were adopted by Augustus into the legislation of Rome; and such was the estimation in which they were held, that the Emperor Antoninus, being solicited to decide a contested point with respect to shipping, is reported to have answered, that it ought to be decided by the Rhodian laws, which were of paramount authority in such cases, unless they happened to be directly at variance with some regulation of the Roman law.— (“*Ego quidem mundi dominus, lex autem maris legis id Rhodios, quia de rebus nauticis præscripta est, judicetur, quatenus nulla nostrorum legum adversentur. Hoc item Divus quoque Augustus judicavit.*”) The rule of the Rhodian law with respect to average contributions in the event of a sacrifice being made at sea for the safety of the ship and cargo, is expressly laid down in the Digest (lib. xlv.); and the most probable conclusion seems to be, that most of the regulations as to maritime affairs, embodied in the compilations of Justinian have been derived from the same source. The regulations as to average adopted by all modern nations, are borrowed, with hardly any alteration, from the Roman, or rather, as we have seen, from the Rhodian law—a conclusive proof of the sagacity of those by whom they had been originally framed. The only authentic fragments of the Rhodian law are those in the Digest. The collection entitled *Jus navale Rhodiorum*, published at Bâle in 1661, is now admitted by all critics to be spurious. See *ante*, pp. 1188-1192.

The first modern code of maritime law is said to have been compiled at Amalfi, in Italy, a city at present in ruins; but which, besides being early distinguished for its commerce, will be forever famous for the discovery of the *Pandects*, and the supposed invention of the mariner's compass. The Amalfitan code is said to have been denominated *Tabula Amalfitana*. But if such a body of law really existed, it is singular that it should never have been published, nor even any extracts from it. M. Pardessus has shown that all the authors who have referred to the Amalfitan code and asserted its existence, have copied the statement of Freccia, in his book *De Subfœdia*. (Collection des *Lois Maritimes*.) And as Freccia assures us that the Amalfitan code continued to be followed in Naples at the time when he wrote (1570), it is difficult to suppose that it could have entirely disappeared; and it seems most probable, as nothing peculiar to it has ever transpired, that it consisted principally of the regulations laid down in the Roman law, which, it is known, preserved their ascendancy for a longer period in the south of Italy than any where else.

But, besides Amalfi, Venice, Marseilles, Pisa, Genoa, Barcelona, Valencia, and other towns of the Mediterranean, were early distinguished for the extent to which they carried commerce and navigation. In the absence of any positive information on the subject, it seems reasonable to suppose that their maritime laws would be principally borrowed from those of Rome, but with such alterations and modifications as might be deemed requisite to accommodate them to the particular views of each state. But whether in this or in some other way, it is certain that various conflicting regulations were established, which led to much confusion and uncertainty; and the experience of the inconveniences thence arising, doubtless contributed to the universal adoption of the *Consolato del Mare* as a code of maritime law. Nothing certain is known as to the origin of this code. Azuni (*Droit Maritime de l'Europe*, tome I., or rather Jourin, *Code Ferdinandando*, from whose work a large portion of Azuni's is literally translated) contends, in a very able dissertation, that the Pisans are entitled to the glory of having compiled the whole, or at least the greater part, of the *Consolato del Mare*. On the other hand, Don Antonio de Capmany, in his learned and excellent work on the commerce of Barcelona (*Antigua Comercio de Barcelona*, tome I., pp. 170-183), has endeavored to show that the

Consolato was compiled at Barcelona; and that it contains the rules according to which the consuls, which the Barcelonenses had established in foreign places so early as 1268, were to render their decisions. It is certainly that the *Consolato* was printed for the first time at Barcelona, in 1692; and that the early Italian and French editions are translations from the Catalan. Azuni has, indeed, sufficiently proved that the Pisans had a code of maritime laws at a very early period, and that several of the regulations in it are substantially the same as those in the *Consolato*. But it does not appear that the Barcelonenses were aware of the regulations of the Pisans, or that the resemblance between them and those in the *Consolato* is more than accidental; or may not fairly be ascribed to the concurrence that can hardly fail to obtain among well-informed persons legislating upon the same topics, and influenced by principles and practices derived from the civil law.

M. Pardessus, in the second volume of his excellent work already referred to, appears to have been sufficiently disposed, had there been any grounds to go upon, to set up a claim in favor of Marseilles to the honor of being the birth-place of the *Consolato*; but he candidly admits that such a pretension could not be supported, and unwillingly adheres to Capmany's opinion. “*Quoique Français,*” says he, “*quelque portée par des sentimens de reconnaissance, qu'aucun événement ne sauroit affoiblir, à faire valoir tout ce qui est en faveur de Marseilles, je dois reconnoître franchement que les probabilités l'emportent en faveur de Barcelone.*”

—Tome II. But to whichever city the honor of compiling the *Consolato* may be due, there can be no doubt that its antiquity has been greatly exaggerated. It is affirmed, in a preface to the different editions, that it was solemnly accepted, subscribed and promulgated, as a body of maritime law, by the Holy See in 1075, and by the kings of France and other potentates at different periods between 1075 and 1270. But Capmany, Azuni, and Pardessus, have shown in the clearest and most satisfactory manner that the circumstances alluded to in this sketch could not possibly have taken place, and that it is wholly unworthy of attention. The most probable opinion seems to be, that it was compiled, and began to be introduced about the end of the 13th or beginning of the 14th century. And notwithstanding its prolixity, and the want of precision and clearness, the correspondence of the greater number of its rules with the ascertained principles of justice and public utility, gradually led, without the intervention of any agreement, to its adoption as a system of maritime jurisprudence by all the nations contiguous to the Mediterranean. It is still of high authority. Casaregis says of it, though perhaps, too strongly, “*Consulatus maris, in materiis maritimiis, tanquam universalis consuetudo habens vim legis, invariabiliter attendenda est apud omnes provincias et nationes.*”—Disc. 214.

The collection of sea laws next in celebrity, but anterior, perhaps, in point of time, is that denominated the *Roole des Jugemens d'Oleron*. There is as much diversity of opinion as to the origin of these laws, as there is with respect to the origin of the *Consolato*. The prevailing opinion in Great Britain has been, that they were compiled by direction of Queen Eleanor, wife of Henry II., in her quality of Duchess of Guienne; and that they were afterward enlarged and improved by her son Richard I., at his return from the Holy Land; but this statement is now admitted to be on no good foundation. The most probable theory seems to be, that they are a collection of the rules or practices followed at the principal French ports on the Atlantic, as Bordeaux, Rochelle, St. Malo, &c. They contain, indeed, rules that are essential to all maritime transactions, wherever they may be carried on; but the references in the code sufficiently prove that it is of French origin. monarch's having large possessions in France at the period when the Rules of Oleron were collected, naturally facilitated their introduction into England; and they have long enjoyed a very high degree of authority in that country. "I call them the laws of Oleron," said a great civilian (*Sir Leoline Jenkins, Charge to the Cinque Ports*), "not but that they are peculiarly enough English, being long since incorporated into the customs and statutes of our admiralties; but the equity of them is so great, and the use and reason of them so general, that they are known and received all the world over by that, rather than by any other name." Molloy, however, has more correctly, perhaps, said of the laws of Oleron, that "they never obtained any other or greater force than those of Rhodes formerly did; that is, they were esteemed for the reason and equity found in them, and applied to the case emergent."—*De Jure Maritimo et Navali*.

A code of maritime law issued by Wisby, in the island of Gothland, in the Baltic, has long enjoyed a high reputation in the north. The date of its compilation is uncertain; but it is comparatively modern. It is true that some of the northern jurists contend that the laws of Wisby are older than the Rules of Oleron, and that the latter are chiefly copied from the former! But it has been repeatedly shown that there is not so much as the shadow of a foundation for this statement. See PARDESSUS, *Collection*, etc., tome i., pp. 425, 462; *Foreign Quarterly Review*, No. 13, art. *Hanseatic League*. The laws of Wisby are not certainly older than the latter part of the 14th or beginning of the 15th century; and have obviously been compiled from the *Consolato del Mare*, the Rules of Oleron, and other codes that were then in use. Gretius has spoken of these laws in the most laudatory manner:—"Quæ de maritimis negotiis," says he, "*insula Gothlandica habitatoribus placuerunt, tantum in se habent, tam equitatis, tum prudentiæ, ut omnes oceani accolæ eo, non tanquam proprio, sed velut gentium jure, utantur*."—*Prolegomena ad Procopium*, p. 64.

Besides the codes now mentioned, the ordinances of the Hanse Towns, issued in 1597 and 1614, contain a system of laws relating to navigation that is of great authority. The judgments of Damme, the customs of Amsterdam, etc., are also often quoted. A translation of the law of Oleron, Wisby, and the Hanse Towns, is given in the 8d edition of Malynes's *Lex Mercatoria*, but the edition of them in the work of M. Pardeus, referred to in the text, is infinitely superior to every other. But by far the most complete and well-digested system of maritime jurisprudence that has ever appeared, is that comprised in the famous *Ordonnance de la Marine* issued by Louis XIV., in 1681. This excellent code was compiled under the direction of M. Colbert, by individuals of great talent and learning, after a careful revision of all the ancient sea laws of France and other countries, and upon consultation with the different parliaments, the courts of admiralty, and the chambers of commerce, of the different towns. It combines whatever experience and the wisdom of ages had shown to be best in the Roman laws, and in the institutions of the modern maritime states of Europe. In the preface to his treatise on the *Law of Shipping*, Lord Tenterden says:—"If the reader should be offended at the frequent references to this ordinance, I must request him to recollect that those references are made to the maritime code of a great commercial nation, which has contributed much of its national prosperity to that code: a code composed in the reign of a politic prince; under the auspices of a wise and enlightened minister; by laborious and learned persons, who selected the most valuable principles of all the maritime laws then existing; and which, in matter, method, and style, is one of the most finished acts of legislation that ever was promulgated." The ordinance of 1681 was published in 1760, with a detailed and most elaborate commentary by M. Vallin, in 2 vol-

umes, &c. It is impossible which to admire most in this commentary, the learning or the sound good sense of the writer. Lord Mansfield was indebted for no inconsiderable portion of his superior knowledge of the principles of maritime jurisprudence to a careful study of M. Vallin's work.

That part of the *Code de Commerce* which treats of maritime affairs, insurance, etc., is copied with very little alteration, from the ordinance of 1681. The few changes that have been made are not always improvements. No system or code of maritime law has ever been issued by authority in Great Britain. The laws and practices that now obtain among them, in reference to maritime affairs have been founded principally on the practices of merchants, the principles laid down in the civil law, the laws of Oleron and Wisby, the works of distinguished juriconsults, the judicial decisions of their own and foreign countries, etc. A law so constructed has necessarily been in a progressive state of improvement; and, though still susceptible of amendment, it corresponds, at this moment, more nearly, perhaps, than any other system of maritime law, with those universally recognized principles of justice and general convenience by which the transactions of merchants and navigators ought to be regulated. The decisions of Lord Mansfield did much to fix the principles, and to improve and perfect the maritime law of England. It is also under great obligations to Lord Stowell. The decisions of the latter chiefly, indeed, respect questions of neutrality, growing out of the conflicting pretensions of belligerents and neutrals during the late war; but the principles and doctrines which he unfolds in treating those questions, throw a strong and steady light on those branches of maritime law. It has occasionally, indeed, been alleged—and the allegation is probably, in some degree well founded—that his lordship has conceded too much to the claims of belligerents. Still, however, his judgments must be regarded, allowing for this excusable bias, as among the noblest monuments of judicial wisdom of which any country can boast. "They will be contemplated," says Mr. Serjeant Marshall, "with applause and veneration, as long as depth of learning, soundness of argument, enlightened wisdom, and the chaste beauties of eloquence, hold any place in the estimation of mankind."—*On Insurance*, Prelim. Disc. The *Treatise of the Law Relative to Merchant Ships and Seamen*, by the late Chief Justice of the Court of King's Bench, does credit to the talents, erudition, and liberality of its noble and learned author. It gives, within a brief compass, a clear and admirable exposition of the most important branches of our maritime law; and may be consulted with equal facility and advantage by the merchant, the general scholar, and the lawyer. Mr. Serjeant Marshall has entered very fully into some, and has touched upon most points of maritime law, in his work on *Insurance*; and has discussed them with great learning and sagacity. The works of Mr. Justice Park, Mr. Holt, and a few others, are also valuable. Of the earlier treatises, the *Lex Mercatoria* of Malynes is by far the best; and, considering the period of its publication (1622), is a very extraordinary performance. See *North Am. Rev.*, vi., 323 (J. STONY), ii., 218, xiii., 1 (H. WHEATON); *Hunt's Mag.*, xiii., 292, 455, x., 337, ix., 261, 358, 643, xiv., 547, xv., 75, xxiv., 191.

The marine law of the United States is the same as the marine law of Europe. It is not the law of a particular country, but the general law of nations; and Lord Mansfield applied to its universal adoption the expressive language of Cicero, when speaking of the eternal laws of justice: "Nec erit alia lex Romæ, alia Athenis; alia nunc, alia posthæ; sed et omnes gentes, et omni tempore una lex et sempiterna, et immortalis continetbit."

In treating of this law, we refer to its pacific character as the law of commerce and navigation in time of peace. The respective rights of belligerents and neu-

trals in time of war constitute the code of prize law, and that forms a distinct law of inquiry. When Lord Mansfield mentioned the law-merchant as being a branch of public law, it was because that law did not rest essentially for its character and authority on the positive institutions and local customs of any particular country, but consisted of certain principles of equity, and usages of trade, which general commerce and a common sense of justice had established to regulate the dealings of merchants and mariners in all the commercial countries of the civilized world.

In the study and cultivation of maritime law our improvement has been rapid, and our career illustrious, since the adoption of the present Constitution of the United States. The decisions in federal courts, in commercial cases, have done credit to the intellectual and moral character of the nation, and the admiralty courts in particular have displayed great research and a familiar knowledge of the principles of the maritime law of Europe.

The reports of judicial decisions in the several States, and especially in the States of Massachusetts, New York, and Pennsylvania, evince great attention to maritime questions; and they contain abundant proofs that our courts have been dealing largely with that business of our enterprising and commercial people.

Declaration respecting Maritime Law signed by the Plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in Congress at Paris, April 16, 1856:

The plenipotentiaries who signed the Treaty of Paris, on the 30th of March, 1856, assembled in conference, considering: That maritime law in time of war has long been the subject of deplorable disputes; that the uncertainty of the law and of the duties in such a matter gives rise to differences of opinion between neutrals and belligerents which may occasion serious difficulties, and even conflicts; that it is, consequently, advantageous to establish a uniform doctrine on so important a point; that the plenipotentiaries assembled in Congress at Paris can not better respond to the intentions by which their governments are animated, than by seeking to introduce into international relations fixed principles in this respect. The above-mentioned plenipotentiaries, being duly authorized, resolved to concert among themselves as to the means of attaining this object; and having come to an agreement, have adopted the following solemn declarations:

1. Privateering is, and remains, abolished. 2. The neutral flag covers enemies' goods, with the exception of contraband of war. 3. The neutral goods, with the exception of contraband of war, are not liable to capture under enemy's flag. 4. Blockades, in order to be binding, must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast by the enemy.

The governments of the undersigned plenipotentiaries engage to bring the present declaration to the knowledge of the States which have not taken part in the Congress of Paris, and invite them to accede to it. Convinced that the maxims which they now proclaim can not but be received with gratitude by the whole world, the undersigned plenipotentiaries doubt not that the efforts of their governments to obtain the general adoption thereof will be crowned with full success. The present declaration is not, and shall not be binding, except between those powers who have acceded or shall accede to it.

Done at Paris the 16th of April, 1856.

(Signed,)

The United States' Executive, through the Department of State, communiated to the French government its reply in August 1856, viz.:

These four points are *indivisible*, because he can not accept the first point—the abolition of privateering. Governor Marcy respectfully proposes, however, two distinct amendments:

1. Either to add to the first proposition in the "declaration" of the Congress of Paris—

"Ar: that the private property of the subjects or citizens of a belligerent on the high seas shall be exempted from seizure by public armed vessels of the other belligerents, except it be contraband;" or

2d. To adopt the 2d, 3d, and 4th propositions, without the first.

The argument contained in the reply of Governor Marcy is historical, argumentative, and forcible.

It goes to say, that no nation has a right to prescribe to another what shall constitute her military or naval force; and that we can, consistently with our institutions and policy, neither agree not to employ volunteers on land, nor privateers on the high seas. When a nation having a large standing army, the latter must have recourse to volunteers; and so when a nation with a large navy, makes war on another with an inferior navy, the latter must have recourse to privateers, otherwise the nation with a large navy could employ a portion of her navy to keep the inferior navy of her enemy in check, and with the rest sweep the commerce of the latter from the ocean. Parity of position could only be reached if the armed cruisers of the superior navy and other national ships of war would forego making captures of the enemy's property on the high seas, or if the nation with an inferior navy armed privateers to inflict as much damage on the commerce of the greater naval power as the latter does on its inferior enemy. The concluding portion of Mr. Marcy's reply is as follows:

"In discussing the effect of the proposed measure—the abolition of privateering—a reference to the existing condition of nations is almost unavoidable. An instance will at once present itself in regard to two nations where the commerce of each is about equal, and about equally wide-spread over the world. As commercial powers they approach to an equality, but as naval powers there is great disparity between them. The regular navy of one vastly exceeds that of the other. In case of war between them only an inconsiderable part of the navy of the one would be required to prevent that of the other from being used for defense or aggression, while the remainder would be devoted to the unembarrassed employment of destroying the commerce of the weaker in naval strength. The fatal consequence of this great inequality of naval force between two such belligerents would be in part remedied by the use of privateers; in that case, while either might assail the commerce of the other in every sea, they would be obliged to distribute and employ their respective navies in the work of protection. This statement only illustrates what would be the case, with some modification, in every war where there may be considerable disparity in the naval strength of the belligerents.

"History throws much light upon the question. France, at an early period, was without a navy; and in her wars with Great Britain and Spain, both naval powers, she resorted, with signal good effect, to privateering, not only for protection, but successful aggression. She obtained many privateers from Holland, and by this force gained decided advantages on the ocean over her enemy. While in that condition France could hardly have been expected to originate or concur in a proposition to abolish privateering. The condition of many of the smaller States of the world is now, in relation to naval powers, not much unlike that of France in the middle of the 16th century.

At a later period, during the reign of Louis XIV., several expeditions were fitted out by him, composed wholly of privateers, which were most effectively employed in prosecuting hostilities with naval powers. Those who may have at any time a control on the ocean will be strongly tempted to regulate its use in a manner to subservise their own interests and ambitious projects. The ocean is the common property of all nations; and instead of yielding to a measure which will be likely to secure to a few—possibly to one—an ascendancy over it, each should pertinaciously retain all the means it possesses to defend the common heritage. A predominant power upon the ocean is more menacing to the well being of others than such a power on land; and all are alike interested in resisting a measure calculated to facilitate the permanent establishment of such a domination, whether to be wielded by one power or shared among a few others. The injuries likely to result from surrendering the dominion of the seas to one or a few nations which have powerful navies, arise mainly from the practice of subjecting private property on the ocean to seizure by belligerents. Justice and humanity demand this practice should be abandoned, and that the rules in relation to such property on land should be extended to it when found upon the high seas.

"The President, therefore, proposes to add to the first proposition in the 'Declaration' of the Congress at Paris the following words: 'And that the private property of the subjects or citizens of the belligerent on the high seas shall be exempted from seizure by public armed vessels of the other belligerent, except it be contraband.' This amended, the government of the United States will adopt it, together with the other three principles contained in that 'Declaration.' I am directed to communicate the approval of the President to the second, third, and fourth propositions, independently of the first, should the amendment be unacceptable. The amendment is recommended by so many powerful considerations, and the principle which calls for it has so long had the emphatic sanction of all enlightened nations in military operations on land, that the President is reluctant to believe it will meet with any serious opposition. Without the proposed modification of the first principle, he can not convince himself that it would be wise or safe to change the existing law in regard to the right of privateering.

"If the amendment should not be adopted, it will be proper for the United States to have some understanding in regard to the treatment of their privateers when they shall have occasion to visit the ports of those powers which are or may become parties to the declaration to the Congress at Paris. The United States will, upon the ground of right and comity, claim for them the same consideration to which they are entitled, and which was extended to them under the law of nations, before the attempted modification of it by that Congress.

"As connected with the subject herein discussed, it is not inappropriate to remark that a due regard to the fair claims of the neutrals would seem to require some modification, if not an abandonment, of the doctrine in relation to contraband trade. Nations which preserve the relations of peace should not be injuriously affected in their commercial intercourse by those which choose to involve themselves in war, provided the citizens of such peaceful nations do not compromise their character as neutrals by direct interference with the military operations of the belligerents. The laws of siege and blockade, it is believed, afford all the remedies against neutrals that the parties to war can justly claim. These laws interdict all trade with the besieged or blockaded places. A further interference with the ordinary pursuits of neutrals, in nowise to blame for an existing state of hostilities, is contrary to the obvious dictates of justice. If this view of the

subject could be adopted, and practically observed by all civilized nations, the right of search, which has been the source of so much annoyance, and of so many injuries to neutral commerce, would be restricted to such cases only as justified a suspicion of an attempt to trade with places actually in a state of siege or blockade.

"Humanity and justice demand that the calamities incident to war should be strictly limited to the belligerents themselves, and to those who voluntarily take part with them; but neutrals, abstaining in good faith from such complicity, ought to be left to pursue their ordinary trade with either belligerent without restrictions in respect to the articles entering into it.

"Though the United States do not propose to embarrass the other pending negotiations relative to the rights of neutrals, by pressing this change in the law of contraband, they will be ready to give it their sanction whenever there is a prospect of its favorable reception by other maritime powers.

"The undersigned avails himself of this opportunity to renew to the Count de Sartiges the assurance of his high consideration.

"W. L. MARCY."

The points here settled are all of them important. Privateering has been the scourge of the ocean—a lawless sort of warfare between belligerents themselves—a grievous annoyance and damage to neutrals, and a most prolific source of piracy. Those whose recollection extends back 80 or 40 years remember when the ocean was traversed by pirates, trained for their fiendish business by the long wars of the earlier years of the century. The best men of modern Christendom had never ceased to protest against the system. Sweden and Holland attempted, in the 17th century, to put an end to the practice, but without effect. The United States and Prussia, in 1786, entered into stipulations against privateering, as between themselves, but did not renew the provision. The French Legislature, in 1792, made a similar, but fruitless effort. Privateering was destined to have one license more for perpetrating its atrocities, and shocking the sense of mankind. Jurists lamented the practice, but were forced to acknowledge it a part of the law of nations, and gave up in despair all expectation of an early abandonment of the legalized outrage.

When the late war between the United States and Mexico occurred, it was matter of general gratulation that the circumstances of the case saved the world from the curse of privateering; and much more did the world rejoice, at the commencement of the late European war, when England and France announced their intention to grant no letters of marque. With the conclusion of that war—as part of the conclusion, indeed—we have the solemn compact of the great powers of Europe, that "privateering is, and remains, abolished." It is an important step in the progress of humanity.

The declaration that "the neutral flag covers enemies' goods, with the exception of contraband of war," diminishes greatly the liabilities of the world to future strife. Until the breaking out of the recent war, Great Britain had steadily maintained the contrary doctrine as the law of nations. The Empress of Russia, in 1780, set forth precisely the doctrine of the late Paris Conference, and gained the concurrence of most of the States of Europe, and of the government of the United States. Great Britain refused to yield, and the other nations, one after another, submitted to the interpretations of that power. Even Russia herself conceded that point, and in 1801 agreed, by treaty, that an enemy's property was not protected in neutral ships. Jurists, our own with the rest, regarded the question of international law as settled on the British interpretation. The qualified accession of England, in the Declaration of 1854, to the principles of the Armed

Neutrality occasioned, therefore, general and gratifying surprise. It then entered the minds of none, however, that within two years she would make her full accession to those principles, by a compact with those very powers against whom, on this same question, she had leveled the broadsides of her fleets. In regard to this particular, Russia is the victorious party, and her triumph is a note of human progress. Turkey, too, has a proud distinction in this declaration, for in settling the point that free ships make free goods, she is but publishing anew what she was the first to declare 250 years ago. The labors of our own government have been in the same direction through the whole period of our national history. Our government, while admitting the English rule as to the law of nations, has declared that the rule had no foundation in natural right, and in repeated treaties has gained the insertion of the doctrine now proclaimed in Paris.

The third item in the late Declaration has been less the occasion of differences than the second. The fourth is a conclusive testimony against "paper blockades."

Whether our government will "accede" in form to the points named may be doubted, though every one of them is a concession to principles or usages for which we have contended, and all, it may be hoped, will have our uniform and hearty practical concurrence. It has been generally the policy of our statesmen to keep our government clear from alliances which might, under any circumstances, be embarrassing, and that disposition may demand for us, even in this instance, an attitude of independence. However this may be, the moral sense of the nation will accept with thankfulness the results of the Paris Conference, and the Christian will see new foretokenings of that day when nations shall learn war no more.

Maritime Loans. The contracts of *bottomry* and *respondentia* are maritime loans of a very high and privileged nature, and they are always upheld by the admiralty with a strong hand, when entered into *bona fide*, and without any suspicion of fraud. The principle on which they are founded and supported is of great antiquity, and penetrates so deeply into it, that Emerigon says its origin can not be traced. It was borrowed by the Romans from the ancient Rhodians, and it is deeply rooted in the maritime general law of Europe, from which it has been transplanted into the law of this country. The object of hypothecation bonds is to procure the necessary supplies for ships which happen to be in distress in foreign ports, where the master and owners are without credit, and in cases in which, if assistance could not be procured by means of such instruments, the vessels and cargoes must be left to perish. The authority of the master to hypothecate the ship and freight, and even the cargo, in a case of necessity, is indisputable. The vital principle of a bottomry bond is, that it be taken in a case of unprovided necessity when the owner has no resources or credit for obtaining necessary supplies. If the lender knew that the owner had an empowered consignee or agent in the port, willing to supply his wants, the taking the loan is a fraud; but if fairly taken under an ignorance of the fact, the courts of admiralty are disposed to uphold such bonds, as necessary for the support of commerce in its extremities of distress. And if the lender of money on a bottomry or respondentia bond be willing to stake the money upon the safe arrival of the ship or cargo, and to take upon himself, like an insurer, the risk of sea perils, it is lawful, reasonable, and just, that he should be authorized to demand and receive an extraordinary interest, to be agreed upon, and which the lender shall deem commensurate to the hazard he runs.

A *bottomry bond* is a loan of money upon the ship or cargo and accruing freight, at an extraordinary interest, upon maritime risks, to be borne by the lender for a specific voyage, or for a definite period. It is in

the nature of a mortgage, by which the ship-owner, or the master on his behalf, pled, as the ship as a security for the money borrowed, and it covers the freight of the voyage, or during a limited time. A *respondentia* bond is a loan upon the pledge of the cargo, though an hypothecation of both ship and cargo may be made in one bond; and it amounts at most to an equitable lien on the salvage in case of loss. The condition of the loan is the safe arrival of the subject hypothecated, and the entire principle as well as interest is at the risk of the lender during the voyage. The bottomry holder undertakes the risk of the voyage as to the enumerated perils, but not as to those which arise from the fault or misconduct of the master or owner. The money is loaned to the borrower, upon condition that if the subject pledged be lost by a peril of the sea, the lender shall not be repaid, except to the extent of what remains, and if the subject arrives safe, or if it shall not have been injured, except by its own defect, or the fault of the master or mariners, the borrower must return the sum borrowed, together with the maritime interest agreed upon, and for the repayment the person of the borrower is bound, as well as the property pledged. This is the definition of the contract given by Pothier, and it was taken from the Roman laws, and has been adopted by Emerigon, and he says the definition is given in nearly the same terms by all the maritime jurists.—KENT'S Com.

Mark, or Marco, a weight used in several parts of Europe, for various commodities, especially gold and silver. In France, the mark was divided into 8 oze, =64 drachms=192 deniers or pennyweights=4,098 grains. In Holland, the mark weight was also called Troy weight, and was equal to that of France. When gold and silver are sold by the mark, it is divided into 24 carats.

The pound, or *livre poids de marc*, the weight most commonly used in retail dealings throughout France, previous to the Revolution, was equal to 2 marcs, and consequently contained 16 oze.=182 drachms=384 den.=9,216 grains. One kilogramme is nearly equal to 2 livres. Subjoined is a table of livres, *poids de marc*, from 1 to 10, converted into kilogrammes. Any greater number may be learned by a simple multiplication and addition.

Livres.	Kilog.	Livres.	Kilog.

5	= 2.4475	10	= 4.8951

Mark, is a term sometimes used for a money of account, and in some countries for a coin. The English mark is $\frac{1}{16}$ of a pound sterling, or 13s. 4d.; and the Scotch mark is $\frac{1}{16}$ of a pound Scotch. The mark Lubs, or Lubec mark, used at Hamburg, is a money of account, equal to 29 $\frac{1}{2}$ cents. See HAMBURG.

Market, a public place in a city or town, where provisions are sold. No market is to be kept within 7 miles of the city of London; but all butchers, victualers, etc., may hire stalls and standings in the flesh-markets there, and sell meat and other provisions. Every person who has a market is entitled to receive toll for the things sold in it; and by ancient custom, for things standing in the market, though not sold; but those who keep a market in any other manner than it is granted, or extort tolls or fees where none are due, forfeit the same. See FAINS.

Marseilles, a large commercial city and sea-port of France, on the Mediterranean, lat. 43° 17' 49" N., long. 5° 22' E. Population, 1851, including suburbs, 195,257. The harbor, the access to which is defended by several strong fortifications, is in the centre of the city, forming a basin 525 fathoms in length, by about 152 fathoms in breadth. The tide is hardly sensible; but the depth of water at the entrance to the harbor varies from 16 to 18 feet, being lowest when the wind is north-west, and highest when it is

south-west varies from and cons are const prevent possible t of the be sized me above 100 quays; a specilly y eau and rock of which is and not a point of anchorage ships bet to the south, it l 49° 11' 5 erected ot the light, every half seen 7 leas Planter, of 44 miles, s 7 miles fr of it, heav bor; it is pilot on 1 whether th they seldom per to vessels, an with France Jean, on th The *luzeres* a little to t pital on Rat is dubious. for pilotage form quar entering at

All crew have declared, an gling is vi

south-west. Within the basin, the depth of water varies from 12 to 24 feet, being shallowest on the north, and deepest on the south side. Dredging machines are constantly at work to clear out the mud, and to prevent the harbor from filling up. Though not accessible to the largest class of ships, Marseilles is one of the best and safest ports in the world for moderate-sized merchantmen, of which it will accommodate above 1000. Ships in the basin lie close alongside the quays; and there is every facility for getting them speedily loaded and unloaded. The Isles de Ratonneau and Pomogues, and the strongly fortified islet or rock of If, lie W.S.W. from the port; the latter, which is the nearest to it, being only 1½ miles distant, and not more than ¼ of a mile from the projecting point of land to the south of the city. There is good anchorage ground for men-of-war and other large ships between the Isles de Ratonneau and Pomogues, to the west of the Isle d'If. When coming from the south, it is usual to make the Isle de Blanier, in lat. 43° 11' 54" N., long. 5° 13' 59" E. A light-house erected on this island is 131 feet high; the flashes of the light, which is a revolving one, succeed each other every half minute, and in clear weather it may be seen 7 leagues off. Ships that have made the Isle de Blanier, or that of Le Maire, lying east from it about 4½ miles, steer northerly for the Isle d'If, distant about 7 miles from each, and having got within ¼ or ½ a mile of it, heave to for a pilot, who carries them into a harbor; it is not, however, obligatory on ships to take a pilot on board; but being obliged to pay for one whether they avail themselves of his services or not, they seldom dispense with them. The charge is 4 sous per ton in, and 2 sous per ton out, for French vessels, and the vessels having reciprocity treaties with France. There is a light-house in the fort St. Jean, on the north side of the entrance of the port. The *lazaretto*, which is one of the best in Europe, lies a little to the north of the city; and there is an hospital on Ratonneau Island, for individuals whose health is dubious. With the exception of the above charge for pilotage, and the charges for such vessels as perform quarantine, there are no port charges on ships entering at or clearing out from Marseilles.

Usage.—As soon as the master has, on his arrival, made his declaration at the Health Office, and received *pratique*, he is directed to an office close by, called the *Patache*, where he makes two similar declarations, the one for the captain of the port, and the other for the custom-house; the day and hour of the latter being made is marked, in order to ascertain if the regular manifest of his cargo is delivered at the custom-house within 24 hours after, as required by law. As soon as these declarations are made, the master is accosted by one or more public brokers, who alone are authorized by law to enter ships at the custom-house and other public offices, and to interpret, if it be necessary, for the master. The broker whom he may select then gives the master all the necessary information respecting the usages of the port as regards the ship and cargo, and goes through all the formalities respecting them that the law or local regulations require. Independent of the regular manifest which it is usual in all ports for the master to give in to the custom-house, he is here required to give in a full and complete list of all the ship's stores, provisions, &c., that he has on board for his own use, and that of his crew; and he can not be too careful to make this list as correct as possible, as when it is subsequently verified on board by the custom-house and excise officers, any variation subjects the ship to penalties. This is particularly the case with tobacco, which, being a government monopoly, is watched with the greatest vigilance. All the tobacco on board over that which the crew have in their chests for their own use, must be declared, and any attempt at concealment or smuggling is visited with heavy fines. When the ship

sails, the stores, provisions, &c., are again examined, and an excise duty charged on such provisions and other excisable articles as may have been consumed in the port. No fire or light is allowed on board, and the cooking is all done on shore. Marseilles is a city of great antiquity, and has long enjoyed a very extensive commerce. Havre, partly, no doubt, from its being, as it were, the port of Paris, used to enjoy a greater share of the trade of France; but, notwithstanding the increased importance of the former, it has recently been surpassed by Marseilles. The customs duties collected at Havre in 1851, were 26,164,000 francs, whereas those collected at Marseilles during the same year amounted to 30,677,000 francs; having increased to that amount from 25,899,000 francs in 1830.

This statement shows conclusively, that the trade of Marseilles is not only increasing, but that it is already very extensive. She is the grand emporium of the south of France, and the centre of 9-10ths of her commerce with the countries on the Mediterranean and Black Sea. The exports consist principally of silk stuffs, wines, brandies, and liquors; woollens and linens; madder, oil, soap, refined sugar, perfumery, stationery, verdigris, and all sorts of colonial products. Among the principal imports are sugar, coffee, and other colonial products; dye stuffs; corn from the Black Sea and the north coast of Africa; cotton from Egypt and America; coal, linen, thread, and various descriptions of manufactured goods from England; with hides, wool, tallow, timber, &c. Marseilles engrosses almost the whole trade between France and Algiers. She is now also the principal seat of the intercourse carried on by steamers with Malta, Alexandria, and Constantinople; and besides the steamers employed by the government as packet, she ran upward of 28 steamers belonging to private companies. Mr. Maclaren says that in 1839 most of the latter had English-made engines, and English engineers; and that they burnt English coal, which sold here for about 30s. a ton. There belonged to the port, on the 31st of December, 1851, 634 sailing vessels of the burden of 63,577 tons, and 43 steamers of the burden of 9,505 tons. A joint-stock bank established here in 1835 is said to have been exceedingly successful.

The arrivals and departures in this and the preceding year are considerably above the average, a consequence of the great importations of foreign corn. In

1846 the imports of wheat amounted to 1,290,000 quarters, and in 1847 to about 2,200,000 quarters.

We are unable to lay before the reader any very recent account of the import and export trade of Marseilles. We believe, however, that the value of the first was, in 1858, estimated at about 200,000,000 francs, and that of the exports at about as much. For information as to money, weights, measures, duties, etc., the reader is referred to FRANCE and HAVRE, under which heads he will find an account of the trade of France.

The trade of Marseilles has been much increased by the occupation of Algiers, she being the grand centre of the intercourse carried on with that country. But independently of this circumstance, Marseilles engrosses by far the largest share of the extensive commerce carried on between France and the east coast of Spain, Italy, Greece, and the Levant. See FRANCE.

Martinico, or Martinique, one of the French West India Islands, in the windward group, between lat. 14° 24' and 14° 53' N.; and long. 60° 50' and 61° 18' W. Population, 1850, 121,145. It is mountainous, and contains several extinct volcanoes; the numerous small rivers are used to turn sugar-mills. About one quarter of the surface is covered with dense forests. Soil fertile, but only one fifth of the superficies is cultivated. Chief products, sugar, coffee, and cacao. This island, called by the natives Madians, was discovered by the Spaniards in 1493. The French founded a colony on it in 1685. It was taken by the English in 1762, but resigned in 1763; they again occupied it from 1784 to 1809, and it was finally given up to France in 1814. The capital of the colony is Port Royal, but St. Pierre is the most populous town and the centre of commerce. The island is nearly 50 miles in length by about 16 in breadth, and comprehends an area of 860 square miles. The surface is uneven, and intersected in all parts by steep and rugged rocks. Piton de Corbet, one of the highest, is about 812 feet above the level of the sea. The shape of this calcareous hill resembles a cone, and it is on that account very difficult of access. The palm-trees with which it is covered, become more lofty and abundant near the summit, and these continually attract the clouds, which occasion noxious damps, and contribute to render it more rugged in appearance, and more dangerous to ascend. There are also two other mountains conspicuous from their elevation, and from these, particularly from the first, descend numerous streams, which irrigate the island. Martinique is better supplied with water, and less exposed to hurricanes than Guadeloupe, while the productions are nearly the same. Of 75,821 hectares, the superficial area of the island, 17,922 are employed in raising sugar-cane, 3861 in coffee, 719 in cocoa, 491 in cotton, 17,191 are pasturage, and 19,997 are woods. The annual production is valued at 21,000,000 francs. In 1824 the island consumed French products to the value of 16,000,000 francs, and exported to the mother country goods to the amount of 18,000,000 francs. The tonnage engaged in this commerce amounted to 33,500 tons. The revenue in 1823, was 4,000,000 francs. The commerce of Martinique has continued nearly the same since the period at which the above estimate was made.

Port Royal, the capital and seat of the courts of justice of Martinique, is situated on one of the several bays which indent the island, and possesses one of the safest and most capacious harbors in the West Indies, or even in the world.

The commercial relations of Martinique and Guadeloupe are regulated by the royal decrees of February 5, 1826, and by such other decrees as have subsequently been promulgated. Foreign and national ships may import into all open ports of the islands (in Martinique, the ports of St. Pierre, Port Royal, and Trinité; in Guadeloupe, Moule, La Basseterre, and

Poin-à-Pitre; and in Marigalante, or Grandbourg, the principal town and only port of the island), articles of merchandise enumerated in the following tariff:

TARIFF FOR ALL FLAGS, NATIONAL AND FOREIGN.

Denomination of merch.	No., weight or measure.	Rate of duty.
Animals, living	10 per ct. ad val.
Beef, salt	100 kiloa = 220 lbs.	\$2 80 4-5
Codfish & other salt fish	1 30 1-5
Indian corn, in grain	1 hect. = 2 4-5 bush.	87 1-3
Vegetables, dried	64 4-5
Rice 220 lbs.	1 30 1-5
Salt	88
Tobacco	7 per ct. ad val.
Hoop-poles 1,000	\$1 68
Wine, foreign	1 hect = 26 gals.	In for shps. 95 c.
		In nat. " 48 c.
Stone coal 220 lbs.	\$0 02

By decree of March 10, 1855, salted provisions (meats) of every description pay only 50 centimes (5-8 cents) per 100 kilogrammes. Wood of all sorts, other than hoop-poles; tar, pitch, and other extracts of pine, etc.; hides, with the hair on; forage, green and dry; table fruits, and seeds, pay 4 per cent. ad valorem.

No. 2.—*Free of Duty*.—Ammonia, unpulverized; animal substances used in medicine and perfumery; bones and horns of animals; cassia; cochineal; cocca-shells; copper; elephants' teeth; fats, except of fish; ginger; gloves; gums; indigo; Jesuits' bark; kermes; lac; lead; medicinal balsams, juleps, roots, barks, herbs, leaves, and flowers; mother-of-pearl; nutmeg; peltries; pepper; potash; quercitron; rocou; rushes and reeds; seeds hard to be crushed; skins, dry and undressed; sumach; tin, unwrought; tordise-shell, turmeric; vanilla; vegetables, green; wax, not worked; whale fins; woods, odoriferous, dye, and cabinet. Foreign vessels importing the above enumerated merchandise are subjected to no other port charges, light-house and tonnage duties, than are levied on French vessels. All goods not enumerated in the above tariff, and imported from foreign countries, either in foreign or French bottoms, are liable to confiscation.

The articles enumerated in lists Nos. 1. and 2, as well as all articles imported from France, may be re-exported, duty free, from one colony to another, but only in French vessels; on condition, however, that the importer of merchandise contained in list No. 1 proves that the duties have been discharged in the colony of original importation. Foreign vessels, as well as French, may export, duty free, to foreign countries, articles imported into the two colonies, whether from France or elsewhere; but these exportations can only be allowed from the ports opened by the ordinance of February 5, 1826, for the importation of merchandise enumerated in lists 1 and 2. Foreign flour may be imported (if necessity or urgency authorizes the importation) for a fixed duty of \$3 94.2 per 80 kilogrammes, or 177½ lbs.; but then it can only be done if a special order by the governor permitting the importation has been issued, which allowance will never extend beyond the term of three months.

Maryland, one of the central United States, lies between 38° and 39° 44' N. lat., and between 75° 10' and 79° 21' W. long. It is 196 miles long and 120 broad, containing 11,000 square miles. Population in 1790, 319,728; in 1800, 845,824; in 1810, 380,546; in 1820, 407,850; in 1830, 416,918; in 1840, 460,222; and in 1850, 683,035.

Early History of Maryland.—In the year 1632 King Charles I. gave a charter to Cecilus Calvert, Lord Baltimore, and granted to him a tract of land lying in that peninsula, between the ocean and Chesapeake Bay, and round the northern extremities of that same bay, and ordered this land to be called "Maryland," in honor to the Queen Henrietta Maria, the consort of Charles I. She was of the Catholic religion, like Lord Baltimore himself, and likewise the greater part of the settlers which he carried out. The name appears for the first time in the charter of Maryland of the 20th

June, 1632. It is possible that Lord Baltimore and his associates, in proposing to the king that name, had also at the same time the old Spanish maps of North America before their eyes, on which Chesapeake Bay is called "St. Mary's Bay" (*Bahia de Santa Maria*) and that they had a desire to carry back to this bay that old and historical name. It may be a mere accident that the name Maria was as well in modern as in ancient times applied to the same regions. But what we call accident in history is often secretly linked together by an association of ideas which escapes our research.

Others think that the Calverts and their associates, and their Catholic missionaries, who explored and settled the territory of Maryland, thought, in giving this name, exclusively of the Queen Henrietta Maria and not at all of the Holy Virgin. It was among Spaniards and French, and among all Catholic colonists and discoverers, very customary to vow a new country or place, to which they gave a name in honor of some person, at the same time to the protection of that saint which bore the same name. They would, for instance, call a place named after Christopher Columbus, not "Christophoro," but "St. Christophuro," because they thought at once as well of the man as of his protecting saint. That something similar was going on at the baptism of Maryland seems not unlikely, from the circumstance that the first principal settlement of Maryland was called St. Mary, and that this settlement, as well as the surrounding country, is so called to this day. The fact that the old forgotten name Mary, in later times, returned to the same regions, appears one of the so-called "curious coincidences in history worthy to be pointed out."—J. G. KOHL.

Physical Features, etc.—Eastern Maryland, or that part of the State east of the Chesapeake Bay, is mostly level. The country on the west shore to the head of the tides is similar to the eastern shore; the soil of this portion is generally fertile, producing wheat, Indian corn, tobacco, etc. Above the tides the surface rises into hills, and the western part attains an elevated region, being crossed by the Alleghany Mountains. The western part contains much fine land, adapted both to grain and grazing. Extensive beds of coal and iron ore exist. There were in this State in 1850, 2,797,906 acres of improved land, and 1,836,445 of unimproved land, in farms; cash value of farms, \$87,178,545; and the value of implements and machinery, \$2,463,443.

Live Stock.—Horses, 75,684; asses and mules, 5644; milk cows, 86,869; working oxen, 84,125; other cattle, 98,595; sheep, 177,902; swine, 352,911. Value of live stock, \$7,997,684.

Agricultural Products, etc.—Wheat, 4,494,680 bushels; rye, 226,014; Indian corn, 11,104,631; oats, 1,242,161; barley, 745; buckwheat, 108,371; peas and beans, 12,816; potatoes, 764,939; sweet potatoes, 208,938. Value of products of the orchard, \$164,051. Produce of market gardens, \$200,869. Pounds of butter made, 3,806,160; of cheese, 8975; maple sugar, 47,740; molasses, 1430 gallons; bees' wax and honey, 74,802 pounds; wool, pounds produced, 480,226; flax, 35,686; silk cocoons, 89; hops, 1870; tobacco, 21,407,497 pounds; hay, tons of, 167,956; clover seeds, 15,217 bushels; other grass seeds, 2561; flax seed, 2445 bushels; and were made 1431 gallons of wine. Value of home-made manufactures, \$111,828; of slaughtered animals, 1,954,800.

The Potomac River, which divides the State from Virginia, is 360 miles long, and navigable about 150 miles to Washington city. It is 7 1/2 miles wide at its mouth. The great falls are 14 miles above Washing-

ton; the perpendicular descent is 76 feet, and the rapids extend for several miles up the river, and form a very picturesque view. The Susquehanna is a large river which enters into the head of Chesapeake Bay in

this State. It is 1½ miles wide at its mouth, but is navigable only 5 miles, being above that much obstructed by falls and rapids. The Patuxeco is a small river, navigable, however, 14 miles to Baltimore for ships. The Patuxent is 110 miles long, and is navigable for 50 miles for vessels of 250 tons. The other rivers are Elk, Sassafras, Chester, Choptank, Nanticoke, and Pocomoke. The Chesapeake Bay is 270 miles long, and from 70 to 20 wide, and by its numerous inlets furnishes many fine harbors.

Manufactures, etc.—There were in the State in 1850, 33 cotton factories, with a capital invested of \$2,248,600, employing 1212 males and 2035 females; products valued at \$2,021,396; 43 woolen factories, with a capital of \$258,100, employing 264 males and 106 females; products valued at \$319,240; 19 establishments making pig iron, with a capital of \$1,033,500, employing 1351 persons, producing 43,641 tons of pig iron, etc., valued at \$1,048,250; 16 establishments, with a capital of \$350,100, employing 761 persons, and making 6244 tons of castings, etc., valued at \$685,000; 17 establishments, with a capital of \$780,650, employing 568 persons, manufacturing 10,000 tons of wrought iron, valued at \$771,431; 392 flouring and grist mills; 130 saw mills; 116 tanneries, with a capital of \$628,900, employing 470 persons; value of products, \$1,103,139; 59 printing-offices; 6 daily, 4 tri-weekly, 54 weekly, 1 semi-monthly, and 2 monthly publications. There were in this State (January, 1856) 3 railroads, with 466 miles of road finished and in operation, and 30 miles in course of construction. The Chesapeake and Ohio Canal, 184 miles long, is mostly in this State. Capital invested in manufactures, \$14,753,143; value of manufactured articles, \$32,477,702.

The principal places in the State are Baltimore, the metropolis; Annapolis, the capital; Havre de Grace, Frederick, Hagerstown, and Cumberland. There were (January, 1854) 25 banks, with an aggregate cash capital of \$9,538,409. The exports of Maryland in 1852 of domestic produce in American vessels amounted to the value of \$1,391,692; in foreign vessels, \$2,122,949. Foreign produce in American vessels, \$120,129; in foreign vessels, \$38,091. Total value, \$6,667,861. The imports same year in American vessels amounted to \$5,620,114; in foreign vessels, \$1,099,872. Total, \$6,719,986. Tonnage, 1852, 201,186.

For History, Finances, etc., of Maryland, see *Am. Quar.*, ix., 483; *HUNT'S Mag.*, v., 50; *Bank Mag.*, i., 394; *Jo. Sc.*, xxvii., 1; *DE Bow's Ker.*, x., 645.

The principal port is Baltimore, situated on the north side of the Patuxeco River, about 14 miles above its entrance into the Chesapeake Bay, in lat. 39° 17' N., long. 76° 36' W. The harbor is spacious and convenient, and the water deep. Its tonnage in 1856 amounted to 183,344 tons. In the fiscal year, 1855-6, there were built at this port, 12 ships, 8 barks, 43 schooners, 3 sloops, with an aggregate tonnage of 15,303 tons.

Annapolis, city, port of entry, and capital of Maryland, on the Chesapeake Bay, at the entrance of Severn River. The State House is remarkable as the building in which the American Congress, during the revolutionary war, held some of its sessions. The Senate Chamber, which witnessed the last scene of the great drama of the Revolution, Washington's resignation of his commission to the Congress, has been preserved unaltered. The United States' Naval Academy, at Fort Severn, has 7 professors, and 70 midshipmen as students. Tonnage of the port in 1856, was 1332 tons.

Number of vessels built, and their tonnage, in the State of Maryland, during the year ending June 30, 1856:

Vienna	83	..	83	1,920
Snow Hill	7	..	7	468
Annapolis	2	..	2	133
Total	19	8	110	3	138	19,018

Massachusetts, one of the eastern United States, lies between 41° 23' and 42° 52' north lat., and between 69° 30' and 73° 30' west long. It is about 190 miles long, with an average breadth of 90 miles, and contains 7250 square miles. Population in 1790 was 388,727; in 1800, 422,845; in 1810, 472,040; in 1820, 523,287; in 1830, 610,408; in 1840, 737,639; and in 1850, 994,499.

Early History.—The first and most ancient names which were given by historians to the territory of the State of Massachusetts were more or less the same with those of Maine, and we need not repeat them here. The name "*La Côte des Almouchiquois*" (the Coast of the Almouchiquois Indians), which the French introduced, and which the Dutch geographers frequently changed to "*The Land of Almuskikosen*," covered particularly the whole extent of Massachusetts. This latter name was first introduced by the English navigators and explorers. The word is said to be composed of the Indian words *Moos* (*Arrowhead*) and *Wetuset* (*Hill*). The pure and correct orthography of the compound word is from this said to be *Moswuset*, the hill in the shape of an arrowhead. The king of an Indian tribe is said to have resided on such a hill near the shores of Massachusetts Bay, and his tribe of Indians received from this, the name "*The Indians of Moswuset*." The name is already mentioned by Captain John Smith under the year 1616. He writes it *Massachuset*. In the early times, the name was, however, corrupted in many different ways. Captain Dermer writes, in his celebrated letter on his discoveries, *Massachusit* (1619). In a letter from Plymouth in the year 1629, the name is written *Massachulets Bay*, and in the patent of Sir Fernando Gorges, repeatedly *Massachusiac*. In the earliest time of the Plymouth Colony this name included only the country round Boston harbor, and the name was principally given to that great bay, of which Boston harbor is a part, and which was called *Massachusetts Bay*. The first English colony or province was therefore not called from the country, but from the bay, "*The Colony of Massachusetts Bay*" (since 1626). The territory which this name covered was at first not extensive, but by and by it became the greatest name throughout the whole of New England. In the year 1692 the country of the Plymouth Colony was united to it, and for the whole was now introduced the name of "*The Province of Massachusetts*." So long also as New Hampshire and Maine were united to the mighty Massachusetts, during the greater part of the 17th and 18th centuries, the geographers, forgetting local names, extended the name of Massachusetts often over the greater half of all the New England seas and countries; while since 1773 the name "*State of Massachusetts*" includes the coasts between Merrimack River in the north and Narragansett Bay in the south.—J. G. KOHL.

Physical Features.—This State presents three distinct zones. The first toward the ocean, is a marine alluvion but little elevated above the sea; it is mostly sandy, and the least fertile and smallest in extent of the three sections. This plain is followed by a fine hilly tract which crosses the State from north to south, elevated in some places 300 feet above the sea; from these elevations the rivers flow in every direction. The second, or middle zone, includes part of the beautiful valley of the Connecticut, and is followed by the mountainous, but highly fertile county of Berkshire, which comprises the whole western part of the State. Through Berkshire passes two mountain ranges, the Tuglihanic, on the western border of the State and between the Housatonic and Connecticut Rivers, the Green Mountain range here called the Hoosick Mountains. Mount Holyoke, near Northampton, is near 1200 feet above the level of the sea, and Wachusett Mountain in Princeton, is an elevated peak from 2000 to 3000 feet high. Saddle Mountain in the Tuglihanic range in the north-west corner of the State is 4000 feet

high, and south-west. The value of those of 1850, 2,14 of unimp \$109,076, chinery & and mules 46,611; of 81,119; v. **Agriculture.** rye, 481,05 barley, 115 43,709; pe orchard, \$ 620; pour 7,088,142; 4693 gallo wool, pound coons, 7; h tons of, 66 grass seeds made 4688 manufacture 500,924. high, and Mount Washington in the same range in the south-west corner of the State, is about 8000 feet high. The valleys of the Connecticut are fertile, as are also those of the Housatonic. There were in this State in 1850, 2,183,436 acres of land improved, and 1,222,576 of unimproved land in farms; cash value of farms \$109,076,847, and the value of implements and machinery \$3,209,584. Live stock—horses, 42,216; asses and mules, 84; milch cows, 130,009; working oxen, 46,611; other cattle, 89,284; sheep, 188,651; swine, 81,119; value of live stock, \$9,647,710.

Agricultural Products, etc.—Wheat, 31,211 bushels; rye, 481,021; Indian corn, 2,945,490; oats, 1,165,146; barley, 112,385; buckwheat, 105,895; peas and beans, 43,709; potatoes, 3,585,984. Value of products of the orchard, \$463,995; produce of market gardens, \$600,020; pounds of butter made, 8,071,370; of cheese, 7,088,142; maple sugar, 795,525 pounds; molasses, 4693 gallons; beeswax and honey, 59,508 pounds; wool, pounds produced, 855,136; flax, 1162; silk cocoons, 7; hops, 121,595 pounds; tobacco, 138,246; hay, tons of, 651,807; clover seed, 1002 bushels; other grass seeds, 5085; flax seed, 72 bushels; and were made 4688 gallons of wine. Value of home-made manufactures, \$205,333; of slaughtered animals, \$2,500,924.

The principal rivers are the Connecticut, a noble stream winding for 50 miles across the State. Housatonic, which rises in Berkshire county, and flows through the west part of the State, and Merrimac, which rises in New Hampshire, and has a course of 50 miles in the north-east part of the State, and enters the ocean below Newburyport. It is navigable for large vessels to Haverhill, 15 miles. Besides these, there are Nashua, Concord, Taunton, and Blackstone Rivers. Massachusetts has numerous good harbors. There are several important islands off the south shore of this State, to which they belong. The largest is Nantucket, 15 miles long and 11 miles broad, and which constitutes a county of its own name. Martha's Vineyard, west of Nantucket is 20 miles long and from 2 to 10 miles broad, which, with other small islands, constitutes Duke's county. The shores of Massachusetts are diversified by some bold promontories and capacious bays. Of the latter, Massachusetts Bay, between Cape Ann on the north and Cape Cod on the south, is about 40 miles in breadth. Buzzard's Bay is on the south-west side of Cape Cod, and is 20 miles long. Cape Ann, in the north part of the State, is a rocky promontory 15 miles in length. Cape Cod is a peninsula in the south-east part of the State, extending 75 miles long and from 2 to 20 miles broad, with a bend in the middle nearly at right angles. The peninsula of Nantuxet, a few miles north of the harbor of Boston, is connected with the mainland by Lynn-bench two miles long. It has become, on account of its cool breezes and wild sea views, a place of fashionable resort during the summer months.

There were, January, 1856, 43 railroads, of which 1409 miles were finished and in operation, and 48 miles in course of construction. The Middlesex Canal, 27 miles long, connects Boston with Lowell. The Blackstone, and the Hampshire and Hamden Canals are both in disuse.

The value for the year of the products of industry, as found by adding the separate returns throughout the State, is found to be \$295,820,681. If allowance be made for defective and erroneous returns, the Secretary thinks the whole amount would be at least \$350,000,000. The returned value without allowance, shows an enormous increase of the productive energy of the State as compared with the previous returns, viz.:

Year	Production	Population
1827	\$56,292,516	700,000
1845	194,749,457	845,000
1855	295,820,681	1,138,193

That is, while the population has increased only 34 and 62 per cent. respectively; the value of the product

of industry (returned) has increased 188 and 242 per cent. The amount of capital invested in manufactures and other productions in Massachusetts, is shown to be \$120,000,000, and the gross value of products \$295,000,000 annually. The number of hands employed is 245,908. The leading products of the State in 1855, and the amount of capital employed in 1845 and 1855 are as follows:

Products.	1845.		1855.	
	Value.	Capital.	Value.	Capital.
Cotton goods	26,140,000	61,981,000	17,739,000	17,739,000

The principal ports are: 1. Boston, lat. 42° 23' N., long. 71° 4' W. The city is situated at the head of a deep bay, on a peninsula, being surrounded on three sides by water. Generally there is sufficient depth of water to enable the largest ships to come up to the city at all times of the tide; and they usually moor alongside of docks where there is perfect safety. The depth of water in the channel varies from 15 to 30 feet. It is the great centre of the commerce of New England, and in this capacity receives and distributes one fifth of the whole commercial material of the United States. The tonnage of Boston in 1856 was 521,117 tons. See *HOWSON*. 2. Salem, city and port of entry. It is chiefly built on a tongue of land formed by two inlets from the sea, called North and South Rivers; over the former are two bridges (one of which is crossed by the railroad), connecting it with Beverly. The harbor has good anchorage ground, but vessels drawing more than 12 or 14 feet of water must be partially unloaded before they can come to its wharves. The tonnage of Salem in 1856 was 29,970 tons. 3. Nantucket. Tonnage in 1856, 16,857 tons. 4. New Bedford. 5. Fall River. 6. Newburyport. 7. Gloucester.

Mast, a long piece, or system of pieces, of timber, placed nearly perpendicularly to the keel of a vessel to support the yards or gaffs on which the sails are extended. When the mast is one entire piece, it is called a pole-mast; but in all larger vessels it is composed of several lengths, called lower, top, and top-gallant masts: sometimes a fourth, called a royal mast. The

method of supporting each mast on the one next below it, is peculiar. On the sides of the lower mast, some feet below the head, are placed cheeks; on these are fixed horizontally two short pieces of wood, fore and aft, called trestle trees. Across these at right angles are laid, before and abaft the mast, two or more longer and lighter pieces, called cross trees, which give the name to the entire system. On the mast head itself is a cap. The topmast being placed up and down, the fore side of the lower mast is swayed up between the trestle trees, and through the round or foremost hole in the cap. When raised so high that the heel of the topmast is nearly up to the surface of the cross trees, a piece of iron, called the fid, is put through the hole in the heel for the purpose; and on this fid, of which the ends are supported on the trestle trees, the topmast rests. When fidded, the topmast is stayed, and the rigging or shrouds set up to the dead eyes in the ends of the cross trees. These dead eyes pull from the lower rigging below, and thus the cross trees serve merely to extend the rigging. The topgallant is supported in the same manner on the topmast. When the mast is to be taken down, it is first raised to relieve the fid; which being drawn out, the mast is lowered. The masts are supported by a strong rope, leading forward, called the stay; by others, leading aft on each side of the ship, called, in general, back-stays; and by others abreast, called shrouds, and also breast-back-stays. Large lower masts are composed of pieces, and have for some years been made of several lengths, about a foot or so square, and the whole supported merely by hoops at intervals. The mainmast is near the middle of the vessel, the foremast is that which is nearest the fore part, and the mizzenmast is abaft the mainmast. The old rule for the length of the main

lower mast is to take one half the sum of the length of the lower deck and extreme breadth: the foremast is eight ninths of the mainmast, the mizzenmast considerably smaller. The topmast is about three fifths of the lower mast. These rules, as well as others for the thicknesses, etc., are merely for convenience, based on no mechanical principle, and are by no means strictly followed.

Masts are still built up in pieces, but by the aid of marine glue. A joint secured by this glue is less easily separable than the actual fibres of the wood itself. In the great Exhibition of London there were many curious specimens illustrative of the use of this extraordinary cement. One was a piece of the mast of the ship *Caragoa*, found inseparable even by the wedge. Another was part of a mainmast, from which a glued fragment was torn away only after a force of 22 tons had been applied. A third was a block of elm, joined with glue; it was exploded by gunpowder, but the joint did not yield. Another was an oak cannon-ball, made of two glued pieces; it had been fired with eight ounces of powder, but the joint held fast. Another was a deal block, which broke in the fibres by a force of four tons. Others were pieces of masts, intended to show how intensely strong a mast becomes when built up with pieces which are joined by this glue. It is not only a glue; it is also a substitute for pitch. Many vessels have the seams payed or calked with this glue, which is found much more durable for the purpose than ordinary pitch.

Master, in commercial navigation, the person intrusted with the care and navigation of the ship. "The master is the confidential servant or agent of the owners; and in conformity to the rules and maxims of law the owners are bound to the performance of every lawful contract made by him relative to the usual employment of the ship."—*ANNOTT on the Law of Shipping*. From this rule of law it follows that the owners are bound to answer for a breach of contract, though committed by the master or mariners against their will, and without their fault. Nor can the expediency of this rule be doubted. The owners, by selecting a person as master, hold him forth to the public as worthy of trust and confidence. And in order that this selection may be made with due care, and that all opportunities of fraud and collusion may be obviated, it is indispensable that they should be made responsible for his acts. The master has power to hypothecate, or pledge, both ship and cargo for necessary repairs executed in foreign ports during the course of the voyage; but neither the ship nor cargo can be hypothecated for repairs executed at home. The master has no lien upon the ship for his wages, nor for money advanced by him for stores or repairs. In delivering judgment upon a case of this sort, Lord Mansfield said: "As to wages, there is no particular contract that the ship should be a pledge; there is no usage in trade to that purpose; nor any implication from the nature of the dealing. On the contrary, the law has always considered the captain as contracting personally with the owner; and the case of the captain has, in that respect, been distinguished from that of all other persons belonging to the ship. This rule of law may have its foundation in policy for the benefit of navigators; for, as ships may be making profit and earning every day, it might be attended with great inconvenience, if, on the change of a captain for misbehavior, or any other reason, he should be entitled to keep the ship till he is paid. Work done for a ship in England is supposed to be done on the personal credit of the employer: in foreign parts the captain may hypothecate the ship. The defendant might have told the tradesman, that he only acted as an agent, and that they must look to the owner for payment." The master is bound to employ his whole time and attention in the service of his employers, and is not at liberty to enter into any engagement for his own benefit

that may occupy any portion of his time in other concerns; and, therefore, if he do so, and the price of such engagement happen to be paid into the hands of his owners, they may retain the money, and he can not recover from them.—*ANNOTT on Shipping*.

Willfully destroying or casting away the ship, or procuring the same to be done by the master or mariners, to the prejudice of the owners, freighters, or insurers; running away with the cargo; and turning pirates; are offenses punishable by transportation beyond seas for not less than 15 years, or by imprisonment for not more than 3 years. After the voyage has been commenced, the master must proceed direct to the place of his destination, without unnecessarily stopping at any intermediate port, or deviating from the shortest course. No such deviation will be sanctioned, unless it has been occasioned by stress of weather, the want of necessary repair, avoiding enemies or pirates, succoring of ships in distress, sickness of the master or mariners, or the mutiny of the crew.—*MARSHALL on Insurance*. To justify a deviation, the necessity must be real, inevitable, and imperious; and it must not be prolonged one moment after the necessity has ceased. A deviation without such necessity vitiates all insurances upon the ship and cargo, and exposes the owners to an action on the part of the freighters. If a ship be captured in consequence of deviation, the merchant is entitled to recover from the owners the prime cost of the goods with shipping charges; but he is not entitled to more, unless he can show that the goods were enhanced in value beyond the sum above mentioned. If a merchant ship has the misfortune to be attacked by pirates or enemies, the master is bound to do his duty as a man of courage and capacity, and to make the best resistance that the comparative strength of the ship and crew will allow. By the common law, the master has authority over all the mariners on board the ship—it being their duty to obey his commands in all lawful matters relating to the navigation of the ship, and the preservation of good order. But the master should in all cases use his authority with moderation, so as to be the father, not the tyrant, of his crew. On his return home he may be called upon by action of law, to answer to a mariner he has either beat or imprisoned during the course of the voyage; and unless he show sufficient cause for chastising the mariner, and also that the chastisement was reasonable and moderate, he will be found liable in damages. Should the master strike a mariner without cause, or use a deadly weapon as an instrument of correction, and death ensue, he will be found guilty, according to the circumstances of the case, either of manslaughter or murder.—*ANNOTT*, part ii., c. 4. The master may by force restrain the commission of great crimes: but he has no jurisdiction over the criminal. His business is to secure his person, and to deliver him over to the proper tribunals on his coming to his own country.

The master must not take on board any contraband goods, by which the ship and other parts of the cargo may be rendered liable to forfeiture and seizure. Neither must he take on board any false or colorable papers, as these might subject the ship to the risk of capture or detention. But it is his duty to procure and keep on board all the papers and documents required for the manifestation of the ship and cargo, by the law of the countries from and to which the ship is bound, as well by the law of nations in general, as by treaties between particular States. These papers and documents can not be dispensed with at any time, and are quite essential to the safe navigation of neutral ships during war. It is customary in bills of lading to insert a clause limiting the responsibility of the master and owners, as follows: "The act of God, enemies, fire, and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, save risk of boats, as far as ships are

liable thereto, excepted." When no bill of lading is signed, the master and owners are bound, according to the common law. The most difficult part of the master's duty is when, through the perils of the sea, the attacks of enemies or pirates, or other unforeseen accidents, he is prevented from completing his voyage. If his own ship have suffered from storms, and can not be repaired within a reasonable time, and if the cargo be of a perishable nature, he is at liberty to employ another ship to convey it to the place of destination. He may do the same if the ship have been wrecked and the cargo saved, or if his own ship be in danger of sinking, and he can get the cargo transferred to another; and in extreme cases he is at liberty to dispose of the cargo for the benefit of its owners. The most celebrated maritime codes, and the opinions of the ablest writers, have differed considerably as to these points. According to the Rhodian law (Pand. l. 10, § 1) the captain is released from all his engagements, if the ship, by the perils of the sea, and without any fault on his part, becomes incapable of proceeding on her voyage. The laws of Oleron (art. 4), and those of Wisby (arts. 16, 37, 55), say that the captain may hire another ship; harmonizing in this respect with the present law of England. The famous French ordinance of 1681 (tit. *Du Frêt*, art. 11), and the *Code de Commerce* (art. 286), order the captain to hire another ship; and if he can not procure one, freight is to be due only for that part of the voyage which has been performed (*pro rata itineris peracti*). Vallin has objected to this article, and states that practically it meant only that the captain must hire another ship if he would earn the whole freight. Emerigon (tom. i. p. 428) holds that the captain, being the agent not only of the owners of the ship, but also of the shippers of the goods on board, is bound, in the absence of both, to use his best endeavors to preserve the goods, and to do whatever, in the circumstances, he thinks will most conduce to the interest of all concerned; or what it may be presumed the shippers would do were they present. This, which seems to be the best and wisest rule, has been laid down by Lords Mansfield and Tenterden, as stated above, and may be regarded as the law of England on this point.

But to use the words of Lord Chief Justice Tenterden, "the disposal of the cargo by the master, is a matter that requires the utmost caution on his part. He should always bear in mind that it is his duty to convey it to the place of destination. This is the purpose for which he has been intrusted with it, and this purpose he is bound to accomplish by every reasonable and practicable method. What, then, is the master to do, if, by any disaster happening in the course of his voyage, he is unable to carry the goods to the place of destination, or to deliver them there? To this, as a general question, I apprehend no answer can be given. Every case must depend upon its own peculiar circumstances. The conduct proper to be adopted with respect to perishable goods, will be improper with respect to a cargo not perishable; one thing may be fit to be done with fish or fruit, and another with timber or iron; one method may be proper in distant regions, another in the vicinity of the merchant; one in a frequented navigation, another on unfrequented shores. The wreck of the ship is not necessarily followed by an impossibility of sending forward the goods, and does not, of itself, make their sale a measure of necessity or expedience; much less can the loss of the season, or of the proper course of the voyage, have this effect. An unexpected interuption of commerce, or a sudden war, may defeat the adventure, and obliges the ship to stop in her course; but neither of those events doth of itself alone make it necessary to sell the cargo at the place to which it may be proper for the ship to resort. In these, and many other cases, the master may be discharged of his obligation to deliver the cargo at the place of destination; but it does

not therefore follow that he is authorized to sell it, or ought to do so. What, then, is he to do? In general, it may be said, he is to do that which a wise and prudent man will think most conducive to the benefit of all concerned. In so doing he may expect to be safe, because the merchant will not have reason to be dissatisfied; but what this thing will be, no general rules can teach. Some regard may be allowed to the interest of the ship, and of its owners; but the interest of the cargo must not be sacrificed to it. Transhipment for the place of destination, if it be practicable, is the first object, because that is in furtherance of the original purpose; if that be impracticable, return, or a safe deposit, may be expedient. A disadvantageous sale (and almost every sale by the master will be disadvantageous) is the last thing he should think of, because it can only be justified by that necessity which supercedes all human laws."—*Law of Shipping*, part iii., c. 3.

The master of a ship is liable for goods of which she is robbed, in part; and the reason, as Lord Mansfield stated, is, lest room should be given for collusion, and the master should get himself robbed on purpose, in order that he might share in the spoil. The master is, however, entitled to indemnify himself out of the seamen's wages for losses occasioned by their neglect. If any passenger die on board, the master is obliged to take an inventory of his effects; and if no claim be made for them within a year, the master becomes proprietor of the goods, but answerable for them to the deceased's legal representatives. Bedding and furniture become the property of the master and mate; but the clothing must be brought to the deck, and there appraised and distributed among the crew. If a master die, leaving money on board, and the mate, becoming master, improve the money, he shall, on allowance being made to him for his trouble, account for both interest and profit. The conditions under which seamen and apprentices are to be taken on board ship, and the obligations of the master with respect to them, are fully set forth in the article SEAMEN, in this work; and to it also the reader is referred for a statement of the duty of the master with respect to the registry of seamen, and the contributions, etc., due to the corporation for the relief of decayed seamen, their widows, etc. For the duties of the master as respects custom-house regulations, see the articles CONSULS, FREIGHT, SEAMEN, UNITED STATES, and INSURANCE, etc.; and for a further discussion of this important subject, see the excellent work of LORD TENTERDEN, in the *Law of Shipping*; PARSONS *On Commercial Law*, vol. iii.; and the articles CHARTER-PARTY, FREIGHT, etc.

Qualifications of Masters. Means by Which They Should be Ascertained.—Considering the important nature of the duties which the master of a ship has to perform, it has been customary in some countries to require that all persons, previously to their being nominated to act in that capacity, should undergo an examination by some public board respecting their knowledge of seamanship, and their possession of the various qualifications necessary to act as masters, and that none should be appointed without their being licensed by such board or other competent authority. We are inclined to think that this practice is consistent with sound policy. "The interposition of government in a case of incapacity, is not only absolutely just and necessary, but it is conformable to the highest authority. The famous French ordinance of 1681, has the following article:—'Aucun ne pourra ci-après être reçu capitaine, maître, ou patron de navire, qu'il n'ait navigué pendant cinq ans, et n'ait été examiné publiquement sur le fait de la navigation, et trouvé capable par deux anciens maîtres, en présence des officiers de l'Ambassade et du Professeur de l'Hydrographie, s'il y en a dans le lieu.' A like article has been inserted in the *Code de Commerce*; and in 1825, the French government issued

an ordinance specifying, in detail, the qualifications that are necessary before any one can obtain a certificate of his fitness to command a ship, either on a foreign or a coasting voyage; the persons who are to examine candidates; and the rules to be observed in the examination. A similar system has been adopted in Prussia; and we can not entertain a doubt that it would be of the greatest service were it introduced into this country. The authority of the master is so very great, and the trust reposed in him, including not merely the ship and goods of his employers, but the lives of the crew and passengers, so very extensive, that it is the bounden duty of the public to provide, in as far as practicable, that it be not committed to ignorant or incapable hands. At present the care of the lives of hundreds of passengers may be committed without check or control of any sort, and without their knowing any thing of the matter, to any incapable blockhead who may be able to prevail on an owner to appoint him to a ship. No doubt it is for the interest of the owner to appoint the best captain he can find; but he may be unable to form a correct estimate of the qualifications necessary for such a situation; and, though this were not the case, hundreds of circumstances may conspire to blind his judgment, and to make him select a master who is really unworthy. Hence the advantage of the preliminary examination by competent parties, which, if made efficient, would certainly afford a powerful guaranty against the chance of an unfit person being appointed."

Mastic, Mastich (Ger. *Mastix*; Du. *Mastik*; Fr. *Mastic*; It. *Mastic*; Sp. *Almastica*, *Almaga*; Arab. *Arâh*). This resinous substance is the produce of the *Pistacia Lentiscus*, a native of the Levant, and particularly abundant in the island of Chios. It is obtained by making transverse incisions in the trunks and branches of the trees, whence the mastic slowly exudes. About 1600 cwt. are annually exported from Chios, part of which is brought to this country, packed in chests. The best is in the form of dry, brittle, yellowish, transparent tears; it is nearly inodorous, except when heated, and then it has an agreeable odor; chewed, it is almost insipid, feeling, at first gritty, and ultimately soft. Its virtues are trifling.—*ALNSLIE'S Materia Indica*; THOMSON'S *Dispensatory*.

Mate, in a merchant ship, the deputy of the master, taking, in his absence, the command. There is sometimes only one, and sometimes two, three, or four mates in a merchantman, according to her size—denominated first, second, third, etc. mates. The law, however, recognizes only two descriptions of persons in a merchantman—the master and mariners; the mates being included in the latter, and the captain being responsible for their proceedings. In non-war, the officers immediately subordinate to the captain are called lieutenants. But the *master*, or officer whose peculiar duty it is to take charge of the navigation of the ship, has certain mates under him, termed *master's mates*, sometimes selected from the midshipmen. The boatswain, gunner, carpenter, etc., have each their mates or deputies, taken from the crew. See articles **MASTER**, **SHIPPING**, and **CONSULS**.

The mate is the next to the master on board, and upon his death or absence, the mate succeeds, *virtute officii*, to the care of the ship and the government and management of the crew. He does not cease to be mate in such cases, but has thrown upon him, cumulatively, the duties of master. He is *quasi* master, with the same general powers and responsibilities, *pro hac vice*, and with the preservation of his character and privileges as mate. He may sue in the admiralty for his wages as mate, and is entitled, in that character, to be cured, if sick, at the expense of the ship. The master, and even the consignee, may appoint a substitute in a foreign port, in cases of necessity. Even a supercargo, in cases of necessity, and acting with reasonable discretion, may bind the owner.

Matches, Lucifer. According to Dr. R. Boettger, in *Annalen der Chemie und Pharmacie*, vol. xviii., p. 384, take phosphorus, four parts; nitre, ten parts; fine glue, six parts; red ochre, or red lead, five parts; smalt, two parts. Convert the glue with a little water by a gentle heat into a smooth jelly, put it into a slightly warm porcelain mortar to liquefy; rub the phosphorus down through this gelatine at a temperature of about 140° or 150° Fahr.; add the nitre, then the red powder, and lastly the smalt, till the whole forms a uniform paste. To make writing-paper matches, which burn with a bright flame and diffuse an agreeable odor, moisten each side of the paper with tincture of benzoin, dry it, cut it into slips, and smear one of their ends with a little of the above paste by means of a hair pencil. On rubbing the said end after it is dry against a rough surface, the paper will take fire, without the intervention of sulphur. To form lucifer wood matches, that act without sulphur, melt in a flat-bottomed tin pan as much white wax as will stand one tenth of an inch deep; take a bundle of wooden matches free from resin, rub their ends against a red-hot iron plate till the wood be slightly charred; dip them now in the melted wax for a moment, shake them well on taking them out, and finally dip them separately in the viscid paste. When dry, they will kindle readily by friction.

The Manufacture of Friction Matches.—Among articles of great demand that have become of importance, though apparently insignificant, there is nothing more worthy of notice than the friction or lucifer match. About 20 years ago chemistry abolished the tinder-box; and the burnt rag which made the tinder went to make paper. Slowly did the invention spread. The use of the match is now so established, that machines are invented to prepare the splints. In New York one match manufactory annually cuts up a large raft of timber for matches. The English matches are generally square, and thus 30,000 splints are cut in a minute. The American matches are round, and the process of shaping being more elaborate, but 4500 splints are cut in a minute. We find that a bundle of 1800 thin splints, each 4 inches long, is finally converted into 3600 matches. Without being separate, each end of the handle is first dipped into sulphur—when dry, the splints adhering to each other by means of the sulphur, must be parted by what is called dusting.

Mats (Du. *Matten*; Fr. *Nattes*; Ger. *Matten*; It. *Stanze*, *Stoje*; Port. *Esteiras*; Rus. *Prugoshki*; Sp. *Esteras*), textures composed, for the most part, of flags, reeds, the bark of trees, rushes, grass, rattana, old ropes, etc. In this country mats are used for a great variety of purposes. The coarser sort are very largely employed in the packing of furniture and goods; in the stowage of corn and various other articles on board ship; in horticultural operations; in covering the floors of churches and other public buildings, etc. The finer sorts are principally employed in covering the floors of private houses. In Europe, mats are principally manufactured for sale in Russia, where their production is a prominent branch of national industry. They consist of the bark of the lime or linden-tree, and are known in this country by the name of *bast* mats. The Russian peasants manufacture this sort of material into shoes, cordage, sacks for corn, etc., and employ it in an endless variety of ways. In consequence of the vast quantities of matting that are thus made use of at home and sent abroad, the demand for it is immense. It is principally produced in the government of Viatka, Kostroma, and those immediately contiguous; and in the months of May and June, the period when the bark is most easily detached from the stem, the villages in the governments in question are almost deserted, the whole population being then in the woods employed in stripping the trees. The academician Koppen, who has carefully investigated this curious subject, estimates the average

annual production of mats in European Russia, as follows:

	Government of	Pieces.
Viatka	4,000,000
Kostroma	4,000,000
Kazan	1,000,000
Nijni Novgorod	1,000,000
Vologda, Tambov, Simbirsk, and Penza	2,000,000
Total	14,000,000

Köppen further estimates that about one fourth part of this vast quantity, or 8½ millions, are exported, the rest being consumed at home. It is obvious from these statements that the annual destruction of lind-trees must be quite enormous; and it may well excite astonishment that they are not already all but exhausted. But whether it be from the rapid growth of the tree, or the vast extent of the forests in which it is found, the gloomy forebodings of Mr. Tooke as to its destruction have not hitherto been realized (*View of Russia*, iii., 262), and mats have not become either scarcer or dearer. It is, however, hardly possible to suppose that such should continue to be the case, seeing the rapid increase of population and of the consumption of matting in most parts of the empire. But in the event of its becoming rarer, the inhabitants will have no difficulty in finding substitutes; so that we agree in opinion with those who think it would be bad policy to impose any restrictions on this branch of industry, in the view of averting an evil which may never occur; and which, if it do occur, may be easily obviated.—See *Supplément au Journal de l'Intérieur de Petersbourg*, for 1841.

Archangel is the principal port for the shipment of mats; and it appears that at an average of the years 1851 and 1852, the export of mats from that port amounted to 615,360 pieces a year. Large quantities are also shipped from Petersburg, Riga, and other ports; and most descriptions of Russian produce sent abroad are packed in mats. Various descriptions of reed mats are extensively manufactured in Spain and Portugal; some of them being very beautifully varied. In Spain large quantities of matting are made of the Esparto rush. Rush floor mats, and rattan table mats of a very superior description, are brought from China. They should be chosen clean, of a bright clear color, and should, when packed, be thoroughly dry. The mats of the Japanese are soft and elastic, serving them both for carpets and beds; they are made of a peculiar species of rush cultivated for the purpose. The bags in which sugar is imported from the Mauritius consist of matting formed of the leaves of a tree growing in the island, interwoven in broad strips. They are very strong and durable, and may be washed and cleaned without sustaining any injury. Being imported in large quantities, they are sold very cheap. (Beside the works already referred to, see *MILBURN'S Oriental Commerce*, and the valuable little work entitled *Vegetable Substances, Materials of Manufactures*, published by the Society for the Diffusion of Useful Knowledge, London.) It is probable that mats formed the first sort of woven fabrics produced by man; and it is worthy of remark that but few savage tribes have been discovered which have not attained to considerable eminence in their manufacture. On the coast of Guinea and other places in the west of Africa, pieces of fine mat, about a yard long, and of a pretty uniform texture, were denominated *makettes*, and formed a sort of money; the value of commodities being rated and estimated in them.—*MONNELLER, Prospectus d'un Dictionnaire de Commerce*. They enjoyed this distinction, no doubt, from their utility, and the great care and labor bestowed on their preparation. There is hardly an island in the South Seas in which the natives have not acquired great skill and dexterity in the making of mats. The finer sorts consist, generally, of dyed reeds or grass; and have a very brilliant appearance.

Maulmain, or **Moulmein**, a sea-port town of India beyond the Ganges, capital of the British province of Martaban, at the mouth of the great River Than-lung, having north the Burmese town of Martaban, on the opposite side of the river, and west, the island of Balu, which serves as a natural breakwater to defend the port from the heavy sea that would otherwise be thrown in from the west, 100 miles S.S.E. of Rangoon, 27 miles N.N.E. of Amherst, lat. 16° 30' N., long. 97° 38' E. It was founded in 1825, when the site was selected by Sir A. Campbell as eligible as well for a commercial as a military station. It is about 200 feet above the level of the river, and extensive and fertile plains stretch eastward from it toward the mountains. Its port is good, and, from its extensive command of internal navigation, it promises to become a considerable emporium. The principal articles of export are teak-timber and rice; but there is also a considerable export of tobacco, stick-lac, betel-nut, ivory, cutch, cocca-nuts, &c. The imports consist principally of European cotton goods and marine stores. The principal trade of the place has hitherto been carried on with Calcutta, Madras, Rangoon, and Penang; but in 1837 a direct trade was commenced with London. Owing to the facility with which supplies of teak-timber are obtained, ship-building is carried on very extensively. The population in 1848 was estimated at about 35,000. The principal article of commerce at Maulmain is teak-timber, with which from 25 to 30 ships annually load for England. The quantity of teak exported to that country from 1810 to 1847, and its estimated official value, was as follows:

Years.	No. of tons.	Price per ton.	Value.
1840	4,952	25	123,800
1841	6,399	25	159,975
1842	11,847	25	296,175
1843	10,529	30	315,870
1844	14,245	30	427,350
1845	13,960	40	558,400
1846	16,798	45	755,925
1847	7,878	50	393,900

Maulmain is a free port, on the same footing as Singapore, &c. There is no custom-house, and no duties on sea-borne goods; but foreign sugar, and sugar from Singapore and Malacca, is contraband. The coins in use are the Company's rupee and its subdivisions, the same as are current in Calcutta. The English sovereign is generally worth 11 rupees, and the Spanish dollar 220 rupees per 100 dollars. The weights are the Madras vis, equal to 3-065 lbs. avoirdupois, or, say, 3½ lbs.; in this there are 100 piculs. The Bengal bazaar maund of 82 lbs., is also occasionally used. The measures principally used are called baskets; they are of uncertain size. A basket of cleaned rice is about 65 lbs. in weight; of mixed about 60 lbs.; paddy 51 lbs. Ship-building is well adapted to the place; and some of the finest teak-ships in the world have been built here. There are several dry docks, though not of a very efficient description, for repairing vessels. The British government bought here, during 1847, upward of 5000 tons of teak for the royal dockyards in England.

The *Maulmain Almanac* for 1852 contains the following statements: "The value of the imports by sea into Maulmain during 1850 amounted to 22,57,983 rupees, and the exports to 23,32,951 rupees; while in the first 10 months of 1851 the imports increased in value to 28,78,487, or £287,848, and the exports to 28,79,797 or £287,979. The town, which 20 years back contained only a few miserable fishing-huts, is thus shown to have a trade of nearly £600,000 a year, which is still increasing. The value of the piece goods imported from Europe during 1851 amounted to £63,229, coals, £5408, and iron £1849. Provisions were imported to the extent of £3496, and wines of the value of £492; military stores £1853, &c. The articles of export pre-

sent no remarkable feature of interest, except timber, the value of which in 1850 was £55,408, and in the first 10 months of 1851, £81,561. The town possesses a large and thriving European population, and 40 vessels, of an aggregate burden of 17,170 tons, have been launched from its dockyard since 1890. It contains three printing-presses, seven places of public worship (five of which are Protestant), besides eight schools, English and native."

Mauritius. The Isle of France was discovered by the Portuguese, A. D. 1500, but the Dutch were the first settlers, in 1598. The Mauritius was so called by the Dutch in honor of Prince Maurice; but it was first settled by the French in 1720; and is indebted for most part of its prosperity to the skillful management of its governor, the famous M. de la Bourdonnais. It was taken by the English in 1810, and was definitively ceded to them in 1814. Mauritius is fertile, a considerable part of the surface being, however, occupied by mountains. Its shape is circular, being about 150 miles in circumference. The climate is healthy, but subject to hurricanes. The principal product of the island is sugar, which is now cultivated to the almost total neglect of every thing else; but it also produces excellent coffee, indigo, and cotton. The blackwood, or ebony, of the Mauritius is very abundant, and of a superior quality. Very little corn or grain of any kind is raised in the island, most articles of provision being imported. Previously to 1825, the sugar and other articles brought to Great Britain from the Mauritius were charged with the same duties as the like articles from India; but in the above-mentioned year this distinction was done away, and it was enacted that all goods of the growth, produce, or manufacture of the Mauritius should, upon importation into any port of the United Kingdom, be subject to the same duties and regulations as the like goods being of the growth, produce, and manufacture of the British colonies in the West Indies; and that the trade with the Mauritius should be placed as nearly as possible on the same footing as that of the West India Islands. This was a great boon to the Mauritius, and the exports of sugar from it have since rapidly increased. According to Milburn (*Oriental Commerce*, ii., 568), they amounted, in 1812, to about 5,000,000 lbs. In 1818 they amounted to about 8,000,000 lbs.; and in 1824 to 23,384,553 lbs. Since 1826 nine tenths of the sugar raised in Mauritius has been shipped for the United Kingdom.

Sugar Trade.—The recent removal of the interdiction against the importation of coolies into the island of Mauritius has contributed largely to the prosperity of that colony, and materially augmented the sugar returns of 1856-57 over those of preceding years. Advertisers from the island, under date of July 11, refer in glowing terms to the prosperous condition of the sugar planters, and inform us of the gratifying fact—the more gratifying, inasmuch as the price of sugar has sensibly declined since that date—that "just as we are about to harvest the largest crop ever made, and the removal of the interdiction to emigration from India at the same time, has wonderfully improved the position of every landed proprietor, and has placed the colony in a high state of prosperity." In 1856 the shipments were 235,958,460 lbs., amounting in value to \$12,483,492, equal to 5-26 cents per pound. From January to May there were shipped 98,445,286 lbs., valued at \$6,042,500, or 6-13 cents per pound. The average price in 1856 was \$5 26 per 100 lbs.; and during the first five months of the present year it rose to \$6 13, showing an advance of 87 cents. The shipment of the old crop, it was believed, would be brought to a close by the end of July, and would reach nearly 220,000,000 lbs., against 235,000,000 lbs. produced in 1856. This, however, was the largest crop ever made on the island. The next crop (1857-58) it is estimated will reach 240,000,000 lbs., or 20,000,000 lbs. more than the crop now closed. We annex a statement

showing the production of sugar in Mauritius during the past seven years:

Year.	Pounds.	Year.	Pounds.
1854-51.....	116,000,000	1856-55.....	314,000,000
1851-52.....	184,000,000	1855-56.....	294,000,000
1852-53.....	180,000,000	1856-57.....	220,000,000
1853-54.....	209,000,000	1857-58.....	240,000,000

About one fourth of the number of mills in the island were already, in (July) in operation, and by the first of August sugar-making would be general. Some few parcels had reached market, and sold at high prices to complete a cargo to Australia. Thus, for vacuum cleared \$9 75 to \$10; good and fine yellow, \$8 75 to \$9 25 per cwt. The news from Europe has, however, before this time arrested these advancing rates, and our next advices will show a considerable decline.

With the exception of molasses, ebony, and a few other unimportant articles, sugar is almost the only article of export. The principal imports consist of provisions, particularly grain and flour; the supply required for the use of the island being almost entirely derived from the Cape of Good Hope, Madagascar, India, Bourbon, &c. Earthenware, machinery, furniture, hardware, piece goods, wine, &c., are also largely imported. The total declared value of the exports from the United Kingdom to the Mauritius in 1852 amounted to £243,045. In 1851 the population of the Mauritius amounted, including military and seamen, to 183,506 souls, of whom between 9000 and 10,000 were whites. The population of the Seychelles—small islands dependent on the Mauritius—amounted at the same time to 8000. The emancipation of the slaves was little less injurious to the Mauritius than to the sugar colonies in the West Indies. But, owing to its more convenient situation, vast numbers of hilly-coolies and other laborers from India have been enticed away and imported; and to this the increase of population and of the exports of sugar are wholly to be ascribed.

The principal imports from the United States are beef, pork, butter, cheese, candles, lard, and tobacco. The discriminating duties in favor of British produce and manufactures limit American exports to the articles above enumerated. *Ad valorem* duty 10 per cent., and specific duties various: On tobacco unmanufactured, 6 cents per pound; manufactured, 8 cents per pound; segars and snuff, 24 cents per pound. All foreign nations enjoy equal commercial privileges. The ports of the Mauritius are Mahébourg, Port Louis, and Seychelles Island.

There is some direct trade between the United States and the Mauritius. Occasionally a cargo of lumber arrives from California, but as yet this trade has not been profitable.

Maury, Matthew F.—Lieutenant Maury is a native of Virginia. He received an appointment as midshipman in the navy in 1825, and was ordered to the *Branlynoine*, then fitting out at Washington, to convey the illustrious Lafayette to France. He returned home in that vessel, and in the spring of 1826 again sailed in her to the Pacific, and was absent about four years, returning in the *Vincennes* sloop. Passing his examination, he was again ordered to the Pacific station as master of the sloop-of-war *Falmouth*. From the time of his entrance into the navy he was a close student. He made himself master of the Spanish tongue, by studying a course of mathematics and navigation in that language. His work on "Navigation" he commenced in the stowage of the *Vincennes*, and it was completed in the frigate *Potomac*, to which he was ordered as acting lieutenant, when the *Falmouth* was about to return to the United States. When again Lieutenant Maury came home, he was regularly promoted to a lieutenancy, and was appointed astronomer to the South Sea Exploring Expedition, under Commander Thomas Ap-Catesby Jones. Soon after that officer gave up the command of the expedi-

tion, Lieutenant Maury retired from it also, and was afterward put in charge of the dépôt of charts and instruments which has served as a nucleus for the national observatory and hydrographical office of the United States, of which he now has charge. His labors in organizing the observatory were great and efficient, and he was successful in at once putting it on a respectable footing. The investigations of Lieutenant Maury as to the winds and currents of the ocean, the charts which he has constructed, mapping out better paths and more rapid routes across the trackless depths, and the incalculable benefits which he has thus bestowed upon the mercantile and marine interests of the world, are well known. See *South. Lit. Mess.*, vii, 560, li., 454; *HUNT'S Mag.*, xviii, 516.

Mayagües, or Mayaguan. This is the most important port on the island of Porto Rico. It possesses large capital, and contains several costly and fine dwellings. Rapidly rebuilt after the great conflagration, by which it was destroyed in 1841, Mayagüez has gained in prosperity; having been before that disaster but an inconsiderable village, it has now become the most important city on the island. The surrounding district produces large quantities of coffee, though, since 1840, there has been a sensible diminution in that article. For that year, the exports amounted to 80,000 quintals, while in 1853 they fell to 43,500 quintals. The coffee of Mayagüez stands in such high repute in America and Germany, that purchases are frequently made in advance of the crop. Hence comes also the best sugar of the island, which is mostly imported in American bottoms into the United States. In 1853, there arrived 83 American vessels, of 13,272 tons, carrying freight to the value of \$223,000; and there cleared 76, of 12,680½ tons, taking cargoes worth \$460,018. The molasses from this port is always of the best quality, and much sought after by American and English shippers. Besides coffee, in 1853 there were exported 16¼ hogheads of rum; 8,221 hogheads of molasses; 20,766,033 pounds of sugar; but only 4,463 pounds of tobacco, showing a decrease, compared with the preceding year, of over 50,000 pounds. There were, besides, 1,000 hogheads of rum mixed with tabasco pepper (*malagueta*), a preparation constituting now a new and profitable branch of domestic industry. Imports from the United States and England are generally similar to the imports into San Juan.

Mead, or Metheglin. (Ger. *Mehl, Meth*; Du. *Meede, Needrank*; Fr. *Hydromel*; It. *Idromele*; Rus. *Lipez*), the ancient, and for a long time, the favorite drink of the northern nations. It is a preparation of honey and water.

Meal. (Ger. *Mehl*; Du. *Meel*; Fr. and It. *Farine*; Sp. *Farina*; Rus. *Muka*; Lat. *Farina*), the edible part of wheat, oats, rye, barley, and pulse of different kinds, ground into a species of coarse flour. See COUK, FLOUR, WHEAT, and BREADSTUFFS.

Measures and Weights. They were invented by Phidion of Argos, 869 B.C.—*Arund. Marbles*. They became general in most countries soon afterward; and were very early known in England. Standards of weights and measures were provided for the whole kingdom by the sheriffs of London, 8 Richard I., A.D. 1197. Standards were again fixed in England, 1257. They were equalized for the United Kingdom in 1825. *Measure*, in legal and commercial sense, denotes a certain quantity or portion of any thing bought, sold, valued, or the like. See WEIGHTS and MEASURES.

Meats, Preserved. The interest which has of late attached to the subject of such meats, warrants us in bringing under examination the principles and practice on which this important branch of industry is based. The art itself is of modern invention, and differs in every respect from the old or common modes of preserving animal food. These, as is well known,

depend on the use of culinary salt, saltpetre, sugar, or similar substances, which, when in solution, do not possess the power of absorbing oxygen gas, and therefore out off effectually all access of air to the meat they protect. It might be imagined that water alone would answer this purpose; but the contrary is the case, for pure water absorbs oxygen, and is, therefore, all the less adapted for preserving meat, in proportion as it is free from saline matter, since it then so much the more capable of combining with oxygen gas. Thus, snow, which is pure water crystallized, has a power of producing the pansy fermentation when mixed with flour; and this it is able to do in consequence of the large quantity of gaseous oxygen which it contains. Similarly, rain water, and especially dew, will bring on the putrefaction of animal matters much sooner than spring water; and the vulgar prejudice respecting the effect of the moon's rays in accelerating the corruption of meat, is, beyond doubt, dependent upon the fact, that during clear moonlight nights, there is always a large deposition of dew; and this having fallen in a minutely divided state, possesses the largest amount of free oxygen, which pure or distilled water is capable of absorbing from the atmosphere, and, therefore, has a proportionate power of decomposing—just as it also has of bleaching. Thus far our remarks have been applied solely to raw or uncooked meats; but the practical bearing of the object which we have in hand really points to those which are more or less cooked or preserved. It is with reference to provisions of this kind, that a parliamentary inquiry is now in progress; and we can not do better than show the great importance of such a subject to a maritime nation, by stating, that these provisions, when sound, are an absolute preventive of sea-scurvy—a disease said, on good authority, to have destroyed more life, and to have done more damage to commerce, than all the enemies and tempests which shipping ever encountered. We need not go far in search of evidence to prove the fearful havoc caused by this disease; for we are well furnished by the history of Admiral Anson's memorable expedition, to damage the interests of Spain in the Pacific Ocean, by intercepting the annual treasure-ship or galleon on her return to Europe. In spite of every thing that care and experience could do, Anson tells us that he lost, in all, fully four fifths of his people by scurvy. Of 400 men with whom the *Centurion* departed from England, only 200 lived to reach the island of Juan Fernandez, and no more than 8 of these were capable of doing duty; and but for a supply of others at St. Helena, there would not have been strength remaining to carry the ship to her anchorage. After describing, in the most pathetic manner, the dreadful sufferings of his crew, and rejoicing at the improvement caused by the sojourn at Juan Fernandez, the writer concludes—"I therefore shall sum up the total of our loss since our departure from England, the better to convey some idea of our past sufferings and our present strength. We had hired on board the *Centurion*, since leaving St. Helena, 292 men, and had remaining on board 214. This, will, doubtless, appear a most extraordinary mortality; but yet, on board the *Glooucester* (his other ship of war) it had been much greater: for, out of a much smaller crew than ours, they had hurried the same number, and had only 82 remaining alive. It might," continues Anson, "have been expected that, on board the *Tryal* (a privateer ship), the slaughter would have been most terrible; but it happened otherwise, for she escaped more favorably than the rest, since she only buried 42, and has now 59 remaining." The real object of the voyage was, however, not yet commenced; though out of 960 men with which the three vessels left England, 626 were dead before this time.

