time, Adams & Co. experienced not a little annoyance from their want of regular express facilities from New York to Philadelphia, and they used an infinity of "shiffs" to put their parcels through. In the mean time, the Camden and Amboy Railroad directors had quarreled with Harnden & Co. for non-payment of compensation alleged to be due them, and had stopped their express over that road. Nor were they more favorably disposed to make a similar contract with any one else. Still, at his partner's solicitation, Adams went to Philadelphia to apply for a contract. Stevens, who represented the Board upon that occasion, gave him a very decided refusal at once. Adams then made another proposition; viz., to do the express business over that railroad in connection with the company; the latter to allow Adams & Co. a portion of the avails. This impressed Stevens more favorably, and the immediate result was a contract that Adams & Co. should fill a certain number of crates daily, and deliver the goods, receiving for their trouble a certain portion of the freight money; the railroad company to have the rest.

In 1842 Harnden & Co.'s Boston and Albany Express was bought out by its Springfield agent, the enterprising Colonel Thompson, and called Thompson & Co.'s Express. Messrs. Melcher and Johnson are his partners. Gay & Co. (Gay and Littlefield) started an express between Boston and New York, via Stonington, in 1842. They carried only a trunk of parcels, and had no contract. Gay would run one way, and Littlefield the other; and each had the profits which he happened to make upon each day's work, and pocketed the same, without being expected to render an account to his nominal partner. This arrangement, apparently so primitive and simple, did not work well in the long run, and Littlefield retired from it. Kinsley next joined Gay, and the firm was styled Gay & Kinsley. The latter, for some years past president of

a bank at Newport, Rhode Island, has become eminent as an expressman.

In 1844 there were expresses between Boston and Lowell, Boston and Salem, and on one or two other short routes in Massachusetts, and they were increasing. The first express west of Buffalo was established April 1, 1845, under the name of Wells & Co. The members of that firm were Henry Wells, W. G. Fargo, and D. Dunning. For the want of railroad facilities (and when the steamers were laid up), it was a wagon express between Buffalo and Detroit. In February, 1847, W. G. Fargo and William A. Livingston became sole proprietors of the express west of Buffalo, under the style of "Livingston & Fargo." The latter is deserving of honorable mention for his industry, perseverance, and sound sense. Wells & Co.'s line extended from New York to Buffalo, via Albany.

W. F. Harnden & Co.'s *Foreign Express* elicited the applause of the community, and gave an *éclat*, at home and abroad, to their already well-known name. Still, it by no means contributed to the advantage of their express in the United States. It only served to divide and weaken their energies. The result was, that the more concentrated efforts of their rivals here met with a larger share of success, and in 1846 Adams & Co.'s business between Boston, New York, and Philadelphia was more valuable than Harnden & Co.'s.

Canada was without an express until Virgil & Rice started one from Troy to Montreal, via Lake Champlain, in the summer, and by wagons and stages in the winter. This, we think, was in 1847 or 1848. Subsequently Rice retired, and Messrs. Virgil & Co. contracted with the Saratoga Railroad for a car. The express from New York to Troy was owned by Pullen & Co., who in the year 1849 united with Virgil & Co., under the style of Pullen, Virgil, & Co. Under the management of these experienced and able men, the business was nursed and tended with most praiseworthy perseverance, until it grew to considerable importance.

In 1849 a new order of express service was destined to spring up. The "California gold fever" had broken out, and thousands of young men were thronging to the newly-acquired Golconda, when Daniel Hale Haskell, a highly-esteemed clerk in Adams & Co.'s Boston office, suggested to his employers the expediency of establishing a California express. With characteristic prudence, Adams & Dinsmore at first opposed the proposition; foreseeing that the most important point of operations must necessarily be in San Francisco, many thousands of miles beyond their supervision, and they preferred to have all their business where they could give it their frequent personal inspection. However, they at length yielded to Haskell's solicitations, and he went out to San Francisco in the steamer of September, 1849, to act as their partner in the proposed business. The building which he took for an express-office was a little shanty, of which I. C. Woods was either the owner or the owner's agent. As the business increased rapidly, this building had to be pieced out, or extended in depth every few weeks, to hold the multitudes which thronged to it to hear the news, obtain or send letters, and remit their gold dust. The enterprise compensated beyond the most sanguine dreams of its sanguine projector. Let us give some idea of the prices.

The charge made by Adams & Co. for freight, from New York to San Francisco, was seventy-five cents per pound for packages not exceeding fifteen pounds each; and for parcels of less weight, not bulky, such price was made as could be agreed upon. Three dollars was their price for conveying an ordinary-sized daguerreotype; twelve dollars for a parcel not larger than a common size novel; and this was always exacted in advance. It was paid cheerfully and without any haggling. Since then the prices have fallen about 60 per cent.

Upon the arrival of the steamer at Chagres with the express, the freight would be sent ashore in boats—a tedious and perilous job, for the sea usually ran high, and the boats were frequently swamped. At Chagres it was transferred to river-canoes, and propelled by natives to Cruces, where it was again transferred and placed upon the backs of mules, which bore it (by a road that would have defied the locomotion of any other kind of beast) to Panama, where the Pacific steamship awaited to convey it to San Francisco. Being liable to be saturated with water in being carried ashore at Chagres, and in crossing the Isthmus, by reason of rains and streams, it was required of shippers to put up their merchandise in water-proof packages. The load of a mule rarely exceeded 300 lbs. Usually he bore two oblong boxes or trunks weighing not over 125 lbs. each.

Another class of messengers to which Adams & Co.'s express in California gave rise were wont to perform their service on horseback between San Francisco (and other towns) and the numerous "digging." Sometimes they made use of mules; but in either case the beasts must be sure and swift of foot and easy under the saddle, or they were discarded and better procured in their stead. To be able and willing to run fleetly at a word from its rider, was a *sine qua non* in the stead of an express messenger; and there are heard wonderful stories of the time made, under the saddle, in this service.

The express companies may be said to influence the domestic exchanges of the country, inasmuch as they transport nearly all the specie and bullion, as well as considerable portions of the bank-notes, bills of exchange, drafts, bonds, and other securities; and the price of exchange between one city and another depends in some measure upon the express charges for conveyance. The rates paid for the transportation of bank-notes is usually fixed by contract in writing, and are low. For instance, between New York and Cincinnati, 900 miles, one dollar per thousand. The total value of the capital employed in the express business was valued in 1856 at ten millions of dollars. Four years ago, the entire number of miles of express routes in America was estimated at 25,000. As facilities have been increased, and express routes extended, the whole distance traveled by express daily is probably not less than 28,000. The multifarious lines stretch in every direction, crossing each other like the threads of the spider's web. And now we find the principal expressmen undertaking the enterprise of conveying the United States mail overland to California. September 15, 1857, Messrs. Butterfield, Dinsmore, Fargo, and others, executed an agreement to that effect. The contract, which is to run six years, is to go into effect twelve months from that date. Six hundred thousand dollars per annum is the price to be paid the contractors. The extraordinary character of the labor thus confidently assumed can hardly be appreciated until the work shall have been accomplished. Certainly the establishment of such a route is an appropriate reward for express enterprise.—For a full history of the express business, see *Bankers' Magazine*, New York, September, 1857.

Extract, or Extractive Matter. The term extract is applied in pharmacy to the brown substance which remains after the evaporation of certain decoctions or infusions of vegetables; thus we have *extract of bark*, *extract of rhubarb*, and so on. These extracts are usually mixtures of gum, starch, sugar, or other soluble matters, along with a certain portion of a peculiar vegetable principle of a brown color, or which becomes so by exposure to air, and which is soluble in water and in alcohol, but scarcely soluble in ether. It combines with alumina, and is often the basis of brown dyes; it is this principle which chemists call *extractive*, and which is frequently closely allied to various forms of coloring matter.

Fac-simile (Lat. *facere*, to make, and *simile*, like), expressed in French by *fac-similable*, signifies an exact and faithful copy of any writing, engraving, or other work of art.

Factor, an agent employed by some one individual or individuals, to transact business on his or their account. He is not generally resident in the same place as his principal, but usually in a foreign country. He is authorized, either by letter of attorney or otherwise, to receive, buy, and sell goods and merchandise; and, generally, to transact all sorts of business on account of his employers, under such limitations and conditions as the latter may choose to impose. A very large proportion of the foreign trade of this and most other countries, is now carried on by means of factors or agents. Factors and brokers are, in some respects, nearly identical, but in others they are radically different. "A factor," said Mr. Justice Holroyd, "differs materially from a broker. The former is a person to whom goods are sent or consigned; and he has not only the possession, but, in consequence of its being usual to advance money upon them, has also a special property in them, and a general lien upon them. When, therefore, he sells in his own name, it is within the scope of his authority; and it may be right, therefore, that the principal should be bound by the consequences of such sale. But the case of a broker is different; he has not the possession of the goods, and so the vendor can not be deceived by the circumstance; and, besides, the employing a person to sell goods as a broker does not authorize him to sell in his own name. If, therefore, he sells in his own name, he acts beyond the scope of his authority; and his principal is not bound."

A factor is usually paid by a percentage or commission on the goods he sells or buys. If he act under what is called a *del credere* commission, that is, if he guarantee the price of the goods sold on account of his principal, he receives an additional percentage to indemnify him for this additional responsibility. In cases of this sort the factor stands in the vendee's place, and must answer to the principal for the value of the goods sold. But where the factor undertakes no responsibility, and intimates that he acts only on account of another, it is clearly established that he is not liable in the event of the vendee's falling. The sound maxim, that the principal is responsible for the acts of his agent, prevails universally in courts of law and equity. In order to bind the principal, it is necessary only that third parties should deal *bonâ fide* with the agent, and that the conduct of the latter should be conformable to the common usage and mode of dealing. Thus, a factor may sell goods upon credit, that being in the ordinary course of conducting mercantile affairs; but a stock broker, though acting *bonâ fide*, and with a view to the benefit of his principal, can not sell stock upon credit, unless he have special instructions to that effect; that being contrary to the usual course of business.

A sale by a factor creates a contract between the owner and buyer; and this rule holds even in cases where the factor acts upon a *del credere* commission. Hence, if a factor sell goods, and the owner give notice to the buyer to pay the price to him, and not to the factor, the buyer will not be justified in afterward paying the factor, and the owner may bring his action against the buyer for the price, unless the factor has a lien thereon. But if no such notice be given, a payment to the individual selling is quite sufficient. If a factor buy goods on account of his principal, where he is accustomed so to do, the contract of the factor binds the principal to a performance of the bargain; and the principal is the person to be sued for non-performance.

F. But it is ruled, that if a factor enter into a charter-party of affreightment with the master of a ship, the contract obliges him only, unless he lade the vessel with his principal's goods, in which case the principal and lading become liable, and not the factor. Where a factor, who is authorized to sell goods in his own name, makes the buyer debtor to himself; then, though he be not answerable to the principal for the debt, if the money be not paid, yet he has a right to receive it, if it be paid, and his receipt is a sufficient discharge; the factor may, in such a case, enforce the payment by action, and the buyer can not defend himself by alleging that the principal was indebted to him in more than the amount.

"Where a factor," said Lord Mansfield, "dealing for a principal, but concealing that principal, delivers goods in his own name, the person contracting with him has a right to consider him, to all intents and purposes, as the principal; and though the real principal may appear, and bring an action on that contract against the purchaser of the goods, yet that purchaser may set off any claim he may have against the factor, in answer to the demand of the principal."

Merchants employing the same factor run the joint risk of his actions, although they are strangers to each other; thus, if different merchants remit to a factor different bales of goods, and the factor sell them as a single lot to an individual who is to pay one moiety of the price down and the other at six months' end; if the buyer fail before the second payment, each merchant must bear a proportional share of the loss, and be content to accept his dividend of the money advanced.—BEAWE, *Lex. Merc.*

A factor employed, without his knowledge, in negotiating an illegal or fraudulent transaction, has an action against his principal. On this ground it was decided, that a merchant who had consigned counterfeit jewels to his factor, representing them to be genuine, should make full compensation to the factor for the injury done to him by being concerned in such a transaction, as well as to the persons to whom the jewels had been sold.

The office of a factor or agent being one of very great trust and responsibility, those who undertake it are bound, both legally and morally, to conduct themselves with the utmost fidelity and circumspection. A factor should take the greatest care of his principal's goods in his hands; he should be punctual in advising him as to his transactions on his behalf, in sales purchases, freights, and, more particularly, bills of exchange; he should deviate as seldom as possible from the terms, and never from the *spirit and tenor*, of the orders he receives as to the sale of commodities; in the execution of a commission for purchasing goods, he should endeavor to conform as closely as practicable to his instructions as to the quality or kind of goods; if he give more for them than he is authorized, they may be thrown on his hands; but he is bound to buy them for as much less as he possibly can. After the goods are bought, he must dispose of them according to order. If he send them to a different place from that to which he was directed, they will be at his risk, unless the principal, on getting advice of the transaction, consent to acknowledge it.

A factor who sells a commodity under the price he is ordered, may be obliged to make good the difference, unless the commodity be of a perishable nature and not in a condition longer to be kept. And if he purchase goods for another at a fixed rate, and, their price having afterward risen, he fraudulently takes them to himself, and sends them somewhere else, in order to secure an advantage, he will be found, by the custom

of merchants, liable in damages to his principal. If a factor, in conformity with a merchant's orders, buy with his money, or on his credit, a commodity he is directed to purchase, and, without giving advice of the transaction, sells it again at a profit, appropriating that profit to himself, the merchant may recover it from him, and have him amerced for fraud. If a factor buy, conformably to his instructions, goods of which he is robbed, or which suffer some unavoidable injury, he is discharged, and the loss falls on the principal. But if the goods be stolen from the factor, he will not be so easily discharged; for the fact of their having been abstracted by *stealth*, and not by *violence*, raises a strong presumption that he had not taken that reasonable care of them which was incumbent upon him. If, however, he can prove that the goods were lodged in a place of security, and that he had not been guilty of positive negligence, nor exercised less care toward them than toward his own property, he will not be held responsible even for a theft committed by his servants.—JONES on *Bailments*, 2d ed., p. 76; CHITTY on *Commercial Law*, vol. iii., p. 868.

If a factor, having money in his hands belonging to his principal, neglect to insure a ship and goods, according to order, he must, in the event of the ship miscarriage, make good the damage; and if he make any composition with the insurers after insurance, without orders to that effect, he is answerable for the whole insurance. A principal at the end of a very long letter, directed his agent thus: "Observe, the premium on this value is also to be insured." But the agent, not noticing this sentence, neglected to insure the premium; and being sued, was held liable for the omission. If goods are remitted to a factor, and he make a false entry of them at the custom-house, or land them without entry, and they are, in consequence, seized or forfeited, he is bound to make good the damage to his principal; but if the factor make his entry according to invoice or letters of advice, and these proving erroneous, the goods are seized, he is discharged. It is now a settled point, that a factor has a lien on goods consigned to him, not only for incidental charges, but as an item of mutual account for the balance due to him so long as he remains in possession. If he be surety in a bond for his principal, he has a lien on the goods sold by him on account of such principal, to the amount of the sum he is bound for.

It being the general rule of law "that property does not change while *in transitu*," or in the hands of a carrier, a consignment made *before* the bankruptcy of a consignee, but not arriving till *after*, remains the property of the consignee, except, indeed, where the *delivery* is made *by the order* and upon the account of the consignee, and is a complete *alienation* from the consignee. In the case, therefore, of a consignment to a factor, the property remains the consignee's, and passes into the hands of his assignees. When a factor has a lien on goods, he has a right to the price, though received after the bankruptcy. Where general or unlimited orders are given to a factor, he is left to buy and sell on the best conditions he can. And if detriment arise to a principal from the proceedings of a factor acting under such authority, he has no redress, unless he can show that he acted fraudulently or with *gross negligence*. A factor or broker acting against the interest of his principal, can not even receive his commission. If he pay money on account of his principal, without being authorized, he can not recover it back. An agent can not delegate his rights to another so as to bind the principal, unless expressly authorized to nominate a sub-agent.

For further information as to the general powers and liabilities of factors and agents, see KENT'S *Commentaries*; PARSONS on *Mercantile Contracts*; STORRY on *Contracts*; BEAWE'S *Lex Mercatoria*, arts. *Factors*, *Supercargoes*, etc.; CHITTY'S *Commercial Law*, vol. iii.,

c. 8.; WOOLRYCH on *Commercial Law*; see also the article BROKER.

Under the law with respect to the transactions of factors or agents on third parties that prevailed down to the act 6 Geo. 4, c. 94, it was held, that a factor, as such, had no authority to *pledge*, but only to *sell* the goods of his principal; and it was repeatedly decided that a principal might recover back goods on which a *bond fide* advance of money had been made by a third party, without his being bound to repay such advance; and notwithstanding this third party was wholly ignorant that the individual pledging the goods held them as a mere factor or agent. It used also to be held, that *bond fide* purchasers of goods from factors or agents not vested with the power of sale, might be made liable to pay the price of the goods a second time to the real owner. The extreme hardship and injurious influence of such regulations is obvious. It is the business of a principal to satisfy himself as to the conduct and character of the factor or agent he employs; and if he make a false estimate of them, it is more equitable, surely, that he should be the sufferer, than those who have no means of knowing any thing of the matter.

"All agents who sell goods for their principals, and guaranty the price, are said abroad to act under a *del credere* commission. In this country, this phrase is seldom used, nor is such guaranty usual. See DEL CREDERE COMMISSION.

"Generally, neither factor nor broker can claim their commissions until their whole service be performed, and in good faith, and with proper skill, care, and industry. But if the service begins, and is interrupted wholly without their fault, they may claim a proportionate compensation. If either bargains to give his whole time to his employer, he will not be permitted to derive any compensation for services rendered to other persons. Nor can either have any valid claim against any one for illegal services, or those which violate morality or public policy.

"A principal can not revoke an authority given to a factor, after advances made by the factor, without repaying or securing the factor.

"The distinction between a *foreign* and a *domestic* factor is quite important. A domestic factor is one who is employed and acts in the same country with his principal. A foreign factor is one employed by a principal who lives in a different country. And a foreign factor is as to third parties, for most purposes, and under most circumstances, a principal. Thus they can not sue the principal, because they are supposed to contract with the factor alone, and on his credit, although the principal may sue them; and a foreign factor is personally liable, although he fully disclose his agency, and his principal is known. But this doctrine is not extended to cases where a contract for personal services is made in the country where the factor is doing business, by a person resident there; but the contract is to be performed or executed in the country where the principal resides. For, if such a contract be made in the name of the principal, he alone is responsible. One who deals with a domestic factor may sue the principal, unless it is shown that credit was given exclusively to the factor. And for the purpose of this distinction, and the rules founded upon it, we hold, on the weight of authority, that our states are foreign to each other.

"Every factor is bound to reasonable care; and he is liable for a loss by fire, or robbery, or other accident occurring without his default, if he had previously done some wrongful act, without which the property might have been safe. And this rule would apply even to a gratuitous agent."—PARSONS' *Mercantile Law*, pp. 168-162.

Factorage, or Commission, the allowance given to factors by the merchants, manufacturers, etc., who employ them: it is a percentage on the goods they

purchase or sell on account of their principals, and varies in different countries, and as it refers to different articles. It is customary for factors, as observed in the previous article, to insure the debts due to those for whom they sell for an additional, or *del credere* commission, generally averaging from $1\frac{1}{2}$ to 2 per cent. Factorage or commission is also frequently charged at a certain rate per cask, or other package, measure, or weight, especially when the factor is only employed to receive or deliver: this commission is usually fixed by special agreement between the merchant and factor.

Factory, in commerce, a place where merchants and factors reside, to negotiate business for themselves and their correspondents on commission.

Fairs and Markets. These institutions are very closely allied. A fair, as the term is now generally understood, is only a greater species of market recurring at more distant intervals. Both are appropriated to the sale of one or more species of goods, the hiring of servants or laborers, etc.: but fairs are, in most cases, attended by a great concourse of people, for whose amusement various exhibitions are got up. Fairs and wakes are of Saxon origin, and were first instituted in England by Alfred, A. D. 886.—*Spelman*. They were established by order of Gregory VII. in 1708, and termed *Feria*, at which the monks celebrated the festival of their patron saint; the vast resort of people occasioned a great demand for goods, wares, etc. They were called wakes from the people making merry during the vigil or eve. Fairs were established in France and England by Charlemagne and William the Conqueror, about A. D. 800 in the first, and 1071 in the latter kingdom. The fairs of Brucaille, Falaise, and Leipsic, are the most famous in Europe. See E. B.—*Haydn*.

1. *Origin of Fairs.*—Institutions of this sort are peculiarly servicable in the earlier stages of society, and in rude and inland countries. The number of shops, and the commodities in them, are then either comparatively limited, or they are but little frequented by dealers; so that it is for the advantage of all, that fairs should be established, and merchants induced to attend them. For this purpose various privileges have been annexed to fairs, and numerous facilities afforded to the disposal of property in them. To give them a greater degree of solemnity, they were originally, both in the ancient and modern world, associated with religious festivals. In most places, indeed, they are still held on the same day with the wake or feast of the saint to whom the church is dedicated; and, till the practice was prohibited, it was customary in England to hold them in churchyards!—(*Jacob's Law Diet.*, art. *Fair*.) But since the growth of towns, and the opportunities afforded for the disposal and purchase of all sorts of produce at the weekly or monthly markets held in them, the utility of fairs, in this country at least, has very much diminished; they have also lost much of their ancient splendor; and, though some of them are still well attended, and of real use, a good number might be advantageously suppressed. But it is far otherwise in inland countries, where the facilities for carrying on commercial transactions are comparatively circumscribed. There it is of the utmost importance that certain convenient places and specified periods should be appointed for the bringing together of commodities and dealers. This is not only the readiest and best means of promoting commerce, but also of softening national antipathies, and diffusing a knowledge of the products, arts, and customs of other countries.

2. *Establishment of English Fairs.*—No fair can be holden without grant from the crown, or a prescription which supposes such grant. And before a patent is granted, it is usual to have a writ of *ad quod damnum* executed and returned, that it may not be issued to the prejudice of a similar establishment already exist-

ing. The grant usually contains a clause that it shall not be to the hurt of another fair or market; but this clause, if omitted, will be implied in law; for if the franchise occasion damage either to the king or a subject, in this or any other respect, it will be revoked; and a person whose ancient title is prejudiced is entitled to have a *scire facias* in the king's name to repeal the letters patent. If his Majesty grant power to hold a fair or market in a particular place, the lieges can resort to no other, even though it be inconvenient. But if no place be appointed, the grantees may keep the fair or market where they please, or rather where they can most conveniently.

3. *Time of holding Fairs and Markets.*—These are either determined by the letters patent appointing the fair or market, or by usage. The statute 2 Edw. 3, enacts, that the duration of the fair shall be declared at its commencement, and that it shall not be continued beyond the specified time. By statute 5 Edw. 3, any merchant selling goods after the stipulated time is to forfeit double the value of the goods sold.

4. *Effects of Sales in Fairs and Markets.*—A *bonâ fide* sale made in a fair or open market, in general, transfers the complete property of the thing sold to the vendee; so that however vicious or illegal that title of the vendor may be, the vendee's is good against every one, except the king. But the sale, in order to come within this rule, must take place on the market day, and at the place assigned for the market. The city of London is said to be a market overt every day of the week, except Sunday; every shop being a market overt for such things as the shopkeeper professes to deal in. The property of goods may, however, be changed, and effectually transferred to the buyer, by a *bonâ fide* sale in a chop out of London, whether the shopkeeper be the vendor or vendee, if the goods are of the kind in which he trades. A wharf in London is not within the custom, and is not a market overt for articles brought there. But a sale in a market will not be binding if it be such as carries with it a presumption of fraud; as, for example, if it take place in a back room or secret place; if the sale be covinous, and intended to defraud the real owner, or if the buyer know that the vendor is not the real owner of the goods, etc. It is very difficult to transfer the property of horses, even when they are sold in an open market, without the consent of the real owner.

5. *Court of Pie Poudre.*—According to English usage, at every fair or market there is incident, even without any express words in the grant, a court of *pie poudre*, in allusion to the dusty feet of the suitors. The steward or mayor may preside. It has cognizance of all questions as to contracts made in the market respecting goods brought and delivered there, etc. Formerly *pie poudre* courts were held at every considerable fair, but they are now entirely laid aside.

6. *Principal British Fairs.*—Among these may be specified Stourbridge, in Worcestershire. Bristol has two considerable fairs, one in March and one in September. Exeter December fair, for cattle, horses, and most sorts of commodities. Weyhill fair, in Hampshire (October 10), has, probably, the greatest display of sheep of any fair in the kingdom. Bartholomew fair, in London, used to be of considerable importance, but latterly it was appropriated only to shows of wild beasts, and such-like exhibitions, and has, within these few years, been very properly suppressed. St. Faith's near Norwich (October 17), is the principal English fair for Scotch cattle. They are sold to the graziers and feeders of Norfolk, Suffolk, Essex, etc., by whom they are fattened for the London markets, where they are met with in great abundance. But besides those sold at St. Faith's, large numbers of Scotch cattle are disposed of at Market Harborough, Carlisle, Ormskirk, and other places. Ipswich has two considerable fairs: one in August, for lambs; and one in September, for butter and cheese:

It is reckoned that above 100,000 lambs are annually sold at the former. Woodborough-hill, in Dorset, for west country manufactures, as kerseys, druggets, etc. Woodstock October fair, for cheese. Northampton and Nottingham have each several large fairs, for horses, cattle, cheese, etc. The August fair of Horn-castle, in Lincolnshire, is the largest horse-fair in the kingdom, many thousand horses being exhibited for sale during its continuance: it is resorted to, by crowds of dealers from all parts of Great Britain, by several from the Continent, and sometimes even from North America. Howden, in Yorkshire, has, also, a very large horse-fair, particularly for Yorkshire hunters. Devizes, in Wiltshire, has several large fairs for sheep and cattle. There is usually a large display of cheese at the Gloucester April fair. A guild, or jubilee, commencing the last week of August, is held every twentieth year at Preston, in Lancashire; the last was held in 1842, and was well attended. The October fair of Market Harborough, Leicestershire, lasts 9 days, and a great deal of business is usually done in cattle, cheese, etc. Woodbridge Lady-day fair is celebrated for the show of Suffolk horses. Falkirk fair, or tryst, is one of the most important in Scotland, for the sale of cattle and sheep. The October fair of Ballinascloe, in the county Galway, is famous for the display of cattle and sheep; by far the largest proportion of these animals raised for sale in Connaught being disposed of at it. The sheep are generally from three to four, the heifers from three to four, and the bullocks from four to five years of age. They are mostly lean; and are kept for a year in Leinster before they are fit for the Dublin or Liverpool markets.

7. *Principal French Fairs.*—Among these may be specified the fairs of St. Germain's, Lyons, Rheims, Chartres, Rouen, Bordeaux, Troyes, and Bayonne; but they are much fallen off. The most important of the modern French fairs, is that of Beaune, on the right bank of the Rhone opposite to Tarrascon, 14 miles east of Nismes. It is very favorably situated for an *entrepôt*, being, exclusive of the command of internal navigation afforded by the Rhone, connected by canals with the sea and the *Canal du Midi*. The fair, which commences on the 22d and finishes on the 28th July, was formerly the greatest in Europe, and, though a good deal fallen off, it is still attended by a vast concourse of people, not from France only, but also from Switzerland, Germany, Italy, Spain, and the Levant. Almost every sort of article, whether of convenience or luxury, may then be met with in the town. It is said that the number of visitors still amounts to from 70,000 to 80,000, and the amount of business done to 150,000,000 fr.; but we have little doubt that these estimates are very greatly exaggerated; and that the first would be nearer the mark were it reduced to 50,000 or 60,000. All bills due at this fair are presented on the 27th, and protested on the 28th. A tribunal instituted for the purpose, takes cognizance of, and immediately settles all disputes growing out of transactions that take place at the fair. A military force attends to preserve order, and the prefect of the department, who is always present, entertains the principal merchants and strangers.

8. *German Fairs.*—The principal German, or rather European fairs, are those of Frankfort-on-the-Maine, Frankfort-on-the-Oder, and Leipzig. The concourse of merchants, and the business done at these fairs, are generally very great. They are copiously supplied with the cotton stuffs, twist, cloths, and hardware of England; the silks and jewelry of France; the printed cottons of Switzerland and Austria; the raw, manufactured, and literary products of Germany; the furs of the North; Turkey carpets; Cashmere shawls, etc.; and there, also, are to be found merchants of all countries, those of Isphahan negotiating with those of Montreal for the purchase of furs; and Georgians and Servians supplying themselves with the cottons of

Manchester and the jewelry of Paris. There, in fact, are met the representatives, as it were, of every people in the world, laboring, though without intending it, to promote each other's interest, and to extend and strengthen those ties that bind together the great family of the human race. The fairs at Frankfort-on-the-Maine should begin the first on Easter Tuesday, and the second on the Monday nearest to the 8th of September. Their duration is limited to three weeks; but they usually begin from eight to fifteen days before their legal commencement. Accounts are kept in rix-dollars, 1 rixdollar of account = 1½ florin, or 4½ copsticks, or 22½ batzen. The rixdollar = 8s. 18d.; so that the par of exchange is 141 batzen per £1 sterling. 100lb. common Frankfort weight = 103lb. avoirdupois. The foot = 11.27 English inches. The fairs at Frankfort-on-the-Oder are three in number, viz.: Remisiscere, in February or March; St. Margaret, in July; and St. Martin, in November. They ought, strictly speaking, to terminate in eight days, but they usually extend to fifteen. The Prussian government gives every facility to those who attend these fairs. Accounts are kept in Prussian money, that is, in rix-dollars of 2s. 11d. 100lb. Prussian = 103lb. avoirdupois. The foot = 12.366 English inches. The fairs of Leipzig are still more celebrated than those of either Frankfort. They are held three a-year—on the 1st of January, at Easter, and at Michaelmas. The first is the least important. The Easter and Michaelmas fairs are famous, particularly the former, for the vast number of new publications usually offered for sale. They are attended by all the principal booksellers of Germany, and by many from the adjoining countries, who adjust their accounts, learn the state of trade in all parts of the world, and endeavor to form new connections. Most German publishers have agents in Leipzig; which is to the literature of Germany, what London is to that of Great Britain. As many as 5000 new publications have been in a single Leipzig catalogue! They are also great markets for Saxon woolsens and other goods, British calicoes, French silks, and, in fact, for most descriptions of produce. The fairs ought to close in eight days, but they usually continue for about three weeks. No days of grace are allowed. The holder of a bill must demand payment on the day it becomes due; and, if not paid, he must have it protested on that very day, and returned by the first opportunity. If he neglect any of these regulations, he loses all right of recourse upon the drawer and indorsers. Money of account at Leipzig same as Frankfort-on-the-Maine. 100lb. Leipzig = 103lb. avoirdupois. The foot = 11.11 English inches.—*KELLY'S Cambist; Manuel de Nellenbrecher; BOWRING'S Report on the Prussian Commercial Union*, pp. 255, 269, etc. Dr. Bright gives, in his *Travels in Hungary* (pp. 201-223), an interesting account of the fairs held at Debretzin and Pesth. The latter has become the grand centre of Hungarian commerce; most part of which is conducted at its fairs.

9. *Italian Fairs.*—Of these, the most celebrated is that of Sinigaglia, a small, but handsome town of the Papal dominions, on the Misa, near its confluence with the Adriatic. The fair commences on the 20th of July, and should terminate on the last day of that month, but it usually continues eight or ten days longer. The duties on goods brought to the fair are extremely moderate, and every thing is done to promote the convenience of those frequenting it. All sorts of cotton, woolen, and silk goods, colonial produce, iron and steel, hardware, jewelry, brandy and liquors, timber, drugs, spices, etc., are brought here by the English, French, Austrians, Swiss, etc. These are exchanged for the various raw and manufactured products of Italy and the Levant; consisting, among others, of raw, thrown, and wrought silks; oil, fruits, cheese, alum, soda, sumach, sulphur, etc. The value of the imports for the fair of 1841, was estimated at about

£1,700,000. Accounts are kept in scudi of 20 soldi; the scudo = 4s. 4d. very nearly. 100lb. Singaglia = 78½ avoirdupois. The oil or braccio measures 25.83 English inches.—*Manuel de Nellenbrecker; Macgregor's Tariffs, Italy, p. 121.*

10. *Russian Fairs.*—These are numerous, and many of them are well attended. The most important is held at Nijnii-Novgorod, at the confluence of the Oka with the Volga, lat. 56° 19' 40" north, long. 44° 28' 30" east. Previously to 1817 this fair was held in a less convenient situation, at Makarieff, lower down the Volga. But the buildings for the accommodation of the merchants at the latter having been accidentally burnt down in 1816, government took advantage of the circumstance to remove the fair to Nijnii. It is principally carried on within the new bazars constructed for that purpose on the left bank of the Oka. These, which are divided into parallel rows, or streets, are constructed of stone walls and roofed with iron, having covered galleries in front supported by iron pillars. They are built on piles, and to guard against inundations, the ground on which they stand has been raised about 20 feet. Being inclosed on three sides by canals, and on the fourth by a navigable inlet of the Oka, there is every facility for the delivery and shipment of goods. The establishment is of great extent, comprising 2524 booths, and is admitted on all hands to be at once the largest and most perfect of its kind that is anywhere to be met with. But, in addition to the above, no fewer than 2500 shops and booths belonging to private parties, and constructed of wood, were occupied during the fair of 1841. The fair begins on the 1st of July, and continues for a month or six weeks.

The total value of the various articles of Asiatic (including Chinese) produce exposed for sale at Novgorod in 1841 amounted to 2,146,719 silver roubles, being more than double the value of the products of western Europe exposed in the same year. Of the latter, indigo, wine, and cottons were the principal articles.—*Journal des Manufactures, Peterbourg, 1842.* The stationary population of the town, which may amount to about 25,000, is, during the fair, said to amount to from 180,000 to 160,000, including Chinese, Persians, Armenians, Tartars, Bokharians, &c. Theatrical exhibitions, shows of wild beasts, and other Bartholomew fair exhibitions, add to the attractions of the scene. Another celebrated Russian fair is held in the month of December, at Kiachta, in Mongolia, on the Chinese frontier, lat. 50° 21' 5" north, long. 106° 28' 15" east. The town is small; the population not exceeding 4000 or 5000; but by far the largest part of the commerce between the Russian and Chinese empires is transacted at its fair, and it is also the centre of the political intercourse between them. The commodities brought hither by the Russians consist principally of Russian and German broadcloths, furs, sheep and lamb skins, leather, coarse linens, worsted stuffs, cattle, &c., with, for the most part, bullion. These they change with the Chinese for tea, raw and manufactured silk, nankeens, porcelain, sugar candy, rhubarb, tobacco, musk, &c., the value of the articles, however, other than tea, being comparatively inconsiderable. The quantity of tea purchased at the Kiachta fairs by the Russians, which has latterly increased very considerably, amounted, in 1850, according to the official returns, to 210,179 poods, or 7,566,444 pounds, of very superior tea, worth about 2s. 6d. per pound, and 85,440 poods (3,076,840 pounds) inferior or black tea. At an average of the six years ending with 1850, the total imports of all sorts of tea into Russia through Kiachta was estimated at 11,748,464 pounds, Eng. a year. According to the same accounts, the total value of the exports to China through Kiachta, in 1850, amounted to 6,916,671 silver roubles, and that of the imports to about the same. The customs duty received at Kiachta in 1848 amounted to 4923,564. The Russian

trade is in the hands of a comparatively small number of merchants, some of whom are very rich; that of the Chinese is much more diffused. Commodities may be conveyed from Kiachta to European Russia either by land or by water. In the former case the journey takes a year; in the latter, it takes three years, or rather three very short summers; the rivers being for the most part of the year frozen over.—*Schnitzler, Statistique Générale de l'Empire de la Russie, p. 148, etc.*

11. *Turkish Fairs.*—Several important fairs, of which little or nothing is known in this country, are held at various places in European Turkey. Among others may be specified those of Usundji, or Usundjova, in Roumelia; Joanina, in Albania; Stronga on the Lake of Oerida; Novi-Bazar, in Upper Moesia; Ielivni, in Thrace; Prellip and Nicopol, in Macedonia; Eski-Djouna, in Bulgaria; and Zeitoun and Pharsalla, in Thessaly. The largest and most important of these fairs is that of Usundji, held at the village of that name, on the Usundji, a tributary of the Maritza, about 44 miles W. by N. of Adrianople. It was visited by M. Blanqui in 1841, and by Mr. Spencer in 1850. The latter says (but statements of this sort are very apt to be exaggerated), that it was attended by from 80,000 to 100,000 people, who had journeyed hither from all parts of European Turkey for the purpose of disposing of their wool, hides, raw cotton, leeches, and other products of the country, and of purchasing in return the manufactures of the West. The show of the latter is very extensive. Sheds are erected in the village by government, which serve as warehouses for the merchants, and every house is converted into a han for the reception of strangers. But by far the greater number of the latter have, notwithstanding, to encamp with their camels, horses, &c., on the surrounding plain. Blanqui speaks in high terms of commendation of the good order that prevailed, in the absence of anything like police, among the motley population at the fair.—(BLANQUI, *Voyage en Bulgarie*, p. 252; SPENCER'S *Travels in European Turkey*, ii, 346, etc.) This great fair, which lasts for 15 days (Blanqui) is held, like the other fairs, in autumn, immediately after harvest. But though it be largely frequented by German, Swiss, Italian, and Greek merchants, who transact a great amount of business, it is very little, if at all, known in England. This is the more surprising, seeing that we have consuls at Adrianople and other places not very distant from the seat of the fair. And it might have been supposed that these functionaries would have been anxious to send home the most ample details with respect to this and other fairs in their vicinity; describing the products which might be most advantageously bought and sold at these markets; the routes by which they might be most easily reached, and so forth. But if such reports anywhere exist, they have not, at all events, been published. And hence, probably, the fact of the business of these fairs being mostly in the hands of foreigners.

12. *Eastern Fairs.*—The most important fair in the Eastern world is that held at Mecca during the resort of pilgrims in the month of Dhalhajja. It used to be frequented by many thousands of individuals of all ranks and orders, brought together from the remotest corners of the Mohammedan world; and though the numbers attending it have declined of late years, the concourse is still very great. See CARAVAN. Hurdwar, in Hindostan, in lat. 29° 57' N., long. 78° 2' E., 117 miles N.E. from Delhi, is famous from its being one of the principal places of Hindoo pilgrimage, and the greatest fair in India. The town, which is but inconsiderable, is situated on the Ganges, at the point where that sacred stream issues from the mountains. The pilgrimage and fairs are held together at the vernal equinox; and Europeans, no wise addicted to exaggeration, who have been repeatedly present on these occasions, estimate that from 200,000 to 300,000 strangers

are then assembled in the town and its vicinity. But every twelfth year is reckoned peculiarly holy; and then it is supposed that from 1,000,000 to 1,500,000, and even 2,000,000 pilgrims and dealers are congregated together from all parts of India and countries to the north. In 1818, which happened to be a twelfth year, when the auspicious moment for bathing in the Ganges was announced to the impatient devotees, the rush was so tremendous that no fewer than 480 persons were either trampled to death under foot, or drowned in the river! The foreigners resorting to Hrudwar fair for commercial purposes only, consist principally of natives of Nepal, the Punjab, and Beshwair, with Afghans, Usbeck Tartars, etc. They import vast numbers of horses, cattle, and camels; Persian dried fruits, shawls, drugs, etc.: the returns are made in cotton piece goods, indigo, sugar, spices, and other tropical productions. The merchants never mention the price of their goods, but conduct the bargain by touching the different joints of their fingers, to hinder the bystanders gaining any information. During the Makratta away, a kind of poll-tax and duties on cattle were levied; but all is now free, without impost or molestation of any sort. Owing, also, to the precautions adopted by the British government, the most perfect order is preserved; much to the surprise and satisfaction of the natives; for, antecedent to our occupation of the country, the fairs usually ended in disorder and bloodshed.—(*Private Information*, and the excellent account of *Hrudwar* in HAMILTON'S *Gazetteer*.)

The fairs of Portobello, Vera Cruz, and Acapulco, once so famous, are now totally deserted; that of the Havana is also much fallen off.

In the United States, fairs are principally confined to exhibitions of agricultural and mechanical articles, and also for the sale of fancy articles for charitable purposes, under the control of private companies, and not subject to especial restrictions or laws. In the western States, especially in the stock-growing districts of Kentucky, fairs are held in each county, at the county towns, once every month, for the sale of live stock, etc., subject only to local restrictions. These fairs or sales are of great convenience to the farmers or drovers, by bringing them together at stated times. As an instance of their usefulness, in Paris, Bourbon county, Kentucky, a town of 1500 inhabitants, live stock to the amount of \$100,000, on an average, changes hands every court day.

Falkland Islands (*Fr. Malouines, Sp. Malvinas*), a group of islands in the South Atlantic Ocean, belonging to Great Britain, and lying about 250 miles east of the nearest mainland of South America, between 51° and 58° S. lat., and 57° and 62° W. long., or is precisely the same latitudes south as London and the midland counties are north. The group consists of two principal islands, East and West Falkland, with several hundred others of different sizes clustered around and in the strait between them. East Falkland is about 85 miles in length by 40 in breadth, and West Falkland 80 miles long by 25 to 30 miles wide. They are separated from each other by Falkland Sound. The other islands range in size from 16 miles by 8 to mere islets of half a mile across. The whole group is deeply indented by numerous harbors and creeks, which, if they diminish the area, produce more than counterbalancing advantages. Very little is known of West Falkland. It is uninhabited, but at certain seasons it is visited by whaling and other vessels. East Falkland is nearly divided into two unequal portions by the estuaries called Breton Sound and Chosen Sound, the two parts of the island being connected by an isthmus not more than a mile and a half across. The northern portion is crossed by a chain of rugged hills, called the Wickham Heights, extending due east and west from Port William to Port Sussex, and varying in height from 800 to 2000 feet.

There are few wild animals indigenous to the Falklands. The only quadruped is the warrah or wolf-fox (*Canis Magellanicus*), rather taller, but not much heavier, than our fox. The other animals which are found in a wild state are those which have been left there by Europeans, as horned cattle, horses, sheep, wild hogs, and rabbits, all of which are very abundant. There is a plentiful supply of excellent fish in all the creeks, and of small trout in the lakes and rivulets. Hair and fur seals abound, and the black whale is still numerous about these coasts. The wild fowl are also numerous, as swans, geese, ducks, snipes, &c. There are few land birds or insects, and no reptiles. A gigantic sedge grass, called tussock, of the genus *Carex*, is very common on most of these islands. Its blade averages seven feet in length by about three quarters of an inch in width, is extremely nutritious, and admirably adapted for fattening cattle. Turnips, carrots, potatoes, and vegetables thrive well, and barley and oats have been successfully cultivated. Furze and other shrubs grow well, but there are as yet no trees. Peat is abundant, and some of it is highly bituminous. Coal has been discovered, but whether it can be profitably worked has not yet been ascertained.

The discovery of these islands has been by many attributed to Amerigo Vespucci, in 1502; but it is more probable that they were first discovered by Davis in 1592. In 1594 Hawkins sailed along their north shore; and in 1600 Strong sailed through the channel which separates East from West Falkland, and called it Falkland Sound, whence the group afterward took its name. During the earlier parts of the eighteenth century these islands were frequently visited by French vessels; and in 1764 a French colony was established at St. Louis, on East Falkland. Two years later the English planted a colony at Port Egmont, West Falkland. In 1767 the Spaniards took possession of the French settlement, and three years later of the English. In consequence of this step, some negotiations were entered into, the result of which was that the sovereignty of these islands were ceded to the English, who, however, some time afterward abandoned them. Though frequently visited by whaling vessels and others, they continued without permanent inhabitants till 1820, when they were taken possession of by the republic of Buenos Ayres. A settlement was formed at Port Louis, which rapidly increased until 1831, when, in consequence of a dispute with the United States, it was destroyed by the Americans. In 1833 the English again assumed possession of the Falklands, and stationed an officer and boat's crew at Port Louis. In 1840 the government resolved to colonize these islands, and sent out for that purpose a governor and a small establishment, who settled at Port Louis. A more advantageous situation for a settlement was subsequently found on the south side of Stanley Harbor, where, in 1844, a town was laid out. Mr. Lafone, a wealthy merchant, obtained from government an extensive tract of land, and possession of all the wild cattle and other wild stock for six years, from 1st January, 1848, in consideration of a payment by installments of £60,000. Mr. Lafone's interests have recently been purchased by a chartered company, which now possesses, in East Falkland, all the southern peninsula called Lafonia, consisting of about 600,000 acres, besides 138 islands and islets, with an aggregate area of about 200,000 acres, until January, 1856. The company possesses absolute right to all the wild cattle or other wild stock which may be found upon any of the islands, but after that period this right ceases except as to stock, etc., then in actual possession of the company. In 1847 the population of the colony was 270. The governor of these islands, in January, 1853, reports the colony to be steadily progressing. In 1851, the number of tons of shipping that entered the port of Stanley was 17,538, and in 1852 it was 22,024, being

an increase of 4,486 tons. This necessarily produces a demand for produce and labor. Unskilled laborers earn from 5s. to 6s. a day, and skilled from 6s. to 10s. Provisions are abundant, and at reasonable prices. "The transference to the Falkland Islands Company of the large interests held by Mr. Lafone, and the commencement by that corporation of a more comprehensive system of operation, supported by a large capital, gives me very favorable hopes of benefit to the colony, and, I trust, to the shareholders." (Report.) In 1839, twelve allotments of one acre each, near the town, were put up for sale, and were sold on an average at £6 per acre; and eleven similar allotments, sold in 1852, brought on an average £12 per acre, or six times the usual government price. "The master of a barque, the *Record*, lately in the harbor, publicly notified that he would take passengers to the gold diggings in Australia at £10 per head, and it gives me much pleasure to add that not a person could be found in the colony to accept his proposition." (Report.) Being chiefly dependent upon the ships that call here to rest or for refreshments, the opening of a ship-canal between the Atlantic and Pacific Oceans would affect this settlement very much, and might probably lead to its abandonment.—E. B.

Except as commercial and military stations, these islands possess no importance. There is no tonnage duty levied on vessels entering the ports of these islands; nor, indeed, any charges, except for storage, which is effected in bulk, and for which there is a charge of from \$5 to \$10 per day. In a recent official communication addressed by the present governor of the Falkland Islands, that functionary observes: "I state that, as regards the precise limit to which Great Britain will limit the right of fishing, I have no instructions. I will, however, communicate with her Majesty's government on the subject by the first opportunity." As American captains cruising about these islands have, on one or two recent occasions, been subjected to considerable inconvenience and expense by the executive authority of the Falkland Islands—so much so, indeed, as in one instance to render the interposition of a United States' vessel of war necessary—it becomes a matter of some importance to American whaling interests to have the question settled as speedily as possible.—*Com. Rel. U. S.*

Fall, the name given in Scotland to a measure both of length and superficies. As a measure of length, the fall is equal to six Scots ells, or 6-1764 English yards; and as a measure of superficies, to 36 square ells.

Fall, the sea term for the rope of any pulley or system of pulleys. To *fall aboard* signifies to run foul of another vessel.

Falling Home. The term applied to the timbers or upper parts of the sides of a ship when they curve inwards. The old ships fell home, or tumbled in (as it is called), much more than the modern ones, which approach more nearly to being *wall-sided*.

Fall River, Massachusetts, 46 miles S. of Boston, situated on the Fall River, at its junction with the Taunton, which falls into Mount Hope Bay, a branch of Narraganset Bay. The harbor on Taunton River is safe and easy of access, and has depth of water sufficient for the largest ships. Fall River has a large coasting trade, and is engaged in the whale and other fisheries. It has extensive cotton and woolen factories, bleaching-works, foundries, etc., and communicates regularly with New York by steamers, and with Boston by railway. Pop. (1855) 12,680.

Falmouth, a seaport town of England, on a branch of the estuary of the Falmouth, 14 m. N.N.E. the Lizard Point. Lat. 50° 8' 8" N., long. 5° 2' 7" W. The harbor is formed by the estuary of the Falmouth, has numerous creeks, and is about five miles in length and one mile in breadth. The entrance is defended by Pendennis and St. Maw's castles, both built in reign

of Henry VIII., and the former containing large barracks, magazines, etc. Its position at the entrance of the English Channel, has rendered Falmouth for the last 160 years a principal station for the foreign mail-packets, and the great rendezvous for fleets proceeding to the south and west.

False Keel the timber added below the main keel, both to serve as a defense, and also, by deepening the plane surface, to enable the ship to hold a better wind.

Fan, a simple and well-known implement employed to produce coolness by agitating the air. Upward of 3000 years ago the artist of ancient Egypt painted the fan on the walls of the tombs at Thebes, where the Pharaoh sits surrounded by his fan-bearers. These officers acted as generals or marshals, using their fans as standards in war, and in peace they assisted the Pharaoh in the temple, and waved their variegated fans both to produce a cooling breeze, and to guard the sacred offerings from the contamination of noxious insects. The fan is mentioned by Euripides, and its Grecian forms were far more beautiful than the Egyptian. The wings of a bird joined laterally and attached to a slender handle, formed the simple yet graceful fan of the priest of Isis, when Isis became a Grecian deity. It was sometimes formed of feathers of different lengths, spread out in the form of a semi-circle, but pointed at the top. This fan, the precise type of the state-fan of India and China of the present day, was waved by a female slave. The fan is mentioned by Terence and Ovid; and was termed indifferently "flabellum" or "muscarium." When the Romans were at meals, it was the duty of certain slaves, when the weather was warm, to cool the room with fans and drive away the flies. The modern Greek church places a fan in the hands of its deacons to guard the officiating priest and the elements from desecration. When the fan was brought to France by Catherine de Medici, it was so constructed that it could be folded in the manner of those used in the present day. Fans in the luxurious reigns of Louis XIV. and XV., shone with gilding and gems, and were ornamented with the pictures of Boucher and Watteau. At that time no toilet was esteemed complete without a fan, the cost of which was frequently as high as from \$60 to \$70.

In fan-making, the Chinese and French are the great rivals, and may be said to monopolize the supply of the whole world. In the lacquered fans the superiority of the natives of China is fully admitted. These are unrivaled both in lowness of price and in originality of design, brilliancy of coloring, and in general correctness of workmanship. In China the manufacture of fans is almost entirely confined to Canton, Sontcheu, Hang-tehoo, and Nankin. The fans of ivory and bone, and of feathers, are made exclusively for exportation to Europe or America. Those used by the Chinese are of bamboo, polished or japanned, and covered with paper. They are sold at from 20 cents to \$3 per dozen, according to the quality of the frame and the design of the leaf.—E. B.

In France, fan-making has arrived at a high degree of perfection, and presents a remarkable instance of the subdivision of labor. About twenty different operations, performed by as many pairs of hands, are necessary to the production of a fan which sells for less than one halfpenny. The processes are not all carried on in the same manufactory; but form four distinct branches of trade, directed by distinct masters; but the operatives usually work at home at their own houses. The frame-work of fans is mostly made in the department of Oise, where 2000 men, women, and children are thus employed. The woods employed are chiefly plum, ebony, lime, and sandal-wood; and the piercings which form such a general decoration to fans, are performed by minute saws, which the workman makes for himself out of pieces of watch-spring.

In one of the piercings printing; of fans a factories "The who finish the provi ployed 10 166 child of fans. In one fan there are in some specimens 1600 saw-piercings in a square inch of mother-of-pearl. The printing, the coloring, the mounting, and the finishing of fans are mostly conducted at Paris, where the factories are on a considerable scale.

"The number of fan-makers, or *eventailistes* (those who finish the fans which have been roughly made in the provinces), in Paris, in 1827, was 15, who employed 1010 work-people (844 men, 500 women, and 166 children), and sold about 1,010,500 francs' worth of fans. According to the *Statistique sur l'Industrie à Paris*, it appears that in 1847 there were 122 fan-makers, comprising chamber-masters, as mounters, fuillistes, painters, and colorers. The value of the fans made was 2,526,816 francs. These masters employed 575 work-people (262 men, 264 women, 99 youths, and 20 girls). The workmen on the average earn 4 francs, and the women 2½ francs per day. The men were for the most part copper-plate engravers and printers, lithographic draughtsmen and printers, painters, and colorers; the women were mounters, illuminators, painters, colorers and overlookers. Thus in twenty years it appears that the produce in fans had increased in value nearly threefold, while the number of work-people had diminished one half. This change is attributed to the employment of machinery, especially of the fly-press, in stamping out and embossing the ribs, and the extensive employment of chromo-lithography, an art not practiced at the former period. By these means the French have been enabled greatly to increase their exports by the production of cheap fans, to compete with those made by the Chinese.

Farina. (Lat. *far*, corn, of which it is made.) Meal or flour, obtained by grinding and sifting wheat and other seeds; hence the term *farinaceous food*.

Færoe, or Feroe (Danish, *Færøerne*), a group of islands belonging to Denmark, in the North Sea, between Iceland and the Shetland Islands, about 200 miles north-west of the latter, between N. lat. 61° 20' and 62° 26', and between W. long. 6° 16' and 7° 40'. The group consists of 17 uninhabited and several uninhabited islands, the former having an area of 490 square miles, and (in 1860) 8150 inhabitants. The principal islands, with their populations, in 1845, were Strömö, 2162; Osterö, 1909; Söderö, 1156; Vaagö, 649; Sandö, 528; and Bördö, 804. They consist throughout of rocks and hills, rising to a considerable height, and separated from each other by narrow valleys, or rather ravines. Although, however, these hills rise abruptly, there are often on their summits, or at different stages of their ascent, plains of considerable magnitude. They everywhere present to the sea perpendicular cliffs, broken into a thousand fantastic forms, presenting to those who sail along the coast, at every turn, the most picturesque and varied scenery. The highest peak is that of Skellingfjell, in the island of Strömö, which rises to about 8000 feet above the sea. The rocks consist generally of trap, and exhibit little variety of composition, though they present some striking geological phenomena. The zeolites and chalcocenes here collected have long supplied the best specimens of these minerals to the cabinets of Europe. Coal is found in Söderö and some of the other islands, and turf is abundant.

The climate is moist and foggy, and violent storms are frequent at all seasons. July and August are the only summer months, but the winters are not very severe. It seldom freezes for more than one month, and the harbors are rarely ice-bound. The only grain crop is barley; and on account of the uncertainty of the weather, it is frequently reaped in a half-ripe condition. Agriculture is in a very backward state, the infield, or cultivated land, being calculated to be to the outfield, or uncultivated, in the proportion 1 to 60. The plow is seldom used, being in fact ill suited to the rugged and uneven surface of the land.

The ground is therefore turned up with the spade, care being taken not to destroy the roots of the grass. Horses and cows are few in number, and the latter give very little milk, in consequence, probably, of the very coarse hay upon which they are fed. Sheep are numerous, and form the chief riches of the islanders—some individuals having flocks of from three to five hundred. The sheep are never housed either in summer or winter, and in severe seasons they suffer considerably. The wool is generally coarse, and is torn off the animals in so rough a manner as often to lacerate the skin. The catching of the numerous birds which build their nests upon the face of the cliffs, forms a great source of subsistence to the inhabitants. The persons employed in this hazardous trade display great ingenuity and the most adventurous spirit. Sometimes the sewer is let down from the top of the cliff by a rope fastened to his waist; at other times, where there is any footing at all, he climbs the steepest rocks, or, where that is impossible, he is pushed upward by poles made for the purpose. The puffin (*Alca arctica*) is the most common of these birds, and the elder-duck is here often shot for food. The fisheries are important and valuable.

The monopoly of the trade of the Færoe Islands was for some time in the hands of a mercantile house at Copenhagen; but it has now been assumed by government, and neither Dane nor foreigner is allowed to interfere. The trade is carried on between Copenhagen and Thorshavn. The chief exports are hosiery, tallow, dried and salt fish, train-oil, feathers, skins, and butter. Thorshavn, the capital of these islands, is situated on the south-east side of the island of Strömö, upon a narrow tongue of land, having creeks on each side, where ships may be safely moored. Population about 1500. The houses are built of wood, and roofed with birch bark covered with turf, the greenness of which makes it impossible, at a very short distance, to distinguish the place from the surrounding fields. The character of the people is generally marked by great simplicity of manners, kindness and hospitality. They are well fed and clothed, and seem to be kindly treated by the Danish government. The average duration of life, as stated by Dr. Panum, is 44 2-5 years; while in Denmark it is only 38. The language of the people is a remnant of the old Norse, but that of the courts, churches, and schools is the modern Danish. See *Færoen and Færoen Reserata*, by LUCAS JACOBSEN DENES, translated from the Danish into English, 1675; *Description of the Færoe Islands*, by the Rev. G. LANDT, London, 1810; an account of their geology and mineralogy, in the *Trans. of the Royal Soc.*, Edin., vol. vii., by Sir G. S. MACKENZIE, Bart., and THOMAS ALLEN, Esq.; *Den Danske Stats Statistikk*, vol. iv., 1853; J. NICHOL'S *Account of Iceland, Greenland, and the Færoe Isles*; Dr. PANUM'S *Official Report on the Diseases of Færoe*, 1849, of which an abstract in vol. vii. of the *Medico-chirurgical Review*. The scenery of these islands is well illustrated in a work entitled *Cruises of the Yacht Maria*, London, 1855.—E. B.

Farthing, a small English copper coin, amounting to ¼ of a penny. It was anciently called *fourthing*, as being the fourth of the integer or penny. A farthing of gold, equal in value to the fourth part of a noble, or 20d. in silver, is mentioned in statute 9th Henry V., cap. 7.

Fascines (*fascia*, a bundle), in fortification, faggots, or bundles of rods, or small branches of trees, bound together in several places. They are used for various purposes, such as raising batteries, filling ditches, forming parapets, etc., and vary in dimensions according to the purposes to which they are to be applied. Fascines dipped in pitch are sometimes employed to fire the enemy's lodgments or other works.

Fashion (Fr. *façon*; originally from the Lat. *facere*, to make or form), a term used to signify the

prevailing mode or taste in any country, the only recognized quality which it possesses being mutability. It may safely be averred that, in proportion to the influence which fashion exercises in any country may its claim to civilization be vindicated—nothing being so characteristic of a rude and barbarous state of existence as a rigid adherence to the customs of antiquity. The term *fashion* has generally been considered as applicable chiefly to the adornment of the person, in conformity with the prevailing taste as introduced by some individual of consideration in society; but it has a much wider signification, being applied to the most trivial kind of conventional usages, a disregard or ignorance of which is sufficient, in the eyes of the votaries of this tyrannical goddess, to banish the offender beyond the pale of civilized society.

Fat, an oily concrete substance, contained in the cells of the adipose or cellular membrane of animal bodies. Fat also denotes a measure of capacity, but indefinite. Thus a fat of seining contains from 3½ cwt. to 4 cwt.; of yarn, from 220 to 221 bundles, etc. Fat, or vat, a large wooden tub or vessel used in breweries and tanneries; also as a measure for malt, containing eight bushels.

Fathom, a measure of length, six feet, chiefly used for measuring the length of cordage, and the depth of water and mines.

Fayal. The Azores, or Western Islands form a range situate in the Atlantic Ocean, extending in an oblique line from north-west to south-east, between 37° and 40° N. lat., and 25° and 32° W. long. It has been a subject of some controversy among geographers, to what division of the globe they ought to be referred; but they are now generally considered as pertaining to Europe. It does not appear that the ancients had any knowledge of the Azores, or of any group in this sea, except the Canaries, to which they finally applied the celebrated appellation of the Fortunate Islands. But the Arabian geographers, Edrisi and Ibn al Wardi, describe, after the Canaries, nine other islands in the Western Ocean. That these were the Azores is highly probable, since their number is exactly nine; and because a species of hawk is specially noticed by these writers as existing there in great abundance—a circumstance that afterward appeared to the Portuguese so remarkable, that they gave them the name of Azores, or Hawk Islands. The climate in which they are placed also makes them north of the Canaries. Some other coincidences also might be pointed out; and, upon the whole, there appears no reason to doubt that the Azores are really the nine islands enumerated by the Arabians. The Arabian writers represent them as having been populous, and as having contained cities of some magnitude; but they state that the inhabitants had been greatly reduced by intestine warfare. At the time of their discovery they were uninhabited, and covered with forests and underwood, which have now entirely disappeared.

The first European discovery of this group is claimed by the Flemings. A Flemish merchant named Van der Berg, is reported, in sailing from Lisbon, to have been driven upon these shores in the year 1439. The intelligence soon reached the court of Lisbon, where it excited considerable interest; and the navigator Cabral was sent to prosecute the discovery. In 1459 the islands began to be planted and colonized, and in so fertile a soil the inhabitants rapidly multiplied. In 1580 they fell, with the other Portuguese territories, under the dominion of Spain. At this time the Azores were the grand rendezvous in the voyage homeward of the fleets, which came laden with the wealth of both the Indies. Hence they became a theatre of that maritime warfare which was carried on with such spirit by the English under Queen Elizabeth against the peninsular powers. In 1586 Sir Walter Raleigh equipped two pinnaces of 35 and 40 tons, the

command of which he gave to Captain Whiddon. Having taken two or three prizes, they fell in, off St. Michael, with the great fleet of Spanish galleons, consisting of 24 sail, two of them carracks of 1000 or 1200 tons. They attacked them, however, without hesitation, hoping to cut off some straggling member of this great body, but were unable to make any impression upon it. In 1687, Sir Francis Drake, after having swept the harbor of Oadia, sailed for the Azores, where he took an East India carrack, richly laden, and the first that had ever fallen into the hands of the English. In 1689 the Earl of Cumberland fitted out a squadron, called for the Azores, and made numerous prizes. Under the active administration of Pombal, considerable exertions were made for the improvement of the Azores; but the stupid and bigoted government which followed rather tended to destroy these benefits, and to make the islands take a retrograde course.

Physical Aspect.—The Azores within a recent period attracted some attention as the theatre of contest between the parties contending for the crown of Portugal. The adherents of the constitution, who supported against Miguel the rights of Maria da Gloria, obtained possession of Terceira, where they succeeded in maintaining themselves. After various struggles, Queen Maria's authority was eventually established over all these islands.

The aspect of all the islands is very similar in general characteristics, presenting an elevated and undulating outline, with little or no table-land, and rising into peaks, of which the lowest (that of St. Mary's) is 1889 feet, and the highest (that of Pico) 7613 feet above the level of the sea. Their lines of sea-coast are, with few exceptions, high and precipitous, with bases of accumulated masses of fallen rock, in which open bays, or scarcely more inclosed inlets, form the harbors of the trading towns. The climate is particularly temperate and equable, the extremes of sensible heat and cold being, however, increased by the degree of humidity present in the atmosphere. The range of the thermometer is from 45° Fahr., the lowest known extreme—or 48° the ordinary low extremes of January—to 82° the ordinary, or 86° the highest known extreme of July, and near the level of the sea. Between these two points (both taken in the shade) there is from month to month a pretty regular gradation of increase or decrease, amounting to somewhat less than four degrees. (*Geographical Journal*, vol. xv.) They have an aggregate area of 700 square miles, and in 1841 had a population of 214,300. St. Michael, the largest and most populous of these islands, has an area of 224 square miles and (1840) 80,809 inhabitants. Proceeding from east to west, this island presents a considerable variety of surface. The east end rises from a bluff sea-cliff of between 1200 and 1400 feet elevation, to a lofty inland peak from which a central range, varying in height from 9000 to 2500 feet, runs to the westward, terminating in the Serra de Agos de Fao, 3060 feet above the sea. The sea-coast gradually declines in approaching the last point, where it is not more than about 100 feet high. The part next seen is lower, and its outline, as presented by the summits of numerous volcanic monticules of about 1300 feet elevation, united in a central ridge more undulating; the western extremity being marked by the conspicuous Serra Gorda, 1574 feet above the sea; and its shores on both sides are low, broken, and rocky. Of the remaining part the aspect is that of a vast truncated cone, irregularly cut off at an elevation of about 800 feet, and falling on the north, south, and west sides to a perpendicular coast of between 300 and 800 feet high. The outline is varied by the intervention of peaks, thrown up on the summit and flanks, and round the foot of the mountain. In the higher parts, the surface is generally covered with an undergrowth of heaths, cedar, laurel, laurestinus, and other evergreen shrubs

which give the mountains an exceedingly rich and wooded appearance. Like all volcanic countries, the face of the island is uneven and irregular, being deeply excavated by numerous ravines and roughened by streams of semi-sterilized and scoriaceous lava that resist all atmospheric influences and repel vegetation. Heavy rains falling on the mountains afford a constant supply of water to four lakes at the bottom of extinct craters or subsidences, and a number of minor reservoirs; and through them to small streams running rapidly down on all sides into the sea.—*Geographical Journal*, vol. xv. See Hurr's *Merck Mag.*, 1865-6; *Com. Rel. U. S.*, pp. 238, 284; pub. by Dep. of State.

In the year 1591 a most tremendous earthquake appears to have been felt all over the Azores, and to have shaken St. Michael for twelve days without intermission. Since that period, there is no record of any such great convulsion, except one in 1757, of which we have no particulars, and it was probably much less formidable; nor are any of its volcanoes at present in a state of action. Hot springs abound in every part of the island, and from almost every crevice vapor is seen issuing. But the most remarkable phenomena are the Calderas or boiling fountains, which rise chiefly from a valley called the Furnas, near the western extremity of the island. The water ascends in columns to the height of about 12 feet, after which it dissolves in vapor, forming clouds of various shapes and colors. The heat is such as to boil an egg in two minutes, though the sulphureous impregnation unfit it from being employed in culinary purposes. The ground in the immediate vicinity is entirely covered with native sulphur, like bear frost. At a small distance is a remarkable phenomenon called the Muddy Crater, the vertex of which, 45 feet in diameter, is on a level with the plain. Its contents are in a state of violent and continual ebullition, accompanied with a sound resembling the waves of a tempestuous ocean. Yet they never rise above its level, unless occasionally to throw to a small distance a spray of the consistence of melted lead. The Furnas abounds also in hot springs, some of which it is impossible to touch without being scalded. There is almost always, however, a cold spring near to the hot one, so that the water can be brought to any temperature that may be desired. These springs, after being long neglected, have, within the last half century, been greatly resorted to, and the cures performed in cases of palsy, rheumatism, and similar maladies, are said to have been very wonderful.

The plains are fertile in wheat, barley, and Indian corn; while vines and oranges grow luxuriantly on the sides of the mountains. They are made to spring even from the interstices of the volcanic rocks, which are sometimes blasted in order that they may receive the plants. Raised in this manner, these fruits are said to be of superior quality; but the great expense originally required in such a mode of cultivation confines it to persons of some capital. The western part of the island yields hemp, which might be raised to a considerable extent. The exports consist of wine, fruit, and provisions. Foreign intercourse used to be confined rigorously to Lisbon; but since the emigration of the court, the inhabitants have assumed the privilege of trading directly with England, America, and other countries. The principal town on the island is Ponta Delgada, which contains about 20,000 inhabitants. It is built with tolerable regularity, the streets being straight and broad. The religious edifices are numerous and elegant. When visited by Captain Bold in 1831, it had six churches, eight monasteries, and four convents; but these last, which were noted for the irregular lives of their vestals, have since been suppressed. The harbor receives only small vessels: those of any magnitude must anchor in an open road, which, though not dangerous, can not be occupied during the prevalence of southerly gales. Its other

towns are Villa Franca, Ribeira, Grande, Alaga, Agoa de Pao, etc.

St. Mary.—St. Mary is a small island immediately adjacent to St. Michael, through the medium of which its trade is conducted, as it has no good harbors of its own. It has an area of 86 square miles, producing wheat in abundance, of which a considerable quantity is exported. It is of trap formation, and contains beds of marine shells. Population in 1840, 4666.

Terceira.—Terceira, though smaller than St. Michael, yet being placed in a more central position with respect to the other islands has been chosen as the seat of government. The port of Angra is also superior to any of those in St. Michael. This island does not exhibit nearly the same extensive traces of volcanic action; and the summits of its mountains are generally level. It is represented by Adanson, however, as entirely composed of volcanic products. The lava, he says, is of a thicker grain than that of Terceira. It abounds in grain and cattle; but the wines are inferior, and the fruits are raised merely for internal consumption. The residence of the government renders the society somewhat superior to that which is found in the other islands. The number of inhabitants is estimated at 50,000.

Fayal.—Fayal is the most frequented of all the islands after St. Michael, as it has one of the best harbors in the Azores, and lies directly in the track of vessels that are crossing the Atlantic in any direction. Its principal town is Villa de Horta. Captain Cook found that all sorts of fresh provisions might be obtained there: the bullocks and hogs are good, but the sheep small and poor. The town is defended by two castles and a wall, both in decay, and serving rather for show than strength. The city contains two convents for monks and three for nuns, with eight churches. These are the only good buildings in it, no other having glass windows. The bay is two miles in length and three quarters of a mile in breadth, and the depth of water from 6 to 20 fathoms. Though a good road, it is not altogether free from danger in S.S.W. and S.E. winds. Population 23,000.

Pico.—A considerable quantity of wine is shipped from Fayal under the appellation of Fayal wine, but really the produce of Pico, one of the most remarkable of the Azores. This island is composed of an immense conical mountain, rising to the height of 7613 feet, and bearing every trace of volcanic formation. The soil consists entirely of pulverized lava, and the ground has even been said to sound hollow when struck. All the lower parts of the mountain are in the highest state of cultivation, and covered with vine and orange plantations. The wine, which forms a sort of inferior Madeira, is in considerable demand. Pico produces also a valuable species of wood, resembling and equal in quality to mahogany. Population 26,000.

Graciosa and St. George are two small islands, situated between Fayal and Terceira. Graciosa is chiefly noted for the extreme beauty of its aspect and scenery. About fifty years ago St. George suffered from one of those awful visitations to which the Azores are subject. In 1808 a caldera, situate in the centre of the island, was observed to be in a state of violent fermentation. It continued during several days to emit subterranean noises, and to cause violent convulsions throughout every part of the island. At length the great crisis came; vast streams of fire issued forth in every direction, with clouds of smoke, which, but for the volcanic light, would have involved every thing in midnight darkness. The principal stream took its direction toward the beautiful town of Ursula, which it seemed on the point of swallowing up; but suddenly changing its direction, it rushed into the sea by a different channel; a happy event, which superstition ascribed to the prayers of the Ursuline nuns. Many hundred acres of fertile land, however, were covered with scoria and

ashes; some lives were lost, and general gloom and consternation diffused throughout the island. The inhabitants, however, soon applied themselves to repair the injury which their land had sustained. Population about 30,000.

The two small and most westerly islands of Corvo and Flores seem but imperfectly to belong to the group. They lie also out of the usual track of navigators; but to those who, missing their course, are led hither, Flores affords good shelter in its numerous bays. Its poultry is said to be the finest in the world; and the cattle are numerous, but small. The surplus produce of these islands is not of much importance. Population above 15,000.

Commerce of the Azores with the United States.—A communication to the Department of State, dated Fayal, April 2d, 1857, laments the inability to announce any improvement in the commerce between the Azores and the United States. The vicinities of 1855 and 1856 were so much injured by the "odum," both in regard to quantity and quality, that no wine has been shipped abroad, and the quantity yet remaining of former vintage is exceedingly small. From the Island of St. Michaels there were shipped last season, just ended, an amount equal to 200,000 Sicily boxes of oranges, about 40,000 from Terceira, and about 5,500 from this island; and of all that quantity only about 1,500 boxes were shipped to

the United States. Shipments have been made on a larger scale, but the results have been unfavorable; the vessels having to contend with almost constant gales of contrary winds, and the fruit being of a more perishable nature than that of Sicily, Spain and Portugal. The importation of cereals will swell the amount of imports, but it will be very ephemeral, and the ports will be closed as soon as circumstances will permit.

The seat of government of the Azores lies at Angra, in Terceira. Ponta Delgada, in St. Michaels, is, however, the chief commercial city. The exports of corn from the Azores from 1835 to 1841, principally to Portugal, are given in the following table:

Years.	Quantity.			Value.
	Mines.	Quarters.	Bushels.	
1835	11,675	25,995	280,200	299,230
1836	11,080	23,340	263,920	272,465
1837	5,665	14,020	138,560	182,710
1838	9,290	21,740	229,280	244,785
1839	4,990	14,670	117,960	119,625
1840	12,158	26,450	291,672	311,025
1841	9,000	27,000	216,000	236,000

The oranges exported in 1861 amounted in value to \$50,000; in 1820, to \$125,000; and in 1840, to \$450,000. For five years, ending with 1840, the average annual value of exports to Portugal was \$215,645; to foreign countries, \$260,815. Average annual value of imports during the same period, from Portugal, \$266,600; from foreign countries, \$397,110.

COMMERCE OF THE UNITED STATES WITH FAYAL AND OTHER AZORES, FROM OCTOBER 1, 1840, TO JULY 1, 1856.

The harbor of Fayal is the best in the Azores, and great facilities are offered to ships in distress, by affording refuge or supplies. American whalers frequently visit Fayal, and deposit large quantities of oil, to be transhipped to other ports, amounting annually to a value of upward of \$300,000, most of which is forwarded to the markets of the United States. The direct imports from the United States to the Azores consist chiefly of timber, staves, heads for hogheads, etc. The duties on lumber and staves are moderate. On cut nails they exceed 100 per cent,

and on window-glass they rise over 300 per cent. American cotton manufactures are in good demand, and during the past few years have competed advantageously with those of Great Britain. The commercial regulations differ but little from those of the mother country. Foreign vessels, bringing the productions of the country to which they belong, and coming from the ports of the same, are admitted on the same footing as Portuguese vessels. When laden with the produce of other countries, they are subject to a differential duty of 15 per cent. There are no

tonnage duties, light, or hospital fees, levied on shipping at the Azores. The entire charges to which a vessel is subject amount to \$19 80, which is raised to \$28 40 if the vessel has crossed the equator. The navigation of these islands employs about 3,000 tons in foreign and coasting trade. The latter is carried on with Lisbon, Madeira, and the different ports of the islands, and is restricted to national vessels. In 1852, 77 vessels, with a tonnage of 8,780 tons, entered these islands; of which number 8 were American, with an aggregate tonnage of 1,800 tons.

The chief inconvenience to which foreign tonnage is subjected in these islands, arises from the inconsistent and arbitrary sanitary regulations, which emanate from the home government at Lisbon, and which preclude all discretionary power on the part of the local authorities. For instance, should the Portuguese consul at New Orleans notify his government that the yellow fever prevails in that city (say in the month of September), orders are immediately forwarded by the Board of Health at Lisbon to the authorities of the islands to consider that city as infected. These orders, by the ordinary mode of conveyance, will not reach the islands until the following January; and notwithstanding it may be notorious that the fever ceased in October or November, a vessel that should arrive at Fayal, having left New Orleans in January, or later, would not be admitted, even should she be provided with a clean bill of health, certified with all formality, by the very same consul who had reported to his government the existence of the sickness! This regulation frequently exposes American captains to great inconvenience and considerable loss.—*Com. Rel. U. S.*

Feathers, Bed-feathers (Fr. *Plumes, Plumes à lit*; Ger. *Federn, Bettfedern*; Du. *Bedeern, Pluimen*; It. *Piume*; Sp. *Plumas*), make a considerable article of commerce; particularly those of the ostrich, goose, heron, swan, peacock, and other poultry. The feathers of the ostrich have been held in the highest estimation from antiquity downward, and have furnished favorite decorations for the fans and head-dresses of ladies, the helmets of warriors, and the most splendid processions. Many parts of Great Britain supply feathers for beds; and an inferior sort is brought from Ireland. Eider-down, the finest variety of its class, is imported from the north of Europe; the ducks that supply it being inhabitants of Greenland, Iceland, and Norway. The eider-duck breeds in the islands on the west of Scotland, but not in sufficient numbers to form a profitable branch of trade to the inhabitants. Hudson's Bay furnishes very fine feathers, especially for quills. The down of the swan is brought from Dantzic, as well as large quantities of superior feathers.

Ostrich and other Plumes.—The long feathers of the wings and the tail constitute the ordinary ostrich plume. The animal is captured and killed with much care, to prevent any injury to the plumage. The feathers are sorted into various qualities, scoured or cleaned, bleached, dried, shaken, and opened, the ribs scraped with a bit of glass, the filaments made to assume a curly form by scraping, dyed or not, according to circumstances, and adapted for the adjustment of military hats or other garments. Those in England who are versed in the heraldry of pomp and formality would know the ostrich plumes worn by the Knights of the Garter or the Knights Grand Crosses of the Bath from the court plumes adapted for ladies, and the black plumes for officers of the Highland regiments. In recent years, means have been devised for imparting brilliant dyes to ostrich feathers, several different colors to one feather, gradually shaded or blended one into another. Then, besides the ostrich, we have the feathers of the marabout, the ibis, the bird of paradise, the vulture or rhea, the emu, the heron, the plover, the egret, the pheasant, the peacock, the turkey, the swan, the eagle, and some other birds

—all applied as ornaments to dress. Some of these are very costly; some are used almost exclusively for one particular purpose, while others have their fashionable and unfashionable periods in the public favor. Some of the marabout feathers are knotted with gold, to make a costly trimming for dresses. The emu feathers are more worn on the Continent than in England. The heron feathers, worn by the Knights of the Garter, frequently cost 50 guineas the plume, and sometimes above 100 guineas, on account of their scarcity. The large egret feathers are worn by the Hussars.

Fécamp, a seaport town in France, department of Seine-Inférieure, situated on the English Channel, at the mouth of a small cognominal river 28 miles N.N.E. of Havre. Population about 10,000. It occupies the bottom and sides of a narrow valley opening out toward the sea, between two cliffs, on one of which stands a light-house. Its port, though small, is one of the best on the Channel, and has lately been greatly improved by the construction of an inner port, with a fine quay, etc. It carries on a considerable trade in Baltic and colonial produce, brandy, salt, etc.; and sends vessels to the whale, cod, mackerel, and herring fisheries. The river affords abundant water-power for numerous cotton, oil, and other mills. Fécamp has also sugar refineries, tanneries, building-docks, and manufactures of hardware, candles, soda, etc. The town consists almost entirely of one street upward of two miles in length.

Feejee Islands. These islands constitute a group in the South Pacific Ocean, favorably situated for the whaling interests of the United States, if the habits of the natives did not render it unsafe for whale-ships to enter any of their ports, unless under the protection of a man-of-war. The group consists of 154 islands in all, 65 of which are inhabited, and contains a population estimated at 134,000 souls. The principal islands are Viti Levu and Paou, or Sandal-wood Island; others are Yuna, Kandaboo, Ovoulu, Bau, Mathuatu, and Goro; each of the islands containing from 5,000 to 13,000 inhabitants. Sandal-wood was formerly a leading production of this group, but it has now entirely disappeared. The great fertility of the soil, however, and the low price at which vessels could recruit their stores, and obtain supplies of fresh provisions and excellent water, taken in connection with the fact that the whaling interests of citizens of the United States in that quarter involve annually from seven to eight millions of dollars, show how important this group might become to American whalers, if they were only strong enough to prevent or resent acts of piracy and plunder.

An official communication to the State Department, under date of January 1, 1854, says: "The chief and inhabitants of Bau (at present the controllers of this group), causing the destruction of property at Lavuke, live by the fruits of begging, theft, and robbery—one unbroken series of robberies and butcheries. In default of justice, these men escape." When our whalers are fortunate enough to escape from the atrocities above described, they can obtain a full supply of all descriptions of vegetables, pork, poultry, etc., for an entire crew for about \$56, in trade. The same communication further informs the Department, that American vessels are actually driven away from this archipelago, the natives being emboldened in the perpetration of these acts by the absence of American vessels of war in any of their ports. During the past year (1855) an American ship of war, the *John Adams*, visited the Feejee Islands for the purpose of inquiring into, and demanding reparation for, the cruelties and acts of plunder and piracy committed by the natives upon American ships trading and fishing in the Feejeean archipelago. The result of this visit, it is believed, will put an end to the atrocities of these savages, and secure a safe and commodious retreat for American whalers in those distant seas. It is understood that

this security is guaranteed by a convention or treaty agreed to by Tui Viti, the king of the islands. There are no quarantine regulations observed at any of these islands, and consequently no bills of health are required. Passengers are subjected to no port or landing requirements, and are at liberty to go ashore when and as they please.

There are no custom duties, nor are there any light, hospital, or other dues or taxes exacted. For pilots, the charges are such as can be agreed upon. It has been already stated that this group of islands affords a convenient and excellent stopping-place for our whale-ships engaged in their hazardous and laborious toil in the South Pacific seas. It should be added, that our trading ships generally, in that quarter of the globe, could beneficially call at these islands, particularly if freighted with miscellaneous cargoes of cotton goods, weapons of war, cutlery, and other similar wares suited to the barbarous and semi-civilized natives, could they but be taught to pay proper respect to the American flag. During the three years ending with 1853, the exports from the United States to the Feejee Islands amounted, in the aggregate, to \$136,000, viz.: in 1851, to \$32,000; in 1852, to \$54,000; in 1853, to \$50,000. The merchandise received in barter for American imports consist of liche-de-mer, tortoise-shell, gums, arrow-root, and cocoanut-oil. The exports from the United States consist of assorted cargoes, and the annual value may be estimated from the preceding figures, as the trade is almost exclusively one of barter, in which the American shippers usually realize 250 per cent. profit on their merchandise. During the last six months of 1855, there arrived at the port of Lanthala five American vessels, including two ships of war (the *John Adams* and the *St. Mary's*), measuring, exclusive of the two latter, an aggregate of 1124 tons. Three whale-ships also touched at the islands during the same period. The inward cargoes of two of the merchant vessels referred to, amounting in value to \$4000, consisted of general cargoes, of which was landed, in value, \$3000. The remaining vessel was laden with outfits, stores, and whaling-lines, valued at \$30,000, none of which was landed at the islands. The outward cargoes consisted of liche-de-mer, 1500 peals, and shells, 1000 pounds, valued at \$41,000. One of these vessels made a voyage to Sydney with yams, cocoanut-oil, and live stock, while the natives were collecting her cargo of liche-de-mer.—C. D.—*Con. Rel. U. S.*

Felt, a kind of stuff resembling coarse cloth, made of hair or wool, without weaving. The fur of the hare, rabbit, seal, beaver, and the wool of the sheep, are the materials chiefly used for making it. The hairs and loose flocks of wool are thoroughly mixed together by an operation called *bowing*, which depends on the vibrations of an elastic string; when, in consequence of their anatomical structure, they become matted to-

gether.
Felted Cloth. This woollen fabric is made by beating and spinning or weaving. *Varnished or Japanned Felt* is made by imbuing the stuff of coarse hat bodies with drying oil, prepared by boiling 50 lbs. of linseed oil with a white lead, litharge, and amber, of each one pound. The felt is to be dried in a stove, and then polished by pumice-stone. Five or six coats of oil are required. The surface is at last varnished. When the object is intended to be stiff, like visors, the fabric is to be impregnated first of all with flour-paste, then stove-dried, cut into the desired shape, next imbued with the drying-oil, and pumiced repeatedly; lastly, placed, to the number of 20, in a hot iron mold, and exposed to strong pressure. Japanned hats made in this way are sold in France at 1s. 3d. a piece; and they will stand several years' wear.

Felting (*Fr. Feutrage; Ger. Filzen*), is the process by which loose flocks of wool, and hairs of various animals, as the beaver, rabbit, hare, etc., are mutually

interlaced into a compact textile fabric. The first step toward making felt is to mix, in the proper proportions, the different kinds of fibres intended to form the stuff; and then, by the vibratory strokes of the bowstring, to toss them up in the air, and to cause them to fall as irregularly as possible upon the table, opened, spread, and scattered. The workman covers this layer of loose flocks with a piece of thick blanket stuff slightly moistened; he presses it with his hands, moving the hair backward and forward in all directions. Thus the different fibres get interlaced, by their ends pursuing ever tortuous paths; their vermicular motion being always, however, root foremost. As the matting gets denser, the hand pressure should be increased, in order to overcome the increasing resistance to the decussation. A first thin sheet of soft, spongy felt being now formed, a second is condensed upon it in like manner, and then a third, till the requisite strength and thickness be obtained. These different pieces are successively brought together, disposed in a way suitable to the wished-for article, and united by continued dextrous pressure. The stuff must be next subjected to the fulling-mill.

Felling Timber. In arboriculture, when a full-grown tree is cut down, it is said to be felled; but this term is never applied to young trees or bushes, undergrowth, or hedges, which are said to be rooted out or cut over. Much has been written respecting the proper season for felling trees; some arguing in favor of mid-winter, and others in favor of midsummer. The question principally turns upon the quantity and the value of the soft or outer-wood in the trunk of the tree to be felled, known by foresters and carpenters as the sap. As this sap or outer-wood is the only portion of the trunk in which the sap or juices of the tree circulate, it is evident that if no value be set upon it the tree may be cut down at any season, because the truly valuable part of the trunk, the mature timber, is impermeable to the sap in its ascent through the soft wood, and is, therefore, in the same state at every season of the year. On the other hand, where much value is attached to the soft or outer-wood, where this outer-wood is wished to be made as valuable as possible, or where, as in the case of comparatively young trees, the greater part of the trunk consists of sap-wood, felling ought to take place when there is least sap in the course of circulation. This season is, without doubt, midwinter, which, all other circumstances being equal, is unquestionably the best season for felling timber; the next best being midsummer, when the sap is chiefly confined to the young shoots, the circumference of the soft wood, and the bark; as the worst is the spring, just before the development of the buds, when the tree is fullest of sap, and receiving constantly fresh supplies from the root; and in autumn, immediately before the fall of the leaf, when there is a superabundance of sap, from its being as it were hrown out of employment by the falling of the leaf. In general, all the soft woods, such as the elm, lime, poplar, willow, etc., should be felled during winter; hard woods, like the oak, beech, ash, etc., when the trunks are of large size, and valued chiefly for their heart-wood, may be felled at any time. See articles *Dry Rot* and *Worm*.

Felucca (*Ital. feluca*), a little vessel with oars and lateen sails, common in the Mediterranean. It has a rudder at the stem and another at the stern, to be applied as occasion requires.

Ferment (*Lat. ferreo, I boil*), the substance which is essential to the process of fermentation. It is either naturally present in the fermentable juice, as in the grape, or it is added, as in the manufacture of beer, where yeast constitutes the ferment. Ferments are of an albuminous or glutinous character; the presence of nitrogen seems essential in their composition, hence they are classed by chemists among azotized compounds. Their *modus operandi* is still unexplained.

Fermentation (Lat.) When certain vegetable substances are dissolved in water, and subjected to a due temperature (between 65° and 85°), they undergo a series of changes which terminate in the production of alcohol or spirit; these changes constitute the phenomena of *vinous fermentation*. Sugar and some ferment are essential to the process; and during the formation of the alcohol the sugar disappears, and carbonic acid is more or less abundantly evolved. The simplest case of fermentation is that of *must*, or of the expressed juice of the grape, which, when exposed, either in close or open vessels, to a temperature of about 70°, soon begins to give off carbonic acid, and to become turbid and frothy; after a time a scum collects upon the surface, and a sediment is deposited; the liquor which had grown warm gradually cools and clears, loses its sweet taste, and is converted into *wine*. The chief component parts of must are water, sugar, mullage, gluten, and tartar. During the fermentation carbonic acid escapes, the sugar disappears, and with it the greater part of the mucilage; the gluten chiefly forms the scum and a portion of the sediment; and the tartar, originally in solution, is thrown down in the form of a colored deposit. It appears, therefore, that the new products, which are *alcohol* and *carbonic acid*, are principally formed at the expense of the sugar; and Gay Lussac's experiments have shown that 45 pounds of sugar are resolved, in the process of fermentation, into 23 of alcohol and 22 of carbonic acid. Sugar and water alone will not ferment; the ingredient requisite to the commencement of the change is the gluten, which absorbs in the first instance a little oxygen from the air, becomes insoluble, and induces the subsequent changes. The reason why grapes never ferment till the juice is expressed, seems to depend upon the exclusion of air by the husk or membranes; and if grapes be bruised in a perfectly close vessel, carefully excluding oxygen, the juice undergoes no change; so that the mere breaking down of the texture of the fruit is insufficient. But a very short exposure of the pulp to air is sufficient to induce that change in the juice which leads on to fermentation, and which is afterward independent of the further contact of air, the evolution of carbonic acid being exclusively referable to the decomposition of sugar. In *beer* the alcohol is derived from the sugar, original and produced, of the malt. When wine is exposed to air and a due temperature, a second fermentation ensues, which is called *acetous fermentation*, and which terminates in the production of *vinegar*. During this process oxygen is absorbed, and more or less carbonic acid in most cases evolved; but the apparent cause of the formation of vinegar is the abstraction of hydrogen from the alcohol, so as to leave the remaining elements in such proportions as to constitute *acetic acid*. Thus alcohol is theoretically constituted of charcoal, water, and hydrogen, and acetic acid of charcoal and water only; the oxygen of the air, therefore, converts the hydrogen of the alcohol into water, and so effects the change into vinegar.

Fern, or Fern Islands, a group of small islets or rocks, 17 in number, lying off the coast of Northumberland, but included in the county of Durham. There are two light-houses on these islands. It was here, in 1838, that Graco Darling and her father, in stormy weather, rescued the passengers of the *Farfusshire* steamer. The Fern Islands are frequented by immense numbers of sea-birds.

Fernando de Noronha, an island in the South Atlantic, lying about 70 leagues from the coast of Brazil. It is about 20 miles in circumference, and the surface is rugged and mountainous. It has several harbors defended by forts, and serves as a place of banishment for criminals from Brazil. N. lat. 3° 56', W. long. 32° 28'.

Fernando Po, or Fernao do Pao, an island on the west coast of Africa, lying in the gulf of Benin,

about 20 miles from the mainland, in N. lat. 3° 25', E. long. 8° 50'. It is about 44 miles in length from N.N.E. to S.S.W., and about 20 in breadth. The coasts are steep and rocky, and the interior is mountainous. A ridge of mountains toward the centre of the island rises to the height of 8000 feet, and is terminated at each extremity by a peaked mountain, the one at the northern extremity attaining a height of 10,700 feet. The southern extremity of the island is also intersected by several steep mountains, varying from 1,000 to 3,000 feet. These mountains are covered, most of them to their summits, together with the intervening valleys, with dense forests of shrubs and lofty trees of luxuriant growth. The rocks are of volcanic origin, and the soil is rich and fertile, producing rice, sugar-cane, cotton, tobacco, yams, palms, &c. Sheep, goats, fowls, turtle, and fish, are abundant. The climate is salubrious, though the rainy season lasts from May to December, and is succeeded by a season of dense fogs. The harbors are small, the largest being Port Clarence on the northern shore. This island was discovered in 1471 by a Portuguese navigator, whose name it bears. It was taken possession of by Spain in 1778, but abandoned in 1782. The English in 1827 formed a settlement here, but relinquished it in 1834; the Spaniards resumed possession of it in 1844, and have given it the name of *Puerto de Isabel*. The native population is estimated at about 15,000.

Ferrol, a seaport town of Spain, province of Coruña, and one of the first naval arsenals in the kingdom, is situated on the N. arm of the bay of Betanzos, 12 miles north-west of the town of Coruña. The harbor, which is one of the best in Europe, is deep, capacious, and secure; but the entrance, which is a strait about two miles in length at the narrowest part, only admits one ship at a time, and is commanded on either side by strong forts. The town is protected on the land-side by a wall, on which 200 cannon might be mounted. The dockyard is divided into two parts, the outer being the smaller, and the whole occupying a space of more than 115,000 square yards. Behind the inner dock are the dwellings of the operatives, and in the north angle are the foundries, rope-walks, and magazines. They are all, however, as well as the arsenal, in a neglected and ruinous condition.

Ferry (Germ. and Sax. *fahren*, to pass over), in law, a right arising from royal grant or prescription to have a boat to carry men and horses across a river, and to levy reasonable toll. The land on both sides ought to belong to the owner of the ferry-boats.

Fescue grass, a valuable grass for meadows and pastures. (*Festuca pratensis*, Linn.) In deep, rich soils, somewhat moist, it is considered as the most bulky and nutritive of all grasses; but in poorer soils it is equalled, if not surpassed, by the rye grass (*Lolium perenne*), and the meadow foxtail grass (*Alopecurus pratensis*). The meadow fescue grows to the height of between 2 and 3 feet; but the sheep fescue (*F. ovina*), and several other species, seldom grow above 6 inches or a foot in height, and are chiefly sown on sheep pastures, and used to lay down lawns and grassy surfaces to be mown in pleasure grounds. All the fescues are perennials.

Fez, an extensive country of Africa, and at one time the most flourishing kingdom in the northern part of that continent. It now, however, forms a province of the empire of Morocco. *Fez, or Fas*, the capital of this kingdom, was built in 793, A. D., by a prince named Edris, and having soon risen to be a city of the first magnitude, became the capital of the western Mohammedan states. In the 12th century it is said to have contained 700 temples and mosques, and other public edifices, a number of which were erected upon a magnificent scale, and adorned with a profusion of marble pillars. The manufactures of Fez consist of woolen *haaks*, sashes, and silk handkerchiefs, slippers

of good leather, which they tan remarkably well, red felt caps, some coarse linen cloth, fine carpets, a curious kind of earthenware, weapons of several kinds, saddlers' ware, jewelry, and copper utensils. The arts here find little encouragement, and are, indeed, far inferior to those of Europe, except in the preparation of leather, and in the fabrication of carpets and of hbaiks, which the manufacturers know how to weave as fine and as transparent as gauze. They are also expert workers in wax, weapons, and harness. The heat during the summer is very great; but in other seasons of the year, particularly winter, the climate is agreeable. With regard to the number of inhabitants, much difference of opinion prevails among travelers.

Fibre (Lat. *Fibra*), a fine thread or filament; a fine slender body, such as those of which flesh, nerves, plants, roots, etc., are composed. In our manufactures vegetable filaments and fibres are among the most important of the whole series of raw produce; furnishing thread, cloth, cordage, and the like. For these purposes the filamentous parts of the *Gossypium Canadense*, and *Linum*; or cotton, hemp, and flax, are used. The fibres of other plants have been employed in different countries for the same uses. Putrefaction destroys the pulpy matter, and leaves the tough filaments entire. Different kinds of cloth are prepared in the East from the fibres of the bark of certain trees boiled in a strong lye. Some of these cloths are very fine, and approach to the softness of silk, but in durability fall short of cotton; others, again, are coarser and stronger, and much exceed cotton in durability. See **FLAX**.

Fid, a short bar of wood or iron put through the heel or lower part of a topmast, and resting by its ends on the trestletrees, and on which the mast is therefore supported. When the topmast is to be got down, it is first lifted to take the pressure off the fid, which is then withdrawn.

Fid, or **Splicing-fid**, is also a sharp cone of wood for opening the strands of rope.

Fiddles, or **Violins** (Ger. *Violinen*, *Geigen*; Du. *Violen*; Fr. *Violons*; It. *Violini*; Sp. *Violines*; Rus. *Skrpipini*), musical instruments, too well known to need any particular description. The finest-toned violins are those made in Italy; they are usually called Cremonas, from the name of the town where they were formerly manufactured in the highest perfection; \$500 and more have not unfrequently been given for a first-rate Cremona violin.

Figs (Ger. *Feigen*; Du. *Eygen*; Fr. *Figuee*; It. *Fichi*; Sp. *Higos*; Lat. *Fici*, *Carica*; Arab. *Teen*), the fruit of the fig-tree (*Ficus carica*), a native of Asia, but early introduced into Europe.

It flourishes in Turkey, Greece, France, Spain, Italy, and northern Africa, and even sometimes ripens its fruit in the open air in this country. Figs, when ripe, are, for the most part, dried in ovens to preserve them; and then packed very closely in the small chests and baskets in which we import them. The best come from Turkey; those of Kalamata, in the Morea, are said to be the most luscious.—*Thomson's Dispensatory*.

Dried figs form a very considerable article of commerce in Provence, Italy, and Spain; besides affording, as in the East, a principal article of sustenance for the population. In Spain, figs are chiefly exported from Andalusia and Valencia; but they are more or less abundant in every province. In the northern parts of France there are many fig gardens, particularly at Argenteuil.

Figure Head. The figure, statue, or bust, on the projecting part of the head of a ship, called the cut-water.

Figures, in Arithmetic, are the numeral characters, or ten digits, by which numbers are expressed. They are supposed to be of Indian origin, and to have been introduced into Europe by the Moors of Spain in

the 13th century; but the date of their introduction is much disputed.

Filbert, or **Filbard**, the well-known fruit of the cultivated hazel nut, or *Corylus avellana*, is a seed-vessel enclosed within an involucre or cupule, which is the part commonly called the husk. This organ is of the same nature as the cup of the oak, and the prickly case in which the nuts of the sweet chestnut and the mast of the beech are inclosed. In the filbert it is much larger than in the common nut; and it is this character, together with the lengthened figure of the nut, which distinguishes the two races of nuts and filberts. The best known varieties of the filbert are the red, the frizzled, and the white, the latter being the kind most commonly grown.

File, **Files** (Da. *File*; Du. *Vysen*; Fr. *Limes*; Ger. *Fellen*; It. *Lime*), an instrument of iron or forged steel, cut in little furrows, used to polish or smooth metals, timber, and other hard bodies. Files are of various forms, sizes, and cuts, according to the uses to which they are to be applied. When the surface is cut in transverse furrows by a straight sharp-edged chisel and mallet, the instrument is properly called a file; but when it is raised by a triangular punch, it is termed a rasp. This last kind is chiefly employed for rubbing wood and horn. The larger kind of files are made of blistered steel; but the small and fine files of cast steel. Various ingenious machines have been contrived for cutting the teeth of files, but these have not hitherto succeeded so well as to supersede file-making by the hand. After the file has been cut it must undergo the process of tempering. This is said to be well effected in the following manner: A saturated solution of common salt, stiffened to the consistency of cream with ale grounds, or with any cheap farinaceous matter, such as bean-flour (some use well-dried chimney-soot), is to be spread over the file, in order to preserve its surface from oxidation during the process; it is then uniformly heated in a coke or charcoal fire to a cherry-red color; and on its removal from the fire it is to be suddenly quenched in cold and pure spring water. It is subsequently cleaned with charcoal and a rag; after which it is laid up in wheat bran to preserve it from rust. When the file is intended to cut iron or steel, it is found preferable to substitute animal carbon for the grounds or farinaceous matter mentioned above. This will give even to iron a superficial hardness sufficient for any kind of file.