It is almost superfluous to multiply instances of the same kind; though, in order to demonstrate the great

Meat, F
Cities.—The
bread, beef,
near Newm
of a society
ment of the

utility of preserved meats in the navy, we shall give two or three other examples.

In October, 1788, the fleet of Admiral Keppell came into harbor, and, before the end of December, had sent 3,000 sick to the hospital at Haslar. In 1779, the Channel fleet under Sir C. Hardy, sent 2,600 to the hospital, and retained more than 1000 on board for want of hospital accommodation. Within 4 months during a subsequent year, 6,064 were sent to Haslar, and Sir H. Hawkins asserts, that, within the space of 20 years, to his own knowledge, no less than 10,000 men had died of scurvy. When Admiral Geary's fleet returned to Portsmouth, after a 10 weeks' cruise in the Bay of Biscay, 2,400 men were ill of the scurvy; and the gross number of admissions into the hospital that year was 11,792, of whom 250 died. Now the highest medical authorities in this kingdom, and also on the continent, have all expressed the opinion that this fearful disease and mortality is altogether caused by the use of salt provisions; and the evidence of a host of navy surgeons and officers can be adduced to corroborate the truth of this view; therefore, not only motives of humanity, but also of self-interest, imperatively demand that, wherever unsalted provisions can be used, their employment should be insisted on by the voice of the entire nation. Such being the case, it becomes necessary for us to inquire how far the art of preserving unsalted provisions has reached that degree of uniformity, and certainty of result, which alone can warrant their introduction into the navy.—*Brande's Dict.*

Meat-Biscuits.—The American *meat-biscuits*, now coming extensively into use, are a kind of preserve differing from most others. The manufacture is located chiefly at Galveston, Texas. The prairies of that country abound in cattle of good quality, which are procured at so low a price as to justify the manufacture on the spot, thus saving the expense of transporting the useless portion of the meat. The meat-biscuit contains in a concentrated state and portable form all the nutriment of the meat, combined with wheaten or other flour. One pound of this biscuit is said to contain the nutriment or essence of five pounds of good meat; a 22-gallon cask can contain the concentrated nutriment of 500 pounds of fresh meat with 70 pounds of flour. As compared with corn or flour, the meat-biscuit is said to be less liable to heating or moulding during long voyages, and less subject to the attacks of weevils and other animals. It may be easily preserved in all climates, and for a great length of time; though it is not pretended that it possesses the lasting quality of well-canistered food. The United States' Army in Mexico was supplied with these meat-biscuits; and their use is rapidly spreading in America. The meat-biscuits are made in the following way:—Good beef is selected, and boiled by steam until all the nutritive qualities are extracted. The liquor is strained, allowed to settle, and then evaporated by heat to the consistence of thick treacle; the fat is skimmed off as it rises. While the liquor is yet hot, flour is added to it, and both are kneaded up into a stiff dough, which may then be rolled, pressed, made into biscuits, and baked. The biscuits are either kept whole or are ground to powder, and are preserved in air-tight cases. For making into soup the powdered biscuit is mixed with hot water, and boiled with the addition of salt and other condiments. Professor Lindley, in a lecture before the Society of Arts, expressed an opinion that the meat-biscuit "is one of the most important substances which the exhibition of 1851 has brought to our knowledge."

Meat, Prices of. *Prices of Meat and Bread in Cities.*—The following table of the prices of wheat-bread, beef, veal, and mutton, in 20 cities of the world, near November 15th, 1856, is derived from the report of a society in the city of New York for the improvement of the condition of the poor; the quantity of

each pound avoirdupois, and the price in cents and hundredths of a cent, American weight and money:

Medals, are pieces of metal, generally in the form of a coin, and impressed with some peculiar stamp, intended to commemorate some individual or action. Medals are of very different prices—varying according to their rarity and preservation, the fineness of the metal, the beauty of the workmanship, etc.

Mechanics. The time when the simple mechanical powers were first introduced is so uncertain, and perhaps so little known, that they have been ascribed to the Grecian and other deities of the heathen mythology—for instance, the ax, the wedge, wimble, etc., are said to be the invention of Dædalus. We know nothing of the machinery by which the immense masses of stone which are found in some of the ancient edifices were moved and elevated.

Mediterranean Pass. The nature of this sort of instrument has been described by Mr. Reeves, in his *Treatise on the Law of Shipping*, as follows:—"In the treaties that have been made with the Barbary States, it has been agreed, that the subjects of the King of Great Britain should pass the seas unmolested by the cruisers of those States; and for better ascertaining what ships and vessels belong to British subjects, it is provided that they shall produce a *pass* under the hand and seal of the Lord High Admiral, or the Lords Commissioners of the Admiralty. In pursuance of these treaties, passes are made out at the Admiralty, containing a very few words, written on parchment, with

few American vessels visit Cartagena, Allcants, and Valencia, where American produce would be salable, with profit.

The cargoes which American ships take up in those places are mostly brandies, red and white wines, silk goods, shawls, cloths, woolen goods, paper, laces, saffron, nuts, raisins, and other dried fruits, olives, etc. As to the commerce with France, only Marseilles participates in it, and this very little, in comparison with the great trade with the United States. The advantages of Havre have already been stated. Of commercial ports, we name also Genoa, Leghorn and Messina. The old plan to connect Genoa, by a regular steamship line, with New York, has now been taken up anew, and will soon be in readiness. This connection is expected to give a powerful impulse to the Italian commerce, and also to awaken greater interest on the part of the Americans. Until now the Italian commerce with the United States has not been of much importance, compared with what it would be, had it frequent and regular communication. Of American articles, there are sugars of Louisiana and Cuba, as, also, American grain, highly appreciated, imported by Genoa, and again shipped to the Levant and other smaller ports. On the other hand, the articles imported from Genoa are many, and in the United States in fair demand. They consist in fresh and dried fruits, olive-oil, soap, silk goods, damasks, velvets, linen, gloves, ribbons, liquors, prepared marble, etc. American articles for export to Genoa, are Indigo, dye-roots, honey, provisions, butter, etc. Resin and pitch are bought freely in Genoa, and re-sold to other smaller ports in the Mediterranean.

The commerce of the United States with Tuscany presents interesting features. Tuscany exported, in the year 1854, to the United States, a value of merchandise of \$1,152,717—much more than Trieste and the other Austrian ports together. The United States exported to Tuscany, of her own and foreign produce, not more than \$48,707. This small figure is more remarkable, as American produce is in fair demand at Leghorn. For Sicily, the ports of Palermo and Messina are the most prominent. From these are exported to the United States, wines, fruits, extracts, oils, brandies, argols, tongues, sardines, prepared marble, senna, cantharides, soap, leeches, etc. The Americans export there stockfish, salted and dried meat, sugar, zinc, lead, indigo, cochineal, dye woods, cotton, cocoa, coffee, flour, tobacco, etc. The commerce of Sicily is important. England has, however, as will be seen, the lion's part.

As MacGregor relates, the import in Sicily was, in the year 1844, £744,630; the export, £1,085,026. The whole commerce with the exterior, £1,779,656. Of this the United States exported only £58,480, and imported from there, £224,988. In the year 1854, the United States exported to Sicily only \$260,051 (£52,000); and imported from there, \$950,300 (£191,860), which shows a decrease on both sides. This decrease is a peculiar fact, if we consider the quantity and quality of the articles there consumed. It can only be explained by the great activity of England, and the little attention paid to this quarter by Americans. Bused with the great commercial projects on the Atlantic, and culture in the interior, they have not yet found time to pay more attention to this commerce, and not being much posted up in the market prices in Sicily, they ignore partly the importance of that trade.

It is now time to act with energy. The energy will not be missed, while the communication with the Mediterranean will be facilitated and trade increased. The commerce of the United States with Trieste and other Austrian ports, is not satisfactory to the great wants in the trans-Atlantic markets, nor to the sales of Austrian manufactures, which are considered of very good quality. Cloths, woolen goods, linen and silk

goods, can be had from Austria, at cheap prices and in fair quality. Nevertheless, the import of the said articles, in 1853, was \$78,064,297. Other Austrian articles would also find good market here, by a regular and quick communication.

As to the Austrian ships, very few sail into the Atlantic. In the year 1854 only four Austrian ships came to the United States. Considering the passivity with which the commerce with the United States is regarded, it will not surprise us that so little is done between them. What has been exported from Austria to the United States, during 1854, via Trieste, and other Austrian ports, was not more than \$741,019; in fact a great sum compared to the many good industrial articles; and its navigation, as also its ports, of which especially Trieste and the world-renowned Venice seem to be called to play a great part in the future commerce of the United States. The export of the United States to Trieste is much larger than their import from Austria, and was, in the year 1854, not less than \$1,908,609.

The direct commerce of the United States with Turkey is fixed by the following data: to Turkey, the United States exported, in 1854, merchandise in value of \$325,198; importing from there \$808,714. This is a very poor trade, if we consider the means of both parties. This trade is in its first development and will soon be increased, if the Americans will take hold of it with their usual enterprise. Greece and the Ionian Islands are entirely forgotten by the Americans; no direct commerce is carried on from there to the United States.

Mr. Baker says, "The commerce with the Morea would be of the greatest importance to the Americans, if they would only attempt and explore it. The great quantity of produce would easily procure re-cargo to American vessels. The demand for zinc, lead, etc., is permanent, also of fish; rice, flour, and other American produce, would find easy market. The same," says Mr. Baker, "of the Ionian Islands, where a good trade would result."

Indirect Commerce.—As to the indirect commerce of the United States to the Mediterranean, there are very meagre data. The total export of the United States in 1854, to all ports in the Mediterranean, of goods not produced in the United States, was only \$953,417. These foreign productions consist in coffee, tea, cocoa, leather, skins, pepper, rum, dye-woods, sugar from Cuba, segars, cochineal, and honey.

As to the American indirect import from those countries, it is difficult to find it out. The lists of navigation give only the direct trade; and at the nominations of the value of importation from the States on the Mediterranean, no port is named from where sent.

England, which has the greatest trade with the Mediterranean ports, and which is from there extended in all directions, keeps no direct ship communication from there to the United States. Of the 8508 British ships, tonnage 1,746,000, which came, in 1854, to the United States, not more than 820 tons were from Gibraltar; not one single ton from Malta. The cause is natural. England finds it more in her interest to do the commercial trading with the Mediterranean and Levantine produce to the United States, not directly, but from Liverpool and other ports. The advantage of this proceeding is easily explained.

The English merchants receive, through Liverpool, regular reports by the Collins and Cunard steamers, of the standing of the trans-Atlantic markets. This puts them in the way to use there all the chances offering to dispose of their rich stocks of Mediterranean produce with advantage, to the United States. The same is the case in other ports of the European continent, which follow the same policy. In this way considerable quantities of red and white wines, fruits, drugs, and other produce of the Mediterranean, come by indirect commerce to America.

We transported European United States other articles no direct already the rich and Asia tienne. lean vessels States. which those the productions have is the Adriatic, to the Ind with the ation to the advantage of the U Africa, v says: "H if the Am would con undertake has not be are no stat there. T mentioned commerce.

The An year 1854, \$1,386,360 belong to Islands, \$229,958 African ter are consider lean ports them at C goods from of African Mecca plentily.

From th appear in as far less And it is tories, for and comm Americans are in oppo the Medit lines of C not suffici and a Mea sver the through a road and M sonor be that Triest In general, to pass wi been done by Trieste give satisfi communic exported is much a communic were only advantage Austria, ar ranean and

We take, for example, the corinthians, which are exported from Zante and Corfu to England, and other European ports, from where they are sent to the United States in small quantities. It is the same with other articles, to countries where the Americans have no direct communication. In addition to the ports already named, we can add, under the same category, the rich islands of the Turkish dominions in Europe and Asia, viz.: Cyprus, Rhodes, Candia, Samos, Mytilene. Even from ports regularly visited by American vessels, goods are sent indirectly to the United States. This is the consequence of the isolation in which the United States are placed, in relation to those ports. In Smyrna, the large storing place of the produce in the Levant, where merchants of all nations have a counting-room, there is no American. It is the same in other ports of the Mediterranean, the Adriatic, and Levant. This isolation is advantageous to the indirect intercourse of the English and French with the United States; both are in the fortunate situation to turn the chances of both hemispheres to their advantage. Mr. Baker, in speaking of the commerce of the United States with the French dominions in Africa, viz., Algiers, Tunis, Tripoli, and Morocco, says: "It would be very profitable for our commerce if the Americans would engage in this branch; they would convince themselves, very soon, that such an undertaking would be very profitable. This advice has not been followed up to this time; at least there are no statistics that there have been any imports from there. These are almost exclusively African, and mentioned only in general terms, without branches of commerce in these dominions."

The American export to Africa in general, in the year 1854, amounted to \$1,804,729; the imports to \$1,386,660; of which proportion, \$47,708 and \$30,007 belong to Madeira, Teneriffe, and other Canarian Islands, \$20,417 and \$39,598; Cape of Good Hope, \$299,958 and \$448,903. There is no data for the other African territories. According to late disclosures, there are considerable numbers of vessels which leave American ports to embark secretly in the slave-trade, land them at Cuba, and import a considerable quantity of goods from Africa. Americans can buy many kinds of African produce from the great caravans of the Mecca pilgrims, which traverse Africa in its greatest extremity to the Mediterranean.

From the above, it will be seen that the Americans appear in the Mediterranean as well as in the Levant as far less than a mercantile power of the first class. And it is but too plain that those great and rich territories, for hundreds of years the centre of shipping and commerce of well-advised nations, are, by the Americans, very much neglected. England and France are in opposition with steamers and manufactures on the Mediterranean, Adriatic, and Levant. The mail lines of Cunard, Collins, Bremen, and Havre, are not sufficient for our steam commerce with Europe, and a Mediterranean line, alone, will be found to answer the interests of American commerce. And through all this, the great project of the Pacific Railroad and Marine Telegraph across the Atlantic will the sooner be brought to completion. It is to be hoped that Trieste and the Austrian commercial community in general, will not allow such progressive movements to pass without considering that the same which has been done by the small city of Bremen, can be done by Trieste, with its powerful resources. Bremen can give satisfactory proof of the importance of a steam communication with the New World. Bremen has exported in 1854, not less than \$14,613,927. Bremen is much ahead of Hamburg, on account of its steam communication with New York, as its exports in 1854 were only \$3,322,971. Trieste would have double the advantage; it would have all the direct commerce with Austria, and the indirect connection with the Mediterranean and the New World. The project is great, but

promises well-paying results. It can be developed by a direct, regular, and quick connection with New York. It is also well to mention, that Austria would, by these means, come into a more productive relationship with the Orient, as the commerce of Austria can look to a very prosperous future, on account of the Marine Telegraph from Sardinia to Constantinople and Alexandria, as the connection of the Mediterranean and the Red Sea.—*Nautical Magazine*. For Commerce, etc., of the Mediterranean, see *Ed. Rev.*, vi., 478; *Hunt's Mag.*, vi., 201; *Fraser*, xviii, 377; *Quar. Rev.*, lxxv., 280; same article in *Eclectic*, v., 83; *Living Age*, v., 301.

Melbourne, the capital of the British colony of Victoria, formerly Port Phillip, in Australia, occupying the south-east portion of that continent, stretching through 9° of longitude, from Cape Howe on the east to the Glenelg River on the west. The town is situated on the north bank of the Yarra-Yarra River, about nine miles, following its windings, from its mouth, in the basin of Port Phillip, latitude 37° 49' 5" S., long. 144° 58' 85" E. It was founded in 1837, and extends along the banks of the river. In 1851 it had a population of 23,000; and such has been the immigration consequent on the discovery of the gold-fields, that, including suburbs, it had on the 24th of April, 1854, 71,188 inhabitants. A considerable portion, however, of this immense population is to be regarded as migratory only, and as residing in town merely till their ultimate destination has been decided upon. This sudden increase of population raised house rent to an unparalleled height; and for some considerable time a large proportion of the population was not housed, but encamped under tents. But partly through the extraordinary stimulus which was thus given to building, and partly through the mercantile failures consequent to the overtrading of 1853 and 1854, there has been a very heavy fall of rents, which do not now (1856) exceed half their amount in 1852. The site of the town is unfortunate; for the river being obstructed by a bar and shallows, it is not generally navigable for vessels of more than 60 tons burden; and it has the further disadvantage of being low, and liable to be flooded by the overflowing of the river during the wet season. It has been proposed to facilitate the trade of the town by removing the bar at the mouth of the river, and deepening its channel; but this would be a very expensive undertaking, and one of which the success would be not a little doubtful. The excavation of a ship canal from the deep water in the bay to Melbourne has also been proposed; and it probably would be the preferable plan; but, in the near time, a railway has been commenced, and is in progress to the bay, which, when completed, as is probably the case, will obviate many of the inconveniences which are now experienced. It seems, however, not unlikely that the trade of the town, and the greater part, perhaps, of its population, will ultimately centre at Williamstown, a village a few miles distant, on a headland extending into the bay, opposite to which all large vessels coming to Melbourne are obliged to anchor. The principal objection to Williamstown is the scarcity and bad quality of the fresh water; but this serious defect might, perhaps, be obviated by sinking wells, or by conveying thither a supply of water from some of the adjacent streams. Nothing can more strikingly illustrate the present unfavorable situation of the town for commercial purposes, and the extraordinary state of things which was lately prevalent there, than the fact that while the ordinary charge for the freight of goods from England to Melbourne Roads was in November, 1853, £3 10s. a ton, it was £5 to the quays.

There are very few goods or articles exported from the colony to the United States. The principal articles have been gum, in small quantities, a few hides, and some bones. With the exception of gold, on which

there is a duty of 60 cents per ounce (2s. 6d.), none are liable to duty.

IMPORTS, EXPORTS, AND POPULATION OF THE COLONY OF VICTORIA FROM 1839 TO 1853, BOTH INCLUSIVE.

Years.	Imports.	Exports.	Total of external trade.	Population, average of year.

The following statement exhibits the quantity of gold exported from the several ports in Australia in each year from the commencement of the gold discoveries to the end of the year 1853; the exports chiefly destined for Great Britain and colonial possessions:

Gold exported from New South Wales.	Quantity.	Value.
1850 29th May to 31st Dec.	144,120 17 16	\$2,341,680
1851.....	902,378 16 19	18,000,580
1852.....	4,063,988	8,203,823
1853.....	237,210 18 22	3,866,045
1855.....	61,824 4 8	1,046,250
Total.....		\$34,160,710

Gold exported from Victoria.	Quantity.	Value.
1851.....	145,137 3 12	\$2,198,865
1852.....	1,093,526 10 13	30,078,640
1853.....	2,487,739 15 16	43,822,645
1854.....	3,144,099 9 13	41,277,750
1855.....	2,575,745 4 17	56,819,900
Total.....		\$174,992,821
Ave during last 4 years.....		\$43,578,205

To the preceding statement we annex an official return of all the gold coined at the mint in Great Britain each year from January 1, 1846, to December 31, 1855:

Gold coined in Great Britain—	1853.	1854.	1855.
1846.....	\$91,674,556	1853.....	\$59,761,955
1847.....	25,792,200	1854.....	20,760,915
1848.....	12,259,995	1855.....	45,043,816

1850.....	7,451,181	Total.....	\$269,351,299
1851.....	23,092,065	Average	36,935,029
1852.....	69,711,351		

For further details, see the Articles COLONIES, PRECIOUS METALS, and CALIFORNIA. Here, as in other parts of Australia, wool, down to the discovery of the gold fields, was the principal article of produce and export. And it is seen from the following statement that its exportation went on increasing down to the present year.

ACCOUNT OF THE WOOL SHIPPED DURING THE YEARS ENDING 10TH OCTOBER, 1853, 1854.

	1853.	1854.
Melbourne.....	9,570,771	11,104,190
Geelong.....	7,019,900	5,644,400
Portland.....	3,475,815	4,162,499
Port Fairy.....	1,361,825	1,458,900
Port Albert.....	840,880	292,376
Total.....	21,968,104	22,598,668

A continuous high price of wool in the English markets will afford great encouragement to the settlers to struggle with these two tendencies so greatly deteriorative to our wool; and the manufacturers of Great Britain will have to afford that encouragement, or they must gradually teach themselves to look elsewhere for a supply.

EXPORTS OF VICTORIA, 1845-1855.

Years.	Produce of Victoria.	British manufactures.	Produce of British Colonies.	Produce of foreign states.	Total.
1845.....	£451,792	28,479	£100	£2,226	\$469,597

Scale of Commercial Charges adopted at a Special General Meeting of the Melbourne Chamber of Commerce, 15th May, 1854.

Commissioners.—On cash payments, when not in funds, 5 per cent.; on cash payments when in funds, 2½ per cent.; on purchase and shipment of gold dust, 1 per cent.; on purchase and shipment of gold dust, if drawn against, 2½ per cent.

On the amount of invoice in either case.

On purchase and shipment of merchandise and on other purchases when not in funds, 5 per cent.; on purchase and shipment of merchandise and on other purchases when in funds, 2½ per cent.; on private sales, including the purchase of bills for remittance, 5 per cent.; on guaranty of sales, including remittances, 5 per cent.; on goods received for sale and reshipped, and on consignments of merchandise withdrawn, on invoice value, 2½ per cent.; on debts, rents, and other accounts collected, recovered, and remitted, 5 per cent.; on granting of letters of credit, 2½ per cent.; on letters of credit acted upon, an additional charge of 2½ per cent.; on freight or charter procured for vessels, and freight or passage-money collected, 5 per cent.; on freight paid at port of departure, 2 per cent.; on ships' disbursements and outfits when not in funds, 5 per cent.; on ships' disbursements and outfits when in funds, 2½ per cent.; on guaranty of captains' drafts on owners, taken for balance of ships' disbursements, 5 per cent.; on money obtained on bottomry or respondentia, 5 per cent.; on insurance effected, or orders written for insurance, on the assured value, ½ per cent.; on insurance losses, partial or total, settled, or on premiums recovered, 5 per cent.

All sales of goods understood to be guaranteed, unless there be special orders to the contrary.

Guaranty on security for contracts, 5 per cent.; acting as trustee on assignments, 5 per cent.; on advances on produce for shipment, 2½ per cent.

Auctioneers' commission and brokerage to be charged when incurred.

Advances and current accounts not liquidated at the end of the season, March 31st, the balance to be charged as a fresh advance, subject to a commission of 5 per cent.

Interest.—On advances for duty, freight, and lighterage, and on amounts occurring per annum, 10 per cent.

Charges.—For passing accounts with the government for emigrant ships, £21; for entering ship inward at the custom-house, when the original port of departure is Australia, Van Diemen's Land, or New Zealand, £2 2s.; for clearing ship outward, when

the port Land, or ward from ward, £5 lighters, a fee for each survey of for survey ceiving, w load; in a draft of 1

Into or out of Port Albert, p. ton	0	9	0	60	5
Into or out of all other ports.....	0	6	0	40	4
Between Melbourne & Geelong.	0	6	0	40	4

The above rates include two removes by the pilots.

Exemptions.—All ships belonging to her majesty, all ships outfitting to or refitting from the fisheries, all ships employed in the coasting trade, all ships regularly trading between any part of Victoria and of any of the colonies of New South Wales, Van Diemen's Land, New Zealand, West and South Australia (the

master of such ship holding a certificate from the Pilot Board that he is competent to act as pilot to such trader), unless the services of a pilot shall have been actually received; and all ships not having actually received the services of a pilot.

The basin of port Phillip, which receives the Yarra-Yarra, and other rivers, is a large circular bay, or inlet of the sea, whence the colony derived its former name. It has a narrow entrance, not more than 1½ miles in width, partly occupied with rocks and shoals. A light-house has been erected near the extremity of Point Lonsdale, near the west side of the entrance, lat. 88° 16' S., long. 140° 40' E., and another on Point Gellibrand, near the head of the bay, between Williamstown and the mouth of the Yarra-Yarra River, lat. 37° 52' S., long. 144° 55' E. The bay is about 40 miles in depth from south to north, and where widest is about 40 miles from east to west. It is said to cover an area of above 800 square miles, and might accommodate all the navies of all the countries in the world. The whole trade of the colony, which is already very extensive, and is increasing with extraordinary rapidity, is at present carried on from this basin. And from its advantageous situation, and its stretching so far inland, it is probable it will always continue to engross the largest share of the trade, though, no doubt, it will be partly, also, carried on from other ports. Geelong, at the head of a deep bay on the west side of the basin, has a large population, and a very considerable trade.

Memel, a commercial town of east Prussia, lat. of light-house 55° 43' 7" N., long. 21° 6' 2" E. Population, in 1846, 9400. Memel is situated on the north-east side of the great bay, denominated the *Curriache Haf*, near its junction with the Baltic. It is, consequently, the principal entrepôt of the country traversed by the Niemen, and as such enjoys a pretty extensive commerce. The harbor of Memel is large and safe; but the bar at the mouth of the Curriache Haf has seldom more than 17 feet water, and sometimes not more than 13 or 14 feet; so that ships drawing more than 16 feet water are frequently obliged to load and unload a part of their cargoes in the roads, where the anchorage is but indifferent, particularly when the wind is north or north-west. A light-house, originally 75, but now 100 feet in height, has been erected on the north-east side of the entrance to the harbor. The light, which is fixed and powerful, may be distinguished in clear weather at more than 20 miles' distance. The outer buoy lies in 6 fathoms water, about a mile without the light-house, which bears from it south-east by east ½ east. The channel thence to the harbor is marked by white buoys on the north, and red on the south side. Three beacons to the north of the town, when brought into a line, lead directly into the harbor. Inasmuch, however, as the channel is subject to frequent changes,

both in depth and direction, it is always prudent, on arriving at the outer buoy, to heave-to for a pilot; but this is not obligatory; and the Prussian authorities have issued directions for ships entering without a pilot, which may be found in Nour's *Sailing Directions for the Cattegat and Baltic*, p. 36. Timber forms the principal article of export; for though that of Dantzic be considered better, it is generally cheaper, and almost always more abundant, at Memel. Here, as at Dantzic, the best quality of all sorts of wood articles is called *khron*, or crown, the 2d, *brack*, and the 3d, *bracks brack*. Large quantities of hemp and flax are also exported, as are bristles, hides, linseed (the finest for crusting brought to England), wax, pitch, tar, &c. The exports of grain are sometimes very considerable. The wheat of Lithuania is reckoned the best. All flax and hemp shipped from Memel must be *brucked*, or assorted, by sworn selectors. See FLAX and HEMP. The imports consist principally of salt, herrings, coffee, sugar, spices, dye-woods, tobacco, tea, iron, cotton stuffs and yarn, cutlery, wine, &c. Merchants at Memel generally send their bills to Königsberg to be sold, charging their correspondents with 1 per cent. for bank commission, postages, &c. The navigation generally closes about the latter end of December, and opens about the middle of March.

Mercantile Agency System, U. S.—The Mercantile Agency is a name applied to various houses in the leading cities of the United States, and in Montreal and London. The principal object of the Agency is to supply, to annual subscribers, information respecting the character, capacity, and pecuniary condition of persons asking credit. The valuable services it has rendered to the domestic trade of the country, as a check upon our credit system, are acknowledged by the mercantile community. Its history, together with an explanation of its mode of operation, may not be without interest to the general reader and foreign merchant.

The Agency was first established in 1841 in the city of New York, by Mr. Lewis Tappan, and was conducted by him, upon a comparatively limited scale, until 1846, when Mr. Benjamin Douglass became his coadjutor, and assumed the chief management. From this time the business increased rapidly, and assumed a permanent and recognized position among the mercantile institutions of the country.

Our limits will not permit us to trace, step by step, the growth of the Agency, or to dwell upon the personal aspects of its history. Founded upon the interests of merchants, and conducted from the beginning by men of ability, capacity for work, high character, and thorough knowledge of the wants of mercantile business, its progress has been uninterrupted. From New York it has extended its branches and associate offices to seventeen other cities, viz.: Philadelphia, Boston, Montreal, Baltimore, Richmond, Petersburg, Charleston, New Orleans, Pittsburgh, Cleveland, Cincinnati, Chicago, Milwaukee, Dubuque, St. Louis, Detroit, and London, England. All these branches are under the direction of the proprietors at New York, and are governed by uniform rules. A daily interchange of information facilitates the answering of the inquiries of the respective subscribers for all parts of the country.

It is obvious that the gigantic labor of reporting the business men of Canada and the United States could not be performed by any one office, nor could the expense be borne by the merchants of any one city. It is performed by means of their system of branch offices, each supported by the subscriptions of the merchants, bankers, and manufacturers of the city in which it is located. The district allotted to each office is the country of which its city is the centre of trade. For instance, the Boston office reports that portion of the New England States of which it has the chief trade; the Dubuque, the greater part of Iowa; the Milwaukee, Wisconsin; the Charleston, South Carolina and Georgia; while the Ohio Valley is divided between the offices at Pittsburgh, Cincinnati, and Louisville.

This subdivision of labor is the means of securing a minuteness and accuracy of reports, which, to any one unacquainted with the machinery of the Agency, is very great. The operations of a branch office do not embrace a large extent of country. They are usually limited to the 150 or 200 counties, the majority of whose traders buy their goods chiefly at the city where it is established. In each of these counties the principal of the office secures one, two, three, or more correspondents, the number varying with the population, and the division of the local trade among towns. These correspondents are selected for their integrity, long residence in the county, general acquaintance, business experience, and judgment. Their duties are to advise the Agency promptly, by letter or telegraph, of every change affecting the standing or responsibility of traders; to notify it of suits, protests, mortgages, losses by fire, indorsements, or otherwise; to answer all special inquiries addressed to them by any of the associate offices; and to revise before each trade season, or oftener if required, the previous reports of every trader in the county, noting any change for the better or worse. No report is considered full unless it embraces, in regard to each trader, his business, the

length of time he has pursued it, his success or the contrary, his age, character, habits, capacity, means, prospects, property out of business, real estate, judgments, mortgages, or other liens upon his property. The greatest care is taken in selecting the agents, who furnish the bulk of the information to the Agency. Their integrity of character, freedom from prejudice, and from any entangling connections with mercantile men, which might bias them in their reports, their social position, influence, and opportunities for knowing thoroughly the men they are reporting, are all taken carefully into consideration, and the very great success and expansion of the business is, we have little doubt, to be attributed, in a great measure, to the judgment and careful discrimination which has been exercised in this particular. Nevertheless, after all this care in the selection of the agents, preference would seem to require some check upon them. This is done by traveling agents who are sent through the country, and who report the traders upon their own resources, and generally without any knowledge of what the local agent has previously reported. Their reports are compared carefully with those of the local agent, and any discrepancy thoroughly investigated. Again, much information of a most valuable character is derived from special correspondents, as bank cashiers, insurance agents, notaries public, sheriffs, and others, whose official position gives them peculiar opportunities of knowing not only the resources and character of business men, but also the degree of promptness with which they meet their business obligations. Another source of information is that afforded by merchants themselves, who frequently make "statements" of their own affairs from their books. These are given under their own signature, with the avowed purpose of having them used by the Agency as a basis for credit. The leading facts contained in such "statements" are of course always made matter of special investigation. As, for instance, a merchant in his "statement" says he owns a farm or a number of town lots, in a certain county, worth a certain sum. The records of the county are examined to see if any such property stands in his name; the estimate he puts upon it is compared with that given by persons acquainted with the value of property in that locality; and, lastly, a careful examination is made to ascertain if any incumbrance exists against it not mentioned in the voluntary statement of the merchant. All the other facts in his statement are scrutinized in like manner, and it is thus subjected to a very searching analysis. Reports obtained with the care thus exhibited, and from such a variety of sources, must certainly approach as near perfection as is practicable under any circumstances.

The records of each office are arranged according to counties. Each partnership and individual name is indexed for convenience of reference on inquiry being made by subscribers. The reports coming in daily are copied without delay in the book for the county to which they refer, and transmitted by mail or express to the next or central office. All unfavorable information is promptly copied on slips, and sent simultaneously to all the offices whose subscribers' interests are probably involved therein. Serious embarrassments, assignments, and failures, are telegraphed. The mass of information thus contributed by the branches to the central office passes into the hands of the chief clerk, is distributed by him to the heads of departments, by them in their turn parcelled out among the clerks, and by these last recorded and indexed in the proper books. The records of the New York office of the Mercantile Agency contain the aggregate knowledge of traders possessed by the seventeen most extensive mercantile communities in North America.

A comparison of the system of the Mercantile Agency with that of the "Commercial Traveler," which it superseded, is much to the advantage of the former, as regards the item of cost as well as information. From

a large expense it was, who were ion was bility. men, who collection

a large dry-goods house we learn that, in old times, its expenses for travelers counted by thousands, and that it was, to a vexatious extent, in the power of clerks, who were anxious to make sales, and whose good opinion was too often won by civilities than by responsibility. Now it holds an efficient check upon its salesmen, who travel not to choose customers, but to make collections, and obtain orders.

It has been urged as an objection to the Agency that it is secret in its operations, and that to the casual observer it partakes of the nature of a system of espionage, seemingly at variance with that candor and love of open dealing so characteristic of our commercial usages. This objection, with the explanations herein given, will appear utterly futile. It is necessarily of a confidential, and, to a certain extent, of a secret nature, because such communications must always be so. What merchant, banker, or president of an insurance company, who asked for and received such information as that kept by the Agency, from a business cor-

respondent, would think of using it in any other way than as confidential, and to be kept strictly secret? What would his correspondent say if his communications were used as though they were not so regarded? Who would give such information, however pure the inquirer's motive might be, unless he were assured that he could implicitly rely upon this?

The principal Mercantile Agency established in the United States is that in the city of New York. Branches and associate offices are at all the following points: New York, Boston, Philadelphia, Baltimore, Cincinnati, Louisville, St. Louis, New Orleans, Charleston, Pittsburgh, Richmond, Chicago, Cleveland, Ohio; Detroit, Michigan; Dubuque, Iowa; Milwaukee, Wisconsin; Montreal, Canada East; London, England.

[It is proper to add that the editors do not entirely coincide with the writer of the above as to the merits of the Mercantile Agency system, but insert the article as being valuable and reliable as to statements and statistics.—Eds. Cyc. of Com.]

STATISTICS OF BANKRUPTCY IN THE UNITED STATES FOR THE YEAR 1857.

	Number of stores	Failures.		Ordinary Failures.		How many have arranged with Creditors, and at what Average.

Mercantile Law. Among the ancient Romans, trade and manufactures were accounted degrading and dishonorable employments; and what was done in that way was performed by slaves. None who had been employed in trade, or whose father had been a slave, could be chosen into the senate; and no senator, or father of a senator, could, by law, keep a bark above a certain small burden, in order, no doubt, to prevent his engaging in commerce. The Comorists likewise despised trade; and at the Council of Melfi it was solemnly determined that none could exercise any traffic, nor follow the profession of the law, with a safe conscience.

These notions, however, were singular, and very different from the policy which has ever prevailed in England. According to a law of Athelstan, if any merchant made three voyages on his own account beyond the British Channel, or narrow seas, he was entitled to the privilege of a Thane; and it is especially provided by Magna Charta (c. 30), that all merchants, unless publicly prohibited beforehand, shall have safe conduct to depart from, to come into, or to tarry in and go through the realm, for the exercise of merchandise, without any unreasonable imposts, except in time of war; and that if a war breaks out with another country, the merchants of that place shall be attached, but their person only, till the king is informed how our merchants are treated in the land with which we are at war; and if our merchants are secure, theirs shall be so too. Upon this Montesquieu remarks, with admiration, that the English have made the protection of foreign merchants one of the articles of their national liberty; and also that the English know much better than any other people on earth how to value at the same time these three things, religion, liberty, and commerce. These, indeed, are the common rights of mankind. They are also inseparably connected together; and as liberty is the life of commerce, so commerce is in its turn the parent of man's advantages, moral and physical, personal, and political. Its protection and encouragement are now, therefore, an established principle of the law of nations.

Trade and commerce being thus the immediate offspring of natural liberty, the *lex mercatoria*, or the law of merchants, is less a branch of this or that system of municipal law, than the law of nations, or that universal law which reason teaches all men. It is, if one may so call it, an ambulatory system of civil law, not confined to any one place or locality, but attaching to the persons of men in all their commercial transactions throughout the world; the custom of merchants being everywhere acknowledged, as their persons and property are by the law of nations everywhere protected.

Thus, not to enter here at large into all the details of mercantile law, which will be found in other parts of this work, divers sorts of writing used among merchants and trading people in commercial transactions, are sustained in our courts, after the example of other States, although not executed with all the formalities of common deeds. Misive letters, *in re mercatoria*, are valid, although not holograph, and commissions from merchant to merchant, though not signed before witnesses; nor do fitted accounts among merchants, in mercantile matters, require the writer's name or witnesses. But of all obligations, *bills of exchange*, which owe their origin to merchants, are the most favored. The risks and accidents of trade have also caused particular favor to be extended to persons engaged therein, who have fallen into bankruptcy; provision being made by statute for their entire discharge on their surrendering their effects to their creditors. See LAWS OF COMMERCE.

Mercator Gerard, one of the most celebrated geographers of his time, was born at Rupelmonde, in 1512. He applied himself with such industry to geography and mathematics that he is said to have fre-

quently forgotten to eat and drink. The Emperor Charles V. had a particular esteem for him, and the Duke de Juliers made him his cosmographer. He composed a chronology, some geographical tables, and an atlas, having engraved and colored the maps himself. He died in 1594. His method of laying down charts is still used, and bears the name of *Mercator's Charts*.

Mercator's Charts. The true inventor of these charts is said to have been a Mr. Wright, who made several voyages; and in his absence Mercator published the charts in his own name, 1568.—PADDON. They are, however, now confidently ascribed to Mercator's own ingenuity. In these charts the meridians and parallels of latitude cut each other at right angles, and are both represented by straight lines, enlarging the degrees of latitude as they recede from the equator.

Mercator's Chart, or Projection, is a representation of the sphere on a plane, in which the meridians are represented by equidistant parallel straight lines, and the parallels of latitude also by straight lines perpendicular to the meridians. This projection, which is universally adopted for nautical charts, by reason of the facilities which it affords in navigation from the circumstance that the rhumb, or sailing course between two points, is represented by a straight line, was invented by Gerard Mercator (his true name was *Kauffman*, of which Mercator is the Latin equivalent), a native of Rupelmonde, in East Flanders, born in the year 1512. But, though Mercator gave his name to the projection, it does not appear that he knew the law according to which the distance of the parallels from the equator increases. The true principles of the construction were found by Edward Wright, of Caius College, Cambridge, who explained them in his treatise, entitled *The Correction of certain Errors in Navigation*, published in 1599, and are as follows: Suppose one of the meridians on the globe to be divided into minutes of a degree; one of these, taken at any parallel of latitude, will be to a minute of longitude, taken on that parallel, as the radius of the equator to the radius of the parallel; that is, as radius to the cosine of the latitude, or as the secant of the latitude to radius. This proportion holds true on the map in this sense, that if a minute of the equator be taken as the unit of a scale, and that unit be considered as the radius of the tables, then the representation of a minute of latitude will be expressed by the number in the trigonometrical tables which is the secant of that latitude. Hence, in the map, while the degrees of longitude are all equal, the degrees of latitude marked on the meridian form a scale of which the distances go on increasing from the equator toward the poles, each being (approximately) the sum of the secants of all the minutes of latitude in the degree. The numbers resulting from the addition of the secants of the successive minutes, reckoned from the equator, form a scale of meridional parts, which is given in all books of navigation. The very remarkable property of this projection, namely, that the divisions of the meridian are analogous to the excesses of the logarithmic tangents of half the respective latitudes augmented by 45° , above the logarithm of the radius, was discovered by Bond about the year 1645; but was first demonstrated by James Gregory, in his *Erraticiones Mathematicæ*, published in 1668.—*UNE'S Dict.*

Mercator's Sailing is that which is performed by Mercator's charts.

Merchant, a person who buys and sells commodities in gross, or deals in exchanges, or one who traffics in the way of commerce, either by importation or exportation. The merchants of London and Amsterdam were accounted the most enterprising and richest in the world. An attempt was made by Queen Anne's ministry to exclude merchants from sitting in the House of Commons, in 1711; but it failed. The Mer-

chant Adventurer's Society was established by the Duke of Brabant in 1296. It extended to England in Edward III.'s reign, and was formed into an English corporation in 1564.—HAYDN.

Laws of Merchants.—The laws controlling merchants and commercial transactions are numerous, and are treated of in detail in the article **LAW OF COMMERCE**. As an analysis of these laws, it may be stated, that most of the European and American countries have left uncontrolled the free action of the merchant. In Lubec every merchant is required to be a citizen. Russia has established numerous restrictions. The body of merchants are divided into three guilds or classes, to which none but Russian subjects or denizens (*i. e.* naturalized foreigners) may belong. In each guild a certain tax is imposed, and a determinate amount of capital is required; also, the nature and extent of the commercial operations permitted have proportioned limitations. Nearly every country, except Great Britain, France, and the United States, prescribes the enrollment in a public register of commerce, of the name of the merchant, the nature of his business, the name of each partner of the firm, and the dormant partners included in the firm and company, the power conferred on any party to act per procuram, and every particular connected with the formation and dissolution of the partnership. In some countries these details must be published in the gazette and newspapers. This register is either established at the tribunals of commerce or at the civil courts. Every publicity is given to such enrollments; and any person, by paying a small fee, may obtain extracts from them. The parties interdicted from engaging in trade are, with a few exceptions, only those who are laboring under a civil disqualification.

General Regulations.—The institutions of guilds or privileged companies are of Roman origin. Traces of them still exist in London and in Scotland; but the convivial meetings in which are expended the grants, which, in ancient times, they received from government, are the only evidences of periodical revival. The word "guild" was originally applied to a society of merchants, as by the statutes of the guild in 1283, and by the statute of William, c. 35, but out of them arose all the different corporations of craftsmen. A decree, arbitral, promulgated in Edinburg, dated from "Halvruidhouse, the twenty-two day of Apryl, the year of God, one thousand four hundred four-score three years," thus expresses the union of merchants and craftsmen in the guildry: "Toward the lang controverses for the guildrie, it is finally, with common consent, appoyntit, agreit, and concludit, that als well craftsmen as merchants sall be received and admitted gild brether, and the one not to be refusit nor secludit therefra mair the uther, they being burgeses of the burgh, als met and qualified thairfore; and that gildbrether to have liberty to use merchandice;" and by the same decree it is ordered, "That na manner of person be sufferit to use merchandice or occupy the herdiewark of any free craft within this burgh, or yet to exercise the liberty and priviledge of the said burgh without he be burges and freeman of the same." This decree was ratified in Parliament; and, therefore, after this period, the general right of the original guilding, or society of merchants of the realm, was abridged so far that they could not trade in Edinburg unless they were admitted as burgeses. The commercial regulations of Lubec are still founded on the same system; the merchants are divided into nine companies and colleges, and administrators, all of which bear the stamp of antiquity. Russia, besides the forming of merchants into guilds, divides commerce into various branches, and specifies what commercial operations include, with some notices of commerce with patent. France determines what are acts of trade with regard to the competency of tribunals of commerce. Holland, Wurtemberg, and a few

other countries, have similar determinations of what is comprised in commercial operations.

Who may be Parties to Mercantile Contracts.—It was once the doctrine of the English courts, that the law-merchant did not apply to any contracts between parties who were not merchants. But this view has passed away; and it has long been a well-established rule in that country as well as this, that the law merchant applies to mercantile contracts, such as negotiable notes, bills of lading, charter parties, policies of marine insurance, and the like, whoever may be the parties to them. All mercantile transactions begin and end in contracts of some kind—express or implied, executed or to be executed; and the first element of every contract is the existence of parties capable of contracting. Generally, all persons may bind themselves by contract. Whoever would resist a claim or action founded on his contract, on ground of incapacity, must make this out. See *PANSON'S Mercantile Law*.

Minors.—By the English law, a minor can not contract commercial engagements; yet he may act as a partner, and perform other functions for beneficial purposes, without being liable for contracts entered into during his minority. In Scotland, a minor may become a trader; and when he holds himself out as a major, he becomes responsible. In France, minors, by being emancipated, may engage in trade previous to the 18th year of their age, when authorized by a registered act, either of their parents or family council, or by civil authorities. They are allowed, in this case, to pledge or mortgage their estates. Similar principles are adopted in Spain, Portugal, Prussia, &c., &c.

The age at which minority ceases, is: In England, Scotland, British Colonies, United States, Hungary, Roman States, France, Normandy, Two Sicilies, &c., 21 years; in Mauritius, British Guiana, 24 years; in Cape of Good Hope, Ceylon, Holland, 25 years; in Gurnsey, Jersey (Coutume of Normandy), 20 years.

Married Females.—In London, a married female may engage in trade as a *ferre sole*, but she must trade within the city, and on her account; she is, therefore, liable to be a bankrupt. In England she may engage in trade when authorized by her husband, but she is not responsible. Her endorsement, acceptance, negotiation of bills of exchange, are null, and no action can be maintained against her. The husband is liable for the debts contracted by her in a separate trade. In Scotland, parties may settle, by marriage contract, their several rights and interests. A married female can not act by or for herself.

In France, Spain, Portugal, Prussia, and Sardinia, the authority of the husband is necessary for her engaging in trade. Her property by dowry, and that held in common, are responsible for the obligations she contracts with reference to trade. The authority of the husband ought to be made public, as also the revocation of the same. In America, the common law of England is generally retained, with some exception, in Pennsylvania, Louisiana, and South Carolina. In Lower Canada and St. Lucia, same as the Coutume of Paris; and in the Mauritius it is regulated by the civil code. In Malta, a married woman may engage in trade with the consent of her husband, but she can not be imprisoned for debt. In Lubec, married females must receive the authority of the Senate for opening a shop. In Wallachia, a married female can not engage in trade without a marriage contract.

Aliens.—In Great Britain, United States and America generally, aliens enjoy the same privileges as natives with regard to trade. In France they enjoy the greatest liberty, and the same rights as the natives. In Russia and Sweden, a variety of provisions are enacted with regard to aliens, but a restriction prevails in all. In Spain and Portugal, aliens not naturalized may engage in trade, but they are established according to existing treaties with their respective govern-

ments. In Lubec, the restrictions on foreigners are extended even to deny them the power of establishing themselves as residents, without the authority of the tribunal of judicial police. See *Luvv's Com. Law*.

Mercury, or Quicksilver (Fr. *Vif argent*; Ger. *Quicksilber*; It. *Argento vivo*; Sp. *Azogue*; Rus. *Rtut*; Lat. *Hydrargyrum*; Arab. *Zibak*; Hind. *Parah*; Sans. *Parada*). This metal was known in the remotest ages, and seems to have been employed by the ancients in gilding, and separating gold from other bodies, just as it is by the moderns. Its color is white, and similar to that of silver; hence the names of *hydrargyrum*, *argentum vivum*, *quicksilver*, by which it has been known in all ages. It has no taste or smell. It possesses a good deal of brilliancy; and when its surface is not tarnished, it makes a very good mirror. Specific gravity 13.568. It differs from all other metals in being always fluid, unless when subject to a degree of cold equal to -39° , when it becomes solid. The congelation of mercury was first observed in 1759.—*Thomson's Chemistry*. Mercury is found in various parts of the world. Among the principal mines are those of Almaden, near Cordova, in Spain; Idria, in Carniola; Wolfstein and Morfeld, in the Palatinate; Guanacavelica, in Peru, etc. Most of the ores of mercury are readily distinguished from those of any other metal: in the first variety, globules of the metal are seen attached to or just starting on the surface, which is at once a sufficient criterion, mercury being unlike every other metal; in the second, by the fine white color, and the action of the blow-pipe, which sublimes the mercury and leaves the silver behind; the third, by its beautiful deep red tint, varying from cochineal to scarlet red, excepting in those termed hepatic cinnabars, which are generally of a lead gray; the fourth, by its gray color, its partial solubility in water, and its complete volatilization by heat, emitting at the same time an arsenical odor. Before the blow-pipe, these varieties burn with a blue flame and sulphurous odor, leaving more or less residue behind them, and which may consist of earthy matter, as silice and alumina, together with the oxyds of iron and copper.—*Joyce's Chem. Min.*

Mercury is often adulterated by the admixture of lead, bismuth, zinc, and tin. When the metal quickly loses its lustre, is covered with a film, or is less fluid and mobile than usual, or does not readily divide into round globules, there is reason to suspect its purity. Our supplies of mercury are derived almost wholly from Spain. The imports usually amount to from 2,000,000 to 3,000,000 lbs., of which about 300,000 lbs. are retained for home consumption, the surplus being exported to South America, France, the East Indies, etc. The exports of quicksilver from Spain in 1849 amounted to 48,868 quintals, of which nearly 40,000 quintals were furnished by the mines of Almaden. The province of Idria, in Austria, has also some rather productive quicksilver mines. And the produce of this metal in California, and other parts of in South America, is said to be already considerable, and to be increasing. There are two sulphurets of mercury; the black or *ethiops mineral*, and the red or *cinnabar*. When mercury and sulphur are triturated together in a mortar, the former gradually disappears, and the whole assumes the form of a black powder, denominated *ethiops mineral*. If this powder be heated red-hot, it sublimes; and on a proper vessel being placed to receive it, a cake is obtained, of a fine red color, which is called *cinnabar*. This cake, when reduced to powder, is well known in commerce by the name of *vermilion*. Cinnabar may be prepared in various other ways. Calomel, or protochloride of mercury (*mercurius dulcis*) is the most useful of all the preparations obtained from it. It is in the form of a dull white, semitransparent mass, having a specific gravity of 7.176. It is more generally employed, and with better effect, than almost any other remedy in the whole range of

materia medica. Besides its uses in medicine, mercury is extensively employed in the amalgamation of the noble metals, in water-gilding, the making of vermilion, the silvering of looking-glasses, the making of barometers and thermometers, etc. For the imports of mercury into the United States, see *QUICKSILVER*.

Meridian, in geography, a great circle supposed to be drawn through any part of the surface of the earth and the two poles, and to which the sun is always perpendicular at noon. In astronomy, this circle is supposed to be in the heavens, and exactly perpendicular to the terrestrial one.

Meridional Distance, in navigation, is the same with departure, or easting and westing, being the difference of longitude between the meridian under which the ship now is, and any other meridian which she was under before. Meridional parts, miles, or minutes, in navigation, are the parts by which the meridians in a Mercator's chart increase as the parallels of latitude decrease.

Meridian, First. The meridian from which longitudes are reckoned. The choice of the first meridian is entirely arbitrary; and most nations reckon the longitudes from their capital, or meridian passing through their principal observatories. Thus, in English works, the longitude is reckoned from Greenwich; in French, from Paris; in Russia, from St. Petersburg, etc. Ptolemy employed the Canary Islands, and the French formerly reckoned from Ferro, and the Dutch from the Peak of Tenerife. Mercator chose the Island Del Corvo. See *LONGITUDE*.

Meridian Line. A line traced on the surface of the earth, coinciding with the intersection of the meridian of the place with the sensible horizon.

Meridian of a Globe, or the Brass Meridian, is a graduated circular ring, within which the globe is suspended and revolves, and by means of which it is connected with the frame bearing the horizontal scale. Meridian lines are also traced on the globe itself, usually at 15° distance, or a difference of longitude corresponding to an hour of time. It is probable that these, with the parallels of latitude, suggested to Descartes the idea of *co-ordinates*, which he applied so successfully to connect algebra with geometry.

Merino Sheep. A breed of sheep till lately peculiar to Spain, but now reared in Saxony, England, and more particularly in Australia, chiefly for the superior fineness of their wool. The word *merino* signifies overseer of pasture lands, and is applied to this breed of sheep, because in Spain they are kept in immense flocks, under a system of shepherds, with a chief as a head, and with a general right of pasturage all over the kingdom. The best flocks of Spanish merinos are found in Leon and Castile: of the Saxon variety, at Stolzen and Rochsburg; but merinos are to be found in North America, the Cape of Good Hope, and, above all, in New South Wales, which promises to be one of the principal wool-growing countries in the world. See *Wool*.

Merschau (Ger.; Eng. *sea-froth*; Fr. *Ecume de Mer* *Magnésic carbonatée silicifère*), is a white mineral, of a somewhat earthy appearance, always soft, but dry to the touch, and adhering to the tongue. Specific gravity 2.6 to 3.4; affords water by calcination; fuses with difficulty at the blow-pipe into a white enamel, and is acted upon by acids. It consists, according to Klaproth, of silica, 41.5; magnesia, 18.25; water and carbonic acid, 39. Other analysts give silica 50, magnesia, 25, water 25. It occurs in veins of kidney-shaped nodules, among rocks of serpentine, at Egriedes, in the Island of Negropont, Eski-Schehir, in Anatolia, Brussa, at the foot of Mount Olympus, at Baldissero, in Piedmont, in the serpentine veins of Corn. wall, etc. When first dug up, it is soft and greasy, and lathers like soap; and is on that account used by the Tartars in washing their linen. The well known Turkey tobacco-pipes are made from it, by a process analogous to that for making pottery-ware. The bowls of the pipes,

when imported into Germany, are prepared for sale by soaking them first in tallow, then in wax, and finally by polishing them with shave-grass.

Messina, Zante and Mesana, a city and sea-port of Sicily capital of a province on the Strait of Messina, eight miles north-west from Reggio. Latitude of light-house $38^{\circ} 11' 10''$ N., long. $16^{\circ} 54' 7''$ E. Population 53,772. It is built on the west side of a noble harbor, inclosed by old walls; has wide, handsome streets, paved with lava, and lined with white stone houses. The port, defended by several fortifications, is formed by a long curved tongue of land, projecting north-east from the main land, and then bending westward in the form of a sickle, whence its ancient Greek name. It is about four miles in circumference, has deep water throughout, and large vessels can load and unload close to the quays. The trade is considerable. The exports comprise oranges and lemons, silk, olive-oil, wine and spirits, linseed, salt, fish, etc. The imports consist of colonial produce, cotton and woolen fabrics, hardware, and other manufactured goods. It has an active tunny and other fisheries, and manufactures of damasks and satins. Population of the province in 1851, 849,484. *The Strait of Messina (Fero di Messina)*, separates Sicily from South Italy, and unites two basins of the Mediterranean. Length, north to south, 22 miles; breadth, 10 miles to 2½ miles at its north extremity, between the Faro Tower, Sicily, and the Rock of Scylla. No bottom has been reached in it with 200 fathoms of line. On its shores are the cities of Reggio and Messina, opposite which latter is the whirlpool of Charybdis.

A treaty of reciprocity between the United States and the Two Sicilies was concluded on the 1st of December, 1845, and ratified on the 1st of June, 1846. The terms of the treaty are faithfully adhered to, inasmuch as the citizens of the United States are treated in the same manner as the subjects of the Two Sicilies. The commercial intercourse of the United States is dependent solely on the regulations of the mother country; the existing regulations are neither temporary nor fixed to a definite period, but permanent. There are no privileges permitted to the commerce of other nations which are denied to the United States. There are restrictions imposed on commerce of others which have not treaties of commerce with the Sicilian government, as to be seen in the custom-house regulations. All goods imported by privileged vessels have a per centage allowed of 10 per cent. on the import duty, and the vessels themselves enjoy all the privileges and exemptions of national vessels, except the coasting trade. The few articles shipped to the United States, on which an export duty is paid, are brimstone, oil, and linen rags; if shipped by American or Neapolitan vessels to the United States they enjoy a drawback of 10 per cent. on the export duty. The port charges consist of the tonnage duty and some small charges in the police, the custom-house, and the health-office. The tonnage duty is 8 Sicilian grains, or 4 Neapolitan bajos per ton, which is equal to 3½ American cents. The small charges amount to nearly the same, consequently the whole port charges are from 7½ to 8 cents, United States' currency, per ton. Pilotage is \$5 for a vessel of any size. The transshipment of goods in vessels belonging to the United States is not permitted for another port in the kingdom of the Two Sicilies, although it is allowed for foreign ports without any privilege or restriction. United States' vessels may complete their cargoes in one or more ports of this kingdom, or on the Island of Sicily, without being subject to pay the tonnage duty more than once. The moneys, weights, and measures known and in common use at the different ports are not the same as those established by the supreme law of the mother country; and they are even at variance in the ports of Messina, Catania, and Syracuse.—*Com. Rel. U. S.*, 1856-7.

Metalliques, a kind of Austrian stock, so called because the interest is paid in the precious metals, and not, like the interest of other stocks, in paper money. The name was afterward used in Russia and other countries, for stocks of a similar kind.—E. A.

Mexico. Discovered in A. D. 1518. It was conquered by the Spaniards under Cortez, whose name is infamous on account of his cruelties to the vanquished, A. D. 1521. The mint of Mexico, the richest in the world, was begun in 1555. This country, like other States in the New World, has recovered its independence. Iturbide made emperor, May, 1822. Mexican constitution proclaimed by the president, Vitoria, October, 1823. Iturbide shot, July 19, 1824. Treaty of commerce with Great Britain ratified, April, 1825. Titles suppressed, May, 1828. The expulsion of the Spaniards decreed, March, 1829. Spanish expedition against Mexico surrendered, September 26, 1829. Mexican revolution; the president Guerrero deposed, December 32, 1829. The independence of Mexico, previously recognized by the great European powers, also recognized by the Emperor of Brazil, June, 1830. Civil war between Bustamante and Santa Anna, 1832. Santa Anna elected president, March, 1834. Declaration of war against France, November 30, 1838. Castle of San Juan de Ulloa taken by the French, November, 27, 1838. This war terminated March 9, 1839. Civil war, with change of leaders at various times. Santa Anna displaced Bustamante again, October 6, 1841. Insurrection of General Paredes against Santa Anna, November 5, 1844; succeeds without bloodshed, and Herrera made president, December, 1844. Paredes overthrows Herrera, December, 1845. War with the United States, 1846; Mexicans defeated at Palo Alto, May 8, 1846, and subsequently at Matamoros. Santa Fé captured, August 28, and Monterey September 24, 1846. Mexican Congress authorized their government to raise \$15,000,000 for the war against the United States, upon the mortgage or sale of church property, January 8, 1847. Battle of Buena Vista, February 22, 1847. Vera Cruz surrendered to General Scott, March 29, 1847. Battle of Cerro Gordo, April 18. General Paredes landed at Vera Cruz in disguise, August 14, 1847. Battles of Contreras and Churubusco, August 20, 1847; of Chapultepec, September 12. Surrender of City of Mexico to American General Scott, September 14, 1847. Treaty of peace with the United States ratified at Queretaro, May 30, 1848. Mexico evacuated by the American troops, June 12. Paredes excites a revolt at at Guanajuato, June 15. Herrera becomes president, July 6. Bustamante defeats Paredes, July 18. Vera Cruz surrendered by the United States, August 1. Signor de la Rosa first Mexican minister to the United States after the war, presented his credentials, December 2, 1848. See *MAYER'S Mexico*; *POISSNETT'S Notes on Mexico*; *DE BOW'S Rev.*, ii., 27, 165 (J. R. POISSNETT), v., 401; *North Am. Rev.*, xliii., 226 (JUDGE BULLARD), xx., 77 (J. SPARKS); *HUNT'S Mag.*, x., 118 (B. MAYER), xv., 250, xvi., 455.

The territory constituting the republic of Mexico has an area of 855,964-49 square miles, and forms, in its political divisions, 21 States, a Federal District, and three Territories. The population has somewhat augmented since the time of its independence, and the census (Tejada's) of 1850 states its position and numbers as follows:—No two authorities agree as to the area and population of Mexico.

Area in 1851.	Ceded to U. S. by treaty of 1848.	Area in 1850.*	Population in 1851.
Sq. leagues.	Sq. leagues.	Sq. leagues.	
216,012-27	109,944-50	106,967-47	7,650,919

* By the treaty of Dec. 30, 1850, defining more accurately the boundary between Mexico and the United States, additional territory was ceded to the latter, for the consideration of \$10,000,000.

More recent returns would indicate a greater increase of the white than other classes of population;

but it is probably explained by the fact that certain literary acquirements define color, and that successful efforts have been made to advance the common education in many of the States. A census stated to have been taken in 1854, makes some very slight alterations in the preceding table. It raises the population to 7,863,304.

Along the eastern declivity of the Cordillera of the Andes, from 8000 to 4000 feet above the level of the sea, grow the coffee and tobacco, both of unusual excellence; but the coffee is heavily burdened with the internal taxes of the States, and the sale of tobacco is a monopoly of the government; so that, with these restrictions upon them, their cultivation languishes. From this elevation to the sea is the country of cane, of the product of which little is at present exported. Cochineal, which has greatly diminished in quantity within the past few years, has become of little importance. Wheat, the growth of the table-lands, is equal to the best in the world, and, when not absolutely forbidden, a heavy duty rests upon the imported article, which, unless in times of scarcity, is equal to a prohibition. The lands of the people of the hot and temperate climates are chiefly taxed with this great difference; and, in consequence, the flour is brought to them, often a distance of 200 miles, on mule-back, instead of being received at a fair and cheaper rate from abroad, by the sea. This weight falls heavily upon the State of Vera Cruz, and exists for the benefit of the proprietors of the wheat-fields, principally of Puebla; but force and wealth prove ever to abide with the latter State, in every attempt to obtain relief. Nor do the burden and vexation stop here. Notwithstanding the exemption seemingly given to the imported article from other than the federal duties, the owner has often to pay other sums at the ports of entry, in the nature of municipal duties, and at every remove from State to State.

Maize, although indigenous to the table-lands, and growing in every climate of the republic, is rarely to be found at a low price anywhere; and this, not from any falling of industry or a want of knowledge in its cultivation, but from droughts that continue, at times, for years, and sometimes until districts are half depopulated. Even in the fertile valley of Mexico, about the capital itself, corn usually bears a price of about \$2 the bushel. The cotton, wherever it has been attempted to be raised, has been materially and discouragingly affected by insects; and the article is yearly the subject of special licenses to individuals, to be introduced at Vera Cruz at rates lower than those designated by the tariff, to supply the calls of cotton manufactories. The vine and the olive have been attempted to be cultivated since the revolt from Spain, but with poor, or only partial success. The price of the *maguey*, both in its natural state as *pulque*, and as the distilled liquor made from it, *mescal*, is an important item in the economy of considerable territories, but of no consideration in commerce. The pith of some varieties of the plant, baked like a potato, is, in many places, the food for nearly the year round of the half-wild tribes of the *sierras*; and the spirituous extract is the inebriating draught that keeps a large portion of the population about the cities and towns where it can be raised or bought, in a state of wretchedness and physical destitution.

The principal manufactures of Mexico are sugar and rum, sloes, wine, and brandy, earthen and stone ware, glass, paper, and tissues of cotton, wool, and silk. M. Lerlo de Tejada estimates the entire value of the manufactures of all kinds in Mexico, annually, at \$80,000,000 to \$90,000,000.

The production of gold and silver in the republic has arrived at a state of great prosperity; but the inadequate supply of quicksilver is felt as a considerable obstacle to the still greater development of the mineral wealth of Mexico.

Manufactures.—The principal products of Mexican industry are brandy, and sugar made from cane, mescal, made from the juice of the maguey, oil, wine, and brandy made from grapes, earthen and glass wares, paper and spun and woven cotton, silk and woolen. Sugar is made in mills on all the estates where the cane is cultivated, and which are found chiefly in the States of Vera Cruz, Tabasco, Yucatan, Mexico, Guerrero, Michoacan and Guadaluajara; and brandy by stills in most of them. Although the ancient and imperfect system is generally pursued, some improvements have begun to be introduced, of which may be cited the apparatus lately put up on the hacienda of La Puga, near Tepic, that of San Carlos, in the Cañada of Cuautla, and in Silva, four leagues from San Juan Bautista de Tabasco, for sugar-making and distilling brandy. For the making of oil there are already in the capital 49 mills, besides those in Tacubaya, Toluca and Puebla. Not only oil is made in them from olives, which nearly supplies the consumption, but from ajonjote, linseed, rape-seed, colwort, higuera, almonds, cacahuete, small nuts, and finally from calves' and pigs' feet, etc., to oil wheels and machinery. With respect to grape-wine and brandy, although there were vineyards in several States, they are manufactured only in those of Guanajuato, Coahuila, Lower California, Sonora, and Chihuahua, from the last of which are annually made more than 600 barrels of brandy, 300 of wine, and 200 tierces of raisins. For the manufacture of earthen vessels of all kinds there are establishments in the republic, where they are made with much skill, the best in Mexico, Guanajuato, and Guadaluajara. In fine pottery, great improvements have been recently made in Puebla, where the business has been carried on from very remote times, in Salamanca, in the state of Guanajuato, and lately in the capital a manufactory excels all the rest. There are four establishments for plain glass in the capital, and the States of Mexico and Puebla, the product of which exceeds the consumption. There are eight paper mills in the Federal District, and the States of Mexico, Puebla and Jalisco, which not only supply the demand for the press, but for other purposes, particularly writing-paper equal to that of other countries. The scarcity of linen rags requires most of the paper to be made of cotton, though some is made of linen, and also of the filaments of the maguey. Although many hand-loom wheels are used in making cotton fabrics, as rebozos, mantas and other ordinary articles, there are 62 large establishments moved by machinery, in the Federal District, and the States of Coahuila, Durango, Jalisco, Puebla, Mexico, Queretaro, and Vera Cruz. Although some pretty fine linens are made in them, they are but few, the chief part being hilazas and mantas, which in 1845 amounted to 3,000,000 pounds of the hilazas and 1,000,000 pieces of the latter. The manufactory of rebozos in the city of Zamora in the State of Morelia, is worthy of particular notice. For woolen fabrics, besides the numerous shops in which are manufactured ordinary cloths and various common articles, there are seen large establishments in the district and the States of Mexico, Queretaro, Zacatecas and the territory of Hoxcala, in which are made cloths, cassimeres, carpets, baize, etc., which compete with those imported, both in quality and in price. In spinning and winding silk, more than 60 hand machines are in the capital, Puebla and Guadaluajara, and the products are preferred to the foreign. In the capital is a machine by horse-power, on the French plan, which can spin above 100 lbs. a day. About 40,000 lbs. are estimated to be spun in Mexico annually. The only woven silk yet made are some rebozos and bands. All kinds of fancy trimmings are made in Mexico, as buttons, cords, braids, and many ornaments of cotton, wool, and silk; and the best factory is that of the Hospicio for the poor in the capital, where they are as well made as in Europe. silver thread of all kinds are made, and bugles, span-gles, gillioo, cords and belts of silver and gold, and belts of silver and copper. Oil-cloths are made, of qualities and patterns equal to foreign. Many other minor articles are also manufactured, to a considerable amount annually. An establishment for stearine candles has been commenced, under an exclusive privilege. According to the estimates of Señor Quiros in 1817, this branch of products amounted to \$18,011,818; they are now, probably, not less than \$80,000,000 or \$90,000,000.

Mineral Resources of Mexico.—In a period of 27 years, from 1825 to 1851, both inclusive, the average value of the precious metals annually exported was \$9,481,042, as appears from a recent work of Miguel Lerdo de Tejada, "*Comercio de México des de la Conquista hasta hoy*," which gives the following table of the amounts legally exported in coin and otherwise, during the period designated:

Year.	Value.
1825.....	\$3,702,447
1826.....	5,847,795
1827.....	9,669,426
1828.....	12,887,388

It is believed that immense quantities of sulphur, sufficient, it is stated, to supply the manufacturing wants of the whole world, are to be found in the State of Puebla. A late Mexican paper says, in reference to these sulphur-beds: "The volcano of Popocatepetl is no uncertain or chance enterprise. It possesses a real and certain treasure, and that treasure is the inexhaustible amount of pure sulphur which is springing up every day in infinite abundance from its bowels." The *Siglo* newspaper, published in Mexico, says: "The United States consume annually, in manufactures, sulphuric acid to the amount of the enormous sum of \$18,000,000 to \$22,000,000; and, perhaps, it would not be out of the way to estimate the imports of sulphur into Great Britain at nearly the same amount. In these two countries alone, we should find a market for over \$30,000,000 worth annually. The price of sulphur is now at about \$50 per ton, in the English and American markets, for the article brought from Vesuvius and the sulphur-beds of Italy. The article from Popocatepetl would, of course, command a higher price, from its superiority. * * * The supply in Vesuvius is limited, while that of Popocatepetl would find little diminution by the labor of a century." This seems to be no doubt of the existence of incalculable quantities of pure sulphur in the vicinity of this volcano. From observations actually made, and estimates formed on the spot, by scientific officers, it is believed that the sulphur thrown up and hardened may be set down at millions of millions of arrobas. The government of Mexico has already given attention to this subject. The stipulations by which commercial relations between the United States and the republic of Mexico are regulated are found in the treaty of April 5, 1831, and that of May 30, 1848; the latter known as the treaty of Guadalupe Hidalgo.

Article 8d of the latter treaty provides that all the custom-houses then in possession of officers of the United States should be immediately restored to the Mexican authorities, together with all bonds and evidence of debt for duties on imports and exports not fallen due; and further, that all duties collected at such custom-houses by the United States' officers, from and after the ratification of the treaty, shall, after deducting the cost of collection, be delivered over to the Mexican government, at the city of Mexico, within three months after the exchange of ratifications.

Articles 6 and 7 relate to the navigation of the Gulf of California, the Rivers Colorado and Rio Bravo del Norte (annulled by 4th article of the treaty of December 30, 1853, ratified and exchanged 30th June, 1854). Article 17 revives treaty of 1831 for 8 years, with the usual stipulation of 72 months' notice by either party desirous of terminating the same. From the treaty of 1831 the "additional article" is excepted, and also such stipulations as are incompatible with the treaty of 1848. Article 20 continues in force, for 60 days after the ratification of the treaty, the tariff established by the United States at ports and places occupied by their forces. Article 21 provides for the appointment of commissioners or arbitrators to settle any disagreements which may hereafter arise between the two governments concerning the political or commercial relations of the two countries. Article 22 prescribes rules and proceedings to be followed, should a war unhappily break out between the two republics, and covenants protection, etc., for the citizens of each residing in the other; and also provides that this article shall not be annulled under the pretense that war dissolves all treaties, or under any other pretense whatever.

The treaty of 1831, revived by the 17th article of the treaty of 1848, secures to the citizens of each country, in the territory of the other, equal footing with the citizens and subjects of all foreign nations, and provides that neither country shall grant any particular favor to other nations in respect of commerce and navigation, that shall not immediately become common to the other party; no higher or other duties, imposts, or fees whatsoever, to be paid by the citizens or vessels of either country in the ports of the other, than are, or may be, paid by the citizens or vessels of the most favored nation; all merchandise, the produce, growth, or manufacture of either country, imported into the other, to be subject to no higher or other duties than similar importations from any other foreign country; no export duties or prohibitions to be prescribed by either country, that shall not equally apply to all other foreign nations; the vessels of both countries, in the ports of either, to be placed on the footing of national vessels, as respects tonnage duties, light or harbor dues, pilotage, salvage in case of damage or shipwreck, or any other local charges, the coasting trade being reserved by each of the high contracting parties to its own vessels, respectively; the duties on imports and exports of articles, the growth, produce, or manufacture of either country, to or from the ports of the other, to be the same, whether such importations or exportations take place in vessels of the United States or of Mexico; all merchants, captains, commanders of vessels, and other citizens of either country, to have full liberty to manage, themselves, their own affairs, or choose their own brokers, factors, agents, or interpreters in the ports and territories of the other. The fourth section of the 34th article saves from the operation of this treaty all former or existing treaties with other sovereign States or powers.

Measures of Weight.—The largest measure for brandy, wine, and other liquors, is the jarva, which contains 18 cuartillos, of 1 pound, or 16 ounces of distilled water at the temperature of its greatest density. Brandy barrels are distinguished into medidos and

redondos. The former contain 262 cuartillos, and the latter 160. The redondo barrel of wine contains 150 cuartillos. Oil is bought and sold at wholesale by weight; but at retail a particular cuartillo is used, containing 17 ounces and 9 drachms of distilled water. For olive oil the same cuartillo is used as for brandy, wine, etc. At the mines the marco is used for gold and silver. The gold marco is divided into 50 castillanos, of 8 tomines of 12 grains. The silver marco has 8 ochoados, of 6 tomines of 12 grains. Assayers, to determine the purity of these two metals, use the same marco. For gold, the castellano is divided into 24 quilates, of 4 granos de ley, each grano equivalent to 50 in weight. For silver, the marco is divided into 12 dineros of 24 granos de ley, each grano being equivalent to 16 in weight. Lapidaries, for the assay of precious stones, use the quilate, which is the tenth of an ounce. Apothecaries use the libra medicinal, which is divided into 12 common ounces of eight drachms, of 3 scruples, of 24 granos.

Money in Circulation.—Baron Humboldt calculated, in 1803, the value of the money accumulated in Mexico to be \$55,000,000 or \$66,000,000; which sum compared with the population then existing in New Spain, corresponded in proportion to \$10 for each inhabitant. Taking this calculation for a basis, and considering the property in mining from that time to this, there is no hazard in saying that the value of the money now in the republic, notwithstanding the great exportation past and present, amounts to \$90,000,000 or \$100,000,000. Although this sum is, doubtless, sufficient for all the operations of the interior trade, which is very small, as well in agriculture as in manufactures and commerce, the circumstance of the greater part being confined to a few hands on the one side, and on the other the want of confidence, causes the frequent scarcity of the money in circulation, causing the rare phenomena of a country which produces gold and silver so abundantly, paying a higher interest on money than in countries not yielding it.

The geographical position of the States and Territories of Mexico is thus defined: 1. *Eastern or Gulf Coast.*—The States of Yucatan, Chiapas, Tabasco, Vera Cruz, and Tamaulipas. 2. *Western or Pacific Coast.*—The States of Oajaca, Puebla, and Territory of Tlascala; State of Mexico, and Federal District; States of Michoacan, Jalisco, and Territory of Colima; States of Sinaloa, Sonora, Guerrero, and Territory of Lower California. 3. *Interior.*—The States of Queretaro, Guanajuato, Zacateca, San Luis Potosi, New Leon, Coahuila, Durango, and Chihuahua.

Yucatan.—The State of Yucatan occupies the greater portion of the peninsula which bounds the southern edge of the Gulf of Mexico. It comprises an area of about 52,947 square miles, and contains a population of 680,948.

The principal productions of Yucatan are maize, cotton, rice, tobacco, pepper, sugar-cane, dye-woods, hides, and soap. Foreign trade with Yucatan is distributed between the United States, France, England, Spain, and other countries. The proportions may be estimated from the following table, showing the value of imports into Yucatan during the year 1850, from each of the countries above designated: Spain, 1,950,000 francs; England, 1,400,000 francs; United States, 1,000,000 francs; France, 225,000 francs; other countries, 925,000 francs; total, 5,500,000 francs, or \$1,023,000.

The principal ports in Yucatan are Campeche and Sisal, both open to foreign commerce. In the former, the water is so shallow that vessels are obliged to anchor some considerable distance from the town of Campeche, and discharge and take in cargoes by means of lighters and canoes. Sisal possesses a deeper port than Campeche, but it is more exposed to the north winds, which prevail in the Gulf of Mexico from October to April. It is the dépot for the import

and export trade of Merida, the capital of Yucatan, and for all merchandise transported to or from the interior of the State. Campeche attained, under the ancient rule, a high degree of commercial prosperity. It enjoyed a monopoly of all the imports and exports of the province; but since the independence of Mexico, its commerce has declined—a result brought about by the opening of other ports to general trade, as well as by its difficulties with the central government, and the fearful ravages of epidemics, by which, in one year, fully two fifths of its population were carried off.

Chiapas.—The State of Chiapas possesses but little commercial interest. It was incorporated into the territory of Mexico in 1833, forming, before that year, a portion of the territory of Guatemala. Its productions are corn, cocoa, sugar, tobacco, indigo (of the very finest quality, but in small quantities), tropical fruits, and timber of almost every variety. Like Yucatan, this State derives its chief interest from the ancient remains of a former advanced civilization within its territories, bearing date long anterior to the Spanish conquest. The ruins of Palenque, in Chiapas, and of Uxmal and Chichen, in Yucatan, are, perhaps, the most wonderful of all that have been discovered hitherto on the western continent.

Tabasco.—Tabasco, the smallest State of the confederacy, was, previous to the revolution, a province belonging to the Intendency of Vera Cruz. Its principal productions are cocoa, coffee, pepper, sugar, tamarinds, arrow-root, palmetto, and some tobacco. Its capital, Villa de San Juan Bautista, lies about 70 miles from the Gulf, and is reached by vessels of light draught. Its commerce is chiefly carried on with the adjoining States and with Guatemala.

Vera Cruz.—The State of Vera Cruz lies under the burning sky of the tropics, and is comprised within a long, but somewhat narrow, strip of territory along the Gulf of Mexico, running from the mouth of the Tampeco River in the north, to the Guasacualco and the boundaries of Tabasco on the south. It contains an area of 3199.50 square leagues, and a population of 264,725 inhabitants. The port of Vera Cruz lies in 19° 11' 52" N. lat., and 98° 29' 19" W. long. from Paris, on a sandy plain, interspersed with marshes, which bound the Gulf of Mexico. From the month of May to that of November, the usual period during which the northern cease blowing, the unhealthiness of Vera Cruz is proverbial. The principal productions of the State of Vera Cruz are tobacco, coffee, sugar, cotton, corn, barley, wheat, jalap, sarsaparilla, vanilla, mahogany, ebony, dye-woods, and every variety of tropical fruit. The port of Vera Cruz supplies a great part of the republic, and is considered by far the most important shipping point on either coast. Foreign vessels are allowed to introduce goods and effects from foreign countries only, and they are permitted to enter but one port for discharge; they may then proceed, in ballast, to any other port in the republic for the purpose of taking in cargoes of the produce of the country. During the year 1852 there arrived at the port of Vera Cruz, from all foreign countries, 173 vessels, with an aggregate of 21,958.23 tons. The total value of merchandises exported, including gold and silver, was \$10,449,070 05. Of the vessels named, there were 49 American, measuring 6294.15 tons. The character or value of their inward cargoes is not given in the United States' consular returns, but the import duties are stated to have amounted to \$159,301 20. Amount of silver exported, \$853,287; of gold, \$55,884; other products, \$205,150; total value of homeward cargoes, \$614,322.

During the same year there arrived from Great Britain 88 vessels, with an aggregate of 2655.22 tons. Total amount of exports, \$9,175,763 82, of which silver

covered \$8,566,850 52, and gold \$47,952. France holds the next rank in the trade of Vera Cruz. The number of French vessels arrived in 1852 was 28, of 5717 tons. Inward cargoes not ascertained. Outward, total value \$421,936; of which, silver \$118,921, gold \$45,554. Number of Spanish vessels arrived at Vera Cruz during the year 1852, 26, with an aggregate of 3211-67 tons. Total value of cargoes exported \$141,287, chiefly silver and gold. The residue of the foreign trade of this port, during the same year, was distributed between 82 vessels, with an aggregate of 4190 tons, carrying, respectively, the Belgian, Danish, Hanoverian, Mexican, Portuguese, Sardinian, and Venezuelan flags. From Hamburg there were 8 vessels, exporting a total value of \$23,196.

During the prevalence of the northern, the port of Vera Cruz is considered to be very unsafe. In 1846 the United States' brig-of-war *Somers* was lost in sight of the city, making the third United States' national vessel lost during that season, in the Gulf of Mexico. A northern generally continues two or three days. "It comes on," says a publication elicited by the loss of the *Somers*, "gradually, so that the mariner who is unaccustomed to navigate the Gulf of Mexico is often unsuspecting of danger, and flatters himself with the idea that the 'stiff breeze' which impels his vessel onward will soon carry her to her port of destination. And so it does, but not in safety; for the 'stiff breeze' freshens into a gale, and the gale into a hurricane; and, at length, the vessel strikes on one of the rocks with which the harbor of Vera Cruz is studded. In that harbor the anchorage ground is, perhaps, the worst in the world. At Vera Cruz no number of anchors hardly will keep a vessel from going ashore in a norther. All that the captain of a vessel can do, under such circumstances, is to slip his anchors and stand out to sea immediately. Vessels of war, even those belonging to friendly powers, are not allowed by the Mexican government to enter the harbor of Vera Cruz. They always anchor at Sacrificios, a barren island at the entrance of the harbor. At Sacrificios the anchorage is pretty good. Mexican men-of-war, when there are any such in the harbor of Vera Cruz, are always moored to rings set in the walls of the castle of St. Juan de Ulloa, and by that means, are secured from the effects of a norther." The official account of the loss of the *Somers*, bearing date December 12, 1846, is on file in the Navy Department, and contains many valuable suggestions relative to the dangers to which navigation is exposed in the Gulf of Mexico.

Tamaulipas.—This State is bounded north by the State of Texas; north-west by the Mexican State of Coahuila; on the west by the States of New Leon, San Luis Potosi, and Vera Cruz; and on the east by the Gulf of Mexico. In breadth it varies from 12 to 55 leagues. This State has more than 350 miles in length of sea-coast, and is fringed with lagoons varying from 4 to 18 miles in width, divided from the gulf by a bank of sand. The shallowness of the shores along the coast, and the dangerous bars which choke the mouth of the rivers, render the navigation difficult and dangerous for vessels of almost all classes. Population in 1850, 110,074; though the census of 1854 gives but 100,064. The chief productions of this State are similar to those found in the State of Vera Cruz. The coasting and foreign trade is conducted principally in the ports of Tampico de Tamaulipas and Matamoras. From these places large quantities of European and North American manufactures enter the middle and northern States of the republic. Queretaro, San Luis, Nuevo Leon, Coahuila, Zacatecas, Jalisco, Durango, Chihuahua, and Sonora, receive most of their foreign supplies from these points. Tampico de Tamaulipas, on the northern bank of the Panuco, is the principal commercial port of this State. Its bar is dangerous, and its harbor considered unsafe. The town is situated

in the midst of extensive marshes, and can not be approached by large vessels. Its foreign commerce is represented as increasing (vide *MAYER'S Mexico*, vol. II., p. 206), though a consular return from that port, bearing date February 17, 1854, says that the trade with the United States is on the decrease, owing to "high rates of duties, both impost and consumption; as also circulation and municipal."

Tampico exports hides, sarsaparilla, goat-skins, fustic, vanilla, wool, jerked beef, and Mexican hemp. Tampico is the outlet of the metals and other productions of San Luis Potosi, Guanajuato, Zacatecas, and Durango, considered to be the richest mining districts in Mexico. The foreign trade of Tampico during the year ending December 31, 1852, was as follows: Total value of inward cargoes, \$1,228,948; total value of outward cargoes, \$3,266,034; total foreign trade, \$4,495,582.

Total number of American vessels included in the above, 22, with an aggregate of 2207 tons. Value of inward cargoes, \$196,936; value of outward cargoes, \$287,944; total trade in American vessels, \$484,880. Total number of British vessels, 17; aggregate tonnage not ascertained. Of these, 14 belonged to the British Royal Mail Steamship Company, and 8 were sailing vessels. Total value of inward cargoes (exclusive of 1000 flasks of quicksilver, value not ascertained), \$287,500; total value of outward cargoes, \$2,928,418; total trade in British vessels, \$3,215,918. Total number of French vessels, 3, of 1,316 tons. Total value of inward cargoes, \$398,000; total value of outward cargoes, \$2080; total trade in French vessels, \$400,080. Total number of Spanish vessels, 7, of 728 tons. Total value of inward cargoes, \$193,300; total value of outward cargoes, \$50,176; total value of trade in Spanish vessels, \$243,476.

The residue of the trade at the port of Tampico, during 1852, was distributed between Sardinia, Hamburg, Holland, and Mexico. Matamoras lies on the right bank of the Rio Grande, or Rio Bravo del Norte, at the distance of nearly 80 miles from its mouth. For purposes of navigation, this river is, perhaps, the most important in Mexico, and has proved navigable by steamers for a considerable distance into the interior. Recent returns from this port are not at hand, but the general trade of Matamoras is not of much importance. The following facts relative to its trade are derived from French official returns: Imports into the port of Matamoras consist chiefly of breadstuffs, spices, provisions, and cloths, from New Orleans; exports, of specie, hides, and wool. In 1844 there entered 33 vessels, of 2054 tons, floating inward cargoes of the value of 1,633,000 francs, and outward about an equal amount. Two thirds of all commercial operations at this port are under the American flag. In 1841 commercial movements with the United States reached the sum of 23,000,000 francs—12,000,000 for inward, and 11,000,000 for outward cargoes. Of the imports, British merchandise imported in American bottoms reached 5,000,000, while American produce and manufactures amounted to only 2,500,000. French merchandise in American bottoms figured as high as 1,300,000 francs, and German 1,080,000. Cotton cloths (mostly British) reached, in this trade, 5,136,000 francs. The export trade to the United States during this year covered 9,000,000 francs in specie, and over 2,000,000 in hides.

Chihuahua.—The principal port in this State is El Paso del Norte, lying on the right bank of the Rio Grande. "The position of this town is an important one, inasmuch as the road by it is the only practicable one for wagons leading from Santa Fé to Chihuahua." —*MAYER'S Mexico*. The valley of El Paso is the most fertile in Mexico, producing maize, wheat, and almost every variety of fruits. The commerce of the United States with this port has decreased since 1851, not half the amount of merchandise having been imported from

the United States in 1862 as in 1850 and in 1851. This decline is attributed to the failure of the crops in the State of Chihuahua, and the high duties, which amount almost to a prohibition. Mexican and foreign merchants send to the United States wine and brandy, manufactured in the El Paso valley, and sugar, soap, robes, saddles, bridles, leather, segars, mats, and fruits, amounting annually to about \$70,000.

Oajaca.—This State has a sea-coast on the Pacific extending 118 leagues, and comprises an area of about 150 square leagues, containing a population of 525,101 inhabitants. The fertility of soil and richness of productions render this State, in a commercial aspect, one of the most important in Mexico. There is not, however, any port open to foreign commerce on this part of the Pacific, from the boundary line of Guatemala to Acapulco, a distance of nearly 900 miles. The coasting trade is nearly nominal, although the State possesses nine sea-ports or anchorages, namely: Tehuantepec, Huastulco, Escondido, Chachaha, and Jamiltepec. Corn, cotton, coffee, sugar, cocoa, vanilla, tobacco, cochineal, wax, honey, and indigo, are the staple productions. The indigo crop, produced in the department of Tehuantepec, is estimated at 500 garrones, of 175 pounds each, and that in the valley of Sonola at 600 garrones, making the whole crop of indigo equal to 192,500 pounds. The price paid to planters is 62½ cents to \$1 per pound. From a message of the Governor of Oajaca to the National Congress, it appears that, during the 17 months previous to March 1, 1851, the crop of cochineal produced in the State of Oajaca reached as high as 1,248,560 pounds. The price usually ranges from 60 cents to 75 cents per lb., according to quality. This State possesses, also, considerable mineral wealth. There are, at present, silver mines worked, 4; not worked, 3; gold mines worked, 5; lead mines, 1. Annual product of all the mines, \$352,900; annual products of iron mines, 244,000 pounds. On both sides of the Isthmus of Tehuantepec great quantities of mahogany and other cabinet woods, gums, etc., are produced. The cocoa raised in some parts of this State is of so superior a quality,

that, while the country belonged to Spain, it was reserved for the royal family. It still has a deserved reputation.

Guerrero.—This State comprises the districts of Acapulco, Chilapa, Tasco, and Tlapa, and the municipality of Coyucaan. Its principal port is Acapulco, so spacious and secure that 500 vessels can lie at anchor in it with perfect safety. The trade of Acapulco is inconsiderable; the foreign vessels entering the port being either freighted with coals for the Pacific Mail Steamship Company, or in distress—the former being compelled to clear in ballast. By decree dated February 4, 1854, the Supreme Government made a reduction in the tonnage dues upon all vessels arriving in that port laden with coal, and consigned to any steamboat company having a dépôt of coals in the harbor, viz.: 50 cents per ton, instead of \$1 50, as formerly. During the year 1855, there entered the port of Acapulco 81 American steamships, of 107,007 tons; 8 sailing vessels (ships) carrying 4,369 tons; 1 bark, and 2 schooners. Besides Acapulco, there are other ports on the Pacific coast open to foreign trade; but the Department is not in possession of information respecting them. They possess, however, no commercial importance. The other States of Mexico, being either in the interior of the republic, or possessing no ports open to foreign commerce, are not deemed of sufficient commercial consideration to demand separate notices. Returning to the general commerce of Mexico with foreign nations, particularly with the United States, it is found that the principal articles of importation from the latter to that country are, machinery, articles of iron, small wares, linen, woolen, and cotton cloths; silks, flour (when not prohibited), raw cotton, timber for the construction of houses, prepared medicines, household furniture, vehicles, harnesses, horses, salt meats, sperms, paper, marble and other stones.

The imports into the United States from Mexico consist, principally, of gold, silver, dyewoods, dyestuffs, hides, skins of sheep, cattle, and other productions of less value. The following statement shows a decrease in the importance of our commerce.

COMMERCE OF THE UNITED STATES WITH MEXICO, FROM OCTOBER 1, 1824, TO JULY 1, 1856.

This exhibit may be relied upon, having been made up from official reports on "Commerce and Navigation." It will be perceived that the commerce between the two countries decreased during the 80 years embraced in the above table. In 1854 it experienced considerable activity, exceeding in value the totals of 1850, but not reaching those of 1840, and still further below those of 1830. The value of imports in 1854, as already given, was \$3,463,190; and of exports, \$3,185,486; making a total of \$6,648,676—being \$91,066 less than for the year 1840, and \$9,474,023 less than for 1830. The importations from Great Britain into Mexico may be illustrated from a report made by order of Parliament. For a period of seven years, from 1840 to 1846, both included, the sum total of the value of the imports was \$82,246,706, making an average value of nearly \$12,000,000 per annum. The principal articles of import were as follows: drugs, haberdashery, and wearing apparel, arms and ammunition, malt liquors, printed books, manufactures of brass and copper, furniture, carriages, coals, cordage, manufactures of cotton, earthenware of all kinds, glass wares, hardware and cutlery, hats, iron and steel in bars, manufactured lead, prepared skins, harnesses and saddles, manufactures of flax, machinery and machines, and musical instruments. Of these articles, the manufactures of cotton rank highest; the estimated value of the importation for the seven years amounting to more than \$37,000,000, while that of manufactures of linen (which comes next in order of value) was more than \$12,000,000, leaving only some \$12,000,000 or \$13,000,000 as the aggregate value of all the other imports from Great Britain into Mexico. The character and value of merchandise entering into the commercial movement of Mexico with France may be exemplified by those of the year 1851, as exhibited from the data furnished by the official returns of France. The reason of the shipments thither of the precious metals being in so small amounts, is, that the exchange with England can always be more conveniently arranged than with that country.

The importation to Mexico from Germany consists principally of linen textures, such as Silesian linen, creas, etc.; to which are added, in smaller quantities, some chintzes, muslins, silk handkerchiefs, cloths, cassimeres, crystals, pluin glass, fine and common hardware, arms, carriages, furniture, and pianos.

The quantities of linen exported from Hamburg and Bremen to Vera Cruz and Tampico, during the years designated, were as follows:

The foregoing is exclusive of city and hospital contributions, and *internacion*, or internal duty, levied upon the same goods when dispatched to the interior.

The commerce of Mexico is confined to the reception of foreign goods sufficient for the necessities or luxury of a very small class of the population, for which is given in exchange a large portion of the products of the mines, and some few products of the soil. As the yield of the mines is estimated only at \$26,000,000 annually, the amount of commerce can not much exceed that sum. The total number of Mexican merchant vessels, all of which are small, does not exceed 50, and of these more than half belong to the merchants of Yucatan.

The following account of the trade and commerce of the republic for the year 1851-52 is compiled from the official returns:

Ports.	Total Tonnage.	Passengers.	
		Arrived.	Departed.
Vera Cruz.....	28,209	1,429	1,846
Tampico.....	7,704	173	126
Campeche.....	6,992	4,975	1
Sisal.....	4,239	43	93
Tabasco.....	3,789	81	21
Acapulco.....	131,350	81,342	25,540
Mazatlan.....	1,402	11	—
San Blas.....	50,321	4,563	4,920
Mazatlan.....	30,762	7,006	5,000
Ahualulco.....	1,158	81	9
Guaymas.....	4,535	718	35
Total.....	256,092	43,510	40,168

Of the vessels arriving, 68 belonged to Mexico, 436 to the United States, 108 to England, 69 to France, 60 to Spain, 13 to Hamburg, 24 to Peru, 5 to Belgium, 2 to Bremen, and 1 each to Portugal, Nicaragua, Sweden, Hanover, and Venezuela.

Among the arrivals were 219 steamers, viz., 145 at Acapulco, 7 at Vera Cruz, 4 at Tampico, 27 at San Blas, 35 at Mazatlan, and 1 at Guaymas. Of these, 145 were United States' vessels.

Of the classes of vessels, beside steamers, there were 55 frigates (vessels of war), 114 bark, 163 brigs, 63 hermaphrodite brigs, 155 schooners, and 68 pilot boats.

The chief coasting trade of the republic, on the Gulf of Mexico, is performed by schooners between Tampico, Tuspan, Sisal, Campeche, Tabasco, Minatitan, Alvarado, and Tlalotalpan. For this trade, a few vessels exist of about a hundred tons burden, built at Campeche, and are equal to American vessels of like quality in respect to capacity, sailing properties, and durability. National vessels make voyages only to the ports of New Orleans and Cuba; and in the year 1852 only seven sail were thus employed, and the amount of coasting in the same time was very small. There appears to be no increase in this trade, nor in the building of vessels. The commerce with foreign

two peninsulas, and contains 56,243 square miles. Population in 1810, was 4528; in 1820, 9448; in 1830, 31,639; in 1840, 212,276; and in 1850, 897,654.

Physical Features, etc.—The surface of the lower, or southern peninsula is generally level, having few elevations which may be denominated hills. The interior is gently undulating, rising gradually from the lakes to the centre of the peninsula. This central region may be regarded as a table land, elevated about 300 feet above the level of the lakes, covered with fine forests of timber, oak plains, and prairies. Along the eastern shore of Lake Michigan are sand-hills, thrown up by the winds into fantastic forms generally quite barren and naked. The part lying between Lake Huron and Saginaw Bay is low and swampy. No part of the United States is better supplied with fish, aquatic fowl and game.

There were, in this State, in 1850, 1,929,110 acres of land improved; and 2,454,780 acres of unimproved in farms; cash value of arms, \$51,872,446, and the value of implements and machinery, \$2,891,571. Live stock—horses, 58,506; asses and mules, 70; milch cows, 99,676; working oxen, 55,350; other cattle, 119,471; sheep, 746,435; swine, 205,847; value of live stock, \$8,008,734.

Agricultural Products, etc.—Wheat, 4,925,888 bushels; rye, 165,871; Indian corn, 5,641,420; oats, 2,866,656; barley, 75,249; buckwheat, 472,917; peas and beans, 74,254; potatoes, 2,359,897; sweet potatoes, 117; value of products of the orchard, \$132,650; produce of market gardens, \$14,738; pounds of butter made 7,065,878; of cheese, 1,011,492; maple sugar, 2,439,794; molasses, 19,823 gallons; beeswax and honey, 350,292; wool, pounds produced, 2,048,263; flax, 7152; silk cocoons, 108; hops, 10,663 pounds; of tobacco, 1245; hay, tons of, 404,934; clover seeds, 15,980 bushels; other grass seeds, 9285; flax seed, 519 bushels; and were made, 1654 gallons of wine; value of home-made manufactures \$340,947; of slaughtered animals 11,328,327.

Of the northern peninsula, Mr. Schoolcraft says:—"Portions of it are the mere development of sublime scenery which pertains to that comparatively elevated portion of the continent. Mountains and lakes, plains, rivers, and forests, spread over it with a boldness of outline which may be said to constitute almost a peculiar type of North American Geography. This division embraces the mineral region. It is of little value for the uses of agriculture. The interior abounds in small lakes. On the shore of Lake Superior are several large bays and good harbors. Recent explorations here have discovered immense deposits of rich copper ore; on the southern shore of Lake Superior is a series of lofty bluffs and isolated rocks, having the appearance of ruins, tottering walls, and caverns. *La Chapelle*, or the Arched Rock, is a beautiful specimen of this character, as are the Pictured Rocks, etc. There are also several picturesque cascades."

The southern peninsula of Michigan is drained by several large rivers and numerous smaller streams, which, rising in the interior, pass off in easterly, westerly, and northerly directions into the lakes. Rain and Huron Rivers flow into Lake Erie, Rouge River into Detroit Strait, Clinton and Black Rivers into the Strait of St. Clair, Saginaw River formed by the junction of Titibawasse, Flint, and Cass Rivers enters Saginaw Bay. Thunder Bay, Cheboygan River, and some smaller streams fall into Lake Huron. St. Joseph, Grand, Kalamazoo, and Muskegon Rivers flow into Lake Michigan. Many small lakes of pure water, stocked with fish of fine quality, are found in the interior. This State borders on four of the great lakes, viz., Erie, Huron, Michigan, and Superior. The principal rivers of the upper peninsula are Ontonagon, Huron, Menomonee, Montreal, St. Mary, Eagle, Cedar, White Fish, Black, Sturgeon, Rapid, and Manistie. The principal islands are Drummond, Sugar, St.

Joseph, Bois Blanc, Mackinac, Manitow, and Beaver Island, in Lakes Huron and Michigan; Isle Royale and the Apostles, in Lake Superior.

Manufactures, etc.—There were in this State in 1850, 15 woolen factories, with a capital of \$94,000, employing 78 males and 51 females, manufacturing 141,570 yards of cloth, valued at \$80,242; 1 establishment making pig iron, with a capital of \$15,000, employing 23 persons, producing 660 tons of pig iron, etc., valued at \$21,000; 63 establishments with a capital of \$194,450, employing 337 persons, and making 2070 tons of castings, etc., valued at \$279,697; 231 flouring and grist mills, 477 saw mills, 45 tanneries; 57 printing offices, 58 newspapers, 8 daily, 2 semi-weekly, 47 weekly, 2 semi-monthly, and 9 monthly publications. Aggregate number of copies published, 3,247,736. Capital invested in manufactures, \$5,764,645; value of manufactured articles, \$10,407,285. There were, January, 1856, 500 miles of railroad in operation.

The principal places in the State are Detroit, the metropolis, Monroe, Ann Arbor, Ypsilanti, Adrian, Jackson, Marshall, Kalamazoo, Lansing, the capital, St. Josephs, Mackinac, Grand Haven, and Sault St. Marie. There were in 1854, 6 banks and 1 branch, with an aggregate capital of \$1,084,718. Exports (1852) in American vessels, of domestic produce, to the value of \$100,436; in foreign vessels, \$31,930; of foreign produce in American vessels, \$4338; in foreign vessels, \$8448. Total value, \$145,142. Imports in American vessels, \$191,976; foreign vessels, \$4264. Total value, \$196,240. Tonnage, 1853, 4,591,284.

The shipments from Detroit were as follows:

Flour.....	bbls.	1854.	1855.
Wheat.....	"	837,143	646,898
Indian corn.....	"	897,139	737,830
	"	687,489	629,995

White Fish.—One of the largest and most important items in the commerce of Detroit, is the trade in white fish. From the head of Lake Erie to the head of Lake Superior, including Lake Michigan, during the fall and spring months, the fisheries form an important branch of our western commerce. But probably there is no place of the same area along our lakes and rivers which is so valuable in this particular, as the river contiguous to this city. From Fighting Island, to the northern point of Belle Isle, a distance of 17 miles, there is one complete fishery, from which large numbers of fish are yearly taken. The cost of taking them, when the run is fine, is very light, and fishermen realize large profits. They are known through all the States, and are esteemed among the choicest delicacies to be had in any market. The large demand creates a corresponding valuation, and in every city they have become the first brand of fish sought. The river fish are generally larger, fatter, and better flavored than those of the lakes, and are, therefore, always in greater demand, and always command better prices. In New York, Boston, New Orleans, and even San Francisco, the Detroit River white fish are eagerly sought for.

The season of 1855 was a remarkably good one. At the fisheries (about 50 in number), between Fighting Island and Belle Isle, over 7000 barrels, or some 700,000 fish, have been taken. About half of these have been sold fresh, at an average of 11 cents each, bringing in a revenue of \$8860. The remaining portions are mostly held by the fishermen until navigation shall open to them the southern and eastern trade. These 3500 barrels, when sold, will net the holders about \$30,000, or in the neighborhood of \$8 or \$9 per barrel. From the fisheries upon Belle Isle about 7000 fish were taken, a majority of which were sold fresh. The remainder of them were caught below the city, mostly upon the American side of the river.

The method of catching fish here in the river differs somewhat from the means adopted for lake fishing. There gill-nets are the principal agency employed, while seines are the instruments here used.

The number of barrels caught annually in the lake fisheries is nearly as follows:

Lake Superior.....	8,000	Lake Erie.....	8,000
Lake Michigan.....	15,000	Detroit River.....	7,000
Lake Huron.....	14,000	Total.....	42,000

These are sold at an average price of \$11 per barrel, the aggregate amount of sales being \$462,000, or nearly \$500,000. Probably one sixth of all the fish caught in Lakes Michigan, Huron, and Superior, are trout; the remainder being white fish. They are commonly caught by gill-nets, set some 10 miles distant from the shore. Large quantities of the fish are taken from the Detroit River, which they ascend from Lake Erie to spawn. On their return to the lake they are captured. The number of fisheries in the river is 50. In some of the rivers that flow into the lakes, enormous quantities of pickerel are caught. Not less than 1000 barrels are taken annually from Fox River, Wisconsin; from Saginaw River, Michigan, 1500 barrels; St. Clair River, Michigan, 1500; Maumee River, Ohio, 8000 barrels, and an equal quantity of bass, mullet, etc., making a total of 10,000 barrels, which are sold for \$9 50 per barrel, or \$65,000 in the aggregate. The annual product of the lakes and tributary rivers is thus shown:

The Lakes.....	\$5,000	Value.....	\$85,000
Detroit River.....	7,000		77,000
Other rivers.....	10,000		83,000
Total.....	22,000		\$247,000

See HUNT'S Mag., vi., 333, xix., 19 (J. R. WILLIAMS), xxii., 131.

The principal port is Detroit, a large and flourishing city on the Detroit River, opposite Windsor, the terminus of the Great Western (Canada) Railroad, which here connects by ferry with the Michigan Central Railroad, together forming a convenient line between Niagara and Chicago. It is also the south-western terminus of the Detroit and Milwaukee Railroad; and a line (the Detroit and Toledo Railroad) is now in progress to connect with the railroads centering at Toledo. It has one of the finest harbors in the United States, and is admirably adapted for commerce. It has also extensive manufactures, chiefly machinery, agricultural implements, etc., and a large trade in lumber. On the whole, it is a most flourishing place, and ranks as the first city of the State. Population in 1855, 50,448. Detroit was founded in 1760 by the French, and was for many years the State capital. Twenty-five years ago it had only 2000 inhabitants. The tonnage of Detroit in 1860 was 68,688 tons.

Port Huron.—A town at the mouth of Hacks River, on the St. Clair, and two miles south of Lake Huron. It has a large lumber business and fine general trade.

Microscopes. Invented nearly at the same time in Italy and Holland, A. D. 1621. Those with double glasses were made at the period when the law of refraction was discovered, about 1624. The honor of this invention is awarded to Drebel and Torricelli. Solar microscopes were invented by Dr. Hooke. In England, great improvements were made in the microscope by Henry Baker, F.R.S., who wrote two treatises upon it about 1763.—*Eng. Diet.*

Mile (Lat. *mille passuum*, a thousand paces). The Roman pace being five feet, and a Roman foot being equal to 11/62 modern English inches, it follows that the ancient Roman mile was equivalent to 1614 English yards, or very nearly 11-12ths of an English statute mile. The English statute mile was defined (incidentally, it would seem) by an act passed in the 35th year of the reign of Queen Elizabeth, by which persons were forbidden to build within three miles of London; and the mile was declared to be 8 furlongs of 40 perches of 16 1/2 feet each. The statute mile is, therefore, 1760 yards, or 5280 feet. See WEIGHTS AND MEASURES. The mile is used as an itinerary measure in almost

all countries formerly used difficult to come to the great you. d that in fountain with table shows of the mode countries in 1

all countries of Europe, particularly those which were formerly under the sway of the Romans; but it is very difficult to conjecture the cause which has given rise to the great diversity of its valves. It has been supposed that in some countries the Roman mill was confounded with the ancient Celtic league. The following table shows the length, in statute miles of 1760 yards, of the modern mile, and also the leagues of various countries in English yards:

Milford-Haven, a harbor of England, on a basin or deep inlet of the Atlantic, on the coast of South Wales, county Pembroke, forming one of the best ports in the British dominions. Latitude of St. Anne's Head, the north-western extremity of the entrance, and on which are three light-houses, with fixed lights, 51° 41' N., long. 50° 10' 25" W. Length of haven about 15 miles; average breadth, 2 miles. It is completely land-locked, has deep water, and the whole shipping of the empire might ride here as safely as in dock, in any weather; while the access is easy, and the egress can be accomplished, by aid of the strong ebb, even in head winds. It has for some time been a favorite scheme with the southern States to have a line of steamers between this port and Norfolk, Virginia, and thereby secure a portion of the importing and carrying trade now absorbed by the ports of New York and Boston.

Milk (Fr. *Lait*; It. *Latte*; Lat. *Lac*), a fluid secreted by the female of all those animals denominated *mammalia*, and evidently intended for the nourishment of her offspring. The milk of every animal has certain peculiarities which distinguish it from all other milk. But the animal whose milk is most used by man, and with which, consequently, we are best acquainted, is the cow. The external character of all milk is that of a white opaque fluid, having a sweetish taste, and a specific gravity somewhat greater than that of water. When allowed to remain at rest, it separates into 2 parts; a thick whitish fluid called *cream*, collecting in a thin stratum over its surface, and a more dense watery body, remaining below. Milk which has stood for some time after the separation of the cream, becomes *acescent*, and then coagulates. When the coagulum is pressed gently, a serous fluid is forced out, and there remains the caseous part of the milk, or pure cheese. Butter, one of the most valuable animal products, is solidified cream, and is obtained artificially by churning. Milk has always been a favorite food of most European nations, and especially of the British. *Lacte et caseo vivunt*, says Cæsar of our ancestors; and the same articles still continue to form a large part of our subsistence. See articles **BUTTER**, **CHEESE**, **DAIRY**.

Millet (Ger. *Hirse*; Fr. *Millet*, *Mil*; It. *Miglio*, *Panicastro*; Sp. *Mijo*; Lat. *Milium*, *Panicum miliaceum*). There are 3 distinct species of millet; the Polish millet, the common or German millet, and the Indian millet. It is cultivated as a species of grain;

and is sometimes employed to feed poultry, and as a substitute for rice. The Indian millet grows to a large size; but the autumn in England are seldom dry and warm enough to allow of its being cultivated here.—*LONDON'S ENCYC. OF AGRICULTURE*.

Milliner. Defined by Shakespeare and Johnson as a seller of ribbons and dresses for women, a very ancient occupation; the term is supposed to be derived from Milan. There are men-milliners, and the adoption of such a trade by the male sex has been strongly and justly censured. In 1810, men-milliners and other classes of an epicene character were very strongly censured in the Society of Arts. Young females are employed at all seasons, and in all weathers, to carry handboxes through the streets, exposed to the insolence of libertines, and the perils of vicious example, while the perfumed coxcomb ["He was perfumed like a milliner."—*Shakespeare*.] measures ribbons safely at home, or folds gauzes, and licks the white in lady phrases to females of distinction.—*Butler*.

Mill-stones (Ger. *Mühlsteine*; Fr. *Pierres meulieres*; It. *Mole macine*; Sp. *Muelas de Molino*; Rus. *Schernovoi kamen*), the large circular stones, which, when put in motion by machinery, grind corn and other articles. The diameter of common mill-stones is from 5 to 7 feet, and their thickness varies from 12 to 18 inches. These stones have been principally imported from Rouen and other parts of France; the burr-stones of that country being supposed to be more durable than our own. The island of Milo, in the Archipelago, furnishes mill-stones of a very excellent quality. They are exported to Greece, Italy, and other countries on the Mediterranean, where they are employed in grinding the hard wheat, or *grano duro*, used in the manufacture of macaroni, vermicelli, &c. The quarries are wrought on account of government, and the stones sold at moderate prices fixed by a tariff, which, however, leaves a handsome profit to the State.—*TOURNEFORT, Voyage au Levant*; *STRONG'S Greece*. The stones used by millers are of various sizes, according to the intensity of moving power obtainable. Technically, the two stones are called the runner and the bedder; and the operation of "hanging a runner," or adjusting the upper stone over the lower, is one of some delicacy; since not only must the two be rigorously parallel, but the distance between them must depend on the fineness of the flour to be produced and on the rapidity with which the upper stone rotates. Other things being equal, the greater the velocity, the closer must the stones be together, else the centrifugal force would drive away the corn unground or half-ground.

Mineral Pitch, *Maltha*. A solid, softish bitumen. Sp. gr. about 1.5.

Mineral Tar. The bituminous substance called *petroleum*. It is brown, viscid, and unctuous. Its specific gravity is 0.88. It is found in Britain, and on the continent of Europe, in the West Indies (Barbadoes tar), and in Persia. It may be resolved by distillation into naphtha and petroleum.

Mines (*Mine*, Fr.; *Myny*, or *Mven*, Welsh), a subterraneous work or excavation for obtaining metals, metallic ores, or other mineral substances.

Minim. The smallest liquid measure, generally regarded as about equal to one drop. The fluid dram is divided into 60 minims.

Minnesota, a north-western Territory of the United States of America, lies between lat. 42° 30' and 49° N., and long. 91° and 108° 5' W. Area, 141,839 square miles. Population, 1850; whites, 6,038; colored, 89; total, 6,077; in 1857 estimated at 150,000.

Physical Features.—Minnesota is an elevated tableland, with a surface but little varied, being mostly a rolling prairie, abounding with lakes of pure water, and streams which flow in all directions, excepting toward the west. The soil is a fertile, sandy loam, easily cultivated, and well adapted to agricultural purposes. The Mississippi River rises centrally in the Territory, in Itasca Lake, a beautiful sheet of water. The river flows first in an eastern, thence in a southern direction, to the confines of the Territory, in its course to the ocean. It is also drained by the Missouri and its numerous tributaries, the Red River of the North, whose water pass off to Hudson Bay, and the St. Louis entering Lake Superior on the eastern border of the Territory. Forests of pine and other valuable woods for timber, border the principal streams, and lead and copper ore have been found to some extent, and iron ore on the shore of Lake Superior. There were in the Territory in 1850, 5,035 acres of improved land, and 23,846 acres of unimproved land in farms. Cash value of farms, \$161,948; and the value of implements and machinery, \$15,981. **Livestock.**—Horses, 860; asses and mules, 14; milch cows, 607; working oxen, 655; other cattle, 740; sheep, 80; swine, 734. Value of live stock, \$2,850. **Agricultural Products.**—Wheat, 1,401 bushels produced; rye, 125; Indian corn, 16,725; oats, 30,582; barley, 1,216; buckwheat, 515. Value of the products of market gardens, \$150; pounds of butter made, 1,100 lbs.; maple sugar, 2,950; beeswax and honey, 80; tons of hay, 2,019; potatoes, 21,145 bushels; wool, 85 lbs.; sweet potatoes, 200; peas and beans, 10,002. Value of slaughtered animals, \$2,480. The common traveling roads and military roads are the only improvements yet constructed. The route of the great Northern Pacific railroad has been explored across the Territory. Congress, in May 1856, appropriated over 1,000,000 acres for the construction of railroads.

The French were the first Europeans to explore the region now comprised in Minnesota, and the Mississippi River was explored by the Jesuit fathers, even beyond the Falls of St. Anthony, at a very early period. The first American military post was established here in 1819, and called Fort Snelling. This county has formed a part of several territorial governments: the last were Iowa and Wisconsin. It was formed into a Territory with its present name (in 1849), which it derives from the original Indian name of St. Peter's River.

Mint. Athelstan first enacted regulations for the government of the mint, about A.D. 928. There were several provincial mints under the control of that of London. Stow says the mint was kept by Italians, the English being ignorant of the art of coining, 7 Edward I., 1278. The operators were formed into a corporation by the charter of King Edward III., in which condition it consisted of the warden, master, comptroller, assay-master, workers, coiners, and subordinates. The first entry of gold brought to the mint for coinage, occurs 18 Edward III., 1343. Tin was coined by Charles II., 1681; and gun-metal and pewter by his successor, James. Between 1806 and 1810, grants amounting to £252,000 were made by Parliament for the erection of the present fine structure in London. The new constitution of the mint, founded on the report of the Honorable Mr. Wellesley Pole, took effect in 1815. The master is now the chief officer.

the expenses of the mint and branches of the United States for the fiscal year, to the following effect:

Mint at Philadelphia.....	\$177,500
" New Orleans.....	68,500
" Charlotte, N. C.....	21,600
" Dahlonega, Ga.....	19,850
" San Francisco.....	277,300
" New York Assay Office.....	62,500

Congress loses sight of the fact that the coinage of the branches at New Orleans, Dahlonega, and Charlotte, could be easily dispensed with, and with decided advantage to the Treasury. Those branches were established at periods when the bulk of American gold was produced in the southern Atlantic States. Now the supplies are mainly from California, and the expenses at the three branches named are a dead weight upon the Treasury. The coinage at Dahlonega and Charlotte, particularly, is too trifling to re-order either necessary or expedient any further operations there. The coinage at each place last year, and the appropriations for the coming year, are as follows:

	Coinage—1855.	Expenses—1855.
Philadelphia.....	\$12,045,732 93	\$177,500
New Orleans.....	2,368,500 00	68,500
Dahlonega.....	116,778 50	20,850
Charlotte.....	217,985 50	11,600
San Francisco.....	21,121,752 48	277,300
New York Assay Office.....	30,441,918 68	62,500
Total.....	\$56,812,732 99	\$602,250

The coinage at Philadelphia, in 1855, was suspended for several months, in order to make extensive improvements, and to make the building, for the first time, fire proof. The coinage of the parent mint has of late years been over 50,000,000 annually. The above statement will, however, show that the coinage at New Orleans costs nearly 3 per cent., Dahlonega 9 per cent., and Charlotte over 5 per cent. A Report of the Committee on Commerce, in 1850, demonstrated that the actual cost of coinage for a series of years was as follows:

	Per cent.
At Philadelphia.....	2 23
New Orleans.....	6 45
Charlotte.....	9 90
Dahlonega.....	9 97

This, he it remembered, was when the coinage at the southern branches was more than double what it now is—the production of gold in that region being either actually less, or its profits less. The coinage at the three southern branches has now dwindled down to such small sums as to demand the closer attention of the government, and indicates the expediency of cessation at all those points. The following is a summary of the gold of domestic production for each year, 1850—1855:

Years.	New Orleans.	Charlotte.	Dahlonega.
1850.....	\$4,580,021	\$320,259	\$247,693
1851.....	8,770,722	316,061	379,206
1852.....	8,777,784	420,900	475,789
1853.....	2,006,678	308,157	452,290
1854.....	951,511	218,606	280,225
1855.....	411,217	216,983	116,652

Thus the production of gold which was at the two small branches \$567,000 in the year 1850, has gradually become reduced to \$333,000, and in order to maintain the *show of coinage* at these two points, an annual expenditure of \$22,000 is by Congress deemed expedient, when the same work could be done at Philadelphia for \$6000. Since 1838, the gross product of the gold mines of North Carolina, as far as indicated by the mint returns was \$4,238,236, and of Georgia \$5,686,864; total, \$9,925,100; and the aggregate expense of maintaining them \$22,000 annually, or about \$400,000 for the whole period. See COINAGE.

Mirage (Fr.), an optical illusion very common at sea, and especially in high latitudes, and sometimes also witnessed on land, particularly in Egypt and Persia, and on the margin of rivers and lakes, or on the sea-shore. It arises from unequal refraction in the

lower strata of the atmosphere, and causes remote objects to be seen double, as if reflected in a mirror, or to appear as if suspended in the air. When the effect is confined to apparent elevation, the English sailors call it *looming*; when inverted images are formed, the Italians give it the name of *Fata Morgana* (see the term). Ships in the whale fisheries are often described, and sometimes known, by means of the mirage, at considerable distances. Captain Scoresby recognized his father's ship at the distance of more than 30 miles, and consequently when below the horizon, by its inverted image in the air, though he did not previously know that it was cruising in that part of the fishery. The mathematical theory of the phenomenon is given by Biot, in the *Memoires de l'Institut* for 1809. See also CADDINGTON'S *Optics*; BIOT'S *Traité de Physique*, tome III.; BREWSTER'S *Optics*, *Cabinet Cyclopaedia*.

Mississippi, one of the southern United States, is situated between 30° 10' and 35° N. lat., and between 80° 30' and 81° 35' W. long. It is 339 miles long from north to south, and 150 broad, containing 47,151 square miles. Population in 1816 was 45,929; in 1820, 75,448; in 1830, 138,506; in 1840, 375,651; and in 1850, 606,555.

The tract of land which now belongs to the present State of Mississippi was in olden times comprised under all those different ancient and general names under which the whole northern shore of the Mexican Gulf became known to Europe. In the year 1798 the name of the river was for the first time given to a Territory, and the great "Mississippi Territory" was erected, which included also the present State of Alabama. In the year 1817 the eastern portion of this Territory was separated from it and received the name of Territory of Alabama, while the western portion, with a very limited sea-shore (from Pearl River to Grande Bay), was admitted into the Union as the State of Mississippi.

The southern part of the State, for about 100 miles from the Gulf of Mexico, is mostly a sandy, level pine forest, interspersed with cypress swamps, open prairies, and inundated marshes, and a few hills of a moderate elevation. This region is generally healthy, and by cultivation produces cotton, Indian corn, sugar, indigo, etc. As you proceed further north, the country becomes more elevated and agreeably diversified, and the soil is a deep rich mold, producing abundantly cotton, Indian corn, sweet potatoes, indigo, peaches, melons, and grapes. The natural growth of timber consists of poplar, hickory, black walnut, sugar-maple, cotton-wood, magnolia, lime, and sassafras. The country in the north of the State is healthy and productive, and the lands watered by the Yazoo through its whole course in the north-west are very fertile.

There were in this State in 1850, 3,444,356 acres of land improved, and 7,046,061 of unimproved land in farms; cash value of farms, \$54,738,634, and the value of implements and machinery, \$5,762,927.

Live Stock.—Horses, 115,400; asses and mules, 34,547; milch cows, 214,231; working oxen, 83,485; other cattle, 436,251; sheep, 304,929; swine, 1,582,731. Value of live stock, \$19,403,662.

Agricultural Products, etc.—Wheat, 137,990 bushels; rye, 9,606; Indian corn, 22,416,552; oats, 1,503,288; barley, 228; buckwheat, 1121; peas and beans, 1,072,757; potatoes, 261,482; sweet potatoes, 4,711,795; rice, 2,719,856 pounds. Value of products of the orchard, \$50,405; produce of market gardens, \$46,250. Pounds of butter made, 4,346,234; of cheese, 21,191; sugar, hogsheds of, 388; molasses, 18,318 gallons; beeswax and honey, 397,460 pounds; wool, pounds produced, 559,619; cotton, 484,293; flax, 665; silk cocoons, 2; hops, 473; pounds tobacco, 49,960; hay, tons of, 12,504; hemp, 7 tons; clover seeds, 84 bushels; other grass seeds, 533; flax seed, 26 bushels; and

were made 407 gallons of wine. Value of home-made manufactures, \$1,164,020 of slaughtered animals, \$3,636,582.

The Mississippi River, with its various windings, forms the entire western boundary of the State, and its margin consists of inundated swamps, covered with a large growth of timber. Back of this the surface suddenly rises into what are called bluffs, and behind them the country is a moderately elevated table land with a diversified surface. Cotton is the principal production of the State. The Yazoo is the largest river that has its whole course in the State. It rises in the north-west part, and after a course of 250 miles, enters the Mississippi. The Pascagoula River, after a course of 250 miles, enters the Gulf of Mexico. At its mouth it widens into a bay. It is navigable for a considerable distance for small vessels. The Big Black River, after a course of 200 miles, enters the Mississippi just above Grand Gulf. It has a boat navigation of 50 miles. Pearl River rises in the central part of the State, and passing through it to the south, forming in its lower part the boundary between this State and Louisiana, enters Lake Borgne. Its navigation is much impeded by sand bars and obstructions of timber. The Homochitto is a considerable river which enters the Mississippi. Beside these, there are a few other small rivers or creeks. A chain of low, sandy islands, six or seven miles from the shore, enclose several bays or sounds, the largest of which are Mississippi Sound, the Ascagoula Sound, and Lake Borgne.

Manufactures, etc.—There were in the State in 1850, 2 cotton factories, with a capital invested of \$38,000, employing 19 males and 17 females, producing 171,000 pounds of yarn, valued at \$90,500; 8 establishments, with a capital of \$100,000, employing 112 persons, and making 324 tons of castings, etc., valued at \$117,400; 157 flouring and grist mills, 266 saw mills, 130 tanneries, 53 printing offices, 56 newspapers, 2 tri-weekly, 2 semi-weekly, and 52 weekly publications. Capital invested in manufactures, \$1,835,395; value of manufactured articles, \$2,962,038. There were, January, 1856, 10 railroads in the State, 87 miles completed and in operation.

The principal places in the State are Jackson, the capital, Natchez, Grand Gulf, Washington, Vicksburg, Columbus, Aberdeen, and Holly Springs. On the 1st of January, 1854, there was one bank, with a capital of \$240,000. Total tonnage of the State, 1853, 2,500,000 tons.

DIRECT FOREIGN COMMERCE OF THE STATE OF MISSISSIPPI.

Year.	Exports.	Imports.
1824.....	\$10,029
1826.....	5,650
1827.....	\$304,831
June 30, 1854 to June 30, 1855.....	4,338
1851 and 1852.....	6,721

These returns are very incomplete, and only include the direct commerce. Most of the imports for Mississippi are entered in the port of New Orleans.

Mississippi River, the largest river of North America; and in length of navigable tributaries, and in extent of facilities afforded to commerce, the greatest river in the world.

Discovery of the Mississippi.—There seems to be little doubt that Pinedo, the Captain of Garay, saw for the first time the mouth of the Mississippi when he accomplished, in the year 1519, his first circumnavigation of the whole Mexican Gulf. We have no special report of Pinedo's proceedings. But on this few maps, or sketches of the Mexican Gulf which were made in Spain soon after Pinedo's return (of the years 1520, 1521, and 1529), there is to be found, near the centre of the northern gulf shore, a large inlet called "Mar pequeña" (the little sea), and a mighty river leading into it called "Rio del Espiritu Santo." Diego Ribero, on his large and accurate map (of 1529), which he made for the Emperor Charles V., has this bay and

the mouth of the river already under 20° north latitude, which is very remarkable, because it is the true latitude of the Mississippi mouth, and because it nearly decides the question that not Mobile Bay, as some have supposed, but the Mississippi, was indicated by it. Nobody could have made this discovery, given these names, and brought home the news of it, but Pinedo. Since that time the "Mar pequeña" and the great River "Del Espiritu Santo" appear on the old maps. We can trace and follow them on the Spanish maps through the whole of the 16th century, and find them always, with some slight variations, in the middle part of the northern gulf shore, and generally under the latitude from 25° to 30° north.

It is thought that with the name "Mar pequeña" is meant that great bay which is included between the projecting promontories formed by the Mississippi passes and the northern gulf shore, and for which we have no general name. The Mississippi passes must have appeared to the old Spanish navigators as very dangerous and difficult of approach. And very often they put the name of the Holy Cross to express of this description.

The second traveler after Pinedo who saw and crossed the Mississippi was no doubt Cabeça de Vaca and his companions, between the years 1537-1538. From Cabeça de Vaca's report, it is evident that his commander, Narvaez, and his companions, got lost about Mobile or Perdido Bay, or somewhere else not very far to the east of the Mississippi. Once, he says, they believed themselves to have arrived at the "Bay of Espiritu Santo, near the Mississippi." Afterward Cabeça and his followers wandered westward in the direction of New Mexico; so they must have crossed the Mississippi. But that is all we can say. He mentions so many great rivers in his report, that we can not recognize among them the true "Rio Grande," the Mississippi.

De Soto.—Fernando de Soto was the third discoverer and principal old Spanish explorer of the Mississippi. He arrived at its borders, in the neighborhood of the so-called Chickasaw bluffs, 1542, and ascended and descended the river, which in the reports of his expeditions is generally only called "Rio Grande," up and down. He died on the shore of the river, and was buried near its waters somewhere about the mouth of the Arkansas River. De Soto's successor, Moscoso, carried the rest of the Spanish army, in the year 1543, down the whole river, and he was the first commander who sailed from the mouth of the river into the sea. Which of the passes it was can not be made out. Bladwin, one of the writers on De Soto and Moscoso, and one of their companions, states, however, that the river had different mouths and branches. In one of the reports on De Soto's expedition (by Garcilasso de la Vega) it is said that the Indian name of the great river was "Chucagua." Probably, in consequence of this, the geographers put sometimes on their maps the name "Chucagua" to the river. Generally, however, the old name of "Rio del Espiritu Santo" (River of the Holy Ghost) prevailed after De Soto for a long time. One of the historians of De Soto, Ogas called "Lutagnese gentleman of Elvas," sometimes calls it "the Great River of Guachoya." Guachoya was one of the places along the river where De Soto encamped. "In Guachoya," says Garcilasso, "the great river is called 'Tannalson' in Nileo; 'Taputa' in Coça; 'Mico' at the port or mouth it is called 'El.'"

Lana.—In the year 1557 the Governor, Lana, was sent to Pensacola Bay, and from thence, with his captains and men, made many forays into the interior toward the north and west. It is very possible, though it is nowhere exactly stated, that some of his men also got as far east as the Mississippi.

Marquette and La Salle.—The French Marquette (1673) and soon after him the Sieur de la Salle (1682) re-discovered the Mississippi, and saw a greater part

of the river than was ever seen before them. De la Salle was, after Moscoso (1648), the first who sailed (1682) down the whole river to its mouth, and entered the Mexican Gulf. He explored in boats the whole delta of the passes, and saw, without however naming them, all the principal passes. A little above the dividing point of the passes he erected a monument with the arms of France. This was on the 8th of April, 1682. On the 7th of the same month he had explored the principal branches of the river and seen the sea. He observed also the latitude of this place; but there is a great diversity about the results of his observations. Some say that he observed the latitude 27° north, as, for instance, that remarkable document of the taking possession of the country at the mouth of the river by La Salle. Also, Barcia says that La Salle observed the latitude of the mouth between 27° and 28° north latitude, "though," he adds, "some heard La Salle say that the mouth was between 28° and 29° north latitude." After this, La Salle ascended the stream again to the north.

Father Marquette (1672) was the person who introduced for the first time into geography the Indian name of the river, "Mississippi." He, however, gave to it at the same time the Christian or French name "*Rivière de Conception*." La Salle seems to have ratified this latter name. He called the river, after the great French minister, "*Rivière de Colbert*." On some maps even the whole upper Mississippi country is called "La Colbertia" (Colbert's land). The name Riviere Colbert may be called La Salle's name for the Mississippi. It seems, however, soon to have given way to the Indian name Mississippi, which really was already longer known to the European missionaries, and which was already oftener adopted in books and in commerce than those new inventions of the European discoverers.

Tonti.—The next man after De La Salle who came down the Mississippi was the Sieur de Tonti, or Tonty, who had already accompanied La Salle on his first navigation. De Tonti had heard that La Salle had set out from France to the mouth of the river, and he came, in the year 1685, down to meet him at the shores of the Gulf. He arrived there during "the Holy Week" (Easter) of 1686, but did not find La Salle, who had reached the coast of Texas instead of that of the Mississippi passes.

Origin of the Name.—"One of the names of the river under which Iberville, in 1699, had heard it called," says Charlevoix, "was *Malbouchia*." But the name Mississippi seems already then to have been quite common. At least the first journal written in this colony—that of Captain Sauvol (1699, 1700)—uses always the name Mississippi, and not once that of Riviere Colbert. In the year 1712 an attempt was made to give the river still another name. The great King of France himself ordered, in the letters patent to Crozat, that the great river "hitherto called Mississippi" should henceforward be called "*Rivière St. Louis*." But this name, newly sent out from France by royal authority, did not keep its ground against the old long-age adopted Indian name. Charlevoix, who traveled along the river in 1721-22, and published his work in 1744, never uses it. He always calls it "*Mississippi*" or "*Missisipi*." Into general use the name Riviere St. Louis has certainly not come; but on maps made by royal geographers or great savans like D'Anville, we find it still used in the year 1732, though always besides the name Mississippi.

The name "Mississippi" is an Ojibbeway word, which the first discoverers of that stream heard pronounced in their missions round Lake Superior. According to some, its meaning is "*the Great Water*." Others, for instance the Reverend Bishop Baraga, explain it as "rivers," or "waters from all sides."

The French authors generally write "Missisipi;" Spanish authors have always "Missisipi." We now

double every consonant in it, and write "Mississippi," in which word, I have no doubt, some letters could be spared.—J. G. KOHL.

Description.—Its extreme source, according to the explorations of Schoolcraft, July 13, 1832, is Itaska Lake, 47° 10' N. lat., and 95° 54' W. long., at an elevation of 1500 feet, and the distance of 3180 miles above the Gulf of Mexico. Itaska Lake is a beautiful sheet of water, lying among hills surrounded by pines. The outlet of the lake is 10 or 12 feet broad, and from 12 to 18 inches deep. Its course is then northwardly and north-eastwardly, and it passes through Lakes Irving and Travers, and then eastwardly and south-eastwardly, and through some small lakes, to Lake Cass. This lake is of considerable extent, and contains a large island, 182 miles below its source, and its surface is elevated 1330 feet above the Gulf of Mexico. Its course is west to Lake Winlice, then south-west, through Little Winnipee Lake, until it receives Leech Lake Fork, the outlet of a considerable lake of the same name. The most northern point attained by the river is a few minutes short of 48°; it then pursues a winding course eastwardly, passing through some small lakes, until it attains a southwardly direction. The average descent of the Mississippi, from its source to its entrance into the Gulf of Mexico, is a fraction over five inches per mile. The region about the source of the Mississippi is an elevated table land, abounding in small lakes of pure water, and fed chiefly by springs.

The average width of the Mississippi below the Missouri is about a mile; but the large rivers which enter it greatly increase its depth. Its medial current is about four miles an hour. At the head of the delta, the depth is from 75 to 80 feet; at New Orleans it is

100. At the distance of 105 miles below New Orleans, by the course of the river, but 90 in a direct course, this majestic river enters the Gulf of Mexico by several mouths, the principal of which are called the Balise, or North-east Pass, in 29° 08' 30" N. lat., and 89° 01' 24" W. long. Draining a country of over 1,000,000 square miles in extent, it would naturally be expected that its spring floods would be vast; and in consequence of them, it overflows its banks at that season to a great extent. From the sources to the mouth of the Missouri, the flood commences in March, and does not subside before the last of May, at an average height of 15 feet. From the Missouri to the Ohio it rises 25 feet, and below the Ohio, for a great distance, 50 feet. At every flood it overspreads a country, chiefly on its western side, from 10 to 30 miles wide, 550 miles from its mouth. This river is extremely winding in its course; and sometimes a bend will occur of 90 miles in extent, in which the distance across the neck will not exceed a mile. This circumstance undoubtedly impedes the current, and thus favors navigation.

There are three light-houses at the passes, and one at the head of the South Pass, viz.: the one at the north-east is a fixed light, elevated 78 feet above the surface of the Gulf, and visible 13½ nautical miles; at the South Pass is a revolving light, on a tower of 54 feet above the sea; at the south-west pass is a fixed light, elevated 60 feet above the surface of the Gulf, and visible 12 nautical miles; and one with a fixed light at the head of the South Pass, built of iron in 1832: it shows a fixed light.

The acquisition of Louisiana and Florida by the United States having included within their boundary the whole river from its source to the Gulf of Mexico, and the stipulation in the treaty of 1783, securing to British subjects a right to participate in its navigation, not having been renewed by the Treaty of Ghent, in 1814 the right of navigating the Mississippi is now vested exclusively in the United States.—WHEATON'S *International Law*, p. 258.

"The right of the United States to participate with Spain in the navigation of the River Mississippi, was rested by the American government on the sentiment written in deep characters on the heart of man, that the ocean is free to all men, and its rivers to all their inhabitants. This natural right was found to be universally acknowledged and protected in all tracts of country, united under the same political society, by laying the navigable rivers open to all their inhabitants. When these rivers enter the limits of another society, if the right of the upper inhabitants to descend the stream was in any case obstructed, it was an act of force by a stronger society against a weaker, condemned by the judgment of mankind. The then recent case of the attempt of the Emperor Joseph II., to open the navigation of the Scheldt from Antwerp to the sea, was considered as a striking proof of the general union of societies on this point, as it was believed that Amsterdam had scarcely an advocate out of Holland, and even there her pretensions were advocated on the ground of treaties, and not of natural right. This sentiment of right in favor of the upper inhabitants must become stronger in the proportion which their extent of country bears to the lower. The United States held 600,000 square miles of inhabitable territory on the Mississippi and its branches, and this river with its branches afforded many thousands of miles of navigable waters penetrating this territory in all its parts. The inhabitable territory of Spain below their boundary, and bordering on the river, which alone could pretend any fear of being incommoded by their use of the river, was not the thousandth part of that extent. This vast portion of the territory of the United States had no other outlet for its productions, and these productions were of the bulkiest kind. And, in truth, their passage down the

river might not only be innocent, as to the Spanish subjects on the river, but would not fail to enrich them far beyond their actual condition. The real interests, then, of the inhabitants, upper and lower, concurred in fact, with their respective rights."—WHEATON'S *International Law*, pp. 258, 259.

Missouri, one of the western United States, is situated between 36° and 40° 30' N. lat., and between 89° and 95° 30' W. long. It is 287 miles long, and 290 broad, containing 65,087 square miles. Population in 1810 was 10,839; in 1820, 60,589; in 1830, 140,074; in 1840, 383,702; and in 1850, 682,043.

Physical Features, etc.—This State presents a great variety of surface and soil. Alluvial or bottom land is found on the margin of the rivers; receding from them the land rises in some places gently, and in others very abruptly, into elevated barrens or rocky ridges. In the interior, bottoms and barrens, naked hills and prairies, heavy forests and streams of water, may often be seen at one view, presenting a diversified and beautiful landscape. The south-east part of the State has a very extensive tract of low, marshy country, abounding in lakes, and liable to inundations. Back of this a hilly country extends as far as the Osage River. This section is rich in minerals. The lead region covers an area of more than 3,000 square miles. In St. Francis county is the celebrated "Iron Mountain," elevated 300 feet above the surrounding plain, and ½ miles across its summit, and 80 per cent. of its mass pure iron. Five miles distant is the Pilot Knob, 300 feet high, and with a base a mile and a half in circumference of the same species of rich ore. Between the Osage and Missouri Rivers is a tract of country very fertile, and agreeably diversified with woodland and prairie, and abounding with coal, salt, etc. The country north of the Missouri is emphatically "the garden of the West." There is no part of the world where a greater extent of country can be traversed more easily when in its natural state. The surface is for the most part delightfully undulating and variegated, sometimes rising into picturesque hills, then stretching away into a sea of prairies, occasionally interspersed with shady groves and shining streams.

There were in this State in 1850, 2,938,425 acres of land improved, and 6,794,245 of unimproved land in farms; cash value of farms, \$63,225,548, and the value of implements and machinery, \$3,981,525. *Live Stock*.—Horses, 225,319; asses and mules, 11,667; milch cows, 230,169; working oxen, 112,168; other cattle, 449,173; sheep, 762,511; swine, 1,702,625; value of live stock, \$19,887,590.

Agricultural Products, etc.—Wheat, 2,581,652; rye, 44,268; Indian corn, 36,214,537; oats, 5,278,079; barley, 9,631; buckwheat, 23,611; peas and beans, 46,017; potatoes, 993,006; sweet potatoes, 335,505; rice, 700 pounds; value of the product of the orchard, \$514,711; produce of market gardens, \$99,454; pounds of butter made, 7,834,359; of cheese, 203,572; maple sugar, 178,910; molasses, 5,636 gallons; beeswax and honey, 1,328,972 pounds; wool, 1,627,164 pounds produced; flax, 527,160; silk cocoons, 186; hops, 4,130; tobacco, 17,113,784; hay, 116,925 tons; hemp, 16,628 tons; clover seeds, 619 bushels; other grass seeds, 4,346; flax seed, 13,696; and were made 10,563 gallons of wine. Value of home-made manufactures, \$1,674,705; of slaughtered animals, \$3,367,196. The Mississippi winds along the entire eastern boundary of the State for a distance of 100 miles, and receives in its course the waters of the Great Missouri, which indeed deserves to be regarded as the main stream. Through the central and richest part of the State the Missouri rolls its immense volume of water, being navigable for six months in the year for steamboats 1,800 miles from its entrance into the Mississippi. The La Mine, Osage, and Gasconade on the south, and the Grand and Chariton on the north side, are navigable

tributaries of the Missouri. Maramec River runs through the mineral district, is a navigable stream, and enters the Mississippi 18 miles below St. Louis. Salt River, which is also navigable, enters the Mississippi 85 miles above the Missouri. The White and St. Francis drain the south-east, and the tributaries of Neosho the south-west part of the State.

Manufactures, etc.—There were in the State in 1850, 2 cotton factories, with a capital invested of \$102,000, employing 75 males and 80 females, producing articles valued at \$142,900; 1 woolen factory, with a capital of \$20,000, employing 15 males and 10 females, manufacturing 12,000 yards of cloth, and 6,000 pairs blankets, valued at \$56,000; 5 establishments making pig iron, with a capital of \$619,000, employing 331 persons, and producing 19,250 tons of pig iron, etc., valued at \$314,600; 6 establishments, with a capital of \$187,000, employing 237 persons, and making 5,200 tons of castings, etc., valued at \$336,435; 2 establishments, with a capital of \$42,100, employing 101 persons, manufacturing 963 tons of wrought iron, valued at \$68,700; 75 flouring and grist mills, 338 saw mills, 210 tanneries; 56 printing offices, 5 daily, 4 tri and semi-weekly, 45 weekly, and 7 monthly publications. Capital invested in manufactures, \$9,194,999; value of manufactured articles, \$24,250,578.

The principal places in this State are St. Louis, Jefferson City, the capital, St. Charles, Palmyra, Columbia, Liberty and Lexington. There were in January, 1854, 1 bank with 5 branches, with a cash capital of \$1,215,405. There were 3 railroads in the State; 50 miles of road completed, and 963 in the course of construction. Tonnage, 1853, 45,441 tons.

DIRECT FOREIGN COMMERCE OF THE STATE OF MISSOURI.

From October 1st, 1852, to October 1st, 1840	Import—
" " " " " " " " " " " "	1840, to July 1st, 1850,
" " " " " " " " " " " "	July 1st, 1850, to July 1st, 1855,
	2,398,150

District tonnage enrolled and licensed, 34,065 tons. The returns of the foreign commerce are very incomplete, and only include the direct exports.

The following statement exhibits a rapid increase in the population of Missouri for the years mentioned:

POPULATION.	
1850	682,007
1852	722,371
1856	900,000

The statement below shows a most gratifying advancement in the number, quantity, and value of the chief objects of taxation in the State. The years mentioned are selected merely for the reason that the aggregates for those years are the most accessible, without making laborious additions. Any other periods would exhibit the same flattering results:

Years.	Polls.	Land.		Personal property.
		Acres.	Value.	
1840	83,798	8,808,608	\$31,512,000	\$7,730,000

1853	97,470	11,296,855	51,740,000	19,021,000
1854	102,853	12,901,237	67,734,000	22,974,000
1855	106,150	15,890,334	79,010,000	24,342,000
1856	121,438	18,658,129	89,702,000	30,846,000

For mineral resources, etc., of Missouri, see *North Amer. Rev.*, xlviii., 514 (W. G. ELIOT); *HUNT'S Mag.*, viii., 535 (C. C. WHITTLESEY), xlii., 222, xv., 28, xvi., 177.

Missouri, a large river in the United States, rises in the Rocky Mountains, and takes its name after the union of three branches, denominated Jefferson, Galatin, and Madison, in 45° 10' N. lat., and 110° W. long. The spring sources of Missouri, and those of the Columbia, which flows west to the Pacific, are not more than a mile apart. At the distance of 411 miles from the extreme point of navigation of its head branches, the Missouri passes through the Rocky Mountains by what is denominated the Gates. For a distance of six miles the rocks rise perpendicularly from the water's edge to the height of nearly 1200

feet, and the river is only 160 yards wide. 110 miles below this and 521 miles from its source, are the Great Falls, 2,575 miles above its entrance into the Mississippi. The river descends 357 feet in 18 miles, by a succession of falls. The Yellowstone River, 800 yards wide at its mouth, enters the Missouri from south-west 1211 miles from its source and 1,880 from its mouth. The Missouri enters the Mississippi 3,090 miles from its source, which, added to 1395 miles, the distance to the Gulf of Mexico, makes the whole length 4,491 miles. Through this whole length there is no serious impediment to navigation except the Great Falls. The principal tributaries are navigable from 100 to 500 miles. See **MISSISSIPPI RIVER**. The Missouri through the greater part of its course is rapid and turbid, and about a mile in width. The flat or valley of its banks is exceedingly fertile and from 5 to 25 miles wide on each side.

Mobile, city, port of entry, and capital of Mobile county, Alabama, 200 miles south-west of Montgomery, 217 miles south by west of Tuscaloosa, 170 miles east north-east of New Orleans, 55 miles west by north of Pensacola. Mobile is situated on the west side of a river of the same name, at its entrance into Mobile Bay, 30 miles north Mobile Point, at the mouth of the bay, and at the commencement of the Mobile and Ohio railroad. Lat. 30° 41' 26'' N., long. 88° 1' 29'' W. from Greenwich, England. Population, 1836, 3,194; 1840, 12,672; 1850, 20,515; 1854, 25,000. Mobile is situated on a beautiful and extended plain, elevated 15 feet above the highest tides, open to refreshing breezes from the bay, and commanding a beautiful prospect. It is lighted with gas, and supplied with pure water brought from "the spring" near Spring Hill, a distance of 8 miles, and distributed throughout the city in iron pipes. The entrance to Mobile Bay is between Mobile Point on the east, and Dauphin Island on the west, about 3½ miles apart; the deepest channel having 15 feet water at low ebb; but vessels drawing more than 8 or 9 feet water can not, owing to a shoal in the bay, reach the town except at high water. A light-house erected on the point, lat. 30° 16' N., long. 88° 32' W., exhibits a fixed light elevated 55 feet above the level of the sea. Vessels drawing more than 8 feet water pass up Spanish River, 6 miles, around a marshy island into Mobile River, and then drop down to the city. It is, next to New Orleans, the greatest cotton mart of the South. 681,000 bales were exported in the year 1855. The exports amount to from \$12,000,000 to \$16,000,000 annually. Tonnage of the port 1853, 176,949. It is defended by Fort Morgan, formerly Fort Lowyer, situated on a long, low, sandy point at the mouth of the bay, 30 miles below the city. Near Dauphin Island is the anchorage for large class vessels, where may be seen at times a fleet of 50 or 60 sail. It was surrendered to the Americans by Spain in 1813, chartered as a town in 1814, incorporated as a city in 1819. It has suffered severely by fire: 170 buildings were burned in 1827, and 600 in 1839. But it has been rebuilt, with additional beauty and convenience.

STATEMENT OF THE VALUE OF IMPORTS AND DUTIES AT THE PORT OF MOBILE FOR THE YEAR 1856, AND FOR THE FIRST AND SECOND QUARTERS OF 1857.

Tariff of Charges on Cotton at Mobile.—The proprietors of the several presses and warehouses at Mobile, have adopted the following uniform tariff of charges on cotton: Factor's storage on cotton for the season, 20 cents per bale; compressing cotton, 50 cents per bale; extra ropes on compressed cotton, each 6½ cents per bale; labor on ship marked cotton, 5 cents per bale; drayage, compressed cotton, 5 cents per bale; wharfage, compressed cotton, 5 cents per bale; storage on cotton going coastwise, per week, 5 cents per bale; turning out and re-storing cotton, 5 cents per bale; arranging, 8 cents per bale.

Alabama Finances.—The Comptroller and Treasurer of this State have published the biennial reports for the fiscal year ending September 30, 1856, which show a total of receipts into the treasury, from all sources,

of \$798,008 46; of which sum \$616,863 15 was on the assessment of taxes for the year 1855; the balance, \$61,145 81, making up the first sum, was derived from taxes of 1844, 1847, 1851, 1853, 1854, from State Bank branches, bonus from Stock Banks, Marietta and Ohio Railroad, 16th section fund, and 2 and 8 per cent. funds, etc. The above sum of receipts, \$798,008 46, with the balance in the treasury, September 30, 1855, of \$1,192,652 96, makes \$1,990,656 42. The disbursements for the year ending 30th September last, amount to \$486,807 52, of which \$158,552 21 were paid for educational purposes, \$100,000 to Bank Commissioner, \$61,745 50 to pay members of the Legislature, etc., \$26,350 87 to insane hospital, and the balance to the judiciary, university fund, etc., etc. There was in the treasury on September 30, 1846, \$1,503,788 90.

Mobile Bay, Alabama.—The bay sets up from the Gulf of Mexico, and is 30 miles long, and on an average 12 miles broad. It communicates with the gulf by two straits, one on each side of Dauphin Island. The strait on the west side will not admit of vessels drawing more than 5 feet water; that on the east side, between the island and Mobile Point, has 22 feet water, and the channel passes within a few yards of the point. There is a bar across the bay, near its upper end, which has only 11 feet water. The Mobile Point light-house is on the east side of the entrance into Mobile Bay. Lat. 30° 13' 48" north, long. 88° 00' 30" west. Shows a revolving light, elevated 57 feet above the level of the sea, and visible for a distance of 12 nautical miles. Three miles south-west of Mobile Point, is Sand Island light, lat. 30° 11' 18" north, long. 88° 02' west. Shows a fixed light, elevated 54 feet above the sea, and is visible for a distance of 12 nautical miles. Within the bay, a little south of the city of Mobile, is the Choctaw Point light-house; it shows a fixed light, elevated 54 feet above the surface of the bay, and is visible for a distance of 11 nautical miles.

Mocha, the principal port in the Red Sea frequented by Europeans, in that part of Arabia called Yemen, about 40 miles to the north of the Strait of Bab-el-mandeb, lat. 13° 19' 30" north, long. 43° 20' east. Population variously estimated; but may, perhaps, amount to from 5000 to 7000. It is encircled with walls, and indifferently fortified. Its appearance from the sea is imposing. Mocha is situated on the margin of a dry sandy plain. It is built close to the shore, between two points of land which project and form a bay. Vessels drawing from 10 to 12 feet water may anchor within this bay at about a mile from the town; but large ships anchor without the bay in the roads, in 5 or 7 fathoms water—the grand mosque bearing east south-east, and the fort to the south of the town south by east, distant about two miles from the shore. The great article of export from Mocha is coffee, which is universally admitted to be of the finest quality. It is not possible to form any very accurate estimate of the quantity exported; but we believe it may be taken at 10,000 tons, or perhaps more. The greater portion is sent to Djidda and Suez; but there

Is a pretty large export to Bombay, and other parts of India, whence some is sent to Europe; occasionally, however, the exports from Mocha and Modela, direct from Europe, are very considerable. Besides coffee, the principal articles of export are, dates, ajoué, or paste made of dates, myrrh, gum Arabic, oilibanum, senna (*cassia senna*), sharks' fins, tragacanth, horns and hides of the rhinoceros, balm of Gilead, ivory, gold dust, civet, aloes, saganapum, etc. The principal articles of import are, rice, piece goods, iron, and hardware, etc. The ivory, gold dust, and civet, met with at Mocha, are brought from the opposite coast of Abyssinia, whence are also brought slaves, ghee, etc. The greater part of the foreign trade of Mocha is transacted by the Itanians; and it is much safer to deal with them than with either Turks or Arabs. Europeans pay a duty of 3 per cent. *ad valorem* on all goods imported by them from Europe, India, or China; the duty being levied on the amount of the sales. The buyer pays brokerage, cooile and boat-hire. All kinds of foreign goods are sold on credit, and the payment is made by three instalments, at a certain day, according as may have been agreed on. Coffee is always paid for in ready money. On the sale of other goods, the produce of the country, a credit is given; or if ready money be paid, a discount is allowed at the rate of 9 per cent. When goods are discharging the master must furnish the custom-house officer with a manifest, or account of the marks, numbers, and contents of each package. He then opens two or three bales taken at random; and if they correspond with the account delivered, no further examination is made; but if they do not correspond, the whole bales are opened, and double duty is charged upon the excess. The quantities being thus ascertained, their value is learned from the account of sales rendered by the seller, and the duty charged accordingly. In this respect there is nothing to object to at Mocha; but a good deal of extortion is practiced in the exaction of port charges, presents, etc., which may, however, be defeated by proper firmness. The port charges on ships, or *three-mast* vessels, may amount to about 400 Mocha dollars, and those on brigs to about half as much. Provisions are plentiful and cheap; but water is dear; that in the vicinity being brackish and unwholesome, whatever is used for drinking, by all but the poorest persons, is brought from Mesa, about 20 miles off. Fish are abundant and cheap, but not very good.

Mogadore, a sea-port town on the west coast of Morocco, lat. 31° 50' north, long. 9° 20' west. Population about 10,000. It is indifferently fortified; the country in the immediate vicinity is low, flat, sandy, and unproductive. Water is scarce and rather dear; being either rain-water collected and preserved in cisterns, or brought from a river about 1½ miles distant. The port is formed by a small island lying to the southward of the town; but as there is not more than 10 or 12 feet water in it at ebb tide, large ships anchor without, the long battery bearing east, distant 1½ miles. The principal imports are English woollen and cotton stuffs and hardware, German linens, tin, copper, earthenware, mirrors, glass, sugar, pepper, paper, and a variety of other articles. The exports principally consist of sweet and bitter almonds, gum Arabic, and other gums, beeswax, cow and calf skins, ivory, ostrich feathers, gold dust, olive oil, dates, etc.

"The duties levied on imported articles are not paid in money, but in kind, and on English manufactures, army and navy cloth, brass, copper, tea, and sugar, and in fact, in all cases, with few exceptions, are rated at 20 per cent., or a fifth part of the goods, whatever they may be, that are landed. This primitive mode of business is also accompanied by disadvantages, and assists, in conjunction with the high tariff, to cripple any endeavors attempted to bring the Barbary States in closer mercantile alliance with ourselves." It is to be hoped that the government of Morocco may become

allive to the mischievous consequences of this system. Nothing would do so much to promote industry and civilization in the country, as the effectual reduction, or rather the total repeal, of the existing duties on exports.

Mohair (Ger. *Mohr*; Fr. *Moire*; It. *Moero*; Sp. *Mae*, *Muer*), the hair of a variety of the common goat, famous for being soft and fine as silk, and of a silvery-whiteness. It is not produced anywhere but in the vicinity of Angora, in Asia Minor. The exportation of this valuable and beautiful article, unless in the shape of yarn, was formerly prohibited; but it may now be exported unspun. The production, preparation, and sale of mohair have long engrossed the principal attention of the inhabitants of Angora; and it used to form an important article of Venetian commerce. It is manufactured into camlets and other expensive stuffs. Hitherto but little has been imported into England. See, for further particulars, TOURNEFORT, *Voyage du Levant* and UNQUAHARTON, *Turkey and its Resources*.

Moire Antique. In an ordinary woven goods the threads cross each other at right angles; the long threads forming the warp, and the short threads the weft. According as the fabric is of high quality, so do these threads intersect in a regular and equable quality; but be it as good as it may, there are always some irregularities; they may escape the eye, but they become apparent in a singular way. If good silk be wrapped tightly and carelessly round a roller, it may become moire much against the inclination of the possessor; it will have acquired an irregular kind of glossing in some parts rather than in others; and this irregular glossing, when viewed from a little distance, presents somewhat of the appearance of moire, or watering,—who knows? Perhaps an accident to a piece of rolled silk suggested the first idea of watering as a distinct mode of adornment to silken goods? Such accidents have frequently occurred in the history of manufactures. However, accident or no accident, watered silks have long been in use, both in this country and in France. If a pattern be engraved upon one cylinder in relief, and a similar pattern on another cylinder, in sunken devices; and if one of these be heated from within, and if a piece of silk or velvet be drawn between the cylinders, then will the silk or velvet acquire an embossed pattern, because some parts of the surface are more pressed, and are consequently more glossy than the rest. Numerous varieties of this process are employed in the preparation of fancy goods, but this is not exactly watering. For this process two layers of silk are laid face to face, and are pressed tightly between rollers. What follows? However close the threads may be, there are still interstices between them; they follow each other in ridge and hollow fashion throughout the length and breadth of the piece. Now, if the slightest irregularity exists in the pressure, some of the threads become pressed in particular parts more than others; and the over-pressed portions present a greater gloss, a greater power of reflecting light than the rest. The more capriciously these proportions distribute themselves, the more undulatory and cloudy will be the result. We do not say that the actual process is nothing more than this, but that this is the basis on which the whole is founded. The goods may be sprinkled with water previously or not; the rollers may be both heated or both cold, or one heated and one cold; the rollers may be plain or variously indented; they may move smoothly over each other or may have a slight lateral movement—how these variations of method would produce variations of effect every one will see. The adjective "antique" is most likely given to the silks thus produced from their resemblance to the tabby silk dresses worn in former times. It is chiefly produced in France; but in Spitalfields, England, its weavers and moirers combined, have lately copied the art so cleverly as actually to excel the French. But Spitalfields

guards its secret as sedulously as the magician in a fairy tale guards the optive princess in the castle, and will not let the world have a peep at their doings.

Molasses, or Mellasses (Fr. *Sirap de Sucre, Mellasses*; Ger. *Syrup*; It. *Mielazzo di zucchero*; Sp. *Miel de azucar, Chanaoa*; Port. *Melasso, Assucar liquido*; Rus. *Fatoka sucharnaja*), the uncrystallizable part of the juice of the sugar cane, separated from the sugar during its manufacture. It is of a brown or black color, thick, and viscid; has a peculiar odor, and a sweet empyreumatic taste. About 8 gallons of proof spirit may, it is said, be obtained from a cwt. of molasses, such as has recently been imported; but this depends, of course, wholly on the richness of the molasses. Part of the refuse that remains, after refining muscovado sugar, is a sweet syrup, which, as well as the syrup that remains after boiling molasses to obtain bastards, is called treacle. But the treacle obtained from the former is always preferred to that obtained from the latter, and fetches 50 cents per cwt. more. Molasses is sometimes used in preparing the coarser sort of preserves; and on the European continent it is extensively used in the manufacture of tobacco. The following statistics show the foreign trade of the United States in molasses, and also show the receipts to the foreign and home of this staple. The last table shows the average value of the different kinds of molasses at the port of New York for two years:

Total consumption in 1854. 17,265,985
Decrease in 1855. 11,466,077

It will be seen by the foregoing statistics, that the receipts of foreign molasses in the United States for the year ending December 31, 1856, were 25,035,724 gallons, against total receipts in 1855 of 24,152,446 gallons, and the total consumption of this description in 1856 was 23,014,878 gallons, against a consumption

of foreign in 1855 of 23,533,423 gallons, being a decrease in the consumption of foreign in 1856, as compared with 1855, of 2 per cent., while the total consumption of foreign and domestic in 1856 was 89,608,878 gallons, against a consumption in 1855 of 47,266,085 gallons, being a falling off in 1856 of 7,657,207 gallons, or the large decrease of 16-20 per cent.

The consumption of all kinds in 1856, as shown, was 16-20 per cent. less than that of 1855, while that of 1855 was 16½ per cent. smaller than the consumption of 1854. This continued large decrease is attributable, in a great measure, to the rapid decline in the yield of Louisiana cane. The following table shows the average value of molasses in New York for two years.

See SUGAR.

Mole, in architecture, a massive work formed of large stones laid in the sea by means of coffer dams, extended either in a right line or an arc of a circle, before a port, which it serves to close; to defend the vessels in port from the impetuosity of the waves, and

to prevent the passage of ships without leave. It is frequently fortified. *Mole* is sometimes used to signify the harbor itself, which it serves to form or defend.

Money. When the division of labor was first introduced, commodities were directly bartered for each other. Those, for example, who had a surplus of corn, and were in want of wine, endeavored to find out those who were in the opposite circumstances, or who had a surplus of wine and wanted corn, and then exchanged the one for the other. It is obvious, however, that the power of changing, and, consequently, of dividing employments, must have been subjected to perpetual interruptions, so long as it was restricted to mere barter. A carries produce to market, and B is desirous to purchase it; but the produce belonging to B is not suitable for A; C, again, would like to buy B's produce, but B is already fully supplied with the equivalent C has to offer. In such cases—and they must be of a constant occurrence wherever money is not introduced—no direct exchange could take place between the parties; and it might be very difficult to bring it about indirectly. The difficulties that would arise on such occasions, and the devices that would be adopted to overcome them, have been very well illustrated by Colopel Torrens, in his work on the *Production of Wealth*, p. 291. The extreme inconvenience attending such situations must early have forced themselves on the attention of every one. Efforts would, in consequence, be made to avoid them; and it would speedily appear that the best or rather the only way in which this could be effected, was to exchange either the whole or a part of one's surplus produce for some commodity of known value, and in general demand; and which, consequently, few persons would be inclined to refuse to accept as an equivalent for whatever they had to dispose of. After this commodity had begun to be employed as a means of exchanging other commodities, individuals would become willing to purchase a greater quantity of it than might be required to pay for the products they were desirous of immediately obtaining; knowing that should they, at any future period, want a further supply either of these or other articles, they would be able readily to procure them in exchange for this universally desired commodity. Though at first circulating slowly and with difficulty, it would, as the advantages arising from its use were better appreciated, begin to pass freely from hand to hand. Its value, as compared with other things, would thus come to be universally known, and it would at last be used, not only as the common medium of exchange, but as a standard by which to measure the value of other things. Now this commodity, whatever it may be, is money.

An infinite variety of commodities have been used as money in different countries and periods. But none can be advantageously used as such, unless it possess several very peculiar qualities. The slightest reflection on the purposes to which it is applied, must, indeed, be sufficient to convince every one that it is indispensable, or, at least, exceedingly desirable, that the commodity selected to serve as money should (1) be divisible into the smallest portions; (2) that it should admit of being kept for an indefinite period without deteriorating; (3) that it should, by possessing great value in small bulk, be capable of being easily transported from place to place; (4) that one piece of money, of a certain denomination, should always be equal, in magnitude and quality, to every other piece of money of the same denomination; and (5) that its value should be comparatively steady, or as little subject to variation as possible. Without the first of these qualities, or the capacity of being divided into portions of every different magnitude and value, money, it is evident, would be of almost no use, and could only be exchanged for the few commodities that might happen to be of the same value as its indivisible portions, or as whole multiples of them; without the second, or the capacity of being kept or hoarded without deteriorating, no one would choose to exchange commodities for money, except only when he expected to be able speedily to re-exchange that money for something else; without the third, or facility of transportation, money could not be conveniently used in transactions between places at any considerable distance; without the fourth, or perfect sameness, it would be extremely difficult to appreciate the value of different pieces of money; and without the fifth quality, or comparative steadiness of value, money could not serve as a standard by which to measure the value of other commodities; and no one would be disposed to exchange the produce of his industry for an article that might shortly decline considerably in its power of purchasing.

The union of the different qualities of comparative steadiness of value, divisibility, durability, facility of transportation, and perfect sameness, in the precious metals, doubtless formed the irresistible reason that has induced every civilized community to employ them as money. The value of gold and silver is certainly not invariable, but generally speaking it changes only by slow degrees: they are divisible into any number of parts, and have the singular property of being easily reunited, by means of fusion, without loss; they do not deteriorate by being kept; and from their firm and compact texture, they are very difficult to wear. Their cost of production, especially that of gold, is so considerable, that they possess great value in small bulk, and can, of course, be transported with comparative facility; and an ounce of pure gold or silver taken from the mines in any quarter of the world, is precisely equal, in point of quality, to an ounce of pure gold or silver dug from the mines in any other quarter. No wonder, therefore, when all the qualities necessary to constitute money are possessed in so eminent a degree by the precious metals, that they have been used as such, in civilized societies, from a very remote era. "They became universal money," as Turgot has observed, "not in consequence of any arbitrary agreement among men, or of the intervention of any law, but by the nature and force of things." When first used as money, the precious metals were in an unfashioned state, in bars or ingots. The parties having agreed about the quantity of metal to be given for a commodity, that quantity was then weighed off. But this, it is plain, must have been a tedious and troublesome process. Undoubtedly, however, the greatest obstacle that would be experienced in early ages to the use of gold and silver as money, would be found to consist in the difficulty of determining the degree of their purity with sufficient precision; and the discovery of some means by which their weight and fineness might be readily and cor-

rectly ascertained, would be felt to be indispensable to their extensive use as money. Fortunately these means were not long in being discovered. The fabrication of coins, or the practice of impressing pieces of the precious metals with a stamp indicating their weight and purity, belongs to the remotest antiquity. Goussier, *De l'Origine des Loix*, etc., tome I., p. 269. And it may safely be affirmed, that there have been very few inventions of greater utility, or that have done more to accelerate the progress of improvement.

It is material, however, to observe, that the introduction and use of coined money make no change whatever in the principles on which exchanges were previously conducted. The coinage saves the trouble of weighing and assaying gold and silver, but it does nothing more. It declares the weight and purity of the metal in a coin; but the value of that metal or coin is in all cases determined by precisely the same principles which determine the value of other commodities, and would be as little affected by being re-coined with a new denomination, as the burden of a ship by a change of her name. Inaccurate notions with respect to the influence of coinage seem to have given rise to the opinion so long entertained, that coins were merely the signs of values! But it is clear they have no more claim to this designation than bars of iron or copper, sacks of wheat, or any other commodity. They change for other things, because they are desirable articles, and are possessed of real intrinsic value. A draft, check, or bill may not improperly, perhaps, be regarded as the sign of the money to be given for it. But that money is nothing but a commodity; it is not a sign—it is a thing signified.

Money, however, is not merely the universal equivalent, or *merchandise banale*, used by society: it is also the standard used to compare the values of all sorts of products; and the stipulations in the great bulk of contracts and deeds, as to the delivery and disposal of property, have all reference to, and are commonly expressed in, quantities of money. It is plainly, therefore, of the utmost importance that its value should be preserved as invariable as possible. Owing, however, to improvements in the arts, the exhaustion of old mines, and the discovery of new ones, the value of the precious metals is necessarily inconstant; though, if we except the effects produced in the 16th century by the discovery of the American mines, it does not appear to have varied so much at other times as might have been anticipated. Great mischief has, however, been repeatedly occasioned by the changes that have been made in most countries in the weight, and sometimes also in the purity, of coins; and since the impolicy of these changes has been recognized, similar, and perhaps still more extensive, disorders have sprung from the improper use of substitutes for coins. It is, indeed, quite obvious, that no change can take place in the value of money without proportionally affecting the pecuniary conditions in all contracts and agreements. Much, however, of the influence of a change depends on its direction. An increase in the value of money is uniformly more prejudicial, in a public point of view, than its diminution; the latter, though injurious to individuals, may sometimes be productive of national advantage; but such can never be the case with the former. See *Principles of Political Economy*, by McCULLOCH, 3d ed., pp. 510-515.

No certain estimate can ever be formed of the quantity of money required to conduct the business of any country; this quantity being, in all cases, determined by the value of money itself, the services it has to perform, and the devices used for economizing its employment. Generally, however, it is very considerable; and when it consists wholly of gold and silver, it occasions a very heavy expense. There can, indeed, be no doubt that the wish to lessen this expense has been one of the chief causes that have led civilized and commercial nations to fabricate a portion of their

money of some less valuable material. Of the various substitutes resorted to for this purpose, paper is, in all respects, the most eligible. Its employment seems to have grown naturally out of the circumstances incident to an advancing society. When government becomes sufficiently powerful and intelligent to enforce the observance of contracts, individuals possessed of written promises from others that they will pay certain sums at certain specified periods, begin to assign them to those to whom they are indebted; and when the subscribers are persons of fortune, and of whose solvency no doubt can be entertained, their obligations are readily accepted in payment of debts. But when the circulation of promises or bills in this way has continued for a while, individuals begin to perceive that they may derive a profit by issuing them in such a form as to fit them for being readily used as a substitute for money in the ordinary transactions of life. Hence the origin of bank notes. An individual in whose wealth and discretion the public have confidence, being applied to for a loan, say \$5000, grants the applicant his bill or note, payable on demand, for that sum. Now, as this note passes, in consequence of the confidence placed in the issuer, currently from hand to hand as cash, it is quite as useful to the borrower as if it had been gold; and supposing that the rate of interest is 5 per cent., it will yield, so long as it continues to circulate, a revenue of \$250 dollars a year to the issuer. A banker who issues notes, coins, as it were, his credit. He derives the same revenue from the loan of his written promise to pay a certain sum, that he could derive from the loan of the sum itself, or of an equivalent amount of produce. And while he thus increases his own income, he, at the same time, contributes to increase the wealth of the public. The cheapest species of currency being substituted in the place of that which is most expensive, the superfluous coins are either used in the arts or are exported in exchange for raw materials or manufactured goods, by the use of which both wealth and enjoyments are increased. Ever since the introduction of bills, almost all great commercial transactions have been carried on by means of paper only. Notes are also used to a very great extent in the ordinary business of society; and while they are readily exchangeable, at the pleasure of the holder, for coins, or for the precise quantities of gold or silver they profess to represent, their value is maintained on a par with the value of these metals; and all injurious fluctuations in the value of money are as effectually avoided as if it consisted wholly of the precious metals.

In common mercantile language, the party who exchanges money for a commodity is said to buy; the party who exchanges a commodity for money being said to sell. Price, unless where the contrary is distinctly mentioned, always means the value of a commodity estimated or rated in money. For a further account of metallic money, see the article COIN.

See *Bankers' Mag.*, v., 309, 384, ii., 1, 611; *HUNT'S Mag.*, i., 50 (C. F. ADAMS); *Ed. Rev.*, x., 284, xiii., 35, xxxiii., 568; *West. Rev.*, ix., 99; *DE BOW'S Rev.*, vi., 243, vii., 501.

Monopoly. By this term is usually meant a grant by competent authority, conveying to some one individual, or number of individuals, the sole right of buying, selling, making, importing, exporting, etc., some one commodity, or set of commodities. Such grants were very common previously to the accession of the house of Stuart, and were carried to a very oppressive and injurious extent during the reign of Queen Elizabeth. Commercial monopolies reached to such a height in England, that Parliament petitioned against them, and they were in consequence mostly abolished about the close of Elizabeth's reign, 1602. They were further suppressed, as being contrary to law, 19 James I., 1622; and were totally abolished, and it was decreed that none should be in future cre-

ated, as was previously the custom, by royal patent, 16 Charles I., 1640.—ANDERSON'S *History of Commerce.* The grievance became at length so insupportable, that, notwithstanding the opposition of government, which looked upon the power of granting monopolies as a very valuable part of the prerogative, they were abolished by the famous act of 1624. The act of James I. declared that all monopolies, grants, letters patent for the sole buying, selling, and making of goods and manufactures, shall be null and void. It excepts patents for 14 years for the sole working or making of any new manufactures within the realm, to the true and first inventors of such manufactures, provided they be not contrary to law, nor mischievous to the State. It also excepts grants by act of Parliament to any corporation, company, or society, for the enlargement of trade, and letters patent concerning the making of gunpowder, etc. This act effectually secured the freedom of industry in Great Britain; and has done more, perhaps, to excite the spirit of invention and industry, and to accelerate the progress of wealth, than any other in the statute book.

Monsoons (from the Malay *musim*, season), periodical trade winds, which blow six months in one direction, and the rest of the year in an opposite one. They prevail in the Indian Ocean north of the 10th degree of south latitude. From April to October a violent south-west wind blows, accompanied with rain, and from October to April, a gentle dry north-east breeze prevails. The change of the winds or the *breaking up* of the monsoons, as it is called, is accompanied by storms and hurricanes. These periodical currents of winds do not reach very high, as their progress is arrested by mountains of a moderate height.

Monsoons are, for the most part, formed of trade-winds. When at stated seasons of the year a trade-wind is deflected in its regular course from one quadrant to another, or drawn in by overheated districts, it is regarded as a monsoon. Thus the African monsoons of the Atlantic, the monsoons of the Gulf of Mexico, and the Central American monsoons of the Pacific, are, for the most part, formed of the trade-winds, which are turned back or deflected to restore the equilibrium which the over-heated plains of Africa, Utah, Texas, and New Mexico have disturbed. When the monsoons prevail for five months at a time, for it takes about a month for them to change and become settled, then both they and the trade-winds, which they replace, are called monsoons. The north-east and the south-west monsoons of the Indian Ocean afford an example of this kind. A force is exerted upon the north-east trade-winds of that sea by the disturbance which the heat of summer creates in the atmosphere over the interior plains of Asia, which is more than sufficient to neutralize the forces which cause those winds to blow as trade-winds; it arrests them; and were it not for the peculiar conditions of the land about that ocean, what are now called the north-east monsoons would blow the year round; there would be no south-west monsoons there; and the north-east winds, being perpetual, would become, all the year, what in reality for several months they are, viz., north-east trade-winds.

As long ago as 1831, Dove maintained that the south-west monsoon was the south-east trade-wind rushing forward to fill the vacant places over the northern deserts. Dove admits the proofs of this to be indirect, and acknowledges the difficulty of finding out and demonstrating the problem.—*Annalen der Physik*, No. 94. Translated by Dr. Rosengarten for the *American Journal of Science*, vol. xx., 60.

The north-east and south-east trade-winds meet, we know, near the equator, where they produce the belt of equatorial calms. All vessels that pass from one system of trade-winds to the other have to cross this calm belt. Sometimes they clear it in a few hours. Sometimes they are delayed in it for weeks; and the

calm is so still and the rain so copious that the fresh water is sometimes found standing in pools on the sea. If it be true, as Dove maintains, that the south-west monsoons of the Indian Ocean are the south-east trade-winds of that sea pressing up toward the desert regions of Asia, then a vessel bound hence to Calcutta, for instance, and entering the Indian Ocean at the time of the south-west monsoon, should find no belt of equatorial calms there at all, but, on the contrary, she should find the south-east trade-wind to haul more and more to the south, until finally, without having crossed any belt of equatorial calms, she would find her sails trimmed to the south-west monsoon. In like manner, Jansen maintains that the north-west monsoon is a similar deflection of the north-east trade-wind.

The Desert of Gobi and the arid wastes of Asia are the cause of the monsoons of the Indian Ocean. When the sun is north of the equator, the force of his rays, beating down upon these wide and thirsty plains, is such as to cause the vast superincumbent body of air to expand and ascend. Consequently, there is an indraught of air from the surrounding regions to supply the ascending column. The air that is going to feed the north-east trades is thus arrested, drawn in, heated, and caused to ascend; and so, the north-east trade-winds are first weakened, then "killed," and afterward drawn into the vortex of ascending air over the burning sands of the deserts; on the other hand, the south-east trade-wind, failing, when it arrives at the place where the equatorial Doldrums were wont to be, to meet with them or any opposing force from the north-east trades, are drawn over into the northern hemisphere. Going now from the equator toward the poles, their tendency is to obey the forces of diurnal rotation, as well as those of the indraught for the heated plains, and thus the south-east trades become south-west monsoons. In this view, the "equatorial Doldrums" of the Indian Ocean are transferred, as it were, during the south-west monsoons, to the deserts of central Asia. It may be asked by some, saying, Since we can not always tally the air, how do we know that these south-west monsoons are the south-east trades of the Indian Ocean? The reply is, We infer that they are, because in co-ordinating for the Pilot Chart of that sea we have found no belt of calms between the south-east trades and the south-west monsoons, but a gradual change, so to speak, of the one wind into the other. Thus, confining ourselves to August—one of the south-west-monsoon months—and to the strip of ocean between 85° and 90° east, the investigation gives as follows for calms and winds in the field between: 10° S. and 5° S. 131 observations, wind south-east. 5° S. and 102 observations, 3 calms, wind south. 5° N. 99 observations, 3 calms, wind south-west. 5° N. and 10° N. 77 observations, wind south-west. These monsoons do not, as we are generally taught to suppose, commence or end at the same time all over the Indian Ocean. In the first field below Calcutta, *i. e.*, between the land and 20° N., the north-east trade-winds, toward the latter part of January, begin their conflict with the south-west monsoons. The conflict rages in February, and by March the south-west monsoons in that "field" are considered to have regularly set in. They now remain the dominant wind for upward of six months, and until some time in the early part of September. The north-east monsoons or trades now renew the conflict, which is carried on with more and more vigor until the latter part of November, when they obtain the ascendancy, and prevail until the latter part of January, when, as before stated, the south-west monsoons commence their annual struggle for the mastery. In the next field below, *i. e.*, between 15° and 20° N. lat., the north-east monsoons begin to grow light and variable, and to have conflicts with the south-west in February. The period of this conflict, or change, as it is called, frequently lasts until some time in March,

when the force that is calling in and driving the monsoons from the south-west finally gains the ascendancy. They then blow steadily until late in September, when the north-east trade-wind forces begin again to assert their ascendancy and to renew the conflict on this side through October, by which time the north-east trades or monsoons become the prevailing winds. Thus, by going 200 or 300 miles further from the supposed place of heat and rarefaction that give rise to this system of winds, the duration of the north-east monsoons is prolonged nearly a month; for in this "field" they prevail from November to January inclusive, three months, while the south-west last from about the middle of March to the middle of September, say six months. In the next field below, *i. e.*, between the parallels of 10° and 15° the south-west monsoons blow about five months, perhaps not quite so long; they do not commence as early, nor blow so late as in the "field" above. They begin the conflict with the north-east trade-wind forces in the latter part of March, and gain the ascendancy in May. They then prevail till October, when the north-east trade-wind forces, escaping from the heated plains of the interior, begin to renew the annual combat which is to get them the victory. They soon achieve it, and maintain the mastery undisturbed till the last of March or first of April.—MAURY, *Phys. Geog. of the Sea.*

Changing of the Monsoons.—Lieutenant Jansen thus describes this phenomenon: "We have seen that the calms which precede the sea-breeze generally continue longer, and are accompanied with an upward motion of the air; that, on the contrary, those which precede the land-breeze are, in the Java Sea, generally of shorter duration, accompanied by a heavy atmosphere, and that there is also an evident difference between the conversion of the land-breeze into the sea-breeze, and of the latter into the former. Even as the calms vary, so there appears to be a marked difference between the changing of the monsoons in the spring and in the autumn in the Java Sea. As soon as the sun has crossed the equator, and its vertical rays begin to play more and more perpendicularly upon the northern hemisphere, the inland plains of Asia, North Africa, and of North America are so heated as to give birth to the south-west monsoons in the China Sea, in the North Indian Ocean, in the North Atlantic, and upon the west coast of Central America; then the north-west monsoon disappears from the East Indian Archipelago, and gives place to the south-east trade-wind, which is known as the east monsoon, just as the north-west wind, which prevails during the southern summer, is called the west monsoon. This is the only monsoon which is found in the southern hemisphere, while in the northern hemisphere the north-east trade-wind blows in the China Sea and in the Indian Ocean; in the East Indian Archipelago the west monsoon prevails; and here, when the south-east trade blows as the east monsoon, we find the south-west monsoon in the adjacent seas of the northern hemisphere. Generally the westerly monsoons blow during the summer months of the hemisphere wherein they are found. As the land-breeze daily destroys in miniature the regular flow of the trade-wind, so does the latter the west monsoon in larger measure, and observations will be able to decide whether monthly disturbances do not also take place. In the Java Sea, during the month of February, the west monsoon blows strong almost continually; in March it blows intermittently, and with hard squalls; but in April the squalls become less frequent and less severe. Now the changing commences; all at once gusts begin to spring up from the east; they are often followed by calms. The clouds which crowd themselves upon the clear sky give warning of the combat in the upper air which the currents there are about to wage with each other."

Montevideo, a sea-port, and the capital of the Republic of Uruguay, on the north bank of the Rio de

la Plata, lat. 34° 54' 11" S., long. 56° 13' 18" W. The population, which is variously estimated, may probably be about 22,000. The town is built in the form of an amphitheatre, on a regular plan, and is well fortified. It has suffered much from the various revolutions to which it has been subject during the last 30 years. Montevideo is situated 2° 3' 33" W. of Cape St. Mary, the northern limit of the embouchure of the La Plata. Vessels from the north bound to Montevideo generally make this cape, entering the river between it and the small island of Lobos, in from 14 to 17 fathoms. The course is thence nearly west to the Isle of Flores, on which is a light-house 112 feet above the level of the sea, with a revolving light. From Flores to Montevideo is 16 miles in a direct line, and the course west by south by compass. A light-house, 475 feet above the level of the sea, has been erected on the summit of the Montevideo, whence the town has its name. The latter is built on a projecting tongue of land, the port being on its south side. This, which is the best on the La Plata, is a large circular

basin, open to the south-west. Generally the water is shallow, not exceeding from 14 to 19 feet; but the bottom being soft mud, vessels are seldom damaged by grounding. It should, however, be observed that the depth of water in the harbor, as well as throughout the whole of the Rio de la Plata, depends very much on the direction and strength of the winds. The south-west wind, called *pampero*, blows right into the bay of Montevideo with much force, not unfrequently causing a rise of a fathom or more in the depth of water! But it rarely occasions much damage to vessels properly moored with anchors to the south-west, south-east, and one to the north. (BLUNT'S *American Pilot*, edit. 1857; *Coulier sur les Phares*, etc.) Montevideo has a considerable commerce. The great articles of export consist of animal products, or of hides, beef, tallow, hair, bones, grease, wool, etc. The imports principally consist of British cottons, woollens, and hardware, flour, wine and spirits, linens, sugar, tobacco, boots and shoes, salt, etc. The following shows the exports from these ports for five years:

ACCOUNT OF SUNDRY EXPORTS FROM BUENOS AYRES AND MONTEVIDEO IN THE FOLLOWING YEARS.

Duties on Imports, in National or Foreign Vessels, at Montevideo.—1. Machinery, agricultural implements, instruments used in the arts and sciences, books, prints, and maps, free. 2. Silk, raw and wrought, laces, blonde, gold and silver embroidery, watches, jewelry, saltpetre, plaster of Paris, coal, timber, cotton fringe, and wooden hoops, 5 per cent. 3. Powder, pitch, tar, rosin, and naval stores, 13 per cent. 4. All raw materials, and manufactured articles, not included in the preceding enumeration, 15 per cent. 5. Sugar, Paraguay and China teas, cocoa, cassia lignea, and cinnamon, spices, drugs, and provisions in general, 20 per cent. 6. Furniture, pictures, looking-glasses, musical instruments, all sorts of carriages, carts, etc., and harness, saddles, horses' furniture (excepting horse cloths of the manufacture of the adjacent provinces, which pay 15 per cent.), ready-made clothes, boots and shoes, liqueurs, brandy, wine, vinegar, ale and porter, cider, tobacco, and soap, 25 per cent. Salt, 2 reals the fanega, say 11d. per 290 pounds. 7. Hides of all classes, hair, horns, tallow, silver and gold, in bullion or coin, free. A small charge is made for warehousing and portage on passing through the custom-house. Goods may be bonded for an indefinite period, during which time they are subject to a moderate warehouse rent. Foreign flour pays as follows: \$8 per barrel, when wheat is worth \$2 to \$3 per fanega, about 23 pounds; \$6 per barrel, when wheat is worth \$3 to \$5; \$4, when wheat is worth \$5 to \$7; \$2, when wheat is worth \$7 to \$9; \$1, when wheat exceeds \$9. Wheat: \$3 per fanega, when wheat is worth \$2 to \$3 per fanega; \$2, when wheat is worth \$3 to \$6; \$1, when wheat is worth \$6 to \$10; nothing, when wheat is worth above \$10 per fanega; goods transhipped, or shipped out of bond, pay 2 per cent. Foreign goods, shipped in vessels of less than 150 tons burden, for ports of the Uruguay and Paraguay, pay only 1 per cent. 8. All goods imported, paying duties, are subject to pay an additional 1 per cent. to the consulado; $\frac{1}{2}$ per cent. to the hospital; and for the extinction of copper money, 1 per cent. additional on all goods that pay 5 per cent. (This has, much to the honor of the authorities and people, been already accomplished; but the duty is maintained for general purposes.) On all goods that pay 13, 15, and 20 per cent., 3 per cent. On all goods that pay 25 per cent., 5 per cent. On flour, 10 per cent. On wheat, 3 per cent.

Duties on Exports, in National or Foreign Vessels.—Ox and cow hides, 2 reals, 25 centesimos, for reconnidor valuations of \$1, and 1 per cent. consulado. Horse hides, 1 real for reconnidor, on valuations of 5 reals for reconnidor each, and 1 per cent. consulado. All other produce of the country pays 4 per cent. on the market value, and 1 per cent. consulado. Jerked and salt beef, pork, etc.; also all foreign goods that have paid the import duty, free. Gold and silver, coined or in bullion, 1 per cent.

Port Charges.—Tonnage from beyond sea, foreign vessels, 3 reals; national vessels, 2 reals. During loading and unloading, both classes pay \$1 per day. Pratique, with pilot, foreign vessels, \$8; national vessels, \$4. Boat, with pilot, foreign vessels, \$2; national vessels, \$2. Without pilot, foreign vessels, \$4; national vessels, \$2. National and foreign vessels that neither discharge nor load cargo, and that do not remain more than six days, pay nothing; those that remain in the harbor more than six days pay one third of the above tonnage dues. National vessels, and vessels belonging to the provinces of Buenos Ayres, employed within the River Platte, called coasting, pay for a license for each voyage, if 3 to 7 tons, 4 reals; 8 to 15 tons, 10 reals, or \$1 02; 16 to 30 tons, 18 reals, or \$2 02; 31 to 45 tons, 26 reals, or \$3 02; 46 to 60 tons, 30 reals, or \$3 06; 61 to 80 tons, 38 reals, or \$4 06; 81 to 100 tons, 46 reals, or \$5 06; 101 and above, 54 reals, or \$6 06.

Hospital Dues.—National and foreign vessels, sailing for a foreign port beyond sea or in the River Platte, pay \$2 for the vessel, 4 reals for the captain, 2 reals for each seaman, \$1 for each passenger.

Phitoge from Montevideo to Buenos Ayres to be paid in Montevideo. If the draught of water do not exceed 9 feet, Burgos measure, \$50; 9 to 10 feet, \$60; 10 to 11 feet, \$70; 11 to 12 feet, \$80; 12 to 13 feet, \$100; 13 to 14 feet, \$120; 14 to 15 feet, \$140; 15 to 16 feet, \$160; 16 to 17 feet, \$190; 17 to 18 feet, \$220.

Moneys, Weights, and Measures.—Paper money there is none. Current money, the Brazilian patacon and Spanish dollar; they pass for 360 centesimos. 100 cents make a real; 800 cents, or 8 reals, make a dollar; 960 cents, or 9 reals 60 cents, make $\frac{1}{2}$ current dollar, or 1 hard dollar or patacon. Weights and measures same as those of Spain; for which, see CAUZIZ.

Montevideo, we find it has much diminished of late years, which may be attributed to the late civil war of nine years' duration. The interior of the country, which formerly abounded in horned cattle, is now without a sufficiency to supply the "Estancias" for breeding those useful animals, millions of them having been destroyed for their hides alone in the course of the war before mentioned, by the troops of Generals Rozas and Oribe; and the consequence is, that little or no produce comes in from the country. Vessels from the United States with their outward cargoes proceed onward to Buenos Ayres, where they find return cargoes, which are easily obtained. Capitalists of late have turned their attention to agriculture, particularly to the cultivation of wheat and Indian corn, which flourish here in a high degree; and in the course of a few years this country will, probably, be enabled to supply Brazil with the article of flour in abundance, in exchange for coffee, sugar, tobacco, etc. articles of vast consumption. There is a fine opening here for a steam mill, for the grinding of wheat and corn, none as yet (September, 1854) having been introduced into this country, and it is worth the attention of some of the enterprising citizens of the United States. Wind, and horse power for mills, are the only means used at present throughout the country; and although its streams of water are innumerable, that power has not been brought into action. The manufactures consist chiefly of soap, tallow candles, chocolate, and leather, the latter of very inferior quality, which may be attributed to the species of bark used in tanning. Steam navigation on the Rio de la Plata, and its tributaries, is gradually increasing. There are two steamers running regularly between this city and Buenos Ayres, and others to the Parana and Uruguay Rivers, carrying freight and passengers; however, it may be considered as yet in its infancy. The very high price of fuel is a serious obstacle to steam navigation in this quarter, as no coal mines are found here, and the coal used comes from England and the United States, at a very dear rate, and, in consequence, the steamers have not realized so profitable a business as was anticipated.

Port Charges on Foreign Vessels at the Rate of 800 Reis to the Montevideo Dollar.—Pilotage inward, \$10; mooring, \$4; tonnage duty, 300 reis per ton (say on 150, if not more), \$43 06; free of entry, if to discharge, \$8; stamps for ditto, \$12; custom-house officer \$1 per day while discharging and loading, say for 30 days, \$30; stamps, in case of loading, and on being dispatched, \$25 04; hospital fees, from \$4 to \$6, according to the number of hands on board the vessel, \$5; pilot to Franquia, \$4; bill of health, \$4 04; escribano's fees, if for balance of cargo, \$8, or if the vessel lade here, \$12. Spanish 127 to 1000 reis, or \$158 06 at 800 reis. Vessels are allowed to lay 12 days from arrival without entering at the custom-house, and may land samples, so as to dispose of a part or the whole of their cargoes.

Montreal, a city and river port of entry, Canada East, and the largest and most populous city and chief seat of commerce of British America. Situated on the left bank of the St. Lawrence, 142 miles in a direct line south-west of Quebec. Lat. 45° 30' north, long. 73° 25' west. Population, 1840, 27,297; in 1852, 57,716; 1854, 65,000. The site is not so commanding as that of Quebec, but it is in every other respect superior to that city. The position of Montreal, at the head of the ship navigation of the St. Lawrence, and near its confluence with the Ottawa, as well as its situation with respect to the city of New York, necessarily makes it one of the greatest emporiums of Canada. The harbor, though not large, is secure, and vessels drawing 15 feet water, may lie close to the shore. Its general depth is from 3 to 4 fathoms. Its chief advantage consists in the rapid St. Mary, about one mile below the city wharves, which vessels often find it difficult to stem, without the aid of steam-tugs. To

obviate the obstructions in the navigation above Montreal, the Lachine Canal, 9 miles long, 20 feet wide, and 5 feet deep, was undertaken in 1821, and completed at an expense of £130,000. The communication with the opposite side of the river is carried on by several steam and other vessels; and during the summer a regular steamboat communication is kept up with Quebec. At this season vast rafts of timber come down and pass the city of Quebec; and scows, batteaux of about six tons, and Durham boats bring to Montreal the produce of Upper Canada. Neither is the trade of Montreal suspended in winter, like that of Quebec. Numerous sledges may be seen coming in from all directions with agricultural produce, frozen carcasses of beef and pork, firewood and other articles. Montreal is the centre of the commerce between Canada and the United States, carried on by Lake Champlain and the Hudson, and not only is it the depot of all the adjacent country, but most of the business done in Quebec is carried on by branches from the Montreal houses. See *Exports of Canada*, p. 853. The imports in 1853, amounted to £3,603,696, and the net amount of duties, £447,089. In the same year, 4885 vessels entered the port, of 491,928 tons burden. The wharves of this city are constructed in a manner unequalled upon this continent; the entire line of which is over two miles in length, and considerable additions (to meet the rapidly increasing trade of the city) will be speedily commenced. The Lachine Canal, with its locks and basins, is another of these public works of which the city may well be proud. The Champlain and St. Lawrence Railroad, commences at Brewsterville, opposite the city and connects with the lines to New York and Boston, at Rouse's Point, a distance of 43 miles. This road is now completed and the cars run daily. The Lachine Railroad connects the city, by a line of road 9 miles in length, with the village of that name. The continuation of this road from Caughnawaga till it connects with the Ogleburg Road at Moers, is now complete, and the whole line is known as the Montreal and New York Railroad. The St. Lawrence and Atlantic Railroad, connecting Montreal with the city of Portland, a distance of 292 miles, is now complete. A line from Quebec to Melbourne, a distance of 100 miles, is also in course of construction, and will be completed in 1851. The Grand Trunk Railroad to connect Montreal with Kingston, Toronto, etc., is now in course of construction. The entire length of the road from Trois Pistoles to Sarnia, will be 1112 miles, and it will probably be completed in 1856. The Montreal and Bytown Railroad will pass through a fine district of country, and is in progress of construction. The length will be about 121 miles, and will be opened in 1856. *The Victoria Bridge.*—This splendid and useful structure is to cross the St. Lawrence from Point St. Charles to the south shore, a total length of 9437 feet, or somewhat over a mile and three quarters. It is to be built on the tubular principle, and will have a track for railroad cars in the centre, while on the outside of the tube there will be a balcony on each side, with a foot path for passengers. The bridge will rest on 21 piers and two abutments of limestone masonry, the centre span being 330 feet long, and 60 feet high from summer water level. The iron used in its construction will be the best boiler plate T iron, and the total cost of the work is to be £1,500,000 sterling, or \$7,500,000. Formerly this city was the head-quarters of the fur-trade, but its interest in it has greatly declined. It has establishments for the manufacture of cotton goods, India rubber, steam engines, railroad cars, axes, etc., cast iron foundries, distilleries, breweries, soap, emille, and tobacco manufactories, several ship-building establishments, etc.; various articles of hardware, lined oil, floor-cloth, etc., are made in the city. The markets are abundantly supplied with beef, fish, poultry, fruit, vegetables, etc. About three fourths of the population are

of French descent, the remainder consisting principally of emigrants from Great Britain.

A letter from the United States Consul at Montreal, dated October 9, 1855, remarks:—"Since my last communication, the only material alteration between the trade of the two countries has been the ratification and adoption of the reciprocity treaty, which has proved, so far, at least, as has come under my observation, highly satisfactory to the provincial government, and to the people of Canada at large; and there is every appearance of its increasing in usefulness, to this country at least. It is, if I may be allowed to use the expression, commercially speaking, tantamount to annexation; while its beneficial effects have shown themselves in the increased value of farms and landed estates on this side of the line, and I am induced to believe, by careful observation, that there has been a corresponding advance on the west side of the

United States, particularly the larger sea-port towns. This treaty has been instrumental in doing much for the advantage of the carrying trade, by conveying the products of this province over the railroads and canals of the Union, thereby placing Canada and the lower provinces, so far as their trade is concerned, in the position of one of the States of the Union. There has been, since my last communication, hitherto alluded to, but one enactment on the part of the Canadian government in relation to the trade between the United States and Canada, which was to the effect that the governor in council had abolished the duty levied upon the original packages, containing products of the United States imported into this province, under the provisions of the reciprocity treaty."

The following figures will show the comparative importance of the trade of the principal cities of Canada:

CITY.	IMPORTS.				EXPORTS.				DUTIES COLLECTED.				
	1853.	1854.	1855.	1856.	1854.	1855.	1853.	1854.	1855.	1856.	1853.	1854.	1855.
Quebec....	£1,141,595	£1,754,320	£1,750,000	£1,594,465	£2,511,767	£1,558,702	£128,454	£179,189	£174,967	£24,907	£114,141	£114,141	£114,141
Montreal....	3,981,540	3,810,099	3,001,000	1,885,000	£722,514	475,650	449,192	478,603	310,219	310,219	310,219	310,219	310,219
Toronto....	1,165,056	1,802,706	1,401,454	221,500	273,040	494,105	156,063	172,573	122,598	122,598	122,598	122,598	122,598

The St. Lawrence, however, with all its acknowledged capacity, is not without its drawbacks. Foremost was the long winter, which sealed its waters during six months of the year; and next may be classed the dangers of a navigation of 700 miles between Belle Isle and Quebec. There were other circumstances which threatened that commercial prosperity which once appeared to be the undoubted appanage of the most convenient port of this large river—using the term "most convenient" in reference to breadstuffs, the chief produce of the West, and to manufactured goods, the chief article in demand by the West. The principal of these was the discovery that the most fertile lands lay beyond the barrier formed by Niagara. Hence, the population which would otherwise, in the natural order, have filled up the nearest land first, was tempted to the shores of Lake Erie and the country lying between that lake and the head waters of the Mississippi. It has been in this region that the great emigrant population has chiefly established itself, leaving the less fruitful shores of the St. Lawrence and Lake Ontario comparatively bare of inhabitants.