Filigree, or **Filigree** (Ital. *filigrano*; Lat. *filum*, a thread, and *granum*, a grain), a very delicate kind of ornamental work in gold or silver, wrought in the manner of little threads, or threads and grains intermixed. Filigree work is of eastern origin, and was first introduced into Europe by the Italians. In Sumatra, manufactures of this kind have been carried to the highest degree of perfection, and yet the tools employed are exceedingly coarse and clumsy. These are generally rudely and unartificially formed from any piece of old iron. A piece of iron hoop suffices for making the wire-drawing instrument; an old hammer head, stuck in a block, serves as an anvil; and two old nails, tied together at one end, will suffice for a pair of compasses. The gold is melted in a piece of *precco* or earthen rice-pot, or sometimes in a crucible of ordinary clay. In general no bellows are used, but the fire is blown with the mouth, through a joint of bamboo; and if the quantity of metal to be melted is considerable, three or four persons sit round the furnace, which is an old broken galley or iron pot, and blow together. At Padang, where the manufacture is most considerable, they have adopted the Chinese bellows. The method of drawing the wire differs but little from that which is used by European workmen. When drawn to a sufficient fineness, it is flattened by beating it on the anvil; and when flattened, a twist is given to it by rubbing it on a block of wood with a flat stick. After twisting they again beat it upon the

anvil, and thus it becomes flattened wire with indented edges. The end of the wire is folded down with a pair of pliers, and thus is formed a leaf, or element of a flower, which is cut off. The end is again folded and cut off till they have a sufficient number of leaves, which are laid on singly. Patterns of the flowers or foliage, in which there is seldom much variety, are prepared on paper of the size of the gold plate on which the filigree is to be laid. According to these, they begin to dispose on the plate the larger compartments of the foliage; for which they use plain flattened wire of a larger size, and fill it up with the leaves before mentioned. In order to fix the work, they employ a gelatinous substance made of the berry called *bocas sago*, ground to a pulp on a rough stone. After the leaves have been all placed in order, and stuck on bit by bit, a solder is prepared of gold filings and borax moistened with water, which is strewn over the plate, when it is put in the fire for a short time, and the whole becomes united. This kind of work on a gold plate is called *carrang papan*; but when the work is open, it is called *carrang trouze*. In executing the latter, the foliage is laid out upon a card, or soft kind of wood, and stuck on, as before described, with the sago berry; and the work, when finished, being strewn over with the solder, is put into the fire, when the card or soft wood burning away, the gold remains connected. If the piece be large it is soldered at several times. In the manufacture of badjoo buttons, they first make the lower part flat, and having a mold formed of a piece of buffalo's horn, indented to several sizes, each like one half of a bullet mold, they lay their work over one of these holes, and with a horn punch press it into the form of a button; after which they complete the upper part. When the filigree is finished they cleanse it by boiling it in water with common salt and alum, or sometimes lime juice; and in order to give it that fine purple color which they called *sapo*, they boil it in water mixed with brimstone. The manner of making the little balls with which their works are sometimes ornamented, is simple. They take a piece of charcoal, and having cut it flat and smooth, make in it a small hole, which they fill with gold dust, and this being melted in the fire becomes a little ball. They are very inept at finishing and polishing the plain parts, hinges, screws, and the like, being in this as much excelled by the European artists as the latter fall short of them in the fineness and minuteness of the foliage. The Chinese also make filigree, mostly of silver, which looks elegant, but wants the extraordinary delicacy of the Malay work. The price of the workmanship depends upon the difficulty or uncommonness of the pattern. In some articles of usual demand it does not exceed one third of the value of the gold, but in matters of fancy it is generally equal to that of the metal.

In India, the articles usually made in gold and silver filigree are bracelets, ear-rings, brooches, chains, groups of flowers, and small boxes and caskets. Mr. Taylor, in his "Account of the Arts in India," says: "The design best adapted for displaying the delicate work of filigree is that of a leaf; it should be drawn on stout paper, and of the exact size of the article intended to be made. The apparatus used in the art is exceedingly simple, consisting merely of a few small crucibles, a piece of bamboo for a blow-pipe, small hammers for flattening the wire, and sets of forceps for intervening it. The gold and silver wire made by the Hindoos for this and other purposes is of varied character, according to the purposes for which it is intended; thus, the *goolbatoon* is made at Dacca for the embroidering of muslins and silks; *gashoo* for caps and for covering the handles of chowries; *salmah* for turbans, slippers, and hookah-snakes; and *boovin* for gold lace and brocades. For some of these purposes it is not strictly wire, but gold thread, that is, silk covered with silver and then with gold."—E. B.

FIL. The sea term for bracing a yard which had been laid aback, so that the wind may act on the after or proper side of the sail.

Finesse (Fr.) may be defined simply as a peculiar aptitude of discovering, in any business, the best means of attaining the object in view; or as the power of embracing in one comprehensive glance the various interests of any subject, together with ingenuity to devise and tact to carry out the plan best calculated to obtain success.

Finland, called by the natives *Suomenna*, the Region of Lakes and Swamps, is a government of Russia, comprising, besides the old Swedish province of Finland, the two Lapmarks of Kaml and Torneå, and the district of Wiborg. It lies between N. lat. 59° 56' and 70° 6', and E. long. 20° 30' and 32° 45' being bounded on the N. by Norwegian Finmark, by Sweden W. and the Gulf of Bothnia, S. by the Gulf of Finland, and E. by the governments of St. Petersburg, Olonetz, and Archangel. It is about 780 miles in length from N. to S., with an average breadth of about 185 miles. The sea-coast of Finland throughout its entire extent presents the same succession of fiords and rocky headlands as characterize the whole seaward frontier of Sweden and Norway. The fiords of Finland, however, are far more limited than those to the west of the Gulf of Bothnia, and seldom exceed a few miles in extent, although their mouths contain an equal number of islands, some of which, as the isles of Sveaborg, have been converted into fortresses of great strength. The coasts of the Bothnian and Finland Gulfs are thickly strewn with rocks of granite and limestone, presenting in some places a labyrinthine archipelago of little islands, rendering the navigation extremely dangerous. The greater portion of the interior is a vast table-land averaging in height from 400 to 600 feet, and interspersed with hills of no great elevation. In the north, however, are the Manselka Mountains, which attain a height of nearly 4000 feet, and stretch southward, though with several interruptions, until they terminate in lofty cliffs on the Gulf of Bothnia. The great mass of mountains is composed of red granite, and vast quantities of the same rock lie in boulders on the lower grounds, and prove a very serious obstacle to their cultivation. Many of the heights are bare, but the greater part of them being of moderate elevation are covered with forests chiefly of pine; and in their combination with the vast number of lakes inclosed by their bases, often form very romantic scenery. The extensive forests are sometimes devastated by the tempests of winter, which seem to find access to their very centres in tornadoes, tearing up by the roots or bending and snapping the largest pines. Frequently also ravages are committed in them by conflagration occasioned often through the carelessness of the peasants. The interior of Finland is also intersected and broken up by a vast number of lakes, throwing out winding arms and branches in all directions, which, while they offer the greatest facilities for inland navigation, render land traveling circuitous and dangerous. Many of the high roads pass over islands on these lakes, the natural strength of whose situation has been taken advantage of, to cover them with batteries; and some of them, as at Wiborg and Nyslott, are considered impregnable, save to fraud or famine. The principal of these lakes are Ladoga, the greater portion of which belongs to this government; Lake Saima, which is crowded with islands and discharges its superfluous waters in a series of cataracts into Lake Ladogn, but which is now connected by means of a canal with the Gulf of Finland near Wiborg; and Lake Enara in the extreme north, covering above 1000 square miles, and having its outlet in the Frozen Ocean. The chief rivers are the Ulea, which is navigated by trading-vessels, though its stream is very rapid; the Cano, which passes Björneborg; the Aurajoki, which at Abo is about 100 yards broad; the

Kymen, which flows into the middle of the Gulf of Finland; and the Tornea, which discharges itself at the northern extremity of the Gulf of Bothnia, and forms the present boundary between Sweden and Russia. The climate varies much according to the locality. In Lapmark, in the north, it is polar somewhat modified, and the sun disappears during December and January. Further south at Uleaborg, winter begins in October and continues to May, to which month spring is limited. Summer commences in June and lasts three months, which are generally so hot and dry that the crops, particularly where the soil is of a sandy nature, often suffer from drought. The autumn, like the spring, is confined to one month, and may be said to commence and terminate in September. Even in summer the nights are cold, particularly about the middle of August. During summer, however, the progress of vegetation is remarkably rapid; and there have been instances of grain being sown and reaped in six weeks. In the more southern parts the climate is less severe; the winter being of five or six months' duration. Dense fogs are frequent, and heavy rains take place in autumn. The soil is for the most part stony or sandy; but notwithstanding this it is much more productive than the opposite part of the Scandinavian peninsula, and when in the possession of Sweden it was termed the granary of that country. The principal crops are barley and rye, but owing to the nature of the surface and climate a large portion of the land is fit only for pasture. In the north, where vegetation is almost confined to the growth of moss and lichen, other domestic animals are superseded by the reindeer, of which great herds are kept. In addition to timber (chiefly fir), large quantities of potash, pitch, and resin are obtained, and form the principal articles of export. The mineral productions are chiefly confined to iron, lead, sulphur, slate, and granite. The first is only wrought to a limited extent for the supply of a few furnaces; wrought iron being now principally imported from Sweden. A great number of excellent granite quarries have been opened chiefly on the borders of the lakes or sea-coasts to secure the advantage of water carriage. From these are obtained blocks of extraordinary magnitude and beauty, which are employed for architectural and artistic purposes. One of the finest specimens is the monolith obelisk recently erected in St. Petersburg to the Emperor Alexander. In its rough state it was 12 feet in diameter, and 80 feet in length. The manufactures of Finland are insignificant. Agriculture, the rearing of cattle, and fishing are the principal occupations of the inhabitants. The coasts present many good harbors, but on account of the long winter they can not be extensively used. In winter sledges afford an easy and rapid communication with different parts, and even with Sweden across the Gulf of Bothnia. In March, 1809, Barclay de Tolly crossed over with a division of the Russian army from Vasa to Umea in Sweden.

From official documents the returns of the trade of Finland for the year 1848, were, in silver roubles of the value of about 3s. 2d., as follows:

Exports.	
To Sweden and Norway.....	197,949
To other countries.....	1,946,994
Export duty on the same.....	34,704
Total.....	3,189,640
Imports.	
From Sweden and Norway.....	490,866
From other countries.....	3,123,690
	3,614,556
Deduct import duty thereon.....	893,500
Total.....	2,660,456

Showing an excess in the imports over the exports of 476,816 roubles, which, however, was in part covered by the freight earned by the merchant shipping. The

above statements indicate a falling off as compared with former years in the export trade to Norway and Sweden. To these two countries the leading articles of export and their value were—fish, 23,569 roubles; hides, 8616; beef, 24,578; grain, 15,083; tallow, 80,809; tar, 11,488; firwood, 11,483. The imports were—books, 16,200 roubles; fish, 25,228; iron and steel, 250,870; sugar, 66,418; tobacco, 4377; dye-woods and stoffs, 23,900. The exports to other countries were also less than in former years; the chief articles were—potash, 16,793 roubles; butter, 183,409; tar, 324,717; wood and timber, 921,860. The chief imports from other countries were—medicines, 20,912 roubles; cotton, 138,918; arrack, rum, brandy, 169,794; coffee, 597,708; fruits, 106,042; dye-stuffs, 134,550; yarn, 349,993; iron and steel, 89,709; salt, 531,665; sugar, 544,485; wine, 140,528; manufactures wove, 666,145.

In 1831 Finland was divided administratively into eight circles or *läns*, which are subdivided into *fogderier* or districts, and *herads* or parishes. There is a distinct establishment at St. Petersburg for the government of this vast province. The governor-general, who resides at Helsingfors, has the superintendence of the military affairs. Finland has a diet composed of the four orders of the nobility, clergy, citizens, and peasantry, and a code of laws and judicial system similar to that of Sweden, but the diet is rarely convoked, except to consent to the imposition of fresh taxes, a senate more recently established having replaced it in the exercise of its functions. The regiments raised in Finland are not promiscuously intermixed with the general forces of the Russian empire; and their fleet, by far the best manned portion of the Russian navy, forms a distinct squadron under the Finnish flag. None but a native Finlander can hold any office of trust in the country. Almost all the inhabitants are Lutherans under the bishops of Abo and Borgo, except in the circle of Wiborg, where they belong to the Russian church. Public education is in a very backward state. At Helsingfors is a university, transferred from Abo in 1828; and all the towns have schools, but there is a great deficiency of country schools. The majority of the inhabitants are Fins, who call themselves *Suomalans* or *Suomes*, but they are denominated Tschudes by the Russians. They are of middle height, robust, flat-faced, with prominent cheek-bones, light, reddish, or yellowish-brown hair, gray eyes, little beard, and a dull sallow complexion. They are courageous, hospitable, and honest, but obstinate in the extreme, indolent, dirty, and, it is said, revengeful. Their customs and habits have been handed down from time immemorial, and their costume forcibly bears out the supposition of their being of oriental origin. The peasants wear long loose robes of a coarse manufacture, secured by a silken cincture like the *kummerbund* of the Mussulmans. The eight läns with their areas and populations are as follows, commencing from the south and east:

	Area.	Population.
Wiborg.....	16,700	224,701
St. Michael.....	9,271	195,281
Nyland.....	5,375	149,714
Tavastehus.....	7,112	182,656

The chief towns of Finland are Helsingfors, the present capital, Abo, the former capital, Wiborg, Tavastehus, Vasa, Uleaborg, and Tornea. The Fins were pagans living under their own independent kings till the twelfth century, about the middle of which Finland was conquered by the Swedes, who introduced Christianity. The province of Wiborg was seized by Peter the Great in 1721, and the remainder of the

country was annexed by conquest to the Russian dominions in 1809.—*Athenaeum*, 18th March, 1854.

Fire-Arms. Under this designation is comprised all sorts of guns, fowling-pieces, blunderbusses, pistols, etc. The manufacture of these weapons is of considerable importance; employing at all times, but especially during war, a large number of persons. Small arms were contrived by Schwartz, A. D. 1678; they were brought to England about 1688. Fire-arms were a prodigious rarity in Ireland in 1489, when six muskets were sent from Germany as a present to the earl of Kildare, who was then chief-governor. Muskets were first used at the siege of Rhegen, in 1425. The Spaniards were the first nation who armed the foot soldier with these weapons.—*Ulloc*. Voltaire states, that the Venetians were the first to use guns, in an engagement at sea against the Genoese, in 1377; but our historians affirm that the English had guns at the battle of Cressay, in 1346; and the year following at the siege of Calais.

Fire-engine, a species of forcing-pump in which the water is subjected to pressure sufficiently strong to raise it to the required height. These of the ordinary construction consist of two forcing-pumps, wrought by the reciprocating motions of two transverse levers. The water is forced into an air-vessel, by which means the included air is condensed, and by its reaction it forces the water through a moveable pipe, which terminates in a conical form, and is directed upon the flame. Braithwaite's steam fire-engine is an ingenious application of the moving power of steam to the working of fire-engines. The mechanical arrangement of this machine consists of two cylinders of about six inches in diameter, one of them being the steam-cylinder, and the other the water-pump; and they are placed horizontally, so that a parallel motion is easily obtained. An engine of this kind will deliver about 9000 gallons an hour to the height of 90 feet. The time of getting the engine into action from the moment of igniting the fuel (the water being cold), is less than ten minutes. Mr. Miles Greenwood, of Cincinnati, made, in 1852, the first successful practical application of the steam fire-engine; and engines of his construction are now in use in Cincinnati, St. Louis, and many other large cities.

Fire-damp, the explosive carburetted hydrogen of coal mines. See SAFETY LAMP.

Firelock, or Fusil. A musket or small gun, which is fired with a flint and steel; and thereby distinguished from the old musket, or *match-lock*, which was fired with a match. The date of the invention of firelocks is uncertain.

Fire-ships. They were first used in the sixteenth century. Among the most formidable contrivances of this kind ever used, was an explosion vessel to destroy a bridge of boats at the siege of Antwerp, in 1585. The first use of them in the English navy was by Charles, Lord Howard of Effingham, afterward earl of Nottingham, lord high admiral of England, in the engagement with the Spanish Armada, July, 1588.—*Rapin*.

Fireworks. (*Feux d'artifice*, Fr.; *Feuerwerke*, Germ.) The composition of luminous devices with explosive combustibles is a modern art resulting from the discovery of gunpowder. The finest inventions of this kind are due to the celebrated Huggert, father and son, who executed in Rome and Paris, and the principal capitals of Europe, the most brilliant and beautiful fireworks that were ever seen. The following description of their processes will probably prove interesting to many of my readers:

The three prime materials of this art are, nitre, sulphur, and charcoal, along with filings of iron, steel, copper, zinc, and resin, camphor, lycopodium, etc. Gunpowder is used either in grain, half crushed, or finely ground, for different purposes. The longer the iron-fillings, the brighter red and white sparks they

give; those being preferred which are made with a very coarse flint, and quite free from rust. Steel-fillings and cast-iron borings contain carbon, and afford a more brilliant fire, with wavy radiations. Copper-fillings give a greenish tint to flame; those of zinc a fine blue color; the sulphuret of antimony gives a less greenish blue than zinc, but with much smoke; amber affords yellow fire, as well as colophony, and common salt; but the last must be very dry. Lampblack produces a very red color with gunpowder, and a pink with nitre in excess. It serves for making golden showera. The yellow sand, glistening mica, communicates to fireworks golden radiations. Verdigris imparts a pale green; sulphate of copper and sal-ammoniac, a palm-tree green. Camphor yields a very white flame and aromatic fumes, which mask the bad smell of other substances. Benzoin and storax are used also on account of their agreeable odor. Lycopodium burns with a rose color and a magnificent flame; but it is principally employed in theatres to represent lightning, or to charge the torch of a fury.

Firkin, a measure of capacity, equal to 9 ale gallons, or $7\frac{1}{2}$ imperial gallons, or 2538 cubic inches. See WEIGHTS AND MEASURES.

Firlet, a dry measure used in Scotland. The Linnithgow wheat firlet is to the imperial bushel as 998 to 1; and the Linnithgow barley firlet is to the imperial bushel as 1456 to 1. See WEIGHTS AND MEASURES.

Firman (more properly *Ferman*), in the Persian language, signifies a command, and is the name given in Turkey, Persia, and India, to mandates or certificates of the sovereign, issued for various purposes. Those best known to Europeans are given to travelers, and serve as passports. The Ferman has placed at its head in Turkey the cipher of the reigning Sultan, written in a complicated manner, affixed by the chief secretary of the sign manual. In the East Indies, the term firman is used for a written permission to trade.

Fisc (Lat. *fiscus*), in *Civil Law*, the treasury or revenue of a state. *Fiscus*, in its primary sense, denoted a basket or hanaper used by the Romans for holding large sums of money, and hence was applied to a money-chest or a purse. Under the emperors the term *fiscus* came to be applied to the imperial revenue or privy purse, in contradistinction to the *erarium* or public treasury. Ultimately, when the emperors had concentrated in themselves the whole sovereign power, the word *fiscus* lost its distinctive character, and was used in the same sense as *erarium* under the republic. Various officers were employed in the administration of the *fiscus*; as procuratores, advocati, patroni, and prefecti. From *fisc*, is derived the word confiscation, which signifies to take the goods of a condemned person and appropriate them to the public treasury.

Fiscal Year. The fiscal year of the United States formerly ended on 31st December, and up to the year 1843, on 30th September; but Congress enacted, August 26, 1842, "That on and after the first day of July, in the year of our Lord 1843, the fiscal year of the treasury of the United States, in all matters of accounts, receipts, expenditures, estimates, and appropriations, shall commence on the first day of July in each year; and the reports and estimates required to be prepared and laid before Congress at the commencement of each session by the Secretary of the Treasury, in obedience to the acts of Congress, of the 2d of September 1789, and of May 10th, 1800, shall be a report and estimate for each fiscal year, commencing as aforesaid, and terminating on the 30th day of June, in the succeeding calendar year."

Fish (Ger. *Fische*; Da. *Fisken*; Da. and Sw. *Fisk*; Fr. *Poissons*; It. *Pesci*; Sp. *Pescados*; Port. *Pezes*; Rus. *Ryb*; Pol. *Rybi*; Lat. *Pisces*), a term used in natural history to denote every variety of animal inhabiting seas, rivers, lakes, ponds, etc., that

can not exist for any considerable time out of the water. But in a commercial point of view, those fishes only are referred to, that are caught by man, and used either as food or for some other useful purpose. Of those, herring, salmon, cod, pilchard, mackerel, turbot, lobster, oyster, whale, etc., are among the most important. See the different articles under these titles.

As the seeds of a plant are numerous enough to insure an immense progeny if even a small percentage of them be properly managed, so do fishes produce eggs in such number as might soon overstock the waters, were there not destructive agencies at hand. It is not improbable that we are on the eve of valuable improvements in the management of fish. It has been found that trout and other valuable fish have declined in some of the French rivers; and on careful investigation it has been made apparent that not one egg in a hundred comes to maturity—the rest being devoured by other fish, washed away, or destroyed by mud. Two French fishermen, observing these facts, resolved on an attempt to collect some of the trout-eggs, and to secure the young fish from the voracity of the larger ones; they did so, and placed the eggs on a layer of gravel, which they deposited in a box full of holes. This box they fixed in the bed of a flowing stream, and covered it with pebbles, thus far imitating the practice of the mother-fish. In due time the eggs excluded, and almost every one was found to be good. Several hundred fish were thus obtained, which were kept in water free of danger, and supplied with food. Applying this operation the next year to a great number of fish, they obtained several thousand trout; and in a year or two more the number had increased to millions. The rivers in many departments of France were supplied from this artificial source; and the French government are now encouraging the system in every way. Not only trout, but salmon, carp, pike, tench, and perch, are thus preserved; and, moreover, the system has enabled fish of different species to be naturalized in strange waters, or removed from river to river.

Fisheries. The fisheries may be divided into deep-sea and shore fisheries. The latter are, of course, under the control of the nation owning the shore along whose line the fish are caught. But the deep-sea fisheries and the ownership of discovered shore-lines, have always given rise to disputes and quarrels. It has, however, been settled that a nation has exclusive control and right over the shore fisheries extending three miles from the coast; giving, sometimes, under certain restrictions, a right for other nations to use the shore for the purpose of curing and packing the fish caught beyond three miles of the shore.

Although fishing is an ancient and honorable employment, fisheries were not of much importance until after the discovery of Newfoundland. Holland had fisheries of some note in the 16th century; but owing to the state of maritime knowledge they were much confined; when, however, Newfoundland was discovered, an almost magical change took place. In the library of Venice there is a map, which authorizes the conjecture that land was found before 1486. But little was known until 1497, when Cabot made his first voyage. From this time voyages were made in pursuit of codfish at irregular periods, until the latter part of the 16th century, when enterprise and capital became plenty. Colonies were formed first at Newfoundland, and afterward at Acadia which comprised Nova Scotia and New Brunswick, and part of Maine. So much importance was given to the fisheries as a nursery of seamen, even at that early age, that laws were enacted in 1653 to prevent persons from eating meat Wednesdays and Saturdays except under a license, so that fisheries might be increased.

The great benefit from the fisheries was from the early colonization of this country. It is questionable

whether we should not have been quite a century behind in this, had it not been for colonies founded on our coasts by the fishermen. The first direct voyage made by the English was in 1602, and the vessel catching codfish near the southern cape of Massachusetts, gave the name it yet bears.

The disputes in regard to fishing have disturbed commerce since this country was discovered. A full account of the disputes and treaties settling them, can be found in the able report of Lorenzo Jabin, Esq., to Congress in 1852.

We can notice but one or two affecting our own country. In 1783, Adams, Franklin, Jay, and Laurens were commissioners to negotiate a treaty with Great Britain, which contained this article:

"It is agreed that the people of the United States shall continue to enjoy, unmolested, the right to take fish of every kind on the Grand Bank, and on all the other banks of Newfoundland; also, in the Gulf of St. Lawrence, and at all other places in the sea where the inhabitants of both countries used at any time heretofore to fish; and also, that the inhabitants of the United States shall have liberty to take fish of every kind on such part of the coast of Newfoundland as British fishermen shall use (but not to dry or cure the same on that island), and also on the coasts, bays, and creeks, of all other of his Britannic majesty's dominions in America; and that the American fishermen shall have liberty to dry and cure fish in any of the unsettled bays, harbors, and creeks of Nova Scotia, Magdalene Islands, and Labrador, so long as the same shall remain unsettled; but so soon as the same, or either of them, shall be settled, it shall not be lawful for the said fishermen to dry or cure fish at such settlement, without a previous agreement for that purpose with the inhabitants, proprietors, or possessors of the ground."

Notwithstanding the position taken by Messrs. Adams, Clay, Bayard, and Gallatin, at Ghent, that our treaty rights were not abrogated by the war, the British government revived their pretension to the contrary immediately after the peace. An American vessel was fallen in with by an armed ship, the *Jacser*, Locke, commander, in June, 1815, when about 45 miles from Cape Sable; and her papers were endorsed, "Warned off the coast, not to come within 60 miles." So extraordinary a procedure was promptly disavowed as unauthorized; but discussions ensued, which were terminated in 1818, by the conclusion of a treaty that embodied a compromise of the adverse views of the two cabinets, and which is still in force. The article is as follows:

"Whereas, differences have arisen respecting the liberty claimed by the United States, for the inhabitants thereof, to take, dry, and cure fish on certain coasts, bays, harbors, and creeks, of his Britannic majesty's dominions in America, it is agreed between the high contracting parties, that the inhabitants of the said United States shall have forever, in common with the subjects of his Britannic majesty, the liberty to take fish of every kind on that part of the southern coast of Newfoundland, which extends from Cape Ray to the Rameau Islands, on the western and northern coast of Newfoundland; from the said Cape Ray to the Quirpon Islands, on the shores of the Magdalen Islands and also, on the coasts, bays, harbors and creeks, from Mount Joly, on the southern coast of Labrador, to and through the Straits of Bellisle, and thence northwardly indefinitely along the coast; without prejudice, however, to any of the exclusive rights of the Hodson's Bay Company; and that the American fishermen shall also have liberty, forever, to dry and cure fish in any of the unsettled bays, harbors and creeks of the southern part of the coast of Newfoundland, heretofore described, and of the coast of Labrador; but so soon as the same, or any portion thereof, shall be settled, it shall not be lawful for the

said fishermen to dry or cure fish at such portion so settled, without previous agreement for such purpose, with the inhabitants, proprietors, or possessors of the ground. And the United States hereby renounce, forever, the liberty heretofore enjoyed or claimed by the inhabitants thereof, to take, dry, or cure fish, on or within three marine miles of any of the coasts, bays, creeks, or harbors of his Britannic majesty's dominions in America, not included within the above-mentioned limits; provided, however, that the American fishermen shall be permitted to enter such bays or harbors for the purpose of shelter, and of repairing damages therein, of purchasing wood, and of obtaining water, and for no other purpose whatever. But they shall be under such restrictions as may be necessary to prevent their taking, drying, or curing, fish therein, or in any other manner whatever, abusing the privileges hereby reserved to them."

The distinguishing features of this article, as compared with the stipulations of the treaty of 1788, are obviously two: first, that we gave up the catching along certain shores; and, secondly, that our facilities of drying and curing were increased. The practical construction of both governments has been, until a recent period, that our vessels could fish everywhere, as under the treaty of 1788, except within three miles of certain coasts; in other words, that our rights were not impaired on the southern shore of Newfoundland, between Cape Ray and the Rameau Islands, on the western and northern shores of Newfoundland, from said Cape Ray to the Quirpon Islands, at the Magdalen Islands, between Mount Joly and the Straits of Belleisle, and through these straits to an indefinite extent along the shores of Labrador; while elsewhere in British America we retained the sea-fisheries, but surrendered the inner, or shore fisheries.

During the discussions abroad, in consequence of the outrage of the *Jessur* and other British cruisers, Congress was not unmindful of the fishing interest, both to repair the wrongs of unauthorized captures and to afford protection against foreign competition. The tariff of 1816 imposed a duty of one dollar the quintal on foreign dried or smoked fish imported into the United States, two dollars the barrel on salmon, one dollar and fifty cents the barrel on mackerel, and one dollar the barrel on all other kinds of pickled fish.

So, in 1817, an act was passed which required that all officers, and three quarters of the crews of vessels employed in the cod-fishery, and claiming the bounty or allowance, should be American citizens, "or persons not the subjects of any foreign prince or state;" while no such vessel, it was provided by further enactments, should be deprived of bounty, if prevented from fishing the full time prescribed by law, by reason of detention or seizure by British ships-of-war.

In the revision of the tariff in 1824, there was no change in the rates of duty imposed on foreign fish. These rates were continued also in the tariffs of 1828 and 1832. Thus, in four revisions, the principle of staple protection was preserved, except that the products of the sea, like all other commodities imported, were subject to the provisions of the "compromise" measure introduced by Mr. Clay. In the present tariff, specific duties on fish are entirely abolished, and the uniform rate of 20 per cent. ad valorem substituted, which on some kinds is merely nominal, and on all insufficient. The ad valorem system has proved extremely beneficial to British colonists. In fact, having driven us from the markets of Catholic Europe, they are in active competition with us for our own.

A bounty or allowance has been commonly allowed by governments in consideration of the fisheries being nurseries for seamen, and a chief dependence in time of war to supply the marine.

In 1852, the bounty laws in this country, gave to vessels:

"If measuring more than five tons, and not exceeding thirty tons, \$3 50 per ton."

"If measuring more than thirty tons, \$4 per ton."

"If the above 80 tons, with crews not less than 10 persons, and having been exclusively employed at sea in the cod-fishery 8½ calendar months, \$3 50 per ton."

"The allowance for one vessel during the season, whatever may be her tonnage, can not exceed \$600."

"Vessels exclusively employed at sea in the cod-fishery the full time required to entitle them to bounty, and afterward wrecked, may be allowed bounty under the provisions of the act of 26th May, 1824, which requires the evidence of the loss of the vessel to be transmitted to the Comptroller for his decision thereon. Under the act of March 3, 1849, this duty has been transferred to the Commissioner of the Customs, to whom the proof, certified by the collector of the district to which the vessel belonged, should be sent for his official direction thereon."

"Instructions will be given in due season in regard to the mode of payment of bounty allowances, at and after the close of the year. To obviate any responsibility which might otherwise devolve on collectors, should such payments be made upon proof regarded as insufficient under the present instructions, it will be advisable that probable claimants to fishing-bounty allowances be apprized, before the sailing of vessels on their first cod-fishing voyage, of the requirements of these instructions, which are intended to supersede and supply the place of all former instructions on this subject. THOMAS OORWIN, Secretary of the Treasury."

We make the following extracts from Sabine's able Report on the American fisheries:

Cod-fishery of France.—The French were the first European cod-fishers in the American seas. There is a tradition among the fishermen of Biscay that their countrymen visited Newfoundland before the time of Columbus. It is said, indeed, that the great discoverer was informed of the fact by a pilot who had been engaged in the enterprises. The story, improbable as it is, seems to have been treated with respect by some writers of the 16th century, but may be dismissed now as one which rests upon no clear and authentic testimony.

But that the Newfoundland fisheries were known to the Biscayans and Normans as early as the year 1504, is quite certain. When Cabot discovered our continent, Europe, including England, was Catholic; and during the fasts of the church, the pickled herring of Holland was the principal food. The consumption of fish was immense; and the Dutch, having enjoyed the monopoly of the supply, had become immensely rich. The knowledge communicated by Cabot and the voyagers who followed him, that the waters of America contained, not only an abundance, but many varieties of fish, gave rise to an excitement on the subject of fishing hardly less intense than is witnessed at the present time relative to mining. Persons of the highest rank, and not engaged in commercial pursuits, became shareholders in adventures to the new fishing-grounds. And though the Dutch refused to abandon the particular fishery by which they had obtained both wealth and celebrity, vessels wearing the flags of France, England, Spain, and Portugal came annually in search of the cod for nearly a century before a single European colony was founded in America north of the ancient limits of the United States.

We have seen that when, in 1778, France embarked in our revolutionary struggle, her fishermen, absent at Newfoundland, were recalled to enter her ships of war. The same reliance is placed upon them now. War was apprehended in 1841, and M. Thiers followed the example of the statesman referred to; and M. Rodet affirmed that, "without the resources which were found in the sailors engaged in the fisheries, the expedition to Algiers could not have taken place."

These reasons are not only sufficient to justify, but to demand, national encouragement. But it may be urged, in addition, that the open or deep-sea cod-fishery differs from almost every other employment; that in war it is nearly or quite destroyed; that in peace it can not be pursued for more than four or five months in a year; that often skill and industry are insufficient to insure good fares; and that, when success attends severe toil and exposure, the fishermen barely subsist. The effects of a "bad catch" are, indeed, sad and calamitous. The disasters of 1847 afford a recent and a forcible illustration. In that year the French cod-fishery proved a failure. The quantity of fish caught was scarcely a sixth part of that of former seasons; and the fishermen, discouraged, abandoned the business as early as the middle of August. The labor of the summer and the expenses of repairs and of outfit lost, the actual want of food and clothing until another year came round was alone prevented by the bounty allowed by the government.

The manner of fishing is now the only topic that need claim attention. It is to be observed that the principal fishing-grounds are three, and that on each there is a difference in the mode of operations and in the size of the vessels. First, the fishery on the coast of Newfoundland, which has always been considered the most important, as being more certain and employing the greatest number of men. The vessels are of all sizes—from 80 to 200, and even 300 tons. The latter size is, however, rare. When the vessel arrives on the coast, which is generally early in June, she is dismantled. Her boats, with two men and a boy in each, are sent out every morning, when the weather will permit, to fish until night. On the return in the evening, the fish taken are split, salted, and put in "kenches" or piles; remaining in piles a few days, they are "washed out" and dried until they are fit to ship. These processes are repeated from day to day until the fare is completed or the season has passed away. Toward the close of September, fishing is suspended, and the vessels depart for France or the West Indies.

The Grand Bank fishery is pursued in vessels of between 100 and 200 tons' burden, with two strong *chaloupes*, or boats, to each. From 16 to 20 men compose a crew. The vessels proceed first to St. Pierre, land the shore fishermen and "curers," and thence take position on the banks, anchoring in 70 or 80 fathoms of water. Every thing in readiness, the *chaloupes* are launched and sent out at night to place the "ground-lines," to which are attached some four or five thousand hooks. When not too boisterous, these lines are examined every day, and the fish attached to the hooks split, salted, and placed in the hold of the vessel. Meanwhile, the fish caught on board by the men not assigned to the boats are treated in the same way. The first fare is usually secured in June, and carried to St. Pierre to be dried. The second fare is cured at the same place; but the third—if fortunately there be another—is commonly carried to France "green."

This fishing is difficult and dangerous. It requires expert and daring men. It is prosecuted in an open, rough, and often a stormy sea, and frequently involves the loss of boats and their crews.

The third fishery, at St. Pierre and Miquelon, is similar, in some respects, to that between Cape Ray and Cape John, on the coast of Newfoundland. Boats, instead of vessels, are, however, employed in it. The boats of the two islands are between three and four hundred in number, and require two men to each. They go out in the morning and return at night. Thus, as in all shore fisheries, the fishermen always sleep at their own homes. As this is the only business of the islands, nearly all the men, women, and children are engaged in catching or curing. The season opens in April, and closes usually in October.

We have seen the importance attached by France to her immense American domains, and with what pertinacity she maintained her pretensions to the monopoly of the fishing-grounds. It remains to speak more particularly than has yet been done of the two lone, bare, and rocky islands that remain to her as monuments of the vicissitudes of the human condition and of national humiliation.

The situation of St. Pierre and Miquelon commands the entrance of the Gulf of St. Lawrence. The growth of wood is insufficient even for fuel. They produce no food, and the inhabitants are dependent on France and other countries for supplies. The population of St. Pierre in 1847 was 2030, of which about one quarter was "floating," or non-resident. The population of Miquelon at the same time was 625.

There are several Catholic churches and schools, priests, monks, and nuns. In 1848 a hospital, sufficiently commodious to receive upward of 100 sick persons, was erected. The dwellings are of wood. The government-house is of the same material, and plain and old-fashioned. The streets are narrow, short, and dirty. The official personages are a governor, a commissary or minister of marine, a harbor master, and some inferior functionaries. The military, limited by treaty to 50 men, consists of about 30 *gens d'armes*. Upon the station is a single armed ship, though other armed vessels are occasional visitors. The present light-house was erected in 1845, at a cost of 80,000 francs, and, well built of brick, is a substantial edifice.

Such are the two islands—two leagues in extent—which remain to the power that once possessed the whole country bordering on the Mississippi, the limitless regions penetrated by the St. Lawrence; Acadia, from Canseau, in Nova Scotia, to the Kennebec river, in Maine; the island of Cape Breton; and the hundred other isles of the bays of the northern and eastern possessions.

The extent of the French cod-fishery may be estimated from the following statistics:

FRENCH COD-FISHERY.

Years.	No. of vessels.	Tonnage.	Number of men.	Quintals of fish.	Value.
1504
1627	13
1677	150
1578	150
1615	100
1721	400
1744	584	27,500	1,441,500
1745	100
1768	359	24,430	9,722	200,000	\$801,723
1773	264	24,996	10,128
1774	15,187
1786	7,000	426,400
1787	6,000	128,800
1816	30,054	8,108
1823	124	16,358	8,655
1824	348	36,999	6,672
1825	386	85,175	6,811
1826	341	38,938	7,088
1827	387	44,869	8,228
1828	381	45,094	7,957
1829	414	50,574	9,428
1830	377	48,036	8,174
1831	302	35,180	6,248	800,000
1833	10,000
1834	10,000
1835	800,000
1839	64,695	14,499
1841	400	11,900
1843	400
1847	12,000	450,000

Cod-fishery of Spain.—Participating in the excitement which prevailed in Europe on the discovery in the American seas of varieties of fish not previously known or used in the fasts of the Roman church, Spain was an early competitor with France and England. Vessels of her flag were certainly at Newfoundland as soon as the year 1517. 60 years later, the number of her vessels employed in the fishery there is estimated at 100. The number rapidly diminished. Sylvester

Wyat, of Bristol, England, who made a voyage to the St. Lawrence and Newfoundland in 1698, found only eight Spanish ships in a fleet of upward of 80 sail of French and English vessels. From the remarks of Smith—who became the Father of Virginia—it would seem that in the early part of the 17th century, the Spanish fishery was pursued with greater vigor than at the time last mentioned. But the greater wealth to be acquired in the gold regions of South America soon lured the Spaniards from an avocation of so great toil, and of so uncertain rewards. No controversy between Spain and England as to their respective rights to the fishing-grounds ever arose.

Spain retired from our waters in peace, and at her own pleasure. Little is heard of her in connexion with our subject for quite a century, and until the peace of 1763. Her claim—resting on discovery—ever vague and uncertain at the north, had become almost as obsolete as that of the King of England to the title of King of France. Still, in the definitive treaty concluded at Paris, she formally renounced "all pretensions which she has heretofore formed, or might form, to Nova Scotia or Acadia, in all its parts, and guarantees the whole of it, and with all its dependencies," and ceded and guaranteed to England, "in full right, Canada, with all its dependencies, as well as the island of Cape Breton, and all other islands and coasts in the Gulf and River of St. Lawrence; and, in general, every thing that depends on the said countries, lands, islands, and coasts, with the sovereignty, property, possession, and all rights acquired by treaty or otherwise." With this treaty the history of the Spanish fishery in America terminates. Spain relinquished her rights at the peace of 1763, with reluctance, though she had long ceased to exercise them. A letter of Sir Joseph Yorke is quoted in the correspondence of Horace Walpole, in which it is said: "By what I hear from Paris, my old acquaintance, Grimaldi, is the cause of the delay in signing the preliminaries, insisting upon points neither France nor England would ever consent to grant, such as the liberty of fishing at Newfoundland—a point we should not dare to yield, as Mr. Pitt told them, though they were masters of the Tower of London."

Cod-fishery of Portugal.—An account of this fishery may be embraced in a single paragraph. If materials exist by which to ascertain its progress and final extent, I have not been able to find them.

Portuguese vessels were at Newfoundland as early as those of Spain; and in 1577, the number employed there is estimated at 50. These two facts comprise the substance of my information upon the subject, except that Portugal, like Spain, soon abandoned all attention to the claims derived from the voyages of her navigators to the northern parts of our continent, and devoted her energies and resources to colonization in South America, and the acquisition of wealth in the mines of Brazil. The rivers and coasts of Portugal abound in fish; but the fisheries are neglected by the government. The whole number of sailors and fishermen who belonged to the kingdom in 1826, was only 18,700. I find in an official document a statement which shows that during the 24 years ending in 1825, the quantity of dry codfish imported into Portugal was 7,520,000 quintals, of the value of more than \$39,000,000! As late as the year 1839, certainly, the government pursued the policy of levying a tax or duty on the produce of the domestic or coast fishery—a fact which enables us to account for the miserable condition of the kingdom, as regards its maritime strength and resources.

English Cod-fishery—Newfoundland.—Newfoundland is the oldest colony of England in America. It is said that in the public library of Venice there is a map, constructed by Andrea Bianco, in 1486, which authorizes the conjecture that it was known to fishermen before the voyage of Cabot, in 1497. The story,

to state its substance in a word, is, that the island *Scorvake*, or *Storvake*, on the map, and the island of Newfoundland, are identical, because the codfish is called *stockfish* in the northern languages. The English resorted to Iceland for the cod, previous to the year 1415, but there is no account of their fishing at Newfoundland prior to 1517. Some writers suggest that the French commenced at the same time. But the fact, generally admitted, that the ships from England, France, Spain, and Portugal, to the number of fifty, were employed in 1517; is alone sufficient to show that the fishing-grounds had been visited for several years. Indeed to consider that the French went to Newfoundland for the first time in 1504, and that in thirteen years, and in the infancy of distant and perilous voyages, their adventures had attracted the attention of three other nations to the extent just stated, is to allow an increase of flags and of vessels so rapid as to still require explanation, without a knowledge of the fishing enthusiasm of the period. Besides, some forty or fifty houses for the accommodation of fishermen were built at Newfoundland as early as 1522.

A few miles back from the coast, Newfoundland is almost an unbroken wilderness. The inhabitants, as a body, are as ignorant of the interior of the island as are others. To them, and to all the world, the colony is known for its fisheries, and for these alone. To enumerate St. John's, Ferryland, Fogo, and Burin, and the settlements on the bays of Conception, Trinity, Bonavista, Fortune, Bull's, Placentia, and St. Mary's, is to recall almost every place of note. There was no free port until 1828, and no bank until eight years later. From the discovery of Cabot to the arrival of a bishop of the church, was 843 years. The population in 1806—about two and a quarter centuries after the attempt at colonization by Gilbert—was less than 26,000. It was less than 74,000 in 1836; and but 98,606 in 1845.

It remains to speak of the fishing-grounds; of the manner of catching and curing, and of the habits of the persons who are employed in the fishery. As the vessel or "bank" fishery has been abandoned by the English, an account of it is reserved for the third part of this report. The boats used for the shore fishery require from two to four men each. The number of boats in 1838, was 6159; and in 1845, 9989. The fishery is performed within the harbors, and early in the season, near the land. The men stand while at their toil, and each is able to tend more than one line. At times the fish fasten to the hooks so rapidly, that the fishermen display great activity. A boat is often filled in two or three hours. On the shores are "stages," or buildings erected on posts, and projecting into the sea, to allow boats to come to them as to wharves or piers. The fish are carried to these "stages," where, in the hands of the "cut-throat," the "header," the "splitter," and the "salter," as four classes of the "shoremen" are called, they are prepared for the "dryer." When sufficiently salted, they are washed, and transported on "hand-burrows" to the "flakes," where they are spread and dried. Once cured, they are piled in warehouses to await sale or orders for shipment. The "salter" and the "dryer" should be careful and expert men; the one to distribute the salt with a skillful hand—the other, that damps and ruins do not injure the fish while exposed in the air. Three qualities are usually sorted for exportation, and a fourth, consisting principally of broken and discolored fish, is retained for consumption. Women and children are sometimes employed in the boats, and very frequently assist the curers on shore. During the fishing season there are no idlers of either sex.

The labors of the fishermen and shoremen are almost incessant. The time devoted to sleep, under circumstances that often occur, is insufficient for the demands of nature; while long abstinence from food is not uncommon.

The fishermen formerly lived in the rudest of structures; but they now occupy comfortable dwellings. Their food is coarse, and their manners rough. Intoxicating drinks were once as common among them as tea or water. Of late years there has been a sensible change for the better; and a large class are moral and temperate. Their habits of life are irregular, from the necessities of their position; but in hospitality and acts of kindness they are not excelled by men of the higher walks of society. They are to be judged in mercy, for their opportunities to improve are few, and their temptations to err are many.

The Newfoundland Seal-Fishery, so called.—This business is of recent origin. The first account of it is in 1795, but it was not prosecuted to any extent until the general peace, in 1814. Seals frequent the coasts of Newfoundland in the spring. They go upon the ice in the polar seas to bring forth their young, and are swept along by the currents to milder regions, where, still upon the ice, hundreds of thousands of them are annually killed. During the passage from the remote north, they apparently live without much food, but yet are quite fat when seen by those who adventure in pursuit of them. The vessels engaged in catching seals are from fifty to two hundred tons, and

carry from fifteen to forty men each. They leave Newfoundland in March, and proceed to sea until they meet the ice, and on falling in with it, are forced into it as far as possible, by implements which are arranged for the purpose. Fast imbedded in the vast and seemingly limitless fields of ice the crews disperse in every direction in search of seals, which are inactive, and are generally easily caught. They are killed with fire-arms and with clubs, and often while asleep. Occasionally the large ones resist. The means of the young during the slaughter are pitious.

The flesh of seals is unfit for food, and they are only valuable for their fat and skins. The common method is, to strip off the skins and fat together, and to carry these parts to the vessels, leaving the remainder upon the ice; but when the weather or other circumstances will not permit this, the carcass is transported whole, and the valuable parts are stripped off subsequently. Seal-catching closes toward the end of April. The most fortunate vessels make two voyages in a season. After the arrival of the vessels in port, the fat is separated from the skins, cut into pieces and put into vats, where, by the warmth of the sun, the oil oozes out. The skins are spread and salted in piles, and when properly cured, are packed in bundles of convenient size. In the whole circle of human employments, few or none are more exciting and perilous than the catching of seals. A storm of sleet and snow in the night is terrible, and the stoutest hearts quail. While the vessels are absent, the greatest anxiety prevails in the ports of departure, and the most distressing rumors prevail: at times, a full month elapses before the arrival of a single vessel, and every imaginable cause is assigned by alarmed families and friends for the delay of tidings from the sealing-ground. North-east gales drive the ice toward the shore, and frequently produce fearful disasters to both life and property. In 1843 the loss of vessels was very considerable, and several entire crews perished. Some vessels were wrecked in 1849.

The year 1827 was uncommonly prosperous. Forty-one vessels laden with seals arrived at St. John's in a single week. They caught 69,814 of the objects of their search. One of these vessels took upward of 3000 in six days, and another, still more successful, about 3500 in the same time. The intense excitement which attended the slaughter of so large numbers, in so short a space, can be readily imagined.

try since the year 1830. It will be seen that the return of vessels fitted out, is from the port of St. John's alone. The harbor from Conception, Trinity, and Bonavista Bays, and from other parts of the island, is known to be considerable, and in 1845 to have exceeded that of the capital, but I have been unable to procure accurate accounts for any other year.

Fisheries of Nova Scotia.—The original grantee of that half fabulous, never defined country, Acadia, was Pierre de Gast Sieurs de Monts, a Protestant, and a gentleman of the bed-chamber of Henry the Fourth of France. In 1603, his royal master, by letters patent, gave him the territory between the 40th and 46th degrees of latitude, and in the following year De Monts came in person to explore and take possession of his domain. Sixteen years before the landing of the pilgrims at Plymouth, he wintered upon an island in the River St. Croix, which, since the adjustment of the boundary-line between the United States and New Brunswick, has been considered within the limits of Maine. This island is claimed by the heirs of the late General John Brewer, of Robinsonton. Relics of De Monts' sojourn upon it continue to be found. Annapolis—the Port Royal of the French—was founded before his return, and is the oldest settlement in Nova Scotia. The "Lieutenant-general of Acadia, and the circumjacent country," accomplished but little. His patent allowed him to "carefully search after and to distinguish all sorts of mines of gold and silver," and gave him the monopoly of the trade in furs. He seems to have confined his attention to measures to secure the latter; yet fish were caught, cured, and carried to France. A permanent fishery was established at Canseau. Acadia soon passed from De Monts into Catholic hands, while the English grant to Sir William Alexander, in 1621, embraced a large part of it. As the events connected with our subject at this time appear in the account of the French fisheries, there is nothing to demand our attention until after Nova Scotia was permanently annexed to the British crown, by the treaty of Utrecht, in 1713.

Down to the period of our Revolution, Nova Scotia was hardly known except for its fisheries. The resident English population was so small in 1719, that Phillips, the military governor, was compelled to select the council, required by his instructions, from his garrison. Thirty-six years later, the whole number of inhabitants was estimated at only 5000. In 1760, the township of Liverpool was settled by persons from Massachusetts, who designed to prosecute the salmon-fishery, and who, successful in their labors, caught a thousand barrels in a season. They were followed in 1763 by about one hundred and sixty families from Cape Cod, who selected the spot called Barrington, transported thither their stock and fishing vessels, and founded one of the most considerable fishing towns at present in the colony. The whole value of the imports at this period was less than five thousand dollars. In truth, the House of Assembly asserted in 1775, that the amount of money in Nova Scotia was £1200 (or \$4800), of which one fifth was in the hands of farmers. Such was the general condition. The settlement of Halifax, the capital, requires a more particular notice. Thomas Coran, a famous projector of the time, whose name occurs often in the history of Maine, engaged in a scheme to commence a town on the site of this city as early as the year 1718, and his petition for a grant of land received a favorable report from the Lords of Trade and Plantations; but the agents of Massachusetts opposed his plans, because they interfered with the freedom of the fisheries, and he was compelled to abandon his purpose.*

* It is said, in Burke's *Commoners of England*, that Major William Markham (of the family of Markham, of Becca Hall), who was born in 1686, built the first house in Halifax, Nova Scotia.

At the restoration of Cape Breton, in 1745, the founding of a capital for Nova Scotia was undertaken as a government measure. "As a substitute for Louisbourg restored to France," said Mr. Hartley in the House of Commons, "you settled Halifax for a *Place d'Armes*, leaving the limits of the province as a matter of contest with France, which could not fail to prove, as it did, the cause of another war. Had you kept Louisbourg, instead of settling Halifax, the Americans could not say, at least, that there would not have been that pretext for imputing the late war to their account." The new city was named in honor of the Earl of Halifax, the president of the Lords of Trade and Plantations. "The site," says Halliburton, "about midway between Cape Canseau and Cape Sable, was preferred to several others, where the soil was better, for the sake of establishing in its neighborhood an extensive cod-fisher; and fortifying one of the best harbors in America." Thus, Halifax was designed as a fishing capital, and "as a substitute for Louisbourg." Liberal grants of land were made to officers and men who were dismissed from the land and naval service at the close of the war, and Edward Cornwallis was appointed military governor. Horatio Gates then an officer in the British army, and subsequently the victor at Saratoga, was among the first who landed at Halifax, in 1749. The project involved the government in serious difficulties, and the expenditure of enormous sums of money. The amount first appropriated was £40,000. In a few years the cost to the nation was nearly two millions of dollars! The fisheries were neglected, and the colonists, unable to support themselves, petitioned Parliament for additional relief, even after so large an amount of money had been disbursed for their benefit. Omitting details, we may state that five millions of dollars of public money were expended finally in the colonization of Nova Scotia, according to the plan devised by the Board of Trade and Plantations.

Un ed States.—Our continent was discovered in 1497, by Cabot; and from the moment that the chronicle of his voyage made known to the people of England that our waters teemed with fish—that here "were great seals, and those which we commonly call salmon; and also soles about a yard in length, but especially there is a great abundance of that kind which the savages call *baccalos* or codfish"—down to the year 1620, as we have seen in the first and second parts of this report, the intercourse of the French and English with the northerly seas of America was constant; and of all this were not the Puritans as well informed as others? Were they ignorant of what transpired in the New World in the ten years immediately preceding their flight from England, and during the ten years of their residence in Holland? While among the Dutch they were neglected, if not unkindly treated, and became poor and unhappy. Many places to which to emigrate were mentioned, and the advantages and disadvantages of each were amply discussed. As soon as the decision of the little flock was made, some were dissatisfied and withdrew. The question arises, why did they decide to come to America?

I have no space to argue a question which involves so many inquiries, but can not forbear to state that, in a few words, some of the principal incidents which attended their coming to their "wilderness home." Omitting to notice the accounts of Amidas and Barlow, who explored the southern coast of the United States in 1584, under the auspices of Sir Walter Raleigh, and what is said of Sir Richard Grenville's expedition to the same region the year following, as well as the various other enterprises which, in several particulars, are pertinent to the subject, we come at once to the voyage of Gosnold, in the year 1602. He was the first Englishman who sailed directly across the ocean, and the first who attempted to make a settlement within

the limits of New England. The story of his adventures was written by two of his associates, Archer and Breton, and published in London* immediately after his return. Of Breton's little seems to be known; but Gosnold and Archer were subsequently prominent among the early settlers of Virginia, and between the latter and the celebrated Smith there was a long and a desperate quarrel. From Breton's narrative, as well as from the tracts appended thereto, it appears that Raleigh was the patron, perhaps the original mover, of the enterprise. As containing the earliest information of Massachusetts printed in England, these papers are of great value. The attention of merchants, of fishermen, and of those interested in colonization hitherto, and for nearly a century, directed exclusively to Newfoundland, was now to be diverted, in some measure, to New England. The results will appear as we progress.

Arrived on our coast, Gosnold anchored near land which he called "Shoal Hope;" but, catching a "great store of codfish," he changed the name to Cape Cod.† While there, says Archer, "we saw skulls of herring, mackerel, and other small fish, in great abundance." Breton, whose account is more exact and definite, remarks with much earnestness upon most matters connected with our inquiries. "Surely, I am persuaded," he observes, "that, in the months of March, April, and May, there is upon this coast better fishing, and in as great plenty as in Newfoundland; for the skulls of mackerel, herrings, cod, and other fish, that we daily saw as we went and came from the shore, were wonderful; and, besides, the places where we took these cods (and might in a few days have laden our ship) were but seven fathoms water, and within less than a league of the shore, when in Newfoundland they fish in forty or fifty fathoms water, and far off."

To pass the observations which were recorded as they continued their explorations, we find in the tracts appended to Breton the prediction that, "so much as merchants are diligent inquirers after guine, they will soon remove their trade from Newfoundland" to New England, where there is a better climate, greater security against the depredations of pirates, and less expense for outfit, shorter voyages, and safer harbors. The writer, anticipating that a colony would soon be founded, predicted further, that the ships of all the nations that "have been accustomed to repair unto the Newfoundland for the commodity of fish and oils alone, will henceforth forsake" that island, "when once we have planted people in these parts; by whose industry shall be provided, for all commerce," the products of the sea, "and many commodities besides, of good importance and value." Eighteen years elapsed; the Pilgrim anchored off the same "Shoal Hope," and settled this very country.

Pring followed Gosnold, and explored the waters of Maine in 1608. He saw and named the Fox Islands, in Penobscot Bay, and found good mooring and fishing. Like Gosnold, he considered the fish which he took superior to those of Newfoundland. He made a second voyage three years later; and Gorges remarks that his discovery of the eastern part of New England was perfect, and his account of it accurate. Waymouth, under the patronage of several English noblemen, and other persons of rank, came in 1605. "A True Relation" of his adventures was written by James Rosier, "a gentleman employed in the voyage," and printed in London in the same year. He agrees with those who had preceded him in every essential particular. As they departed for England, they caught very large fish; and he says that those

on board of the ship, who were familiar with 'he business, "would warrant (by the help of God), in a short voyage, with a few good fishers, to make a more profitable return from hence than from Newfoundland; the fish being so much greater, better fed, and abundance with train," etc.

The fisheries from the commencement of the Revolutionary Controversy to the Declaration of Independence. — In tracing the origin and progress of the fisheries of New England, we have seen that they furnished our first articles of export, and laid the foundation of our navigation and commerce. It was so in Europe. Of the present maritime powers of the Old World, there is scarcely one that does not owe much of its commercial prosperity to the same branch of industry. Some fugitives from the wrath of the monster Attila fled to the Isles of the Adriatic, where, of necessity, they adopted the avocation of fishermen. By this employment, steadily continued, Venice in a few centuries became renowned for her wealth, commerce, and naval strength. The origin of the republic was celebrated for a long period, and the omission or refusal of a Doge to provide the customary banquet, and to submit to the fishermen's embrace, allowed by his predecessors on this national festival, made the name of Contarini hateful, and well-nigh caused the subversion of all legal restraint, and the overthrow of the reigning family. Genoa, too, grew rich and powerful by the same means, and, not content with her own limited fishing-grounds, undertook the conquest of others. Usurping the fisheries of the regions of the Bosphorus, she captured and for a while awed into submission their rightful owners. Amsterdam, from a village of herring-catchers, cabins, and curing-sheds, rose, by the skill of the inmates of these frail structures, by the fame of their commodities in foreign countries, and by the immense consumption of them at home, to unexampled affluence and grandeur; and the sayings everywhere current two centuries ago, that "Amsterdam is founded on herring-bones," and that "Dutchmen's bodies are built of pickled herrings," were hardly more than quaint expressions of historic truth.

So steadily and successfully were the fisheries pursued by the people of Plymouth, Massachusetts, New Hampshire, and Maine, that only fifty years elapsed from the landing of the Puritans, before an English writer of high authority in matters of trade, expressed his apprehension as to the events likely to result, in the following remarkable words: "New England," said he, "is the most prejudicial plantation to this kingdom." And why? Because, "of all the American plantations, his majesty has none so apt for building of shipping as New England, nor any comparably so qualified for the breeding of seamen, not only by reason of the natural industry of that people, but principally by reason of their cod and mackerel fisheries; and, in my poor opinion, there is nothing more prejudicial, and in prospect more dangerous, to any mother kingdom, than the increase of shipping in her colonies, plantations, or provinces." Sir Josiah Child was alarmed too much, probably, at what really was in his own time, but still saw with a prophet's eye, what was to be. But the policy of England, from the restoration of the Stuarts down to the Revolution, was in strict accordance with the apprehensions expressed by him, and she not only neglected and declined all support to the navigation and commerce of New England, but directly oppressed and restrained them. Omitting notice of the acts of Parliament which do not relate specially to the subject before us, the first law to claim our attention was passed in 1733, after a discussion of two years. This act, by imposing duties on rum, molasses, and sugar, imported into the colonies from any West India islands other than British, was designed to break up an extensive and valuable trade

* Republished in Collections of Massachusetts Historical Society, vol. 8th of 3d series.

† Prince Charles changed the name to "Cape James," in honor of his father; but Gosnold's appellation has been preserved to the present time.

* With larger fleets—of course affording more oil.

with the French, Dutch, and Spanish islands, where these products of the plantations were exchanged for fish. It is said that, previous to the commencement of the trade to these islands, molasses was thrown away by the planters, and that this article, which is now so extensively used in food, was first saved and put into casks to be brought to New England, to be distilled into rum. Certain it is, that on the passage of the act of 1788, the people of the northern colonies insisted that, unless they could continue to sell fish to the planters of the foreign islands, and to import molasses from thence to be manufactured into spirit, for domestic consumption and for trade with the Indians, they could not prosecute the fisheries without ruinous losses. The penalty for violating the act was the forfeiture of vessel and cargo. Yet New England never submitted, though a fleet was sent to enforce obedience; and the interdicted trade with the French, Dutch, and Spanish islands, did not cease until a late period of the controversy which terminated in the Revolution. In fact, therefore, a measure which threatened to ruin the cod-fishery of New England, produced, as I incline to believe, no serious injury to it, for quite thirty years.

But in 1764 the act was renewed, and the collection of the duties it imposed on rum, molasses, and sugar, was attempted by the officers of the crown, in a manner to create the most anxious concern; for, the jurisdiction of the admiralty courts was enlarged, and the people were deprived of the trial by jury in all cases arising between them and the government under this law, and the trade and navigation laws generally.

The most alarming discontents followed the collisions and quarrels which constantly occurred between ship-masters and merchants, on the one hand, and the officers of the customs on the other, in various parts of New England, and especially in Boston, Salem, Gloucester, Falmouth, and elsewhere in Massachusetts; and the impression became general among commercial men, that their business and property were both to be sacrificed to appease the clamors of the planters of the British islands, and to test the ability of the mother country to "raise a revenue in America" under the "sugar and molasses act," as this odious law was called in the politics of the day.

These incidents will serve to show the connection of

the fisheries with the questions which caused a dismemberment of the British empire. It remains to speak of the act of Parliament passed in 1776, which, by depriving the people of New England of the right of fishing, was designed to "starve them into submission." The trade arising from the cod-fishery alone, at that period, furnished the northern colonies with nearly half of their remittances to the mother country, in payment for articles of British manufacture, and was thus the very life-blood of their commerce. The fishing towns had become populous and rich. Marblehead, for example, next to Boston, was the most important place in Massachusetts, and was second to the capital only in population and taxable property. A fearful change awaited all. The dispute was now to be determined by an appeal to arms, and every maritime enterprise was to be interrupted and ruined.

We have already given in this article a short historical account of the fishery of the United States, and of the treaties now or hitherto in force respecting the fisheries; so the remainder of this article will be confined to the statistics of our fisheries since our separation from Great Britain.

The Mackerel Fishery, from the settlement of New England to the year 1852.—It is frequently said that the mackerel fishery is of very recent origin, or that, at least, vessels were not employed in it until about the close of the last or the beginning of the present century. Both suppositions are entirely erroneous. The Indians, regardless of the fishable form and color of the fish, called it *wascuwankeesag*, on account of its fatness. There is mention of it in the earliest records of the country. Winthrop relates that in 1633, the ship *Griffin*, two days before her arrival at Boston, lost a passenger by drowning, as he was casting forth a line to catch mackerel. The first settlers must have commenced the fishery soon after, since, to omit several minor incidents, we have the fact that Allerton, one of the Pilgrims who came over in the *Mayflower*, received mackerel for sale at New Haven, on "half profits," in the year 1633. That the business was prosecuted with success is evident from the additional

fact, that in 1660 the commissioners of the colonies of New England recommended to the general courts of the confederacy to regulate it, "considering" that "the fish is the most staple commodity of this country." The mackerel fishery at Cape Cod was held by the government of the colony of Plymouth as public property, and its profits were appropriated to public uses. The records show that it was rented from time to time to individuals, who paid stipulated sums; and that a part of the fund to support the first free school established by our Pilgrim fathers was derived from it.—SABINE'S Report to Congress, 1855.

The proposition to found and endow a school of this description seems to have been made in 1663, but not to have been adopted until seven years later, when the general court, "upon due and serious consideration, did freely give and grant all such profits as might or should annually accrue to the colony," from this and the bass and herring fisheries, at the same place. In 1689, the "rent of the Cape fishery was added to the appropriation for magistrates' salaries for that year."

* Maine, 9,858; New Hampshire, 481; Massachusetts, 89,416; Rhode Island, 190; Connecticut, 594; Total, 50,589.

Exact statements as to the progress and extent of the mackerel fishery previous to the Revolution, are hardly to be found; but it is still certain that the people of Rhode Island and Connecticut, as well as those of Massachusetts, were "largely concerned in it;" and that fleets of sloops employed in it were often seen upon the coast and in the harbors. It is certain also that about the year 1770 the town of Scituate alone owned upward of 30 vessels that were annually fitted out as "mackerel catchers;" and that the whole number of vessels in Massachusetts was not less than 100.

Soon after the peace of 1783, a writer in a Boston newspaper, in a series of articles on American commerce, said that the mackerel fishery "was of more value to Massachusetts than would be the pearl fisheries of Ceylon."

ANNUAL RETURN OF THE NUMBER OF BARRELS, HALVES, QUARTERS, AND EIGHTHS OF BARRELS OF MACKEREL AND OTHER PICKLED FISH, RETAINED IN BARRELS, INSPECTED IN MASSACHUSETTS, FOR THE YEAR ENDING DECEMBER 31, 1852, AS PER THE RETURNS OF THE DEPUTY INSPECTORS, NOW IN THE OFFICE OF THE INSPECTOR GENERAL.

Where Inspected.	No. of Barrels.
Boston.....	36,591
Gloucester.....	43,019
Beverly.....	866
Rockport.....	5,845
Newburyport.....	11,805
Provincetown.....	17,640
Truro.....	2,540
Wellfleet.....	11,987
Chatham.....	37,642
Harwich.....	9,147
Dennis.....	19,394
Yarmouth.....	3,295
Barnstable.....	3,193
Hingham.....	18,133
Cohasset.....	11,618
Plymouth.....	67
Salmon.....	14

Total..... 106,763
 The above includes all except two returns from Provincetown and one from Scituate, estimated at..... 1,000
 Total 1852..... 197,763
 Retrospected at Boston..... 19,771
 Total..... 317,534
 All other kinds of pickled fish..... 9,254
 Total amount of mackerel inspected in 1852 197,763
 Total amount of mackerel inspected in 1851 329,278
 Decrease of 1852 from 1851..... 131,509

There is little of interest relating to this branch of industry for several years after the period last mentioned. A highly respectable shipmaster, who is still living, entertains the opinion that the fishery in vessels was commenced within 60 years; and that "he was personally engaged in the first regular mackerel voyage ever made in New England." His account, as related to me by himself, would occupy too much room. Its substance is, that he engaged in the coasting business for

some time between Massachusetts and Maine; he commonly saw and caught mackerel during the summer months in the vicinity of the island of Mount Desert; that believing that they might be taken in quantities, he resolved finally to fit out a vessel for the express purpose; that his success was even greater than he had expected, and that others were induced to follow his example. The mistake of this gentleman probably is, that what he considered the origin of the vessel fishery was only a revival of it; since we can easily imagine that repeated losses and discouragements had caused a suspension of it.

The Herring Fishery, from its commencement to the year 1852.—We hear of this fishery among the Pilgrims. In 1641 they rented the herring wear at Plymouth for three years to three men, "who were to deliver the shares of fish, and receive 1s. 6d. per 1000 for their trouble." We hear of it on the coast of Maine also a few years afterward. Jesselyn says that the "herring" were "so numerous, they take of them all summer long. In 1670," he continues, "they were driven into Black Point harbor, by other great fish that prey upon them, so near the shore that they threw themselves (it being high water) upon dry land in such infinite numbers that we might have gone half way the leg among them for near a quarter of a mile." He repeats the account in his "Chronological Observations of America;" where he states, that so "wonderful" was the quantity, that "they were half-leg deep for a mile together." Of the manner of cooking at that period he remarks, that "we used to qualify a pickled herring by boiling of him in milk." These incidents are sufficient to show the early origin.

From the fragmentary notices of the fishery which are to be met with, it seems probable that, for a long time, as the schools of herrings came to our coasts, the inhabitants on the sea and rivers, from Maine to the Carolinas, generally secured sufficient for consumption fresh; that the more careful provided themselves with salt to cure quantities for future use; and that some, becoming regular fishermen, caught and cured the fish for sale to their neighbors of the interior. And that the practice was continued, substantially, without interruption, until the waters resorted to by the herring for the deposit of its spawn were obstructed by dams and mills, is hardly to be doubted. It is certainly true that on some of the rivers, where the fishery is now nearly extinct, the supply at the revolutionary era was considered inexhaustible; and that farmers and fishermen were in the constant habit of filling wagons and boats with scoop-nets and other simple implements.

The Halibut Fishery.—The halibut fishery on George's Bank is a new enterprise. It was commenced within a few years by the adventurous fishermen of Cape Ann. Pursued in mid-winter, it is as hazardous an employment as can well be imagined.

While the fishery was confined to the coast, the consumption of the fish was very limited. In April, 1843, the *Norfolk Herald* announced that "our market, yesterday morning, was enriched with a delicacy from the northern waters, the halibut—a strange fish in these parts, known only to epicures and naturalists."

The New Orleans *Picayune*, in May of the same year, contained a similar paragraph. At present, the fish, packed in boxes with ice, is sent, sound and sweet, by railroads and vessels, to the most distant sections of the country. Vessels employed on the Bank are absent from port from six to fourteen days. The average catch of halibut is perhaps 200 to a vessel, though some obtain double that number. The weight of the fish is from 50 to 200 pounds. [For nearly the whole of this article we are indebted to Mr. Sabine's valuable *Report on Fisheries*, 1853.]

For some time, dealers in Boston purchased, packed, and shipped the fish almost exclusively; but a company was finally formed at Gloucester for the purpose of transacting this part of the business as well as the

other. The fishermen, however, resort again to Boston; for this company, after losing a considerable part of their capital, relinquished their design.

The growth of the fishery has been rapid. The number of vessels employed in it, owned at Gloucester, was 30 in 1844, 63 in 1848; and about 75 in April, 1852. The present fleet contains many new, well-modeled, and fast-sailing vessels. The value of the halibut caught in 1851 was upward of \$60,000.

I can not forbear to add, that had our statements stood by the doctrine which was asserted and maintained at Ghent by the American commissioners, one source of calamity at least would have been spared to our fishermen. The rights guaranteed to us formed a part of, and in their very nature were as perpetual as, our independence as a nation. The first article of the convention of 1818 should never have been agreed to by our government. The third article of the treaty of 1788 ought never to have been stricken from that instrument. It is now too late to correct the mistake.

The earnings of the vessels sent to the Bank are generally ample; but the fishery is not profitable, in consequence of the extraordinary wear and tear of sails and rigging, and the frequent loss of cables and anchors. More than all, hardly a season passes without appalling disasters. Whenever a vessel is lost on George's, all on board perish.

An American citizen may contend, if he will, for the repeal of our bounty laws; he may favor a low duty, or no duty whatever, on foreign fish; but he is bound to honor the courage and perseverance of the halibut catchers of Cape Ann, who, mid the storms and gales of a northern winter, procure for him the luscious napes and fins which garnish his board.

The statistics of the produce of the United States' fisheries for 1855 and 1856 are shown by the following table, taken from the Report on Commerce and Navigation:

Reciprocity Treaty between the United States of America and her Britannic Majesty: concluded 6th June, 1854; ratified by the United States 9th August, 1854; exchanged 9th September, 1854; and proclaimed 11th September, 1854.

ARTICLE 1. It is agreed by the high contracting parties that, in addition to the liberty secured to the United States' fishermen by the above-mentioned convention of October 20, 1818, of taking, curing, and drying fish on certain coasts of the British North American colonies therein defined, the inhabitants of the United States shall have, in common with the subjects of her Britannic majesty, the liberty to take fish of every kind, except shell-fish, on the sea-coasts and shores, and in the bays, harbors, and creeks of Canada, New Brunswick, Nova Scotia, Prince Edward's Island, and of the several islands thereunto adjacent, without being restricted to any distance from the shore, with permission to land upon the coasts and shores of those colonies, and the islands thereof, and also upon the Magdalen Islands, for the purpose of drying their nets and curing their fish: provided that, in so doing, they do not interfere with the rights of private property, or with British fishermen, in the peaceable use of any part of the said coast in their occupancy for the same purpose.

It is understood that the above-mentioned liberty applies solely to the sea fishery; and that the salmon and shad fisheries, and all fisheries in rivers, and the mouths of rivers, are hereby reserved, exclusively, for British fishermen.

And it is further agreed, that in order to prevent or settle any disputes as to the places to which the reservation of exclusive right to British fishermen, contained in this article, and that of fishermen of the United States, contained in the next succeeding article, apply, each of the high contracting parties, on the application of either to the other, shall, within six months thereafter, appoint a commissioner. The said commissioners, before proceeding to any business, shall make and subscribe a solemn declaration that they will impartially and carefully examine and decide, to the best of their judgment, and according to justice and equity, without fear, favor, or affection to their own country, upon all such places as are intended to be reserved and excluded from the common liberty of fishing under this and the next succeeding article, and such declaration shall be entered on the record of their proceedings.

The commissioners shall name some third person to act as an arbitrator or umpire in any case or cases on which they may themselves differ in opinion. If they should not be able to agree upon the name of such third person, they shall each name a person, and it shall be determined by lot which of the two persons so named shall be the arbitrator or umpire in cases of difference or disagreement between the two commissioners. The person so to be chosen to be arbitrator or umpire shall, before proceeding to act as such in any case, make and subscribe a solemn declaration in a form similar to that which shall already have been made and subscribed by the commissioners, which shall be entered on the record of their proceedings. In the event of the death, absence, or incapacity of either of the commissioners, or of the arbitrator or umpire, or of their or his omitting, declining, or ceasing to act as such commissioner, arbitrator, or umpire, another and different person shall be appointed or named as aforesaid to act as such commissioner, arbitrator, or umpire, in the place or stead of the person so originally appointed or named as aforesaid, and shall make or subscribe such declaration as aforesaid.

Such commissioners shall proceed to examine the coasts of the North American provinces and of the United States' embraced within the provisions of the first and second articles of this treaty, and shall designate the places reserved by the said article from the common right of fishing therein.

The decision of the commissioners and of the arbitrator or umpire shall be given in writing in each case, and shall be signed by them respectively.

The high contracting parties hereby solemnly engage to consider the decision of the commissioners co-jointly, or of the arbitrator or umpire, as the case may be, as absolutely final and conclusive in each case decided upon by them or him respectively.

ARTICLE 2. It is agreed by the high contracting parties that British subjects shall have, in common with the citizens of the United States, the liberty to take fish of every kind, except shell-fish, on the eastern sea-coasts and shores of the United States north of the 36th parallel of north latitude, and on the shores of the several islands thereunto adjacent, and in the bays, harbors, and creeks of the said sea-coasts and shores of the United States, and of the said islands, without being restricted to any distance from the shore, with permission to land upon the said coasts of the United States and of the islands aforesaid, for the purpose of drying their nets and curing their fish: provided that, in so doing, they do not interfere with the rights of private property, or with the fishermen of the United States in the peaceable use of any part of the said coasts in their occupancy for the same purpose.

It is understood that the above-mentioned liberty applies solely to the sea fishery; and that salmon and shad fisheries, and all fisheries in rivers and mouths of rivers, are hereby reserved exclusively for fishermen of the United States.

ARTICLE 3. It is agreed that the articles enumerated in the schedule hereunto annexed, being the growth and produce of the aforesaid British colonies or of the

United States, shall be admitted into each country respectively free of duty:

SCHEDULE OF ARTICLES FREE OF DUTY AT RECIPROCAL TREATY WITH THE BRITISH PROVINCES OF N. A. AND THE UNITED STATES.

GRAIN, FLOUR, AND BREAD-STUFFS, of all kinds.	COAL.
A WALLS of all kinds.	BITUMEN, TAR, TURPENTINE, AND ASPHALT.
FURS, SMOCKED, AND SALTED MEATS.	TIMBER AND LUMBER of all kinds, round, hewed, and sawed, unmanufactured in whole or in part.
COTTON-WOOL, SEEDS, and VEGETABLES.	FISH-WOOD.
UNDRIPPED FRUITS, DRIED FRUITS.	PLANTS, SHRUBS, and TREES.
FISH of all kinds.	FELTS, WOOL.
PRODUCTS OF FISH, and of all other creatures living in the water.	FISH-OIL.
POULTRY, EGGS.	RICE, BROOD-CORN, and BARK.
HIDES, FURS, SKINS, or TAILS, undressed.	GYPSEUM, ground or unground.
STONES or MARBLE, in its crude or unwrought state.	HAWK or WROUGHT, or UNWROUGHT BEAR or GRIND-STONES.
SLATE.	DYE-STUFFS.
BUTTER, CHEESE, TALLOW.	FLAX, HEMP, and TOW, unmanufactured.
LARD, HORNS, MANURES.	UNMANUFACTURED TOBACCO.
ORES of METALS, of all kinds.	BAGS.

ARTICLE 4. It is agreed that the citizens and inhabitants of the United States shall have the right to navigate the River St. Lawrence, and the canals in Canada used as the means of communicating between the great lakes and the Atlantic Ocean, with their vessels, boats, and crafts, as fully and freely as the subjects of her Britannic majesty, subject only to the same tolls and other assessments as now are, or may hereafter be, exacted of her majesty's said subjects; it being understood, however, that the British government retains the right of suspending this privilege on giving due notice thereof to the government of the United States.

It is further agreed, that if at any time the British government should exercise the said reserved right, the government of the United States shall have the right of suspending, if it think fit, the operation of Article 3 of the present treaty, in so far as the province of Canada is affected thereby, for so long as the suspension of the free navigation of the River St. Lawrence or the canals may continue.

It is further agreed that British subjects shall have the right freely to navigate Lake Michigan with their vessels, boats, and crafts, so long as the privilege of navigating the River St. Lawrence, secured to American citizens by the above clause of the present article, shall continue; and the government of the United States further engages to urge upon the State governments to secure to the subjects of her Britannic majesty the use of the several State canals, on terms of equality with the inhabitants of the United States.

And it is further agreed, that no export duty, or other duty, shall be levied on lumber or timber of any kind cut on that portion of the American territory in the State of Maine watered by the River St. John and its tributaries, and floated down that river to the sea, when the same is shipped to the United States from the province of New Brunswick.

Fish-hooks (*Hamecons*, Fr.; *Fishangeln*, Ger.) are constructed with simple tools, but require great manual dexterity in the workmen. The iron wire of which they are made should be of the best quality, smooth and sound. A bundle of such wire is cut in lengths, either by shears or by laying it down upon an angular wedge of hard steel fixed horizontally in a block or anvil, and striking off the proper lengths by the blows of a hammer. In fashioning the *barbs* of the hooks, the straight piece of wire is laid down in the groove of an iron block made on purpose, and is dexterously struck by the chisel in a slanting direction, across so much of the wire as may be deemed necessary. A sharp-pointed little wedge is thus formed, whose base graduates into the substance of the metal. The end of the wire where the line is to be attached is now flattened or screw-tapped; the other end is sharp-pointed, and the proper twisted curvature is given.

The soft iron hooks are next case-hardened, to give them the steady stiffness and elasticity, by imbedding them in animal charcoal contained in an earthen or iron box; after which they are brightened by heating and agitating them with bran, and finally tempered by exposure to a regulated temperature upon a hot iron plate. Hooks for salt-water fishing are frequently tinned to prevent them wearing rapidly away in rust.

Fish-ponds are ponds made by art, in which different kinds of fish are bred and fattened. In general this is only attempted with fresh-water fish; but in some places ponds have been formed on the sea shore, and so contrived as to have their waters renewed every tide, and in these sea fish have been kept for use for a considerable time. The fresh-water fish which is the most successfully managed in ponds is the carp.

Fiume, a seaport town of Austria. The commercial movements in the port of Fiume in 1850, including coasting trade, were: imports, 16,604,000 francs; exports, 17,803,000 francs. The coasting trade of Fiume, at all times more important in the general commerce of that port than the foreign trade, amounted in the year 1850 to 6,840,000 francs for imports, and 8,473,000 francs for exports; leaving a total for foreign commerce of 19,094,000 francs. The latter trade was distributed between the Pontifical states, Naples, Ionian Isles, Turkey, England, and France. Total tonnage employed, 342,498 tons; of which more than two thirds under the Austrian flag.

Flag, an ensign or colors; a cloth on which are usually displayed certain devices, and attached to a staff. In the army, it signifies a small banner by which one regiment is distinguished from another; in the marine, a certain banner by which an admiral is distinguished from the other ships of his squadron, or by which the ships of one nation are distinguished from those of another. The flag acquired its present form in the sixth century in Spain; it was previously small and square.—**ARMS**. The flag is said to have been introduced there by the Saracens; before which time the ensigns of war were extended on cross pieces of wood.—**PANOPON**. The term flag is more particularly used at sea to denote to what country a ship belongs, and the quality of its commander. The honor of the flag salute at sea was exacted by England from very early times; but it was formally yielded by the Dutch in A.D. 1673, at which period they had been defeated in many actions. Louis XIV. obliged the Spaniards to lower their flag to the French, 1680.—**HERAULT**. After an engagement of three hours between Tourville and the Spanish Admiral Papachin, the latter yielded by firing a salute of nine guns to the French flag, June 2, 1688.—*Idem*.

To lower or strike the Flag, in the navy, is to pull it down upon the cap, or to take it in, as a token of the respect due from all ships or fleets to those which are undeniably their superiors. To lower or strike the flag in an engagement is a sign of submission or surrender. The method of leading a ship in triumph is to attach the flags to the shrouds, or the gallery in the hind part of the ship, letting them hang down toward the water, and to tow the vessels by the stern. Livy relates that this was the mode in which the Romans used the ships of Carthage.

To hoist out the Flag, is to display or put abroad the flag.

To hang out the White Flag, is to ask quarter; or, when a vessel has arrived on a coast, it shows that it has no hostile intention, but comes to trade, or the like. The red flag is a sign of defiance and battle.

Flag officers are those who command the several squadrons of a fleet.

Flag of the United States.—The act to establish the flag of the United States was enacted by Congress, April 4, 1818, viz.: "That from and after the 4th day of July next the flag of the United States be thirteen horizontal stripes, alternate red and white; that the

Flail, an instrument for threshing corn, consisting of the hand-staff, or piece held in the thresher's hand; the swile, or that part which strikes the corn; the caplins, strong leathern thongs which unite the hand-staff and swile; and the middle-band, a leathern thong or fish-skin that ties the caplins together.

Flambeau, a kind of torch made of thick wicks, covered with wax, and used in the streets at night, at illuminations, and in processions. Flambeaux usually consist of four wicks or branches, about an inch in thickness, and three feet long, made of coarse half-twisted hempen yarn; and these, being suspended by one end, are coated with white or yellow wax, which is poured over them from a ladle until the requisite thickness be obtained.

Flannel, a woolen stuff, composed of a woof and warp, and woven after the manner of baize. Dr. Black assigns as a reason why flannel and other substances of the same kind keep the body warm, that they compose a rare and spongy mass, the fibres of which touch each other so lightly that the heat moves slowly through the interstices, which being filled only with air, and that too in a stagnate state, give little assistance in conducting the heat. From the experiments of Count Rumford, it appears that there is no relation between the power which the substances usually worn as clothing have of absorbing moisture, and that of keeping the body warm. Having provided a quantity of several of these substances (as mentioned below), he exposed them, spread out upon clean china plates for the space of twenty-four hours to the warm and dry air of a room which had been heated by a German stove for several months, and during the preceding six hours he had raised the thermometer to 85° of Fahrenheit; after which he weighed equal quantities of the different substances with a very accurate balance. They were then spread out upon a china plate, and removed into a very large uninhabited room upon the second floor, where they were exposed forty-eight hours upon a table placed in the middle of the room, the air of which was 45° of Fahrenheit. At the end of this time they were weighed, and then removed into a damp cellar, where they were placed on a table in the middle of the vault, the air of which was at the temperature of 45°, and, by the hydrometer, seemed to be fully saturated with moisture. In this situation they were suffered to remain three days and three nights, the vault being all the while hung round with wet linen cloths, to render the air as completely damp as possible. At the end of three days they were weighed, and the weights at the different times were found as in the following table:

	Weight after being dried in the hot room.	Weight after remaining 12 hours in the cold room.	Weight after remaining 12 hours in the vault.

In regard to these experiments Count Rumford observes, that though linen, from the apparent ease with which it receives dampness from the atmosphere, seems to have a much greater attraction for water than any other, yet it would appear, from what is related above, that those bodies which receive water in the un-

elastic form with the greatest ease, or are most easily wet, are not those which in all cases attract the humidity of the atmosphere with the greatest avidity. "Perhaps," says he, "the apparent dampness of linen to the touch arises more from the ease with which that substance parts with the water it contains than from the quantity of water it actually holds; in the same manner as a body appears hot to the touch in consequence of its parting freely with its heat; while another body which is really at the same temperature, but which withholds its heat with great obstinacy, affects the sense of feeling much less strongly. It is well known that woollen cloths, such as flannels, etc., worn next the skin, greatly promote insensible perspiration. May not this arise principally from the strong attraction which subsists between wool and the watery vapor which is continually issuing from the human body? That it does not depend entirely on the warmth of that covering, is clear; for the same degree of warmth produced by wearing more clothing of a different kind does not produce the same effect. The perspiration of the human body being absorbed by a covering of flannel, it is immediately distributed through the whole thickness of that substance, and by that means exposed, by a very large surface, to be carried off by the atmosphere; and the loss of this watery vapor which the flannel sustains on the one side by evaporation, being immediately restored from the other, in consequence of the strong attraction between the flannel and this vapor, the pores of the skin are disencumbered, and they are continually surrounded by a dry and salubrious atmosphere."—*Philosophical Transactions*, No. 483.

Flannels are much more luxurious productions than they were in years gone by. We knew them formerly only as woollen or worsted goods; but modern ingenuity has devised flannel made of mingled wool and silk. Its inventors claim for it a superiority over ordinary flannels, in being less irritating to the skin; it shrinks less in washing; the silk increases the strength and durability of the texture, and renders it less liable to tear. Such flannels have even been embroidered, and used for ladies' opera cloaks. Then we have choice "Thibet" flannels, made from the finest wool; and flax flannels, in which flax, prepared on Claussen's process, is mixed with wool; and fancy-colored flannels—pink, rose-color, cherry, crimson, blue, orange, and other dainty tints. The philosophy of cheapness has also visited the flannel regions, for some of the low-priced flannels contain a portion, more or less, of cotton. There are striped flannels, and cricketers' flannels, and "anti-rheumatic" flannels, and many other special and oddly-named kinds.

Flax (Ger. *Flachs*; Du. *Vlasch*; Fr. *Lin*; It. and Sp. *Lino*; Rus. *Len*, *Lon*; Pol. *Len*; Lat. *Linum*), an important plant (*Linum usitatissimum*) that has been cultivated from the earliest ages in Great Britain and many other countries; its fibres being manufactured into thread, and its seed crushed for oil. Russia supplies by far the largest portion of the flax imported into England, the principal sorts being Petersburg, Narva, Riga, Revel, Pernau, Liebau, Memel, and Oberland. Petersburg and Narva flax are nearly of the same quality, the latter being but little inferior to the former. Both sorts come in bundles, of 12, 9, and 6 heads. The Riga flax seems to deserve the preference of any imported from the Baltic. It is the growth of the provinces of Murlenburg, Druania, Thisenhausen, and Lithuania. The best Murlenburg is called simply Murlenburg (M), or Murlenburg clean; the second quality, cut (GM); and the third, *rieten drayband* (RD); of the three other provinces, the first quality bears the name of *rakitzer*; as, *Druania rakitzer* (DR), *Thisenhausen rakitzer* (TR), and *Lithuania rakitzer* (LR). The cut flax of these three provinces is the second quality; and to the third quality belongs the *badstub* and *balstub* cut (B and BG); the *paternoster*

(PN); and *hafs three band* (HD). *Badstüb* and *partmester* are the refuse of the *rakiter* flax, and the *three band* again the refuse of the former sort, and consequently very ordinary. The *Revel* and *Pennau* consists of *Marlenburg, cut, risen, hafs three band, and three band*. The *Liebau* and *Memel* growths are distinguished by the denomination of *four* and *three band*. These two sorts, as well as the *Oberland flax*, come from *Königsberg, Elbing, etc.*, and are little esteemed in the British market. *Flanders* or *Dutch flax* is well dressed, and of the finest quality. Flax is extensively cultivated in *Egypt*. Of late years, some of the Italian ports, which used to be supplied from *Russia*, have been fully supplied, on lower terms, from *Alexandria*.

The *Pharmanum tenax*, or *New Zealand flax*, has been said to exceed every other species in strength of fibre and whiteness; qualities which, if it really possesses them in the degree stated, must make it peculiarly well fitted for being made into canvas and cordage. In point of fact, however, there is a great diversity of opinion as to its real merits, and it fetches at present but a low price. In 1831 and 1832 the imports of *New Zealand flax* amounted respectively to 15,725 and 15,867 cwts.; but they fell off in 1835 to 7812 cwts., and since then only trifling quantities have been imported. It is alleged that this is in consequence of the imperfect preparation of the flax, which has hitherto been entirely intrusted to the native women. But without presuming to say whether the defects with which it is charged be inherent in the flax itself, or depend on its preparation, it is abundantly certain that unless it be furnished of a superior quality, it will not suit our markets. When flax is brought to the principal Russian ports whence it is shipped, it is classified according to its qualities, and made up in bundles by sworn inspectors (*bruckers*), appointed by government for the assortment of that and all other merchandise. These functionaries are said to perform their task with laudable impartiality and exactness. A ticket is attached to every bundle of assorted flax, containing the name of the inspector and owner, the sort of flax, and the period when it was selected or inspected. See **HEMP**. Good flax should be of a fine bright color, well separated from the tow, codilla, or coarser portion of the plant; and of a long, fine, and strong fibre. In purchasing flax, it is usual to employ agents wholly devoted to this peculiar business.

Flax has been but little cultivated in the United States, and only for home consumption. Efforts are now being made to increase the production. Linnæum mills have been erected in Fall River and other places; and the demand will after this equal the supply.

During the last half century various attempts have been made to effect the separation of the flurous from the woolly portion of the flax stem by chemical and mechanical means. In several cases the results at first appeared to be very promising, but in every instance it was soon found that there were insuperable practical objections. Among chemical agents, solutions of sul-

phuric acid, caustic potash, caustic soda, quicklime, and soft soap, were all in turn tried and discarded, and among mechanical processes, the ingenious contrivances of Mr. James Lee, and Messrs. Hill & Bundy, shared the same fate. Whatever may have been the comparative merits of the two processes of these rival inventors, in the course of a few years both were relinquished and forgotten. Various other ingenious mechanical arrangements have been devised, but hitherto they have had very little success.

Schenck's process, for which he obtained a patent in 1846, is undoubtedly a very important improvement. It consists merely in steeping the flax stems in warm water, heated artificially to the temperature best suited to fermentation. In this simple way the operation is rendered rapid and certain, all uncertainty from fluctuation in temperature and weather is avoided, and the whole process is entirely under the command of the manufacturer. The temperature best suited for this purpose is about 80°, or from 80° to nearly 90°. Above this point the process proceeds too rapidly, and the fibre is almost sure to be more or less injured. The time required is from about 70 to 90 hours. It appears to be generally admitted that the warm-water steeping increases the percentage of fibre obtained from the flax stem over that obtained by the old modes of retting by nearly one fifth; and that, while the fineness and spinning qualities of the fibre are increased, the strength is in no way weakened or diminished, unless the process be permitted to proceed too far—an accident that need never happen, from the complete control over it which the manufacturer has throughout. Although there is no doubt as to the practical value of the use of warm water in flax retting, yet the introduction of Schenck's process is far from removing all the difficulties of the flax manufacturer; much still remains to be effected; and it is by no means improbable that are long a yet more perfect process may be devised.

It is interesting to observe, that the use of warm water in the preparation of vegetable fibre is not altogether new, it having been employed by the Malays, and by the natives of Rungpoor, in Bengal. The process adopted at Bencoolen is stated by Dr. Campbell to consist of steeping the stems of the hemp in warm water, in which it is allowed to remain for two days and nights. The old German process, called "Molkenretten," sometimes used in preparing the finer sorts of flax, is also, to some extent, an application of the same principle. In this mode of retting, the flax was steeped for four or five days in a warm mixture of milk and water, and thus the desired degree of fermentation in the flax stems was produced. This operation must be distinguished from the more modern one, in which sour milk was used in order to give a good color to linen—a process introduced by the Dutch toward the middle of the last century. The linen was boiled in a weak alkaline lye, and subsequently treated with sour butter-milk, for the purpose of aiding in removing the alkali, and dissolving the earthy impurities present in the fibre. Occasionally, also, salt of sorrel was used for the same purpose; and in 1775 Reuss states that sulphuric and muriatic acids might be used for the same end; but that being too costly, they had not as yet come into general use. Of course all processes in which boiling, or even hot, water is used, are quite different in their mode of action from those in which only warm water is employed. When boiling water is used, it is with a view of dissolving and removing the useless matters which incrust the fibrous parts of the plant; while, on the other hand, warm water is used to soften them, and to aid in their putrefaction or decomposition, through the agency of fermentation. In 1787, much interest was excited in Ireland by the publication of a plan for improving the retting of flax by the action of hot water. In this scheme it was proposed to scald the flax-stems in boiling water to

soften them, and to remove a portion of the extraneous vegetable matters which they contain; and it was conceived that after this treatment the subsequent retting of the flax would be more rapid, certain, and manageable; so that time would be saved, the noisome process of pond-retting be obviated, and the result be to yield a stronger and whiter fibre. The minute and careful experiments of Hermbstaedt on the chemical principles involved in the retting of flax (made about the beginning of the present century) threw much light on the whole subject, and, to some extent, indicated the influence of temperature on the success of the operation.

Flax-cotton is a material prepared from flax, hemp, and other vegetable fibres, and which very nearly resembles the fibre of the *Gossypium* or cotton-plant. M. Clausen's ingenious process for making flax-cotton (patented August, 1850) consists essentially in boiling the cut and crushed stems of the flax, hemp, or other plant, in a dilute solution of caustic soda, containing about 1-2000th part of alkali. The fibrous matter is then removed, and plunged into a bath of dilute sulphuric acid, containing 1-500th part of acid, in which it is boiled for about an hour. It is next transferred into a solution containing about 10 per cent. of carbonate of soda; and, lastly, when it has remained in the latter for an hour, it is plunged into a weak solution of sulphuric acid, consisting of one part of acid to 200 or 500 parts of water; in this it is left for about half an hour, and the process is completed. The effect of these several processes is "to divide and split up" the fibre in a most remarkable manner, so as completely to alter its character. Flax thus treated is converted into a substance very nearly resembling cotton. It is probable that flax-cotton can be advantageously used in the manufacture of mixed fabrics, as it appears capable of being spun with wool, silk, and other fibres; it may, therefore, perhaps hereafter lead to several new and important practical applications.

The idea of modifying the fibre of the flax and hemp, so as to convert it into a kind of cotton, is by no means new. In 1747, Lilijkreuzes and Palmquist described a mode of converting flax into "cotton," by boiling it for some time in a solution of caustic potash, and subsequently washing it with soap. In 1775, considerable quantities of refuse flax and hemp were converted into "flax-cotton" by Lady Moira, with the aid of T. B. Bailey, of Hope, near Manchester. The full details of the process employed do not appear to have been published; but from Lady Moira's letters in the *Transactions of the Society of Arts* for 1775, it appears that the fibre was boiled in an alkaline lye, or a solution of kelp, containing carbonate of soda, and subsequently scoured. The result of this was that "the fibres seem to be set at liberty from each other," after which it may be "carded on cotton cards." It appears that at this time flax-cotton "was made and sold at 3d. per pound;" and Lady Moira states, that she believes that it takes colors better than flax. It is curious to observe the fate of Lady Moira's scheme: she says: "I have no reason to be vain of the samples I have sent you: they merely show that the material of flax-cotton, in able hands, will bear manufacturing, though it is in my ill fortune to have it discredited by the artizans who work for me. I had, in Dublin, with great difficulty, a gown woven, and three waistcoats; but had not the person who employed a weaver for me particularly wished to oblige me, I could not have got it accomplished."

Subsequently to this, several attempts were made in Germany to convert flax into a fibre resembling cotton. In 1777, Baron Meidlinger proposed to convert flax into a sort of cotton, by the action of alkaline solutions, etc. In 1780, a factory was established at Bercholdsdorf, near Vienna, for the practical working of this process; and similar plans were subsequently brought forward by Kreutzer in 1801, Stadler and

Hauptner in 1811, by Sokou in 1816, and by several others. At the factory at Bercholdsdorf, not only was flax converted into cotton, but also a useful cotton-like fibre was prepared from tow and refuse flax; and the same is said to have been done by Hagg, near Presburg, in 1788, by Göbell in 1803, and Segalla in 1811. Whether these various plans failed from the effects of jealousy and opposition, like that which prevented Lady Moira from introducing her "flax-cotton," is unknown; but it does not appear that any of them were long persevered in. It is probable that in most cases the neighboring manufacturers set themselves against the introduction of flax-cotton; for Beckman, who speaks of its manufacture near Brunewick, states that the work-people determined not to use the new material, though at the same time he observes, that excellent fustians were made, which could not be distinguished from those manufactured with ordinary cotton. The extreme similarity of flax-cotton to ordinary cotton is also remarked by Des Charmes (1799), who states, that if the staple be cut before it is carded, it is not possible to distinguish it from cotton, either in its raw state or when manufactured. The matter was subsequently investigated by Berthollet, by Gay Lussac, and by Giobert, who employed alternately steepings in hot solutions of soap, alkali, and sulphuric or muriatic acid. Berthollet observes, that equally fine cotton is obtained from the commonest refuse tow as from the best flax.

For some valuable information on fibrous materials, the produce of India, which may be cheaply and usefully substituted for Russian hemp and flax, see "The Fibrous Plants of India fitted for Cordage, Clothing, and Paper," by J. Forbes Royle, M. D., F.R.S.; London, 1855; and also an article entitled "Indian Substitutes for Russian Produce," in the *Edinburg Review* for July, 1855.