Imports to the Port of Montreal.—In 1815, £2,614,911; 1816, £2,303,908; 1855, £3,093,145; 1856, £3,993,000. The export trade generally has received a great impetus during the past year, owing in part, no doubt, to the establishment of the ocean steam line. The exports from Montreal for the first three quarters of the year 1856 were but £339,610; for the year 1856 they have amounted to £716,475, or more than double.

The population of the country is steadily increasing, and it is believed that at no former period was its trade and general business on a more healthy footing. In 1800, the population was 9000; 1816, 14,000; 1825, 22,000; 1831, 27,297; 1851, 57,715; 1856, 75,000, at a very moderate estimate.

Regulations in Force.—Merchandise shall not be laden in Canadian ports except after the entry, at places designated for that purpose, under penalty of forfeiture. Merchandise shall not be imported except into some port at which a custom-house is established, under penalty of forfeiture of vessel and goods, if under the value of £1000; if above that sum, they shall be retained as security for the payment of that amount.

Banks connected with Montreal.—Montreal being a large commercial centre, the banking facilities afforded to the business community are on an extended scale. The banks of Canada have been, on the whole, prudently and judiciously managed, and have proved remunerative to the shareholders, while there has yet been no instance of the stoppage of a Canadian bank. The names and capital of the banks carrying on their business in Montreal are here given, selected from the official statement, with a statement of whether the office be a head office of agency. These banks all, with one exception, transact business under Canadian charters, and their stockholders are liable in double the amount of their shares. The bank of British North America holds a royal charter, the head office being in London, but the principal colonial office is in Montreal.

BANKS ACTING UNDER CHARTER.—1856.

Moore, vessel by that she is both in the weights of These weights apparatus, Morocco in a fine kind imported by etc. It is tensively

portions of western Africa. Point Gallenas has been brought within the limits, and under the humanizing influences, of a young, vigorous, and Christian republic. Where the slave factories once stood, pulpits are now erected; and savage tribes, and barbarous chiefs, instead of warring with each other for human plunder, have cast away the implements of carnage, and now seek a common protection in the plow and the gospel. Geographically, Macgregor divides Africa into seven great regions:

1st. The region of the Nile, under which may be comprised Egypt, Nubia, and Kordofan. 2d. The region of the north, situated between the Mediterranean and the great desert of Sahara, and extending from Egypt west to the Atlantic, generally known as the States of Harbary—namely, Morocco, Tunis, and Tripoli. The soil and climate of this region are eminently favorable to the culture and growth of the choicest productions. 3d. The third region comprehends the vast desert of Sahara, west from Fezzan and Dairour to the Atlantic, and south from the Harbary States to Senegambia, Soudan, and Bornou. 4th. The fourth region comprehends Nigritia, or western Africa, extending from the south boundary of the western desert to the south boundary of Benguela, in about latitude 16° south, including the republic of Liberia. 5th. The fifth region comprehends the Cape of Good Hope colony; the country of the Caffres and Hottentots; and the extensive dry desert coast north of the Hottentot country, to Benguela, and the great unknown southern desert. 6th. The sixth region, or eastern Africa, extending along the sea-coast, and to an unknown inland limit, from Delagoa Bay, in latitude 26° south, to the frontiers of Abyssinia. 7th. The seventh region comprehends the States of Abyssinia and Somalia, extending from Cape Ras-asser, or Guardafu, to Zeylah, and along the Red Sea to the territories of the Pacha of Egypt.

Of the seven divisions thus given by Macgregor, the 1st, 4th, 5th, and 6th, only, possess any commercial importance: the first, comprising the Harbary States; the fourth, the republic of Liberia; the 5th, the colony of Good Hope (some account of which will be found in the Digest of British Colonial Possessions); and the sixth, the African possessions of the Sultan of Muscat, including the Island of Zanzibar.

Harbary States.—Under the collective denomination of Harbary States, are grouped together the countries which form the northern coast of Africa, viz.: Morocco, Tunis, and Tripoli. Prior to the submission of Algeria to the French arms, this division was also comprehended under the same general name. Being now a French colony, it is included in the Digest of French Colonial Possessions.

Empire of Morocco.—Morocco is one of the most powerful of the Harbary States, and comprises an area of 220,000 square miles, with a population estimated at 8,500,000. Although agriculture is in the most backward state, the soil yields, in great abundance and of the finest quality, wheat, barley, maize, olives, hemp, and cotton; and lemons, grapes, figs, oranges, almonds, and various fruits are grown in the greatest profusion. The sugar-cane, the tobacco-plant, and the date-tree thrive wherever they are cultivated. Under a liberal government, and with ordinary industry, Morocco could be made one of the most productive countries in the world. Islamism, however, wherever it extends, spreads its withering blight over every branch of industrial improvement. Among the varied physical resources are mines of iron, tin, copper, antimony, and salt; the last of which only appear to be worked. Two treaties of peace, friendship, etc., and for the security of persons and property, have been concluded by the United States with Morocco; the former bearing date January, 1787, and the latter, September, 1836. The principal stipulations

relating to trade and commerce, in the treaty of 1836, are embodied in the following summary:

Article 8. If any vessel of the United States shall meet with a disaster at sea, and put into one of our ports to repair, she shall be at liberty to land and reload her cargo without paying any duty whatever. 14. The commerce with the United States shall be on the same footing as is the commerce with Spain, or as that with the most favored nation for the time being; and their citizens shall be respected and esteemed, and have full liberty to pass and repass our country and sea-ports whenever they please, without interruption. 15. Merchants of both countries shall employ only such interpreters and such other persons to assist them in their business as they shall think proper. No commander of a vessel shall transport his cargo on board another vessel; he shall not be detained in port longer than he may think proper; and all persons employed in loading or unloading goods, or in any other labor whatever, shall be paid at the customary rates, not more and not less. 17. Merchants shall not be compelled to buy or sell any kind of goods but such as they shall think proper, and may buy and sell all sorts of merchandise but such as are prohibited to the other Christian nations. 18. All goods shall be weighed and examined before they are sent on board; and, to avoid all detention of vessels, no examination shall afterwards be made, unless it shall first be proved that contraband goods have been sent on board; in which case the persons who took the contraband goods on board shall be punished according to the usage and custom of the country, and no other person whatever shall be injured, nor shall the ship or cargo incur any penalty or damage whatever. 19. No vessel shall be detained in port on any pretense whatever, nor be obliged to take on board any article with but the consent of the commander, who shall be at full liberty to agree for the freight of any goods he takes on board. The treaty to continue in force 50 years, with the usual 12 months' notice after the expiration of that period.

The principal ports of Morocco are Mogadore, on the Atlantic, with a safe harbor for vessels of 150 tons; Tangier, Tetuan, Dar el Auda, Mazagan, Safi, Rabat, and Larache. The import duties are often arbitrarily raised, and frequently corruptly levied. With the exception of cochineal, coffee, cotton, iron, raw silk, sugars, and tea, on which articles there are specified duties, and tobacco, which can be sold only to the temporary assignees of the emperor's monopoly, a general duty of 10 per cent. is levied on all imports. When thus sold, it is admitted free; the price of the monopoly varying according to the number of bidders, but usually reaching as high as \$180,000. The assignee realizes from net sales about \$180,000. Besides tobacco, the sultan reserves the monopoly of brimstone, gunpowder, and lead. Every article entering into the export trade of Morocco is subject to arbitrary, and frequently oppressive duties. On leeches and cork-bark the sultan retains the monopoly, which is annually sold to the highest bidder, and sometimes adds to the sultan's revenue as much as \$100,000 per annum. If we compare this large amount with the total value of these articles annually exported, viz.: leeches \$120,000, cork-bark \$110,000 (about 50 per cent. of which is paid for the monopoly), it can be seen at once how much the trade in these articles is affected by these burdensome internal taxes. Morocco maintains an extensive trade with the interior of Africa by caravans, the principal of which usually accompanies the pilgrims across the whole continent of Africa to the Red Sea, and the tomb of Mohammed, and Mecca. The value of the investment in this caravan has been usually estimated at \$2,000,000. The caravans trading with the interior depart from Tetuan, Morocco, and Fez, and meet at Tullit, in order to cross together the great desert of Sahara. Morocco is principally indirect, through the ports of Marseilles and Gibraltar, and is conducted for the most part in French and British bottoms. It is suggested to the Department of State, by the United States' consul at Tangier, that this carrying trade could be secured to American vessels: our import duties on produce in general of Morocco, especially on coarse wool, were reduced to the same standard that rules in England. In 1853 the carrying export trade of the United States to Morocco, amounting to \$84,000, was entirely effected in foreign vessels. In 1852, of the 474 vessels of all sizes, measuring an aggregate of 30,426 tons, engaged in the foreign trade of the empire, there were but four American vessels, measuring in all 1,100 tons. The imports into the United States from Morocco consist of coarse wool, guma, skins, ostrich feathers, etc. The exports from the United States to Morocco are raw cotton, coarse domestics, brown sugar, rice, and tobacco. The latter article is supplied almost exclusively from the United States.

In 1848 the maritime commerce of Morocco reached 15,046,979 francs (\$2,798,738), viz.:

	Imports. Francs.	Exports. Francs.
Merchandise.....	8,747,304	5,699,275
Specie.....	258,500	856,400
Total.....	2,004,304	6,045,675

In this general movement the returns assign to the port of Mogadore amounts as follows: Imports, 2,281,038 francs; exports, 2,584,304 francs; total, 4,865,342 francs. See MORADORE, *ante*, p. 1368.

This leaves 10,181,137 francs for the other ports—Mazagan, Tangier, Tetuan, Dar al Baida, Laroche, and Rabat.

For the purpose of comparison, the general movements for 1847 are given as follows: Imports, 7,077,208 francs; exports, 6,910,946 francs; total, 13,988,154 francs.

Compared with 1846, these figures show a diminution of 390,547 francs; but when compared with the returns for 1848, they exhibit an increase of 1,058,825 francs, exclusively on imports. The diminution principally affects the trade with France; thus, in 1847, the trade of this country with Morocco amounted to 2,314,154 francs—(imports 520,955, exports 1,793,189)—while in 1848 it fell to 1,656,886 francs—(imports 404,906, and exports 1,251,480)—showing a decrease of 657,768 francs. With every other country engaged in this trade there was an augmentation in 1848, both in imports and exports. In one article, rather auspiciously called "Americanos," England largely augmented her export trade to Morocco—the whole increase in 1848 being upward of \$1,500,000. This description of merchandise is thus explained in an official dispatch transmitted to the Department of State from Tangier: "Throughout the whole empire, from the sultan down to the lowest subject, the article which we call 'coarse domestics' is used under the appellation of *Americanos*. It is the principal article of import, and is an imitation, by the manufacturers of Manchester, England, of the coarse domestics of Massachusetts. * * * * * It took with the Moors, who were so enthusiastic in their praise of it, that the English manufacturers dispatched an agent to this country to examine and report on the fabric, and the probable demand. They then set to work to

manufacture an article in every respect similar; and, stealing the name, they managed to undersell our countrymen and monopolize the market." The tabular statements that follow, giving a condensed view of the trade and navigation of Morocco, are brought down to the latest period for which authentic data are accessible. They are compiled from French official publications:

TABULAR STATEMENT EXHIBITING THE TRADE OF MOROCCO FOR 1848, COMPARED WITH 1847.

Ports.	Imports.		Exports.	
	1847.	1848.	1847.	1848.
Tangier.....	1,695,000	2,904,000	1,102,000	1,090,000
Tetuan.....	1,098,000	1,829,000	595,000	459,000
Laroche.....	561,000	1,187,000	320,000	251,000
Rabat.....	935,000	229,000	648,000	898,000
Dar al Baida.....	875,000	428,000	1,157,000	929,000
Mazagan.....	840,000	148,000	817,000	866,000
Mogadore.....	2,955,000	2,231,000	2,380,000	2,355,000
Total.....	7,077,000	9,001,000	6,910,000	6,048,000

Official returns give to England the principal share of this trade—an advantage which she enjoys, partly because of the proximity of Gibraltar, but mainly because she monopolizes the large bulk of the carrying trade between the United States and Morocco.

The imports, these years, consisted of cottons (*Americanos*) and woolen cloths, raw silk, iron, steel, copper and lead, sugar, coffee, grains, drugs, hardware, tea, and specie; the exports were wool, hides and skins, leeches, gum, olive-oil, Morocco leather, and ostrich feathers. The general commerce of the Mediterranean in 1854 increased materially over that of 1853; the increase was chiefly with Spain, Morocco, Sardinia, the United States, and Tuscany.

Navigation.—The following table exhibits the navigation of the ports of Morocco in 1850:

Nationally.	No. of vessels.	Tonnage.
England.....	612	33,853
France.....	157	13,089
Spain.....	49	1,839
Portugal.....	32	2,120
Turkey.....	14	1,840
Other countries.....	13	1,623
Total.....	877	59,155

The principal imports are cotton goods of all kinds, cloth, silk stuffs, velvets, copper, iron, steel, hardware, cochineal, indigo, and other dyes, tea, coffee, sulphur, paper, glass, beads, rum, etc. The exports consist in hides, wax, wool, leeches, dates, almonds, oranges, and other fruit, bark, flax, darra, woolen sashes, haicks, Moorish slippers, etc.

The following table exhibits the values of this trade during a period of five years ending with 1856:

Years.	Imports.	Exports.	Total.
1852.....	\$395,260	\$350,230	\$745,490
1853.....	416,965	382,150	799,115
1854.....	636,245	222,080	858,325
1855.....	662,180	255,750	917,930
1856.....	677,830	386,320	1,064,150
Total.....	\$2,788,420	\$1,605,530	\$4,393,950
Average.....	\$557,684	\$321,106	\$878,790

That our commercial readers may see the share which Great Britain holds in the trade of Tangier, we subjoin a tabular statement showing the navigation of this port during the same period, distinguishing the number and tonnage of British vessels:

Years.	Entered.				Total.		Cleared.				Total.	
	British ships.		Foreign ships.				British ships.		Foreign ships.			
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.

sale. Whatever these rules are by which the absolute transfer of property is regulated, they will equally apply to a conveyance or assignment by way of hypothecation. As real estate is usually required by the laws to be conveyed by written documents, and, according to the laws of most places, these conveyances are evidenced by public records of the instruments by which they are made, there is no necessity of an open, visible possession of the estate by the grantees, that the public may take notice of the grant, for they may find the evidence of it at the office of public record. The case is not the same with personal property, the title to which is usually confirmed and established to the purchaser by a delivery of the article into his possession. In respect to all chattels, of which manual possession and transfer from place to place is practicable, the delivery by the vendor, and actual possession by the purchaser, are very material circumstances in establishing the right of property in the latter. It is, indeed, laid down as a maxim of the English, and also of the American law, that movables can not be validly sold or mortgaged without a delivery actual, or constructive, to the purchaser or mortgagee, and a possession by him. But this rule is very much modified and relaxed; not that a delivery to and a possession by the vendee and mortgagee are not considered requisite to establish his title, but a very liberal interpretation has been put upon circumstances showing a constructive delivery and possession. The object and policy of the law is to leave the movable, just as it does land, to be used either by the mortgager or mortgagee, without affecting their mutual rights and obligations as to the property in the thing, as far as this indulgence can be carried without leading other persons into a misapprehension, and exposing them to fraud and imposition in giving credit to the mortgager, upon the supposition of his being the absolute owner of the property hypothecated. The various rules and distinctions by which the mortgage of chattels is regulated in this respect, constitute an essential part of the law upon this subject. But, after all, we may lay it down as an essential doctrine, that a mortgaged chattel must be in possession of the mortgagee, in order to render his title secure; and when the mortgager has, by the law, been permitted still to use the thing, it is only in cases where his possession is, in legal construction, that of the mortgagee.

The most material consideration relating to mortgages, whether of lands or chattels, is the effect of the non-performance of the condition by the mortgager. This will depend, it is true, in part, upon the terms of the contract of hypothecation or mortgage. If it be agreed between the parties, that in case of non-performance of the condition of the hypothecation, the mortgagee shall sell the thing hypothecated, whether land or goods, and account to the mortgager for the proceeds in satisfaction of the debt, or discharge of the obligation, intended to be secured, and pay over the surplus, if any, this is all that justice or the law can demand, and this is, in effect, what the law aims at where the parties do not make any such stipulation; but, on the contrary, agree, either expressly or impliedly, that, in case of a non-performance of the condition, the thing mortgaged shall be absolutely and immediately forfeited to the mortgagee, without any right on the part of the mortgager to redeem it, or to call upon the mortgagee to sell it and account with him for the proceeds. Thus, in the common form of mortgaging land, it is conveyed to the mortgagee with a provision that unless he shall pay a certain debt, or do a certain thing within a time specified, the conveyance shall be void. According to the literal construction, therefore, if this condition is not complied with, the thing henceforth belongs absolutely to the mortgagee. But here the law steps in and controls the agreement, and attempts to prevent it from operating as a penalty or forfeiture, at the same time giving it all its force as a

security or guaranty. For this purpose, different modes are adopted in different codes of laws, all of which agree in applying the value of the thing mortgaged, in satisfaction and discharge of the debt or obligation intended to be secured; so that by all the codes justice is done, if there is no surplus value. But if there be a surplus value, some of the codes will reach it, and others not, and the same code will reach it in regard to one kind of pledge, mortgage, or hypothecation, and not another. For example, by the English and American law, if a debtor pledges bills of exchange, or any personal property for a debt, to an amount exceeding its value, the creditor must account for the proceeds, and pay over the surplus to the debtor; but in England, and so in some of the United States, if the debtor mortgages lands, of which the creditor takes possession for breach of condition, the debtor has three years to redeem it, after which time the land is absolutely gone, though twice the amount of the debt in value. The law, in this case, supposes three years to be time enough to allow the debtor to redeem it, in case of an excess of value of the land; and this supposition is not wholly unreasonable, since the debtor has all that time to sell the land if he can get more than the amount of the debt for it. The civil law, as more generally administered, where it has been made the basis of modern codes, and so the laws of many of the United States adopt a different mode, prescribing an appraisement of the mortgaged land, and providing that it may be sold by auction, if two thirds of the appraised value is bid for it, and the proceeds of the sale are applied in satisfaction of the debtor obligation guaranteed by the mortgage, and the surplus, if any, paid over to the debtor.—E. A.

MOSU. *Iceland Moss (Cetraria Islandica)*, a species of lichen, a native of the mountainous heaths and woods in the Alpine parts of Scotland, and of the Asturias, in Spain, as well as in Iceland and the north of Germany. It grows to a height of only two or three inches, and has rather a rugged, bushy appearance, and doubtless would thrive, and perhaps with profit, in the northern parts of the United States, particularly in Minnesota, Wisconsin, Michigan, northern New York, Vermont, New Hampshire, and Maine. In Iceland and Lapland, this plant is used as an article of diet, being boiled in broth or milk, after being freed from its bitterness by repeated maceration in water; or dried and made into bread. The dried plant differs but little from its appearance in a recent state. Medicinally, it is tonic and demulcent. The decoction, as ordered in the pharmacopœia, is so bitter as to prevent many persons from taking it; and when deprived of its disagreeable taste, it can only be viewed as a demulcent, and is hardly equal in its effects to linseed, quince-seed, and marsh-mallows. It certainly does not cure phthisis pulmonalis; but in the last stage of that disease, when solid food is oppressive, and the diarrhœa appears to be kept up by the acrid contents of the stomach and bowels, it has appeared to check the latter, and to impart both vigor and nourishment to the digestive organs.—*Patent Office Rep.* See ICELAND.

Mosaic Gold. For the composition of this peculiar alloy of copper and zinc, called also *Or-molu*, Messrs. Parker and Hamilton obtained a patent in November, 1825. Equal quantities of copper and zinc are to be "melted at the lowest temperature that copper will fuse," which being stirred together so as to produce a perfect admixture of the metals, a further quantity of zinc is added in small portions, until the alloy in the melting-pot becomes of the color required. If the temperature of the copper be too high, a portion of the zinc will fly off in vapor, and the result will be merely spelter or hard solder; but if the operation be carried on at as low a heat as possible, the alloy will assume first a brassy yellow color; then, by the introduction of small portions of zinc, it will take a purple or violet blue, and will ultimately become perfectly white; which is the appearance of the proper compound

In its fused state. This alloy may be poured into ingots; but as it is difficult to preserve its character when re-melted, it should be cast directly into the figured molds. The patentees claim the exclusive right of compounding a metal consisting of from 52 to 55 parts of zinc out of 100. Mosaic gold, the *aurum musivum* of the old chemists, is a sulphuret of tin.

Mosaic (*Mosaïque*, Fr.; *Mosaik*, Germ). There are several kinds of mosaic, but all of them consist in imbedding fragments of different colored substances, usually glass or stones, in a cement, so as to produce the effect of a picture. The beautiful chapel of Saint Lawrence, in Florence, which contains the tombs of the Medici, has been greatly admired by artists, on account of the vast multitude of precious marbles, jaspers, agates, aventurines, malachites, etc., applied in mosaic, upon its walls. The detailed discussion of this subject belongs to a treatise upon the fine arts.

Mosquito Coast, Mosquitia. The limits of this pseudo Central American State, Mosquitia or the Mosquito Coast, are so indefinite, and its extent inland so imperfectly ascertained, that scarcely more of a reliable character can be said respecting it physically, than politically or commercially. It is supposed to extend from Cape Honduras to the mouth of the River San Juan, having west the States of Honduras and Nicaragua, and north and east the Caribbean Sea, and to embrace about 26,000 square miles. The Mosquito Indians, its native and almost only inhabitants, are represented as an active and daring race, never brought under submission by the Spaniards. The San Juan River is claimed as its south boundary. Its capital is Blewfields, and it contains several other small villages, inhabited chiefly by native Indians and some few British colonists. The country is fertile, and, under proper cultivation, would produce cocoa, cotton, sugar, indigo, vanilla, and logwood; but, until some change takes place either in the mode of cultivation, or the form of government, its resources have but small chance for development. See HONDURAS.

Mother of Pearl (*Nacre de Perles*, Fr.; *Perlen mutter*, Germ.) is the hard, silvery, brilliant internal layer of several kinds of shells, particularly oysters, which is often variegated with changing purple and azure colors. The large oysters of the Indian seas alone secrete this coat of sufficient thickness to render their shells available to the purposes of manufacturers. The genus of shell fish called *pentadina* furnishes the finest pearls, as well as mother of pearl; it is found in greatest perfection round the coasts of Ceylon, near Ormus in the Persian Gulf, at Cape Comorin, and among some of the Australian seas. The brilliant hues of mother of pearl do not depend upon the nature of the substance, but upon its structure. The microscopic wrinkles or furrows which run across the surface of every slice, act upon the reflected light in such a way as to produce the chromatic effect; for Sir David Brewster has shown, that if we take, with very fine black wax, or with the fusible alloy of D'Arcet, an impression of mother of pearl, it will possess the iridescent appearance. Mother of pearl is very delicate to work, but it may be fashioned by saws, files, and drills, with the aid sometimes of a corrosive acid, such as the dilute sulphuric or mullitic; and it is polished by colcothar of vitriol.

Mozambique, a fortified maritime city, and the capital of the Portuguese possessions in eastern Africa, on an island at the entrance of Mesaril Bay, an inlet of the Mozambique Channel, 5½ miles broad, and 6 miles in length, and receiving 3 small rivers, its entrance being sheltered also by the islands St. George and St. Jago, which help to bound its harbor. Mozambique Island, in lat. 15° 2' S., long. 40° 48' E., is about 14 miles in length, low, and of coral formation.

Mulberry. *Soil, Situation, Propagation, etc.*—The *morus nigra*, or black mulberry-tree, will grow in almost any soil or situation that is tolerably dry, and

in any climate not much colder than most parts of Britain and the United States. It is very easily propagated by truncheons or pieces of the branches, eight or nine feet in length, and of any thickness, being planted half their depth in tolerably good soil; when they will bear fruit the following year. As it is extremely tenacious of life, every part of the root, trunk, boughs, and branches may be converted into plants by separation; the rootlets, and small shoots or sprays, being made into cuttings, the larger boughs into stakes, the arms into truncheons, and the trunk, stool, and roots, being cut into fragments, leaving a portion of the bark on each, and planting them after the Italian mode of propagating the olive-tree. The mulberry may also be increased from seeds, by layers, or by grafting and budding. This tree, from its slowness of putting out its leaves, being rarely injured by spring frosts, and its leaves being seldom or never devoured by any insect, except the silkworm, and never touched with mildew, very seldom fails to produce a good crop of fruit. This fruit, however, though excellent, and exceedingly wholesome, does not keep, and is so far troublesome, that it is only good when it is quite ripe, and is heat when it is suffered to fall from the tree itself. For this reason, mulberry-trees are generally planted on a lawn or grass-plot, to prevent the fruit that falls from being injured by the gravel or dirt. This practice, however, is objectionable, as no tree, perhaps, receives more benefit from the spade and the dung-hill than the mulberry, and it ought, therefore, to be frequently dug about the roots, and occasionally assisted with manure. The ground under the tree should be kept free from weeds throughout the summer, particularly when the fruit is ripening, as the reflected light and heat from the bare surface of the soil is thus increased. In a cool, moist climate, like that of Britain, the fruit is also very fine if the tree be trained as an espalier, with the reflection of the south side of a building or wall. As a standard tree, whether for ornament or fruit, the mulberry requires very little pruning or attention of any kind, other than that which is given above. As it increases in age, it increases in productiveness, and in full-grown trees the fruit is much larger and better flavored than in those which are young.

Properties and Uses.—The wood of the *morus nigra* is less compact than even that of the white mulberry, and when perfectly dry, weighs only about 40 pounds to a cubic foot. It is said to be durable, and has been employed in England for various purposes of carpentry, for hoops, bows, wheels, and even ribs for small vessels, instead of oak. In France, this wood is considered of but little value, except for fuel. In some parts of Spain, in Sicily, and in Persia, the leaves of this species are said to be preferred to those of the white mulberry for the food of silkworms. The leaves are also eaten by cattle, sheep, and goats. The roots have an acrid, bitter taste, and are considered as an excellent vermifuge, when taken, in powder, in doses of half a drachm. The tree, in every part, contains a milky juice, which, being conglutinated, is found to form a coarse kind of elastic gum. The fruit of this tree is of an agreeable acid and aromatic flavor, and is eaten raw, as a dessert, or may be formed into an agreeable preserve; and Evelyn says that, mixed with the juice of cider apples, it makes a very strong and agreeable wine. Dr. Clarke observes, that he saw some Greeks, in the Crimea, employed in distilling brandy from mulberries; which he describes as "a weak but palatable spirit, as clear as water." A wine is also made from it in France; but it requires to be drunk immediately, as it very soon becomes acid. The fruit, when ripe, is regarded as cooling and laxative, allaying thirst, and being grateful in cases of fever. When made into a syrup, it is considered excellent for a sore throat. Like the strawberry and raspberry, it is said to undergo the acetous fermenta-

tion in the stomach, and therefore may be safely eaten by persons afflicted with the rheumatism or gout. All kinds of poultry are excessively fond of this fruit, and devour it with avidity, whenever within their reach.

Insects and Diseases.—The leaves of the *morus alba*, or white mulberry-tree, are believed to be eaten by no other insect but the silkworm (*bombyx mori*). M. Pullen, however, made experiments with various kinds of insects, but they all rejected the mulberry leaf for food, except "a green worm, about an inch long, and as thick as an oat straw." Although he found it upon a mulberry, it was his belief that it was not peculiar to that tree alone, but found its way there by accident. The white mulberry, however, is attacked by numerous diseases, occasioned partly, no doubt, by the unnatural manner in which it is treated, by being stripped of its foliage. One of these diseases is brought on by any sudden check given to the transpiration of the leaves, which turn yellow, and fall off, shortly after causing the tree to die. Another is the death of the roots, which is accompanied by the formation on them of parasitic fungi. The leaves are also apt to be attacked with honey-dew, mildew, rust, and other diseases, which render them unfit for the food of the silkworm. These leaves covered with honey-dew may be washed, and, when thoroughly dry, may be given to the insects without injury; but the other diseased leaves should be thrown away. If leaves covered with honey-dew are employed without washing, they cause dysentery and death to the worms. As it is not our intention to treat of the whole art of the rearing and management of the silkworm, we are compelled to refer the reader to a "Treatise on the origin and Progressive Improvement of the Silk Manufacture," being the 22d volume of the London Cabinet Cyclopaedia; also to the work of Count Dandolo, entitled "Dell'Arte di governare i Bachi da Seta;" KEMPNER's "American Silk-Grower's Guide;" and to most of the agricultural journals of the day.

Properties and Uses.—The wood of the *morus alba*, when dry, weighs 44 pounds to a cubic foot. In France, the principal uses of that of the trunk, is for various purposes of turnery, and carpentry, and for the making of wine-casks, for which it is highly valued, as it is said to impart an agreeable violet-like flavor to white wines. The branches are used for vine-pricks, posts and rails to rural fences, and for fuel. The bark may be converted into linen of the fineness of silk. For this purpose the young wood is gathered in August, during the second ascent of the sap, and immersed for three or four days in still water. It is then taken out, at sunset, spread on the grass, and returned to the water at sunrise. After repeating this process daily for some time, it is finally taken out, dried, and prepared like flax. The bark is also used like that of the European lime-tree, for making bast for mats, etc. The bark, and more especially the leaves of the white mulberry, abound in a milky juice, which is found to possess more or less of the properties of caoutchouc, according to the climate in which the tree is grown. It is doubtless owing to this property in the leaves of the mulberry, that the cocoons of the silkworm have so much more tenacity of fibre than those of any other insect that feeds on the leaves of trees. Hence, also, the silk, like the tobacco and wine of warm climates, and of poor, dry soils, is always superior to that produced in colder climates, and from rich and moist soils. To verify this opinion, we quote the following very judicious observations from the "Journal d'Agriculture de Pays-Bas," which will not only show the impracticability of profitably raising silk in the higher latitudes, but will serve as an infallible guide in the choice of a soil and climate for this species of agriculture: "The mulberry-tree is found in different climates; but the juice of the leaves grown in the north is much less suitable for the production of good silk, than that of the leaves of the south. In this respect,

mulberry leaves and silk differ as much as wines, according to the climate and soil in which they are produced. In general, every climate and soil that will grow good wheat will produce large, succulent mulberry leaves; but these leaves will, in many cases, be too nutritive; that is, they will have too much sap, and too much substance and succulency. The wild mulberry, with small leaves, answers better, for such a soil, than the grafted mulberry, with large leaves. A general rule, and one to be depended on, is, that the mulberry, to produce the best silk, requires the same soil and exposure that the vine does to produce the best wine. Experience has proved that silkworms nourished by leaves gathered from a dry soil, succeed much better, produce more cocoons, and are less subject to those diseases, which destroy them, than those which have been nourished by leaves produced by an extremely rich soil." The fruit of the white mulberry is less acid than that of the black species, and that of some of the varieties, particularly of the *morus a. multicaulis*, is used for making robs and syrups, and is said to be remarkably good to eat, in warm climates.

The perfect wood of the *morus rubra*, or red mulberry-tree, which is fine-grained and compact, though light, is of a yellowish hue, approaching to lemon-color. It possesses strength and solidity; and, when properly seasoned, it is almost as durable as that of locust, to which, by many persons, it is esteemed equal. In the dockyards at Philadelphia, Baltimore, and the more southern ports, it is employed in the construction of both the upper and lower frames of vessels, for knees, floor-timbers, etc.; and is preferred to every other kind of wood for trenails, except that of the locust. In Charleston, South Carolina, it is sometimes selected for the ribs of large boats. It is also used in the parts of the country where it abounds, for the posts of rural fences, which, from their durability, are as much esteemed as those of the locust. As the leaves of this species are thick, rough, and hairy, while young, they are improper for the food of silkworms, which feed with advantage, in a cold climate, only on the *morus alba*, or some of its varieties. The red mulberry is well deserving of cultivation, both from its thick and shady foliage, and the agreeable flavor of its dark-red fruit.

The wood of the paper mulberry, which is soft, spongy, and brittle, is of little value except for fuel. The leaves are too rough and coarse, in their texture, for the food of silkworms; but they are found to be excellent fodder for cattle; and as the tree will grow rapidly in almost every soil, and throws out numerous tufts of leaves, it has been suggested that it might be valuable to cultivate, in some situations and climates, for that purpose. The juice of this tree is sufficiently tenacious to be used in China as a glue, either in gilding leather or paper. The finest and whitest cloth worn by the inhabitants of Otaheite, and of the Sandwich Islands, is made of its bark. But the principal use, however, to which this tree appears to be applied, is for the manufacture of paper. The following is an abridgment of Kempfer's account of the process of making this article in Japan, as quoted from the fifth volume of the London "Penny Cyclopaedia:" "The branches of the current year, being cut into pieces about a yard long, are boiled until the bark shrinks from the wood, which is taken out, and thrown away; and the bark, being dried, is preserved till wanted. In order to make paper, it is soaked for three or four hours in water; after which, the external skin (*epidermis*), and the green internal coat, are scraped off, and the strongest and finest pieces are selected; the produce of the younger shoots being of an inferior quality. If any very old portions present themselves, they are, on the other hand, rejected as too coarse. All knotty parts, and every thing which might impair the beauty of the paper, are also removed. The chosen bark is boiled in a lye-tivum till its downy fibres can be separated by a touch of the finger. The pulp, so produced,

is then agitated in water till it resembles tufts of tow. If not sufficiently boiled, the paper will be coarse, though spongy; if too much, it will be white, indeed, but deficient in strength and solidity. Upon the various degrees and modes of washing the pulp, much also depends as to the quality and beauty of the paper. Mucilage obtained from boiling rice, or from a root called oreni, one of the mallow tribe, is afterward added to the pulp. The paper is finished much after the European mode, except that stalks of rushes are used, instead of brass wires." The article thus made, constitutes the India or China paper used by engravers for taking proofs, and by chemists for filters.—*BROWN'S Trees of America.*

Munjeet, a species of *Rubia tinctorum*, or madder, produced in Nepal, and in various districts of India. That which is brought to England is imported from Calcutta, and is cultivated in the high lands about Natpore in Purnea. The roots are long and slender, and when broken appear of a red color. It is used in dyeing; the red which it produces being, though somewhat peculiar, nearly the same as that produced by European madder. Dr. Bancroft says that the color which it imparts to cotton and linen is not so durable as that of madder; but that upon wool or woollen cloth its color is brighter and livelier; and, when proper mordants are used, nearly, perhaps quite, as permanent.—*Permanent Colors*, vol. ii., p. 279. The best munjeet is in pieces about the bigness of a small quill, clean and firm, breaking short, and not pipy or chaffy. Its smell somewhat resembles liquorice root.

Muriatic or Hydrochloric Acid; anciently *marine acid*, and *spirit of salt*. (*Acide hydrochlorique*, and *Chlorhydrate*, Fr.; *Salzsäure*, Germ.) This acid is now extracted from sea-salt, by the action of sulphuric acid and a moderate heat; but it was originally obtained from the salt by exposing a mixture of it and of common clay to ignition in an earthen retort. The acid gas which exhales, is rapidly condensed by water. 100 cubic inches of water are capable of absorbing no less than 48,000 cubic inches of the acid gas, whereby the liquid acquires a specific gravity of 1.2109; and a volume of 142 cubic inches. The muriatic acid of commerce has usually a yellowish tinge, but when chemically pure it is colorless. It fumes strongly in the air, emitting a corrosive vapor of a peculiar smell. The characteristic test of muriatic acid in the most dilute state, is nitrate of silver, which causes a curdy precipitate of chlorid of silver.

Muscat, a city and seaport situated on the east coast of Arabia, about 96 miles N. W. of Cape Rasselgate (Ras-el-had), in lat. 23° 38' N., long. 53° 37½' E. Population uncertain; but estimated by Lieutenant Wellsted at 40,000, which we incline to think beyond the mark. There are more Banians here than in any other city in Arabia. There are among them some very extensive merchants, who engross almost the whole pearl trade of the Persian Gulf, and the supply of corn from India. The negro slaves are numerous, and are generally stout, well made, and active. The harbor, which is the best on this part of the Arabian coast, opens to the north, and is shaped like a horse-shoe. It is bounded on the west and south by the lofty projecting shores of the mainland, and on the east by Muscat Island, a ridge of rocks from 200 to 300 feet high. The town stands on a sandy beach at the south end or bottom of the cove or harbor, about 1½ miles from its mouth. The depth of water near the town varies from three to four and five fathoms. Ships at anchor are exposed to the north and north-west winds; but as the anchorage is everywhere good, accidents are of very rare occurrence. The harbor is protected by some pretty strong forts. Vessels are not allowed to enter after dusk, nor to leave before sunrise. If the usual signal be made for a pilot, one will come off, but not otherwise. It is best to make them attend till the vessel be secured, as they

have excellent boats for carrying out warp anchors. Muscat is a place of considerable importance, being at once the key to, and commanding the trade of, the Persian Gulf. The dominions of the imaum, or prince, are extensive, and his government is more liberal and intelligent than any other in Arabia or Persia. The town, situated at the bottom of a high hill, is ill-built and filthy; and, during the months of July and August, is one of the hottest inhabited places in the world. The country in the immediate vicinity of the town is extremely barren; but it improves as it recedes from the shore. Dates and wheat, particularly the first, are the principal articles of produce. The dates of this part of Arabia are held in high estimation, and are largely exported, those of Bushire and Bussorah being imported in their stead. A date tree is valued at from \$7 to \$10, and its annual produce at from \$1 to \$14. An estate is said to be worth 2,000, 3,000, 4,000 date trees, according to the number it possesses.

But the place derives its whole importance from the commerce and navigation of which it is the centre. The imaum has some large ships of war, and his subjects possess some of the finest trading vessels to be met with in the Indian seas. The part of Arabia adjoining to Muscat is too poor to have any very considerable direct trade; but, owing to its favorable situation, the backward state of the country round the Persian Gulf, and the superiority of its ships and seamen, Muscat has become an important entrepôt, and has an extensive transit and carrying trade. Most European ships bound for Bussorah and Bushire touch at it; and more than half the trade of the Persian Gulf is carried on in ships belonging to its merchants. (See *Bussorah*.) But, exclusive of the ports on the gulf, and the south and west coasts of Arabia, ships under the flag of the imaum trade to all the ports of British India, to Singapore, Java, the Mauritius, the east coast of Africa, etc. The pearl trade of the Persian Gulf is now, also, wholly centered at Muscat. All merchandize passing up the gulf on Arab bottoms pays a duty of one half per cent. to the imaum. He also rents the islands of Ormuz and Kishme, the port of Gombroon, and some sulphur mines, from the Persian government. In the magazines of Muscat may be found every species of produce imported into or exported from the Persian Gulf. Various articles are also imported for the use of the surrounding country, and for the internal consumption of Arabia. Among these, the principal are rice, sugar, coffee for building, cotton and cotton cloth, cocoanuts, wood for building, slaves from Zanguebar, dates from Bushire and Bussorah, etc. Payment for these is chiefly made in specie and pearls; but they also export drugs of various descriptions, ivory, gums, hides, ostrich feathers, horses, sharks' fins, a sort of earthen jars, called *martaban*, to Tranquebar, dried fish, an esteemed sweetmeat called *bulwah*, and a few other articles. The markets of Muscat are abundantly supplied with all sorts of provision. Beef, mutton, and vegetables of good quality may be had at all times, and reasonably cheap. The bay literally swarms with the greatest variety of most excellent fish. Water is excellent, and is conveyed to the beach in such a manner that the casks of a vessel may be filled in her boats while afloat. Firewood is also abundant, and is cheaper than at Bombay. A duty of five per cent. is laid on imports, all exports being duty free. The entire value of the imports has been estimated at £500,000.

Money, Weights, and Measures.—Accounts here are kept in *goz* and *manoodies*: 20 *goz* = 1 *manoodi* and 20 *manoodies* = 1 dollar. All Persian, Turkish, and Indian coins, as well as French and German crowns, and Spanish dollars, are met with; their value fluctuating with the demand; and they are generally sold by weight. The weights are, the *cuban* and *maund*; 24 *cubans* = 1 *maund* = 8 lbs. 12 oz. *avoirdupois*. Niebuhr thinks that Muscat occupies the site

of the *Mosca* of Arrian and other Greek writers (*Voyage en Arabie*, vol. ii., p. 71, ed. Amst. 1780); a conjecture which seems to be confirmed, not merely by the resemblance of the name, but also by the terms applied. Arrian to *Mosca* being sufficiently descriptive of Muscat; and as the port is bounded on all sides by rocks, it must now present almost the same appearance as in antiquity. Dr. Vincent, however, though he speaks doubtfully on the subject, is inclined to place *Mosca* to the west of Cape Rasselgate.—*Commerce and Navigation of the Ancients*, vol. ii., pp. 344-347. For further particulars, besides the authorities above referred to, see HAMILTON'S *New Account of the East Indies*, vol. i., p. 63; FRAZER'S *Journey to Khorasan*, pp. 5-19; WELLSTED'S *Travels in Arabia*, i., pp. 14-25. The longitude given above is that of ARROWSMITH'S *Chart of the Persian Gulf*.

Commerce with the United States.—The Sultan of Muscat concluded a treaty with the United States, September 21, 1833, and it took effect June 24, 1837, the day on which the President of the United States made his proclamation. Its stipulations establish perpetual peace between the two countries, and open the ports of each to the vessels and citizens of the other, with unrestricted liberty of trade, reserving in the island of Zanzibar the sale of muskets, powder, and ball to the government only, but leaving the trade in these articles in all other parts of the sultan's dominions free from every restriction. The treaty further stipulates that vessels of the United States entering any port within the sultan's dominions shall pay no more than five per cent. duties on the cargoes landed, which shall be in full of all import and export duties, tonnage, license to trade, pilotage, anchorage, or any other charge whatsoever; that no charge shall be made on that part of the cargo which may remain on board and be re-exported; that no charge shall be made on any vessel of the United States which may enter any of the sultan's ports for the purpose of refitting, or for refreshments, or to inquire the state of the market. It is farther stipulated that the American citizen shall pay no other duties on export or import, tonnage, license to trade, or other charge whatsoever, than the citizens of the most favored nation shall pay; and similar equality in the ports of the United States is extended to the vessels and citizens of the sultan.

In the report to the Department of State, of the agent by whom this treaty was negotiated, the following paragraphs occur: "The Sultan of Muscat is a very powerful prince. He possesses a more efficient naval force than all the native princes combined, from the Cape of Good Hope to Japan. His resources are more than adequate to his wants. They are derived from commerce, running himself a great number of merchant vessels; from duties on foreign merchandize; and from tribute-money and presents received from various princes; all of which produce a large sum. His possessions in Africa stretch from Cape Delgado to Cape Guardafui, and from Cape Aden, in Arabia, to Ras el Haud; they extend along the northern coast of Amman to the entrance of the Persian Gulf; and he claims also the sea-coast and islands within the Persian Gulf, including the Bahrein Islands, and the pearl-fishery contiguous to them, with the northern coast of the gulf, as low down as Scindy. * * * In Africa he owns the ports of Moughow, or Mongallow, Lyndy, Quiloah (Keelwah), Melinda, Larimo, Patta, Brava, Mungulohu (alias Mogadore), and the valuable islands of Monfeua, Zaazibar, Pamba, Socotra (Socotera)," etc.

The exports from the African part of his dominions are gum-copal, aloes, gum-arabic, culumbo-root, and a great variety of other drugs, ivory, tortoise-shell, rhinoceros' horns, hides, beeswax, coconut-oil, rice, millet, etc. From Muscat the exports are wheat, raisins, drugs, dates, salt, dried fish, etc. It is estimated that seven-eighths of all the ivory imported in-

to the United States, and all the copal of the finest quality, are from the island of Zanzibar. To this place all the goods collected for this large trade are imported, and sold to the Banians and Hindoos at six months' credit. The United States supply by far the most important goods for all the coast trade, viz.: Lowell manufactured sheetings and shirtings. Other goods in demand for the coast trade are powder, muskets, brass-wire, glass-beads, and India rubber goods. The currency of Muscat differs materially from that of the Persian Gulf or Africa, and, with its weights and measures, is peculiar to the country. The Spanish dollar is current, and the Spanish doubloon varies in value from \$14 to \$16. See ZANZIBAR.

Muscat, Imamot of, an extensive and powerful State of Arabia, comprising the eastern portion of that peninsula, its authority also extending over its south-east coast nearly as far as Aden, and over parts of the coast of Persia on the Persian Gulf, and that of east Africa from the equator south to Cape Delgado. Area and population not ascertained. Besides Muscat, the capital, this dominion comprises the towns of Rostak, Muttra in Arabia, and Juba, Melinda, Mombas, Magadoxo, Bravah, Quiloah and Lyndy in Africa, with the islands Zanzibar, Socotra, etc., and it has an active trade with all the adjacent countries, and with British India. The Imam has a patriarchal and despotic sway, and the most efficient naval force of any native prince from the Cape of Good Hope to Japan.—*Muscat or Mascua* (probably the *Mosca* of Arrian), a fortified maritime city of east Arabia, capital above dominion, on a peninsula in the Arabian Sea, lat. 23° 37' N., long. 58° 35' E. Population estimated at 40,000 to 50,000. It is surrounded by heights all strongly fortified. The harbor of the city is well sheltered, and has deep water. Muscat is the grand emporium of east Arabia, and the key to the entrance of the Persian Gulf. Imports estimated \$4,500,000 in value annually, and consist chiefly of almonds, aloes, assafoetida, gum ammoniac, sulphur, nitre, gum copal, frankincense, coffee, pearls, ivory, horns, hides, wax from Persia and Africa, most of which are re-exported to India and the East; the returns thence being made in British and India cotton goods, shawls, China manufactures. Large quantities of dates, as also wheat, horses, salt, and dried fish, are among the principal exports. The port is usually touched at by vessels going up the Persian Gulf. Though the country around it is sterile, a plentiful supply of provisions may generally be obtained at Muscat.

Commercial Relations with the United States.—The treaty made by the United States in 1837, with the Sultan of Muscat has been duly observed, and a very friendly disposition shown by the authorities to all Americans. The present existing commercial regulations are fixed and permanent. There are no privileges permitted to other nations which are denied to our own. There are no port charges or other dues levied on vessels of the United States. There is no drawback of duties; merchandise from one vessel to another, or landed for re-shipment, must pay a duty of 5 per cent. The German crown, and piece, and pic, from the East India Company's possessions, are the only currency. The number of pic for a German crown (better known in these countries as the black dollar) varies, according to the supply, from 118 to 128. At this present time, 120 pic are given for one black dollar, and 3 pic make one pic. Spanish and Mexican dollars are worth no more, and do not circulate freely. They are purchased for the Bombay market, usually at a premium of 2 to 3 per cent. at the commencement of the south-west monsoon, in April, and also near its close, in September, and find their way from thence to China. American half eagles are worth \$5; English sovereigns, \$4.75; Spanish and Portuguese doubloons, \$16; Spanish quarters and eighths pass freely at 25 and 12½ cents, and American

dimes and half dimes at 10 and 5 cents. Merchandise is bought and sold for dollars and cents.

Ivory.—This article varies greatly in price, according to quality and size. The superior kinds, and largest and best, are sent to the United States. In lots, average weight 70 lbs. and upward, \$40 to \$44 per frasila of 35 lbs. Ivory, 50 to 60 lbs. average weight, \$37 to \$40 per frasila. Tortoise shell per pound, of 3 lbs. English, \$2 to \$6. Gum copal, per frasila of 35 lbs. English, \$5 to \$7. Hides, per conge of 20 lbs., \$10 to \$15 per conge. Cloves, per frasila of 35 lbs., \$1.75 to \$2.50.

Commissions usually charged, 2½ per cent. As for freights and insurance, there are no rates to the United States. Cargoes imported from the United States are invariably sold at 6 months' credit. If cash is wanted for a sale, a discount is made of 4½ per cent. for 6 months. As for exchange, the captains of whale ships draw upon their owners for the cash they require, and the usual charge is 20 per cent. Duties, 5 per cent. on all cargo landed. No duties on exports to the United States. There are no internal taxes of any kind paid by the people of this island directly. The sultan's revenue is derived from duties on all articles of commerce brought from the neighboring coast, Red Sea, Aden, Persian Gulf, Bombay, and the Malabar coast. The negro slaves are almost the only common laborers, and receive per day about 12½ cents, or \$2.50 to \$3 per month. The higher order of servants to oversee the work in preparing and shipping cargoes are paid from \$7.50 to \$10 per month. Native workmen in the various branches of mechanic industry receive about \$5 to \$7 per month.

No steamers are owned or built here, and there are no facilities for ship-building, or even repairing, to any extent. The sultan has a few ships-of-war built either at Bombay or at places on the coast of Malabar. They are manned by slaves and officered by Arabs. The only vessels owned here by natives are called *does*, and seem to answer the purpose very well, but are the rudest kind of ship possible to conceive of, and never undertake to get to any place against the monsoon. They sail fast, and are of very peculiar construction. Zanzibar is a large, fertile, and populous island, and the favorite residence of the sultan, who is far superior to his brother princes in intelligence, and has a disposition to introduce improvements into his dominions. But his subjects, like all Arabs, are far behind other nations, and despise all improvement. Cloves are produced upon this island in large quantities, and the annual increase is considerable. All other articles of export are brought from other places. See *Com. Rel., U. S.*, vol. iii., 1866-57, pp. 367-368.

Musk (Fr. *Musc*; Ger. *Bisam*; Du. *Muskus*; It. *Muschio*; Sp. *Amizete*; Rus. *Muscus*; Arab. and Pers. *Musk*) is obtained from a species of deer (*Moschus moschiferus*) inhabiting the Alpine mountains of the east of Asia. The musk is found in a small bag under the belly. Musk is in grains concentered together, dry, yet slightly unctuous, and free from grittiness when rubbed between the fingers or chewed. It has a peculiar, aromatic, and extremely powerful and durable odor; the taste is bitterish and heavy; and the color deep brown, with a shade of red. It is imported into England from China in caddies containing from 60 to 750 oz. each; but an inferior kind is brought from Bengal, and a still baser sort from Russia. The best is that which is of the natural follicle or pod. Being a very high-priced article, it is often adulterated. This is done by mixing with the animal's blood may be discovered by the largeness of the lumps or clots. It is sometimes mixed with dark, highly colored, friable substances, which appear to the touch to be of a more crystalline texture, and is harder as well as heavier

than genuine musk. 20 cwt. of musk are allowed to a ton. It was not permitted to be brought home in the China ships belonging to the East India Company.—**THOMSON'S Dispensatory**; **MILNERS'S Orient. Com.**

Muslin (Ger. *Muselin*, *Neaseluck*; Du. *Neteluck*; Fr. *Mouseline*; It. *Mousolina*; Sp. *Moselina*; Rus. *Kissea*) is derived from the word *mouale* or *moualeh*, a name given to it in India, where large quantities are made. It is a fine thin sort of cotton cloth, with a downward nap on the surface. Formerly all muslins were imported from the East; but now they are manufactured in immense quantities at Manchester, Glasgow, etc., of a fineness and durability which rival those of India, at the same time that they are very considerably cheaper. See **CORTEX**.

Mustard (Ger. *Mueterl, Senf*; Fr. *Moutarde*; It. *Mostarda*; Sp. *Mostaza*; Rus. *Gortschiza*; Lat. *Sinapis*; Arab. *Kharid*; Hind. *Rili*), a plant (*Sinapis*) of which there are several species. It is a native of Europe, and is now naturalized, and a common weed in some parts of the United States. It is besides very commonly cultivated for the sake of the seeds, which, when powdered and mixed with vinegar, form a well known pungent condiment in daily use. The root is annual; the stem three or four feet high; the lower leaves are lyrate, and the upper ones lanceolate and entire. The flowers are small and yellow. It belongs to the natural family *cruciferae*, and is known by the smooth four-cornered pods which are pressed close to the stem. Table mustard, mixed with warm water, and taken in considerable quantities, acts as an emetic, and as such is so much the more valuable from its being always at hand. The white mustard (*S. alba*) is milder than the preceding, and on this account is more agreeable to some palates.—**E. A.**

Mutiny of the Bounty. Memorable mutiny on board the *Bounty* armed ship returning from Otaheite with bread fruit. The mutineers put their captain, Bligh, and 19 men, into an open boat near Annamooka, one of the Friendly Islands, April 28, 1789, and they reached the island of Timor, south of the Moluccas, in June, after a perilous voyage of nearly 4000 miles, in which their preservation was next to miraculous. The mutineers were tried September 15, 1792, when six were condemned, of whom three were executed.

Myrobalans are the dried fruits of different varieties of *terminalia*. The fruit, varying from the size of an olive to that of a gall-nut, consists of a white pentangular nut, covered by a substance about two lines in thickness. The latter, which is the only valuable part, is mucilaginous and highly astringent; and being separated from the nut is employed, with the best effect, both by dyers and tanners, especially by the latter. It produces with iron a strong, durable, black dye and ink; and with alum, a very full, though dark, brownish yellow. The imports vary considerably.—**BANCROFT On Permanent Colors**, i., 351, etc.

Myrrh (Ger. *Myrrhen*; Du. *Mirre*; Fr. *Myrrhe*; It. and Sp. *Morra*; Lat. *Myrrha*; Arab. *Murr*), a resinous substance, the produce of an unknown tree growing in Arabia and Abyssinia. It is imported in chests, each containing from one to two cwt. Abyssinian myrrh comes to us through the East Indies, while that produced in Arabia is brought by the way of Turkey. It has a peculiar, rather fragrant, odor, and a bitter aromatic taste. It is in small irregularly shaped pieces, which can hardly be called trees. Good myrrh is translucent, of a red-lish yellow color, brittle, breaking with a resinous fracture, and easily pulverized. Its specific gravity is 1.36. When it is opaque, mixed with impurities, and either white, or of a dark color approaching nearly to black, with a disagreeable odor, it should be rejected.—**THOMSON'S Dispensatory**.

Nails (Ger. *Nägel*, *Spiker*; Du. *Spykers*; Fr. *Clous*; It. *Chiodi*, *Chiodi*, *Aguti*; Sp. *Clavos*; Rus. *Gwozdi*) are small spikes of iron, brass, etc., which, being driven into wood, serve to bind several pieces together, or to fasten something upon them. The consumption of nails is immense; and the aggregate value of those annually produced is very large.

See IRON and HARDWARE.

NANGASACKI, a sea-port town on the south-west coast of the island of Ximo, one of the Japanese islands, being, according to Krusenstern, in lat. 32° 43' 40" N., long. 130° 11' 47" E. The harbor extends N. E. and S. W. about 2½ leagues, being, in most places, less than a mile in width. Ships lie in 5 or 6 fathoms water, within a gunshot of the town, near the middle of the bay where they are protected from all winds.

Nankeen or Nankin (Ger. *Nanking*; Du. *Nanking*; Fr. *Toile Nankin*; It. *Nanquino*; Span. *Nanquina*), a species of cotton cloth in extensive use in this country. It takes its name from Nanking, in China, a European corruption of Kyang-ning, the capital of the extensive province of Kyang-nan, where it is principally produced, and which also furnishes the greater part of the green teas. In the East, the man-

ufacture is wholly confined to China. The cloth is usually of a yellowish, though occasionally it is of a blue color, and of different degrees of fineness; the broad pieces called "the Company's nankeens," are generally of a better quality than the narrow ones, and are most esteemed. The color, whether yellow or blue, is given to the cloth by dyeing; for though yellow cotton wool be raised in the East, the cloth made from it is too glaring. The nankeens brought to England come under the general denomination of piece goods. They are mostly made into trousers and waistcoats for gentlemen's wear during summer, ladies' pelisses, etc. In some of the more southern parts of Europe, the warmer parts of Asia and America, and the British settlements in Africa, nankeen is worn by both sexes all the year round, and constitutes the principal article of attire. Latterly, however, they have become unfashionable in this country, and their importation has, in consequence, all but ceased. See article CANTON.

Nankin, or Nanking ("court of the South"), a city, and the ancient capital of China, capital of the province of Kiangsu, near the Yang-tze-Kiang, about 90 miles from its mouth. Lat. 32° 2' N., long. 118° 49' E. Population estimated at 400,000. Its ancient walls can be traced over hill and dale for 85 miles, but Nankin has so greatly declined since the transference of the seat of empire to Peking by Kublai-khan in the 13th century, that the modern walls are of much less extent, and the city scarcely occupies one eighth part of the surface inclosed by them, and it is commanded by hills especially on the east, and otherwise ill-calculated for defense. Principal objects of interest are the famous porcelain tower of 9 stories and 200 feet height, completed in 1432 at a cost, as stated, of about \$3,500,000; and the "tomb of kings" (supposed to be of the Ming dynasty, A. D. 1328 to 1621), leading to which is a fine-paved road with an avenue of gigantic armed figures. The governor's palace, and an observatory, are worthy of notice. Here are important manufactures of crape, satin of the finest quality, paper, artificial flowers, China or Indian ink, and nankeen, which hence derives its name, but is also made throughout the whole province. It is the centre of a very extensive trade, and by the great canal which crosses the Yang-tze-kiang, about 50 miles eastward, it communicates directly with Peking, to which city a good deal of fish is sent hence, among other articles. It is also the place of a grand viceroys, with authority over the Kiang provinces, of a great military dépôt, and the chief seat of literature in the empire.

Nantes, a large commercial city and sea-port of France, on the Loire, about 34 miles from its mouth, in lat. 47° 13' 6" N., long. 1° 32' 44" W. Population, in 1851, 96,362. Vessels drawing 18 and 19 feet water come up to Palmbeuf, about 24 miles lower down the river; but no vessel, drawing more than 11 or 12 feet can come up to the city, unless at high water a day or two before full and change. There are three entrances to the Loire. The first and most generally frequented is between the bank called *Le Four* and *Point Croisic*; there is a second between *Le Four* and the bank called *La Blanche*; and the third, which in southerly winds is much resorted to, between the latter and the rocks called *La Couronne*. The navigation, which is naturally rather difficult, has been much facilitated by the erection of light-houses and beacons. Of the former, one has been recently constructed on the north part of *Le Four*, about a league from *Croisic*, in lat. 47° 17' 53" N., long. 2° 38' 3" W. It is 56 feet high. The Light is a revolving one; the flash, which continues for 7 seconds, being succeeded by a dark interval of 53 sec-

onds. Two light-houses, called the Alguillon lights, stand on the north side of the river, near its mouth; the lower light, adjoining *Point de Levi*, being in lat. 47° 14' 33" N., long. 2° 15' 46" W. The light is fixed, and is 111 feet above the level of the sea. The upper Alguillon light, situated about a mile N. 81° E. from the lower, is 127 feet high; it also is a fixed light, varied, however, by a flash every 3 minutes. A beacon tower, called the Turk, is erected on the southernmost extremity of *La Blanche*, the course for vessels entering between it and *La Couronne*, is to bring the Alguillon lights in one. The depth of water on the bar at the mouth of the river varies from 2 to 2½ fathoms. At springs the rise is 14, and at neaps 7 or 8 feet. High water at full and change 3½ hours.

Her situation renders Nantes the emporium of all the rich and extensive country traversed by the Loire, so that she has a pretty considerable import and export trade, particularly with the West Indies. The exports consist of all sorts of French produce, but principally of brandy, wine and vinegar, silk, woolen and linen goods, refined sugar, wheat, rye, biscuits, &c. The principal imports are sugar, coffee, and other colonial products, cotton, indigo, timber, hemp, &c. Nantes is a considerable entrepôt for the commerce of salt, large quantities being made in the Department, principally at *Nolmunters* and *Criste*. During the time that the slave trade was carried on, Nantes was more extensively engaged in it than any other French port. The custom duties of Nantes, exclusive of those on salt, produced, in 1851, 10,817,000 francs; she being in this respect inferior only to *Marseille*, *Havre*, and *Bordeaux*. There belonged to the port, except river craft, coasters, and steamers, on the 31st December, 1851, 569 ships, of the burthen of 68,121 tons.

The port charges levied on vessels of the United States are the same, as far as the port charges levied on French vessels, except the tonnage duty, which is 94 cents per ton register, the same as the French vessels pay in the United States. The transshipment in vessels of the United States of goods is permitted to any port, except from a French port to another French port, which would be considered as a coasting trade; and no vessels of any nation whatsoever are allowed to do that trade, except the Spanish vessels, Spain having an ancient treaty with France to that effect.

AMOUNT AND CHARACTER OF THE PORT CHARGES LEVIED ON AMERICAN VESSELS AND FRENCH VESSELS AT THE PORT OF NANTES, THE VESSEL BEING SUPPOSED TO BE OF A BURDEN OF 200 TONS PER REGISTER, AND DRAWING 11 FEET AMERICAN.

Pilotage.—Vessels under 80 tons (if French or assimilated by treaty) are not obliged to take a pilot at sea, but must have one for the river. The rates, which are fixed by law, are paid by the *foot* from the sea to *Palmbœuf*, and *from thence* to Nantes for all vessels under 80 tons. Above 80 tons, they are per ton. The master of a vessel bound to *Palmbœuf* or Nantes has merely to give a note to the pilot stating where the pilot boarded him, where he left him, the name and draught of water of his vessel in *English* feet. The note will be deposited at the pilot's office, and the pilotage be received from the ship's broker. No foreign vessel, however small, can be removed from the anchorage to another, or to or from a quay,

but by a pilot. Every vessel is boarded at *St. Nazaire*, and if she has a foul bill of health, or disease on board, is instructed where to go. *River Dues* on vessels ascending from *Palmbœuf* to Nantes are about 1½d. per ton. At *Palmbœuf*, and below it, none are levied. If a vessel under sail causes damage to another that is properly moored, she must pay all the expenses of repairs; if to a vessel at single anchor (unless intentionally done) or under sail, the expense of the repairs of both are added together, and each pays a moiety. The same rule is enforced if damage be caused by one vessel properly moored driving on board another in the same situation; but if either were riding at single anchor, the one properly moored is indemnified; if both were at single anchor, both bear the loss alike.

Naples, a large city and sea-port in the south of Italy, the capital of the kingdom of the same name, the light-house being in lat. 40° 50' 12" N., long. 14° 14' 16" E. Population, in 1851, 416,475. Naples is well situated for commerce; but the policy of the government has hitherto been most unfavorable to its growth, and has confined it within comparatively narrow limits. The Bay of Naples is spacious, and is celebrated for its picturesque views. The harbor is formed by a mole, built nearly in the form of the letter L, having a light-house on its elbow. Within the mole there is from 3 to 4 fathoms water, the ground being soft. The water in the bay is deep, and there is no bar; it is, however, a good deal exposed to the south-westerly winds; and to guard against their effects, vessels lying in the bay moor with open hawse in that direction. There is no obligation to take a pilot on board, but it is usual to take one the first time that a ship anchors within the mole. The light-house has a revolving light. The period of revolution is 2 minutes, during the first of which the full strength of the light is continued, and during the second minute its brilliancy rapidly decreases. The height of the light is 161 feet above the sea, and it is visible at the distance of 18 or 20 miles. At the extremity of the mole is a low fixed light to guide vessels round its head.

EXPORTS FROM THE CONTINENTAL STATES OF THE TWO SICILIES, BY LAND AND BY SEA, IN NATIONAL AND FOREIGN VESSELS, IN EACH YEAR FROM 1840 TO 1850, BOTH INCLUSIVE.

Years.	By sea.				Total values.
	By land.	In national vessels.	In foreign vessels.

1848	262,700	6,268,595	8,184,888	9,890,678	1,653,318
1849	251,545	5,861,960	4,962,691	13,776,696	2,296,016
1850	429,823	9,480,914	4,840,629	14,760,429	2,460,070

The exports principally consist of the products of the adjacent country. Of these, silk is the most important. Olive oil is also a most important article; but it is principally supplied by *Gallipoli*, a town in the *Terra d'Otranto*, whence it is commonly called *Gallipoli* oil. The entire exports of oil from the kingdom of Naples have been estimated at about 200,000 salme, or 36,393 tons, a year, which, taking its mean value when exported at £100 per ton, is equivalent to the annual sum of \$3,633,300. See *OLIVE OIL*. The other articles of export are wool, wine, brandy, dried fruits, red and white argol, tallow, liquorice, cloves, madder, hemp, linseed, cream of tartar, bones, lamb and kid skins, oak and chestnut staves, rags, saffron, &c. There is a great variety in the Neapolitan wines. The most esteemed is the *lacrima Christi*, a red luscious wine, better known in England by name than in reality, the first growths being confined to a small quantity only, which is chiefly reserved for the royal

cellars. The one-rate wine such as the are sold are largely exported sweet wine, *cient and M* at Naples d vintage. cellars. There are, however, large quantities of second-rate wines produced in the vicinity of Naples, such as those of Pozzuoli, Ischia, Nola, etc., which are sold under the name of *lacrima Christi*, and are largely exported. Several parts of Calabria produce sweet wines of superior quality.—*HERKENSON'S Ancient and Modern Wines*, p. 239. The price of wine at Naples depends entirely on the abundance of the vintage. The imports consist principally of cottons and cotton twill, hardware, iron and tin, woollens, sugar, coffee, indigo, spices, &c. Naples is a good market for pitchards, and it requires a large supply of dried and barreled cod.

"The existing regulations as to commercial intercourse with the United States appear fixed. When our treaty, however, shall expire, if not renewed, a change may follow, as well for tonnage dues as for the additional 10 per cent. on the duties of merchandise. I know of no privileges permitted to the commerce of other nations which are denied to the United States, nor are there any restrictions on the commerce of other nations and not on the United States. The amount and character of the port charges and other dues levied on vessels of the United States are as follows: *On entry*.—Tonnage, 4 grains, or 3 and one fifth cents per ton, when there is a treaty; without treaty and indirect voyage, 40 grains, or 32 cents per ton. Light money, \$1; presentation of manifest, \$1; custom-house visit, 80 cents; liquidation of manifest and boleto, 35 cents; customary present, 60 cents. Total amount on entry, except tonnage, \$3.75. *On clearance*.—Bilgetto of departure, \$1; bill of health, \$1; roll of police, 25 cents; roll of port, 25 cents; usual present, 60 cents; "spozizioneri," or broker's commission, \$2. Making a total amount on clearance of \$5.10. National vessels pay the same, but the presents are greater by them. The health officer has for granting pratique on arrival \$5. Should the vessel be subject to quarantine, the charges increase according to circumstances, and still more so when sent to *Visita* to perform it. Transhipment in vessels of the United States of goods, either to another port in the kingdom or to a foreign port is prohibited, as well as in other vessels, except the Neapolitan steamboats. It is allowed by favor when the manifest, on arrival, specifies the goods and the port to which they are intended to be transhipped.

"Exports from this port have been put on board free of any duty, at prices as follows: Refined argols, at 20 cents per pound; refined yellow pink, at 25 cents per pound; cream tartar, at 25 cents per pound; licorice paste (Cotigliano) at 15 cents per pound; licorice, Barocco and other, at 15 to 154 cents per pound; olive oil, in casks, at 78 cents per gallon; oranges, per box, \$2.20 to \$2.25; lemons, \$1 to \$3.20; filberts, 44 cents per pound; walnuts, 5 cents per pound. There have been exported during the year, from the first of July last, about 60,000 lbs. of sewing silks—first, second, and third qualities—at \$4.20, \$3.80, and \$3.60 per lb. of 16 oz.; also about 25,000 lbs. of such silks, raw or undyed, at \$3 per lb. of 16 oz. These are shipped by steamers for Marseilles or Liverpool for the most part. In like indirect way are also sent clay pipes with reed tubes, of little value, musical strings, coral and lava ornaments, but no prices can be quoted, as their value depends on the beauty of the article and the execution of the work. Between wholesale and retail prices there may be a difference of about 10 per cent. Five or six foreign vessels (Neapolitan and English) have loaded in part with oranges and lemons for the United States, and gone to Sicily to fill up, or first take a part cargo in Sicily and fill up here. About 20,000 boxes are shipped in the year from this port, but the prices vary continually; they are now double what they were in the beginning of the season."—*Com. Rel. U. S.*, 1856-7.

Commercial Policy.—The policy of the Neapolitan

government with respect to commerce was for a lengthened period the most objectionable that can well be imagined. Articles, whether of import or of export, were burdened, alike, with oppressive duties and restrictions; and even the warehousing of foreign goods could hardly be said to be permitted. Of late, however, we are glad to observe, the administration appears to have become alive to the injurious influence of this *felo de se* system, and has given its sanction to several measures of a comparatively liberal character.

The duties on imports have also undergone various modifications. Those on fish, sugar, and other colonial products, have been reduced fully a half. But we submit in illustration of these changes the following statement of the old and new rates of duty on certain articles:

		Old duty.		New duty.	
		duc. c.	duc. c.	duc. c.	duc. c.
Herrings.....	cantar gross	5 51	3 0		
Codfish.....	" "	5 7	3 20		
Coena.....	" "	16 50	8 0		
Coffee.....	" "	24 75	12 0		
Camphor, raw.....	" "	35 0	24 0		
" refined.....	" "	1 12	0 70		
Cinnamon, in sorts.....	rotto	1 54	0 60		
Cassia lignea, of any sort.....	cantar	50 0	30 0		
Cloves.....	" "	77 0	30 0		
Nutmegs.....	rotto	1 54	0 80		
Pepper.....	" "	3 25	7 0		
Pitchards, etc.....	cantar gross	2 47	1 20		
Stockfish.....	" "	4 63	3 0		
Sugar, any kind, in powder.....	" "	22 0	10 0		
" " " in loaves.....	" "	33 0	15 0		
Vaullia.....	" "	2 78	1 80		

We have no doubt that the beneficial influence of these wise and liberal measures will lead to further changes. The duties on iron, with those on cottons, woollens, and other descriptions of manufactured goods, are a great deal too high. These duties are imposed partly for the sake of revenue, and partly in the view of encouraging domestic manufactures; but they have not accomplished either object. See *TWO SICILIES AND ITALY*.

Naphtha. A limpid bitumen, which exudes from the earth upon the shores of the Caspian and some other eastern countries. Near the village of Amiano, in the State of Parma, there exists a spring which yields this substance in sufficient quantity to illuminate the city of Genoa, for which purpose it is employed. It has a peculiar odor, and generally a yellow color, but may be rendered colorless by distillation. Its specific gravity is about 0.75. It boils at about 160°. It is highly inflammable, burning with a white smoky flame. It appears to be a compound of 36 of carbon with 5 of hydrogen, and is therefore a pure hydro-carbon. A liquid very similar to mineral naphtha is obtained by the distillation of coal tar. It has sometimes been used in lumps, but is apt to smoke. This variety of naphtha is in great request as a solvent for caoutchouc.

Napier, John, Baron of Merchiston. Celebrated as the inventor of Logarithms. Born 1550, and educated at the university of St. Andrews. On returning from his travels, in 1574, his learning and accomplishments attracted great attention, and would have raised him to the highest offices of State; but, declining all civil employment, he devoted himself to scientific researches and to theology. In 1614 he published his *Logarithmorum Canonis Descriptio*. To Napier science is indebted for considerable improvements in spherical trigonometry, &c. He is principally celebrated, however, by his *Rabology and Promptuary of Multiplication*, or instruments and tables for the more easy performance of great arithmetical operations, connected with which were the rods of ivory, &c., known as *Napier's bones*. In addition to his scientific treatises, he wrote several works on theological subjects. He died in 1617, in his 68th year, and was buried in the cathedral of St. Giles, at Edinburgh.

Narrows, The, a channel between Long Island and Staten Island, connecting New York Bay with the Atlantic, nine miles south of New York. The channel is 1900 yards wide, and is well defended by forts and batteries.

Natal, a colonial possession of Great Britain, on the south-east coast of Africa, between lat. 27° 40' and 30° 40' S., and long. 29° and 31° 10' E., having south-east the Indian Ocean, west, the Drakenberg, or Kahlamba Mountains, separating it from the territory between the Orange and Vaal Rivers, recently annexed to the Cape Colony; and north-east the Zoolofo and Tugela Rivers, dividing it from the Zuloo country. Estimated area, 18,000 square miles. Population uncertain. Surface undulating, well watered, and mostly covered with tall grass. Timber in the interior grows only in clumps, but the sea-coast is bordered by a belt of mangroves. Climate most healthy, and the soil is reported to be far more fertile than in the Cape Colony. Cotton and indigo grow wild, and the former has been produced for exportation, of the finest quality. Sugar, coffee, wheat, oats, beans, and tobacco, are important crops. Superior coal has been found in the interior; building stone is found all over its surface, and iron ore is abundant. Butter, corn, hides, ivory, tallow, tobacco, cotton, and wool, were lately among the chief exports. Value of exports in 1851, \$15,000. Imports same year, valued at \$280,000. The territory, which is a dependency of the Cape of Good Hope, is administered by a lieutenant-governor, assisted by an executive and a legislative council.

It is subdivided into the districts D'Urban, Pietermaritzburg, Umvoti, Impafane, Upper Tugela, and Umzinzate, exclusive of a tract in the south, hitherto without an established magistracy. Pietermaritzburg, the capital, is 50 miles inland from *Port Natal*, which is near the centre of the coast line. This colony derives its name from the fact of its having been discovered on Christmas day (1493), by the Portuguese. It was revisited in 1575 by order of King Sebastian.

National Debt. The first mention of parliamentary security for a debt of the English nation, occurs in the reign of Henry VI. The present national debt commenced in the reign of William III. It had amounted, in the year 1697, to about five millions sterling, and the debt was then thought to be of alarming magnitude.

1702, On the accession of Queen Anno, the debt amounted to.....	£14,000,000
1714, On the accession of Geo. I.....	54,000,000
1749, Geo. II.; after the Spanish war.....	78,000,000
1763, Geo. III.; end of the 7 years' war.....	139,000,000
1798, Three years after the American war.....	368,600,000
1798, The civil and foreign war.....	462,000,000
1802, Close of the French revolutionary war.....	571,000,000
1814, Close of the war against Bonaparte.....	585,000,000
1817, When the Irish and English exchequers were consolidated.....	843,292,477
1830, Total amt of the funded and unfunded debt.....	\$40,184,023
1840, Total amount of ditto.....	789,578,000
1845, Funded debt.....	768,739,000
1857, ".....	780,000,000

The national debt of the United States originated in consequence of the expenses incurred during the revolutionary war, and amounted in the year 1791 to about \$75,000,000. The revenue of the government enabled it to curtail the debt until the year 1812, when it was only \$45,000,000. The war with England in 1812-15, added largely to this debt, the loans necessary for war expenditures being raised at a considerable loss. At the end of the war the debt was over \$108,000,000. This was rapidly curtailed, and by the year 1835 was fully liquidated, besides an appropriation of several millions of surplus revenue to the individual States. In 1839, the revenue was less than the expenditure, and another debt was created which had been nearly liquidated up to the year 1845, when the war with Mexico rendered further loans necessary. The

progress of the national debt from 1701 to 1857 was as follows:

Years.	Fund-U. S.	Years.	Debt-U. S.

For funded debts of various European nations, see article EUROPE, p. 622.

Naval Architecture. In the small space we can assign to this subject we shall merely endeavor to convey a general notion of the principles and process of construction. Ships are built in different forms, according to the service they are intended for, and the burdens they have to carry. It is in men-of-war, which, besides possessing in an eminent degree the general qualities of a ship, have to support a heavy armament of cannon, and which are destined to severe and long-continued service, that the principles of construction have been carried to the greatest perfection. The form of the ship, her strength, or the scantling necessary for the services required of her, are, from our imperfect knowledge of hydrodynamics, the results of experience alone. When a ship is to be built, her form is projected in three different planes perpendicular to each other.

1st. The *sheer draught*, which is the side view, or projection on the plane of the keel. On this are laid off the length, the heights of all the parts from the keel, the position and rake of the stem and sternpost, the principal frames or timbers of the sides, the ports, deck, channells, place of the greatest breadth or midship frame, stations of the masts, &c. The frames before the midship frame are distinguished by letters; abaft it, by numbers. The midship frame is not exactly in the middle of the length, but rather before it.

2d. The *body plan*, or end view. This shows the contour of the sides of the ship at certain points of her length, and since the two sides are exactly alike, the left half represents the vertical sections in the after part of the body, and the right-hand half those in the fore part. The base of the projection is the midship, or largest section, called also the *dead flat*, within which the other sections are delineated. On this are exhibited also the beams of the decks.

3. The horizontal or floor plan, called also the *half breadth plan*. The base of this is the section made by the horizontal surface of the water and the outside surface of the ship, and is called the *upper water line*, or *load water line*. If the ship now be supposed to be lightened uniformly, she will exhibit another water line, and thus any number of like parallel sections at equal distances down to the keel. On this projection the water lines appear as curves, on the sheer draught as straight lines parallel to the keel. These three sec-

tions any two of these loft, a The In the piles of a decl foot. its con keel is furthe fact, t and in connec the ste the ke At the pl is hun, other layer o ward a the Mo the kee like tin ends. shifting. Th to receiv of the ri lining th are shor son for t the well water, to the b

less both places are on the same meridian, or both on the equator, when the rhumb line and great circle coincide. The *difference of latitude* between any two places is an arc of a meridian intercepted between the parallels of latitude on which the places are situated; and the *difference of longitude* is the arc of the equator, or the angle at the pole included between the meridians of the places. Hence, when the latitudes or the longitudes of two places are of the same denomination with respect to north or south, east or west, the difference is found by subtracting the less from the greater; but when of different denominations, what is called their difference is found by taking their sum. See LATITUDE, LONGITUDE.

Navigation owes its origin to the Phenicians, about 1500 n.c. The first laws of navigation originated with the Rhodians, 916 n.c. The first account we have of any considerable voyage is that of the Phenicians sailing round Africa, 604 n.c.—**BIANA.** On the destruction of Thebes by Alexander the Great, 335 n.c. its commerce passed to Alexandria, and subsequently the Romans became the chief masters of commerce. It passed successively from the Venetians, Genoese, and Hanse Towns, to the Portuguese and Spaniards; and from these to the English and Dutch.—**HAYDN.**

Navigation Laws. These laws form an important branch of maritime law. In this country they are understood to comprise the various acts that have been passed, defining the way in which ships are to be manned, the peculiar privileges enjoyed by them, and the conditions under which foreign ships shall be allowed to engage in the trade of the country, either as importers or exporters of commodities, or as carriers of commodities from one part of the country to another.

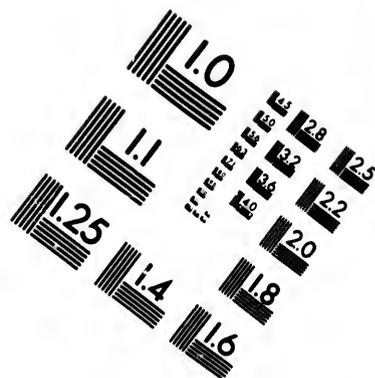

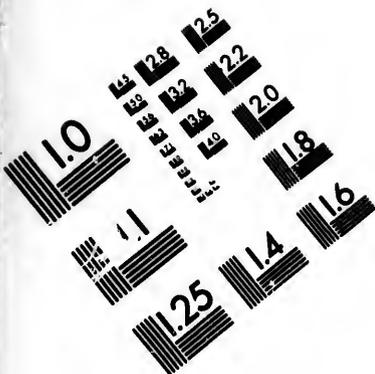

Sketch of the History and Principles of the Navigation Laws.—The origin of the navigation laws of England, which are the foundation of ours, may be traced to the reign of Richard II., or perhaps to a still more remote period. But, as no intelligible account of the varying and contradictory enactments framed at so distant an epoch could be compressed within any reasonable space, it is sufficient to observe, that in the reign of Henry VII., two of the leading principles of the navigation law were distinctly recognized, in the prohibition of the importation of certain commodities, unless imported in ships belonging to English owners, and manned by English seamen. In the early part of the reign of Elizabeth (5 Eliz. c. 5), foreign ships were excluded from the fisheries and coasting trade. The republican Parliament gave a great extension to the navigation laws, by the act of 1650, which prohibited all ships, of all foreign nations whatever, from trading with the plantations in America, without having previously obtained a license. These acts were, however, rather intended to regulate the trade between the different ports and dependencies of the empire, than to regulate intercourse with foreigners. But in the following year (9th of October, 1651), the republican Parliament passed the famous *Act of Navigation*. This act had a double object. It was intended not only to promote British navigation, but also to strike a decisive blow at the naval power of the Dutch, who then engrossed almost the whole carrying trade of the world, and against whom various circumstances had conspired

to incense the English. The act in question declared, that no goods or commodities whatever, of the growth, production or manufacture of Asia, Africa or America, should be imported either into England or Ireland, or any of the plantations, except in ships belonging to English subjects, and of which the master and the greater number of the crew were also English. Having thus secured the import trade of Asia, Africa and America, to the English ship-owners, the act went on to secure to them, as far as that was possible, the import trade of Europe. For this purpose, it further enacted, that no goods of the growth, production, or manufacture of any country in Europe, should be imported into Great Britain, except in British ships, or in such ships as were the real property of the people of the country or place in which the goods were produced, or from which they could only be, or most usually were, exported. The latter part of the clause was entirely leveled against the Dutch, who had but little native produce to export, and whose ships were principally employed in carrying the produce of other countries to foreign markets. Such were the leading provisions of this famous act. They were adopted by the royal government which succeeded Cromwell, and form the basis of the act of the 12th Car. 2, which continued, to a very recent period, to be the rule by which naval intercourse with other countries was mainly regulated; and has been pomposely designated the *Charter Maritime of England*!

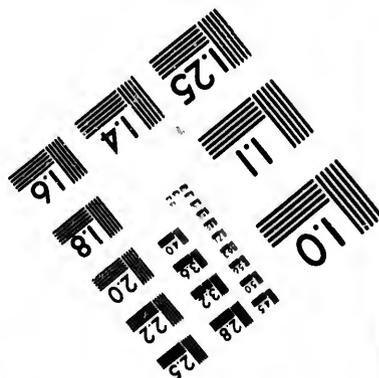

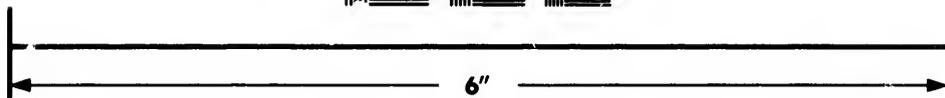

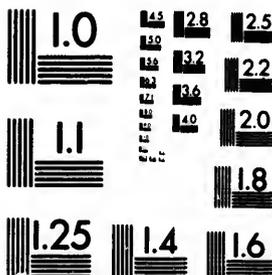

American View of the Rights of Navigation.—The liberty of passage to be enjoyed by one nation through the dominions of another, was treated by the most eminent writers on public law, as a qualified, occasional exception to the paramount rights of property. They made no distinction between the right of passage by a river, flowing from the possessions of one nation through those of another, to the ocean, and the same right to be enjoyed by means of any highway, whether of land or water, generally accessible to the inhabitants of the earth. The right of passage, then, must hold good for other purposes, besides those of trade; for objects of war as well as for those of peace; for all nations, no less than for any nation in particular, and be attached to artificial as well as to natural highways. The principle could not, therefore, be insisted on by the American government, unless it was prepared to apply the same principle by reciprocity, in favor of British subjects, to the navigation of the Mississippi and the Hudson, access to which from Canada might be obtained by a few miles of land carriage, or by the artificial communication created by the canals of New York and Ohio. Hence the necessity which has been felt by the writers on public law, of controlling the operation of a principle so extensive and dangerous, by restricting the right of transit to purposes of innocent utility, to be exclusively determined by the local sovereign. Hence the right in question is termed by them an imperfect right. But there was nothing in these writers, or in the stipulations of the treaties of Vienna, respecting the navigation of the great rivers of Germany, to countenance the American doctrine of an absolute natural right. These stipulations were the result of mutual consent, founded on considerations of mutual interest growing out of the relative situation of the different States concerned in this navigation. The same observation would apply to the various conventional regulations which had been at different periods applied to the navigation of the River Mississippi. As to any supposed right derived from the simultaneous acquisition of the St. Lawrence by the British and American people, it could not be allowed to have survived the treaty of 1783, by which the independence of the United States was acknowledged, and a partition of the British dominions in North America was made between the new government and that of the mother country.

This argument, it was replied, on the part of th

United States, that, if the St. Lawrence were regarded as a strait connecting navigable seas, as it ought probably to be, there would be less controversy. The principle on which the right to navigate straits depends, is, that they are accessorial to those seas which they unite, and the right of navigating which is not exclusive, but common to all nations; the right to navigate the seas drawing after it that of passing the straits. The United States and Great Britain have between them the exclusive right of navigating the lakes. The St. Lawrence connects them with the ocean. The right to navigate both (the lakes and the ocean), includes that of passing from one to the other through the natural link. Was it then reasonable or just that one of the two co-proprietors of the lakes should altogether exclude his associate from the use of a common bounty of nature, necessary to the full enjoyment of them? The distinction between the right of passage, claimed by one nation through the territories of another, on land, and that on navigable water, though not always clearly marked by the writers on public law, has a manifest existence in the nature of things. In the former case, the passage can hardly ever take place, especially if it be of numerous bodies, without some detriment or inconvenience to the State whose territory is traversed. But in the case of a passage on water no such injury is sustained. The American government did not mean to contend for any principle, the benefit of which, in analogous circumstances, it would deny to Great Britain. If, therefore, in the further progress of discovery, a connection should be developed between the Mississippi and Upper Canada, similar to that which exists between the United States and the St. Lawrence, the American government would be always ready to apply, in respect to the Mississippi, the same principles it contended for in respect to the St. Lawrence. But the case of rivers, which rise and debouch altogether within the limits of the same nation, ought not to be confounded with those which, having their sources and navigable portions of their streams in States above, finally discharge themselves within the limits of other States below. In the former case, the question as to opening the navigation to other nations, depended upon the same considerations which might influence the regulation of other commercial intercourse with foreign States, and was to be exclusively determined by the local sovereign. But in respect to the latter the free navigation of the river was a natural right in the upper inhabitants, of which they could not be entirely deprived by the arbitrary caprices of the lower States. Nor was the fact of subjecting the use of this right to treaty regulations, as was proposed at Vienna to be done in respect to the navigation of the European rivers, sufficient to prove that the origin of the right was conventional, and not natural. It often happened to be highly convenient, if not sometimes indispensable, to avoid controversies, by prescribing certain rules for the enjoyment of a natural right. The law of nature, though sufficiently intelligible in its great outlines and general purposes, does not always reach every minute detail which is called for by the complicated wants and varieties of modern navigation and commerce. Hence the right of navigating the ocean itself, in many instances, principally incident to a state of war, is subjected, by innumerable treaties, to various regulations. These regulations—the transactions of Vienna, and other analogous stipulations—should be regarded only as the spontaneous homage of man to the permanent Lawgiver of the universe, by delivering his great works from the artificial shackles and selfish contrivances to which they have been arbitrarily and unjustly subjected.—WHEATON'S *International Law*, pp. 268-266.—[This chapter in Mr. WHEATON'S work furnishes the best view, in brief, of the rights of navigation of the St. Lawrence, the Mississippi, the Rhine, and of the rights of Territory.—Ems. C. of C.]

Laws of trade and navigation can not affect foreigners, beyond the territorial limits of the State, but they are binding upon its citizens, wherever they may be. Thus, offenses against the laws of a State, prohibiting or regulating any particular traffic, may be punished by its tribunals, when committed by its citizens, in whatever place; but if committed by foreigners, such offenses can only be thus punished when committed within the territory of the State, or on board of its vessels, in some place not within the jurisdiction of any other State.—WHEATON, *Int. Law*, p. 175.

Claims to Portions of the Sea upon the Ground of Prescription.—Besides those bays, gulfs, straits, mouths of rivers, and estuaries which are inclosed by capes and headlands belonging to the territory of the State, a jurisdiction and right of property over certain other portions of the sea have been claimed by different nations, on the ground of immemorial use. Such, for example, was the sovereignty formerly claimed by the republic of Venice over the Adriatic. The maritime supremacy claimed by Great Britain over what are called the Narrow Seas, has generally been asserted merely by requiring certain honors to the British flag in those seas, which have been rendered or refused by other nations, according to circumstances, but the claim itself has never been sanctioned by general acquiescence. Straits are passages communicating from one sea to another. If the navigation of the two seas thus connected, is free, the navigation of the channel by which they are connected ought also to be free. Even if such strait be bounded on both sides by the territory of the same sovereign, and is at the same time so narrow as to be commanded by cannon shot from both shores, the exclusive territorial jurisdiction of that sovereign over such strait is controlled by the right of other nations to communicate with the seas thus connected.

Such right may, however, be modified by special compact, adopting those regulations which are indispensably necessary to the security of the State whose interior waters thus form the channel of communication between different seas, the navigation of which is free to other nations. Thus the passage of the strait may remain free to the private merchant vessels of those nations having a right to navigate the sea it connects, while it is shut to all foreign armed ships in time of peace.—WHEATON'S *Int. Law*, pp. 238-240.

Navigation of the Mississippi.—By the treaty of peace concluded at Paris in 1763, between France, Spain, and Great Britain, the province of Canada was ceded to Great Britain by France, and that of Florida to the same power by Spain, and the boundary between the French and British possessions in North America was ascertained by a line drawn through the middle of the River Mississippi, from its source to the Iberville, and from thence through the latter river and the lakes of Maurepas and Pontchartrain to the sea. The right of navigating the Mississippi was at the same time secured to the subjects of Great Britain from its source to the sea, and the passages in and out of its mouth, without being stopped or visited, or subjected to the payment of any duty whatsoever. The province of Louisiana was soon afterwards ceded by France to Spain; and by the treaty of Paris, 1763, Florida was retroceded to Spain by Great Britain. The independence of the United States was acknowledged, and the right of navigating the Mississippi was secured to the citizens of the United States and the subjects of Great Britain by the separate treaty between these powers. But Spain, having thus become possessed of both banks of the Mississippi at its mouth, and a considerable distance above its mouth, claimed its exclusive navigation below the point where the southern boundary of the United States struck the river.

This claim was resisted, and the right to participate

in the navigation of the river from its source to the sea was insisted on by the United States, under the treaties of 1763 and 1783, as well as by the law of nature and nations. The dispute was terminated by the treaty of San Lorenzo et Real, in 1795, by the 4th article of which his Catholic majesty agreed that the navigation of the Mississippi, in its whole breadth, from its source to the ocean, should be free to the citizens of the United States; and by the 22d article they were permitted to deposit their goods at the port of New Orleans, and to export them from thence, without paying any other duty than the hire of the warehouses. The subsequent acquisition of Louisiana and Florida by the United States having included within their territory the whole river from its source to the Gulf of Mexico, and the stipulation in the treaty of 1783, securing to British subjects a right to participate in its navigation, not having been renewed by the treaty of Ghent in 1814, the right of navigating the Mississippi is now vested exclusively in the United States.—WHEATON'S *Int. Law*, pp. 257, 268. The navigation of the continuous waters of the United States and Canada is provided for in the following articles of the treaty of June 5, 1854. The third article, whose operation may be affected at the will of the American government, by a suspension of this privilege, as stipulated in the fourth article, on the part of Great Britain, provides for a reciprocal trade, free of duty, between the United States and the British colonies, in the articles of their respective growth and produce, as enumerated in the schedule thereto annexed.

"It is agreed that the citizens and inhabitants of the United States shall have the right to navigate the River St. Lawrence and the canals in Canada, used as the means of communicating between the Great Lakes and the Atlantic Ocean, with their vessels, boats, and crafts, as fully and freely as the subjects of her Britannic majesty, subject only to the same tolls and other assessments as now are, or may hereafter be, exacted of her majesty's said subjects; it being understood, however, that the British government retains the right of suspending this privilege on giving due notice thereof to the government of the United States. It is further agreed, that if at any time the British government should exercise the said reserved right, the government of the United States shall have the right of suspending, if it think fit, the operation of article 8, of the present treaty, in so far as the province of Canada is affected thereby, for so long as the suspension of the free navigation of the River St. Lawrence or the canals may continue. It is further agreed that British subjects shall have the right freely to navigate Lake Michigan with their vessels, boats, and crafts, so long as the privilege of navigating the River St. Lawrence, secured to Americans by the above clause of the present article, shall continue; and the government of the United States further engages to urge upon the State governments to secure to the subjects of her Britannic majesty the use of the several State canals, on terms of equality with the inhabitants of the United States."—WHEATON'S *Int. Law*, pp. 266, 267. [A full understanding of this subject, and of the able views of Mr. WHEATON, can be had only by a careful reading of his elaborate and highly-prized work on *International Law*.—Eos. C. of C.]

Navigators' Islands. A group of islands in the southern Pacific Ocean, remarkable for their extent, fertility, and population. They are about 10 in number, and are situated between 169° and 172° 30' W. long., and from lat. 18° 25' to an uncertain boundary southward. When seen from the ocean, they present a lofty appearance, and are mountainous, but neither surrounded with a low border nor inclosed by reefs, like the Society Islands. The first discovery of these islands was made in 1722, by Roggewin and Banman, who fell in with the easternmost of the number; while Bougainville, in 1768, added another; and Porouse, in

1787, discovered the two westernmost, which are the largest, being more than 40 miles in length. The last navigator was informed of three more to the southward. The whole group was visited in 1791 by Captain Edwards. The inhabitants are a stout and well-made race, of the ordinary height of 5 feet 9 or 11 inches. They are altogether savage in their manners, which are said to be remarkably indecent. They are also of the most ferocious disposition. The least dispute between them is followed by blows from clubs, sticks, or paddles, and is often attended with the loss of life. They are very ingenious, and fashion their work dexterously with hatchets shaped like adzes, and made of very fine and compact basalts. With these they finish works in wood, and give them so high a polish that they appear to be coated with the finest varnish. They also manufacture a species of cloth which possesses great strength and pliability, and is well calculated for the sails of canoes. The name of Navigators' Islands was bestowed by Bougainville, from the practice which prevails among the inhabitants of continually traveling in canoes. We have no data upon which we can calculate the amount of the population, but it must be considerable, considering that these islands are among the most fertile in the South Seas.

Navy Department. The Navy Department was created by an act of Congress, 30th April, 1798, and is under the direction of the Secretary of the Navy. The Department conducts its business in several bureaux, namely, the Bureau of Docks and Navy Yards; the Bureau of Ordnance and Hydrography; the Bureau of Construction, Equipments, and Repairs; the Bureau of Provisions and Clothing; the Bureau of Medicine and Surgical Instruments, etc.; and the National Observatory at Washington is under the charge of this Department. The ministerial duties of these several bureaux were formerly exercised by a Board of Navy Commissioners.

Secretaries of the Navy.—George Cabot, Mass., May 3, 1798; Benjamin Stoddard, Md., May 21, 1798; Robert Smith, Md., January 26, 1802; Jacob Crowninshield, Mass., March 2, 1805; Paul Hamilton, S. C., March 7, 1809; William Jones, Penn., January 12, 1813; Benjamin W. Crowninshield, Mass., December 17, 1814; Smith Thompson, N. Y., November 30, 1818; Samuel L. Southard, N. J., December 9, 1823; John Branch, N. C., March 9, 1829; Levi Woodbury, N. H., August, 1831; Mahlon Dickerson, N. J., June 30, 1834; James K. Paulding, N. Y., June 30, 1838; George E. Badger, N. C., March 5, 1841; Abel P. Upshur, Va., September 13, 1841; David Henshaw, Mass., July 24, 1843; Thomas W. Gilmer, Va., February 15, 1844; John Y. Mason, Va., March 14, 1844; George Bancroft, Mass., March 10, 1845; John Y. Mason, Va., 1846; William B. Preston, Va., March 7, 1849; William A. Graham, N. C., July 20, 1850; James C. Dobbin, N. C., March 5, 1853; Isaac Toucey, Conn., March, 1857.

Navy Yards of the United States.—Portsmouth, Christstown, Brooklyn, Philadelphia, Washington, Gosport, Pensacola.

Navy Dry Docks.—Charlestown, Brooklyn, N. Y., Pensacola, Gosport.

United States' Navy Squadrons.—East Indian, Pacific, African, Brazilian, Mediterranean, Home (West Indies).

Navy Hospitals.—Chelsea, Mass., New York, Portsmouth, Va., Pensacola.

Naval Magazines.—Charlestown, Mass., New York, Washington, Norfolk, Pensacola.

National Observatory, Washington; Naval Academy, Annapolis; Naval Asylum, Philadelphia.

Navy. The first fleet of galleys, like those of the Danes, was built by Alfred, A. D. 897. In the time of Henry VIII. the British navy consisted of 1 ship of 1200 tons, 2 of 800 tons, and 6 of 7 smaller; the largest was called the *Great Harry*. Elizabeth's fleet at

the time of the Spanish Armada, in 1588, consisted of only 28 vessels, none larger than frigates. — James I. added 10 ships of 1400 tons each, and 64 guns, the largest then ever built. — GIBSON'S *Camden*.