In 1816, M. Girard found means to apply machinery and to substitute the spindle in the spinning of flax. To France, then, belongs the honor of the discovery, but England was the first to profit by it and put it in practice, and her example was followed, at the interval of some years, by France, Belgium, and Germany, in the order indicated. The progress of this industry was rapid, and the following table presents its present position (July, 1856):

	Spindles.
Great Britain and Ireland.....	1,450,000
France.....	540,000
Germany (including Austria),.....	171,000
Belgium.....	182,000
Russia.....	60,000
Other European States.....	46,000
United States of America.....	31,000
Total.....	2,460,000

While the progress of machine-spinning in Great Britain, Germany, and Switzerland, independent of all kinds of protection, except in the case of Prussia, certain premiums paid by the government to those who have established factories, its extension in France and Belgium, and more especially in the former, is due to legislative interference. Let us, then, direct our attention to France, where an extreme import duty exists. Although the duty was made high in 1826, the import of English yarn was progressive, but slow, until 1836, when the rate was considerably reduced. Immediately afterward the quantity increased rapidly. In 1830 France received but 7,500 lbs. of linen yarn from England. In 1835, in spite of a high tariff, the import had increased to 11,700,000 lbs. Under the reduced duties it went on augmenting until, in 1842, it reached 24,750,000 lbs. Then came the establishment of the present excessively protective scale of duty; its consequences are manifest in the rapid extension of flax-spinning in France. In 1840 there were 90,000 spindles; in 1845, the number was 127,000; in 1850, 275,000; in 1855, 490,000. In the mean time the import of yarns from all countries fell from 24,750,000

lbs. to 1,698,000 lbs. If we had only to do with the establishment of a great spinning-trade in France, and the monopoly of the supply of yarn at home, these figures would be triumphant. But unfortunately for the consumer, as well as for the wealth and resources of the nation, the operation of the tariff has been a costly affair. While the capitalists who had placed their money in the spinning-factories rejoiced at the results detailed, and in the large profits which their government had given them a legalized right to derive from the mass of consumers, we may inquire whether every one was equally satisfied with such a system of political economy.—*Report to the Reform Congress of Brussels, by Mr. J. MACADAM, of Belfast, 1856.*

Mr. Macadam's conclusions were as follows: I. In all cases I would advocate the free entry of the raw materials, flax and tow. Where natural and social facilities exist for the cultivation of flax, no protection is required, as it only renders the growers careless of improvement. Where these elements of success are wanting, it is evident that the culture should be abandoned. A nation should never be subjected to a tax simply to supply itself with a material which it can have better and cheaper from elsewhere.

II. I would urge a moderate fixed *ad valorem* duty for the exorbitant ones now levied in many States, and fix it for 10 per cent. on the present value of English yarns. If to this rate of duty be added the cost of packing, transport, commission and other charges, the rate of protection would really amount to 15 per cent. French and Belgian spinners may, perhaps, say that this duty would be inadequate to protect them, but I can not admit this. It is true that the cost of fuel is higher in France and Belgium than in the United Kingdom. But, on the other hand, I can prove that in Ireland we pay more in proportion, as compared with Great Britain, than France or Belgium does, as compared with us. For example, while at Leeds coals cost 4s. 8d. per ton, and at Dundee 8s., they cost in Belfast 10s. to 11s. 6d. per ton, making a difference in favor of the English spinners of 140 per cent., and of the Scotch of 30 per cent. At Ghent, coals cost at present 14s., and have been much cheaper. At Lille they cost 15s. 6d.; the difference, therefore, in favor of the Irish spinners, as compared with the French or Belgian, is 50 per cent. We might, consequently, at Belfast, just as well demand protection from the English and Scotch spinners, as the French and Belgians ask it against us. As to the cost of labor, the factories of Ghent and Lille are in a better position than ours. On what, then, do the spinners of France and Belgium base their claim to protection? On the superiority of English machinery? But these machines may enter Belgium free of duty; and lately, in France, great advantages have been accorded in their import. Or is it on the great capital of England, and the smaller rate of interest of money? As well might we, in poor Ireland, ask protection against these, and yet in the face of them, we have progressed more rapidly than either England or Scotland. Further, how does it happen that Prussia and Austria have progressed to such an extent in their spinning without this immediate protection? The first named had, in 1846, but 47,000 spindles, and has now 96,000. The second, which, in 1845, had but 21,000, now numbers 82,000. And 10 per cent. duty, I repeat, is abundantly sufficient to protect the Belgian and French spinners, while it would prove of great benefit to the manufacturers of linen in those countries.

III. A duty of 20 per cent. on unbleached linens might be proposed. When it is remembered that, in almost all parts of the Continent, weaving at present costs less than in the United Kingdom, it will be recognized that the linen manufacturers of the Continent have an advantage over ours. There was a time when weaving cost as little in Ireland as in any other country, and less than in many. But the thinning of

the population by the disastrous years of famine which followed the potato disease; the large emigration which subsequently took place; the recruitment of able-bodied men for the army; and other causes, have led to different results.

In the United States of America, where the manufacture of linen is on an extremely small scale, and the whole Union only contains 80,000 spindles, a duty of 20 per cent. existed on yarns and linens up to July, 1857. The annual import reaches £1,600,000, so that the nation pays a tax of £320,000 on its yearly consumption. Originally at 5 per cent., the duty was raised to 37½ per cent. in 1812. In 1832 it was abolished, but in 1842 was re-established at 25 per cent., and reduced, in 1846, to 20 per cent. In 1853, the revenue of the United States had so much increased, and the cash in the Treasury was of so great an amount, that Mr. Guthrie, the Secretary of the Treasury, issued a circular to merchants, in which he proposed to reduce or abolish the duties on many articles, and he requested their opinion as to those on which such a change might most beneficially take place, specifying that it should be on such articles as were generally consumed by all classes of the population, and yet not leading items of native manufacture, and the remission of the duty on which would tend to lighten the labors of the custom-house. Now, there could scarcely be an article more fully answering to these requirements than linen; largely consumed by all classes, the native manufacture was quite insignificant, while the disputes as to value, in levying the duties, between the custom-house and the importers, gave endless trouble.

The following table shows the number of bushels of flax-seeds, and the number of pounds of flax produced, in the United States in the year 1850:

States and Territories.	Flaxseed.		Flax.
	Bushels.	Pounds.	
Alabama.....	69	3,900	
Arkansas.....	821	12,200

els, something in the manner of plastering; when this is dry a second coat follows it; and in this way seven coats of paint are usually applied in succession, three on the back and four on the front. When the cloth in this state, and of one color, is sufficiently dry, it is removed from its frame upon a large roller, and carried to the upper part of the building to be printed, that is, to receive its pattern. This was originally effected by a process of penciling; but in the year 1780, Mr. Smith introduced the great improvement of block-printing, by which the colors are more correctly laid on, and in greater body and variety. The printing-table, which is about 80 feet long, 4 wide, and 2 feet 6 inches high, is very firmly constructed of deal timbers laid edgewise, and clamped together, the surface being truly planed; and the roll of painted cloth is placed underneath it, and as it is unrolled it gradually passes over the table, where it is printed, and is then drawn forward so as to hang perfectly free while drying, the height of the building being such as conveniently to admit of this, without rolling, doubling, or folding the material, which in these stages would of course injure it. The colors, which are the usual oil colors very carefully prepared, are put on in succession with wooden blocks, which are made of pear-tree, box, or holly-wood, and on which the patterns are cut in relief; they are about 18 inches square, and are applied in succession over the whole of the surface of the cloth lying upon the printing-table. Every color is put on by a separate block, and much dexterity is required in so placing them that the patterns may correctly interlace and join each other, without in any case overlapping or interfering. To effect this, the workman is aided by guide-pins, or *pitches*, as they are termed, which direct him in placing the block. The colors are first brushed or tiered upon hard cushions, from which they are transferred to the block and thence to the cloth; and, though many are often required, it is astonishing how much effect is sometimes obtained by the judicious arrangement or mixture of two only, upon a third, which forms the ground. It will be obvious, from what has been stated, that the weight of the finished oil-cloth, as compared with the naked canvas, is no unimportant criterion of its goodness—each square yard, when finished, weighing from 3½ pounds to 4 or 4½; this distinguishes a good oil-cloth from those which are vamped up and stiffened with size and other perishable materials.

Independent of the common application of oil-cloth, it is not unfrequently advantageously employed as a roofing material, especially for covering verandas and other light structures. When used for this purpose, the canvas should be made of picked long flax, and thoroughly saturated with good oil paint; it will then stand our climate and last for 14 or 15 years.

Florida, one of the southernmost States of the United States of America, lies between 21° 32' and 31° N. lat., and between 81° 30' and 87° 35' W. long. It is 385 miles long, and from 50 to 250 wide, containing 59,268 square miles. Population in 1830, was 34,729; in 1840, 54,447; and in 1850, 87,401. The State was, in 1850, divided into 28 counties.

Early History of Florida.—The name which the country to the north of Cuba had among the Indians of the Lucayan Islands was "*Cauto*," the signification of which is, as Herrera gives it, rather obscure. The Spaniards heard this country "*Cauto*" already spoken of before they saw it. They heard also of the famous and fabulous fountain of youth of which the Indians had a tradition, and which was called the fountain of Bimini. From this fountain the country to the north itself was sometimes called "*Bimini*." On some of the first maps of the 16th century it is also called "*Terra de Cuba*" (the country of Cuba), as if there were, 1st, an island of Cuba, and, 2d, a continent of Cuba. When Ponce de Leon, in the spring of 1512, discovered this coast, he gave to it the name of "*Flor-*

ida" (the florid), from two reasons, as Herrera says: at first because the country presented a very flourishing and pleasant aspect, and then because he saw the coast at that festival-day which the Spaniards call "*Pascua Florida*," which corresponds to our Palm Sunday. This name has since that time always remained to the large peninsula which we to this day call Florida, though the name was sometimes taken in different senses, and though sometimes there have been attempts made quite to do away with it. At first, so long as Florida was supposed to be an island, the name had only a very limited application. When the Spaniards, after the year 1520, discovered, however, the continuation of the coasts on both sides of Florida, they applied this name to the whole western half of North America, from the boundaries of Mexico and from Cape of Florida, toward the north, in *indefinitum*. The so-called "*Goverment of Florida*" was often given to different Spanish governors within the said limits. The "*Rio de las Palmas*" (Palm River) in Mexico was the south-western boundary of this government.

We see the name of Florida on many maps, with large letters, written through the whole Mississippi valley, throughout the whole area of the United States; and even as late as the year 1723, the Spanish historian Barcia treated, in the work which he calls "*The History of Florida*," also of Canada, and even of the English expeditions for a discovery of the north-west passage. This latter passage the Spanish authors very often style "*a strait through Florida*," Herrera, however, already remarks that the name of Florida was taken in two senses: it had a more extensive and a narrower meaning. In the latter sense the peninsula was called "*Florida par excellence*." Some authors looked upon this peninsula only as upon a large tongue or promontory attached to the great Floridian continent, and named it the "*Promontory of Florida*" (*Promontorium Florida*). On many old maps we see this name cover the whole peninsula. Still other names for the whole peninsula grew out, as it were, from its root or from its southern point. At the time of the Spanish governor, Don Pedro Menendez, in the year 1565, the Spaniards discovered near the Cape of Florida an Indian village called Tequesta, or Tegesta, also written Tegesta. This often-spoken-of village the map-makers put down on their maps, and changed it to a "*Provincia de Tegesta*" (a province of Tegeste). Some authors applied this name to the whole peninsula of Florida: thus, for instance, did Laët, in his work as well as on his maps (A. D. 1633).

When the French discovered and settled the Mississippi valley, and named it Louisiana, they extended this name and their pretensions as far as possible; and on one French map by Nic. de Fer, of the year 1713, we see the name "*Peninsule de Louisiane*" even given to our peninsula of Florida. This was, however, only a single and unfortunate attempt, which had no further consequences, either in geography or politics. The Spaniards, on their side, gave not up their pretensions to claim, under the name of Florida, much more than their neighbors, the British, to the north, and the French, to the west, would allow them. But the Spaniards extended, before 1763, their actual possession and government in Florida, toward the east, not further than Mobile Bay and River, and to the north not further than the St. Mary's River. When, in the year 1763, the Floridas were ceded to Great Britain, and also all the French dominions east of the Mississippi, then the boundaries of the name Florida were extended again. Great Britain established two provinces of Florida, "*East and West Florida*." The first extended as far north as the St. Mary's River, or about the 31st degree of north latitude, and the latter as far west as the Mississippi Delta, to the Lakes Pontchartrain and Maurepas. In the year 1783 Great Britain retroceded the Floridas to Spain, and Spain at

the same time received the possession of the whole of French Louisiana to the west of the Mississippi. Now, for the first time, Spain held in actual possession all the shores of the Mexican Gulf, and all the countries lying around it. Spain adopted the English division in Eastern and Western Florida—*Florida Oriental and Occidental*—and retained also the extension of this name as far as the Mississippi Delta. The 31st degree of north latitude, which runs not much farther than 40 miles from the northern shores of the Mexican Gulf, and is parallel to it, was agreed upon as the northern boundary of "the Floridas" toward the United States. So, since the year 1763, the name of Florida extended again over half the circuit of the shores of the Mexican Gulf. But soon after the cession of Louisiana to the United States Florida was curtailed again. The United States claimed the western part of it as far east as Perdido River, received the possession of it in the year 1811, and joined it to their "Territory of Mississippi," and afterward of "Alabama." Since this time (1811) the dominion of the name of Florida has not changed, though the so-called country changed, till 1821, its masters, when Spain ceded it to the United States. It was then at first called "the Territory of Florida," and since 1845, "the State of Florida." But the limits remained (with some slight exceptions) unchanged—Perdido River in the west, and St. Mary's River and the 31st degree north latitude, in the north. The division into East and West Florida disappeared under the American government.—Korr.

Physical Features, etc.—The face of the country is uneven, but nowhere elevated over 800 feet above the sea. The whole extent of the coast is indented with bays and lagoons. A large portion of the country is covered with pine forests, the trees of which standing at a considerable distance from each other, without brush or underwood, afford an opportunity for the grass and flowers to spread with luxuriance over the surface of the earth during the whole year. The borders of the streams are usually skirted by hammocks of hard timber entangled with grape and other vines. A large portion of Florida consists of what are usually denominated "pine barrens," and much of it is sterile, though there are extensive tracts of table land, hammock, and swamp of the richest soil, and well adapted to the cultivation of sugar, rice, cotton, Indian corn, tobacco, and fruits. A considerable portion of the pine land is equally rich, and even the barrens afford extensive ranges of growing land, usually intersected with streams of pure water. Many parts of the State abound in yellow pine and live oak timber. The sea coast is generally healthy, and in parts remarkably so, and the interior is equally healthy, unless it be in the neighborhood of extensive marshes. The peninsula, which is the southern portion of the State, presents a singular alternation of savannahs, hammocks, and lagoons, called collectively the Everglades, which extend into the heart of the country for 200 miles north of Cape Sable. They are drained on the north by the St. John River, and on the west by Meco or Charlotte River.

There were in this State in 1850, 849,049 acres of land improved, and 1,246,240 unimproved in farms. Cash value of farms \$6,328,109, and the value of implements and machinery \$668,795.

Live stock, etc.—Horses, 10,848; asses and mules, 5002; milch cows, 72,876; working oxen, 5704; other cattle, 182,415; sheep, 23,311; swine; 209,453. Value of live stock, \$2,880,058; of slaughtered animals, 514,685.

Agricultural Products, etc.—Wheat, 1027 bushels; rye, 1152; Indian corn, 1,996,809; oats, 66,586; buckwheat, 55; peas and beans, 185,359; potatoes, 7828; sweet potatoes, 787,226; rice, 1,075,000 pounds. Value of products of the orchard, \$1280; produce of market gardens, \$8721. Pounds of butter made, 871,498; of cheese, 18,015; sugar, hds., 2750; mo-

lasses, 852,893 gallons; beeswax and honey, 18,971 pounds; wool, pounds produced, 23,247; cotton, 48,181; flax, 50; silk cocoons, C hops, 14 pounds; tobacco, 998,614; hay, tons of, 251; and were made 10 gallons of wine. Value of home-made manufactures, \$75,682.

Rivers, Bays, etc.—There are many bays on the western side of the peninsula, some of which form good harbors. They are Perdido, Pensacola, Choctawhatchee, St. Andrew, St. Joseph, Apalachicola, Appalachee, Tampa, Carlos, and Gallivans. On the east coast of the peninsula, the inlets afford harbors for coasting vessels. The St. John is the principal river on the eastern coast; it often spreads from three to five miles in width, and at other places it is not more than one fourth of a mile wide. It is exceedingly winding, and flows through a beautiful and healthy country. St. Mary's River rises in Okefinoke Swamp, Georgia, and enters the Atlantic between Cumberland and Amelia Islands. Of the rivers which enter the Gulf of Mexico, the Apalachicola is the principal. It is formed by the junction of Chattahoochee and Flint Rivers, about 100 miles from the Gulf of Mexico. The Chattahoochee branch of this river is navigable for steamboats 280 miles to Columbus, Georgia. The other principal rivers are Escambia, Suwanee, Withlacoochee, Ocella, Oclockony, and Choctawhatchee. Perdido River forms the western boundary between Florida and Alabama. It is navigable about seven miles above the bay, is a fine mill stream, and its banks are covered with superior yellow pine timber. There are in this State several streams of limpid water which sink into the earth and disappear, and several which rise suddenly from the earth: one in particular (the Wakulla) is navigable from its very source. The quantity of lumber shipped from the St. John River annually is estimated at 50,000,000 feet. Total tonnage of the State in 1853 amounted to 12,124.25 tons.

The principal places in the State are Tallahassee, the capital, Key West, St. Augustine, Jacksonville, Pensacola, and Apalachicola. On the 1st of January, 1856, there were 26 miles of railroad in operation. May, 1856, Congress granted to railroads lands amounting to over 1,000,000 acres, which, if rightly managed, will build all necessary railroads.

Manufactures, etc.—There were in the State in 1850, 1 cotton factory, with a capital of \$80,000, employing 28 males and 67 females, producing 624,000 yards of sheeting, etc., valued at \$49,920; 8 flouring and grist mills, 48 saw-mills, 4 tanneries, 10 printing-offices, 1 semi-weekly, and 9 weekly newspapers published. Capital invested in manufactures, \$547,140; value of manufactured articles, \$668,435.

Principal Ports.—Key West is built on an island of the same name, sixty miles south-west of Cape Sable, lat 24° 32', and long. 81° 52' W. It is a port of entry, and one of the few populous towns in the State. Its position commands the Florida Pass, and hence it is important also as a naval station; but the principal occupation of the people at the present time is "wrecking," and here is located a special court for the adjudication of salvages. From fifty to sixty vessels are wrecked in the vicinity every year, and upward of \$250,000 are paid on salvages. Salt and sponges are the principal exports, but there is a large import trade for the supply of the military stationed here. Steamers plying between the Atlantic ports and Havana generally call here. The town contains about 4000 inhabitants. The tonnage of the port in 1856 was 3668 tons.

Pensacola is a town and port on the west side of Pensacola Bay, ten miles from the Gulf, and has a fine harbor. The United States' government has here a first-rate naval station and a marine hospital. The trade of Pensacola is principally in cotton. The tonnage of the port in 1856 was 1960 tons. A railroad from Pensacola to Mobile is in course of construction.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Florin, a coin first made by the Florentines. A *sovereign* was issued by Edward III., which was current in England at the value of 6s. in 1387.—**CADIZ**. This English coin was called *sovereign* after the Florentine coin, because the latter was of the best gold.—**ASNE**. The florin of Germany is in value 2s. 4d.; that of Spain 4s. 4d.; that of Palermo and Sicily 2s. 6d.; that of Holland 2s.—**ATLAFE**. By mint valuation the florin of the southern states of Germany is worth 40 cents. The florin of Austria and the city of Augsburg, 48 cents.

A new English coin, by the name of florin, was authorized by acts of Parliament, 1849-1851, of the value of two shillings, or one tenth of the sovereign or pound sterling. This is the first practical attempt at a decimal currency in Great Britain. Up to this time (1857) few of the coins have been issued or put in circulation, and there seems some doubt of its becoming one of general use. The obverse of the new florin has an exquisitely graceful bust of Queen Victoria in left profile—the favorite side in all the coins of the present reign. Unlike all the previous coins of this reign, however, the effigy is crowned—the coronal "round and top of sovereignty" of the kingdom being faithfully copied, with its borders of jewels, its rim of *feurs-de-lis* and Maltese crosses. The legend, in bold, broad capitals, is "VICTORIA REGINA, 1849."

Floss-Silk (*Filoele, Bourre de soie, or fleur, Fr.*), is the name given to the portions of reeled silk broken off in the flature of the cocoons, which is carded like cotton or wool, and spun into a soft coarse yarn or thread, for making bands, shawls, socks, and other common silk fabrics. The floss or fleur, as first obtained, must be steeped in water, and then subjected to pressure, in order to extract the gummy matter, which renders it too harsh and short for the spinning-wheel. After being dried it is made still more pliant by working a little oil into it with the

hands. It is now ready to be submitted to the carding engine. See **COTTON MANUFACTURE**. It is spun upon the flax-wheel. The female peasants of Lombardy generally wear clothes of homespun floss-silk. Of late years, by improved processes, pretty fine fabrics of this material have been produced, both in England and France. M. Ajac, of Lyons, presented at one of the French national exhibitions of the objects of industry, a great variety of scarfs and square shawls of *bourre de soie*, closely resembling those of *chamire*.

Flota, a name given by the Spaniards to the ships that formerly sailed together, or under convoy, from Cadiz and the other ports of the Peninsula authorized to trade directly with the transatlantic possessions of Spain.

Flotilla (Sp.), literally a little fleet; in which sense, however, it is seldom used, being applied almost invariably to a fleet, how large soever, composed of small vessels. Thus the term *flotilla* was given to the immense naval force with which Napoleon meditated the invasion of Great Britain, and which consisted of 2,365 vessels of every description, was manned by about 17,000 sailors, and carried 160,000 soldiers, and 10,000 horses. In Spain the name *flotilla* is given to a number of vessels appointed to announce to the home government the departure and nature of the cargo of the flota or mercantile ships from foreign ports on their homeward voyage.

Flotsam, Jetsam, and Lagan. In order to constitute a legal wreck, the goods must come to land. If they continue at sea, the law distinguishes them by the foregoing uncooth and barbarous appellations: *flotsam* is when the goods continue swimming on the surface of the waves; *jetsam* is when they are sunk under the surface of the water; and *lagan* is when they are sunk, but tied to a cork or buoy to be found again.—(BLACKSTONE, book 1, c. viii.)

Flour of first method added, which vessel which contain one tion of this

Flour (Ger. Feines mehl, Semmelmehl; Du. Bloem; Fr. Fleur de Farine; It. Fiore; Sp. Flor), the meal of wheat corn, finely ground and sifted.

The imports of breadstuffs into Great Britain, our best customer, is fully shown by the following table. It will be observed that three fourths of the flour imported into England were obtained from the United States, in addition to three fifths of the quantity of Indian corn, and more than a fourth of the quantity of wheat.

IMPORTS OF BREADSTUFFS INTO ENGLAND FOR THE YEAR 1856.

Table with 4 columns: Countries whence imported, Wheat, Flour, Indian corn. Rows include Russia, Sweden, Norway, Denmark, Prussia, Mecklenburg-Schwerin, Hanover, etc.

* Quarters = 3 measured bushels. † Cwts. = 112 lbs.

Breadstuffs.—The following official statement exhibits the aggregate value of breadstuffs and provisions exported annually from the United States, for each fiscal year, from 1821 to 1856:

Table with 2 columns: Amount, 1821-1856. Rows list years and corresponding values.

EXPORTS OF BREADSTUFFS FROM THE UNITED STATES TO GREAT BRITAIN AND IRELAND, FROM SEPTEMBER 1, 1855 TO AUGUST 31, 1856.

Table with 5 columns: From, Flour, Meal, Wheat, Corn. Rows list destinations like New York, New Orleans, Philadelphia, etc.

FLOUR EXPORTED FROM THE UNITED STATES TO SOUTH AMERICA, FOR THE PART NINE YEARS.

Table with 7 columns: Destination, 1846, 1845, 1844, 1843, 1842, 1841, 1840. Rows list destinations like Rio Janeiro, Pernambuco, Bahia, etc.

STATEMENT SHOWING THE ANNUAL AVERAGE EXPORT PRICE OF FLOUR FROM THE UNITED STATES, FROM 1840 TILL JUNE 30TH, 1856.

Table with 17 columns: 1840, 1841, 1842, 1843, 1844, 1845, 1846, 1847, 1848, 1849, 1850, 1851, 1852, 1853, 1854, 1855, 1856. Rows list export prices for various locations.

The exports of flour from the United States, during the year ending June 30th, 1856, were as follows:

Table with 2 columns: Barrels, Value. Rows list destinations like New York, Baltimore, Philadelphia, etc.

gypsum or ground bones be mixed with the flour, they will not only increase its density still more, but they will remain after burning away the meal.

The second method is by ascertaining the quantity of gluten which the suspected sample will afford, by the process prescribed under the article BARAD. The two following chemical criteria may also be employed:

1st. Nitric acid has the property of coloring wheat flour of a fine orange yellow, whereas it affects the color neither of fecula nor starch. 2d. Pure muriatic acid colors good wheat flour of a deep violet, but dissolves fecula or starch, and forms with it a light, colorless, viscous fluid, decomposable by alkalis. It may also be observed, that as fecula absorbs less water than flour, this affords a ready means of detection. The adulteration with bean or pea flour may be detected by pouring boiling water upon it, which develops the peculiar smell of these two substances.

Flour of Wheat, adulterations of, to detect.—The first method is by specific gravity. If potato flour be added, which is frequently done in France, since a vessel which contains one pound of wheat flour will contain one pound and a half of the fecula, the proportion of this adulteration may be easily estimated. If

* Highest price.

† Lowest price—2,000 barrels sold.

The grain of wheat has for a very long time constituted an important article of food, and has, for about three centuries, been the staple grain. The kind usually cultivated is the *triticum sativum*. A bushel of it should weigh, if very good, about 64 pounds. Wheat in the form of flour is sometimes manufactured as macaroni and vermicelli; but its almost universal use is as bread. (See BAKING.) The following is the composition of first-class wheaten flour: Water, 14.0; albuminous compounds, 14.6; oil, 1.2; saccharine compounds, 66.9; cellulose, 1.7; ash, 1.6. The greater part of the ash is made up of phosphorus, potassium, and magnesia. The bran contains much less saccharine matter, but absolutely more oil and more albuminous matter; and "seconds" in this respect

stand intermediate between fine flour and bran. The cheaper price of seconds and bran, therefore, appears to be somewhat arbitrary and improper, and brown bread is probably more economical than that made from fine flour. The objection to it is probably that bran does not leaven particularly well. 2. Oats (*Avena sativa*). In Scotland, the climate and soil of which seem particularly adapted to its cultivation, this cereal has long constituted the staple article of diet. This is also the case in the high-lying land in the West Riding of Yorkshire and the adjacent parts of Lancashire. A bushel of good oats weighs about 45 pounds. Oats are made into flour or meal, and before being submitted to the mill they are always kiln-dried, to facilitate the separation of the husks. The proportion of husk

is perhaps about 15 per cent. The bran, therefore, receives the name of "seconds" and "thirds" because it constitutes extra articles of food. Oats afford about the loss being the loss of the husk, and the analysis (the analysis) had been dried and the loss of water was not compounds, no do, 7.33; 1 of ash, principally potassa, and man quantity. Oats more nutritious

is perhaps about a quarter per cent. When the husk is separated, but before the grain is ground, the seeds receive the name of groats. When ground, the dust constitutes oatmeal, and it is found in practice that oats afford about half their original weight of meal, the loss being the water expelled by the kiln-drying, the husk, and the chaff. The following is Norton's analysis (the arrangement being altered) of oats that had been dried to 212°. Perhaps in this drying the loss of water would be about 20 per cent. Albuminous compounds, 19.91; saccharine do., 68.69; oleaginous do., 7.33; husk, 2.28; ash, 2.60. The proportion of ash, principally phosphates and sulphates of lime, potassa, and magnesia, is sometimes in much larger quantity. Oatmeal, therefore, contains considerably more nutritious matter than the same weight of wheat

flour. The husks consist mainly of cellulose, and are almost never used as human food. 3. Rye (*Secale cereale*) has been cultivated from time immemorial, and was for a long time much used for bread-making in this country, as it still is (constituting the staple) in Russia, many parts of Germany, etc. A bushel of rye weighs about 54 pounds. Rye grain is very coarsely powdered, and the mixture of flour and bran made into fermented bread, which is distinguished from other bread by its black color. The following is an analysis of rye flour, the water having been previously expelled: Albuminous compounds, 10.5; saccharine do., 78.0; oil, 3.5; salts, 6.0, principally phosphates of potassa, soda, and magnesia; loss, 2.0=100.0. These three cereal grains constitute the basis of the food of the modern European nations.

Flowers (*Fleurs*, Fr.; *Blumen*, Ger.) of benzoin, of sulphur, of zinc, etc., is the appellation given by the older chemists to such substances as were obtained in a pulverulent or rather minutely crystalline form by the process of sublimation.

Flowers, Artificial, Manufacture of. The art of representing by flowers, leaves, plants, etc., vegetable nature in her ornamental productions, constitutes the business of the artificial florist. The Italians appear to have been the first people in Europe who excelled in the art of making artificial flowers; but of late years the French have been most ingenious in this branch of industry. Ribbons folded in different forms, and of different colors, were originally employed for imitating flowers by being attached to wire stems. This imitation soon gave way to that by feathers, which are more delicate in texture, and more capable of assuming a variety of flower-like figures. But a great difficulty was encountered in dyeing them with due vivacity. The savages of South America manufacture perfect feather flowers, derived from the brilliant plumage of their birds, which closely resemble the products of vegetation. The blossoms and leaves are admirable, while the colors never fade. The Italians employ frequently the cocoons of the silk-worm for this purpose; these take a brilliant dye, preserve their color, and possess a transparent velvety appearance, suitable for petals. Of late years, the French have adopted the finest cambric for making petals, and the taffeta of Florence for the leaves. M. de Bernardiere employs whalebone in very thin leaves for artificial flowers; and by bleaching and dyeing them of various hues, he has succeeded in making his imitations of nature to be very remarkable.

The coloring matters used in flower dyeing are the following: For red; carmine dissolved in a solution of carbonate of potash. For blue; indigo dissolved in sulphuric acid, diluted and neutralized in part by Spanish whitening. For bright yellow; a solution of turmeric in spirit of wine. Cream of tartar brightens all these colors. For violet; archil, and a blue bath. For lilac; archil. Some petals are made of velvet, and are colored merely by the application of the finger dipped in the dye.

Flute, a wind-instrument of great antiquity, the older varieties of which are described by Père Merseone in his *Harmonie Universelle*, Paris, 1636. The *Flute-à-bee* (disused for more than a century) was of various dimensions. The largest was a bass-flute, with a compass from F in the bass-clef, below the first line, up to D below the first line of the treble clef. The next, a tenor-flute, extended from B flat on the second line of the bass clef up to G on the second line of the treble clef; and each of these large flutes was sounded through a bent tube, like the S of a bassoon. The alto-flute reached from F on the fourth line of the bass clef up to D on the fourth line of the treble clef. The treble-flute extended from F in the first space of the treble clef up to F two octaves above. These two had *beaks*, like the bill of a cock. But all these flutes gave way, early in the last century, to the German flute, which, however, was then very imperfect in its intonation, having only one finger-key. By the addition of various flager-keys, for semitones, the German flute has been much improved in the present century. Like the fife, it is blown by an oval side-hole. It consists of four separable tubes, and has a compass of nearly three octaves, from the lowest C in the treble clef upward. Smaller flutes of this kind are called third, fourth, and octave flutes. The octave flute is the *piccolo*, used in modern orchestras and in military music.

Fluke is applied in navigation to the broad part of the anchor which takes hold of the ground.

Flux (Eng. and Fr.; *Fluss*, Ger.), signifies any substance capable of promoting the fusion of earths or metallic ores by heat. White flux is the residuum of

the deflagration in a red hot crucible, of a mixture of two parts of nitre, and one of cream of tartar. It is in fact merely a carbonate of potash. Black flux is obtained when equal parts of nitre and tartar are deflagrated. It owes its color to the carbonaceous matter of the tartaric acid, which remains unconsumed; the quantity of nitre being too small for that purpose. The presence of the charcoal renders this preparation a convenient flux for reducing calcined or oxidized ores to the metallic state. Limestone, fluor-spar, borax, and several earthy or metallic oxyds are employed as fluxes in metallurgy.

Flying Fish, a name given to several species of fishes which, by means of long fins, can sustain themselves for some time in the air. The common flying fish of the Mediterranean is thus able to raise itself so far above the surface of the sea as frequently to throw itself upon the deck of a ship; but the extreme limit of its flight is confined to an arch extending about 120 feet, when the drying of its fins necessitates its return to its proper element. See index to Ichnyology, in *Ency. Brit.*, 1856-7.

Fodder (Ger. *futter*), in agriculture, the food given to quadrupeds, which consists of the stems and leaves of plants, such as the culmiferous stems of the grasses, the haulm of legumes, potatoes, etc.; or, in short, whatever is given as the ordinary food is designated fodder; whereas corn, beans, and other articles, which present nourishment in a more concentrated form, are not included under the term fodder, but rather known as solid food.

Fodder is the name of a weight formerly used in the weighing of lead: it was of various magnitudes, but most commonly amounted to about 2400 lbs.

Fog (Dan. *fog*), in meteorology, a dense vapor near the surface of the land or water. Fogs, in general, are the consequence of the nocturnal cooling of the atmosphere. The air, by its rapid cooling, becomes surcharged with moisture; a part of which being precipitated in the form of a cloud, gives rise to the ordinary fog. During the day the heat of the sun generally disperses the fog, because the quantity of moisture which the air is capable of holding becomes more considerable in proportion as its temperature is increased.

In calm weather, the surfaces of rivers, lakes, etc., are frequently in the morning covered with fog. The reason is this. During the night the air is colder than the water; the strata of air in contact with the water are consequently heated, and become saturated with moisture. The mixture of the vapor with the air, together with its elevation of temperature, renders the air specifically lighter. It rises in consequence, and mixes with the cold air in the superior strata, is cooled, and precipitates its moisture. The cloud or fog resulting from this precipitation can only rise to a small height, because the uniformity of temperature is soon restored. Hence, it is easy to see how winds, or a great agitation of the air, prevent the formation of fogs over the surface of water. In the equinoctial regions, fogs sometimes continue during a considerable part of the year. Humboldt relates that Lima is often covered with a fog half the year, especially in the mornings and evenings; and that along the whole of that coast fogs supply the place of rain, which is extremely rare. In the polar seas thick fogs often prevail, even during the warmest months; and they are so dense that objects frequently can not be distinguished at the distance of a few yards.

Sometimes, though rarely, fogs occur of which the cause is not very well understood. In 1783, the whole of Europe was covered with a dense fog during nearly two months. On the 23d of May, 1822, about five o'clock in the afternoon, a fog covered Paris and the neighborhood, which had the odor of nitrous gas; it continued about an hour. Dry fogs, or those in which no moisture is present, are supposed to be the vapors

and ashes ejected from volcanoes.

Foil (Fr. *feuille*) is generally applied to paper which is manufactured with a thin layer of the flattening mill, or which is polished or covered with a thin layer of gold or silver.

Fold (Sax. *feald*) is a term applied to the practice of folding up the sides of a field for the purpose of protecting it from the wind, or for the purpose of raising the soil. Folds are also applied to the practice of folding up the sides of a field for the purpose of raising the soil. Folds are also applied to the practice of folding up the sides of a field for the purpose of raising the soil.

Folio (It. *fo*) is a term applied to the practice of folding up the sides of a field for the purpose of raising the soil. Folds are also applied to the practice of folding up the sides of a field for the purpose of raising the soil.

Foo-Chow, a city of China, situated on the north bank of the river Yangtze, and one of the five great cities of the empire. It is situated on the north bank of the river Yangtze, and one of the five great cities of the empire.

Fou, a city of China, situated on the north bank of the river Yangtze, and one of the five great cities of the empire. It is situated on the north bank of the river Yangtze, and one of the five great cities of the empire.

Fou, a city of China, situated on the north bank of the river Yangtze, and one of the five great cities of the empire. It is situated on the north bank of the river Yangtze, and one of the five great cities of the empire.

and ashes ejected by volcanoes, and diffused in the atmosphere by the winds.

Foil (Fr. *feuille*, or Lat. *folium*, a leaf). This term is generally applied to varnished metal. Common foil is manufactured as follows: a copper plate, covered with a thin layer of silver, is rolled out into sheets under the flattening mill; the silver surface is then highly polished or covered with a colorless varnish. The colored foils are similarly prepared with colored varnishes.

Fold (Sax. *fealde*), a temporary inclosure for keeping cattle or other agricultural animals together, either for the purpose of protection during night, or jointly for protection and feeding. Sometimes, also, sheep are folded for the purpose of manuring. The barrier of which folds are constructed is commonly wooden hurdles; but sometimes, when the fold is only to contain ewes and lambs, netting stretched between posts is made use of, there being a strong rope fixed to the lower parts of the posts close to the ground, to which the under edge of the netting is attached, while its upper edge is attached to a rope stretched along the tops of the same posts. The practice of folding sheep on naked fallows, with a view to manuring them, is still common in several parts of England; but the more improved sheep farmers consider that it deteriorates the wool, and impedes the fattening of the sheep, by keeping them for the greater part of the night wholly without food.

Folio (It. a leaf), in account-books, signifies page. Thus folio 7—written abridgely fo. 7—denotes the seventh page; Folio recto, or *F^o R^o*, signifies the first page; Folio verso, or *F^o V^o*, the second page of a leaf. A book in folio, or simply a folio, is that where the sheet is only folded in two, each leaf making half a sheet.

Foo-Chow, Fou Tchow Fou, or Fuhohau Fu, a city of China, capital of the province of Fo-ken, and one of the five ports recently opened for commerce, stands on the north side of the Min River, 34 miles from its mouth, and 9 miles from Pagoda Island, where ships anchor. North lat. $26^{\circ} 5'$, east long. $119^{\circ} 20'$. The walled city is about three miles from the river, but extensive suburbs stretch along both its banks. They are connected with each other, and with a small islet in the river by a stone bridge 420 paces long, lined with shops, and resting on solid stone piers, 40 on the northern, and 9 on the southern side. Several lookout houses are placed over the streets, or upon the roofs of buildings, one of which immediately attracts the attention of the visitor from its height, and its clock-dial with Roman characters. Few vacant spaces occur within the walls of the city, which is everywhere equally well-built. Serpentine canals divide the country around into plats of greater or less extent, and help to drain the city, as well as provide channels for boats to come up from the river. These parts of the landscape are dotted with hamlets and cottages, or, where the ground is higher, with graves and tombstones. The maritime commerce of the city is very considerable, and its manufactures of cotton goods and porcelain ware are extensive. The population of Fou Tchow Fou and suburbs, is estimated at about 600,000.

This port has no direct trade with foreign countries. Vessels enter at other ports, pay duties, and receive a permit to land goods at Foo-Chow. The arrivals and departures of foreign vessels during the year 1855 were over 100, showing a large increase over the year immediately preceding—including, however, coasting vessels in the opium trade, all of which were under the British flag. The trade of the port is said to be rapidly increasing, bidding fair to render it the second port in China as regards foreign trade, Shanghai being the first. It already surpasses Canton in commerce with the United States. The number of American vessels arriving at Foo-Chow during the last six months of 1855 was 18, with an aggregate tonnage of 10,540 tons; clearances 20, with a tonnage of 18,026 tons, and with 15,106,070 lbs. of tea; of

which, 7,674,300 lbs. were for New York, 523,200 lbs. for Boston, and 6,908,570 lbs. for London.

A correspondent residing at Foo-Chow writes to the State Department, U. S., that the tea exported in American ships visiting this port during the last quarter, amounted to 4,824,198 lbs., valued at \$715,000. "The entire number of American ships which arrived in 1856 was 84, and one ship-of-war, the United States' ship *Levant*. To give an idea of the increase of foreign trade at this port, I would remark that in the year 1853 (the year the port was opened for trade) there were only 6 American ships; in 1854, there were 12 American ships; in 1855, 27; and in 1856, 84. The whole number of foreign ships which entered this port in 1853, was 14; in 1854 there were 50; in 1855, 117; and in 1856, 175. There is very little done in the way of imports, except in opium. In this article there is an immense trade, a single firm selling in one month more than \$200,000 worth. Nearly every firm in the port import opium with the full sanction of the Chinese authorities. There is scarcely a day, and never a week in the year, when opium is not landed in open day, within 10 feet of the door of the custom-house, and of course in full view of the officers. There is, I believe, an understanding between the importers of this article and the officials, that the latter are to receive \$10 on each chest landed, which amount goes to the custom-house officers, and is divided among them from the collector down to the custom-house hostmen, each receiving according to his rank."

Food. All substances susceptible of digestion and assimilation may come under the denomination of food; but the proximate principles of organic bodies on which their nutritive powers depend are comparatively few. Hence, although the articles employed in different countries for the support of animal life are almost infinitely various, their sustaining powers may be referred to certain substances capable of being separated and identified by chemical analyses and tests. Among the proximate elements of vegetable food gluten and its modifications, starch, gum, sugar, and lignin or woody fibre, are by far the most important; and among those of animal food, albumen, gelatin, and their modifications, together with fats and oils, which are common to both kingdoms of nature.

To illustrate the actual simplicity of our food as compared with its apparent multifariousness and complexity, it may suffice to state, that wheat and almost all the esculent grains consist principally of starch and gluten; that the same ingredients are found in many fruits and roots; that sugar, gum, or a relation of gum which is called vegetable jelly, together with minute traces of aromatic principles which give flavor, and more or less abundance of water, and of vegetable acids, are the chief component parts of apples, pears, peaches, currants, gooseberries, and all analogous tribes of fruits; a very few also, contain oil. Then, as regards animal food, the muscular fibres of various animals closely resemble each other in composition and nutritive power; in some cases texture merely, and in others minute additions of foreign matters, confer upon them their relative digestibilities, and their different aspects and flavors: albumen or fibrin, and gelatin, small proportions of saline bodies, and a large quantity of water are found in them all.

It often happens that the truly nutritious part of food is so combined with, or protected by indigestible matters, as to escape the solvent powers of the stomach, unless previously prepared and modified by various chemical and mechanical agents. Indurated woody fibre, for instance, or lignin, as chemists call it, will often resist the joint action of the stomach and bowels, and pass through the alimentary canal with scarcely any alteration. The husks of many seeds and fruits are composed almost exclusively of this material. This is the case with the kernels of the apple, pear, etc.; the seeds of the currant, gooseberry,

melon, and so on; the skin, or husk of peas, beans, etc., and of wheat, barley, and oats; so that unless the woody part is either broken down by the teeth, or previously removed, the food which it envelops is protected from the solvent action of the secretions of the stomach. This is in some respects a wise and cautious provision in nature; for birds in this way become the carriers of seeds, which pass through them not only undigested, but even retaining their vegetative powers; and in this way, uninhabited and sterile portions of the globe may gradually become clothed with verdure, and shrubs, and trees. Bones are highly nutritive; but unless broken into very small fragments by the masticatory powers of the animals which eat them, they too, would elude digestion. In reference, however, to the food of man, much of its digestibility and nutritious power is referable to the important chemical operations preparatory to its use which are carried on in the kitchen: in other words, cookery is essentially a chemical art; and substances totally unfit, in their raw state, for reception into the stomach, are rendered palatable, digestible, and nutritious by the skill of the cook. And here salt, and a variety of condiments, as they are called, and which are aromatic and stimulant substances, chiefly of vegetable origin, play an important part; nor must the mere effect of heat be overlooked, for it is most important. Meat, by boiling and roasting, is not only softened in its fibre, but new substances are generated in it. Among these a peculiar extractive matter, and *emazone*, or the principle which gives an agreeable flavor and odor to dressed meat, are especially recognized. Nor are the changes which vegetables suffer under the influence of heat less obvious.

There is another important point in the history of our food, namely, its *ultimate composition*. We have spoken of starch, sugar, gum, albumen, and other substances as the *proximate* principles upon which we live; but what is the *ultimate* constitution of these secondary products, what are their true *elements*? It is curious that four *elements* only are principally concerned in the production of our food. These are carbon, hydrogen, oxygen, and nitrogen. Among vegetable substances, gluten (including vegetable albumen) is the only one which abounds in nitrogen; gum, sugar, starch, and the rest are constituted of carbon, hydrogen, and oxygen only; and what is very remarkable is, that in all these important principles, and also in lignin, the oxygen and hydrogen bear to each other the same relative proportions as in water, so that they may be figuratively described as compounds of *charcoal and water*. Now there are two very curious points in reference to that part of the chemical history of our food, which has been adverted to: the one is, that no animal can subsist for any length of time upon food which is destitute of nitrogen; and the other, that a certain mixture of different kinds of food is absolutely essential. An animal fed *exclusively* on starch, or sugar, or albumen, or jelly, soon begins to suffer in health; peculiar diseases make their appearance, and his existence is painful and brief; but mix these together, and occasionally modify their proportions, and he then thrives and fattens. Magendie's experiments on this subject, together with those of Tiedemann and Gmelin, well illustrate this fact. Thus, geese fed upon gum, died on the 10th day, those fed upon starch on the 24th, and those fed on boiled white of egg on the 46th; in all these cases they dwindled away and died as if of starvation.

Habit, as is well known, will do much in accustoming the stomach to particular descriptions of food; many persons live exclusively, or almost so, on vegetable, others on animal matters, and particular kinds of diet are forced on the inhabitants of many regions of the globe; but, as far as we are concerned, a due mixture of vegetable and animal matter is not only most palatable, but most conducive to health. Nothing is

fit for food which has not already undergone organization, and *water*, though an essential part of the food of all animals, is obviously not in itself nutritious, though it performs the extremely important function of dissolving nutritive matter, so as to render it conveyable by the lacteals and other absorbents into the blood. No compound, then, of nitrogen, hydrogen, carbon, and oxygen, which can be formed artificially, can constitute food. Air, water, and charcoal, though involving the *elements* of our nutriment, are themselves unfit for our support; and it is only by passing through the hidden processes which are carried on in the vessels of living things, that they are so recombined and modified as to be rendered capable of supporting animal life. It is the vegetable world which commences this wonderful operation. Plants absorb their nutriment from the air and from the soil; they assimilate inorganic as well as organic matter; they become the food of the graminivorous tribes, and from these man derives the great bulk of his animal food.

In speaking of the composition of food, that of *milk*, the most important of all food, must not be forgotten; in its nature has wonderfully provided a mixture which, though secreted by an animal, partakes also of the nature of vegetable food, and it presents a perfect analogy to that combination of vegetable and animal matter which has been mentioned as most congenial to the palate and stomach. The albumen or *curd* of milk is a highly elaborated animal principle, abounding in nitrogen, yet, from its attenuated and soluble state, easy of digestion. A second principle of milk is what is termed *sugar of milk*; in composition and properties it resembles a vegetable product, and is intermediate between gum and sugar. The third component of milk is *butter*, partaking of the nature of vegetable oil and animal fat; there are certain saline and acid substances in small proportion; and all these matters are either dissolved or suspended in a large relative proportion of water.

The above table represents the relative proportion of solid digestible matter contained in 1000 parts of the different articles of food which are enumerated. When blood, for instance, is evaporated to dryness, at a temperature not exceeding 212°, the residue amounts to 215 parts in 1000, and may be regarded as almost entirely composed of digestible matters; it consists of albumen and coloring matter, with small proportions of saline substances. The different kinds of meat were dried in the same way. The loss of weight during their desiccation is almost wholly referable to water; and the dry residue composed of albumen or fibrin, with some gelatin, and perhaps traces of fat and saline matters, represents the true nutritive value. Upon an average, therefore, the nutritive matter in a pound of meat is not more than four ounces. This, however, only applies to raw meat; for when dressed, a considerable portion of its constituent water is often dissipated. The nutritive matter of wheat is chiefly starch and gluten, and in this species

of grain the portion of the nutritive matter to the starch there is little doubt that the food, depends on the nitrogenous substances of the vegetable-animal such as carrots, the leading nutrient contain sugar, together with a or lignin, which

of grain the gluten is in much greater relative proportion to the starch, than in barley, oats, or rye. In rice there is little else than starch. There can be little doubt that the great value of wheat as an article of food, depends upon this excess of gluten, which is a nitrogenous substance, and has not inaptly been termed the vegeto-animal principle. In the esculent roots, such as carrots etc., but especially turnips, sugar is the leading nutritive matter; and the common fruits contain sugar, gum, albuminous matter, and acids, together with a highly attenuated form of woody fibre, or lignin, which, in that state, is probably digestible.

The following table shows the ultimate composition of those proximate principles which have been above adverted to as constituting the nutritive part of food.

Yearly Food of One Man.—From the army and Navy diet scales of France and England, which, of course, are based upon the recognized necessities of large numbers of men in active life, it is inferred that about $\frac{1}{2}$ pounds avoirdupois of dry food, per day, are required for each individual; of this about three fourths are vegetable, and the rest animal. At the close of an entire year the amount is upward of 800 pounds. Enumerating under the title of water all the various drinks—coffee, tea, alcohol, wine, etc.—its estimated quantity is about 1500 pounds per annum. That for the air received by breathing may be taken at 800 pounds. With these figures before us, says the *Medical World*, we are able to see how the case stands. The food, water, and air, which a man receives, amount, in the aggregate, to more than 3000 pounds a-year; that is, to about $1\frac{1}{2}$ tons, or more than 20 times his weight. This enormous quantity may well attract our attention to the expenditure of material required for supporting life. A living being is the result and representation of change on a prodigious scale.

Food, Adulterations of.—It has long been known that very fraudulent, and sometimes very unwholesome, adulterations of food are extensively practiced; but until lately it was not easy in all cases to pronounce decidedly on the nature of the fraud that had been committed. Now, however, by means of the microscope and the chemist's test-tube, there is little difficulty in so doing, and many important disclosures have by their use been made. The proprietors of the London *Lancet* employed Dr. Hassall (one of the most accomplished of the microscopical observers of our day) to thoroughly investigate the subject, and his reports have appeared from time to time in that periodical. As he published the names of the different trades-people from whom he bought spurious or adulterated articles of food, and as none of them have succeeded in disproving (and, indeed, very few have ventured to contradict) any of the statements, the thorough accuracy of the report may be relied upon, and the facts in this article are based upon it. Although Dr. Hassall purchased the articles of food that he examined from London shop-keepers, there can be no doubt that the same adulterations will be found in the provinces. Indeed, the great adulterators are the wholesale houses, which supply indiscriminately London and country shop-keepers.

I. ADULTERATIONS OF ARTICLES OF FOOD NOT WHOLELY OF A MANUFACTURED NATURE.—Milk,

usually supposed to be much adulterated, is comparatively little so. In towns, water is generally added to it, and a portion of the cream is likewise abstracted; but chalk, gum, etc., are very rarely employed (as has often been alleged) to give the appearance of greater strength. Salted butter is frequently melted, and when in that state has water added to it. In this manner 50 per cent of water may, it is said, be incorporated. Lard is mixed up with water, potato flour, and refuse mutton fat, and the amount of the potato starch has sometimes been known to amount to 20 per cent. Oatmeal, in London, and perhaps elsewhere, is extensively mixed with barley meal; the latter, as it contains so much more water, only selling for about half the price of the former; but wheat flour, unless it contains alum, as it perhaps does, seems quite pure. Arrowroot is adulterated to a large extent. Of 50 samples bought from London shops, Dr. Hassall found 22 to be impure; of these, 10 scarcely contained any arrowroot at all, but were made up of sago, tapioca, and potato starch; while in the others there was a considerable admixture of these cheaper articles.

Raw sugar has many impurities, among which the immense number of acari with which it swarms are the most disgusting; but it is also extensively mixed with flour, apparently to make impure dark sugar appear like purer and lighter-colored, and perhaps with other foreign ingredients. Loaf-sugar seems sufficiently pure. Tea is in a lamentable state, for it is meddled with by both the Chinese and those through whose hands it passes here. With regard to black tea, Dickson maintains that the Chinese mix with their exportations of tea to this country many millions of pounds of leaves of other plants, which they mix with genuine tea plants. In other respects, however, and even perhaps in this, the Chinese do not adulterate the common black teas, as Congou, Sou-chong, and ordinary Pekoe; but other descriptions, as scented Orange Pekoe and Caper, are, almost without an exception, impure; the former by being glazed with black-lead, and the Caper by being extensively mixed with Paddy and Lie tea, i. e., an imitation of tea leaves obtained from other plants; or by not containing any tea leaves at all, but altogether other leaves sprinkled with tea dust, and made up into little masses by means of gum, and which masses are glazed with plumbago, turmeric or Prussian-blue, and the whole sprinkled over with mica, etc. But the imitation black teas are also entirely made up of the leaves of indigenous plants of this country, as those of acyamore and horse-chestnut, broken down, sprinkled with catechu (to communicate tannin), dried, and coated with gum. But a still more common imposture is to purchase exhausted tea leaves, which are sold at about 3d. a lb., from hotel-keepers and the like, and attempt to imitate fresh tea by admixture with catechu, gum, sulphate of iron, to strike a dark color with the catechu, Prussian-blue, logwood, black-lead, talc, etc. Some of these adulterations, as the Prussian-blue, for example, are calculated to have serious effects upon the health. Green teas are more adulterated than black ones, a really unadulterated specimen being very rarely to be met with. They are mixed in China with leaves of other plants, and are subsequently glazed with gum, Prussian-blue, turmeric, and various other substances, some of which are very unwholesome. Imitation green teas of home manufacture are also occasionally, perhaps even often, exposed for sale. Coffee, until the government interfered to prohibit the sale of a mixture of coffee and chicory as "coffee," almost invariably contained a large, and sometimes an amazingly large, admixture of chicory. Several contained, in addition, roasted corn, beans, potatoes, sometimes red ferruginous earths, and other impurities. Ground chicory itself, so much employed to secretly mix with coffee, is itself an article extremely adulterated. Nearly a half of the specimens examined

were largely so, the substances employed for the purpose being roasted wheat, ground acorns, mangel-wurzel, carrots, mahogany sawdust, and ferruginous earths, the two latter for the purpose of communicating color. Cocoa and chocolate are no better, the great majority of samples of them being largely mixed with sugar, and with potato, and other starch; but a worse adulteration is, that they also contain coloring, earthy matter, usually, probably, of a ferruginous nature, but which sometimes, perhaps, have for ingredients red lead and vermilion, two very dangerous ingredients, and tallow and other fats seem to be sometimes mixed with them. The acknowledged substitutes for tea, coffee, and cocoa, as *Revalenta*, *Semola*, *Prince of Wales's Food*, etc., etc., are very familiar substances. Du Barry's much vaunted "*Revalenta*" is a mixture of pounded lentils and barley meal, and the syrup that accompanies it is treacle. Bullock's "*Semola*" is the gluten of wheat with a little starch; and "*the Prince of Wales's Food*" is potato flour.

Ground ginger is very commonly, and very largely adulterated. Dr. Hassall found three fifths of his samples to be so, the substances admixed being sago-meal, potato flour, common flour, ground rice, cayenne pepper, and mustard husks, and these generally constituting the greater part of the powder. Mustard, i. e., ground, is almost invariably adulterated, the articles employed for the purpose being flour and turmeric, and these sometimes constitute nearly the whole of the article. Pepper is likewise very frequently mixed with linseed meal, pea meal, powdered mustard, and other substances cheaper than itself. Cayenne pepper is scarcely ever sold pure; and as the adulterations employed are bisulphuret of mercury, red lead, and other mineral coloring-matter, cayenne pepper is often a pretty active poison. In like manner, curry-powder, of which four samples out of five were found to be adulterated, frequently contains red lead, and is, therefore, very deleterious. Of the other spices, cinnamon and mixed spices are often impure; but pimento, mace, cloves, and turmeric, are almost always pure. Vinegar was found by Dr. Hassall to vary a good deal in strength, and also in the quantity of sulphuric acid that most of it contains; many samples containing more of this than was formerly allowed when the vinegar-makers were under the control of the excise; but some specimens, and these very good vinegars, were found to contain none of it, and this is a satisfactory proof that the addition of sulphuric acid is by no means necessary to vinegar.

II. ADULTERATIONS OF ARTICLES OF FOOD AVOIDED BY A MANUFACTURED NATURE.—Although some of the above adulterations communicate poisonous properties, yet most of them are frauds merely; some of which, however, must press very severely upon the artisan, to whom a nominally cheap article is almost irresistible. But the adulterations now to be noticed are all of a deleterious nature, and probably produce an immense amount of chronic disease, and sometimes, indeed, speedy death. Every sample of bread—49 in number—examined by Dr. Hassall, contained alum. Indeed, the sale of "stuff," which is a mixture of alum and salt, to the bakers, is carried on on a very large scale. The object of the baker in using it is to take advantage of the affinity that it has for water, and thereby make the bread retain more water than it otherwise would, and thus give his loaves an artificial weight, and also to whiten and discolored flour, and make it pass for that of superior quality. Each four-pound loaf contains on an average 82 grains, and a person consuming two such loaves a week, introduce into his system in that period 2 drachms and 44 grains of alum—a quantity which, as alum is a powerful astringent, must be very injurious, and which probably produces a great deal of the dyspepsia of large towns. The unnecessary

quantity of salt employed by bakers is also for the purpose of retaining water among the bread in unnecessary abundance. The pickles sold in bottles in the shops are very bad indeed. In the first place, few of them, if we take the definition of pickle as given in the article *Food*, are pickles at all. The vegetables are greened with copper, preserved with salt and water, and packed into bottles, into which some very weak vinegar and diluted sulphuric acid are poured. Even the vegetables are not always genuine, and white cabbage is dyed to pass for red, slices of turnips made to look like cucumbers, etc. Of 20 specimens examined by Dr. Hassall, the supposed vinegar never contained the proper amount of acetic acid, and in general only about half. All contained oil of vitriol, and, which is still worse, all (16 were tested for this purpose) salts of copper—two in small quantities only, eight in much, one in considerable, three in very considerable, one in highly deleterious, and two in immediately poisonous amount. Of the extremely injurious effects upon the health of those who daily eat these pickles thus contaminated with copper, there can be no doubt. Among the symptoms produced by the continued use of cupreous preparations in small doses, are paralysis, chronic inflammation of the respiratory and digestive apparatus, slow fever, and wasting of the body. The stire sauces are extensively adulterated. Of 28 samples of anchovy sauce, 23 contained Armenian bole, a ferruginous earth of a full red color. All the samples of soy were found to consist of treacle and salt, or at least nearly so. Six out of seven bottles of tomato sauce contained coloring matter, in all cases save one Armenian bole; and a very extensively-used fish-sauce contains acetate of lime and chips of charred wood. None of the sauces, however, were found to contain lead or copper. This, however, is not the case with preserves and jams, and 33 of these out of 35 that were tested, were found to be adulterated with copper, and some of them in very large amount. Fruits preserved in bottles, too, nearly all had copper, and French olives in particular contained a large amount. As in preparing bottled fruits no copper utensils are employed, the poison must be deliberately added. This, too, must often be the case with preserves. Articles of sugar confectionery are perhaps most deleterious of all. Besides often containing sulphate of lime, which is not wholesome, the greater proportion of the colors employed are virulent poisons. Among these may be mentioned red oxyd of lead, carbonate of lead, and the chromate of lead, carbonate of copper, arsenite of copper, and bisulphuret of mercury. Accordingly, from time to time, cases of virulent poisoning follow the use of these colored articles of sugar confectionery.—E. B.

It is probably generally understood that organic substances, that is, those of vegetable or animal derivation, can not be distinguished from each other by chemical analysis, as mineral substances can be. They are composed of few elements, carbon, hydrogen, nitrogen, and oxygen; but these combine together in complicated forms among themselves, producing substances of very different properties, even when the elements in the aggregate continue the same. Moreover, some subtle essence, that chemical skill can not detect, often gives peculiar characters to organic substances. But Nature does not leave herself without witnesses in the organic, any more than in the mineral world; and if these are not brought out by chemical researches, they must be by some other. But what these could be has been so little suspected, that as, lately as the year 1850, when repeated remonstrances were addressed to the British government to prohibit the adulteration of coffee with chicory, the chancellor of the exchequer urged in the House of Commons non-interference with the matter, on the ground that neither by chemistry, nor by any other means, could the adulteration be detected. And this

plea, sustained and tingued by Dr. Hassall, was to be detected, and mixed to ample, each taint by the The principle fossil botany, and species stone, the del is more won stances, like veal to the mi of plants whi and indelibly dences of her epochs. In London, bako and grind the animal mixtures n increase its valu. mixture, unless it the root of a plant no active element greatly diminishes

plea, sustained by the report of three of the most distinguished chemists of the day, was successful. But Dr. Hassall finds, by the application of powerful microscopes, that the identity of organic substances can be detected, and that even when these are ground up and mixed together, as different kinds of flour, for example, each kind can be recognized with absolute certainty by the peculiar structure of the fine particles. The principle was known before, and was applied in fossil botany, especially to the determination of genera and species of plants. Even when converted into stone, the delicate organization still remains, and what is more wonderful than all, when fossil organic substances, like anthracite, are consumed, the ashes reveal to the microscope the peculiar forms of the family of plants which produced the coal. Thus faithfully and indelibly does Nature record and preserve the evidences of her operations in the remotest geological epochs. By the investigations of Dr. Hassall, the microscope has become a most convenient and efficient aid to organic analysis, and while greatly adding to its precision, wonderfully simplifies and reduces the cost and labor of the process. Illustrating the completeness and accuracy of his investigation, we find throughout the book numerous diagrams representing the appearance under the microscope of the various substances submitted to his examination. We see the genuine ground coffee and the genuine chicory root, and the mixture of these and roasted wheat, beans, and potatoes, plainly exposed in samples, that had been purchased with such high-sounding names as "*Delicious Family Coffee*"—really one fourth coffee and three fourths chicory; "*Coffee as in France*"—principally chicory; "*Fine Ceylon Coffee*"—very little coffee, a great deal of chicory with some roasted corn (wheat?); "*Celebrated Jamaica*"—very little coffee; principally chicory. "*Fine Java Coffee*"—much chicory and some roasted potato; very little coffee. And so through the various articles of diet, as tea, cocoa, sugar, milk, flour and bread, butter, arrowroot, condiments, pickles, confectionery, bottled fruits, liquors, and drugs. In many of them the results of chemical as well as microscopic examinations are given, each serving to aid the other, and together leaving little to be desired in the thoroughness and exactness of the researches.

Coffee.—Thirty-four samples of this were examined by Dr. Hassall, of which thirty-one were adulterated—all of the thirty-one with chicory—twelve with roasted wheat in addition; one of them contained bean and one potato flour. In many instances the coffee was present in very small quantities; in some it amounted to one fifth, one third, and so on. But coffee is also adulterated with other substances. In 1851 there were offered for sale, at about two cents a pound, by a Scotch house, eighty tons of "*caffina*," a substance imported expressly for the adulteration of coffee, and described as the highly nutritious seed of a Turkish plant. It proved on examination to consist of the roasted seeds of some leguminous plant, probably a lentil, and was no doubt prepared from an importation of 100 tons of lupine seeds, which arrived a little before at Glasgow from Egypt. The same firm, it appears, was offered, about the same time, 500 tons of foreign acorns, at about a cent per lb. for the same purpose, no doubt, of adulterating coffee. Oak bark tan and exhausted tan are also used, and the baked livers of horses and cattle. Horse liver appears to be preferred for coffee to ox liver, and brings a higher price. In London, there are men whose business is to bake and grind these articles. It is stated that these animal mixtures make the coffee go further, and thus increase its value. Chicory is a harmless sort of mixture, unless it operates to produce diarrhoea; it is the root of a plant of the dandelion family, contains no active element like that of coffee, and no doubt greatly diminishes the evil effects attributed to the

free use of coffee. Perhaps for this reason its use ought to be encouraged; but as it is worth only one fifth or a quarter as much as coffee, the purchaser would naturally prefer to buy the articles separately, and mix them to suit himself. Sir Charles Wood, the chancellor already referred to, appears to have a high opinion of its nutritive properties; but the value of his opinion is somewhat lessened from the question having been raised, whether he was not largely interested in the great crops of chicory grown in Yorkshire, as well as from his zealous efforts to sustain the practice of this adulteration. But Professor Beer, an eminent oculist of Vienna, is of opinion that the continual use of chicory seriously affects the nervous system, and gives rise to blindness from amaurosis. In this city there are many like Sir Charles Wood, who rather prefer chicory; but it is not so extensively used for adulterating coffee as a small variety of dried pea. In the great coffee-roasting establishments this may be seen in large quantities, openly exposed, just as if the mixing a cheap and inferior article with one of considerable value, to sell at nearly the cost of the latter, was an honest business. It is a singular fact that chicory, used to adulterate coffee, is itself adulterated with still cheaper materials. It is sold in powder, and this is found to consist in part of other matters used for adulterating coffee, not excepting the laked livers. Carrots, beets, parsnips, and mangel wurtzel are roasted and ground for the same purpose. One witness before the Parliamentary committee testified to having manufactured in one year 700 tons of carrots into chicory. Burned sugar and Venetian red are used to give the proper color of coffee.

Tea.—Tea is extensively adulterated in China, inferior qualities being made to resemble closely the most valuable, by mixtures of highly deleterious ingredients, and foreign substances introduced, as leaves of trees of various kinds, to take the place of genuine tea leaves. Some of these are candidly sold by the Chinese with the name of "*Lie Teas*," or when mixed with other teas, the proportion is stated of each. The Souchongs and Congous imported into England are said to be rarely adulterated; but the black Gunpowders, Capers or Chulons and scented Orange Pekoes, are rarely otherwise than adulterated. In detecting the strange leaves and determining their names, the microscope is particularly useful. The green color of the Twankay, Hyson-skin, Young Hyson, Hyson, Imperial, and Gunpowder imported into England, is stated to be imparted without exception by artificial coloring matters, such as ferrocyanide of iron, Prussian blue, turmeric, and China clay. Indigo and sulphate of lime are also used, the last for fixing the color. The Chinese exhibit great skill in the mixture of the coloring matters to produce the desired shade, and also a remarkable readiness to execute the orders for any tea required, though it amounts to many times the quantity of all this tea grown. It must be admitted also that they are not much more restrained by any conscientious scruples as to the consequences that may result from their poisonous coloring mixture, than those "*outside barbarians*" who practice similar arts in Christian countries. In England, besides the poisonous prussiate, it appears, from some seizures that have been made by the excise officers, that for the *facing* of tea, or giving the outside gloss to the leaves, the highly-poisonous substances, carbonate and arsenite of copper, and chromate of lead are used. Of the teas purchased in London and examined, it is found that some are made up of exhausted tea-leaves by the use of gum, and these are artificially glazed and colored; that the coloring matters are more injurious than those used by the Chinese, and that it is not uncommon for tea, both black and green, to be fabricated from British leaves, which possess none of the properties of tea leaves. The detection of the adulterations of tea is not very difficult, some being

English market of late years, and many of them have found their way to this country, with the high-sounding names they were christened with there. The most famous and highly esteemed of these are *Wharton's Revalenta*, and *Du Barry's Revalenta Arabica*. They sold in England at 2s. 9d. per pound, or about 67 cents. These, examined under the microscope, prove—the former to be a mixture of the French or German lentil, which is almost precisely the same thing as the common pea, and the remainder a substance resembling Indian-corn meal, but possibly the meal of the Sorghum. The latter was composed of the red, or Arabian lentil, and barley-flour. Another sample of it showed some sugar, and a third some salt, and also appeared to be flavored with celery seed. Edwards Brothers' *Arabian Revalenta*, at 1s. (24 cents) per pound, was ascertained to consist of lentil powder—probably of the red and yellow lentil mixed. Lentils, it seems, being somewhat cheaper than peas, are supplied to the work-houses for the preparation of soup for the paupers. It is certainly a much more profitable operation to convert them into *Revalenta*, and sell them at 67 cents per pound, or export them in this form to this country, where, we believe, by our own experience, when acting, some time since, under medical advice, they cost half a dollar for a small paper, possibly weighing half a pound. In London, where these valuable lentils can be easily procured at 8 cents per quart, the preparation may be made by mixing to a uniform powder red or Arabian lentil flour, 2 pounds; barley flour, 1 pound; salt, 3 ounces. This preparation will contain all the valuable properties of the *Revalenta*, and cost four cents per pound. Unfortunately, we have no Arabian lentils; but Dr. Hassall has given another recipe, equally good, designed for such contingencies, and of which we can easily avail ourselves, viz.: Pea flour, 2 lbs.; Indian-corn flour, 1 lb.; salt, 3 os. Mix as before. We do not know whether such choice preparations as *Prince Arthur's Farinaceous Food* and the *Prince of Wales's Food*, would ever be allowed to come to this country to nourish republican babies; but, by great good luck, we possess the materials of this royal diet, as Dr. Hassall's microscope proves the one to be composed entirely of *baked wheat flour*, and the other of *potato flour*. *Maidman's Nutritious Farina* consists entirely of potato flour, artificially colored of a rosy tint.

Spices.—Cayenne pepper is very generally adulterated, and frequently with red lead, in considerable quantity. Vermilion, or the sulphuret of mercury, is sometimes used for the same purpose. As mineral poisons are apt to accumulate in the system, and finally produce very serious consequences, if taken frequently, even in small quantities, this adulteration, as the similar treatment of colored confectionery, is one of the most reprehensible forms of this vile system. Instances of poisoning from these causes are known, and also from cheese poisoned by red lead, which was introduced into the annatto used to color the cheese. This coloring ingredient in cheese and butter is an entirely useless addition to these articles, possessing no good properties of its own; but being frequently made the vehicle of introducing its different adulterating mixtures, its use ought to be abandoned.

Spices are to a considerable extent adulterated, and probably as much so in this country as in England. Of 21 samples of ginger, 15 were thus impure, the mixtures consisting of the meal of sago, tapioca, potatoes, wheat, rice; also, Cayenne pepper, mustard husks, and turmeric powder, which, in the majority of the cases, constituted the principal part of the article. Every one has noticed in cinnamon the hard, tasteless bark, thicker than that which has the genuine flavor, but otherwise much resembling it. This is the bark of the cassia, a tree of the same genus as that which produces the cinnamon bark, but of very inferior quality. It is largely mixed with cinna-

mon, but, even in the ground state, is easily detected by the microscope. Of 12 samples of whole cinnamon examined, seven proved genuine, and five were nothing but cassia; and of 19 samples of the ground article, only six were genuine—three consisted entirely of cassia, three of cassia adulterated, and seven of cinnamon adulterated. The adulterating mixtures were baked wheat flour, sago, meal, potato-flour, and arrow-root. In his examination of the nutmeg, Dr. Hassall does not appear to have found any of the famous wooden imitations; but a French author he quotes, states, that "nutmegs are sometimes mixed with riddled nuts, eaten by insects, and become brittle; the small apertures are then closed with a kind of cement, formed of flour, oil, and the powder of nutmegs. This paste has even served to fabricate false nutmegs, inodorous and insipid." These qualities without doubt, characterize the Connecticut article also, and will enable any one to detect it. Dr. Hassall's advice to soak them in water, when, of course, they would readily break down, would not apply to these.

To present this subject in its most revolting features, it would be necessary to carry out this description through the long list of liquors and drugs; and the data for this might easily be furnished to considerable extent from materials already at hand of our own operations, without drawing upon those so abundantly provided in the book before us. But enough has already been said to convince the most incredulous (if there be anywhere incredulity on this subject), that whatever we purchase to eat or to drink, or to administer as medicine, we have no security that we obtain the article we ask and pay for. The chance is decidedly against us in all articles, which skillful ingenuity can imitate successfully, even if it be necessary to resort to dangerous poisonous substances. The laws afford little protection, though they recognize the existence of the evil.

But besides the repugnance we naturally feel to being cheated and poisoned, there are evils of greater consequence brought upon the community by the toleration of these practices, that should rouse a higher indignation. These are, that loose state of morals the system encourages, and the lowering of the respect which should attach to the mercantile profession. The encouragement, too, of the unscrupulous trader, by the advantages of profit it gives him over the honest; thus driving the latter out of a business in which competition is not open to him. Then, again, its evil effects upon the poor, who, ignorant of these frauds, fall helplessly into the snares of those who sell at the lowest rates. Judging from the qualities of articles sold by "respectable" traders, it is probable we have little idea of what is palmed off upon the great bulk of the population of a city like this, in the cheap shops frequented by the poorer classes. Our newspapers make frequent mention of the more prominent frauds committed upon unsuspecting strangers by the emigrant runners; but of this under-current, which is fibbing without cessation the hard earnings of the multitudes, poisoning health and morals alike, reducing the standard of mercantile integrity, and taking from the mouths of the sick and of the infants those most nutritious foods nature has kindly provided for their benefit—of this we hear little mention. The disease lies too deep and works too insidiously for its eradication to be hoped for. But this is not so. There is a cure for it; and this cure is the one adopted by Dr. Hassall. Let those who have the skill, and the time, and the taste for such pursuits, adopt the course he followed. Let purchases of articles likely to be adulterated be made in various places, and the results of their examination be exposed, together with the names of the tradesmen selling them. There is no fear but one would be sustained in this. All honest dealers would encourage it; for it would restore them to their rightful position. The dishonest could not help themselves. Such a

course, steadily pursued by a few individuals, would, we believe, soon produce as marked a change in this city as it has done in London. If one would undertake it, others would be likely to follow. The field is large, and will accommodate many laborers. We wish a commencement might soon be made upon milk.—See ADULTERATIONS DETECTED; or, Plain Instructions for the Discovery of Frauds in Food and Medicine. By ARTHUR HILL HASSELL, M. D.: London, 1857. H. Bailliere, New York.

Foot, a measure of length derived from the length of the human foot, and consisting of 12 linear inches. For its length in different countries, see WEIGHTS AND MEASURES.

Fore. The sea term for the part of the ship near the head.

Fore and Aft implies lying in the direction of the head and stern; also, the whole of the vessel generally.

Forecastle, that part of the upper deck of a ship forward of the foremast; also, in merchant vessels, the forward part of the ship, under the deck, where the sailors live.

Foreigner, the natural-born subject of a foreign state.

Forelock, in nautical language, a flat wedge of iron, driven through the end of a bolt to prevent its drawing.

Foremast, the forward mast of all vessels.

Forestalling, in law, is described to be the buying or contracting for any merchandise or victual coming in the way to market; or dissuading persons from bringing their goods or provisions there; or persuading them to enhance the price when there. This, as well as *engrossing*, which is the buying up of large quantities of corn, or other dead victuals, with intent to sell them again, and *regrating*, the buying up of such commodities in any market, and selling them again in the same market, or within four miles of it, was looked upon as injurious to the public, by unnecessarily tending to raise the price of provisions; and accordingly several statutes were passed in Great Britain prohibiting forestalling under severe penalties. Statute 31st Edw. I. enacted that "no forestaller shall be suffered to dwell in any town who manifestly is an oppressor of the poor, a public enemy of the whole commonalty and country, who meeting grain, fish, herring, and other things coming by land or by water to be sold, doeth make haste to buy them before other, thirsting after wicked gain, oppressing the poor, and deceiving the rich." In Great Britain, by the statute of Edw. VI., it was enacted that whoever should buy any corn or grain with intent to sell it again, should, for the first offense, suffer two months' imprisonment, for the second, six months' imprisonment, and forfeit double its value, and for the third, be set in the pillory, suffer imprisonment during the king's pleasure, and forfeit all his goods and chattels. This statute further enacted, that no one could transport corn from one part to another without a license, ascertaining his qualifications as a man of probity and fair dealing.

The very imperfect knowledge of political economy that then prevailed led to the belief that the intervention of a third party between the producer and consumer tended to raise the price of provisions; and that corn would be bought from the farmer cheaper than from the corn-merchant. It may seem somewhat strange that though the law thus compelled the farmer to deal directly with the consumer, yet it in many cases prohibited the manufacturer from selling his own wares by retail, in order that the shopkeepers might not be undersold. The farmer was thus forced to carry on two trades; and part of the capital which should have been employed in the improvement and cultivation of the land, was obliged to be kept in his granaries and stock-yard; whereas the corn-merchant, by afford-

ing a ready market for the farmer's produce, enables him to employ his whole capital in cultivation; and the existence of a free competition obliges the corn-merchant to sell his corn as cheap as the farmer could afford to do. The principle here is the same as in manual labor. The workman who is wholly employed in one operation accomplishes a greater quantity of work, and can afford to do it at a cheaper rate, than one who has to carry on several operations; and, in the same way, the dealer whose whole stock is employed in a single branch of business acquires so easy and ready a method of transacting business that, with the same capital, he can carry on a much larger business, and so dispose of his goods cheaper than if his capital and attention were employed in a greater variety of objects. "If," says Adam Smith, "a merchant ever buys up corn, either going to a particular market, or in a particular market, in order to sell it again soon after in the same market, it must be because he judges that the market can not be so liberally supplied through the whole season as upon that particular occasion, and that the price must, therefore, soon rise."—E. B.

Fore-tackle; tackle on the foremast, and also tackle used for stowing the anchor.

Foretop-men; men stationed in the foretop, in readiness to set or take in the smaller sails, and to keep the upper rigging in order.

Forge, a furnace where wrought iron or other metal is hammered and fashioned with the aid of heat. This is called a smith's forge. In ships a very convenient kind is the portable truck forge. Forge is also applied to the blast furnace, in which iron ore is smelted; also, where the production of the blast furnace is fused, and afterwards beaten with enormous hammers, or drawn through cylinders of different diameters, in order to render the metal soft, pure, and more malleable and ductile. Such great workshops are otherwise called *shingling mills*. See IRON-MAKING.

An ordinary smith's forge consists of the hearth or fireplace, which is merely a cavity in masonry or brick-work, lined with fire-clay or brick, and containing ignited fuel, upon which a powerful blast of air is driven through the nozzle of a double-bellows, worked by a hand-lever. There are also portable forges, of small dimensions, but answering all the ordinary purposes of a smith's forge. Such are the traveling forges of armies, those used on board ships, &c.

Forgery (from the French *forger*, signifying *accorde fabricare*, to beat on an anvil, forge, or form) may be defined at common law to be the fraudulent making or alteration of a writing or seal, to the prejudice of another man's right; or it is the crime of imitating the subscription of another, alibiing it to a deed, and putting that deed to use by acting under it, receiving property in virtue of it, founding on it as a title to sue or to defend, or transferring it to another. In considering forgery, it is necessary to attend, first, to the mode of proof by which the crime is established; and secondly, to the punishment which is inflicted on the perpetrator thereof.

The proof of forgery is either direct or indirect. The direct proof consists in the examination of the writer of the deed, and of the witnesses who sign the deed and attest the subscription. As the subscription of witnesses is an attestation to which the law gives effect to the extent of receiving it on their death as evidence of the regularity of the deed, and as weight is given to the subscription of a witness, even where he does not recollect having admitted it; so, to cut down a deed regularly attested, the instrumental witnesses, as they are called in Scotland, must be brought to swear to circumstances of sufficient force to invalidate the evidence given by their subscriptions; a species of proof which the law does not and indeed can not reject. The indirect mode of proof consists in an investigation of all the circumstances from which it may be inferred that the person by whom

a deed is subscribed; as, for the stamp, the paper, or a of the handwriting of the same date and where the the one founded pronounced of. It is an established forgery by a inadmissible.

Forgery in Evidence forged by standing in the nostrils slit and perpetual Forgery was first

Forgery, Remedy Daniel and merchants, were The Rev. Dr. bond, in the name greatest interest was exerted to fore the council, III., "If your have murdered accordingly, Jun a London bank Joseph Hutton, December 8, 1826 gery at the Old center 31, 1829.

Forgery of Seal following law, Man shall knowingly a letter, Mediterranean, or shall kno Mediterranean pa istry, he shall fo \$5000 to be recov of the United Sta diction, and if an ever thereafter of office of trust or p ted States."

Fork, a well-handle and a shaft or prongs. The England till the remarkable passage lates the history of mention a thing t fore in discourse d served a custom in through the which other country that think any other n but only Italy. T that are common use a little forke w with their knife, w cut the meats out which they hold in so that whatsoever of any others in dish of meats with doe cut, he will give any as having tra ners, inso much that browbeaten, I und of feeding, I und of Italy, their forks yron, steel, and a only by gentlemen. is, because the Italia

a deed is said to be executed actually did not subscribe; as, for instance, an error in the date, an *alibi*, the stamp, the contorture of, or date impressed upon the paper, or a *comparatio literarum*. The comparison of the handwriting is made with genuine subscriptions of the same date as that alleged to have been forged; and where the real subscriptions differ materially from the one founded on, the forgery of the latter may be pronounced on with a considerable degree of certainty. It is an established rule, however, that the proof of forgery by a mere comparison of handwriting is not admissible.

Forgery in England.—The forging of, or giving in evidence forged deeds, etc., made punishable by fine, by standing in the pillory, having both ears cut off, the nostrils slit up and seared, the forfeiture of land, and perpetual imprisonment.—5 ELIZABETH, 1562. Forgery was first punished by death in 1634.

Forgery, Remarkable Executions for.—The unfortunate Daniel and Robert Perrean, brothers and wine-merchants, were hanged at Tyburn, January 17, 1776. The Rev. Dr. Dodd was found guilty of forging a bond, in the name of Lord Chesterfield, for £4200: the greatest interest was made, and the highest influence was exerted to save him, but when the case came before the council, the minister of the day said to George III., "If your majesty pardon Dr. Dodd, you will have murdered the Perreans;" and he was hanged accordingly, June 27, 1777. Mr. Henry Fountleroy, a London banker, was hanged November 30, 1824. Joseph Hinton, a Quaker merchant, suffered death, December 8, 1828. The last criminal hanged for forgery at the Old Bailey, was Thomas Maynard, December 31, 1829.

Forgery of Sea-Letters.—Congress enacted the following law, March 2, 1808:—"That if any person shall knowingly make, utter, or publish any false sea-letter, Mediterranean passport, or certificate of registry, or shall knowingly avail himself of any such Mediterranean passport, sea-letter, or certificate of registry, he shall forfeit and pay a sum not exceeding \$5000 to be recovered by action of debt, in the name of the United States, in any court of competent jurisdiction, and if an officer of the United States, he shall ever thereafter be rendered incapable of holding any office of trust or profit under the authority of the United States."

Fork, a well-known instrument, consisting of a handle and a shaft terminating in two or more points or prongs. The *table-fork* did not come into use in England till the reign of James I., as we learn from a remarkable passage in Coryat, who thus solemnly relates the history of its introduction:—"Here I will mention a thing that might have been spoken of before in discourse of the first Italian townes. I observed a custom in all those Italian cities and townes through the which I passed, that is not used in any other country that I saw in my travels, neither do I think any other nation in Christendome doth use it, but only Italy. The Italians, and also most strangers that are commorant in Italy, doe always at their meals use a little forke when they eat their meate; for while with their knife, which they hold in one hand, they cut the meate out of the dish, they fasten the forke, which they hold in the other hand, upon the same dish, so that whatsoever he be that sitting in the company of any others at meals shall unadvisedly touch the dish of meate with his fingers from which all the table doe eat, he will give occasion of offence unto the company as having transgressed the lawes of good manners, inasmuch that for his error he shall be at least browbeaten, if not reprehended in wordes. This form of feeding, I understand, is generally used in all parts of Italy, their forks for the most part being made of yronn, Steele, and some of silver, but those are used only by gentlemen. The reason of this their curiosity is, because the Italian can not by any means indure to

have his dish touched with fingers, seeing all men's fingers are not alike cleane. Hereupon I myself thought good to imitate the Italian fashion by this forked cutting of meate, not only while I was in Italy, but also in Germany, and often times in England since I came home: being once quipped for that frequently using my fork, by a certain learned gentleman, a familiar friend of mine, Mr. Lawrence Whitaker, who in his merry humor doubted not to call me a *table-furcifer*, only by using a forke at feeding, but for no other cause."—E. B.

Formosa (Chinese, *Taewan*, i. e., *Terrace Beach*), an island lying about 90 miles off the coast of China, from which it is separated by the channel of Fo-kien. It is about 250 miles in length from north to south, and 80 in breadth, lying between north lat. 22° and 25° 30' and east long. 120° 30' and 122°. A volcanic mountain chain, rising to the height of upward of 12,000 feet, traverses the centre of the island from north to south, and separates the Chinese portion of it on the west from the independent portion on the east. Some parts of the coast present bold headlands; but all the west shore is flat and surrounded with rocks and quicksands, presenting no good harbors, with the exception of Kélung at its northern extremity. The Chinese portion of it is fertile and well watered, and possesses a very salubrious climate. Almost all grains and fruits may be produced on some part of the island, which is familiarly known as the granary of the maritime provinces of China. The rice-trade alone with these provinces employs more than 300 vessels. Among its other articles of trade, are maize, tobacco, sugar, fruits, timber, salt, sulphur, camphor, cotton, hemp, silk, etc. Of the eastern portion of the island little is known; the inhabitants bear no resemblance to the Chinese, but are apparently allied to the Malay or Polynesian tribes. They are of a slender form, olivaceous complexion, wear long hair, and blacken their teeth. They have no written language, and their religion seems to be confined to a superstitious belief in demons and sorcerers. Many of the aboriginal inhabitants are still to be found on the western portion of the island, living in independent villages; others, however, have become incorporated with the Chinese settlers, or live in villages of their own, under the general supervision of Chinese officers.

Formosa was unknown to the Chinese till about 1403. About 1634 the Dutch established themselves here, and built Fort Zealand on a small island commanding the harbor of the capital Taewan. After retaining possession of it for 28 years, they were expelled by the famous Chinese rebel Coxinga, whose successors ruled in the island till 1683, when it was taken by the Chinese. Taewan, the capital, stands on the west coast in north lat. 23°, east long. 120° 32'; but the entrance of its harbor is now choked up. The population of Formosa is estimated at from 2,000,000 to 3,000,000.

Fort, a small fortified place, environed with a ditch, rampart, and parapet. The use of forts is to secure some high ground, or the passage of a river, to make good an advantageous post; to defend the lines and quarters of a siege, and the like. Forts are built of different figures and dimensions, according to the exigencies of the case. Some are provided with bastions, others with demi-bastions; some are of a square form, others pentagonal, and others again are stellated, having five or seven angles.

Forth, one of the largest rivers in Scotland. It is first formed of several small streams rising on the north of Bon Lomond, or flowing from Loch Katrine and the other lakes in the adjacent country. It proceeds easterly in a direct course for above 100 miles, receiving in its progress the tributary waters of the Goodie, the Teith, and the Allan above Stirling, and below it the Devon, the Carron, the Avon, the Almond, the Leth, the Esk, the Leven, the Tyne, and

others; and it discharges itself into the German Ocean in about 56° 10' of north latitude.

The Forth, like other streams connected with the ocean, ebb and flows twice in 24 hours, but the flood and ebb run about two hours longer in the middle than at the shore. The tide flows 4½ miles above Stirling shore. At this harbor spring-tides rise 7 feet 9 inches, and at Alloa, 19½ feet.

It was high water, according to Captain Thomas's observations in 1815, at

	M. M.	Spring Tides	Neap Tides
		Time	Time
Elle Harbor.....	9 11 p. m.	14 feet.	6 feet.
Leith & Burntisland 9 15 "	"	18½ "	7 "
Hopetoun House... 9 30 "	"	17 "	6½ "

The tides at Leith and Kinghorn rise sometimes as high as 19 feet above low-water mark, the average being 17½ feet.

There are in the Forth, as elsewhere in similar rivers and arms of the sea, particular currents. Among the most remarkable are those known by the name of *Leakes* above the Queensferry, which are particularly observed from Culross to Alloa. These consist in an intermission of the tide at certain places during the flood, and before high water the sea ebbs. On the contrary, while the sea ebbs, and before low water, the ebb intermits, and a flow commencing, continues some time; after which the ebbing is resumed until low water. This is seen during two hours, and the irregularity occupies more or less of the river according as it is spring or neap tide.

The principal obstructions to the navigation of the Forth between Alloa and Stirling, have hitherto arisen in a great measure from the two fords of the river, the one called the Town Ford and the other the Abbey Ford, and from the channel being rendered shallow partly by large boulders and partly by accumulations of peat. The peat accumulations have arisen chiefly from the proprietors above Stirling clearing several thousand acres of their lands for cultivation, by removing the peat which covers them, and moving it into the river in order to be carried away by the current to the sea. This practice has been followed since 1732. The moss covering the soil varies in depth from 14 to 4 or 5 feet, but the greater proportion is 10 feet. Mr. Drummond, of Blair-Drummond, from 1783 to 1839, floated away upward of 1,600 acres of this substance.

The principal sand-banks which obstruct the navigation further down the firth are the Drum-sands, near Cramond, and the Sand-end, on the east of Burntisland harbor. The principal rocks which require to be avoided by the mariner are the South Carr Reef, lying N.N.W. from Dunbar, the North Carr, about a mile and a quarter east of Fifeness, the Blae to the west of Kinghorn Ness, the Commons to the west of Burntisland, Craig Waugh S. E. one half E. of Inchkeith, and the Gunnat Rock, Pallas Rock, Long Craig, Briggs, and Harwit in its neighborhood; and several miles further west, and nearer Inchcolm, the Oxcares, Careralg, and Micky Stone. Many of these rocks are seen at the lowest ebbs; their position, together with the different land-marks, which are necessary to point them out to the mariner, are delineated on the admiralty charts, and the sailing directions for the Firth of Forth, contained in the *Coaster's Assistant*, which is published in Leith. To show their position still better, floating buoys have been placed upon Craig Waugh, the Gunnat, the Harwit, and the Pallas Rocks; and beacons have been erected on the Oxcares, the North Carr, and on the Long Craig, and on most of the other dangerous rocks, and on several shoals and sand-banks. Besides the provisions for aiding the navigation, there are two light-houses on the Isle of May, one on the island of Inchkeith, and various other light-houses are now erected on all the harbors and landing-places of importance in the firth.

The anchorage of the Firth of Forth is excellent.

Mr. Osborne, in a report to the Lords of the Admiralty on 2d May, 1853, says of it: "Between the Humber and the Frith of Cromarty there is no other harbor or anchorage into which large ships of war can safely run for shelter or rendezvous other than the Frith of Forth, and more particularly in the reach above the Queensferry, where the shelter is complete. But as the Frith of Cromarty is away from all important interests, the Frith of Forth must be considered the only war port north of the Humber, and therefore a most fitting place for a naval arsenal." Besides the great and important anchorage at St. Margaret's Hope, in the reach above the Queensferry, which is more particularly referred to in this Admiralty report, Leith Roads to the west of Inchkeith is another, which is capable of holding a large fleet of ships of war of any size. The minor anchorages in the firth, which are also very good, are at Aberlady Bay, the western part of Largo Bay, Burntisland, St. Davids, Limekilns, etc.

The landing-places or harbors in the Forth are, on the south side the harbors of Dunbar, North Berwick, Port Seton, Morrison's Haven, Fisherrow, Leith, Newhaven, Trinity, Granton, South Queensferry, Borrowsdowne, Grangemouth, and Stirling Shore, and on the north side, Crail, Anstruther, Elie, Pittenweem, Leven, Methel, West Wemyss, Dysart, Kirkcaldy, Kinghorn, Pettycur, Burntisland, Starleyburn, Aberdour, St. Davids, Inverkeithing, North Queensferry, Charleston, Crombie Point, Culross, Kincardine, and Alloa. Great improvements and new erections have lately been made at most of these harbors which are of any note; and in particular, the Duke of Buccleuch's magnificent harbor in progress of formation at Granton, and the extension of Leith Pier into deep water, may be referred to. Of less magnitude is the deepening of the channel of the Forth between Alloa and Stirling by commissioners acting under the act of Parliament 6th and 7th Victoria, cap. 47. Since the passing of this act in 1843, a channel of about 500 yards in length has been formed through the Abbey Ford, giving about 3 feet 6 inches greater depth of water than formerly. A channel about 1,000 yards in length has also been formed through the Town Ford, which is not yet fully completed as regards its depth of water. In these operations many thousands of large boulder-stones and the peat accumulations which formed obstructions to the navigation have been removed, and no doubt is entertained by the inspectors, who have reported to government on this subject, but a depth of 10 or 17 feet at spring-tides will be obtained up to Stirling when the works in progress are completed. Upward of £9,000, including the expense of the act and of erecting a quay at Stirling, have already been expended by the Harbor Commissioners on these operations, and £7,000 more is about to be expended upon them. This sum is to be paid to the commissioners by the Town Council of Glasgow for damage likely to arise to the improvements in progress on the Forth, from the liberty obtained by the city of Glasgow to draw a large quantity of water from Loch Katrine. In addition to these sums, the revenue of the Forth Commissioners, which is considerable, will enable them still further to extend their works.

Further, the low-water ferry landing-place at Burntisland, belonging to the Edinburgh, Perth, and Dundee Railway Company, is a great improvement at that port; and at Kirkcaldy, Buckhaven, and other harbors, extensive works are in progress under Harbor Commissioners.

The coasting and foreign trade of the Forth is carried on in vessels varying in size from 18 to 500 tons. The principal port to which they belong is Leith; but there are several whalers and large vessels engaged in the Australian, American, Mediterranean, and Baltic trades, which belong to other ports in the Forth.

The traffic in goods and passengers between the ports in the Forth and London, Greenock, Glasgow, Liverpool, Hull, Newcastle, Dundee, Perth, Aberdeen, Inverness, Peterhead, and almost every considerable sea-port in Scotland, is conducted chiefly by vessels of joint-stock companies, which vessels sail periodically. Joint-stock companies are also engaged in the Leith trade with Hamburg and Rotterdam. The Glasgow, Greenock, and Liverpool trade, is chiefly conducted through the Forth and Clyde canal.

The number and tonnage of the vessels belonging to the ports in the Forth in 1855 are as follows :

At Alloa, including the creeks of Kilmardine and Strling, 74 vessels, with a tonnage of	12,402
At Borrowatounness, including the creeks of Chaceleston and Lunckins, 47 vessels, with a tonnage of	8,731
At Grangemouth, 54 vessels, with a tonnage of	9,233
At Inverkeithing, 23 vessels, with a tonnage of	4,361
At Kirkcaldy, including the creeks of Largo, Leven, Wemyss, Dysart, Kinghorn, Burntisland, and Aberdour, 60 vessels, with a tonnage of	7,637
At Leith, including the creeks of Granton, Fisherrow, Cockenzie, and Dunbar, 176 vessels, with a tonnage of	25,404
Total 484 vessels, with a total tonnage of	60,868

E. B.

Fortified Island, an island in the India seas, lying off the coast of Canara, about a mile from the land, a little way north from the entrance to Lake Onore. The island abounds in cocoa-nut, palm, and plantain-trees, and has plenty of fresh water. It produces the best kind of earl, which is used by the natives in painting their houses. Its name is derived from its fortifications, which were greatly strengthened by Tipoo Saib, from whom it was taken in 1792 by three British frigates. It is upward of a mile in circuit. Long. $74^{\circ} 27' E.$; lat. $14^{\circ} 16' N.$

Fothering, a peculiar method of endeavoring to stop a leak in the bottom of a ship while she is afloat, either at sea or at anchor, which is performed by fastening a sail at the four corners, letting it down under the ship's bottom, and then putting a quantity of chopped rope-yarn, oakum, wool, cotton, etc., between it and the ship's side. By repeating the latter part of this operation several times, the leak generally sucks in a portion of the loose stuff, and thereby becomes partly and sometimes wholly stopped. Some persons prefer thrumming the sail, instead of letting down the loose stuff; but in this mode the sail is soon chafed through by the hole if the leak is considerable, without affording sufficient substance to stop it.

Foul, a sea phrase that is used in distinction from clear, and implies entangled, embarrassed. Hence, foul anchor, when the cable is twisted round the stock and flukes; foul bottom, when a bay is covered with weeds, grass, shells, filth, and rocks. Foul huwse means that the cables are turned round each other by the slip having swung the wrong way when moored. Foul rope, a rope entangled and unfit for immediate use. Foul water, is water troubled, and rendered turbid by the ship's bottom rubbing on the ground. Foul wind, is used to express that the wind is unfavorable, or contrary to the ship's course, as opposed to large or fair.

Foundery, or **Foundry,** the art of melting and casting metals. See COPPER; IRON.

Foundry of Small Works, or Casting in Sand.—The sand commonly used for casting small works is at first of a pretty soft, yellowish, and clammy nature; but it being necessary to strew charcoal dust in the mold, it at length becomes of a quite black color. The sand is worked over and over, on a board, with a roller and a kind of knife; and is placed over a trough to receive it, after it has by these means been sufficiently prepared.

This being done, the workmen take a wooden board of a length and breadth proportional to the things to

be cast, and putting a ledge round it, they fill it with sand a little moistened, to make it duly cohere. They then take either wood or metal models of what they intend to cast, and apply them to the mold, and press them into the sand so as to leave their impression there. Along the middle of the mold is laid half a small brass cylinder, as the chief canal for the metal to run through, when melted, into the models or patterns; and from this chief canal are placed several others, which extend collaterally to each model or pattern placed in the frame. After this frame is finished, they take out the patterns, by first loosening them all round, that the sand may not give way; then they proceed to work the other half of the mold with the same patterns in just such another frame, only that it has pins, which entering into holes corresponding to it in the other, make the two cavities of the pattern fall exactly on each other. The frame, thus molded, is carried to the melter, who, after extending the chief canal of the counterpart, and adding the cross canals to the several models in both, and strewing mill-dust over them, dries them in a kind of oven prepared for the purpose. Both parts of the mold being dry, they are joined together by means of the pins; and to prevent their giving way, by reason of the melted metal passing through the chief cylindrical canal, they are screwed or wedged up as in a press. While the molds are thus preparing, the metal is fusing in a crucible of a size proportional to the quantity of metal intended to be cast. When the molds have cooled, the frames are unscrewed or unwedged, and the cast work is taken out of the sand, which sand is worked over again for another casting.

Foundry of Statues.—The casting of statues depends on the due preparation of the pit, the core, the wax, the outer mold, the inferior furnace to melt off the wax, and the upper to fuse the metal. The pit is a hole dug in a dry place, somewhat deeper than the intended figure, and made according to the prominence of certain parts of it. The inside of the pit is commonly lined with stone or brick; but when the figure is very large, they sometimes work on the ground, and raise a proper fence to resist the impulsion of the melted metal. The inner mold, or core, is a rude mass, to which is given the intended attitude and contours. It is raised on an iron grating strong enough to sustain it, and is strengthened within by several bars of iron. It is generally made either of potters' clay mixed with cow-hair, or of plaster of Paris mixed with brick-dust. The use of the core is to support the wax and the shell, and lessen the weight of the metal. The iron bars and the core are taken out of the brass figure through an aperture left in it for that purpose, which is soldered up afterward. It is necessary to leave some of the iron bars of the core, which contribute to the steadiness of the projecting part, within the brass figure. The wax is a representation of the intended statue. If it be a piece of sculpture, the wax should be all from the hand of the sculptor himself, who usually forms it on the core; though it may be wrought separately in cavities, molded on a model, and afterward arranged on the ribs of iron over the grating, filling the vacant space in the middle with liquid plaster and brick-dust, by which means the inner core is proportioned as the sculptor carries on the wax. When the wax, which is of the intended thickness of the metal, is finished, small waxen tubes, perpendicular to it from top to bottom, are filled, to serve both as canals for the conveyance of the metal to all parts of the work, and as vent-holes to give passage to the air, which would otherwise occasion great disorder when the hot metal came to encompass it.

The work being brought thus far, must be covered with its shell, which is a kind of crust laid over the wax, and which being of a soft matter, easily receives the impression of every part, which is afterward communicated to the metal upon its taking the place of

the wax, between the shell and the mold. The matter of this outer mold is varied according as different layers are applied. The first is generally a composition of clay and old white crucibles well ground and sifted, and mixed up with water to the consistence of a color fit for painting; and it is applied with a brush, by means of which it is laid on seven or eight times successively. For the second impression horse-dung and natural earth are added to the former composition; but for the third impression only horse-dung and earth are used. Lastly, the shell is finished by laying on several more impressions of this last matter, made very thick, with the hand. The shell, thus finished, is secured by several iron girths bound round it, at about half a foot distant from each other, and fastened at the bottom to the grating under the statue, and at top to a circle of iron where they all terminate.

If the statue be so large that it would not be easy to move the molds with safety, these must be wrought on the spot where it is to be cast. This is performed in two ways. In the first place, a square hole is dug in the ground, much larger than the mold to be made therein, and its inside is lined with walls of freestone or brick. At the bottom is made a hole of the same materials, with a kind of furnace, having its aperture outward; and in this a fire is made, to dry the mold, and afterward melt the wax. Over this furnace is placed the grating, and upon this the mold, formed as above. Lastly, at one of the edges of the square pit is made another large furnace, to melt the metal. In the other way, it is sufficient to work the mold above ground, but with the precaution of a furnace and grating underneath. When finished, four walls are run around it, and by its side a melting furnace is prepared. For the rest, the method is the same in both cases. The mold being finished, and inclosed as described, whether below ground or above it, a moderate fire is lighted in the furnace under it, and the whole covered with planks, that the wax may melt gently down, and run out at pipes, contrived for that purpose, at the foot of the mold, which are afterward exactly closed with earth, as soon as the wax is all carried off. When this is done, the whole is filled up with bricks, thrown in at random, and the fire in the furnace augmented, until both bricks and mold be some red-hot. The fire is then extinguished, and every thing being cold again, the bricks are taken out, and their place filled up with earth, moistened, and beaten a little at the top of the mold, in order to render it firmer. These preparatory measures being duly taken, there remains nothing but to melt the metal, and run it into the mold. This is done by means of the furnace above described, which is commonly made in the form of an oven, with three apertures, one to put in the wood, another for a vent, and a third to run the metal out at. From this last aperture, which is kept very close while the metal is in fusion, a small tube is laid, by which the molten metal is conveyed into a large earthen basin, over the mold, into the bottom of which all the large branches of the jets or casts, which are to convey the metal into the different parts of the mold are inserted.

Foundry of Bells.—The metal for cast-iron bells, it is to be observed, is different from that employed for casting statues; there being no tin in the statue metal, whereas in the bell metal there is a fifth or more.

The dimensions of the core and the wax for bells, especially a chime, are not left to chance, but must be measured upon a scale, or diapason, which gives the height, the aperture, and the thickness necessary for the several tones required. It is on the wax that the several moldings and other ornaments and inscriptions, to be represented in relief on the outside of the bell, are to be formed. The clapper or tongue is not properly part of the bell, but is furnished from other hands. In Europe it is usually of iron, with a large knob at the extremity; and is suspended in the middle of the bell. In China a wooden mallet is used, which is

struck by the hand against the bell; and hence the Chinese bells can have comparatively little resonance. The Chinese have a method of increasing the sound of their bells, by leaving a hole under the cannon; but this our bell-founders would reckon a defect.

The proportions of our bells differ very much from those of the Chinese. In ours, the modern proportions are, to make the diameter fifteen times the thickness of the brim, and the height twelve times. The parts of a bell are, first, the sounding bow, terminated by an inferior circle, which grows thinner and thinner; secondly, the brim, or that part of a bell whereon the clapper strikes, and which is thicker than the rest, thirdly, the outward sinking of the middle of the bell, or the point under which it grows wider to the brim; fourthly, the waist or furniture, and the part that grows wider and thicker quite to the brim; fifthly, the upper vase, or that part which is above the waist; sixthly, the pallet, which supports the staple of the clapper within; and, seventhly, the bent and hollowed branches of metal uniting with the cannons, to receive the iron keys, by which the bell is hung up to the beam, and which forms its support and counterpoise when rung out.

Fountain-tree, or Til-tree, a very extraordinary tree said to have existed formerly in the island of Hierro, one of the Canaries, and to have distilled water from its leaves in such abundance as to satisfy the requirements of those who lived near it. Whether such a tree ever existed is questionable; yet various writers have mentioned the fountain-tree of Hierro in apparently good faith. Glaese, in his *History of the Canary Islands*, published at London in 1764, alludes to it in the following terms:—"Many writers have made mention of this famous tree, some in such a manner as to make it appear miraculous; others, again, deny the existence of any such tree, among whom is Father Feijoo, a modern Spanish author, in his *Teatro Critico*. But he, and those who agree with him in this matter, are as much mistaken as those who would make it appear to be miraculous. This is the only island of all the Canaries which I have not been in; but I have conversed with natives of Hierro, who, when questioned about the existence of this tree, answered in the affirmative."

Frankincense, or Olibanum tree (*Boswellia serrata*) is indigenous to the mountains of central India, where it is known under the name of *Sali*, and as producing the olibanum of commerce, or the gum frankincense of the ancients. It is a lofty tree, with the foliage crowded at the extremity of the branches, and is frequent in the forests between the Sone and Nangpur, from which circumstance it may be inferred that it would be adapted to the soil and climate, in favorable locations, in some of our southern States.

Olibanum distills from heilsdoms made in the bark of the tree during the summer months, occurring in the form of semi-transparent masses, or tears, of a pale-yellowish or pink color, solid, hard, and brittle. It has a bitterish acrid taste, and, when chewed, sticks to the teeth, and renders the saliva milky. When heated, it burns brilliantly, and diffuses an agreeable odor, in consequence of which, in the early ages, it was much used as incense in the sacrifices, and in modern times, the Greek and Roman Catholic churches still retain the use of frankincense, in some of their ceremonies. It is seldom employed for other purposes, except as a perfume in the rooms of the sick, although other gums bearing that name are in more general use, and are by many regarded as identical with it; for instance, Lamarck designates the gum of the *Amyris gileadensis* by this name; Forskal and Sprengel, that of the *Amyris kataf*; while Linnaeus erroneously thus denominates the resin of the *Juniperus lycia*.—*Patent Office Report*, 1855.

end of the 17th century equal, or very nearly appears to have contained. In 1791, it was and in 1851 nearly 30 ways maintains a large peace established usually in December, 18 on service is about equivalent Britain, with 62,000

Surface.—The surface, an advantageous ground. Less level than many, or the greater on the whole, less moist and may with great profit with this distinction,

France. This important part of continental Europe extends from the 43d to the 51st degree of north lat., and from long. 6° 25' east, to long. 4° 48' west. The greatest length of France, exceeding 665 miles, is from east to west—from Alsace to Brittany, which projects into the Atlantic like a wedge, and without which France would approach in form to a square. Its breadth from north to south is about 576 miles; and its superficial extent, as stated in the *Statistique de la France*, is 52,708,618 hectares, equal to 204,855 square miles, or 180,787,16 $\frac{1}{2}$ English acres—nearly twice the total area of the British Isles.

Though in point of extent and ready access from the interior to the sea, France is far inferior to Great Britain and Ireland, she is, on the other hand, more fortunate in these respects than the vast inland territories of Austria and Russia. She has the advantage over these countries likewise in strength of natural barriers, the Pyrenees forming a great bulwark on the south-west, the Alps on the south-east, and the Jura and the Vosges Mountains on the east. The Belgian is the only open part of the frontier.

France enjoys, upon the whole, greater natural advantages than any other country in Europe. Her territory is above a half larger than that of Great Britain and Ireland, and both her soil and climate are better—the climate being less equable indeed, but there being a greater amount of summer heat to bring the fruits of the earth to perfection. She has a greater proportion of arable land than any of her neighbors; the natural means of communication throughout her provinces are abundant and easy; she is well provided with all the useful metals except tin; and is better supplied with coal than any other country of Europe, but Britain. Even during the distractions of her great Revolution, though her foreign trade was annihilated, her agriculture and manufactures were extended and improved, her population was increased, and its condition ameliorated. The surface of France contains about 180,000,000 of acres. It is estimated that, of this quantity, the waste land, including roads and rivers, amounts to an eighth part; the arable land to near a half; the wood-land and pasture-land and meadows, each, to about a seventh; the vineyards to a 26th part; wild-land, quarries, buildings, orchards, gardens, olive, and other plantations, making up the remainder. In addition to the vegetable productions that grow in England, the climate of France enables her to raise vines, olives, mulberries, and chestnuts. Wine and olive oil are two of her most valuable productions. The cotton trade has been for some time rapidly extending over the northern and eastern provinces; and Lyons has been long famous as the centre of the silk trade of Europe, a branch of manufacture that has been brought to great perfection in that city. The manufactures of woolen cloth, flax, hemp, and iron, are also very extensive, and have been carefully fostered under the protective system, which still prevails here, as elsewhere on the Continent, notwithstanding the example which has been set by Great Britain. Toward the end of the 17th century, the territory of France, then equal, or very nearly equal, to its present extent, appears to have contained about 20,000,000 of inhabitants. In 1791, it was found to be above 26,000,000, and in 1851 nearly 36,000,000. The government always maintains a large standing army, amounting on the peace establishment to about 350,000 men, but actually in December, 1851, to 581,000. Her armed fleet on service is about equal in number of ships to that of Britain, with 62,000 men.

Surface.—The surface of France exhibits, in general, an advantageous succession of high and low ground. Less level than Poland, the north of Germany, or the greater part of European Russia, it is, on the whole, less mountainous than Spain or Italy, and may with great propriety be compared to England, with this distinction, that while in the latter, the

mountainous tracts are in the north and west, in France they are in the south and east. Issuing over lofty ridges which form the frontier line of France on the side of the Pyrenees, the Alps, the Jura, and the Vosges, and confining our attention to the interior, we find throughout Flanders, Picardy, Normandy, and the countries to the north and south of the Loire, a level tract, diversified occasionally by hills, either insulated or in succession, but by none of the massy elevations entitled to the name of mountains. These we do not meet until reaching the south of Champagne and north of Burgundy, near the sources of the Meuse, the Moselle, the Saône, and the Seine. From this bleak quarter (lat. 47° and 48°), a very long range of mountains proceeds from north to south in a direction parallel to the coast, first of the Saône, and subsequently of the Rhône, until, on approaching the Mediterranean, they branch off to the south-west and join the Pyrenees. Their greatest height is in Auvergne (about lat. 45°), where this chain, or more properly a lateral branch of it attains, at the mountains called Cantal and Puy-de-Dôme, an elevation of fully 6355 feet, and has its highest ridge covered with snow during the greater part of the year. Another, but a much less lofty range, extends from Bordeaux to the south-east, a distance of 150 miles, until it reaches the Pyrenees. The smaller chains are numerous in the east and south-east of the kingdom—in Lorraine, the Nivernois, Dauphiné, Provence; also in part of the interior, particularly the Limousin and Guienne. They are interspersed with extensive plains, but, on the whole, the south and east of France are rugged and elevated tracts, and may be said to be that country what Wales and Scotland are to Great Britain.

Rivers.—The course of the great rivers is easily connected with this view of the surface of the territory of France. The Moselle, the Meuse, the Marne, the Aube, the Seine, the Yonne, taking their rise on the northern side of the mountain chain, between lat. 47° and 48°, flow all to the north or north-west, until reaching the sea or quitting the territory of France. From the southern slope of the same range proceed the Rhône, the Doubs, and the Ain. These, along with many smaller streams, are all received by the Rhône, which flows almost due south, with a full and rapid current, until it reaches the Mediterranean. The Loire has much the longest course of any river in France. It rises to the southward of lat. 45°, flows in a northerly direction above 200 miles; turns, near Orléans, to the west; is joined by the Cher, Indre, and Vienne from the south, and, after receiving the Sarthe from the north, falls into the Atlantic below Nantes. The Garonne, a river of less length of course, but of a greater volume of water, descends from the French side of the Pyrenees, flows northward, and after receiving from these mountains a number of tributary streams, of which the chief is the Arrigüe, turns to the westward near Montauban (lat. 44°), and falls into the Atlantic after being augmented by the waters of the Tarn, Aveyron, Lot, and finally the Dordogne—all flowing from the western face of the mountains of Auvergne.

France has very few lakes, either in the mountainous districts of the south, or in the great levels of the north and west. It contains, however, a number of maritime inlets, forming inland bays, and communicating with the sea only by a channel of greater or less width. These occur partly in the south-west coast, in Gascony; but more in the south and south-east, in Languedoc and Provence. Their want of depth prevents them from serving as roadsteads for shipping, and they are useful chiefly for fishing, or for the manufacture of bay-salt.

Forests.—France has much less of artificial or ornamental plantation than England, and much more of natural forest, the total extent of ground covered by wood being computed at 17,000,000 of acres, or one

eighth of the territorial surface of the kingdom. Forests are found in almost every department. Lower Normandy contains several of considerable extent. There is a large one at Fontainebleau, only 45 miles from Paris; and a larger one to the north of the Loire, in the vicinity of Orléans. Those situated in the neighborhood of the sea, or of navigable rivers, or of great works, such as glass-houses and iron-founderies, have long been subjected to an improvident consumption, which is likely to be increased by the still heavy though reduced duties imposed on foreign coal, and by the undue encouragements given to the smelting of iron by the heavy duties which were, in 1814 and in 1822, laid on the importation of foreign iron; so that at present the principal forests are at a distance inland, particularly in the east, in the Department of Ardennes, and in the long mountainous tract that forms the boundary of France on the side of Switzerland.

Climate.—In a country of so great extent, and of such diversified surface as France, it is difficult to condense a description of the climate under a few comprehensive heads. The most natural division is into the north, south, and central regions. The north, comprehending Flanders, Picardy, Normandy, Brittany, and in general all that part of France which would be bounded on the south by a diagonal line from lat. 47° on the west to lat. 49° on the east frontier, bears a great resemblance, both in temperature and produce, to the south of England, rain occurring frequently, and the country being consequently fit for pasture. There, as with us, the predominant culture is wheat, barley, oats, rye, and such fruit as apples, pears, cherries; also, hemp, flax, and rapeseed. It is here only in France, that the natural pastures are rich and extensive; here, also, the species of wood, oak, ash, elm, bear a close resemblance to ours. The central region may be said to comprehend the country to the south of the Loire, or rather of the diagonal line we have mentioned, until reaching a similar line in lat. 45° on the west and 47° on the east frontier. Here, with the exception of the mountainous parts, the winter is sensibly shorter and milder. Wheat, barley, oats, and rye, are still cultivated, but maize begins to appear, and vines become general. The weather in this great inland tract is much more steady than in the north. In the summer months there is little rain, and storms, when they occur, are frequently accompanied with hail; but, on the whole, the temperature is perhaps the most pleasant in France, being exempt equally from the oppressive heat of the south and the frequent humidity of the north. The third region, comprehending the whole breadth of the French territory from lat. 45° 30' and 46' to lat. 43°, and in some parts to 42° 30', approaches in climate to the heat of Spain and Italy, rendering it necessary in the summer to suspend all active exertion during the middle of the day, and to reserve it for the morning and evening. A shaded situation is here the desideratum for a dwelling, and a supply of water for agriculture. In this region the heat invariably produces an exuberant crop where an irrigation can be supplied; hence the frequency of wells, which are generally worked by a wheel and some rude machinery. Wheat is partially cultivated; barley, oats, and rye, only on the high grounds; maize is very general, and vines supply not only the main article of export, but the usual drink of the inhabitants. The common fruits are olives and mulberries, and, in a few very warm situations, oranges and lemons. Pasturage is good only on mountainous or irrigated tracts. To pulmonary invalids the climate may be advantageous, but in this respect, also, material distinctions occur from locality, the winter in the south-east of France being at intervals very cold, from the *vent de bise*, a piercing wind that blows from the Alps and the mountains of Auvergne. Here, notwithstanding the latitude, the cold of winter is intense. Brittany, projecting into the

Atlantic, is as rainy as Ireland or Cornwall. Normandy, with part of Picardy and French Flanders, may be compared to our inland counties. In the interior of France the rains are less frequent, but far more heavy; so that there is much less difference in the quantity of rain that falls in the course of the year than in the number of rainy days. The atmosphere of France is much less cloudy than that of Britain. The most frequent wind in the north of France, as in Great Britain and Ireland, is the south-west; it prevails, also, but to a less degree, in the central part of the kingdom. In the south of France the more common winds are from the north. The difference of temperature between London and Paris is not considerable, nor is the degree of heat found to be intense along the west coast of France, until reaching or rather passing Poitou. In the interior it is much more perceptible, being strongly felt at Lyons, Bordeaux, Toulouse, and still more in the latitude of Nîmes, Aix, Marseilles, and Toulon. On the whole, the variations of climate between the north and south of France are considerably greater than between the north and south of Britain, where the effect of difference of latitude is so much modified by the vicinity of the sea, and where no such variation is known as the very material one indicated by the diagonal line from east to west, the latter being two degrees colder in consequence of the breezes and vapors of the Atlantic.

The harvest begins in the north of France between the 20th and 25th July, in the central part about the middle of that month, in the south about the end of June. September and October are the months of vintage. The great hazard to the corn of the central part of the kingdom arises from violent storms of rain and hail; in the south, from the want of rain in the spring. In the winter, the *vent de bise* often proves destructive to the olives. The great heats are in July, August, and September; a time of much annoyance in the south of France, from mosquitoes, gnats, flies, and other insects; while even scorpions are found in that warm latitude.

Soil.—To exhibit a classification of the different kinds of soil is a task of difficulty in any extensive country, and in none more so than in France, where a striking difference prevails, not only in contiguous departments, but in adjacent districts of the same department. In Flanders, Picardy, Artois, Normandy, and the Pays de Beauce, a fertile tract to the south of Paris, the soil consists frequently of a loamy mold; in the central and southern parts of the kingdom it is often lighter; while the greater part of Brittany, and of the departments along the western coast, have a heathy soil, naturally unproductive, but capable of considerable improvement. Not these collective estimates are liable to great deductions; and the attempts made by Arthur Young, and other statistical writers, to calculate the proportion of the different descriptions of soil, whether loam, henth, chalk, gravel, or the like, are considered by the French as far from successful; even the more systematic effort made by their own government, in the beginning of this century, to compute the value of land by *masses de culture*, that is, by classing all kindred soils under one head, proved altogether abortive. We shall forbear, therefore, all such vague calculations, and proceed to state the value of annual produce in the different departments, endeavoring to cast the latter in lots, according to their position and relative productiveness.

Harbors, Rivers, Canals, Roads, Bridges.—In this important point France is considerably inferior to England, her long tract of coast washed by the Atlantic and the Bay of Biscay being indifferently provided with sea-ports, and those on the southern shore of the Channel forming a striking contrast to the spacious maritime inlets on the English side. To begin from the north-east, Dunkirk has a small harbor, but improved in the interior of the town, approached on

the Dutch plan by a canal leading from the sea. Boulogne has a roadstead—which, however, has been much deepened and improved—indebted for its celebrity under Bonaparte to the facility of giving protection, by land batteries near its entrance, to a numerous assemblage of small craft. The port of Dieppe is exposed, and of course unsuitable for winter; that of St. Malo is better; while Cherbourg, on which immense sums have been expended, is now a port and arsenal of great utility and importance to the imperial navy. On doubling the projecting part of Brittany; we find, in the south-west of that province, L'Orient. Brittany also possesses Brest, the great maritime port of the Atlantic for the navy. Proceeding further to the south, we find Rochefort, at La Rochelle, a small but secure harbor, and at Bordeaux a river nearly equal in width to the Thames at London. From this there is no sea-port until we reach Bayonne, a place of no easy access. On the Mediterranean, France has the ports of Cette and Marseilles, the latter spacious and secure, and the great maritime port, arsenal, and dockyard of Toulon, which, with Cherbourg, Brest, L'Orient, Rochefort, and Toulon, are called, in ordinary parlance, *ports militaires*.

Nantes, though a large commercial town, adjoins a shallow part of the Loire, and vessels of burden are obliged to load and unload at Palmbeuf. The great dockyards and naval stations of the kingdom are at Brest and Toulon, both excellent harbors, and at Rochefort, which is situated on the River Charente, near its mouth. In all these the accommodation for shipping is the gift of nature; but at Cherbourg the case is very different, that port containing works, of which the labor and expense (see the article BARRACKS, *Encyclo. Brit.*) have been very great. Its roadstead, extensive but open, has a sea-wall, affording protection from the swell of the sea; and its spacious dock, excavated since the beginning of this century, at an expense of £8,000,000 sterling, is capable of containing fifty sail of the line. Le Havre de Grace, the best mercantile harbor in the north of France, has also been formed at a large expense.

Inland Navigation.—The square form of France, favorable as it is for military defense, subjects the greater part of the country to the want of those ready and economical means of transport by sea which form the great physical advantage of Great Britain and Ireland. Unluckily, this want is very imperfectly supplied by the inland waters, canals being very little extended, and the navigation of the great rivers subject to many obstructions; occurring in one part from rapidity, in another from shallowness; at one season from drought, at another from overflow. The application of steam to navigation has corrected in part this most inconvenient hardness; but the accommodation which is afforded by the Loire in the interior, the Rhône in the south, the Seine in the north, and the Garonne, with its Canal du Languedoc in the south-west, is but a small portion of what is furnished by our numerous interconnections in England, or of what is wanted for so extensive a territory as that of France. The Canal of Languedoc, or the *Canal du Midi*, as it is now generally called, begun in the reign of Louis XIV. and completed in the year 1668, was the first example in Europe of inland navigation on a great scale. It is the most stupendous undertaking of the sort that has been executed in France. Its general breadth is sixty feet, its depth six and a half feet. It has 114 locks and sluices, and in its highest part it is 600 feet above the level of the sea. As a scientific work, it did honor to an age as yet little advanced in engineering; but in a peculiar point of view it was unproductive, the tolls never having paid the interest of the very large sum (upward of £1,200,000 sterling) expended upon it.* The canal begins at Toulouse on

the Garonne, remounts the valley of the Lhers, traverses the chain of the Monts Corbières, which joins the Cevennes to the Pyrenees, descends the valley of the Aude at Carcassonne, which it leaves at Ginestas to pass by Béziers, where it traverses the Rive d'Orb. Passing through Hérault above and near Agdet, it ends at l'Étang de Thau, at the place called le Port des Onglous. The navigation is however continued to the port of Cette by the canal of Cette, and thus the Atlantic and Mediterranean are united.

The canal of Briare is of earlier date, and of much less extent. The object here was to open a navigation from the Loire on the south to the Seine on the north, by a canal running almost due north, a distance of forty miles. It then receives from the west the canal of Orléans, commenced in 1675, and proceeding also from the Loire; after which the canal is continued to the north, under the name of Canal de l'Oing, till it reaches the Seine. This canal was begun in 1605, in the reign of Henri IV., and was completed in 1642, under Louis XIII. There are, besides this great work, several other important and extensive canals in France. The Canal du Centre unites the Saône and the Loire in the upper part of the course of the latter. It is 72 English miles in length, and was completed in 1791, at an expense of £456,000. Its summit level is about 240 feet above the level of the Loire at Angouin. It has 81 locks, $5\frac{1}{2}$ feet of water, 48 of breadth at the water's edge, and 30 feet at the bottom. The Canal of St. Quentin, 28 English miles in length, was completed in 1810, but the navigation was far from perfect. In 1826 the necessary expenses to render the canal perfect were estimated at 4,000,000 francs. A concession of the canal was made to a Sieur Honorez in 1827, for a period of twenty years. On the 11th of July, 1847, the state entered into full and entire possession of the line which it had conceded. It joins the Scheldt and the Somme. The Canal of Beaucaçon is extensive. It joins the Saône, and consequently the Rhône, to the Rhine. From the Saône it stretches a little above St. Jean de Losne, by Dôle, Beaucaçon, and Mulhausen, to Strasbourg, a distance of 200 miles, where it joins the Rhine. The canal of Burgundy joins the Rhône to the Seine. This canal was opened along its whole line in December, 1832, by way of trial, and in the past year, 1854, it was completely opened. The canal of the Ourcq was dug, not for a commercial purpose, but to convey the water of that little river to Paris for the consumption of the inhabitants. At a village called La Villette, on the north side of Paris, there was some years ago excavated, at the cost of a million sterling, a basin, approaching in size to our London docks, and adapted, when the necessary canals shall be completed, for the deposit of merchandise brought from Havre and Rouen on the one side, and Flanders and Champagne on the other. In the south of France there is a short canal proceeding from the Rhône, near Tarascon, in a south-west direction, to the Mediterranean, called, from its vicinity to a well-known annual fair, *Canal du Beaucaire*. This canal traverses a great extent of marsh, which it has had the effect of draining. This water-way was opened to supply the imperfect navigation of the lesser Rhône, and of the two canals by which the communication from the Garonne to the Rhône was formerly carried on. These are among the chief canals of France. In the year 1836 there were seventy-four canals, having a total length of 3,699,913 metres, nearly equal to 2280 English miles. But since then large sums have been allocated by the state for canalization. In the fifteen years between the 12th July, 1837, and the 28th March, 1852, M. Ernest Grangez, chief-de-bureau at the ministry of commerce and pub-

*according to M. Ernest Grangez (see *Precis Historique et Statistique des rivières navigables*, p. 404), according to the present value of money, a sum of 30,000,000 francs.

* The cost of the canal was 17,000,000 francs, representing,

Ho works, tells us that, for this purpose, extraordinary credits have been taken for 241,936,361 francs. Of this sum 227,695,500 francs had been expended on 31st December, 1858. In 1854, a credit of 8,000,000 francs had been granted.

The canalisation of the Mayenne from Laval to Mayenne, of the Vire from the Pont de Gourfaleur to Vire, of Rheims to the Marne, of Bouc to Martignes, from Caen to the sea, from the Charente to Marennes, from La Rochelle to Marans, and from Saint Thibault to the lateral canal of the Loire, is in course of execution. But it is probable that this improved mode of communication may be superseded by the still greater improvement of the railroad, which had to a considerable degree engrossed the public attention in France. There are, however, obstacles to the progress of these improvements, arising partly from the mode of management adopted, and partly also from the high price of the materials required. All great works for the benefit of the community at large, such as canals, railroads, docks, and the like, are carried on at the expense, for the benefit, and under the control of the government. Plans and estimates must be made out and laid before the minister of the interior, who refers them to other public functionaries, namely, the prefect of the department, and afterward to the *bureau des ponts et des chaussées*; and when all these persons are satisfied, a public officer is then appointed to superintend the work. The tedious official routine, through which all public undertakings have to pass, tends to discourage individual enterprise, and accounts perhaps for the comparatively few works of this description which have been undertaken in France. The high price of iron, in consequence of the tax on foreign iron, has likewise operated as a great discouragement to the construction of railroads in France; and this we have an additional illustration of the ruinous effects of this tax in obstructing the domestic improvements of the country.

Roads.—The great roads in France are managed, not, as with us, by county commissioners, but by government *bureaux*, or boards, the chief of which are at Paris. These boards are all under the direction of the minister of public works. The extent of road under their direction is about 80,000 miles; and the annual expenditure under £1,800,000 to £1,500,000, the whole of which is defrayed without one toll or turnpike. An attempt was made under Bonaparte to levy tolls; but this excited so much clamor in a country where commercial intercourse is carried on almost wholly by land-carriage, that it was found indispensable to seek the necessary funds from another source—a tax on salt. The great roads in France are in general in tolerable condition; but no epithet can convey an idea of the wretched state of the cross roads in almost every department—full of hollows, encumbered with stones, or inundated with water, they receive hardly any repair, but are abandoned, year after year, to the effects of the weather. Notwithstanding the little done by government to favor locomotion, the traffic on roads increased a third in the thirty years between 1811 and 1841.

The great roads in France are much wider than in England, exhibiting frequently a long straight avenue lined on each side with chestnut or other large trees. Roads in France are classed under three categories—imperial roads 14 metres in breadth, departmental roads about 11 metres broad, and the *chemins vicinaux*. They are often paved like a street for many miles in succession; the art of road-making being as yet too little understood to prevent material injury from the heavy wagons and ill-constructed wheels, without resorting to this unpleasant alternative. Traveling is thus much less agreeable than in England, particularly as the villages want neatness and cheerfulness, while most of the towns along the road are disfigured by narrow crooked streets, in which new stone buildings

are often mixed with antiquated wooden structures, such as have disappeared from our provincial towns for nearly a century past. The mails are now conveyed as with us by the railroad, but where there is no rail, in a kind of chariot called a *mallo-poste*. The diligences, though somewhat improved in structure, are still clumsy and lumbering.

Railroads.—During the twenty years between 1828 and the 24th February, 1848, the railroad conceded to private companies in France amounted to 2287 miles. The revolution of February put a sudden stop to all enterprises of this kind. There was not a single concession made in 1848, 1849, or 1850. Indeed, some companies, unable to carry on the work confided to them, were either sequestered or taken possession of by the state. The concession of the line from Paris to Rheims was made on the 10th July, 1851, of the line round Paris on the 11th December, 1851, of the line from Paris to Lyons, 5th January, 1852, of the line from Lyons to Avignon, 8th January, 1852. These and other concessions in 1852 added 2050 miles to the extent of rail. In 1853 the progress continued, and concessions to the extent of 1926 miles were granted. The year 1854 has been consecrated to the execution of the works, and more than 872 miles have been opened between the 1st January and the 31st December, 1854. At the breaking out of the February revolution, the concessions for railways amounted to 2287 miles; in 1854 they amounted to more than 6214 miles. At the end of 1855, 8728 miles additional were opened to the public. The length of lines conceded and executed have thus increased threefold in the space of a few years. About £80,000,000 have been expended on these enterprises. The credit required in the budget of 1856 for railways is equal to that of 1855—namely, 55,435,999 francs. At present (1855) the branch rail from Strasbourg to Rheims, from Hec d'Allier to Clermont, with a branch to Nevers, from St. Germain des Fossés to Roanne, from Mons to Laval, from Marseilles to Toulon, from Caen to Cherbourg, from Bordeaux to Bayonne, and from Narbonne to Perpignan, are in course of construction. Some of these lines are to be opened this year, some in 1857, and some in 1858.

Bridges.—The French have few cast-iron bridges, all their great structures of this description being of stone. Of these, the chief are the bridges over the Loire at Orléans, Tours, and Nantes; those on a smaller scale over the Seine at Paris; and those over the Saône and Rhône at Lyons. The Pont du St. Esprit above Orange, over the Rhône, is a long structure of 16 arches. At no great distance from it is the Pont du Gard, one of the most entire, stupendous, and beautiful monuments of Roman architecture, composed of a triple tier of arches, erected for the purpose of conducting an aqueduct over the river Gardon. This magnificent structure is 157 feet in height, 530 feet in length at the bottom, and 872 at the top. Of the lately-erected bridges in France, the most remarkable are those over the Seine at Neuilly near Paris, and over the Oise at St. Maixent, with two of larger dimensions, viz., one over the Garonne at Horiéux, the other over the Seine at Rouen. Bridges, as well as roads, and all other means of intercommunication are under the direction of the minister of public works; a special school for the formation of engineers of bridges and roads is established at Paris. The territory of France is divided into 16 inspectorships of *ponts et chaussées*. The telegraphic communications are principally made by means of the electric telegraph, of which the government reserves to itself a monopoly, but private persons are allowed to avail themselves of it.

Agriculture.—The agriculture of France is in a very different state from that of England or Scotland, being marked by a degree of backwardness not a little surprising in a country so far advanced in many departments of art and science. The causes of this, however, are not of difficult explanation. France enjoyed for scarcely more than 88 years, i. e., from 1814 to 1848, the advantage of a representative body; and the condition of the peasantry was long far inferior to that of the same class in England. No ecclesiastical reformation had taken place to remove a valuable part of the national territory out of the hands of indolent life occupants; and the *grands seigneurs*, the other great body of landholders, devoted their attention to Paris and Versailles, without bestowing a thought on their lands or their tenantry, except to extract from them the means of defraying their expenses in the capital. To this was added a system of taxation, less heavy, indeed, than that to which we are subjected in England, but extremely crude and impolitic, as evinced in the *gabelle*, or tax on salt used in private families, and in the *corvée*, or obligation on the peasantry to labor on the high roads. To these were joined the humiliating enactments of the game laws, and the more substantial injury of tithes; for the clerical body in France levied this pernicious assessment as in England, though possessing in property, lands of the computed rent of five millions sterling.

Another great drawback on French agriculture was the insignificant size of the occupancies, whether held as farms or as property. A French agriculturist on a small scale has little idea of selling his paternal acres, and converting the amount into a capital for a farm. He is much more likely to go on as the proprietor of eight or ten acres of land, and the cultivator of as many more. The mode of paying rent was equally singular; money rents were general only in the north or most fertile parts of France; they did not, on the whole, exist in more than a fifth or sixth of the kingdom before the Revolution. A more frequent species of tenure was by a grant made under the reservation of a fine, of a quitrent, or of certain servitudes, of which the least burdensome were sending corn to the mill, or grapes to the press, of the proprietor. But of all indications of poverty and backwardness, the most striking was the system of *mitaire* (rent in kind); a practice by which a tenant, having little capital of his own, receives from the proprietor the live stock and implements necessary for cultivating his petty tenure, and divides with him its produce. This wretched method was and still is common, not indeed in the north and north-east of France, but in many of the poorer districts of the centre and south. There are, it is to be remarked, several distinctions in this system; the landholder, in some parts, providing only half the cattle and seed, and in others the whole. There is, of course, a corresponding difference in the apportionment of the produce.

Effects of the Revolution.—*La Révolution a été faite pour le cultivateur* is a common saying in France. Indeed, that great convulsion improved so much the situation of the agriculturists, by canceling, at one decisive blow, the tithes, the game-laws, the *corvée*, and other relics of feudal servitude, that, after all the horrors of Jacobinism, and all the tyranny of Bonaparte, a strong attachment to the Revolution survives among this pacific class. Further, the sale of the church lands transferred a valuable mass of property from indolent into active hands. But with this must terminate the eulogy on the Revolution, the further progress made by agriculture, having been caused less by any political change, than by the gradual effect of experience, and the diffusion of information. The degree of agricultural improvement in France since the first Revolution has certainly been less than in England and Scotland, and in one very material point that memorable convulsion has tended to retard it;

we mean by the law suggested by a jealousy of the ascendancy of the *noblesse*, which obliges the owner of property, whether in land or money, to make an almost equal division of it among his children. The parent of two children has the free disposal of only one third of his property, and the parent of three children of only one fourth, the residue being shared equally among all. The claim of primogeniture is thus in a manner annulled; and a law which is apparently wise and equitable, proves the source of great injury to agriculture, by multiplying the petty plots of land throughout a country where they were previously far too numerous.

The following table, taken from official documents published by M. Duchâtel, exhibits in hectares the physical and agricultural division of the French territory, which has not materially changed within the last 20 years.

	Hectares.		Hectares.

Stony soil.....	6,612,848	Hectares, 52,762,690	
		(Acres, 130,772,475.)	

The surprising proportion of land in France under tillage is owing to the smallness of the occupancies, the cheapness of labor, and the general use of bread instead of animal food by the humbler orders. The last is connected with another remarkable circumstance; the very slender proportion of land under pasture, of which the main cause is the dry climate of the southern and central part of the kingdom. In the proportion of poor and unproductive land France and England are nearly on a par, but the French incur a very heavy disadvantage by using wood instead of coal for fuel, and covering with forests many tracts which might be made available for either pasture or tillage. All France in 1840 gave 13.14 hectolitres per hectare. The total value of cereals in 1813 was 1,780,478,000 fr., or 9387 fr. per hectare, or 59 fr. per head. In 1840 (which was the last account) it was calculated at 2,565,238,000, at 18,900 fr. per hectare, or 77 fr. per head. In 1840 there were 5,586,787 hectares in wheat. In England 2,130,900 hectares. The wheat product in 1840 was 6.07 for 1. In England it is 9 for 1. The total value in the United Kingdom, 978,500,000 fr. at 25 fr.; in France, 1,400,000,000 fr. at 20 fr. the hectolitre. The arable land of France in 1840 was 22,240,090 hectares. The value of the cereals, fallows, and artificial meadows in France reaches 2,351,518,975 fr., and their mean value 106 fr. per hectare. The trees in 1840 covered 1,972,340 hectares. The total return of French cultivation in agriculture reaches:

	France.

General average of all France, per English acre.....	9	1

We proceed to add a few remarks on French agriculture, with reference to articles less known or less generally raised in England. Buckwheat is cultivated extensively in Brittany, Normandy, and the north of France, partly as green food for cattle, partly for the diet of the peasantry; it is generally sown in June and reaped in the end of September. Wheat and meslin are principally cultivated in the north, but the produce of the south, though less abundant, is generally preferred. Barley and oats are also more common in the north. Rye is raised pretty equally in all parts of France. Rape-seed is very general in French Flanders and Normandy; it supplies oil for the market and food for cattle, either when green or in cakes. Colza (coleseed) is raised for the same purposes. Tobacco would be generally cultivated in France, were it not monopolized for the benefit of the State; hence its cultivation is confined to certain licensed districts, which are chiefly in Alsace and Picardy. The quality of the article produced under the royal monopoly is greatly inferior to that produced by private cultivators abroad, while the price being 400 per cent. higher, the latter is smuggled into France in great quantities, notwithstanding all attempts to prevent it. Flax is raised very generally, not merely in French Flanders, Alsace, and Normandy, but in the provinces of the west and south, where the family of almost every peasant rears a little stock annually to be spun by his wife and daughters. Hops are almost exclusively grown in those parts of France bordering on Belgium. Hemp also is raised in many parts of France, particularly in the north. Maize is a plant of great importance, whether for the food of man or of cattle; when intended to stand for harvest, it is planted in rows with very little seed, and yields more than twice the quantity of wheat that would be produced on the same space. During its growth the leaves are stripped reg-

ularly for the food of cattle; and in some districts it is sown thick and mown merely for that purpose. Maize and millet are chiefly grown in the south and south-east. Such valuable substitutes have, as yet, prevented turnips from being generally introduced into France. Even potatoes were long very little known, and it is only during the last half century that the dislike to this tuber has disappeared. Potatoes are more cultivated in the east than in any other district. Chestnuts are most common in the central part of France, where they supply no inconsiderable portion of the food of the peasantry. In the south the fruits are chiefly olives, almonds, mulberries, figs, and prunes; oranges are partially cultivated in the south-eastern extremity of the kingdom, on the verge of Italy, but with great uncertainty, for a severe winter is fatal to these trees, and in some measure also to the olives.

Irrigation is little understood in the north of France, but in the south the want of frequent rain renders it a primary object of attention; it in fact determines the ratio of productiveness, since the warmth of the sun seldom fails to ripen whatever has received an adequate supply of moisture. According to M. Beccarel, there has been a progressive annual increase in the number of hectolitres produced since 1813. There has been a very decided progress in agricultural improvement in every part of France, but notably in the west and south-west. The increase in productiveness in all manner of grains is estimated at 2,141,217 hectolitres.

The culture of the vine extends more or less over fully the half of France, beginning as far north as Champagne, and spreading over the country to the south and the west. This culture is, however, very limited in Champagne, and even in Burgundy; in Provence, and the lower part of Languedoc, the climate is warmer, and the culture general, though not managed with such skill as along the banks of the Garonne, where the spirit of improvement is excited by a demand for foreign markets. As vines succeed in light and unproductive soils, their culture gives a value to much ground which would otherwise be useless; and the petty subdivisions of land are here less injurious than in the case of corn. From the great variety of soil and climate, the quality of French wines is very various. The amount produced has been considerably increased since 1790, as well from the division of many large estates, as from the quantity of waste land which has been brought into cultivation. It is, however, remarked by M. Moreau de Jones (Statistique de l'Agriculture de France, 1848) that the consumption of wine in France has remained stationary since 1791, and that the quantity consumed by each individual is not more than it was half a century ago. Considering the increase of wealth and population, M. Jones calculates that the consumption should have increased 60 per cent. It is computed that nearly 5,000,000 acres of land are planted with vines, and that the value of the annual produce is from £28,000,000 to £30,000,000, of which about a tenth or twelfth part only is exported. It is very difficult to say to what extent the vine disease and the excision of vine branches in consequence thereof, has affected the production of wine either in quantity or quality. It has unquestionably had the effect of raising the price of the finer wines from 25 to 35 per cent., and of raising the price of brandy, during the last two years, nearly 300 per cent.

1854.....	92,400,000	11,090,000

The exports of wine and brandy from France for the following four years, are as follows:

	WINE, Imp. Galls.	BRANDY, Imp. Galls.
1851.....	50,149,078	1851.....
1852.....	53,991,190	1852.....
1853.....	44,190,438	1853.....
1854.....	35,898,912	1854.....

It is a curious fact that the effect of the *oidium* or vine disease has for the last few years caused an importation of foreign wine into France for home consumption. The following is an account of the imports of foreign wine and spirits into France for the years 1852-4:

	WINE, Imp. Galls.	SPIRITS, Imp. Galls.
1852.....	76,494	1852.....
1853.....	98,404	1853.....
1854.....	2,670,530	1854.....

It will be observed, that the import immensely increased during the last year, owing to the large quantities used for the supply of the French army in the Crimea.

Of the spirits in the above table, 802,019 gallons were rum imported from England.

A quantity equal to about a sixth of the wine is made into brandy, for brandy is distilled wherever vines are grown; and of it also the best in quality is in the vicinity of the Garonne. This important and staple branch of French industry has been very seriously injured by the prohibitory system of custom-house laws, which were extended and increased in rigor during the reigns of Louis XVIII. and Charles X., and were not much mitigated during the 18 years' reign of Louis Philippe. Many of the leading statesmen of France still evince a most mistaken partiality to the prohibitive system. France, by excluding the produce of other nations, virtually deprives, or greatly limits, by the same laws, the reception of her own produce into foreign countries. It is clear that they must pay for the wines of France with their own produce, which, if France refuse to receive, they have no other equivalent to give her in return; they must procure an equivalent from foreign countries, and the effect of this is to restrict the trade, by raising the price of French wines. Accordingly, it appears that while France exported to England from 16,000 to 20,000 tons of wine when the population was only 5,000,000, this supply had fallen off, partly owing to the heavy duties imposed in Great Britain, and partly to the prohibitory duties imposed in France on British produce, to 1,800 tons, while the population of the country had in the mean time greatly increased; and a melancholy illustration of the effects of that illiberal policy which pretends to improve commerce by prohibiting the free intercourse of commercial countries.

France is the largest producer of beet sugar in the world. The origin of the manufacture must be traced from the year 1807, but 40 years elapsed before the manufacturer of this article was enabled to cope successfully with colonial sugars. From France the culture spread through the different countries of Europe, even into the interior of Russia; and it is calculated that there is now produced of this kind of sugar on the Continent of Europe not less than 350,000,000 pounds, nearly one half of which is manufactured in France. In the vicinity of Lille, the average yield of the sugar is 16 tons per acre, and at Valenciennes, 19 tons; in some localities 25 tons are produced. The

annual manufacture of sugar is about 40,000 tons, and the non-crystallized matter extracted from the lees and dregs, furnishes enormous quantities of sweetening matter to breweries, and also to the wine-doctors and wine-falsifiers of Cetta and the Gironde. Nor is this the only use to which beet is turned, as a large quantity of spirit is distilled from it.

The minuteness of the *Cadastral* survey has led to official calculations in France of products which have not yet engaged the attention of other governments. Madder is cultivated on a small scale, partly in the north, partly in the south of France; its chief use is in dyeing woollens and cottons. Wood is used for yellow and green colors; saffron, cultivated formerly to a great extent, is now confined to one district (the Gatineis) in the south of France; hops are raised only in Picardy and French Flanders.

Subjoined are the values of the following articles produced annually in France:

Wine.....	£28,000,000

Totals, 1854.....	£34,800,000

Of the pasturage ground of France, occupying one eighth of its territory, the chief part is in Normandy, Brittany, and other humid quarters of the north and west. In the south, the natural pasture is confined to particular districts, chiefly mountainous; in the low grounds, the grass, whether natural or sown, is brought forward only by means of irrigation. Clover and sainfoin are cultivated in France, but chiefly in the north and north-east; lucerne is much more general, being raised not merely in the north, but in the central and southern provinces, wherever irrigation is practicable and the soil and climate are favorable. The art of improving cattle by breeding is little understood in France, nor is there much judgment shown in gradually fattening them by a removal to richer pastures. Still the beef and mutton of the north and west are very good, more especially what is called the *près saillé* mutton, i. e., sheep fed on the salt marshes. Their price varies from province to province, but very seldom from year to year; the general rate was 30 per cent. less than in England, but within the last four or five years the price of meat has risen much in France, and closely approximates to the price in England. Butter is made and used throughout the chief part of France, as in England, but cheese comparatively little. In the south, however, even butter is little known, and its place in cooking is supplied by olive-oil, which is largely used throughout southern Europe. One of the latest novelties in French pasturage is the introduction, in 1819, of a large flock of Cashmere goats, which were sent to browse in the eastern Pyrenees, and are said to experience but little inconvenience from the change of climate.

Horses.—In the number of horses, as well as in their size and beauty, France is greatly inferior to this country. In the performance of labor, however, the inferiority is much less conspicuous; large, old-fashioned carriages, drawn by four or six horses, are seen proceeding along a paved road much more easily than we should anticipate from the weight of the vehicle, the knotted harness, and the diminutive size of the animals. The same observation is applicable to the plows, the carts, and the wagons of France, which are awkwardly built, but all dragged on with expedition, the strength of the horses surpassing the promise of their appearance. A French diligence, in the provinces in which such carriages still run, performs only five miles an hour; but this is owing less to inferiority in the horses than to the state of the

roads, and to the general want of dispatch at post-houses. Of the aggregate of horses in France, more than half belong to the northern provinces—Normandy, Brittany, Picardy, Alsace, and the Isle of France. In the central and southern departments a great proportion of the work is done by oxen, which are more suitable to petty farms and mountainous districts.

Sheep.—Sheep are reared in almost every province of France, the gentle elevations of the north and the mountains of the south being alike favorable to them. The mutton is good; but in the art of improving the fleece, the French have as yet much to learn. Merinoes were first brought from Spain in 1787, and formed into a royal flock at Rambouillet. The consumption of meat in the country then was small, and consequently the first desire was to improve the wool. The quality, originally good, has been progressively improved, and distributions of Merinoes have been successively made to proprietors of sheep pastures in all parts of the kingdom. The consequence has been, that in ^{some} districts the weight of the fleece has been nearly doubled. The sheep-farming of France appears just now to be in a transition state; its past history offers many points of instructive deduction, while from its future we may expect very beneficial results. These imported sheep were used for crossing with the native breeds, to which but little attention has been paid either as regarded the carcass or the fleece. As time advanced, these crossed breeds increased with varied success; in some districts the wool produce was permanently improved by continuing to introduce pure blood; in others it was found more advantageous to develop the physical organization of the animal. The result has been that, notwithstanding the laudable endeavors of the flock-masters to obtain a breed associating both weight and quality of wool with the production of meat, that end has not been satisfactorily obtained; the flocks still remain in an intermediate condition, neither producing the fine quality of wool of the Saxon, nor the weighty fleece or carcass of the English sheep. To encourage the rearing of sheep, a duty of 20 per cent. was in 1822 laid on foreign wool.

Mules.—Mules are almost as little known in the north of France as in England; but in the central and southern parts they are very generally reared. Poultry, in France, are both larger in size and more abundant than in England, more especially in Normandy and the department of La Sarthe.

with the domestic animals, 7,502,905,000 and 224.

Even in the north and north-east of France, the farms are of small extent. To occupy 200 acres, or to pay a rent of £200 a year, places one in the foremost rank of farmers. Larger possessions are common in pasture districts, that department of agriculture admitting, in France, as in England, of a greater concentration of capital and extension of business than in the case of tillage. But such districts are rare; and in by far the greater part of France the farms under tillage are of fifty, forty, thirty, and often as small as twenty, or even ten acres, there being, it is computed, no fewer than three millions of such occupancies in the kingdom. In the south of France the system of *métairie* (paying rent in kind) is still prevalent, and nearly on the same footing as in Lombardy and Tuscany. That such insignificant occupancies are adverse to all enlarged ideas of farming, is sufficiently obvious; and to their many disadvantages there can only be opposed their single benefit, that no spot of tolerable soil is neglected, even the space given by us to hedges being reserved for culture.

The beneficial effect of long leases is as little understood in France as it still unfortunately is in a great part of England. The common method is to let land for periods of three, six, or nine years. The peasantry, though illiterate, are not slow or phlegmatic. They exhibit, as Frenchmen in general do, no small share of intelligence, of sprightliness, and of activity in the individual, with very little concert or combination in the mass. They are content to hand down the family occupancy from father to son, without any idea of altering their mode of life. The dwellings of the farmers, and still more of the cottagers, are like those of our forefathers half a century ago; the outside having frequently a pool of water in its vicinity, while the inside is miserably bare of furniture. In the comparative trials that were made at the French Exhibition of 1855, the superior character of the English agricultural implements over those of France was made very evident—in none, perhaps, more, than in the plowing trials, when the dynamometer showed that while it required only a force equal to 17·01 to turn over a certain quantity of earth in a certain time with the best English plow, it required a force of more than 27 to do the same with the best French one. The diet of the French peasantry is exceedingly simple. Bread and cider, with soup, peas, cabbage, or other vegetables, form its chief ingredients in the northern provinces; while in the central and southern ones the same elements are in use, with the substitution of thin wine (*vin du pays*) for cider, and of chestnuts for the pears and apples of the north. Butcher-meat is reserved for the tables of the middle and upper classes.

The landholders in France give little or no attention to beautifying the country; its aspect is consequently monotonous, without plantations, seats, or cheerful cottages. The peasantry live in villages, frequently ill built and inconveniently situated. The purchase of land, however, is the favorite mode of investing money in France. It sells, in general, for twenty-five years' purchase; while the public funds seldom fetch above sixteen or eighteen. There is at Paris a society similar to the Board of Agriculture in England, and, forming, like it, a central point for corresponding with the different agricultural societies in the kingdom. It holds its sittings twice a month, and a public meeting annually for the distribution of prizes. The French have also (since 1819) a corn law, permitting imports and exports only when the home market shall be above or below a specific rate. The chief difficulty the French government have to contend with in regard to the corn trade, is the popular prejudice that freedom of export raises the home price.

Timber.—Of the 18,350,093 acres which are covered with wood, in 1836, there belonged to government 2,547,800 acres, which were divided into 1473 forests. A very small part of this is allowed to grow into large timber. The rest is subject to an annual cutting and sale, for fuel; coal being very little used in France, except for forges, glass-houses, and other large works. In the government forests gross mismanagement took place during the disorders of the first Revolution. Extensive tracts were sold for an insignificant consideration, while in those that remained timber was felled with a lavish hand, and without any regard to the ultimate effect on these valuable properties. In 1801, however, a special board, appointed for the care of the forests, introduced the most beneficial regulations. In the years of financial pressure (1815, 1816, and 1817), it was proposed to effect sales of these great domains; but a fair price being unattainable, government continues to keep them. During the monarchy the revenues derived from the wood annually cut and sold amounted to £700,000 or £800,000 sterling.

The administration of the forests is (1855) placed under the direction of the minister of finance. The French territory, comprising Algeria, is divided into 20

arrondissements forestiers, at the head of which is placed a *conservateur* who corresponds with the administration, and who has under his orders a number of inspectors and sub-inspectors. Under these are the *gardes généraux*. Every one employed in the forests must be twenty-five years of age, but this provision may be dispensed with if the employé be a pupil of the *École Forestière*. There are (1855) 32 *conservateurs*, 200 *inspecteurs*, 100 *sous inspecteurs*, and 500 *gardes généraux* of forests in France.

Fuel being comparatively little wanted in the south of France, the forests are confined to remote and rugged situations. These, like most of the forests of the kingdom, harbor a multitude of wolves, which are frequently destructive to the sheep and lambs. Regular officers, called *lieutenants de louveterie*, are appointed for wooded districts; and on occasions of heavy loss, recourse is had to a general *battue*, which seldom results in any sensible reduction of the number of wolves. Bears also are found in the forests; but they are much more rare, being confined to the elevated districts in the Alps and Pyrenees.

Mines and Quarries.—France yields in this essential article of produce, not only to Britain, but to Germany, to Russia, to Sweden, and to Hungary. According to the most approved works recently published, the mines of France may be classed into five groups, namely, the mines of the Vosges and the Black Forest; those of the central provinces of France; those of Brittany; those of the Pyrenees; and those of the Alps. It is not many years since the mines of the Vosges yielded above 30,000 cwt. of lead, and a small quantity of silver, besides copper mixed with silver. The produce did not, it is probable, repay the expense, as they have since been abandoned. There are now a very few copper mines in the Vosges. In the central part of France there are numerous mines of lead, but they are not productive. They are chiefly situated in the department of La Lozère; and they yield annually, along with the lead, 1600 marcs of silver. The only metallic mines of any consequence in Brittany; now are the three great mines of *galène argentifère* of Poullaouen and Huelgét; and there is one mine of what is called in the divisional nomenclature of the minister of commerce and public works, *plomb argentifère*. In the chain of the Pyrenees there is only one mine of copper, which has long since been abandoned. There are, however, numerous iron mines, which furnish materials for more than 100 forges. The chain of the Alps contains many mines of iron, but is not rich in other metals; it possesses some unproductive mines of lead, and one of silver, which has long been abandoned. There are some appearances of gold in the department of the Isère, but not such as to encourage any trial of their value. If there are few other mines, those of iron are in great abundance, being thirty-eight in number, scattered throughout the country, and of these the produce is every day improving. The whole value of the metallic produce of France was estimated in 1828 to be equal to £3,139,595. The number of mines was estimated in October, 1854, at 824, viz., 448 of coal, 177 of iron, 159 of other substances; and the number of workmen they employed in 1854, at 33,531. (*Travaux Statistiques des Mines de 1847 à 1852*. Imprimerie Impériale, octobre, 1854.) The working of mines is impeded in France by the want of good roads and canals by which to convey the ore and the coal for smelting it. The production of iron has been encouraged by the heavy duties on foreign iron. In 1814 a duty was imposed of fifteen francs per fifty kilogrammes, or 12s. 6d. per 110 lbs. imperial, on all foreign iron imported, which, in 1822, including the décime or the tenth added to all duties, raised to £1 2s. 11d. on all coal-worked foreign iron. But this prohibition did not bring prosperity to the trade, though by these duties the price of iron in France was £23 9s. 2d. per ton,

while English iron was sold at £9 6s. 8d. It is estimated that these heavy duties on foreign iron cost the agriculturists of France, in the additional expense of plows and other implements of agriculture, a sum varying from £1,500,000 to £2,000,000 a year. (See *First Report on the Commercial Relations between France and Great Britain*, p. 28.) Estimating the annual consumption of iron in France to be 160,000 tons, and the difference of price between French and English iron to be £10 per ton, the law of 1814, which imposed a duty on foreign iron, and the law of 1822 which increased that duty, can not have cost the French people less than £30,000,000 sterling of direct loss; while it is scarcely possible to calculate the indirect evil of this monopoly or protecting duty in favor of the iron-masters. One reason of the high price of French iron is the want of coal, an evil which is aggravated by the heavy duty on foreign coal in consequence of which the French are compelled to employ wood in their forges; and it is calculated that one fourth part of the wood cut down in the forests is consumed in the manufacture of iron. Coal has been discovered in more than half the departments of the kingdom (in forty-five departments), and would doubtless be traced in others; but the want of water communication limits the consumption of this article almost to the place where it is produced. In a report to the present Emperor of the French in 1854, by the minister of commerce and public works, that functionary attributes the high price of native coal in France not to the method of working the mines, or to the insufficiency of the machinery, but to the want of better intercommunication both by land and water. (*Requis des Travaux Statistiques des Mines de 1847 jusqu'à 1852*.) It is a fact that more than half the departments that consume the coal of the Loire pay for it a price four, five, and six times higher than it costs at the mouth of the pit. (*Rapport adressé à l'Empereur par le Ministre au département de l'Agriculture et du Commerce*, 1854.) One fifth part of the coal consumed in France is used in the department Du Nord. At St. Etienne, near Lyons, are excellent coal mines; but there being no iron mines in the vicinity, nor of course iron-works, there is no consumption of fuel on a large scale. The coal is only used for domestic fuel, and for the manufacture of hardware. M. Costaz, in an estimate contained in his work on the agriculture and commerce of France, makes the coal produced in France to amount to 15,310,687 metric quintals; the value of which he estimated at between £700,000 and £800,000. The quantity of coal imported from Great Britain amounted in 1831 to 40,000 tons, though subject to a heavy duty of one franc sixty-seven centimes per hundred kilogrammes, or 1s. 4½d. per 220 lbs. imperial; and there were imported from Belgium, the duty being thirty-three centimes per hundred kilogrammes, 440,000 tons. The importation of coal in 1853 rose to 2,224,555 tons, of iron (*fonte brute*), to 73,689 tons. In December, 1853, the importation of iron went on increasing. The heavy duty on coal operates most injuriously on the industry of France. It is a most serious impediment to the working of the iron mines, for the encouragement of which such heavy duties are imposed on foreign iron. But such is always the effect of the prohibitory system. It pulls down with one hand what it builds up with another. The iron-masters and the coal-owners have each a monopoly of the home market. But it is not clear that these two monopolies run counter to each other, and that the iron trade is encouraged by the one, while it is most seriously discouraged by the other, and the whole inhabitants of France are taxed in a much higher price for fuel by the heavy duty laid on the importation of this useful article? Steamboat navigation is also discouraged, so that no steamboats ply regularly between any of the Atlantic ports of France. A steamboat which in England could be navigable at an expense of £2280 for coal, would

cost in France £5700, about 18 per cent. on the capital employed. It is the owners of forest property who are the most zealous supporters of this duty, an impost which benefits them at the expense of the whole of France, and indirectly depresses the national commerce and industry in its most important branches. For many years only a small portion of Paris was lighted with gas, which is ascribed to the high price of iron pipes; and the supply of water is also impeded by the same cause. (An imperial decree of the 22d November, 1853, materially reduces the customs duties on the importation of coal and iron. Coal paid with the *décime* 55 centimes per 100 kilogrammes upon the greater part of the French frontier from the Sables d'Olonne to Dunkirk; and upon the remaining portion of the frontier it paid 83 centimes, by the land frontier, except in certain places, by the Meuse, and in the department of the Moselle. Henceforth the great zone from the Sables d'Olonne, and from that by land to Helluin, is to have but one duty—amounting to 83 francs for French, and to 88 francs for foreign vessels. The rest of the maritime frontier is assimilated to the principal part of the land frontier. A double duty to that levied on coal was charged on coke. Henceforth coke is only to pay a half beyond what is levied on coal. As to iron, from the 1st of January, 1855, there is no distinction between iron smelted by coal or wood. The *fonte brute* is to pay 4 francs 40 centimes the larger bars, 11 francs the smaller bars, and steel 33 francs. Rails for railroads are to pay 132 francs. The greatest reduction is on steel.) The mines, like other large undertakings in France, are under the direction of government, being superintended by a board at Paris (*Conseil Général*), and having an *École Impériale* with public teachers, the whole under the control of the minister of the home department. This, however, does not prevent their machinery being in general very clumsy and antiquated.

Turf fit for fuel, or peat, is found in various parts of France, and will be more used as wood becomes progressively scarcer. This article is produced in the departments of Gard, Isère, the Lower Rhine, the Somme, Pas de Calais, Lotre-Inférieure, l'Isère, Seine-et-Oise, Oise, Aisne, Doubs, Marne. The cutting and preparation of turf is computed to occupy the labor of from 50,000 to 55,000 workmen on an average of 40 days. The greatest turf-producing department in France is La Somme.

Salt is made in various parts of the kingdom. The works corresponding to the salt mines, or rather to the brine springs of Cheshire, are called, from their position, *Salines de l'Est*, and are situated in the small town of Salines in Franche Comté; they are wrought by undertakers on lease, yield about 20,000 tons a year, and afford a considerable revenue to government. The heat of the climate on the south and south-west coast of France is favorable to the evaporation of salt water, and consequently to the formation of bay salt, the name given to salt made, not by the action of fire, but by the heat of the sun, operating on sea water inclosed in a shallow bay. The duty raised from salt in France is nearly £2,000,000, a sum of great importance to the treasury, but attended with fully as much injury to the productive powers of France as was formerly our salt tax to those of England. Since 1818 the *droits* on salt have been reduced two thirds. The first Revolution began by abolishing entirely the odious *gabelle*; and salt being soon afterward made in great quantities, and sold very cheap, became the object of a most extensive consumption, being given to cattle as food, mixed with manure on the fields, or scattered as a stimulant to vegetation at the foot of olive-trees. But this extended use of salt was of short duration. No sooner was the power of Bonaparte consolidated, than he ventured to impose a tax on salt, less impolitic and oppressive indeed than the *gabelle*, but which had the effect of limiting the use of this article to such a degree,

that the value of bay salt consumed, instead of amounting to £1,000,000, did not in 1836 exceed £100,000. It was thought that a considerable increase in the consumption of salt would take place from the year 1849. There has no doubt been a certain increase, but it has in no degree corresponded with the diminution of the duty.

In 1847 the quantity of salt produced was 350,210,300 kilogrammes; in 1848, 465,435,700; in 1849, 479,438,400; in 1850, 495,183,900; in 1851, 590,175,200; but in 1852 the quantity produced fell to 428,087,500 kilogrammes. The price of the metrical quintal of salt in 1847 was 8 francs 47 cen. In 1851 it fell to 1 franc 60 cen. The amount of salt produced from all the salt mines and saline sources in France in 1852 was 724,002 metrical quintals, valued at 2,865,556 francs. The consumption is confined to domestic purposes, and to a trifling export; yet the few cattle which still receive salt as a part of their food are visibly in better condition than those that are deprived of it.

France is in general much better supplied with quarries than England. The vicinity of Paris abounds in quarries of freestone. The case is similar in the mountainous districts, and even in several, such as Lower Normandy, that are comparatively level. The houses are consequently built of stone in those cities which, like Paris or Caen, are in the vicinity of quarries.

Fine variegated marbles are quarried at Campan, in the Upper Pyrenees. It appears from official documents published by the government that in the year 1846 there were 22,000 quarries in course of working, which employed 75,390 workmen. The value of the material sent into the market was 41,047,519 francs; in 1849, 86,379 persons were employed in quarrying; and in 1850, 87,486.

Manufactures.—Our historical notices of French manufactures are very imperfect until toward the year 1600, when the wars of religion were brought to a close, and peaceful industry received encouragement from Henri IV. and his minister Sully; a minister, however, who had a horror of luxury of all kinds, and who was much more favorably disposed to agriculture than to manufactures. It was under the "*roi cultivant*," however, that the patronage of government was extended to the manufacture of silk, glass, jewelry, gold and silver tissues; also of the finer woollens and linens, the coarser kinds having been established many centuries before. But the great extension of the finer manufactures of France took place after 1668, during the reign of Louis XIV., and the ministry of Colbert. It was then that workmen were invited from Genoa, Venice, and Holland, and induced to settle at Sedan and Abbeville, places still celebrated for their woollens. In the south of France also establishments were formed for making the light cloth suited to the Turkey market; and that toward the year 1700 the manufactures of France, as well of woollens as of other articles, had made considerable progress. Cloth serges were improved under Colbert, and *point de Gènes* and *point de Venise* introduced. In 1656, stocking-weaving, which had been introduced into France from England by two manufacturers of Nimes, was extended and improved. The manual labor of the French workmen was ingenious, the machinery extremely imperfect. The linen, the paper, and in some measure the woollens and hardware, found their way abroad, because in the rest of Europe these manufactures were very backward, and, in particular, because the exports of England were then very limited. The repeal of the Edict of Nantes was a very impolitic measure, but its consequences have been overrated, for England has profited very little by the extension of her silk fabrics; and Brandeburg, the chief resort of the French emigrants, has never become an exporting manufacturing country. Another and a more important error is the

current notion merely (from 1668) of abolishing them at almost total extinction like many other more loose sanctioning such a progressive the *Woolens*.—To diffused branch, numbers of work very different p viz.:

current notion that French manufactures were formerly (from 1660 to 1750) more extensive and flourishing than at present, also that they underwent an almost total extinction during the Revolution. These, like many other impressions in regard to France, rest on mere loose allegations. Official data, far from sanctioning such fluctuations, are decidedly in favor of a progressive though slow increase.

Woolens.—To begin with the oldest and most widely diffused branch, woolens, we find that the relative numbers of workmen at three distinct intervals, and in very different parts of the country, were as follows, viz.:

	1739.	1800.	1815.	1840.
Carcassonne.....	8,000	9,000	7,000	
Limoux, Chalabra, etc.....	4,400	4,500	3,200	5,000

Roubaix, Nord..... alternately in wool and cotton,	30,000
Elbeuf.....	25,000
Louviers.....	6,500
Sedan, Ardennes.....	11,500

Lisieu, also, in the north, had nearly the same number of workmen (5000) throughout. The finest qualities of black woolens are made at Sedan, in Ardennes, and at Louviers, in Normandy. In these the only material is merino wool. At Elbeuf and Darnetal, and in Normandy, the qualities are very various, the price being from 6s. to 28s. the English yard. Carcassonne and Limoux owed the origin of their extensive manufactures to the abundant supply of wool from the pastures in the Pyrenees. Since the reduction of their exports to the Levant, an alteration in the quality of their cloths has opened to them a market in the interior of France. The mountainous districts in Languedoc contain great numbers of sheep, and are the seat of the manufacture of serges, tricots, and other coarse woolens, most of which are made, not by workmen collected in a factory, but in the hamlets or villages of the departments of the Tarn and Aveyron. Almost every house has its loom; and during the evenings in winter, or in the daytime when the weather is adverse to country labor, the women employ themselves in spinning, and the men in weaving. A highly finished species of the woolen manufacture, viz., shawls, veils, ladies' cloth, etc., has been introduced in the present age into France. Rheims is the seat of this important branch, and employs in the town and neighborhood no less than 20,000 workmen. Similar articles are made at Paris. The bounties granted on *fila et tissus de laine* in 1852 amounted to 7,500,000 francs.

Shawls.—Shawls became fashionable in France as an indispensable article of female apparel after the expedition of Bonaparte to Egypt. The first lady in France who wore one (in 1801) was Madame Gaudin, the beautiful Duchess of Gaeta, a Greek by birth, whose husband was then a high functionary. Many of the officers who were attached to the army brought back presents of shawls, and they were imported in great quantities from Constantinople, Moscow, Vienna, and London. These shawls, however, brought an enormous price when imported into France, which necessarily limited their consumption to the richer classes. The great demand turned the attention of manufacturers to this important article; attempts were made to imitate the Cashmires, and specimens were exhibited at the *Exposition* of 1801. Ordinary shawls are now made of merino and other wools. But this was only a step in the progress of the manufacture; and a finer species of wool having been imported from the countries to the north of the Caspian Sea, the ingenious manufacturers with these materials at last produced shawls which rivaled in beauty those of the East, and in which it required the most practiced and skillful eye to discern any difference. In 1819 M. Jaubert proceeded on the part of the shawl manufacturer, Ter-

naux, to the countries between the Black Sea and the Caspian to buy a numerous flock of Astracan goats, for the purpose of using the wool for shawl-making. The speculation was a complete failure; and the French government, which was interested in it, lost 800,000 francs.

Two towns very remote from each other, Lodève in the south and Vire in the north-west of France, manufactured, under Bonaparte, very largely for the army. French woolens are, in general, much thicker than ours. In the fine qualities the raw material forms (CHAPTAL, vol. ii., p. 181) somewhat more than half the cost. In ordinary qualities it is somewhat less; but it is only in the slight qualities that the price of labor goes considerably beyond that of the materials. The computation for the whole country is, that a value of 44,000,000 sterling in wool becomes converted into a manufactured value of 49,000,000, of which a tenth only is exported. The cloth in France which corresponds to our superfine, and which is worn in general by the upper ranks, is very fine and durable, but heavy, with the exception of the superfine black. The price of the cloths produced at Sedan varies according to a graduated scale, from 15 to 50 francs the yard, and of kerseymere from 7 to 24 francs. The duty on foreign wool has been very injurious to the French woolen manufacturers; because, by compelling the French to pay a high price for the raw material, it prevented them manufacturing woolen cloth as cheaply as their English competitors, to whom the foreign market, where the raw material had now fallen to a low price, was open.

WOOL AND WOOLENS IMPORTED INTO FRANCE.

Year	Kilograms	Consumption in value	France

Belgium, Spain, Germany, Turkey, Barbary, Algiers, and England send wool to France. The exportation of woolen goods in 1839 reached 60,600,000 francs. In 1838 the exportation was 2,578,487 kilogrammes, valued at 65,823,346 francs. The wool produced in France amounts to 20,350,000 kilogrammes of fine wool; 20,000,000 of common; total, 44,350,000—about half that of England.

The wool imported from England in 1853 was 21,597 quintals, in value 9,481,836 francs, and the cloth 231,419 kilogrammes, valued at 5,795,332 francs. The worsted or thread was 19,680 kilogrammes, valued at 365,844 francs. The importation of the Thibet fur or hair was in value in 1839 3,576,480 francs, but has since declined to 2,058,920 francs. This material is spun in Paris, employing 500 or 600 persons. The wool of France is of an inferior quality. Its annual value averages about 120,000,000 francs, being 60,000,000 kilogrammes. There are 5,500,000 sheep of a superior breed, Saxons, Merinoes, and those imported from England; and 24,000,000 of indigenous race. Since 1829 the French sheep have increased nine per cent. The manufacture of merinoes and bombazines employs 17,000 hands; 6000 are employed at Amiens in the manufacture of alépins, and about 36,000 pieces are made there, about a third of which are exported. The bonneterie in wool employs 15,000 workmen, 800,000 kilogrammes of colored wool, worth 8,000,000 francs, and returns 17,500,000 francs in manufactured goods. Coverlets are made at Rheims, Rouen, Beauvais, Lille, Lyon, Orléans, and at Sommières (Gard). This fabric is valued at 20,000,000 francs, and employs 10,000 hands, besides auxiliary assistance to the extent of 25,000 more.

Carpets.—Carpets are made to the annual value of 3,500,000 francs, the larger part at Aubusson and Felletin, two towns in the department of the Creuse, employing 1800 hands, and producing goods to the value of 1,500,000. Carpets are also made at Abbeville, at Amiens, Turcoing, and Besançon. The finest and

richest velvets carpets, called "de Savonnerie," are made at Beauvais, and at the Gobelins in Paris. These are only made to order, and are not articles of traffic. The exports of woollen goods reach on an average the sum of 65,000,000 or 66,000,000 francs, consuming 2,578,487 kilogrammes of wool. They consist of coverlets, carpets, cloth, cassimeres, and merinos, varied stuffs, shawls woven or made by hand, boneterie, ribbon of worsted, and similar light goods, and stuffs of mingled materials. Machinery has been used for spinning wool in place of the hand only since 1809. Rheims is the great centre of French wool-spinning, it being situated in that part of the country where sheep are most numerous. There are at Rheims 275 establishments for spinning carded wool, and nearly 55,000 spindles, or 60 establishments for combed wool. The number of workmen is 50,000. France annually exports woollen yarn to the value of 2,000,000 francs and upward. Neapolitan flannels, English flannels or "bolivars," crasseins, lastings, cloths, cassimeres, merinos, mousseline-de-laine, cul-de-laine, made at Carres first in 1819, and poplins, are noted manufactures.

Cotton.—The cotton manufacture was introduced into Amiens in 1773, the raw material being supplied, not from America, but from the Levant, with machines procured from England. In 1784 a privilege was conferred on an inhabitant of Seine and Oise for a manufactory; and soon afterward the manufacture passed to Rouen, St. Quentin, Paris, Lille, and other parts in the north, extending with a rapidity surpassed only by that of England. At present, as for many years past, the great import of cotton is from the United States. In this great department of manufacture the French have only followed in the footsteps of Great Britain, whose machinery, after the lapse of a certain time, the French manufacturers have imitated; and though they have equalled the British manufacture in durability, they have generally been inferior in cheapness. This is, in a great measure, owing to the centre of the manufacture being at Rouen and Paris, places where the support of workmen, including the extra price of fuel, is not less expensive than in Lancashire. The districts most remarkable for the cotton manufacture are Alsace and Normandy. The manufacture of *cotton creton* was begun at Amiens so early as 1765; and in 1784 M. Marlin of Amiens obtained, under the title of "the first importer from England of machines invented there for spinning cotton," the authority to establish a cotton factory, with special privileges. Nimes is celebrated for its fine but not very durable cotton stockings. There are also manufactories of *bonneterie de coton* at Besançon, Vitry, Har le Duc, etc.

The cotton manufacture is prosecuted in many parts of France, and presents a great variety of fabrics and an extensive division of labor. In one place the weaving alone is followed; in other places the manufacture of threads, which are sold to those who weave them into cloth. Such is the case in the department Du Nord, which exports a great quantity of thread to the cloth manufacturers. In other places they bleach the linens, which are afterward dressed and stamped. The workmen employed in the cotton manufacture were estimated 20 years ago at 260,000, and they now amount to 355,000. Still, however, France is decidedly inferior to Great Britain in almost every branch of the cotton manufacture; and the consequence is, that as the importation of English cotton goods is prohibited, they are smuggled into the country in great quantities. Among these, the introduction of cotton twist is most extensive; and as the French mills can not manufacture the higher numbers, from 170 to 200, which are required in the fabrication of bobbinet, it has been found impossible to repress the contraband importation of this article. "It makes its way," say the writers of the Report on the Commercial Relations between Great Britain and

France, "both by land and sea, in spite of all interdictions, and to a continually increasing amount." The English can be sold also at half the price of the French article, which presents an additional inducement to the smuggler. The annual value of the manufactures thus illicitly introduced was estimated in 1833 at £500,000 sterling; but smuggling has been reduced more than a fourth since that time. It is difficult to estimate the amount introduced, but very experienced persons in the trade doubt if it much exceeds £250,000. English bobbinet was also smuggled 20 years ago into France to the estimated annual value of £625,000 sterling; but it is questionable whether the amount of illicit traffic now amounts to £300,000, though English bobbinet sells at from seven to eight per cent. above the price of French goods of the same nominal quality. Quillings, cambrics, and muslins are also largely introduced by the illicit traders; and the delivery of these goods is insured at a premium of from 18 to 50 per cent., according as the risk is greater or less in the case of heavy or of light goods. In 1852, 1,700,000 francs were paid in bounties on *fila et tissus de coton*. The average wages of men employed in the cotton trade is 2 francs 50 per centimes per day; of women 1 franc 20 centimes; children are paid 50 centimes. The value of the cotton fabrics of Normandy is 105,000,000 francs, that of Alsace 80,000,000 francs. In the last district 70,000 hands are employed in weaving; from 12,000 to 15,000 in printing; and 1000 in the bleaching grounds. In Normandy and vicinity, including a part of the Somme, Pas de Calais, Aisne, Eure, and Manche, 129,000 hands are employed, namely, 60,000 weavers for the Bouennerie, 20,000 for the calicoes, and 49,000 in other divisions of the labor. Alsace produces principally cotton cloths for printing, and exports a part into Switzerland. The number of pieces of printed cotton and muslins made is calculated at 1,100,000, valued at 40,000,000 francs. They are of three kinds and prices, but are unable to cope in cheapness with the English. Tulle, at first made only in Normandy, are now manufactured wherever cotton fabrics are made; to the extent of 32,725,000 francs, of which 20,000,000 francs is the cost of the embroidery. The most important of this branch of the manufacture is carried on at and near Calais, where from 600 to 700 looms, and 4800 men, women, and children, are in constant employment. The manufactures of muslins are most in arrears of all, owing to the fineness of the thread required, which is not yet made in France, but imported for the purpose. Tarare is the seat of this manufacture, valued at 20,000,000 francs. These muslins are generally embroidered. Blonds and lace are made at Caen, Bayeux, and above all, at Chantilly (Oise) where 70,000 persons are employed. Cotton *bonneterie* is made at Troyes to the value of 7,000,000 francs, employing 10,000 looms, and from 10,000 to 12,000 hands.

In 1803 the import of cotton wool had reached 10,711,665 kilogrammes, and in 1820 had doubled that amount. The cost of the raw material in France, and its manufacture, are enhanced by the expense of fuel and carriage. The profits, deducting all outlay and wear and tear of machinery, and making allowance for every expense, are considered to be about 30,000,000 francs. It appears, that prior to the legal permission to import cotton thread free, when above No. 113, not less than 5,000,000 kilogrammes were smuggled, when the duty was from 70 to 80 francs the kilogramme. This traffic has not yet ceased. The spinners number from 80,000 to 90,000, and the mean wages of adults and children are 1 franc 50 centimes per head, who attend to 3,500,000 spindles. No. 132 of the French thread corresponds to 120 of the English, because of the difference between the English pound weight and the French demi-kilogramme. In the year 1806 the utmost degree of fineness attained in cotton thread was

No. 110. In the year 1809 it had reached No. 160. In general the French thread remains much below the English, but it continually improves. No. 180, which in France sells at 39 francs or 40 francs, costs in England only 18 francs. In the Seine Inférieure, at Rouen, and vicinity, there are about 1,000,000 of spindles at work. In the arrondissement of Lisle 600,000 are worked by 82 steam-engines, of 860 horse-power in all. St. Quentin works 210,000 spindles with 200 horse-power of steam, besides water-power. The spinning in Alsace employs 18,000 persons of all ages. The dyeing of cotton occupies 87 establishments at Rouen and its vicinity alone. The principal part of the weaving takes place in Normandy, Alsace, Amlens, St. Quentin, and Troyes. The looms are above 270,000, and employ 885,000 hands, the mean of whose wages is 75 centimes per day. Many of the looms there are worked by hand. The principal products are calicoes for printing.

In the departments of the Seine Inférieure, Somme, Pas de Calais, Aisne, Eure, and La Manche, the spinners, weavers, dyers, muslin fabricators, machinists, carlmakers, amount to 107,000. The individuals connected with the manufacture in other ways, the whole comprising 160,000 families, carry the total number concerned up to 400,000. Of the workmen immediately designated, the number is 107,000, employed thus:—

Spinners	21,000
Machinists	5,000
Loom weavers	65,000
Dyers	5,000
Muslin fabricators	9,000
Cardmakers and others	2,000
Total	107,000

In Alsace, including the Haut and Bas Rhin, the Vosges, the Meurthe, Haute Saone, and Doubs, above 100,000 persons are employed:

Spinners	17,000—18,000
Loom weavers	70,000
Printers	12,000—15,000
Bleachers	1,000
Total	104,000

The principal places for the manufacture of yarn in Alsace are Mulhausen, Wesselling, St. Mary aux Mines, and Guebwiller. In the other parts of France the principal are St. Quentin, Rouen, Caen, Amiens, Bar le Duc, Lille, Roubaix, Turcoing, Lyons, Paris, Darnetal, Bolbec, Troyes, Gisors, etc. The yarn made in the Seine Inférieure exceeds the whole made in Alsace. In the departments of the Somme, Pas de Calais, Aisne, Eure, and Manche, there are 60,000 weavers of *Rouennerie*, 20,000 of calico, and 49,000 in the other branches of the manufacture.

Linen.—In the extent of her linen manufacture, France is greatly superior to England; not that her soil is better adapted to the growth of hemp and flax, but because England depends on importations of linen from Ireland and Germany, and the spinning of flax does not form the occupation of our female peasantry. In France, particularly in the north, every farmer, and almost every cottager, covers a little spot with hemp or flax to employ his wife and daughters in spinning throughout the year; a stock of linen being the usual dowry of these humble occupants of the soil. The manufacture of this article is not exclusively concentrated in the towns, like that of the other fabrics; many of the weavers reside in villages and hamlets; and the hemp and the flax are spun by the hand. This is a most valuable branch of domestic industry, which gives employment to females under the roof of their parents; but it is destined, in the progress of capital and industry, to be superseded by machinery and great establishments. In Normandy, Lisieux, Dieppe, the neighborhood of Havre, Yvetot, Bolbec, and the more inland towns of Vimoutiers and Domfront, are all remarkable for one or more branches of

the linen manufacture. The more backward province of Brittany manufactures, at Rennes, St. Malo, and Vitré, quantities of coarse linen, canvas, and sacking; but Anjou affords a much superior article; the *toiles de Laval* have long been in repute, and gave employment, in Laval and the contiguous towns, to nearly 25,000 workmen. Lille and its populous district have very extensive manufactures of hemp and flax; for the number of workmen so employed, directly or indirectly, in this part of French Flanders, is not short of 50,000. Since 1790, fine linen has, in France as in England, been in a great measure replaced by fine cotton; and the two together employ, at St. Quentin (in Picardy) and the neighborhood, more than 30,000 workmen. In another part of the kingdom, the province of Dauphiné, there are carried on linen manufactures of various qualities, the prices being from 1 franc 10 centimes to 5 francs the yard. The value of the linen manufacture of France of every kind is no less than 525,000,000 francs. The raw material grown in France is valued at 30,941,840 francs for the hemp, and 19,000,000 francs for the flax. The hemp imported, and the thread together, give 85,699,003 francs value. About 1,000,000 francs is the worth of the flax imported. Total, 20,000,000 francs. The manufacture gives:

For the hemp	Frans.
flax	107,097,000
	75,000,000
A total of	182,097,000

The manufactures of hemp and linen employ 600,000 workmen. The exports of linen, principally to England, were, in 1840, nearly 6,167,781 kilogrammes. The manufacture has doubled since the first Revolution. Lille, Dunkirk, Essonne, Pont Henry, Bellais, Vernon, and Alençon, are noted places for their linen manufacture. Normandy sends to Paris annually 20,000 pieces of linen. The linens of Brittany are mostly consumed at home. The fine linen cloths called *toiles de mulquinerie* are principally made in the departments of the Aisne and Nord. St. Quentin was once noted for them; now that town, Cambry, Valenciennes, and Solesmes, produce cloths so fine, called *batists* and *linen*, that 70,000 pieces are exported to England. The beautiful *batist* embroidery employs 13,000 persons at Nancy. *Coutils*, a cotton cloth crossed with thread of linen, are woven in the department of Mayenne, where 4500 looms are employed upon this article. French linen differs in quality according to the place of manufacture; but in general it is thicker and stiffer than Irish linen, while in whiteness it is inferior to the linen of Flanders and Holland. It is, however, a substantial and durable article. Cambrics, thread, gauze, and lawn, rank among the leading manufactures of the north-east part of France. They are made at St. Quentin, Valenciennes, Cambry, and to a smaller extent at Douai, Chauney, and Guise. Lace is still more general, being made in quantities at Valenciennes, Dieppe, Alençon, Caen, Hayeux, and Argentau. Machinery had, up to 1820, been very little applied to this manufacture in France, and the number of women employed in it was very great. There are considerable manufactures of printed linens; and the dyeing of linen thread gives rise to an extensive commerce. At Rouen, and in the surrounding districts, this branch of industry is carried on; and many stuffs of great variety, and for which there is a brisk demand, are produced. In 1822 the duties on foreign thread and linen were raised by the French government till they were nearly prohibitory; and the annual importation from Germany and Belgium, which formerly amounted to a million and a half, almost entirely ceased. The price of home-made linen rose 25 and 30 per cent.; the consumers had recourse to cotton as a substitute; the French dyeing trade fell off, and also the entrepôt trade in foreign linens, both of them sources of great business.

The value of the hemp annually grown in France may be computed at £1,200,000, the quantity imported at £200,000; together £1,400,000; a value which is doubled in the coarse manufactures, and tripled in the finer. Of this quantity of hemp, the half is made into canvas and thread, a third into cordage, and the remainder into cloth for domestic use. Of the flax annually employed, the value is about £800,000; a sum which is tripled when it is made up into thread, linen, and mixed stuffs, and much more than tripled in the finer qualities.

Iron.—France had in 1855 about 569 furnaces, of which more than 300 are said to be blast-furnaces. It is, however, almost impossible to ascertain the exact number of blast-furnaces, the position of which is regulated by that of the iron mines. They are chiefly in the mountainous departments of the Dordogne in the south-west, and of the Haute Marne, the Haute Saône, and the Côte d'Or, in the east of the kingdom. Of forges for malleable iron, called *forgeries à la Cote-lanc*, there are eighty-six scattered throughout different departments, but chiefly in the hilly part of Languedoc. There are also a number of wire-works in France, in which, as in the blast-furnaces, there has been since 1790 a progressive but very slow increase, altogether different from the rapid advance of the iron-works of England previously to 1815.

The stationary character of these works has evidently been owing to the deficiency of fuel and of water communication; disadvantages which prevent the hardware manufactures from being concentrated in cities or populous districts, and cause them to be spread over the country in petty towns or villages, with a very limited division of labor, and a consequent inferiority of execution. The result is, that France does not export hardware, and that in nothing is the inferiority of domestic accommodation in that country more conspicuous than in articles which belong to the province of the locksmith and cutler. The amount of pig-iron annually made in France appears to be about 100,000 tons. The value of the hardware of the kingdom, including cutlery, arms, and other articles of nice workmanship, is computed at £8,000,000 or £9,000,000 sterling. Fine cutlery in former times was largely smuggled into France, but now to a much smaller extent. The annual import of iron and steel is only from £2,000,000 to £3,000,000. The high price of iron is a great obstruction to the progress of the hardware manufactures; and this circumstance places in a strong light the impolicy of the heavy duties on foreign iron, by which, notwithstanding the change in the scale of duty in 1838, all those important branches of industry in which iron is used are stunted in their growth. In copper, the importations greatly exceed the home produce. From Great Britain the quantity imported for the last ten years has increased from 200 to 20,000 hundred weight. Of lead, also, the chief part is imported. The manufacture of steel has only been lately introduced into France. Prior to 1786 there was no manufactory of this useful article; and it was only after accounts had been published by scientific persons of the composition of that article, and after repeated experiments, that in 1809 manufactories of steel were established, which have been since extended to several departments, especially to those of the Loire.

Silk.—As regards silk, France possesses, both from physical causes and from the long-established manufacture, a decided superiority. Mulberry-trees were introduced in the fifteenth century, and were first planted, not in the south, but in the central part of the kingdom, near Tours. That town was the seat of the earliest silk manufactures, and it was not till 1600 that the culture of the mulberry was carried southward. The mulberry thrives in a variety of soils, and may be planted with success in neglected borders or in waste lands.

The manufacture of silk is considered as an important branch of French industry, not only on account of the variety and beauty of the fabrics, but because the raw material is an indigenous product of the country. It was estimated* 20 years ago that the amount of the annual sales to foreigners was 80,000,000 fr.; that the home consumption of the kingdom amounts to £3,835,334; and that the whole annual value of the silk manufacture was equal to £4,568,889. The manufacture of silk is not confined to any particular spot. It is carried on in different parts of the country, in all of which it diffuses prosperity. It has enriched the poor of Nimes, of Avignon, and of Tours. St. Chamond and St. Etienne owe a great part of their prosperity to the manufacture of ribbons, and the town of Ganges to bonneterie. Paris derives immense profits from her manufacture of silk stockings, and other fabrics, either of silk with a mixture of silk, or of wool and cotton. Silk is also the great staple manufacture of Lyons, in which it is carried on in all its branches with astonishing success; and since the Revolution, in addition to fabrics of silk, all sorts of stuffs mixed with silk, and with cotton and wool, have been manufactured; and to these manufactures Lyons is indebted for its riches, having risen not only to be the second town in France, but one of the most opulent and flourishing cities in the world. It was 20 years ago estimated that about 60,000 or 70,000 individuals, young and old, were supported by the silk manufacture in Lyons and the adjacent district; but the number has increased 25 per cent. since 1835. The dyeing of silk being an important branch of the manufacture, many experiments were made to bring it to perfection; and, in particular, a dye of perfect black that would retain its color was a desideratum. This dye was invented by a common dyer at Lyons, who received a pension, beside being made a member of the Legion of Honor. Prior to this, the black dye which was used changed in a few days to a brown, and came off the stuff when it was hard pressed by the hand. Another improvement which was made consisted in producing a silk of a permanent white color. The eggs of the worm which produced this silk were brought from China, not however with the desired success. The worm was afterwards purchased from a merchant of Alais, and distributed in the northern department of the country; and the produce of white silk is now very considerable, and of great importance in the manufacture of gaves, crapes, and tulle. Other inventions were devised for saving labour at the various stages of the silk manufacture, by which, in this branch of industry, France was long enabled to outstrip all her neighbors, though of late years the silk manufacture has made immense advances in Great Britain.

There were in 1820 no less than 9,631,624 mulberry trees in France for the nourishment of the silk-worm. These supplied food for cocoons producing in 1819, according to Chaptal, 5,147,609 kilogrammes of cocoons. In 1835, the product had increased 9,000,000, yielding 278,000 kilogrammes of silk grège, and 161,000 kilogrammes organzine. At present (1855) the quantity of silk furnished amounts to 1,600,000 kilogrammes; which, at 55 fr. per kilogramme, the average price, gives a sum of 88,000,000 fr. as the value of the amount produced. In 1810 the amount was only 4,673,198 kilogrammes of cocoons, at 3 fr. 45 cen. per kilogramme. In 1830 it had risen to 9,097,967, at 3 fr. 02 cen.; while the wound silk (*grèges filées*), which in 1810 only reached 350,629 kilogrammes, at 45 fr. 12 cen., in 1835 had increased to 876,016 kilogrammes, at 58 fr. 64 cen. per kilogramme. But the home growth not being enough to meet the demand, importations took place to the extent of 1,154,956 kilogrammes, valued at 53,781,578 fr., and they still increase. Italy,

About 500,000 kil in the other depart were silk introduced in France in value 5,464,699 fr Articles of leather in England.

Jewelry, Porcelain the value of 50,000 deus, Clermont, as jewelry. Watch a great extent in time-piece in there ornamental furniture of clocks and watch is not less in value 10,000 hands. The factured in the cap branches and stages further annual value Paris is remarkable luxury; in particular

Switzerland, Turkey, and Greece, supply the larger part. A small quantity is obtained from Austria and Sardinia. The exportation of silks, plain and flowered, from 1787 to 1789, on a mean of 10 years, was 87½ millions of francs in value. In 1829 it was 111,000,000, and in 1836 206½ millions of francs, consisting of 2,720,924 kilogrammes, under 22 different denominations of goods. The United States, England, Germany, then Belgium, and, lastly, Spain, are the principal outlets for the silks of France; but South America, Russia, and Switzerland, are also considerable purchasers. France exports silks to a large amount in the way of transit. Lyons, Avignon, Tours, and Nîmes, are the principal seats of the manufacture of silk stuffs; and St. Etienne, St. Chamond, and Paris, for that of ribbons. In the arrondissement of Lyons and Ville Franche, there are 81,083 looms. The manufacture of ribbons at St. Etienne employs 20,000 workmen and 30,000 looms, producing 27,473,000 fr. value annually. The fabrication is divided into the manufactures *unis* and *façonnés*. Under the first head are those with the *peûx gros*; as, *gros de Naples*; those called *pou de soie*, *fantaisie*, *crepes*, which last are subdivided; then satins and the like. The ribbons are, in like manner, distinguished by different appellations, after the nature of the fabric. St. Etienne employs in all 279,000 spindles (*broches*); of which 165,000 work organzines and tranes, and 114,000 work the silk intended for crepes and gauze ribbons. The number of looms has been estimated in all at 65,000 for weaving silks, and 80,000 for ribbons.

The raw silk or silk-wool consumed in France in 1840 was valued at 53,731,536 fr.; whilst the value of the silks in transit reached 40,134,301 fr. Plain and flowered silk consumed at home, = 5,299,490 fr.; that which passed in transit = 37,204,483 fr.; being a total of 136,369,810 fr. A decree of the 19th August, 1852, permits the free exportations of silk.

The silk-wool of French production exported in 1840 was valued at 3,738,103 fr.; the foreign grown silk-wool exported at 47,491,154 fr. The value of the export and import together was thus 380,256,696 fr. The following are the most important districts of the mulberry, with the growth respectively, and the cocoons produced in 1840:

Districts.	Hectares.	Cocoon.
Gard.....	14,911	2,698,000
Drôme.....	6,212	2,585,352
Ardeche.....	5,602	1,765,121
Vaucluse.....	3,986	600,600
Hérault.....	2,592	1,248,972
Isère.....	2,071	530,507
Bouches du Rhône.....	1,516	549,750
Rhône.....	1,295	471,560
Alp.....	886	74,716
Var.....	787	491,750
Total.....	39,770	11,833,358

About 500,000 kilogrammes of cocoons are produced in the other departments. The importation of English worn silk into France in 1869 was 52,702 kilogrammes, in value 5,464,699 fr.

Articles of leather are in France much cheaper than in England.

Jewelry, Porcelain, etc.—Jewelry is made in Paris to the value of 50,000,000 fr. Lyons, Marseilles, Bordeaux, Clermont, and Strauburg are also famous for jewelry. Watch and clock-making are carried on to a great extent in France, particularly in Paris. A time-piece is there a much more frequent article of ornamental furniture than in England; and the number of clocks and watches made annually in the kingdom is not less in value than 80,000,000 fr., employing 10,000 hands. The works in bronze are chiefly manufactured in the capital, and reach, in their different branches and stages, of which gilding is the chief, a further annual value of 37,000,000 fr.

Paris is remarkable for other fabrics of taste and luxury; in particular, the porcelain of Sèvres, near St.

Cloud, and the beautiful but very expensive tapestry of the Gobelins. The materials of the latter are silk and the finest woolen thread; the subjects woven into the work are taken from paintings executed on purpose. Both the establishments have been long conducted by government at a sacrifice, and both are now on a reduced scale, the articles being far too costly for ordinary fortunes. The articles more frequently purchased are *passementerie*, by which is understood artificial flowers, fringes, gold and silver lace, with a variety of trifling but tasteful articles, all sufficiently adapted to a city where so much more is thought of display than of utility.

Soap.—The value of all the soap made in France is computed at 80,000,000 fr. The main ingredient is olive oil; and Marseilles was formerly the seat of this manufacture for almost all France—an advantage owing both to the extent of the olive-grounds in the south-east of the kingdom, and the vicinity of Marseilles to Italy, the Levant, and Spain, whence soda and olive oil were imported in vast quantities. A million of francs were paid for bounties on the export of soap in 1852. The export of soap from France in 1838 was 2,011,631 kilogrammes, valued at 2,941,631 fr. The disorders of the first Revolution, and the establishment of similar manufactures in other parts of France, have caused to Marseilles the loss of a third of its soap works; they are still, however, very extensive. Of the oil used in France, whale oil forms a very small proportion: the great supply is of vegetable oil, viz., that extracted from the rape and cole-seed of the north, and the olive oil of the south.

Beer, formerly little drunk in France, has become of extended consumption since 1790; but even at present, the quantity used does not exceed £2,000,000 sterling, its place being supplied by cider in the north, and by wine in the south. Within the last few years there is a considerable consumption of English bottled stout and porter, and a lesser, though increasing, consumption of English ale. The breweries have increased, and are interesting, in Paris, as well as in the northern departments. The consumption which corresponds to that of English home-made spirits and rum, is in brandy, of which the value annually made is between £2,000,000 and £3,000,000 sterling. The distillation varies in amount with the season. The brandsies of Cognac, Jarnac, and Angoulême, are most in esteem. The best brandy is made in a district called Champagne, comprehending a part of Saintes Jonzac and Cognac territory. In France-Compté and Alsace, a brandy called Kirsch is made, but little of which is exported. The Hérault, Aude, and Gard, supply the largest quantity of spirit of wine. The best is called that of *trois-six*. The amount varies from 40,000 to 80,000 pipes of 80 veltes, five of which form a quintal. A velte is 7.61 litres = 1.675 gallon. Beer is brewed in the northern and eastern departmen'ts, viz.:

	Quantity, Hectolitres.	Value, Fr.
Nord Oriental.....	3,115,615	41,416,492
Nord Occidental.....	527,378	9,429,201
Midl Oriental.....	160,942	5,447,719

Cider is made everywhere; in largest quantity in the Nord Occidental, and the best in La Mancha and Calvados. Some is distilled for brandy. The quantity is estimated at 11,000,000 hectolitres, at 7 fr. 75 cent. Normanly furnishes half. The whole is worth 34,000,000 fr. There is also a considerable distillation of spirit from potatoes, "which," says Chuphal (vol. ii, p. 197), "has been generally approved, and has been brought into competition with brandy."

Lesser Manufactures.—Of hats, the manufactures, formerly concentrated at Lyons and Marseilles, are now diffused throughout several towns; and the value annually made is about 24,000,000 fr. The hat manufacture of Paris is estimated at an annual production of 1,200,000, of the average value of five francs each, and employing 2000 men and 2500 women. Superior

qualities of silk hats are sold to the retail tradesmen at from 9 fr. to 11 fr., for which the latter obtain from 15 fr. to 18 fr. The hat manufacture in France employs 17,000 hands, and yields a value of 19,500,000 fr., in 1159 workshops. The second order of hatters, who finish the hats according to the different tastes required, elevate the value of the trade to 24,375,000 fr. The manufacture of gloves—principally made at Grenoble, though called "Paris gloves"—employs 25,000 persons. In 1839, the value of the gloves made in France was 3,436,000 fr.; in 1840, 5,556,000 fr. The tanneries prepare 33,286,004 kilogrammes of leather, valued at 82,864,706 fr., for boots, shoes, saddlery, etc. Perfumery is made extensively in Paris, and in the south, chiefly at Montpellier, where, from the mildness of the climate, aromatic plants are abundant. The value of the manufacture is about 13,000,000 fr. Paper being exempt from the heavy duties of England, is sold in France upon very reasonable terms, while in quality it is equal to our own. The value annually used in printing and in writing is computed at 25,000,000 of francs; and the paper employed in the hanging of rooms is estimated at an equal value. Of glass, the manufacture has been much improved and extended during the present age. Whether for mirrors, for windows, or for bottles, this article in France is good, and of a moderate price. The number of glass-houses in 1818 was 185, and is now over 220. Small mirrors are manufactured much cheaper in France than in England. Bohemia is the country with which the French manufacturers state they can not compete. As to earthenware, it is only since 1790 that English pottery has been successfully imitated in France. It is now made to the value of 29,000,000 fr.; while the coarse earthenware, fabricated in almost every province of the kingdom, is computed at 15,900,621 fr., employing 10,433 hands. French earthenware is very inferior to English. Salt-petre, till lately a monopolized manufacture, is now unrestricted. Sulphuric acid has, since the beginning of the present century, been greatly lowered in price and increased in quantity.