ACCOUNT OF THE PROGRESSIVE INCREASE OF THE ROYAL NAVY OF ENGLAND FROM HENRY VIII'S BRIG TO THE CLOSE OF THE WAR, 1814.

Year.	Ships.	Tons.	Men voted.	Navy estimate.
1581	16	7,360	...	no account.

Neap, or Neep Tides, are the lowest tides, being those which are produced when the attractions of the sun and moon on the waters of the ocean are exerted in directions perpendicular to each other. When the two forces act in the same or exactly opposite directions, the *spring* or highest tides are produced. The neap tides take place about four or five days before the new and full moons. See **TIDES**.

Needles. They make a considerable article of commerce, as well as of home trade in England. German and Hungarian steel is of most repute for needles. The first that were made in England were fabricated in Chapside, London, in the time of the sanguinary Mary, by a negro from Spain; but, as he would not impart the secret, it was lost at his death, and not recovered again till 1566, in the reign of Elizabeth, when Elias Growse, a German, taught the art to the English, who have since brought it to the highest degree of perfection. — STOWE. The family of the Greenings, ancestors of Lord Dorchester, established a needle manufactory in Bucks about this time. — ANDERSON.

Needles are made from the best steel, reduced by a wire-drawing machine to the suitable diameter. The manufacture is supposed to have originated in Spain, and to have been introduced into England about the year 1565, by Elias Krause, or Growse, who then settled in London. Dr. Ure, in his *Dictionary of Arts*, states that "the construction of a needle requires about 120 operations; but they are rapidly and uninterruptedly successive. A child can trim the eyes of 4000 needles per hour. When we survey a manufactory of this kind, we can not fail to observe that the diversity of operations which the needles undergo bears the impress of great mechanical refinement. In the arts, to divide labor is to abridge it; to multiply operations is to simplify them; and to attach an operative exclusively to one process, is to render him much more economical and productive." — E. A.

Nests, Esulent. A species of nests built by swallows peculiar to the Indian Islands, and very much esteemed in China and other parts of the world. These nests resemble in form those of other swallows; they are formed of a viscid substance, and in external appearance as well as consistence are not unlike fibrate ill-coagulated bluishness. Esulent nests are principally found in Java, in caverns usually situated on the seacoast. Nothing satisfactory is known as to the substance of which these nests are composed.

Net (*Fr. Filet, resseau; Ger. Netz*), is a textile fabric of knotted meshes for catching fish and other purposes. Each mesh should be so secured as to be incapable of enlargement or diminution. The French government offered in 1802 a prize of 10,000 francs to the person who should invent a machine for making nets upon automatic principles, and adjudged it to M. Buron, who presented his mechanical invention to the *Conservatoire des Arts Mériers*. It does not appear, however, that this machine has accomplished the object in view; for no establishment was ever mounted to carry it into execution. Nets are usually made by the fishermen and their families during the periods of leisure. The formation of a mesh is too simple a matter to require description in this dictionary.

Nett (*It. netto, pure*), that which remains of a weight, quantity, &c., after making certain deductions. Thus, in mercantile language, the *nett weight* is the weight of any article after deducting tare and tret; *nett profits, income, &c.*, is the absolute profit or income, after deducting expenses, interest, &c. It is opposed to *gross* (brutto).

Nettings, in a ship, a sort of grates made of small ropes seized together with rope-yarn, or twine, and fixed upon the quarters and in the tops. They are sometimes stretched upon the ledges from the waist-trees to the roof-trees, from the top of the fore-castle to the poop, and sometimes are laid in the waist of a ship to serve instead of gratings.

Netherlands (Kingdom of the), or Holland (*Du. Koningrijk der Nederlanden; Fr. Royaume des Pays Bas*), a State of western Europe, on the German Ocean (capital Amsterdam), composed of the Netherlands proper, or the ancient republic of the Seven United Provinces, and part of the Duchy of Limburg, situated between lat. 50° 43' and 53° 21' N., and long. 3° 24' and 7° 12' E., bounded east by Hanover and Prussia, south by Belgium and the Grand Duchy of Luxemburg (the south-east portion of which is held by the King of the Netherlands), and west and north by the German Ocean. Extent and population as follows:

The leading features of the new navigation laws of the Netherlands may be gathered from the following summary: 1. Unconditional repeal of discriminating favors granted to the Dutch flag, by suppression of the rules allowing to this flag preference above foreign flags. 2. Conditional similarity of flag in the navigation to and from the Netherlands' colonies. 3. Stipulations by law concerning the trade and navigation in the colonies of the realm carried on by other nations. 4. Repeal of interdiction to grant Netherlands registers to foreign-built vessels, by their admittance for registry (naturalization) at a duty of 4 per cent. of their value. 5. Diminishing of import duties on principal materials for ship-building. 6. Suspension of the shipping duties on the Rhine and Yssel. 7. Total abolition of transit duties.

Public revenue, in 1853, 71,685,772 florins, of which amount nearly half is raised by direct taxation and excise duties. Expenditure, 70,085,078 florins. National debt, 1,206,493,330 florins. The marine force in

The Netherlands is a name, which, for several centuries, was applied to the countries now forming the kingdoms of Belgium, and the Netherlands, and part of the north of France (Departments Nord and Pusde-Calaie). This country belonged almost entirely to Charles V. United to Franche-Comté, it formed the circle of Burgundy. From this seven of the north provinces separated themselves in 1579, and formed the republic of Holland, or the Seven United Provinces. Part of the low country was conquered by Louis XIV., and called the French Netherlands; the rest, first under the dominion of Spain, passed in 1714 to that of Austria, and was called Spanish Netherlands, Austrian Netherlands, or Belgium.

The fisheries formed the origin of prosperity in the Netherlands, and the herrings prepared by the Dutch still maintain their superiority. In 1842, 1603 boats, manned by 8280 men, were employed in this fishery. The whole fishery in the Sea of Spitzbergen has been profitably carried on since the 16th century. The manufacturing industry of the country is very active, Holland having long been celebrated for its linens, velvets, and paper; and during the 17th and 18th centuries, its typography enjoyed a well-merited reputation. The absence of cold, and the prevalence of strong winds, have led to the adoption of the windmill as a motive power, and it is universally employed in all kinds of work. The chief manufactures are wools of the finest quality, woollens, silks, and velvets, paper, leather, cordage, hats, ribbons, saltpetre, and tobacco. The manufacture of cotton has been recently introduced. There are numerous distilleries of "Geneva" (rather jenever, from the juniper berry, which which the gin is flavored), or "Hollands," and extensive bleach fields, brick and tile works. Holland presents the appearance of an immense net-work of canals, which form the usual access not only to towns and villages, but even to private mansions. The most important is that of North Holland, between Amsterdam and the IJelder, the finest work of the kind in Europe 55 miles in length, 125 feet broad at the surface, and 21 feet in depth. By means of this important work, ships bound for Amsterdam avoid the danger and delay of navigating the Zuyder Zee; it is spacious enough to admit 2 frigates abreast. Since not only

the surface but the bed of many of the canals is above the level of the land, the drainage of the *polders* or meadows, through which they pass, is an object of great solicitude; it is effected by means of pumps worked by wind-mills. In a country where human industry is engaged in a continual struggle with the sea, from the domaine of which it has been conquered, the management of dykes, canals, and roads, is a special object of attention on the part of the government. The roads, which are always formed on the dykes and bordered by canals, are excellent. In 1849 lines of railroad were completed from Amsterdam west to Harlein, and south to Leyden, the Hague, and Rotterdam, and south and east by Utrecht to Arnhem. The principal imports consist of colonial products and manufactured goods, corn, wines, cotton, wool, and leather, valued in 1851 at 803,993,224 florins. Chief exports are butter, cheese, dried fish, gin, the manufactures of the country, and colonial produce; valued at 242,744,806 florins.

A letter from the United States' consul at the Hague gives the annexed information, under date of July 20, 1855: "The second Chamber has, by a vote of 48 to 7, passed the bill abolishing the tonnage dues. The deficit in the revenues, caused by this bill, is calculated at 500,000 francs a year, and is to be covered by an additional excise duty on refined sugar, which has also been passed by the Chamber. The abolition of the tonnage dues, and of the still more vexatious malt tax, has been hailed throughout the country with joy as an indication of a progressive policy, to which the present ministry has appeared but little inclined till now."

Neutrals. *Of the General Rights and Duties of Neutral Nations.*—The rights and duties which belong to a state of neutrality form a very interesting title in the code of international law. They ought to be objects of particular study in this country, inasmuch as it is our true policy to cherish a spirit of peace, and to keep ourselves free from those political connections which would tend to draw us into the vortex of European contests. A nation that maintains a firm and scrupulously impartial neutrality, and commands the respect of all other nations by its prudence, justice, and good faith, has the best chance to preserve unimpaired the blessings of its commerce, the freedom of its institutions, and the prosperity of its resources. Belligerent nations are interested in the support of the just rights of neutrals, for the intercourse which is kept up by means of their commerce contributes greatly to mitigate the evils of war. The public law of Europe has established the principle, that, in time of war, countries not parties to the war, nor interposing in it, shall not be materially affected by its action; but they shall be permitted to carry on their accustomed trade, under the few necessary restrictions which we shall hereafter consider.

A neutral has a right to pursue his ordinary commerce, and he may become the carrier of the enemy's goods, without being subject to any confiscation of the ship, or of the neutral articles on board; though not without the risk of having the voyage interrupted by the seizure of the hostile property. As the neutral has a right to carry the property of enemies in his own vessel, so, on the other hand, his own property is inviolable, though it be found in the vessels of enemies. But the general inviolability of the neutral character goes further than merely the protection of neutral property. It protects the property of the belligerents when within the neutral jurisdiction. It is not lawful to make neutral territory the scene of hostility, or to attack an enemy while within it; and if the enemy be attacked, or any capture made, under neutral protection, the neutral is bound to redress the injury, and effect restitution. The books are full of cases recognizing this principle of neutrality.—*KENT'S Com.*

Prizes brought into Neutral Ports.—A neutral has no right to inquire into the validity of a capture, except in cases in which the rights of neutral jurisdiction were violated; and, in such cases, the neutral power will restore the property, if found in the hands of the offender, and within its jurisdiction, regardless of any sentence of condemnation by a court of a belligerent captor. It belongs solely to the neutral government to raise the objection to a capture and title, founded on the violation of neutral rights. The adverse belligerent has no right to complain when the prize is duly libeled before a competent court. If any complaint is to be made on the part of the captured, it must be by his government to the neutral government, for a fraudulent, or unworthy, or unnecessary submission to a violation of its territory, and such submission will naturally provoke retaliation.—*Ibid.*

Arming in Neutral Ports.—The government of the United States was warranted, by the law and practice of nations, in the declarations made in 1793, of the rules of neutrality, which were particularly recognized as necessary to be observed by the belligerent powers, in their intercourse with this country. These rules were, that the original arming or equipping of vessels in our ports, by any of the powers at war, for military service, was unlawful; and no such vessel was entitled to an asylum in our ports. The equipment by them of government vessels of war, in matters of which, if done to other vessels, would be applicable equally to commerce or war, was lawful. The equipment by them of vessels fitted for merchandise and war, and applicable to either, was lawful; but if it were of a nature solely applicable to war it was unlawful. And if the armed vessel of one nation should

depart from our jurisdiction, no armed vessel, being within the same, and belonging to an adverse belligerent power, should depart until 24 hours after the former, without being deemed to have violated the law of nations.—*Ibid.*

Prizes in Neutral Ports.—Though a belligerent vessel may not enter within neutral jurisdiction for hostile purposes, she may, consistently with a state of neutrality, until prohibited by the neutral power, bring her prize into a neutral port, and sell it. The neutral power is, however, at liberty to refuse this privilege, provided the refusal be made, as the privilege ought to be granted to both parties, or to neither. The United States, while a neutral power, frequently asserted the right to prohibit, at discretion, the sale within their ports of prizes brought in by the belligerents; and the sale of French prizes was allowed as an indulgence merely, until it interfered with the treaty of England of 1794, in respect to prizes made by privateers.—*Ibid.*

Neutral Property in an Enemy's Vessel.—It is also a principle of the law of nations relative to neutral rights that the effects of neutrals, found on board of enemy's vessels, shall be free; and it is a right as fully and firmly settled as the other, though, like that, it is often changed by positive agreement.

The two distinct propositions, that enemy's goods found on board a neutral ship may lawfully be seized as prize of war, and that the goods of a neutral found on board of an enemy's vessel were to be restored, have been explicitly incorporated into the jurisprudence of the United States, and declared by the Supreme Court to be founded in the law of nations. The rule, as it was observed by the court, rested on the simple and intelligible principle, that war gave a full right to capture the goods of an enemy, but gave no right to capture the goods of a friend.

The neutral flag constituted no protection to enemy's property, and the belligerent flag communicated no hostile character to neutral property. The character of the property depended upon the fact of ownership, and not upon the character of the vehicle in which it is found.—*Ibid.*

Of Restrictions upon Neutral Trade.—The principal restriction which the law of nations imposes on the trade of neutrals, is the prohibition to furnish the belligerent parties with warlike stores, and other articles which are directly auxiliary to warlike purposes. Such goods are denominated contraband of war; but in the attempt to define them, the authorities vary, or are deficient in precision, and the subject has long been a fruitful source of dispute between neutral and belligerent nations.

Contraband of War.—In the time of Grotius, some persons contended for the rigor of war, and others for the freedom of commerce. As neutral nations are willing to seize the opportunity which war presents, of becoming carriers for the belligerent powers, it is natural that they should desire to diminish the list of contraband as much as possible. Grotius distinguishes between things which are useful only in war, as arms and ammunition, and things which serve merely for pleasure, and things which are of a mixed nature, and useful both in peace and war. He agrees with other writers in prohibiting neutrals from carrying articles of the first kind to the enemy, as well as in permitting the second kind to be carried. As to articles of the third class, which are of indiscriminate use in peace and war, as money, provisions, ships and naval stores, he says that they are sometimes lawful articles of neutral commerce, and sometimes not; and the question will depend upon circumstances existing at the time.

Law of Blockades.—A neutral may also forfeit the immunities of his national character by violations of blockade; and among the rights of belligerents, there is none more clear and incontrovertible, or more just and necessary in the application, than that which gives

rise to the law of blockade. Bynkershoek says, it is founded on the principles of natural reason, as well as on the usage of nations; and Grotius considers the carrying of supplies to a besieged town, or a blockaded port, as an offense exceedingly aggravated and injurious. They both agree that a neutral may be dealt with severely; and Vattel says he may be treated as an enemy. The law of blockade is, however, so harsh and severe in its operation, that, in order to apply it, the fact of the actual blockade must be established by clear and unequivocal evidence; and the neutral must have had due previous notice of its existence; and the squadron allotted for the purposes of its execution must be competent to cut off all communication with the interdicted place or port; and the neutral must have been guilty of some act of violation, either by going in, or attempting to enter, or by coming out with a cargo laden after the commencement of the blockade. The failure of either of the points requisite to establish the existence of a legal blockade, amounts to an entire defeasance of the measure, even though the notification of the blockade had issued from the authority of the government itself.

Right of Search at Sea.—In order to enforce the rights of belligerent nations against the delinquencies of neutrals, and to ascertain the real as well as assumed character of all vessels on the high seas, the law of nations arms them with the practical power of visitation and search. The duty of self-preservation gives to belligerent nations this right. It is founded upon necessity, and is strictly and exclusively a war right, and does not rightfully exist in time of peace, unless conceded by treaty. All writers upon the law of nations, and the highest authorities, acknowledge the right in time of war as resting on sound principles of public jurisprudence, and upon the institutes and practice of all great maritime powers. And if, upon making the search, the vessel be found employed in contraband trade, or in carrying enemy's property, or troops, or dispatches, she is liable to be taken and brought in for adjudication before a prize court.

Neutral nations have frequently been disposed to question and resist the exercise of this right. This was particularly the case with the Baltic confederacy, during the American war, and with the convention of the Baltic powers in 1801. The right of search was denied, and the flag of the State was declared to be a substitute for all documentary and other proof, and to exclude all right of search. Those powers armed for the purpose of defending their neutral pretensions; and England did not hesitate to consider it as an attempt to introduce, by force, a new code of maritime law, inconsistent with her belligerent rights, and hostile to her interests, and one which would go to extinguish the right of maritime capture. The attempt was speedily frustrated and abandoned, and the right of search has, since that time, been considered incontrovertible.

This right of search is confined to private merchant vessels, and does not apply to public ships of war. Their immunity from the exercise of any civil or criminal jurisdiction but that of the sovereign power to which they belong, is uniformly asserted, claimed and conceded. A contrary doctrine is not to be found in any jurist or writer on the law of nations, or admitted in any treaty; and every act to the contrary has been promptly met and condemned.

Neutral Documents.—A neutral is bound, not only to submit to search, but to have his vessel duly furnished with the genuine documents requisite to support her neutral character. The most material of these documents are, the register, passport or sea letter, muster-roll, log-book, charter-party, invoice and bill of lading. The want of some of these papers is strong presumptive evidence against the ship's neutrality; yet the want of any one of them is not absolutely conclusive. "*Si aliquid ex solemnibus deficit, cum equi-*

tas possit subveniendum est!" The concealment of papers material for the preservation of the neutral character, justifies a capture and carrying into port for adjudication, though it does not absolutely require a condemnation. It is good ground to refuse cost and damages on restitution, or to refuse further proof to relieve the obscurity of the case, where the cause labored under heavy doubts, and there was *prima facie* ground for condemnation independent of the concealment.

The spoliation of papers is a still more aggravated and inflamed circumstance of suspicion. That fact may exclude further proof, and be sufficient to infer guilt; but it does not in England, as it does by the maritime law of other countries, create an absolute presumption *juris et de jure*; and yet, a case that escapes with such a brand upon it, is saved so as by fire. The Supreme Court of the United States has followed the less rigorous English rule, and held that the spoliation of papers was not, of itself, sufficient ground for condemnation, and that it was a circumstance open for explanation, for it may have arisen from accident, necessity, or superior force.—KENT'S *Comm.*, vol. 1. See WILKINSON'S *International Law*.

Neutral Trade.—The present position of the United States in regard to neutrals may be learned from the following extract:

"Soon after the commencement of the late war in Europe, this government submitted to the consideration of all maritime nations two principles for the security of neutral commerce; one, that the neutral flag should cover enemy's goods, except articles contraband of war; and the other, that neutral property on board merchant vessels of belligerents should be exempt from condemnation, with the exception of contraband articles. These were not presented as new rules of international law, having been generally claimed by neutrals, though not always admitted by belligerents. One of the parties to the war (Russia), as well as several neutral powers, promptly acceded to these propositions; and the two other principal belligerents, Great Britain and France, having consented to observe them for the present occasion, a favorable opportunity seemed to be presented for obtaining a general recognition of them both in Europe and America.

"But Great Britain and France, in common with most of the States of Europe, while forbearing to reject, did not affirmatively act upon the overtures of the United States.

"While the question was in this position, the representatives of Russia, France, Great Britain, Austria, Prussia, Sardinia, and Turkey, assembled at Paris, took into consideration the subject of maritime rights, and put forth a declaration containing the two principles which this government had submitted nearly two years before to the consideration of maritime powers, and adding thereto the following propositions: 'Privateering is and remains abolished,' and 'Blockades, in order to be binding, must be effective, that is to say, maintained by a force, sufficient really to prevent access to the coast of the enemy; and to the declaration thus composed of four points, two of which had already been proposed by the United States, this government has been invited to accede by all the powers represented at Paris, except Great Britain and Turkey. To the last of the two additional propositions—that in relation to blockades—there can certainly be no objection. It is merely the definition of what shall constitute the effectual investment of a blockaded place, a definition for which this government has always contended, claiming indemnity for losses where a practical violation of the rule thus defined has been injurious to our commerce. As to the remaining article of the declaration of the conference of Paris, 'that privateering is and remains abolished,' I certainly can not ascribe to the powers represented in the conference of Paris any but liberal and philanthropic views

In the attempt to change the unquestionable rule of maritime law in regard to privateering. Their proposition was doubtless intended to imply approval of the principle that private property upon the ocean, although it might belong to the citizens of a belligerent State, should be exempted from capture; and had that proposition been so framed as to give full effect to the principle, it would have received my ready assent on behalf of the United States. But the measure proposed is inadequate to that purpose. It is true that if adopted, private property upon the ocean would be withdrawn from one mode of plunder, but left exposed, meanwhile, to another mode, which could be used with increased effectiveness. The aggressive capacity of great naval powers would be therefore augmented, while the defensive ability of others would be reduced. Though the surrender of the means of prosecuting hostilities by employing privateers, as proposed by the conference of Paris, is mutual in terms, yet, in practical effect, it would be the relinquishment of a right of little value to one class of States, but of essential importance to another and a far larger class. It ought not to have been anticipated that a measure, so inadequate to the accomplishment of the proposed object, and so unequal in its operation, would receive the assent of all maritime powers. Private property would be still left to the depredations of the public armed cruisers.

"I have expressed a readiness, on the part of this government, to accede to all the principles contained in the declaration of the conference of Paris, provided that relating to the abandonment of privateering can be so amended as to effect the object for which, as is presumed, it was intended, the immunity of private property on the ocean from hostile capture. To effect this object, it is proposed to add to the declaration 'that privateering is and remains abolished,' the following amendment: 'And that the private property of subjects and citizens of a belligerent on the high seas shall be exempt from seizure by the public armed vessels of the other belligerent except it be contraband.' This amendment has been presented not only to the powers which have asked our assent to the declaration to abolish privateering, but to all other maritime States. Thus far it has not been rejected by any, and is favorably entertained by all which have made any communication in reply.

"Several of the governments, regarding with favor the proposition of the United States, have delayed definite action upon it, only for the purpose of consulting with others, parties to the conference of Paris. I have the satisfaction of stating, however, that the Emperor of Russia has entirely and explicitly approved of that modification, and will co-operate in endeavoring to obtain the assent of other powers; and that assurances of a similar purport have been received in relation to the disposition of the Emperor of the French.

"The present aspect of this important subject allows us to cherish the hope that a principle so humane in its character, so just and equal in its operation, so essential to the prosperity of commercial nations, and so consonant to the sentiments of this enlightened period of the world, will command the approbation of all maritime powers, and thus be incorporated into the code of international law."—*Message President United States, Dec., 1856. See MARITIME LAW, NAVIGATION LAWS.*

Nevis, a West India Island, belonging to Great Britain, leeward group, in lat. $17^{\circ} 10' N.$, long. $62^{\circ} 40' W.$, separated from the south end of St. Christopher's by a channel two miles across. Area about 20 square miles. Population in 1851, 10,200. Shape circular; the surface rises to a central peak 2,500 feet in elevation. Soil generally fertile, and in 1841, the total produce exported amounted in value to £17,455, sugar standing for £15,527. Total value of imports in 1841, £23,728. The legislature is composed of the ad-

ministrators of the government, a legislative council, and a house of assembly of 15 members. Salary of administrator, £500. The island consists of 5 parishes, Charlestown, the capital, is at its south-west extremity. Public revenue in 1845, £4,560. A letter from the United States' consul, dated December 6, 1853, says: "The legislature of Nevis has passed a law, to go into operation on the 1st of March ensuing, removing all duties on imports, exports, and tonnage duties on vessels, thereby creating a free port. The consequence will be that the commercial intercourse with the United States will be very considerable."

New Bedford, a port of entry in Massachusetts, 55 miles south of Boston, 28 east of Newport, 49 south-east of Providence, 226 east of New York, 434 from Washington; in $41^{\circ} 38' 10'' N.$ lat., and $70^{\circ} 55' 16'' E.$ long. Population in 1830, 7,592; in 1840, 12,087; in 1850, 16,443; in 1851, 18,044; and in 1854, 20,060. There are 33 manufactories of all sorts; the most important of which are, 15 for oil and candles, the product of the whale fishery; one large cotton factory, called the Wamsutta mill, propelled by steam, containing 12,500 spindles, 288 looms, employing 230 hands, and turns out daily 4,800 yards of cotton cloth, which has obtained several medals for its superior quality; one cordage factory, with an invested capital of \$75,000, employing 100 hands, and producing annually 1,000 tons of cordage, celebrated for being of the best quality; a large paper-hanging manufactory which turns out 400,000 rolls of paper annually; also a rivet factory worked by steam, and two iron founderies; four printing offices, issuing two dailies, three weeklies, and one monthly publication; and 186 mercantile stores. There are two marine railways, one of them capable of taking up large ships. Railroad cars leave three times daily for Boston and Providence, and every afternoon for Fall River and Stonington to connect with steamboats at those places running to New York. The whale fishery is the principal business which is carried on at New Bedford, and has been the means chiefly of building it up to its present importance in population and wealth. As early as 1761, small sloops of 40 to 60 tons burden were fitted out to cruise, during the summer months, off the Capes of Virginia and Hatteras for sperm whales; taking care to return to port before the equinoctial gales commenced; the blubber was brought into port and tried out on shore. Gradually the voyages were extended in larger vessels to the Bay of Mexico, and about the West India Islands, thence to the Azores, and Cape de Verd Islands, and coast of Guinea. In 1791, a ship called the *Rebecca*, was fitted out for a whaling voyage to the Pacific Ocean; this ship was the first American whaler that ever entered that ocean in pursuit of whales; her voyage was successful. From these small beginnings, the whale fishery has steadily increased to its present importance, with the exception of the interruption of the revolutionary war, and of the war of 1812 with Great Britain, until New Bedford has become the greatest whaling port in the world. Her ships now circumnavigate the globe, and explore every ocean and sea from the Arctic to the Antarctic in pursuit of whales. The number of vessels employed in the whale fishery from the United States at this time, 1852, is 620, their tonnage, 133,990, of which there are belonging to the district of New Bedford, 372 vessels, employing upwards of 10,000 seamen. There were entered into the United States, during the year 1851, of sperm oil, 99,591 bbls.; of right whale oil, 328,483 bbls.; of whalebone, 3,916,500 lbs.; amounting in value to \$10,028,089, of which there were imported into the district of New Bedford, of sperm oil, 60,465 bbls.; of right whale oil, 175,460 bbls.; of whalebone, 2,173,500 lbs.; amounting in value to \$5,781,118; of which value, about \$5,000,000 was brought into the port of New Bedford. The average length of the voyages of the right whale ships are 36 months; sperm whale ships

New Brunswick, a British province, east coast of North America, lat. $46^{\circ} 5'$ to $48^{\circ} 40'$ N., long. $68^{\circ} 50'$ to $68^{\circ} W.$; bounded west by the State of Maine; north-west Lower Canada, from which it is separated by the River Restigouche; north, Bay of Chaleurs; east, Gulf of St. Lawrence and Northumberland Strait, the latter separating it from Prince Edward Island; and south, the Bay of Fundy, and part of Nova Scotia. Its coast-line is about 500 miles in length, interrupted only at the point of junction with Nova Scotia, where an isthmus of not more than 10 miles in breadth connects the two provinces, and separates the waters of Northumberland Strait from those of the Bay of Fundy, which it is proposed to unite by means of a canal. The most remarkable bays and harbors are Bathurst Bay, on the north coast; Miramichi Bay, on the east coast; Passamaquoddy Bay, and St. John harbor, on the south coast. There are, besides these larger indentations, numerous smaller harbors, particularly on the south portion of the east coast. Area, 27,704 square miles.

The population of this province is principally composed of British settlers and their descendants. The remnant of French extraction, are settled around the Bay of Chaleurs. There is still a few of the aborigines left, consisting of the Micmacs, Melicetes, and others, amounting in 1851 to 1,116 persons.

Physical Features, &c.—The general surface of the country presents a series of bold undulations, sometimes rising into mountains, or continuous ridges of high land. The latter are seldom of any considerable height; but their precipitous acclivities, sharp outline, and deep ravines, give them an alpine and picturesque character that finely and strikingly contrasts with the rich valleys and sheltered plains which alternate with the more rugged scenery. The shores of the Gulf of St. Lawrence and Northumberland Strait, however, present different and far less pleasing features. There the land, for about 12 miles inland, is low and sandy, covered with trees of a stunted growth, and skirted with extensive marshes, large deep morasses, and long sand beaches. Along the shores of the Bay of Chaleurs and the Gulf of St. Lawrence, gray sandstone and gray clay-slate predominate, with detached rocks of granite, quartz, and ironstone; on the south coast, limestone, graywacke, clay-slate, with sandstone, interrupted occasionally by gneiss, trap, and granite. Specimens of amethyst, cornelian, Jasper, etc., have been picked up in various places. Coal is plentiful, and iron ore abundant; the former is said to extend over 10,000 square miles, or above one third part of the whole area of the province.

New Brunswick is drained by numerous rivers and small streams, the principal of which is the St. John, navigable for vessels of 50 tons to Fredericton. The next river in importance is the Miramichi, which rises near the west limits of the territory, whence it flows north-east, and falls into Miramichi Bay, on the east coast, about lat. $47^{\circ} 5'$ N., long. $64^{\circ} 53'$ W.; its whole course is upward of 110 miles, it is navigable for nearly 40 miles, and admits vessels of 600 or 700 tons. The Restigouche is the next considerable river; it forms the north-west limit of the province, and falls into the head of the Bay of Chaleurs, after a course of about 100 miles. There are a number of small lakes in New Brunswick, particularly in the northern part, but none of any considerable size. In the south there are a few somewhat larger, the most important of which are Grand Lake, 20 miles long, by about 5 miles broad; and Washedemoak Lake, about 20 miles long, by 2 miles broad—both lying between St. John and Fredericton.

Manufactures, &c.—There were in the province in 1851, 52 woolen factories, employing 96 persons; 261 grist mills, employing 366 persons; 584 saw mills,

employing 4,802 persons; 125 tanneries, employing 255 persons; 11 foundries, employing 242 persons; 8 breweries; 52 weaving and carding establishments (5,475 hand looms), employing 96 persons; 96 of various manufacturing establishments, employing 553 persons. Coals raised, 2,482 tons; iron smelted, 810; lime burnt, 35,599 casks; grindstones quarried, 58,840; gypsum, 5,465 tons quarried.

Products.—Cloth, 622,287 yards; and 100,975 gallons malt liquor. Value of boots and shoes made, £89,967; leather, £35,165; chairs, cabinet ware, and wood ware, £38,977; candles, £19,860; soap, £18,502; hats, £8,360; iron castings, £20,025.

The principal places are St. John, the metropolis, and Fredericton, the capital. There were in 1854 several railroads in course of construction; 5 banks, aggregate capital, £337,500; a savings' institution, and 4 insurance companies.

Fisheries of New Brunswick.—There were French fishing establishments in that part of Acadia now known as New Brunswick, as early as 1638. The English succeeded to these at the treaty of Utrecht, in 1713; but they do not seem to have formed many others until after the cession of Canada, in 1763.* Among the first, I suppose, was that of Lieutenant Walker, of the royal navy, in the Bay of Chaleurs, which was extensive, controlling the fur and fish trade of that region for several years. There were similar settlements on the River St. John; but from the estimates of Mr. Grant, made in 1764, at the request of the Rev. Dr. Stiles, the whole population of British origin could not have exceeded 1000.

At the peace of 1763, several thousand "Tories," or loyalists, compelled to abandon their native land, settled in New Brunswick, and transferred thither the jurisprudence, the social and political institutions of "the old thirteen;" and, the year following, were allowed to organize a separate colonial government. Like those who went to that part of Acadia still called Nova Scotia, many of the loyalists were gentlemen of education, eminent private virtue, and distinguished consideration. Some obtained offices of honor and emolument; others adopted agricultural pursuits; and another class, fixing their abodes on islands and the shores of the main land, resolved to earn their support on the sea. Of the latter description, several, though compelled to toil and exposure in open fishing boats, had been persons of note and property. But, ruined by the confiscation laws of the Whigs, or by the general disasters of a civil war, they resorted to the hook and line to relieve the pressure of immediate want, indulging the hope of "better times," and more congenial avocations. Few, however, abandoned the employment, and their children, trained to it from early youth, and acquiring fishermen's habits, succeeded to boats, fishing-gear, and smoke-houses, as their only inheritance, and continue it at the present day. I have often met with common boat fishermen of this lineage, whose earnings were hardly sufficient to procure the absolute necessities of life.

The fisheries of New Brunswick are prosecuted with neither skill nor vigor. The apparent exports, small as are the statistics, do not indicate their real condition; since it is certain, that of the products of the sea shipped to other countries, a part is first imported from Nova Scotia, and furnishes a proportion of the exports of that colony.† The number of vessels sent to Labrador and other distant fishing grounds is never large, and often almost nominal. The cod-fishery in the Gulf of St. Lawrence and the Bay of Chaleurs is

* The French built two forts on the River St. John prior to the peace of Utrecht (1713), which they repaired in 1754, although the country had been ceded to England quite half a century.

† The imports into St. John from Nova Scotia for three months only (July 10 to October 10) of the year 1852, were 7,864 quintals of dried fish, 860 barrels of mackerel, 2,423 barrels of herring, and other pickled fish.

not as extensively might be reasonably expected from the long experience of the inhabitants there, and the general safety and productivity of the harbors and indentations of the coast.

The same remarks need slight qualification when applied to the Bay of Fundy, and its principal branch, the Bay of Passamaquoddy. Cameron's, Doggett's, Drake's, Woodward's, Money, and Whale Coves; Dark Harbor, Long's Eddy, Grand Harbor, and Long, Duck, Nantucket, and Kent's Islands, which are all in the group of islands known as "Grand Menan," afford excellent facilities for catching and curing cod, pollock, and herring, in large quantities. In the waters that surround Campo Bello, Deer, and Indian Islands, as well as in those that wash Bean's, Adams's, Parker's, Minister's, Hardwood, and Fish Islands, and along the coast between Little Passage and Point Lepreau, embracing Mace's and Back Bays, Hike's Island, Seely's Cove, Crow, Beaver, and Deadman's Harbors, the advantages for fishing are very good. Every place here mentioned is within a few hours' sail of the frontier ports of Maine, and many of them are within cannon-shot distance of the shores of the United States. The fishermen of both countries meet on the same fishing grounds; borrow and lend "bait," ask after each other's "woman" at home; narrate the wonderful cures of the last-discovered remedy for the "reumatis" complain of the "scacity" of fish, and the low price of "flour" discourse about "flat-hooped flour;" and generally conduct toward one another as friends and brethren, owing allegiance to one government. Indeed, the observation of quite 25 years authorizes me to say that the colonists always agree far better with the Americans than with each other. Our countrymen are not often considered interlopers when they leave the fishing grounds nearest home and visit those of Grand Menan; but the fishermen of Campo Bello, and the other islands on the British side of the Passamaquoddy, are sometimes roughly accosted and "twitted" when they venture to take the same liberty. Frequent attempts have been made to disturb the friendly relations which have generally existed between the people of the two flags, but without success. The efforts of officious individuals, and of functionaries of the colonial government, have been alike disregarded. The captains of the British ships-of-war on the station, gentlemen in their feelings, have steadily refused to stoop to wage a petty warfare against the American boats that cross the imaginary boundary line in the waters of the Passamaquoddy, though, of course, they have always obeyed their instructions. Yet, in the spirit of Nelson, who looked at the signal he meant to disobey with his blind eye, they have never been able to see a "Yankee," or to distinguish one from a subject of her majesty. Some of them—as I remember the stories of by-gone years—admitting the necessity of driving off the aggressors, have asked, "How are we to know them—are they marked?" Others, sending their barges into the fleet of boats, have directed that "all who say they are Americans must be told to go to their own side of the line;" but, strangely enough, the unbroken silence of the fishermen to whom the question was propounded afforded proof that all were "Bluenoses." Still others, satisfying themselves, by peering through glasses from their quarter-deck, that all the boats in sight must belong to the islands in New Brunswick, have thought the sending of barges to inquire a needless ceremony. One, in 1840—the captain of the *Kingdore*—in his official report, recommended that "every British boat should have a license; otherwise," said he, "it is impossible to discriminate them from Americans."

Those who seek to put an end to this state of things, whatever their motives, do not take into the account

* They thus speak of their wives.

that the instant they shall accomplish their object, border strifes will follow of necessity. Before renewing their efforts, they may be kindly asked to consider that harmony and good-fellowship between the inhabitants of frontier settlements are indispensable, and far better securities against the marauder's torch and bludgeon than armed ships or bodies of troops. The produce of the boat-fishery of the Bay of Fundy, and of the Passamaquoddy, is not only small in value, but generally inferior in quality. An increase of this fishery, under present circumstances, is not desirable. The fishermen dress and cure the cod, pollock, hake, and haddock—the kinds usually dried—in a slovenly manner.

It is stated in an official document that in 1850, at the different fishing-stations mentioned as within these bays, there were employed 62 vessels of 1,268 tons, 244 open boats, 55 weirs, and 1,337 men, in catching and curing the several kinds of fish just referred to; and that the value of the products of the various branches of the fishery were £33,080 currency, or \$182,320. These facts show that the fishermen received a miserable pittance for their toil; since, without allowing for the use and depreciation of the capital invested in the vessels, boats, weirs, nets, and other fishing-gear, they earned for the year less than \$100 each. We may lament that men who pursue their avocation both day and night, amid rains and gales, are so poorly rewarded. We may lament, too, that the people of Grand Menan, falling short of those of Campo Bello, West Isles, and the parishes on the coast of the main land, earn even less than the average. But, what then? The fault is their own; entirely so. They may, if they will, produce as sweet and as well-cured pollock and cod as do their brethren of Barrington, and as good colored and flavored smoked herring as do those of Digby, and obtain prices to correspond with the quality.

The general poverty among them is not to be attributed entirely or principally, as they aver, to the occasional loss of boats and nets, nor to glutted markets and bad seasons, nor to the interlopers who visit their fishing grounds, but to their own want of industry, thrift, cleanliness, and honesty. The few "who work it right," acquire property, and enjoy the entire confidence of the dealers, command credit for supplies, and high prices for their commodities when offered for sale.

It remains to speak of the fisheries of the Bay of Chaleurs, and of the Gulf of St. Lawrence. The county of Restigouche borders on Canada, and the counties of Gloucester, Northumberland, and Kent, are favorably situated for adventures in these waters. The fishing grounds are safe, and generally close to the shores; and those near Caraquet, in Gloucester, are much frequented by boats from Gaspe, and owned by residents of Canada. Since 1835, the catch of both cod and herring by the fishermen of Restigouche and Northumberland has fallen off more than half, and in Kent has nearly become extinct. But the inhabitants of the port of Caraquet, availing themselves of the advantages of their position, have actually produced a large portion of the dried cod exported from the colony for some years. These four counties are more remote from the capital of New Brunswick, and from the markets of the United States, than the county of Charlotte, which embraces Grand Menan, and the other islands in the Bay of Fundy (where the fish are so badly cured), and the attention of the people is divided between several branches of industry; but fishing, as an occasional and irregular employment merely, has commonly proved a source of profit, or at least has afforded a fair reward for the labor and capital devoted to it. The fish shipped at Caraquet are in much better repute than these caught in the Bay of Fundy, and the remark is true of the produce of the Bay of Chaleurs and St. Lawrence fisheries generally. It may be presumed that these the herring does not

"become rotten before salting;" that, when sold as the "gibbed" article, it is not packed without taking out the entrails; and that the cod is washed after being split, and not salted and put in "kinch" in all its blood and dirt.—*Savary's American Fisheries.*

The following statement exhibits the value of imports and exports to and from the United States and New Brunswick during the years 1840 and 1850:

	1840.	1850.
Exports to New Brunswick....	\$1,922,810	\$1,810,740
Imports from	357,910	337,000

The following abstract of the trade between the United States and the port of St. John, New Brunswick, shows the number of ships and tonnage entered inward, and the value of imports at that port during the year ending 31st December, 1851: Vessels inward: 605 vessels, of an aggregate tonnage of 166,052 tons; value of imports, \$1,458,205. Vessels outward: 859 vessels, of an aggregate tonnage of 64,344 tons; value of exports, \$812,895.

The United States export to New Brunswick, principally, books and stationery, Indian corn, flour, wheat, lumber, salted provisions, rice, coal, tobacco, timber, &c. various kinds of manufactured goods, and merchandise; and receive, in return, timber of different kinds (except pitch-pine, oak, locust, hickory, and black walnut), lumber, staves, laths, shingles, spars, and fish. Coal and timber being classed among the staples of both countries, an examination has been instituted with a view to ascertain the probable effect of the Reciprocity Treaty on the trade in these articles between the United States and New Brunswick. To meet this inquiry, it is necessary to know whether the coals and timber of New Brunswick and the United States are similar in character and kind, or whether they differ in both, and in the uses to which they are applied; each having their own peculiar advantages for certain purposes.

Dr. Jackson, an American geologist of ability, in a sketch "of the early history and of the present state of our knowledge of the geology, &c. of Nova Scotia and New Brunswick," referring to the mineral productions of these provinces, says: "The coals of Nova Scotia are of various kinds, and are wholly different from those of the United States; at least, they differ from all the coals which are found on the eastern side of the Appalachian Mountains, so that they do not enter into competition with the coals obtained from mines in the United States, which supply our coast." In a subsequent part of this essay Dr. Jackson remarks, in substance, that recent explorations in New Brunswick have brought to light a beautiful and before unknown variety of highly bituminous coal, containing 60 per cent. of gas-making bitumen and 40 per cent. of coke. This coal is a new variety, particularly adapted to the uses of the gas-house; and it is represented by Dr. Jackson as the very material wanted by gas-manufacturers to enrich the products of our semi-bituminous coals of Maryland and Virginia. In the formation of gas, this New Brunswick production can not be used alone, but is mixed with other coals, in the proportion of from one fifth to one third; and thus gives the best material that can be obtained. It also gives greater value to the coke of our more ash-bearing coals. If these facts are to be relied upon (and they are supported by high authority), it follows that the importation of the New Brunswick coal into the United States, so far from interfering with the sale of our own coals, would contribute, in a great measure, to make available, in the manufacture of gas, much of those which would otherwise be unsuitable for that purpose. With these distinctive characters and different applications, the coals of New Brunswick and Nova Scotia will always be required, whatever may be the supply of our own mines of Pennsylvania, Maryland, and Virginia. Indeed, the mine near Richmond, Virginia, is the only one in the United States that furnishes bituminous coal

that will fully serve in the place of the coals of Nova Scotia.

From the imports and exports of timber between the United States and New Brunswick, it will be seen that New Brunswick imports from the United States large quantities of pitch-pine, oak, locust, hickory, and black walnut, none of which are found in that province; while the United States receives, in return, boards, scantling, deals, various kinds of lumber, and fish. The interchange of these products must be greatly increased under a system which relieves them from all import duties.—*U. S. Com. Rel.*

Newcastle. The following information is from the United States' consul at Newcastle in answer to a circular issued by the State Department: "In this port there are no privileges that British or any other vessels have which American vessels have not to the same extent; but there are restrictions and extra charges at this port on the vessels of some other nations that have not treaties of reciprocity with England, viz., France, Two Sicilies, and Portugal. French vessels, taking cargoes to, or bringing them from, any place but France proper, are subject to double the ordinary light-house dues; also, to double harbor lights, double Ramsgate dues; and in case the vessel loads coals or grindstones, instead of paying 4 cents, or 2d., per chaldron town dues, as the vessels of nations in reciprocity, 16 cents, or 6d., per chaldron, is charged. When the vessel goes to any place but France proper, such vessels also pay 12 cents, or 6d., per foot extra pilotage. Vessels belonging to the Two Sicilies are subject to the same extra charges. Vessels belonging to Portugal have the additional privilege of taking cargoes to or from their own colonies on the same terms as to Portugal proper, but to or from any other country they are subject to the above extra charges. There are, also, other nations, such as some of the South American States, whose vessels are subject to these extra charges, but such vessels never visit this port. These extra local dues are, nevertheless, payable by all foreign vessels coming to this port, but the British government satisfy these claims on the vessels of nations in reciprocity.

"The port charges on vessels of the United States are the same as on British vessels. Annexed are particulars of the charges on a vessel of 400 tons register, carrying 200 chaldrons, or 530 tons, of coals and 60 tons of other goods. Vessels belonging to the United States (by a law passed this (1854) session of Parliament) are allowed to carry goods of any kind coastwise without any restriction, and with every privilege that British vessels enjoy.

LIST OF CLEARING CHARGES AT THE PORT OF NEWCASTLE, CHARGED ON AN AMERICAN VESSEL OF FOUR HUNDRED TONS REGISTER, CARRYING TWO HUNDRED CHALDRONS OF COALS AND SIXTY TONS OF OTHER GOODS.

"If the vessel bring ballast, there is an additional charge on it of 1s. 6d., or about 36 cents, per ton on the ballast. Sea pilotage, in winter, 1s. 6d.; and in summer, 1s. 3d. per foot. Tonnage, according to distance, from 6s. to £3.

"Insurances are mostly effected in the States; the rate here runs from 2½ to 5 per cent., according to season and class of vessel. Freight from \$4 84, or 20s., to \$7 74, or 32s., per ton, according to circum-

stances. Commission for purchasing is usually 2 1/2 per cent. Sales are made either by direct correspondence or through agents resident here. Terms vary, with the articles, from 2 to 4 months. Bills, and a various discount for cash, are the ordinary terms. There is no export duty payable on goods to the United States. There are no internal taxes levied on any of the commodities mentioned, either in a crude, partially manufactured, or wholly completed state.

Newfoundland Colony of, is in lat. 46° 40' and 51° 39' N., and long. 53° 44' and 59° 31' W. Area, 35,913 square miles. Extreme length, about 420 miles, and extreme breadth, about 300 miles.

Newfoundland is an island lying on the north-east side of the Gulf of St. Lawrence, and is bounded on the whole east shore by the Atlantic Ocean, on the north-west and north by the Strait of Belleisle, which separates it from Labrador, on the west by the Gulf of St. Lawrence, and on the south-west it approaches at Cape Bay toward Cape Breton, so as to form the main entrance from the Atlantic into the St. Lawrence. Capital, St. John's. The island is of a somewhat triangular form, but without any approach to regularity, each of its sides being broken into numerous bays, harbors, creeks, and estuaries. Its perimeter is not less than 1000 miles. From the sea it has a wild and sterile appearance, and its general character is that of a rugged, and, for the most part, a barren country. Hills and valleys continually succeed each other, the former never rising into mountains, and the latter rarely expanding into plains. Of various character, the hills sometimes form long, flat-topped ridges, and are occasionally rounded and isolated, with sharp peaks and eraggy precipices. The valleys vary also from gently sloping depressions to rugged and abrupt ravines. The sea-cliffs are bold and lofty, with deep water to their bases; and the rough character of the country is increased by the existence of vast boulders scattered over it. This uneven surface is naturally distinguished into woods, marshes, and barrens. The "woods" are spread over the whole country wherever there is an, water-course, and are even found crowning the summits, and near the sea-coast are especially luxuriant. The trees consist principally of pine, spruce, fir, larch (or hackmatack), and birch; in some districts the mountain ash, the alder, the aspen, and a few others are found. Most of the wood is of small and stunted growth, although the character of the trees is greatly varied in this respect according to soil and situation, and in small groups wood of fair growth and length may be found. The open tracts are generally called "marshes." These are not necessarily low, or even level lands, but are frequently at a considerable height above the sea, and have often an undulating surface. They are open tracts, covered with moss, sometimes to the depth of several feet. This thick coating of moss is precisely like a great sponge spread over the country. At the melting of the snow, it becomes thoroughly saturated. Numerous small holes and pools, and in the lower parts small sluggish brooks or gullies are met with. But in most cases the surface is sufficiently eligible for drainage, and when the moss is stripped off, dry ground or bare rock is generally found beneath. The "barrens" occupy the summits of the hills and ridges, and other elevated and exposed tracts. They are covered with a thin and scrubby vegetation, consisting of berry-bearing plants, and dwarf bushes of various kinds. Bare patches of gravel and boulders, and crumbling fragments of rock are frequently met with upon the barrens, which are generally altogether destitute of vegetable soil. These different tracts are none of them of great extent; woods, marshes, and barrens frequently alternating.

Not the least remarkable features of the island are its lakes and ponds. These are found in every direction, and in almost every situation, not only in the

valleys, but on the highlands, and even in the hollows of the summits, and on the very tops of the hills. They vary in size from pools of 50 yards in diameter to lakes 80 miles in length, and from 4 to 5 miles wide. The number exceeding 2 miles in extent amount to several hundreds, while those of smaller size are absolutely countless.

But with all this lake surface, there are few large water-courses; yet this absence of any thing which can be called a navigable river is readily explained. The character of the natural surface, indeed, is such that it absorbs every new accession of moisture from rain and melted snow, and only parts with it again by evaporation or a slow drainage into the ponds, the overflow of which is the only supply the brooks have. Thus there is never formed a current sufficiently powerful to dig out a deep channel, or to breach opposing barriers. The area covered by fresh water has been estimated at one third the whole island, and this large proportion will not probably be found exaggerated.

The coast of Labrador is also included in the government of Newfoundland, to which it was annexed in 1808. It has a sea-coast of about 100 miles, and is frequented during the summer season by more than 20,000 fishermen. This vast country, inhospitable in climate and uninviting, is inhabited by Esquimaux and Moravian missionaries, in all numbering some 8000 or 10,000 souls. Situated in a severe and gloomy climate, and producing nothing that can support human life, this is one of the most barren and desolate of countries. But, as if in compensation for these disadvantages, the sea in its vicinity teems with fish, and thus thousands of hardy adventurers are drawn to its rugged shores, and their industry and enterprise amply rewarded. The sea in this locality indeed forms the most valuable fishery in the world. In no part the mainland of Labrador exceeds the height of 500 feet above the sea, and is often much lower, as are all the islands, except Great and Little Meadina. Both are of granite rock, and almost bare of trees; and there are few ponds of dark bog water, frequented by water-fowl and flocks of Labrador curlew. The coasts are beset with islands and rocks, sometimes so intricate as to forbid navigation. There are, however, several harbors fit for large vessels, and which may be safely entered. The Strait of Belleisle, which separates the two parts of the government, is about 50 miles long and 12 wide. It is deep, but its passage is not considered a safe one, owing to its currents. There are no harbors on that part of the Newfoundland coast which faces this strait, and few on the opposite coast. During the winter months the resident population of European descent scarcely numbers 800 souls, and many of these have intermarried with the Esquimaux. The few widely scattered families reside at the establishments for sea and salmon fishing and for fur-trading. Seals and salmon are very plentiful, and the latter are of a large and superior description. The furs of Labrador are very valuable, and consist of fox, otter, sable, lynx, bear, wolf, deer, ermine, hare, etc. The Canadian partridge and the ptarmigan are also plentiful. The "egging" business employs a large number of small schooners. The eggs obtained are chiefly those of the murr, but the eggs of puffins, gannets, gulls, older ducks, and cormorants, are also collected. Halifax is the principal market for these, although no small quantity is disposed of at Boston and other United States' ports. Feathers are also extensively collected on the coasts and islands.

The average size of Newfoundland vessels is about 130 tons. The chief coasting trade consists in carrying provisions and supplies for the fishery, and bringing back the proceeds of the voyage.

Newfoundland proper is divided into nine districts, the population of which, in 1845, the last census year, was as follows:

The population of Newfoundland at various periods, from 1806, has been as follows: in 1806 it was 26,506; in 1816, 52,672; in 1828, 62,157; in 1825, 56,719; in 1828, 60,088; in 1832, 59,380; in 1836, 73,705; and in 1845, as above stated. The population in 1851 was estimated at 101,600 souls.

The chief statistics of the agricultural condition of the colony, as gleaned from the census of 1845, are exhibited in the subjoined table, showing the disposition of land, number of live stock, and agricultural products:

Electoral Districts.	Land in cultivation.		Land in possession.		Live stock owned.					Agricultural products.			
	Acres.	Acres.	Horses.	Cattle.	Sheep.	Pigs.	Goats.	Potatoes.	Grain.	Hay, &c.	Tons.	Bushels.	Tons.

Total	39,645	83,428	4,361	18,310	341,160	11,695	11,008	

The manufactures of the colony are very limited, and consist only of the following establishments: at St. John's, 2 corn, 1 saw, and 1 bone mill, 1 iron foundry, and 1 brewery. The city has gas and water works. At Brigus, Conception Bay, there is 1 corn mill; at Harbor Grace, 1 corn mill and gas-works; in Trinity Bay, 1 saw mill; and at Green Bay 2 saw mills. These are all that are noted.

As before stated, the chief wealth of the colony consists in its fisheries. The extent and value of these will be best appreciated by perusal of the statistical returns.

In 1846 the number of fishing-boats, etc., was as follows: boats from 4 to 15 quintals, 8092; boats from 15 to 30 quintals, 1025; boats from 30 quintals and upward, 972; cod seines, 879; and seal nets, 4568.

The value of property employed in the fisheries, on an average of four years, ending in 1849, has thus been stated:

341 vessels engaged in the seal fishery	\$1,223,000
80 " " " coasting and cod fishery	30,000
10,689 boats engaged in the cod fishery	756,675
Stages, fish-houses, and flukes	125,000
4,563 nets of all descriptions	65,500
879 cod seines	110,000
Vessels for making seal-oil	250,000
Fishing implements and cables for live	150,000
Total	\$2,568,175

The value of the annual products of the colony during the same average period is thus stated:

949,169 quintals fish exported	\$2,010,000
4,010 barrels of salmon	60,500
14,476 barrels of herrings	49,500
508,446 seal-skins	224,000
6,200 tons of seal-oil	850,000
3,890 tons of cod-oil	525,000
Fuel and skins	6,000
Balt sold to the French	56,750
Value of agricultural produce	1,011,775
Fuel	300,000
Game, venison, and wild-fowl	40,000
Timber, boards, staves, hoops, &c.	250,000
Fresh fish used by inhabitants	125,000
Salted "	175,000
Oil consumed by	42,500
Total	\$6,352,080

The outfit for the seal fishery in 1851 and 1852 is shown in the subjoined table:

From	1851.		1852.	
	Yds.	Tons.	Yds.	Tons.

Bay Bulls, Aquaforte, and Renewa

The chief foreign trade of Newfoundland vessels is with England, Scotland, Ireland, Spain, Portugal, Hamburg, Brazil, the West Indies, United States, and British North America. The time occupied on the voyage to Europe and back is from six to eight weeks. To Great Britain the cargo, generally, is oil, and to the other European countries dried codfish. A voyage to the West Indies and back requires about nine weeks. The outward cargo is dried cod and pickled fish, and the inward cargo West India produce. Vessels from the West India sometimes return by thence to Europe with cotton, sugars, &c., and on their return to this consulate bring manufactured goods from Great Britain. This voyage occupies them from three to four months. The trade with the United States and Canada is almost exclusively in the importation of provisions. American vessels could be advantageously employed in the foreign trade, particularly in carrying breadstuffs, provisions, &c., to this colony, and dried fish thence to the West Indies, &c.

The following table exhibits the quantity and value of the products of the fisheries exported for the eleven years ending 1851:

Years.	Dried fish.		Oils.		Seal skins.		Salmon.		Herrings.	
	Quintals.	Value.	Gallons.	Value.	No.	Value.	Tierces.	Value.	Barrels.	Value.

Making an aggregate of 1265 vessels, and 142,467 tons (manned by 8465 men), entered, and a total of 1106 vessels, and 128,890 tons (with 7741 men), cleared. From this exhibit it will be seen that the arrivals from the United States greatly exceed the departures for this country, thereby showing the balance of trade to be strongly against this colony.

The entrances and clearances for the past four years have been as follows:

Years.	Entered.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.
1849	1,156	182,388	1,074	126,843
1850	1,293	188,228	1,087	108,725
1851	1,292	137,465	1,084	141,578
1852	1,265	142,467	1,106	128,590

The statistics of ship-building for a series of years exhibit the following results:

Years.	No.	Tons.	Years.	No.	Tons.

The Labrador coast, as before observed, is the resort of a large number of fishermen. Since the treaty of Paris, this fishery has increased more than sixfold. No accurate account of the products can be ascertained, but the following is considered to be an approximation. The salmon fisheries average annually about 30,000 tierces. The herring fisheries are also very large, and the seal fisheries are equal in value to those of Newfoundland. The imports of Labrador have been estimated by the authorities of Newfoundland at £600,000 per annum, and the following is an approximation to the value of the exports:

American vessels.....	£450,000
Nova Scotia vessels.....	450,000
Canada vessels.....	144,000
Vessels owned or chartered by English and Jersey houses having establishments on the coast.....	450,000
Vessels owned or chartered by the people of Newfoundland.....	1,200,000
Total.....	£2,784,000

The total exports, however, are by some persons estimated at £4,000,000.

The trade of Newfoundland with other countries than the United States; particularly with Spain, Portugal, Italy, and the Brazil, is much more extensive, in proportion to its commercial capabilities, than is that of any other North American colony. The heavy balance against that island, in its trade with the United States, may suggest a reason why it seeks a European market for so large a portion of its products. The United States export to Newfoundland, beef, pork, pitch and tar, corn-meal, flour, rice, tobacco, and general merchandise. It may be seen from the following table that flour and pork amount to fully three fourths of the total exports from this country to Newfoundland.

" Article 8. It is agreed that the articles enumerated in the schedule hereunto annexed [the preceding list], being the growth and produce of the aforesaid British colonies, or of the United States, shall be admitted into each country, respectively, free of duty." The colonies referred to in the foregoing articles are, Canada, New Brunswick, Nova Scotia, and Prince Edward's Island. With respect to Newfoundland, article 6 provides as follows: " And it is hereby further agreed, that the provisions and stipulations of the foregoing articles shall extend to the island of Newfoundland, so far as they are applicable to that colony. But, if the imperial Parliament, the provincial Parliament of Newfoundland, or the United States, shall not embrace in their laws, enacted for carrying this treaty into effect, the colony of Newfoundland, then this article shall be of no effect; but the omission to make provision by law to give it effect, by either of the legislative bodies aforesaid, shall not in any way impair the remaining articles of this treaty." This treaty is limited to ten years, with the usual notice of 12 months by either of the high contracting parties who may wish to terminate the same. Date of exchange of ratifications of the treaty above referred to, September 9, 1854. Date of President's proclamation of

the same, September 11, 1854. Date of its acceptance by Canada, 23d September, 1854; by New Brunswick, 11th November, 1854; by Nova Scotia, December 15, 1854; by Prince Edward's Island, 11th October, 1854; and by Newfoundland, 14th November, 1855.—*U. S. Com. Digest*, 1856. See HUNT'S *Mar. Mag.*, x., 880; FRASER, xxvii., 740; *Elec. Rev.*, xiii., 816.

New Granada is the most important of the three republics into which the South American republic of Colombia resolved itself at the dissolution of that confederation in 1831. Till 1810 it was a vice-royalty under the Spanish crown, but subsequently a part of the republic of Colombia, the middle and western portions of which it now embraces. New Granada is bounded on the north by the Caribbean Sea, on the east by the republic of Venezuela, on the south-east by Brazilian Guiana, on the south by the republic of Ecuador, and on the west by the Pacific Ocean. It lies mostly between the equator and 12° N. lat., and between 70° and 83° W. long. Area about 480,000 square miles.

The llanos or plains of the Orinoco extend over the entire tract, stretching away to the western banks of the Orinoco and to the Casiquiare, between the Rio Negro on the south, and the Rio Apure on the north. As far south as the Yichada, the northern part is a complete level, averaging only 300 feet above sea-level near the mountains, whence it gradually, but almost imperceptibly, declines toward the Orinoco. With the exception of a few palms that occur at great intervals all over the plain, and some low bushy trees along the rivers, this district is quite destitute of trees. During the rainy season, which is from April till November, rain falls in torrents, accompanied with fearful thunder-storms, which usually occur between two and four o'clock in the afternoon; but the contrast is very striking in December, January and February, when a cloud never crosses the sky. This immense plain is not at all fit for cultivation; but innumerable herds of cattle and horses find abundant pasture on it during the rainy season, though they suffer much during the dry months, from November till April. The wet season is, on an average, 8° Fahr. hotter than the dry, and the mean annual temperature is 80° Fahr.

The principal rivers of New Granada are the Magdalena and Cauca, which run their whole course within the territory of the republic, taking their rise in the Andes near the southern frontier, and after flowing nearly the entire length of the country from south to north, unite in one channel, and discharge their combined waters through a delta, by three channels, into the Caribbean Sea, about W. long. 75°. Besides these two principal streams, a large number of the tributaries of the Orinoco, having their sources in the different ranges of the Andes, drain the llanos of the east. Of these, the principal are the Apure, Meta, Yichada, Guaviare, Rio Negro and Japura, on the mutual boundary with Ecuador. The lakes of New Granada are inconsiderable; the most celebrated is the Guatavita, not far from the city of Bogotá, into which, it is affirmed, large treasures were thrown by the natives during the Spanish invasion and conquests.

The mineral riches of New Granada are considerable, and mostly occur in the western declivity of the three chains of the Andes. They consist of salt-rock, lead, iron, copper, mercury, platinum, silver, and gold. Along all the central and western declivity of the Andes gold is found, and is obtained by washing the sand of the rivers, as well as that on the sides and foot of some hills. It is found on the plateaux of Cucuta and Girona in the eastern Andes, where silver also is obtained in considerable quantity. There are also some very rich mines in the mountain region between the Rios Cauca and Magdalena, north of N. lat. 5½°. Platinum is found in the western declivity of the western Andes, and mercury in the valley of Santa Rosa, near Antioquia, and near the Pass of

Quindiu in the central Andes. Copper is found in the eastern Andes, near Pamplona, and north of Tunja. Iron and coal occur in the mountains bordering on the table-lands of Bogotá, and lead in various parts of the eastern Andes. In some mountains north-east of Bogotá large masses of rock-salt are found, and it is worked by the government. Large quantities of salt are furnished also by salt-springs in the same mountains.

From the great diversity of surface, soil, and climate of New Granada, the natural productions are extremely varied, embracing almost every variety found in the temperate as well as in the tropical zone. The chief objects of culture over the table-lands of Bogotá, and the district north of it, along the western slopes of the eastern range, are the cereals as in Europe, the aracacha-root, and potatoes; but in the river-valleys, and on the coast-plains, maize is the chief grain cultivated, with rice, sweet potatoes, and plantains. As articles of commerce, are cultivated coffee, cotton, cocoa, tobacco, some sugar, and indigo. The forests abound with numerous kinds of useful timber trees; but those converted into articles of export are the log-wood, Brazil, Nicaragua, and fustic trees, which grow most abundantly in the forests of the Santa Marta chain. The balsam of Tolu, so named from a village near Cartagena, is collected largely on the banks of the Rio Sinu, and ipecacuanha on those of the Rio Magdalena; cinchona, or Peruvian bark, is obtained in large quantities in the region of the Sierra de Santa Marta, as well as in several other places; cochineal of the finest quality is procured from the banks of the Sogamoze. Previous to the discovery of this country by Europeans, horses and cattle were unknown in these regions; but now tasajo, or jerked beef, and hides, as articles of commerce, are furnished by the immense herds of cattle which the llanos support; and mules, horses, and cattle are exported to the West Indies.

The population of New Granada are descendants of the Spaniards who have settled there during the three last centuries, and some of the native tribes intermixed with a few negroes. Very different degrees of civilization are found among the native tribes. Before the invasion of the Spaniards, those of the table-lands along the eastern Andes had organized a political system, and made some progress in the simpler arts of civilization. These, with the Indians in the valley of the upper Magdalena, are still the best husbandmen in the republic. Between the Pacific and the western Andes, nearly all the population are descendants of the aboriginal native tribes, whose progress in the arts of civilized life is very small, and almost exclusively owing to the few Spanish priests scattered among them as missionaries. None but the descendants of Europeans dwell in the treeless llanos; and their occupation is the care of the herds of mules, horses, and cattle. Wandering Indians, still in a very barbarous state, occupy the southern wooded portion of the llanos. The numbers of the respective races occupying New Granada have been estimated by Humboldt as follows:—

White Caucasians.....	450,000
Native civilized Americans.....	300,000
Negroes.....	80,000
Mets (descendants of Spaniards and natives).....	999,000
Mulattoes.....	283,000
Banoyes.....	120,000
Zambos (in Magdalena).....	100,000
Quatroces.....	30,000

Total estimated population in 1838, 2,363,000

Agriculture holds the first place in the industry of New Granada. Rice, cotton, tobacco, cocoa, sugar, and tropical fruits, are among the productions of the coast region; while the elevated plains yield maize, wheat, and all the products of a temperate zone. The cultivation of the soil, however, is carried on very carelessly; and reclaimed land bears but a small proportion to the whole. On the llanos toward the Orinoco, almost the sole occupation of the people is the

rearing of cattle and horses. Agriculture is chiefly in the hands of the converted Indians, who manifest a very decided predilection for these labors of peace. Manufacturing industry is of so little importance that it can hardly be said to exist in the republic. It is limited to home-made coarse woollens and cottons, adapted for the use of the lower classes only. At Bogotá, the capital, and the other principal towns, indeed, straw hats, carpets, and some other articles are made, but in no case does the native industry become commensurate with the demands of the country, so that nearly all manufactured goods in use are imported. Mining is carried on, but only to a very inconsiderable degree. There is a silver mine at Santa Ana, in Bogotá, the only one now worked; and gold is collected in a few localities. Emeralds, diamonds, and pearls, are, however, extensively worked. With the exception of this last, the mining business of the country is left entirely to the poor and ignorant.

The principal ports of New Granada are—on the Caribbean Sea, Santa Marta, Cartagena, Chagres, Rio de la Hacha, and Portobello; on the Pacific, Panama and Buenaventura. Steamers now navigate the Magdalena; and the only railway in the country is that from Aspinwall to Panama.

Christopher Columbus discovered terra firma in 1498, and, during his fourth voyage, on the 2d of November, 1502, found Chagres and the Bay of Limones, called also Navy Bay. Different governments have been established throughout the Granadian territory, while Spanish colonies; a vice-royalty was at length formed in 1732, of what are now the republics of New Granada and Ecuador. In 1810, New Granada separated herself from the Spanish monarchy, and maintained a constant war until 1824, when the Spanish army was conquered by the republican, of which two thirds consisted of Colombians. Bolivar, the most distinguished leader of the Spanish-American revolution, was the first proposer of the union of Venezuela and New Granada, in 1818; and when the Congress of Angostura met, early in 1819, the fundamental law was enacted which established Colombia, on the 17th of December of that year. Venezuela separated herself in November, 1829, and Ecuador in May, 1830; and the central part of Colombia instituted itself the republic of New Granada on the 21st of November, 1831. In 1832, the constitution of the State was sanctioned, under the form of a democratic republican government, by dividing the supreme power into the executive, legislative, and judicial, under a central regimen, but giving to the provinces a municipal corporation, that each section might legislate in its local affairs. The republic was divided into provinces, these into cantons, and the cantons into parochial districts. The State recognized no national religion; but has declared that it will pay for the Catholic worship, and protect Granadians in its exercise. The law of Colombia, which attributed to itself the law of patronage exercised by Spain, has continued in vigor to the present time. The republic was first divided into 18 provinces; and they have since been increased to 35. The constitution of 1832 was reformed in 1843, without any variation in the form of government.

Commercial relations between the United States and New Granada are regulated by treaty of December 12, 1846, proclaimed June 12, 1848. The following summary presents the principal commercial features of this treaty:

There shall be a perfect, firm, and inviolable peace and friendship between the two republics. No favors to be granted by either party to other nations, which shall not become common to the other. Mutual benefits in trade and residence to be equally enjoyed. The coasting trade reserved by each country to its own flag. Equalization of duties granted by each country on vessels and their cargoes. The privileges respecting

drawbacks equalized to the flag of each in the ports of either. Importations and exportations of articles, the produce or manufacture of either country, into or from the other, equalized as to duties with similar importations and exportations of any other foreign country. All prohibitions as to articles of import or export to be equal in each country as respects the flag of the other; the three preceding stipulations to apply, whether the vessels proceed from their own ports or from foreign ports, respectively. The citizens of either country to be free to manage their own business, as well with respect to shipping and its incidents, as to purchases, sales, etc., in the country of the other; and this privilege to be enjoyed personally or by agents—they being in all these cases treated as citizens or subjects of the most favored nation. In case of embargoes, detention of vessels, etc., for public or private uses, full indemnity to be allowed. The vessels of either party seeking refuge in the ports of the other to be protected. Vessels captured by pirates to be delivered up to the owners. Assistance to be given in cases of shipwreck, etc., in the ports of each to the vessels of the other, in the same manner as to the national flag. Citizens of either country authorized to dispose of their personal goods and real estate within the jurisdiction of the other, by sale, donation, testament, or otherwise; and their representatives, being citizens of the other country, to succeed to their said personal goods or real estate, whether by testament or *ab intestato*, and to take possession thereof, either by themselves or others acting for them, and to dispose of the same at their will, paying only such dues as the inhabitants of the country are subject to in like cases. Protection to persons and property formally guaranteed, whether such persons are transient or dwellers in the territories under the jurisdiction of either party, respectively; and access to the legal tribunals of each country, free and unrestricted, granted to the citizens of the other, on the same terms as to the native or other citizens of such country. Liberty of conscience and the free and unrestricted rites of burial guaranteed. Both parties at liberty to trade with those at enmity with the other.

Free ships to make free goods, contraband of war excepted. Enemy's property, to be protected by a neutral flag, must be shipped within two months after declaration of war. Articles contraband of war specified. Blockade defined to be the besieging or blockading of those places only which are actually attacked by a belligerent force capable of preventing the entry of the neutral. All contraband articles liable to confiscation. In case of blockade, vessels to be turned away, but not detained. Vessels entering before blockade may quit unmolested. During a visit at sea, armed vessels to remain out of cannon-shot. In case of war, sea-letters, certificates of cargo, etc., to be furnished, showing to whom the property belongs. In case of war between the two nations, merchants allowed time (6 months to those residing in ports, and 12 months to those residing in the interior) to arrange their business, transport their effects, etc. Citizens of other occupations, who may be established in the territories of the United States or of New Granada, to be respected and maintained in the full enjoyment of their personal liberty and property, this protection being dependent on their conduct. No confiscation of debts, etc., in the event of war. Citizens of the United States, their vessels and merchandise, placed on the same footing as those of New Granada in the ports of Panama. Right of transit across the Isthmus of Panama guaranteed to citizens of the United States, and no other or higher tolls to be exacted from them than from citizens of New Granada. The United States guarantees to New Granada the perfect neutrality of the Isthmus. Citizens to be held personally responsible for infringing any articles of the treaty; but reprisals not to be authorized, nor war declared, until justice has been demanded and refused.

An additional article provides that the two republics will hold and admit as national ships, of one or the other, all those that shall be provided by their respective governments with a patent issued according to its laws. The treaty to continue in force twenty years from the date of its ratification, and after that period the usual twelve months' notice required. The navigation and tariff regulations of New Granada are marked by a spirit of liberality, though the foreign commerce of the republic has not, as yet, attained any considerable importance. This commerce of the United States, however, with that republic, is thought to labor under some disadvantages, as appears from the following extract from a late consular return: "Our commerce, by treaty, is put on the footing of the most favored nations. But this is nominal only; for, in the list of dutiable articles, those supplied by the United States are taxed at a higher rate than such as come from England, France, and Germany. I can not now give you many instances; but my recollection is, that flour, bacon, and provisions generally, as well as common hats, boots, and shoes, may be enumerated. The articles mainly produced by the United States being taxed at a higher rate than articles produced by England, etc., etc., creating a practical discrimination against us, necessarily operates as a double injury in the exchange for the products of this country. * * * These matters should be corrected, and there should be a stipulation inserted in the treaty (should a new treaty be entered into) prohibiting the provinces from adding any tax, direct or indirect, except, perhaps, to enforce *bona fide* inspection."

The principal commercial ports of New Granada are Santa Martha, Cartagena, and Panama; the aggregate trade of which ports, for the year 1852, is given in the following statement:

COMMERCE OF NEW GRANADA, 1852.

Principal ports.	Entered.		Cleared.	
	Ships.	Tons.	Ships.	Tons.
Cartagena.....	114	14,871	109	13,734
St. Martha.....	59	4,157	48	4,127
Panama.....	312	143,899	297	183,896
Total.....	485	162,427	454	151,697

	Value entered.	Value cleared.
Cartagena....	\$81,846 lvr. sterl.	\$9,207 lvr. sterl.
St. Martha....	84,734 "	16,999 "
Panama.....	302,968,000 francs.	2,476,009 "

The subjoined analysis of this statement will show the distribution of the commerce of New Granada for the year specified:

	Per cent.		Per cent.
England and colonies.....	30.93	Cuba.....	0.50
France.....	7.42	Holland.....	0.49
United States.....	4.23	Hanse Towns.....	0.40
Caracoo.....	2.54	Mexico.....	0.27
St. Thomas.....	2.31	Spain.....	0.25
Sardinia.....	0.63	Nicaragua.....	0.10

The imports, during the same year, consisted of printed, dyed, and white cottons, calicoes, and other similar tissues; silks, linens, woollens, hardware, furniture, manufactures of metals, medicinal drugs, wines, spirits, flour, and provisions generally. The chief article of export was gold, of which the amount for this year was about \$1,000,000.

A comparison of exports for a number of years exhibits the fact, that the quantity of gold exported has either remained stationary or slightly diminished. The cause is not found in any deficiency in the auriferous resources of the country, as the mines of Antioquia, and those in the country along the Pacific, on the Rio Zulia and the Rio Hacha, contain large quantities of the precious metals; but the difficulties attending the transportation of heavy machinery, indispensable in working the mines of Antioquia, seem to be insuperable, beyond a certain weight. Until good roads shall have been established, and the mines thereby rendered more accessible, but little improve-

ment in the mining industry of this region (the richest in New Granada) can be expected.

Large quantities of gold, in ingots and dust, enter into the clandestine trade of the republic, of which no account can be taken in the official returns.

Next to gold, tobacco is the most important article in the export trade of New Granada, and its most productive staple. The soil, in many parts of the republic, is peculiarly adapted to the growth of tobacco, and its production might be made a source of the principal agricultural wealth of the State, under a different system of properly regulated industry. The quantity exported in 1848 exceeded that of the preceding year by 35 per cent.; and the returns for several preceding years exhibit a regular, though not so large, augmentation.

Cabinet-maker's wood and dye-stuffs rank next in the exports of the country. In 1848, they amounted in value to \$161,500. The large bulk of these products is sent to the United States, in part exchange for provisions, cotton goods, furniture, medicinal drugs, and sundries. Excellent coffee and cocoa are raised, chiefly in the valley of Cucuta; whence transported to Maracalbo, in Venezuela, they enter into the returns of Venezuelan exports.

In addition to these products of New Granada, a new species of bark has recently been discovered, which promises to become a valuable article of commerce. A letter from a mercantile house in London to a correspondent in New Granada, written in 1845, says: "We imported last year 17,000 seroons (hampers or baskets) of New Granada and 500 seroons of Bolivian bark. The New Granada all sold; but the Bolivian being held for a monopoly price, is still in the market—proving that this kind has very little demand."

Delondre, in his new work on quinine barks, gives an analysis of a Bolivian bark containing quite as much quinine as New Granada calisaya. If the calisaya of Santa Fé, or fusagasaga and playas bark of New Granada, had been introduced into the market before the Bolivian, there would be no question about the quality of the alkaloids they yield.

There seems a probability that this New Granadian bark will soon enter largely into the export trade of that country. The chemical test to which it has been subjected in England, has already stamped it as a valuable acquisition to the materia medica; and the periodical scarcity of quinine, which sometimes raises that article to a most exorbitant price, will render it still more popular. In reference to this bark, and other valuable products of New Granada, a report submitted in July, 1856, to the French government, relative to the commercial movements of France in New Granada, says: "Formerly, that republic had no other equivalent to offer, in exchange for foreign merchandise, than the gold of its mines." The abolition, in 1853, of the monopoly of tobacco, however, has given a new stimulus to agricultural industry, and attracted numbers to the cultivation of that article. This agricultural movement is not the only benefit accruing to New Granada from the suppression of this monopoly. In bringing the capitalists of the country in contact with foreign merchants, it has taught them to appreciate better than formerly the immense wealth to be found in the soil of the republic. Thus, quinquina, which has remained almost unknown since the departure of the Spaniards, has been a second time discovered in 1853, and has already entered into their exports, and will soon become a considerable article among the staples of New Granada. The cultivation of cocoa, formerly limited to the consumption of the country, has also been largely extended, and is now become an article of export.

The navigation laws of New Granada, by a decree of the Senate and Chamber of Representatives of that republic, bearing date May 27, 1853, a translation of

regulat

which is subjoined, undergo some modifications in favor of foreign commerce, as follows:

ARTICLE 1. The following ports and territories of the province of Choco shall be free for all nations in the world, from January 1, 1854, for twenty years:

1. The ports of the Atlantic and the territory watered by the River Atrato, from its mouth to its confluence with the River Guilio, comprehended between the western chain of the Andes and that branch of it toward the eastward which separates said province from that of Antioch-Chin.

2. The ports of the Pacific and the territory watered by the River San Juan, from its embouchure, as far as the city of Navita, contained between the abovementioned chain of the Andes and that branch of it which separates it toward the southward from the province of Buenaventura.

ART. 2. Consequently, no custom-houses can be established in said ports and territories within the time specified; nor can any duties be levied, save those of toll, passage, and excise, corresponding to the municipal revenues, and in conformity with the existing laws.

ART. 3. In order to recover the duties on importation of foreign merchandise which may be introduced for the consumption of the interior of the rest of the province, and other provinces of the republic, there shall be established two custom-houses, one in the city of Quibdo, and the other in the city of Navita, with necessary officers, etc., etc.

ART. 4. The executive power is authorized, when it deems it indispensable for weighty motives of public convenience, to assign other ports for custom-houses than those expressed in this law; in which case, the maritime ports expressed in article 1, and the territory comprised between the coasts and the spot on which such custom-houses shall be fixed, alone can enjoy freedom.

Another decree of similar importance to the interests of foreign commerce was published in the official paper of the New Granadian government of the 20th of July, 1854, in virtue of legislative authority, declaring Cartagena a free port for the commerce of all nations, from the 1st of September ensuing. By this decree, however, vessels will continue to pay tonnage duty, conformable to the law of the 25th of June last in relation to that subject. The exemption from import duties is circumscribed to the walled portion of the city, and hence does not apply to goods carried to the outside villages of Cabrero, Bocagrande, Espinal, and Manga Pi de la Popa. Counterfeit money, and Spanish, Colombian, and Granadian money, under the standard of 0.900, as well as copper not sold for the use of the republic, are prohibited; also, rum, and its compounds, so long as the legislature shall not decree the free manufacture and sale of that article. Vessels must exhibit the usual papers on entering the port; and when a vessel is only going to leave a part of her cargo, the captain must, within twenty-four hours, present a manifest of what he intends to land, and what to leave on board. If the vessel come in search of a market, and not for the determined purpose of landing her goods, the captain will be allowed forty-eight hours to present a manifest of what he intends to land and what to retain on board. If the vessel come in ballast, a manifest will not be required, but the visiting officer will satisfy himself that such is the state of the vessel. A vessel from another port of the republic, or from a port of a nation in which, by virtue of stipulations entered into with this republic, by treaty or convention, merchandise put on board in the ports of such nation must be accompanied by bills of lading, will be required to produce bills of lading for articles which may have been shipped in said ports, and a general manifest for the remainder of the cargo not embraced in such bill. The captain or supercargo not fulfilling these regulations must leave port immediately; first paying

tonnage duty, unless exempted from such payment by the law of the 25th of June, before cited. Vessels carrying a mail, and steam or sailing packets, shall be visited at any hour of the day or night, and in like manner their goods and the baggage of their passengers may be landed. A custom-house officer will board vessels at Bocachica. When the vessel contains goods subject to import duties, the hatchways, etc., shall be closed and sealed by the commanding revenue officer, packets being excepted from this regulation; after which formality, the custom-house officers will retire, leaving a suitable guard, which shall be relieved daily. The seals on the hatches, etc., are not to be broken, except by the commanding officer who placed them there, or by his deputy. The decree embraces a number of additional provisions in relation to the discharge of cargo, custom-house inspection, re-exportation, etc., etc., and is accompanied by an explanatory note from the Secretary of the Treasury of New Granada.

The coasting trade of New Granada is open to all foreign vessels, but only foreign steamers are permitted to navigate the rivers of the republic. This is an important privilege to foreign vessels, and one which is destined to stimulate American enterprise in this neighboring republic. When the repairs of the canal connecting the harbor of Cartagena with the Magdalena, now in progress, under the superintendence of an American engineer, shall have been completed, the internal trade of New Granada will be the means of developing more fully its great resources, and bringing to market the tobacco, India rubber, guinea, hides, corn, cocoa, coffee, sugar, etc., the production of which can be increased to an incredible extent. When this canal shall have been completed, Cartagena will become the great emporium of New Granada—at least of 20 of the principal agricultural provinces, containing a population of 1,628,471 inhabitants. The present tariff regulations of New Granada, to be found in Part II., have been in force since May 1, 1855; but by a late act of Congress, the manumission duty of 20 per cent. is to be suppressed, and, in lieu, the additional duty of 25 per cent. on the total amount of the import duty is to be increased to 50 per cent. The port regulations of New Granada are such as are deemed necessary, as well in view of the general convenience and safety of vessels, as to answer proper police and harbor discipline. Places are pointed out into which all rubbish, etc., is to be thrown. Ballast is to be taken in and thrown out under written authority of proper officers. Cannon are not to be fired without permission of the captain of the port. At Cartagena, it is forbidden to sound the upper or interior channels of the port, or to have any communication with the shore between eight o'clock at night and five o'clock in the morning. It is also forbidden to disembark any individual before the visits of the officers of customs and captain of the port. For the violation of any of these regulations, fines are imposed, varying from 10 to 40 dollars, according to the nature of the case.

There are no quarantine regulations at any of the ports of New Granada, and consequently no bills of health are required. No light or hospital money is levied. No local impost is charged. At the port of Savanilla there is a water-tax upon all vessels arriving there of \$4 each, imposed by the provincial legislature. Pilots are employed and paid by government. Their duty is to visit all vessels requiring their assistance, and all vessels coming from a foreign port are required to pay the full fees, whether they take on board a pilot or not. The fee is \$11, in and out. There is also a fee of \$6 40 to be paid to the captain of the port on visiting the vessel, and \$1 60 for the interpreter. With the exception of the interpreter's fee, this amount is also levied on New Granadian vessels. By a decree of the Congress of New Granada, bearing date June 19, 1856, which, like that of July 20, already given, comes to hand as these sheets go to press, new regu-

to be cleaner than most Spanish American cities. It is encircled by irregular and not very strong fortifications, constructed at different periods. The houses are partly of wood, straw, and other frag materials. The tides daily rise and fall from 20 to 27 feet, so that it is peculiarly well fitted for the repair and building of ships. The Panama railroad has one of its termini here, and another at Aspinwall, on Manzanilla Island, Navy Bay. Trains take about four hours in passing from sea to sea. See PANAMA.

Cartagena, or Carthagena, a strongly-fortified city and sea-port of New Granada, South America, of which republic it is the chief naval arsenal, capital of the province, on a sandy peninsula in the Caribbean Sea. Lat. of the dome 10° 25' 36" N., long. 75° 34' W. Population, 10,000, nine tenths of whom are a mixed black race. Its excellent port is defended by two forts, and is the only harbor on the north coast of New Granada adapted for repairing vessels. Cartagena is the principal depot for the produce of the provinces watered by the Cauca and Magdalena Rivers, and is connected with the Magdalena by a canal. It exports sugar, cotton, coffee, tobacco, hides, specie, hullion, etc. Under the Spaniards, this city was the seat of a captain-general, and one of the three tribunals of the Inquisition in America. It was the first town that proclaimed independence, and in 1815 endured a most vigorous siege, and was subdued only by famine. Population of the province, 103,783.

New Hampshire. It is situated between lat. 42° 41' and 45° 11' N., and 70° 40' and 72° 30' W. long. It contains 8,030 square miles.

Population in 1790, was 141,885; in 1800, 133,858; in 1810, 214,460; in 1820, 244,161; in 1830, 269,828; in 1840, 284,574; and in 1850, 317,864.

Early History.—John Mason, one of the first eminent settlers of the north-eastern coast of New England, having agreed with Sir Ferdinand Georges to make the Piscataqua the division line between them,

took subsequently from the Plymouth Council a patent of what lies between that river and Merrimack, and he called that tract of land "New Hampshire," because he had been Governor of Portsmouth, in Hampshire, in England.

In the year 1680 New Hampshire separated from the province of Massachusetts, and was established as an independent royal province. It was afterward united again with Massachusetts, but in 1740 finally separated, and has existed since that time as an independent community, first under the name of "the Province of New Hampshire," and since 1770 under that of "the State of New Hampshire."

The Connecticut River has its source in the highlands, on the north border of the State, and its west branch forms the boundary line between New Hampshire and Canada to within one mile of the 45th degree of north latitude. Its general course is south by west, and dividing New Hampshire and Vermont it passes through the western part of Massachusetts, and the central part of Connecticut, where it enters Long Island Sound. Merrimack River, the Penigewasset branch, rises near the Notch in the White Mountains, and is joined by the Winnipisogee, 70 miles below the source of the former. It here takes the name of Merrimack. The Androscoggin and Saco Rivers rise and have a part of their course in this State.

Granite is plentiful throughout the State, and also marble and limestone. Iron ore, zinc, tin, lead, and copper exist, some of which have been worked to advantage.

There were in this State in 1850, 2,251,488 acres of land improved, and 1,140,928 of unimproved land in farms. Cash value of farms, \$55,245,997, and the value of implements and machinery, \$2,814,125. *Live Stock.*—Horses, 34,283; asses and mules, 19; mixed cows, 94,277; working oxen, 59,027; other cattle, 114,006; sheep, 384,756; swine, 63,487; value of live stock, \$6,871,901.

Manufactures, etc.—There were in the State in 1850, 43 cotton factories, with a capital invested of \$10,974,700, employing 2,915 males and 9,335 females, producing sheetings valued at \$8,861,749; 91 woolen factories, with a capital of \$2,547,500, employing 878 males, and 1,021 females, manufacturing 1,712,840 yards of cloth, and 165,300 lbs. of yarn, valued at \$2,439,967; 1 establishment with a capital of \$4,000, employing 90 persons; producing 200 tons of pig iron, etc., valued at \$17,200; 28 establishments with a capital of \$292,700, employing 874 persons, and making 5,764 tons of castings, etc., valued at \$371,710; 2 establishments with a capital of \$4,000, employing 8 persons, manufacturing 110 tons of wrought iron valued at \$10,400; 178 flouring and grist mills, 80 saw mills, 185 tanneries, with a capital of \$441,075, employing 518 persons; 40 printing offices, 2 daily, 38 weekly, 1 semi-monthly, and 2 monthly newspapers. Capital invested in manufactures, \$18,242,114; value of manufactured articles, \$28,160,568.

Agricultural Products, etc.—Wheat, 185,658 bushels; rye, 183,117; Indian corn, 1,573,670; oats, 978,381; barley, 70,256; buckwheat, 65,265; peas and beans, 70,856; potatoes, 4,904,019; value of products of the orchard, \$248,563; produce of market gardens, \$56,810; pounds of butter made, 6,977,056; of cheese, 3,196,563; maple sugar, 1,294,863; molasses, 8,811 gallons; beeswax and honey, 117,140 pounds; wool, 1,108,476; flax, 7652; silk cocoons, 4,191; hops, 267,174; tobacco, 50; hay, tons of, 598,854; clover seeds, 829 bushels; other grass seeds, 8,071; flax seed, 180; and were made 344 gallons of wine. Value of home-made manufactures, \$398,455; of slaughtered animals, \$1,522,873.

Principal Port.—Portsmouth is the only sea-port in the State. It is situated on the south side of the Piscataqua River, on a peninsula, three miles from the sea, lat. 43° 40' N., long. 70° 45' W. The harbor is one of the best in the world; it has 42 feet water at low tide through the whole channel, and the current is sufficient to prevent it from freezing. The United States' Navy Yard is located on an island near the main bank of the river. The city has valuable manufactures and a large foreign and country trade, and being intersected by the line of railroads between Boston and Portland is connected thereby with all the New England and Canada towns; a railroad also extends to Concord. The tonnage of Portsmouth in 1856, was 34,590 tons.

The principal places in this State are Concord, the capital, Manchester, Portsmouth, Dover, Exeter and Nashua. There were in 1856, 15 railroads, with 660 miles of track completed and in operation, and 24 in course of construction. The only canals are those facilitating the navigation of the Merrimack River. For commerce, resources, etc., of New Hampshire, see HUNT'S *Merch. Mag.*, v. 348; *Am. Jo. Science*, xlix., 27; *Am. Quar. Reg.*, xlii., 170; *North Am. Rev.*, xviii., 33.

New Jersey lies between 38° 55' and 41° 24' N. lat., and between 73° 59' and 75° 29' W. long. It is 163 miles long and 52 broad, and containing 8,851 square miles.

Population in 1790, was 184,189; in 1800, 211,149; in 1810, 245,592; in 1820, 277,575; in 1830, 320,779; in 1840, 373,306; and in 1850, 489,555.

Early History of New Jersey.—The shore and territory of the present State of New Jersey were at first, since 1606, a part of the great English province of northern Virginia; and then (since about 1621) it was considered (at least by the Dutch) as a part of their *New Netherlands*.

The English, however, always claimed the country; and in the year 1648 Sir Edmund Ployden and some English gentlemen received a charter and grant of a great tract of country "lying midway between New England and Maryland," to which the name of *New*

Albion was given. This is the first English name which this country received. The charter had, however, no great consequences. The Dutch remained in possession, and the name *New Albion* was forgotten.

When the English conquered the *New Netherlands* for the Duke of York, all this land was included in the large territory given to the Duke of York. But the Duke of York very soon sold (as early as the year 1664) that part of his grant which was lying between Delaware and Hudson's River to Sir George Carteret and John Lord Berkeley. The grant which he gave to them is dated on the 24th of June, 1664. The country received at once the name of *New Jersey*, in compliment of Sir George Carteret, whose ancestors came from the Island of Jersey, and who was himself Governor of the Island of *New Jersey*.

The Hudson and Delaware Rivers flow on the eastern and western sides of this State. The *Karitan* is navigable 17 miles to *New Brunswick*, and it enters *Karitan Bay*; the *Pasaic* is navigable for small vessels for about 15 miles, and enters into *Newark Bay*; the *Hackensack*, navigable 10 miles, also enters *Newark Bay*. Great Egg Harbor River, navigable 20 miles for small craft, passes through a bay of the same name and enters into the Atlantic. The principal bays are *Newark* and *Raritan*. *Delaware Bay* is on its south-eastern border. It has two important capes, viz., *Cape May* on *Delaware Bay*, and *Sandy Hook* at the entrance of the *Bay of New York*. It contains quarries of good building stone, valuable mines of zinc and of iron, and in the south parts, beds of marl.

The principal places in this State are *Trenton*, the capital, *Princeton*, *New Brunswick*, *Rahway*, *Elizabethtown*, *Jersey City*, *Hoboken*, *Paterson*, *Hackensack*, *Morristown*, *South Amboy*, *Freehold*, *Burlington*, and *Camden*. There were in the State, July, 1857, 38 banks with a paid capital of \$5,147,741. The total tonnage of the State, January, 1853, amounted to 33,300 tons.

The northern part of the State is mountainous, being crossed by a branch of the *Alleghany Ridge*; the middle portion is agreeably diversified by hills and valleys; while the southern part is level, sandy, and mostly covered with pines and a scanty growth of shrub oaks. The northern and middle portions of the State have a fertile soil.

There were in the State in 1850, 1,767,991 acres of improved land, and 984,955 of unimproved in farms. Cash value of farms \$120,287,511; and the value of implements and machinery \$4,425,503. *Livestock.*—Horses, 63,955; asses and mules, 4,089; milch cows, 118,736; working oxen, 12,070; other cattle, 80,455; sheep, 160,488; swine, 250,370; value of live stock, \$10,679,291.

Agricultural Products, etc.—Wheat, 1,601,190 bushels produced; rye, 1,255,578; Indian corn, 8,759,794; oats, 3,588,063; barley, 6,492; buckwheat, 878,934; peas and beans, 14,174; potatoes, 3,207,236; sweet potatoes, 508,015; value of products of the orchard, \$607,278; produce of market gardens, \$475,242; lbs. of butter made, 9,487,210; of cheese, 365,756; maple sugar, 2,197; molasses, 954 gallons; beeswax and honey, 156,694 lbs.; wool, 375,396; flax, 182,965; silk cocoons, 28; hops, 2,133; tobacco, 310; hay, 435,950 tons; clover seed, 28,280 bushels; other grass seeds, 63,051; flax seed, 16,625; and were made, 1,812 gallons of wine; value of home-made manufactures, \$112,781; of slaughtered animals, \$2,638,552.

Manufactures, etc.—There were in the State in 1850, 29 cotton factories with a capital invested of \$1,691,000, employing 739 males and 1,299 females, producing 8,122,580 yards of sheeting, etc., and 2,000,000 pounds of yarn valued at \$1,289,648; 51 woolen factories with a capital invested of \$410,650, employing 407 males and 137 females, manufacturing 771,100 yards of cloth, etc., valued at \$784,772; 9 establishments making pig iron, with a capital invested of

\$967,000, employing 600 persons, producing 24,081 of pig iron, etc.; entire value of products \$917,000; 45 establishments with a capital of \$508,250, employing 803 persons, making 10,269 tons of castings, valued at \$686,430; 58 establishments with a capital of \$1,016,843, employing 598 persons, manufacturing 3,162 tons of wrought iron valued at \$629,278; 891 flouring and grist mills; 75 printing offices, 61 newspapers, 8 daily,

50 weekly, and 3 monthly publications. Capital invested in manufactures, \$22,184,710; value of manufactured articles, \$89,134,614. The Delaware and Raritan Canal, 42 miles long, and the Morris, 102 miles long, are the canals in this State. There were, January 1, 1856, 11 railroads with an aggregate length of 504 miles in operation, and 29 miles in course of construction. The State of New Jersey has no public debt.

FOREIGN COMMERCE OF THE STATE OF NEW JERSEY, FROM OCTOBER 1, 1820, TO JULY 1, 1854.

Principal Ports.—Jersey City is a flourishing city at the mouth of the Hudson River, opposite New York city, and is the terminus of the southern railroad travel, and also of the New York and Erie Railroad and of the Morris Canal. Though a separate municipality, it may be considered as a suburb of the great metropolis, with which it connects by several ferries. It is a place of considerable manufacturing industry, ship-building, and commerce, and it is the American station of the Cunard line of New York and Liverpool steamships.

Paterson is situated immediately below the falls of the Passaic River, 17 miles from New York. It ranks next to Newark in manufactures, and is the third city in the State as to population. Its principal products are cotton and silk goods, locomotives, machinery, paper, etc. On the opposite side of the river is the manufacturing town of Manchester. Paterson communicates with New York by the Paterson and Hudson Railroad and Morris Canal.

The other towns of note are Newark, New Brunswick, Camden, Trenton, and Princeton.

New London, Connecticut, is situated on the Thames River, 3 miles from the ocean, 50 miles east of New Haven by railroad. Its harbor is one of the best in the United States, but is seldom visited by foreign vessels. The whale fisheries constitute its main interest, and it has also a large coasting trade. Several railroads connect it with the interior, New York, and Boston, and regular steamboats ply to and

from New York. The tonnage in 1856, was 40,971 tons. Population in 1830, 4850; in 1854, 10,000.

New Mexico, a Territory of the United States of America, lies between lat. 32° 30' and 38° 32' N., and long. 103° and 116° W. from Greenwich, England. Area, 210,744 square miles.