Sugar.—The manufacture of sugar from beet-root was introduced into France during the reign of Napoleon Bonaparte, when, the coasts of France being blockaded by the fleets of Britain, the importation of foreign articles, and among others that of sugar, was rendered dangerous and difficult; and its price was so high as entirely to preclude its consumption by the middle classes of society. Various articles were resorted to as substitutes, such as honey, and juice of raisins, etc., but they were not relished by the taste of the people; and in this case experiments were tried by eminent chemists to extract from beet-root the sugar which it contained. These experiments were successful. There were in 1831 more than 200 establishments, from which were produced annually 7,480,000 pounds of raw sugar; and there were in 1864 303, producing 62,205,600 pounds. The largest sum paid by the administration of the customs has been for refined sugar. It amounted in 1852 to 16,000,000 fr.

Machinery.—The manufacture of machinery has greatly increased. Steam-engines have been introduced into France from Great Britain, where they are now employed in every department of industry. It was in the year 1779, at the village of Chaillot, near Paris, that the first steam-engine was established in France; but, owing to prejudices, and attachment to old customs, it was long before these engines came into very general use. Prejudice, however, gradually faded away before the productive powers and manifest utility of this extraordinary application of science to the business of life, and there are now many establishments for the manufacture of these machines. The scarcity of coal is a great obstruction to the extensive use of steam-engine; and the tax on foreign coal is, in this view, peculiarly impolitic, and injurious to the

general interests of the community. The tax, though lately reduced by the Imperial government, requires still further reduction.

In 1836, of 1749 steam-engines in France, 1899 were home made. In 1839 the import surpassed the export. Since that year the reverse has been the case. The metallic castings in France are still very inferior to those of England. Paris is the principal seat of the manufacture of French machinery, then Arras, Creuzot, Rouen, Mulhausen, and Nantes. Locomotive engines are made at Bitschwiller, in the department of the Il at-Rhin; machinery for steam-vessels at Indret. The value of French industry has been estimated in the mean product as follows:

	France.
Iron from the ore to the perfect state, minerals, etc.	124,000,000
Copper, zinc, and lead	26,500,000
Glass, crystal, and looking-glasses	47,500,000
Tiles, bricks, lime, plaster	66,500,000
Porcelain, pottery, etc.	27,300,000
Chemical manufactures, the products	22,000,000
Hemp and Flax (supposed to be no less than 525 millions of francs)	360,000,000
Cotton	500,000,000
Wool	400,000,000
Silk	230,000,000
Leather and skins	300,000,000
Sugar	45,000,000
Paper, colored and figured	25,000,000
Printed paper, books, etc.	25,000,000
Machinery	10,000,000
Clocks and watches	80,000,000
Bronzes	25,000,000
" plated ware	6,000,000
" jewelry and goldsmith's work	50,000,000
Distilleries, breweries	208,000,000
Different branches of industry	185,000,000
Mechanic and domestic arts	220,000,000

"Labor in Paris is as much dearer relatively to the provincial towns of France, as labor in London is relatively to those of England. It still remains for us to remove from our capital some manufactures which have been most injudiciously established there; but the French have carried this false calculation much further, Paris being the centre not only of ornamental fabrics, such as jewelry, bronze, sculpture, cabinet-making, and the vast variety of elegant trilles comprised under the term "articles de Paris," but of a number of coarser employments, which a very slight change of plan might transfer to a cheaper quarter. Periodical exhibitions of French manufactures are held at Paris every three or four years, at which are present the sovereign, the princes, the nobility, and all eminent men of science. In 1855 was opened in Paris an Exhibition of the Industry of all Nations, similar to that which took place in London in 1851, and in Dublin in 1853. The Parisian exhibition, like the Dublin one, contained a branch dedicated to the fine arts. This exposition continued open from May till the middle of November. It was twice visited by her majesty Queen Victoria between the 20th and 25th August in her nine days' visit to France. There is also in that capital a *Conservatoire des Arts et des Meters*; a collection, on a large scale, of models of all instruments or machines that relate to arts and manufactures. It is more the practice also in France than in Britain to encourage ingenious inventions in the mechanical arts, by premiums, orders of merit, and other honorary marks of distinction. Yet, with all these advantages, industry has not made the same progress as in this country.

"To prescribe the mode of manufacture was formerly a favorite course with government in England as in France. From the time of Colbert (1660) the French ordinances prescribed peremptorily the length and breadth of serges, of druggets, in short, of every kind of cloth calculated for export, under the plausible plea that all these precautions were necessary to establish a reputation for quality. It is a curious fact, that these rules were desired by the manufacturers them-

selves, and French in and permit his own n thus made the regulat The power ordonnance former En were no p tion. Much from the ab settling in which he ha abrogated in

selves, and were long considered as the safeguard of French industry. A change was introduced in 1779, and permission given to every manufacturer to follow his own method, provided he distinguished the goods thus made from those which were in conformity with the regulations. But this was of very short duration. The power of habit and prejudices prevailed. New ordinances, issued the succeeding year, revived the former limitations; and the manufacturers of France were not put on an unrestricted footing till the Revolution. Much inconvenience had also been sustained from the absurd law which prevented a workman from settling in business in any town excepting that in which he had served an apprenticeship. This law was abrogated in 1767.

"The manufacturing industry of France is confined, far more than ours, to the home market, whether we look to the supply of the raw material, or to the export of the finished articles. Her imports are large only in cotton and silk; in woolen and iron they are not considerable; while in flax, hemp, and leather, they may be termed insignificant. In exports the limitation is still more striking, her hardware, her linen, her wooleens, her cotton, her leather, and, in a great measure, her silk, being confined to the home market; a restriction owing partly to our manufacturing superiority, but more to the capital of our merchants, their ability to give long credit, and to deal with foreign traders and merchants in a liberal and not in a petty retail spirit. The productive industry of France is consequently much less subject than ours to sudden fluctuation. It follows nearly the same routine year after year. On the occurrence of a war, or other political change, the commerce and manufactures of our neighbors, to borrow a phrase of Talleyrand (Letter to Mr. Fox, 1st April, 1806), *se replient sur eux-mêmes*."—E. B.

Commerce, Colonies, Fisheries, Shipping.—In no country in Europe has trade been laid under such galling restrictions as in France; and it is remarkable that this system of restriction has in a great measure been the creation of modern times. The ancient legislation of the kingdom was rather friendly to foreign trade. It encouraged importation in preference to exportation. This latter privilege of export was in 1577 claimed by Henri III. as his royal and seigniorial right; and he regulated by his ordinances the export duty on a variety of articles, while the produce of foreign countries was admitted on payment of an *ad valorem* duty of 2 per cent. Louis XIV. introduced a sort of navigation act, by which he levied a tax of 50 sous on all foreign ships. In 1667 further restrictions were introduced; and in 1687 the exclusive system was established in its full rigor. The statesmen of France seem to have imagined that a flourishing commerce could be created by legal authority, and that domestic industry could only be encouraged by the exclusion of all foreign competition; and hence all the vices and obsolete maxims of the mercantile system will still be found in the commercial policy of our neighbors. The extension of the restrictive system was promoted by the authority of Colbert, a minister who, though he introduced order into the finances, and improved in many particulars the system of taxation, and was indeed a great master of detail, adopted the most erroneous maxims of commercial legislation. It is justly observed, in the report of Villiers and Bowring on the commercial relations between Great Britain and France, that the "whole of the bounties by which he induced adventurers to enter into remote speculations, as well as the excessive duties which he imposed on cheaper foreign articles, were almost uncompensated sacrifices; while, on the other hand, of the manufactures which he transplanted into France, and which he protected by the exclusion of rival productions, scarcely one took permanent root;" and even those which he intended to support by special encouragement would all of

them have been more prosperous, but for the regulations with which his mistaken zeal retarded the progress of manufacturing industry. His whole system was an attempt to regulate by law what would have been better left to the sagacity of individuals, and to give a forced and artificial direction to the national capital. Thus he encouraged a trade to the West Indies by granting a bounty of 25s. on every ton of goods exported, and of 41s. 8d. on every ton imported. He boasted of setting up 40,000 looms by virtue of legal enactments, without considering that the capital employed in these establishments would have taken a more natural direction, and been more profitably employed, but for his interference. The restraints also which were thus laid on domestic industry were often enforced by the despotic authority of government. Many of the absurd and pernicious regulations of Colbert were broken down by the first French Revolution; but others remained, and the tariff of 1791 was from beginning to end a system of prohibition, the object of which was to encourage the home manufacturer by freeing him from all foreign competitors. It must be confessed that England set the example of illiberality; and it was no wonder that the French of that day should be jealous of a country which excluded her silks and cambrics, and laid a discriminating duty of 33½ per cent. on French wines; and whose Parliament, under the reign of William III., declared the trade with France to be a nuisance. The commercial treaty concluded with France in 1786 by Mr. Pitt was the earnest of a better system. Since this period the legislature of this country have been impressed with the injurious tendency of all commercial restrictions. But in France the progress of improvement has been slower, and it has besides been retarded by political events. The long and sanguinary war waged between Great Britain and France subjected the latter to the maritime hostility of her powerful opponent, the consequence of which was, that her trade with foreign countries was interrupted, and the supply of many of their staple articles of produce greatly diminished, and raised enormously in price. It became a great object, in this case, to produce these articles at home. In addition to the existing restraints upon the importation of foreign manufactures, special encouragements were given to the production of articles for which neither the soil nor the climate of France was peculiarly fitted. Thus when the maritime blockade of France was raised by the peace of 1814, her industry, partly from ancient and mistaken maxims, partly from the pressure of war, received a very artificial direction, and was oppressed by ruinous and complicated restrictions. At the restoration of the Bourbons in 1814, the tariff of 1791 was the law of the land. It had undergone a few modifications, but these were mostly in the restrictive and prohibitory spirit, and were accommodated to the hostile position which France occupied in regard to surrounding nations. When the barrier to a free intercourse with foreign nations was at length thrown down by the peace of 1814, the exclusive provisions of the tariff of 1791 were brought into full operation; and when the obstacles to the commercial intercourse of France with foreign nations raised up by the war were withdrawn, a no less effectual line of circumvallation was drawn around her commerce by the restrictions and prohibitions of her own erroneous policy. It is remarkable, indeed, that a committee of the Chamber of Deputies, in reporting on the budget in 1832, enters into an exposition and defense of the restrictive system, the principle of which is to encourage domestic industry by the exclusion of the cheaper and better manufactures of foreign nations.

The tariff of 1791 either excluded from France, or laid under heavy duties, almost all the great staple manufactures of other countries. Manufactured iron in every shape, manufactured steel, copper, tin, cut-

lery, and all articles manufactured from any of the metals; all fabrics of wool, cotton, silk, or tissues of hair, saddlery, spirituous liquors, grain, refined sugar, tobacco, toys, and various other inconsiderable articles, are included in this class of domestic commerce. The inconsistency, and the fallacies on which this system is founded, are well exposed in the report of Villiers and Bowring. The passage, though somewhat long, is replete with instruction.

"It requires merely to state some of the objections to importations in order to show their narrow and anti-commercial spirit. The introduction of manufactured tin, for example, is opposed because it might benefit England, which is rich in tin mines, as if the importation into France could take place without actually benefiting her. The reasons, too, which are grounded on the superiority of other countries; as, for example, 'dangerous rivalry' in the case of manufactured steel; 'cheapness' of foreign articles in the case of shipping; threatened 'annihilation of the French manufacture' in that of cutlery; 'extra advantages of the English' in plated ware; 'apprehension of the English' in articles of pottery; 'imprudence of admitting English saddlery,' as so many persons, regardless of price, prefer it; 'advantages of machinery' in works of iron; all are modes of announcing the superiority of the foreign articles, and the power which foreigners possess of supplying them on cheaper terms than they can be produced at home.

"There are other grounds of prohibition by which particular French manufactures are avowedly sacrificed to the interest of other branches of French industry. The importation of extracts of dye-woods is disallowed for the purpose of encouraging the importation of the dye-woods themselves; the interest of the dyer, the manufacturer, the consumer, being wholly forgotten. The importation of iron of certain sizes is prohibited, lest small manufacturers should establish factories, and supply the markets at a less cost than the larger establishments. Woolen yarn is not allowed to be imported because it can be produced in France, though the high price must be a great detriment to the woolen manufacture; and cast iron of a great variety of sorts is prohibited, on the ground that a sufficiency may be obtained at home, though the cost is not nearly more than double that of many articles of foreign cast iron. Molasses is not allowed to be introduced, because the price in France is so low, and the exportation so large, on the ground that importation will lower the price still more, though the lowness of price would obviously make importation unprofitable; and the fact of considerable exportation is the best evidence that the average price are low in France. Rock salt was prohibited in 1791, and the prohibition is now justified on the ground that mines have lately been discovered. The prohibition of refined sugar was supported on the ground that its admission would not benefit the treasury; but it is clear, if the interest of the treasury were kept in view, that all prohibitions would be appreciated, or superseded by a system of duties. While some articles are prohibited because the production is small in France, and it requires protection, others are prohibited (dressed skins, for example) because the production is great, and engages a large number of hands."

There is another branch of the French legislation regarding commerce, which is equally exceptionable with the prohibitory: to import foreign manufactures; namely, the system of drawbacks and bounties on the exportation of domestic produce. Having by special encouragements created a surplus of certain articles at home, and which the high price prevented from being sold to foreigners, the public were called upon to pay the difference between this high price and the price abroad; and thus they were taxed, by the exclusion of the foreign article, in a higher price for what was consumed at home, and also taxed for all that was consumed abroad, in the bounty which was paid on the exportation of the article. This is a double iniquity, which has gone on increasing in France. In 1817, the whole amount of what was conceded on this account amounted to £350 per annum, while in 1830 it amounted to £600,000, nearly one fifth of the nett amount of the whole custom-house revenues of France; and as it was going on progressively, it might soon have absorbed the whole custom-house income, without in the least benefiting, but rather injuring, the general interests of commerce. During the first nine

months of the year 1832 premiums or bounties were paid to the amount of 24,448,875 francs, or £1,018,682.

The commerce of France, obstructed by these restrictive duties, has not made the same advances as her agriculture and manufactures. The internal produce of every country necessarily increases with its population; and the inhabitants of France having increased, since 1780 to 1855, to full 80,000,000 (for the census of 1851 makes the population 85,781,628) from 24,900,000 must produce as well as consume more. But in the mean time her commerce has not kept pace with this increase in her population. The value of the imports into France amounted in 1787 to 631,700,700 francs, or about £25,000,000 sterling, and engaged 888,868 tons of shipping; and her whole imports only amounted in 1830 to £25,500,000 sterling, and employed 1,009,454 tons of shipping, which is far from being an increase corresponding to her augmented population. According to the last accounts, the value of imports was in 1853 £65,240,000, of which to the value of £44,120,000 remained for home consumption, and engaged 4,605,000 tons of shipping. The whole trade of France with its own colonies and foreign powers amounted for the year 1853 to an official value of 5,448,000,000 francs, which was an increase of 12 per cent. on the year 1852, and an increase of 32 per cent. on the average of the years between 1844 and 1848. The foreign commerce of England was, in the year 1787 about 7,000,000 less than that of France, or about £18,000,000 sterling, and employed 1,349,419 tons of shipping. Her population was 9,000,000. In 1830 her foreign trade had increased to £69,700,748, including £17,127,764 to the colonies, which employed 2,866,615 tons of shipping. Thus, while the official value of the commerce of England had nearly quadrupled, and her shipping nearly doubled in forty-three years, not above one fifth part was added to the foreign commerce of France; a fact which strongly illustrates the pernicious influence of monopolies in damping the energies of individual enterprise, and thus obstructing the national prosperity.

1832.....	1,498,000,000	1,682,000,000
1833.....	1,632,000,000	1,801,000,000

Total..... 6,544,000,000 8,128,000,000

The intercourse of France with its colonies and foreign States in 1853, exports and imports united, formed a sum in official value equal to 3,491,000,000 francs, being an augmentation of 373,000,000 francs over 1852. The actual value of the imports in 1853 was 1,217,000,000 francs against 1,006,000,000 francs in 1852, and of the exports the actual value was 1,572,000,000 francs against 1,278,000,000 francs in 1852. The ocean imports were in actual value 1,070,000,000 francs, and those by land 625,000,000 francs. The exports by sea were 1,633,000,000 francs actual value, and those by land, 420,000,000 francs.

Observations on Trade.—During the four years from 1850 to 1854 inclusive, the value of French commerce has augmented 303,329 francs, and the number of seamen employed has increased 19,046. The exports to Russia, owing to the war, were reduced in 1854 to three outward-bound vessels. The commerce with England has increased with great rapidity, having nearly doubled the amount in 1850. With Sweden and Norway the increase has also been considerable. With Austria, on the other hand, there has been a diminution, and also with the Roman States. With China there is an increasing trade, as well as with the United States of America, but with Rio de la Plata and Ecuador there has been a falling off. Most of the other States with which France carries on a commercial intercourse, exhibited an increase which, if small, augmented the general commerce so much as to show

that the country career of traffic.

Returns of the customs duties levied on the principal merchandise imported into France during the nine months of 1855 ending on the 1st of October, give an amount of £5,927,030. Compared with those of 1854, they show an augmentation of £1,723,976. The receipts during the month of September were £465,688, or £40,368 less than in the corresponding month of last year. The salt-tax produced during the nine months of 1855, £930,891.

The value of exports in 1853 reached £74,640,000, of which £54,520,000 represented French produce, and £20,120,000 was foreign produce re-exported. The imports for home consumption showed an increase of £4,680,000, and the exports of French produce an increase of £5,200,000 above 1852.

The following is a brief sketch of the trade of France with other countries:

The corn, the hemp, the flax, the tallow, which form such important articles of export from the north of Europe to England, are comparatively unnecessary to France. Their timber and pitch are imported there, but the quantities required by a people where ship-building is so limited, are necessarily of little consequence. It would appear, however, that in the progress of the recent war against Russia, many articles imported from the north of Europe have become more necessary to France, and by a decree published in the *Moniteur* on the 20th October, 1855, building-timber, wood for cabinet-making, of a certain thickness, rough castings, bar and sheet iron, hemp, etc., may be imported for three years free from import duty. Pitch, tar, and tallow, when employed in ship-building, may be imported at a duty of 10 per cent. If it can be proved they have been used *bona fide* for the purpose within a year. The further articles of import are iron, copper, lead, salt fish, all likewise on a small scale. The returns from France are no longer in the sugar and coffee, which, before the loss of St. Domingo, furnished an annual export to the north of fully £2,000,000 sterling. They are limited to wine and brandy, luxuries of which the consumption is con-

fined to a few large towns, such as Petersburg, Hamburg, Lubec, Stockholm, and Dantzic.

With Germany the exchanges of France are now carried on by steam, canal, and land-carriage, and for lighter articles and *articles de Paris* by railroad, and river navigation.

From Holland are imported spirituous liquors, spices, butter, cheese. The returns from France consist chiefly of wine, silks, brandy, and dried fruit. When the Netherlands were subject to France, this intercourse was very active.

From Italy, France imports raw silk, corn, rice, olive-oil, and fruit, chiefly lemons, oranges, figs, and raisins. The returns, various in kind, but small in quantity, consist of wine, brandy, cattle, woolens, linen, leather, hats, stockings, jewelry, glass, hardware. From the Levant, the imports, though less than formerly, still consist of raw silk, cotton, wool, corn, dried fruits; the exports, manufactured silks, woolens, stockings, and, in a small degree, hardware, paper, liquors, linens, lace. With Spain the intercourse is more extensive; the exports from France consist of corn, flour, salt fish, wines, brandy, also woolens, cottons, silks, leather, linen, lace, hats; all articles which have passed through some process of manufacture, and bear testimony to the industry of the French. The Spaniards, on the other hand, true to their character, make no returns except in produce and raw materials, viz.: wool, silk, fruit, sweet wines, along with some iron and copper. During the years 1854 and 1855 there have been considerable exportations of Spanish wine into France for the use of the French troops serving in the Crimea. With Portugal the trade of France is not considerable, the staple products, wine and brandy, being the same in both countries.

The intercourse between the French and Americans should be great, but the Americans require long credit, and to give credit exceeds the means of the French. The cotton, tobacco, and rice of the United States are paid partly by wine and brandy, but in a slight degree by manufactures. This branch of trade will increase with the population and wealth of the United States. At present the intercourse with England is more considerable than with almost any other country; but a reduction of the custom-house duties would extend greatly the mutual trade of the two countries. Great Britain would supply France in greater quantities with imports, consisting of cottons, hardware, earthenware, copper, tin, iron, coals, etc.; while a corresponding increase would take place in the French exports, of which the staple articles are wine and brandy, the smaller silks, olive-oil, fruit, butter, poultry, corn, and butcher's meat.

The chief commercial business of Paris is necessarily inland; but it is the centre of exchange transactions for France, foreign as well as inland; as London is for England, and Amsterdam for Holland. Havre de Grace is the channel for the maritime intercourse of the capital, the outlet for its exports, and the medium through which it receives colonial produce, raw materials, and foreign manufactures. Bordeaux is a sea-port of great activity, as well for the exportation of wine and brandy, as for the importation of sugar, coffee, and cotton. Marseilles, a larger but a less bustling city, continues the emporium for the trade with Italy and the Levant. Nantes has suffered greatly by the loss of St. Domingo, as well as by the abolition of the slave-trade, of which it was the centre. It still exports to Martinique and Guadeloupe, linen, hardware, printed cottons; and, like Bordeaux, receives in return sugar, coffee, and raw cotton. Rouen, though accessible to vessels of burden, is, like Lyons and Lille, chiefly remarkable for manufactures.

The mercantile marine of France recently presented the following results, which are remarkable while En-

gland and America are building vessels of such superior tonnage:

Navy.—The superiority of the English navy over the French existed when her pecuniary means were far inferior; and though, during the middle of the reign

of Louis XIV. the French, by financial sacrifices, obtained a numerical superiority, one great battle, that of La Hogue, in 1692, was sufficient to change the ascendancy. The war of 1741, however successful on the part of France by land, was, particularly toward its close, unfortunate for her at sea. In the succeeding interval of peace, great efforts were made to reinstate the French navy; but the war of 1756, though the French admiral, De la Galissonnere, boasted of a success over Byng, proved doubly disastrous, and at last swept it almost entirely from the ocean. A very different scene opened in the war of 1778, when France, unembarrassed by a continental struggle, was enabled to direct all her disposable resources to her marine, an object of great care and solicitude to Louis XVI. She was then enabled to keep in an effective state about 70 sail of the line, the crews of which, added to those of the frigates and corvettes, formed a total of 60,000 seamen. The injuries sustained by this force, toward the end of the war were repaired with great diligence during the peace; and to prepare young officers for the sea in preference to the land service became a favorite object in several of the government schools. In 1791, an official report stated the effective French navy at 74 sail of the line, 62 frigates, and 29 corvettes; a state of preparation which accounts for the resistance made by the revolutionary government under all the disadvantages of an unparalleled continental struggle.

The proud naval force, however, disappeared progressively at the capture of Toulon, the victory of the 1st June, 1794, and still more in the victory of Aboukir; so that Bonaparte, on his accession to power, found the French marine in a very reduced state. He labored, however, to reconstitute it. The years of continental peace, 1801, 1802, 1803, and 1804, were favorable to his efforts; and in 1805 he boasted of having in equipment 60 sail of the line, a force destined to an early diminution at Trafalgar and St. Domingo. The Bourbons, on recovering their crown, found little more than half the force which existed previously to the Revolution. It has since been augmented, and in 1831 it amounted to 35 ships of the line, 40 frigates, 23 corvettes, 57 brigs, 29 galiots and cutters of eight and four guns, 12 steamboats, 16 armed store-ships, 32 armed transports, and two yachts; total, 284; and in 1854, according to the last authentic account, it consisted of

64 other vessels, } guns.

407 (1855)

In the present year (1855) 14 ships of iron (nine being vessels of the line) have been launched, and 32 new vessels are on the stocks.

On the 1st January, 1855, the officers of the French navy consisted of two admirals, 17 vice-admirals, 37 contre-admirals, 108 capitaines, 238 capitaines de frigate, 638 lieutenants, and 614 ensigns.

Fisheries.—The bounties paid for the cod-fisheries in 1852 absorbed between 6,000,000 and 7,000,000 of francs, which was double the sum paid on the average of the five years between 1820 and 1830. The vessels equipped for the fisheries of Newfoundland, St. Pierre, Miquelon, etc., proceed from the ports of St. Malo, St. Briec, and Granville. The vessels proceeding to Iceland sail from Dunkirk. The French fish are of very inferior quality to those caught by the Americans, the latter selling at 47 francs 35 centimes per quintal, while the French cod-fish only brought 26 francs 35 centimes. With all this expense, however, the French fisheries are not adequate to the sup-

ply of the colonies, which receive considerable quantities of fish from foreigners, as will be seen from the following table:

FISHRY AND EXPORT OF COD, FROM 1848 TO 1858.

Year.	Ships.	Men.	Expenses of Shipping.	Exportation from all ports.	T. also-pieces.

1852	375,862	54,409	25,829
1853	345,541	65,307	12,081

The mean of the first five years is above 391,915 quintals. Vessels of France employed in the fisheries generally—1848, 819; 1849, 685; 1850, 838; 1851, 923; 1852, 959; 1853, 943. The mean of five years is 851 vessels. The total amount of codfish exported in 1853 from all the ports of France amounted to 1,597,971 kilogrammes, or 55,307 quintals. See article FISHERIES.

Whale-fishery.—The whale-fishery was established in France in 1784, by means of encouragements held out by Louis XVI., who ordered that no duty should be collected on the articles exported, and that the produce of the fisheries should pay no import duty. He guaranteed the adventurers against loss, and ultimately paid, in addition to £12,590, which he advanced without interest, an additional sum of £6695, being the balance of loss on 17 voyages. Notwithstanding these encouragements, the whole project was abandoned in 1787. In 1816 the offer of bounties attracted new adventurers into this branch of trade. The premium offered by the government was 50 francs (£2) per man, and two thirds of the crews were allowed to be foreigners. In 1819 40 francs were allowed to foreign vessels having a crew half French, 50 francs when the captain and one third of the crew were French; the premium to be doubled if the vessel passed Cape Horn. In 1829 a new ordinance granted 90 francs per ton on vessels wholly equipped by Frenchmen, 40 francs when only two thirds were Frenchmen, and 30 if the captain was a foreigner. The premium was doubled if the vessel passed Cape Horn. A supplementary premium was allowed to vessels fishing to the south-east of the Cape of Good Hope, and the double premium was given to all vessels fishing at a higher northern latitude than 60°; and as the fishing is seldom or never prosecuted at a lower latitude, this premium of 180 francs per ton (£7 4s) was invariably paid. The law of 1832, which regulates the whale-fishery of France, established a bounty of 70 francs per ton from March 1832 to March 1833, if the whole crew were French; the bounty to be diminished four francs yearly till it reached 54 francs. If one third of the crew be foreigners, the bounty to be 48 francs per ton, to diminish two francs yearly till it reached 40 francs per ton. A supplementary bounty to be given of 50 francs per ton if the crew be French, decreasing three francs per annum per ton; and 21 francs if one third be foreigners, decreasing one franc per annum, to be paid to vessels doubling Cape Horn, or reaching 62° of south latitude, if returning with less than half

a cargo, or after an absence of 16 months; 500 tons to be the minimum for a single whaler.

With these extraordinary encouragements, capital was attracted to this new line of industry; and in 1831 three vessels cleared out for the Greenland whale-fishery, and 13 for the South Sea fishery, which employed 6412 tons of shipping, and were manned by 551 men. Notwithstanding all the bounties given to the whale-fishery, France has very few vessels engaged in it. There were only 17 ships in the trade in 1849, and 7 only re-entered French ports. There were but 5 vessels left Havre in 1853, of a tonnage of 2045 tons, and with a crew of 127 men. The return of the product was 112,435 kilogrammes of the whale, 1589 of the cachalot, and 81,710 kilogrammes of whalebone.

It was estimated by the minister of commerce, in his report on this subject to the Chamber of Deputies more than 50 years ago, that the 550 seamen employed in the whale-fishery did not cost the State less than 1,300 francs per man at the rate of £72 12s. per man, or £6 a month. The wages granted by the budget to seamen on coasting ships of war amounted to £1 per month, so that the allowance to the seamen employed in the Greenland fishery was six times the ordinary allowance of seamen in the public service. It is remarkable that France was granting these extravagant allowances for the encouragement of the whale-fishery exactly at the time that Great Britain was withdrawing the bounties by which she had formerly endeavored to promote this branch of trade as a nursery for seamen. Yet, in 1830, the number of vessels that cleared out for the fishery in England was 123, consisting of 40,166 tons, navigated by 5044 seamen; being thus about eight times the quantity of tonnage employed by France. The government of Louis Philippe, alarmed at the large outlay in bounty, endeavored to lessen it, and to render it transitory and temporary only. M. d'Argout, the minister of commerce, insisted that these bounties exhausted the resources of the State, and decreasing bounties were after a period adopted, but M. Cunin Gidiale, who was minister of commerce, relapsed into the old error by introducing supplemental bounties. The provisional government of 1848, by one decree augmented the bounties, and by a second extended the term of the law to 31st December 1851. On the 23d of July, 1851, the National Assembly voted for the continuance of the bounties to 1861.

Shipping.—France seems destined, by the natural advantages which she possesses, to become a maritime power of the first rank. Her sea-coast exceeds in extent that of any other continental State. On the Atlantic she has 130 leagues of coast, 150 on the Channel, and 90 on the Mediterranean; while her position between northern and southern Europe, and her numerous ports and navigable rivers, are eminently favorable to the extension of her navigation. But in this as in all other branches of the French trade, the prejudicial effects of the restrictive system have been abundantly manifest. France, in forcing a trade with her colonies, containing less than half a million of inhabitants, has sacrificed her trade with other tropical countries and their numerous population, to the great injury of her shipping interest. A great increase has taken place in the tonnage employed in the coasting trade of France, a fact which affords clear and convincing evidence of the extending resources of the country, which would have equally occasioned an increase in the shipping employed in the foreign as well as the domestic trade, if this important branch of industry had not been stunted in its natural growth by the monopolizing system. The navigation of France no doubt suffered grievously during the last war, under the maritime hostility of Great Britain. But in the course of nearly 20 years it would have recovered from this state of depression, if the natural energies of the country had been allowed free scope in this line of industry.

Butcher's Meat.—The Revolution of 1830 did not alter the system, prevailing antecedently with respect to the trade in butcher's meat, but modified it. The same may be said of the Revolution of 1848. It did not change the system but modified under certain heads the practice of the trade. The *droits d'octroi et de caisse de Poissy* were at first suppressed, then re-established, but with a radical change in this respect, that the duty was levied by the *weight* of the cattle, and not at so much per head, as before. This alteration had long been ineffectually demanded by the agricultural breeders. Butchers from the interior of France were also to provide stock and meat for the Paris market as well as their brethren of the capital. These regulations and modifications satisfied neither agriculturists nor butchers. In the month of January, 1852, the National Assembly directed an inquiry into the production and consumption of butcher's meat. The commission charged with this inquiry seriously engaged in it, but the events of the 2d December, 1851, prevented it from finishing its task. From the portion of the report, however, that has been printed, we know that it was the opinion of the committee that there should be liberty of commerce in meat, and that the local authorities should, under no pretext whatsoever, be allowed to interfere with this cardinal principle. The committee considered meat, like spice, silk, or cloth, a mercantile commodity, and were of opinion that the police should only interfere as to frauds in reference to quantity or quality, or as to the wholesomeness of the victual as an article of food. This was only returning to the principle professed in the laws of the 14th and 17th June, 1791, and the 1st Brumaire An. VII. On the question of the *octroi* they were of opinion that it interfered with the price and consumption of food, and that it should be abolished from the 1st January, 1860. Since this report was published the price of butcher's meat has increased, and the supply has diminished at Poissy, the great market which supplies Paris. In consequence of this, recourse was had to an expedient which sound political science has proved to be utterly ineffectual. An ordinance appeared in the *Moniteur* of the 11th and 12th October, 1855, of which the following is the substance:

"On and after the 16th of the present month, butcher's meat shall be sold at prices taxed by the authorities. The prices shall be fixed every fortnight for every kind of meat, according to the returns made at the Caisse de Poissy, and to the weight of meat ascertained to have been sent from the public slaughter-houses of Paris during the preceding fortnight. In the shops established in the markets, meat shall be sold at 10c. at least, per kilogramme (about a half-penny per pound) below the fixed price."

This decree, which violates every sound principle of political economy, appears to have been well received by the poorer classes of the population, who had long complained of the dearthness of meat, and of the exorbitant profits of the butchers. But the way to reduce the profits of the butcher is to destroy the monopoly, and to render trade in meat free.

Revenue and Expenditure.—In France, the ancient system of taxation and finance was extremely unequal and oppressive. Her various provinces, though they were united under one head, retained many of their own peculiar laws and privileges, which were absurd in themselves, and opposed to the general interests of the empire. Among these was an exemption from certain imposts, to which some were subjected, and consequently over-taxed; and others, again, contributed a certain quota of revenue to government, which they raised by taxes imposed by their own local authorities. The consequence was, that no uniform system of taxation could be established throughout the country. The taxes on many commodities were higher in one province than in another; and custom-

houses were accordingly established on their respective frontiers, to prevent the importation of goods until they had paid the duties. In this manner, owing to the inequality of taxation, commodities could not freely pass from one district of the country to another; and the kingdom was thus broken into separate divisions, to the great interruption of trade. The partiality shown to the privileged orders was another serious grievance to the ancient system of French taxation. The taxes by which the public revenue was raised were, first, the *taille*, a tax on real property, or on income derived from commerce and industry. From this tax the lands of the noblesse and clergy were exempt. "The tax was called *taille*," says Borel, "because the peasant collectors, not knowing how to write, marked down what they had received on a wooden tally." Secondly, the *vingtième* was the tax of 1-20th on property, from which the clergy alone were exempted. This tax was established in 1750, and was levied upon all property of whatever description. In 1753, it was taken off the amount of income arising from personal industry. Thirdly, a poll tax was levied on all classes indiscriminately. Many of the taxes were farmed by rich capitalists, called farmers-general, or *fermiers-généraux*, who paid annually into the treasury a fixed sum, and collected the taxes from the people. These farmers-general held the monopoly of the manufacture and sale of tobacco and salt; and also the *octroi*, which was a duty on all articles entering Paris and other large towns. The power delegated to these contractors, was the source of grievous oppression to the people. The duties called *aides* were imposed on spirituous liquors and other articles of consumption; they also include duties on all articles worked in gold or silver, on wrought iron, playing-cards, leather, paper, starch, &c. These duties levied by collectors for the benefit of government were abolished by the National Assembly in 1790. The *corvée*, which consisted in so many days' labor annually, of men, horses, oxen, carriages, &c., was nominally applicable to the maintenance of roads. The tax was payable either in money or in labor. The system of taxation, so prejudicial to internal commerce, was, to a certain extent, reformed by Colbert, the minister of Louis XIV., who, though his views in regard to the principles of commerce were narrow and illiberal, yet improved in many particulars the system of taxation, by rendering it more uniform, and thus breaking down the barriers which obstructed the free intercourse between the different provinces. Under his administration the public revenue of France amounted in 1682 to £5,000,000.

The long and expensive wars of Louis XIV. produced a great accumulation of debt (nearly £100,000,000 sterling), which, after his death, was lessened by an appeal to a singular privilege, of which advantage has often been taken in France, viz., that a new sovereign is not bound to pay the debts of his predecessor in full. During the 18th century, the revenue of France increased progressively, but more slowly than that of England; the vicious system of farming the taxes still continued. Necker, appointed to office in 1776, endeavored to teach the French court the value of publicity in financial statements; and exhibited the rare example of a war conducted for several years without new taxes, the supplies being found by loans, the interest of which was provided for by successive retrenchments in the public expenditure. His successor, M. de Calonne, pursued a very different course, and was found altogether incapable of the measures necessary to remedy an annual deficiency of £2,000,000. The revenue of France was then about £22,000,000 sterling. The sum required for payment of the interest of the public debt was nearly 10,000,000 (Report of Camus to the National Assembly in September, 1790), leaving only £12,000,000 for the army, navy, civil list, and other public expenses.

Such was the state of the French finances at the era

of the Revolution of 1789, which was followed by invasion on the frontier, and in the interior by all the confusion consequent on the reign of terror. In this era of confiscation and judicial murder, the national debt could hardly be respected. It was not, however, openly canceled, but the interest was issued in assignats of no value except for purchases of national property. At last, in 1798, on an approximation to regularity in the management of public business, there was passed a law declaring that one third of the old national debt should be sacred, and the interest on it payable in *bons*, or paper receivable in discharge of taxes. This third was called *la tiers prorisoire*, but its price in the market continued very low until Bonaparte succeeded to power, and placed Guadin, afterward Duke of Gaeta, at the head of the treasury, when means were found to redeem the public funds from their depression, and to resume the payment of the dividenda in cash. The amount of the revenue was greatly impaired by the general confusion of the Revolution. In 1799 the expenditure exceeded the receipt by £8,000,000 sterling. (Gandia, *Notice Historique des Finances de la France*.) A partial reduction of expenditure, and improvements in the collection of the taxes, brought, in 1803, the receipts to £19,500,000, while the expenditure was £20,000,000. In subsequent years both received a progressive augmentation; and in 1813 the revenue derived from France, exclusive of conquered territory, was about 27,000,000. On the restoration of the Bourbons, in 1814, the public debt, funded and unfunded, did not exceed 123,000,000 (Bignon, *Exposé Comparatif de la France*); its interest £7,900,000. France had thus a fair prospect of financial prosperity, when the return of Bonaparte, and a second invasion by the allied troops, overthrew public credit, and produced a national loss and a general derangement of trade. It has been estimated that the return of Napoleon from Elba, which led to the second invasion of France by the allied troops occasioned a loss to the country of 4,000,000,000 of francs. The direct loss, which included the expenses paid to the allied powers, and those incurred by the maintenance of their armies, placed in cantonments throughout France, may be estimated; but the indirect evils occasioned by the ravages inseparable from the invasion of a hostile army, by the confusion and derangement of all commercial relations, and the impossibility of collecting the revenue in such a time of trouble, can not be summed up in money. At the same time there are scarcely any national difficulties which may not be overcome by the energies and industry of a free and intelligent people such as the French. With an inconsiderable addition to her debt, France has defrayed all these heavy expenses, the contributions imposed on her by the allied powers, the expenses of the temporary maintenance of their armies, and her own warlike expenses. For this purpose, however, it became necessary in 1815 to impose additional taxes. In 1817 a loan was required of 322,380,000 francs; and in 1818, to defray the extraordinary contribution of 575,807,137 francs, paid in that year to the allies, the minister had recourse to another loan of 220,510,718 francs; while, by the taxes which had been imposed, the revenue of that year was carried to £35,000,000.

MEAN REVENUE OF FRANCE IN THE TEN YEARS BETWEEN 1832 AND 1842.

	1832.	1842.

Total	954,103,791	1,174,584,975

The expenditure of 1853 was as follows:

	Francs.
Interest on Public Debt, etc.	873,314,577
Dotations—Civil List, etc.	17,263,580
Expenses of various Ministries—Justice, Foreign Affairs, etc.	787,538,516
Expense of Collecting and Paying Taxes, etc.	151,095,385
Drawbacks, Discounts, Bounties, etc.	58,948,953
Total	1,412,274,991
Travants Extraordinaires or Additional Works	73,788,894
Total	1,486,013,825

Besides the public revenue of the empire, the communes raised a revenue for their own local expenses. According to the latest published accounts, this revenue arises partly from *octrois*, which amount throughout France (there being 1436 *octrois*) to 93,176,602 francs, and partly from other sources, the whole of which amounted to 230,633,209 francs in 1850. The total of the ordinary ways and means of France in the *Budget Prévisionnel* of 1855 amounted to 1,528,110,288 francs. During the administration of M. Villemé the five per cent. in France were converted into a three per cent. fund, at the rate of 133-33 cents, for every 100 of the five per cent. stock; so that the whole five per cent. stock, bearing an annual interest of 30,574,116 francs, was converted into a three per cent. fund, of which the capital was increased one third. The effect of this transaction was, in reality, to reduce the interest on the five per cent. stock to four per cent., by which he saved annual interest to the amount of 6,000,000, though by a very useless complexity in his operations. The interest on the public debt of France, thus reduced, may be stated as follows: it amounted in 1855 to 418,870,342 francs. The sinking fund, or *caisse d'amortissement*, ceased altogether its operations on the 14th July, 1848. In the 32 years of its operation the *caisse d'amortissement* liberated the country from liabilities to the amount of 1,633,174,000 francs, and placed at the disposition of the treasury, from 1833 to 1848, 1,016,630,856 francs.

Taxation.—The ancient system of taxation in France was subverted by the National Assembly in 1791, and new taxes were substituted in lieu of those formerly in force. These consisted of direct and indirect taxes. The direct taxes are, 1. *Contribution foncière*, or land-tax; 2. *Contribution personnelle et mobilière*; 3. A tax on doors and windows; 4. *Droits de patente*, or a license duty on particular trades and professions, and a duty on mines.

The *contribution foncière* is raised equally on all lands and houses, in proportion to their net revenue. There are no longer any exemptions in favor of the nobility since the first Revolution, in 1789. The imperial domains and the property of the State are alone exempted. The *contribution personnelle et mobilière* is divided into two parts. The first is a species of poll tax, rated at three days' labor, calculated in money value to be from 10 to 30 sous per day, and levied on all males above 18 years of age. The *contribution mobilière* is a house-tax, levied on rents from 200 to 3500 francs. For the *contribution personnelle*, the *octroi*, which is a custom-duty on all goods entering a town, is substituted in Paris and other large cities. The tax on street-doors, gateways, and windows, varies in proportion to the size of the town in which the house is situated, and also in proportion to the size and value of the house, and the number of windows. It is regulated by a tariff, in which are two divisions. The *droits de patente*, or license duty, is levied on every person following a profession, trade, or business; and is divided into two heads—the proportional tax or the fixed tax, which depends on the extent and population of the town where he exercises his profession. A merchant pays from 40 to 5000 francs per annum, according to the population of the place where he resides, and an additional 10 per cent. on the rent of his dwell-

ing-houses and their inferior tax is in proportion to their value. The law also determined required of finance municipalities. The sum disbursement allotted to persons appointed assessors taxable property, however some department of the total object in this view a landed property was begun in accurate as considered as *propriétés imposables* according to the taxable land; 533 hectares of nurseries, and 17,400 hectares of the land-tax; just complaint for a more accurate these have generated.

The indirect principal kinds—of articles of consumption, duties on gold and silver, the monopoly of the post office; the entering large imperial treasury expenses. The French revenue duties are laid on francs per hectolitre removed from the nobles pays 10 francs per hectolitre, and Ten per cent. of removal from the duty distinct from population of all wine or spirit of all communes where 4000 are exempted been established, 5000 inhabitants, of the department rate classes—a very uncertain standard duty on wine and 1830 has been reduction of 3 per cent. of 25 per cent. and 50 centimes, and hectolitre. Retail distinct license, which of the town, from public carriages place for passenger

ing-house. Bankers in all cases pay 510 francs a-year; and there is in like manner a fixed rate for other inferior trades and professions. The duty on mines is in proportion to the extent of the surface, and also to their nett produce.

The law which fixes the amount of the direct taxes also determines the quota which each department is required to pay. This is announced by the minister of finance to the prefect of the department, who communicates it to his sous-prefect and to the mayors. The sum thus assigned by the prefect to each arrondissement is subdivided by the councils of the arrondissement and by the communes; and the amount allotted to each is apportioned among the inhabitants by persons appointed for that purpose, called *repartiteurs* or assessors. These assessors regulate the amount of taxable property, and they fix the scale. The land-tax is, however, very unequally assessed, amounting in some departments to six per cent., while in the department of the Seine it is seventeen per cent. The equalization of the land-tax has always been accounted a capital object in the financial policy of France; and with this view a very minute survey and measurement of all the landed property in France (termed the *cadastre*) was begun in 1808, and finished in 1847. The *cadastre*, accurate as it generally is, can not, however, be considered as the expression of actual facts. The *proprétés imposables*, or taxable property, consists, according to the *cadastre*, of 25,681,658 hectares of arable land; 5,159,226 hectares of meadows; 2,050,533 hectares of vines; 628,235 hectares of orchards, nurseries, and gardens; 4,175 hectares of mines; and 17,400 hectares of lakes, ponds, etc. The inequality of the land-tax has long been a subject of loud and just complaint; and various plans have been adopted for a more accurate classification of the land. But these have generally proved inefficient and unsatisfactory.

The indirect taxes consist chiefly of fourteen principal kinds—of the *droits réunis* or excise duties on articles of consumption, of stamp duties, registration duties, duties on carriages, on canals and ferry-boats, on gold and silver plate. A revenue is raised from the monopoly of tobacco and gunpowder; from the post office; the *octroi*, or custom duty on all articles entering large towns, one tenth of which goes to the imperial treasury, the remainder being applied to local expenses. The customs form an important branch of the French revenues. The *droits réunis*, or excise duties, are laid on wine, brandy, etc., which pay 1½ francs per hectolitre of 120 English quarts, on being removed from one place to another. Wine in bottles pays 10 francs per hectolitre on its removal; cider, perry, and mead, pay 80 centimes per hectolitre. Ten per cent. of the above duty is paid on their removal from the wholesale warehouse. Prior to 1830 a duty distinct from the *octroi* was levied on the entry of all wine or spirituous liquors into communes the population of which amounted to 1500 and upward. All communes whose population does not amount to 4000 are exempted from this tax; and a new tariff has been established, rising progressively from 4000 to 5000 inhabitants, in proportion to the estimated wealth of the departments, which are divided into four separate classes—a very vague, as we should suppose, and uncertain standard of taxation. There is a further duty on wine and liquors sold by retail, which since 1830 has been reduced from 15 to 10 per cent. A reduction of 3 per cent. on this duty is made to dealers, and of 25 per cent. if the wine be grown by the retailer himself. Strong beer pays a duty of 2 francs 40 centimes, and small beer a duty of 12 sou, per hectolitre. Retailers of liquors must take out a distinct license, which varies, in proportion to the size of the town, from 6 to 20 francs. Proprietors of public carriages pay one tenth of the price of each place for passengers, a third being deducted for va-

cant places, and one tenth of the price received for merchandise. Private carriages are subjected to a moderate duty, according to their size, of 40 francs per annum for a carriage with two wheels, and holding two persons; and of 150 francs per annum for a carriage with four wheels, and holding nine persons. The *enregistrement*, or registration duties, embraces a variety of transactions, where property is conveyed or given away by marriage-settlement or otherwise. There is a duty on gifts *inter vivos*, which increases with the distance of the relation between the parties. It was modified by an ordinance of Louis Philippe in 1832. The duties payable on registry are either fixed or *ad valorem*; the fixed or certain duties apply to common certificates, those of life or residence, account-books, bills of lading, appointments of arbitrators, valuations of furniture, and the like. The *ad valorem* duty applies to all bonds or obligations, discharges, judgments, deposits or releases of sums of money, and for every transfer of property, etc. The stamp duty applies to receipts, bills of exchange, newspapers, handbills, playbills, admission cards to public places, and upon paper used for civil and judicial acts.

The total received from the *impôt direct* in 1854 was 411,273,000 francs. In 1853 the sum received was 420,064,000 francs, which shows a deficit of nearly 9,000,000 of francs in 1854. The total receipts of the *impôts indirects* in 1854 were 847,260,000 francs. The *impôt on salt* produced in 1854 a sum of 33,270,131 francs. The total of "droits" received in 1854 amounted to 149,337,510 francs.

	Francs.
Land carriage or roulage 81,000,000 of tons, the mean transport at 15 leagues, at the mean price of 1 franc per ton.	465,000,000
The public voitures which travel 18 leagues per day; in place of the common carriages of 8 or 10 leagues, yielded, per annum.	60,000,000
The duty on the public conveyances returns 6,000,000 francs; three fourths are derived from the passengers, and one fourth from the goods they convey.	

The share capital of the French railways in 1848 was £40,044,000 sterling. The total merchandise conveyed per transit in 1844, was in value 229,820,795 francs. In 1854=54,926,640 francs official value. Value of wine, spirits, beer, and cider consumed in France, reckoned at 500,000,000 francs, give 811,000,000 francs wine, 54,000,000 francs brandy, 69,000,000 francs beer, and 76,000,000 francs cider.

The duties levied on this branch of the French revenues produced £5,483,765 in 1852 and £5,505,686 in 1853. In France these duties are laid on in many cases more with a view to restriction and monopoly than to revenue. France sacrifices a large revenue for the encouragement of the colonial monopoly; paying for the produce of the colonies an exorbitant price, and afterward, as in the case of sugar, the staple article that is imported from the colonies, giving a great portion of the duty as a bounty on its exportation to foreign countries, to indemnify the exporter for the loss that he would incur if he were selling the sugar at its ordinary price in the markets of Europe. In 1830 the gross receipts from the sugar duty amounted to £1,397,340, of which one third, namely, £420,903, were paid back in bounties on the exportation of the surplus. Thus the nett duty only amounted to £976,437, while in 1822, though the quantity of sugar consumed was only 1,086,596 cwts., or 281,075 cwt. less than in 1830, the nett amount of the duty was £1,234,653. The consumption of sugar in France in 1847 only reached to about 2,576,000 cwts. It is by means of heavy custom-duties that the French legislators endeavor to preserve the monopoly of the home market to their own manufacturers, by which policy they compel the French community to buy at a high price the inferior articles of their own manufacture, rather than the better articles of the foreigner at a lower price. The

increased numbers and superior vigilance of the custom-house officers have been still counteracted by the new expedients and persevering ingenuity of the smuggler.

The frontier of France is the scene of this persecution against commerce, where all the illegal, daring, and ingenious resources of the contraband traders are called into activity. Among other expedients, they trained packs of dogs, according to Messrs. Villiers and Bourtry, to carry prohibited goods across the frontier. These dogs being conducted to the frontier, are kept without food for many hours; they are then beaten and laden with goods, and are started on their travels when it begins to grow dark, and reach the abodes of their masters as soon as they can, where they are well treated, and receive a full meal. According to the accounts of the French custom-house, 49,278 of these dogs were destroyed in the year 1830, on which account premiums were paid to the custom-house officers to the amount of 40,278 francs. That the trade, though it may be obstructed, is not prevented, is evident from the circumstance that there are regular rates of insurance on the conveyance of contraband goods into France, varying from 10 to 70 per cent. A revision, and if possible a reduction, of these heavy duties would be the true policy of France. Monopoly was never yet the source of commercial greatness in any country.

National Income and Capital.—Population.—Of the official surveys of the French territory, by far the most minute and accurate is the *cadastre*, a survey which became indispensable from the time it was determined to exchange the taxes on consumption for taxes on produce. A return of the rent of land, such as was made under the property-tax act in England, would not have been practicable in France, where so many thousands of petty lots are cultivated by their proprietors. At first the *cadastre* proceeded on the plan of an estimate *par masses de culture*, or continuous valuation of extensive tracts; but this proving unsatisfactory, it has been conducted since 1807 on a plan of such minute detail, as to give the value of every separate *parcelle* or patch of land. The progress of this minute survey of the landed property in France has been retarded by many causes; and in 1830 not above two thirds of the land had been surveyed. It was estimated in the report of one of the committees of the Chamber in 1832, that it would still require from that period about eight years, and an expense of above £2,000,000 sterling, to complete it. They had only surveyed 31,000,000 of hectares, or 68,000,000 of acres. The annual expense of the survey is £120,000.

The wages of mechanics are so fluctuating and various, that a satisfactory statement of them can scarcely be produced. It may, however, be assumed that they are generally 20 or 30 per cent. lower than in England. The rate of wages of the agricultural population was thus estimated in 1851:

	Fr. cents.	France.
6 millions of men, at 1 50 per diem	75	1,800,000,000
6 " of women, " 75 "	75	900,000,000
6 " of children, " 75 "	75	8,000,000
18 " of agricul. laborers paid yearly.		3,000,000,000

Expense of Living.—A quarter of a century ago the difference in the expense of living in France and in England was about a third less in favor of England. As far as regards provisions, this difference was somewhat greater; but it received a counterpoise in the greater cost of fuel. Paris is now as expensive compared to the rest of France, as London is compared to the rest of England. In 1855 prices were generally on a par with prices in London, and in house-rent and the prices of lodgings and fuel, Paris exceeds London.

In the end of the seventeenth century, the territory of France, when very nearly equal to its present extent, appears, from the report of the intendants or provincial governors, to have contained about 20,000,

000 of inhabitants. This number was found, by the census made by order of the National Assembly, to have increased nearly a third in the course of a century; the amount, in 1791, being 26,863,600, a number which, by computation, made in 1817, had further increased to above 29,000,000. In the year 1820 the population was 30,452,187; and, according to the ordinance of January 1833, it amounted to 32,601,678. By the census of 1851 it appears that the population of France was 35,781,628. The marriages in 1832 and 1833 were annually about 236,996, and the deaths about 785,268, of which 895,250 were males, and 388,018 females. The births were 967,533, of which there were 499,707 boys and 468,826 girls. The number of illegitimate children was then 68,081. In 1852, twenty years after the period here spoken of, the total number of births was 965,080, of which 895,296 were legitimate, and 69,844 illegitimate. The number of children still-born in 1852 amounted to 37,901, the number of deaths to 811,695, and the number of marriages to 281,360.

The estimates of population in France, subsequently to 1791, are formed, not by actual survey, but by adding for the period which has intervened, the births, and deducting the deaths, of which an accurate record is kept in the public offices.

The ratio of the increase of population in France is greatest in the lower classes; the middling and upper ranks have seldom large families. In that country the population evidently increases faster since the adoption of vaccine inoculation.

French Weights and Measures.—The weights and measures of France were reduced, as is well known, to a very simple and uniform scale soon after the first Revolution; but there has been much difficulty in accustoming the inhabitants, particularly in country districts, to the adoption of the new system, which unluckily preserved none of the names with which they were familiar. In 1812 a kind of compromise took place—government sanctioning the retention of the old names, such as pounds, ounces, ellis, and bushels; but requiring that their contents should be calculated by a reference to the new standard. It is accordingly on this footing that business is now transacted in France. The new weights and measures are in general larger by a fraction than the old, and the use of the latter is prohibited by law.

The fundamental standard adopted in France for the metrical system of weights and measures, is a quadrant of the meridian—that is to say, the distance from the equator to the north pole. This quadrant is divided into 10,000,000 of equal parts, and one of these parts or divisions is called a metre, which is adopted as the unit of length; and from it, by decimal multiplication and division, all the other measures are derived.

The length of this quadrant was ascertained by MM. Delambre and Méchain, by measuring an arc of the meridian between the parallels of Dunkirk and

Barcelona, and has been found to contain 5,100,740 French toises, or 32,808,392 English feet. This number divided by 10,000,000 gives 3.2808992 English feet, or 39.37079 English inches very nearly, for the true length of the French metre.

In order to express the decimal proportions, the following vocabulary of names has been adopted:

For multipliers the prefix DECA means	10 times.
" " HECTO " "	100 "
" " KILO " "	1,000 "
" " MYRIA " "	10,000 "
For divisors the prefix DECI expresses	1 part.
" " CENTI " "	.01 "
" " MILLI " "	.001 "

It may assist the memory to observe that the prefixes for multiplying are Greek, and those for dividing Latin; thus decametre means 10 metres, and decimetre 1-10th of a metre; hectometre means 100 metres, and centimetre 1-100th of a metre; kilomètre means 1000 metres, and millimetre 1-1000th of a metre. The metre (as before stated) is the element or prime unit of long measure, and is equal to 39.37079 English inches.

The are, which is a square decametre (or 100 square metres), is the elemental unit of square or superficial measure. It is equal to 119.6083 square yards, or very nearly 2.81 parts of an acre.

The stère, which is a cubic metre, is the elemental unit of solid measure, and equal to 35.3166 cubic feet English, or nearly 85½ cubic feet.

The litre, which is the cubic decimetre, is the elemental unit of all liquid measures, and of all other measures of capacity. It is equal to 61.02705 cubic inches, or is very nearly 11.50ths or 22-100ths of an imperial gallon.

Lastly, the gramme, which is the weight of a cubic centimetre of distilled water at its temperature of greatest condensation, is the elemental unit of all weights, and is equal to 15.4325 grains troy, or 13.23ds of an avoirdupois dram nearly.

French Money.—The French monetary unit of value is the franc, which, in the gold coinage of 20 and 40 franc pieces, is equal in value to 9.525 pence sterling, and in the silver coinage of francs and five-franc pieces, is equal to 9.705 pence; but the common rate of exchange is 25 francs for 1 sovereign, which gives the value of a franc equal to 9.35 pence sterling.

Centime.....	=	4	d.	4	farth.	farth.
Decime.....	=	0	0	0	0	0.25 = 2.5 nearly.
FRANC.....	=	0	9	6	=	8 3-4 = 8 1-25
Five-franc piece.....	=	4	0			
Napoleon or 20-franc piece.....	=	16	0			

In reducing French money to English, from any number of francs subtract their fifth part, and the remainder will be their value in shillings. Or multiply the francs by four, point off the two right hand figures of the product for decimals, and the result will be their value in pounds and decimals of a pound sterling.—E. B.

Commercial Relations of the United States with France.—Prior to the ratification of the treaty of the 6th of February, 1778, we have no reliable account of the value of our trade with France. The navigation acts and other regulations imposed upon the colonies by the mother country, strongly tended to fetter and embarrass their intercourse with other nations; but, in spite of them, irregular, illicit commerce was carried on to a considerable extent. By the treaty alluded to, the high contracting parties reciprocally bound themselves to grant to each other, in respect to commerce, all the privileges and immunities which either of them might thereafter grant to the most favored nations; to charge no more in imposts, port duties, or other customary burdens of trade, to the subjects or citizens of each, respectively, than should be charged to the subjects or citizens of other powers; and to protect the vessels of each other when within their respective jurisdictions. The subjects or citizens of either were excluded from the fisheries of the other, and the United States became bound not to disturb the subjects of the King of France when fishing at the Banks of Newfoundland. The citizens of the United States were exempted from the *droit d'aubaine*, and were empowered to devise real and personal property, and their heirs were permitted to inherit without becoming naturalized in France; and corresponding privileges were secured to French subjects residing in this country. The doctrine that "free ships make free goods" was recognized, and the articles to be deemed contraband of war were enumerated. The remaining stipulations refer exclusively to contingencies of war, and need not be enumerated. On the 14th of November, 1788, a convention was entered into and ratified, defining the powers and duties of the consuls of the high contracting parties. This convention was

intended the more effectually to secure the faithful observance of the treaty stipulations.

These arrangements were ratified while the Continental Congress had no authority to regulate foreign commerce; and the ratification, therefore, only amounted to a pledge that the States would conform to its provisions, they having the sole power to levy imposts and port and tonnage duties. The arrangements continued in force, however, and were observed for more than 20 years, and until annulled by the act of the 7th July, 1798, on the ground of repeated violations of treaty stipulations by the successive revolutionary governments of France. Many of the fetters of trade were removed by this treaty; and, although importations and exportations were, for a time, exposed to the depredations of British cruisers, the enterprise of our seamen opened a commerce of no inconsiderable value. It was estimated that, during the three years immediately preceding the French Revolution, the average annual value of our exports to France was \$1,520,000, and of our imports from thence, \$380,000; showing an excess of exports of the value of \$1,140,000. The imports and exports up to the date of the annulment of the treaty of 1778, were as follows:

Years.	Imports.	Exports.	Excess of exports.
1795.....	\$8,671,381	\$7,608,683	\$4,027,353
1796.....	1,825,066	8,171,759	1,836,698
1797.....	8,045,796	8,823,231	779,435
1798.....	1,871,727	1,476,588	104,561

This statement indicates that, from 1795, there was a rapid decrease of import. and exports, and a decrease of the excess of our exports, attributable, no doubt, partly to the feebleness of federal authority, but chiefly to the convulsed condition of the French nation, the continuance of war in Europe, and the consequent disregard of treaty obligations.

Previous to the annulment of the commercial treaty, Congress passed an act "to suspend the commercial intercourse between the United States and France, and the dependencies thereof," approved June 13, 1798. It was provoked by repeated gross violations of the treaty by the French government and its citizens. The act provided that no vessel should clear from the ports of the United States for France or its dependencies; that no French vessel should enter our ports without a passport from the President, unless in distress; that French vessels found in our ports, and refusing to depart, should be seized and detained; and that the President might dissolve the prohibition of the act whenever he became satisfied that the French government and all under its authority were, in good faith, endeavoring to prevent her citizens from intermeddling with our commerce. This act was continued in force until the end of the ensuing session of Congress, when it expired by its own limitation. Two days subsequent to the annulment of the treaty, another act was approved, "further to protect the commerce of the United States." The President was thereby authorized to instruct the commanders of the naval forces of the United States to capture French armed vessels, which were, by the act, to be forfeited, and to grant letters of marque and reprisal to private citizens. These acts had the desired effect. The French government was in no condition to assume an attitude of open hostility.

On the 30th of September, 1800, a convention was signed by the plenipotentiaries of the United States and France, which was ratified in due time, for the adjustment of all differences, and the regulation of their future commercial intercourse. By its terms, it was to continue in force for eight years. In respect to commerce, it provided that the citizens of each country should enjoy in the ports of the other all the privileges and immunities of the most favored nations; that the citizens of either resident in the other should

have the right to devise their property without being naturalized, and their heirs the right of inheritance; that six months should be allowed for the removal of property in case of war; that debts should not be sequestered or confiscated in consequence of war; that consuls and other agents should be appointed; that the traders of each might buy and sell of the enemies of the other, save in ports blockaded; that certain specified articles only were to be considered contraband; that free ships should make free goods, and the ships of either might carry enemy's property, save only contraband articles; that property of either found in enemy's vessels should be confiscated; that ships under convoy should never be examined; and that various minor provisions enumerated in the treaty, as means for the execution of its provisions, should be observed. This was followed by the treaty of the 30th of April, 1803, for the cession of Louisiana, by which the right of navigating the Mississippi and its tributaries was reserved to France for 12 years; and another convention of the same date, providing for the payment by France of debts due our citizens.

The convention of 1800 regulated our commercial intercourse with France until the 24th day of June, 1822. A few facts will show how our trade with that nation progressed during that important period. It must be borne in mind, that nearly all Europe was combined for three fourths of that space of time in waging war upon the French empire and its allies, and that, for a considerable period, the whole of France was declared by Great Britain to be in a state of blockade. It must also be remembered, that in 1812 the Congress of the United States declared war against Great Britain, and that this war was waged with great vigor on both sides, until brought to a triumphant close in 1815. The vast superiority of the naval force of England rendered intercourse of European nations with their colonies very hazardous, if hostile to her. These nations were hence compelled to rely upon neutrals to carry on this branch of trade. For a time, the productions of the French, Spanish, and Dutch colonies could be carried to their mother countries only under a neutral flag. Our vicinity to the West India Islands enabled us to monopolize most of this carrying trade; and, ere the war closed, such was our increase of tonnage, that we obtained a considerable portion of the carrying trade to and from the East Indies. Some colonial productions were carried in American bottoms directly to Europe. The greater part, however, was brought into our ports; whence, after receiving a drawback, it was shipped to Europe in our own vessels. The manufactures of Europe, as well as those of China and the East Indies, were also imported, and again exported, in large quantities, to the West Indies and South America. From 1793 up to 1807, the profits of these advantages were enormous. The exigencies of the war, and the natural jealousies engendered by such a condition of things, involved us in disputes both with France and England. The latter, therefore, issued her celebrated Orders in Council; in retaliation of which, the former, or rather her emperor, issued his Berlin and Milan Decrees, which were so injurious to our trade as to provoke the adoption of the embargo, which was followed by the non-intercourse act, and ultimately by the declaration of war against Great Britain. This annihilated our carrying trade. On the return of peace, we again enjoyed some of it, but to a much more limited extent than formerly.

The tables of exports and imports fully illustrate the operation of the causes enumerated. In 1799 our imports from France were of the value of \$301,018. The value of exports is not known. The following table exhibits our exports to France from 1801 to 1820. We have no data on which to estimate the imports for that period. The contrast between \$5,461,090 in 1820, and \$31,623,000, in the amount of our domes-

tic exports to France, is flattering evidence of the rapidly growing consumption of our principal staples.

Years.	Domestic produce.	Foreign produce.	Years.	Domestic produce.	Foreign produce.
1804	\$3,310,112	\$5,463,847	1818	\$1,780,251	\$3,266,458
1805	3,070,569	5,233,502	1819	1,868,499	3,20,018
1806	3,234,898	5,107,024	1815	5,038,084	1,858,859
1807	3,715,141	10,315,678	1816	7,352,676	2,222,600
1808	708,607	2,136,390	1817	7,114,535	1,895,232
1809	No data.	1,473	1818	8,710,445	6,346,577
1810	16,752	1,678	1819	6,612,469	3,720,549
1811	673,708	1,119,302	1820	5,461,889	3,154,554
1812	402,808	2,485,218			

For the remaining two years of the period of the operation of the convention of 1800, the imports were, in 1821, of the value of \$4,980,940; and the exports of domestic produce, \$5,168,698, and foreign produce, \$359,861. In 1822, the imports were \$6,089,940 in value; exports of domestic produce, \$4,744,490, and foreign produce, \$1,290,870.

About the year 1792, cotton became a staple product of the southern States. The quantity exported to France from 1790 to 1806, was 15,794,800 pounds. The following table exhibits the exports of the staple to that country for the years enumerated:

Years.	Pounds.	Years.	Pounds.
1801	844,738	1809-10	None direct.
1802	1,907,849	1811	do.
1803	8,881,840	1812	918,438
1804	5,846,545	1813	10,200,343
1805	4,904,890	1814	1,901,087
1806	7,082,118	1815	19,078,128
1807	6,114,358	1816	18,024,667
1808	2,087,450	1816-1820	No data.*

* The imports of cotton into France from all countries during this period were: In 1817, 13,370,898 kilograms (each 2.22 pounds); in 1818, 16,074,159; in 1819, 17,016,491.

In 1821 the exports of cotton were 495,733 pounds of sea island, and 26,943,275 pounds of upland, the value of the whole being \$4,531,861. The fluctuations in quantity during this period are plainly traceable to the wars and confusion in Europe, and to our last war with Great Britain. From 1822 to 1834, the exports of cotton to France were as follows (the figures are compiled from the United States Treasury Reports on Commerce and Navigation):

Years.	Pounds.	Years.	Pounds.
1822	20,900,000	1829	56,630,900
1823	26,881,200	1830	48,856,900
1824	36,647,300	1831	56,111,600
1825	29,098,800	1832	59,242,000
1826	48,222,300	1833	68,401,500
1827	48,186,000	1834	69,401,400
1828	47,557,000		

Tobacco became an important export of this country at the close of the last century. The following table exhibits our exportations of this article to France during the period we are now considering. The regulations of the two countries in respect to it will be elucidated in another part of this digest.

Years.	Hogheads.	Years.	Hogheads.
1800	143	1807	2,370
1801	5,006	1808	550
1802	16,216	1811	569
1803	9,515	1812	142
1804	14,023	1813	188
1805	12,135	1815	2,543
1806	9,182	1816	4,070

In 1809 and 1810 there was no exportation. The same circumstance occurred in 1811. If any was exported, it was so inconsiderable as not to have been noticed by statisticians. From 1817 to 1820 we have no statistical data. In 1821, 3,478 hogheads were exported to France. These cotton and tobacco tables, like those of general imports and exports, are marked in their character by the course of political and military events. Another period of our trade with France commences with the "Convention of Navigation and Commerce," signed by the plenipotentiaries of the two powers on the 24th of June, 1822, and ratified and declared in operation by the United States on the 12th February, 1823. That convention provides that articles, the growth, produce, or manufacture of the United States, when exported to France in vessels of

the United States, shall pay an additional duty, not exceeding 20 francs (\$3 75) per ton of merchandise, over and above the duties paid on the like articles exported to France in French vessels; that articles, the growth, produce, or manufacture of France, imported into the United States in French vessels, shall pay an additional duty not exceeding \$3 75 per ton of merchandise, over and above the duties paid on like articles imported in vessels of the United States; that no discriminating duties shall be levied upon the productions of France imported in French bottoms into our ports for re-exportation; that a like advantage shall be given, and is given, to the United States; that the following quantities shall be considered a ton for the articles specified, viz.: 4 GI-gallon hogheads, or 244 gallons of 281 cubic inches of wine, American measure; 244 gallons of brandies and all other liquors; 50 cubic feet of silk, American measure, in the United States; and 42 cubic feet, French measure, in France; 804 pounds avoirdupois of cotton; 1,600 pounds avoirdupois of tobacco; 2,240 pounds avoirdupois of pot and pearl-ashes; 1,600 pounds avoirdupois of rice; and for all weighable articles not specified, 2,240 pounds avoirdupois; that the duties of tonnage, light-money, pilotage, port-charges, brokerage, and all other duties on foreign shipping, over and above those paid by the national shipping in the two countries, other than those above specified, shall not exceed, in France, for vessels of the United States, 5 francs (94 cents) per ton of the vessel's American register, nor for vessels of France in the United States 94 cents per ton of the vessel's French passport; that the convention shall remain in force two years from the 1st of October, 1822, and after that time until the conclusion of a definite treaty, or until one of the parties shall have declared its intention to renounce it, which declaration shall precede the renunciation six months; and, finally, that, in case this convention shall not be discontinued by either party, the duties specified, exclusive of tonnage, light-money, pilotage, port-charges, etc., laid upon articles of the growth, produce, or manufacture of either country, shall, at the expiration of two years, be reduced one fourth of the whole amount, and afterward by one fourth of said amount, from year to year, so long as it is not renounced by either party.

1855	31,609,104	31,029,998	1,204,390

The convention with France of July 4th, 1831, a city slightly modifies the convention of 1822.

of France, from the ratification of that convention until the passage of the tariff act of 1846, were imported at duties not exceeding the following rates by the gallon, United States' measure, viz.: For red wines, in casks, 6 cents; for white wines, in casks, 10 cents; and for all kinds of wines, in bottles, 22 cents. This stipulation was limited to 10 years, and consequently expired on the 4th of July, 1841. Our trade has, therefore, been since regulated by the convention of 1822, and guarded by the powers

and privileges secured to the consuls of each nation by the consular convention of the 28th February, 1853. The results of the operation of the stipulations of these conventions may be traced in the preceding and following tables of imports and exports.

The preceding table is made up from the annual Treasury Reports on Commerce and Navigation of the United States. It will not prove uninteresting, however, to subjoin, for comparison, a similar statement put forth by the French government.

VALUE OF COMMERCE BETWEEN THE UNITED STATES AND FRANCE, FOR THE YEARS SPECIFIED; TAKEN FROM THE OFFICIAL REPORTS PUBLISHED BY THE FRENCH MINISTRY OF COMMERCE.

1853.....	179,736,000	157,921,000	328,992,000	309,196,000	508,775,000	377,116,000

In these tables it is not difficult to trace the effects of the controversy relative to the re-charter of the Bank of the United States, the temporary expansion of the paper currency, the necessary contraction following the restoration of the constitutional currency, and the addition to the gold circulation of the world made by the mines of California. All these historical facts are of too recent occurrence to need comment in a work such as this. In like manner may be traced the effects of the French revolution of 1830, the 18 years' policy of Louis Philippe, the convulsions of 1848, the temporary ascendancy of republican principles, and the re-establishment of the empire. Causes like these, which affect commerce without a change of international obligations, would require more space for their elucidation in detail, than can be accorded to them in this digest. They are, however, alluded to for the purpose of awakening suggestive trains of reasoning. From 1831 to 1841 the general commerce between the two countries increased 154,377,000 francs, or about 83 per cent. This augmentation falls especially upon the products of the United States imported into France, the amount of which has tripled in this period. In the following years the effect of the high tariff of 1842 will be perceived, especially on the value of exports from France into the United States. The article of cotton has, for a number of years, constituted in value, upon an average, three quarters of all our domestic exports to France. The average annual value of our exports of home products to France from 1830 to 1833, was \$9,000,000; and the exports of cotton for the same period, \$7,000,000. The following table exhibits the quantities of cotton exported to France for the years enumerated, viz.:

Years.	Pounds.	Years.	Pounds.
1830.....	71,110,600	1845.....	124,610,400
1831.....	80,000,000	1846.....	121,518,000
1832.....	80,231,900	1847.....	125,028,900
1833.....	96,316,000	1848.....	107,457,400
1834.....	76,690,400	1849.....	127,132,900
1835.....	106,878,200	1850.....	129,479,300
1836.....	110,700,000	1851.....	118,913,224
1837.....	115,130,400	1852.....	167,429,900
1838.....	123,497,000	1853.....	174,639,940
1839.....	119,945,600	1854.....	144,428,960

The tables from which we extract do not give the values of our cotton exports for the years stated above, but, as in some preceding years, we learn from other data, they have been equal to the value of three fourths of our exports of home products. It may be added, that, with the exception of 1854, the above figures have been compiled from French custom-house returns. They are considerably below those given in the annual reports prepared by the United States' Treasury Department, and are not so reliable. The following table, compiled from these annual reports, will show the exports of cotton to France for six years, ending with June 30th 1850, and the value; as also the total value of domestic exports to France during the said years, respectively:

Years.	Pounds.	Value.	Total value domestic exports.
1850.....	125,884,091	\$14,395,449	\$17,950,277
1851.....	139,164,571	18,124,512	23,302,085
1852.....	186,213,270	15,488,588	22,190,670
1853.....	189,226,913	10,248,076	25,120,866
1854.....	144,428,569	14,592,172	30,368,222
1855.....	210,118,300	19,035,423	31,625,599

* The export of gold and silver coin and bullion was unusually large this year, amounting to \$6,000,000.

Tobacco.—Our other chief export to France is tobacco. In that country, the trade in this article is monopolized by the government. Information on this subject is derived from a recent publication, from the pen of a gentleman who has analyzed and studied our European tobacco trade in the principal markets of the eastern continent. The exclusive right to purchase imported and indigenous tobacco is invested in the *regie*, or commission—an association under the supervision of the Minister of Finance. This *regie* alone can authorize its manufacture, fix the prices at which it is to be sold to retailers, and the prices at which the latter shall sell for consumption. The capital of the *regie*, consisting of houses, offices, machinery, and tobacco in store, is of the value of about \$45,000,000. There is usually kept on hand a supply of tobacco sufficient to meet the demand for three years. This enables the *regie* to manufacture it more

perfectly, the supply one but license, w fixed by the system portation, Individual duties equ sales. perfectly, and to provide against accidental failures of the supply. No one can purchase at wholesale of any one but the *regie*; and no one can retail without a license, which compels the purchaser to sell at prices fixed by that commission. Of late years, however, the system has been so far relaxed as to allow an importation, for personal use, of a certain quantity by individuals, upon the payment, by the importer, of duties equal to the profits reaped by the *regie* upon its sales. One fact is encouraging: while the consumption is constantly increasing, the culture remains in France at a stand. It remains at a stand, because it is also under the supervision of the *regie*, which prescribes the methods of cultivation, and confines its produce to certain departments, and even to certain individuals. There is nothing to stimulate enterprise, or to secure the concurring energy of individual interest.

Up to 1817 purchases were made upon the offers of merchants submitted to the director-general, and communicated by him to the Council of Administration. The number of competitors created embarrassment, and the present system was, after some years, adopted. The system is this: Proposals are published by the *regie* to make contracts for the supply of certain qualities and certain quantities of specified kinds of tobacco. Samples of the kinds and qualities are submitted to the inspection of those who desire to contract, and they thereupon submit their offers to supply at certain prices within a time specified. The samples submitted to the contractors are carefully preserved; and when the cargoes arrive at the various ports, samples of them are forwarded to Paris and compared with the model samples, and the acceptance or refusal depends upon this comparison.

It requires but little reflection to perceive that this system is seriously injurious to our trade. It is a moderate estimate to make, to suppose that, if tobacco were admitted into France as other products are admitted, we should export ten times as much as we do at the present time. The abolition of the system would, therefore, seem to be an object constantly to be kept in view by our government. It has stood so many years, however, and under so many forms of government, and is so productive to the revenues, and so important to the government itself, in the number of persons thus brought under its direct influence, that we can not hope to see it soon materially changed. In addition to the facts already detailed on the subject of this important staple, the following extracts from official dispatches, communicated to the Department of State, are presented as pertinent:

"Tobacco is only permitted to be cultivated in six departments as a staple, and this cultivation is under the most rigid *surveillance* of the government. In the other departments agriculturists are allowed to grow four plants for each tenement for medical uses. On the tobacco disposed of by the *regie*, whether imported or produced, the profit realized amounts to 47 per cent. The retail dealers in the article, numbering about 30,000, are under the control of the *regie* inspection, and are allowed a commission on their sales of from 10 to 12 per cent. There are only ten manufactories. They are located at Paris, Havre, Lille, Strasbourg, Morlaix, Tanneins, Lyons, Marseilles, Toulouse, and Bordeaux. Each has its circle of departments to supply, and is restricted to transactions therein. The manufactured article is deposited in magazines, of which there are 357. In the departments adjoining Switzerland, Germany, and Belgium, the price established is vastly below that which rules in the interior. The object of this is to prevent smuggling. Where frontier facilities are afforded for illicit importations, the rate is comparatively moderate. Where none exist, it is enormous. Thus, at Strasbourg a pound is worth only 15 sous (cents), while at Orleans it is worth 8 francs (\$1 06). Last year (1848) the receipts from the customs only amounted to about 116,000,000

francs—86,000,000 of which were derived from tobacco, nearly all grown in the United States—under the workings of the *regie*. Were this *regie* abolished, and a moderate import duty substituted, instead of a market of 16,900 or 18,000 hogheads of tobacco per annum, France would take from us double that quantity immediately thereafter."

At the present time, we export about two fifths of all the tobacco consumed in Europe. Strict attention to its proper culture will enable us to furnish a much greater proportion. From 1827 to 1836, our exports to France amounted, annually, on an average, to 5,727,900 pounds. For many years we have exported from three fourths to four fifths of the tobacco consumed in France. From official reports of the French authorities, we gather the following statistics of our exports and sales to the *regie* in the years specified:

Years.	Pounds.	Years.	Pounds.
1837	10,622,108	1846	17,798,000
1838	11,643,710	1847	15,562,907
1839	18,089,096	1848	18,046,305
1840	17,846,619	1849	16,852,180
1841	21,646,924	1850	19,612,628
1842	19,148,800	1851	19,088,576
1843	27,771,788	1852	28,305,240
1844	26,891,000	1853	9,741,000
1845	24,818,800		

* United States' Treasury reports give the quantities of tobacco exported to France for the fiscal years ending June 30, 1854 and 1855, respectively, as follows: 1854, 15,162,000 lbs.; 1855, 40,866,000 lbs, besides 2,905 cases, and 579 hales. The excess of the latter year was probably for the army in the Crimea. The French fiscal year ends with that of the calendar.

No values are attached to those quantities, but they may be estimated by the aid of other data. The cost of American tobaccos, on delivery at the factories of the *regie*, all expenses included, is given by a French legislative report as follows, on an average for several years: Maryland tobacco, 9 5 cents per lb.; Virginia, 8 2 cents; Kentucky, 7 7 cents; Missouri, 7 5 cents. The following statement, also derived from French authorities, shows the net profits of the *regie*, which, after paying all expenses of purchase, transportation, manufacture, and sale of tobacco, it has paid over to the State treasury, annually, from the 1st of July, 1811 (commencement of the monopoly with the *regie*), to the 1st of January, 1853:

Years.	Francs.	Years.	Francs.
1811	6,000,000	1833	40,230,280
1812	20,000,000	1834	50,348,714
1813	29,355,812	1835	51,700,181
1814	32,000,000	1836	58,029,540
1815	38,123,908	1837	60,026,012
1816	32,856,021	1838	61,682,425

1821	42,279,004	1843	77,308,735
1822	41,950,997	1844	79,499,379
1823	41,584,489	1845	82,584,451
1824	43,129,728	1846	86,561,080
1825	44,380,451	1847	86,301,198
1826	44,980,057	1848	85,271,033
1827	45,729,083	1849	88,186,106
1828	46,385,683	1850	88,916,060
1829	46,632,490	1851	92,239,729
1830	46,782,448	1852	95,344,082
1831	45,920,030		
1832	47,761,037		
		Total	2,238,201,725

French official documents furnish the following facts relative to our cotton trade with that empire. By the custom-house return for 1855, it appears that there were received for that year, from all countries, 167,200,000 lbs.; and, for 1854, 157,520,000 lbs.; 1853, 165,000,000 lbs.; 1852, 158,400,000 lbs.

The following table shows the quantities of cotton imported into Havre, from all countries for a period of four years, ending with 1855:

Years.	From the United States.		From Brazil.		From elsewhere.		Total.
	Bales.	2,500.	Bales.	2,500.	Bales.	2,500.	
1855	406,800	2,000	2,000	2,000	12,000	425,000	415,000
1854	411,000	2,000	2,000	2,000	12,200	389,500	396,300
1853	374,500	2,800	2,800	2,800	14,400		
1852	374,900	6,000	6,000	6,000			

TABLE SHOWING THE QUANTITIES OF COTTON RECEIVED AT THE OTHER PORTS OF FRANCE DURING THE SAME YEARS.

Years.	From the United States.	From Brazil.	From Egypt.	From elsewhere.
	Bales.	None.	Bales.	Bales.
1855	12,000		30,700	2,800
1854	19,300		21,400	4,800
1853	14,500		38,000	17,000
1852	17,900		35,100	12,500

The preceding table exhibit a total importation of cotton into France, viz :

	Bales.
In 1855.....	43,800
" 1854.....	470,000
" 1853.....	454,000
" 1852.....	462,900

The document from which the preceding tables are translated and condensed, adds: "We may further remark, that, while England imp. is from the East Indies annually 400,000 bales of cotton, and thus finds profitable employment for her commercial marine, France is deprived of the advantages of this trade. The fault is found in the apathy of our cotton spinners and in our custom-house regulations. Cotton from the Indies, imported in the direct trade in French vessels, ought to be admitted free of duty; and the impost on cotton introduced from the entrepôts of Europe should be extremely moderate."

The articles of domestic produce usually shipped from the United States to France, besides cotton and tobacco, are hops, fish, pot and pearl-shes, whale-oil and whalebone; and those of foreign produce are principally sugar, coffee, teas, cocoa, pepper, and other spices. The principal articles imported into the United States from France are wines, brandies, silks, olive-oil, jewelry of all kinds, and, latterly, some cotton goods. An examination of the details of the trade in these articles could add nothing to the inferences which the general tables, already presented, suggest.

In the year 1793 an act was passed by the National Assembly, interdicting direct commercial intercourse between foreign nations and the French republic. This act, although never formally repealed, has been practically abrogated by the introduction of numerous modifications. Even foreign goods actually prohibited are admitted to entrepôt for re-exportation at the ports of Marseilles, Bayonne, Bordeaux, Nantes, Havre, and Dunkirk, on payment of specified duties; and these goods may be transferred from one bonded warehouse to another. Goods not prohibited may be thus transferred by land, on the terms of the transfer, free of duties. Arles, Port Vendre, and Strasbourg are points where merchandise not prohibited is received in bond, and from which it can be exported by sea only. There is also, at Lyons, a special dépot to which all the ports of bonding dépôts may transmit merchandise for consumption or exportation.

By the terms of the convention of the 24th of June, 1822, the time for levying discriminating duties has long since expired. The only charges upon commerce, in articles of home produce, which can be made by either country, are duties upon tonnage; and they are specifically limited to 5 francs (or 94 cents) per ton on the vessel's measurement, which is to be calculated according to the American vessel's register, and the French vessel's passport. This tonnage duty exceeds the amount levied by France on every other country, and thus operates injuriously to American interests. Vessels of all other countries, except Great Britain, pay 77 cents. British vessels, going direct to France, pay 20 cents; going in ballast from any other country, nothing. Other trivial port charges, such as light-money, permits, certificates, &c., are charged equally to all nations. The vessel's tonnage duties, alluded to, gives great advantages to some other nations over both France and the United States. This is the case as regards Australia, the Hanseatic League, and several other countries, which, by the terms of

their treaties with the United States, are permitted to carry on an indirect trade. The vessels of these nations, being subjected to a lower duty than ours in France, and a lower duty than French vessels in our ports, are thus enabled to carry merchandise to and from the United States cheaper than the vessels of either country can do it. In this way they have monopolized no inconsiderable portion of the carrying trade between the two countries.

The reciprocity stipulated in the convention of 1822 extends only to articles of the growth, produce, or manufacture of the respective countries. To admit a cargo from the United States to the advantages secured by the treaty, it must be certified by the French consul at the port of clearance to be of the growth, produce, or manufacture of the United States. The American ship-master is subjected, in a French port, to many small charges for the authentication of certificates, etc., from which the French master is exempt in our ports. Most of these are, probably, sheer abuses, without authority of law. They practically operate as an increase of duties, not warranted by the provisions of the treaty. There is a stipulation in the convention of 1822, by which the products of the United States, carried in American vessels, after a certain period, are to become liable to no higher rate of duty than if imported in French vessels. This does not include tin, the products of the fisheries, or spermaceti, simply pressed. Copper and lead* are also excepted; but, in point of fact, are admitted to the advantages of this provision, if it be shown that they are of American production.

The prospects of future commerce with France depend upon a variety of facts and contingencies. The facts, of a permanent character, which operate upon them, are the natural capabilities of the countries, the populations, and the subdivisions of their labor; the contingencies chiefly arise from their relations to other countries and their legislation. The facts bearing upon the subject, in the United States, are to be found in its history and its census, and are familiar to all. Those respecting the French empire, may be briefly summed up in a suggestive rather than an elaborate form. France proper, to which alone reference is now had, lies between 42° 49' and 51° 5' north latitude, and embraces an area of 204,355 square miles, greatly variegated by mountains, streams, and plains. The soils and their proportions are as follows:

Parts.		Parts.	
Mountain country.....	5	Soll of stones.....	13
Lands of plains.....	104	" sand.....	10
Soll of rich mold.....	14	" clay.....	5
" chalk.....	18	" marsh.....	04
" gravel.....	7	Various soils.....	14

Making an aggregate of..... 100

One half the area of France is cultivable; and of this, 9 parts are meadow; 44 parts vineyard; 15 parts woods and forests; 15 downs, pastures, and heaths; all the remainder consisting of roads, cities, canals, vegetable gardens, etc. It presents every variety of geological formation, exhibited in almost every variety of known relations. All the departments, 86 in number, contain mineral substances. There are 36 coal-fields in 30 departments. The most important are those of the Loire, embracing an area of 42,000 acres, lying between the Loire and the Rhône, down which their products reach markets. Next to these come those of Nord, Saône, Avignon, Gard, Calvados. The remainder are small. The annual produce of coal exceeds 3,000,000 tons. France is surpassed by England only in the production of iron. There are twelve iron mines in operation. Lead, silver, antimony, copper, and magnesia are found, but do not assume commercial importance. Salt is made in several localities, and has become a considerable source of wealth. 300.

The following ports of wine from are the principal statistics exhibit the belief of nu France over ten t what is more cu United States im times as much as four times as grea

000 persons are engaged in mining, and their operations show an annual value of \$80,000,000.

The population of France, in 1861, was 35,781,628. The increase in the preceding 10 years was nearly 2,000,000. A like increase would give in 1855 a population of fully 37,000,000. A little less than one half are males. Those of them who were old enough to vote under the late republican constitution were employed as follows:

Working class, or paupers.....	6,585,000
Manufacturing, commercial, and agricultural capitalists.....	927,000
Learned professions, and independent incomes.....	425,000
Paid officials, army, navy, and pensions....	370,000

About the same distribution of employments yet prevails. Schools are provided for only about one sixteenth of the children. The revenues of France are direct and indirect. The average aggregate annual revenue, from all sources, is about \$300,000,000. The national debt is over \$1,100,000,000.

The number of acres under vine cultivation exceeds 5,000,000, giving employment, in the cultivation of the vine and the manufacture of wine, to about 2,000,000 of persons (mostly females), and in its transportation and sale, to 250,000. The average home value depends, as does all other produce, on the supply and demand; rarely, however, exceeding 20 cents, or falling below 10 cents per gallon. The vine disease, now more or less prevailing in all wine-producing countries, has increased the average price of wine from 100 to 175 per cent.

The following statements, showing the produce of wine in France, and the exports in 1845 and 1846, were furnished to the *Economist* from which we have taken them, by the authorities in Bordeaux.

Total productions, 35,769,000

The following table gives a clear exhibit of the exports of wine from France, and shows what countries are the principal consumers of French wine. These statistics exhibit some curious facts, and opposite to the belief of most persons. Algeria imports from France over ten times as much wine as England, and, what is more curious, wine of a higher price. The United States imports from France not quite three times as much as England, but in value more than four times as great.

Total.....	147,133,100	135,548,100		

In 1849 there were produced in France, in round numbers, 925,000,000 gallons of wine. This was an increase over the quantity produced in 1839 of 115,000,000 gallons; but there were half a million of acres more under cultivation. The quantity annually exported averages about 45,000,000 gallons.

In 1849 there were exported.....	Gallons.
1850.....	41,000,000
1851.....	42,000,000
1852.....	49,500,000
1853.....	53,200,000
1854.....	43,500,000

The quantity exported in 1854 has not been ascertained. About 50,000,000 gallons are annually distilled into brandy, the exportation of which is under special government restrictions. 133,000,000 gallons of wine, in its various forms, are annually exported to foreign countries. The government derives a considerable portion of its internal revenue from the manufacture of wine. The excise duty in 1853 amounted to upward of \$22,000. Besides the 90,000,000 gallons converted into brandy, it is estimated that 220,000,000 gallons are manufactured into other kinds of spirits. If this estimate be correct, there will be left for home consumption over 700,000,000 gallons, or about 21 gallons for each inhabitant.

The disease of the vine, during the past few years, has been very destructive in France, Spain, Madeira, and other old wine-producing countries. Should the disease unfortunately continue in these countries which have hitherto supplied the markets of the world

with this beverage, the day may not be distant when the United States shall become the exporter instead of the importer of wine. The vine culture has already attracted attention in the western and southern States. The following table will exhibit the annual value of each of the chief products of France, all which enter into or influence its commerce:

Products.	Quantity.	Value.
Wheat.....	150,000,000 bushels	\$150,000,000
Rye and mixed corn.....	85,000,000 "	70,000,000
Rickwheat.....	26,000,000 "	18,000,000
Barley.....	28,000,000 "	30,000,000
Peas and Beans.....	8,970,000 "	7,500,000
Potatoes.....	56,000,000 "	11,500,000
Oats.....	90,000,000 "	54,000,000
Indian corn.....	12,000,000 "	9,000,000
Wine.....	803,000,000 gallons	100,000,000
Hemp.....	6,000,000
Raw silk.....	8,000,000
Flax.....	4,000,000
Madder.....	1,000,000
Fuel and timber.....	28,000,000
Olive-oil, rape-seed, etc.....	12,500,000
Tobacco.....	1,500,000
Chestnuts.....	1,500,000
Aggregate ann'val. of products.....	532,500,000

The wild animals are not numerous enough to have any material influence upon trade. It is not so with those domesticated. The annual value of the wool grown from sheep is about \$18,000,000. This branch of industry is very inadequately attended to. There are 14 or 15 different species of beees, and the total number of all kinds is about 12,000,000. This branch of husbandry is also much neglected. In the southern departments olive-oil supersedes butter. The horse is not as well managed as in England, nor are there as many horses. Hogs are abundant, and so are domestic fowls. The latter are well attended to.

Landed property is more minutely divided in France than anywhere else in Europe, or even than in the United States. In a few departments may be found estates of 200 acres; but they are rare, and daily becoming more so, as the law divides the land equally among the children. The greater portion of the farms are now less than 20 acres. Improvements in the methods of cultivation progress languidly, and the methods of manuring and rotation of crops, and of employing machinery, continue to be very defective.

Commerce and manufactures may be justly said to have commenced with Charlemagne. They were repressed during the feudal ages, when the barons enslaved the artisans and peasants. They were revived by the return of the crusaders, who brought a taste for the luxuries of the East. Louis XIV. well understood their importance. The death of Colbert and the revocation of the Edict of Nantes again paralyzed them, and the industry of France became subjected to monopolies. They continued enslaved, in a great measure, until the Revolution of 1789 unfettered them. Since that period, legislation has favored them by keeping them free, and giving full scope to individual enterprise and genius. They have only been retarded or disturbed by the intervention of wars. Their progress has, of late years, been wonderfully accelerated by the progress of science and its application to machinery and the useful and ornamental arts. Of scientific stimulants, the most important has been the application of steam-power. To science are also attributable metallurgy; the process of dyeing; the various preparations of animal substances; the weaving of cloths, cashmeres, and damasks; the making of paper, watches, and clocks, and of fine and common pottery; the manufactures of silks and ribbons; and numberless other useful and tasteful arts, which have spread wide the wings of commerce.

The average annual value of the exports of France, from 1825 to 1833, was about \$81,108,160, and of its imports \$79,785,012. The official statement of the

imports and exports, for the years 1844 to 1853, estimated in francs, were as follows:

Years.	Imports.		Exports.	
	French vessels.	Foreign vessels.	French vessels.	Foreign vessels.
1844	378,300,000	484,100,000	385,000,000	440,500,000
1845	399,500,000	474,000,000	408,500,000	454,700,000
1846	425,600,000	468,500,000	408,600,000	456,100,000
1847	448,000,000	526,000,000	499,000,000	581,000,000
1848	323,000,000	284,000,000	336,100,000	476,100,000
1849	401,000,000	349,200,000	540,000,000	508,600,000
1850	410,000,000	361,200,000	526,500,000	506,900,000
1851	392,100,000	341,800,000	560,000,000	708,700,000
1852	471,500,000	457,800,000	559,700,000	745,600,000
1853	507,000,000	522,100,000	619,700,000	580,000,000

The number and tonnage of the vessels employed in the foreign trade of France during the same years were as follows:

Year.	INWARD.				OUTWARD.			
	FRENCH.		FOREIGN.		FRENCH.		FOREIGN.	
	No.	Ton'ge.	No.	Ton'ge.	No.	Ton'ge.	No.	Ton'ge.
1844	6,392	679,106	10,770	1,859,759	5,867	677,092	6,396	671,111
1845	6,920	746,910	10,770	1,489,320	5,789	651,670	6,318	734,322
1846	8,188	879,508	12,118	1,681,290	6,955	654,072	6,623	709,506

The following table, made up from materials contained in "Anuades du Commerce Extérieur," brings down this statement of the amount and character of the foreign navigation statistics of France to the year 1853, the entrances and clearances being given in aggregate:

NAVIGATION TABLE CONTINUED TO 1853—THE ENTRANCES AND CLEARANCES UNITED.

Year.	FRENCH VESSELS.		FOREIGN VESSELS.	
	No.	Tonnage.	No.	Tonnage.
1847.....	9,701	1,047,000	20,794	2,708,000
1848.....	10,010	1,049,000	18,820	1,629,000
1849.....	11,200	1,142,000	14,768	1,721,000
50.....	11,808	1,192,000	16,892	2,110,000
51.....	11,068	1,202,000	19,347	2,380,000
1852.....	11,216	1,192,000	19,808	2,540,000
1853.....	12,132	1,393,000	20,425	2,433,000

In 1856 the arrivals and departures were thus distributed:

	Vessels.	Tons.
Entered.....	25,745	4,075,000
Cleared.....	14,475	2,321,000
Total.....	40,220	6,396,000

The great disparity between arrivals and departures is explained by the fact that the larger portion of imports consists of bulky and cumbersome merchandise, destined for our workshops and manufactures, while vessels leaving French ports are usually freighted with manufactured products, the value of which consists in their skillful workmanship rather than in their specific weight or the space which they occupy. This year (1856), especially, the importation of cereals was necessarily heavy.

A comparison of the different flags engaged in this general movement forces us to repeat the remark which we are constrained to make whenever we examine this subject—namely, that the French flag is invariably behind that of other nations in her own commerce. How stands our flag in 1856?

	Vessels.	Tons.
French Flag.....	16,820	2,521,000
Foreign Flags.....	23,898	3,875,000
Total.....	40,218	6,396,000

These figures are of themselves sufficient to show how necessary and urgent it is that the French merchant marine should be placed in a better condition to compete with the flags of foreign countries in her own ports.

The special commerce of France with foreign countries in 1853, was distributed as exhib-

ited in the sources:

		Glassware.....	21,500,000

The manufacture of cotton was first introduced in 1770, and has increased at an enormous rate. The total number of persons now employed in it is near 300,000. The total value of all the manufactures of France, annually, is 1,600,000,000 francs, and they are rapidly increasing.

The commercial legislation of France, which the tariff, inserted under its appropriate head,* is more especially designed to illustrate, has undergone, during the past few years, several important modifications. The latest, and not the least advantageous to the tonnage interests of the United States, is a decree which allows foreign-built vessels to be naturalized, and to take the French flag with all its privileges, on the payment of 10 per cent. on their assessed value.

This will create a new market, and an active demand for American vessels of 500 to 900 tons, and especially for steamers of 1000 to 1200 tons. A decree has also been promulgated admitting lumber, timber, naval stores, etc., free of duty for three years. Another extends to December 31, 1856, the decree of October 9, 1854, exempting from tonnage duties all vessels wholly laden with breadstuffs, flour, rice, etc.; and if only partially laden therewith, an exemption of tonnage duties proportionate to the quantities of such cargoes. A decree has also been published, reviving an old decree of 1816, exempting from tonnage duties all vessels entering French ports for the purpose of exporting salt, on which article the export duty has been suppressed.

Early in 1855 important movements were made in France, indicating an evident disposition in favor of the introduction and more general consumption of American salted provisions. From 1852 to 1854 the price of salt meats advanced at the extraordinary rate of 30 to 45 per cent. This state of the provision market immediately arrested the attention of the government, and various projects were adopted with a view, not only to prevent a further increase in prices, but also to reduce the rates already raised to so exorbitant a figure. The import duty on foreign cattle was lowered, viz.: from \$10 23 to 74 cents per head, on beef; and every means was resorted to likely to encourage the use of salted beef among the general mass of the French people. To this end, the duty on salted meats has been successively reduced from \$5 58 to \$3 72, and again to \$1 86; and in the month of September, 1855, it was further lowered to 9½ cents per 100 kilogrammes (220 pounds). The effect of this reduction of duty has

been to open the markets of France to American salted provisions; and the importation has increased, since that period, to such an extent as to render it not at all improbable that this article will, henceforth, become a leading staple of export from the United States to France.

England is now almost exclusively supplied with salted meats by the United States and Ireland—the latter country exporting about an equal quantity with the former. The supply from the United States could be made always to equal the demand; and if France should open her ports to American salted provisions, the consumption in that country would be almost exclusively supplied from the United States. The following brief summary of the trade in salted provisions in France during the past 20 years will exhibit the development which this article of American produce has made in that country.

In 1834, the importation into France of salted meats reached only 3527 quintaux, equal to about 777,844-68 pounds. After a lapse of 21 years—that is to say, in January, 1855, and during that single month—the importation reached as high as 3720 quintaux, exceeding the importation of the whole year of 1852 by 203 quintaux, or 44,769 pounds. Prime pork is imported into France in barrels of 331½ pounds gross, in brine of gray salt, and is usually sold at from \$14 80 to \$15 81 the barrel. For the English market such pork is exported from the United States in tierces of 304, 320, and 336 pounds, and in barrels of 200 pounds.

American mess pork is too fat for the French market, and seldom finds a purchaser; American sugared hams, however, always find a ready market and a brisk competition among purchasers. Shoulders, well cured, and put up in hogheads of 994 pounds, are equally in demand, and bring from \$18 60 to \$19 53 per 220 lbs. A similar feeling is manifested in France in behalf of her colonies. By decree of 10th March, 1855, the duty on salted meats has been reduced as follows: into Martinique, Guadeloupe, Guiana, and Reunion, salted meats of whatever origin, or under whatever flag, pay 9½ cents per 220 pounds. This measure has attracted the attention of pork merchants of the United States, and already heavy freights of this article have been forwarded to those islands. Various other modifications have been decreed, but as they relate mostly to the tariff regulations, they are merely alluded to here for the purpose of noting the tendency to a more liberal commercial policy, which has, of late years been, observable in French legislation. Recent custom-house returns, published in France, show that the revenue to the State during the first six months of 1855, upon 18 different articles, the duties on which have been lowered, was 34,181,574 francs, against 18,258,808 francs, derived from the same description of merchandise during the corresponding six months of 1854.

Such figures supply the best argument in favor of free trade, especially in a country in which a prohibitive and protective system has so long prevailed. The annexed table will also illustrate the wise policy by which, it would appear, that the commercial legislation of France is henceforth to be shaped.

According to the *Journal des Economistes*, during the first six months of the year 1856, the commercial transactions of France exhibit a satisfactory condition; although the receipts for customs, compared with those for the corresponding six months of last year, show a decided falling off, amounting, for the entire period, to 4,364,836 francs. This indicated a decrease in importations, which is to be regretted, but which, all things being considered, should cause no disquietude. The movements in 1855 exhibited, in point of fact, results altogether exceptional; thus the first six months, compared with the corresponding period in 1851, showed an increase in import duties of 21,000,000 francs, of which 5,000,000 were for June alone.

This important branch of French commerce comprises all the foreign merchandises transported over the French territories to other countries. Its vast increase may be perceived from the following statement for three years:

Years.	Metric quintals. (220 lbs.)	Real Value, France. (15¢ cents each.)
1859.....	618,303	\$92,000,000
1854.....	782,525	\$117,378,750
1855.....	760,434	\$114,065,100

The countries which supported this transit trade in 1855, were:

Whence.	France.	Walthier.	France.
Switzerland.....	143,000,000	United States.....	124,000,000
Belgium.....	102,000,000	England.....	99,000,000
England.....	59,000,000	Switzerland.....	74,000,000
Zollverein.....	46,000,000	Brazil.....	11,000,000
United States.....	16,000,000	Belgium.....	11,000,000
Sardinia.....	6,000,000	Sardinia.....	11,000,000
		Zollverein.....	10,000,000
		Spain, etc.....	8,000,000

Statement showing the amount of precious metals, gold and silver (ingots and specie), imported and exported to and from France, during a period of 26 years, from 1830 to 1855:

IMPORTED.		
Gold.	Silver.	Total.
France.	France.	France.
1,570,000,000	4,044,000,000	5,614,000,000
EXPORTED.		
Gold.	Silver.	Total.
France.	France.	France.
567,000,000	2,229,000,000	3,096,000,000

Commercial Decrees—Brandies.—By a decree of the 22d of September, 1854, all foreign brandies are admitted into France, by paying a duty of 15 francs per each hectolitre of pure alcohol.

Wines.—By a decree of the 15th of October, 1854, all wines, such as Madeira, Sherry, etc. ("vins de liqueur"), in casks, leather bottles, or bottles, are subject to the importation duty of 25 centimes per 100 litres.

Salted Meats.—By a decree of the 5th of October, 1854, a duty is fixed upon salted meats, of 50 centimes per 100 kilogrammes.

Medicinal Leaves.—By a decree of the 25th of October, 1854, the importation duty on medicinal leaves is fixed as follows: Orange, Ivy, stems and branches included; belladonna; clove; senna (leaves and foliolas, whole or broken); and others not enumerated: By French ships, from countries out of Europe, free; by French ships, from entrepôts, 10 francs per 100 kilogrammes; by foreign ships, 20 francs per 100 kilogrammes.

The delay fixed by the decree of the 24th of June, 1855, concerning divers measures relative to alimentary products, is put off till the 31st of July next (decree 21st of October, 1854). These measures are as follows, viz. 1st. Suppression of navigation dues (surtaxes) upon grain and flour imported by foreign vessels. 2d. Lowering of the entry dues upon those products to the minimum fixed by the law of the 15th of April, 1832. 3d. Reduction to 25 centimes for every 100 kilogrammes of the duties upon rice, dry vegetables, and oat-meal. 4th. Prohibition of the exportation of potatoes and dry vegetables. 5th. Exemption of tonnage duties on foreign vessels when they arrive laden with grain, flour, rice, dry vegetables, oat-meal, and potatoes. 6th. Facility for the same ships to effect the transport of the same alimentary products by coasting from one French port to another. 7th. Facilities for foreign ships to effect the transport of grains, flour, rice, and dry vegetables, between Algeria and France. 8th. Prohibition of the exportation of potatoes and dry vegetables from Algeria to foreign destinations, and facility of expediting these products from France into Algeria.

Foreign ships to bring grain.—By a decree of the 19th September, the decree of the 22d June, allowing foreign ships to bring grain, is extended to the 31st December, 1855, and the same in reference to Algerine exportations. By the decree of the 14th February, 1855, the importation duty upon spermaceti from the whale and eschalon of foreign fisheries is provisionally established, as follows: Bars, by French vessels, from countries situated beyond Cape Horn and the Cape of Good Hope, 5 francs per 100 kilogrammes. By French vessels, from elsewhere out of Europe, 7, 50 francs per 100 kilogrammes. By French vessels, from the entrepôt, 10 francs per 100 kilogrammes. By foreign vessels, 15 francs per 100 kilogrammes. Pressed, 20 francs per 100 kilogrammes. Refined, 50 francs per 100 kilogrammes.

By a decree of February 17, 1855, it is provisionally established, that from the 1st of March next the rate of drawback allowed on the exportation of soap shall be as follows: White or mottled soap, composed of alkali and olive oil, or of oleaginous seeds, or mixed with animal fat; 1st. The oil entering by one half, at least, in the mixture of greasy matter, 8, 20 francs per 100 kilogrammes. 2d. The oil entering for less than one half, 6 francs per 100 kilogrammes. Soap of animal fat: 3d. Pure, 6 francs per 100 kilogrammes. 4th. Mixed with rosin, 4 francs per 100 kilogrammes. Soap of palm or cocoa oil mixed with animal fat or rosin, 4 francs per 100 kilogrammes.

Cocoa tresses or filaments.—By a ministerial decision of the 23d of February, 1855, filaments of cocoa in the shape of tresses or twists are assimilated to the coarse tresses for nating, and admitted as such at the duty of 2 francs, and 2 francs 20 centimes, according to the mode of importation.

Duties on wines in the French colonies.—By a decree of the 31st January, 1855, "until otherwise ordained," foreign wines of all kinds imported from abroad into the colonies of Martinique, Guadeloupe, Gouana, La Réunion, and Senegal, shall pay the following duties: By French vessels, 25 centimes per hectolitre. By foreign vessels, 5 francs per hectolitre.

Iron.—By a ministerial decision of the 15th March, 1855, the leave or American prune will in future pay an entry duty similar to the ground and Taulouma nut, either 1, 2, 3 francs, or 3 francs 50 centimes the 100 kilogrammes, according to the source from whence it comes and mode of importation.

Salted Meats to the French colonies.—By a decree of the 15th of March, 1855, "salted meats" of all sorts of foreign origin, imported from any country whatsoever, or by any flag, into our colonies of Martinique, Guadeloupe, Gouana, and La Réunion, will pay on entry a duty of 50 centimes per 100

kilogrammes. The importation of these same meats, on the payment of a duty of 50 centimes per 100 kilogramme, is also permitted into St. Louis (Senegal), but by French vessels only, either direct from abroad or by extraction from the entrepôt at Gorée. Those which arrive at Senegal under a foreign flag will continue subject to the same regulations that exist at present.

Liquors from French colonies.—By a decree of the 11th of April, 1855, the duty on "liqueurs" imported from the French colonies is fixed at 15 francs the hectolitre of liquid.

By a decree of the 1st of April, 1855, the importation duties on raw wool are as follows, viz.: Imported direct, by French ships, from countries situated beyond Cape Horn and the Cape of Good Hope: From Australia and the Colony of the Cape, including Cape Town, present duties. From elsewhere, in the grease, 10 centimes per kilogramme. Cold-washed, in whole fleeces, 20 centimes per kilogramme. Official or refuse, 10 centimes per kilogramme. Hot-washed, in whole fleeces, 20 centimes per kilogramme. Official or refuse, 15 centimes per kilogramme. From elsewhere, present duties.

Nitrate of Soda and Potash.—By a decree of the 22d of April, 1855, the importation duty on nitrate of soda and of potash is established as follows: By French ships, from countries situated beyond Cape Horn and the Cape of Good Hope, 1 franc per 100 kilogrammes. From other countries out of Europe, 6 francs per 100 kilogrammes. From entrepôts, 8 francs per 100 kilogrammes. By foreign ships, 11 francs per 100 kilogrammes.

Drawback on Nitrate and Sulphuric Acids.—The provisions allowed by the laws of 6th May, 1841, and 11th June, 1845, on exportation of nitric and sulphuric acids, are—For nitric acid, 5 francs the 100 kilogrammes net of acid. For sulphuric acid, 20 centimes the 100 kilogrammes net of acid.

Citric Acid.—By a decree of the 23d of April, 1855, aduty is taken off citric acid of all sorts from the French colonies.

Foreign Vessels loading Salt exempt from Tonnage Duty.—By a decree dated May 10, 1855, the dispositions of the ordinances of 31st July, 1810, and 4th December, 1816, allowing foreign vessels to load salt in French ports when coming in ballast, free of tonnage duties, are extended to vessels coming to France with cargoes. The exemption from tonnage duties shall be in proportion to the quantity of salt exported.

Lowland Trees.—By a decree of the 23d June, 1855, the importation duty on lowland trees is fixed as follows: By French ships, 25 centimes the 100 kilogrammes. By foreign ships, 1 franc the 100 kilogrammes.

Navigation Dues—Exemption to 31st December, 1855.—By a decree of the 5th June, 1855, the exemption of navigation dues accorded up to the 31st July, 1855, on cargoes of grain, flour, rice, potatoes, and dry vegetables, is extended to the 31st December, 1855.

By a decree of the 11th July, 1855, the regulation for the admission of molasses intended for distillation is fixed as follows, until it shall be otherwise ordained: By French vessels, from French colonies, exempt. By French vessels, from the East Indies, exempt. By French vessels, from South America, exempt. By French vessels, from the West Indies, exempt. By French vessels, from elsewhere, 2 francs the 100 kilogrammes. By foreign vessels, 3 francs the 100 kilogrammes.

By a decree of the 3d October, 1854, the duty then existing on the exportation of tresses, of 50 centimes per 100, was abolished; and on the 5th, a duty of 50 centimes per 100 kilogrammes was imposed on the importation of salted provisions. On the 9th, a decree prolonged the free entry of vessels laden with grain, flour, rice, potatoes, and dried vegetables, from the 31st July, 1854, to the 31st July, 1855. Another decree dated the 25th, permitted the importation of leaves of oranges, ivy, cloves, and senna, intended for medicinal purposes, free of duty. On the 26th the distillation of grain, and all other farinaceous substances whatsoever, was prohibited by an Imperial decree, under that date; and on the 6th November, a similar decree allowed the free admission of quercitron bark, imported by French vessels from countries out of Europe, and reduced the existing duty of 40 francs on that article, arriving by French vessels from the entrepôts of Europe, to 20 francs; and from 60 francs to 30 francs when imported by foreign vessels having no commercial treaty with France. On the 16th November, notice was communicated by circular, that, by a treaty concluded between France and Belgium, the former admitted geographical and marine charts, linen, printing-ink, types, thread and bemp yarn, straw plait, slate, stone, and other raw materials, without a certificate of origin—Belgium conceding to France a similar privilege on charts, types, printing-ink, clothes, pasteboard in sheets, paper of all descriptions except colored

or morocco, and Ghampas in cask.

On the 5th, between the 1st and 15th of the month (not excepted) imported by French vessels of the dunnage for pay wines imported in cask, being and at 10 centimes by another decree the French exported free; when the duty of 3 francs per 100 kilograms is fixed at 15 francs.

On the 6th J published; on sheet copper the country which intended for their origin must be their departure, bound to make

On the 10th J published; on sheet copper the country which intended for their origin must be their departure, bound to make

or morocco, elates, prepared plaster, Bordeaux, Burgundy, and Champagne wines, and also those of Tours and Bayonne, in cask.

On the 6th December, a declaration was promulgated between the Emperor of the French and the Prince of Monaco, by which the former reduced the then existing duty on olive oil (not exceeding 180,000 kilogrammes in quantity), when imported by French vessels, or those of the Prince of Monaco, to a uniform duty of 15 francs per 100 kilogrammes—the vessels of the principality being assimilated to those of Sardinia for payment of tonnage dues—the duty on French wines imported into the territory of the Prince of Monaco, in cask, being fixed at 3 francs 36 centimes per hectolitre, and at 10 centimes in bottle not containing more than a litre. By another decree, dated the 20th December, molasses from the French colonies, arriving by French vessels, is admitted free; when imported from countries out of Europe, at a duty of 3 francs and from the entrepôts at a duty of 8 francs per 100 kilogrammes. When imported by foreign vessels, it is fixed at 18 francs per 100 kilogrammes.

On the 6th January of the current year, three decrees were published: one permitting the temporary importation of sheet copper into France by French vessels, or direct from the country where it is produced, free of duty; when it is intended for the manufacture of boilers or machinery. Its arrival must be certified by the French consul at the place of its departure. Immediately on its arrival, the importer is bound to make a declaration at the custom-house, of the number and weight of the sheets, as well as of their length, breadth, and thickness. The custom-house, after having ascertained the correctness of such declaration, is enjoined to cause a stamp to be put on each sheet, in order to assure the exportation of the same copper; and a charge of 5 centimes for stamping, including the cost of the stamp, is made for every sheet so stamped. Bond must be given that the whole quantity of copper imported shall be used, and re-exported, or placed in the public stores (excepting such parts as may remain from cuttings or corners of sheets, in which the duty must be paid in the same proportion as if they were whole sheets), within six months; and the custom-house is enjoined to assure itself that the articles so manufactured are equal in quantity, kind, and quality, so that, temporarily admitted, sheet copper can only be exported from ports or places having public warehouses, or from places to which such articles are allowed to be sent *in transitu*. By another, the temporary introduction of old cast iron belonging to foreign-built steamboats, which may put into France for repairs, is also admitted free of duty—the importers giving sufficient security for replacing in the entrepôts of France within six months, an equal quantity of iron, proper for ships' use, to that which may have been employed in such repairs. Iron imported under this decree, and the articles manufactured therefrom, can only be exported from places having government warehouses; and the custom-house is charged to see that the iron imported and not used be broken up in such way as to render it impossible of being used, otherwise.

The third decree subjects foreign vessels at the Island of Senegal to a simple tax of 50 centimes per ton, without the additional 10 per cent., but this is limited to the port of Gorée. A decree relative to French and foreign emigration was promulgated on the 15th of January, a copy of which, in *excerpts*, with a translation into English, was forwarded by me to the Department on the 31st of that month. A circular, dated 15th January, exempts from the tax of *acombrage*, or landing, certain articles of French origin, or foreign goods on which the duty imposed by law has been paid, when they are sent by water from one part of the empire to another, precautions being taken to assure the identity of the goods on their arrival at the port of destination. By a circular, dated 16th January, the decree of 20th December, prohibiting the importation of foreign molasses, extends to such only as is intended for distillation; and the exemption from duty on French molasses equally applies to such as is imported solely for distillation. Molasses so imported is always under the surveillance of the customs till after its completion at the place of distillation.

By another circular of the 27th of the same month, alcohol produced in Corsica, from the distillation of the bulbs of daffodils, figs of the cactus (prickly pears), juniper and myrtle berries, and all other substances, with the exception of ferriacetas (the distillation from which substances the circular continues to prohibit), are added to the number of articles admitted free of duty. A decree of the same date modifies the duty on juniper and myrtle berries, and also on table-fruits, and equalizes the duty on the bulbs of daffodils and figs of cactus. By a decree of the 31st of January, foreign wines of every description are admitted into the Islands

of Martinique, Guadeloupe, Guiana, La Réunion, and Senegal subject to a duty, when imported by French ships, of 25 centimes per hectolitre, and to that of 5 francs when imported by foreign vessels. A circular of the 1st of February exempts from examination, at the custom-house of France, the baggage of foreigners arriving from foreign ports, to embark for places abroad; and a decree of the 10th allows the free importation of salt (foreign) intended for the mackerel fishery, which hitherto was confined to that of France, from the 15th of February of every year; and another decree of the 14th extends the period for its introduction from the 1st of March to the 15th of June; previously to the date of that decree, it was only admitted between the 10th of March and the 15th of June. A decree of the 14th of February imposes a duty on sperm or whale oil, imported in French ships, from countries beyond Capes Horn and Good Hope, of 5 francs per 100 kilogrammes on the gross weight; from other countries than Europe, 7.50 francs, and by foreign vessels, 15 francs per 100 kilogrammes. By another decree of the same date, flour from Algeria is admitted free of duty into all parts of the empire.

On the 17th of February a decree was issued granting a drawback of 3.20 francs per 100 kilogrammes on white or yellowed soap, composed of alkali and olive oil, or from vegetable oil, entering for at least one half in such composition, or for less than half if mixed with animal substances. On soap made wholly from animal substances, a drawback of 6 francs per 100 kilogrammes is allowed, and 4 francs per 100 kilogrammes on soap made from palm or cocos oil, mixed with animal substances or rosin. A circular of the 28th of February specifies the objects which shall be considered as coming within the meaning of the treaty concluded with Spain on the 15th November, 1853, which are books, dramatic and musical compositions, paintings, drawings, engravings, lithographs, sculptures, geographical maps, and all other similar productions, with the exception of works of art applicable to agriculture and industrial manufactures; prohibits the reproduction of the works of either in the country of the other, and indicates the ports in France by which alone such works can be introduced. A decree of the 10th of March authorizes the introduction into Martinique, Guadeloupe, Cayenne, and La Réunion, of salted provisions of every kind, from whatever country or under whatever flag they may be imported, on the payment of an inward duty of 50 centimes per 100 kilogrammes. The same provisions are allowed to be introduced into Senegal (St. Louis), at the same duty, if imported by French vessels, whether from foreign countries or from the entrepôt at Gorée. No change is made in the law actually in existence, with respect to provisions arriving at Senegal under a foreign flag.

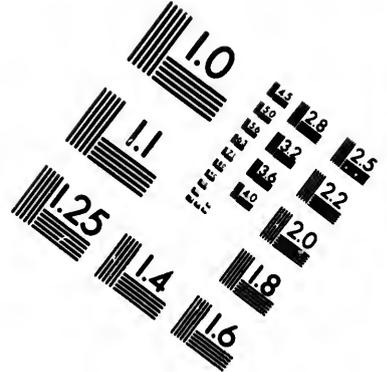

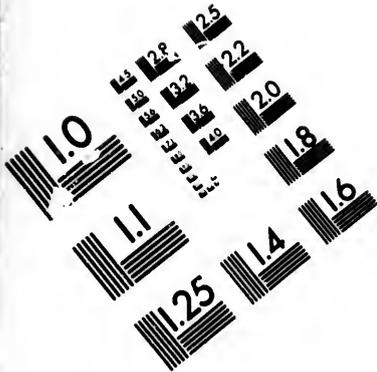

A decree of the 14th of April modifies the inward duty on wool, arriving direct from countries situated beyond Cape Horn and the Cape of Good Hope, when imported by French vessels, but leaving the duty actually existing unchanged when imported from other parts of the world. Another decree of the same date repeals the export duty of 5 centimes per 100 kilogrammes on lime; and by another decree, under the same date, the duty on liquors imported from the French colonies is fixed at 15 francs per hectolitre of liquid.

On the 23d of April an allowance of five per cent. for loss in weight, whether from water or decay, was authorized by decree on refined salt, if imported by sea and shipped in bulk at the place of production; and a second decree of the same date establishes the inward duty on nitrates of soda and potash arriving by French vessels from countries situated beyond Cape Horn and the Cape of Good Hope, at 1 franc per 100 kilogrammes; from places in Europe, 6 francs per 100 kilogrammes; from entrepôts 5 francs per 100 kilogrammes.

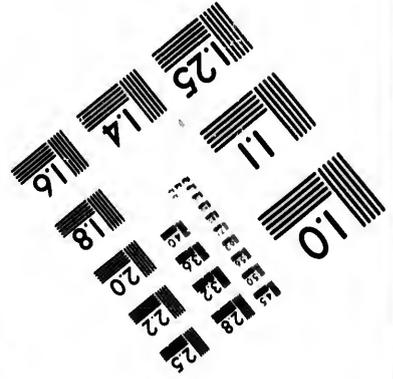

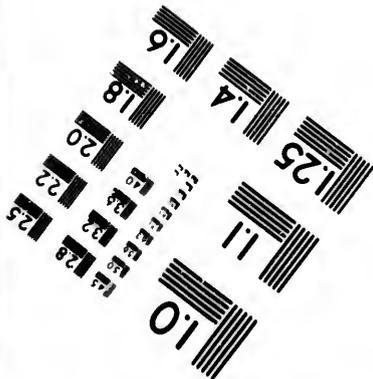

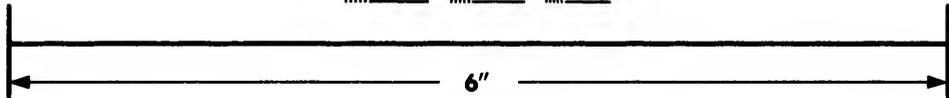

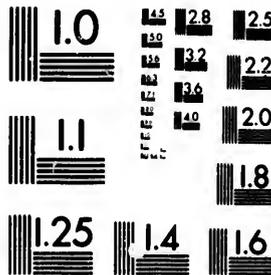

Citric acids of all sorts imported from the colonies of France, in French ships, are admitted free of duty; by foreign vessels, at a duty of 11 francs per 100 kilogrammes.

A premium or bounty of 5 francs is allowed on the exportation of every 100 kilogrammes of net nitric acid, and one of 20 centimes on sulphuric acid. On the 24th of April a circular was issued authorizing the temporary free admission into France of machinery, glass (for re-*reilvering*), bronzes, and other similar works, and books, when imported separately, or in small quantities, for the purpose of being repaired or finished, on condition of their being re-exported within six months. By a decree of the 28th of April, iron work, in bars or sheets (without distinction of origin) fit for the construction of cellars or dwelling-houses, is allowed to be imported into Senegal by French vessels, free of duty, whether coming from the entrepôts of the metropolises or that of Gorée. Another decree, of the same date, fixes the duty on old worn-out type at 5 francs per 100 kilogrammes. An *arrêté* of May 5th orders the withdrawal from circulation of all gold pieces of the value of 10 francs, bearing the effigy of the

present emperor, to take place on the 15th of October, 1855. By ordinance of the 31st July and 4th December, 1846, all vessels arriving in France, in ballast, to take in salt, were exempted from tonnage duty. By a decree of the 10th of May, 1855, foreign vessels arriving with cargo enjoy the same privilege, but only in proportion to the quantity of salt taken by them; and by a circular of the 2d of June the export duty on salt is suppressed.

Alcohol distilled from daffodils in Algeria is admitted into France free of duty, by decree of May 23d. By a decree of the 2d of June, the delay fixed for the introduction of provisions into France is prolonged to the 31st of December, 1855; by another of the 5th, the free admission of ships importing grain, flour, rice, &c., is extended; and by a circular of the 11th, the exportation of these articles is prohibited during the same period. A decree of the 23d of June accords the privilege of transporting grain and flour between Algeria and France to foreign vessels, having left their port of loading on or before the 31st December, 1855. By another decree of the same date the exportation of corn and barley from Algeria, to foreign countries is prohibited, and by a third decree, the importation of carol beans by French vessels is admitted at a duty of 25 centimes per 100 kilogrammes, and of 1 franc per foreign vessels. A decree of the 7th July admits, free of duty, vanilla, imported by French vessels arriving direct from the French colonies, Cayenne and Mayotte. A circular of 10th July imposes a double décime on the amount of all government taxes, to remain in force till the 1st of January, 1856; increases the excise consumption duty on brandies, spirits, liquors, and brandy fruits, from 24 francs to 50 francs per hectolitre of alcohol, and from 50 francs to 66 francs, exclusive of the double décime, the tax on these articles on their admission into Paris, and further imposes a tax of 10 per cent. on the receipts of passenger money by railroad, and also on the conveyance of goods by fast or express trains. By a decree of the 14th July, molasses imported for distillation by French vessels from the colonies of France, India, South America, and the West Indies, is admitted free of duty, and from other ports at a duty of 3 francs per 100 kilogrammes. When imported by foreign vessels, the duty is 3 francs per 100 kilogrammes.

A decree of the 16th July makes many changes and modifications in the tariff of duties. They are too numerous to be embodied in this communication. They will no doubt be published in one of the supplements to the general tariff, which shall be forwarded to the Department when published, with any others which may have preceded it, or by which it may have been followed. The avowed object of these modifications is to give additional encouragement to its maritime commerce by the total repeal of duty on the raw material of certain articles—the produce of distant countries—when imported direct by French vessels, for the purpose of contributing to the progress of their own manufactures, and by totally repealing the duty on certain articles of small productive revenue. Among the most important of these modifications is the alteration of the duty on caoutchouc. The duty on this article of 20 francs per 100 kilogrammes is continued when it is melted solely for articles of manufacture. Until the publication of this decree, when other substances were mixed with caoutchouc, or gutta percha, either for the purpose of giving color or adding strength to the article manufactured, the duty was 200 francs per 100 kilogrammes. This tax is now reduced to 50 francs. The duty of 200 francs will in future be payable only on articles composed of caoutchouc or gutta percha, with which other substances are combined, and when intended for other purposes than that of being melted. A decree of the 31st August accords the free admission of game, poultry, and shell-fish (*tortue*); and one of the 22d September prolongs to the 31st December, 1856, the exemption from tonnage duty of all vessels laden with grain, flour, rice, potatoes and dried vegetables.

The increase in the price of meats in France has been very great since 1848; so much so, that general complaint exists on the subject. From 1853 to 1854 there has been an increase of price from 40 to 45 per cent. The attention of the government of France having been called to this fact, its efforts have been not only to prevent a further increase, but to effect a diminution from present prices. To this end the tariffs have been revised, and very great reductions have been made upon the importation of foreign cattle, to wit: from \$10 23 to 74 cents a head on beef, &c. Not only so, but the direct attention of the people of France has been called to the use of salt meat, and the experiment of opening the market is being made with much success. The duty upon this article has been successively reduced from 45 58 to 23 73, to \$1 86, and in the month of October last, to 94 cents the 221 pounds, or 100 kilogrammes. Under these reductions there has been an astonishing development in its importation. In

1854 the importation of meat, fresh and salt, reached only 2327 quintaux, or 777,544 58-100 pounds; while in the first month of the present year, the importation has reached 2730 quintaux, being more than in the whole year of 1853 by 208 quintaux, or 44,769 82-100 pounds. I transmit herewith an extract from the *Echo d'Agripol*, showing the usual mode of importing salt meats, with the respective values of the several qualities: "Prime pork is the most common kind in brine of gray salt; barrels of 181½ lbs. gross, or 198 90-100 lbs. net; value from \$14 90 to \$15 81 the barrel. Mess pork is little imported, and does not find a sale, being too fat. Prime mutton, first quality, preserved in brine with white salt, from lean hogs, is from \$15 60 to \$19 63 per barrel. Hams salted, sugared, and smoked, sustain a comparison with the best we have in Europe, and find a ready sale. Shoulders, dry salted, find a good deal of favor in France. They come in dry barrels, of 994 40-100 lbs. net; value from \$13 60 to \$19 53 the 221 lbs., or 100 kilogrammes. Lard comes in barrels of 265 20-100 lbs., or in firkins of 46 63-100 lbs. net; value \$18 the 1104 lbs., or 50 kilogrammes." The foregoing extract will indicate the kind, manner of importation, and values, for the benefit of importers. By a decree of the 10th of this month (March) the rates of duties on salt meats into the French colonies have been reduced as follows: Into Martinique, Guadeloupe, Guiana, and La Réunion, salt meats of foreign make, from whatever country imported, and under whatsoever flag, will pay a duty of 50 centimes (½ cent) per kilogramme, or 221 lbs. The same duty is required at St. Louis, Senegal, but only when imported in French bottoms, either directly from abroad, or by extraction from the entrepôt of Gorée. These meats imported into Senegal, under a foreign flag, are charged the duty in force before the decree.

In Africa the French possess Gorée and some factories near the mouth of the Senegal. In the East they have the Isle of Bourbon, and Pondicherry, Chandernagore, and some smaller factories on the mainland of India; and their vessels are, like the Americans, admitted to trade with Calcutta, Madras, and other British settlements, on payment of moderate dues. The retention of the Mauritius by England, at the peace of 1814, deprived them of the great receptacle for their privateers in the East; and on the continent of North America, they retain nothing since the cession of Louisiana to the United States in 1803. Since 1841, when the sovereign of the Island of Mayotte placed himself under the protection of France, this Island, situated at the extremity of the Mozambique Channel, is to all intents and purposes a French settlement. Mayotte is capable of feeding a population of 20,000 souls, and of regularly furnishing provisions to a squadron of ships. France also possesses an establishment in Aus-

trails, for since the 22d of March 1854, Captain Dubourest has been commandant of the Marchesses and imperial commissary at the Society Islands and New Caledonia. There is also an unimportant French settlement at Madagascar, and an attempt at a penal colony has been made at Guiana, where, to the disgrace of the French government, political prisoners have been mixed with the refuse of the galleys. In the seas of Europe, Corsica is almost the only insular possession of the French. They have no great maritime fortresses, like Gibraltar or Malta, and no dependencies of the nature of the Ionian Islands.

Commerce, &c.—The commerce of France with her colonies is regulated by the same narrow maxims as the other branches of her foreign trade. The colonies and the mother country are mutually bound to trade exclusively with each other. The staple produce of the French West India colonies, as well as the Isle of Bourbon in the East, is sugar; and it appears that the price of this article in the European markets will not repay the expense of its cultivation in those countries. The colonists, therefore, insist that all other sugars shall be excluded by heavy duties from the markets of France; that they shall have the exclusive privilege of supplying these markets; and on a complaint that the duties imposed on foreign sugars were not high enough to give them the monopoly of the home market, an additional duty was, in 1822, on the suggestion of the director-general of the customs, imposed on all foreign sugars. In return, France possesses the exclusive privilege of supplying the colonies with all the manufactures and other European goods which they require. On this principle of mutual monopoly the trade is now conducted. The effect of this system is to levy a tax on the inhabitants of France, in order to indemnify the colonists for the losses which they incur in carrying on an unprofitable trade. They can not furnish a supply of sugar to France at the ordinary rate of the European market; and the price must therefore be artificially raised in that country, in order to enable them to carry on the cultivation of their estates; while, on the other hand, they are not at liberty to buy the goods which they require in the cheapest market, but must take them at whatever price they can be afforded by the mother country.

Another evil of this colonial monopoly is, that the colonies supply more sugar than France can consume. But it can not be sold in other countries at the price which is paid to the colonies by the mother country; and hence it becomes necessary to find out the means of forcing a sale of the surplus which can not be consumed at home. A bounty is accordingly granted on all sugar exported from France; and in 1801, while the duty on the importation of sugar produced £1,696,000, there was paid back for bounties £488,951, which was more than one fourth of the gross receipts. The loss which France has incurred since the peace of 1814 by this erroneous system is estimated in "Bowring and Villiers' Report," at £40,000,000 sterling; and in return for these great sacrifices, the colonies afford but a limited demand for the manufactures of the mother country; in 1852, it amounted to 23,482,000 kilogrammes; in 1858, to 26,481,000 kilogrammes; in 1854, to 33,297,000 kilogrammes.

Colonies.—The colonial possessions of France are quite unequalled to her greatness in other respects. The insurrection engendered by the first Revolution deprived her of the western half of St. Domingo, a rich and beautiful territory, containing formerly more negroes, and exporting more produce, than all the British West Indies together. The French government seems to have relinquished the hope of regaining this country, at least by military means, and to limit its ambition to the remaining colonies, Martinique, Guadeloupe, Cayenne, in the West Indies. The first two are, like most of our West India islands, cultivated to a considerable extent, but capable of much improve-

ment. The petty island of Marie Galante is in a similar state; but Cayenne forms a part of a most extensive tract, of which one corner only is as yet rendered productive, and which may eventually become a great settlement; though on the score of health it is as unpromising as the adjacent colonies of Demerara and Surinam. Before the loss of St. Domingo the annual import into France amounted to 70,000 hds. of muscovado or brown sugar, 60,000 hds. clayed, and nearly 20,000 of fine clayed. Of this very large supply there were exported nearly 40,000 hds. of brown, and above 60,000 hds. of clayed, forming, exclusively of any duty, an annual value of between £2,000,000 and £3,000,000 sterling, and affording a most acceptable exchange for a number of imported commodities. The sugar thus imported from St. Domingo has long been lost to France, no sugar being now exported from that country.

Algiers.—Among the colonies of France is Algeria, which the government has retained since its conquest in 1830. Of this dependency Algiers is the capital, the seat of government, of a prefecture, and of a bishop's see since 1838. Algiers also possesses a government printing-office, an academy of public instruction, a court of appeal, a tribunal of first instance, a tribunal, and a chamber of commerce. A bank has been recently established. Several newspapers are published at Algiers. The *Moniteur* of Algiers is the official paper. There is also the *Akhbar*, the *Mobacher*, the official journal in Arabic, the *Atlas*, &c.

The population of Algiers, according to the last returns, amounted to 55,682 Europeans, of whom 23,147 were French, and 24,996 natives, of whom 17,656 were Musulmans, 1380 negroes, and 5758 Jews. A Protestant church was commenced in Algiers in 1848 and finished in 1845. There are at Algiers four large mosques and about thirty lesser ones, two great and twelve lesser synagogues. There are few manufactories in the capital unless of silks, carpets, woolen tissues, fire-arms, saddlery, jewelry, leather, &c. From the last published official returns there entered Algiers within the year 2270 ships, measuring 209,642 tons; of these 255 were government vessels, 1134 French commercial bottoms, and 120 native; the remaining vessels were under foreign flags. There sailed outward from Algiers, in the last year of which we have any official records, 2237 ships measuring 208,810 tons. Of these 249 were government ships, 1148 French ships, and 117 native. By a decree of the present Emperor of the French, a bourse was created at Algiers on the 16th of April, 1852. For a more detailed account, see ALGIERS.

of passage, which appears periodically in shoals, like the herring. The fishery of *sardines* is said to give employment to 8000 seamen, and the sales resulting from the produce amount to between 8,000,000 and 4,000,000 of francs. The turpny, a fish not known in northern latitudes, is found in the Mediterranean in the early part of summer. It varies in weight from 10 to 25 pounds, and is in like manner caught in shoals.

These home fisheries, little calculated for forming seamen, have been left to their natural progress, while repeated attempts have been made by government to extend the fishery in America; a design favored by the early possession by France of Newfoundland and Canada, as well as by the long peace that followed the treaty of Utrecht. Toward the middle of last century the French fisheries in America employed annually about 6000 seamen; but the unsuccessful contest with England in 1756 reduced them greatly, and deprived them of their principal station, Cape Breton. The peace of 1763 was concluded under better auspices. The islands of St. Pierre and Miquelon were ceded to France by the treaty of Versailles, and the rights of fishing and of drying fish from the Cape St. John to Cape Ray. In the Gulf of St. Lawrence her rights were subsequently recognized, by the treaties of 1802 and 1814, at 3 leagues' distance from the coasts belonging to Great Britain; but within the gulf, at a distance of 15 leagues from Isle Royale, and 30 leagues from New Brunswick.

For the management of the French fisheries, enormous pecuniary sacrifices have been made. By the law of the 22d of July 1851, bounties are granted to the fisheries till 1861, at the rate of 120 francs the ton. A ship of 600 tons thus receives 72,000 francs bounty, which would be 2000 to 3000 francs per man. The only time they were ever in a prosperous state was, not when they were protected by the artificial encouragement of the mother country, but when the French colonists, being in possession of a large tract of the American sea-coast, were in consequence compelled to trust to prudence and economy alone for the success of their adventures. During the session 1833 of the Chamber of Deputies, a committee, appointed to inquire into this subject, made their report.

French Fisheries.—High bounties have, since the year 1767, been paid to those owning ships, and to men employed in the French fisheries. In pursuance of ordinances dated the 24th of June, and 9th and 12th of July, 1851, the following bounties were granted for the encouragement of the French fisheries. They came into operation on the 1st January, 1852, and are to remain in force until the 30th June, 1861:

Cod-fishery.—Premiums for Chartering and Equipping Vessels.—For every man engaged in the fisheries, having drying or curing grounds, whether on the coasts of Newfoundland, Saint Pierre or Miquelon, or upon the great Newfoundland Bank, 50 francs. For every man engaged in the fisheries, not having drying or curing grounds, in the Icelandic Seas, 50 francs. For every man engaged in the fisheries, not having drying or curing grounds, on the great Newfoundland Bank, 80 francs. For every man engaged in the fisheries on the Dogger Bank, 15 francs.

Bounties on the Produce of Fisheries.—On the im-

portation into the French colonies, whether in America or on the other side of the Cape of Good Hope, of every quintal of dried codfish, the produce of French fisheries on the coasts of Newfoundland, Saint Pierre, or Miquelon, or which may be taken from entrepôts in France, 20 francs. On the importation into the above colonies, of every quintal of dried codfish, the produce of French fisheries, if the fish shall be exported from the French ports without having been there warehoused, 16 francs. On every quintal of dried codfish, the produce of the French fisheries, and imported direct from the same or from French entrepôts, into such foreign Mediterranean ports (except those of Sardinia and Algeria) in which a French consul may reside, 16 francs. On every quintal of dried codfish, the produce of the French fisheries, forwarded direct either from those fisheries or from French ports, and imported into Sardinian and Algerian ports, 12 francs. For every quintal of cod-souids that the fishing-vessels may bring into France, the produce of their fishery, 20 francs.

Vessels departing for the fisheries with drying grounds, whether on the coasts of Newfoundland, Saint Pierre, Miquelon, or the great Bank of Newfoundland, shall have a crew whose minimum is to be fixed by a royal ordinance.

Whale-fishery.—The bounties granted in pursuance of the laws of 24th June, and 9th and 12th July, 1851, for the encouragement of the whale-fisheries, shall be fixed as follows, to date from the 1st January, 1852, and to continue in force until the 30th June, 1861:

Bounties on the Departure of Vessels.—For every ton of shipping outward bound, with crews composed entirely of French sailors, 70 francs; and for vessels with crews composed partly of French and foreign sailors, agreeably to the provision that the foreigners exceed not one third either of the officers or crew, 48 francs.

Bounties on the Return of Vessels.—On each ton of shipping where the crew is composed entirely of French sailors, 50 francs. On each ton of shipping with a mixed crew, 24½ francs.

Under the conditions that the vessels shall have fished either beyond Cape Horn, or to the east of the Cape of Good Hope, as far as 62° of latitude, and shall have been out at least 16 months. In addition to the above, there shall be allowed to vessels especially manned for the sperm-whale (*cochalo*) fishery, in the Pacific Ocean, after they have been at sea for the space of at least 30 months, and during which time they may have reached as far as 28° of north latitude, an additional bounty of 15 francs upon the sperm oil, etc., which they shall bring home. The bounty on the produce will only be accorded for an amount not exceeding 600 tons.

Colonial Tariffs.—The navigation between France and her colonies is confined to French vessels measuring not less than 40 tons, in which the officers, and at least three-fourths of the crew are French.

French Guiana (Cayenne).—The tariff of this colony is established by decrees of the local authority, sanctioned by the metropolitan government.

Duties on Imports.—French merchandise (with the exception of that admitted free), imported direct from ports of France or her colonies, in French bottoms, pays 2 per cent. ad valorem. Foreign merchandise (with the exception of that admitted free) permitted to be imported, both under French and foreign flags, viz.:

Beef, salted; * butter; codfish, green, dried, and salted; fish-oil; wheat flour, rye flour, and corn meal; lard; vegetables, fresh and dry; lime, slacked; salt pork; rice; salt; staves; stone coal; tallow, and tallow candles; tobacco, in leaves; whalebone and whale-

* By a late decree, salted provisions under all flags and from all countries pay 50 centimes per 100 kilogrammes.

oil; wood, and pitch-pine, pay 5 per cent. ad valorem. All articles not enumerated above, 10 per cent. ad valorem."

The following articles are prohibited importation for consumption, and are only admitted in entrepôt (*entrepôt fictif*)*

"From French Colonies in French Vessels.—Cocoa, cinnamon, cloves, coffee; cotton, raw; indigo, and prepared roucou; all spirituous liquors, with the exception of brandy, French and Martinique cordials; Kirchenwasser and gin; nutmegs, pepper; sugar, raw and whitened, and wool.

"From Foreign Countries and in Foreign Vessels.—Clothes, ready made, comprising hats and all articles for the feet; cotton, spun; gunpowder; sugar, refined; tissues of cotton, silk, wool, and, hemp."

The following articles are admitted free of duty, without reference to their source, under all flags:

"Animals, living; agricultural instruments imported for trial; machines, and similar articles necessary for colonial industry; specimens of natural history; precious metals in bullion and coin; quick-lime."

By French Vessels Arriving Direct from France.—Utensils and implements of husbandry, especially shovels, hoes, hatchets, plows, pruning-hooks, and harrows; salt beef; boilers for sugar factories; codfish and other salted fish; flour and all other farinaceous provisions; vegetables, fresh and dry; salt pork, red herrings.

Duties on Exports.—All products of the colony (except those which are free) exported to France or to French colonies, in French vessels, 1/2 per cent. ad valorem. The same exported to foreign countries in French vessels, 2 per cent. ad valorem.

The following products of the colony are subject, on exportation, to the following additional duty, called (*contribution foncière*) "ground-tax:"

Designation of merchandise.	Number, weight, or measure.	In national vessels.	In foreign vessels.
Annatto or roucou.	100 kilos, or 220 lbs.	\$0 55-8	\$0 55-8
Cocoa	" "	8-33	39-33
Cloves, flowers	" "	43-5	30-7
" stalks	" "	3	7-5
Coffee	" "	46-3	1 02
Cotton	" "	37-2	64-8
Molasses	" "	9-3	9-3
Orchides	Each	1	4
Tafia (rum)	1,000 litres, or 264 gal	9-3	9-3
Sugar, raw or white	220 pounds	12-9	24

* Foreign prohibited goods having been seized and re-exported, 2 per cent. ad valorem. Foreign prohibited merchandise on leaving the "entrepôt fictif," 1/2 of 1 per cent. ad valorem."

The following articles are exempt from all exportation duties, whether for France or foreign countries:

"Cinnamon; egges, fresh; ginger-root, indigo, nutmegs, pepper, pimento, simarouba, specimens of natural history, turmeric, turtles, vanilla, and wood."

Charges for Nationalizing Foreign Vessels.—For a vessel of 100 tons and under, \$11 23-5; 101 to 200 tons,

\$18 88-8; 201 to 300 tons, \$18 88-6; over 300 for each additional 100 tons, \$2 30-8.

Clearance Duties.—For the long course (foreign voyage) per vessel, \$3 70-33; for the great and small coasting trade, \$2 80-8; inscription duty (registration free) for changing the proprietorship, \$1 11-6.

Pilot Dues.—If the vessel anchors in the roads or in the harbor.—For a vessel under 50 tons, great and small coasting trade, \$5 55; 50 to 99 tons, \$7 40-7; 100 to 149 tons, \$9 80; 150 to 199 tons, \$11 28-5; 200 to 299 tons, 13 88; 300 to 399 tons, \$16 66-8; 400 tons and upward, for each additional 100 tons, \$9 80-8. If the vessel casts anchor in the roads:—Pilots' services in the roads, on demand of the captain, when not retained for conducting the vessel into port, for one tide, \$1 88; charges of anchorage in the harbor of Cayenne, \$1 11-6; delay of pilot on board of a vessel, either on demand of the captain, or because of quarantine, independent of board, which is to be furnished to him at the expense of the ship, for 24 hours, \$1 11-6; pilotage from the harbor of Cayenne to the Point of Moncouria, without respect to the tonnage of the vessel, \$5 55-5.

The pilot dues are the same for clearing as for entering the port.

Mayotte and Dependencies.—There are only pilot dues to be paid at Mayotte.

Senegal and Dependencies.—Foreign vessels pay in Senegal 4 francs, or 74-4 cents, and in Gorée only 50 centimes per ton. They can, however, neither export nor import (except through Gorée), as the whole trade is open only to French shipping and French manufactures, and is prohibited to all other nations.

French Settlements in the East Indies.—The ports of these dependencies are free, and therefore open to all nations.—Navigation Act of September 21, 1793.

Tarif.—Pondicherry, Karikal, and Mahé, tonnage duty, without distinction of flag, 4 cents per ton. (1847.) Pondicherry alone, light-house dues, without distinction of flag, 3 cents per ton. Pondicherry alone, ferrage dues, without distinction of flag, 88-8 cents for one vessel.

St. Pierre and Miquelon.—Before 1846, American vessels were allowed to import into these islands only such goods as the French trade could not supply, and which were required by the necessities of the population. These restrictions were abolished by a decree of the governor, of May 7th, 1846. American ships sailing direct from the United States for Miquelon and St. Pierre, either in ballast or loaded, enjoy the same privileges as French vessels coming from the United States, and pay no more duty than the said French vessels, with the exception only of a compensation for the interpreter—which, however, by another decree of June 26, 1847, has become entire, optional; that is, if the captain or any one else on board understands the French language, he is not obliged to take an interpreter. The duties for American vessels are, therefore, as follows:

Designation of vessel.	DUTIES.			
	NAVIGATION.			
	Tonnage, per ton.	Pilotage, per vessel.	Light-house, per vessel.	Hospital dues, per vessel.
Under 80 tons	Exempt.	Exempt.	Exempt.	Exempt.
80 to 49 "	\$0 7 1/2	\$2 80-8	\$1 86	\$1 36
50 to 79 "		4 63		
80 and upward		6 48		
			Custom-house dues on the valuation of cargo.	1 per cent. ad val.

Océanie.—The ports of the French dependencies in the Pacific Ocean are free ports.

Tonnage Duties.—For vessels over 10 tons, 28-0 cents per ton; for vessels under 10 tons, 13-8 cents per ton.

Duties for Nationalizing.—For vessels under 100 tons, \$1 67; from 100 to 200 tons, \$3 88-8; from 200

to 300 tons, \$4 44; for each 100 tons additional, \$1 11-6.

Duties for Clearance.—Decked vessels, \$1 11-6; without deck, \$0 18-6.

These are duties both for American and French vessels coming or going direct from or to the United States, in virtue of the above-mentioned decree. If, however, trading indirectly, they are subjected to the same duties as all other ships, for which, both French and foreign, the duty is as follows:

* "Entrepôt fictif," a private storehouse where goods are under the sole supervision of the depositor.

TARIFF OF 1847.

French West Indies.—The French colonial possessions in the West Indies formerly comprised a domain of great extent and value, agriculturally and commercially. The war consequent upon the great Revolution in France terminated in an almost total destruction of her power in the New World. Hayti was then wrested from her. Her necessities compelled her to dispose of Louisiana. At the close of the war in 1815, the naval power of Great Britain had enabled her to seize every one of the French islands, and drive the fleet of France from the seas. By the treaty of peace consummated in 1814, and confirmed in 1815, England released to her some of the captured islands. Her possessions in that quarter now consist of Martinique, Guadalupe and adjacent islands, and the north side of St. Martin.

The intercourse between the United States and the French islands (San Domingo being then included) was originally regulated by an *arrêté* of the French government, dated the 30th of August, 1784. American vessels of at least 60 tons were admitted into certain ports in these islands, laden with lumber of all kinds, dye-woods, live stock, salt beef, salt fish, rice, raw hides, peltry, rosin, pitch, and tar, which they exchanged for rum and molasses, and goods of French manufacture, paying thereon the local duties, and one per cent. ad valorem on all imports and exports. A further duty of three livres was imposed on every hundred weight of salt beef and fish, to form a fund for premiums to be given for fish from the French fisheries. The colonial legislatures were authorized, in times of scarcity, to suspend this law. Prior to the French Revolution, the policy of France was in contrast with that of England. That of England was to monopolize the carriage of the articles exchanged; that of France, to monopolize the articles themselves. The former was willing that the United States should have sugar and coffee, provided they were carried in British bottoms; the latter was willing that the United States should supply her sugar and coffee plantations with certain articles she was unable to furnish herself, but would not allow them to receive in return, the most valuable productions of the colonies. They were reserved for consumption in the mother country, and to augment the national wealth. Under these regulations, the United States were prompt in availing themselves of the advantages of the carrying trade and from the French islands.

In 1786, our exports, domestic and foreign, to the French West Indies, were of the value of 13,263,000 livres; and our imports from thence of the value of

7,263,000 livres;* and the American vessels engaged in the trade had an aggregate of 5095 tons' burden. Upon the declaration of war against Great Britain, in 1793, France opened a free trade with all her colonies. She offered the United States the monopoly of this trade, on condition of a guaranty of her possessions, which was wisely declined. Our trade with the islands during the war was nevertheless much augmented. Our proximity enabled us to seize the advantages in advance of other countries. The following table exhibits the imports from and exports to the French West Indies for the years designated:

Years.	Imports.	Exports.
1795.....	\$15,751,758	\$4,854,952
1796.....	16,748,774	8,408,946
1797.....	14,090,387	8,565,653
1798.....	15,880,091	5,844,600
1799.....	2,022,929	2,776,694
1800.....	9,885,111	5,129,433
1801.....	18,598,255	7,147,972

The exports of our domestic produce during the years 1804, 1805, 1806, and 1807, were of the average value of \$2,800,000, and of foreign produce between \$3,000,000 and \$4,000,000. Our imports during the same period were of much greater value; but the principal part of them were re-shipped to France and other countries. About the latter part of the year 1807 the English had become possessed of nearly all the French islands; and they were not restored to France until 1814, and then with the loss of the most important one—San Domingo. Its loss greatly reduced the amount of commerce of those islands with the United States, as is exhibited by the subjoined statement of imports and exports from 1821 to 1833:

Years.	Imports.	Exports.	Years.	Imports.	Exports.
1821..	\$900,619	\$806,435	1823..	\$996,651	\$1,024,771
1822..	960,569	961,022	1824..	777,922	1,072,917
1823..	898,613	867,505	1825..	618,687	808,729
1824..	884,694	811,732	1826..	671,842	717,877
1825..	848,968	1,011,956	1827..	578,857	624,975
1826..	978,270	956,174	1828..	511,242	613,719
1827..	921,390	1,040,533			

The conditions of our commercial intercourse with the French West Indies were again changed by a royal ordinance bearing date the 5th February, 1826, and an act of Congress bearing date the 9th May, 1828. By the former, it is ordained that, after the 1st July following, all vessels, either foreign or national, may import into Guadalupe and Martinique certain articles of merchandise, specified in the table accompanying the ordinance, on paying the duties therein required, without regard to their flags. This ordinance also annuls all then existing tariffs. The act of Congress admits all French vessels "coming directly from the islands of Martinique and Guadalupe, and laden with articles the growth and manufacture of either of said islands, and which are permitted to be exported therefrom in American vessels," into the ports of the United States, on payment of no higher duty on tonnage or on cargoes than are imposed on American vessels, and on cargoes imported in American vessels. The French ordinance exempts foreign vessels also, importing the articles thus authorized, from any other duties or tonnage, or any port charges, but those to which the vessels of France are subjected. The importation of other ar-

On the 8th of December, 1849, the tariff of 1826 was somewhat modified by slightly enlarging the imports; but the equal conditions upon which national and foreign vessels were placed in respect to tonnage and port charges were not disturbed. The prospects of an increase of our trade with the French West India possessions, and the motives to impel us to strive to obtain it, will be found in a brief summary of their natural resources and the condition of their population.

The island of Guadeloupe lies between 15° 58' and 16° 13' north latitude, 20 miles north of Dominica. Its dependencies are Marie Galante, La Desirade, Les Saintes, and a portion of St. Martin. The aggregate area of the whole of them is 309 square miles, and the populations of all 135,000. The central ridge of Guadeloupe is a chain of volcanic mountains 3000 feet high. From its base a multitude of rivulets descend, watering the low lands to the sea. The Saintes are three small islands situated between Guadeloupe and Marie Galante; Desirade is 10 miles long and five miles broad. Marie Galante approximates to a circle, and is 14 miles in diameter. The soil of Guadeloupe is light, and easy of tillage. The climate is excessively hot, but much tempered by the sea-breeze. About 86 inches of rain falls during the year. About one half its surface is planted in sugar-cane. The improvement in machinery has added much to its productive powers. The live stock consists of black cattle, sheep, and mules. Guinea-grass is the only forage grown. The annual value of all the produce exported averages 25,000,000 francs, and consists chiefly of raw sugars, rum, and molasses, with some coffee, dyewoods, cotton, copper, etc. Nearly all these exports go to France. The imports consist of salt meats and fish; flour, olive oil, cotton, linen, and silk fabrics; wine, perfumery, etc.; and the annual value of which equals that of the exports. About 500 vessels, measuring an aggregate of 50,000 tons, enter and depart during the year.

Martinique is situated between latitude 14° 23' and 14° 52' north. It is about 28 miles long, and 10 in average breadth, with an area of 290 square miles, and a population of 15,000. Mountains occupy its centre, sloping into plains toward the sea-shore. About one third of the island is level land, and cultivation ascends 1500 feet along the mountain-sides. The staple product is sugar; its other products are like those of Guadeloupe. The annual value of its exports is a little under 20,000,000 francs, and the imports are of a like value. About 750 vessels, French and foreign, are engaged in the trade. Both these islands are divided into arrondissements, and have a governor and legislative council, and judicial tribunals. Slavery was abolished in all the French colonies some years since. The larger portion of their population is black.—*Com. Rel. U. S.*

French vessels from the French islands of Martinique, Guadeloupe, St. Pierre, Miquelon, and Cayenne in French Guiana, were exempted from tonnage duty under the special act of Congress of the 9th May, 1828, and, as to St. Pierre and Miquelon, by the proclamation of the President of the United States, dated the 20th of April, 1847, consequent on the removal by France of the restrictions on vessels of the United States in said islands.

A French vessel bringing fish from the banks of the British colony of Newfoundland, being the product of the waters of that colony, is not exempt from tonnage duties; the act of the 3d of March, 1845, exempts from such duties only French vessels coming directly from the islands of Miquelon and St. Pierre, either in ballast or laden with articles the growth or manufacture of either of said islands, and there is no other provision of law or treaty authorizing an exemption.

French Colonies.—Decree of September 29th, 1856.—The Emperor Napoleon, has decreed as follows:

ARTICLE 1. The extension fixed by the decree of September 19th, 1856, for the operation of the modifications in the tariff of customs in the colonies of Martinique, Guadeloupe, the island of Reunion, and of Senegal, in all that relates to grains, breadstuffs, and dried pulse, is continued to December 31st, 1857.

ARTICLE 2. Our ministers, secretaries of state, etc., will see to the execution of this decree which will also be published in the "*Bulletin des Lois.*" The United States' consul at Paris communicates to the State Department, under date November 10th, 1856, as follows: "I beg to point out to your notice a modification in the duties on wool, as published in the *Moniteur* of the 8th instant (which I herewith inclose), and of which the following is a translation: 'Viewing the law of the 27th July, 1856, which has modified the importation tariff on wool in bulk.' Considering that it is necessary to place the duties established on the importation of combed and dyed wool in unison with the existing duties on wool in bulk, it is decreed:

ARTICLE 1. The custom-house duties on the importation of combed wool and dyed wool are fixed as follows:

Combed wool.....	By French vessels, per 100 kilo's	70
"	By foreign vessels, " "	80
Dyed wool of all sorts..	By French vessels, " "	100
"	By foreign vessels, " "	115

St. Pierre, January 22d, 1857.

"Since my last report there has been a considerable change in the duty on tobacco imported from the United States. It has been raised from 20 francs, or about \$3 75 per 220 lbs., to the enormous figure of 60 francs, or about \$11 25 per 220 lbs., making an augmentation of 200 per cent.

"Some slight ameliorations have been made with respect to the importation of pork and hams, which heretofore had to pass through a French port before admission, but which can now be imported direct from the United States under a duty merely nominal.

"It is much to be desired that the French government should extend this privilege to all articles indiscriminately that could be imported here from the United States.

"The importation of flour from the United States into this island has been much greater this year than during previous years. From the 30th June to the 31st December, 1856, upward of 10,000 barrels have been imported direct from the United States, and about an equal quantity of United States' flour has been imported by way of French ports. This may be accounted for by the duty having been temporarily reduced, and it is much to be regretted the measure is not a permanent one. The new duty (which expires to give place to the old one on the 31st December, 1857) is, on every 220 lbs. of flour, 2 francs, or about 37½ cents. The old one is, on every 220 lbs. of flour, 20 francs, or about \$11 75, a duty that of course rendered the importation of flour impossible so long as it

existed. You will observe from the returns, that this island exports almost nothing to the United States. The staple products are sugar, rum, coffee, and these are not allowed to be exported except to France. Some years ago there was a considerable exportation of molasses to the United States; but this branch of commerce has completely died out, owing to the great extension of distilleries in the island and the consequent scarcity of molasses.—*Consular Returns.*

In order to present an English view of the commerce and finances of France of late years, we add from TOOKER'S "History of Prices" (vol. vi., London, 1857) the following "Conclusions arising out of the Inquiry as to the Finances and Credit Institutions of France," contributed by WILLIAM NEWMARCH, Esq., to the new volumes of that work.

"That the revolution of February, 1848, occurred at a period when, by the operation of numerous causes, the finances of the French government were already seriously embarrassed; that among the most important of these causes were the laws of 1841 and 1842, under which the State had taken upon itself the responsibility and the expenditure entailed by the construction throughout France of an extensive network of trunk lines of railway; the unproductive expenditure for a long series of years of large annual sums in Algeria; the unproductive expenditure of considerable sums on public works, yielding no adequate return either direct or indirect; and the maintenance for a long period of an excessive annual outlay on the army and marine; and that in immediate aggravation of all these causes of financial disorder, there had occurred in France, in the closing months of 1846, and throughout the greater part of 1847, a commercial crisis (taking its origin in the serious failure of the harvest of 1856) more severe and disastrous than had been experienced in France for 20 or 30 years.

That the suspension of cash payments by the Bank of France, adopted in March, 1848, and maintained for two years and a half, till August, 1850, was a measure wholly unavoidable, in consequence of the prevalence in March, 1848, of extreme internal discredit, which admitted of being met in no other form; that the prevalence, during these two and a half years, of a very low price of corn in France; of a state of the external trade of France which established a large yearly balance in favor of that country; and of the absence of any political causes which rendered it necessary for the government to require excessive advances from the Bank of France, rendered the suspension practically unproductive of any depreciation or inconvenience; and led to its removal in August, 1850, by the spontaneous accumulation in the Bank of France of an amount of treasure quite equal to the amount of notes in circulation.

That among the important circumstances which have contributed to strengthen the position of the Bank of France since 1848, and to aid the government in its plans for fostering credit, has been the extension by £12,000,000 or £14,000,000 sterling of the disposable means of the Bank of France in consequence of the addition of that amount in the form of small notes to the former average circulation of the establishment.

That under the autocratic government, established in December, 1851, there have been introduced into France a set of financial principles; and there have been placed in course of trial a series of financial experiments, distinguished by a novelty which finds no sanction in any successful precedent; by a hardihood which set at naught almost every established canon of finance; and by a disregard of the future, which purchases present popularity at any cost.

That the earliest purposes to which the new financial policy was devoted were the reduction, in March, 1852, of the interest on the French 5 per cent. debt; the imposition on the Bank of France of a new charter which compelled it at once to lower the rate of dis-

count to 3 per cent. and to make large advances on stock-exchange securities; the concessions, on conditions more or less onerous to the State, of a large number of lines of railway; and the introduction of several joint-stock companies, encouraged by every State appliance to foster the application of credit to purposes of speculation.

That between the early part of 1852 and the autumn of 1853, the prosperity and progress which seemed to prevail in France were chiefly the results of the artificial measures.

That the difficulties of various kinds which have occurred in France since the close of 1853; and more especially the difficulties experienced by the Bank of France in the autumns of 1855 and 1856, have arisen in a principal degree—allowing, of course, for the war and the scarcity—from the embarrassments and disorders entailed by the policy which has forced upon France enterprises and speculations disproportionate to its resources of available capital.

That these embarrassments and disorders would have become altogether overwhelming if it had not been for the springing up, since 1849, chiefly in the gold countries, and in consequence of the gold influx, of a demand for French manufactures and produce, so large and continuous that, during the 9 years 1848-'56, the balance of trade in favor of France has amounted to not much less than £80,000,000 sterling.

That neither the apparent success of the reduction of the French 5 per cents. in March, 1852, nor the apparent success for some time of the enforced maintenance of a low rate of discount; nor the setting up of popular discount and loan banks; nor the apparent alacrity with which the subscription lists of the war loans of 60,000,000 were filled up; nor the maintenance for a long period of the schemes of selling bread at an artificially cheap price; nor the multiplication of railway companies by means of guaranteed dividends; nor the apparent prosperity created by public works and credit institutions, afford the smallest support, when examined minutely and fully, to the financial principles and the financial practices which have held the supreme place in France since December, 1851.

That of the two great credit institutions called the Crédit Foncier and the Crédit Mobilier, the former is directed to a useful and laudable object, but is degraded and disfigured by the introduction of elements of gambling, empirical and pernicious; and the latter, the Crédit Mobilier, seeking to obtain large profits by exciting violent fits of stock-jobbing, and to obtain large funds by the issue of obligations practically not payable in specie, approaches, in design and machinery, nearer than any institution of recent times, to the model afforded by Law's Bank of 1716, and the Compagnie des Indes of the three following years.

That as the result of the whole investigation concerning the financial policy of France since 1847, there have been made apparent three principal facts, namely: 1st. That between 1847 and 1851, it was the abundant harvests and low price of food in France, which contributed in the largest degree to preserve order, to restore cash payments, and to re-establish an equilibrium between the income and expenditure. 2d. That between 1851 and 1857, it has been the £100,000,000 sterling, made available to France by the economy of its metallic circulation, and by the demand for its silks and wines in the gold countries, which has so far carried it through the perils of war, scarcity, and extravagance; and, 3d. That the reckless and socialistic financial policy introduced since December, 1851, has already exposed France to failures and perils quite as formidable as any that were threatened by the revolution of 1848, and unless subjected to early and severe restraints, will assuredly produce the most disastrous consequences." See TOOKER'S *History of Prices*, vol. vi., London, 1857, pp. 130-134.

The chief ma oil-cloth, cotton,

Frank, the name by which the Turks, Greeks, Arabs, etc., designate a Christian. It probably originated during the crusades, in which the French (descendants of the Ger. an Franks) particularly distinguished themselves. Europe itself, too, was named *Frankistan*, or the country of the Franks.

The Frank language, *Lingua Franca*, is a jargon which is spoken in the Levant, as the common medium of communication between Europeans and the inhabitants of the East. Its chief ingredient is Italian, and it probably originated during the crusades, which brought so many different nations together.

Frankfort-on-the-Maine (Ger. *Frankfurt Am Maine*), one of the four free cities of Germany, and so called to distinguish it from the Prussian town of Frankfort-on-the-Oder. It took its name (*Franken Furf*) from the river being fordable at this point; and is supposed to have been founded by the Franks in the fifth century.

From the earliest times Frankfort has been closely connected with the other free cities of Germany. During the ancient empire the cities formed together one corporation at the Imperial Diet, and enjoyed one vote in the public affairs. Up to the dissolution of the German empire, in the year 1804, there existed a great number of free towns, which had preserved their sovereignty and independence against the surrounding prince, depending only on the empire, and enjoying various privileges granted to them by the emperors. These disappeared, for the greater part, with the events of the Revolution. Of those which had survived the German empire the towns of Hamburg, Bremen, and Lubec were incorporated with the French empire; while Frankfort became the seat of the Grand Duchy of the same, created by Napoleon, and placed under the rule of the Prince Primat Archbishop of Batisbon. The overthrow of the French conqueror in 1813 restored these towns to their former independence, and they were received as sovereign members of the confederation. The towns of Hamburg, Bremen, and Lubec once belonged to the Hansa, that celebrated league which was formed in the thirteenth century. Its real object was the protection and extension of commerce; but its power and influence increased in such a way that it at length included eighty-five towns; it equipped fleets, and declared war on neighboring States. England and other powers concluded treaties with the Hansa, and were glad to enjoy its friendship. This league, however, was dissolved in 1630, when the last of its diets was held at Lubec; and from that time the three cities of Hamburg, Bremen, and Lubec remained alone, as the properly-called Hanse Towns. These, with Frankfort-on-the-Maine, form the four free cities of the German Confederation. These four free cities are represented in the German Diet by one minister, and have together one common voice. Notwithstanding this joint representation, each one of the four cities has its own particular representative at the seat of the Diet. Hamburg is represented by Mr. Kirchenfrauer, Bremen by Burgomaster Smidt, Lubec by Senator Elder, and Frankfort by DeHarnier, senator and eldest burgomaster. The joint vote of the four cities is alternately intrusted to each of the towns for the period of a year. The free cities likewise have in common a supreme court of appeal for law cases, and political questions, too, sitting at Lubec; and the control over which is alternately exercised by one of the four cities. Besides that, there exists between them a similitude of political institutions. Their form of government is that of a republic, the basis of which (excepting the short period of 1848-'50) has, nevertheless, always been rather more of an aristocratical than of a democratical character. Their interests are closely united; they have the same political friends and opponents.

The chief manufactures are carpets, table-covers, oil-cloth, cotton, woolen, and silk fabrics, jewelry, to-

bacco, playing-cards, etc. Frankfort was made a free port in 1831, and is also one of the four great emporiums for supplying Germany with merchandises. The river Maine, which is navigable to Bamberg in Bavaria, where commences the Donau-Maine Canal leading to Kelheim on the Danube, and the numerous railways which centre in Frankfort, render it the industrial and commercial centre of the south-west and west parts of Germany. No German city, with the exception of Berlin, is the centre of so great a number of railways. Four great lines, and seven others of a mere local character, meet in the city. The Mainz-Necker railway leads southward to the Grand Duchy of Baden, whence railways proceed to Switzerland, Wurtemberg, and Bavaria. The Taunus railway leads west and north-west to Mayence, and to Wiesbaden. From Mayence a railway goes to Ludwigshafen, the harbor of the Bavarian Palatinate opposite Mannheim, thence to Strasbourg, and therefrom to Paris as well as to Switzerland. Another branch from Ludwigshafen meets the Strasbourg and Paris railway at Nancy. From Wiesbaden a line is now (1855) in course of construction to Coblenz. The Main-Weser railway passes through the greater part of the two Hesses to Cassel, and communicates with Hanover, Bremen, Hamburg, etc. On the right its branches lead to Berlin and Saxony, and on the left a line will soon be opened to Cologne. The Hanau railway connects Frankfort with Hanau and the chief places on the Maine to Bamberg, from which southward with Nuremberg, Augsburg, Munich and Austria, and in another direction with Leipzig, Dresden, and Bohemia. There are also local lines to Offenbach, the chief manufacturing town of Hesse Darmstadt, to Sothen, a much-frequented bathing-place, and to near Lumburg, one of the famous spas of Germany. Frankfort, however, is chiefly indebted for its great wealth to being the seat of extensive banking, commission, and financing transactions. In proportion to its size, it is probably the richest city in the world. There are about twenty first-class banking houses; among these are the Rothschilds, Grunelius, Metzger, and others, well known in the commercial world. The number of those in the stock and exchange business amounts to at least 200. A city bank, with a capital of 10,000,000 florins, was established last summer, and has just (1855) commenced business operations. The two fairs of Easter and Michaelmas are still much frequented. Goethe was born here in 1749. Civil population (1852) 62,361, being 47,100 Protestants, 10,661 Catholics, and 4600 Jews; military, 5650—1717 being Austrians, 1713 Prussians, 1391 Bavarians, and 829 natives. The population of Frankfort is but slowly increasing, on account of the old illiberal laws still in force as to admission to citizenship. Only such are admitted as can prove their ability to maintain a family; so no merchant can be admitted unless he prove that he possesses at least 5000 florins, and generally persons possessing that sum, or even more, are not admitted unless they marry a citizen's daughter, in which case the law is more favorable. The ancient law is also still in force, that none shall mend a shoe or drive a nail unless he be a master and member of one of the corporations, and he can not become a member unless he be the son of a citizen, or marry a citizen's daughter. The restrictions to which the Jews were long subject have now mostly been removed. They are entitled to vote at the elections of members to the legislative assembly, and may return four of their own number; they are also admissible to all offices not connected with the senate, the permanent assembly of the citizens, law, religion, or education. The inhabitants of Sachsenhausen are mostly of Saxon descent, and distinguished from their fellow-citizens in manners, dress, and language, as well as occupations, being mostly employed in gardening, fishing, etc.

The city, with a small territory of thirty-eight

square miles lying immediately around it, constitutes the free state of Frankfurt. The government is vested in a senate, a legislative assembly, and a permanent committee of citizens. The senate, which exercises the executive power, is composed of 44 members, divided into three branches—justices, senators, and counselors, and having two presidents, one chosen from each of the two first-mentioned benches. The legislative assembly is composed of 94 members, of whom 20 are senators, 20 members of the permanent committee of citizens, 45 chosen annually by the citizens collectively, and 9 deputies from the rural districts. The permanent committee consist of 60 members chosen from among the citizens of all ranks. The legislative assembly meets annually in the month of November, and sits for six weeks; and its sanction is requisite to all new laws, the budget, etc. With the free cities of Lubeck, Bremen, and Hamburg, Frankfurt occupies the seventeenth place in the Germanic Confederation. It enjoys one vote in the general assembly (*Plenum*), and furnishes a contingent of 688 men to the federal army. Population of the State (1859) 77,971.

Frankfort-on-the-Oder, a town of Prussia, province of Brandenburg, and capital of the government of Frankfort, stands on the left bank of the Oder, fifty miles east by south of Berlin, with which, since 1842, it has been connected by railway. The town is regularly built, and surrounded by old walls with towers and ditches. It has three suburbs, one of which stands on the opposite bank of the river, and communicates with it by means of a wooden bridge. The university founded here in 1506 was removed to Breslau in 1810. Frankfort has a Roman Catholic and six Protestant churches, a synagogue, gymnasium, obstetric school, orphan asylum, work-house, theatre, etc. Being the capital of a government, it is the seat of a superior and other judicial tribunals, of boards of taxation, agriculture, &c. Though inferior to its namesake on the Maine, it is a place of considerable commercial activity, being situated on the high road from Berlin to Silesia, and on a navigable river communicating by canals with the Vistula and the Elbe. It has three annual fairs in the months of February, July, and November, attended by merchants not only from Germany, but also from other parts of Europe. It has manufactures of woolen and silk goods, stockings, gloves, leather, tobacco, sugar, brandy, mustard, etc. Immediately beyond the bridge is a monument to Prince Leopold of Brunswick, who was drowned here in 1785 while attempting to rescue an unfortunate family from an inundation of the Oder. At Kannersdorf, in the vicinity, Frederic the Great was defeated with great loss by the Austrians and Russians on 12th August, 1759. Population (1849) 29,969.

Freebooters (Fr. *flibustiers*), a name given to a class of piratical adventurers of all nations, but especially of France and England, who have obtained a place in history by the courage and intrepidity they displayed in executing the most difficult enterprises. The origin of their history is involved in obscurity, nor has the derivation of their name been precisely determined; but the *flibustiers* of the French historians correspond to the *buccaniers* of our own writers. (See BUCANERS.) The South American islands formed the chief theatre of their exploits; and such was the relentless hostility they exercised against the Spaniards, that during the latter half of the seventeenth century their commerce in those seas was almost utterly ruined. At the commencement of the following century these daring adventurers sustained a series of disasters which sensibly diminished their numbers; and their name, which during a period of 50 years had been so reprobable and dreaded, ceased to be formidable from that time. The term freebooter has been applied in a general sense to robbers and other plunderers. See BUCANERS.

Free Imperial Cities.—This appellation was bestowed, under the German empire, on certain cities which acknowledged no head but the emperor, and were governed by their own magistrates. Some of these cities, as Worms and Cologne, acquired various privileges and immunities at an early period, in consequence of the assistance they rendered the emperors in repressing the arrogance of the nobles; and commerce and manufactures gradually contributed to their importance. In this manner the imperial cities originated in the middle of the twelfth century. It would appear, however, that there were free cities in Germany which had existed from the time of the Romans, though possessing little in common with those of later times, and which in the beginning of the sixteenth century lost their most valuable privileges, and even the name of free cities, through the ignorance and carelessness of their magistrates. As to the nature of these privileges it will be sufficient to remark that they were such as to constitute them nothing less than independent republics. The cities of Lombardy, enriched by commerce and encouraged by the popes, often ventured to resist their masters the emperors; and their example was followed by those of Germany. In the middle of the thirteenth century two important confederacies were established for common objects—the Hanseatic League in 1241, and that of the Rhenish cities in 1246. The powerful Hanseatic League lasted nearly 400 years, and its dissolution was effected by several causes in 1630. The remnants of this league, with the former confederacy of cities which had its representatives in the German Diet, as well as the free cities of Hamburg, Bremen, and Lubeck, were incorporated with the French empire in 1810. As these cities co-operated vigorously in the recovery of German independence, they were acknowledged, together with Frankfort, as free cities by the congress of Vienna; and as such they joined the German confederacy, June 8th, 1815, and obtained the right of a vote in the Diet. See also HANSE TOWNS.

Free Trade. A nation, possessing all necessary physical resources, but imperfectly developed, like England a century ago, like the United States now, may do one of two things. It may resolve to produce for itself, or resolve to let others produce for it. If it resolve to use its own products, it must resolve not to use the products of other nations. Now, what is a protective tariff, which prevents the sale of foreign products, but this resolution expressed by legislation? Two things are necessary: 1st. Not to use the products of others. 2d. To produce for one's self. The first is protection. Now it is true, that without industry at home, protection from abroad will avail nothing, for there is nothing to protect. And without resources, neither protection nor industry will avail anything. We admit the necessity, first, of natural resources; second, of industry; we claim, third, the necessity of protection.

Protection, then, is the resolution of a nation not to use foreign products; this is the negative side of the policy of home industry. A resolution to produce for itself is the affirmative side, and is necessary to complete it. Such a resolution in a nation is like self-control in an individual, and protection is no more unnatural in the one than self-control in the other.

It is a domestic policy, designed to keep foreign goods out of the home market. Now, a nation may say it will not buy of others. This is protection. It can not say others shall buy of itself. This is beyond the power of protection; and England reached this point years ago, we think as early as the beginning of the century. During the European war she enjoyed the most effectual protection, for we admit the sting of the free-traders, that protection is a sort of war, thus far, that it involves mutual exclusion. England's fleets swept the seas, conveying around the world her merchantmen that carried the raw materials to her fac-

ories, and of the earth pretended to be favored by ture.

England What had a tecton had cio; and ye when they h some of the are told she was a mistak

"We have seen that, apart from foreign trade, the population of every country supply their own wants to the extent of from 90 to 99 per cent. of their whole consumption; that the business of furnishing this supply is by extreme division of labor, apportioned among four fifths of a people; that their internal trade consists in distributing these products of industry; that this distribution is substantially an exchange among the whole individuals of a population, of products for products, or products for services, or, in the last analysis, of labor for labor; that this exchange is made by the agency of merchants, and takes the shape of sales and purchases, that is, leaving out of view the medium of exchange, men pay with their own labor for what they need of the labor of others; that all the agency of merchants, brokers, banks, and credit, is merely a means of effecting this exchange, that the commodities of labor thus exchanged, are estimated at prices expressed in money of account, which prices are mainly governed by the price of labor; that upon the regular movement of this exchange, mainly depends the well-being and comfort, the energy and productiveness of labor; that if this movement proceeds rapidly and undisturbed, production and consumption will

go hand in hand, until individuals reach the full power of both, and a greater degree of general comfort and competency be enjoyed than has yet been known. We have seen that one of the great disturbing causes of this system of domestic distribution, of the comforts and necessities of life, was found in the occasional derangement of the commercial agencies by which it is effected; and we have remarked upon the necessity of reforming that agency with a view to the interests of humanity.

"We now proceed to consider another disturbing cause. We remark first, however, that neither the labor nor the products of labor, nor the distribution, nor the means by which it is effected are the primary objects of consideration. The first consideration is the people, then, in their order, their labor, their products, and the distribution of them. The whole object of their industry is their well-being. As they can only purchase by their own labor what they need of the labor of others, it is absolutely necessary for all to work; whatever deprives men of the opportunity of labor, deprives them of bread, and of every other comfort and necessary of life. Men consume freely and largely when they are fully paid for their labor; that is, when they can purchase for their labor an equal quantity of the labor of others; in this case, the nominal rate is of little account, because it is labor for labor. If the 25,000,000 of people in the United States, are consuming \$10 worth each of domestic woolen goods annually, upon the manufacture of which 250,000 of the people are dependent for their entire living, and if it be found that these same goods, which cost at home \$3, can be purchased at \$2 per yard in Europe, then, at first sight, it would seem but reasonable, that the cheaper article should be imported from Europe. To import \$250,000,000 worth is impossible, because we can not pay for them, as we are constantly importing more than we can pay for, and that sum is the figure of our whole imports. We import, then, say 10 per cent., or \$25,000,000 worth of woolen goods, and sell them in our great commercial marts, where prices are chiefly made, 33 per cent. cheaper than the domestic article. Consumers fly to the cheaper article, and the domestic goods must come down to the same price. The annual domestic product must fall in price 33 per cent., and instead of bringing its manufacturers \$250,000,000, it will only bring them \$166,000,000; their consumption of the products of others must be reduced one third. The effects of this reduction will extend until they are felt throughout a whole nation. The importation of 25,000,000 of cheaper woolsens, would thus inflict a direct loss by reduction of price upon the woolen manufacturers of \$83,000,000, and this loss is multiplied many times by indirect results in the reduction of consumption. The average consumption of cotton goods is about the same as that of woolsens, and the same illustration is applicable. The introduction of cheaper goods, of a kind which our country must, after all, chiefly manufacture for itself, is introducing against our own labor, the price of which is \$1 per day, the labor of other countries, the price of which is less than 50 cents per day. This can not but inflict a serious blow upon the whole system of our internal industry, and if continued, must lead to the utter prostration of the domestic manufacture thus attacked, and the utter poverty and ruin of the hundreds of thousands depending on it for a living. The effect of this in the case of woolen goods, would be a reduction in the average consumption of woolsens, of from \$10 to \$5, for the whole population, and a rise in the prices above the original domestic rates. While, therefore, it may at first sight appear to be very plainly better to import certain goods which can be offered to consumers at lower prices than the corresponding domestic article, several questions must be asked before such a policy is adopted. As, Will the importation seriously injure any home manufacture? Will it throw many people out of employ-

ment? It is a great mistake to suppose that such measures affect only employers: in woolen and cotton manufactories, there are hundreds of men, women, and children, depending upon every employer. If we lessen our domestic production, will not our increased demand produce speculation, and a higher foreign price for the article imported? If we resolve upon importing our whole supply of a necessary article, are we sure that we can increase our exports to a sufficient extent to pay for the additional importation? Are we sure that we shall not, by this policy, deprive the poor of their supply of a needful domestic product, and convert it into a foreign product, chiefly supplied for the consumption of the rich? What mode can be adopted to secure a supply of these needful articles in time of war, or interrupted commercial intercourse? All these, and many more inquiries, should be made and faithfully studied, before any branch of domestic industry is broken up, under the temptation of buying cheaper goods abroad. On the contrary, it should be well understood in every country, that many sacrifices may, with advantage, be endured, to introduce the manufacture of any article of general consumption, even though it can not be made as cheap as elsewhere. A manufacture can only grow and flourish in a country where the people are willing to consume its products, and they can only consume them where their labor will purchase them. A people can consume largely of a domestic product even at a high price, but may not be able to consume even a small proportion of a corresponding foreign article at a low price. Let any one think of the innumerable articles which figure in our internal trade, and which go to pay for, as well as to make up our consumption of home commodities, and he will see the difference between purchasing abroad and at home."—*Litt's Pol. Ec.*, by S. COLWELL.

Those who wish to examine the literature of *freetrade*, will find the principles fully discussed in the following works: HUNT'S *Mag.*, vol. iv., 227 (S. G. ARNOLD), 425 (H. GREERLEY), v., 168 (H. GREERLEY), vi., 220 (C. C. HAVEN), viii., 407 (C. WOODBURY), ix., 161 (J. B. FISHER), x., 309, 522, xl., 227, xxiv., 53 (S. Freight, the sum paid by the merchant or other person hiring a ship, or part of a ship, for the use of such ship or part, during a specified voyage or for a specified time. The freight is most commonly fixed by the charter-party, or bill of lading; but in the absence of any formal stipulations on the subject, it would be due according to the custom or usage of trade. In the case of a charter-party, if the stipulated payment be a gross sum for an entire ship, or an entire part of a ship, for the whole voyage, the gross sum will be payable although the merchant has not fully laden the ship. And if a certain sum be stipulated for every ton, or other portion of the ship's capacity, for the whole voyage, the payment must be according to the number of tons, etc., which the ship is proved capable of containing, without regard to the quantity actually put on board by the merchant. On the other hand, if the merchant have stipulated to pay a certain sum per cask or bale of goods, the payment must be, in the first place, according to the num-

ber of casks and bales shipped and delivered; and if he have further covenanted to furnish a complete lading, or a specific number of casks or bales, and failed to do so, he must make good the loss which the owners have sustained by his failure. If an entire ship be hired, and the burden thereof be expressed in the charter-party, and the merchant bind himself to pay a certain sum for every ton, etc., of goods which he shall load on board, but does not bind himself to furnish a complete lading, the owners can only demand payment for the quantity of goods actually shipped. But if the merchant agree to load a full and complete cargo, though the ship be described as of less burden than she really is, the merchant must load a full cargo, according to the *real burden* of the ship, and he will be liable for freight according to what ought to be loaded.

The delivery of goods at the place of destination is in general necessary to entitle the owner to freight; but with respect to living animals, whether men or cattle, which may frequently die during the voyage, without any fault or neglect of the persons belonging to the ship, it is ruled, that if there be no express agreement whether the freight is to be paid for the lading, or for the transporting them, freight shall be paid as well for the dead as for the living: if the agreement be to pay freight for the *lading*, then death certainly can not deprive the owners of the freight; but if the agreement be to pay freight for *transporting* them, then no freight is due for those that die on the voyage, because as to them the contract is not performed. These distinctions have been made in the civil law, and have been adopted into the modern systems of maritime law. Freight is most frequently contracted to be paid either by the whole voyage, or by the month, or other time. In the former case the owners take upon themselves the chance of the voyage being long or short; but in the latter the risk of the duration falls upon the merchant; and if no time be fixed for the commencement of the computation, it will begin from the day on which the ship breaks ground and commences her voyage, and will continue during the whole course of the voyage, and act on all unavoidable delays *not occasioned by the act or neglect of the owners or master*, or by such circumstances as occasion a suspension of the contract for a particular period. Thus, the freight will be payable for the time consumed in necessary repairs during a voyage, provided it do not appear that the ship was insufficient at the outset, or that there was any improper delay in repairing her.

In the absence of an express contract to the contrary, the entire freight is not earned until the whole cargo be ready for delivery, or has been delivered to the consignee according to the contract for its conveyance. If a consignee receive goods in pursuance of the usual bill of lading, by which it is expressed that he is to pay the freight, he, by such receipt, makes himself debtor for the freight, and may be sued for it. But a person who is only an agent for the consignor, and who is known to the master to be acting in that character, does not make himself personally answerable for the freight by receiving the goods, although he also enters them in his own name at the custom-house. In some cases freight is to be paid, or rather an equivalent recompense made to the owners, although the goods have not been delivered at the place of destination, and though the contract for conveyance be not strictly performed. Thus, if part of the cargo be thrown overboard for the necessary preservation of the ship and the remainder of the goods, and the ship afterward reach the place of destination, the value of this part is to be answered to the merchant by way of general average, and the value of the freight thereof allowed to the owner. So, if the master be compelled by necessity to sell a part of the cargo for victuals or repairs, the owners must pay to

the merchant the price which the goods would have fetched at the place of destination; and, therefore, are allowed to charge the merchant with the money that would have been due if they had been conveyed thither.

When goods are deteriorated during a voyage, the merchant is entitled to a compensation, provided the deterioration has proceeded from the fault or neglect of the master or mariners; and of course he is not answerable for the freight, unless he accept the goods, except by way of deduction from the amount of the compensation. On the other hand, if the deterioration has proceeded from a principle of decay naturally inherent in the commodity itself, whether active in every situation, or in the confinement and closeness of a ship, or from the perils of the sea, or the act of God, the merchant must bear the loss and pay the freight; for the master and owners are in no fault, nor does their contract contain any insurance or warranty against such an event. In our West India trade, the freight of sugar and molasses is usually regulated by the weight of the casks at the port of delivery here, which, in fact, is in every instance less than the weight at the time of the shipment; and, therefore, the loss of freight occasioned by the leakage necessarily falls upon the owners of the ship by the nature of the contract.

Different opinions have been entertained by Valin, Pothier, and other great authorities as to maritime law, with respect to the expediency of allowing the merchant to abandon his goods for freight in the event of their being damaged. This question has not been judicially decided in this country. "The only point," says Lord Tenterden, "intended to be proposed by me as doubtful, is the right to abandon for freight alone at the port of destination; and in point of practice, I have been informed that this right is never claimed in this country."—*Law of Shipping*, part iii., c. 7. Freight being the return made for the conveyance of goods or passengers to a particular destination, no claim arises for its payment in the event of a total loss; and it is laid down by Lord Mansfield, that "in case of a total loss with salvage, the merchant may either take the part saved, or abandon."—*Abbott*, part iii., c. 7. But after the merchant has made his election, he must abide by it.

It often happens that a ship is hired by a charter-party to sail from one port to another, and thence back to the first; as, for example, from London to Leghorn, and from Leghorn back to London, at a certain sum to be paid for every month or other period of the duration of the employment. Upon such a contract, if the whole be one entire voyage, and the ship sail in safety to Leghorn, and there deliver the goods of the merchant and take others on board to be brought to London, but happen to be lost in her return thither, nothing is due for freight, although the merchant has had the benefit of the voyage to Leghorn; but, if the outward and homeward voyages be distinct, freight will be due for the proportion of the time employed in the outward voyage. "If," said Lord Mansfield, in a case of this sort, "there be one entire voyage out and in, and the ship be cast away on the homeward voyage, no freight is due, no wages are due, because the whole profit is lost; and by express agreement the parties may make the outward and homeward voyage one. Nothing is more common than two voyages: wherever there are two voyages and one is performed, and the ship is lost on the homeward voyage, freight is due for the first."—*K. B., Trin. Term. 16 Geo. 3.*

It frequently happens that the master or owner fails to complete his contract, either by not delivering the whole goods to the consignee or owner, or by delivering them at a place short of their original destination; in these cases, if the owner or consignee of the goods derive any benefit from their conveyance, he is liable to the payment of freight according to the proportion of

the voyage performed, or *pro rata itineris peracti*: and though contracts of this nature be frequently entire and indivisible, and the master or owner of the ship can not, from their nature, sue thereon, and recover a ratable freight, or *pro rata itineris*; yet he may do so upon a fresh implied contract, for as much as he deserves to have unless there be an express clause in the original charter-party or contract to the contrary. A fresh implied contract is inferred from the owner's or consignee's acceptance of the goods. Many difficulties have, indeed, arisen in deciding as to what shall amount to an acceptance: it is not, however, necessary actually to receive the goods; acceptance may be made by the express or implied directions, and with the consent, of the owner or consignee of the goods, but not otherwise.

It sometimes happens that the owner of the ship, who is originally entitled to the freight, sells or otherwise disposes of his interest in the ship: where a chartered ship is sold before the voyage, the vendee, and not the vendor or party to whom he afterward assigns the charter-party, is entitled to the freight. But where a ship has been sold during the voyage, the owner, with whom a covenant to pay freight has been made, is entitled to the freight, and not the vendee. A mortgagee who does not take possession, is not entitled to the freight.

The time and manner of paying freight are frequently regulated by express stipulations in a charter-party, or other written contract; and when that is the case, they must be respected; but if there be no express stipulation contrary to or inconsistent with the right of lien, the goods remain as security till the freight is paid; for the master is not bound to deliver them, or any part of them, without payment of the freight and other charges in respect thereof. If the master can not detain the cargo on board the vessel till these payments be made, as the merchant would, in that case, have no opportunity of examining the condition of the goods. In England, the practice is, when the master is doubtful of payment, to send such goods as are not required to be landed at any particular wharf, to a public wharf, ordering the wharfing not to part with them till the freight and other charges are paid. No right of lien for freight can exist, unless the freight be earned. If the freighter, or a stranger, prevent the freight from becoming due, the ship owner or master's remedy is by action of damages.

For further information and details with respect to this subject see the article CHARTER-PARTY; *Abbott* (Lord Tenterden) on the *Law of Shipping*, part iii., c. 7; *Chitty's Commercial Law*, vol. iii. c. 9, etc.

Freight is a common subject of insurance. In common conversation, this word means sometimes the cargo carried, and sometimes the earnings of the ship by carrying the cargo. The latter is the meaning in mercantile law, and especially in the law of insurance. It includes the money to be paid to the owner of a ship by the shipper of goods, and the earnings of an owner by carrying his own goods, and the amount to be paid to him by the hirer of his ship, and the profits of such hirer, either by carrying his own goods or by carrying for pay the goods of others.

An interest in freight begins as soon as the voyage is determined upon and the ship is actually ready for sea, and goods are on board or ready to be put on board, or are promised to be on board by a contract binding on the owner of the goods.

If a ship is insured on a voyage which is to consist of many passages, and sail without cargo, but a cargo is ready for her at the first port she is to reach and sail from, the owner has an insurable interest in the freight from the day in which he sails from his home port.

If one makes advances toward the freight, he is to pay, and this is to be re-paid to him by the shipowner; if the freight is not earned, the advance has no insurable interest in what he advances; but if he

there deliver the goods to the merchant or his assigns in the same condition as they were received on board; and further, that during the course of the voyage the ship shall be kept tight, and staunch, and furnished with sufficient men and other necessaries, to the best of the owner's endeavors. If the ship prove not to be tight, staunch, and sufficient, the owners will, nevertheless, be liable although they themselves believed her to be so. The merchant undertakes to load or unload within the time appointed, or within a reasonable time, and to pay the freight. Provisions are also often introduced relative to demurrage, which will be explained hereafter. The ship, and freight, and cargo, are also often bound in a penalty by the owners or master, and the freighter respectively, for the performance of their undertakings. But these clauses seem in this country, at least, to be of no utility, for in an action for the failure of the undertaking the plaintiff would recover to the amount of the injuries he had suffered, and in no case, whatever penalty might be introduced, could he recover more. Neither could these clauses give any direct remedy as against the ship, or freight, or cargo.

If either party be not ready by the time agreed on, the other may seek a ship or cargo elsewhere, and also bring an action for the insufficiency; or if the merchant appears to be insolvent he may safely make up a cargo from other quarters. When the goods have been put on board, bills of lading are signed by the master. These are evidence that the particular goods are shipped as the charter-party is of the contract for conveyance. The ship owner has a lien upon goods in respect of which a payment is due to him, and may therefore detain them till the payment is made. But he can not by virtue either of the general law of lien, or of the clauses above alluded to, detain the goods because of the merchant's failure to perform his undertakings generally, as for instance his undertakings to pay demurrage or port dues, etc. Moreover, a party can have no lien unless he has possession of the property over which he claims to exercise it. An absolute owner, therefore, of a ship who has so completely parted with the possession and control of her as to cause the hirer to become the temporary owner, will not have the right of lien over the goods conveyed on board his ship. Owners ought carefully to consider this consequence, because if they part with the possession of their ship, and the hirer of it be not a responsible person, they will cease to have in their hands one very convenient and direct means of securing remuneration. Special terms of course may be introduced in the contract by which the right of lien may either be entirely released, or it may be extended beyond what is conformed by the general rule of law. By the following agreement the owner was held to have created for himself a right of lien for the balance due to him under the charter-party as to all the lading, though part had been transferred by endorsement of a bill of lading independently of the general rule of law, or the question whether he remained in possession of the ship. The agreement between the parties was that ownership of the ship "should remain firmly and be fully vested in the owner, and that he should at all times during the said intended voyage and service, have a full and complete lien upon the lading of the ship as well as for all losses and damage which the said owner might sustain or be put to in consequence of non-payment of any of the bills to be given for freight, etc., and should have full power and authority to hold and retain the said goods until full payment of all such losses, charges, damages, and arrears of freight paid for on account of the charterer, and which he of right ought to pay agreeably to the true intent of the charter-party."

The freighter may either fill the ship with his own goods or relet the whole or part to others. Where a ship has been let to hire at so much a month and the

freighter lets at so much a ton, the owner has no right to detain the cargo for the amount the freighter has agreed to give him. The actual shippers are only liable for what they have agreed to give the freighter. The owner, therefore, may have no right to detain the goods of the actual shippers for the freight stated in the charter-party, but he may for that which is mentioned in the bill of lading. And he has a right to that in preference to the freighter. The bankruptcy of the charterer or any pledge or assignment made by him will not affect the owner's right of lien.

Sailing with the first wind, is held to mean sailing without unnecessary delay. "Leave Amsterdam," does not necessarily mean to sail thence on the voyage. But "final sailing" means the final departure from port and being at sea, ready in all respects to proceed on the voyage. (See chapter on Marine Insurance.) If either party be not ready by the time agreed on, the other may seek another ship or cargo and bring action for the damages caused by the delay. A deviation on the voyage will not deprive the owner of his right to freight, though it may subject him to action if it causes a loss of the insurance to the freighter.—*Mercantile and Maritime Guide, London, 1856.*

Freight, in the common acceptance of the term (according to KEAY'S *Commentaries*—see vol. iii., chap. xvii.), means the price for the actual transportation of goods by sea from one place to another, but in its more extensive sense, it is applied to all rewards or compensation paid for the use of ships, including the transportation of passengers. The personal obligation to pay freights rests either on the charter-party or on the bill of lading, by which the payment of freights is made a condition of delivery; and the general rule is, that the delivery of the goods at the place of destination, according to the charter-party, is necessary to entitle the owner of the vessel to freight. The conveyance and delivery of the cargo form a condition precedent, and must be fulfilled. A partial performance is not sufficient; nor can a partial payment or ratable freight be allowed, except in special cases; and those cases are exceptions to the general rule, and called for by the principles of equity.

The amount of freight is usually fixed by agreement between the parties; and if there be no agreement, the amount is ascertained by the usage of the trade, and the reason of the case. If the hiring be of the whole ship, or for an entire part of her, for the voyage, the merchant must pay the freight, though he does not fully load the ship; but if he agrees to pay in proportion to the amount of goods put on board, and does not agree to provide a full cargo, the owner can demand payment only for the cargo actually shipped. If the merchant agrees to furnish a return cargo, and he furnishes none, and lets the ship return in ballast, he must make compensation to the amount of the freight; and this is sometimes termed dead freight. In contradistinction to freight due for the actual carriage of goods.