New Mexico is a mountainous country, with an extensive valley in the middle, running from north to south, and formed by the *Rio del Norte*. The valley is generally about 20 miles wide, and bordered on the east and west by mountain chains, continuations of the Rocky Mountains, which have received here different names, as Sierra Blanca, de los Organos, Oscura, on the eastern side, and Sierra de los Grullas, de los Mimbres, toward the west. The height of the mountains south of Santa Fé is from 6000 to 8000 feet, while near Santa Fé, and in the more northern regions, some snow-covered peaks rise from 10,000 to 12,000 feet above the sea. The mountains are principally composed of igneous rocks, as granite, sienite, diorite, basalt, etc. On the higher elevations, excellent pine timber grows; on the lower, cedars, and sometimes oak; in the valley of *Rio del Norte*, mesquite. The main artery of New Mexico is the *Rio del Norte*. Its head waters were explored in 1807 by Captain Pike, between 37° and 38° N. latitude; but its highest sources are supposed to be about 2° further north in the Rocky Mountains, near the head waters of the Arkansas and the Rio Grande (of the Colorado of the west). Following a generally southern direction, it

runs through New Mexico, where its principal affluent is the Rio Chamas from the west, and winds its way then in a south-eastern direction along the borders of Chihuahua, Coahuila, and Tamaulipas, to the Gulf of Mexico, in 25° 56' N. lat. Its tributaries below El Paso, are the Pecos, from the north; the Conchos, Salado, Alamo, and San Juan, from the south. The whole course of the river, in a straight line, would be near 1,200 miles; but by the meandering of its lower half, it runs at least 2,000 miles from the region of perpetual snows to the almost tropical climate of the Gulf. The elevation of the river above the sea near Albuquerque is about 4,800 feet; at El Paso del Norte, about 3,900; and at Reynosa (between 300 and 400 miles from its mouth), about 170 feet. The fall of its water between Albuquerque and El Paso, is from 2 to 3 feet in a mile, and below Reynosa 1 foot in 2 miles. The fall of the river is seldom used as a motive power, except for some flour mills, which are oftener worked by mules than water. The principal advantage which is at present derived from the river, is for agriculture, by their well-managed system of irrigation. As to its navigation in New Mexico, even canoes could not be used, except perhaps during May or June, when the river is in its highest state from the melting of the snows in the mountains. The river is entirely too shallow, and interrupted by too many sand-bars, to promise anything for navigation. On the southern portion of the river, the recent exploration by Captain Sterling, of the United States' steamer *Major Brown*, has proved that steamboats may ascend from the Gulf as far as Laredo, a distance of 700 miles. Although the steamboat used did not draw over two feet of water, yet the explorers of that region express their opinion, that "by spending some \$100,000 in a proper improvement of the river above Mier, boats drawing four feet could readily ply between the mouth of the Rio Grande and Laredo."

There were in this Territory in 1850, 166,201 acres of land improved, and 124,370 of unimproved land in farms. Cash value of farms \$1,658,952, and the value of implements and machinery \$77,960. *Live Stock*.—Horses, 5,079; asses and mules, 8,654; milch cows, 10,335; working oxen, 12,257; other cattle, 10,085; sheep, 377,271; swine, 7,314; value of live stock, \$1,494,629.

Agricultural Products, etc.—Wheat, 196,516 bushels produced; Indian corn, 865,411; oats, 5; barley, 5; buckwheat, 100; peas and beans, 15,688; potatoes, 3; value of products of the orchard, \$8,231; produce of the market gardens, \$6,679; pounds of butter made, 111; of cheese, 5,848; molasses, 4,236 gallons; bees-wax and honey, 2 pounds; wool, 32,901; hops, 50; tobacco, 8,467; and woad made, 2,363 gallons of wine; value of home-made manufactures, \$6,033; of slaughtered animals, \$82,125.

Besides agriculture, the inhabitants of New Mexico pay a great deal of attention to the raising of stock, as horses, mules, cattle, sheep, and goats. Their stock is all rather of a small size, because they care very little for the improvement of the breed; but it increases very fast, and as no feeding in stables is needed in the winter, it gives them very little trouble. There are large tracts of land too distant from the water-courses to be cultivated, or in too mountainous parts, which afford, nevertheless, excellent pasturage for millions of stock during the whole year; but unfortunately the raising of the stock has been crippled by the invasions of the hostile Indians, who consider themselves secret partners in the business, and annually take their share away.

A third, much neglected branch of industry in New Mexico, are the mines. A great many now deserted mining places in New Mexico, prove that mining was pursued with greater zeal in the old Spanish times than since, which may be accounted for in various ways, as the want of capital, want of knowledge in

mining, but especially the unsettled state of the country and the avarice of its arbitrary rulers. The mountainous parts of New Mexico are very rich in gold, copper, iron, and silver. Gold seems to be found to a large extent in all the mountains near Santa Fé, south of it in a distance of about 100 miles, as far as *Gran Sangre*, and north for about 120 miles up to the River *Sangre de Cristo*. Throughout this whole region, gold dust has been abundantly found by the poorer classes of Mexicans, who occupy themselves with the washing of this metal out of the mountain streams. At present, the old and new *Paeer*, near Santa Fé, have attracted most attention, and not only gold washes, but some gold mines, too, are worked there. They are the only gold mines worked now in New Mexico. Several rich silver mines were, in Spanish times, worked at Avo, at Cerrillos, and in the Nambé Mountains, but none at present. Copper is found in abundance throughout the country, but principally at las Tijeras, Jemas, Abiquilú, Gaudelupita de Mora, &c. There is but one copper mine worked at present south of the placers. Iron, though also abundantly found, is entirely overlooked. Coal has been discovered in different localities, as in the Baton Mountains, near the village of Jemez, south-west of Santa Fé, and in a place south of the placers. Gypsum, common and selenite, are found; most extensive layers of it exist in the mountains near Algodones, on the Rio del Norte, and in the neighborhood of the celebrated "Salinas." It is used as common lime for whitewashing, and the crystalline or selenite instead of window-glass.

Santa Fé is the capital of the Territory. There were in 1850, 3 printing offices in the Territory, issuing a weekly and a tri-monthly, and a monthly publication. In the same year there were 1 academy, with 40 pupils; 146 Roman Catholic churches. Total amount of church property valued at \$188,200.

The climate of New Mexico is of course very different in the higher, mountainous parts, from the lower valley of the Rio del Norte; but generally taken, it is temperate, uniform, and healthy. The summer heat in the valley of the river will sometimes rise to nearly 100° Fahrenheit, but the nights are always cool and pleasant. The winters are long and severe; the higher mountains are always covered with snow, and ice and snow are common in Santa Fé; but Rio del Norte is never frozen with ice thick enough to admit the passage of horses and carriages, as was formerly believed. The sky is generally clear, and the atmosphere dry. Between July and October, rain falls; but the rainy seasons are here not so constant and regular as in the southern States. Disease seems to be very little known, except some inflammations and typhoid fevers in the winter season.

Of the history of New Mexico we authentically know but little. The Spaniards, it seems, received the first information in regard to it, in 1561, from a party of adventurers, commanded by Captain Francisco de Leyva Bonillo, who, finding the aboriginal inhabitants and the mineral wealth of the country to be similar to those of Mexico, called it New Mexico. In the year 1594, the Count de Monterey, then viceroy of Mexico, sent Juan de Oñate, of Zacatecas, to take formal possession of the country, in the name of Spain, and to establish colonies, missions, and presidios (forts). They found many Indian tribes, which they succeeded in Christianizing in the usual Spanish way, with sword in hand, and made them slaves. The villages of the Christianized Indians were called *Pueblos*, in opposition to the wild and roving tribes that refused such favors. Many towns, of which only ruins exist now, were established at that time; many mines were worked, and the occupation of the country seemed secure, when, in 1680, a general insurrection of all the Indian tribes broke out, and the Spaniards, who were quite unacquainted and unprepared, were

massacred almost to a man. The Governor of New Mexico, Don Antonio de Otermin, after a hard struggle, retreated from Santa Fé, and marched as far south as Pao de Norte, where he and his followers met with some friendly Indians, made a stand, and laid the foundation of the town of that name. The war with the Indians lasted 10 years, when the Spaniards reconquered the whole country. Subsequently, several insurrections have taken place, none, however, have been so disastrous as the first, but the deep rancor of the Indian race against the white, has continued to the present time. There has grown up a hatred between the Indians and the Mexicans, never to be subdued but with the extinction of the race.

Santa Fé was taken by General Kearney, September 8, 1846, and the Territory was ceded to the United States by the treaty of Guadalupe Hidalgo, February, 1848, and the present territorial government established in 1850. The legislative assembly consists of a council of 13 members, elected for 2 years, and a house of representatives, of 26 members, elected for 1 year. Governor appointed by the President of the United States for 4 years. Every free white inhabitant, 21 years of age, and a citizen of the United States, is a legal voter.

New Orleans, the capital of Louisiana, one of the United States, on the eastern bank of the Mississippi, about 105 miles from its mouth, lat. $29^{\circ} 57' 45''$ N., long. $90^{\circ} 9' W.$ Population, in 1850, 119,461. The new-built streets are broad, intersecting each other at right angles; and the houses are mostly of brick. It is the grand emporium of all the vast tracts traversed by the Mississippi, the Missouri, and their tributary streams, enjoying a greater command of internal navigation than any other city, either of the Old or New World. Civilization has hitherto struck its roots, and begun to flourish only in some comparatively small portions of the immense territories of which New Orleans is the sea-port; and yet its progress has been rapid beyond all precedent. It appears from the accounts printed by order of Congress, that during the year ended the 30th June, 1852, the value of the native American produce exported from this city amounted to \$48,808,169, while the value of that exported from New York was \$74,042,581. With respect to imports, the case is materially different; the value of those of New Orleans, in the year just mentioned, being only \$12,057,724, whereas those of New York amounted to \$182,329,806. It is believed by many, seeing how rapidly settlements are forming in the "West," that New Orleans must, at no very distant period, exceed every other city of America, as well in the magnitude of its imports as of its exports; and, considering the boundless extent and extraordinary fertility of the uncultivated and unoccupied basins of the Mississippi and Missouri, the anticipations of those who contend that New Orleans is destined to become the greatest emporium, not of America only, but of the world, will not appear very unreasonable. Steam navigation has been of incalculable service to this port, and, indeed, to the whole of the valley of the Mississippi. The voyage up the Mississippi, that used formerly to be so difficult and tedious, is now performed in commodious steam packets with ease, celerity, and comfort. "There have been counted," says Mr. Flint, "in the harbor, 1500 flat-boats at a time. Steam-boats are arriving and departing every hour; and it is not uncommon to see 50 lying together in the harbor. A forest of masts is constantly seen along the levee, except in the sultry months. There are often 5000 or 6000 boatmen from the upper country here at a time; and we have known 30 vessels advertised together for Liverpool and Havre. The intercourse with the Havana and Vera Cruz is great, and constantly increasing." As a shipping port, New Orleans now ranks third in the Union; being in this respect inferior only to New York and Boston. Vessels of the

largest burden may navigate the river several hundreds of miles above the city. The aggregate burden of the shipping belonging to the port on the 30th June, 1852, amounted to 266,013 tons; of which 162,637 were employed in steam navigation. In the year ending 31st August, 1852, the arrivals of steamers, principally from the interior, were 2784. The depth of water in the river opposite to New Orleans is, at a medium, about 70 feet; and it maintains soundings of 30 feet till within a mile of its confluence with the sea. Besides three or four of inferior consequence, the Mississippi has four principal passes or outlets. In the south-east, or main pass, at Balize, the water on the bar, at ordinary tides, does not exceed 12 feet; and as the rise of tides in the Gulf of Mexico is not more than 2 or 2½ feet, vessels drawing much water can not make their way from the ocean to New Orleans. The unhealthiness of the climate is the great drawback on New Orleans. This probably arises from the low and marshy situation of the city and surrounding country, which is under the level of the Mississippi, being protected from inundation by an artificial levee or mound, varying from 5 to 30 feet in height, and extending along the bank of the river a distance of 100 miles. The unhealthy season includes July, August, and September; during which period the yellow fever often makes dreadful havoc, particularly among the poorer classes of immigrants from the North and from Europe. Latterly, great efforts have been made to improve the health of the city, by supplying it abundantly with water, paving the streets, removing wooden sewers, and replacing them with others of stone, etc. Many places, where water used to stagnate, have been filled up; and large tracts of swampy ground contiguous to the town have been drained. And as such works will no doubt be prosecuted on a still larger scale, according to the increase of commerce and population, it is to be hoped that the ravages of fever may be materially abated, though the situation of the city excludes any very strong expectation of its ever being rendered quite free from this dreadful scourge. It has latterly been proposed to bring earth from the upper parts of the Mississippi, and to employ it in forming a site for a new city raised some feet above the level of the river. It is believed that this would be the most likely means to guard against fever; and the object in view is of such paramount-importance, that the expense of the scheme should be reckoned a very inferior matter.

Several cotton presses are among the most imposing structures in the city. The Orleans cotton press is on ground 632 feet long and 308 wide, which is nearly covered with buildings. It contains a centre building, three stories high, surmounted by a cupola, which affords a fine view of the city. The wings are two stories high, and very extensive. It presses, on an average, 150,000 bales of cotton annually, but its capacity is much greater. There are other cotton presses. Several of the banks have fine buildings, and some of the hotels are magnificent. Two of these hotels cost \$600,000 each. The United States branch mint has an edifice, 282 feet long, and 108 feet deep, with two wings 29 by 81 feet, the whole, three stories high, which cost \$182,000. The city is supplied with water raised by powerful steam-engines from the Mississippi River into a reservoir constructed on an artificial mound, 21 feet high at its base. The reservoir is 250 feet square, built of brick, and plastered with hydraulic cement. It is divided into four compartments, to allow the water to settle before it is distributed over the city in cast-iron pipes, which are laid to the aggregate length of 18 miles. The water works belonged to the Commercial Bank, and cost \$722,004. The city lighted with gas. A draining company, with a capital of \$64,000, has two steam-engines for draining the marshes of 35 miles in extent between the city and Lake Pontchartrain. There are in the city a United

States' land office, several public and private banks, having a large capital, and several insurance companies, with commensurate capitals.

The manufacturing establishments of this city are comprised under the head of furnaces, foundries, machine shops, sugar refineries, cotton factories, distilleries, tobacco factories, saw mills, etc. The whole employed a capital in 1850 of \$21,200,000, and manufactured articles valued at \$4,462,044; since which time the increase has been very rapid, and in 1854 were estimated to have doubled the amounts of 1850.

On the right bank of the river, and opposite to New Orleans, connected by a steam ferry, is Algiers; and adjoining, the suburb of Macdonough, where are the United States' Marine Hospital and many pleasant residences. Algiers contains several large machine shops, iron foundries, and ship-building establishments.

There are steam and sailing packet lines to all the large sea-port cities, sailing weekly. Also, steam packets weekly to Vera Cruz and other ports in the Gulf.

For commercial purposes, New Orleans occupies a very superior and commanding situation. It is the natural entrepôt for supplies destined to all parts of the Mississippi valley, as well as the dépôt for those products of that salubrious region which seek a market seaward. By means of the Mississippi River and its tributaries, an inland trade is opened to her grasp, the magnitude of which has never been equaled. Steamers may leave her wharves and proceed on voyages of several thousand miles without breaking bulk. The Mississippi and its affluents are flanked on either side by extensive territories, un surpassed in richness of soil, which readily yield a harvest to the labors of the agriculturist, whether it be of sugar, corn, or cotton. These are the principal staples of the valley, and the receipts of each of their products at New Orleans are rapidly increasing. Heretofore, the river has been the only channel depended upon for their transportation. Several lines of railroad are in process of construction now, however, to facilitate the transportation of cotton and sugar produced at a distance from the river, to market, and thus enlarge the area of production. These bulky products will not bear an extensive land carriage by the old mode, and result in wealth to the producer; but the construction of railroads for their cheap transit to the river even, will not only change the prospects of the interior planters for the better, but will add greatly to the wealth and commerce of New Orleans, which is eminently a place of exchange and distribution. It is the great dépôt of the south-western plantations, where cotton and sugar crops are bought and sold while still in the field, or "advanced" upon prospectively if necessary. It has also an extensive trade with Texas, Mexico, and the Gulf ports, as well as a very heavy foreign export trade. She has, besides, a large coasting trade with Atlantic ports, the value of which can only be known generally by its results. Her commercial life may be said to date after the cession of Louisiana to the United States, in 1803, as previous to that, her commerce was insignificant; and yet, in this short period of about 40 years, she already ranks as the fourth city of the world for the magnitude and value of her commerce. The facilities and convenience of transacting business at New Orleans are fully equal to, and in many respects superior to those of any other place. It is the centre of immense exchange operations, and any amount of funds can at all times be obtained at the shortest notice under good letters of credit, and bills negotiated with great readiness and facility on any prominent point in the United States, or any of the commercial cities of western Europe; and the banking institutions afford all reasonable accommodations to the local wants and trade of the city. Some European cities can show more splendid quays or magnificent docks for the accommo-

nation of shipping, and the landing and loading of cargoes, far exceeding a appearance and durability any thing of the kind in New Orleans, but in no way superior in point of actual convenience to the unpretending wharves of the city. As is generally known, the surface of the alluvial soil of Louisiana, including, of course, the site of the city, is considerably below the river in ordinary stages of high water, and the country is protected from inundation by a raised and solid embankment called the "levee," extending on both sides of the river below, and a great distance above the city. Outside of the levee the bank of the river is called the "batture," which in many places is increasing from the continual alluvial deposits, while in other places the river has what is called "a falling bank," and the water gradually encroaches on the land. In the former case the levee is advanced as the batture increases, and this has been the case in a large portion of the front of New Orleans, where, in some parts, the levee has, in the last 25 years, advanced fully 1000 feet; and the front warehouses now stand for a long extent that distance from the water, affording a splendid space for the vast bulk of produce that is annually landed and shipped. The wharves are constructed outside the levee on massive piles, driven with a heavy iron ram into the mud, and extending over the river into the water sufficiently deep to admit the heaviest steamboats and ships to lie up against them; heavy sleepers connect the piles at their tops, and on these piles the platform is laid, of thick planking, the edges of which are separated about one inch, to prevent the accumulation of dirt, which falls through these interstices into the river flowing below, and in five minutes after the heaviest storm the whole surface is in perfect condition to receive any description of merchandise. These wharves are thus planked back till they join the crown of the levee, in some places 150 to 200 feet, which is made firm and solid by a constant coating of shells, and always kept in good order. One of these wharves presents an unbroken front on the river of 1500 feet, and others 600 to 800 feet, and in the business season it is usual to see these fronts entirely occupied with steamboats lying bow on, and each with her stage rigged out to the wharf, actively engaged in loading or unloading. The wharves intended for sea-going vessels are detached from each other with an intervening dock, and each wharf accommodates a tier of vessels, which, unlike the steamboats are moored up and down the river, one outside the other, three, four, and five tiers deep, with a broad, common stage communicating with the levee, and extending on the bulwarks of the vessel to the outside one; the timber, plank, and all the conveniences for this staging, being furnished by the city, who even also supply tarpaulins to protect the goods in case of rain.

New Orleans was founded by the French in 1717. In 1762 it was conveyed to the Spanish, who, in 1800, re-conveyed it to the French, and in 1803 it was included in the purchase of Louisiana by the United States. On January 8th, 1815, the British under General Packenham made an attack on the city, approaching it through Lake Borgne, but were signally defeated by the Americans under General Jackson. The British loss in killed and wounded was 3000 men, and General Packenham was killed; the Americans lost only 7 men killed and 6 wounded. In 1718 Bienville, at that time governor of the province, selected the present site of New Orleans, but owing to difficulties he had to encounter, it was not located until 1722. In 1727 the Jesuits arrived and were located in a tract of land, on a portion of which St. Charles Hotel now stands. In 1763 they were compelled to quit Louisiana by an order from Pope Clement XIII., and all their property confiscated, then estimated to be worth \$180,000, which is now worth over \$20,000,000. In 1769 the first case of yellow fever known, was introduced by a British slaver with a cargo from Africa.

In 1778 *Le Moniteur*, the first newspaper, was published; there are now 12 dailies and as many weekly papers published. In 1810 the first street was paved in New Orleans. At this time such was the state of the streets after a rain, that sleds were used to drag cotton, which paid \$1 a bale. In 1834 gas and water were introduced. The present area of the city is not far from 40 square miles, double the size of New

York. In 1825 the grounds above Canal-street and below Esplanade-street were principally plantations. The following statistics give a complete view of the trade of this great and growing emporium. Its preponderance in shipment of cotton is as decided as that of Manchester in its manufacture: for further information refer to articles, COTTON, COTTON MANUFACTURE, GREAT BRITAIN, LOUISIANA, UNITED STATES.

Commerce of New Orleans.—The following tables, which we have compiled from our records, present some leading facts connected with the commercial progress of this city, and will be found valuable for future reference by the readers of this work:

STATEMENT OF THE RECEIPTS AND EXPORTS OF COTTON AND TOBACCO AT THE PORT OF NEW ORLEANS IN EACH YEAR, FROM 1822-23 TO 1856-57, A PERIOD OF THIRTY-FIVE YEARS.

Table with columns for Years, Cotton (Receipts, Exports), and Tobacco (Receipts, Exports). Rows list years from 1822-23 to 1856-57 with corresponding values.

Upon the supposition that the average value of cotton and tobacco for the 35 years above stated may be fairly estimated at \$40 per bale for the former, and \$70 per bushel for the latter, it would give a total value for these two articles alone of \$1,203,048,310.

IMPORTS OF SPECIE AT NEW ORLEANS, FOR TWELVE YEARS, FROM 1ST SEPTEMBER TO 31ST AUGUST.

Table with columns for Years, Value, and Years, Value. Rows list years from 1856-57 to 1851-52 with corresponding values.

EXPORTS OF SUGAR AND MOLASSES AT NEW ORLEANS, FOR THREE YEARS (UP THE RIVER EXPORTED), FROM SEPTEMBER 1ST, 1854, TO AUGUST 31ST, 1857.

Table with columns for Whither exported, Sugar, and Molasses. Rows list various destinations like New York, Philadelphia, Charleston, etc., with corresponding quantities.

COMPARATIVE PRICES OF SUGAR AND MOLASSES AT NEW ORLEANS, ON THE FIRST OF EACH MONTH, FOR FIVE YEARS.

Table with columns for Months, 1856-57, 1855-56, 1854-55, 1853-54, 1852-53, 1856-57, 1855-56, 1854-55, 1853-54, 1852-53. Rows list months from September to August with prices for Sugar and Molasses.

COMPARATIVE PRICES OF FLOUR, ON THE 1ST OF EACH MONTH FOR FIVE YEARS.

Table with columns for Months, 1856-57, 1855-56, 1854-55, 1853-54, 1852-53. Rows list months from September to August with prices for Flour.

COMPARATIVE PRICES OF CORN, SACKS, AT NEW ORLEANS ON THE 1ST OF EACH MONTH, FOR FIVE YEARS.

Table with columns for Months, 1856-57, 1855-56, 1854-55, 1853-54, 1852-53. Rows list months from September to August with prices for Corn.

COMPARATIVE RATES OF EXCHANGE ON LONDON, PARIS, AND NEW YORK, AT NEW ORLEANS, ON THE 1ST OF EACH MONTH FOR THREE YEARS. (60 DAY BILLS).

Table with columns for Months, 1856-57, 1855-56, 1854-55. Rows list months from September to August with exchange rates for London, Paris, and New York.

New York, Boston, Philadelphia, Baltimore, Other U.S. Cities, Cuba, Other U.S. Cities, Total

Vertical list of import categories including Apples, Bacon, Butter, Beans, Beef, Corn, Cotton, Feathers, Glassware, Hemp, Iron, Lard, Linen, Meat, Molasses, Onions, Oil, Potatoes, Pork, Sugar, Soap, Starch, Tobacco, Twine, Whisky, Wheat.

EXPORTS OF FLOUR, PORK, BACON, LARD, BEEF, WHISKY, AND CORN, FOR TWO YEARS, FROM SEP. 1 TO AUG. 31.

Table showing exports of flour, pork, bacon, lard, beef, whisky, and corn for two years (1884-85 and 1885-86) from Sep 1 to Aug 31. Columns include Ports, Flour, Pork, Bacon, Lard, Beef, Whisky, and Corn.

In the above exports to Mobile, etc., via the Pontchartrain Railroad and New Canal, are included.

IMPORTS INTO NEW ORLEANS, FROM THE INTERIOR, FOR TEN YEARS, FROM THE 1ST SEPTEMBER TO THE 31ST AUGUST IN EACH YEAR.

Large table showing imports into New Orleans from the interior for ten years (1855-56 to 1947-48). Columns include Articles, 1855-56, 1856-57, 1857-58, 1858-59, 1859-60, 1860-61, 1861-62, 1862-63, 1863-64, 1864-65, 1865-66, 1866-67, 1867-68, 1868-69, 1869-70, 1870-71, 1871-72, 1872-73, 1873-74, 1874-75, 1875-76, 1876-77, 1877-78, 1878-79, 1879-80, 1880-81, 1881-82, 1882-83, 1883-84, 1884-85, 1885-86, 1886-87, 1887-88, 1888-89, 1889-90, 1890-91, 1891-92, 1892-93, 1893-94, 1894-95, 1895-96, 1896-97, 1897-98, 1898-99, 1899-00, 1900-01, 1901-02, 1902-03, 1903-04, 1904-05, 1905-06, 1906-07, 1907-08, 1908-09, 1909-10, 1910-11, 1911-12, 1912-13, 1913-14, 1914-15, 1915-16, 1916-17, 1917-18, 1918-19, 1919-20, 1920-21, 1921-22, 1922-23, 1923-24, 1924-25, 1925-26, 1926-27, 1927-28, 1928-29, 1929-30, 1930-31, 1931-32, 1932-33, 1933-34, 1934-35, 1935-36, 1936-37, 1937-38, 1938-39, 1939-40, 1940-41, 1941-42, 1942-43, 1943-44, 1944-45, 1945-46, 1946-47, 1947-48.

MONTHLY ARRIVALS OF SHIPS, BARKS, BRIGS, SCHOONERS, AND STEAMBOATS, FOR THREE YEARS, FROM SEPTEMBER 1 TO AUGUST 31.

Table with columns for Months (September to August) and years (1846-47, 1845-46, 1844-45). Sub-columns include Ships, Barks, Brigs, Schoon., S. Ships, Total, S. Boats.

MONTHLY ARRIVALS OF FLATBOATS FOR THE PAST SEASON.

Table with columns for Months (September to August) and states (Ohio, Kentucky, Indiana, Virginia, Pennsylvania, Illinois, Arkansas, Tennessee, Mississippi, Total).

DIRECT IMPORTS OF COFFEE, SUGAR, AND SALT, FOR THREE YEARS, FROM SEPTEMBER 1 TO AUGUST 31.

Table with columns for Articles (Coffee-Cuba, etc., Sugar, etc., Molasses, etc., Salt) and years (1846-47, 1845-46, 1844-45).

New Orleans Levee Dues.—The subjoined ordinance, passed by the Common Council of the city and approved by the mayor, May 28, 1852, is now in force:

An Ordinance to Regulate the Levee and Wharfage Dues on Ships and Vessels arriving from Sea, and on Steamboats, Flats, Barges, etc.—ARTICLE I. That from and after the passage of this ordinance the levee or wharfage rates on ships or other sail vessels, steamships, steamboats, flats, barges, and other craft, shall be fixed as follows: On all ships or sail vessels of 1,000 and under, 25 cents per ton. Excess of tonnage over 1,000 tons, 20 cents per ton. On all steamships, 17 1/2 cents per ton. On all steamboats of 1,000 tons and under, 15 cents per ton. Excess of tonnage over 1,000 tons, 10 cents per ton. Provided, the boats arriving and departing more than once each week, shall pay only two thirds of these rates. On each flatboat not measuring over 80 feet, \$10. On each flatboat measuring 80 to 100 feet, \$12. On each flatboat measuring over 100 feet, \$15. On each barge more than 70 feet long, \$12. On each barge less than 70 feet long, and not exceeding 15 tons burden, \$8. On each steamboat hull used as a barge, \$25. On each scow and coastwise pirogue, \$2. For every flatboat, barge, or other vessel, not including steamboats, employed in the transportation of brick, lumber, or other building materials, or in bringing produce from this and neighboring parishes to this city, and measuring not over 25 tons, the levee and wharfage dues shall be \$30 per annum. From 25 to 50 tons, \$60 per annum. Over 50 and not exceeding 75 tons, \$80 per annum. Over 75 and not exceeding 100 tons, \$125 per annum. Over 100 tons, \$200 per annum.

ARTICLE 2. Every proprietor of any small craft of the description above-mentioned, who shall desire to enjoy the privilege accorded by the present ordinance, must apply to the treasurer of the city of New Orleans for the purpose of obtaining a license, approved by the mayor, and countersigned by the controller, which license shall specify the number or name of such craft, which shall be painted in a conspicuous place on the side of the said craft.

ARTICLE 3. Hereafter it shall not be lawful for any pirogue, flatboat, barge, boat, or keelboat, to remain in port longer than eight days, under the same provisions and penalties contained in Article 3, of an ordinance of the General Council, approved May 20, 1843.

ARTICLE 4. That the payment of the levee dues on ships or sail vessels, steamships, and steamboats, shall be exacted and collected by the collectors of levee dues, and an extra duty of one third these rates shall be paid by all sail vessels or steamships which may remain in port over two months, the same to be recovered at the commencement of the third month; and if over four months, an additional duty of one third these rates. Steamboats shall be entitled to remain thirty days in port after payment of the dues. All over thirty days to pay an additional duty of \$2 per day.

ARTICLE 5. That all vessels now in port, and that have paid a daily or weekly wharfage, shall be allowed (and the collectors are hereby authorized) to deduct the amount so paid from the rates now to be collected. All ordinances or parts of ordinances conflicting with the foregoing be, and the same are hereby, repealed.

TARIFF OF COMMERCIAL CHARGES AND RATES ADOPTED BY THE NEW ORLEANS CHAMBER OF COMMERCE, IN 1846 AND 1848, AND AMENDED MAY 10, 1852.

Table with columns for Tariff of Commercial Charges and Rates, including Sugar, cotton, tobacco, lead, flour, and other products of the soil, Domestic manufactures, and all foreign merchandise.

Commission on Sales—continued.

Consignments of merchandise withdrawn or re-shipped per order, on account of advances and responsibilities—full commission.
 On the surplus amount of invoices of such consignments, deducting advances and liabilities—half commission.
 Drawing, indorsing or negotiating foreign bills of exchange..... 1/2 "
 Ditto, on domestic bills of exchange..... 1 "
 Receiving, entering, and re-shipping merchandise to a foreign port—on amount of invoice..... 1 "
 On amount of advances, charges, and liabilities on same..... 3/4 "
 For drawing, accepting, negotiating, or indorsing notes or drafts without funds, produce, or bills of lading in hand..... 3/4 "
 On cash advances in all cases..... 2 1/2 "
 For entering and bonding merchandise for the interior—on amount of duties, freight, and charges (besides the regular charge for forwarding)..... 2 1/2 "
 Agency for steamboats—according to special contract.

The foregoing rates to be exclusive of brokerage and charges already incurred.

New South Wales. Prior to 1836, official returns exhibit no evidence of any trade between the United States and New South Wales. In that year six American vessels entered the harbor of Sydney with freights valued at \$69,510, and carrying home staples and other colonial produce to the amount of \$92,970. From that period to 1850 but little advance was made either in the import or export trade with that colony; the highest return being that for 1841, which shows the following summary:

Vessels from the United States entered the ports of New South Wales, in 1841, 13; tonnage, 4,751.

TRADE WITH THE UNITED STATES.

	1841	1845	1855
Imports from U. S.....	\$176,410	\$148,450	\$1,068,975
Exports to U. S.....	24,185	25,405	15,140

The principal imports from the United States to New South Wales are: Apparel, bags and sacks, butter and cheese, candles (tallow and sperin), carts and wagons, coffee, preserves, drugs and medicines, salt fish, flour and bread, fruits, furniture, glassware, oats, rice, and barley, hardware and ironmongery, ice, leather manufactures, linens, provisions, spirits (chiefly rum and whisky), stationery and books, sugar, tobacco, woodenware, watches and clocks, and wine. The principal exports to the United States from New South Wales are: Coals and coke, lard, etc. The leading staple of New South Wales is wool; but it cannot be imported into the United States advantageously, while it is admitted free into British ports. The total exports of wool from New South Wales during the four years ending with 1853, were 56,984,938 pounds, valued in the colony at \$16,463,920.

Newspapers. publications in numbers, consisting commonly of single sheets, and published at short and stated intervals, conveying intelligence of passing events. It is foreign to the purpose of this work to consider the moral and political effects produced by newspapers; of the extent of their influence there is no doubt, even among those who differ widely as to its effect. Their utility to commerce is, however, unquestionable. The advertisements or notices which they circulate, the variety of facts and information they contain as to the supply and demand of commodities in all quarters of the world, their prices, and the regulations by which they are affected, render newspapers indispensable to commercial men, supersede a great mass of epistolary correspondence, raise merchants in remote places toward an equality, in point of information, with those in the great marts, and wonderfully quicken all the movements of commerce. Hut newspapers themselves have become an important commercial article.

The first newspaper published in England, which might truly be considered as a vehicle of general in-

formation in 1663, continued to appear until the claims of the previous century, at Elizabeth Armada, 23, in the year 1643 (the variety of the news to the news of the England Parliament intelligence Scout's curius Ctry's Britannic

formation, was established by Sir Roger L'Estrange, in 1663; it was entitled the *Public Intelligencer*, and continued nearly three years, when it ceased on the appearance of the *Gazette*. A publication, with few claims however to the character of a newspaper, had previously appeared; it was called the *English Mercury*, and came out under the authority of Queen Elizabeth, so early as 1588, the period of the Spanish Armada. An early copy of this paper is dated July 23, in that year. In the reign of James I., 1622, appeared the *London Weekly Courant*, and in the year 1643 (the period of the civil war) were printed a variety of publications, certainly in no respect entitled to the name of newspapers, of which the following were the titles:

England's Memorable Accidents, The Kingdom's Intelligencer, The Diurnal of Certain Passages in Parliament, The Mercurius Aulicus, The Scotch Intelligencer, The Parliament's Scout, The Parliament's Scout's Discovery, or Certain Information, The Mercurius Civicus, or London's Intelligencer, The Country's Complaint, etc., The Weekly Account, Mercurius Britannicus.

A paper called the *London Gazette* was published August 22, 1642. The *London Gazette* of the existing series, was published first at Oxford, the court being there on account of the plague, November 7, 1665, and afterward at London, February 5, 1666. The printing of newspapers and pamphlets was prohibited 31 Charles I., 1680.—SALMON'S *Chron.* Newspapers were first stamped in 1713. Number of the stamps issued in England:

Year.	No.	Year.	No.

The total number of newspapers published in the United Kingdom in 1849 was 603, viz.: 160 in London, 232 in the English provinces, 117 in Ireland, and 94 in Scotland. The number of advertisements inserted in the London newspapers in 1849 was 886,108, paying a gross duty of £66,458 2s.; in the English provincial newspapers, 834,729, yielding to the crown a revenue of £62,604 13s. 6d.; and in the Irish papers, 220,524, paying £11,026 4s.; and in the Scotch papers, 240,911, paying in duty £18,075 3s. 6d.

Newspapers, etc., in the United States.—The *Boston News Letter* was established in 1704, which was continued till 1774; the second was the *Boston Gazette*, 1719; the third the *American Weekly Mercury*, at Philadelphia, started one day after the last. First *New York Gazette*, in 1725; first newspaper in the Carolinas, at Charleston, 1731-2; first *Rhode Island Gazette*, at Newport, 1732; first *Virginia Gazette*, at Williamsburg, in 1736. In 1775 there were in all the colonies 37 newspapers; in 1810, in the United States, 358; in 1828, 802; in 1839, 1555, and in 1850, 2526.

Newspapers in France.—The first was the *Gazette de France*, established by Renardot, in 1631, and continued with few interruptions till 1827, when it ceased and another paper assumed its name. The *Moniteur*, commenced in 1789, has been since 1800 the official journal of the government. The *Constitutionnelle* and the *Journal des Debats* have long had the largest circulation. There were 374 newspapers published in France in 1832. See PERIODICAL LITERATURE.

Newspapers, Irish.—The first Irish newspaper was *Purcell's Occurrences*, published in 1700. FAULKNER'S *Journal* was established by George Faulkner, "a man celebrated for the goodness of his heart, and the weakness of his head," in 1728.—*Supplement to Swift's*. The oldest of the existing Dublin newspapers is the *Freeman's Journal*, founded by the patriot, Dr. Lucas, about the year 1755.—*Westm. Rev.*, January, 1830. The *Lim-*

erick Chronicle, the oldest of the provincial prints, was established in 1768.—*Idem*.

Notices of Newspapers.—The history of newspapers, and of periodical literature in general, remains to be written; and were the task executed by an individual of competent ability, and with due care, it would be a most interesting and important work. It appears, from the researches of Mr. Chalmers, that the first newspaper published in modern Europe made its appearance at Venice in 1536; but the jealousy of the government would not allow of its being printed; so that, for many years, it was circulated in manuscript! It would seem that newspapers were first issued in England by authority during the alarm occasioned by the approach of the Armada to her shores; in order, as was stated, by giving real information, to allay the general anxiety, and to hinder the dissemination of false and exaggerated statements. From this era, newspapers, of one sort or other, have, with a few intermissions, generally appeared in London, sometimes at regular, and sometimes at irregular intervals. During the civil wars, both parties had their newspapers. The earliest newspaper published in Scotland made its appearance under the auspices of Cromwell in 1652. The *Caledonian Mercury* was, however, the first of the Scotch newspapers of native manufacture; it made its appearance at Edinburgh, under the title of *Mercurius Caledonius*, in 1660; but its publication was soon afterward interrupted. In 1715 a newspaper was, for the first time, attempted in Glasgow.

To Boston belongs the honor of establishing the first newspaper in North America. It was issued in the year 1690. It was deposited in the State Paper Office, in London, and stopped by the government. It was of the size of an ordinary sheet of letter paper. One copy of it alone was known to be in existence, and that it was that shared the luckless fate above-named. The first regular paper that was issued was also of Boston. Its title was the *News Letter*, its date was 1704, and it was printed by John Allen, in Pudding Lane. We have seen some of its early numbers, and they are peculiar. Its latest news from England was dated one hundred and twenty days previously, and consisted of a speech of Queen Anne to Parliament. An advertisement informs us that the mail between Boston and New York set out once a fortnight. Negro men, women, and children were advertised for sale, and an urgent appeal appeared in one, calling upon a female who had stolen a piece of fine lace, valued at 14 shillings a yard; and upon another who had conveyed a piece of fine calico from its proper destination, under her riding-hood, to return the same or suffer exposure in the newspapers. For 74 years this paper continued in existence as the leading Tory paper. About those days, the revolutionary struggle drawing near, the *Boston Gazette* was issued at Watertown as the organ of the patriots. When the war broke out, there were 37 newspapers being published in the United States; eight of them were committed to the interests of the British, and five others were brought over to the government side.

Old Papers.—The *Worcester Spy*, published in 1770, is the oldest existing paper of Massachusetts. There are copies extant of the *Albany Journal*, or the *Montgomery, Washington, and Columbia Intelligencer*, printed in 1788. It was issued semi-weekly, at a subscription price of 12 shillings per annum. Its size was about 11 by 13 inches. Charles K. and George Webster & Co. were its publishers. Its leading article is an extract from a letter from Philadelphia, dated February 20, as follows: "On Saturday last, upon the arrival of the news of the ratification of the Federal Constitution by the powerful State of Massachusetts, the bells of Christ Church were rung, and congratulations of joy have appeared in every part of the city for several days." The "latest news from Europe" is made a feature of the sheet; it bears date December

1787, by which it would appear that it took some three months to cross the water.

New York and her Newspapers.—The position which this city sustains, as compared with any other city of the world, in the number and circulation of her journals, can be adjudged by a glance at the following table, which gives the supposed number of newspapers in the world, 1852—56:

Austria.....	10	Belgium.....	65
France.....	14	Denmark.....	25
Asia.....	90	German States.....	850
Great Britain and Ireland.....	500	Portugal.....	26
Russia and Poland.....	50	Spain.....	24
		United States.....	2,800

Of these, New York alone issues 122 sheets, as follows: secular journals, daily, morning, 8; evening, 6; semi-weekly, 2; weekly, 59; German dailies, 3; weeklies, 8; French daily, 1; Spanish weeklies, 2; Welsh, 3; of religious weeklies, there are 20 sheets. It is difficult to obtain a correct estimate of the present circulation of so many papers. Of the daily papers, at least 250,000 copies must be circulated; while 13 religious weeklies are spread before 150,000 subscribers.

The whole number of newspapers and periodical publications in the United States on the 1st of June, 1852, amounted, according to the official returns, to about 2,800. Of these, 2,494 were fully reported upon,

while the particulars with respect to the others were in part estimated.

From these returns, etc., it appears that the aggregate circulation of papers and other publications was about 5,000,000; and that the entire number of copies printed annually in the United States, amounted to about 422,600,000. The following table shows the number of daily, weekly, monthly, and other issues, with the aggregate circulation of each class:

	No.	Circulation.	No. of copies printed annually.
Daily Journals.....	850	750,000	225,000,000
Tri-weekly.....	150	75,000	11,700,000
Semi-weekly.....	125	80,000	8,220,000
Weekly.....	2,000	2,575,000	140,500,000
Semi-monthly.....	50	800,000	7,200,000
Monthly.....	100	900,000	10,800,000
Quarterly.....	25	90,000	840,000
Total.....	2,800	5,000,000	422,600,000

Four hundred and twenty-four journals were issued in the New England States; 876 in the Middle States; 716 in the Southern States; and 784 in the Western States. Of the whole 2,800 publications, about 2,200 were newspapers, properly so called; the residue being scientific, religious, and educational journals. The average circulation of the mere papers was 1,785. There was one publication for every 7,161 free inhabitants in the United States and Territories. The following summary is based on the official returns:

NEWSPAPERS AND PERIODICALS PUBLISHED IN THE UNITED STATES IN 1850.

States & Territories.	Daily.		Tri-weekly and semi-weekly.		Weekly.		Semi-monthly.		Monthly.		Quarterly.		Aggregate.		
	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.

New Style. Ordered to be used in England in 1751; and the next year eleven days were left out of the calendar—the 3d of September, 1752, being reckoned as the 14th—so as to make it agree with the Gregorian Calendar, which see, and also article CALENDAR. In the year A.D. 200, there was no difference of styles; but there had arisen a difference of eleven days between the old and the new style, the latter being so much beforehand with the former: so that when a person using the old style dates the 1st of May, those who employ the new, reckon the 12th. From this variation in the computation of time, we may easily account for the difference of many dates concerning historical facts and biographical notices.—M.

New York, one of the United States of America, situated between 40° 30' and 45° 01' N. lat., and between 71° 50' and 79° 56' W. long., and contains an area of 46,000 square miles. The population in 1790 was 340,120; in 1800, 586,030; in 1810, 959,049; in 1820, 1,372,812; in 1830, 1,913,508; in 1840, 2,428,921; and in 1850, 3,097,394.

Early History of New York State.—The Spaniards considered the territory of the present State of New York under their great name of Florida, and designated it also on their maps of the sixteenth century particularly as the "Tierra de Stephen Gomez," or shorter "Tierra de Gomez," because Gomez (1525) was for a long time the only Spanish navigator who was known to have explored especially these coasts. The English comprised it since 1585 under the name Virginia, and since 1606 under the name of Northern Virginia, or the Northern Colony. Since 1616 they considered it as a part of New England, which name took the place of the old name of Northern Virginia, and went down like this as far south as the fortieth degree of north latitude. The Dutch began soon after the discovery of Hudson (1609) to call it "Nieuw Nederland" (the New Netherlands). This name may already have been in use for some time, but it occurs for the first time in a public document in the year 1614. They also sometimes called it "Nieuw Holland." It is on maps also sometimes called "New Belgium." They at first gave to it very extensive boundaries, as far east as Cape Cod, including the whole Barnstable peninsula, and south as far as the Delaware River and beyond it. With these limits we find it represented on many old Dutch maps. The southern limit on the Delaware River remained pretty much unchanged on the Dutch maps. Not so the eastern boundary. On later maps we see this advancing only as far as Nassau Bay, Rhode Island. Since 1630 or 1635 the maps have it only as far as the Connecticut River, where at this time the English had already arrived with their plantations. When, in the year 1664, the English conquered the whole country, it was named the "Province of New York," in honor of James, Duke of York, brother of Charles II. It lost in the same year a part of its coast by the grant which the Duke of York made to a company of gentlemen who founded the province of New Jersey, between the lower Hudson and the Delaware Bay.—J. G. KONI.

When the province became, in 1776, a State, the name remained unchanged, and also the limits along the coast.

Physical Features.—This State is divided into three unequal parts, by two great valleys, viz.: 1st. The valley of the Hudson, including the depression in which Lake Champlain is situated, or, more properly, the valleys of the Hudson and Champlain united. 2d. The valleys of the Mohawk, and Ononda Lake, and

Oswego River, united. The eastern division is a long narrow belt, extending from New York island to the head of Lake Champlain. Its eastern limits are the borders of Connecticut, Massachusetts, and Vermont, with a slope westward to the Hudson, traversed longitudinally by several narrow valleys. This division comprehends the western slope of the Tughkanic mountains, which form the *water-shed* that separates the waters flowing into the Hudson, from those which flow into Long Island Sound. The north division of the State is traversed by the Clinton range. There are several subordinate ranges connected with this group. It begins at Little Falls, in the valley of the Mohawk, and pursues a north-east course across the country to Trembleau Point, on the west shore of Lake Champlain. There are numerous lofty peaks which formed a remarkable group, and have been styled the Adirondack mountains. Mount Marcy, the highest of the range, attains to an elevation of 5,487 feet above the sea. This ridge presents the *water-shed* of the region dividing the waters of the Hudson, or those which flow south into the Atlantic, from those which flow into the Gulf of St. Lawrence. The south division is situated between Lake Ontario and the Mohawk, and the Hudson valleys and Pennsylvania. It rises with a gradual ascent until it reaches its maximum height near the southern boundary of the State. The south-eastern part of this division is comprised in three ranges, viz., the Highlands, broken through by the Hudson, the Shawangunk, and the Catskill. There were in this State in 1850, 12,408,964 acres of land improved, and 6,710,120 of unimproved land in farms. Cash value of farms, \$654,656,042, and the value of implements and machinery was \$22,084,926. *Live Stock.*—Horses, 447,014; asses and mules, 963; milk cows, 931,824; working oxen, 178,900; other cattle, 767,406; sheep, 3,453,241; swine, 1,018,252; value of live stock, \$78,570,490.

Agricultural Products, etc.—Wheat, 13,121,498 bushels; rye, 4,148,182; Indian corn, 17,958,400; oats, 26,552,814; peas and beans, 741,546; barley, 8,585,059; buckwheat, 3,183,953; potatoes, 15,368,368; sweet potatoes, 5,629; value of products of the orchard, \$1,761,950; produce of market gardens, \$912,047; pounds of butter made, 79,766,094; of cheese, 40,741,413; maple sugar, 10,357,484; molasses, 56,539 gallons; beeswax and honey, 1,755,830 pounds; wool, 10,071,301 pounds produced; flax, 940,577; silk cocoons, 1,774; hops, 2,536,299 pounds; tobacco, 88,189; hay, 8,728,797 tons; hemp, 4 tons; clover seed, 88,222 bushels; other grass seed, 96,493; flax seed, 57,963; and were made 3,172 gallons of wine; value of home-made manufactures, \$1,280,338; of slaughtered animals, \$13,573,888.

The principal rivers are the Hudson, 324 miles long, navigable 156 miles to Troy. The Mohawk, 135 miles long, which enters the Hudson a little above Troy; the Genesee, 125 miles long, which enters Lake Ontario, having at Rochester, 5 miles from its mouth, 2 falls of 96 and 75 feet. Black River, which rises near the sources of the Hudson, and flows 120 miles into Lake Ontario; the Saranac, 65 miles long, entering Lake Champlain at Plattsburg; the Oswegatchie, 100 miles long, flowing into the St. Lawrence; the Oswego, proceeding 40 miles from Ononda Lake into Lake Ontario; the Au Sable, rising in the Adirondack mountains, and having a course of 75 miles to Lake Champlain. The majestic St. Lawrence forms a part of the northern boundary of the State. The head branches of the Susquehanna, the Alleghany, and the Delaware, rise in this State. Besides Lakes Ontario and Erie on the north, and Champlain on the east, which are but partly within it, there are wholly within the State many picturesque sheets of water, viz., Lakes George, Ononda, Skaneateles, Owansco, Cayuga, Seneca, Crooked Lake, Canandaigua, and Chautauque. The islands belonging to New York are—Long Island,

120 miles long from west to east, with an average width of about 15 miles, within whose waters on the east are Fisher's, Shelter, Robin's, and some other islands. Staten Island, south-west of the harbor of New York, 38 miles long, and 8 wide. Manhattan Island, on which the city of New York stands, 18 1/2 miles long, and about 1 1/2 wide at an average breadth. Grand Island, in Niagara River, 15 miles long, and from 2 to 7 wide, and extending to within a short distance of the Falls. The harbor of New York is one of the finest in the United States. On the bar at Sandy Hook it has a depth of from 21 to 27 feet. Sag Harbor on the east, and Brooklyn on the west end of Long Island, have good harbors; Sackett's Harbor has a good natural, and Oswego a good artificial harbor on Lake Ontario. Buffalo and Dunkirk are harbors on Lake Erie.

Manufactures.—There were in the State in 1850, 118 cotton factories, with a capital invested of \$5,554,920, employing 3,877 males and 5,499 females, producing 59,532 yards of sheetings, etc., and 5,806,861 pounds of yarn, valued at \$5,019,320; 203 woolen factories, with a capital invested of \$3,944,000, employing 3,500 males and 2,645 females, manufacturing 7,124,600 yards of cloth, etc., valued at \$6,442,869; 28 carpet factories, employing a capital of \$802,175; 29 establishments making pig iron, with a capital invested of \$727,500, employing 934 persons, producing 23,022 tons of pig iron, etc., valued at \$1,067,572; 823 establishments, with a capital of \$4,622,482, employing 5,925 persons, and making 104,588 tons of castings, etc., valued at \$5,921,980; 60 establishments, with a capital of \$1,131,300, employing 1,037 persons, manufacturing 18,036 tons of wrought iron, valued at \$1,423,968; 1,442 flouring and grist mills; 4,599 saw mills; 942 tanneries; 550 printing offices; 458 newspapers, viz., 54 daily, 18 tri-weekly, 18 semi-weekly, 813 weekly, 13 semi-monthly, 25 monthly, and 3 quarterly publications. Capital invested in manufactures, \$99,904,405; value of manufactured articles, \$237,599,361.

The principal places in the State are New York, the metropolis, Albany, the capital, Troy, Brooklyn, Newburgh, Poughkeepsie, Hudson, Saratoga Springs, Plattsburg, Schenectady, Utica, Syracuse, Auburn, Geneva, Rochester, Buffalo, Lockport, Oswego, and Ithaca. There were, January, 1856, 23 railroads, with 2,794 miles of road finished and in operation. There is in this State the greatest extent of canal navigation within any State or country on the face of the earth, forming an aggregate of 787 miles. See CANALS and RAILROADS. There were, January, 1856, 287 banks, and 1 branch, with a paid capital of \$6,890,000.

Canals.—The canals of New York were the chief element of her early prosperity, and we give a short history of them, and their present commercial importance.

From 1814 till 1817, the subject of the canal was warmly discussed in the legislature by the friends and opponents of the internal improvement system; and the act authorizing the construction of the canal was finally passed in 1817, by a vote of 18 to 9 in the Senate. The first contract was made on the 27th of June, 1817, and the 4th of July was celebrated by breaking ground at Rome for the construction of the canal. Buffalo then had a population of less than 2,000. Notwithstanding the vast benefits conferred upon the State by De Witt Clinton in his vigorous efforts to bring about a system of internal improvements, he was removed in 1824 from the office of canal commissioner, by a vote of 21 to 3 in the Senate, and 61 to 34 in the Assembly. In 1825, a report on canals was made, written by Mr. Marcy, afterward governor, in which he said:

"From the views taken by the commissioners, it appears reasonable to indulge the hope that within the space of 10 years the canal debt may be extinguished; and this copious stream of revenue, yielding, according to the most moderate estimates, an annual income of

more than \$1,000,000, may be turned into the treasury, and the government be thereby enabled to remove from the people the burden of taxation, to diffuse the blessings of education in a more abundant manner than at present, and to carry forward this State with increasing progress, in its career of general prosperity."

In 1826, Governor Clinton congratulated the legislature on the completion of the water communication between the lakes of the West and the Atlantic Ocean, affording an "inland navigation unparalleled in the experience of mankind." It was in this year (1826) that the first act for a railroad was passed by the Legislature of New York, being the road from Albany to Schenectady, 16 miles in length. This road was not completed for several years.

In 1827, Governor Clinton called the attention of the legislature to the subject of internal improvements by the general government. The project of the Chesapeake and Ohio Canal was then before Congress, and the aid of the government was given in behalf of that then considered great work. Governor Clinton observed: "It has become a question of great moment, whether the general government has power, with or without the consent of the State governments, to construct canals and roads in their territories, and whether such power, if not already vested, ought not to be granted. * * * I think it due to a sense of duty and an spirit of frankness, to say, that my opinion is equally hostile to its possession or exercise by, or its investment in, the national authorities." See CANALS.

River and Canal Navigation.—The subjoined tables show the date of the opening and closing of the Hudson River and Erie Canal for a period of 15 years, and the number of days they were open each year.

HUDSON RIVER.

River opened.	River closed.	Days open.
1842, February 4	November 23	308
1843, April 18	December 10	242

1855, " 1	" 10	224
1856, " 8	" 10	

The average cost of railroads has been as follows:

	Total cost.	Per mile.
30 roads in New York	\$90,000,000	\$46,344
38 " Massachusetts	60,000,000	44,432
12 " the South and West	50,000,000	45,638

The number of railroads, including branches, now in progress in the United States, is 372. The miles in operation are 13,586; the miles in progress, 10,828; and the amount now expended is \$400,000,000—the average cost being \$80,000 per mile. The average cost of the whole 2,579 miles being about \$35,000 per mile. The amount expended on the canals of the United States is about \$150,000,000.

The New York Canals.—The Annual Report of the Canal Auditor of this State, for 1856-7, has been com-

municated to the Senate. The revenue for the past year has been greater and the expenses less than for the year 1855. The following comparative statement shows the difference in the receipts and payments between the two years:

	1854.	1855.
Tolls received.....	\$2,483,793 19	\$2,748,139 40
Payments by superintendents, and to repair-constructors.....	789,761 41	606,993 89
Payments to canal commissioners for repairs.....	83,279 82	63,473 78
Payments to collectors, weigh-masters, and inspectors.....	79,846 40	82,023 83
Refunding tolls, salaries, etc.....	88,984 40	84,608 36
Total.....	\$2,766,633 40	\$2,748,139 40

The whole amount of tolls received is \$2,748,212. Which amount is composed as follows:

Toll on boats and passengers.....	108,997
" products of the forest.....	\$899,656
" products of animals.....	27,947
" vegetable food.....	2,922,089
" other agricultural products.....	8,261
" manufactures.....	120,462
" merchandises.....	585,891
" other articles.....	164,400
Total.....	\$2,748,212

The whole amount of tonnage transported on the canals during the last season of navigation, ascending and descending, was \$4,116,082. And is composed as follows:

Products of the forest.....	1,478,674
Products of animals.....	\$38,826
Vegetable food.....	1,153,894
Other agricultural products.....	4,963
Manufactures.....	254,901
Merchandise.....	870,753
Other articles.....	789,078
Total.....	\$4,116,082

The value of such tonnage is as follows:

Products of the forest.....	\$10,211,983
Products of animals.....	\$1,466,433
Vegetable food.....	42,006,336
Other agricultural products.....	977,784
Manufactures.....	10,308,419
Merchandise.....	135,661,816
Other articles.....	11,064,891
Total.....	\$218,327,062

The total amount of freight, or number of tons carried one mile during the last season of navigation, was 592,000,603. The total movement of the several classes composing such total tonnage is as follows:

Products of the forest.....	149,724,515
Products of animals.....	6,155,070
Vegetable food.....	250,425,018
Other agricultural products.....	930,750
Manufactures.....	253,118,341
Merchandise.....	28,409,668
Other articles.....	38,428,158
Total.....	592,000,603

The whole amount of tonnage received at tide water by way of the Erie Canal from western States and Canada during the last season of navigation, was 1,212,550 tons. The whole amount of tonnage arriving at tide water, the produce of this State, during the same period, was 374,880 tons. The whole number of barrels of flour arriving at tide water through the canals, during the last season of navigation, was 1,180,509.

The whole number of bushels of wheat arriving during the same period, was 11,779,332, which turned into flour, calculating five bushels to the barrel, would make 2,355,266.

Total in barrels..... 3,486,775

The whole number of bushels of corn arriving at tide water during the same period, was 9,587,148. The total number of new boats registered during the last year, is 364, with a total tonnage of 38,990, making an average tonnage of 107.4.

The number of lockages at Alexander's lock, for the season, was 31,223, and the greatest number of lockages at any one lock, was 87,969, at lock No. 45, Frankfort.

Comparing the season of 1855 with that of 1854, it shows a decrease in revenue of \$56,871, and an increase

in tonnage of 93,465, divided among the different articles, as follows:

Products of the forest—decreased.....	Tons.	Tons.
animals.....	59,980	
Other agricultural products.....	14,865	
Merchandise.....	525	
Total.....	3,844	75,994
Vegetable food—increased.....	100,739	
Manufactures.....	8,023	
Other articles.....	5,013	
Total.....	108,759	

Increase..... 98,465

The increase in lockages at Alexander's lock is 350. In flour and wheat comprised in the returns of vegetable food, there has been an increase on tonnage the past year of 112,537 tons, and an increase of tolls of \$160,594. In corn and oats there has been an increase during the same period of 28,969 tons, and an increase in tolls of \$7,691. Under the head of "Products of the forest," there was an increase in tonnage upon shingles, boards, and scantling, as compared with 1855, of 32,163 tons, and a decreased tonnage upon timber, staves, and wood, of 97,705 tons, and an increase in pot and pearl ashes of 9,615 tons. Under the head of "Other articles," there was an increase in the tonnage of mineral coal, for the same period, of 77,568 tons, and an increase in undries of 15,323 tons.

Statement No. 47, appended to the report, shows the tone and description of freight carried on the New York Central and New York and Erie Railroads, ending 30th September, 1853, 1854, 1855, and 1856, and on the New York Canals during the seasons of navigation the same years.

Thus three lines of freight transit, it is well known, take all the carriage which passes through the State between New York and the Hudson River and the West, including a considerable portion of Upper Canada. It may with justice be said they are all of them competing lines of transport for what is termed "through freight," and two of them are virtually competing lines for both through and way freight.

The ascertained results presented by these tables are interesting, and worthy of much reflection. They not only show the steady and progressive increased carriage and movement by railway, and the steady and progressive decreased carriage and movement by canal, but they also show the description of freight wherein the carriage by railroads exceeds that of the canal.

Tons Carried.

	Railroad.	Canal.	Total.
1853.....	991,081	4,267,303	5,258,384
1854.....	1,295,553	4,165,802	5,461,355
1855.....	1,512,121	4,022,818	5,534,939
1856.....	1,719,927	4,116,082	5,836,009

This statement shows an increase of more than 700,000 tons in 4 years by rail, and a loss of 181,771 tons to the canal in the same time.

Total Movement.

	Railroad.	Canal.	Total.
1853.....	156,337,873	700,389,933	856,727,806
1854.....	211,376,114	668,359,544	879,735,658
1855.....	230,379,334	619,170,651	849,550,005
1856.....	329,131,724	592,009,609	921,141,333

The total movement by railway in 1853 was not quite one fifth of that by the canals. In 1854, it was nearly one third—nearly one half in 1855, and it was quite three fifths in 1856. At this rate of progression on the part of the railroads, and of loss by the canals, the total movement of freight on those two railroads will be equal to that of the canals in about 3 years from this time, if not sooner.

The aggregate of the total movement has increased on the railroads from 1853 to 1856, 164,483,622, and the loss to the canal has been 108,380,930.

The annexed tables show why it is that with an increased tonnage in 1856 of 93,465 over 1855, the total movement should be 27,171,048 less. This increase in the number of tons carried was on short distances;

otherwise an increase in the receipts of tolls would have been the result.

But this statement also exhibits the amount of freight earnings on these railroads, and tolls received on the canals, including the tolls on boats and passengers during the above period, together with these total movements. These comparative statements show the rapid and successful progress of the former, and the immobility of the latter:

	1853.	Freight and Tolls.
N. Y. Cen. R.R., tons moved 1 m'le,	354,801,850	1,638,830
N. Y. and Erie R.R., "	101,696,623	3,637,314
Canals, "	700,889,933	8,304,718
Total	\$566,387,305	7,680,762

	1854.	Freight and Tolls.
N. Y. Cen. R.R., tons moved 1 mile,	331,163,080	2,472,830
N. Y. and Erie R.R., "	130,808,034	3,869,560
Canals, "	669,669,044	2,775,566
Total	\$899,639,158	5,622,976

	1855.	Freight and Tolls.
N. Y. Cen. R.R., tons moved 1 mile,	399,676,806	3,189,603
N. Y. and Erie R.R., "	120,674,998	3,658,062
Canals, "	619,170,661	2,906,077
Total	\$999,450,495	3,647,992

	1856.	Freight and Tolls.
N. Y. Cen. R.R., tons moved 1 mile,	415,738,478	4,398,041
N. Y. and Erie R.R., "	183,458,046	4,545,739
Canals, "	593,009,608	2,745,219
Total	\$921,901,937	11,692,035

This statement also shows the total tonnage of freight on these roads for 1855 and 1856 separately from other tabular calculations, from which it appears the increase on through freight in one year was 182,358 tons, and on way 14,847 tons.

The operations of these roads, for the year ending September 30, 1855, were as follows:

Roads.	Through freight.	Way freight.	Total number.	Total movement or mileage.	Tolls and canal rates in 1855.
1855.	Tons.	Tons.	Tons.		
N. Y. & Erie.	335,469	634,566	970,035	180,678,998	\$549,188
N. Y. Central.	156,194	518,979	675,173	99,603,889	487,019
Total	511,663	1,153,545	1,665,208	280,282,887	\$1,036,207
1856.					
N. Y. Central.	253,220	922,694	1,175,914	145,788,076	\$491,451
N. Y. & Erie.		Not reported			

The New York and Erie Railroad received on through freight in 1855, \$1,461,419 18, equal to \$9 40 per ton, on the quantity transported, and in the same year the New York Central received \$1,289,706 97 on through freight, which gives an average of \$8 25 7-10 per ton on the amount carried.

The comparative tabular statement herewith submitted is a condensed view of the total tonnages and receipts of toll on all the canals on the different descriptions of property carried, for the period of six years:

Year.	Tonnage carried.	Tolls received.	Av. per ton.
1851.....	2,852,738	\$3,073,993	89-06
1852.....	2,863,442	2,966,385	74-19
1853.....	4,347,853	2,965,097	69-51
1854.....	4,105,862	2,547,438	61-16
1855.....	4,022,617	2,610,420	64-89
1856.....	4,116,083	2,504,315	61-05

The receipts of toll above given are upon the property carried exclusive of the tolls on boats and passengers, and the average must be affected by the rates of toll charged and received, and the distance that property or freight is transported on the canals. The average of 1851 on the tonnage of 1856 would give \$3,542,178 of tolls. The Auditor is satisfied that the rates of toll as arranged in 1851 may be imposed on most of the property transported on the canals without any injury to trade, if the legislature will interpose its constitutional authority to protect the trade of the canals.

The canal debt of 1846, to which the annual Sinking Fund of \$1,700,000 is applicable and constitutionally pledged, was, on the 30th September, 1856, \$13,223,704 33, the annual interest of which, payable quarter yearly, amounts to \$792,193 28, and \$5,739,024 76 of this debt are for loans made upon the credit

of this Sinking Fund to supply the deficiencies which existed in that fund, to pay the debt as it fell due after 1847. Former financial officers of the State have estimated that the Sinking Funds established by article 7, section 1, of the Constitution, would be ample to meet all the charges upon them from year to year, and finally to liquidate the Canal debt, of \$16,944,815 57 outstanding on the 30th of September, 1846, in 18 years and 3 months, with a surplus of \$95,333 48 on the 1st of January, 1865, when it was assumed the whole of the debt would be paid.

CANAL DEBT.—STATEMENT SHOWING THE AMOUNT OF PRINCIPAL AND INTEREST ACTUALLY PAYABLE IN EACH YEAR, TOGETHER WITH THE RESULTS OF THE SINKING FUND, UNDER THE CONSTITUTION, ART. 7, SEC. 1, FROM SEPTEMBER 30TH, 1856; ALSO THE AMOUNT OF SURPLUS ON SEPTEMBER 30TH, OF EACH YEAR, AND THE AMOUNT OF ANNUAL INTEREST OF THE SAME AT FIVE PER CENT. PER ANNUM.

Year.	Principal payable.	Total principal and interest.	Surplus on Sept. 30th, of each year.	Interest on surplus in each year.
1856 surplus	\$1,259,901	\$42,996
1857	2,830,705	116,380
1858	\$3,058,605	3,718,568	484,672	21,793
1859	639,868	1,617,148
1860	1,468,016	1,929,784
1861	5,588,649	1,142,629
1862	1,958,841	1,841,419

				\$19,154,180

The following statement shows the tonnage of all the canals of the State from 1850 to 1855, inclusive, the total movement in the years stated, and the total value of all the property carried on the canals in each year.

Years.	Total tonnage.	Total movement.	Total value of property carried.
1850	8,016,617	\$156,897,929
1851	2,387,199	152,961,501
1852	8,862,441	603,800,518	196,605,517
1853	4,247,853	706,889,898	207,175,570
1854	4,165,562	668,659,044	210,284,812
1855	4,022,617	619,170,651	204,890,147

The two lines of railway in the State, which, during the season of canal navigation, most effectually and seriously compete with the canals in the transport of freight, are the New York and Erie and the New York Central Railroads. The operations of these lines in the transportation of freight during the years stated below, show a steady and progressive increase.

The largest amount of tolls in any fiscal year was in 1851, when the receipts were \$3,703,999 84; and the per centage of the cost of collection on the gross amount received was \$2 03. This was before the repeal of the laws imposing tolls on freight transported on certain railroads, and the consequent reduction of tolls on the canals, to enable the State to compete for the carrying trade. In 1851 the tonnage of all the canals was 3,582,733. The tonnage of all the canals in 1855, was 4,022,617; 439,884 more than in 1851; while the tolls were only \$2,632,906 11, being \$1,071,093 23 less. The tonnage of 1855, at the rates of toll as they were fixed in 1851, would have yielded about \$4,108,000, or about \$1,536,000 more than were actually received; the very natural and perfectly legitimate results of a policy adopted by the State before it was prepared by the completion of the enlargement to encounter an active and vigorous competition.

Table below shows the amount of the new debt created since 1846, the interest of which is paid by the General Fund; the specific objects for which the several stocks were issued, and the date of redemption of each, followed by a recapitulation of the whole canal debt of the State:

CANAL DEBT.	
6's due 1st July, 1879.....	\$2,250,000
6's " 1st January, 1878.....	1,000,000
6's " 1st July, 1878.....	1,250,000
6's " 1st November, 1878.....	3,250,000
6's " 1st October, 1874.....	2,250,000
Total debt for the enlargement and completion of the canals.....	
6's due 1st July, 1879.....	\$2,250,000
6's " 1st January, 1874, to provide for deficiencies to pay the interest and redeem the principal.....	600,000
	\$11,000,000

RECAPITULATION OF THE CANAL DEBT.

To pay the interest and redeem the principal under Article 7, Section 1, of the Constitution.....	\$18,928,704 83
To pay the interest and redeem the principal under Article 7, Section 3, of the Constitution.....	11,000,000 00
The interest paid by the General Fund.....	442,580 49
Total debt 1st January, 1857.....	\$24,666,899 83
Of the debt paying interest there was held on the 30th September, 1856:	
On the United States' account.....	\$18,928,898 83
On foreign account.....	5,424,000 00
Total canal debt to 30th September, 1856.....	\$24,416,898 83
The interest on the debt is a fraction over 5.51 per cent. On the 1st of July, 1858, there will be redeemed by the Sinking Fund under section one, all the five per cent. stocks then falling due, say.....	
	\$3,063,606 84
The new debt will probably be increased by a resort to the credit of the Sinking Fund under § 3, on the 30th September, 1858.....	
	818,839 44
Decrease in aggregate of canal debt.....	\$2,339,765 90

If the surplus of the canal revenues during the current fiscal year shall not be sufficient to meet the whole annual contribution of \$350,000 to the General Fund Sinking Fund, the deficiency should be made up from the receipts from taxes transferred to the Canal Fund during the year.

The premiums on loans constitute quite an important item of receipts to the State.

PREMIUMS ON LOANS.

The premiums received and paid into the treasury on loans made since the 1st of January, 1854, have been as stated below:	
On loan of June 22, 1854, of \$1,000,000.....	\$175,706 25
" Aug. 31, " 1,250,000.....	167,246 82
" Feb. 22, 1855, of 1,000,000.....	131,380 00
" June 21, " 1,250,000.....	234,500 00
" Oct. 24, " 1,500,000 C. R. C. 250,406 00	
" Oct. 24, " 1,250,000.....	204,511 50
On loans to supply deficiencies in Sinking Funds, December 18, 1855 (6 per cent.).....	4,500,000
On E. and C. Loan, March 25, 1856.....	1,000,000
	31,081 20
	170,709 00
Aggregate to September 30, 1856.....	\$1,375,439 52
On the 18th October, 1856, a loan of \$1,250,000 for E. and C. was made at a premium of.....	171,386 50
Total of premiums.....	\$1,546,826 02

OF THE COST FOR ENLARGEMENT AND COMPLETION.

The late State Engineer and Surveyor, Hon. John T. Clark, in his report to the Legislature in 1856, estimated the cost of completing all the canals, after the 31st of December, 1853, including 10 per cent. for contingencies, the cost of engineering and land damages, at.....	
	\$18,131,908 74
To this cost he applied the constitutional loans, under § 3, article 7.....	9,000,000 00

And estimated a deficiency of..... \$4,131,908 74 which is a pretty large addition to any estimate hereto-

fore given by the engineers of the total cost of enlargement and completion.

Trade and Tonnage of the Canals.—From the tables furnished the Auditor of the Canal Department we compile the annexed statement of the trade and tonnage of the canals for the year 1856. The tables, obtained from the same source, of the movement for the years 1854 and 1855, are also published, for the purpose of giving a comparison in both value and quantity with the business of 1856. The statement will be found of much interest.

It will be found that in the products of the forest the Report of 1856, compared with that of 1855, presents an increase in the articles of furs and peltry, timber and ashes, while in the other articles there is a large decrease, both in value and quantity. Comparing the same products with those of 1854, the increase is in the articles of furs, shingles, and ashes, both as to value and quantity.

Under the head of agriculture the receipts of 1856 show a large increase in some important articles, such as pork, wheat, rye, corn meal, barley, oats, peas and beans, potatoes, dried fruit and hops. In other articles, under the same head, there is a large deficiency; such as beef, bacon, cheese, butter, wool, lard, etc. The products under the same head, compared with those of 1854, show a different exhibit from those of 1855. There is a large deficiency in pork, beef, bacon, lard, wool, corn, corn meal, and clover seed; while in the articles of cheese, butter, hides, wheat, rye, barley, oats, bran, and flax-stuff, peas and beans, potatoes, dried fruit, and sheep seed, there is an increase.

The first constitution of New York was adopted by the Provincial Congress, April 20th, 1777, was ratified by the State Legislature July 26th, 1788, and was somewhat amended in 1801. On the third Tuesday of June, 1821, a convention called by the Legislature met at Albany, and having made a revision of the constitution, the same was ratified by the people in December following. The third and present constitution was adopted in convention at Albany, October 9th, 1846, was ratified by the people on the ensuing 2d November, and went into operation January 1, 1847. Among the provisions of the existing constitution are these:—A sinking fund to pay the State Canal Debt shall be thus formed: from the surplus revenues of the State canals from June 1, 1846, to June 1, 1855, \$1,800,000, annually; from June 1, 1855, thenceforward, \$1,700,000, annually, including \$300,000 then to be borrowed until the debt is wholly paid. After thus appropriating there shall be annually set apart \$350,000 out of the surplus canal revenues from June 1, 1846, until the canal debt is paid; and after said payment, then \$1,500,000 annually, which appropriations shall form a sinking fund to pay the general fund debt of the State. After thus appropriating, \$200,000 or less shall be annually paid from the surplus canal revenues to the State treasury for general State expenses. And the remainder of the surplus canal revenues shall be applied to the completion of the canals. If the above sinking funds are insufficient to satisfy the creditors of the State, equitable taxes shall be laid. * * * The credit of the State shall not be loaned to any individual corporation. To meet casual deficits, the State may contract debts not exceeding \$1,000,000. Other debts may be contracted if submitted by the Legislature to the people, with provisions for payment by direct taxation, and ratified by the people. * * * Corporations are to be formed under general laws, except those for municipal purposes. Municipal corporations are to be restricted by the Legislature in their power of taxation and contracting debts. Stockholders in banks are individually responsible for the debts of their corporation to the amount of their shares of stock. * * The capitals of the common school literature and United States deposit funds are inviolate.

The aggregate statement shows an increase in the down tonnage in 1856 over 1855 of 200,844 tons, and a decrease in value of \$2,674,587.

In respect to the upward movement, there is an increase of tonnage in 1856 over 1855 of 119,846 tons, and in value of \$30,887,844.

STATEMENT SHOWING THE TOTAL QUANTITY AND ESTIMATED VALUE OF EACH ARTICLE WHICH CAME TO THE HUDSON RIVER ON ALL THE CANALS, DURING THE YEARS 1854, 1855, AND 1856.

in 1840, to 812,710; and in 1850, to 515,507. This, however, is exclusive of the population of Brooklyn, which, in 1850, amounted to 96,838, and is as much a part of New York as Birkenhead is of Liverpool. Originally the houses were mostly of wood, and the streets narrow and confined. In these particulars, however, a vast improvement has taken place during the last half century; most part of the old houses having been pulled down and rebuilt with brick. The new streets, which are broad, and intersect each other at right angles, are well paved and lighted. Broadway, the principal street, is one of the largest and finest in the world. Many of the public buildings are commodious and elegant. The pools, that were formerly abundant in the city and its vicinity, have been completely filled up; a measure that has done much to improve the health of the population. In respect of cleanliness, however, New York, though much improved, is still rather deficient. Formerly there was hardly such a thing as a sink or common sewer in the whole city; the night soil and filth were collected in the pits, of which there was one in every house, and being conveyed to the nearest quays, were thrown into the water; and as these were made of timber, with many projections, a great deal of filth was retained about them, producing, in hot weather, an abominable stench. But in these respects a great amendment has been effected; and the deficiency of water, under which the city formerly labored, has been completely obviated by the construction of the Croton Aqueduct, about 40½ miles in length, a work worthy of being ranked with the noblest of the old Roman aqueducts.

New York is indebted, for her wonderful increase, to her admirable situation, which has rendered her the greatest emporium of the New World. The rise of the tide is about 6 feet, and even at ebb there are 21 feet water on the bar; and the water in the outer and inner bays, and in the river, is so deep that ships of the largest burden lie close to the quays, and may proceed to a great distance up the river. The navigation of the bay is rarely impeded by ice. The great strength of the tide, and the vicinity of the ocean, keep it generally open, even when the Chesapeake and Delaware Bays are frozen over. The influence of the tides is felt in the Hudson as far as Troy, 160 miles above New York, affording peculiar facilities for its navigation. Those natural advantages have been vastly extended by a system of canals, which has connected the Hudson not merely with Lake Ontario and Lake Erie, but with the Ohio River, and consequently with the Mississippi and the Gulf of Mexico! So prodigious a command of internal navigation is not enjoyed by any other city, with the exception of New Orleans; but the readier access to the port of New York, the great salubrity of the climate, and her situation, will secure her hereafter the preponderance.

New York Harbor.—In April, 1857, Professor Bache, of the United States' Coast Survey, furnished the Life Saving Association with his *Sailing Directions for Sandy Hook and its Approaches from Sea*, of which 5000 copies have been printed in pamphlet form. A portion of these has been placed in the hands of the dealers in nautical instruments in the following ports for gratuitous distribution to captains of vessels, namely, New York, Portland, Me., Portsmouth, N. H., Boston, Mass., Philadelphia, Baltimore, Savannah, Mobile, New Orleans, Norfolk, Charleston, and a supply of these pamphlets, for the like purpose, has been forwarded to the United States' consuls in Cork, Dublin, Belfast, Bristol, Cardiff, Hull, Sunderland, Portsmouth, Southampton, Glasgow, Dundee, Liverpool, London, Havre, Marseilles, Antwerp, Bremen, Hamburg, Amsterdam, Rotterdam, and Havana.

Range Lights from East End of Gedyney's Channel, between Sandy Hook and Flyer's Knoll.—Two fixed lights located near Point Comfort, New Jersey. The front

light will be exhibited from a lantern on the keeper's dwelling, which is located near the beach, and painted white, with the top of the lantern black. The rear light is located three quarters of a mile distant from the front one, and will be exhibited from a tower painted white, with the head of it and lantern black. The keeper's dwelling is north of it and painted white. The front light is 40, and the rear one 76 feet above the mean level of the sea, and should be seen, under ordinary state of the atmosphere, outside the bar. During the day the front building can be readily recognized from other buildings in the vicinity by the lantern on its centre, and the rear one by the lantern of the tower being projected on the sky above the trees.

Main Ship Channel Range Lights.—Two fixed lights located on the New Jersey shore, west of Highlands of Navesink. The front light will be exhibited from a tower near the beach, painted with 2 white and 1 red horizontal bands, and the roof of the lantern also of the latter color. The keeper's dwelling is west of the tower, and painted white. The rear light is located on the north side of Chappel Hill, 1½ miles distant from the front light, and will be exhibited from a lantern on the keeper's dwelling. The dwelling is painted white, and the top of the lantern red. The front light is 60, and the rear one 224 feet above the mean level of the sea, and both should be seen, under ordinary state of the atmosphere, the length of the range line. During the day they can be readily recognized by the shape and colors of the towers of the front light, and by the lantern of the keeper's dwelling, and isolated portions of the rear one. It is about 1 mile east of Pigeon Hill.

Swash Channel Range Lights.—Two fixed lights located on Staten Island, New York. The front light will be exhibited from a tower near the site of the "Old Elm Tree" Beacon, painted with 2 white and 1 red horizontal bands, and the roof of the lantern also of the latter color. The keeper's dwelling is south of the tower, and painted white. The rear light is located on a hill, near New Dorp, about 1½ miles from the front light, and will be exhibited from a lantern on the keeper's dwelling. The dwelling is painted white, and the top of the lantern red. The front light is 59 feet, and the rear light 189 feet above the mean level of the sea; and both should be seen, under ordinary state of the atmosphere, well outside of the bar at Sandy Hook. During the day they can be readily recognized by the shape of the tower, and colors of the front light, and by the lantern on the dwelling, and isolated position of the rear one.

Sailing Directions.—Masters of vessels intending to enter by Gedyney's Channel around the south-west Spit Buoy, should run on a north-west half west course from the light-vessel for the black and white perpendicular-striped Nun Buoy at the outside of Gedyney's Channel, and from it west by north through the channel, keeping between the buoys, until the range lights near Point Comfort, New Jersey, are in one, when haul up for them, and continue upon the range until the two main channel lights are brought in range, which will also be shown by the main light at Sandy Hook, being a little open to the southward of the West Beacon. From this point the Main Ship Channel range will take them up clear of the "West Bank" and Craven's Shoal. Masters of vessels intending to pass through the Swash Channel, can bring the lights in range outside the bar, and run for them, until the Red Can Buoy, No. 8 (which marks the upper middle), is passed, or until the Main Ship Channel range is on, when haul up on that range until clear of the "West Bank." Vessels drawing more than 17 feet should not be taken through this channel on the range line at low water. A foot more water may be carried through this channel, after crossing the bar, by keeping a little to starboard, and opening the front light

The Croton aqueduct commences at the Croton River, 5 miles from the Hudson, in Westchester county. The dam is 250 feet long, 70 feet wide at the bottom, and 7 at the top, and 40 feet high, built of stone and cement. It creates a pond 5 miles long, covering a surface of 400 acres, and containing 500,000,000 gallons of water. From the dam the aqueduct proceeds; sometimes tunneling through solid rocks, crossing valleys by embankments, and brooks by culverts, till it reaches Harlem River a distance of 83 miles. It is built of stone, brick, and cement, arched over and under, 6 feet 3 inches wide at bottom, 7 feet 8 inches at top of the side walls, and 8 feet 5 inches high; has a descent of 1 1/2 inches per mile, and will discharge 60,000,000 of gallons every 24 hours. It crosses the Harlem River on a magnificent bridge of stone, 1450 feet long, with 14 piers; 8 of them bearing arches of 80 feet span, and 7 others of 50 feet span, 111 feet above tide-water at the top. The receiving reservoir at Eighty-sixth-street, 38 miles from the Croton dam, covers 35 acres, and holds 150,000,000 of gallons. The distributing reservoir, on Murray's Hill, at Fortch-street, covers 4 acres, and is constructed of stone and cement, 45 feet high above the street, and holds 20,000,000 of gallons. Thence the water is distributed over the city in iron pipes, laid so deep under ground

as to be secure from frost. The whole cost of the work has been about \$13,000,000. The water is of the purest kind of river water. There are laid below the distributing reservoir in Fortch-street, more than 200 miles of pipe, from 6 to 36 inches in diameter. See AQUEDUCTS. There are not more than four cities in Europe larger than New York, viz., London, Paris, Constantinople, and St. Petersburg.

STATEMENT SHOWING THE AMOUNT OF TAXES, AND OBJECTS FOR WHICH THEY WERE LEVIED, IN THE CITY AND COUNTY OF NEW YORK, FOR THE YEARS 1850, 1852, 1854, AND 1850.

The heavy warehousing of goods during the past three months, to secure the benefit of the new tariff, will not escape observation. The import of merchandise is more than \$3,000,000 less than in the corresponding three months of 1856, but a nearly equal total import is made up of specie and bullion.

The annexed statement exhibits the value of certain articles imported into and exported from this port during the year 1856, compared with 1855:

COMMERCE OF THE PORT OF NEW YORK.

Large as was the export of specie for the fiscal year, it is less than \$9,000,000 in excess of 1854-55. The export of domestic produce is a trifle larger than last year, with prices averaging about the same—cotton and provisions being higher, and broadstuffs lower.

It will be seen from the above that the value of goods put upon the market falls short of the total value of the import of merchandise, about \$34,500,000, and we have good reason to set down the value of goods in bond July 1, 1856, at \$10,000,000 at least, making the total value of goods in bond July 1, 1857, about \$45,000,000, which is \$6,000,000 or \$7,000,000 greater than was to have been expected from such reports as we have had from time to time. We must not forget to place to the credit of the year, an importation of specie and bullion of \$6,500,000 against a little more than \$1,000,000 the previous year. The total import of merchandise is \$22,000,000 in excess of the previous year, and it is not a flattering fact, that we have been importing most freely, when it was evident that stocks were accumulating. The merchant can not devote a few hours more profitably, than in a careful scrutiny of the above tables.

The extent to which goods have been warehoused, caused the cash receipts at the custom-house to fall below those of last year, as is shown in the following:

CASH DUTIES RECEIVED AT THIS PORT DURING THE FISCAL YEAR ENDING JUNE 30TH, 1857, COMPARED WITH THE TWO PREVIOUS YEARS.

The final result of this expansion, if continued, will be the loss of credit, and as a consequence, a reduction—not, however, until we shall have endured all the penalties incident to bankruptcy. With the realization of the present prospect, good crops, and the continued development of the manufactures of our country, we can expect prosperity, if we can only avoid the evil of excessive consumption, and, as a consequence, importation of foreign manufactures. We have prepared a statement showing the exports of France, Great Britain, and the United States for a period extending from 1847 to 1856, inclusive. This statement enables us to compare the increase in exports, and consequently in wealth, of the three principal maritime countries in the world. With regard to the increase of wealth, a country is in a similar position to an individual. The exports of one are equivalent to the income of the other; and the imports of one, on the other hand, are equivalent to the expenses of the other. In the case of this country, the *ad valorem* tariff prevents us from obtaining a correct valuation of the imports, in order to obtain the exact difference, or, in other words, the increase of wealth,

through the foreign commerce of the country. We may, however, judge in a measure from the character of the imports of the probable gain of wealth. If they are luxuries instead of necessities, or manufactures that could be home-made, instead of the products foreign to our soil and climate, we may justly put that nation down on the extravagant list. And this is the position of the United States. In the period of 10 years below given, the increase of exports to the United States has been equal to 107 per cent.; the increase of imports has been (for the same period) equal to 114 per cent. Showing that even with our enormous productive powers, and the great wants of Europe, our exports have not kept pace with our demand for luxuries. We are apt to congratulate ourselves on the unequalled growth of our country, and its commerce. Of the former we have reason; but of the latter, the figures do not prove our statements. In the last 10 years the exports of the United States have increased 107 per cent, while the increase in the exports of France for the same period is equal to 130 per cent.; and the increase in the exports of Great Britain for the same period is equal to 93 per cent.

Statement showing, separately, the total exports of domestic produce of France, Great Britain, and the United States for the last 10 years:

Year.	France.	Great Britain.	United States.
1847	\$149,000,000	\$203,000,000	\$158,000,000
1848	135,000,000	268,000,000	154,000,000
1849	151,000,000	315,000,000	145,000,000
1850	213,000,000	369,000,000	152,000,000
1851	228,000,000	370,000,000	215,000,000
1852	308,000,000	308,000,000	210,000,000
1853	245,000,000	498,000,000	251,000,000
1854	289,000,000	488,000,000	278,000,000
1855	308,000,000	475,000,000	275,000,000
1856	325,000,000*	575,000,000	326,000,000

* Estimated.

The exports of a country are the best exponent of its commercial prosperity, and in a measure it is in a direct ratio. For although the profit which is made on the articles exported may vary according as they are the natural products of the soil, or manufactures, the raw material of which is the growth of another country, yet there are other allowances to be made which compensate for this difference. It is evident, therefore, that any financial troubles we may have must be the result of our extravagant imports. These we have shown to have increased more rapidly than our exports, even with the valuation of our imports by an *ad valorem* tariff. The correction to be applied, if we wish to continue prosperous, is self-evident; and this correction will, under our present course, become ere long a necessity. A nation's balance-sheet is equivalent to the relation of receipts and expenditures with an individual; and national bankruptcy will surely follow when the imports, for a long series of years, are greater than the exports.

The exports of domestic cottons from the port of New York to foreign ports, for three years past, has been as follows:

Mexico
Dutch
Sweden
Danish
British
Spanish
Siam
British
New G
Brazil
Venez
Argenti
Central
West-c
Hondur
Africa
Austral

Maritime Advancement.—We doubt whether the progress of this country as a maritime power, and of this city as a commercial emporium, can be more clearly demonstrated than in the subjoined simple tables; the first showing the tonnage of the shipping that entered this port from foreign ports, for a number of years, commencing with 1821:

Years.	Home.	Foreign.	Total Tonnage.
1821.....	\$155,738	\$16,249	\$171,987
1825.....	290,525	20,855	311,380
1830.....	255,691	25,931	281,622
1835.....	878,565	90,999	969,564

1851.....	1,144,455	470,509	1,614,964
1852.....	1,291,951	478,087	1,770,038
1853.....	1,321,674	491,581	1,813,255
1854.....	1,442,278	477,985	1,920,263
1855.....	1,810,257	292,000	2,102,257

The increase in the total tonnage from 1821 to 1851, thirty years, was nearly ten-fold. The increase in American tonnage during the same period, was more than seven-fold. The increase in foreign tonnage was nearly thirty-fold—about 2,900 per cent. This explains more clearly than any other fact, the cause of the growing interest felt by European governments in the affairs of this country. The great falling off in the foreign tonnage in 1854, in comparison with several years immediately preceding, was doubtless mainly in consequence of the Eastern war, which employed, not only the Canard steamers running to this port, but a vast amount of British shipping of all descriptions, as

We give two tables, arranged from the report on Commerce and Navigation, showing the complete commerce of the port of New York, and specifying the destination of all vessels when outward bound, or the country from whence they arrived when inward bound; also showing their nationality. This table enables us to see at a glance the distribution of the commerce of New York, and gives a clear exhibit of our relations to other countries in regard to favorable or unfavorable tariffs, and shows some very curious statistics. In our trade to England, four fifths of the tonnage belongs to the United States, showing that we have a fair field for enterprise; while to the

transports. The inactivity in freights hence was also potent in influence. There is no reason to doubt that, with the return of peace, the foreign shipping entering this port yearly, will equal, if not surpass in tonnage, any former year.

The above table shows only the extent of the trade of this city with foreign ports. The coasting trade since 1847 is shown, partially, in the following. But it must be remembered, that coasting vessels to or from ports north of the northern boundary of Georgia, are not compelled to enter or clear, unless distilled spirits are of the cargo. It will at once be seen that this exhibit of the trade of this city coastwise is far from being complete. The same fact will also explain the disparity between the tonnage entered and cleared:

Year.	Entered.	Cleared.
1848.....	402,143	895,989
1849.....	424,976	895,559
1850.....	459,890	1,020,070
1851.....	455,642	1,214,922
1852.....	437,549	1,373,732
1853.....	507,531	1,013,697
1854.....	548,462	1,499,968
1855.....	614,045	1,373,589

But the increase in tonnage is not alone remarkable. It is a common observation that the largest ships of 20 years ago did not exceed in tonnage the ordinary coasters of the present day. Then, a ship of 700 or 800 tons was a wonderful achievement of capital and mechanism. Now, ships of more than 2,000 tons have ceased to be regarded as out of the ordinary course. The following is a statement of the number of vessels, foreign and American, that entered this port in the years indicated, their total and average tonnage. The statement of the entries for 1855, shows a diminution in the average tonnage of foreign vessels, to below that of 1840; which makes it quite clear that the diminished tonnage of the year was, as we have said, caused mainly by the use of a great number of large ships for purposes incident to the war between the Allies and Russia. From 1835 to 1854, the American tonnage increased about four-fold, but the number of ships increased only about 70 per cent., the average tonnage about 117 per cent., exceeding the average foreign tonnage about 60 per cent.

Years.	American.			Foreign.		
	No. of vessels.	Total tonnage.	Average tonnage.	No. of vessels.	Total tonnage.	Average tonnage.
1835	1,544	373,465	245	471	90,899	198
1840	1,447	409,453	280	470	118,186	253
1845	1,484	472,492	319	526	140,855	267
1850	1,592	807,650	427	1,451	441,757	304
1854	2,636	1,442,278	547	1,411	477,985	338
1855	2,457	1,810,257	527	904	292,000	228

British North American possessions we have less than one fourth, showing that we are inferior in enterprise to our neighbors, or they have some tariff advantage. We absorb four fifths of the carrying trade to France, while to the northern European countries we have but an equal amount. The carrying trade to South America goes almost entirely in American bottoms. The Cuba trade is 95 per cent. in American vessels, while to Portugal only about one third; showing that the tariff is in favor of that country. To Hamburg we have less than one fifth; which is probably owing partly to more economy practiced by the Dutch, and lower wages.

STATEMENT EXHIBITING THE NUMBER AND TONNAGE OF AMERICAN AND FOREIGN VESSELS WHICH ENTERED INTO THE DISTRICT OF NEW YORK, AND THE COUNTRIES FROM WHICH THEY ARRIVED, DURING THE FISCAL YEAR ENDING JUNE 30TH, 1856.

The greater increase of the commerce of New York over the other cities, is shown by the tables from the annual report on commerce and navigation. The tonnage built during the year ending June 30, 1856, in all the States, was 469,393 tons, the leading States ranging as follows:

States.	Ships.	Brigs.	Schooners.	Stops and small boats.	Steamers.	Total.	Tons.
Maine.....	155	70	84	4	4	316	149,907.88
Massachusetts.....	64	10	25	1	4	134	80,881.69
New York.....	84	7	161	27	306	76,301.31	
All others.....	53	17	843	313	1-6	947	162,301.90
Total.....	306	108	549	479	221	1,708	469,393.78

Maine, it appears from this, builds an amount of tonnage nearly as large as Massachusetts and New York together, and also nearly as large an amount as all the other States of the Union, omitting Massachusetts and New York; so that there is built on the coast of Maine almost one third of the aggregate tonnage of the Union. Probably, leaving out of view steamships, canal boats, and river craft, Maine builds fully one half of the tonnage of the Union.

Taking the leading ship-owning States, we have the following result as to tonnage owned:

	June 30, 1856.	June 30, 1855.	Tons.
New York.....	1,504,803	1,464,318	Inc. 40,485
Massachusetts.....	801,800	979,305	Dec. 87,845
Maine.....	750,170	806,699	Dec. 26,249
Total.....	3,156,833	3,250,090	
		3,180,883	

Decrease in the year 1855..... 69,857

The following table shows the relative amount of tonnage owned in the large ports which have over 50,000 tons registered at the custom-house of the district:

Ports.	June 30, 1856.	June 30, 1855.
New York.....	1,223,036	1,223,234
Boston.....	621,117	642,263
Philadelphia.....	197,228	294,806
Baltimore.....	158,844	188,108
Baltimore.....	198,980	175,258

Baltimore.....	69,989	74,072
Chicago.....	67,407	70,922
Cleveland.....	60,919	51,578
Detroit.....	58,888	65,058
Belfast.....	76,012	70,762
Baltimore.....	65,196	80,615
Charleston.....	58,129	56,419
San Francisco.....	80,750	87,842
Cuyahoga.....	60,916

The most remarkable decline is that shown in Philadelphia. New York exhibits the greatest increase of tonnage, according to these returns.

Of tonnage employed in steam navigation, New York stands at the head by a large amount. The figures are as follows:

	Tons.
New York State.....	153,733
New Orleans.....	61,751
St. Louis.....	38,745
Pittsburg.....	37,565

 The foregoing comissions to be exclusive of brokerage, and every charge actually incurred.

Nicaragua, San Juan de. A sea-port town at the mouth of the river of the same name, State of Costa Rica, on the west shore of the Caribbean Sea, lat. 10° 55' N., long. 83° 43' W. The port is excellent, and is considered the best on this part of the coast. Till lately, the town was quite inconsiderable, and consisted of little else than a cluster of huts; but latterly it has no doubt been improved.

This place has risen into importance from its being at the western extremity of a proposed line of water communication between the Caribbean Sea and the Pacific Ocean. This line is to consist partly of the River San Juan, flowing from the Lake of Nicaragua east to the sea at San Juan, partly of the lake, and partly of a canal to be constructed from the latter to the Pacific Ocean. This project has been often mooted; but the discovery of the extraordinary mineral riches of California, and the consequent emigration to and intercourse with that country, have given it an incomparably greater interest than it formerly possessed. The country appears to present greater facilities for effecting this great work, than any other part of Central America, except the Isthmus of Darien or Panama. The River San Juan, about 90 miles in length, is said to have been occasionally navigable throughout its entire course for sea-going vessels, till the Spaniards, to protect themselves from the attacks of the buccaneers, sunk vessels loaded with stone in its bed. In consequence of the interruption thus given to the stream, a considerable portion of the water was carried off by a new channel called the Rio Colorado.—CHEVALIER, *L'Isthme de Panama, etc.*, p. 81. The San Juan is still, however, navigated, though with much difficulty, in the rainy season, by steamers and other vessels drawing little water.

The lake itself has deep water throughout, and is adapted for ships of the largest burthen. The distance between its south-western shore and the Gulf of Papagayo, on the Pacific, is only 29,880 yards, or 15½ miles; and though the intervening country be laid down in many maps as mountainous, the greatest actual height of any part of it above the level of the lake is only 19 feet; at least, such is the result given by a series of 347 levels, about 100 yards apart, taken in 1781.—THOMPSON'S *Guatemala, Append.*, pp. 512-520. The surface of the lake is 128 feet 3 inches (English) above the level of the Pacific; an ascent which might be overcome by a succession of locks. The difference in the level of the two oceans, formerly supposed to be so serious an obstacle to the undertaking, is said by Humboldt not to exceed 20, or, at most, 22 feet. (*Nouv. Espagne*, l. 223, ed. 1826.) At its western extremity,

the Lake of Nicaragua is connected by a small river, the Tiptapa, with the Lake of Leon or Managua. The latter, 55 miles in length by nearly 90 in breadth, is also said to have deep water throughout. And the plan which appears to be at present preferred is, to make the channel uniting these two lakes navigable, and to excavate a canal from the latter to the port of Realejo, on the Pacific. Mr. Squier, late *chargé des affaires* of the United States at Nicaragua, has published the following statements in regard to this route.

Length of the route by Lake Nicaragua, etc., across the American Continent, from the Atlantic to the Pacific Oceans: River San Juan, 90 miles; Lake Nicaragua, necessary to be traversed, 110 miles; River Tiptapa, 18 miles; Lake Managua or Leon, 55 miles; from Lake Managua to Realejo, 40 miles; total, 303 miles. Height of the various lakes to be passed, and the elevations of land: height of Lake Nicaragua, 147 feet 9 inches above Atlantic, 128 feet 3 inches above Pacific; height of Lake Managua, 176 feet 5 inches above Atlantic, 156 feet 11 inches above Pacific; highest point of land to be passed, 231 feet 11 inches above Atlantic, 212 feet 5 inches above Pacific.