It is supposed to be the doctrine of the case of *Bell v. Pullen*, that the master would be entitled to freight for bringing back the outward cargo, if it could not be disposed of, though the charter-party was silent as to the return cargo. It would stand upon the equity of the claim to dead freight. The French law, in such a case, allows freight for bringing back the cargo because it could not be sold, or was not permitted to be landed. Mr. Justice Story, in the case of the ship *Hooper*, United States Circuit Court, Massachusetts, May, 1833, 3 Sumner, 542, laid down the general rule that freight for the entire voyage could only be earned by a due performance of the voyage; and that the only acknowledged exception is when there is no default of the carrier-ship to perform the voyage, and the ship-owner is ready to forward them, but there is a default on the part of the owner of the cargo, or he waives a further prosecution of the voyage.

If part of the cargo be sold on the voyage from necessity, the owner, as we have seen, pays the value at the port of delivery, deducting the freight equally as if the goods had arrived. But if the goods be prohibited on entry by the government of the country, and such prohibition takes place after the commencement of the voyage, and the cargo be brought back, the freight for the outward voyage has been held to have been earned; and the case was distinguished (though I think the distinction not very obvious) from that of a blockade of the port of destination, and decided on the authority of the French ordinance of marine. "Nothing can be more just," observes Valin, "than that the outward freight should be allowed in such a case, since the interruption proceeds from an extraordinary cause, independent of the ordinary marine perils. The case of a blockade of, or interdiction of, commerce with the port of discharge, after the commencement of the voyage, is held to be different; for, in that case, the voyage is held to be broken up, and the charter-party dissolved; and if the cargo, by reason of that obstacle, be brought back, no freight is due. The same principle applies if the voyage be broken up and lost by capture upon the passage, so as to cause a complete defeasance of the undertaking, notwithstanding there was a subsequent recapture, as in the case of the *Hiram*. On the other hand, an embargo detaining the vessel at the port of departure, or in the course of the voyage, does not, of itself, work a dissolution of the contract. It is only a temporary restraint, which suspends for a time its performance, and leaves the rights of the parties in relation to each other untouched. If the ship be laden, and be captured before she breaks ground, and afterward recaptured, but the voyage be broken up, the ship-owners are not entitled to any freight, though, by the usages of the trade, the ship was laden at their expense.

It is requisite that the ship break ground to give an inception to freight. It is the same thing with a blockade or hostile investment of the port of departure. Such an obstacle does not discharge the contract of freightment, because it is merely a temporary suspension of its performance; and the ship-owner may detain the goods until he can prosecute the voyage with safety, or until the freighter tenders him the full freight. This was the decision in the case of *Palmer v. Lorillard*, in which the doctrine was extensively examined; and it was shown, by a reference to the foreign ordinances, and the soundest classical writers on maritime law, that the master, in the case of such an invincible obstacle, of a temporary nature, to the prosecution of the voyage, is entitled to wait for the removal of it, so that he may earn his freight, unless the cargo consists of perishable articles which can not endure the delay. He stands upon a principle of equity which pervades the maritime law of Europe, if he refuses to surrender the cargo to the shipper without some equitable allowance in the shape of freight for his intermediate services.

When the goods become greatly deteriorated on the voyage, it has been a very litigated question, whether the consignee was bound to take the goods, and pay the freight, or whether he might not abandon the goods to the master in discharge of the freight. Valin and Pothier entertain different opinions upon this question. The former insists that the regulation of the ordinance holding the merchant liable for freight on deteriorated goods, without the right to abandon them in discharge of the freight, is too rigorous to be compatible with equity. He says the cargo is the only proper fund and pledge for the freight, and that *Casaregis* was of the same opinion. Pothier, on the other hand, was against the right of the owner to abandon the deteriorated goods in discharge of the freight; and this is the better opinion, and the one adopted in the case of *Grievold v. the New York Insurance Company*. It is in accordance with the ordinances of the marine,

and of Rotterdam, and with the new commercial code of France; and the latter puts an end to all further doubts and discussion on the subject in France. The ship-owner performs his engagement when he carries and delivers the goods. The right to his freight then becomes absolute, and the carrier is no more an insurer of the soundness of the cargo, as against the perils of the sea, or its own intrinsic decay, than he is of the price in the market to which it is carried. If he has conducted himself with fidelity and vigilance in the course of the voyage, he has no concern with the diminution of the value of the cargo. It may impart the remedy which his lien affords, but it does not affect his personal demand against the shipper.

If casks contain wine, rum, or other liquids, or sugar, and the contents be washed out, and wasted, and lost, by the perils of the sea, so that the casks arrive empty, no freight is due for them; but the ship-owner would still be entitled to his freight, if the casks were well stowed, and their contents were essentially gone by leakage, or inherent waste, or imperfection of the casks.

Should the cargo consist of live-stock, as is frequently the case in voyages from this country to the West Indies, and some of the horses or cattle, for instance, should die in the course of the voyage, without any fault or negligence of the master or crew, and there be no express agreement respecting the payment of freight, the general rule is, that the freight is to be paid for all that were put on board. But if the agreement was to pay for the transportation of them, then no freight is due for those that die on the voyage, as the contract is not, in that case, performed. The foreign marine law allows freight paid in advance to be recovered back, if the goods be not carried, nor the voyage performed, by reason of any event not imputable to the shipper. The reason is, that the consideration for payment, which was the carriage of the goods, has failed. But the marine ordinances admit that the parties may stipulate that the freight so previously advanced shall, at all events, be retained. In *Watson v. Dugknack*, the rule of the marine law was recognized, though it was not applied to that case, because the contract there appeared to be, that the freight was paid for receiving the passenger and his goods on board; and, in such a case, the payment is to be retained, though the vessel and cargo be lost on the voyage. The general principle of the marine law was admitted in the fullest latitude in *Griggs v. Austin*; and whether the price previously advanced is to be retained or returned becomes a question of intention in the construction of the contract. The French ordinances require a special agreement to enable the ship-owner to retain the freight paid in advance; and Valin says that many authors on maritime jurisprudence, as Kuricke, Loccenius, and Straechin, will not allow even such a special agreement to be valid. The English law is not so scrupulous, and does not require any such express stipulation, and allows the intention of the parties to retain the previously advanced freight to be more easily inferred. In *De Silve v. Kendall*, the Court of King's Bench adopted a directly opposite principle, and observed, that if the charter-party was silent, the law would require a performance of the voyage before freight was due; but the parties might stipulate that part of the freight be paid in anticipation, and be made free from subsequent contingency of loss by reason of loss of the subsequent voyage. If freight be paid in advance, and there be no express stipulation that it shall be returned in the event of freight not being earned, the inference is that the parties did not intend that the payment of the part in advance should be subject to the risk of the remainder of the voyage; and without some provision of that kind, a new implied contract to that effect could not be raised. See *KETT'S Com.*, vol. iii.; *PARSONS ON CONTRACTS*, h. o. a.; *Merc. and Marit. Guide*, London, 1857.

Fresco Painting, a method of painting with water-colors on fresh plaster while it is still in a soft state, by which means the colors are incorporated with the plaster, and become as permanent as the material on which they are spread. The Italians, from whom we borrow the term, call it *fresco* (literally *fresh*), either because it is executed upon fresh plaster, or because it is used on walls, alcoves, and other buildings in the open air. Vitruvius (vii. 4) calls it painting *udo tectorio*. Painting in fresco is a very ancient art. It was practiced by the early Greeks, and may be traced even to Egypt. It is generally executed on walls and vaults, the plaster being laid on in successive portions, or so much only at one time as the painter can dispatch before it dries. The design is usually drawn previously on paper, to be chalked and transferred to the wall about half an hour after the plaster has been laid. From the difficulty of making alterations on the work when the colors are once absorbed, the design should be previously prepared with the greatest accuracy. When an alteration must be made, the part is usually cut entirely away, and relaid with fresh plaster. The ancients painted on stucco; and we may remark in Vitruvius what infinite care they took in making the incrustation or plastering of their buildings, to render them beautiful and lasting; though the moderns find a plaster of lime and sand preferable for fresco painting, both because it does not dry so hastily, and on account of its subdued and agreeable tint. The pigments chiefly employed in this kind of painting are earths, because their colors are not liable to be affected by the burning qualities of the lime. White is made of lime slacked some time previously, or of white marble dust; and the other substances used are red and yellow ochre, verditer, lapis-lazuli, black chalk, &c. These only require to be ground and mixed up with water. The brushes and pencils should be long and soft, otherwise they are apt to rake and raise the surface. In order that the work may come out in all its beauty, the colors must be laid on quickly, while the plaster is still moist; nor should they ever be retouched dry with colors mixed up with white of egg, size, or gum, as is sometimes done; because such colors grow blackish, and soon tarnish.

Freshes, in sea language, the increased current of an ebb tide by means of a flood of fresh water flowing out into the sea, by which its waters are often discolored for a great distance from the coast.

Fresnel, Augustin Jean. The inventor of the light now generally used throughout Europe and in various parts of the United States, for light-houses. He was distinguished for his practical application of optics to the useful arts with which his name will ever be honorably associated. At least as early as 1819 it occurred to him that lenses might be substituted for mirrors, for the purpose of directing parallel rays of light from light-houses, and thus preventing in a great measure the natural weakness, in consequence of its divergence, of light seen at a distance. It further occurred to him that lenses of large size, and of moderate thickness, might be *built up* of segments of lenses. This last idea was not indeed new, for Buffon had proposed to diminish the weight and thickness of lenses by grinding them into zones which should have a common focus; and Condorcet proposed to construct these zones of separate segments. Sir David Brewster suggested, in 1811, a similar construction, unaware, it appears, of what Condorcet had written. But all of these writers described their contrivances as applicable to burning instruments for concentrating the solar rays. Fresnel appears to have been unaware of what his predecessors suggested, but he has the far greater merit of actually applying the suggestion to the important purpose of light-house illumination. It was first carried into effect in France, where *polyzonal lenses* were made by M. Soleil, and have gradually been introduced into other countries, first into Holland, and

then into Scotland. See article **LIGHT-HOUSES**. Not content with this great improvement, Fresnel exerted remarkable ingenuity in contriving further improvements in the mode of distributing light for the purposes of navigation under almost every conceivable circumstance; and he made copious use of the principle of the total reflection of light in glass, which had never before been applied to such purposes. In 1819 he was nominated upon the light-house commission; and in July, 1823, the Corduan Light-house, at the mouth of the Garonne, was completed upon the new plan.—E. B.

He was the author of various works on the *Diffraction of Light*, on the *Influence of Heat on Colors*, on the *Influence of the Earth's Motion*, on the *Mutual Action of Polarized Light*, &c. Through the instrumentality of Messrs. E. and G. W. Blunt, of New York, the Fresnel light was adopted in the United States in the year 1838, and is now in use generally in the light-houses of this country and of Europe.

Fresnel was born May 10, 1788, at Broglie, in the department Ure, Normandy, and died at Ville d'Avray, France, on the 14th July, 1827, aged 39 years.

Frigate (Fr. *frigate* (?); Lat. *aphractus*, a long undecked vessel); a ship of war, usually of two decks, designed for swift sailing. Frigates mount from 20 to 44 guns, and sometimes more. The name was originally applied to a long kind of vessel navigated in the Mediterranean with sails and oars. *Frigateoon*, a Venetian vessel with a square stern and without a foremast, having only a main-mast, mizzen-mast, and bow-sprit.

Frith, or **Firth** (Lat. *fretum*, a narrow sea), is a term chiefly applied to a narrow and deep inlet of the sea upon a river, as the Firth of Forth, in Scotland. This term corresponds to the *ford* of the Danes and Norwegians, who, in all probability, borrowed it from the English. Both Latin and Teutonic are derived not improbably from the same root, *fahren*, to pass over; whence ferry, ford, furt (Germ.), as in Frankfurt, Erfurt, &c.

Frobisher, Sir Martin, a celebrated English navigator of the sixteenth century, was born (in what year is not known), at Doncaster, in Yorkshire. He was the first Englishman that sailed in quest of the north-west passage to China and the Indies. "Being thoroughly furnished of the knowledge of the sphere and all other skills pertaining to the art of navigation, and being persuaded of a new and nearer passage to Catayn than by Capo de Buona Speranza, which the Portuguese yearly use, and knowing this to be the only thing of the world that was yet left undone, whereby a notable mind might be made famous and fortunate," he applied to various English merchants to assist him in his projected enterprise, but for 15 years without success. At the end of that period he was enabled, through the assistance of Dudley, Earl of Warwick, and others, persons of rank and fortune, to set out on the expedition. He sailed from Deptford, June 15th, 1576, with three small vessels, two of them, the *Gabriel* and the *Michael*, barks of 25 tons each, and the third a small pinnace of 10 tons. As they passed Greenwich, the Queen, who happened to be there with her court, commended them, and bade them farewell with shaking her hand at them out of the window." After passing the Shetland Islands they came in sight of "Froeseland" (July 11th), where they were unable to land on account of the ice, and on the 28th of the same month they reached that part of Greenland which Frobisher named "Meta Inceognita." On the 11th August they sailed through a strait which Frobisher called by his own name. Pursuing their way they passed several islands, to which they gave names, and came on the 18th to Butcher's Island, where they lost a boat and part of their crew through the treachery of the natives. After this they turned their bows homeward, and reached England September 7th. Fro-

bisher had taken possession of the various places he touched at in the name of the Queen; and in token of this he ordered his men to put on board ship whatever they first laid hands on. Among other things thus secured was a lump of black stone, which when Frobisher returned home, was accidentally discovered to contain gold. This discovery was soon noised abroad and in the following spring Frobisher readily found the means to fit out another expedition, partly scientific and partly with a view to prosecuting the search for gold. The Queen lent him from the royal navy a ship of 200 tons, with which, and two smaller barks, he sailed from Harwich, May 31, 1577. On arriving at the scene of their former discoveries they found that little of the gold ore remained, but they opened forthwith communications with the natives for the purposes of traffic. One of these, "a man of large corpulence and good proportion," they carried away with them neither in a very just nor handsome manner. They also caught an old woman, "whom they took for a devil or a witch," and stripped off her buskins "to see if she were cloven-footed." After discovering and naming a good many places, and procuring a good deal of ore, he turned his prow southward, August 23d, and reached home in the end of September. The ore when smelted was found to pay the expenses of the voyage and more; a third expedition was fitted out in 1578, which, however, through stress of weather and other circumstances, had no sooner reached the gold country than he was obliged to return from the lateness of the season. This was the last of Frobisher's polar voyages. It is not known how he was occupied during the next seven years, but in 1585 he accompanied Sir Francis Drake on his expedition to the West Indies, and three years later did such good service against the Spanish armada as to be rewarded with the honor of knighthood on board his own ship by the lord high admiral. In 1594, after various exploits against the Spaniards, he was sent to assist Henri IV. of France against the Spaniards, and the members of the league. The enemy had fortified themselves strongly in Crocyon, near Brest; and in an attack on their position Frobisher was mortally wounded. He lived to take his fleet safely home, and shortly after died at Plymouth.—*Biog. Brit.*; HAKLUIT'S *Collect. of Voyages*; STOW'S *Annales*, etc., etc.

Frobisher Strait, an arm of the sea in British North America, between Hudson Strait and Northumberland Inlet. It extends in a westerly direction from the entrance to Davis' Strait.

Fruit (*Ger. Obst. Früchte*; *Du. Ooft*; *Fr. Fruit*; *It. Frutta, Frutte*; *Sp. Fruta*; *Rus. Ovosochtsch*; *Lat. Fructum*). This appellation is bestowed by commercial men upon those species of fruit, such as oranges, lemons, almonds, raisins, currants, apples, etc., which constitute articles of importation from foreign countries. Gardening was undoubtedly among the first of the arts to which the attention of man was directed. If we would ascend into remote antiquity, we can have recourse only to conjecture; for although, in the sacred writings, and in the earliest profane authors, allusions to gardens occur, little is told us either of their productions or their culture. Judging, though, from the literature of the present day, we shall scarcely find any art which receives more attention.

Several varieties of fruit are mentioned as having been introduced into Italy, 70 n. c., *et seq.* Exotic fruits and flowers of various kinds, previously unknown in England, were brought thither in the reigns of Henry VII. and VIII. and of Mary and Elizabeth, between the years 1500 and 1578. See GARDENING, *Ency. Brit.* Among others of less note, were muskmelons, plum-trees, and currant-plants of sundry sorts, the musk and damask roses, tulips, etc.; also saffron, woad, and other drugs for dyeing, but these last were attempted to be cultivated without success. HAKLUIT; LORD KAMES. The following are among

the fruits whose introduction into England has been traced (HAYDN):

The art of gardening became well understood in England about A. D. 1500; before which time many of our vegetables were imported from Brabant. The era of the art was the reign of Elizabeth; but the modern mode of gardening was introduced about 1700. The following came from the countries respectively named:

ROOTS AND VEGETABLES.

Gooseberries.....	Flanders.....	Weeping Willow.....	Levant.....
Gillyflowers.....	Toulouse.....	Fennel.....	Canaries.....
Musk rose.....	Damascus.....		

The damask rose was brought hither by Dr. Linacre, physician to Henry VIII., about 1510. The musk rose was brought from Italy by Lord Cromwell. The tamarisk plant was brought from Germany by Archbishop Grindal, about 1570; and about Norwich, the Flemings planted flowers unknown in England, as gillyflowers, carnations, the Provence rose, etc., 1567. Woad came originally from Toulouse, in France; tulip roots from Vienna, 1578.

and Puget Sound, with the Archipelago of Arro up to the 49th parallel, were all surveyed by the United States' Exploring Expedition. The whole is unsurpassed by any estuary in the world. They comprise many fine harbors and safe anchorages, are entirely free from dangers, and cover an area of about 2000 square miles. The country by which these waters are surrounded is remarkably salubrious, and offers every advantage for the accommodations of a vast commercial and military marine, with conveniences for docks, and many sites for towns and cities, at all times well supplied with water, and capable of being provided with all needful supplies from the surrounding country, which is well adapted for agriculture. This strait is 95 miles in length; average width 11 miles (entrance 8 miles in width). No dangers exist, and it may be safely navigated throughout. The winds blow for the greater part of the year from the westward, and at times strongly. The shores are bold, and anchorage is to be found in but few places; at some parts no bottom is to be obtained, even within a boat's length of the shore, with 60 fathoms of line. The north shore (Vancouver Island), is rocky, and composed of conglomerate and a reddish granite. On this side there are several inlets, in which are anchorages: among them Port San Juan and Victoria. Victoria is a snug harbor and a most important position. There is an inner and an outer basin, sufficiently commodious for large ships of war. Vancouver Island rises abruptly, and is very much broken by mountain ranges, but well covered with timber. It is 240 miles long, and 30 miles wide.

The Gulf of Georgia and Johnson Strait are not well adapted for navigation, in consequence of the rapidity of the tides, and the many sunken rocks at the northern outlet. The harbors within them, both on the main land and Vancouver Island, are useless on account of the great depth of water and the perpendicular banks. Not a shoal exists within the Strait of Juan de Fuca, Admiralty Inlet, Puget Sound, or Hood Canal, that can in any way interrupt their navigation by a 74 gun ship. The shores of all the inlets and bays are remarkably bold—so much so, that in many places a ship's side would strike the shore before the keel would touch the ground. Some few of them have creeks emptying into them, with water sufficient to turn mills. These creeks all have extensive mudflats at their entrances, with fertile prairies at their heads and along their banks. The spring tides rise 18 feet, those of the neap 12 feet, affording every facility for the construction of dry-docks, etc. The country on all these salt water inlets is said to be remarkably healthy. The winter is represented to be mild and but of short duration, and the channels and harbors are never obstructed by ice.

Fuel (from the French *feu*, fire, akin to the Latin *focus*, a hearth or fire-place), a word applied to certain substances which are used in the generation of heat, such as wood, peat, coal, etc., and also sometimes applied to the substances employed in generating light, such as oil, spirits of wine, naphtha, etc. In the present article the former application will alone be considered; for information respecting the latter, see GAS, LAMP, etc.

The abundance and consequent cheapness of fuel has a great influence on the prosperity, habits, and manners of a nation. Where fuel is scarce, factories languish, and commerce declines. In cold climates scarcity of fuel is individually a great calamity, for it abridges the hours of labor, causing persons to spend those hours in sleep which under other circumstances would have been turned to profitable account; it also causes persons to crowd together for the sake of warmth in a way that is injurious to health and morals. Abundance of fuel, on the contrary, with good roads and a system of inland navigation for its distribution, forms the basis of national prosperity, not only mini-

tering to the useful arts, but enabling the occupier of every house to create an artificial climate suited to his wants and wishes.

The most common and widely-distributed description of fuel is *wood*, a term applied to the trunk, roots, and larger branches of trees. Recently-felled wood consists chiefly of woody fibre, sap, and water. The woody fibre is a compound of carbon, hydrogen, and oxygen, and forms the chief bulk of plants; both it and the sap are combustible—that is, are capable, at a high temperature, of combining rapidly with the oxygen of the atmosphere and forming gaseous compounds. It is in the act of this formation that heat is generated. The sap, which forms only a small proportion of the bulk of wood, varies in different kinds of trees: the sap of the pine tribe contains resin; that of the oak, tannin; that of the beech and birch, extractive. The quantity of water in wood varies greatly with the kind of tree, and with the time of year when it is felled, it being least in winter. As the water is not combustible, but must be got rid of at the expense of the heat generated by the parts which are so, it is obviously desirable to store the wood in a dry and airy situation before using it as fuel. By this means 100 pounds' weight of wood have been known to lose 20 pounds' weight in 10 or 12 months. Wood, as commonly used for fuel, contains about one third of its weight of water. Wood also contains earthy and alkaline salts in the proportion of 1-30th to 1-70th, and these remain as an incombustible ash.

Wood is distinguished from all other fuel by the valuable property of reproduction, and also by the fact that it often passes through the various stages of beauty and utility to man before it becomes converted into fuel. The heating power of wood is considerable, in consequence of its excess of hydrogen, which, in burning and forming water, requires for equal weights three times as much oxygen as the carbon does in forming carbonic acid; and it gives out in burning nearly four times more heat than the carbon. The lighter woods contain more hydrogen than the heavier, so that they burn with flame longer than they incandescence as charcoal; they also burn more easily and give out their heat more quickly than the hard woods. During the combustion of wood its volatile parts undergo some complicated chemical changes. When wood is burnt out of contact with the air, the carbon is preserved in the form of charcoal (see CHARCOAL), which is a very useful fuel when an incandescent heat free from flame and smoke is required; but when some of the volatile products are to be collected, the wood is placed in iron retorts, which are gradually raised to a red heat. The volatile products form carburetted hydrogen, carbonic acid, carbonic oxyd, and other gases, and also certain vapors which condense into liquid or solid products. Some of the liquids are soluble in water, such as pyroxylic spirit, pyroigneous acid, etc.; the insoluble products form tar and certain oily substances.

In most countries deposits of *peat* occur of greater or less extent. In Holland, the north of Germany, Ireland, etc., peat deposits are of immense extent. The origin of peat has been accounted for in those districts where clay occurs near the surface by supposing muddy pools to have formed, round the edges of which aquatic plants have taken root and gradually extended themselves into the centre, thus forming a bed where mosses accumulate, and new plants take growth, while the old are decaying and becoming compressed into a solid mass below. This process goes on until the pools are filled up with vegetable matter, and the surplus water is discharged over the neighboring lands, where the process is repeated until a peat bog is formed. Even in mountain districts, where the soil is impervious, clouds and mists may supply moisture, and a bog be formed by the growth of one generation of vegetable matter on the ruins of its predecessor. As

the plants which form the peat are in different stages of decomposition at various depths, the character of the peat varies greatly. Near the surface it is light-colored, spongy, and the vegetable character but little changed; lower down it is brown and dense; while at the base of some bogs, which may be as much as 40 feet in depth, the peat is black, almost as dense as coal, and resembling coal in chemical composition.

On the banks of the Rhine, peat is cut by means of a spade into blocks, and exposed to the air to dry, the upper layer being first separated from the lower and denser portion. In Holland the peat is scooped out by means of spades; or if a considerable quantity of water be present, an instrument is used consisting of a sharp iron ring attached to a handle, a net or cloth being fastened to the ring for draining off the water. The muddy peat thus collected is trodden out by the feet of men, raked, and the stones picked out; it is then thrown into shallow wooden boxes, strewn with hay to prevent the peat from adhering, and the remaining water is allowed to drain off. In the course of a few days, when the mass has attained a certain consistency, women, with flat boards strapped to their feet, stamp down the peat until it has attained such a consistency as not to take an impression from a common tread. It is next stamped with beaters, and the cake, which is eight or nine inches thick, is divided by means of long laths into squares of about four inches, which are removed a few at a time from each box. The cakes are then dried by placing the first taken out transversely on the second, the third upon the fourth, reversing the order when the pieces are piled up in store.

The value of peat depends greatly upon its dryness, density and firmness; if porous and brittle, it crumbles during carriage or after it is stacked, and thus becomes nearly worthless. In many cases the value of peat depends on its capability of being alternated with the substances to be heated. Porous and almost valueless peat has been rendered valuable by being passed through a press, in which case a lump of peat may lose as much as one fourth of its weight of water. Peat may be nearly valueless as a fuel from the quantity of ash which it affords, consisting of vegetable salts and the earthy matter of peat, and amounting in some cases to one third of the weight of the peat. When this large quantity of ash occurs in peat it renders the fuel very dusty, and in smelting processes it is objectionable on account of its chemical action. It is remarkable that the carbonates of the alkalis are not found in this ash, but phosphates, sulphates, etc. In some large towns, peat, or *urf*, as it is also called, is incinerated by employing the refuse bark of the tan-yard, which is made into flat cakes, and chiefly used as fuel by the poor.

In the sandy plains of the East, camels' dung is dried and used as fuel; it was from the use of such fuel in Egypt that sal ammoniac originated, the salt subliming during combustion. Hakluyt, in his *Voyages*, vol. 1, p. 348, says, "We were forced to use for fewell the dung of horses and camels, which we bought dear of the pasturing people." A substance in the form of long sticks, said to be made of camels' dung, is sometimes imported from the East under the name of *chintze*, and is occasionally used instead of the ordinary match for lighting pipes and segars. It burns slowly without flame, and gives out an odor not unlike that of the burning cuttings of trees and shrubs. Other descriptions of excrement are also used as fuel. The Chinese have long been accustomed to mix cow dung and other refuse vegetable matter with soft clay and the dust of coal to form balls which when dried in the sun become a cheap and useful fuel, burning with very little smoke. These balls are largely manufactured in the coal districts of China, and are distributed over the empire by means of the canals. It is a curious fact that Sir Hugh Platt, in 1594, indicated a

method of making coal balls with loam, and that Ray, in 1668, observed this kind of fuel at Lidge (*Journey through the Low Countries, etc.*, 1673, p. 58), where they were called *hot shots*, serving to slake the heat of a fire and keep the coals from burning out too fast. We are informed that in some parts of Wales stone coal culm is made into balls with clay, and is a common form of fuel in Pembrokeshire. The combustion is slow, and a long steady heat is kept up, well adapted for lime burning. In 1855 a patent was taken out in England by M. Ducayla of Bordeaux for the manufacture of fire-balls of such materials as cinders or ashes, wood or lignite, anthracite coal, pit coal, animal black, calcareous earth or clay, mold, etc.

The fuel, in every respect the most interesting, and one of the chief sources of wealth and prosperity, is coal. The very abundance of this article causes it to be used in so lavish and extravagant a manner, that any general attempts to economize it, and to fix its value as a fuel, scarcely interest the public. There are, however, particular cases in which it is desirable to economize coal as far as possible, as in the case of a steamship of a thousand horse-power, a single journey of which may require upward of 2000 tons of coal, or more than 80,000 cubic feet. Hence it is obvious from the details given of the various descriptions of coal in the article COAL, that some varieties of coal are better fitted for the purposes of steam navigation than others. A few years ago, when the British government was establishing a steam navy, Sir H. de la Beche and Dr. Lyon Playfair were requested to examine and report on the coal suited to the steam navy. The inquiry was conducted with great ability, and has resulted in two reports published in 1848 and 1849, which the reader interested in the subject will do well to consult. We will, however, state a few of the chief points elicited by this inquiry.

Bearing in mind the object of the inquiry, the commissioners considered that the chief test of the value of any coal submitted to their examination was its power of converting water into steam, so that if a given weight of coal in a certain time converted a larger proportion of water into steam than the same weight of another coal in the same time, the evaporative power of the one would be greater than that of the other. It was found, however, that the coal best adapted to steamships of war, should also combine other qualities; for example, the fuel should burn quickly, so that steam may be raised in a short time; it should not be bituminous, lest its smoke should betray the position of the ship when it might be desirable to conceal it; it should have such a cohesive power as not to be broken into fragments by the rolling motion of the vessel; it should have such a density and structure as to bear stowing away in a comparatively small space (a condition which in coals of equal evaporative value was found to involve a difference of more than 20 per cent.); lastly, the coal should not contain a large proportion of sulphur, nor be subject to rapid decay, or it might in either case lead to spontaneous combustion. But it was not found possible to unite all these conditions in the same coal. Anthracite, for example, has high evaporative power, but not igniting easily its action is not quick; it is not easily broken by the motion of the ship, but not being a caking coal, it would not cohere in the furnace, and would escape through the grate-bars during the rolling of the ship in a gale; it gives off no smoke, but from the intensity of its combustion, it causes the iron of the grate-bars and of the boiler to oxidize rapidly; hence, with many advantages, anthracite has a few defects sufficiently prominent to preclude its use under ordinary circumstances. It was thought that a patent fuel might be formed with some of the anthracites of Wales, which should combine the advantages and elude the defects above referred to; but it was found that the cementing tar of the patent fuel burnt so

much more than the latter, that the latter, or the draft, or

The common distinguisher is that it is difficult to find that it furnishes a trust the actual theoretical value with no loss of one pound of expressed by one of the formulae V sends water, of pound of coal, that 7 pounds efficient for the number of 1° Fabr.; and on the mechanism one pound of water to 782 pounds rising to the explosion engines are pounds to the coal consumed, the actual force generated of the evaporative power give very dissimilarly 7-88 pound of Newcastle coals; Wickste of water from 80 which is equal to experiments made was found, after pound of coal even 212°; and according Cornwall, at the found that 11-42 p every pound of water in position to that of M

At ordinary combustion under atmosphere, evolving male gases, and explosions. This the higher temperature of moisture or iron pyrites so intense as to ignite is therefore impossible, and such least liable to this coal is kept in iron with sea-water, the iron or coal forming thus promoting oxygen. In the great explosion Co., in the French "small purified coal produce of a system France, England, plan appears to be very sulphurous coal, or also where the coals seams, and can not with slaty and stone (Chemin de Fer du Nord) the locomotives; but evil was for the most ash was also greatly employed for purifying the jigging-machinery after being stamped

much more rapidly in the furnace than the anthracite, that the latter accumulated on the bars and obstructed the draft, or escaped through the grate unburnt.

The commissioners found that the qualities which distinguish particular kinds of fuel are very varied, so that it is difficult to deduce general results. But the data furnished by their experiments enables us to contrast the actual value of a particular coal with its theoretical value, supposing its combustion to be attended with no loss of heat. The actual duty obtained by one pound of coal from the boiler employed, may be expressed by the number of pounds raised to the height of one foot, a result which may be obtained by the formula $W\eta + 965.7 \times 782 = x$, in which W represents water, of which η pounds are evaporated by one pound of coal. This formula is deduced from the fact that η pounds of coal multiplied by 965.7, or the coefficient for the latent heat of steam at 212°, indicates the number of pounds of water which would be raised 1° Fahr. ; and the number 782 arises from experiment on the mechanical force denoted by the elevation of one pound of water 1° Fahr. ; that force being equal to 782 pounds raised to the height of one foot, according to the experiments of Mr. Joule. The best Cornish engines are said to be capable of raising 1,000,000 pounds to the height of one foot for every pound of coal consumed, but this is only about one eighth of the actual force generated, and only one eleventh or one twelfth of the theoretical force. Experiments on the evaporative power of coal made by different observers give very dissimilar results. Smeaton, in 1772, evaporated 7.88 pounds of water from 212° with one pound of Newcastle coal; Wall, in 1788, evaporated 8.62 pounds; Wicksteed, in 1840, evaporated 9.493 pounds of water from 80° with one pound of Merthyr coal, which is equal to 10.746 pounds from 212°. In some experiments made at the United Mines in Cornwall, it was found, after a trial of six months, that every pound of coal evaporated 10.29 pounds of water from 212°; and according to some experiments made in Cornwall, at the request of the commissioners, it was found that 11.42 pounds of water were evaporated by every pound of Welsh coal of similar chemical composition to that of Mynydd Newydd.

At ordinary temperatures coal undergoes a slow combustion under the action of the oxygen of the atmosphere, evolving carbonic acid, nitrogen, and inflammable gases, and in some cases leading to dangerous explosions. This slow combustion is facilitated by the higher temperature of hot climates, and by the presence of moisture. If the coal contain much sulphur or iron pyrites the chemical action may become so intense as to ignite the coals. In stowing coals it is therefore important that they should be as dry as possible, and such a variety should be selected as is least liable to this progressive decomposition. When coal is kept in iron bunkers, and is liable to be wetted with sea-water, the iron rapidly corrodes from the carbon or coal forming a voltaic circuit with the iron, and thus promoting oxydation.

In the great exhibition of 1851, Messrs. Bernard & Co., in the French department, No. 51, exhibited "small purified coals, and residue of the same, the produce of a system for purifying coals, patented in France, England, Belgium, and Germany." This plan appears to be well adapted to the purification of sulphurous coal, or coal containing much iron pyrites; also where the coal deposits are in numerous small seams, and can not be got out without being mixed with slaty and stony matter. The coal used on the Chemin de Fer du Nori was so sulphurous as to injure the locomotives; but by using the purified coal, the evil was for the most part remedied; the quantity of ash was also greatly reduced. The apparatus employed for purifying the coal is similar in principle to the jiggling-machine used in dressing ores, which, after being stamped, in order to separate stony mat-

ter, are agitated in water and allowed to rest, when the various portions become arranged in layers, according to their specific gravities. This purified coal yields a very pure coke.

Mr. Grace Calvert, of Manchester, has taken out a patent for purifying coke from sulphur. It consists in mixing the coal, before coaking, with from 1 to 5½ per cent. of common salt, the proportion varying with the quantity of sulphur. The coking is then conducted as usual. By this contrivance, coal, which was formerly unserviceable in smelting operations, can now be used with effect.

The following table, by Dr. Ure, shows the quantity of water raised from 32° to 212° by one pound weight of the different combustibles enumerated in the first column; it also shows the number of pounds of boiling water, which the same weight of fuel will evaporate, and the quantity of atmospheric air absolutely consumed during combustion. The quantity of air, however, as given in the last column, is much less than would be necessary in practice, where much of the air passes the fuel without coming into contact with it so as to have its oxygen consumed. The heating power also, as represented by this table, can seldom be practically attained.

Combustible.	Pounds of water which a pound of fuel can raise from 32° to 212°.	Pounds of boiling water evaporated by one pound.	Weight of atmospheric air required to burn one pound.

As various kinds of fuel afford different amounts of heat, and as heat can not be measured or weighed, and its quantity ascertained by direct experiment, the relative values of fuels are ascertained by comparing them with each other under similar circumstances. The heating power of a fuel is the quantity of effect produced by it in a certain time, and this in conjunction with its market price gives its value as a fuel. One fuel may produce a certain greater or less effect than another fuel, and thus its relative superiority or inferiority may be accurately ascertained, although the actual amount of heat furnished by it may be entirely unknown. Lavoisier and Laplace fixed these values by making the substance under examination act on ice, and the quantity of ice melted gave the value in each case. Count Rumford measured the value of fuel by the increased temperature which it produced in a given quantity of water. Now, as the same quantity of heat which melts one pound of ice at 0° Cent. is sufficient to raise the temperature of as much water 79° Cent., or 0.79 lb. of water 100° Cent., so also an equal weight of aqueous vapor of any given temperature and elasticity is always formed from the same amount of heat, and always contains the same quantity of heat, and the quantity of heat which water at 100° Cent. renders latent in order to become steam is 5.5 times sufficient to heat the same weight of water from 0° to 100° Cent., hence the water converted into vapor by the heat required to melt one pound of ice is the 5.5th part of the same pound, that is, it can convert into vapor 0.154 lb. of water.

It was found by Despretz and Welter that the quantities of fuel which require equal amounts of oxygen for combustion, give out equal quantities of heat; thus, 1 lb. of oxygen in combining respectively with hydrogen, charcoal, alcohol, etc., raised 29 lbs. of water from 32° to 212°. A given weight of the different combustibles has its heating power represented by the number of pounds of water raised in temperature, as in the following table. (See Journal

of the Franklin Institute, Philad., 1855-7; also SILLI-MAN'S *Journal of Science*, New Haven, Conn., 1854-6.]

More recent researches have, however, cast considerable doubt upon the law that any given quantity of oxygen evolves the same quantity of heat with whatever combustible body it may combine. From a series of tabulated results given in GMELIN'S *Hand-Book of Chemistry*, vol. 1, p. 292 (Cavendish Society's translation), it would rather appear that oxygen develops a larger quantity of heat the stronger its affinity for the combustible substance.

Such experiments as the above tend to confirm the modern view of combustion which regards oxygen as a combustible as much as the fuel with which it combines (see CHEMISTRY, vol. v., En. Br.); so that when oxygen burns by means of any fuel, the heat evolved increases with the quantity of oxygen consumed. It was on this view that Berthier based his process for detecting the quantity of oxygen required for combustion, and the heating power of the combustible in one experiment. His plan is to heat to redness a known quantity of the combustible with a considerable excess of pure litharge until the combustible is entirely consumed by the oxygen of the oxyd of lead. On weighing the lead reduced by this process the amount of oxygen consumed is ascertained, and also the heating power of the fuel under examination. In calculations of this kind, it will be remembered that 6 parts, or 1 equivalent of carbon, require 16 parts, or 2 equivalents of oxygen, for combustion; that 1 part of hydrogen requires 8 parts of oxygen; that by subtracting from the hydrogen a quantity corresponding to the oxygen in the coal, the calculation can be made for the carbon only. Now, 1 part of pure carbon requires for combustion 2.666 of oxygen, and is capable, according to Despretz, of heating 78.15 parts of water from freezing to boiling. By multiplying each part of lead obtained by 2.265, the weight of water is obtained which is capable of being heated between these temperatures by a unit of the coal used in reducing the litharge.

The heating power of a particular fuel is the same, however that fuel may be burnt. It is true, that the power may be more or less economically applied; the power may be expended with greater or less rapidity, greater, for example, in a furnace than in an open grate, but as the fuel during combustion combines with equivalent portions of oxygen, the same amount of heat is liberated whether the combination be rapid or slow. The rapidity of combustion depends not only upon the mode of arranging the draught or supply of air to the fuel, but also on the state of division of the fuel itself. A given weight of wood in the state of shavings will, from the large extent of surface exposed, burn rapidly, and produce its full heating effect in a few minutes, while the same weight of wood, in the form of a log, may keep up a moderate temperature for some hours. The division of a fuel may, however, be carried so far that the air necessary for its combustion can not penetrate it. Such is the case with saw-dust, powdered charcoal, or peat, slack coal, etc. If the powdered coal be of caking quality, it may be burnt into compact coke, and thus be more useful than a fuel which in its first form is compact, but which falls to powder on being heated in the furnace. Small fuel may sometimes be advantageously applied by covering the furnace-bars with pieces of

sand-stone or lime-stone for the purpose of preventing the fuel from falling through, and for distributing the supply of air among it. In the roasting of copper ores in South Wales a flaming coal is necessary in the reverberatory furnace where the operation is carried on. But as the flameless anthracite is much more abundant in this district than the bituminous coal, it is turned to account in an ingenious manner. When burnt under ordinary circumstances it crumbles to powder, as already noticed, and either slips through the bars of the grate, or chokes them up. But when anthracite is raised to a very high temperature it forms a vitreous scoria or clinker, which in the ordinary furnace combines with the iron of the bars and chokes up the grate. In the Welsh furnaces, the clinkers themselves are ingeniously arranged so as to perform the office of grate-bars, namely, to support the fuel, and to limit the supply of air from below. The clinkers are supported on iron bars placed at a considerable distance apart, and are arranged in a layer 12 or 16 inches in depth. Above this layer the fuel of the furnace is in full combustion; this fuel consists of anthracite mixed with about one fourth of its weight of small bituminous coal, and also forms a layer of a depth about equal to that of the clinkers; it is in this the hottest part of the fire that fresh clinkers are being continually formed, and while forming they cako with the numerous fragments of bituminous coal heaped up above them. As fresh portions of the fuel come into operation the clinkers descend toward the bottom of the grate, where, meeting with the numerous jets of air which stream up through the bottom, the vitrified mass splits and cracks in all directions, forming new channels for the ascent of the draught, but not large enough to allow the small coal to escape. As the calciner-man heaps up fresh fuel above, he hooks-out a few clinkers from the bottom to make way for the descent of others. Under this arrangement the oxygen of the air traversing the multitude of channels formed by the cracks in the clinkers, combines with a portion of the fuel and forms carbonic acid, which is inflammable, but before reaching the vault of the furnace it is deprived of a portion of its oxygen, and becomes converted into carbonic oxyd which is inflammable. But in order that this gas may undergo combustion, air is admitted through apertures in the sides of the furnace just above the ore, and in this way the whole surface of the ore, occupying an area of nearly 23 feet square, is played upon by a thin sheet of flame, produced from fuel which gives scarcely any flame at all.

Common coal gas is sometimes used as fuel, in which case it is calculated that 1 lb. or 24 cubic feet thereof, in burning, will raise 76 lbs. of water from the temperature of freezing to that of boiling. Extending this comparison to the other forms of fuel, it is stated that 1 lb. of dry wood will similarly heat 35 lbs. of water, but only 26 lbs. if the wood be not dry, or contain moisture to the extent of from 20 to 25 per cent. One lb. of good dry charcoal will similarly heat 73 lbs. of water, but if exposed to the air it absorbs at least 10 per cent. of moisture, and in burning gives a flame of carburetted hydrogen (or rather, probably, a mixture of carbonic oxyd and hydrogen), arising from the decomposition of the moisture. One lb. of good pit coal is said to raise 60 lbs. of water from freezing to boiling, 1 lb. of coke 65 lbs., and 1 lb. of turf or peat from 25 to 30 lbs.—B. E. See COAL.

Fuels, Artificial.—It is curious to note how many new "patent artificial fuels" there now are. As experimenters tell us that different kinds of coal and other natural fuel possess different qualities, an inducement is offered for the exercise of ingenuity in devising various imitative compositions. The hydraulic press is brought into singular requisition in this art. Thus, Azalay's hard shining blocks of artificial fuel are simply formed of coal-dust, subjected to in-

tense compressed sized bricks by mixing to the bricks a slowly, but g Warlich's se country fuel, —differing in amount of the Warlich's pat establishment borough. tense compression. Warlich's patent fuel, in large-sized bricks weighing about 12 pounds each, is made by mixing together the dust of various kinds of coal; the bricks are dense and well made; the fuel kindles slowly, but gives off very little smoke while burning. Warlich's series comprises Welsh steam fuel, north-country fuel, household fuel, and locomotive coke-fuel—differing in the kind of coal-stuff used, and in the amount of tar with which the dust is agglutinated. Warlich's patents are worked by a company, who have establishments at Deptford, Swansea, and Middlesborough. The Bideford Anthracite Company makes artificial fuel, in brick-form pieces, by a particular mode of treating anthracite. Oram's patent fuel is a condensed mixture of small coal, bitumen, and sand. Williams's fuel is a mixture of dried peat and bitumen. So of numerous other kinds; small coal, bitumen, or peat, or two out of the three, are mixed with various other substances to form a compost fuel. It must be owned, however, that such fuel is not yet much used, even in places where natural fuel is scarce.—*Inventions in Arts.*

Fuhohau, or Fou-tohow-foo. See **Fou Chow.**

Fuller's Earth (Ger. *Walkererde*; Du. *Vollærde*; Fr. *Terre à foulon*; It. *Terra da purgatori*; Sp. *Tierra de batan*; Rus. *Schifferrata*; Lat. *Terra fullonum*), a species of clay, of a greenish white, greenish gray, olive and oil green, and sometimes spotted color. It is usually opaque, very soft, and feels greasy. It is used by fullers to take grease out of cloth before they apply the soap. The best is found in Buckinghamshire and Surrey. When good, it has a greenish white, or greenish gray color, falls into powder in water, appears to melt on the tongue like butter, communicates a milky hue to water, and deposits very little sand when mixed with boiling water. The remarkable detersive property on woollen cloth depends on the alumina, which should be at least one fifth of the whole, but not much more than one fourth, lest it become too tenacious.—*Thomson's Chemistry*; *Jameson's Mineralogy.*

Fulling, the art of cleansing, scouring, and pressing cloths, stuffs, and stockings, to render them stronger, closer, and firmer. It is otherwise called *millng*. Pliny (vii. 56) relates that one Nicias, the son of Hermlas, was the first inventor of the art of fulling; and it appears by an inscription, quoted by Sir G. Wheeler in his *Travels through Greece*, that this same Nicias was a governor in Greece in the time of the Romans. The asperities upon the surface of wool render the spinning of it and the making it into cloth difficult operations. In order to spin wool, and afterward convert it into cloth, its fibres must be covered with a coating of oil, which, filling the cavities, renders the asperities less sensible; in the same way that oil rubbed on the surface of a very fine file renders it less rough. When the piece of cloth is finished, it is carried to the fulling-mill, where it is beaten with heavy stampers in a trough full of water in which some fuller's earth has been mixed, for the purpose of cleansing it from the oil. The clay combines with the oil, which it separates from the cloth, and both are washed away together by the fresh water which is brought to it by the machine. But the scouring of the cloth is not the only object in view in fulling it. The alternate pressure given by the stampers to the piece of cloth occasions (especially when the scouring is pretty far advanced), an effect analogous to that which is produced upon felt by the hands of the hatter. The fibres of wool which compose one of the threads, whether of the warp or the woof, assume a progressive movement, introduce themselves among those of the threads nearest to them, then into those which follow; and thus, by degrees, all the threads, both of the warp and the woof, become felted together. The cloth, after having by this means become short-

ened in all its dimensions, partakes both of the nature of cloth and of that of felt, and may be cut without being subject to ravel. Lastly, the cloth has acquired a greater degree of thickness, and forms a warmer clothing. Knit worsted also may thus be rendered less apt to run in case a stitch happen to drop.

The fulling of cloths and other stuffs is performed by a kind of water-mill, thence called a *fulling* or *scouring mill*. These mills, excepting in what relates to the mill-stones and hopper, are much the same with corn-mills; and there are even some which serve indifferently for both purposes. The principal parts of the fulling-mill are the wheel, with its trundle, which gives motion to the tree or spindles, whose teeth communicate it to the stampers, which are thereby raised and made to fall alternately, as its teeth catch or quit a kind of latch in the middle of each stamper. The stampers and troughs are commonly of wood; but sometimes the stampers are made of polished iron, and the cloth is exposed during the process to the action of steam; by which means the appearance of the cloth, when finished, is said to be greatly improved. These improvements formed the subject of a patent in 1825. In the course of the operation the fuller sometimes makes use of urine, sometimes of fuller's earth, and sometimes of soap. To prepare the stuffs to receive the first impressions of the stamper, they are usually laid in urine, then in fuller's earth and water, and lastly in soap dissolved in hot water. Soap alone would do very well, but it is expensive, and fuller's earth is scarcely inferior to it; but then it must be well cleared of all gritty particles, else it is apt to make holes in the stuff.

Method of fulling cloths and woollen stuffs with soap.—A colored cloth of about 45 ells is to be laid in the usual manner in the trough of a fulling-mill, without first soaking it in water, as is commonly practiced in many places. To full this trough of cloth, 15 pounds of soap are required, one half of which is to be melted in two pails of river or spring water made as hot as the hand can well bear it. This solution is to be poured by degrees upon the cloth, as it is laid in the trough; and thus it is to be fullled for at least two hours, after which it is to be taken out and stretched. This done, the cloth is immediately returned into the same trough, without any new soap, and there fullled two hours more. It is then taken out and well wrung, to express all the grease and dirt. After the second fulling, the remainder of the soap is dissolved as in the former, and cast four different times on the cloth, which is taken out every two hours to stretch it, and undo the plaits and wrinkles it has acquired in the trough. When it is perceived to be sufficiently fullled, it is well scoured in hot water. With regard to white cloths, these full more easily and in less time than colored ones, and thus require only a third part of the soap.

Fulminating Compounds.—Fulminates are of several kinds, being detonating compounds of the fulminic acid with various bases. Such are the fulminates of gold, mercury, silver, etc. The old fulminating powder is a mixture of nitre, sulphur, and potash. The fulminate of mercury is largely used as a priming to the percussion-caps for guns. See **CHEMISTRY**, vi., p. 474.

Fulta, a large village of Hindoostan, province of Bengal, on the east bank of the Hooghly, 20 miles S.S.W. in a straight line from Calcutta, but much more by the windings of the river. It has safe anchorage for ships, where they are protected from the swell of the sea, and where the anchors hold fast, the bottom being stiff clay. Lat^o 22° 18', long. 88° 10'.

Fulton, Robert, a distinguished American engineer and mechanic, among the first who successfully applied steam to the propulsion of vessels, was a native of the State of Pennsylvania. At a very early age he gave decided indications of mechanical genius.

While still a mere youth he began life in the city of Philadelphia as a portrait and landscape painter and in his 22d year, with a view to improving himself in art, he visited England, where he remained for several years under the roof of his countryman West. He states that in 1793 he had conceived the design of propelling vessels by steam, but his numerous engagements prevented him from carrying it into effect at that time. His time was completely engrossed in devising a plane of double incline that should supersede the locks on canals, for which he obtained a patent from the British government in 1794. In the same year he obtained patents for flax-spinning and rope-twisting machines, and various other mechanical inventions, bearing chiefly upon the construction of canals, on which latter subject he published a treatise. In 1797 he removed to Paris, and remained for seven years in the house of Joel Barlow, the American minister at the court of Napoleon I., prosecuting his scientific studies. During that period he projected the first panorama ever exhibited in Paris, and made important experiments on submarine explosives. It was also at this time that he first succeeded, after repeated trials, in propelling a boat through the water by the aid of steam. In 1806 he returned to America, and repeated the experiment on a larger scale and with more decided success. In 1809 he took out his first patent, and seemed to be on the high way to wealth and prosperity, when his rights were disputed, and he became involved in legal proceedings, which embittered the remainder of his existence, and prevented him from reaping the rich harvest to which his industry and genius fairly entitled him. Fulton died February 24, 1815. A minute account of his life and inventions is given in his biography by Cudwallader D. Colden. See STEAM NAVIGATION.

Fulton has, perhaps, contributed more than any other man of the present century, to the progress of commerce throughout the world. The impetus given by his genius to the adoption of steam navigation, has been equally extended (if not more so), to the increase of sailing vessels. At the present day the stock of mechanical and practical knowledge, handed down by tradition, or preserved by means of the press, has become so enormous, that the most brilliant discovery in the useful arts bears but a small proportion to the whole extent of human knowledge. In remote times, the aids, which modern inventors derive from the records of the reasonings, and combinations, and even the abortive attempts of others, were wholly wanting; and if no one of the inventions of antiquity, when taken by itself, can rank in apparent importance with some of modern date, the former were in many instances far more conspicuous as steps in the progress of human improvement. In the dawn of civilization, inventions were usually unexpected, and though often calculated to supply the most pressing wants, excited surprise, because the wants themselves had not been perceived. At the present day discoveries often appear as the almost inevitable result of previous improvement. The highest degree of merit is to be awarded, in the present age, to those who, aware of the wants of the community, or of the world at large, set to themselves as a task the discovery of the means of supplying these wants. If we consider Fulton as an inventor, it may be difficult to say in what exact particular his merits consist; but if we contemplate him in the light of a civil engineer, confidently building a finished and solid structure upon the incomplete foundation left by others, we must rank him, in the extent of his usefulness to mankind, as second to Watt alone. See *Life of Fulton*, by J. RENWICK.

Robert Fulton was born at Little Britain, in Lancaster county, Pennsylvania, in the year 1765. His parents were respectable, though far from affluent; his father a native of Ireland, his mother descended from an Irish family. Fulton himself attached no import-

ance to circumstances of birth, and took pride in being the maker of his own fortune. Except so far as elementary education was concerned, he was under little obligation to his progenitors; being left without patrimony at the death of his father, when three years old. Aware that he was to trust, in his own exertions, even for means of subsistence, he cultivated from an early age a taste for drawing, in the hope of qualifying himself for the profession of a painter. From a familiar acquaintance with his performances as an artist at a later date, when he applied to the easel merely as a relaxation, it may be stated that there is little doubt that had he devoted himself to the profession of painting, he must have become highly distinguished as a professor of that art. At the early age of 17 he went to Philadelphia, for the purpose of practicing as a painter of landscapes, and was so successful as not only to support himself, but to lay up sufficient funds to purchase a small farm in Washington county, Pennsylvania, and to aid his widowed mother. His patrons in Philadelphia were at first among the humbler classes, but afterward he formed acquaintances who were both able to appreciate his promise as an artist, and to facilitate his plans of improving himself as a painter. By their advice he went to England, and through a favorable introduction to West, he was treated by that great artist with even more than his usual liberality, and became an inmate of his house, and remained his guest and pupil for several years. After leaving the family of West, Fulton proceeded to Exeter, where he lived two years, during which time his intelligence and ability gained him many useful acquaintances. Among these, the most important were the Duke of Bridgewater and Earl Stanhope. It appears to have been at the instance of the former that he abandoned painting as a profession, and entered that of a civil engineer. We find him next residing in Birmingham, engaged in the construction of canals, though probably in a subordinate station. Fulton's residence in Birmingham brought him into communication with Watt, who had just succeeded in giving to his steam-engine that perfect form which fits it for universal application as a prime mover. While in Birmingham, Fulton issued a number of patented inventions and several published works. In 1793 he took out a patent for the introduction of the inclined plane in inland navigation, and three years later embodied it, with other projects of a similar nature, in a work on Inland Navigation. This work can be quoted as exhibiting a high degree of originality, ingenuity, and talent, but as inapplicable to any useful purpose. To his instrument for destroying vessels of war, he gave the name of the *Torpedo*. It consisted of an oval copper case, charged with gunpowder. To this he proposed to attach a lock, regulated by clock-work, which, after any required time, might cause the lock to spring and thus communicate fire to the charge. But Fulton met with so much opposition in bringing this into practice during the war with Great Britain, that the only proofs of its value we can cite, were the sleepless nights and anxious days of many British commanders, who felt that the vicinity of Fulton's operations was attended with danger which could only be prevented by unremitting diligence and attention.

Before proceeding to the more important subjects which attracted the attention of Fulton, we have to mention some other fruits of his ingenuity. In 1794 he took out patents for a mill for sawing marble; a method of spinning flax and making ropes; and of excavators for digging canals. The latter object may still remain a desideratum in practical mechanics; the two former at least served as steps in the career of improvement, and have been guides and landmarks to subsequent inventors. Fulton undertook the construction of a vessel which might move either at or beneath the surface of the water, and made the passage over the estuary of the Linn with ease and safety.

The art was connected as to navigation founded on the engine, and he had received it. When the project public, many others, Symington, and Clyde, in 1801 were made by Stevens, of which he engaged the associate of Roosevelt; to the inventor of the Thames tunnel, unsuccessful, and of Livingston a came intimate with funds necessary introducing the experiment were original impressions wheel over any in the year 1803, in length and 8 adapted, and the little doubt of it directly taken to scale in the United from England, fr varied from the sketches furnish application made an exclusive priv State by steam w dered from Watt gland, and direct was completed at the vessel was fin in August, 1807, made, and a few most skeptical an ject was obtained, periment, a voyag This city is distan the river, nearly stances the sloops performed the pas time was four d in 36 hours, and ing with the wish ages until the eno arrangements the facility of wo the machinery, we culties were remov until the boat shou next winter of 180 rebuilding the ves was given. T ality; for a debt v never permitted hi converted into a flo of passages for the was a complete fail was not suitable, replace it by one wood and copper, w soon after leaving pletely, on the ret a voyage prolonge

The art with which Fulton's name is inseparably connected as the principal agent in its creation, is that of navigation by steam. His application of steam was founded on the properties of Watt's double-acting engine, and could not be used until that instrument had received the last finishing-touch of the inventor. When the properties of this engine became known to the public, many hastened to apply it to navigation. Among others, were Miller, of Dalswinton, aided by Symington, who put a boat in motion on the Forth and Clyde, in 1801. In the United States, experiments were made by Fitch and Rumsey; and in 1791, John Stevens, of Hoboken, commenced his researches, which he engaged in for nine years, when he became the associate of Chancellor Livingston and Nicholas Roosevelt; to this association was added Brunel, the inventor of block machinery, and engineer of the Thames tunnel. The efforts of this association were unsuccessful, and were broken up by the appointment of Livingston as ambassador to France, where he became intimate with Fulton, and offered to provide him with funds necessary for an experiment, and to aid in introducing the method in the United States, if the experiment were successful. Fulton had confirmed his original impression of the superiority of the paddle-wheel over any other means of propulsion, and, late in the year 1803, commenced building a vessel 66 feet in length and 8 in breadth. To this an engine was adapted, and the experiment so satisfactory, as to leave little doubt of final success. Measures were immediately taken to construct a steamboat on a larger scale in the United States. An engine was ordered from England, from Watt & Bolton, in 1803; its form varied from their usual models in conformity to sketches furnished by Fulton. At the same time, an application made to the Legislature of New York for an exclusive privilege of navigating the waters of that State by steam was granted. Before the engine ordered from Watt was completed, Fulton visited England, and directed the construction of it in person. It was completed at last, and reached New York in 1806; the vessel was finished and fitted with her machinery in August, 1807. An experimental excursion was made, and a few minutes served to convince the most skeptical and doubtful that the long-desired object was obtained. Within a few days of the first experiment, a voyage was undertaken in it to Albany. This city is distant from New York, by the channel of the river, nearly 150 miles. In a few remarkable instances the sloops which navigated the Hudson had performed the passage in 16 hours; but the average time was four days. Fulton's steamboat went up in 36 hours, and returned in 30. Fulton, complying with the wishes of the public, made regular voyages until the end of the season. Many of the minor arrangements for the convenience of passengers, the facility of working, and safety from accident of the machinery, were yet wanting; some of the difficulties were removed at the time, and others remained until the boat should be laid aside for the winter. The next winter of 1807-8 was occupied in remodeling and rebuilding the vessel, to which the name of *Clermont* was given. Fulton provided such accommodations for passengers, as, in regard to convenience and splendor, had never been approached in other vessels of transportation. This was almost improvident liberality; for a debt was contracted which new demands never permitted him to discharge. The *Clermont*, thus converted into a floating palace, commenced her course of passages for the month of April. The first voyage was a complete failure; the boiler, provided by Watt, was not suitable, and Fulton had been persuaded to replace it by one planned by Livingston, composed of wood and copper, which emitted steam from the joints soon after leaving New York, and gave way completely, on the return passage, near that city, after a voyage prolonged for 56 hours. But a few weeks

sufficed to build a new boiler, and in June, the *Clermont* was again under way. In the hour of departure from New York or Albany the utmost regularity was observed, which required no little perseverance and resolution at first; but the benefit of this punctuality was soon perceptible, and the same system was copied by other steamboat lines. At the end of the second summer the boat became far too small for the passengers, who crowded to avail themselves of this new mode of transport, and Fulton began a second boat, called *The Car of Neptune*.

The most formidable opposition made to the privilege of Fulton, for the exclusive navigation of the waters of New York, was founded upon the discoveries of Fitch, who had constructed a boat which traveled between Trenton and Philadelphia. Fulton, assailed in his exclusive privileges, took, for further protection, a patent from the general government in 1809, and another in 1811. Grants were made to Fitch by the State of New Jersey, and as a compromise could not be agreed upon by the two contending parties, the controversy, which often interrupted the communication by steam between Philadelphia and New York, was not adjusted until the grant, made to Fulton by the State of New York, was declared unconstitutional. A form of ferry-boats was soon after invented by Fulton, which, with the substitution of a single hull for the twin boat, has in its arrangement and distribution undergone little or no change. The steamboats on the Hudson were increased in number, before Fulton's death, to five. A sixth was built, under his direction, for the Sound, which plied for some time on the Hudson. In the construction of this boat he had, in his opinion, exhausted the power of steam in navigation—having given it a speed of nine miles an hour.

When death arrested Fulton in his great career, he was engaged in constructing an improved form of submarine vessel, but as he had made no one a confidant in his plans at his death no person was found willing or able to undertake the completion of the vessel. By exposure in his visits to the Navy Yard, in Brooklyn, he took a severe cold, which his constitution, enfeebled by constant labors and anxieties, could not resist. He died on the 24th of February, 1815. Rarely has it happened that the natural death of any citizen excited so general mourning as that of Fulton. Cut off in the very height of his usefulness, and in the zenith of his reputation, his countrymen felt it as a loss almost irreparable. See *Life of FULTON*, by JAMES RENWICK, LL.D.; *Anal. Mag.*, v. 394. x. 177; SPARKS'S *Am. Biog.*, x. 4; *Quar. Rev.*, x. 347; LITTELL'S *Mus.*, xxxiii. 340; NILES'S *Reg.*, xiii. 51, xxxiii. 15; HUNT'S *Mer. Mag.*, xv. 468. A suitable monument to the memory of Fulton has not yet been erected either by the United States, by any one State, or by any association. It yet remains for his native State (Pennsylvania), or for the State which fostered his early efforts (New York), to place in some great thoroughfare, an appropriate column in memory of one who has so largely contributed to the growth of commerce throughout the civilized world.

Fumigation is the employment of fumes or vapors to purify articles of apparel, and goods or apartments supposed to be imbued with some infectious or contagious poison or fumes. The vapors of vinegar, the fumes of burning sulphur, and explosion of gunpowder, have long been prescribed and practiced; but they have, in all probability, little or no efficacy. The diffusion of such powerful agents as chlorine gas, muriatic acid gas, or nitric acid vapor, should alone be trusted to for the destruction of morbid effluvia.

Funds. To the Venetians is ascribed the origin of the funding system, in A. D. 1171. Public funds were raised by the Medici family, at Florence, in 1340. The English funding system, or the method of raising the supplies for the public service in England, by anticipation of the public revenues (the origin of the national

debt), was introduced at the Revolution, 1689.—MONTMERR'S Broker. The funding system is coeval with the commencement of the Bank of England.—ANDERSON. The three per cent. annuities were created in 1720. The three per cent. consols were created in 1731; the three per cent. reduced, 1746; three per cent. annuities, payable at the South Sea House, 1751; three and a half per cent. annuities created 1758; long annuities, 1761; four per cent. consols, 1762; five per cent. annuities, 1797 and 1802; five per cents. reduced to four, 1822. See *National Debt*.

The following table has been calculated in order to show in which of the public funds money may be invested so as to yield the greatest interest. It gives the prices, differing by one per cent. from 50 to 93 for three per cents., etc., at which they all must be to yield the same interest; so that supposing the three per cents. to be at 93, a sum invested in them, or in the 3½ per cents., will yield the same interest, provided the latter be at 93½; if the 3½ per cent. be below this sum, it will, of course, be more advantageous in so far at least as interest is concerned, to invest in them than in the three per cents.; while, if they be above 93½, it will be less advantageous.

To get the true value of the different funds at any particular period, in order to compare them accurately together, it is necessary to deduct from each the amount of interest accruing upon it from the payment of the last dividend.

TABLE SHOWING THE PRICES THE DIFFERENT FUNDS MUST BE AT TO PRODUCE AN EQUAL INTEREST; AND ALSO THE ANNUAL INTEREST PRODUCED BY £100 STERLING INVESTED AT ANY OF THOSE PRICES.

3 per cent. price.	3½ per cent. price.	4 per cent. price.	5 per cent. price.	Interest.

The public debt of the United States, which amounted, at the close of the last war with Great Britain, to \$158,713,049, was entirely paid off in 1835. This proceeding, so honorable to the United States, naturally tended to raise the character of American securities in the English market, and enabled the government to contract the loans required to carry on the late war with Mexico on very favorable terms. The

debt of the Union, existing on the 20th November, 1851, amounted to \$62,560,395, and is at present (1850) about \$45,000,000.

But in addition to the debt of the Union, most part of the States, and several, also, of the principal cities, have contracted peculiar debts of a less or greater amount. In most cases these were incurred to promote the execution of some public undertaking, such as the construction of canals or railways, the excavation of docks, the erection of buildings, the establishment of banks or insurance companies, and so forth. Some of the debts so contracted have been advantageously laid out; but a large portion borrowed in 1835, and other periods of wild excitement, were contracted on very disadvantageous terms, and expended on projects some of which have turned out extremely ill. This, however, was the affair of the States themselves, and did not afford so much as the shadow of an excuse for the conduct of those States which have declined to provide for the payment of their debts. It was not, indeed, to be wondered at that in the distress into which the Union was thrown by the crash of 1837, and the depression following thereon, some of the States should have been compelled to suspend payment of their debts; but a necessity of this sort could be temporary only. The indebted States are all rich, and eminently flourishing and prosperous communities, and it might have been expected that they would have made every effort to resume payment in full of their debts at the earliest possible moment. But this, we are sorry to say, has not been the case with some of them.

Fundy Bay, of an inlet of the Atlantic, sets up between Cape Sable, the south point of Nova Scotia, and Mount Desert Island, in Maine, a distance of 150 miles. From Eastport to St. John, N. H., is 60 miles. The bay is divided, in its north-east part, into two branches, the north called Chignecto Bay, the head of which is 170 miles from Eastport. The south-east part is called the Basin of Mines, 150 miles from Eastport. Passamaquoddy Bay opens into it on the north-west, near its mouth. Gypsum is obtained on the Basin of Mines, and griststones on Chignecto Bay. This bay is very peculiar; its shores, on both sides, are rocky and abrupt, while near its head, the tide, pressed and confined within diminished limits, rushes with much violence over extensive and wide-spread mud-flats, and rises generally 60 feet or more. Its fisheries are valuable and extensive. (See PERLEY'S valuable report on its fisheries.) There are 16 light-houses on the coasts of the Bay of Fundy, viz., eight on the New Brunswick side, and eight on the Nova Scotia side.

Furl, in navigation, to roll the sail up, and confine it closely to the yard: the sail being gathered up by the men on the yard, the leech or edge is passed along the yard to the middle or *bunt*, where the body of the sail, the foot and clews, are collected. In this way the sails of a man-of-war are removed nearly out of view in an almost incredible short space of time.

Furlong, an English measure of length, containing the eighth part of a mile.

Furs, in commerce, the skins of different animals, covered, for the most part, with thick, fine hair, the inner side being converted, by a peculiar process, into a sort of leather. Furs, previously to their undergoing this process, are denominated *peltry*.

Beaver fur, from its extensive use in the hat manufacture, is a very important commercial article. That made use of in this country is almost entirely brought from North America. It is gradually becoming scarcer and dearer, being now obtainable only in considerable quantities from the most northerly and inaccessible districts. The fur of the middle-aged or young animal, called cub-beaver, is most esteemed. It is the finest, most glossy, and takes the best dye. Fitch, or the fur of the fitchet or polecat, is principally imported from Germany; it is soft and warm, but the unpleasant smell which adheres to it depresses its value.

Marten and mink, a diminutive species of otter, are principally imported from the United States and Canada. The fur of the musquash, or muskrat, a diminutive species of beaver, is imported in vast quantities from our possessions in North America, which also supply us with considerable quantities of otter-skins. Nutra-skins are principally brought from Buenos Ayres. The more valuable furs, as ermine, sable, etc., come principally from Russia.

Fur Trade.—There is, perhaps, no branch of commerce that has drawn forth a more daring and adventurous spirit, or given rise to a more patient and courageous endurance of personal dangers, privations, and hardships, than the fur trade, as is manifest throughout its whole history. By its means we have become accurately acquainted with nearly three fourths of the continent of North America. The indefatigable exertions of the fur merchant, stimulated by the prospect of large gains from his hazardous pursuits, have made known numerous tribes of men and nations partially acquainted with the arts and refinements of civilized life, who otherwise might have remained many ages, or forever, immersed in heathen darkness, and sunk in barbarity. Nor are the general advantages derived from the fur trade confined to a more accurate geographical knowledge of a vast range of country, and the extension of the arts of peace and social happiness. The adventurous fur trader has often been the precursor of the gospel missionary, and has enabled him to pursue his important labors with comparative safety and success.

Whence Furs were Introduced.—The use of furs seems to have been introduced into Europe by the northern invaders of the Roman empire. In the sixth century the skins of sables were brought to Rome from the shores of the Arctic Ocean through the intervention of numerous parties, so that the cost to the consumer was very high. During several centuries after that time, furs were not at all common in western Europe. In 1252, A.D., Marco Polo mentions, as a subject of curiosity, that he found the tents of the khan of Tartary lined with the skins of sables and ermines, which had been brought from countries far north, "from the land of darkness." In less than a century, however, from that time, the wearing of furs as a part of fashionable dress, had become rather prevalent in England, since, in 1367, Edward III. commanded that all persons among his subjects should be prohibited the use of furs unless they could spend £100 per annum.

Arctic Regions.—Early in the 17th century the shores of the Arctic seas were found tenanted by furred animals of great value; and the idea of forming a settlement was suggested by Grosellez, a Frenchman. The suggestion was made first to his own government, but as it was coolly received, he obtained, through the English ambassador, an interview with Prince Rupert, before whom he laid his plans. The prince warmly entered into the project, and assisted in fitting out a vessel, which reached, in September, 1668, the river then called Nemisco, to which the adventurers gave the name Rupert, in honor of the prince. After wintering there, with less difficulty and suffering than they had anticipated, they returned, and gave so favorable a report that Prince Rupert, the Duke of Albeuarde, the Earl of Craven, Lord Ashley, and others, formed themselves into a Company, and subscribed £10,500 for the purpose of commencing a traffic in furs. A charter of incorporation was granted by Charles II. in 1670, giving to the Hudson's Bay Company full possession of "all the lands and territories upon the countries, coasts, and confines of the seas, bays, lakes, rivers, creeks, and sounds, in whatsoever attitude they shall be, that lie within the entrance of the straits, commonly called Hudson's Straits, that are not already actually possessed by or granted to any of our subjects, or possessed by the subjects of

any other Christian prince or state." And the charter proceeds to grant further, that "the whole and entire trade and traffic to and from all havens, bays, creeks, rivers, lakes, and sounds into which they shall find entrance by water or land out of the territories, limits, or places aforesaid; and to and with all the natives and people inhabiting, or which shall inhabit within the territories, limits, and places aforesaid; and to and with all other nations inhabiting any of the coasts adjacent to the said territories, limits, and places which are not already possessed as aforesaid, or whereof the sole liberty or privilege of trade and traffic is not granted to any other of our subjects." On Rupert's River the Company immediately formed a settlement; and in 1674 stations were settled on Moose River, and a few years later on the Albany, and soon after two more on the Nelson and the Severn.

French Settlements and Seizures.—By these vigorous measures the French court was awakened to a sense of its neglect, and Grosellez, already detached from the English service, was sent out, in the year 1682, to found a factory on the River Hayes, which he accomplished, and also surprised the British factory on the Nelson. After this time hostilities became frequent between the French and the English settlers; yet notwithstanding immense losses sustained by the Company from 1682 to 1688 (amounting to £118,014), they were able, in 1684, to pay to the shareholders a dividend of 50 per. cent. Again, in 1688, an equal dividend was made, and in 1689, one of 25 per cent. In 1690, without any call being made, the stock was trebled, while at the same time a dividend of 25 per cent. was paid on the increased or newly-created stock. By other captures of their factories by the French in the years 1692, 1694, 1696, and 1697, the Company suffered further loss to the amount of \$97,500. At the peace of Utrecht, in 1713, however, these captured factories were restored to the Company, who, by 1720, had again trebled their capital, with a call of only 10 per cent. on the shareholders. Now they strengthened the old forts and formed several new ones in the interior; but in 1749 a question arose in Parliament concerning the rights of the Company, which was decided in their favor. Again, in 1782, several of their factories were taken by the French under La Perouse; still their traffic seems to have continued very lucrative until the invasion of their rights and territories by a strong rival association, designated the North-west Company, whose fierce competition caused much animosity and bloodshed. This was not only very destructive to the fur trade, but most injurious to the Indians.

Management.—The North-west Company consisted of 23 partners, comprising some of the most wealthy and enterprising settlers in Canada, and employed about 2,000 persons as clerks, interpreters, guides, and boatmen (voyageurs), who were stationed over the vast regions of Canada ceded in 1763 by the French to the English. Shareholders who engaged actively in the trade were called agents, some of whom resided at the different ports established by the Company in the Indian territory, and others at Quebec and Montreal, each attending to the affairs of the Company in his appointed district. These active partners met annually at Fort William, one of their stations on Lake Superior, where they discussed matters connected with the affairs of the association, and arranged future plans. The clerks of the North-west Company were mostly young Scotchmen, of respectable families, who were willing to undergo the hardships attendant upon a residence of some years in these inhospitable regions, in order that they might thus secure the advantage of succeeding in turn to a share of the profits of the undertaking, the custom being to take from among the clerks as partners those who had acquired the experience necessary for the management of the business. The hunters of this Company crossed the Rocky

Mountains about the year 1805, and established stations on the northern head-waters of the Columbia. In 1813 they purchased Astoria on this river, which was relinquished by Mr. Astor,* of New York, and his partners, in consequence of the war between the United States and Great Britain. At length the Hudson's Bay Company, being roused by the activity of the North-west Association, exercised for the first time its chartered right to colonize, and sold, in 1812, a tract of land on Lake Winnipeg and the Red River; to Lord Selkirk, who introduced a considerable number of persons from Scotland. The consequence was an open war between the partisans of the rival Companies. After a war of two years, the Red River settlement was destroyed by the massacre of the governor, Mr. Semble, and many of his associates, while the survivors were driven away. But this melancholy and barbarous state of matters was put an end to by the union of the rival Companies in 1821, since which the trade has been peacefully and successfully prosecuted. When the partnership of the North-west Company was about to expire in 1821, the three London representatives of the firm offered to merge their interests in those of the Hudson's Bay Company. This was agreed to, and an act of Parliament was passed (1st and 2d Geo. IV., cap. 66), under which the crown grants to the Hudson's Bay Company and to the three representative partners of the North-west Company in London and Montreal a license of exclusive trade for 21 years in the "Indian territories;" that is, over all those tracts that might not be included in the charter given by Charles II., and also over those tracts which by mutual consent were open to the subjects of England and to those of the United States. The three North-west Company agents merged into the Hudson's Bay Company; the exclusive trading license was surrendered in 1838; and, after careful investigation on the part of the government, the crown granted on the 30th of May, 1838, another license for 21 years of exclusive trade over the Indian and neutral territories.

The affairs of the Hudson's Bay Company are at present conducted by a governor, deputy-governor, and a committee of seven, elected by 239 proprietors, representing a capital of £400,000. Of the 239 proprietors, 55 have more than two votes. £900 of stock must be held for six months by each voter previous to voting, except such stock be acquired by bequest or marriage, and each member of the committee must hold not less than £1,800 stock. The mode of election, oaths to be administered, government, etc., are prescribed by the charter of Charles II. already referred to. Accordingly, the Company has established at the Red River settlement a governor, council, recorder, sheriff, coroner, etc., for the proper government of the affairs of the Assiniboia, or Red River Territory, and for the careful and legal administration of justice throughout Rupert's Land. Though not enjoined by the charter of 1670, trial by jury was introduced by Sir George Simpson under the direction of the Hudson's Bay authorities in England. Crime is comparatively rare in Rupert's Land; and justice is administered under the same safeguards that exist in England.

Traffic.—The traffic of the Company in furs and peltry is regulated by a Deed Poll, dated March 26th, 1821, when the North-west Company and it united; and by another Deed Poll, dated June 6th, 1834, "for ascertaining the rights and prescribing the duties of the chief factors and the chief traders, and for conducting the trade." The business of the Company is superintended by the 25 chief factors at the respective stations; and under them the 28 chief traders carry on the traffic with the Indians. The clerks serve under both the factors and the traders; and the very hum-

blest clerk, by good conduct, may rise to the chief positions in the service of the Company. The salaries of the clerks range from £20 to £100 per annum. Three chief factors and two chief traders are allowed to leave the country annually for one year.

Free Trade in Furs.—The Hudson's Bay Company have no monopoly, as some suppose, of the importation of furs into England; they have to compete with the furs of the United States, of Russia, of Norway, etc.; and if other traders can undersell the Company the public have, of course, the benefit. Beaver and other skins are now much lower in price than formerly, when so much used in the manufacture of hats; and the gradual reduction in price of foreign furs has been chiefly brought about by the steady supply from Hudson's Bay territories. Hence London is the most extensive fur market in the world. The fall in the prices of all furs has been very great; but as beaver constitutes the largest item in value, the reduction of profit to the Company will be seen by comparison with the prices and amount of sales. In 1839 a beaver skin was worth 27s. 6d.; in 1846, 3s. 6d. The number of skins sold in 1839 was 55,486 for £76,312; those sold in 1846 45,989 for £7856. There is also great variety in the prices of articles of similar denomination; but the Company are obliged to pay the same price to the Indians for all skins according to tariff; whether the skins are good or bad, the Company must buy them. Hence the profits of the shareholders are not to be estimated by the difference in price between the cost of a skin at one of the Company's forts in the interior, and its sale price in London. The annual dividend is (1855) about 6 per cent.

The Hudson's Bay Company have now about 140 establishments, besides hunting expeditions and shipping, employing 25 chief factors, 28 chief traders, 152 clerks, 1200 regular servants, besides employing in occasional labor, the services of a large number of the natives; a steam vessel and five sailing vessels of from 100 to 300 tons, all armed. Their forts or stockaded positions extend from the coast of Labrador to the Pacific, and from the northern boundaries of Canada to the shores of the Arctic Ocean. At every large trading establishment there is an "Indian Hospital," from which the natives derive the greatest benefit; and several medical men are maintained by the Company at different forts. Ministers of the gospel of every denomination are encouraged and protected by the Company, and a bishop of the Church of England now presides over the diocese of Rupert's Land.

The fur trade is prosecuted in the north-western territories of the United States by an association called the North American Fur Company, of which the chief managers reside at New York. Its principal station is Michilimackinac, to which are brought all the peltries collected at the other ports of the Mississippi, Missouri, and Yellowstone Rivers, and all over the vast range of country extending thence to the Rocky Mountains. This Company is admirably organized and managed; it employs steamboats for ascending the rivers, which also penetrate with ease to regions which could formerly be explored only through the most painful efforts in barges and keel-boats, or by small parties on foot or on horseback. A great many packages of furs are now brought from that section of the country, and from what is called the Red River of the north, by way of St. Paul in Minnesota, and thence by way of river to St. Louis and other cities. It has been proposed to build a railroad from St. Paul up the valley of the Saint Croix to the valley of the Red River; and for this purpose large grants of land have been set aside sufficient to build this railroad. A road once built to this region would make a wonderful and complete revolution in the fur trade.

Fur Skins Imported.—About 5,000,000 skins of animals applicable as furs, are annually imported into

Fur-Skinned Animals.—The northern and arctic regions abound with races of animals, which are thickly covered with fine hair or fur, and whose skins are very beautiful and valuable as articles of clothing. The animals that are captured for their fur, are:—The Russian Sable, *Mustela zibellina*. This rich and beautiful skin has long been esteemed one of the most valuable and useful furs that have been brought to our country. About 25,000 are annually collected in the Russian territories, of which only a small number is imported into England. The fur is brown, with some gray spots on the head. The darker varieties are the most highly valued, a single skin being frequently sold for £9, though the average value does not exceed £2 or £3. Naturalists are not agreed whether to consider the animal from which the skin is procured as a distinct species. Some are of opinion that the Russian Sable, the Stone and Pine Martens, as well as the Hudson's Bay Sable, are but one species, on which the differences of food and climate have produced some slight variations in form and color. To the furrier, however, the Russian Sable is easily distinguishable, from the length and fullness, as well as the darker color of the fur. The use of this choice variety is necessarily limited to the wealthy, on account of its scarcity. In the reign of Henry VIII., by a law which sought to regulate the expenses of the different classes, and to distinguish them by peculiarity of costume, the use of the Sable was confined to the nobility above the rank of viscount.

Marten.—The Hudson's Bay Sable (*Mustela Canadensis*).—The sable skins next in repute to the Russian are those imported by the Hudson's Bay Company, of which no less than 120,000 are annually brought into Great Britain. As the natural color of the skins is much lighter than the prevailing taste, it is the practice to dye many of them a darker color, and the furs thus treated are scarcely inferior to the natural sable. The Bairn, or Pine Marten (*Mustela abietum*).—The Sables imported under this name are the produce of Europe. The animal is found in extensive forests remote from the habitations of man, and preying on birds and smaller animals. They are distinguished from the Stone Marten by the yellow color of the throat; other parts of the skin are brown. When dyed, they have a similar appearance to the best sable. The Stone Marten (*Mustela saxorum*).—This Marten is generally found in mountainous and stony places, though a frequent visitor to farm-yards and homesteads. It is generally distributed through most European countries. The under fur is a bluish-white, with the top

hairs a dark brown. The throat of this variety is usually of a pure white, by which character it is generally distinguished. The French manufacturers excel in dyeing this fur, from which circumstance it is frequently called French Sable. It is also dyed in this country, the excellent qualities of the skin adapting it to a great variety of purposes to which furs are applied. The Fisher.—There are about 11,000 of these skins annually brought to this country from North America; they are larger than the sables, and the fur is longer and fuller. The tail is long, round, and full, gradually tapering to a point, and quite black; a few years since it formed the common ornament to a national cap worn by the Jew merchants of Poland, and at that time was worth from 6s. to 9s., but its present value does not exceed 6d. to 9d.

Mink.—The Mink (*Mustela vison*).—There were 245,000 skins of this little animal brought to this country in 1850 from the possessions of Hudson's Bay Company and North America. The fur resembles the sable in color, but is considerably shorter and more glossy. It is a very durable and useful fur, and is exported in large quantities to the Continent. The Ermine (*Mustela erminea*).—This animal is similar in form and habit to the common weasel of this country; but in Siberia, Russia, and Norway, from whence the skins are imported, the little animal, during winter, becomes as white as the snowy regions it inhabits, and is esteemed as the whitest fur known, though its summer dress is a dingy brown. The tail of the skin, of which the lower half is jet black, is generally introduced as an ornament to the purely white fur. It is worn on state occasions, and in the reign of Edward III. its use was restricted to the royal family. The Fitch or Polecat (*Mustela putorius*).—These skins are produced throughout Europe, and in place of better quality than in Great Britain. The ground of the fur is a rich yellow, while the top hair is a jet black. This fur is at present very little used in Great Britain, but is much worn in America. It is very durable, but the natural smell of the fur, which is rather unpleasant, is difficult to counteract. The North American Skunk (*Mephitis Americana*).—The skins known under this name are imported by the Hudson's Bay Company. The animal from which they are taken is allied to the polecat of Europe, and, from the fetor it emits when attacked, which has been known to affect persons with sickness at 100 yards' distance, has received the soubriquet of "l'Enfan du Diable." It has a soft black fur, with two white stripes running from the head to the tail, which is short and bushy. The skins, though imported into England in small numbers, are usually re-exported to the continent of Europe. The Kolinkski (*Mustela Siberica*).—The Kolinkski or Tartar sable is of a bright yellow color, and is sometimes used for ladies' dress in its natural state, but it is more frequently dyed brown to imitate other sable, to which it bears a strong resemblance. It is remarkable for the uniformity of its color, having no spot or difference of shade in any part of the body. The tail, which is of the same color, is exclusively used for the best artists' pencils.

Muskrat.—The Musquash or Muskrat (*Fiber zibethicus*).—The animal known under this name is found in great numbers in North America, frequenting swamps and rivers, and, like the beaver, building its habitations of mud with great ingenuity. Dr. Richardson states, that it has three litters of young in the course of the summer, producing from three to seven at a litter. The animal has a peculiar smell, similar to that of musk; but it must not be mistaken for the animal from which the musk of commerce is procured, which is a native of Tibet. About 1,000,000 skins are brought into England annually; the fur resembles that of the beaver, and is used by hat manufacturers. The skins are also dyed by the furrier, and manufactured into many cheap and useful articles.

but the skin being exceedingly tender, its use for this purpose has been discontinued. The white hare is also frequently dyed; it looks exceedingly rich, but is not very durable.

The Rabbit (*Lepus cuniculus*).—The English rabbit, both in its wild and domestic state, affords a very plentiful supply of useful fur. When dressed and dyed in imitation of other skins, it is manufactured into a great variety of cheap and useful articles for the middle classes. The wool has recently been manufactured into a peculiar cloth adapted for ladies' use, but by far the greater number of skins are still used for hatters' purposes. The English silver-gray rabbit was originally a breed peculiar to Lincolnshire, where great attention was paid to it; but warrens have since been formed in various parts of the country. Skins of this variety are continually exported to China and Russia, where they are much esteemed and command a comparatively high price. The Hudson's Bay rabbit is beautiful in the length and texture of its fur, but the skin is so fragile, and the fur so liable to fall off with slight wear, that it has little value as an article of dress. The white Polish rabbit is a breed peculiar to that country; its skin is often made into linings for ladies' cloaks, and being the cheapest and most useful fur for that purpose, the animal is exported in great numbers. The Squirrel (*Sciurus vulgaris*).—This attractive little animal abounds in most countries, especially in Siberia and the north of Europe. It is from the Russian dominions that we derive our principal supply of the skins of this agile creature, which exceeds in number that of any of the fur-producing animals. It is said that 15,000,000 are every year captured in Russia, our supply from thence exceeding 3,000,000 annually. The fur of the squirrel, of which there are several varieties, is light, warm, and durable; some of the lighter colors are dyed in imitation of sable. The color of the Siberian squirrels varies from a pearl-gray to a dark blue-gray; the under parts, which are white, are frequently cut out and made into cloak-linings, remarkable for their lightness; the tails are manufactured into boas for foreign markets; they are also extensively used in the manufacture of artists' pencils.

The Chinchilla (*Chinchilla lanigera*).—There are two chief varieties of chinchilla, the produce of South America: those from Lima are short in the fur, and inferior in quality to those from Buenos Ayres and Arica; the color is a silvery gray, Arica producing the darkest and best-colored skins. The general appearance of the animal places it between the squirrel and the rabbit; in its natural abodes it has the agility of the former, and resembles the rabbit in living in holes and burrows. The extreme softness and delicacy of the fur adapt it only for ladies' use. Though much admired and frequently worn in this country, it is more extensively used in France, Germany, and Russia.

The Raccoon (*Procyon lotor*).—The raccoon is an inhabitant of North America; the skins are imported into this country in immense numbers; but meeting with no demand for our home trade, are exported by merchants who purchase them at the periodical sales. They are used throughout Germany and Russia for lining shubes and coats, and, being of a durable nature and moderate in price, are esteemed among the most useful furs. The Common Badger (*Meles vulgaris*); American Badger (*Meles Labradorica*).—The skin of the European badger, from the wiry nature of its hair, is generally used for the manufacture of superior kinds of shaving brushes; but the skins exported from North America have a soft, fine fur, which renders them suitable for many purposes for which the larger furs are used.

The Cat.—In Holland, the cat (*Felis domesticus*) is bred for its fur; it is fed on fish, and carefully tended until the fur arrives at its greatest perfection; large numbers are also collected in England and many other

countries. The wild cat (*Felis catus*) is much larger and longer in its fur, and is met with in extensive forests, particularly in Hungary; the color is brownish-gray, mottled, and spotted with black. The softness and durability of the fur render it very suitable for cloak-linings, and it is also made into wrappers for open carriages and railway traveling. The Canada Lynx (*Felis Canadensis*); Lynx Cat (*Felis rufa*).—The fur of the lynx is long, soft, of a grayish color, and sometimes, as in the Norway lynx, covered with brown spots; the belly is white, silky, and not unfrequently spotted with black. The change of fashion has for some time discarded it from this country; but it is dyed, prepared, and exported in considerable quantities for the American market, where it is much valued and admired. It is generally used for cloaks, linings, and facings, for which purposes it is very appropriate, being exceedingly soft and light.

Preservation of Furs.—The fur of most animals is in its greatest perfection at the approach of winter, and before the animal has attained its greatest age. It is the object of the furrier, by dyeing the inferior skins, to imitate the more perfect specimens. Some difficulty has attended this process, as the nature of the skin will admit of dyes being used only in a cold state; but the method which has been practiced in Paris and London has been so far successful that the permanence of the color in the dyed sable is frequently found of equal durability to that of skins of the natural color. Considerable excellence has been attained also in dyeing rabbit and inferior furs of those colors which are more suitable to the prevailing taste.

The first process of the fur-dresser is to prepare the skins from the raw state, and render them fit for ornamental dress. In this country, the usual practice is to trample them in closed tubs with a little salt butter, turning them over and over for several hours. By this means the skins are made into soft and pliable leather. The next process is to rub them on the flesh side over a blunt iron in order to remove loose pieces of integuments, and to reduce the substance, after which it is necessary to cleanse the fur and skin completely from the grease. For this purpose it is again trampled with saw-dust—usually that from mahogany, which being beaten out and repeated several times, conduces to render the fur glossy and clean, and to fit it for the cutter to fashion into any shape that may be necessary.

Furs are subject to injury by several species of moths, whose instincts lead them to deposit their eggs at the roots of the fine hairs of animals. Linnæus mentions five species that prey upon cloth and furs, of which *Tinea pellionella*, *T. vestionella*, and *T. topetella* are the most destructive. No sooner is the worm hatched than it eats its way through the fur, and continues increasingly destructive until it arrives at its full growth, and forms itself a silken covering, from which in a short time it again emerges a perfect moth. Another cause of the decay of furs is the moisture to which they are frequently exposed; the delicate structure of the fine under-fur can not be preserved when any dampness is allowed to remain in the skin. This fact is well known to the leather manufacturer, who, having wetted his skins, allows them to remain in a damp cellar for a few days for the purpose of removing the hair, which is pulled out with the greatest facility after remaining only one week in a moist condition. It follows from these observations, that to preserve furs it is necessary to keep them dry, and to protect them from moths; if exposed to damp or rain, they must be dried at a moderate distance from the fire; and when put by for the summer should be combed and beaten with a small cane, and very carefully secured in a dry brown paper or box into which moths can not enter. During the summer they should be examined once a month, to be again beaten and aired, if the situation in which they have been placed be at all damp. With

these precautions, the most valuable furs may be preserved uninjured for many years.

Manufacture of Furs for Felting Purposes.—In the manufacturing of furs for the making of hats, the principal kinds of skins used are the hare, rabbit, beaver, and nutria. All these kinds of skins, in the northern parts of Europe, as well as in America, are divided by furriers into two distinct sorts, viz., the *seasoned* and *unseasoned* skins. The former are those which are taken off the animal in winter, when the fur is at its full growth, and in the highest state of perfection as to fineness; the latter are those obtained in spring, summer, and autumn. The fur in the unseasoned skins is short, coarse, and hairy, and is generally not worth more than a third of the value of furs cut off the best-seasoned skins. The mode of manufacturing both descriptions is, however, the same; of which we shall now endeavor to give a brief account.

Hare-skins.—The first mechanical operation performed on the hare-skin, is to open it with a knife down between the middle of the forelegs, taking great care that the skin be not torn; for there is a considerable waste of the fur if this precaution be not attended to. The skin must now be rubbed with what is called a *rate*, which resembles a common dinner-knife, with teeth like a saw. This is used for the purpose clearing away all impurities and dried blood which may happen to be upon the skin. This clearing is of very great importance; for the smallest particle of dirt or blood will greatly injure the fur for felting purposes. The operation requires to be carefully and judiciously performed for another reason. If the workman be not attentive, he will tear up, along with the bloody and dirty parts, a considerable part of the good clean fur, and thus great loss will be incurred.

Hare-skins, after being thus opened and cleaned, must be dumped on the pelt side with a little water, and placed under a heavy weight, pelt to pelt, to press them, so that all ridges and inequalities in the pelt may be removed. The skins are now fit for what is called *shearing*. Their outsides are all covered over with a kind of hair, which possesses no felting properties whatever; and this must be taken off with hand shears. These are of two kinds; the one the common shears used for clipping the wool off sheep; the other kind resembles the cutting shears of tailors, only the bowl is made equally large on both sides for the admission of all the fingers. Some furriers prefer one kind of shears, and some another. Those like tailors' shears make the neatest work when skillfully used; but the others require less time for their management. The shearing of the skins forms a very important part of their manufacture; for if one cuts too far down, he will seriously destroy both quality and quantity of the fur, as well as disfigure its appearance. On this account many furriers confine a part of their work-people to this branch of the business alone; for the greater part of the profits of a master depends upon the manner in which the shearing process is performed.

After a hare-skin has been submitted to the process of shearing, it presents an appearance altogether different from what it did before. A novice would not know it to be the same skin. Previously, it was of a uniform brown color; now, it is down the whole of the back of a most beautiful jet black, which gradually becomes fainter as it approaches the sides of the skin. After it undergoes the process of *rounding*, which consists in taking off all the irregular or angular pieces of skin, and making the pelt smooth and even, it is then fit for the cutting-board.

The cutting-boards of furriers are made of the willow-tree, and are commonly about twenty inches wide, and from two to three feet broad. They ought to be moistened with water at short intervals, when used, to make the wood soft, and prevent the edge of the cutting-knife from being taken off too soon. These knives are sometimes made of common sheet-iron, but

more frequently of steel, which are to be preferred to the former, on account of keeping their edge longer, and being much lighter for the hand. A fine edge will not cut the fur off the skins; it must be a rough edge, which is obtained from rubbing the knife about every two or three minutes upon a piece of common freestone, of not too fine a grain. These knives are from five to six inches in length and three in breadth, and resemble in some measure those knives used by grocers for the cutting up of cheeses. The skins are all, before cutting, split down the middle of the back into halves. The cutting then commences at the head or cheeks of the skin, and always in the line of direction in which the fur lies. The cutting-knife is run quickly backward and forward against the first joint of the finger across the skin: while at every two or three strokes the hand must be lifted up, to gather in the fur that has been cut, and preserve it in as fleecy a form as possible. Care must be taken against *chopping* the fur; because, when this takes place, the felting principle in all furs is considerably weakened, and in some entirely destroyed.

An important point in the getting up of furs for sale is, to keep them in as unbroken or fleecy consistency as possible. This, abstractly considered, is of no consequence to their felting power; but the practice of the trade as to this matter has arisen from a desire to keep the different kinds of fur from being mixed with one another, and thereby in some degree to prevent adulteration. From this cause the above mode of cutting the hare-skin has been long since much improved by the use of instruments made of tin, against which the cutting-knives run, and which are so contrived as to gather in the whole fur off the largest skin with as much ease as the fur of a calf skin could be gathered by the hand when the knife runs against the fingers. This simple invention preserves all the most valuable parts of the skin in one lump or fleece, and enables the workman to sort the fur with more ease and readiness than before.

Rabbit-skins.—The rabbit-skin is cut in precisely the same manner as that of the hare, only there is a considerable difference in the mode of dressing or preparing the former. The rabbit-skin is covered over on the pelt side with large quantities of grease or fat, from which the hare-skin is comparatively free. This must be removed when the rabbit-skin is first opened. The knife used in opening the skin must be pressed down upon that part of the pelt where the fatty substance is, till it gets beneath the cuticle on which it rests, when the whole of the greasy matter may be removed, and a little whitening rubbed on the spot. If this operation be not well attended to, the grease will get mixed with the fur, and damage it considerably. The rabbit, like the hare skin, is covered over with hair upon the top of the fur; but this hair can not be taken off by shearing, as in the case of the former, but must be removed by *pulling* it out. This is done with a short knife about three inches long, which is held so as to grasp the hair between the thumb and it, which is secured from injury by having a piece of buckskin leather placed over it. The hand of the workman ought to fall lightly upon the skin, otherwise the hair will be cut and the fur pulled out also, which will deteriorate its quality and diminish its quantity very considerably.

Beaver-skins.—The skin of the beaver is manufactured in the same way as that of the rabbit. The fat, however, in the former is much greater in quantity and more firmly imbedded in the pelt than in the latter; and of course greater care and trouble are required to remove it. Fullers' earth mixed with whitening is used to imbibe the fatty particles. The pulling the outside hair off is of great importance. The cutting of the beaver has been for some years performed by machines; the thickness and regularity in the pelt affording facilities for this mode of

operation, not.

The fur different kinds of the skin be comparative drab hats.

Nutria-skins.—The hare-skin is stronger than the knife and grocers are full of pulling process and boiling downward, a brush, till it must then be extracted & made for the fore a stove or through the o

Many experimen with the usual proc of fur with knives to the pelts, so as make it leave the force. Lime has o

operation, which the generality of other skins do not.

The fur of the beaver is sorted into three or four different kinds; but that which is cut off the cheek of the skin bears the highest price. White beaver is comparatively scarce, and is much esteemed for fine drab hats.

Nutria-skins.—These are dressed like rabbit-skins, only the hair on the outside of the skins is much stronger than in the rabbit, and requires a sharper knife and greater strength to move it. Nutria-skins are full of fat; and before they are submitted to the pulling process, they must be well washed with soap and boiling water. The skin is laid with the pelt downward, and well scrubbed on the fur side with a brush, till the grease is entirely removed. They must then be well washed in cold spring water, which is extracted from among the fur by a piece of wood made for the purpose. After this they are placed before a stove or hot fire to dry, and are then fit to go through the other manufacturing processes.

Both the beaver and nutria furs, before they are used for hat purposes, must go through the operation of *blowing*. This is done for the purpose of clearing them of those short black hairs which remain among the fur after it is separated from the pelt. A blowing machine consists principally of a cylinder, into which the fur is placed; and by means of a fly-wheel, situated within it, the stuff is thrown up, and the hairs, by reason of their greater specific gravity, fall to the bottom, and leave all the fine fur upon the top. Hare and rabbit furs are also partially used in a blown state for the nap or outside covering of hats.