The River San Juan reaches the ocean by several mouths. The divergence takes place about 20 miles from the sea, forming a low delta, penetrated by numerous canals, or, as they are called on the lower Mississippi, *bayous*, and lagunas. The principal branch is the Colorado, which carries off at least two thirds of the water of the river, and which empties into the ocean some 10 or 15 miles to the southward of the port. There is an almost impassable bar at the entrance, which would preclude the ascent of vessels, even if the depth of water above permitted of their proceeding after it was passed. The little steamer *Orus*, nevertheless, after repeated trials, succeeded in passing. There is another small channel called the *Taura*, which reaches the sea midway between the port and the mouth of the Colorado. The branch emptying into the harbor, the one through which the ascending and descending boats pass, carries off only about one third of the water of the river. It, too, has a bar at the mouth, i. e., at its point of debouchure into the harbor, upon which, at low tide, there are but three or four feet of water. This passed, the bed of the river is wide, and studded with low islands; but excepting in the channel, which is narrow and crooked, the water is very shallow. It has been suggested that the Colorado branch might be dammed, and a greater column of water thrown into the other, or San Juan branch. But the suggestion can only be made by those who are wholly unacquainted with the subject. Allowing it to be possible to build a dam, the stream would probably find a new channel to the sea; or, if it took the direction of the harbor, fill it up during the first rainy season with sand, or at once destroy the sandy barriers which now protect and form it. It can not be made navigable for ships or vessels of any kind, except of the lightest draught, by any practicable system of improvements. The boats used upon the river for carrying freight and passengers are exaggerated canoes, called *bayogs*. Some are hollowed from a single tree, but the better varieties are built, with some degree of skill, from the timber of the *cedro*, a very light and durable kind of wood, which grows abundantly about the lakes. The largest of these carry from 8 to 10 tons, and draw 2 or 3 feet of water when loaded. They are long, and rather deep and narrow, and have, when fully manned, from 8 to 12 oarsmen, who drive the boats by means of long sweeps and setting-poles. Sails are seldom, if ever, used, except upon the lake. The masts are unshipped and left at the head of the river in descending, and resumed again in returning. These boats have a small space near the stern called the "*chupa*," covered with a board roof, a thatch of palm leaves, or with hides, which is assigned to the passengers. The rest of the boat is open, and the oarsmen, or, as they call

themselves *marineros* (sailors), are without protection, and sleep upon their benches at night, covered only with their blankets, and with the gunwale of the boat for a common pillow. The captain, or *patron*, is the steersman, and occupies a narrow deck at the stern, called the *pineta*, upon which he also sleeps, coiling himself up in a knot, if the boat is small and the pineta narrow. The freight, if liable to damage from exposure, is covered with raw hides, which, between sun and rain, soon diffuse an odor very unlike the perfumes which are said to load the breezes of Araby the Blest. The usual freightage from San Juan to Granada—a distance of 160 or 170 miles—is from 30 to 50 cents per cwt.; if the articles are bulky, it is more. The boatmen are paid from seven to eight dollars the trip, down from Grenada and back, which usually occupies from twenty to thirty days, although with proper management it might be made in less time. Time, however, in these regions is not regarded as of much importance, and every thing is done very leisurely.

Nicaragua, a Republic of Central America. It extends from lat. 10° 45' to 13° 20' N., at the Bay of Conchagua, on the Pacific Ocean, long. 83° 40' to 87° 40' W.; having west the Pacific Ocean, east the Caribbean Sea, and part of the so-called Mosquito territory, north the State of Honduras and San Salvador, and South Costa Rica. Area about 49,000 square miles. The Republic is divided into five Departments, each of which has several judicial districts, as follows:

Departments	Pop.	Districts.
Meridional	20,000	divas of Nicaragua.
Oriental	95,000	{ Acaoyapa or Chontales, Granada, Masaga, and Managua.
Occidental	90,000	Leon and Chinandega.
Septentrional of Matagalpa	40,000	Matagalpa.
Septentrional of Segovia	12,000	Segovia.
Total	247,000	

The population here given is the results arrived at, in round numbers, by a census attempted in 1846. It was only partially successful, as the people supposed it preliminary to some military conscription, or new tax. The principal towns of the State, with their estimated population, are as follows:

Leon (the capital), including Subtlava	28,000	Puebla Nueva	2,500
Chinandega	11,000	Nagrote	1,800
Chinandega Viejo	3,000	Souci	2,500
Realfo	1,000	Managua	15,000
Chilchigalpa	2,800	Massaya	15,000
Panatitla	900	Granada	10,000
Telica	1,000	Nicaragua	8,000
Somotillo	2,000	Segovia	8,000
Villa Nueva	1,000	Matagalpa	2,000

It is a singular fact that the females greatly exceed the males in number. In the Department Occidental, according to the census, the proportions were as *three to two*. The civilized Indians, and those of Spanish and negro stocks crossed with them, constitute the mass of the population. The individuals of pure European extraction constitute but a small part of the whole, and are more than equalled in number by those of pure negro blood. The entire population may be divided as follows: Whites, 20,000; negroes, 15,000; Indians, 80,000; mixed, 130,000.—Total, 250,000. Most of these live in towns, many of them going two, four, and six miles daily to labor in the fields, starting before day and returning at night. The plantations, "haciendas," "hacitos," "ranchos," and "chacaras," are scattered pretty equally over the country, and are reached by paths so obscure as almost wholly to escape the notice of travelers who, passing through what appears to be a continual forest from one town to another, are liable to fall into the error of supposing the country almost wholly uninhabited. Their dwellings are usually of canes, thatched with palm, many of them open at the sides, and with no other floor but the bare earth, the occupation of which is stoutly contested by pigs, calves, fowls, and children. These fragile structures, so equalled and mild is the climate, are adequate to such pro-

tection as the natives are accustomed to consider necessary. Some of them are more pretending, and have the canes plastered over and whitewashed, with tile roofs, and other improvements; and there are a few, belonging to large proprietors, which are exceedingly neat and comfortable, approaching nearer our ideas of habitations for human beings. A large part of the dwellings in the towns are much of the same character. The residences of the better classes, however, are built of adobés, are of one story, and include large courts, which are entered under archways, often constructed with great beauty. The court-yard has generally a number of shade trees, usually orange, making the corridors, upon which all the rooms open, exceedingly pleasant.

In October, 1855, Walker, an adventurer from California, landed in Nicaragua with a force of one hundred and fifty men, and being favored by part of the inhabitants, succeeded in effecting a revolution. From this time until 1857 he held possession of the country, though with varied success, against all forces brought against him. In 1857, his expected reinforcements from the United States failing to arrive, he was forced to retreat, and with an almost total loss of his army, and finally had to accept the offer of the United States sloop *St. Mary* to convey himself and command to the United States.

Unfortunately, agriculture is at a very low ebb, and but a small portion of this valuable land is made available. The productions are indigo, of which from 800 to 1000 zerooms are manufactured yearly; sugar, coffee, cacao, and cotton—the last of superior quality, and formerly raised in large quantities; Indian corn, rice, beans, and plantains, the staple food of the people, are raised in abundance; wheat, also, is grown in the mountainous and cooler parts of the country. Fruits, of various kinds, are plentiful, including excellent oranges and lemons. One of the principal sources of wealth consists in cattle, of which there are great numbers in all parts, particularly in the districts on the eastern side of the lake, where extensive and excellent pasturage is met with. The chief exports of the State are indigo, Nicaragua wool, and hides. The executive has the title of Supreme Director, with two counselors, a legislative chamber and senate. From the reports of the Minister of Finance, it was estimated that the receipts into the State Treasury for the year ending 30th June, 1851, would amount to \$122,682, and the expense to \$173,646, leaving a deficit of \$50,964. This, added to the standing debt of the State, \$523,905, makes a total debt of \$574,869.

Commerce with the United States.—On the 13th day of April, 1850, a treaty was concluded between the United States and Great Britain, in respect to a proposed ship-canal between the Atlantic and the Pacific, by which both governments stipulate and declare that "neither the one nor the other will ever obtain or maintain for itself any exclusive control over the said ship-canal." The 8th article further stipulates that the two governments shall "extend their protection, by treaty stipulations, to any other practicable communications, whether by canal or railway, across the Isthmus which connects North and South America, and especially to the inter-oceanic communications, should the same prove to be practicable, whether by canal or railway, which are now proposed to be established by the way of Tehuantepec or Panama." This treaty contains other stipulations relative to the Mosquito coast, Central America generally, etc., but nothing of commercial interest. General information respecting the Central American States is exceedingly limited; though, both for its productions and its geographical position, the country is one of great interest and importance. It abounds in all the precious and useful minerals, and produces almost spontaneously the varied and luxuriant staples of the tropics. It has been termed the portage or stepping-stone between

The delta of the Nile commences in lat. $30^{\circ} 7' N.$, where its waters spread out into numerous streams in the form of a triangle, extending at its base on the Mediterranean over a space of 120 miles; the two principal mouths are the west, or Rosetta branch, and the east, or Damietta branch. The others are the Bourlos and Dibe mouths. The system of the Nile is an anomaly among rivers: in ascending its course no affluent is met with for 1400 miles, the first being the Atbara in Nubia, which joins it on the right, 27 miles south of Berber. It is the only great tropical river which, by its periodical inundations, fertilizes a country surrounded throughout a great part of its course by sandy deserts. The waters begin to rise in June, and they subside in September. —See *EGYPT*. From time immemorial the Egyptians have made use of canals for the purpose of extending the inundations. The rise of the Nile appears due to the periodical rains which fall in the tropical regions of Africa from June to September. In Upper Egypt the swelling of the river amounts to about 30 feet, and at Cairo to 24 feet, perpendicular.

Ning-po, a city of China, province of Che-kiang, and one of the five ports recently opened to foreign trade, on the Takia, or Ning-po River, the mouth of which is directly opposite Chusan, 95 miles east-southeast of Hang-chow-foo, on a tongue of land at the influx of an affluent into the river, here crossed by a bridge of boats; lat. $29^{\circ} 54' N.$, long. $121^{\circ} 32' 30'' E.$ Population estimated at between 200,000 and 300,000. The city, six miles in circumference, inclosed by walls 25 feet in height, and entered by six gates, is surrounded by a fine plain covered with villages and water-courses. It has well-supplied shops, a temple of large size, hexagonal tower 150 feet high; a missionary hospital, opened in 1843; an active trade in junk-building, and a large manufacture of silks for export to Japan. It has been reported that about 670 junks come to it annually from Shang-tung and Len-tong with oil, provisions, fruits, caps, cordage, horns, drugs, rice, and silk; 550 from Fo-ken and Hai-nan with sugar, alum, pepper, black tea, indigo, salt, rice, and dye-woods; from Canton and the Straits some vessels; and from the interior about 4000 small craft yearly; the total imports being estimated at \$7,650,000 annually. It exports large quantities of wood and charcoal to Shang-hai, the trade of which port it has crippled, from being by several days nearer to the green-tea districts. It was taken by the British, without resistance, in 1841, when was captured a ponderous bell, now in the British Museum.

Nitric Acid, Aquafortis (Fr., *Acide Nitrique*; Germ., *Salpetersaure*), exists, in combination with the bases potash, soda, lime, magnesia, in both the mineral and vegetable kingdoms. This acid is never found insulated. It was distilled from saltpetre so long ago as the 13th century by igniting that salt, mixed with coppers or clay, in a retort. Nitric acid is generated when a mixture of oxygen and nitrogen gases, confined over water or an alkaline solution, has a series of electrical explosions passed through it. In this way the salubrious atmosphere may be converted into corrosive aquafortis. When a little hydrogen is introduced into the mixed gases, standing over water, the chemical agency of the electricity becomes more intense, and the acid is more rapidly formed from its elements, with the production of some nitrate of ammonia.

Noble, an ancient money of account, containing six shillings and eightpence sterling, or in United States currency equivalent to one dollar and sixty cents.

North America lies between the 16th degree of north latitude and the Arctic Ocean. It is more irregular in form than South America, but of greater uniform breadth, larger in area, and more deeply indented with gulfs, bays, and inlets. Two extensive elevations or mountain ridges extend near and parallel, the one to its east and the other to its west coast. Between these is a vast plain, the largest in the world, stretching from the Gulf of Mexico to the Arctic

Ocean. In this plain are situated the great lakes of North America, and through it flow the rivers Mississippi, the Mackenzie, and the St. Lawrence, the one forming a southern, the other a northern, and the third an eastern drain for its superfluous waters. Its coast indentations and inlets are Baffin's Bay and Hudson's Bay on the north; the Gulf of St. Lawrence on the east coast; the Gulf of Mexico on the south; the Gulfs of California and Georgia, and Cook's Inlet, on the west. The coast of North America is very extensive, extending in an irregular line from Davis's Strait to the Florida Channel about 4800 miles, and from the latter along the inland sea to Tehuantepec about 3000. The whole length on the Pacific side to Beiring's Strait is about 10,000 miles. The extent of the north and northeast shores can not probably be less than 3000 miles. The entire extent will thus be 22,800 miles. The most remarkable physical characteristics of North America are its sandy deserts, treeless steppes, and prairie; the first stretch along the base of the Rocky Mountains to the 41st degree of north latitude, having an average breadth of 200 to 500 miles. The steppes form another cheerless and extensive region in the northern part of the continent. The prairies or savannas, peculiar characteristics of North America, are chiefly in the Mississippi Valley. They consist of extensive and generally irregular tracts without trees, covered in the spring with bright verdure, intermingled with fragrant flowers. A vast extent is also occupied by forests, comprising probably not less than 600,000 square miles.

Mountains.—Of these there are four principal systems in North America: the Oregon or Rocky Mountains—a continuation of the Andes—the Sierra Nevada or Snowy Mountains of California, merging in its passage northward into the coast range, and the Alleghanies or Appalachian range, extending northeast parallel with the coast. The Rocky Mountain range is a continuation of the Andes, forming the elevated table-land passing centrally through Mexico; thence trending north, divide the waters entering the Pacific and Atlantic Oceans, and continue to the Arctic coast. Several peaks rise above the line of perpetual snows. The Sierra Nevada of California and coast range extend nearly parallel with the Rocky Mountain range, and are connected with the latter by several transverse ridges. The Alleghany range stretches along the eastern portion of the continent. It rises in the gently undulating ridge dividing the waters of the Tennessee from those flowing into the Mississippi and the Gulf of Mexico, and trending across the country in the same general direction from southwest to the northeast, terminates in the headland of Gaspe.

Rivers and Lakes.—The principal rivers are the Mississippi, with its affluent the Missouri, and the St. Lawrence. The first is the largest river in North America, and one of the greatest on the earth, occupying, with its tributaries, the whole of the southern portion of the great central basin of North America. It has its origin in the junction of streams formed on the eastern declivity of the Rocky Mountains, between lat. 42° and $50^{\circ} N.$, and enters into the sea in the Gulf of Mexico in lat. $29^{\circ} N.$ Its whole course, which is from north to south, is calculated to exceed 1400 miles. The St. Lawrence rises under the name of the St. Louis, in lat. $47^{\circ} 45' N.$, long. $98^{\circ} W.$; entering Lake Superior, it flows a southeast and a northeast course, and enters the Gulf of St. Lawrence at Cape Gaspe, where it has expanded to one hundred miles in width. The Mackenzie issues from the Great Slave Lake, from which it flows nearly due north, and enters the Arctic Sea, lat. $69^{\circ} 10' N.$ In the number and magnitude of its lakes North America is unequalled. They form one of its most noted features, and in conjunction with its rivers present a medium of commercial intercourse wholly unsurpassed. The principal are Lakes Superior, Michigan, Huron, Erie, and Onta-

rio, Wisconsin, country, Winnipeg, Slave Lake in Mexico, consider between Woods, passing, magnit

The d ries of same di

rio, which together cover an area of 100,000 square miles. Following the chain of lakes which crosses the country in a northwestern direction, there occur Lakes Winnipeg, Wookaton, Deer Lake, Athabasca, Great Slave Lake, and Great Bear Lake. The Great Salt Lake in Utah, and Mono Lake and Lake Chapala in Mexico. There are, besides these, many smaller yet considerable bodies of water, viz., St. Clair, midway between Lakes Huron and Erie; the Lake of the Woods, between Lakes Superior and Winnipeg; Nepissing, Simcoe, Champlain, and many others of lesser magnitude.

Islands.—In the Atlantic Ocean the principal are Newfoundland, Anticosti, Prince Edward Island, and Cape Breton, all lying at the out-ouchure of the St. Lawrence; Nantucket, Long Island; the Bahama Islands, off the coast of the Carolinas; and the Columbian Archipelago, comprising the islands of Cuba, Hayti, Jamaica, Porto Rico, Santa Cruz, Antigua, Guadalupe, Martinique, St. Lucia, Barbadoes, St. Vincent, Tobago, Trinidad, and other small islands. On the northwest coast the principal are the California group; Vancouver, Queen Charlotte, Prince of Wales, Sitka, and Admiralty Islands; and on the extreme northwest the Aleutian group. In the Arctic Ocean there are a vast number of islands of which but little is yet known.

Geology, Mineralogy, etc.—A remarkable analogy exists in the structure of the land in North America and Central and Northern Europe. Gneiss, mica, schist, and granite prevail in wide areas in the Alleghanies, on the Atlantic slope and the northern latitude of the American continent, and in the high and middle latitudes the Silurian strata extend over 2000 miles. Crystalline and Silurian rocks form the substratum of Mexico, for the most part covered with Plutonic and volcanic formations and secondary limestone. The Rocky Mountains are mostly Silurian, except the eastern ridge, which is of stratified crystalline rocks, amygdaloid, and ancient volcanic productions. The coast range has the same character, with immense tracts of volcanic rocks, both ancient and modern, especially obsidian. In North America volcanic action is entirely confined to the coast and high land along the Pacific. The principal minerals are gold, silver, copper, iron, lead, and coal. The first three are found in greatest abundance in Mexico, where there are nearly 3000 mines of gold and silver alone. Since 1848 the great field for gold gathering has been California, where large quantities have been obtained, and both silver and quicksilver have been found to abound. The silver supplied by the Mexican veins is extracted from a great variety of minerals, pure or native silver being of comparatively rare occurrence. The principal deposits of gold in the United States besides California occur in the primary rocks of the southeastern declivity

of the Alleghanies. The coal-fields are of prodigious extent, the Appalachian stretching without interruption 720 miles, with a maximum breadth of 280, and occupying an area of 63,000 square miles. The Pittsburgh seam, ten feet thick, exposed on the banks of the Monongahela, extends horizontally 225 miles in length and 100 in breadth, and covers an area of 14,000 square miles. Besides the coal-fields named, there are various others of great extent in different parts of North America, including New Brunswick, Nova Scotia, and Vancouver Island. Iron is also extensively worked. Salt is widely diffused throughout the continent.

Climate.—The predominating character of the climate of North America is intense cold, although in some parts an oppressive heat prevails during a portion of the summer. Above the 50th degree of latitude the cold is so severe as to render the country all but uninhabitable, while frosts occasionally occur as low down as the 30th degree of latitude. In winter a keen and piercing northwest wind prevails throughout all North America, adding greatly to the rigor of the northern climate, and carrying its chilling influence into the more southerly regions. The transitions from cold to hot, or from winter to summer, are very sudden, especially in Canada. Among the causes of a lower temperature than obtains in Western Europe may be mentioned the small portion of the continent lying in the torrid zone, the Rocky Mountain range, and also the Sierra Nevada mountains near the Pacific Ocean, prevent the warm winds from the Pacific penetrating the interior; the great expansion of the land north and northeast, and the almost level plain in those directions, allow full scope for the piercing Arctic blasts. The narrowness of the Gulf Stream, and the prevailing winds taking the same general course, carry away from this continent the hot circumambient air, a source of warmth to Western Europe; and the cold polar oceanic current brings down the icebergs of Spitzbergen and Greenland to the shores of Labrador and Newfoundland.

The territorial limits of the United States include that portion of the continent of North America, extending from the Atlantic to the Pacific Ocean, which is bounded by the British possessions on the north, and by the Gulf of Mexico and the Mexican Republic on the South.

The superficial area of the Union, according to a computation made by the Topographical Bureau at the close of 1853, and subsequently reviewed and amended, amounted on the first of January, 1854, to two millions nine hundred and thirty-six thousand, one hundred and sixty-six square miles, being somewhat more than one third of the area of the continent of North America.

AREA OF NORTH AMERICA, EXCLUSIVE OF THE WEST INDIES.

Territory.	Square Miles.	Square Miles.
United States, as ascertained by the Topographical Bureau		2,936,166
(New Britain)	2,693,847	
British America (Upper and Lower Canada)	346,860	
(Nova Scotia, New Brunswick, Cape Breton, &c.)	104,701	
		3,050,398
Mexico		1,058,834
Central America		203,551
Russian America		394,300
Danish America (Greenland)		580,000
Total square miles.		6,092,940

* According to Hall's estimate of the area of North America. Another estimate gives New Britain but 1,800,000 square miles.

† McCulloch. The late Canadian census gives 242,482 square miles as the area over which jurisdiction is actually extended.

‡ Gilbert gives 902,590 kilometres square, or 371,611 square miles.

§ Greenland, from present information, would appear to be a triangular island, 1500 miles long and 600 miles in its greatest breadth. Its area, therefore, can not be greater than we state above. Gilbert gives the area of Danish America 3861 square miles, and McCulloch only 170, meaning only that portion which has been explored.

¶ The area of the continent of North America is variously estimated by geographers at from five to seven millions of square miles. Guyot ("Earth and Man") estimates it at 5,472,000, and that of Europe at 2,688,000, exclusively of islands.

The treaty of 1854 with Mexico settles the boundaries of the two republics as follows: "Retaining the same dividing-line between the two Californias as al-

ready defined and established according to the 5th article of the treaty of Guadalupe Hidalgo, the limits between the two Republics shall be as follows: Begin-

ning in the Gulf of Mexico, three leagues from land, opposite the mouth of the Rio Grande, as provided in the 5th article of the treaty of Guadalupe Hidalgo; thence, as defined in the said article, up the middle of that river to the point where the parallel of 31° 47' north latitude crosses the same; thence due west one hundred miles; thence south to the parallel of 31° 20' north latitude; thence along the said parallel of 31° 20' to the 11th meridian of longitude west of Greenwich; thence in a straight line to a point on the Colorado River, twenty English miles below the junction of the Gila and Colorado Rivers; thence up the middle of the said River Colorado, until it intersects the present line between the United States and Mexico."

For early history, etc., of North America, see *New England Magazine*, vii. 109; *Christian Review*, xiv. 610; *North American Review*, lxxiii. 210 (F. BOWEN).

North Carolina lies between 35° 50' and 36° 30' N. lat., and between 75° 45' and 84° W. long. from Greenwich, and between 0° 20' W., and 1° 39' E. long. from Washington. Area, 45,500 square miles. Population in 1790, 393,754; in 1800, 478,109; in 1810, 555,500; in 1820, 638,829; in 1830, 738,470; in 1840, 763,419; and in 1850, 868,903.

Physical Features, etc.—Along the entire coast of this State there is a ridge of sand separated from the main land in some places by narrow, and in other places by broad sounds and bays. The passages or inlets through it are shallow and dangerous, Ocracoke Inlet being the only one through which vessels pass. Capes Hatteras and Lookout are projecting points in this belt, and off them, particularly the former, is the most dangerous navigation on the coast of the United States. Cape Fear is on an island off the mouth of Cape Fear River. For 60 or 80 miles from the shore the country is level, the streams sluggish, and there are many swamps and marshes. The soil is sandy and poor, excepting on the margins of the streams, where

it is frequently very fertile. The natural growth of this region is mostly the pitch-pine. This tree affords tar, pitch, turpentine, and lumber, which constitute an important part of the exports of the State. In the swampy rice of a fine quality is raised. Back of the flat country, and extending to the lower falls of the rivers, is a belt of land about 40 miles wide, of a moderately uneven surface; a sandy soil, and of which the pitch-pine is the prevailing natural growth.

Throughout the State Indian corn is raised, and in some parts considerable cotton. In the low country, grapes, plums, blackberries, and strawberries grow spontaneously; and on the intervals comes grow luxuriantly, the leaves of which containing green during winter furnish food for cattle. In the elevated country, oak, walnut, lime, and cherry trees of a large growth abound. Principal minerals coal, iron, and gold. It is the only State in the Union where every article enumerated in the census is produced.

Rivers.—The principal rivers are the Chowan, 400 miles long, navigable for small vessels 80 miles; Roanoke, Pamlico, navigable for 80 miles; Tar, Neuse, Cape Fear, the largest river in the State, 280 miles long, with eleven feet of water to Wilmington; the Yadkin, which forms a part of the Great Pee Dee in South Carolina.

The principal places in the State are, Raleigh the capital, Newbern, Wilmington, Fayetteville, Edenton, Elizabeth City, Beaufort, and Charlotte. On January 1st, 1850, there were three railroads, with 631 miles of track finished and in operation. Exports, 1852, valued at \$576,397. Imports, same year, \$300,488. Tonnage of the State, 1853, 56,375 tons. The first permanent settlement in this State was on the eastern bank of the Chowan River, about 1600, by emigrants, who, in consequence of religious persecution, fled from Nansmond, Virginia. The constitution of the United States was adopted in convention November 27th, 1789. Years, 193; days, 75.

COMMERCE OF THE STATE OF NORTH CAROLINA (SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851) FROM OCT. 1, 1820, TO JULY 1, 1850.

the mines of which are situated mostly in the Gulf of Christiania; the silver mine of Kongsberg is at present one of the richest in Europe, and, next to the copper mine of Romaa, the most important in the kingdom.

Manufactures, properly so called, scarcely exist in Norway. Brandy distilleries and saw-mills are the only extensive branches of industry; next to these are forges and metal founderies, the produce of which is exported in a raw state, except what is used in the manufacture of arms at Königsberg, and in the manufactures of iron ware and nails. The manufacture of cloth, linen, and cotton, as well as the preparation of skins and leather, are almost entirely domestic. The other manufactures comprise those of glass, paper, oil, gunpowder, soap, tobacco, and sugar refining. The principal forests are in the interior; the timber is felled in autumn and winter, and is conveyed over the snow to the coast. Holland is now the chief market for Norwegian timber. Fish is exported from all the towns on the west coast, but Bergen is the chief entrepôt. The most important branches of this trade are dried fish and salted herrings. The export of mineral products is less than might be expected, from the number of mines; the principal are iron, copper, and silver. The chief imports are salt, grain, and colonial produce. Commerce in the interior of the country is greatly impeded for want of means of communication; none of the rivers are navigable except near their mouths. Good roads exist only between the towns of the south coast and the principal valleys in Nordland and Finmark; the usual communication is by sea. Among the numerous islands on the west coast, there are violent and irregular currents, which render the coast navigation dangerous. Among these is the celebrated *Maelstrom*, or *Moskenes-Ström*, the danger from which has been greatly exaggerated, since it can at nearly all times be passed over even by open boats. Regular communications have successively been established between the principal towns of the coast from Christiania to Hammerfest, and steam vessels ply in the Gulf of Christiania, and on the lakes of Mjøsen and Tyrifjord. Norway has a national discount bank, established 1817, which has the exclusive right of issuing paper money.

COMMERCE OF NORWAY IN 1853.

* Tons = two tons.

Owing to the difficulty of transport, all the seats of industry, and the only towns, are on the coast, and chiefly on the Gulf of Christiania. Ship-building is actively carried on in the ports. In the Middle Ages, the commerce of Norway consisted exclusively in the exportation of fish, and this is still the most important article of trade. Next to this is the export of timber, which was commenced by the Dutch in the sixteenth century; and, lastly, the products of the mines and metal forges. The timber exported annually amounts to 200,000 lastes, value 1,685,000 specie dollars.

Norway possesses nearly the same natural advantages as Sweden. The inhabitants are chiefly employed in the breeding of horses, sheep, goats, and the reindeer; cultivating small farms, fishing, mining, and such other occupations as a country rich in its forests and minerals, and enjoying a favorable position for commerce, usually affords. Historians represent the ancient navigation and trade of Norway as being in a highly flourishing condition, especially when its towns, in the twelfth century, joined the Hanseatic League. As early as 1217, England concluded a treaty (the first she ever made with a foreign power) with Norway, stipulating an entire reciprocity of trade between the two countries. The trade of Norway has always consisted of the interchange of the produce of her forests, of her copper and iron mines, and of her fisheries, for such articles as she required from foreign countries. The principal sea-ports are Bergen, Trondheim, Christiania, Hammerfest, and its outport Wardahus. Denmark occupies the first rank in the foreign trade of Norway. So much of its trade passes through the ports of this country, particularly Altona, that Denmark may be justly considered the commercial entrepôt of Norway. Its commercial relations with nearly all the countries of Europe are conducted through these ports; and it was not until during the recent troubles in the duchies of Denmark that Norway manifested any disposition to export direct from the producing country. The maritime industry of the Norwegians constitutes the commercial bond which unites them with Denmark. Sweden, on the other hand, being separated from the more populous and industrious divisions of Norway by mountainous and sterile territories, necessarily confines her commercial relations with the sister kingdom to the southern frontier or the coast; and, as their principal productions are generally similar, these relations are not susceptible of any great development.

The Hanse Towns have long been the principal entrepôts for the commercial movements of the north of Europe. The relations of Hamburg with Norway are, even at this day, considerable; but for the past few years they have been stationary, with rather a decreasing tendency. With England, on the other hand, the trade of Norway is becoming more important every year. This is mainly owing to the liberal commercial system of the former country, under which Norway is enabled to compete with British colonial possessions, in America, in supplying the British markets with the varied productions of her forests. France and Holland chiefly import into the markets of Norway colonial or raw produce; but neither of these countries find, in Norwegian markets, a profitable exchange for their manufactures: Holland, because she has but few; and France, for the reason that her works of art and taste are too costly, and perhaps not very well adapted to meet the wants of a people whose cold and inhospitable climate, as well as their maritime occupations, would seem to demand the coarser qualities of manufactures. From official documents recently published, it appears that in 1848 the population of Norway was 1,200,000 souls; their merchant marine counted 3400 vessels, measuring an aggregate of 210,000 tons, and employing 16,500 persons as officers and crews. This would give to Norway one vessel for every 352 inhabitants, and make every seventy-third subject a sailor. At the

same period, the total merchant marine of France consisted of 14,253 vessels, measuring an aggregate of 670,000 tons.

With the United States the trade of Norway is chiefly indirect. Tobacco and cotton are the principal articles of American produce which enter into the consumption and manufactures of the Norwegians. The restrictive character of the tariff of Norway, however, like that of her sister kingdom, and the fallacious principles on which her fiscal and commercial legislation has been so long maintained, must ever prove an insuperable obstacle to the expansion of her foreign trade, and the consequent development of her vast internal resources. So long as Norway adheres to the now generally obsolete idea that the best way to raise revenue and relieve the land-owner is to levy high duties on all goods imported into the country, so long will her relations with foreign countries be limited to the exchange of such articles of necessity as can not be elsewhere procured. The decline which her iron trade has experienced during the few years past, both in England and the United States, will necessarily compel the government of Sweden and Norway to look for a market in France; and it is understood that the latter government is not averse to such amelioration of her tariff as will open her markets to this great staple of Sweden and Norway, by a material reduction of her present seventy per cent. duty on iron. The only equivalent, however, which could satisfy France for so liberal a concession would be a total change in the Swedish and Norwegian tariffs, by which her own manufactures could enter the ports of the united kingdom, and find a profitable as well as a ready market. Nor could such a change in any manner have an injurious effect upon the manufacturing industry of either of those countries, as the great demand would be for such heavy and coarse manufactures as are most needed in so northern a latitude, and which never have been, and perhaps never will be, successfully manufactured in Sweden or Norway—at least, to any extent approximating the great consumption of the kingdom. Such a result would extend its benefits to other countries besides France; and if, in addition to a remodification of the Swedish and Norwegian tariffs in respect of manufactures, the present exorbitant cent-per-cent. duties on American tobacco were liberally reduced, the trade between the United States and Sweden and Norway would be materially benefited, and exports and imports, direct between the two countries, largely augmented.

The Norwegian tariff differs, in many essential particulars, from that of Sweden. Its range is considerably lower, and, owing to this fact, and to the advantages resulting from different weights, it will be found (for instance) that tobacco blades may be imported into Norway at a rate nearly 83.3 per cent. less than into Sweden. The oppressive system of fictitious valuation, in practice in the Swedish custom-houses, is unknown in the sister kingdom; and, besides, greater consideration is shown to the poorer inhabitants of remote provinces. At Ibrodd and Tromsøe, in the northern part of Norway, many articles are admitted at half rates of duty; and at Hammerfest and other remote ports the duty is altogether remitted. This consideration is not shown to the inhabitants of far-off provinces in Sweden; indeed, in districts no further off than Dalecarlia many necessities of life, which the country can not supply to them, must be purchased, if at all, by the poorer peasantry, with the additional costs of inland transportation and the coast navigation of the Gulf of Bothnia. The tariff now in operation came in force on January 1, 1855, and will expire on the 31st December, 1857. The duties on tobacco have been raised nearly to the level of those of Sweden. The latter, upon tobacco blades, is still one cent per pound higher. The augmentation of the duty on this staple of the United States was, doubtless, designed as an additional argument in any negotiations which might be proposed by the government of

Sweden and Norway relative to the iron duties of the United States.

The following brief summary is presented of the new tariff. It will show the duties levied on certain American produce by the old and new Norwegian tariffs:

Tobacco.—(Stem and blade), raised from 5 to 6 skillings per lb. The skilling is nearly equivalent to one cent.

Rice.—Unchanged; namely, 80 skillings per barrel (in husk), or 1½ skillings per lb., without husk or ground.

Cotton.—Raw, unchanged; one-half skilling per pound.

Maize, unground.—Lowered from 72 skillings to 16 skillings per toende (barrel of nearly four bushels).

Maize, ground.—Lowered from 16 skillings to 7½ skillings per lispund (17.6 lbs. avoirdupois).

Wheat.—Unchanged; 72 skillings per barrel (toende).

Flour.—16 skillings per lispund.

The principal ports of Norway are Christiana, Bergen, and Hammerfest, or Alten Hammeres., the chief port of Finmark. Christiana is a deep sea-port, having at all seasons from six to seven fathoms depth of water close to the quay. It is the capital of Norway, and has some few fabrics of woolen, glass, hardware, soap, leather, cordage, tobacco, etc. The deals of this port have ever been celebrated. Its trade has flourished as far back as 1792, in which year the number of ships arrived was 521, of which 518 cleared with cargoes of deals. Bergen has a safe and deep harbor close to the town, but a pilot is necessary for vessels entering or departing, on account of the numerous rocks. It has a few manufactories of tobacco and earthen-ware, several rope-works and distilleries, ship-yards, forges, and other establishments of ordinary handicraft. Its fisheries, however, are its chief resource, and its foreign trade is principally confined to Hamburg. Hammerfest has an extensive trade, chiefly with England, through the port of Hamburg. Its exports are copper, dried stock-fish, salted fish, fish-oil, rein-deer skins, buckskins, walrus hides and teeth, feathers, fox and other skins, etc. Finmark has always enjoyed a high degree of commercial prosperity. Its revenues exceed its expenditures by upward of two millions of doinars. Its chief wealth depends upon its fisheries, a source of remunerative industry that never fails. For centuries back, observes Macgregor, not a single example can be given of a total failure. The value of these fisheries may be estimated from the fact that in five years, ending with 1844, the produce of cod, seal, and halibut was about 500,000 tons, and 20,000 barrels of oil, independently of what was taken by the Russians.

Coarse cottons and woollens are well adapted for the markets of Norway, more especially of Finmark; but the commercial privileges reserved to Russia, by treaty, have hitherto secured to that power the monopoly of this trade. Her linen, raven's-duck, and various other manufactures, are admitted free into Finmark; while duties, varying from 50 to 100 per cent. on the cost price, are interposed on similar manufactures of other foreign countries.

Woolen and woollens admitted even at a moderate duty, American and British manufactures of that description would soon supersede the almost general use of Russian fabrics.

The present condition of the trade of Norway may be gathered from the following summary: Number of vessels from all countries entered in 1850, 8542, measuring in the aggregate 1,174,501 tons; of these there were Norwegian, 5318 vessels, of 881,320 tons. From the United States there arrived but nine vessels—seven carrying 2654 tons of merchandise, and two being in ballast—all under the Norwegian flag. The principal countries of departure of nearly all the others were England, Holland, and Prussia.

During the same year, there cleared from Norwegian ports 8479 vessels, measuring 1,182,332 tons. Of these

there were destined for the United States 31 vessels, floating 13,178 tons of merchandise; 30 being under the Norwegian flag, and one being foreign. From these figures, it will be seen that there arrived from Norway in the United States 31 vessels, carrying 13,178 tons of Norwegian products, against nine cleared from the United States for Norway with American products to the amount of 2634 tons; or a difference of 22 vessels and 10,524 tons of merchandise against the United States in the direct trade with Norway. The restrictive tariff regulations of the latter country will readily account for this great inequality. In 1850, Norway imported upward of 1,700,000 lbs. of cotton. In 1852, the total importation of cotton amounted in value to 1,927,560 francs; viz.: from Great Britain, 1,071,200 francs, from the United States, 650,700 francs; from other places, 205,660 francs; making a total of 1,927,560 francs, or \$266,236 40. In 1850, there were imported into Norway 3,900,000 lbs. of tobacco, 8,000,000 lbs. of sugar, 6,500,000 lbs. of coffee. During the same year the effective merchant marine of Norway consisted of—

For the comparative statement of the commerce of the United States with Sweden and Norway, exhibiting the value of exports to and imports from each country, and the tonnage of American and of Swedish and Norwegian vessels arriving from and departing to each country, during the years designated, see SWEDEN.—*Edinburgh Review*, lxx. 21, xxii. 145, xxiii. 79; *Westminster Review*, xxvii. 164; *North British Review*, ix. 39; *Quarterly Review*, ii. 104; *Fraser*, xxiii. 476; *American Quarterly Register*, xiv. 119 (Rev. Dr. BAIRD); *HUNT'S Merchant's Magazine*, xvi. 138.

Notaries Public. The origin of that class of public officers now called notaries public may be traced as far back as the ancient Roman Republic, although their functions now are different. We find, at the time of the Republic, *scribæ* and *librarii*, who were public secretaries. The private secretaries were called *exceptores*, and also *notarii*, if they were short-hand writers, which service was frequently performed by slaves. The public secretaries were those whom the authorities of state appointed and paid to assist them in their duties of office, and they appear to have corresponded to our present actuaries and secretaries. It does not appear, however, that legal documents were drawn up by public functionaries resembling our notaries public. During the Empire the public secretaries increased both in number and importance. They appear to have been secretaries working in the cabinet of the Emperor, in distinct departments, and they had an overseer, called *magister scribarum*. Distinct, however, from these persons were those who may be compared to our present notaries public, and who were called *tabularii*. It seems that what even at the present day may be seen in Italian cities was already customary in the early days of ancient Rome; namely, that in the public market-place, or forum, scribes offered their services to persons who wanted to have letters written or documents drawn up.

This class of persons were called *tabelliones forenses*, or *persone publicæ*. They occupied themselves with drawing up legal instruments and documents, and other writings (*libelli*) or statements, to be presented to the courts of law, or other authorities of state. It appears, from a "constitution" of Diocletian, that a tariff of fees was established for them. The number of *tabelliones* constantly increased. They then formed them-

selves into a guild or corporation (*schola*), under a presiding officer called *principarius*. The state authorities began, more and more, to exercise surveillance over them, which even went so far that the magistrates determined whether a person should be admitted into, or an unworthy person be removed from, this guild of *tabelliones*. These persons prepared all kinds of legal documents and papers, but they still carried on their business in the public market-place. It was soon found necessary, for judicial purposes, to define by law what should be the requisites of such notarial acts and writings to make them legal evidence. It had become a usage, in important matters, to have witnesses also attest the papers drawn up by these public scribes or *tabelliones*, and it was finally required by law that three witnesses should attest a document, in case the principals could write, and five witnesses if the parties could not write. It was, moreover, required that the notary (*tabellio*) should be present in person at the drawing up of the document, and also affix his signature and the date of execution.

During the Empire another class of officers, called *tabularii*, came up in the cities. Their functions resembled somewhat our archivaries and auditors. They also made out certain documents, and these bore sometimes the names both of a *tabellio* and a *tabularius*; but at a later period both names are used as synonymous. Under the Frankish kings Roman institutions were limited. In the imperial bureaux the emperors needed and employed persons for drawing up documents and counteracting them. These officers were called *referendarii*, *cancellarii*, and *notarii*. The chief of these officers was called *archicancellarius* or *summus notarius*, but at a later period *archicancellarius* as a more honorable title. The Frankish kings, as early as the year 803, appointed these officers, and issued laws to prevent the abuse of their power. It became later the sole prerogative of the kings to appoint these notaries, but by degrees the Popes of Rome also assumed the same right; and we find in documents notaries, such as who were appointed by princes and bishops, and even by cloisters. The legal powers of notaries during the Middle Ages, and their condition as a distinct class of officers, are distinctly seen in the Italian cities. They acted either by authority of the Emperor or that of the Pope, and were engaged for drawing all the various legal documents, and especially last wills and testaments, which were received in all the courts of law as full proof. They were formed into a guild, called *collegium*, and had their own prefects, called *consules*. A candidate for admission into this college had to undergo an examination. Minute and strict rules for the drawing up of instruments, and their attestation, were prescribed. The study of notarial functions was reduced to rules, and notarial schools were established in many cities.

Notaries came to be regarded at an early period as a kind of judges (*judex chartularius*), and a practice grew up among them of inserting in bonds, or other documents of indebtedness, a power for the creditor of taking out execution, by application to the court, in case of non-fulfilment of the contract, which laid the foundation of the so-called "executory process," which prevails still in the Civil Law countries, and which corresponds somewhat to the warrant of attorney to confess judgment in the English law. We shall see that the foreign law on bills of exchange on the Continent of Europe gives this right of "executory process" to the creditor of these mercantile instruments, and thus strengthens the security of the creditor.

France.—In France the notaries have always played an important part in her judicial institutions, as they do so still. The king regarded it as his prerogative to appoint them, but the popes also arrogated this power, and the lords of provinces (*seigneurs*) assumed it likewise. They were regarded then as *judge ordinaire*, and inserted in their documents this executory power or

summa present laid by any roy year of appoint contract the will uments, safe-keep them fo menis fo one nota ceive fu catory of the copies a partic The law of the notarial; contract choice of of instr appoint judicial or in ma tributary, ing up a glish law be removed fiscal post the copy disputes lating at property The la that all registers high. Italy.—

summary execution (*exécution parée*). The basis of the present rights and duties of notaries in France was laid by the law of 1791, which recognized no longer any royal notaries, but only *notaries public*, appointed by the general government. The law of the eleventh year of the Republic recognized them as public officers, appointed for the purpose of drawing up all papers and contracts which, either according to express laws or the will of parties, are to have the effect of public documents, and of fixing the dates thereof, of holding in safe-keeping these acts, and of making out copies of them for the use of the parties concerned. All documents made out in the presence of two notaries, or of one notary and two witnesses, and attested by them, receive full credence in all the courts of law, and are executory throughout the land. The original (*minute*) of the act remains in the hands of the notary, and copies are allowed to be given only to the interested parties, unless specially empowered by the courts. The law points out many cases in which the presence of a notary and his attestation of instruments are essential; e. g., with testaments, donations, marriage contracts, protests, etc. In most cases it is left to the choice of parties to employ a notary in the making out of instruments and documents. But the courts often appoint them, to undertake the part of mediator in some judicial proceedings; for instance, in cases of divorce, or in making out inventories, or in dividing and distributing property and estates, or in taking and making up accounts, like the Masters in Chancery in English law. The notaries are appointed for life, and can be removed only by a judicial decision. By their official position they become the advisers in families and the *confidants* of them. They become the mediators in disputes between the parties, and particularly in regulating and settling estates, and in the distribution of property.

The law of the seventh year of the Republic requires that all acts and documents made out by notaries be registered within ten days, the fees for which are very high. Hence it often happens that the notary must advance the money for the registration, and this obliges him to have sums of money always at his disposal. Thus notaries have gradually come to deal in money affairs in general, by loaning and investing money, and procuring money for borrowers. Hence it is that persons of property intrust their money and property to the hands of notaries, as being the fittest persons to invest it safely and advantageously. The great influence which they thereby must acquire in families; and in all classes of society is manifest; and this great power could not but lead to great abuses. An ordinance of 1843 prohibited notaries, under heavy penalties, from entering into stock speculations, from acting as money-brokers, from investing money intrusted to them in their own names, etc. The requisites for becoming a notary in France are, that the candidate be a French citizen, twenty-five years of age, and that he has served as clerk with a notary for six years. But no man without property can expect to obtain a place as notary, because he is obliged to buy, often for an enormous price (which in Paris often amounts to from 200,000 to 300,000 francs, in smaller towns to 100,000 francs, and in small communes to 10,000 francs), from a notary who is about to retire, or from the heirs of a deceased notary, a study-room or office (*étude*), with the acts and documents belonging to it; for without such an office the mere appointment of notary is of little value. There are also established by law in France notarial chambers, which consist of a number of deputies, chosen by the notaries, who regulate the discipline among them, decide on the admission of candidates, adjust disputes which may arise among themselves, and hear and decide on the complaints of third persons against notaries, and the punishments of delinquent notaries.

Italy.—In Italy the French system of notaries has

been followed in its main features. In Germany, however, the notaries occupy but a subordinate position in most states, and it has been now almost generally established by law that only persons who have attained law for several years can be appointed as notaries.

England.—In England, notaries were known as public officers before the Norman Conquest, and at a very early period they were employed to attest and authenticate instruments of moment and solemnity. But whatever their duties and functions may have been in former times, at present they are described to be, by Richard Brooke, in his treatise on the office of a notary public of England, as follows: "In England a notary is a public officer of the civil and canon law, who derives his faculty or authority to practice from the Court of Faculties of the Archbishop of Canterbury, in London, the chief officer of which is the Master of the Faculties, to whom applications are made for the admission, or removal under any special circumstances, of notaries. In the Institutes of the Laws of England the Court of Faculties is stated to be 'a court, although it holdeth no plea of controversy (like the Court of Audience next before). It belongeth to the archbishop, and his officer is called *Magister ad Facultates*.'" The functions and powers of a notary in England are, to draw and prepare deeds relating to real and personal property, to note and protest bills of exchange, to prepare acts of honor, to authenticate and certify examined copies of documents, to prepare and attest instruments going abroad, to receive the affidavits or declarations of mariners and masters of ships, and to draw up their protests, and to solemnize all other notarial acts. "The expression *notarial act*," says Mr. Brooke, "is one which has a technical meaning, and it seems generally considered to signify the act of authenticating or certifying some document or circumstance by a written instrument, under the signature and official seal of a notary, or of authenticating or certifying as a notary some fact or circumstance by a written instrument, under his signature only." The English notaries have always considered themselves entitled to administer oaths, affidavits, and affirmations, as within the powers and functions of a notary; and the act of 5th and 6th William IV. has placed it beyond dispute. The requisitions for admission to the Faculty of Notaries in England are, an apprenticeship or clerkship of five years with a notary, a certificate from two notaries certifying to the candidate's skill and probity, and that he is a proper person to become a notary. Upon due proof of these facts, the Master of Faculties will admit him upon his taking the prescribed oaths, which are the oath of allegiance, the oath of supremacy, the oath of due service under the articles of clerkship and for the faithful exercise of the office of notary. A notary is liable to be struck off the Roll of Faculties for any malpractice or misconduct in his office, on a complaint made to the Master of the Faculties, and supported by affidavit or other proof.

United States.—In the United States the duties and functions of notaries resemble those of the same officers in England. They are appointed by the respective governors of the States for a limited number of years, or during good behavior, and derive their powers by the statute laws of the States; and in cases where these laws do not specify their powers—as, for instance, in Massachusetts—it must be presumed that all the powers which, by general usage, the custom of merchants, and law of nations are generally exercised by these officers, are also vested in them. We may state their general and customary functions to be, to demand acceptance and payment of foreign and inland bills of exchange and promissory notes, and to protest the same for non-acceptance and non-payment; to note and draw up ship protests, and all other protests which are customary according to the usage of merchants; and to exercise such other powers and duties as by the law of nations, and according to commercial usage, or

by the laws of any other state, government, or country, may be performed by notaries public. But although notaries public are generally considered as accredited officers in other countries, and affidavits sworn before and instruments authenticated by them are received in evidence in foreign courts, it is required by foreign courts that the consuls of the respective foreign states in which the document is to be used certify to the fact that the person whose signature and seal are affixed is a notary public duly appointed. This is, however, not necessary in a protest for the non-acceptance or non-payment of a bill of exchange. The laws of the different States of the Union, in some instances, give some peculiar powers to their notaries, and hence the laws of each State must be consulted in regard to them. The principal functions of an American notary are, to protest bills of exchange and promissory notes on their being dishonored, and, as a part of this function, to present and demand payment of these mercantile instruments. Although the notaries with us generally give notice of the dishonor of bills and notes to antecedent parties, it is not their duty to do so, unless made so by statute, or they undertake so to do as a part of their duty; and then they are liable for any negligence in the discharge of this duty.—See *Manual for Notaries*, 8vo, pp. 220, New York, 1857.

Notes, Promissory.

Nova Scotia (Fr. *Acadie*), a British province, forming a peninsula, connected with the main land by an isthmus only 8 miles broad, having the Bay of Fundy on the one side, and Northumberland Strait on the other. It lies, including Cape Breton Island, between lat. 43° 25' and 46° N., and long. 59° 45' and 66° 30' W., and is bounded north by Northumberland Strait, which separates it from Prince Edward Island, northeast by the Gut of Cansau, flowing between it and the island of Cape Breton (which forms a part of the government of Nova Scotia), south and southeast by the Atlantic Ocean, west by the Bay of Fundy, and northwest by New Brunswick. Area, 18,746 square miles.

Its southeast coast is remarkable for the number and capacity of its harbors, there being no fewer than twelve ports capable of receiving ships of the line, and fourteen of sufficient depth for merchantmen, between Halifax and Cape Cansau, a distance of not more than 110 miles. The surface of Nova Scotia seldom rises to a height exceeding 600 feet above the level of the sea. A ridge of high land extends through the peninsula in a direction east to west, and, with less prominent hills and undulations, gives a pleasing variety to the scenery. The principal rivers of the province are the Annapolis and Shubenacadie; the latter rises in Grand Lake, Halifax County, and, after a rapid and circuitous course of over 50 miles, enters Cobequid Bay; by means of a canal this river forms a navigable communication from Halifax harbor to the Bay of Fundy. It is navigable for some distance. The rise and fall of the tide at the mouth is about 50 feet. The Annapolis, after a course of 75 miles, in which it receives the waters of Moose and Bear rivers, enters Annapolis Bay. It is navigable for large vessels 20 miles above Annapolis. At Pictou, the East, West, and Middle rivers, all three navigable for large vessels, enter the harbor. The Avon receives the waters of the St. Croix, Kennebec, and several others, and empties itself into the Bay of Mines; it is navigable to Windsor. The La Have, Mersey, and Medway; the Shelburne (which forms the fine harbor of that name); the Clyde, one of the most beautiful streams of Nova Scotia; the Tusket and its numerous tributaries; the St. Mary, which, at its embouchure, forms the fine harbor of St. Mary; the Maccou, Nappau, and Gasperau; the Musquedobit, Sale, and Jordan; these form but a few of numerous streams of Nova Scotia. The tide rises with astonishing rapidity in the Bay of Mines to the height of 75 feet, while on the south shore and in the Gulf of St. Lawrence it does not rise more than 6 feet. There

are but few large lakes; the largest is Lake Rosignol, about 30 miles in length; Lake George is another sheet of water of considerable size, and the entire peninsula is dotted over with innumerable small lakes. The mica and minerals of Nova Scotia, though but imperfectly explored, are known to be valuable. Granite, trap, and clay-slate rocks predominate. The most abundant variety is the gray granite, which prevails along the shore, and is well adapted for mill-stones. Clay slate, of fine quality, is of extensive formation in the eastern section of the province, and gray-wacke slate along both shores of Chedabucto Bay. Several extensive and beautiful grottoes are to be found on different parts of the coast; and grindstones of superior quality are obtained from a stratum of sandstone, found between the coal and limestone. Coal, and iron in combination with it, abounds in many places. Copper ore also exists, but the attempts to work it have been hitherto unsuccessful; gypsum is plentiful, and furnishes an active and profitable trade. The soils of Nova Scotia are various; along the south shore the granite forms the basis, extending in many places 20 miles into the interior. This region is the least fertile, but there are elsewhere extensive alluvial tracts producing the most abundant crops. Many fine fertile districts, also, are met with on the north coast, along the banks of rivers and the heads of bays. The climate of Nova Scotia is affected by its almost insular position, and is characterized by a remarkable salubrity. The springs are tedious, but the summer heats being for a brief season excessive, vegetation is singularly rapid, and the autumn is delightful. The thermometer ranges from 18° to 70°. It is estimated that about 7,000,000 acres are still covered with primeval forests. There were in this province in 1851, 40,012 acres of diked land, and 799,310 acres of other improved land.

Live Stock.—Horses, 28,789; neat cattle, 156,857; milch cows, 86,856; sheep, 282,180; swine, 51,633.

Agricultural Products, &c.—Wheat, 297,157 bushels produced; rye, 61,488; Indian corn, 37,475; oats, 1,384,437; peas and beans, 21,638; barley, 196,067; buckwheat, 170,310; potatoes, 1,986,789; pounds of butter made, 3,613,890; of cheese, 652,969; of maple sugar, 110,441; hay, 287,837 tons made; grass seeds, 3686 bushels; and were made 89,976 gallons of malt and distilled liquors. Nova Scotia, however, does not yet supply her population with bread, even in good seasons; large importations of fine flour being yearly made from the United States. The apple orchards of the western counties are very productive. Apples and cider are annually exported, and the domestic supply is cheap and abundant. Cattle and sheep are raised in considerable numbers, and are exported both to New Brunswick and Newfoundland; but the breeds are inferior, and little attention is paid to their improvement. The cod and haddock fisheries are actively prosecuted all along the south coast. Mackerel and herrings are also taken in great quantities; but the salmon fishing has greatly fallen off, from the erection of grist and saw mills on the streams. The fisheries employed, in 1851, 812 vessels, with an aggregate of 43,333 tons, manned by 3681 men, and 5161 boats, manned by 6113 men; the catch amounted to 1669 barrels of salmon, 3536 of shad, 100,017 of mackerel, 53,200 of herrings, and 542 barrels of alewives; total value of fisheries, £217,220; and there were manufactured 189,250 barrels of fish-oil, valued at £17,754. Several attempts have been made to prosecute the whale and seal fisheries, but hitherto with no great success. The manufactures of Nova Scotia are yet but very limited. Coarse cloths, called "homespuns," are made, and are generally worn by the farmers, fishermen, &c. There were in this province, in 1851, 81 woolen factories, employing 119 persons, and 11,096 hand-looms, producing 119,698 yards of filled cloth, 790,101 yards not filled, and 219,352 yards dannel; total value, £36,178; 9 iron foundries, employing 138 persons, making castings, &c.,

timated at 470 miles, and average breadth at 56 miles. It consists of two islands, separated by the channel Matotshkin-snar. Surface on the western side rises generally to 2000 feet, and in some places to from 3200 to 3500 feet above the sea; but the eastern shores are comparatively low and barren. Black clay-slate and limestone are the principal constituent rocks, as in the Ural chain, of which Nova Zembla may be considered an insular continuation. Its coasts are frequented by walrus hunters in summer, but nowhere permanently inhabited. Subterranean stone labyrinths of great antiquity have been discovered here.

Nut, or Hazel-nut (Germ. *Haselnuss*; Fr. *Noisettes*, *Avellanes*; It. *Naccinole*, *Avellani*; Sp. *Avellanas*; Port. *Avellãs*; Lat. *Avellana*), the fruit of different species of *Coryli*, or hazels. The kernels have a mild, farinaceous, oily taste, agreeable to most palates. A kind of chocolate has been prepared from them; and they have sometimes been made into bread. The expressed oil of hazel-nuts is little inferior to that of almonds. Besides those raised at home, we import nuts from different parts of France, Portugal, and Spain, but principally from the latter. The Spanish nuts in the highest estimation, though sold under the name of Barcelona nuts, are not really shipped at that city, but at Tarragona, a little more to the south. Mr. Inglis says that the annual average export of nuts from Tarragona is from 25,000 to 30,000 bags, of four to the ton.

Nuts (Ground) (*Arachis hypogæa*), known in French commerce as "*arachides*," in America as peanuts, and in Africa as *Mandubim*, the fruit of a papilionaceous plant, rising to the height of about 15 inches, being very like the field pea, with yellow flowers. The branches, after flowering, bend down till they touch the ground, into which they work themselves, and upon them grow the pods that contain the nuts. When the nuts are ripe the plant dies. It is then pulled up, and the nuts which adhere to the twigs are collected. The pods, which are of an elongated figure, about three quarters of an inch in length, and half an inch in circumference, and brittle, usually contain two nuts, but sometimes only one, and very rarely three. They are elliptical at one end and flattened at the other. Ground-nuts are grown in light, sandy soils in most tropical countries. They have been used as food from time immemorial in Africa, India, Brazil, and other parts both of South and North America. The best are raised on the banks of the River Gambia, where they are extensively grown in large fields, the ground being prepared for their reception by the natives after the rude fashion of the country. The plant is very prolific; it is also said to be highly exhaustive of the soil, though this is perhaps questionable. Ground-nuts yield large quantities of oil; and within the last 20 years they have begun to be grown in Africa as an article of commerce, and are now largely exported for crushing. A mill for expressing oil from them was constructed in London in 1835. But the French Government having a few years after imposed high duties on most descriptions of oil seeds, the crushers of Marseilles and other towns endeavored to find out seeds not included in the tariff, or less heavily taxed than the others. They were thus led to import *arachides* or ground-nuts, which they found to answer extremely well. France has, in consequence, become the great market for this peculiar product. The exports from the Gambia, which in 1835 did not exceed 47 tons, had increased in 1851 to not less than about 12,000 tons. Of this quantity about 800 tons went to the United States (where they are eaten as dessert, roasted, as are chestnuts elsewhere), 700 tons to England, and the rest to France, principally to Marseilles. The total imports of *arachides* into France in 1851 amounted, according to the official returns, to 16,472,562 kilogrammes, or 16,180 tons.

Nuts are also exported from the Rio Grande, the

Rio Nunez, and from Sierra Leone, and the adjoining rivers. And though there are no accounts of the exact quantities sent from each, it is believed that their aggregate amount is fully equal to the exports from the Gambia. Within the last three or four years considerable quantities have been shipped from the Senegal River. The oil expressed from the nuts differs in quality and price according to the care with which it is refined. That made in London, which is equal to fine olive oil, sold, in 1863, at from £60 to £62 a ton. In Franco the oil is principally used in the manufacture of soap; and being inferior to the former, is only worth from £45 to £48 a ton. Besides being used for the like purposes as other oil in food, in the woolen manufacture, and in lamps, the oil of ground-nuts is said to be especially well fitted for lubricating heavy machinery, including the locomotive engines on railways. The Belgians use it for this latter purpose in preference to all other oils. Ground-nuts are worth at present (September, 1853) from 880 francs to 900 francs per 1000 kilogrammes (a ton) in Marseilles; £13 15s. a ton in London; and from £9 to £10 a ton delivered to a French ship in the Gambia. Sierra Leone nuts bring from £1 to £2 less than those from the Gambia.

Nutmeg (Ger. *Muskatennüsse*; Du. *Muskait*; Fr. *Muscades*, *Noix muscades*; It. *Nocce muscada*; Sp. *Moscada*; Arab. *Jowaldirib*; Sans. *Jittiphala*; Malay, *Buah-pala*), the fruit of the genuine nutmeg-tree (*Myristica Moschata*), a native of the Moluccas, but which has been transplanted to Sumatra, Penang, &c. An inferior and long-shaped nutmeg is common in Borneo; but the fruit nowhere attains to the same perfection as in the Moluccas. Of the several varieties of the tree, that denominated the Queen Nutmeg, which bears a small, round fruit, is the best. The kernel, or proper nutmeg, is of a roundish oval form, marked on the outside with many vermicular furrows, within of a fleshy, farinaceous substance, variegated whitish and bay. Nutmegs are frequently punctured and boiled, in order to obtain the essential oil, the orifice being afterward closed; but the fraud is easily detected by the lightness of the nutmeg.—*Thomson's Dispensary*; *ALEX. LEWIS'S Materia Indica*. Nutmegs should be chosen large, round, heavy, and firm, of a lightish gray color on the outside, and the inside beautifully marbled, of a strong fragrant smell, warm aromatic taste, and a flat, oily body. They are very subject to be worm-eaten. The best manner of packing them is in dry chunam. The oblong kind, and the smaller ones, should be rejected. 15 cwt. are allowed to a ton.—*MILLINER'S Orient. Com.* The dried produce of a nutmeg-tree consists of nutmeg, mace (which see), and shell. Supposing the whole produce to be divided into 100 parts, there are 13½ of mace, 33½ of shell, and 53½ of nutmeg. In the ancient commerce, and down to the establishment of the Dutch monopoly, nutmegs were always sold and exported in the shell. The natives, whenever the commerce is left to their management, continue the practice, which is strongly recommended by Mr. Crawford.—*Eastern Archipelago*, vol. iii. p. 396.

The jealous policy of the Dutch has reduced the trade in nutmegs to a mere trifle, compared to what it would otherwise have been. They have, in so far at least as it was possible, exerted themselves to exterminate the nutmeg plants every where except in Banda. The aboriginal inhabitants of this island have been expatriated, and the land parcelled among settlers from Holland, under the name of *park-keepers*. These persons have about 2000 slaves, who cultivate and prepare the nutmegs. The prices paid by the cultivator are all fixed by Government; and it deserves to be mentioned, as affording one of the most striking illustrations of the ruinous effects of monopoly, that the fixed price which the Government is now obliged to pay for nutmegs is FIVE times greater than the price at which they bought them when the trade was free! We can not

conceive as that scandalous possession of the Bank and 160, dans l'In that the nutmeg some of have all useful applicable golden. of bringing restoration the nutmegs factitious iii. p. 41. STATEMENT CONTINUED

conceive how so enlightened and liberal a Government as that of Holland should continue to tolerate such scandalous abuses, more especially since it has established a free system in Amboyna, Java, and its other possessions. M. Tamminck estimates the produce of the Banda Islands at about 600,000 pounds of nutmegs, and 100,000 pounds of mace.—*Possessions Neerlandaises dans l'Inde Archipelagique*, iii. 283. During the period that the English had possession of the Spice Islands, nutmeg plants were carried to Penang, Bonocoolen, and some of the West India Islands. In the latter they have altogether failed, at least as far as respects any useful purpose; but very good nutmegs, and in considerable quantities, are now raised at Penang and Bonocoolen. Mr. Crawford, however, alleges that the cost of bringing them to market is there so high, that the restoration of a free culture in the native country of the nutmeg would instantly destroy this unstable and factitious branch of industry.—*Eastern Archipelago*, vol. iii. p. 400. See *American Journal of Science*, xii. 322.

STATEMENT SHOWING THE IMPORTS OF NUTMEGS INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1856.

Whence imported.	Pounds.	Value.
Hamburg	1,275	\$851

Nutria, or **Neutria**, the commercial names for the skins of *Mypotamus Donarivensis* (Commerçon), the *Coypon* of Molina, and the *Quiyoa* of D'Azara. In France, the skins were, and perhaps still are, sold under the name of *raccoon*; but in England they are imported as *nutria* skins—deriving their appellation most probably from some supposed similarity of the animal which produces them, in appearance and habits, to the otter, the Spanish name for which is *nutria*. Indeed, Molina speaks of the *coypou* as a species of water rat, of the size and color of the otter. Nutria fur is largely used in the hat manufacture, and has become within the last 15 or 20 years an article of very considerable commercial importance. The imports

fluctuate considerably. In 1841 they amounted to 1,125,212 skins; but in some years they are much less; and in 1840 amounted to only 242,733. Those entered for home consumption pay a duty of 1s. per 100 skins. They are principally brought from the Rio de la Plata.—See FUR TRADE.

The *coypou* or *quiyoa* is a native of South America, very common in the provinces of Chilli, Buenos Ayres, and Tucuman, but more rare in Paraguay. In size it is less than the beaver which it resembles in many points. The head is large and depressed, the ears small and rounded, the neck stout and short, the muzzle sharper than that of the beaver, and the whiskers very long and stiff. There are, as in the beaver, two incisor teeth, and eighteen molar, above and below—twenty teeth in all. The limbs are short. The fore feet have each five fingers not webbed, the thumb being very small: the hind feet have the same number of toes; the great toe and three next toes being joined by a web which extends to their ends, and the little toe being free, but edged with a membrane on its inner side. The nails are compressed, long, crooked, and sharp. The tail, unlike that of the beaver, is long, round, and hairy; but the hairs are not numerous, and permit the scaly texture of the skin in this part to be seen. The back is of a brownish red, which becomes redder on the flanks; the belly is of a dirty red. The edges of the lips and extremity of the muzzle are white. Like the beaver, the *coypou* is furnished with two kinds of fur; viz., the long, ruddy hair which gives the tone of color, and the brownish ash-colored fur at its base, which, like the down of the beaver, is of much importance in hat-making, and the cause of the animal's commercial value. The *coypou* is easily domesticated, and its manners in captivity are very mild.

Nux Vomica (Fr. *Noix Vomique*; Hind. *Kaachla*), the fruit of a species of *Stychnos*, growing in various places in the East Indies. The fruit is about the size of an orange, covered with a smooth, crustaceous, yellow bark, and filled with a fleshy pulp, in which are imbedded several orbicular, flattened seeds, about three quarters of an inch in diameter. Nux vomica is inodorous, and has a very bitter, acid taste, which remains long on the palate. It is known as a very virulent poison. A suspicion has, however, been entertained that it has been used in porter breweries; but its introduction into them is prohibited under heavy penalties.—Thomson's *Dispensatory*, etc.

O.

Oak (Ger. *Eiche*; Du. *Eik*; Dan. *Feg*; Swed. *Ek*; Fr. *Chêne*; It. *Quercia*; Sp. *Roble*, *Corballo*; Port. *Roble*, *Carbalho*; Russ. *Dub*; Pol. *Dab*; Lat. *Quercus*; Arab. *Baalut*). There are several varieties of this valuable tree; but the common English oak (*Quercus robur*) claims precedence of every other. This knotty oak of England, the "unwedgeable and gnarled oak," as Shakespeare called it, when cut down at a proper age (from 50 to 70 years), is the best timber known. Some timber is harder, some more difficult to rend, and some less capable of being broken across, but none contains all the three qualities in so great and equal proportions; and thus, for at once supporting a weight, resisting a strain, and not splintering by a cannon shot, the timber of the oak is superior to every other.

A fine oak is one of the most picturesque of trees; it conveys to the mind associations of great strength, and of all but endless duration. It stands up against the blast, and does not, like other trees, a twisted form from the action of the winds. Except the Cedar of Lebanon, no tree is so remarkable for the stoutness of its limbs; they do not exactly spring from the trunk, but divide from it; and thus it is sometimes difficult to know which is stem and which is branch. The twisted branches of the oak, too, add greatly to its

beauty; and the horizontal direction of its boughs, spreading over a large surface, completes the idea of its sovereignty over all the trees of the forest. Even a decayed oak, such as that described by Spenser:

"..... dry and dead,
Still clad with reliques of its trophies old,
Lifting to heaven its aged, hoary head,
Whose foot on earth has got but feeble hold,"

is strikingly beautiful. To such an oak Lucan compared Pompey in his decline:

"Qualis frugifero quereoa sublimis in agro
Exuvius veteres populi, sacraetate gestans
Dona decem; nec jam valida radicebus herens,
Pondere fixa suo est; nudaque per æera ramos
Effundens, trunco, non frondibus, efficit umbram.
At quamvis primo nutet castra sub Euro,
Tot circum silve firmo se robore tollant,
Sola tamen collitur."—(Lib. i. l. 136.)

The oak is raised from acorns, sown either where the oak is to stand, or in a nursery, whence the young trees are transplanted. The color of oak wood is a fine brown, and is familiar to every one; it is of different shades; that inclined to red is the most inferior. The larger transverse septa are in general very distinct, producing beautiful flowers when cut obliquely. Where

the septa are small, and not very distinct, the wood is much the strongest. The texture is alternately compact and porous; the compact part of the annual ring being of the darkest color, and in irregular dots surrounded by open pores, producing beautiful dark veins in some kinds, particularly pollard oaks. Oak timber has a particular smell, and the taste is slightly astringent. It contains gallic acid, and is blackened by contact with iron when it is damp. The young wood of English oak is very tough, often cross-grained, and difficult to work. Foreign wood, and that of old trees, is more brittle and workable. Oak warps and twists much in drying, and, in seasoning, shrinks about 1-32d of its width. Oak of a good quality is more durable than any other wood that attains a like size. Vitruvius says it is of eternal duration when driven into the earth: it is extremely durable in water; and in a dry state it has been known to last nearly 1000 years. The more compact it is, and the smaller the pores are, the longer it will last.

Remarkable Oaks.—The oldest oak in England stands in the most ancient park, belonging to the Duke of Portland. It is called the Parliament Oak, for it is said that Edward I. held a Parliament under its branches. It is supposed to be 1300 years old. Another remarkable oak is at Welbeck Abbey, in Nottinghamshire, which is famous for its oaks. This tree is called "The Duke's Walking-stick." It is 112 feet high. Three others of these noble trees claim attention for their extraordinary size and longevity, of which the Greendale Oak is the largest. Through its trunk a coach road is cut, and its branches cover a space of 700 square yards. The Two Porters, standing near one of the park entrances, are each 100 feet high; the third is called the Seven Sisters, from its having seven stems rising 90 feet in height from the trunk. The Cathorpe Oak, in Yorkshire, is noted as being the largest oak in England. Its girth is 78 feet.—*The Half Holiday.*

The supply of oak timber in this country is plentiful, but not inexhaustible, and care should be taken to preserve the forests, and, by a judicious use of the timber, avoid the great waste that has been going on; for upon a supply of this lumber depends, in a measure, our success as a maritime nation. Though some prejudices have existed in Europe against the quality of our oak timber, it is now conceded by all to be unsurpassed. By means of the Mississippi River and its tributaries we are enabled to use with advantage the oak forest on the western slope of the Appalachians, and even in the forest of Michigan, and the West will soon be a rival to the East in ship-building. Kentucky especially abounds in the finest oak forests, as yet unmolested, but destined to add greatly to our wealth.—*See SHIP AND SHIP-BUILDING.*

Gall-nut Oak (*Quercus infectoria*), a native of Persia, Asia Minor, Arabia, Egypt, Morocco, and Algeria, in its natural habitat, is an evergreen shrub, with a very crooked stem, and seldom attains six feet in height. From the circumstance of its growing near Paris, where it bears the winter quite well in the open air, though losing its leaves in the autumn, it doubtless would be adapted to the climate of our Middle and Southern States. On this shrub is found the well-known "gall-nuts" of commerce, which are extensively used in the manufacture of writing-ink and in dyeing. These excrescences are the product of the gall-fly (*Cynips sriptorum*), a small insect of a dark-brown color, which may often be found inclosed in the galls sold in the shops of the druggists, collected before the fly had made its escape. There are two kinds of gall-nuts known in commerce; those which still contain the insect, and are known in the trade under the names of "Black," "Blue," or "Green" galls, and those which are collected; and those from which the insect has escaped, and which are called "White" galls. The latter con-

tain not more than two-thirds of the astringent qualities of the former, and are of a pale-brown or whitish color, being not so heavy and less compact.

The *Agilops*, or *Valonia Oak* (*Quercus agilops*), is indigenous to the islands of the Archipelago, and, indeed, to all Greece, and often grows to a height of fifty or sixty feet. It is perfectly hardy in the climate of England, from which it may be inferred that it also would grow in favorable localities in our Middle and Southern States. The cups and acorns of this tree are annually conveyed to Europe, where they are in great demand for tanning, and are believed to contain more tannin than any other vegetable, in proportion to their bulk. These acorns, which are commonly called "Valonia," form a very considerable article of export of the Morea and the Levant, being worth in England from \$60 to \$70 a ton. The more substance there is in the husks, or cups, of these acorns the better. They are of a bright-drab color, which they preserve as long as they are kept dry; but dampness injures them, as they turn black, and become impured, both in quality and strength. A kind of gall is found on this tree somewhat similar to that on the *Quercus infectoria*, and which is employed for the same purposes. These galls are rugose, of an angular form, and are either the fruit itself, distorted by the puncture of the insect (*Cynips quercus calycis*), or merely the scaly cup which is enlarged into a gall.

Oakum, the substance into which old ropes are reduced when they are untwisted, loosened, and drawn asunder. It is principally used in calking the seams, tree-nails, and bends of a ship, for stopping or preventing leaks.

Oar, a long piece of timber, long at one end, and round or square at the other, used to make a vessel advance upon the water. The flat part, which is dipped into the water, is called the *blade*, and that which is within the board is termed the *loom*, whose extremity, being small enough to be grasped by the rowers, is called the *handle*. To push the boat or vessel forward by means of this instrument, the rowers turn their backs forward, and, dipping the blade of the oar in the water, pull the handle forward, so that the blade, at the same time, may move aft in the water. But, since the blade can not be so moved without striking the water, this impulsion is the same as if the water were to strike the blade from the stern toward the head; the vessel is therefore necessarily moved according to the direction. Hence it follows that it will advance with the greater rapidity by as much as the oar strikes the water more forcibly; consequently, an oar acts upon the side of a boat or vessel like a lever of the second class, whose fulcrum is the station upon which the oar rests on the boat's gunwale.

Oats (Ger. *Hafer*; Du. *Haver*; Dan. *Haere*; Swed. *Hafre*; Fr. *Avoine*; It. *Veni*, *Avena*; Sp. *Avena*; Port. *Avea*; Russ. *Oves*; Pol. *o-wo*), a species of grain, the *Avena sativa* of botanists. There are innumerable varieties of this grain. It is the hardiest of all the grasses, growing luxuriantly in cold northern climates, and in coarse mountainous districts, where wheat, barley, or rye can be advantageously cultivated. It thrives best, and is, indeed, chiefly raised, in northern latitudes; being but little known in the south of Europe. In Scotland it forms a large part of the food of the people, and is far more generally cultivated than any other species of grain. There are four leading varieties of this grain cultivated; viz., white tuck, gray, and brown or red oats. The sub-varieties of the white are numerous. That denominated the potato oat is at present almost the only one raised on land in a good state of cultivation in the north of England and the south of Scotland, and usually brings a higher price in the London market than any other variety. It was accidentally discovered growing in a field of potatoes in Cumberland in 1788; and from the produce of that single stalk has been obtained the stock

now in general cultivation. Black and gray oats are little cultivated, except in some places in the north of Scotland. The red oat is chiefly confined to Cheshire, Derbyshire, and Staffordshire. A species of naked oats, provincially called *pillar*, is raised in Cornwall.—LONDON'S *Encyclopedia of Agriculture*; Brown's *Rural Economy*.

The oat, when considered in connection with the artificial grasses and the nourishment and improvement it affords to live stock, may be regarded as one of the most important crops we produce. Its history is highly interesting, from the circumstance that, while in many portions of Europe, when ground into meal, it forms an important aliment for man, one sort at least has been cultivated from the days of Pliny on account of its superior fitness as an article of diet for the sick. The country of its origin is somewhat uncertain, though the most common variety is said to be indigenous to the island of Juan Fernandez. Another oat, resembling the cultivated variety, is also found growing wild in California. This plant was introduced into the North American colonies soon after their settlement by the English. It was sown by Gosnold, on the Elizabeth Islands, in 1602; cultivated in Newfoundland in 1622, and in Virginia, by Berkeley, prior to 1648.

The oat is a hardy grain, and is sown to climates too hot and too cold either for wheat or rye. Indeed, its flexibility is so great, that it is cultivated with success in Bengal, as low as latitude 25 degrees north, but refuses to yield profitable crops as we approach the equator. It flourishes remarkably well when due regard is paid to the selection of varieties, throughout the inhabited parts of Europe, the northern and central portions of Asia, Australia, Southern and Northern Africa, the cultivated regions of nearly all North America, and a large portion of South America.

In this country the growth of the oat is confined principally to the Middle, Western, and Northern States. The varieties cultivated are the common white, the black, the gray, the imperial, the Hopetown, the Polish, the Egyptian, and the potato oat. The yield of the common varieties varies from forty to ninety bushels and upward per acre, weighing from twenty-five to fifty pounds to the bushel. The Egyptian oat is cultivated south of Tennessee, which, after being sown in autumn and fed off by stock in winter and spring, yields from ten to twenty bushels per acre. In the manufacture of malt and spirituous liquors oats enter but lightly, and their consumption for this purpose does not exceed sixty thousand bushels annually in the United States. It will be seen by the following exhibit that New York, Pennsylvania, Ohio, Virginia, and Illinois are the largest producers of oats, and in the order in which they are here placed.

		Total bushels.....	146,678,890

The oat, like rye, never has entered our foreign commerce, as the domestic consumption has always been nearly equal to the quantity produced. The annual average exports, for several years preceding

1817, were seventy thousand bushels. By the Census returns of 1840, it will be seen that the total produce of the United States was 123,000,000 bushels; of 1850, 146,678,890 bushels.—United States Patent Office Report.

A few years since the oat crop of the Western States sold at 80 or 40 cents per bushel. At the present time (October, 1856), owing to the larger number of horses employed in the West and the East, the price is steady at 40 to 60 cents in the West; and 45 to 50 cents in the States of New England and New York.

Observatories. The first is supposed to have been on the top of the temple of Belus, at Babylon. On the tomb of Oeymanidas, in Egypt, was another, and it contained a golden circle 200 feet in diameter; that at Benarea was at least as ancient as these. The first in authentic history was at Alexandria, about 300 n.c. The first in modern times was at Cassel, 1561. The Royal Observatory at Greenwich was founded by Charles II. A. D. 1675; and from the meridian of Greenwich all English astronomers make their calculations.

Ocean (Gr. *oceanos*.) In Geography, the vast body of water which surrounds the continents, and is the receptacle of all their running waters. It is divided by geographers into five great basins; viz., the Pacific Ocean (so called by reason of its comparative stillness), which separates Asia from America, and is the largest of all the basins; 2. The Atlantic Ocean, which has Europe and Africa on its eastern shore, and America on its western; 3. The Indian Ocean, which washes the south of Asia, and the south-eastern coast of Africa; 4. The Arctic Ocean, which surrounds the north pole; and, 5. The Antarctic, which surrounds the south pole. Other smaller portions of the great connected body of water are called *seas*, of which the Mediterranean, the German, the Baltic, and Black seas, are the most considerable. The superficial extent of the several great basins is not known with any certainty, nor, indeed, can their limits be exactly defined. From the nearest estimation that can be made of the extent of the continents and principal islands, it is supposed that nearly three-fourths of the whole surface of the globe are covered by water. The Pacific Ocean alone exceeds the whole surface of the dry land.

Depth of the Ocean.—If the superficial extent of the ocean can not be easily ascertained, it will readily

E. long.; 2. Celebes, with the smaller islands about its coast, and the eastern portion of Borneo up to 3° N. lat.; 3. The Spice Islands; 4. The Soo-loo Archipelago, Mindanao, and the northeast corner of Borneo; and, 5. The Philippine Islands.

These several divisions are peculiar in physical formation, in climate, productions, and inhabitants.

11. *Australasia* extends from 1° N. to 55° S. lat., and from 112° to 180° E. long., and its components are, Australia or New Holland, Van Diemen's Land, New Zealand, Papua or New Guinea, New Britain, New Ireland, the Arru Islands, Solomon Islands, New Caledonia, New Hebrides, Queen Charlotte's Islands, New Hanover, Admiralty Islands, and many smaller islands scattered over the intervening seas.

111. *Polynesia* includes the numerous groups of islands scattered over the Pacific between Asia, Malaysia, and Australasia on the west and southwest, and the western coast of America. The following is the most approved classification of these groups: the Bonin or Arzobispo Islands, the Ladrones or Marian Islands, the Caroline Islands, the Feejee Islands, the Tonga or Friendly Islands, Navigator's or Samoa Islands, Cook's or the Hervey Islands, the Society, Georgian, and Low Islands, the Austral Islands, the Marquesas and Washington Islands, the Hawaiian or Sandwich Islands, the Kermadec Isles, and scattered and isolated islands, among which are Gambier Islands, Pitcairn Island, etc., etc. The *Malaysian*, with the exception of the Philippine Islands, belong chiefly to Holland, and, according to the latest official reports, the following are the statistics of the Dutch possessions: The superficies of Netherlands India is 27,892 square geographical, or 36,887 American miles. The population of Java and Madura, exclusive of the army, is 9,581,130; viz., Europeans, etc., 16,409; Chinese, 119,481; other easterns, 27,687; and natives, 9,420,553. Sumatra has 3,430,000 inhabitants; Banca and dependencies, 50,000; Rhio and dependencies, 70,000; Borneo and dependencies, 1,200,000; Celebes, 300,000; Molluca Islands and dependencies, 718,500; Timor and dependencies, 800,000; Ball and Linchok, 1,205,000. Total, 10,473,500. Total population of Dutch India, 20,057,630. Great Britain is the first power in *Australasia*. The statistics of the following colonies refer to the commencement of the year 1851:

Colonies.	Population.	Value of Imports. £	Value of Exports. £	Tonnage entered.
New South Wales...	192,000	2,078,328	2,331,680	234,215
Victoria.....	77,360			
South Australia...	67,430	845,672	570,816	86,683
West Australia....	5,886	52,351	22,134	15,988
Van Diemen's Land	70,130	1,232,272	1,172,530	23,081

Of the exports, as above, the following is the value of wool from each colony in 1850: New South Wales and Victoria, £1,614,241; South Australia, £131,730; West Australia, £15,482; and Van Diemen's Land, £151,203. The value of minerals, chiefly copper, from South Australia in the same year was £362,568. Since the above returns gold has been discovered in Australia, and the fields have been more productive than those of California. The quantity yielded in the year ending 30th December, 1852, was 3,998,321 ounces, valued at over £15,000,000, or \$75,000,000. The population and every interest has increased, and perhaps doubled, under the stimulating influence of this shower of gold. Among the islands of *Polynesia* the Sandwich Islands hold the first rank, whether viewed in relation to their position, products, population, or civilization. The population in January, 1849, was 80,641. The excess of deaths over births in 1848 had been 6165, or 8 per cent. About 10,000 died of measles and hooping-cough in 1847-8. At this rate of mortality the population in 1860 would be 32,224; in 1870, 14,073; in 1880, 6134; in 1890, 2607; and in 1900, only 1162. In 1890 the Hawaiian race would be extinct. Such is the influence of civilization on aboriginal races—the

same throughout America and throughout the world. In 1853 the islands were visited by small-pox, and about 3000 died of the epidemic. A new census was taken at the commencement of 1854. The extent of the cultivation of sugar in these islands is shown in the annexed table:

	Acres Cultivated.	
	1852.	1853.
Lihue.....	200	580
Koloa.....	240	650
Honolulu, Maui.....	250	800
Makawao, ".....	325	500
Hana.....	45	130
Waimea, Hawaii.....	50	50
Hilo.....	540	540
Total.....	1650	2760

Average yield per acre, 2000 lbs.; average value, five cents per lb.

The *Polynesia* of 29th January, 1853, referring to the year just passed, furnishes the following relating to the commerce of these islands:

"Imports.—There is a large falling off in the value and amount of goods imported for consumption. The value of goods imported, as compared with previous years, is as follows:

1850.	1851.	1849.
\$1,025,068 70.....	\$1,823,821 68.....	\$709,508 54

—giving as an average of imports for three years, \$1,206,249.

"Exports.—The following comparison of some of the staple exports for the islands with those of former years shows at a glance that the exports for 1852 do not equal those of 1850, though a large gain on those of 1851 is apparent.

Staple.	1850.	1851.	1852.
Sugar..... pounds.	750,138	721,030	729,577
Syrup..... gallons.	75,577	60,111	36,575
Molasses..... "	53,855	13,031	41,000
Coffee..... pounds.	204,428	37,190	117,210
Salt..... bushels.	7,652	5,769	7,118

"The custom-house receipts in 1850 amounted to \$121,506 78; in 1851, to \$160,602 19; and in 1852, to \$113,091 93; the receipts of the latter year thus showing a decrease of \$47,510 26 as compared with 1851, and of \$7414 80 as compared with 1850. The number of merchant-vessels that visited the islands in 1850 was 469; in 1851, 446; and in 1852, 235. It is impossible," adds the *Polynesia*, "to give the number of 'whalers' that have visited the islands in 1852, but the number is about 300, which is much more than the number in 1851 or 1850. It may be added here, in regard to the number of merchant-vessels in 1850 and 1851, that a large proportion of them were small vessels engaged in the potato trade, while in 1852 the vessels have been generally of a larger class. Another reason for the large number given in 1850 and 1851 was the fact that vessels more generally then touched at several ports, which would increase the number in the custom-house returns, though in fact it should not. The ports being now more generally known, vessels for produce go directly to the port where they can obtain their cargoes." In a commercial point of view, as an entrepôt between the western coast of America and Eastern Asia, these islands are of the greatest importance; and in view of the vast commerce now springing up in the Pacific, and which will eventually revolutionize the trade of the world, it is possible that the United States may see fit to accept the offer to annex them to the national territory. Already the question has been before Congress.—*American Statistical Annual*.

Odessa, a flourishing sea-port of Southern Russia, on the northeast coast of the Black Sea, between the rivers Dnieper and Bug, in lat. 46° 28' 54" N., long. 30° 43' 22" E. Population in 1850, 78,000. The foundations of Odessa were laid so lately as 1792, by order of the Empress Catharine, after the peace of Jassy. It was intended to serve as an entrepôt for the commerce of the Russian dominions on the Black Sea and the Sea

of Azof, and has in a great measure answered the expectations of its founders. By an Imperial ukase, dated the 7th of February, 1817, it was declared a free port, and the inhabitants exempted from taxation for thirty years; since which period its increase has been extremely rapid. The bay or roadstead of Odessa is extensive, the water deep, and the anchorage good, the bottom being fine sand and gravel; it is, however, exposed to the southeasterly wind, which renders it less safe in winter. The port, which is artificial, being formed by two moles, one of which projects to a considerable distance into the sea, is fitted to contain about 300 ships. It has also the advantage of deep water. There is a convenient lazaretto, on the model of that of Marseilles. The want of fresh water used to be the greatest disadvantage under which the inhabitants labored; but this has been obviated by the construction of a canal, which conveys an abundant supply of water into the town. There are no trees in the vicinity, which has, in consequence, a bleak and arid appearance.

Light-houses.—A light-house has been erected on Cape Fontan, about 6½ nautical miles south of Odessa. The light, which formerly revolved, is now fixed, and is about 203 (Russian) feet above the level of the sea. At the distance of eleven leagues S. E. by E. ½ E. from Odessa, on the north end of the long, narrow, low island of Tendra, a light-house has been erected, of great use to ships approaching Odessa from the south or west. The lantern is elevated 92½ (Russian) feet above the level of the sea. It consists of three reflecting lights, suspended in the form of a triangle, revolving in the space of four minutes, so that each lamp arrives at its maximum of brilliancy after an interval of one minute, twenty seconds. Being also of a red color, this light is readily distinguished from Fontan light, and the other lights in the Black Sea. In foggy weather a bell is kept ringing.—*Coulier sur les Phares*, 2d ed.; *NORRIE'S Sailing Directions for the Mediterranean and Black Sea*, etc. Not being at the mouth of any great river, nor having any considerable manufactures, Odessa is not a port for the exportation of what may be called articles of native growth; but in consequence of her convenient situation, excellent port, and the privileges she enjoys, she is, as already remarked, the emporium where most part of the produce of Southern Russia destined for foreign countries is collected for exportation, and where most part of the foreign articles required for home consumption are primarily imported. The shallowness of the water at Taganrog, and the short period during which the Sea of Azof is navigable, tend to hinder foreign vessels of considerable burden from entering the Strait of Yenikalé, and occasion the shipment of a considerable portion of the produce brought down the Don in lighters to Caffa and Odessa, especially the latter. All the products brought down the Dniester, the Bug, and the Dnieper are exported from Odessa; but owing to the difficult navigation of the first and last mentioned rivers, by far the greater part of the corn brought to Odessa from Podolia, the Ukraine, etc., is conveyed to the town in carts drawn by oxen. The roads traversed by these carts are only practicable at certain seasons of the year; and nothing would contribute so much to increase the commerce of the port, and the prosperity of Southern Russia, as the opening of improved communications with the interior, whether by removing obstructions in the channels of the rivers, constructing canals, or railways, or good common roads. Among the articles of export from Odessa, corn, especially wheat, occupies, as every one knows, the highest rank; but tallow is also an important article; and next to it are linseed, wool, hides, copper, wax, caviar, potash, beef, furs, cordage, sail-cloth, tar, butter, isinglass, &c.

Ports of the Black Sea, the Sea of Azof, and the Crimea.—The importance of the Black Sea as a channel of Russian commerce will be easily understood by cast-

ing an eye over the map of Southern Russia, and tracing the rich and extensive regions which are tributary to its various ports. The Danubus and its branches, the Dniester, the Bug, Dnieper, Don, and several lesser rivers, empty their waters into the Black Sea. Odessa is situated on a bay, 80 miles from the mouth of the Dniester, and 60 from that of the River Dnieper. The bay is secure and accessible, and seldom closed by ice. The port is protected by two moles, each extending 315 fathoms, and raised 7½ feet above the surface of the sea; and, thus formed, it will afford ample protection to two hundred large-sized vessels. Akerman is situated near the Black Sea, on the lagoon on the Dnieper. It is the principal outlet of the produce of Galicia, Podolia, and Bessarabia. The lagoon, or lagoon, on which Akerman is situated, is said to produce annually 7,000,000 poods (252,000,000 pounds) of salt. The port is, however, too shallow for vessels drawing over seven feet of water. Kherson, Nicolaief, and Sevastopol are the remaining principal ports of these seas.

The following table exhibits the tonnage of Odessa in 1852:

Nationality.	Entered.		Cleared.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
England	208	68,601	225	63,175
Austria	196	68,781	206	71,591
Belgium	1	290	2	412
France	42	7,028	42	7,028
Greece	162	43,335	150	43,273
Holland	19	2,603	12	2,046
Ionian Islands	14	2,801	13	2,219
Sicily	27	7,024	26	6,636
Sardinia	172	43,628	197	48,792
Sweden, etc.	90	20,412	88	22,605
Tuscany	10	3,657	11	4,200
Turkey	43	8,311	40	11,332
Others	97	20,317	113	29,119
Total in 1852	1076	296,767	1141	317,101
Total in 1851	625	172,179	648	177,133
Increase in 1852	451	124,618	477	119,668

The preceding table exhibits a total of 2221 vessels (entered and cleared), with an aggregate of 614,598 tons, being an increase over 1851 of 950 vessels, with an aggregate of 265,286 tons. If to the figures given in the table is added the coasting trade, viz., 2301 vessels, with an aggregate tonnage of 418,436, the total navigation of the port of Odessa, in 1852, will amount to 4525 vessels, with an aggregate of 1,033,034 tons. An analysis of the table gives to Austria the first rank in the navigation of this port. Total tonnage entered and cleared, 614,598 tons: Austria, 140,222 tons. England holds the second rank, viz., 137,776 tons; then Sardinia, 92,420 tons; Greece, 83,637 tons; Sweden, 43,017 tons. The augmentation in 1852 over 1851 gives Austria 66,878 tons more; England, 61,531 tons more; Sardinia, 38,977 tons more; and Greece, 13,577 tons more. The steam navigation of Odessa is maintained by the two lines of Constantinople and the Danube. The first is a thirty-six voyages (between the two points), and the second eighteen, annually. The Constantinople line conveyed, in 1852, 1214 passengers; that of the Danube, 995; making a total for both lines of 2209 passengers. The first of these transported to Odessa merchandise and specie amounting to 5,411,520 francs, and the other 359,620 francs. There was exported to Constantinople by the first line merchandise valued at 1,669,108 francs; and to the ports of the Danube, by the other, merchandise to the amount of 637,796 francs. Government steamers keep up the communication between the ports of Kherson, Nicolaief, the Crimea, and the Caucasus. In 1852 they made ninety-five voyages from these different points to Odessa, transporting passengers and merchandise.

The different steamers which make Odessa their starting-point made, in 1852, 149 voyages, transporting 20,905 passengers, and merchandise to the amount of 10,705,768 francs, equal to \$2,000,000 nearly.

COMMERCE OF ODESSA.

	1851.	1851.
	France.	France.
Exports.....	103,402,410	52,503,024
Imports.....	136,110,096	99,880,800
Total, France.....	239,512,506	152,383,824

The principal exports were:

Grains, value.....	63,756,536 franca.
Wool, ".....	17,044,716 "
Linseed, ".....	7,900,580 "
Tallow, ".....	1,927,206 "

The principal imports in 1851-52 were: raw cotton and cotton yarns, olive-oil, dye-stuffs, drugs, metals, wines, and sugar. In 1858 the total value of the foreign trade of Odessa was \$25,958,807, viz.: exports, \$18,583,293; imports, \$7,375,514. Grains constituted the chief export in 1853. Thus, of the \$26,000,000 (in round numbers), grains amounted in value to \$13,000,000; linseed, wool, tallow, and cordage covered \$5,000,000. In 1864 this immense trade must have been completely paralyzed, as an official notification was published at Odessa on 8d March, 1864, prohibiting the exportation of grains of all kinds, from all ports of the Black and Azof Seas, until the 1st of September following. This prohibition, however, is now removed; and official returns, when received, will show how far the blockade of the Russian ports by the allied powers affected the trade of the Black Sea. By declaration published at St. Petersburg 7th [19th] April, 1856, all the mercantile harbors of Russia are open to the merchant vessels of neutral countries.

The total value of the trade of the ports of the Sea of Azof (Taganrog, Kerch, Kostoff, Mariopol, and Berdiansk), was, in 1851: imports, 6,902,000 franca; exports, 27,182,000 franca.

The imports were chiefly from Turkey, the Two Sicilies, Ionian Islands, France, and Greece. The exports were destined to Turkey, England, Sardinia, Tuscany, Ionian Islands, and France. The total value of the trade at the commercial ports of the Crimea (Eupatoria, Balaklava, Theodosia, and Kerch), in 1852, was: imports (including specie), 1,092,500 franca; exports, 654,500 franca. Total, 1,747,000 franca.

Compared with 1851, the imports increased 12 per cent., and exports decreased nearly 60 per cent. Imports consisted of cottons, raw cotton, coals, oil, and fruits; exports, of wool, raw hides, butter, caviar, and grains.—United States Commercial Relations.