Though the hare, rabbit, beaver, and nutria furs are the staple articles of hat manufacture, yet there are other furs occasionally used in their stead, or in conjunction with them. These are the furs of the otter, the seal, musquash, and the mole. The otter is fully as fine as the beaver itself; but the principal objection hatmakers have to its use is, that it does not retain a good black, but acquires a brown or coppery shade. The seal is not so fine as the otter. It finishes dull upon a hat, and, in consequence, is not much used at present. Musquash is a useful fur. The mole is the only skin known to furriers which for felting purposes needs no preparatory dressing before cutting. Its fur is alike fine throughout. But notwithstanding its fineness, it is so very short as to prevent its being extensively used in the hat manufacture.

Within the last century many attempts have been made to apply machinery to the cutting of the various kinds of fur, but, with the exception of the beaver fur, these attempts have hitherto been but partially successful. The great difficulties in the way of machinery for cutting purposes are, the unevenness on the surface, and the inequalities in the thickness of the pelt in different skins. The smallest particles of the fleshy part of the skin getting among the fur will injure it; so much so, that a piece of pelt not larger than a pin's head will destroy the finest hat. This circumstance has greatly increased the difficulty of bringing machinery to bear upon the fur trade. There are, however, at this moment some machines employed in the cutting of hare and rabbit-skins in England; but until they undergo numerous improvements, they are not likely, from the obstacles above adverted to, to realize the expectations of gain at first entertained by those employing them, either in the saving of labor, or in the superior manner in which the fur is manufactured.

Many experiments have also been made to dispense with the usual processes of cutting the different kinds of fur with knives, by applying chemical substances to the pelts, so as to loosen the roots of the fur, and make it leave the pelt upon a slight application of force. Lime has often been tried for this purpose, by

using it in the same manner as skippers do in the management of sheep-skins. Some furriers have also tried a partial state of putrefaction; but this, as well as the lime preparation, has proved abortive. The fur obtained off different kinds of skins by such means looks in every respect as well to the eye as if it had been manufactured in the usual manner; but the felting principle is by all such means entirely destroyed.

Carroted Fur.—Sulphuric acid has the property of increasing the felting power of most kinds of fur. When this is applied the fur is called *carroted*, from the color which the acid gives it. The most common kind of fur submitted to this process is that belonging to the rabbit-skin; and it is generally employed in small quantities for the manufacture of all fine stuff hats. Carroted coney wool is made in the following manner:—Mix one part of sulphuric acid with two parts of pure spring water, in a dish of stone-ware; then take and wet the rabbit-skin with a brush all over, making the liquid penetrate as near to the bottom of the fur as possible; care being used, in this process, not to touch the skin with the fingers, lest they be burned, but with a piece of iron hoop doubled so as to resemble a pair of tongs. When the skins are thus wet, they must be placed over a very hot fire to dry; but they must not be placed too near, lest they take fire, which they are very apt to do from the application of the acid. Instead of drying them before the fire in this manner, some run a hatter's finishing iron, heated to a certain degree, over the skins, and allow them to dry gradually in the sun. This is found to be a very good plan. When the skins are dry they ought to be gently beaten with a rod, and moistened on the pelt side with water, previous to their being put under the pressing stone. They are then cut in the usual manner. Skins prepared in this way attract a great quantity of moisture from the atmosphere; and carroted fur always feels to the hand as if partially wet.

The fur off the rabbit-skin improves in its felting capabilities by being kept a moderate length of time after being taken off the skin; but hare fur does not. Great attention ought to be paid by hat manufacturers, who keep considerable stocks of fur on hand, as to the place in which they are deposited. If it be too damp, they will rot; if too dry, they will diminish in weight; therefore a moderately dry and cool place ought to be chosen. The great enemy to all furs is the common moth. This destroys the felting principle. Whenever the slightest appearance in the fur indicates the secure lodgment of this little creature, it ought immediately to be used; or, if this can not be done, it should be taken out of the paper bags, and broken all over with a small switch rod, or, what will answer the purpose still better, a hatter's bow. The same rules apply to the keeping of skins in good condition as to fur. The situation ought to be cool, dry, and well aired. They will seldom keep longer than twelve or eighteen months without running great risk of suffering injury from the moth or black beetle. Too many ought not to be heaped together, and particularly if they be rabbit-skins, because the fat or grease about these skins will get heated, run among the fur, and become of such an acrid nature as to corrode the very pelt itself. It was formerly the practice to keep hare and rabbit skins a long time, under the idea that the fur upon them will increase in length from the moisture left in the pelt. This is an entirely erroneous opinion. Any one who will make the experiment will find that the amount of fur obtained off any given quantity of skins is much greater in weight when manufactured immediately after they are taken off the animal, than after having been kept for six or twelve months.

The qualities of all kinds of furs differ very considerably, from climate and other local circumstances. The best rabbit fur, used for the manufacture of the

finest London hats, is commonly considered as the produce of the east coast of England, particularly from Lincolnshire to Berwick inclusively. The rabbit fur is always stronger in the felting principle when got off rabbits bred on the sea-coast, than in those found in inland places, however favorable in other respects these places may be for the rearing of the animals. The skins along the tract of coast already mentioned seem all of the same size and quality. North of Berwick the rabbit-skin becomes smaller, and the fur weaker and shorter; and the further north, along the coast, the more inferior it is found. Hare fur in Great Britain is superior, for hat purposes, to any in the world.

The skins and furs imported by or for our manufacturers are more varied and more numerous, perhaps, than would generally be supposed. When we consider, too, how many countries must be ransacked to produce this variety—the beaver, the bear, the ermine, the otter, the racoon, the chinchilla, the wolf, the fox, the musquash, the sable, the marten, the squirrel, the fitch, the mink, the seal, and others—it will be plain that the commerce in furs must be considerable. In 1850, the squirrel furs imported exceeded 2,000,000; the musquash, 1,000,000; the racoon, 500,000; while the rest made up the total number to nearly 5,000,000—not hides for tanning, be it remembered, but skins imported for the sake of the fur. The beauty of a fur does, most unquestionably, in the eyes of a purchaser, depend largely on the price he pays for it; and this price depends on the scarcity in the supply. Why else should a black-and-silver fox fur command a price of 30 or 40 guineas, or a sea-otter skin still more? It is true that fashion also tends to determine the price; and it seems that the different tastes of different countries curiously illustrate this. Thus, the black-and-silver fox skins are mostly purchased for the Russians and Chinese; the red-fox skins are in demand in the East for cloak linings and dress trimmings; the otter skin is used in the same regions for caps and collars; the beaver fur, now getting out of use for hats, is being made available as a beautiful kind of cloth for dresses; the lynx, now out of fashion in England, is a favorite in America. The wolf yields a coarse fur, which the Russians employ for cloaks and coats. The sable has long been a favorite in England, and when dark in color commands a high price; the mink (the choicest specimens) is said to be now in high favor in Paris; the musquash is largely used in England, it being made to do duty for more costly furs by a little "doctoring;" the fur of the black bear is chiefly appropriated by military men, for caps, holsters, rugs, hammer-cloths, etc.; the sea-otter fur is a royal fur in China, and a noble fur in Russia, and hence commands high prices in those countries.

Most of the furs named in the above paragraph are procured from North America, through the medium of the Hudson's Bay Company; but there are some European furs which command an extravagant price. The Russian sable, for instance, will sometimes sell for as much as 10 guineas a skin; and so many of these are employed to form a lining for a cloak, that such a lining has not unfrequently involved a cost of 1000 guineas. The corporation of London display their sable-furred gowns or robes on official occasions. The fur called French sable is really that of the stone marten, which the French show much skill in dyeing. The ermine or minever, from Russia and Sweden, is one of the most remarkable of furs, naturally as well as socially. Its beautiful and delicate white can only be insured by killing the animal in winter, when all is white except the tip of the tail. In social dignities, the ermine, perhaps, takes the lead of all furs; for, not only in many countries of the Continent, but in less despotic England, there is a sumptuary law or custom respecting the ermine; and the sovereign, the royal family, the peers, the peeresses, and the judges, all wear

ermine on state occasions; and this ermine is 'powdered' (as the heralds term it) with small black spots or stripes of some other fur; the number and arrangement of the spots and stripes being indicative of the rank of the wearer, and no deviation therefrom being permitted. For the squirrel fur, which is used in larger quantities in England than any other, we are chiefly indebted to Russia. It is cheaper than any other equal to it in appearance; and some of the white portions are admired for their beauty. The fitch, with its strong and durable fibres, has lately been passing out of favor. The lamb-skin, at a tender age, has all the beauty of fur; and some of the foreign specimens command a high price. The cat-skin is now used largely in England as a fur, greatly to the danger of the domestic "pus" in general. The rabbit is also an extensively used fur; and the white varieties are made to do duty as substitutes for ermine. The little chinchilla yields a soft and delicate fur, much used in England and France. Angora goat-skin was at one time worn extensively as a fur; but it is now more customary to remove the hair or wool, and manufacture it into cloth. Seal-skins, when to be worn as furs, have the long coarse hair removed, and the rich silky down which lies beneath it is dyed of a brownish color.

When these various furs are gathered together from every quarter of the globe, and consigned to the hands of the furriers, they undergo certain processes, which transform them from quadruped attire into biped attire. The "pelt," or under surface, of each fur has to be converted into a kind of leather, by greasing, and pressing, and scraping, and other processes; and the hairy or downy surface has to be dyed and prepared in various ways, to develop all the beauty which naturally belongs to it, and sometimes to impart extraneous beauty to it.

When the light flocculent down from birds is employed as a fur, it requires much patient labor to adjust all the little fibres to their places, since there is no natural "pelt" or skin attached to the down when removed from the animal. As instances of this kind of work, we may adduce the Persian muff and box lately made from the down of a bird called the egret: their value was 160 guineas. There had been only three similar sets previously made—for the Empress of Russia, the Princess Adelaide and the Duchess de Berrie.

ACTUAL IMPORT INTO LONDON OF FURS AND SKINS, FROM SEPTEMBER 1, 1850, TO SEPTEMBER 1, 1851—COMPRISING THE ENTIRE COLLECTION OF THE HUDSON'S BAY COMPANY, AND THE ENTIRE COLLECTION FROM CANADA AND THE UNITED STATES (EXCEPT SHIPMENTS MADE DIRECT FROM THE UNITED STATES TO GERMANY, AND SMALL LOTS USED FOR HOUSE CONSUMPTION, WHICH CAN NOT BE ASCERTAINED). THESE ENTIRE IMPORTS WERE SOLD AT AUCTION IN LONDON, IN JANUARY, MARCH, AND SEPTEMBER, 1851.

The Fur Trade in Minnesota.—Four or five years ago the fur trade was the paramount commercial and industrial interest of the Territory. Two or three years further back, and it was not only the paramount but the sole business interest. The population of the Territory was composed almost entirely of its employ-ers and attachés. St. Paul derived its whole impor-tance (a small importance then) from being the dépôt of the Winnebago and Chippewa outfits; while Men-dota, the seat of the Sioux outfit, gave laws to the im-mense region occupied by the Dakotas and chains of trading-posts as far as Lac qui Parle on the Minnesota; and Pembina, on the Red River, held the whole coun-try like a dependent child at the feet of the magnates of the principal agencies of Pierre Choteau, Jr., & Co. The profits of the fur trade even then had begun to decline. The influx of a white population consequent upon the establishment of a Territorial government—the increase of competition in the Indian trade, co-cur-ring with the gradual decrease of its products, and causes that lay beyond these, and that have been gradually but surely promoting the decline of the western fur trade in general—all contributed to weaken the efficiency of the Fur Company's organiza-tion in our Territory, and to render it undesirable to maintain its expensive establishments any longer than was sufficient for settling its affairs. It has accord-ingly had no practical existence since the consumma-tion of the Sioux treaty in 1852, from which the traders received a parting token of several hundred thousand dollars in payment of the accumulated back debts of some thirty years. Since then the trade has been carried on entirely by private individuals, fore-most among whom, however, are some of the old traders. Two houses alone, Messrs. Forbes & Kitt-son, and Messrs. Culver & Farrington, are connected at this time with the fur trade in this city. The dis-organization of the Indian trade on the Minnesota River, and the diversion of the Indians from hunting, by the pernicious system of annuities, has vastly diminished the productiveness of the fur trade on the Minnesota River.

The trade is almost entirely limited at present to the Pembina or Red River regions, and around the head waters of the Mississippi. The buffalo robes come almost entirely from this source, the buffalo ranges being restricted to the region north of the Cheyenne, and west of the James River. The Minnesota River country has fallen off in buffaloes very considerably—the whole receipts for export from that region not amounting to more than 1200 robes. This does not include, however, the large numbers reserved for home consumption. The table given below, for which we

are indebted to N. W. Kittson, Esq., exhibits the total exports of furs from St. Paul for the present year: 64,292 rats, \$11,572 50; 8276 mink, \$18,621; 1428 marten, \$3,570; 1045 fishers, \$4702 50; 876 red foxes, \$1095; 3400 coons, \$2550; 10 wolverines, \$25; 364 badgers, \$91; 2,082 wolves, \$3048; 405 otters, \$1417 50; 380 beaver (pounds), \$882; 2542 kit foxes, \$1271; 610 bear-skins, \$6700; 20 cross fox, \$100; 8 silver fox, \$400; 50 lynx, \$125; 7500 robes, \$41,200. Total, \$96,750 50. A notable feature of the fur trade for the several years past, is the gradual but sure decline of its productiveness—corresponding with a grow-ing demand in Europe and our own country for furs. Each of these causes has assisted the other to enhance the price of furs—and they have grown expensive—and all these causes concurred to advance prices last year to a sum they never before reached in the American market. Nevertheless it will not do to calculate too surely on last year's prices for the products of the present year, as the consumption of furs is, after all, entirely dependent on the evanescent caprices of fashion.

Before closing this article, we will devote a few lines to the character of the men engaged in the fur trade. The character of the hunters and trappers engaged in the fur trade throughout the extreme north-west is peculiar and original. The trade is not carried on now, as in former times, by means of battaux and canoes, which, under the old French and English sys-tems, enlivened the rivers and lakes of our old North-western Territory. The fur-bearing animals have been driven from a great portion of their borders by the ad-vance of emigration, and their shores have become, to a great extent, the sites of substantial farm-houses and prosperous settlements. The canoe has given place to the steamboat, the trading-post to the city. The great bulk of the trade has been transferred to the region of the mountains, whose wild recesses contain no lakes where they can disport their canoes, no streams which can float their furs to market. These traders and trappers transport their goods or furs upon pack-horses, or carry them on their own backs to a navig-able stream. They move from place to place on horse-back, sometimes conveying their traps upon their shoulders through deep ravines, up steep precipices, inaccessible to the horse, in search of places which contain their favorite game. The life of the trapper be-comes a scene of toil and privation, and yet of pas-sionate excitement. His views are exaggerated, his habits unsettled, his sentiments, generally, noble and generous, like those of a sailor, for the causes which act upon him are similar in their character; and like the sailor, he is nowhere contented except when lead-

ing his life of danger and excitement. Such is the life and character of the active agents of the fur trade, the sturdy hunters and trappers of the north-west. See HUNT'S *Mer. Mag.*, iii., 185 (J. H. LANMAN), iii., 252 (H. MURRAY), xiv., 592 (W. STROUSS); *Journal of Science*, xxv., 811; *Edin. Rev.*, i., 142.

Fur-skin Dressing. Fur-skins are usually dressed by placing them in their dried state in tubs, where they undergo a treading operation with men's feet, until they are sufficiently soft and bend easily. The skins, if large, are sewn up, the fur being turned inward; but if small skins, such as ermine, are being dressed, they require no sewing. This sewing is preparatory to the greasing with butter or lard, and is intended to protect the fur from the grease, and to promote the softening in the succeeding treading operation. The skins are next wetted, and their flesh is removed; or they are fleshed and then hung up to dry. They are again subjected to treading in tubs containing sawdust, and afterward in tubs containing plaster of Paris, or whitening, sprinkled between the skins. They are then beaten with a stick and comb: when the dressing is completed. M. Pierre Thirion proposes, in his patent of June, 1845, to soften the skins, not by treading, but by beating-stocks, of a construction like the falling-mill. They are next sewn up, and again felled in a strong vessel, where they are forced upward by the beaters, turned over and over, and thus speedily softened. They are now fleshed, and then returned to the beating-stocks, and mahogany or other sawdust is sprinkled upon the fur, before the beating is renewed. They are next placed in a heated barrel, furnished within with radial pins for turning the goods over and over, in order that they may be acted upon by various dry substances, which are thrown into the barrel, and absorb the fat from the skins. Through the hollow shaft of the barrel, steam is introduced, which heats the skins, softening the fat, which is then absorbed by sand, flour, or any other desiccative powder. It is proper to take the skins out of the barrel from time to time to comb them. Such as have been sufficiently acted upon may then be set aside. They are lastly freed from the dust by being subjected to a grated cylinder in a state of rotation, and then combed by hand.

Fusel Oil is the German name of the offensive smelling oil which exists in alcohol, as distilled from the fermented infusions of malt, and corn meal of all kinds, as also from the fermented wash of potatoes, and of beets, etc. A like oil occurs in the alcohol distilled from the fermented must of grapes, and the juices of many sweet fruits. This oil is not, however, identical from these several sources; as may indeed be inferred from the diversity in the flavors of the different liquors. But they all agree in being somewhat less volatile than water, and therefore make their appearance chiefly in the spirits toward the end of the distillation process. It is to the presence of this oil that the milkiness of the last, and also sometimes of the first, portions of the spirit that come over, called feints, owe their opalescence and their penetrating odor. When the milky fluid is redistilled, alcohol and water first pass over with very little oil, but if the heat of the still be moderate, the oil may be made a residuum, and obtained in a tolerably concentrated state.

Fustian (Ger. *Barchent*; Du. *Fustein*; Fr. *Fustaine*; It. *Fustagno*, *Frustagno*; Sp. *Fustan*; Rus. *Bumazsa*; Pol. *Barchan*) is a species of coarse, thick tweeled cotton, and is generally dyed of an olive, leaden, or other dark color. Besides the common fustian, which is known by the name of pillow (probably pillow), the cotton stuffs called corduroy, velverett, velveteen, thickset, used for men's wearing apparel, belong to the same fabric. The commonest kind is

merely a tweel of four, or sometimes five leaves, of a very close stout texture, and very narrow, seldom exceeding 17 or 18 inches in breadth. It is cut from the loom in half pieces, or ends, as they are usually termed, about 85 yards long, and after undergoing the subsequent operations of dyeing, dressing, and folding, is ready for the market.

Of velvet, there are properly only two kinds, that with a plain, and that with a tweel, or, as it is here called, a Genoa ground, or back. When the material is silk, it is called velvet; when cotton, velveteen; and this is the sole difference. In the same way a common tweeled cloth, when composed of silk is called satin; when of cotton, fustian or jean; of woolen, plaiding, serge, or kerseymere; and in the linen trade is distinguished by a variety of names according to the quality or fineness, or the place where the article is manufactured.

Fustic (Ger. *Gelbholz*, *Fustic*; Du. *Geelhout*; Fr. *Bois jaune de Brésil*; It. *Legno giallo de Brasile*; Sp. *Palo del Brasilamarillo*), the wood of a species of mulberry (*Morus tinctoria*), growing in most parts of South America, in the United States, and the West India Islands.

It is a large and handsome tree; and the timber, though, like most other dye-woods, brittle, or, at least, easily splintered, is hard and strong. It is very extensively used as an ingredient in the dyeing of yellow, and is largely imported for that purpose. Of 10,800 tons of fustic imported into Great Britain in 1850, 3395 tons were brought from New Granada, 2076 from the British West Indies, 1639 from Cuba, 945 from the United States, 750 from Mexico, and 669 from Brazil. Fustic from Cuba fetches full 30 per cent. more in the London market than that of Jamaica or Colombia. At present the price of the former varies from £9 to £9 10s. a ton, while the latter varies from £5 5s. to £6 a ton. The consumption amounts to about 6,000 tons a year. The duty on fustic was abolished in 1845.

Zante, or *young fustic*, is really a species of sumach (*Rhus cotinus*, L.), and is quite distinct from the *Morus tinctoria*, or *old fustic*; the latter being a large American tree, while the former is a small European shrub. It grows in Italy and the south of France, but is principally exported from the Ionian Islands and Patras in the Morea. It imparts a beautiful bright yellow dye to cottons, etc., which, when proper mordants are used, is very permanent. It is conveniently stowed among a cargo of dry goods, as it may be cut into pieces of any length without injury. Only a small quantity of this species of sumach is imported. Its price fluctuates considerably.—*Trees of America*.

There are several kinds of fustic-trees which might be formed into a peculiar group, from their baccate seeds. The tree fustic of dyers (*Morus tinctoria*) is a large tree 60 feet in height, bearing sweet, edible fruit about the size of a nutmeg, and is a native of Central America, Yucatan, Cuba, Jamaica, etc. The whole plant abounds in a slightly glutinous milk, of a sulphureous color. The wood is yellow, and is much used in dyeing, for which purpose it is chiefly imported into Europe and the United States, under the name of *fustic-wood*. There is a variety of this species, called *Bastard Fustic*, a tree smaller in stature, and less valuable as a dye, and is found from Yucatan to the southern parts of Florida and the *Br* ma Islands.—BROWN'S *Trees of America*, p. 460.

Futtocks, in a ship, the timbers raised over the keel, or the encompassing timbers which form her breadth and capacity. *Futtock plates* are iron plates crossing the sides of the top-rim perpendicularly. The dead eyes of the topmast rigging are fitted to their upper ends, and the futtock shrouds to their lower ends.—DANA'S *Seaman's Manual*.

Gaff, in a head of a foot of the sail.

Gage, a piece of cloth, a glove, cap, or challenge, or a water vessel in the water.

Gage, a piece of cloth, a glove, cap, or challenge, or a water vessel in the water.

Galace, or left bank of the Sereth and N.; long 28° 10' N.

G.

Gaff, in nautical language, a spar to which the head of a fore-and-aft sail is bent. *Gaff-topail*, a small sail set over a gaff, which serves to spread the foot of the sail.

Gage, a pledge or pawn given by way of security. II. *Gage*, a challenge to combat; that is, a gauntlet, glove, cap, or the like, cast on the ground by the challenger, and taken up by the acceptor of the challenge. III. *Gage*, in nautical language, the depth of water a vessel draws, i. e., the number of feet she sinks in the water. In a different sense, when a ship is to windward of another, she is said to have the *weather-gage* of such vessel. IV. *Gage*, among letter-founders, a piece of hard wood variously notched, used to adjust the dimensions, slopes, etc., of the different sorts of letters. In joinery it denotes an instrument to strike a line parallel to the straight side of a board. *Sliding-gage*, among mathematical instrument-makers, a tool for measuring and setting off distances. V. The term *gage*, implying *measure*, as of depth, height, force, quantity, etc., is frequently used in composition to denote particular kinds of instruments; as, sea-gage, tide-gage, wind-gage, rain-gage, etc.

Galatz, or **Galatz**, a town of Moldavia, on the left bank of the Danube, between the confluence of the Sereth and Pruth with that river. Lat. $45^{\circ} 25' N.$; long. $28^{\circ} E.$ It is ill-built and dirty, though in these respects it has latterly been much improved. Population supposed to amount to 25,000. The trade of the town is chiefly carried on by Greek merchants; but, within the last few years, various English and other foreigners have formed establishments in it. Though at a considerable distance inland, Galatz is in the best position for becoming the port of the Danube. At present, however, it is little more than the port of Moldavia, Ibralla, or Brailow, about 12 miles further inland, being the port of Wallachia. The commercial importance of these ports, and indeed of the Danube, dates only from the treaty of Adrianople in 1829. Previous to that epoch the trade of the principalities labored under the most oppressive restrictions, and was principally carried on by land. But all articles of native produce may now be freely exported either by sea or land, on paying moderate duties; and the duties on imports are also, for the most part, comparatively moderate. The probability, indeed, seems to be that Galatz, "the Alexandria," as it has been called, "of the Scythian Nile," will at no very distant period become a first-rate emporium. The rescuing of Moldavia and Wallachia from Turkish misgovernment has been of signal advantage; and it is to be hoped that they may never again be subjected to its paralyzing influence. The establishment of a regular intercourse by means of steam packets between Vienna and Galatz, and thence by the Black Sea, with Constantinople and Trebizand, has already done a great deal, and will every day do more, to introduce a spirit of improvement into the vast and fertile, but long neglected, countries traversed by the Danube in the lower part of its course. The capacities of this great river as a commercial highway are certainly unequalled by those of any other European stream; and their full development would be of immeasurable advantage, not merely to the countries on its banks, but to all commercial nations.

Exports and Imports.—Moldavia and Wallachia are very productive provinces, being fruitful both of corn and cattle. The high prices of corn in France, Italy, and England, in 1846 and 1847, gave an extraordinary stimulus to the export trade of Galatz and Ibralla. The exports of wheat from both ports, in 1817, amounted to no fewer than 570,978 quarters, worth on

board ship, £875,603; the exports of Indian corn during the same years, were 937,720 quarters, worth £1,172,150; and among the other exports were about 820,000 quarters of barley, and 42,000 cwt. of tallow, with a variety of inferior articles. The total value of the exports from the two ports during the above year, amounted to the very large sum of £2,868,472, of which about two thirds were from Ibralla. The quality of the wheat, which is partly hard and partly soft, was, a few years ago, very inferior, being generally damp, and having an earthy smell from its being kept in pits dug in the ground. Latterly, however, it has been much improved; and the finer samples now fetch, in Marseilles, Genoa, and Leghorn, within from 3 to 4 per cent. of the price of Odessa wheat. In 1852, we imported 80,140 quarters of Wallachian and Moldavian wheat, with no fewer than 626,714 do. Indian corn. Both provinces fatten large herds of cattle, particularly Moldavia, which annually sends great numbers to the Austrian States. Tallow may be had in large quantities, its annual produce, in Wallachia only, being estimated at about 3,000,000 okes, or 8,500,000 pounds. Until within these few years, the tallow shipped at Galatz was burdened with a heavy export duty, which checked its sale, and consequently, also, its growth. Happily, however, that duty is now reduced to 3 per cent., and the exportation is rapidly increasing. The quality of the Danubian tallow is excellent. Among the other articles of exports are wool, timber, hides, and skins, lard, butter, bristles, bones, jerked beef, linseed, barilla, yellow-berries, coarse cheese, etc. Timber of the finest quality may be had in any quantity; but as it can only be advantageously exported in large ships, which can not when laden make their way over the bar, the trade in it has hitherto been confined within comparatively narrow limits. One, however, would be disposed to think that this difficulty might be obviated by sending down the timber in rafts and loading outside the bar. Notwithstanding the recent period at which the navigation of the Danube has been opened, and the barbarous state of the countries in the lower part of its course, the value of the exports from Galatz and Ibralla probably in 1853 exceeded £1,800,000 a year, of which from £750,000 to £800,000 may be from the former. But, considerable as this is, it is nothing to what it certainly would be were civilization to make any considerable progress in the countries traversed by the Danube after it leaves the Austrian dominions, and still more were the river to become, as it naturally is, the principal channel for the conveyance of products to and from Hungary and Transylvania. The great articles of import are manufactured cotton goods, and cotton twist, principally from England, the demand for which is rapidly increasing; with sugar, coffee, and other colonial products; olives and olive-oil, iron and steel, hardware, etc.

Entrance to Galatz.—Of the three principal mouths of the river, the Soulineh (middle) mouth, in latitude $45^{\circ} 10' 30'' N.$, long. $29^{\circ} 41' 20'' E.$, is the only one accessible by vessels of considerable burden. The depth of water on the bar, at its entrance, half a mile from the shore, varies from 10 to 13 and 14 feet, according to the season of the year, and the direction of the wind. When the latter blows from the east, it is opposed by the current of water flowing from the west, so that the bar is rapidly increased by the deposit thereon of the mud brought down by the river; and when, on the contrary, the current and the wind coincide, the mud is carried out into the sea, and the depth of water on the bar is progressively augmented. The assistance of a powerful dredging-machine, or

machine fitted to stir up the mud, or other deposit forming the bar during the prevalence of westerly winds, would be of great importance; and it is believed that with its agency the channel might be very materially deepened. Great complaints have been made of the state of the navigation of the Danube during the present year (1855). It appears to have been occasioned partly by difficulties arising out of the disputes between Russia and Turkey, and partly by the prevalence of easterly winds. But it would be easy, by erecting a light-house, to mark the entrance to the river, and employing a dredging-machine and steam-tugs, to obviate the physical obstructions to the navigation. From the bar to Galacz and Ibraila, there is nowhere less than 18 feet of water, and in many places from 60 to 70. Vessels of 300 tons lie close to the quays at Galacz. The shores at the mouth of the river being low and bordered with reeds and shoals, vessels intending to enter the river generally make the small rocky islet of Phidonia, or Serpent's Isle, in lat. 45° 15' 15" N., long. 30° 10' 30" E., whence the Soulineh mouth bears west by south, distance 23 miles. According to Mr. Cunningham, the first objects seen, on nearing the shore, are the masts of vessels in the river and the houses in the town of Soulineh, which, however, are very low. Hagemeister says that there is a wooden tower on the south shore at the entrance to the river; but though the contrary has been often affirmed, and its position given in Arrowsmith's map, there is certainly no light-house. When a ship approaches the entrance, a boat from the Russian captain of the port goes off, and by waving a red flag indicates the course to be kept. Lighters are generally stationed without the bar, into which large ships discharge a part of their cargoes; and pilots may generally be obtained from them or other vessels. As the current is sometimes very strong, and difficult to stem, a proper establishment of steam-tugs at the mouth of the river would be a great advantage. An E.S.E. wind carries a vessel from Soulineh to Galacz through all the different reaches of the river; but otherwise the navigation is difficult, and towing is in part necessary.

Frost usually sets in on the Danube in the month of December, and continues till the month of March; in 1833, however, there was no frost. Freights in the ports of the Danube are always from 20 to 25 per cent. higher than in Odessa; premiums of insurance, on the contrary, are not higher than at the latter, except on such vessels as, on account of their size, are obliged to discharge outside the bar.

Money, Weights, and Measures.—These are mostly the same as at Constantinople, which see. Accounts are kept in piastres and paras. 1 piastre=40 paras.

Galacz.—Ducat blanc=pia. 44. Silver ruble=15 pia. Spanish dollar=19 pia. 32 paras. Turkish yermelik, old coinage=19 pia. 32 paras; Turkish yermelik, new coinage=17 pia. 15 paras. Austrian swanziker=3 pia. 5 paras. It is to be observed that when exchanges are so high that it is requisite to remit in specie, any of these coins may go to a premium, according as it suits better than others for the remittance; and just now, owing to the want of bills to remit to Austria, the ducat blanc=44 pia. 20 paras.

Ibraila has two rates of currency; the one for charges, which is the same as in Galacz, and the other for the purchase of merchandise, as follows:—Ducat blanc=32 pia.; Spanish dollar=14½ pia.; Turkish yermelik, old coinage=11½ pia.; Turkish yermelik, new coinage=12 pia. 28 paras; swanziker=2 pia. 12 paras. **Note.**—The same as in Galacz, any of these coins may go to a premium.

Galacz and Ibraila.—All duties are paid in both places, in the course of the Treasury, as follows:—Ducat blanc=31½ pia.; silver ruble=10½ pia.; Spanish dollar=14 pia.; Turkish yermelik, old=14 pia.; swanziker=2½ pia.

The ducat blanc weighs 1 Turkish drachm. **Exchanges.**—Bills can generally be sold on the following places, and the present (1842) rates are as noted; it must be observed, however, that these rates are very high; and when a great deal of paper is offering, they may go 4 per cent. lower.

Port Charges.—In Galacz anchorage is 30 pia., and a guardian for 5 days' observation, 5 pia. per day. In Ibraila anchorage is 17½ pia., and guardian for 5 days' observation, 5 pia. per day.

Quarantine.—Vessels generally remain in quarantine during their stay, as little or no advantage is gained by taking pratique.

Vessels wishing to take pratique may obtain it in 14 to 21 days according to the state of health in Tur-

key, by taking the captain a passenger, by last year, as well as along the days.

The total number of vessels departing from Galatz and Ibrailla in 1851 was, 1,668, with an aggregate tonnage of 800,845. Of these, 534 were Greek, with an aggregate tonnage of 112,438; 352 were Turkish, with an aggregate tonnage of 50,234; and 304 vessels

were English, with an aggregate tonnage of 55,625. There was one vessel from Buenos Ayres.

The export of grain constitutes the leading commercial movement of the port of Galatz. The following table exhibits the grain export trade of the ports of Galatz and Ibrailla, during three consecutive years:

The port of Galatz is the outlet for the produce of Wallachia and Moldavia. And its imports in 1850 amounted to \$2,175,000, its exports, consisting of grain, tallow, preserved meat, wine, and linseed, reach, annually, about \$3,877,650. How far American interests might be promoted in the foreign trade of the Danubian and other ports of the Turkish dominions, may be gathered from the following table, exhibiting the articles of foreign and colonial produce exported to Turkey in the year 1851. The table includes, also, the imports into Wallachia, Moldavia, Syria, Palestine, and Egypt:

Description of merchandise.	Quantities.

Duties.—An *ad valorem* duty of 3 per cent. is levied on all articles, except provisions, imported into, or exported from, the principalities of Moldavia and Wallachia. Government reserves to itself the power of prohibiting the exportation of any article, but it has to give a month's previous notice of any such prohibition.

Galatz is a free port; that is, a port at which all commodities may be landed, warehoused, re-exported, and consumed in the town, free of duty. Quarantine regulations are strictly enforced, unless performed previously to entering the river.

Ismail and Reni, ports of the Russian province of Bessarabia, are situated on the Danube, and are both, but especially Ismail, a good deal nearer its mouth

than Galatz; but they are much less considerable in point of commercial importance. Having little importation, their trade is confined almost entirely to the exportation of corn, and even in this respect they are very inferior to Galatz and Ibrahlow. They are subject to the Russian duties and regulations. We have gleaned these particulars from a variety of works, but principally from the valuable *Report* by Mr. Cunningham, now vice-consul at Ibrahlow, printed at Galatz in 1841; the work of Hagemester, *On the Commerce of the Black Sea*, Eng. trans. pp. 83-95, etc.; *Purdoy's Sailing Directions to the Black Sea*, p. 193, etc.

The port of Varna is situated on the W. coast of the Black Sea, at the bottom of a rather small bay, about 8 miles N.W. Cape Galata, the latter being in lat. 43°

10° N., long. 27° 56' E. The ordinary anchorage is to the S.E. of the town, in 7 or 8 fathoms, bottom sand and oase. It is open to all winds between E. and S.S.E. Vessels to and unload by means of lighters, it being dangerous to approach within less than one quarter of a mile of the shore. Both hard and soft wheat are shipped from Varna, the value of the former being from 50 to 40 per cent. greater than that of the latter. An export duty is charged on wheat when exported, and being a fixed duty of about 2s. 8d. a quarter, it is high when prices are low, and low when they are high.

Steam to Galacz.—Steam navigation was first established on the Danube in 1830, since which the undertaking has gone on prospering, so much so, that the communication between Vienna and Constantinople is now maintained by a line of 7 or 8 steam vessels. The Austrian Steam Company, which was the first in the field, have extended their scheme by starting vessels between Vienna and Linz, and a Bavarian Company commenced in 1838 running vessels between Ratisbon and Linz. At present (or very recently) steamboats ply on the Danube as long as the river is free from ice (usually from February or March to November), from Ratisbon to Linz, once a week; Linz to Vienna, 10 hours, once a week; Vienna to Presburg at 4 P.M., twice; Pesth to Drenceva, once a week; Gladova to Galacz, once a week; Galacz to Constantinople, once a fortnight. The voyage from Vienna to Constantinople, including stoppages, is seldom performed in less than 14 days, and sometimes occupies 17; in returning against the stream it takes at least a month, including 10 days' quarantine at Orsova. The fare was lately, first place, 134 florins, about £13; second place, 94 florins.

The navigation of the Danube by steamers is unfortunately interrupted for about 50 miles, between Drenceva and Gladova, by rocks and rapids, the lowest and most considerable of which is a sort of cataract, called the "Irongate," about 3 miles below the Hungarian frontier. It is worthy of remark that the most illustrious of the Roman emperors, Trajan, alive to all the advantages to be derived from the easy navigation of the Danube, had with equal industry and sagacity formed a road, or towing path, along the river's edge, for facilitating the operation of towing, of which the remains are still extant, with an inscription commemorative of the completion of the works. It has been proposed to overcome the difficulties in the way of the navigation by renovating the old Roman road, and deepening the channel contiguous to it. But it rarely happens that attempts to improve the navigation in the bed of a river, under any thing like similar circumstances, are even tolerably successful. The better way undoubtedly would be, were it practicable, to construct a lateral canal, or rather a canal from the mouth of the Bereska to Palanka, which would not only avoid the rapids, but also shorten the navigation by getting rid of the bend of the river by Orsova. But the difficulties in the way of such an undertaking, from the nature of the ground, are said to be insuperable; and it is, therefore, probable that the distance of 50 miles along the rapids will continue, if not always, at least for some considerable time, a portage. The inconvenience, however, of this break in the navigation has been diminished, as far as possible, by the construction of an admirable carriage road, at great expense, by the Hungarian diet, from Moldava to Orsova. In the extent of excavations in the rock, and terraces of masonry, upon which it is carried, it is not inferior as a specimen of engineering to the finest roads over the Alps. Several steamers have been transported down these rapids at the season of floods, small barges pass them at all times, and little boats, laden with wax and wool, are towed up by men and oxen. The passengers and goods conveyed by the steamers are transferred from Moldava in row-

boats, to Gladova, below the Irongate, where they embark on another steamer.—*Geog. Dict. art. Danube.* A railroad is completed from Bruun, the capital of Moravia, to Vienna; another railroad diverges, from the Danube at Linz, north to Budweis in Bohemia, where it reaches the banks of the Muldau, and through it communicates with the Elbe.

Junction of the Danube and the Rhine.—The long projected canal to unite the Danube and Rhine, the favorite scheme of Charlemagne, having been undertaken by the Bavarian government, was completed and opened in 1816. It extends from Bamberg, by Erlangen and Nuremberg, to Neumark, joining the Danube at Kellheim, a few miles above Ratisbon. The distance between the Maine near Bamberg, and the Danube, is about 112 miles; but the actual extent of canal is less, the communication being in part effected by the Regnitz, a tributary of the Main, and the Altmuhl, a tributary of the Danube. There is now, consequently, an internal communication by water throughout all the vast country, stretching from the shores of the Netherlands to the Black Sea; so that produce shipped at Rotterdam or at Galacz may be conveyed from the one to the other in the same vessel.

Galangal (Ger. *Galgant*; Du. and Fr. *Galanga*; Rus. *Kalgan*; Lat. *Galanga*; Arab. *Kusutak*; Chin. *Lauandon*), the root of the *galanga*, brought from China and the East Indies in pieces about an inch long, and hardly half an inch thick. A larger root of the same kind (*greater galangal*), an inch or more in thickness, is to be rejected. It has an aromatic smell, not very grateful; and an unpleasant, bitterish, extremely hot, biting taste. It should be chosen full and plump, of a bright color, very firm and sound. 12 cut. are allowed to a ton.—*LEWIS'S Mat. Med.*; *MELNUR'S Orient. Com.*

Galapagos, a group of islands in the Pacific Ocean, so called from the Spanish *galapago*, a land tortoise, from their abounding in that animal. They consist of six principal and seven smaller islands, lying between 1° N. and 2° S. lat., and between 89° and 92° W. long., about 700 miles from the continent of South America. The largest, Albemarle Island, is 60 miles in length, by about 15 in breadth. The highest part is 4000 feet above the sea. They are all of volcanic origin; and along their shores black dismal-looking heaps of broken lava everywhere meet the eye. In many places the lava cliffs are very high, while close to them the water is so deep that a ship can not anchor even in a calm. In the interior are some valleys and plains of moderate extent and of great fertility. The land tortoises, called the great elephant tortoises, their feet being like those of a small elephant, are numerous, and grow to a great size, frequently weighing several hundred pounds. A small colony has been established on Charles Island, in a plain about 1600 feet above the sea. They cultivate bananas, sugar-cane, sweet potatoes, and Indian corn, and supply with these articles the whalers who resort to the island. The climate is healthy, and the heat moderate, considering the geographical position of these islands.

Galatz. See GALACZ.

Galbanum (Fr. *Galbanum*; Ger. *Mutterkatz*; It. *Galbano*; Lat. *Galbanum*; Arab. *Harzud*), a species of gum resin obtained from a perennial plant (*galbanum officinale*) growing in Africa, near the Cape of Good Hope, and in Syria and Persia. It is brought to this country from the Levant in cases or chests containing from 100 to 300 lbs. each. The best is in ductile masses, composed of distinct whitish tears agglutinated together by a pale brown or yellowish substance. It is generally much mixed with stalks, seeds, and other impurities. The separate tears are considered as the best. When the color is dark brown or blackish, it is to be rejected. It has a strong peculiar odor, and bitterish, warm, acrid taste.—*THOMSON'S Dispensatory.*

Gale of storm of wind next a strong gale.

Galena, miles north-west of Bean River, and the metallic mines above it to this place, steamboats. St. Louis, Ne other places of amount of length usually is 42,000 employing about 1000 men of zinc and sulphur region. Therefore, and are not it can not be produced there as *Dry H.* is found in sheets inches to several.

Galena (Fr. metallic-looking crystallizes in of cleavages par gravity, 7-7592 pipe with zinc reduced to metal and then through chloride; the so brilliant laminae of sulphur, 13; times a minute of ore of lead, and formation, in veins always accompanied with lead, heavy powder, called a coarse stonework **Galipot** is a found on fir-tree poor in oil.

Galleons, three or four de rating with Peru.

Galley (Fr. *galles* and oars, and benches one above tiquity were all chiefly mentioned to have had 50 oars trieres (Lat. *trieres* concerning the di has taken place. trireme had three but this is rendered Pliny making men even 50 banks of that so many could each other. Some oars in the trier but obliquely; in ber of banks of o probably the height See *Meibomius, De*

Galleys were like time nations of the Their use in naval the 17th century; the period of its ex ber of war-galleys tier only, and all construction. The but unfit for sea, a

Gale of Wind. The sea term for a continued storm of wind; the lowest degree is the fresh gale, the next a strong gale, and the next a heavy or hard gale.

Galena, a city of Jo Daviess county, Illinois, 290 miles north-west of Springfield, situated on Fever or Bean River, and on the Galena and Chicago Railroad, and the metropolis of the great lead region. It is six miles above the mouth of the river, which is navigable to this place, at all stages of the water, for the largest steamboats. It has an intercourse by steamboat with St. Louis, New Orleans, Louisville, Cincinnati, and other places on the Mississippi and Ohio Rivers. The amount of lead shipped from Galena and vicinity annually is 42,000,000 of pounds, valued at \$1,780,000, employing about 2000 persons. The most productive ores of zinc and copper, sulphuret and carbonate of zinc and sulphuret of copper everywhere abound in this region. Thousands of tons of zinc lie upon the surface, and are neglected, because, in the absence of coal, it can not be profitably smelted. It is popularly known there as *Dry Bones* and *Black Jack*. Sulphate of iron is found in sheets of larger extent, ranging from a few inches to several feet in thickness.

Galena (Fr. *Plomb sulfuré*; Ger. *Bleiglantz*), is a metallic-looking substance of a lead-gray color, which crystallizes in the cubical system, and is susceptible of cleavages parallel to the faces of the cube; specific gravity, 7.5592; can not be cut; fusible at the blow-pipe with exhalation of sulphurous vapors; is easily reduced to metallic lead. Nitric acid first dissolves it, and then throws down sulphate of lead in a white precipitate; the solution affording, with plates of zinc, brilliant laminae of lead (after Saturni). It consists of sulphur, 13; lead, 85; with a little iron, and sometimes a minute quantity of silver. This is the richest ore of lead, and it occurs in almost every geological formation, in veins, in masses, or in beds. It is almost always accompanied by sulphuret of zinc, different salts of lead, heavy spar, fluor spar, etc. Galena in powder, called *alquifoux*, is employed as a glaze for coarse stoneware.

Galipot is a name of a white semi-solid viscid resin found on fir-trees; or an inferior sort of turpentine, poor in oil.

Galileas. Certain Spanish treasure-ships with three or four decks, formerly employed in communicating with Peru.

Galley (Fr. *galère*), a low-built vessel propelled by sails and oars, either on a single tier, or on tiers of benches one above the other. The war vessels of antiquity were all galleys. Among the Greeks, those chiefly mentioned are the pentecontori, which appear to have had 50 oars disposed in a single tier; and the trieres (Lat. *triremes*), vessels with three banks of oars, concerning the disposition of which much controversy has taken place. It is commonly supposed that a trireme had three banks of oars, one above the other; but this is rendered improbable by the circumstance of Pliny making mention of galleys having 30, 40, and even 50 banks of oars; for it seems hardly credible that so many could have been arranged directly above each other. Some have suggested that the rows of oars in the trireme were disposed, not horizontally, but obliquely; in which case an increase in the number of banks of oars would augment the length, and probably the height would be increased in proportion. See *Mibomius, De Fabrica veterum Triremium*.

Galleys were likewise chiefly employed by the maritime nations of the middle ages in the Mediterranean. Their use in naval war hardly ceased until the end of the 17th century; and the Venetian republic, down to the period of its extinction, always maintained a number of war-galleys. The Venetian galleys had a single tier only, and all modern galleys followed the same construction. These were formidable vessels in a calm, but unfit for sea, and accordingly found chiefly in the

Mediterranean. The Venetians had also a large high-pooped sort of galley called *galeazza*, whence the word *galleas* and *galliot* in old English writers.

The *Deal galley* is a long narrow boat used by the Deal boatmen, and managed, on the most hazardous occasions, in saving the crews of stranded vessels, with consummate skill. It is also used by smugglers, on account of its velocity. The galley is also the kitchen of a ship.

The punishment of the *galleys*, i. e., the employment of condemned criminals in the toilsome employment of rowing them, is said to have originated under the Greek empire, as well as the name *Galæas*, or galley-slaves—in French, *galériens*. It was used by all the nations bordering on the Mediterranean. In France, under the old jurisprudence, the punishment of the galleys was the severest after that of death. About the end of the reign of Louis XIV., when galleys themselves began to be disused, the galley-slaves were employed in hospitals, public works, etc.; and the name of the punishment was changed by the Constituent Assembly (1789) to *travaux forcés*, compulsory labor, whence the word *forçat* for a criminal so condemned. Under the code of the empire, the punishment was accompanied with forfeiture of property, infamy, and branding. By an alteration of the law, effected in 1832, the brand was abolished; and the criminals, who had hitherto been intermingled in the three penal fortresses (Toulon, Rochefort, and Brest), were classified. Toulon is now appropriated to those condemned for 10 years and under, Brest to those from 10 to 20, Rochefort to the condemned for life. The name *Bagne*, which is applied in France to prisons in which those condemned to compulsory labor are confined, is derived from the famous Bagno prison at Constantinople, so called on account of some baths situated there. The principal crimes now punished in this manner by the French law are—some acts of violence against the government or public law, coinage and forgery, assaults, followed by death, on legal officers, murder, unless under such aggravated circumstances as are punished by death, cutting and maiming, rape, abduction, burglary, highway robbery, burning of insulated buildings, threatening letters, perjury, etc.

Gallipoli, a seaport town of south Italy, kingdom of Naples, province Terra di Otranto, on the east shore of the Gulf of Taranto, on the rocky islet at the west extremity of a narrow peninsula, to which it is joined by a bridge; lat. 40° 3' N., long. 17° 58' E. It is fortified, has a castle, and is well built. Population about 7000 (6709 in 1843). It is the principal port of the Mediterranean for the shipment of olive oil, and has, in consequence, a considerable trade. It is indebted for this distinction partly to its being situated in a country where oil is produced in the greatest abundance, but more, perhaps, to the circumstance of the cisterns cut in the limestone rock on which the town is built, being peculiarly well fitted for the preservation of the oil. They do not differ much in appearance from a common water-tank. They are usually under the houses of the inhabitants; are arched over, with the exception of a circular hole, into which the oil is poured, and through which it is again drawn up. It will keep in these cisterns for an indefinite period; and is materially improved, not only in clearness, but also in flavor. When the oil is to be shipped, it is drawn off from the cisterns into *ucri*, or skins, which are carried on men's backs to the shore, where the casks, being filled, are conveyed in lighters to the ships.

Gallipoli has no harbor, but a bay or roadstead north-east of the town. The latter has from 10 to 12 fathoms water; but it shoals toward the shore; and vessels of considerable burden should not come within less than a musket-shot of the land. Those that come nearest to the shore, moor with their heads to the north-west, with two cables out ahead and two astern, in

from 16 to 20 feet of water. The only danger in entering or leaving the roads is a blind rock at their entrance, about 500 yards N.N.E. from the fort. It has only about from five to seven feet of water; and as it is not marked by any buoy, pilots should be employed by foreigners. A tunny fishery is carried on inside the bay; but the nets are easily avoided. Winds from the north and north-west throw in a heavy sea. About 1½ miles west from the town is the low, flat island of St. Andrea. It is said, in *Norie's Sailing Directions for the Mediterranean*, that there is a light-house on this island. But, though a light-house on it would be of great service to ships making the port, and though it be laid down in some of the charts of this sea, the truth is that none such really exists, nor is there even a tower on the island! There are some lesser islands between St. Andrea and the main-land. There is deep water between the former and the nearest islands, but not between the latter and the town. A dangerous shoal lies about half a mile south of St. Andrea.

Gallipoli Oil is a coarse olive oil, containing more or less muelage, imported from a sea-port, so named, of the province of Otranto, in the kingdom of Naples.

Galls, or Gall-Nuts (Fr. *Galles Noix de Galle*; Ger. *Gallepfel, Gallus*; It. *Galic, Galluze*; Lat. *Galla*; Arab. *Afa*; Hind. *Majouphal*; Per. *Mazu*), are excrescences produced by the attacks of a small insect, which deposits its eggs in the tender shoots of a species of oak (*Quercus infectoria* Linn.), abundant in Asia Minor, Syria, Persia, etc. Galls are inodorous, and have a nauseously bitter and astringent taste. They are nearly spherical, and vary in magnitude from the size of a pea to that of a hazel-nut. When good, they are of a black or deep olive color; their surface is tubercular, and almost prickly; they are heavy, brittle, and break with a flinty fracture. They are known in commerce by the names of *white, green, and blue*. The white galls are those which have not been gathered till after the insect has eaten its way out of the nidus and made its escape. They are not so heavy as the others, and are of a lighter color, and do not fetch so high a price. The green and blue galls are gathered before the insect has escaped; they are heavier and darker than the former, and are said to afford about one third more of coloring matter.

Galls are of great importance in the arts, being very extensively used in dyeing, and in the manufacture of ink, of which they form one of the principal ingredients. They are the most powerful of all the vegetable astringents; and are frequently used with great effect in medicine. Galls consist principally of three substances: tannin or tannic acid; yellow extractive; and gallic acid. The decoction has a very astringent and unpleasant bitter taste. The ancients reckoned the gall-nuts of Syria superior to every other, and they still retain their pre-eminence. They are principally exported from Aleppo, Tripoli, Smyrna, and Sald; those brought from the first come chiefly from Mosul, on the western bank of the Tigris, about ten days' journey from Aleppo. The real Mosui galls are unquestionably the best of any; but all that are gathered in the surrounding country are sold under this name. Those from Catramania are of a very inferior quality. The galls met with in India are carried thither from Persia by Arabian merchants. It is not unusual to dye the whitish gall-nuts blue, in order to increase their value. The fraud is, however, detected by the deeper blue tinge that is thus imparted to them; and by their being perforated and lighter than the genuine blue galls.—BANCROFT on *Colors*; ANGLER'S *Mat. Indica*, etc.

The *Gall-nut Oak* (*Quercus infectoria*), a native of Persia, Asia Minor, Arabia, Egypt, Morocco, and Algeria, in its natural habitat, is an evergreen shrub, with a crooked stem, and seldom attains six feet in height. From the circumstance of its growing near Paris, where it bears the winter quite well in the open

air, though losing its leaves in the autumn, it doubtless would be adapted to the climate of our middle and southern States. On this shrub, it may be unnecessary to state, is found the well-known "gall-nuts" of commerce, which are extensively used in the manufacture of writing-ink, and in dyeing. These excrescences are the product of the gall-fly (*Cynips scriptorum*), a small insect of a pale-brown color, which may often be found enclosed in the galls sold in the shops of the druggists, collected before the fly had made its appearance.

Galvanized Iron, is the name given to iron tinned by a peculiar patent process, whereby it resists the rusting influence of damp air, and even moisture, much longer than ordinary tin-plate. The following is the prescribed process: Clean the surface of the iron perfectly by the joint action of dilute acid and friction; plunge it into a bath of melted zinc, covered with sal-ammoniac, and stir it about till it be alloyed superficially with this metal; when the metal thus prepared is exposed to humidity, the zinc is said to oxidise slowly by a galvanic action, and to protect the iron from rusting within it, whereby the outer surface remains for a long period perfectly white, in circumstances under which iron tinned in the usual way would have been superficially browned and corroded with rust.

Galvanized Tinned Iron.—One of the most remarkable advancements in the iron manufacture in recent years has been the introduction of *galvanized tinned iron* for an almost innumerable variety of purposes. This material consists of iron plate coated with tin, not by the ordinary tin-plate process, but by galvanic deposition. It serves as a substitute for plain iron, for tin-plate, for zinc, and for lead, under certain special circumstances. It is stronger and more durable, for many purposes, than lead or zinc; it is better than plain iron where rust is to be avoided; it is superior to lead or zinc in warm climates, inasmuch as it does not expand and contract to so great a degree. Within a house and without, in vessels and in utensils, in towns and in the country, in manufactures and in domestic economy, we now find this substance employed. We have galvanized tinned iron corrugated plates for roofing, and for the sides and doors of houses; in another form there are plain plates for the same purpose; roofs for sheds, roofs and sides for store-houses, and many similar purposes. Then, besides the sheet form, there are round and square bars, hoop-iron, wire, tubes, and pipes, nails, rivets, bolts, screws—all formed of iron thus protected by the galvanic process. There is this advantage also, which is unattainable by the ordinary tin-plate process, that articles can be tinned after they are made in the proper form of iron, provided they are of small dimensions. The plates are really a combination of three metals; for, in the first place, a layer of tin is precipitated on the iron plates from a solution of chlorid of tin by the galvanic process; and then a layer of zinc is obtained by dipping the sheets into molten zinc.

Galveston, city, port of entry, and capital, Galveston county, Texas, 350 miles from the S. W. Passage of the Mississippi River. Lat. 29° 18' 32" N., long. 62° 44' 38" W. It is situated on the east end of Galveston island, and is the great commercial emporium of Texas. It was settled in 1837. It contains a bank, capital \$300,000, a steam foundry, 4 printing-offices issuing 2 tri-weekly, 1 semi-weekly, and 1 weekly newspaper, 3 cotton-presses, 50 stores, and population, in 1856, about 6000. Tonnage in 1855, 6173 tons.

The bar outside Galveston harbor and bay, between the north-east end of the island and Point Bolivar on the mainland, has not more than 134 feet of water at the highest springs, and but 10 feet at ebb; hence the smaller class of vessels, or those under 200 or 250 tons are most suitable for the trade of the port, as well as for that of almost all the other ports on the north and east sides of the gulf, the deficiency of water

being all the houses of at a distance feet of water proach the ing-to and promptly at feet of water shoals to making the in five or six excellent, the cables have on the look tempt crossed board. In water. The north to southwest, has no and is inter from five to Several very ures in the command of

Increase. The value of less than that when the valu

being all but universal. Though the land be low, the houses of Galveston may be seen from the mast-head at a distance of several miles. Vessels drawing eight feet of water and upward should, however, not approach the bar nearer than six fathoms, without heaving-to and making the signal for a pilot, which is promptly attended to. Vessels drawing less than eight feet of water may approach the bar till the water shoals to four fathoms before heaving-to. Vessels making the port in the night should invariably anchor in five or six fathoms; and the holding ground being excellent, those who are well found in anchors and cables have nothing to fear. Pilot-boats are constantly on the look-out; and ships should on no account attempt crossing the bar till they have got a pilot on board. In the harbor there is from 18 to 30 feet of water. The bay, which stretches about 35 miles from north to south, and from 12 to 18 miles from east to west, has not generally more than nine feet of water, and is intersected by a bar, on which there is only from five to six feet of water.—*Kennedy's Texas*, p. 29. Several very considerable rivers have their embouchures in the bay, so that the town has a considerable command of internal navigation.

The present year (1856), closes an epoch in the growth of sugar in Texas. The almost total destruction of the plant by the unprecedented cold of last winter will reduce the product of the coming year to almost nothing. Should all who have heretofore produced sugar determine to go on, it is doubtful whether the growing crop of cane will afford much more than seed sufficient for a re-commencement. The receipts of Texas sugar and molasses, at this port, for the calendar years named below, were as follows:

Year.	Molasses, bbls.	Sugar, hhd.
1850.....	2,427	2,789
1851.....	1,909	1,086
1852.....	2,578	1,829
1853.....	6,966	4,076
1854.....	5,999	4,754
1855.....	6,729	4,731

For the commercial year ending August 31, 1855, the receipts of sugar were 5375 hhd. against 7570 hhd. for the year just closed; and the receipts of molasses were then 7504 bbl against 8668 bbls. for the year last past. We apprehend that two years will be required to bring the production again up to these figures.

The following is a comparative statement of shipments of the leading articles of export from Galveston for each calendar year since 1853:

Articles.	1853.	1854.	1855.
Cotton, bales.....	60,892	84,173	68,858
Sugar, hhd.....	4,078	4,754	4,731

Beef Cattle.....	9,769	8,957	4,861
Hides.....	14,146	13,234	20,517

STATEMENT OF THE QUANTITY AND ESTIMATED VALUE OF ARTICLES OF MERCHANDISE OF DOMESTIC GROWTH AND MANUFACTURE, EXPORTED FROM GALVESTON, TEXAS, IN THE YEAR ENDING DECEMBER 31, 1855.

Articles.	Total.	A. average prices.	Valuation.
Cattle.....number	4,801	\$16 00	\$69,776
Cotton.....bales	76,953	35 00	2,693,355
Hides.....number	20,517	4 00	82,068
Molasses.....gallons	84,945	25	2,123,625
Sugar, cane.....pounds	1,894,710	7	13,263,279
Total.....			\$3,001,864

The value of domestic produce exported from this port during the past two years affords a highly favorable contrast in favor of the season just closed. The amount of shipments was, August 31, as follows:

Year.	Coastwise.	Foreign.	Total.
1855.....	\$9,850,770	\$1,492,845	\$11,343,615
1855.....	2,012,604	654,816	2,667,420
Increase.....	\$7,838,166	\$808,029	\$8,646,195

The value of the exports, for the year just past, is less than that of the year ending with August, 1854, when the value of exports, coastwise, was \$3,637,256,

and foreign, \$778,248—total, \$4,415,504.—Texas has not had a favorable season for crops since 1853; and 1856 will add another to the years of short crops, though an improvement over the last two is anticipated.

The number of vessels which arrived at this port, from beyond the district of Texas, during the year 1856, was 269, viz.:

Vessels.	Coastwise.	Foreign.	Total.	1855.
Steamships.....	97	0	97	96
Ships.....	11	7	18	14
Barks.....	46	13	64	69
Brigs.....	28	1	29	32
Schooners.....	60	1	61	43
Total.....	242	97	309	253

Increase—Steamships, 7; ships, 1; barks, 5; brigs, 7; schooners, 12. Total increase, 36.

Of vessels belonging to the port of Galveston the custom-house books of the present year (1856), show that there are:

Year ending Aug. 31.	1855.	1856.
Ships.....	1	0
Barks.....	3	1
Brigs.....	1	3
Schooners.....	63	64
Steamboats.....	16	17
Sloops.....	15	11
Total.....	99	96

The amount of tonnage of vessels cleared at this port for the year just ended was 106,670 tons against 94,118 the year previous. The number of persons employed on board was 3467—of whom but two were boys—being an increase of but two employed during the year.

There is, we believe, no article grown, for human consumption, in any State of the Union, which is not already, or may not be produced in some portion of Texas, such is the variety of soil, climate, and general circumstances. In the production of the great staples of wheat, corn, beef, cotton, and sugar, no State in the Union approaches it, so great is the extent and productiveness of the soil adapted to these articles. It is estimated that the sugar region is capable of producing a crop of 3,000,000 of hogsheds, or much more than is necessary to supply the inhabitants of the whole Union. 60,000,000 of acres of the lands of the State are situated within the cotton-producing region, and one third of this number are believed to be well adapted in point of soil to the growth of that plant. There is no doubt of the capacity of the country to produce a much larger crop than is now yielded by the whole South, while the expense of production is less than the general average in other States.

—*Galveston Price Current and Census Reports.*

Galway, the county town, formerly designated the Liberties of Galway, and a county in itself, having an exclusive local jurisdiction, extending two miles on every side except the south. It stands on the northern shore of the Bay of Galway, Ireland, on the eastern bank of the river of the same name. It is supposed by some to be the Nagnata of Ptolemy. It certainly was considered a position of much importance from the earliest period, as in the divisions of the island into north and south, at first made by the descendants of Heremen, and afterward repeated by Conn and Eogan, it was fixed upon as the eastern extremity of the line of demarcation, which proceeded eastward to Dublin. Galway is likely to become a place of some note, being the proposed eastern terminus of the submarine telegraph communication between Europe and the United States.

Gama, Vasco da, the first European who reached India by doubling the Cape of Good Hope, was born at Sines, a small sea-port of Portugal. Of his early history so little has been recorded, that even the date of his birth is unknown. On attaining manhood, he found that the success of Columbus had given a powerful impulse to the spirit of maritime adventure.

On the 4th of July, 1497, Vasco da Gama sailed from Lisbon with a squadron of three vessels manned by sixty sailors, bent on making his way to India round the Cape of Good Hope, then known as the Cabo Tormentoso, or Stormy Cape. The hardships and dangers to be encountered were appalling, and led to a mutiny, which was with difficulty quelled by the firmness and prudence of the commander. He doubled the Cape at length, and reached in safety the small town of Melinda, where he secured the services of an Indian pilot. In 23 days they reached Malabar, and on the 20th of May 1498 they came to anchor at Calicut. Gama was well received by the zamorin; whom, though not without difficulty, he convinced of the advantages that would accrue to his country by the establishment of a commercial treaty with Portugal. Gama then turned his prows homeward; and, having touched at various points on the Asiatic and African coasts, he once more cast anchor in the Tagus in the September of 1499, after an absence of 2 years and 2 months. Emmanuel received him with great honors, ennobled him, and gave him the title of admiral of the Indian, Persian, and Arabian seas. The effect of Gama's voyage was soon visible in the ruined trade of the Italian commercial republics, which had hitherto monopolized the traffic of the East. In prosecution of Gama's discoveries, another fleet was sent out to India, under Cabral, who accidentally discovered the Brazils, and on reaching his destination established a factory at Calicut. The natives, instigated by the Moorish merchants, who were jealous of the Portuguese, rose up in arms, and murdered all whom Cabral had left behind. To avenge this cruelty, the Portuguese fitted out a powerful armament, of which the command was given to Gama. The admiral set sail, and devastated those parts of Africa and India where he had formerly been received in a hostile spirit. He executed especial vengeance upon Calicut, which he bombarded and reduced to ashes, at the same time hanging the sailors of the vessels in the harbor which had fallen into his hands. He then sailed away to Cochim, where he established a factory, from which the power of Portugal radiated over India. In 1503 he returned home, and as before was welcomed with honors and titles, but was not immediately reappointed to the command in India. He remained at home in inaction during nearly 20 years; but in 1524 (some years after the death of the great Albuquerque, who had been consolidating the Portuguese power in the East), Gama was appointed viceroy of Portuguese India. Not long after arriving at Cochim, Gama died, in 1525, and was buried there; but 13 years later his bones were disinterred and conveyed to Portugal by order of John III., king of that country.

Vasco da Gama was a man of great ability, courage, and enterprise; but he possessed none of these qualities in a higher degree than many others of his contemporaries who have long since passed into oblivion. He owes no small portion of his fame to the fact of his being the hero of the national epic of Portugal. The moment of his doubling the Cape of Good Hope, and seeing in the clouds the Spirit of that stormy region, has been often seized by painters as a striking subject for pictorial delineation. One of the most remarkable of these pictures is that by the late David Scott, of Edinburg.—E. B.

Gambo (Fr. *Gomme gutte*; Ger. *Gummigutt*; It. *Gomma gutta*; Lat. *Gummi gutta*, *Cambogia*; Arab. *Ossarreeband*; Siamese and Cambajan, *Rong*), a concrete vegetable juice, or gum resin, the produce of the *Corvicia Cambogia*, a forest-tree of the genus which affords the mangosteen, the most exquisite fruit of the East. The districts which yield gamboge lie on the east side of the Gulf of Siam, between the latitudes of 10° and 12° north, comprising a portion of Siam and the kingdom of Cambaja, whence its English name. It is obtained by making incisions in the bark

of the tree, from which it exudes, and is collected in vessels placed to receive it. In these it assumes a firm consistence; and being formed into orbicular masses, or more frequently cylindrical rolls, it is at once fit for the market. It is of a bright yellow color, opaque, brittle, breaks vitreous, has no smell, and very little taste. Specific gravity 1.22. When taken internally, it operates as a most violent cathartic. It forms a beautiful yellow pigment, for which purpose it is principally used. The Dutch began to import it about the middle of the seventeenth century. The greater part of the gamboge of commerce first finds its way to Bangkok, the Siamese capital, or to Saigon, the capital of lower Cochinchina; from thence it is carried by junks to Singapore, whence it is shipped for Europe. Its price at Singapore varies, according to quality, from 30 to 80 dollars per picul. Dark-colored pieces should be rejected.—CRAWFORD'S *Embassy to Siam*, p. 425; THOMSON'S *Chemistry*.

Ganges, the principal river of Hindoostan, through the north part of which it flows from west to east, traversing the centre of the British presidencies, Bengal and Agra, almost in their entire length. It rises by two principal heads, Bhagirathi and Alakananda, in lat. 31° N., and long. 7° E., from an immense mass of snow at an elevation of 13,000 feet; flows at first S.W. to Hurdwar and thenceforward mostly E. E. to the Bay of Bengal, which it enters by numerous mouths, its eastmost arm uniting with the Megna or Brahmaputra, and its west branch being the Hooghly River. Total course estimated at 1500 miles. In its course it receives 11 affluents, some of which are equal to the Rhine, and none smaller than the Thames; the principal are the Jumna, Ramgunga, Gooty, Goggra, Sone, Gunduck, Koose, Mahanuddy, and Teesta, which have courses varying from 300 to 600 miles in length. On its banks are numerous cities and towns. Between Hurdwar and Allahabad it is usually from 1 mile to 1½ miles across; below which its breadth increases frequently to 3 miles, and at 500 miles from the sea it is 30 feet in depth, and so continues to near its mouth, where, however, the quantity of deposit it brings down often forms bars and shoals. In the annual overflow of the river, when it is at its height in July and August, the waters rise to 32 feet. The annual deposit of mud at its delta is estimated at 6,000,000,000 cubic feet. It is crossed by no bridges after it leaves the mountains. The Ganges is the sacred river of the Hindoos, and is so called as flowing through *Gang*, the earth, to heaven.

Gangway, a narrow platform or range of planks laid horizontally along the upper part of a ship's side from the quarter deck to the forecabin, peculiar to ships that are waisted, for the convenience of walking to and fro expeditiously fore and aft than by descending into the waist. It is fenced on the outside by iron stanchions and ropes or rails, and in vessels of war with a netting in which part of the hammocks are stowed. In merchant ships it is called the gangboard. *Gangway* is also that part of a ship's side, both within and without, by which persons enter and depart. It is provided with a sufficient number of steps or cleats nailed upon the ship's side nearly as low as the surface of the water, and sometimes furnished with a railed accommodation ladder resembling a flight of stairs projecting from the ship's side and secured by iron braces.

Gangway is also used to signify a narrow passage left in the hold when a ship is laden, in order to enter any particular place as occasion may require, whether to examine the situation of the provisions or cargo, to discover and stop a leak, or to bring out any article that is wanted. Finally, *gangway* implies a thoroughfare or narrow passage of any kind.

To bring to the gangway; a phrase signifying to punish a seaman by seizing him up and flogging him with a cat-o'-ninetails.

Gant (glove), a small plant at all parts of the 13th c. **Garne** *Granatstein*; *noi hamen*; garnet, the first is from its pomegranate and brown glistening, sometimes 4-35. The shades of appear in the nearly opaque THOMSON'S India, and from Green garnets are but stones always in d p. 113.

Gantlet, or Gauntlet (Fr. *gantlet*, from *gam*, a glove), a kind of iron glove, with fingers covered with small plates; formerly worn by cavaliers when armed at all points, and which used to be thrown down as token of challenge. Gauntlets were introduced about the 13th century.

Garnet, Garnets (Fr. *Grenats*; Ger. *Granaten*, *Granatstein*; It. *Granati*; Lat. *Granati*; Rus. *Granatnoi kamen*; Sp. *Granadas*). There are two species of garnet, the precious, and the common. The color of the first is red; and hence the name of the mineral, from its supposed resemblance to the flower of the pomegranate; passes from Columbine red, to cherry and brown red; commonly crystallized. External lustre glistening, internal shining, vitreous; transparent, sometimes only translucent; specific gravity 4.08 to 4.35. The color of the common garnet is of various shades of brown and green. Different colors often appear in the same mass; translucent; black varieties nearly opaque; specific gravity from 3.66 to 3.75.—*Thomson's Chemistry*. The finest varieties come from India, and some good specimens have been received from Greenland. When large and free from flaws, garnets are worth from £2 to £5 or £6, and even more; but stones of this value are of rare occurrence, and always in demand.—*Mawe on Diamonds*, etc., 2 ed., p. 113.

Gas. This inflammable aeriform fluid was first evolved from coal by Dr. Clayton, in 1736-1739.—*Phil. Trans.* Its application to the purposes of illumination was first tried by Mr. Murdoch, in Cornwall, in 1792. The first display of gas-lights was made at Boulton and Watt's foundry, in Birmingham, on the occasion of the rejoicings for peace in 1802. Gas was permanently used to the exclusion of lamps and candles at the cotton mills of Phillips and Lee, Manchester, where 1000 burners were lighted, 1805. Gas-lights were first introduced in London, at Goldenlane, August 16, 1807. They were used in lighting Pall Mall, in 1809; and were general through London in 1814. They were first used in Dublin in 1816, and the streets there generally lighted in October, 1825. The gas-pipes in and round London extend to 1100 miles.—*HAYDN*.

Every one must have remarked that most species of coal, when ignited, give out large quantities of gas, which burns with much brilliancy, yielding a great quantity of light as well as of heat. Dr. Clayton seems to have been the first who attempted, about 1736-1739, to apply this gas to the purposes of artificial illumination; but his experiments were upon a very limited scale, and no further attention was paid to the subject till more than half a century afterward. At length, however, Mr. Murdoch, of Soho, instituted a series of judicious experiments on the extrication of gas from coal; and, by his ingenuity and sagacity succeeded in establishing one of the most capital improvements ever made in the arts. Mr. Murdoch found that the gas might be collected in reservoirs, purified, conveyed by pipes to a great distance from the furnace where it was generated; and that it affords, by its slow combustion, when allowed to escape through small orifices, a beautiful and steady light. This great discovery, which places Mr. Murdoch in the first rank among the benefactors of mankind, was first brought into practice at Redruth, in Cornwall. In 1802, it was applied to light Mr. Murdoch's manufactory at Soho; in 1805, it was adopted by Messrs. Phillips and Lee, of Manchester, in the lighting of their great cotton mill; and is now employed in the lighting of the streets, theatres, and other public buildings, factories, etc. of all the considerable towns of the empire, and also in most considerable towns of Europe and America.

Gas light is indebted, for its rapid diffusion, not more to its peculiar softness, clearness, and unvarying intensity, than to its comparative cheapness. According to Dr. Thomson (*Encyc. Brit.*, art. GAS LIGHTS), if

we value the quantity of light given by 1 lb. of tallow in candles at 1s., an equal quantity of light from coal gas will not cost more than 2 $\frac{1}{2}$ d., being less than a fourth part of the cost of the former. Oil and other substances have been used in furnishing gas for the purpose of illumination, but none of them has answered so well as coal. Most of the oil gas establishments have been abandoned. The construction of gas works on a large scale, and the carrying of pipes through the streets and into houses, etc., is very extensive, and requires a large outlay of capital. Hence most of the gas lights in the different towns are supplied by joint-stock companies. Many of them have turned out to be very profitable concerns.

The first attempt to supply cities in the United States with gas was made at Baltimore in 1821, and at New York in 1823. Both of these attempts were unsuccessful. The New York Gas-Light Company, with a capital of \$1,000,000, was incorporated March 26th, 1823. It was reorganized in 1827, and then commenced a successful business. The Manhattan Gas-Light Company was incorporated with a capital of \$2,000,000, February 26th, 1830. Upon these two Companies the city of New York is now entirely dependent for gas. The former Company supplies all that portion of the city which is below Grand-street, and the latter Company all that portion which lies between Grand-street and Seventy-ninth street. The New York Gas-Light Company has 130 miles of pipes laid through the streets of the city, ranging from 4 to 18 inches in diameter. In 1855 this Company made 300,000,000 cubic feet of gas, consuming about 45,000 tons of coal. It furnished gas to 3,200 street lamps, and to 9,000 private consumers.

The Manhattan Gas-Light Company has 200 miles of pipe laid through the streets of the city, ranging from 3 to 20 inches in diameter. In 1855 this Company made 470,000,000 cubic feet of gas. It lighted 7,148 street lamps, and furnished gas to 17,300 private consumers. These Companies jointly light and keep in order for the city about 10,150 street lamps, for which they are paid \$25 per annum for each lamp. This payment nets the Companies, according to their estimate, only \$1 50 per 1000 cubic feet of gas consumed in the lamps, which is just one half the sum charged to their private customers for gas, but is doubtless profitable even at that low rate. The gas is manufactured from rich bituminous coals, such as Cannon coal, Newcastle coal, and the Albert coal of Nova Scotia. A chaldron of Newcastle coal, weighing 27 cwt., will yield:

Gas	8,650 cubic feet.
Coke	14 cwt.
Ammoniacal liquor	124 gallons.
Tar	12 "

A chaldron of Cannon coal will yield an average of 12,000 cubic feet of gas. The gas coal used in New York costs about \$10 per chaldron. The coke, or shell of the coal after the gas is extracted, is worth about \$4 per chaldron, and makes a very pleasant fire in a grate. The bituminous coal is thrown in a hot iron cylinder, or retort, as it is called, whose mouth is closed and sealed tight with soft clay. The vapor of the coal, distilling in the retort, passes through a tube, by which it escapes into a series of vessels called the condenser, where it cools and deposits all its tar and other condensible impurities. Thence it passes through another series of vessels called the purifier, containing quicklime, of the consistency of cream, which cleanses the vapor of its sulphurous intermixtures. From the lime the purified vapor of the coal, or, in other words, the gas, now flows into the gasometer, and is ready for use. From the gasometer it is driven, through main and service pipes, into the consumers' burners.

The machinery of all gas manufactories is the same in principle, and seems now to be almost perfect. The chief improvements made lately in the machinery consist in the manner of applying to the gasometer the pressure which regulates the force of the gas.

THE FOLLOWING TABULAR VIEW PRESENTS THE COMPARATIVE COST OR PRICE OF GAS AT SEVERAL LEADING CITIES OF THE UNITED STATES, SHOWING ALSO THE YEAR OF INCORPORATION OF THE COMPANY, DATE WHEN GAS WAS FIRST USED, COST OF COAL, AND ORDINARY ANNUAL CONSUMPTION, ETC.

Place.	Gas Company	Gas Grid	Capital of	Price of Gas	Cost of	Annual Con-	Miles of	Description of Coal used.
	incorp'd.	used.	Company.	per 1000 cub. feet, 1857.	Coal used per ton.	sumption of Gas.	Main laid.	
Detroit, Mich.....	1843	1861	274,000	\$ 50	5 25	19,118,000	18	Mineral Ridge, Brier Hill, etc.
Wheeling, Va.....	1849	1850	715,000	3 00	1 40	8,800,000	7-33	Soft bituminous coal.
Cincinnati, Ohio.....	1837	1843	800,000	2 50	4 25	98,000,000	49	Youghiogheny, or Pittsburgh, coal.

Boston, Mass.....	1826	1,000,000	2 50	8 00 to 9 00 ch.	190,000,000	70	Pitcaou coal, \$6. English canal, \$16 50 per chaldron of 2600 pounds.

A very careful and accurate analysis and photo-metric examination of wood gas have been made by two eminent analytical chemists (Dr. Wolcott Gibbs, of New York, and Dr. F. A. Genth, of Philadelphia), whose report of their chemical results furnishes a highly satisfactory explanation of certain curious phenomena that accompany the combustion of this gas.

They examined two varieties of gas, one made from old field pine, the other from small second-growth oak, with the following results:

Specific gravity.....	Gas from Pine.	Gas from Oak.
	0 643	0 689
COMPOSITION.		
Hydrogen.....	32-71	30 44
Light carbonic hydrogen.....	21-50	33-12
Olef. gas and hydro carbon vapors.....	10-37	6-46

Carbonic acid.....	4-90	0-43
Oxygen.....	0-66	None.
Nitrogen.....	2 55	3 39
	100-00	100-00

These gases were collected at the Ninth Ward Works, and taken to New York for analysis. Their illuminating power was tested and found to be over 20 candles for a five-foot burner.

Mr. Murdoch in 1797 exhibited publicly the results of his more matured plans for the preparation of coal gas. The following year (being then connected with Messrs. Boulton and Watt's engineering work-shop) he constructed an apparatus at the Soho foundry for lighting that establishment, with suitable arrangements for the purification of the gas; and these experiments, Dr. Henry states, "were continued with occasional interruptions until the epoch of the peace of 1802, when the illumination of the Soho manufactory afforded an opportunity of making a public display of the new lights; and they were made to constitute a principal feature in that exhibition."

In 1804-5 Mr. Murdoch had an opportunity of carrying his plans into effect on a still larger scale, by means of the apparatus erected under his superintendence in the extensive cotton mills of Messrs. Phillips and Son of Manchester.

It has been alleged that gas-lights were used in France before they were known in England; but as the earliest exhibition of these lights, on which the claim of priority of discovery is founded, took place at Paris in 1802, it is evident, from the foregoing statements, that the exhibition alluded to was ten years subsequent to the first experiment of Mr. Murdoch on the subject.

The practicability of lighting by means of coal gas having been demonstrated by Mr. Murdoch, a number

of scientific men applied their talents to the further development of the art. Dr. Henry, the celebrated chemist, lectured on the subject in 1803 and 1805, and furnished many hints for the improvement of the manufacture. Mr. Clegg, an engineer in the employment of Boulton and Watt, was a worthy successor of Murdoch, and for many years was the most eminent gas engineer of England. A good deal of the machinery of the gas-house in its present form was contrived by Mr. Clegg, and to him, also, we are indebted for the ingenious wet gas-meter. In 1815 Westminster Bridge was first lighted with gas, and in the following year the streets of Westminster were thus lighted; and in 1816 gas became common in London. So rapid was the progress of this new mode of illumination, that in the course of a few years after it was first introduced, it was adopted by all the principal towns in the kingdom, for lighting streets as well as shops and public edifices. In private houses it found its way more slowly, partly from an apprehension, not entirely groundless, of the danger attending the use of it, and partly from the annoyance which was experienced in many cases through the careless and imperfect manner in which the service-pipes were at first fitted up. These inconveniences have been in a great measure, if not wholly, removed by a more enlarged knowledge of the management of gas; and at present there are few private houses in large towns which are not either partially or entirely lighted up by it. As the demand for gas increased, various improvements were from time to time introduced, both in the mechanical arrangements and in the chemical operations of the manufacture. The rapid increase in the population of the metropolis, and of all large towns, has naturally led to an increased consumption of gas; and the application of gas to the purposes of warming and cooking has also further increased the demand for it. Hence it has been not only necessary that new gas-works should be erected for the supply of new districts, but that the resources of old works should be enlarged. It is only a few years ago that a gas-holder capable of storing 250,000 cubic feet of gas was regarded as of enormous size; and at the present time gas-holders are made of double that capacity, and we occasionally hear of them of the capacity of upward of a million cubic feet. There is one such at Philadelphia; it is 140 feet in diameter and 70 feet in height. Nor will such dimensions as these be regarded as superfluous when it is stated that some of the large metropolitan works send out each from a million to a million and a half cubic feet of gas in one night in mid-winter.

Gauging, the art of measuring the contents of casks or vessels of any form. Gauging forms a part of mensuration, but is frequently practiced by persons unacquainted with its theoretical principles, who work by certain rules, with the aid of a gauging-rod, and by the sliding rule. The ordinary gauging-rod consists of four rules made of box-wood, each a foot long, and united by brass joints, so that it may be folded together. The term *gaug*e or *gag*e is applied in various ways, but always with reference to measure or proportion; or, in the literal sense of the word, to that which bounds or confines something else. Thus, in physics, it is applied to several instruments or apparatus for measuring the state of a phenomenon; such as the wind-gage, rain-gage, the barometer-gage for measuring the degree of pressure of the air within the receiver of an air-pump, etc.; in architecture, to the length of a slate below the lap; in railway engineering, to the space between the rails, and the like. See **GAGE**.

Gazette, a paper of public intelligence and news of divers countries, first printed at Venice about the year 1620, and so called (some say) because *una gazetta*, a small piece of Venetian coin was given to buy or read it. Others derive the name from *gaza*, Italian for magic, i. e. chattering.—**TRUSLER**. A gazette was printed in France in 1631; and one in Germany in 1715.—*Nour. Dict. Hist.*

Gauze. Brass wire-gauze or cloth is now made of such exquisite fineness that the separate threads can only be detected by close inspection. Messrs. Estivant, who carry on the brass manufacture on a scale of great magnitude in France, produce wire of remarkable minuteness. There were in the French department of the late exhibition several specimens of brass gauze, each showing the limit of fineness to which the manufacturers had attained at the date of the several industrial exhibitions in France. Each date displayed a degree of fineness greater than that of any previous date; and the specimen for 1851 was the finest of all. It almost exceeds belief that metal could be wrought to such an exquisite degree of minuteness as in this web. There were 67,600 meshes in one square inch of this brass gauze, or 260 parallel threads in one linear inch. The wire-drawing in the first instance, and the weaving afterward, must have been very carefully conducted.

Geelong, a township of Victoria colony, South Australia, comprising five contiguous villages, at the head of the west arm of Port Phillip, 40 miles south-west of Melbourne, with which it has constant communication by steam. Population in 1846, 2,065. It has an increasing trade in wool and grain, though large vessels can not approach it within seven miles. The River Barwon flows past its west border to the Southern Ocean.

Consignees, Masters, and Lighters at Geelong.—We find the following declaration on the respective rights and duties of consignees, masters, and lightermen, in the proceedings of the Geelong Chamber of Commerce. The motion of which notice had been given by Mr. McKellar, "that the committee consider the subject of the delivery of goods by lighters," was brought under discussion, and after careful examination of the law relating thereto, it was clearly ascertained that it is the duty of the master of the vessel, as soon as the arrival of the ship has been reported, to give notice thereof to the owners or consignees of the goods on board; that he can not escape from his liability by immediately landing goods at a public wharf, without giving such notice, because the delivery at the wharf is not a delivery to the consignee; that if they are landed without such notice being given, and are destroyed upon the wharf by an accidental fire before the consignee has had an opportunity of taking them away, the ship-owners will be responsible for the loss, but that the lighterman or master of the vessel is

bound to keep the goods on board or on the wharf at his own risk for a reasonable time, to enable the consignee or his assigns to come and fetch them; and that the lighterman is not released from his responsibility until he has obtained a receipt for the goods upon their delivery to the consignee.

Gelatine (Eng. and Fr.; *Gallert*, *Leim*, Germ.) is an animal product which is never found in the humors, but it may be obtained by boiling with water the soft and solid parts; as the muscles, the skin, the cartilages, bones, ligaments, tendons, and membranes. Isinglass consists almost entirely of gelatine. This substance is very soluble in boiling water; the solution forms a tremulous mass of jelly when it cools. Cold water has little action upon gelatine. Alcohol and tannin (tannic acid, see **GALL-NUTS**) precipitate gelatine from its solution; the former by abstracting the water, the latter by combining with the substance itself into an insoluble compound, of the nature of leather. No other acid except the tannic, and no alkali, possesses the property of precipitating gelatine. But chlorine and certain salts render its solution more or less turbid; as the nitrate and bichloride of mercury, the proto-chloride of tin, and a few others. Sulphuric acid converts a solution of gelatine at a boiling heat into sugar. Gelatine consists of carbon, 47.88; hydrogen, 7.91; oxygen, 27.21.

Gelatine Casts.—The beautiful may often be created out of mere refuse; an example of this is afforded by the articles now made of gelatine. The French show peculiar tact in procuring gelatine from the waste remnants of the skins, bones, tendons, ligaments, and other gelatinous tissues of animals. The well-ordered *abattoirs* of Paris and other large towns, afford facilities which we do not possess, for the economical application of all the waste parts of the slaughtered animals. M. Grenet has been the first to fabricate, on a large scale, out of various residues of animal bodies, beautiful and diversified products which have hitherto been made of the more costly material isinglass. He produces different kinds of gelatine, in thin sheets; pure and white films cut into threads for the use of the confectioner; very thin, white, and transparent sheets, called "papier glacé," or ice-paper, for copying drawings; dyed, gilt, and silvered gelatine sheets, adapted to the fabrication of artificial flowers and to the production of an almost endless variety of ornamented articles; and sheets embossed or stamped with elegant patterns. The gelatine is used, too, as a material in the dressing of stuff goods, and also as a refining ingredient in the clarification of wine.

Gem (Lat. *gemma*), in sculpture, a precious stone, used for the purpose of sculpture. The practice of carving gems is of remote antiquity, though it is doubtful whether they were able to cut the diamond or use the emerald and topaz for sculptural purposes. The stones usually selected are rock-crystal of different colors, jasper, chalcedony, onyx, cornelian, and blood-stone. Among the Greeks the art was carried to great perfection; but having fallen with the other arts into disuse, its revival was effected in Italy in the 15th century, and modern masters have more than rivaled some of the ancient productions.

Geneva (Du. *Genever*; Fr. *Genève*; Ger. *Gaud*, *Genever*; It. *Acqua di Ginepro*; Lat. *Juniper aqua*; Sp. *Agua de Enebro*), a spirit obtained by distillation from grain, rectified with the addition of juniper berries. The latter gives to the spirit that peculiar flavor by which it is distinguished, and are also said to render it diuretic. Geneva is a corruption of *genèvre*, the French term for the juniper berry. By far the best geneva is made in Holland, where its manufacture is carried on to a very great extent. The distilleries of Schiedam have long been famous, and are at present in a very prosperous condition. Schiedam geneva is made solely of spirit obtained from rye and barley, flavored with juniper berries. It becomes milder, and

acquires, as it gets old, an oily flavor disliked by Hollanders; hence nearly the whole of the "Schiedam" is exported, principally to the East Indies. There are no fewer than 100 distilleries in Schiedam, 200 in other parts of Holland, and not more than 40 in Belgium. The entire annual produce of the distillery in Holland is estimated at 2,000,000 ankers, or 20,500,000 wine gallons, of which about two thirds are exported.—Cloer, *Description Géographique des Pays Bas*, p. 32.

Genoa, a maritime city of Italy, once the capital of the famous republic of that name, now of a province of the kingdom of Sardinia, at the bottom of the extensive gulf to which it gives its name; the light-house being in lat. 44° 24' 18" N., long. 8° 54' 24" E. Population in 1848, 100,382. Genoa is one of the finest cities of Europe, and noted as the birth-place of Christopher Columbus, in the year 1441. In general, the streets are inconveniently narrow; but some of the principal ones are moderately wide, and consist almost entirely of public buildings and private palaces erected during the period of her prosperity. Being built on a rising ground, in the form of an amphitheatre, the appearance of the town from the sea is most magnificent, and justifies the epithet given to her of "la superba."

Its ancient inhabitants were the Ligures, who submitted to the Romans, 115 B.C., and underwent the revolutions of the Roman empire till A.D. 950. The Genoese revolt against their count, choose a doge and other magistrates from among their nobility, and became an aristocratic republic, 1090 to 1034. Several revolutions occurred up to 1528, when the celebrated Andrew Doria rescued his country from the dominion of foreign powers. Bombarded by the French in 1684, and by the British in 1688 and 1745, Genoa was taken by the Imperialists, December 8th, 1746; but their oppression of the people was such, that the latter suddenly rose and expelled their conquerors, who again besieged the city the next year, August 17, without effect. Genoa lost Corsica, 1780. The celebrated bank failed 1750. The city sustained a siege by a British fleet and Austrian army, until literally starved, and was evacuated by capitulation, May, 1800; but it was surrendered to the French soon after their victory at Marengo. The Ligurian republic was founded upon that of Genoa, in 1801, and the doge solemnly invested, August 10, 1802. Genoa was annexed to the French empire, May 25, 1805. It surrendered to the combined English and Sicilian army, April 18, 1814; and was transferred to the king of Sardinia in 1816. Insurrection against Victor Emmanuel, April 1st; subdued, April 11, 1849.

Port.—The harbor is semicircular, the diameter being about 1000 fathoms. It is artificial, being formed by two gigantic moles having opposite directions. That on the east side, called the old mole (*molo vecchio*), projects from the centre of the city west by south. It is about 260 fathoms in length, and has a battery near its middle. The new mole (*molo nuovo*), on the opposite side of the port, adjoins the southern extremity of the suburb of St. Pietro d'Arena, projecting about 210 fathoms from the shore in an E.S.E. direction. The mole heads bear from each other N.E. by E. and S.W. by W., the distance between them, forming the entrance to the harbor, being about 350 fathoms. The light-house is without the port, on the west side, near the extremity of a point of land, and contiguous to the bottom of the new mole. It is a lofty square tower; and as it stands on a high rock, and is painted white, it is visible in clear weather at a great distance. There is also a harbor light at the extremity of the new mole. There is no difficulty in entering the harbor; the ground is clean, and there is plenty of water, particularly on the side next the new mole; care, however, must be taken in coming from the west, to give the light-house point a good offing.

Moderate-sized merchantmen commonly anchor inside the old mole contiguous to the *porto franco*, or bonded warehouses, having a hawser made fast to the mole, and an anchor ahead. Men-of-war, and the largest class of merchantmen may anchor inside the new mole, but they must not come too near the shore. Ships sometimes anchor without the harbor in from 10 to 25 fathoms, the light-house bearing N. $\frac{1}{2}$ W. distant 2 or 3 miles. The south-west wind occasions a heavy swell, but the bottom is clay, and holds well. Within the town are two rather shallow basins designed for galleys and small trading-vessels. There is also an arsenal.

Money.—Accounts were formerly kept at Genoa in lire or 20 soldi, each soldo containing 12 denari, and money was divided into *banco* and *fuori di banco*. But since the 1st of January, 1827, the ancient method of reckoning has ceased, and accounts are now kept in lire Italiane, divided into cents. The weight and fineness of the new coins are precisely the same as those of France; so that the par of exchange=25-20 lire per £1, if estimated in silver at 6s. 2d. au oz., and 25-54, if estimated in silver at 5s. an oz. 6 old lire di banco are equal to 5 new lire very nearly.—*Manuel de Nelkenbrecher*.

Weights and Measures.—Those formerly in use in Genoa are described in the old editions of M'CALLUM's *Diet*. In 1847 the French system of weights and measures was introduced, the only difference being the substitution of Italian for French names. Thus, the *chilogramma* (kilog.)=2-2 lbs. avoird. (50½ chilog. being very nearly equal to 112 lbs.) and the *libbra* (livre) or *ponno*= $\frac{1}{2}$ chilog.=1 lb. avoird.; the *quintale centinajo*, or cwt.=220 lbs. avoird.; and the *ettolitro* (hectolitre), liquid measure=22 imp. galls.; ditto, dry measure=2½ imp. bush.; the *metro* (metre)=89-37 inches, etc. A barrel of oil=59½ chilog.=14½ imp. galls. All tares of usage were abolished at the same time that the French metrical system was introduced.

The *Bank of Genoa*, or of St. George, was one of the most ancient and celebrated banks of circulation and deposit in Europe. Until 1746, when the bank was pillaged by the Austrians, it was customary to make all bills of exchange drawn upon Genoa payable in *banco*; but since then they have generally been made payable in money *fuori di banco*. In 1800, when the French were besieged in Genoa by the Austrians, they took the treasure of the bank to pay their troops. The establishment has never recovered from this blow; some warehouses, and a part of the town's revenue, were assigned to it, but they yielded a very poor dividend. It is no longer used as a place of deposit for money.

Trade, etc.—Genoa is the entrepôt of a large extent of country; and her commerce, though inferior to what it once was, is very considerable, and has lately been increasing. She is a free port; that is, a port where goods may be warehoused and exported free of duty. The exports consist partly of the raw products of the adjacent country, such as olive oil (an article of great value and importance), rice, fruits, cheese, rags, steel, argol, etc.; partly of the products of her manufacturing industry, such as silks, damasks, and velvets (for the production of which she has been long famous), thrown silk, paper, soap, works in marble, alabaster, coral, etc.; the printed cottons of Switzerland, and the other products of that country and of the western parts of Lombardy, intended for the south of Europe and the Levant; and partly of the various foreign products brought by sea, and placed in *porto franco*. The imports principally consist of cotton and woollen stuffs; cotton wool, mostly from Egypt; corn from the Black Sea, Sicily, and Harbary; sugar, salted fish, spices, coffee, cochineal, indigo, hides, iron, and naval stores from the Baltic; hardware, and tin plates from England; wool, tobacco, lead (principally

from Spain, cotton, v. the count, vant, etc. so great a the vario charged of Sardinia once on the import lin, as well produce.

* From the Circular of Granta, Balfour & Co., Leghorn.
Gentian (Ger. *Enzian*; Fr. *Gentiane*; It. *Genziana*; Sp. *Jenciana*; Rus. *Enzian*; Lat. *Genziana*), the roots of two alpine plants, *Genziana lutea* and *Genziana purpurea*, found growing in Switzerland and Austria, the

Apennines, the Pyrenees, and in North America. Those brought to this country come from Germany. They are in pieces of various lengths and thickness, twisted, and wrinkled on the outside, and covered with a brownish-gray cuticle. They have no particular odor; and the taste is intensely bitter, without being nauseous.—*THOMSON'S Dispensary*.

Geodesy (Gr. *γη*, and *δαιω*, *I divide*), literally signifies the *division of the earth*, in which sense it is synonymous with land-surveying; but it is usually employed in a more general sense to denote that part of practical geometry which has for its object the determination of the magnitude and figure either of the whole earth, or of any given portion of its surface. In this sense it comprehends all the geometrical or trigonometrical operations that are necessary for constructing a map of a country, measuring the lengths of degrees, etc. In order to construct an accurate map, or determine the form and dimensions of a country, it is necessary, in the first place, to determine the absolute distances between the several stations or points; secondly, to determine the azimuths of the lines thus measured, that is, their situation with respect to the meridian; and thirdly, the differences of latitude and longitude of the stations. The operations necessary for determining the absolute distances, comprehending the measurement of a base, the observation of angles, the computation of the sides of the triangles, and their reduction to the same level, are called the *geodesical or geodetical operations*; while those which are required for determining the azimuths and latitudes are called the *astronomical operations*. The determination of the figure and dimensions of the earth is a problem of very great importance to astronomy and geography, and has accordingly at all times been a subject of much interest to mathematicians; but it is only since toward the middle of the last century that operations on an adequate scale for its solution have been undertaken in different parts of the world. For the results of the more important of these operations, see DEGREE.

Geography. The first correct record we have of geographical knowledge is from Homer. He describes the shield of Achilles as representing the earth, surrounded by the sea.—*Iliad*. He accurately describes the countries of Greece, islands of the Archipelago, and site of Troy. The priests taught that the temple of Apollo at Delphos was the centre of the world. Anaximander of Miletus was the inventor of geographical maps, about 568 n. c. Hipparchus attempted to reduce geography to mathematical bases about 135 n. c. It was first brought to Europe by the Moors of Barbary and Spain, about A. D. 1201.—**LEXICLET**. The invention of the mariner's compass is the important connecting link between ancient and modern geography. The modern maps and charts were introduced into England by Bartholomew Columbus to illustrate his brother's theory respecting a western continent, A. D. 1489.—**HAYDN**. The term Geography, derived from two Greek words, *γη*, the earth, and *γραφω*, *I write*, signifies a *description of the earth*. The description to which this title is applied may be more or less general; either embracing such truths as are only belong to the earth considered as one whole, or extending to particulars which belong to and distinguish the several countries spread over its surface. In whichever of these two aspects the subject be regarded, a vast field opens to the view of the observer. In order to give a full and accurate description of the earth, it would be requisite to consider it in reference to its motion, figure, and magnitude; in reference to its relation to the other bodies of the universe, and more especially to the planetary system of which it forms a part; in reference to its surface, as diversified by land and sea, mountains and valleys, lakes and rivers; in reference to the materials which compose its crust, and to its internal structure; in reference to the constitution

of the atmosphere with which it is surrounded, and the effects arising from the variations in atmospheric pressure, temperature, and humidity. Nor would it be enough to consider the earth only as a mass of inert and unorganized matter; it would be necessary to regard it in its relations to vegetable and animal life; and to trace the phenomena which these, in their endless variety, present in its various divisions and provinces. It would still further be necessary to view it as the abode of man himself, and as modified by his existence; divided into states and kingdoms; adorned with cities, and all the noble monuments of civilized life.

Such is an outline of the picture which geography, in the most unlimited meaning of the term, should exhibit of the globe. To fill up this picture in all its parts, it would evidently be necessary to call in the aid of the whole circle of the sciences. But the description is usually of a less extended character, being confined chiefly to the more obvious and striking features of the various regions and countries of the earth.

In the wide range which the subject presents, several divisions and subdivisions are suggested by the different views in which the earth may be considered. The three following divisions are the most important:

1. *Mathematical Geography*, which illustrates, on astronomical principles, the figure, magnitude, and motion of the earth; teaches how to determine the positions of places on its surface; explains the construction of globes, with their application to the solution of problems; and shows how the whole or any portion of the earth's surface may, on the principles of projection, be delineated on a map or chart.