The United States Consul, under date of July 1, 1854, communicates the following information: There exists a treaty of commerce between the United States and the Imperial Russian government, which was concluded at St. Petersburg on the 8th [18th] December, in the year 1832, and was ratified at Washington on the 11th May, 1833, to which the Russian government abides with strictness. The city and port of Odessa was declared as *porto-franco* by a decree of the imperial government in the year 1823, which was put into execution only on the 15th August, in the year 1824, by which the importation of all kinds of merchandise was allowed, on paying only one-fifth of the entire duty paid in other ports of this empire; and this one-fifth duty was employed to defray the annual expenditure for the benefit of this city, such as pavements, foot-paths, repairing streets, lights, government buildings, and for the expenses of all the local administrations. The importation of all kinds of merchandise is allowed, even those articles which are prohibited at all other ports of the empire, but they are not allowed to be transported into the interior from hence, as tea, refined sugars, strong spirits, cloths—black and green—printed cottons, silks, and wools. These articles are to be consumed at Odessa. The term of these privileges for Odessa expired in the year 1849, but his majesty the emperor, wishing to favor this city, granted a prolongation of the same privileges for a period of five years, which ends on the 14th August, 1854. During this last period the duty was augmented; instead of

one-fifth, it is now two-fifths of the entire duty on the import of any kind of merchandise, with the exception of tobacco, rum, and other strong spirits, on which the entire duty is paid, as at all other ports of Russia. Refined sugars, tea, and wines, have to pay three-fifths of the entire duty, one-fifth of which is destined for expenses of this city, and the remainder in favor of government. There does not exist at this port any privileges granted to any nation, in any way, which is denied to citizens of the United States. The only restriction existing at Odessa is on ships under French and Neapolitan colors, they not being allowed to import any merchandise from foreign countries to Russia, unless paying 50 per cent. more on the import duty, in comparison to Americans, or ships of other nations. This difference on French and Neapolitan vessels exists by the commercial treaties between the respective powers, by which it is also prohibited for Russian vessels to import to France or to Naples merchandise from foreign ports not Russian produce, as the cargo must be, and from a Russian port. There are no differences in the charges, or any other dues, on ships of the United States and Russian vessels. A Russian vessel of 150 lasts (equal to 300 tons) pays the same charges as an American of the same size. The following affords a comparative statement:

Lasts, 150, at 17-100 per last.....	S. R. 25 50 = \$19 18
Light dues.....	7 15 = 5 36
Quarantine dues, custom-house charges and fees.....	20 00 = 15 04

The tonnage and light dues are a fixed charge, and established by law; the quarantine and custom-house dues are not so. The amount of the latter charges is generally paid partly for stamp paper, fees, and other trifles, which reaches the sum above stated, and which every one pays without opposition, as it is the custom and has been for many years past, and by which means business is greatly facilitated. It is prohibited by law to reship merchandise from one ship to another, even if the merchandise reshipped be destined for another Russian port, and no matter under what colors it is brought to this port. The merchandise, before reshipment, must first be landed and visited by the custom-house authorities, and the whole amount of duty paid, before permission can be obtained for such merchandise to be shipped and transported to another Russian port. But if such merchandise is destined for a foreign port, it has to be landed, and after being visited by the custom-house officers, a certificate to that effect is given to the shippers of the cargo, allowing the reshipment and exportation to a foreign port. All foreign, as well as American vessels are allowed to share in the coasting trade from one Russian port to another in the Black Sea or the Sea of Azof. The current coin, weights, *measura*, etc., are the same at Odessa as at St. Petersburg. The value of a silver ruble is 75 $\frac{1}{100}$ cents of an American dollar; one pood weight is 36 English pounds; one arshine measures 28 English inches; one chetwert of wheat is 5 $\frac{1}{2}$ English bushels.

The only cargo exported from hence for America since the 1st of July, 1853, consisted of common washed wool, 505 bales, weighing 5972 tons, 23 pounds; and linseed, 1200 chetwerts—the whole shipped on board of an American bark of 380 tons, bound for New York, and cleared from hence on the 10th November, 1853. The duty on the cargo amounted to 342-80 silver rubles, or \$257 80, being on the linseed alone, as there is no duty on the exportation of wools. No insurances have ever taken place here for the United States, but the general custom is to insure in England for America. The custom in purchasing any kind of merchandise for exportation at this place is to pay ready cash, and without any discount whatever; but in the sale of colonial and other goods imported from abroad sometimes a credit of six or eight months is granted to the buyers. There is no established rate of exchange here for the United States, but the value of the dollar is

nominal at $1\frac{1}{2}$ silver ruble. The amount of duty paid here on merchandise exported for America during the last period amounts to \$257; but no import duty was paid here, as no merchandise arrived from America. There is no duty levied in Russia by government on produce exported in its new state, or partly manufactured, or entirely so; the only existing duty is on raw sugars, on which the refiners of Russia pay an excise to government of $\frac{4}{100}$ silver rubles per pood on the refined sugars, or 45 $\frac{1}{100}$ cents in American currency. Laborers are generally paid here by the day, and, the rate not being fixed, fluctuates according to the wants of such men—ranging from $\frac{30}{100}$ to one silver ruble per day, or from 22 $\frac{1}{2}$ to 75 cents per day, American currency.

A tribunal of commerce was established at Odessa in 1824, whose jurisdiction extends over all disputes connected with trade. There is no appeal from its decisions except to the Senate. There are twelve sworn brokers, approved and licensed by the Tribunal of Commerce, who have duties appointed by themselves. They register all transactions, and receive $\frac{1}{2}$ per cent. from each party as commission. There is a discount or loan bank, established in 1828, and marine and fire insurance societies. Most articles of provision are cheap; and fish, which costs next to nothing, is excellent. Fuel, however, is scarce and dear. Within the last thirty years, the Merino breed of sheep has been extensively introduced into the governments of Taurida, Cherson, and Ekaterinoslov, so that there has been not only a great increase in the quantity, but also a very decided improvement in the quality, of the wool exported. *Corn Trade.*—The principal trade of Odessa is with Constantinople, Smyrna, and other towns in the Levant, Naples, Leghorn, Genoa, Marseilles, etc. "It is generally stated," says Mr. Jacob (*Memoir on the Trade of the Black Sea*, in the Appendix to the octavo edition of *Tracts on the Corn Trade*), "that the supply of Constantinople requires annually 100,000 quarters of Black Sea wheat. The Greek Islands scarcely, on the average of years, produce sufficient wheat for their own consumption, and in some years require a large supply, which is furnished partly from the neighboring continent, and partly from the Black Sea. The Asiatic coasts of the Turkish Empire, especially in Anatolia, are nearly in the same predicament. At times the market of Smyrna is very favorable for the sale of the corn of Southern Russia. The islands of Malta and Gozo produce only about half as much corn as the 120,000 inhabitants require. Sicily, though it has greatly declined from its ancient productiveness, has still a quantity of grain to spare for the less fruitful parts of Italy in most years, and its wheat enters into competition with that of the Black Sea, in the ports of Naples, Genoa, and Leghorn. There are few years in which Tuscany grows a sufficiency of wheat; and its chief port, Leghorn, being one of those in which ships can unload their cargoes of corn, without being detained to perform quarantine, has been at all times a place of deposit for the wheat of the Black Sea. A market at some price may always be found there, as the capitalists are disposed to purchase, relying on the uncertain productiveness of some adjacent country, in which they may realize a profit at no great distance. Genoa, like Leghorn, is a port where wheat can be unloaded within the bounds of the Lazaretto. The country around it yields but little wheat; and at some periods it enjoys a trade in that article even as far as Sonderland. This internal demand, and the chance of advantageous re-exportation, induces much trade in corn. There is said to be seldom less than 10,000 quarters in store at the two ports of Genoa and Leghorn, and at some periods a far greater quantity. Nice, though not having the same advantageous quarantine regulations, and, consequently, not being a *dépôt* for corn beyond its own demand, from the sterile soil that surrounds it, requires every year a large importation

of wheat. That of Sicily and Odessa creates a competition in its port, and the government draws a revenue by imposing a heavy duty on both. Though the corn laws of France have kept the ports closed against the introduction of foreign corn for domestic use, yet it is allowed to be bonded for re-exportation. From the frequent local and partial scarcities which occur on the eastern coast of Spain, at which periods wheat is allowed to be lawfully imported, and, it is said, from the facility of its introduction by contraband when not legally allowed, Marseilles has been a great *dépôt* for the wheat of the Black Sea. From thence, as also from Gibraltar, where there is generally some in store, it can easily be transported to Spain, to Sardinia, to Corsica, to Tunis, to Tripoli, or wherever scarcity has created a beneficial market. The coasts of Barbary, though often having a surplus of wheat, much of which occasionally assists to feed Portugal, in some seasons have been affected with most deficient harvests. This was recently the case in a remarkable degree. Tripoli and Tunis experienced, in the year 1820, a harvest most miserably short, and were supplied from other countries." The warehouse rent of corn at Odessa is from eight to ten copecks per chetwert per month. M. De Hagemeister supposes that Turkey and the different ports of the Mediterranean require, at an average, an annual supply of 1,400,000 chetwerts, or about 1,050,000 quarters, of which 1,060,000 chetwerts, or 750,000 quarters, are furnished by Southern Russia, and principally shipped from Odessa. Wallachia and Moldavia are both very fertile in corn; and were tranquillity and good order introduced into them, and the free navigation of the Danube secured, Galatz and Brailoff would be two of the principal European grain-shipping ports.—See the excellent Report of HAGEMESTER on the Trade of the Black Sea, p. 96-114, Engl. Trans. Exclusive of corn, the other articles mentioned as being exported from Odessa find their way to the different markets in the Mediterranean. Those chiefly for Turkey are iron, tallow, sail-cloth, carriage, anchors for ships of war, butter, etc. The exports to Italy and other European countries are similar. The importation of all foreign articles into the Russian dominions on the Black Sea and the Sea of Azof is confined to Odessa, Theodosia or Kaffa, and Taganrog. The import trade is, however, of inferior importance when compared with the export trade. The principal articles are sugar and coffee, dye-woods, wine and brandy, cotton stuffs and yarn, woolen and silk manufactures, spices, cutlery; oranges, lemons, figs, and other fruit; lemon-juice, oil, tin and tin plates, dried fruits, paper, silk, specie, etc.

Odessa, in addition to its great and rapidly increasing trade with Constantinople and the countries on the Mediterranean, had, before the war of 1854-1855, a considerable trade with Hedout-kalé at the mouth of the Phasis, and with Trebizond and several ports on the south coast of the Black Sea. Georgian and Armenian merchants are already considerable purchasers at the Leipsic and other German fairs, and civilization is beginning to strike its roots throughout all the extensive countries between the Black Sea and the Caspian. It is probable that at no very remote period the Phasis will be frequented by British ships; and that merchants, without any enchantment to aid them, and depending only on the superior cheapness and excellence of their goods, will be hospitably received in the ancient Colchis, and bear away a richer prize than fell to the lot of Jason and his compeers.—See RUSSIA.

Offing, or Offin, in Nautical language, that part of the sea, a good distance from shore, where there is deep water and no need of a pilot to conduct the ship. Thus if a ship from shore be seen sailing out to seaward, they say, "She stands for the offing;" and if a ship, having the shore near her, have another a good way without or beyond her, toward the sea, they say, "That ship is in the offing."

Ohio, one of the United States, lies between lat. 38° 30' and 42° N., and between long. 80° 35' and 84° 47' W. It is 210 miles long from north to south, and 200 miles broad. Area, 39,964 square miles. The population in 1790 was 3000; in 1800, 45,865; in 1810, 230,760; in 1820, 561,434; in 1830, 937,637; in 1840, 1,519,467; and in 1850, 1,980,408. The land in the interior of the State and bordering on Lake Erie is generally level, and in some places marshy. From one quarter to one third of the State, comprehending the eastern and southeastern parts, bordering on the Ohio River, is generally hilly and broken, but in no part mountainous. On the margin of the Ohio River and several of its tributaries are alluvial lands of great fertility. The valleys of the Scioto and the Great and Little Miami are the most extensive sections of level, rich, and fertile lands in the State. At the head of the Muskingum River are prairies of considerable extent, some of which are wet, though generally dry and fertile. The height of land which divides the waters which fall into the Ohio from those which fall into Lake Erie is the most marshy of any in the State, while the land on the margin of the rivers is generally dry. Wheat may be regarded as the staple production of the State, though Indian corn and other grains are largely cultivated. It is rich in mineral wealth, iron, coal, limestone, marble, and superior building stone, grind-stones, etc. There are many valuable salt springs. There were in this State in 1850, 9,861,493 acres of land improved, and 8,146,000 of unimproved land in farms; cash value of farms, \$358,758,603; and the value of implements and machinery, \$12,750,585. *Live Stock*—Horses, 468,897; asses and mules, 3423; milch cows, 544,409; working oxen, 65,381; other cattle, 749,067; sheep, 3,942,929; swine, 1,964,770. Value of live stock, \$44,121,741.

Agricultural Products, etc.—Wheat, 14,487,561 bushels; rye, 425,918; Indian corn, 90,078,695; oats, 13,472,742; barley, 254,958; buckwheat, 638,960; peas and beans, 60,168; potatoes, 5,057,769; sweet potatoes, 167,391. Value of products of the orchard, \$695,921; of the market-gardens, \$214,904. Pounds of butter made, 34,449,879; of cheese, 20,819,842; maple sugar, 4,588,269; molasses, 197,908 gallons; beeswax and honey, 804,275 pounds; wool produced, 10,196,371; flax, 446,982; silk cocoons, 1552; hops, 63,731; tobacco, 10,154,449; hay, tons of, 1,433,142; hemp, 150; clover-seeds, 104,197 bushels; other grass seeds, 37,310; flax-seed, 188,880; and were made, 46,207 gallons of wine. Value of home-made manufactures, \$1,712,196; of slaughtered animals, \$7,439,248.

Rivers, etc.—The Ohio River, which gives name to the State, washes its entire northern border. This river is 1004 miles long from Pittsburg to its mouth, by its various windings, though it is only 614 in a direct line.—See *Onto River*. The Muskingum, the largest river which flows entirely in this State, is formed by the junction of the Tuscarawas and Walhonding rivers, and enters the Ohio at Marietta. It is navigable for boats 100 miles. The Scioto, the second river in magnitude, flowing entirely within the State, is about 200 miles long, and enters the Ohio at Portsmouth. Its largest branch is the Whetstone, or Olentangy, which joins it immediately above Columbus. It is navigable for boats 130 miles. The Great Miami, a rapid river in the western part of the State is 100 miles long, and enters the Ohio in the southwest corner of the State. The Little Miami has a course of seventy miles, and enters the Ohio seven miles above Cincinnati. The Maumee, 100 miles long, rises in Indiana, runs through the northwest part of the State, and enters Lake Erie at Maumee Bay. It is navigable for steamboats to Perrysburg, eighteen miles from the lake, and above the rapids is boatable for a considerable distance. The Sandusky rises in the northern part of the State, and, after a course of about eighty miles, enters Sandusky Bay, and thence into Lake Erie.

The Cnychoga rises in the north part of the State, and after a curved course of sixty miles, enters Lake Erie at Cleveland. It has a number of falls, which furnish valuable mill seats. Besides these there are Huron, Vermilion, Black, Grand, and Ashtabula rivers, which enter Lake Erie.

The principal places are Cincinnati, the metropolis; Columbus, the Capital; Cleveland, Sandusky, Dayton, Springfield, Zanesville, Marietta, and Portsmouth. There were in February, 1854, sixty-eight banks, with a paid capital of \$8,718,866; in January, 1856, forty-six railroads, of which 2725 miles of track were finished and in operation, and 1578 in course of construction. Tonnage of the State in 1853, 25,692 tons.

Manufactures, etc.—There were in the State in 1850 eight cotton factories, with a capital invested of \$207,900, employing 132 males and 263 females, producing 280,000 yards of sheetings, etc., and 413,000 pounds of yarn, valued at \$394,700; 130 woolen factories, with a capital of \$370,220, employing 903 males and 208 females, manufacturing 1,374,087 yards of cloth, and 65,000 pounds of yarn, valued at \$1,111,027; thirty-five establishments making pig-iron, with a capital of \$1,503,000, employing 2415 persons, producing 52,658 tons of pig-iron, etc., and the entire value of products, \$1,255,850; 183 establishments, with a capital of \$2,003,650, employing 2758 persons, and making 87,399 tons of iron castings, etc., valued at \$3,069,350; eleven establishments, with a capital of \$620,800, employing 708 persons, manufacturing 14,416 tons of wrought iron, valued at \$1,076,192; 1082 flouring and grist-mills; 1730 saw-mills; 243 printing-offices, 802 newspapers, twenty-eight daily, six tri-weekly, four semi-weekly, 222 weekly, seven semi-monthly, twenty monthly, and one yearly publication. Capital invested in manufactures, \$28,612,136; value of manufactured articles, \$61,915,036.—See *POW* for further information.

Educational Establishments, etc.—The University of Ohio at Athens, the Miami University at Oxford, Franklin College at New Athens, the Western Reserve College at Hudson, Kenyon College at Gambier, Granville College at Granville, Marietta College at Marietta, Oberlin College at Oberlin, St. Xavier at Cincinnati, Ohio Wesleyan University at Delaware, Wittenberg College at Springfield, Willoughby University at Willoughby, Lane Theological Seminary at Cincinnati. There are also theological departments at Kenyon, Western Reserve at Hudson, Granville at Granville, Oberlin at Oberlin, Wittenberg at Springfield, and a seminary of the Associate Reformed Church at Oxford, Western Reserve Medical College at Cleveland, Medical College of Ohio at Cincinnati, Medical College (Homeopathic) at Cleveland, Starling Medical College at Columbus, and Cincinnati Law College at Cincinnati. The whole having, in 1850, 3621 students. There were also 206 academies, 5052 pupils; 11,661 schools, 484,153 scholars; 352 libraries—aggregate number of volumes, 180,826. School fund, \$304,474.

The first permanent settlement in Ohio was made in 1788 at Marietta. In 1802 Ohio was admitted into the Union.

The progress of banking in the State of Ohio is shown in the following summary:

Year.	Number of Banks.	Capital.
1806	1	\$200,000
1811	4	800,000
1815	13	1,484,000
1818	21	2,061,000
1820	20	1,707,000
1825	25	5,819,000
1828	33	9,247,000
1840	37	10,017,000
1845	8	2,171,000
1850	50	7,139,000
1854	60	6,995,000
1857	64	5,398,000

The free-banking law of Ohio was adopted in the year 1851, and forms at present a part of the banking system in operation.

designate a number of unctuous liquors, which, when dropped upon paper, sink into it, and make it seem semi-transparent, or give it what is called a greasy stain. These bodies are very numerous, and have been in common use from time immemorial. Chemists have divided them into two classes; namely, *volatile* and *fixed* oils. Oil was used for burning in lamps as early as the epoch of Abraham, about 1921 B.C. It was the staple commodity of Attica, and a jar full was the prize at the Panathenean games. It was the custom of the Jews to anoint with oil persons appointed to high offices, as the priests and kings, *Psalms* cxxxiii. 2; 1 *Sam.* x. 1, xvi. 13. The anointing with this liquid seems also to have been reckoned a necessary ingredient in a festival dress, *Ruth*, iii. 3. The fact that oil, if passed through red-hot iron pipes, will be resolved into a combustible gas, was long known to chemists; and after the process of lighting by coal-gas was made apparent, Messrs. Taylor and Martineau contrived apparatus for producing oil-gas on a large scale.—HAYDN.

We borrow from Dr. Thomas Thomson the following statement with respect to these bodies:

I. VOLATILE OILS, called also *essential oils*, are distinguished by the following properties: 1. Liquid, often almost as liquid as water, sometimes viscid; 2. Very combustible; 3. An acrid taste and a strong fragrant odor; 4. Volatilized at a temperature not higher than 212°; 5. Soluble in alcohol, and imperfectly in water; 6. Evaporate without leaving any stain on paper. By this last test it is easy to discover whether they have been adulterated with any of the fixed oils. Let a drop of the volatile oil fall upon a sheet of writing-paper, and then apply a gentle heat to it; if it evaporates without leaving any stain upon the paper, the oil is pure; but if it leaves a stain upon the paper, it has been contaminated with some fixed oil or other. Volatile oils are almost all obtained from vegetables, and they exist in every part of plants—the root, the bark, the wood, the leaves, the flower, and even the fruit, though they are never found in the substance of the cotyledons; whereas the fixed oils, on the contrary, are almost always contained in these bodies. When the volatile oils are contained in great abundance in plants, they are sometimes obtained by simple expression. This is the case with oil of oranges, of lemons and bergamot; but in general they can only be obtained by distillation. The part of the plant containing the oil is put into a still with a quantity of water, which is distilled off by the application of a moderate heat. The oil comes over along with the water, and swims upon its surface in the receiver. By this process are obtained the oils of peppermint, thyme, lavender, and a great many others, which are prepared and employed by the perfumer. Others are procured by the distillation of resinous bodies. This is the case in particular with oil of turpentine, which is obtained by distilling a kind of resinous juice, called turpentine, that exudes from the juniper. Volatile oils are exceedingly numerous. They have been long known; but as their use in chemistry is but limited, they have not hitherto been subjected to an accurate chemical investigation. They differ greatly in their properties from each other, but it is impossible at present to give a detailed account of each.

1. The greater number of volatile oils are *liquid*; many, indeed, are as limpid as water, and have none of that appearance which we usually consider oily. This is the case with the following; namely, oil of turpentine, oranges, lemons, bergamot, roses. Others have the oily viscosity. It varies in them in all degrees. This is the case with the oils of mace, cardamom, saffras, cloves, cinnamon. Others have the property of becoming solid. This is the case with the oils of parsley, fennel, anise seed, balsm. Others crystallize by slow evaporation. This is the case with oil of thyme, peppermint, marjoram. The oil of nutmegs has usually the consistence of butter. This is the case also with the oils of hops and of pepper. 2. The color

of the volatile oils is as various as their other properties. A great number are limpid and colorless; as oil of turpentine, lavender, rosemary, sarsaparilla, anise seed: some are yellow; as spike, bergamot: some are brown; as thyme, savory, wormwood: others blue; as camomil, motherwort: others green; as millet, pepper, hops, parsley, wormwood, cajeput, juniper, sage, valerian: others, though at first colorless, become yellow or brown by age; as cloves, cinnamon, saffras. 3. The odors are so various as to defy all description. It is sufficient to say, that all the fragrance of the vegetable kingdom resides in volatile oils. Their taste is acrid, hot, and exceedingly unpleasant. 4. Their specific gravity varies very considerably, not only in different oils, but even in the same oil in different circumstances. When the volatile oils are heated in the open air, they evaporate readily, and without alteration diffuse their peculiar odors all around; but there is a considerable difference between the different oils in this respect. When distilled in close vessels, they do not so readily assume the form of vapor. Hence they lose their odor, become darker in color, and are partly decomposed. Oils do not seem very susceptible of assuming the gaseous form, unless some other substance, as water, be present.

II. FIXED OILS are distinguished by the following characters: 1. Liquid, or easily become so when exposed to a gentle heat; 2. An unctuous feel; 3. Very combustible; 4. A mild taste; 5. Boiling point not under 600°; 6. Insoluble in water, and nearly so in alcohol; 7. Leave a greasy stain upon paper.

These oils, which are called fat or expressed oils, are numerous, and are obtained partly from animals and partly from vegetables, by simple expression. As instances, may be mentioned whale oil or train oil, obtained from the blubber of the whale and from cod; olive oil, obtained from the fruit of the olive; linseed oil and almond oil, obtained from linseed and almond kernels. Fixed oils may also be extracted from poppy seeds, hemp seeds, beech mast, and many other vegetable substances. All these oils differ from each other in several particulars, but have also many particulars in common.

1. Fixed oil is usually a liquid with a certain degree of viscosity, adhering to the sides of the glass vessels in which it is contained, and forming streaks. It is never perfectly transparent; has always a certain degree of color, most usually yellowish or greenish; its taste is sweet, or nearly insipid. When fresh it has little or no smell.

There exist also in the vegetable kingdom a considerable number of bodies which, at the ordinary temperature of the atmosphere, are solid, and have hitherto been considered as fixed oils. Palm oil may be mentioned as an example. The various substances used in India and Africa as substitutes for butter, and as unguents, may likewise be mentioned.

2. All the fixed oils hitherto examined are lighter than water, but they differ greatly from one another in specific gravity. The same difference is observable in different samples of the same oil. Fixed oil, when in the state of vapor, takes fire on the approach of an ignited body, and burns with a yellowish white flame. It is upon this principle that candles and lamps burn. The tallow or oil is first converted into a state of vapor in the wick; it then takes fire, and supplies a sufficient quantity of heat to convert more oil into vapor; and this process goes on while any oil remains. The wick is necessary to present a sufficiently small quantity of oil at once for the heat to act upon. If the heat were great enough to keep the whole oil at a temperature of 600°, no wick would be necessary, as is obvious from oil catching fire spontaneously when it has been raised to that temperature. When oil is used in this manner, either in the open air or in contact with oxygen gas, the only new products obtained are water and carbonic acid. The drying oils are used as the vehicle of paints and varnishes. Linseed, nut, poppy, and

hemp-seed oils belong to this class. These oils in their natural state possess the property of drying oils, but imperfectly. To prepare them for the use of the painter and varnish maker, they are hotted for some time in an iron pot, and sometimes burned till they become viscid. When they burn for some time, their unctuous quality is much more completely destroyed than by any method that has been practiced. Hence it is followed frequently in preparing the drying oils for varnishes, and always for printers' ink, which requires to be as free as possible from all unctuousity. Nut oil has been found preferable to all other oils for printers' ink; though the dark color which it acquires during boiling renders it not so proper for red ink as for black. Linseed oil is considered as next after nut oil in this respect. Other oils can not be employed, because they can not be sufficiently freed from their unctuousity. Ink made with them would be apt to come off and smear the paper while in the hands of the bookbinder, or even to spread beyond the mark of the types and stain the paper yellow.

The kind of oil used for burning in lamps varies, in different parts of the world, with the sources of supply. Whale oil is used in Great Britain, but seal oil, fish oil, and oils obtained from seeds by pressure are also

largely consumed. In Paris the oils of rape-seed and of poppy-seed are used; and in the south of France, and in Italy, an inferior kind of olive oil, and also the oil of the earth-nut, are employed. In the latter country a lamp oil is expressed from grape-stones. In Piedmont walnut oil is common; oil of sesamum-seed is burned on the eastern and southern coasts of the Mediterranean; while in tropical countries cocoa-nut oil, which is sold in the climate of Great Britain, is generally used. In China, the *Camellia oleifera* is cultivated for the sake of the oil obtained from its seeds; also a shrub, *Croton sebiferum*, the fruit of which yields a useful oil. In consequence of the deficient supply of tallow during the late war with Russia, inquiries have been set on foot in various parts of the world as to the seeds and other vegetable products from which oil may be obtained, and the result of these inquiries has already shown that many oil-yielding substances, not before known in commerce, exist. The export of oils from the East Indies, especially *gingelly*, has greatly increased. Pistachio-nut oil is becoming common, as is also ground-nut oil from Africa. All these oils are used for burning in lamps.

The following is a list of the plants which yield the ordinary unctuous oils of commerce:

No.	Plants.	Oils.	Specific Gravity

41.	<i>Pinus abies</i>		

Candia.—A fair crop or yield of olive oil is estimated at two million gallons, and two and a half millions an abundant crop. Although immense numbers of olive-trees were cut down during the "Greek war" and the civil commotion in 1830, the population is still insufficient to attend to them, and the only culture they receive is slightly plowing the ground on which they stand. The fruit is allowed to drop from the tree, when it is collected by women and children, who receive for their trouble one-third the quantity they collect; if the crop is abundant, generally one quarter is lost for want of hands to collect it. In the district of Opokero the fruit is beaten from the trees, evidently to its injury, for it is smaller in that section than in any other part of the island. The fruit is collected in heaps and taken to a wooden mill of very primitive and rough construction, operated by four men. The oil from the first pressure belongs to the owner of the

olives, out of which the government receives one-tenth; the mass is again pressed, and one-third quantity, in comparison with the first pressure, is obtained, although of an inferior quality; this is divided into tenths, one of which belongs to the government, two divided among the workmen, and the remainder belongs to the owner of the mill.

An instance of the demand for oil is manifest in the palm-oil trade with the west coast of Africa. A few years ago — probably less than fifteen — palm oil, in the west of Africa, was worth a dollar a gallon, and a late account from that region says not one thousand gallons left the country in a year. Now the traffic in that article with Great Britain alone amounts to 700,000 gallons a year, at an average of thirty-three cents a gallon; and with the United States as much more. For lubricating machinery, particularly in steam factories and on railroads in Great Britain, this oil is used more than any or all other articles, being both cheaper and better. There is now a monthly line of steamers from Southampton to the west coast of Af-

rica, the Madeira and Canary Isles. Bristol has fifty-four ships in the trade with that coast; Liverpool thirty-five; and the entire number from Great Britain, both steamers and sailing vessels, is not less than one hundred. Some of these are ships of 1000 tons burden. President Roberts, of Liberia, says twenty ship-loads of palm oil go from Monrovia every year. The import of oils into the United States has been as follows:

	1856.		1855.

The table does not include the amount of oil of whales, but only the whale oil imported, mostly from the British Possessions and of course the olive oil in bottles has been estimated in gallons, and is mostly of French origin. The linseed is almost entirely English.—See OLIVE OIL.

Benzole, or Coal Oil, is a new discovery of products of oil from certain kinds of bituminous coal. At Cloverport, Kentucky, on the Ohio River, are extensive new works, running twelve retorts night and day, consuming from eight to ten tons of coal every twenty-four hours, and producing 750 gallons of crude oil. Re-distilled, this quantity yields 600 gallons of refined oils; viz., 125 gallons of benzole, 75 of naphtha, 225 of lubricating oil, and 175 of oil for illuminating purposes. Benzole readily sells at \$1 50 per gallon; lubricating oil at \$1 25; naphtha and burning at eighty cents. Preparations are making at Cloverport for the manufacture of a beautiful semi-transparent candle from the substance called "paraffine," resembling spermaceti, and which is formed in pearly crystals in the dark oils of the last distillations after they have cooled. The paraffine, as remarked by Professor Silliman, Jun., does not exist ready formed in the original crude product, but is a result of the high temperature employed in the process of distillation, by which the elements are newly arranged. It derives its name from the unalterable nature of the substance under the most powerful chemical agent. The residuum from the last distillation makes the fine quality of asphaltum, used for

smearing vaults, etc., now imported and sold at three dollars per ton.

Oil-painting. Painting in which the medium for using the colors is oil. It is said to have been unknown to the ancients, and not used earlier than the fourteenth century; its invention being attributed to John Van Eyck, sometimes called John of Bruges. By him it was supposed to have been imported to one Antonio da Messina, who first brought it to Venice. Giovanni Bellini, by a stratagem, got possession of the secret from him, and then made it publicly known. Oil-painting has the advantages, above all other modes, of affording great delicacy of execution, a union and insensible blending of the colors, and, above all, that of imparting great force to its effects. The various colors chiefly used in oil-painting are white-lead, Cremenltz white, chrome, king's yellow, Naples and picout yellow, the ochres, Dutch blue, terra da Sienna, yellow lake, vermilion, red-lead, Indian and Venetian red, the several sorts of lake, brown pink, Vandyke brown, burned and unburned umber, ultramarine, Prussian and Antwerp blue, ivory black, blue black, asphaltum. The principal oils are those extracted from the poppy, nut, and linseed. With the latter, driers are introduced.—See PAINTS.

Oldenburg, a state of Germany, in the northwest, with the title of Grand Duchy, composed of three separate portions: 1st. The Duchy of Oldenburg, which forms eight-ninths of the territory. It is surrounded by Hanover on the east, south, and west, and bounded north by the North Sea; capital, Oldenburg; 2d. The Principality of Lübeck, or Eutin, inclosed in the Duchy of Holstein (Denmark); and, 3d. The Principality of Birkenfeld, between Rhenish Prussia and Holstein-Homburg; capital, Birkenfeld. Area, 2421 square miles. Population in 1852, 281,923. Oldenburg lies in the basin of the North Sea, and is entirely flat. Soil in general fertile, but in several places are extensive sand dunes and marshes. Corn raised insufficient for consumption. Pasturage excellent; horses, cattle, and sheep extensively reared. Manufactures confined to linen-weaving and coarse woollens. Revenue (estimated), 1854, 891,000 thalers; expenses, 979,000 thalers; public debt, 1,600,000 thalers. *Oldenburg*, the capital, is situated at the conflux of the Hunte with the Haaren, which here forms a small port, eighty miles west-southwest of Hamburg. Population, 7829. It is the residence of the Grand Duke. Population of circle in 1852, 59,453.

Olibanum (Fr. *Encens*; Ger. *Weiranch*; It. *Olibano*; Arab. *Looban*), a gum-resin, the produce of a large tree (*Libanum thurifera*) growing in Arabia and India. It is imported in chests, containing each about one cwt., from the Levant and India; the best comes from the former, and is the produce of Arabia. Good olibanum is in semi-transparent tears, of a pink color, brittle, and adhesive when warm. When burned, the odor is very agreeable; its taste is bitterish, and somewhat pungent and aromatic; it flames for a long time with a steady, clear light, which is not easily extinguished, leaving behind a black (not, as has been said, a whitish) ash. Olibanum is the frankincense (*thus*) of the ancients, and was extensively used by them in sacrifices.—PLINY, *Nat. Hist.* It has also been used in the ceremonies of the Greek and Roman churches.—AINSLIE'S *Materia Indica*; THOMSON'S *Chemistry*; KIFFISON, *Antiq. Rom.*

Olive, Olives (Fr. *Olives*; Ger. *Oleeren*; It. *Uve*, *Uve*; Sp. *Azeitunas*; Port. *Azeitonas*; Lat. *Olive*), a fruit yielding a large quantity of oil, the produce of the *Olea*, or olive-tree. The wild olive is indigenous to Syria, Greece, and Africa, on the lower slopes of Mount Atlas. The cultivated species grows spontaneously in Syria, and is easily reared in Spain, Italy, and the south of France. It has been raised in the open air in England, but its fruit is said not to have ripened. The fruit is a smooth, oval plum, about three-quarters of an inch in length, and half an inch in diameter; of a deep violet color when ripe, whitish and fleshy within, bitter and nauseous, but replete with a bland oil; covering an oblong, pointed, rough nut. Olives intended for preservation are gathered before they are ripe. In pickling, the object is to remove their bitterness, and to preserve them green, by impregnating them with a brine of aromatized sea-salt;

for this purpose of the wood of the agreeable matters, or cephalic.

Olive (Fr. *Uve*; Sp. *Azeitunas*; Port. *Azeitonas*; Lat. *Olive*), a fruit yielding a large quantity of oil, the produce of the *Olea*, or olive-tree. The wild olive is indigenous to Syria, Greece, and Africa, on the lower slopes of Mount Atlas. The cultivated species grows spontaneously in Syria, and is easily reared in Spain, Italy, and the south of France. It has been raised in the open air in England, but its fruit is said not to have ripened. In pickling, the object is to remove their bitterness, and to preserve them green, by impregnating them with a brine of aromatized sea-salt;

Oil (Fr. *Uve*; Sp. *Azeitunas*; Port. *Azeitonas*; Lat. *Olive*), a fruit yielding a large quantity of oil, the produce of the *Olea*, or olive-tree. The wild olive is indigenous to Syria, Greece, and Africa, on the lower slopes of Mount Atlas. The cultivated species grows spontaneously in Syria, and is easily reared in Spain, Italy, and the south of France. It has been raised in the open air in England, but its fruit is said not to have ripened. The fruit is a smooth, oval plum, about three-quarters of an inch in length, and half an inch in diameter; of a deep violet color when ripe, whitish and fleshy within, bitter and nauseous, but replete with a bland oil; covering an oblong, pointed, rough nut. Olives intended for preservation are gathered before they are ripe. In pickling, the object is to remove their bitterness, and to preserve them green, by impregnating them with a brine of aromatized sea-salt;

for this purpose various methods are employed. The wood of the olive-tree is beautifully veined, and has an agreeable smell. It is in great esteem with cabinet-makers, on account of the fine polish of which it is susceptible.

Olive Oil (Ger. *Baumöl*; Fr. *Huile d'olives*; It. *Olivo d'ulivo*; Sp. *Acete de aceitunas*; Lat. *Oleum ficarium*). The olive-tree is principally cultivated for the sake of its fruit. This is an insipid, inodorous, pale greenish-yellow colored, viscid fluid, unctuous to the feel, insoluble, incapable of combining with water, and nearly insoluble in alcohol. It is the lightest of all the fixed oils; and is largely used, particularly in Greece, Italy, Spain, and France, as an article of food, and in medicine and the arts. It is also very extensively used in England, particularly in the woolen manufacture. The ripe fruit is gathered in November, and immediately bruised in a mill, the stones of which are set so wide as not to crush the kernel. The pulp is then subjected to the press in bags made of rushes; and by means of a gentle pressure, the best, or *virgin* oil, flows first; a second, and afterward a third, quality of oil is obtained by moistening the residuum, breaking the kernels, &c., and increasing the pressure. When the fruit is not sufficiently ripe, the recent oil has a bitterish taste; and when too ripe, it is fatty. After the oil has been drawn it deposits a white, fibrous, and albuminous matter; but when this deposition has taken place, if it be put into clean glass dasks, it undergoes no further alteration; the common oil can not, however, be preserved in casks above one and a half or two years. It is sometimes adulterated by the admixture of poppy oil.—*Thomson's Dispensatory*. The best olive oil is said to be made in the vicinity of Aix, in France. That which is brought from Leghorn, in chests containing thirty bottles, or four English gallons, is also very superior; it is known in our markets by the name of Florence oil, and is used mostly for culinary purposes. Olive oil is the principal article of export from the kingdom of Naples.—*See NAPLES*. Apulia and Calabria are the provinces most celebrated for its production. The Apulian is the best, and is preferred by the woolen manufacturers, by whom it is extensively used. By far the largest portion of the olive oil brought to England is in general imported from Italy, principally from Gallipoli, on the east coast of the Gulf of Taranto (which see), whence it is commonly known by the name of Gallipoli oil. But besides Italy, Spain, Turkey, the Ionian Islands, &c., send us large quantities.

Oil Trade of Naples.—The oils of the kingdom of Naples are produced in Apulia, from Bari to its southern extremity, the Capo di Leuca, a district comprising the territories which export from Gallipoli and Taranto; and in Calabria from Rossano, on the Gulf of Taranto, across to Gioja. The whole coast from Gioja as far as Gaeta is covered with olive-trees. They are also abundant in the Abruzzi and the Terra di Lavoro; but Apulia and Calabria furnish by far the greatest quantity of oil. The principal magazines, or *caricatori*, for oil, are at Gallipoli and Gioja. Gallipoli supplies England, Holland, the north of Europe, and, in short, all those countries that require the most perfectly purified oil. It is clarified to the highest degree by merely keeping it in cisterns hollowed out of the rock on which the town is built. The voyages it has to perform being long, it is put into casks so well constructed that it frequently arrives at Petersburg in the heat of summer without the least waste or leakage—an advantage attributed to the seasoning of the staves, which, before they are put together, are well soaked in sea-water.

The oil received into the cistern in Gallipoli, either belongs to the proprietor, who buys it of the planter, or is received in *deposit* on account of some other party, who gets a receipt (*biglietto di magazzino*) specifying the quantity of the oil received on his account, its quality,

etc. Depositors pay at the rate of 20 grani a year for every salma of oil to the party holding it in deposit, and who is bound to account for it. The *caricatori* of Bari and Monopoli furnish oils for the consumption of Upper Italy and Germany, through the medium of Venice and Trieste. They also draw supplies from Brindisi and Otranto. The *caricatori* of Taranto, of Eastern Calabria or Retromarina, and of Western Calabria, the principal of which is Gioja, furnish supplies for Marseille, &c. But the *caricatori* now mentioned, having no conveniences for clarification, produce only the thickest oils used for soap-making. The oils of Sicily, like those of Tunis, are too thin to be used singly in the making of soap; and, being used only for mixing, are less valuable than most others. A full crop of oil in the province of Terra d'Otranto is supposed to yield about 500,000 salme, or 41,666 tons. To facilitate transactions, orders or *cedules* are circulated, representing quantities of oil deposited in the provincial *caricatori*. These orders are negotiable, like bills of exchange, and are indorsed by the intermediate holder, who receives their value in cash, without, however, becoming liable for their due satisfaction. The only responsible parties are the drawer and drawee. The latter is obliged to deliver the oil at sight of the order, or to hold it at the bearer's disposal, till the 10th of November for the *caricatori* of Apulia, and till the 31st of December for those of Calabria. If the contract be for time, that is, from one year to another, the oil is usually placed at the purchaser's command on the 1st of March, and purchases for time are effected by means of a contract, wherein the vendor undertakes to deliver the oil by the end of January, on receiving payment of the money; but the oil, as observed above, is not ready at the purchaser's disposal before the beginning of March. Hence, in time bargains, the payment of the money precedes the delivery of the oil more than a month; scarce an instance is on record of an engagement of this sort having been broken, and the latter is as readily negotiable as any other security. In purchases of oil at command, payment likewise precedes the delivery of the article; but in this case the advance is confined to the five days necessary to transmit the order to the *caricatore* where the oil is kept for delivery. The oil remains in the *caricatore* under the care and responsibility of the vendor, to be delivered on demand to the bearer of the order, free of all costs and charges whatever for the first year; but for every successive year from 25 to 30 grains per salma are charged for keeping, and for renewal of warranty. (We are indebted for these details to a very valuable Report by Mr. Steel, British vice-consul at Gallipoli, and to a brochure of M. Millenet, entitled *Coup de Œil sur le Royaume de Naples*. Naples, 1822.) *For the trade in Olive oil, see article OILS*.

Olive-tree. The wood of the olive is heavy, compact, fine-grained, and brilliant. The sap-wood is white and soft, and the heart-wood hard, brittle, and of a reddish or yellowish tint, with the pith nearly effaced, as in the box. It is employed by cabinet-makers to inlay the finer species of wood, which are contrasted with it in color, and to form light articles of ornament, such as dressing-cases, snuff-boxes, &c. The wood of the roots, which is agreeably marbled, is preferred to that of the trunk. On account of its hardness and durability, the wood of this tree was anciently used for the hinges of doors; and, before metal became common, it was selected by the Greeks for the images of their gods. From its resinous and oleaginous nature, the wood of this tree is exceedingly combustible, and burns as well before as after it is dried. There exudes from its wood a gum, which is sometimes sold for gum-clemi. There is also extracted from this tree a substance called *olivine*. The bark contains a bitter principle, and is regarded as tonic and febrifugal. The leaves are astringent.

The olives are first bruised by a mill-stone, suffi-

cleatly hard as not to break the kernels, and are then put into sacks of coarse linen, feather-grass, or of wool, and subjected to heavy pressure, by which means the most fluid and the best liquor is forced out, and is called *virgin oil*. It is received into vessels half filled with water, from which it is skimmed, and put into tubs, barrels, and bottles for use. Several coarser kinds of oil are afterward obtained, by adding hot water to the bruised fruit. The best olive oil is of a bright pale-amber color, without smell, and bland to the taste. Kept warm, it becomes rancid, and at 38° Fahr. it congeals. It is of the same nature as all mild expressed vegetable oils; of these the most fluid are preferred, and hence the oils of olives and of almonds are those chiefly used in medicine. One of the most esteemed kinds of oil is that produced at Aix (*Huile d'Aix en Provence*). *Florence oil* is also a fine kind, imported from Leghorn in flasks surrounded by a kind of network, formed of the leaves of a monocotyledonous plant. These are the kinds of olive oil in most frequent use at the table for salads (hence they are called *Salad oils*). *Lucca oil* is imported in jars holding about nineteen gallons each. *Genoa oil* is a fine kind. *Gallipoli oil* is imported in casks, and constitutes the largest portion of the olive oil imported into England. *Sicily oil* is of an inferior quality. *Spanish oil* is the worst. The foot deposited by olive oil is used for oiling machinery, under the name of *Droppings of Sweet oil*.

Another important advantage afforded by this tree is its fruit in a pickled state. It is gathered unripe, and suffered to steep in water for some days, and is afterward put into a lye of water and barilla, or kalli, with the ashes of olive-stones, or with lime. It is then put up in earthen bottles, or in barrels, with salt and water, and in this state is ready for use. Olives are eaten before, as well as after meals, and are believed to excite appetite and promote digestion. The finest kind of prepared fruit is known in commerce by the name of *Picholines*, after one Picholin, an Italian, who first discovered the art of pickling olives. The fruit of the olive is of a pleasant taste, and is eaten by the modern Greeks during Lent, in its ripe state, without any preparation, except with the addition of a little pepper, salt, and oil. From the value of its products, in a commercial point of view, aside from other considerations, the culture of the olive strongly claims the attention of the American agriculturist, and the trial should be made in every place where its failure is not certain, and for this purpose young grafted trees of hardy and choice varieties should be obtained from Europe, and the formation of nurseries immediately begun. A portion of Texas, Louisiana, the islands of Georgia, and chosen exposures of the interior of the last-named State, as well as of some of the Western States, California, or of Oregon, will be the scene of this species of culture, if ever attended with success in North America.—HUTTON'S *Trees of America*.

Omnium, a term used at the English Stock Exchange, to express the aggregate value of the different stocks in which a loan is now usually funded. Thus, in the English loan of £36,000,000 contracted for in June, 1815, the omnium consisted of £120 3 per cent. reduced annuities, £14 3 per cent. consols, and £10 4 per cent. annuities, for each £100 subscribed. The loan was contracted for on the 14th of June, when the prices of the above stocks were—3 per cent. reduced, 54; 3 per cent. consols, 53; 4 per cent., 70; hence the parcels of stock given for £100 advanced, were worth—

	£	s.	d.
£120 reduced, at 54.....	70	4	0
£44 consols, at 53.....	24	4	0
£10 4 per cent., at 70.....	7	0	0
Together.....	101	8	0

which would be the value of the omnium, or £1 8s. per cent. premium, independently of any discount for prompt payment.

Onion (Ger. *Zwiebel*; Fr. *Oignon*; It. *Cipolla*; Sp.

Cebolla; Russ. *Luk*), a well-known bulbous plant (*Allium Cepa*, Linn.) cultivated all over Europe and the U. States for culinary purposes. The Stra-burg, Spanish, and Portuguese varieties are the most esteemed.

Ontario, a lake of New York and Canada, easternmost and smallest in extent of the five great lakes of North America. It is between 43° 10' and 44° N. lat., and between 76° and 88° W. long. It receives Niagara River, the great outlet of the upper lakes, in its south western part, and has its outlet by the St. Lawrence River in its northeastern part, in which, immediately below the lake, is the cluster denominated the "Thousand Islands." Its shape approaches to a long and narrow ellipse, being 190 miles long, and 55 wide in its widest part, and about 480 miles in circumference. It is in some places over 600 feet deep, so that its bottom is considerably below the level of the Atlantic. Its surface is 330 feet below the level of Lake Erie, and 134½ feet above tide-water. In every part it has sufficient depth of water for the largest vessels. It has many good harbors, and is rarely frozen excepting in shallow parts near the shore. The principal rivers which enter it from the southern side are the Genesee, Oswego, and Black rivers, and a large number of creeks. The Bay of Quinte is a long and irregular body of water on its eastern part, which receives a considerable river, the outlet of several small lakes, and Burlington Bay is in its western part. Both these bays are in Canada. It has several important places on its shores, the principal of which are Kingston, Toronto, and Coburg, in Canada; and Oswego, Sackett's Harbor, Port Genesee, or Charlotte, in the United States. It is subject to violent storms and heavy swells. It is connected with the Erie Canal by the Oswego Canal, and from thence the Erie Canal forms a navigable communication with the Hudson River, a distance of 208 miles; and much of the trade of New York for the West passes through it and through the Welland Canal, which is 28 miles long, with 27 locks, and admits the passage of the largest vessels which navigate the lakes. This canal commences at Sherbrooke, near the mouth of Grand River, on Lake Erie, and terminates at Port Dalhousie, on Lake Ontario, nine miles west of Niagara village. Its entrance being a considerable distance west of the outlet of Lake Erie, it is open earlier than the Erie Canal at Buffalo, where the ice often accumulates in the spring. The Rideau Canal forms a navigable communication with the Ottawa River, 126 miles. It has 15 light-houses on the American shore, and 13 on the Canadian side.—SEE LAKES, *Commerce of*.

Onyx (Ger. *Onyx*; Fr. *Onix*, *Onice*; Sp. *Onique*; Lat. *Onyx*). Any stone exhibiting layers of two or more colors strongly contrasted is called an *onyx*, as banded jasper, chaledony, etc., but more particularly the latter, when it is marked with white, and stratified with opaque and translucent lines. But the Oriental onyx is considered a substance consisting of two or more layers or bands of distinct and different colors. A sard, or sardoine, having a layer of white upon it, would be called an onyx; and according to the number of layers it would be distinguished as an onyx with three or more bands. Some of the antique engravings are upon onyxes of four bands.—MAW'S *Treatise on Diamonds*, &c.

Opal (Ger. *Opal*; Fr. *Opale*; It. *Opalo*; Sp. *Opalo*, *Piedra iris*; Port. *Opala*; Lat. *Opalus*), a stone, of which there are several varieties, found in different parts of Europe, particularly in Hungary, and in the East Indies, etc. When first dug out of the earth it is soft, but it hardens and diminishes in bulk by exposure to the air. The opal is always amorphous; fracture conchoidal; and commonly somewhat transparent. Hardness varies considerably. Specific gravity from 1.958 to 2.51. The lowness of its specific gravity in some cases is to be ascribed to accidental cavities which the stone contains. These are sometimes filled with drops of water. Some specimens of opal have the property of

emitting various colored rays, with a particular affluency, when placed between the eye and the light. The opals which possess this property are distinguished by lapidaries by the epithet *Oriental*; and often, by mineralogists, by the epithet *nobilis*. This property rendered the stone much esteemed by the ancients.—Thomson's *Chemistry*; see also PLINY, *Hist. Nat. lib.* xxxvii. c. 6, where there are some very curious details as to this stone.

Opium (Ger. *Mohnsaft*; Fr. *Opium*; It. *Oppio*; Sp. and Port. *Opio*; Lat. *Opium*; Arab. *Ufyoom*; Hind. *Ufem*; Turk. *Madjoon*), the concrete juice of the white poppy (*Papaver somniferum*), which is most probably a native of Asia, though now found growing wild in the southern parts of Europe, and even in England. Opium is chiefly prepared in India, Turkey, and Persia; but the white poppy is extensively cultivated in France and other parts of Europe, on account of its capsules, and of the useful bland oil obtained from its seeds. It has also been cultivated, and opium made, in England; but there is very little probability of its ever being raised here to any considerable extent. The poppy is an annual plant, with a stalk rising to the height of three or four feet; its leaves resemble those of the lettuce, and its flower has the appearance of a tulip. When at its full growth, an incision is made in the top of the plant, from which there issues a white milky juice, which soon hardens, and is scraped off the plants, and wrought into cakes. In India, these are covered with the petals of the plant to prevent their sticking together, and in this situation are dried, and packed in chests lined with hides and covered with gunny, each containing forty cakes, and weighing two maunds, or 149½ lbs.; they are exported in this state to the places where the opium is consumed. Turkey opium is in flat pieces, covered with leaves, and the reddish capsules of some species of *rumex*, which is considered an indication of its goodness, as the inferior kinds have none of these capsules adhering to them. According to Dr. A. T. Thomson, Turkey opium has a peculiar strong, heavy, narcotic odor, and a bitter taste, accompanied by a sensation of acrid heat, or biting on the tongue and lips, if it be well chewed. Its color, when good, is a reddish brown, or fawn color; its texture compact and uniform. Its specific gravity is 1.336. When soft, it is tenacious; but when long exposed to the air, it becomes hard, breaks with a uniform shivering fracture, is pulverulent, and affords a yellowish brown powder. East Indian opium has a strong empyreumatic smell, but not much of the peculiar narcotic, heavy odor of the Turkey opium; the taste is more bitter, and equally nauseous, but it has less acrimony. It agrees with the Turkey opium in other sensible qualities, except that its color is blacker, and its texture less plastic, although it is as tenacious. Good Turkey opium has been found to yield nearly three times the quantity of *morphia*, or of the peculiar principle of the drug, that is yielded by East Indian opium. Opium is regarded as bad when it is very soft, greasy, light, friable, of an intensely black color, or mixed with many impurities. A weak or empyreumatic odor, a slightly bitter or acrid, or a sweetish taste, or the power of marking a brown or black continuous streak when drawn across paper, are all symptoms of inferior opium.—*Dispensatory*. The raising of opium is a very hazardous business; the poppy being a delicate plant, peculiarly liable to injury from insects, wind, hail, or unseasonable rain. The produce seldom agrees with the true average, but commonly runs in extremes; while one cultivator is disappointed, another reaps immense gain. One season does not pay the labor of the culture; another, peculiarly fortunate, enriches all the cultivators. This circumstance is well suited to allure man, ever confident of good fortune.—**COLERIDGE'S Husbandry of Bengal.**

The Opium Trade.—This drug is chiefly grown in British India, where it has long been a strict monop-

oly of the government, and also in Persia and Turkey. It was first imported into China by the Portuguese; but up to the year 1768 the whole quantity imported did not exceed from 100 to 200 chests annually. The East India Company commenced its importation in 1773-4; and in 1780 small depôts for its sale were established a little south of Macao. The trade continued to increase rapidly from India until 1794, when large English ships found it profitable to anchor near Whampoa, for fifteen months at a time, selling opium. In 1800 its sale had risen to about 2000 chests; but recently its further importation into China was prohibited. Since that period the smuggler succeeds the legal importer; and although the importation is no longer conducted in the vessels of the East India Company, it is extensively cultivated under their monopoly, and sold by them to private traders, by whom it is introduced into the prohibited markets of China.

Consumption and Trade of Opium in China.—Opium is pretty extensively used, both as a narcotic and in smoking, in Turkey and India; but its great consumption is in China and the surrounding countries, where the habit of smoking it has become almost universal. The Chinese boil or seethe the crude opium; and by this process the Impurities, resinous and gummy matter, are separated, and the remaining extract only is reserved for use. Thus prepared, the drug loses its ordinary strong and offensive aromatic odor, and has even a fragrant and agreeable perfume. A small ball of it, inserted in a large wooden pipe with some combustible matter, is lighted, and the amateur proceeds to inhale four or five whiffs, when he lies down and resigns himself to his dreams, which are said to have no inconsiderable resemblance to the sensations produced by inhaling the oxyd of azote. Those who do not carry the indulgence to excess do not, it is said, experience any bad effects from it. Nine-tenths of the supplies of opium for the consumption of China have always been derived from India, a comparatively small quantity only being derived from Turkey. The trade has always been contraband, the introduction of the drug having been prohibited by the Chinese government. Until about 1810 the trade had not attracted much attention, or become of any very great importance, and has since been very greatly extended, and has been since 1828 of first-rate consequence. The trade was at first carried on at Whampoa, about fifteen miles below Canton; next at Macao, whence it was driven by the exactions of the Portuguese; and thereafter in the Bay of Lintin. Here the opium is kept on board ships, commonly called receiving ships, of which there are often ten or twelve lying together at anchor. But latterly the trade has been carried on all along the southeast coast of China, by means of a species of fast-sailing vessels called "clippers," built expressly for the trade and strongly armed. The sales are mostly effected by the English and American agents in Canton, who give orders for the delivery of the opium; which, on producing the order, is handed over to the Chinese smuggler, who comes along side at night to receive it. Frequently, however, the smuggler purchases the opium on his own account, paying for it on the spot in silver; it being a rule of the trade, never departed from, to receive the money before the drug is delivered. During the first ten years of the present century the exports of opium from India to China averaged about 2500 chests, of 149½ pounds each. But after the introduction of Malwa opium into the markets of Bombay and Calcutta, the exports began rapidly to increase.

According to the *Friend of India* of Calcutta, October, 1855, the opium sales for the five preceding years were as follows:

1849-50	Chests sold, 35,383	Proceeds, 37,432,000 Rs.
1850-51	" 84,409	" 82,250,000 "
1852	" 89,581	" 87,245,000 "
1853	" 89,433	" 88,348,000 "
1854	" 48,819	" 86,727,000 "

The price paid to the cultivator is about Rs. 240 a chest.

AN ACCOUNT OF THE QUANTITIES AND PRICES (INCLUDING FRACTIONS) OF THE DIFFERENT SPECIES OF EAST INDIA OPIUM IMPORTED INTO CHINA FROM THE SEASON 1816-1817, DOWN TO THE SEASON 1887-1888, WHEN THE TRADE WAS INTERRUPTED.

From April 1st to March 31st.	Number of Chests.	Value in Dollars.
1816-17	3,310	8,687,000
1817-18	3,680	8,944,250
1818-19	4,090	4,151,250

1836-37	21,609	14,387,330
1837-38	30,040	10,868,157

Confiscation of Opium in 1839.—Opium has always been prohibited in China, and consequently its importation has always been looked upon as a smuggling speculation. There would seem, however, to be good grounds for thinking that the prohibition of the importation of opium was all along intended to be more apparent than real. At all events, it is certain that the trade grew gradually up, from a small beginning, to be one of great extent and value; and it is contradictory and absurd to suppose that this should have been the case had it encountered any considerable opposition from the Chinese authorities. But the truth is, that these functionaries, instead of opposing the trade, or even merely conniving at it, were parties to it being openly carried on, and received certain regulated and large fees on all the opium that was imported. It has even been alleged that a part of these fees found its way into the Imperial treasury at Peking, though that is more doubtful. The appetite for the drug increased with the increasing means of gratifying it; and there appeared to be no assignable limits to the quantity that might be disposed of in the empire. The rapid extension of the trade seems at length to have drawn the attention of the court of Peking to the subject. We doubt, however, notwithstanding what has been alleged to the contrary, whether a sense of the injurious consequences of the use of the drug had much to do in the matter. This, indeed, is a part of the subject as to which there exists a great deal of misapprehension; and we are well assured that, provided it be not carried to excess, the use of opium is not more injurious than that of wine, brandy, or other stimulants. The alarm of the Chinese government was probably not so much about the health or morals of its subjects as about their bullion! They are still haunted by the same visionary fears of being drained of a due supply of gold and silver, that formerly haunted the people of this country. The imports of opium having increased so rapidly as to be no longer balanced by the exports of tea and silk, *ayee* silver began also to be exported! The paternal government of Peking might have tolerated what are called the demoralizing effects of opium with stoical indifference, but the exportation of silver was not a thing to be endured. It is, however, only fair to state that the Chinese statesmen are not all of the school of Mun and Gee, and that some of them appear to have emancipated themselves from the prejudices that still influence the majority of their colleagues. The statesmen in question contended that, whether the use of the drug were injurious or not, the taste for it was too deeply seated and too widely diffused to admit of its effectual prohibition; and they, therefore, pro-

posed that its importation should be legalized, subjecting it, at the same time, to a heavy duty. There can not be a doubt that this was the proper mode of dealing with the subject. In the end, however, the government of Peking, influenced by unfounded theories as to the mischievous effect of the export of the precious metals, came to a different conclusion, and resolved to put a stop to the traffic. No sooner had this resolution been adopted, than a most extraordinary change appears to have taken place in the conduct of the Chinese authorities; and their usual caution seems to have wholly deserted them. They now became as precipitate and violent as they had previously been slow and circumspect; and resolved at all hazards to attempt forcibly to put down the trade. To accomplish this, all foreigners were, in March, 1839, prohibited from leaving Canton; and compulsory measures were at the same time resorted to for compelling them to deliver up the opium in their possession. How the affair might have ended, had the English at Canton been left to the exercise of their own judgment in this crisis, it is impossible to say; but we have been assured by those on whose statements we are disposed to rely, that they would most probably have succeeded in getting out of it with comparatively little loss. Instead, however, of acting for themselves, they had to act in obedience to the orders of Mr. Elliot, chief superintendent of the British trade in Canton; and he, while under constraint, occasioned by confinement to the factory, commanded all the opium belonging to British subjects to be given up to him for delivery to the Chinese authorities; declaring, at the same time, that "falling the surrender of the said opium," the British government should be free "of all measures of responsibility or liability in respect of British-owned opium."

We do not presume to offer any opinion as to the necessity or policy of this proceeding on the part of the superintendent; but in consequence thereof, and of the unjustifiable proceedings of the Chinese, above 20,000 chests of opium were delivered up to Mr. Elliot by British subjects, and by him to the Chinese authorities; and the latter, not satisfied with the possession of the opium, which it was their duty to have placed in a state of security till the matters with respect to it should be arranged, immediately proceeded to destroy it! Having succeeded thus far, the Chinese next insisted that the foreign merchants should subscribe a bond, pledging themselves not to import opium into any part of China; or that, if they did, they were to be justly liable to the penalty of death. But this condition being refused, and no arrangement having been come to, Mr. Elliot suspended the trade on the 22d of May. Our readers do not require to be told that a war with China grew out of these extraordinary proceedings.

Indemnity for the Opium destroyed in China.—The question as to the amount of the compensation that should be awarded to the parties who delivered up the opium to the superintendent in China has since attracted considerable attention. The merchants contended that they were entitled to its cost, or to the price at which it had been invoiced to them, or to above £2,300,000. It is, however, admitted on all hands that the price of opium is exceedingly fluctuating, and that it is influenced in a very high degree by variations in the facilities for smuggling into China. And it was contended by government, that such were the obstacles thrown in the way of its clandestine importation when the delivery was made in 1839, that the price of opium had fallen to less than half its invoice cost, and that supposing the merchants had retained it, they must necessarily have sustained a very heavy loss. Having taken this view of the matter, government proposed that indemnity should be made at the rate of £64 per chest (£1,250,000 in all), being (though little more than half the sum claimed) considerably above the current price of opium in Canton previously

to its being delivered up. As might have been expected, this decision was much found fault with. On the whole; however, we think it eminently fair and reasonable. No one doubts, though not a pound of the opium had been delivered up to Captain Elliot, that its owners must, in consequence of the increased difficulties in the way of its sale, have lost heavily; and, under the circumstances, we see no ground for contending that government was bound, because their agent had interfered, to place the merchants in a better position than they would have been in but for that interference. All that they could justly require was, that it should not be permitted to injure them.

Cultivation of Opium in India—Monopoly—Revenue, etc.—Opium is produced in Bengal, principally in the provinces of Bahar and Benares, in parts of Bombay, and in Malwa, in Central India. In Bengal the production of opium is a monopoly, no person being allowed to grow the poppy except on account of government. The latter make advances to the cultivators, who deliver the entire produce into their hands at a fixed price of about 5s. 6d. per lb. It is afterward sold by the Company for about 11s. per lb., so that the profit of the latter amounts to about 7s. 6d. per lb. Opium may be grown and manufactured in Bombay; but it is subjected to the same high duty that is imposed on opium imported into the Presidency. The object of this high duty is to "disencourage its production." Government purchases what little is produced in Bombay, supplying through licensed dealers all that is required for home consumption. The poppy is extensively cultivated in Malwa, in Central India, and yields a large revenue. Down to 1831, it was produced under a monopoly. But in that year the business was thrown open to the public, and the revenue collected by imposing a duty on the opium when passing through the Company's territories to Bombay. The capture of Scinde, by closing the route for the smuggling of opium through Kurachee to the Portuguese settlements of Demau, etc., enabled a large addition to be made to the transit duty on Malwa opium, which was raised in 1847 to 400 rupes per chest, affording a revenue to government of about 5s. 8d. per lb.—(We have borrowed these authentic details from the Official Papers relative to India, p. 73-75, published in 1853.) No one doubts that opium is an excellent subject for taxation; and the higher the rate to which the duty on it can be raised without encouraging smuggling, so much the better. But a great deal has been said for and against the system under which the opium revenue is raised in Bengal and other parts of India; and perhaps it might be the better policy to open the culture of the plant to the unfettered competition of the public, imposing a high duty on the drug when grown or when exported. Without, however, entering on the discussion of this difficult question, we may shortly observe that the monopoly does not appear to have the consequences stated by Mr. Colebrooke; who tells us (*Husbandry of Bengal*, p. 118) that, except in a few situations that are peculiarly favorable, its culture is unprofitable; and that the peasants engage in it with reluctance, being tempted thereto only by the advances made by the government agents. But if such were the case formerly, it would seem that circumstances have changed in the interval; for it appears from the official accounts that the production of Bengal opium, which amounted to 17,858 chests of 160 lbs. each in 1840-'41, had increased to about 30,000 chests in 1848-'49. The number of chests of Malwa opium (140 lbs. each) exported from Bombay during the same period has continued pretty stationary at about 16,000 a year. The whole, or nearly the whole, of this immense supply of above 50,000 chests, is sent to China. Latterly it has produced to the government of India a clear revenue of considerably more than £3,000,000 sterling a year.

It is very doubtful whether the use of opium, when taken in moderate quantities, be so injurious as has

been represented. That it may, like spirits and wine, be abused, is abundantly certain; but it has not been shown that it is more liable to abuse than either of these articles. And the Chinese, by whom it is principally consumed, are a highly industrious, sober, frugal people.

It is computed that, had China no silk nor teas to give in part payment for the opium consumed in the Celestial empire, the drain of specie during the last 30 years would have amounted to \$600,000,000. It is stated in a memorial presented to the Emperor of China, on the subject of the opium trade, that the drain from the Imperial treasury, to supply this destructive luxury, was,

From 1839 to 1851.....	\$24,000,000
" 1851 to 1854.....	28,000,000
" 1854 to 1859.....	40,000,000

The latter sum, it is stated, is about the average annual outlay at the present time; and it is considered by an intelligent commercial correspondent at Macao quite problematical whether the Chinese would have taken more cotton goods and other imports from the United States and England, had they not expended so much for opium. The profits of the East India Company, who are entitled to whatever of credit or discredit may attach to keeping up this lucrative trade in opium, are stated at \$18,000,000 per annum. If the company succeed in opening new markets for the drug (and it is represented that they are establishing retail shops all over the Indian empire), they will be amply reimbursed for their diminished importations into China, since the importation of Turkish opium in American bottoms has so considerably interfered with their previously almost exclusive monopoly of this trade. It should be added, that the importation of opium into China, though illegal, is openly tolerated by the Chinese officials, and no difficulty is experienced in finding cash customers for any quantity imported. From 200 chests in 1756, when the trade was legal, the importation has risen to from 70,000 to 80,000 chests per annum in 1856, when its introduction is prohibited by law. The value of opium imported in 1756 was about \$1,000,000; the value at the present day has risen to \$40,000,000. The basis of foreign exchange with China is as follows: General imports, opium (which makes about 30 per cent. of the whole), bullion and specie, or drafts on London.—*Commercial Relations of the United States*, 1856-'57.

Cultivation in the United States.—A variety of the "Common" or "Opium Poppy" (*Papaver somniferum*), indigenous to the warm and temperate parts of Europe and Asia, from Portugal to Japan, and especially cultivated in China, India, Turkey, Egypt, and in the Morea, has been introduced into the United States, and has proved itself susceptible of easy cultivation on very rich soils, and is well adapted to the climate of the Middle and Southern States. The flowers of the "White Poppy" (*Papaver s. alba*), the variety with which the experiment was made, may be either entirely white or red, or may be fringed with purple, rose, or lilac, variegated and edged with the same colors, but never occur blue nor yellow, nor mixed with these colors, each petal being generally marked at the bottom with a black or purple spot. The seeds are black in the plants having purple flowers, and light-colored in those which are white; although the seeds of the latter, when of spontaneous growth, are sometimes black. The largest heads, which are employed for medical or domestic use, are obtained from the single-flowered kind, not only for the purpose of extracting opium, but also on account of the bland, esculent oil that is expressed from the seeds, which are simply emulsive, and contain none of the narcotic principle. For the latter purpose, if no other, its culture in this country is worthy of attention.

With regard to the cultivation of this plant, with the view of obtaining opium, there can be but little

Oranges (Ger. *Pomeranzen*; Du. *Oranzen*; Fr. *Oranges*; It. *Afelandra*; Sp. *Naranja*; Russ. *Pomeranetsi*; Hind. *Narunge*; Malay. *Sirao-manis*), the fruit of the orange-tree. The common or sweet orange (*Citrus sinensis*, or *Citrus nobilis*), and the Seville, or bitter orange (*Citrus aurantium*), are natives of China; and the Portuguese are entitled to the honor of having transferred the plant to other countries. Particular species of *Citrus* seem to be indigenous to various Eastern countries; but the birth-place of the proper orange may be distinctly traced to China. It is now to be found in our green-houses. Oranges are imported in chests and boxes, packed separately in paper. The best come from the Azores, Spain, and Cuba; very good ones are also brought from Portugal, Italy, Malta, South America, and other places.

The orange trade carried on by this country is of considerable value and importance. Oranges are not much more expensive than most of our superior domestic fruits, while they are, perhaps, the most refreshing and wholesome of these of warmer climates.

The *Citrus aurantium*, or golden-fruited orange-tree, under favorable circumstances, usually attains a height of twenty-five or thirty feet, and is graceful in all its parts. The trunk is upright, and branches into a regular or symmetrical head. The bark of the twigs is of a soft and almost translucent green, while that of the trunk and older branches is of a delicate ash-gray. The leaves are moderately large, beautifully shaped, of a fine healthy green, and shining on the upper sides, while the under sides have a slight appearance of down. The flowers occur in little clusters on the sides of the branches, are pleasing in their form, of a delicate white in the sweet oranges, and in the more acid varieties slightly tinged with pink. In some plants they have a more powerful odor, and are, for the moment, more rich; but in the orange-grove there is a fragrance in the aroma which never attales nor offends; and as the tree is at one and the same time in all stages of its bearing—in flower, in fruit just set, and in golden fruit, inviting the “hand to pull and the palate to taste”—it is hardly possible to conceive or imagine any object more delightful. There is something, too, peculiar in the organization of the fruit of this tree. Its rind, or external covering, is of a spongy texture, containing but little juice or sap of any kind in its substance; but the external surface is covered, or tuberculated with little glands, which secrete an acrid, volatile oil, very

inflammable, and of a strong, pungent taste. The interior of the fruit is usually divided into from nine to twelve carpels or cells, which contain the pulp, seeds, and juice, and are united by a whitish pellicle or leathery skin, radiating from the centre to the rind, and may easily be separated without wasting the juice. The seeds are solitary or several, and are attached to the inner angle of the carpel, and in some varieties are entirely wanting.

The wood of the orange-tree, when dry, weighs forty-four pounds to a cubic foot, is hard, compact, flexible, slightly odoriferous, and is susceptible of being polished. When recently cut, it is of a yellowish hue, but in the course of time it fades. From its scarcity and small size, it is but little employed in the arts, the only particular use to which it is applied being to make boxes, dressing-cases, and other articles of fancy; and in Florida, considerable quantities of straight, young shoots are cut, and shipped in bundles, to be made into walking-canes.

The fruit of the orange may be obtained fresh in any region of the globe, and at almost every season of the year. The aromatic oil and the rind preserve it from the effects both of heat and of cold; and the acidity of the former renders it proof against the attacks of insects. It is true that oranges decay, like other fruit; but that does not happen for a long time, if the rind remains uninjured, and they are kept from humidity, and so ventilated as not to ferment. With regard to the quality of this fruit in various places, there appears to be a diversity of opinion. Some consider those of Malta the best; others those of St. Michael's; while others prefer those of Bahla, Havana, or of St. Augustine.

The *Maltese oranges* are usually large, the rind thick and spongy, and the glands which secrete the volatile oil are prominent. The pulp is red and delicious, although sometimes there is a trace of bitterness in their taste. They are shipped in boxes of an irregular size, and are generally packed in shavings or saw-wood.

The *St. Michael's oranges* are of a small size, the rind is thin and smooth, the glands small, which secrete but little volatile oil, the pulp light-colored, and of a delicious, sugary taste. They are put up in boxes of three hundred and fifty to four hundred, with each fruit enveloped in paper, or in the husks of maize.

The celebrated *Narel oranges* of Bahla are of difficult transport to Europe and the United States, in consequence of the length of the voyage, and of the humidity and warmth of the climate through which they have to pass. If they are gathered green, however, and suspended in the air above deck, or at the stern of the vessel, in netting, they will endure through the voyage.

The *Havana oranges* are usually of a good size, with a moderately rough rind, and a pulp well filled with delicious juice. From the shortness of the voyage to any of the American markets, they may be safely transported during the winter months. The fruit is ripe in Cuba at the end of October, and is usually shipped in barrels of two hundred and fifty to four hundred fruits in each, put up loosely, without any envelopes.

The *St. Augustine oranges* are superior, both in size and quality, to those of Cuba or the Mediterranean. They resemble those of Havana in flavor, but are much larger, and bring from twenty to thirty per cent. more in the New York and Boston markets. Of the smaller sizes, it requires about three hundred fruits to fill a barrel, but of the largest ones only one hundred are necessary.

In Europe, the *Valencia oranges* are eagerly sought after, on account of their early appearance, large size, and beautiful color. They are put up in boxes of two hundred and twenty to two hundred and forty fruits in each, enveloped in brown paper.

The *Sicilian oranges*, and those of the south of Italy, may be regarded as nearly of the same quality. They

are of a medium size, with a fine color, and are rather acid in their flavor. Those shipped from Messina are put up in boxes of two hundred to two hundred and ten fruits in each, and those of Palermo, which mature later, are shipped in boxes of three hundred or more fruits in each. The oranges of Reggio ripen very early, so much so, that it is not unusual to send them away by the 20th of October. They are packed in boxes of two hundred and forty fruits in each, and, like most of the oranges of the Mediterranean, are enveloped in paper.

The *Provence oranges* come to great perfection, and may be classed with those of Genoa. Along the River Var, they have two harvests of the orange, the first commencing from the 10th to the 15th of November, when the fruit begins to turn, and continues till the 4th of December; the second begins about the 10th of January, and is prolonged nearly to the end of February. They are put up in boxes of one hundred and twenty to three hundred and sixty fruits in each, according to their size and qualities.

With the *Seville oranges* may be classed those of Faro, St. Ubes, Oporto, Andalusia, Malaga, and the bitter oranges of Cuba and Florida. This fruit is usually of a good size, of a beautiful color, but unfit to eat, on account of its bitter flavor. Those shipped from Seville are put up in large boxes, of one thousand fruits in each; while those of Faro and St. Ubes are badly packed in cases of three hundred to three hundred and fifty in each. Those of Spain and Portugal are principally carried to England and the Baltic, and are employed in cookery, and in the manufacture of cordials and other aromatic liquors. The essential product of the fruit is in the rind or peel; it is cut into quarters, separated from the pulp, and caused to be quickly dried. It is used in Holland in aromatizing a liquor called *curacao*.—BROWNE'S *Trees of America*.

Orcilla Weed, Orchella, or Arochl (Ger. *Orseille*; Fr. *Orseille*; It. *Orzello*; *Orzella*; Sp. *Orchilla*), a whitish lichen (*Lichen orchella*) found in the Isle of Portland; but that which is used is imported from the Canary and Cape de Verd Islands, Madeira, Barbary, and the Levant. From it is obtained the archil, or orchal, of commerce, which yields a rich purple tincture, fugitive, indeed, but extremely beautiful. The preparation of orchilla was long a secret, known only to the Florentines and Hollanders; but it is now extensively manufactured in England. Orchil is generally sold in the form of cakes, but sometimes in that of moist pulp; it is extensively used by dyers; and in times of scarcity the weed or lichen has sold as high as £1000 per ton!—THOMSON'S *Dispensatory*.

Ordinary, in *Nautical language*, denotes the establishment of the persons employed by government to take charge of the ships of war which are laid up in the several harbors. These are principally composed of the warrant officers of the ships, as the gunner, boatswain, carpenter, deputy purser, and cook. There is, besides, enrolled in the list of the ordinary a crew of laborers, who pass from ship to ship occasionally, to pump, moor, move, and clean them, whenever it is necessary. The term *ordinary* is also applied sometimes to the ships themselves, and it is likewise used to distinguish the inferior sailors from the most expert and diligent. The latter are rated *able* on the navy books, and have higher pay than those who are rated as *ordinary*.

Oregon, territory, United States of America, bordering the Pacific coast, lies between the parallels of 42° and 46° 10' N. lat., and west of the Rocky Mountains. Area, 210,000 square miles. Much of this territory is mountainous, but it abounds in fertile valleys. It forms three sections, separated from each other by nearly parallel ridges, and following the general direction of the coast line. These several sections have each distinct characteristics of soil, productions, and climate. The division extending from the Pacific coast to the Cascade range has a genial climate throughout the year. The valley of the Willamette is exceedingly fertile, the intervale and prairies form the best of farming lands, and the uplands afford good pasturage, and abound with valuable timber; and there is much fertile land bordering the Shastal and Umpqua rivers. The division between the Cascade range and the Blue Mountains has generally a light sandy soil, but with many valleys of rich alluvion; altogether said to be a fine grazing region. The portion lying west of the Rocky Mountains and east of the Blue Mountains, in extent full one half of the territory, is mostly a rocky and rough country, with some few narrow valleys of great fertility. In the southern portion of the territory gold has been extensively found. There were in Oregon and Washington territories in 1850, 132,857 acres of land improved, and 299,951 of unimproved land in farms. Cash value of farms, \$2,849,170; and the value of implements and machinery, \$183,423. *Livestock*: Horses, 8056; asses and mules, 420; milk cows, 9127; working oxen, 8114; other cattle, 24,188; sheep, 15,382; swine, 20,235. Value of live stock, 1,876,189. *Agricultural Products, etc.*—Wheat, 211,913 bushels; rye, 106; Indian corn, 2918; oats, 61,214; peas and beans, 6566; potatoes, 91,326; value of products of the orchard, \$1271; produce of market gardens, \$90,211; pounds of butter made, 211,461; of cheese, 36,380; molasses, 24 gallons; wool, 29,686 pounds produced; flax, 610; tobacco, 325; hay, tons of, 373; clover and other grass seeds, 26 bushels. Value of slaughtered animals, \$164,530.—See *Census Returns*, 1850.

The Columbia forms its north boundary for a distance of 300 miles, and the east part is almost entirely drained by the south branch, called Sapin or Lewis River, and its tributaries; a very small portion only in the southeast corner is drained by the head sources of the Rio Colorado, here called Green River; and also by

the Bear River of Great Salt Lake; Umatilla, John Days, and Willamette rivers enter the Columbia River on the south; and the Shastl or Rogue, Umpqua, Sequatchie, Yaquina, Kilamook, and several small streams enter the Pacific on the west. The principal places are Salem, the capital, Portland, at the head of navigation, Oregon city, and Astoria. The principal articles of export are lumber and agricultural produce. Tonnage in 1853, 1063 tons. There were in the territory in 1850, thirty-seven saw-mills employed in the manufacture of lumber. The fisheries of Oregon are important and valuable. The rivers abound with salmon, especially the Columbia and the Willamette, which are taken in large quantities below the fall. The hunting and trapping of the fur-bearing animals has given employment to a great number of persons, and the rivers and coasts abound with wild fowls. The governor is appointed by the President of the United States for four years. The Legislative Assembly is composed of a council of nine members, elected for three years, and a House of Representatives of eighteen members, elected annually. The elective franchise is enjoyed by every free white male inhabitant twenty-one years of age, and a citizen of the United States.

On the 7th of May, 1792, Captain Robert Gray, in the ship *Columbia*, of Boston, discovered and entered the Columbia River; to which he gave the name of his vessel. He was the first person that established the fact of the existence of this great river, and this gives to the United States the right of discovery. In 1804-'5, Captains Lewis and Clarke, under the direction of the government of the United States, explored the country from the mouth of the Missouri to the mouth of the Columbia, and spent the winter of 1805-'6 at the mouth of the Columbia. This exploration of the River Columbia, the first ever made, constitutes another ground of the claim of the United States to the country. In 1808, the Missouri Fur Company, at St. Louis, established a trading post beyond the Rocky Mountains, on the head-waters of Lewis River, the first ever formed on any of the waters of the Columbia. In 1810, the Pacific Fur Company, under John Jacob Astor, of New York, was formed; and in 1811, they founded Astoria, at the mouth of the Columbia, as the principal trading post, and proceeded to establish others in the interior. A little later in the same year, the Northwest Company sent a detachment to form establishments on the Columbia; but when they arrived at the mouth of the river, they found the post occupied. In consequence of the exposure of Astoria by the war of 1813, the post was sold out to the Northwest Company. At the close of the war, Astoria was restored, by order of the British government, to its original founders, agreeably to the first article of the Treaty of Ghent; but Britain still persisted in claiming this territory, south to the 42d degree of latitude, until 1845. In 1821, the Hudson's Bay and Northwest Company, who had previously been rivals, were united, and since that time have greatly extended their establishments in the region of Oregon. It was held in joint occupancy until the treaty of 1845, when Britain gave up all claims south of the 49th parallel of north latitude. It was organized with a territorial government in 1848. The portion now the Territory of Washington was set off by an act of Congress, March, 1853.

Organs. The invention of the organ is attributed to Archedemus, about 220 n.c.; but the fact does not rest on sufficient authority. It is also attributed to one Ctesibius, a barber of Alexandria, about 100 n.c. The organ was brought to Europe from the Greek em-

pire, and was first applied to religious devotions in churches in A.D. 658.—BELLARMIN. Organs were used in the Western churches by Pope Vitallanus in 658.—AMMONIUS. It is affirmed that the organ was known in France in the time of Louis L., 815, when one was constructed by an Italian priest. St. Jerome mentions an organ with twelve pairs of bellows, which might have been heard a mile off; and another at Jerusalem which might have been heard on the Mount of Olives. The organ at Haerlem is one of the largest in Europe; it has 60 stops and 8000 pipes. At Seville is one with 100 stops and 5300 pipes. The organ at Amsterdam has a set of pipes that imitate a chorus of human voices.

Orgol. See ARGOL.

Orinoco. one of the principal rivers of South America, ranking in size and importance immediately after the Amazon and Plata, north of which former its basin lies. It rises in the Sierra Nevada, Venezuelan Gulana, winds successively west, north, and east, through the centre of the Venezuelan territory, and enters the Atlantic by numerous mouths, in lat. 8° 40' N., and long. 61° W. Total course estimated at 1600 miles, for more than the latter half of which, or to the rapids of Atures, it is uninterruptedly navigable. Area of its basin, 252,000 square miles. It receives numerous large affluents, principal the Meta and Apure, each having a navigable stream of 500 miles, the Guaviara and Caroni. By the Casiquiare it has a singular navigable communication with the Rio Negro and Amazon; and in the upper part of its course are several large cataracts and long rapids. At 200 leagues from the ocean, its breadth is about three miles; and at the city of Bolivar, between 250 and 300 miles from its mouth, to which place the tide reaches, it is four miles across, and, when lowest, 35 fathoms deep. About 100 miles from the ocean, it separates into a delta of numerous mouths. It rises gradually from March to September, yearly, usually from 60 to 70 feet, but in one narrow place to 120 feet. Its banks are clothed with dense forests, which, like its waters, abound with animal life. Like all great rivers, its upper waters separate into several branches, and it does not appear that the main source has been ascertained with any degree of certainty. According to La Cruz d'Olmedilla, it issues from a small lake called Ypava, situated in north latitude 5° 5', whence, by a bend of a spiral form, it enters the Lake Parima; but although the existence of this sheet of water has been determined, doubts are entertained whether it may not owe its origin only to the temporary overflowing of the river. From this lake it is said to issue by two mouths; and after a very circuitous route of upward of fifteen hundred miles, including its windings, it flows into the Atlantic Ocean, opposite the island of Trinidad, by about fifty mouths, seven of which are navigable. The Grand Boca, or principal mouth, which is six leagues wide, is southeast of Trinidad, in lat. 8° 30' N., and long. 59° 50' W.

Orpiment (*Ger. Orperment; Fr. Orpiment; It. Orpimento; Sp. Orpimente; Lat. Auripigmentum*), the name usually given to sulphuret of arsenic. When artificially prepared, it is in the form of a fine yellow-colored powder; but it is found native in many parts of the world, particularly in Bohemia, Turkey, China, and Ava. It is exported from the last two in considerable quantities, and is known in the East by the name of hantel. Native orpiment is composed of thin plates of a lively acid color, intermixed with pieces of a vermilion red, of a shattery foliaceous texture, flexible, soft to the touch like talc, and sparkling when broken. Specific gravity, 8.15. The inferior kinds are of a dead yellow, inclining to green, and want the bright appearance of the best specimens. Its principal use is as a coloring drug among painters, bookbinders, etc.—THOMSON'S *Chemistry*; MILNEUR'S *Orient. Comm.*

Orsedew, Oraidue, Manheim or Dutch Gold (Ger. *Nittergold*; Du. *Klattergoud*; Fr. *Oripeau, Oliguant*; It. *Orpello*; Sp. *Orapel*), an inferior sort of gold leaf, prepared of copper and zinc. It is sometimes called *leaf brass*. It is principally manufactured in Manheim.

Ostrich Feathers. See FEATHERS.
Oswego. Oswego is one of the most thriving cities in the Union. With a population of 20,000, it does as much business as many cities of twice its population. The Welland Canal has given it advantages over even Buffalo, and hence its trade grows enormously. Its increase has been so steady that it will continue to grow with every improvement in the Western States.

The receipts of flour and grain by lake for three seasons are given as follows:

Showing an increase in 1856 of 6,717,717 bushels over 1854, and 3,064,661 bushels over 1855.

The annual review of its commerce for 1856 says, of the grain warehouses of Oswego, "There are ten elevators, which are capable of elevating in the aggregate over 37,000 bushels of grain per hour, and storage room for over two million bushels." This is about the same as Milwaukee. There are in Oswego sixteen mills, with eighty-six run of stone, capable of manufacturing 8600 barrels of flour a day, or over 1,800,000 barrels in a year.

Out of Trim, the state of a ship when she is not properly balanced for the purposes of navigation, which may be occasioned by a defect in the rigging or in the stowage of the hold.

Outrigger, a strong beam of timber, of which there are several, fixed upon the side of a ship, and projecting from it, in order to secure the masts in the act of careening, by counteracting the strain they suffer from the effort of the careening tackles, which, being applied to the mast-head, draw it downward, so as to act upon the vessel with the power of a lever, whose fulcrum is in her centre of gravity. *Outrigger* is also a small boom, occasionally used in the top to give additional security to the top-mast.

Owners of Ships. The ownership or title to a ship can be acquired in several ways, as by purchase, building, or capture. In regard to the first, it is generally done by a bill of sale, of which there are two kinds: the first is where the ship passes from the builder to the first purchaser, and is called the grand bill of sale; the second is where the owner of the ship not being the builder, transfers his interest to another purchaser. Upon the death of the owner, his interests devolve upon his executors or his personal representatives. Special conditions may be introduced which may vest the property in the purchaser, although the property may not have been completed, such as a payment of a certain part of the purchase-money when a part of the vessel has been completed; and the builder may not require him to accept any other.

er.—**ABBOT.** A ship's boat does not constitute a part of a vessel's tackle, apparel, furniture, etc.

Property in ships is sometimes acquired by capture. Daring war ships and private ships having letters of marque, are entitled to make prizes. But before the captors acquire a legal title to such prizes, it is necessary that they should be condemned in the admiralty or other court constituted for that purpose. When this is done, the captors are considered to be in the same situation, with respect to them, as if they had built or purchased them.—See articles PRIVATEERS, LETTERS OF MARQUE, PRIZES, and SHIPS AND SHIPPING.

Oyster, a well-known edible shell-fish, belonging to the genus *ostrea*, occurring in most parts of the world. The European oyster (*O. edulis*), which forms a considerable article of trade on the coasts of England and France, is taken by dredging, after which the animals are placed in pits formed for the purpose, furnished with sluices, through which, at spring tides, the water is suffered to flow. In these receptacles they acquire the green tinge so remarkable in the European oyster, and which is considered as adding to their value. This color, which at one time was supposed to be owing to some mineral impregnation, has recently been ascertained to arise from the *confirma*, and other marine vegetable matter, on which the animal feeds. The oysters brought to the different markets in the United States are furnished by several species, which it is extremely difficult to discriminate, and are known among the vendors and epicures of this food by appellations derived from the places from whence they are brought. The business of taking these shell-fish employs a great many hands, and no inconsiderable amount of tonnage. In many places oysters are planted, as it is called; that is, large artificial beds are formed in favorable situations, where they are permitted to fatten and increase. The breeding-time of oysters is in April or May, from which time to July or August the oysters are said to be *sick* or *in the milk*. This is known by the appearance of a milky substance in the gills. Oysters attain a size fit for the table in about a year and a half, and are in their prime at three years of age; though what the natural term of their lives may be, it is difficult, if not impossible, to determine with any degree of accuracy. Many curious discussions have arisen as to whether oysters possessed the faculty of locomotion. It is well known that, in general, they are firmly attached to stones or to each other; and it has been stated, and generally believed, that they were not endowed with any powers of changing their position. From the observations and experiments of naturalists, however, it appears that they can move from place to place by suddenly closing their shells, and thus ejecting the water contained between them with sufficient force to throw themselves backward, or in a lateral direction. Oysters form the basis of many culinary preparations, but are much more digestible in their raw state than after any mode of cooking them, as this process, in a great measure, deprives them of the non-fishing animal jelly, which forms so large a portion of their substance. The shell of the oyster is composed of carbonate of lime and animal matter, and was at one time supposed to possess peculiar medical properties; but analysis has shown that the only advantage of these animal carbonates of lime over those from the mineral kingdom arises from their containing no admixture of any metallic substance. The lime obtained from the calcination of oyster-shells, though exceedingly pure and white, is better suited for work which does not require great tenacity, as for plastering rooms, than for the common purposes of building, as it does not form as hard a compound with sand as the mineral limes.

Pacific Ocean, a vast watery expanse extending from the Arctic to the Antarctic circle, through 127° of lat., and between America on the east, and Asia, the Malay Archipelago, and Australia on the west. In its widest part, at the equator, it is 10,000 miles across; it narrows especially toward the north, where it communicates with the Arctic Ocean by Behring's Strait; and, including the Indian Ocean, it contains upward of 70,000,000 of square miles, or more than all the dry land on the globe. Its coast line on the American side, though generally bold, is very little broken by inlets; on the Asiatic side it is very irregular; and the Celebes, China, and Yellow seas, with the seas of Japan, Okhotsk, and Kamtschatka, are inlets of this ocean. It is studded with a great number of island groups, the principal of which, proceeding from west to east, are the Ladrones, Carolines, Solomon, Queen Charlotte's, New Hebrides, Feejee, Friendly, Society, Low, Marquesas, Sandwich, and Galapagos islands, and New Zealand, besides a vast multitude of solitary islands, reefs, and sand banks. The great equatorial current of this ocean originates in the *Antarctic drift current*, which flows north along the shores of South America, and then west through the Pacific, where it occupies the entire space between the tropics. Strong land currents sweep round the shores of East Australia and Japan. The northeast trade-wind prevails uninterruptedly between lat. 5° and 23° N.; the southeast trade-wind commonly blows from the equator to lat. 26° S.; between them is the region of calms, extending over 5°, and varying in position according to the season. Greatest equatorial temperature of Pacific 88°-5 Fahr. In lat. 56° 26' the temperature of the sea throughout its depth is 39°-5 Fahr. This ocean became first known to Europeans in 1513; it received its name from Magalhães, who sailed across it in 1521. In the 18th century its different parts were explored by Behring, Anson, Byron, Bougainville, Cook, Vancouver, Broughton, La Perouse, etc. In the present century by D'Entrecasteaux, Krusenstern, Beechey, Fitzroy, D'Urville, Wilkes, and Sir James Ross.

Current of the Pacific.—Lieutenant Bent, of the United States navy, recently read a paper before the Geographical and Statistical Society of New York, of which the following is an abstract, upon "the great ocean current of the Pacific," corresponding with the Gulf Stream of the Atlantic. The Japanese have known it for many years, and call it the Kuro-sino, or Black Stream, from its dark blue color compared with that of the adjacent ocean. The fountain from which this stream springs is the great equatorial current of the Pacific, which in magnitude is in proportion to the vast extent of that ocean, when compared with the Atlantic. Extending from the tropic of Cancer on the north, to Capricorn, in all probability, on the south, it has a width of nearly three thousand miles. With a velocity of from twenty to sixty miles per day, it sweeps to the westward in uninterrupted grandeur around three-eighths of the circumference of the globe, until, diverted by the continent of Asia, and split into innumerable streams by the Polynesian Islands, it spreads the genial influence of its warmth over regions of the earth, some of which, now teeming in prolific abundance, would otherwise be but barren wastes. One of the most remarkable of these off-shoots is the Kuro-Suro, or Japan Stream, which, separated from the parent country by the Hashoe Islands and south end of Formosa, where its strength and character are as decidedly marked as those of the Gulf Stream on the coast of Florida. This northwesterly course continues to the parallel of 26° N., when it bears off to the northward and eastward, washing the whole southeastern coast of Japan as far as the Straits of Sangar, and increasing in strength as it advances, until reaching the chain of islands to the southward of

the Gulf of Yedo, where its maximum velocity, as shown by our observations, is 80 miles per day. Its average strength from the south end of Formosa to the Straits of Sangar is found to be from 85 to 40 miles per twenty-four hours at all seasons that we traversed it.—*Scientific Annual*, 1857.

The Pacific Trade of the United States.—The whole number of arrivals in the United States from ports in the Pacific during the year 1855 were 69; and in 1856, 146.

Package, Scavage, Ballage, and Portage, were duties charged in the port of London on the goods imported and exported by aliens, or by denizens being the sons of aliens. During the Dark Ages it was usual to lay higher duties upon the goods imported or exported by aliens, whether in British or foreign ships, than were laid on similar goods when imported or exported by natives. But according as sounder and more enlarged principles prevailed, this illiberal dis-

tion was gradually modified, and was at length wholly abolished, in so far at least as it was of a public character, by the act of 24 Geo. III. The duties thus preserved to the city were very heavy; but the principle on which they were imposed was exceedingly objectionable, and their collection was attended with a great deal of trouble and inconvenience. Not being levied in other places, they operated to the prejudice of the trade of the metropolis. The act 3 and 4 Will. IV. c. 66, authorized the Lords of the Treasury to purchase up the duties in question from the city. This was done at an expense of about £140,000, and the duties were abolished.

Packet, in Navigation, meant originally a vessel appointed by government to carry the mails between the mother country and foreign countries or her own dependencies. It is now used as nearly synonymous with an ordinary vessel, chiefly of small burden, that freights goods or passengers.—See NEW YORK, PASSENGERS, and POST-OFFICE.

Pack-horse, a horse employed to carry goods on its back in bundles, called packages or packs. In countries not yet intersected by regular roads this is the only mode of transporting goods from one part to another. In Britain, horses were formerly employed for this purpose, but for these carts and wagons are now substituted. In Spain, mules and asses are still so employed, and in Asia and Africa camels and dromedaries.

Padang. This settlement lies on the west coast of Sumatra, and receives its imports almost exclusively from Java. It has no direct importations from foreign countries. Port, harbor, and other commercial regulations the same as at Java, to the government of which island Padang is subordinate. Under the operation of high tariff duties, especially on American cotton goods, the trade between the United States and Padang is insignificant.

Painter In *Naval Language*, a rope used to fasten a boat either along side of the ship to which it belongs, or to some wharf, quay, etc., as occasion requires.

Paints. The coloring substances or pigments used in the arts. The following are some of the principal pigments and coloring substances included in the commercial name of **Paints**, and coloring substances:

Asphaltum,	Lead, red and white,
Bronze Powders,	Mineral White,
Ironawick Green,	Ochre,
Brunswick Blue,	Oxyd of Zinc, etc.

Palermo (anciently **Panormus**), a large city and sea-port, the capital of the noble island of Sicily, on the north coast of which it is situated, the light-house being in lat. 38° 8' 15" N., long. 13° 21' 56" E. Population, 170,000. The Bay of Palermo is about five miles in depth, the city being situated on its southwest shore. A fine mole, fully a quarter of a mile in length, having a light-house and battery at its extremity, projects in a southerly direction from the arsenal into nine or ten fathoms water, forming a convenient port, capable of containing a great number of vessels. This immense work cost about £1,000,000 sterling in its construction; but the light-house, though a splendid structure, is said to be very ill lighted. There is an inner port, which is reserved for the use of the arsenal. Ships that do not mean to go within the mole may anchor about half a mile from it, in from sixteen to twenty-three fathoms, the mole light bearing N.W. ½ W. A heavy sea sometimes rolls into the bay, but no danger need be apprehended by ships properly found in anchors and chain cables. In going into the bay, it is necessary to keep clear of the nets of the tunny fishery, for these are so strong and well moored as to be capable of arresting a ship under sail.—SMYTH'S Sicily, p. 70, and *Append.* p. 4.

Imports and Exports.—The great articles of export

from Sicily, are barley, wheat, fruit, and wine. The principal articles of import are, iron, lead, oil, and various manufactures. The principal exports are, wool, silk, and various manufactures. The principal imports are, iron, lead, oil, and various manufactures.

from Sicily are, olive oil, grain, particularly wheat and barley, silk, brimstone, wine and brandy, barilla, lemons and oranges, lemon juice, manna, shumac, liaseed, fruit, salted fish, and salt; with argol, liquorice, pumice-stone, rags, skins, honey, cotton wool, saffron, etc.

Wheat is largely exported. It is of a mixed quality, hard, and is generally sold from the public magazines, or *caricatori*, by measure, without weight. But the best hard wheat, grown in the neighborhood of Palermo, is sold by the *salma* of 272 rotoll = 476 lbs. English; the difference between weight and measure being made good by the seller or buyer, as the case may be. Wine is principally shipped from Marsala; lemons, oranges, and lemon-juice from Messina; salt from Trapani; and barilla from the southern coast. But all the articles to be found on the coast may, for the most part, be had at Palermo; unless, however, the quantity required be small, it is usually best to ship them from the outports, the expense of their conveyance to Palermo being very heavy. The crops of barilla and shumac come to market in August; but brimstone, salt, oil, wine, rags, etc., may generally be had all the year round. The first shipments of lemons and oranges may be made in the beginning of November.

Purchases of produce are always paid for in cash, generally half on making the purchase, and the other half on delivery, when in Palermo, and on receiving order for delivery, on the coast. The imports consist of cotton yarn, wool, and stuffs; sugar, coffee, cocoa, dye stuffs, iron, earthen-ware, spices, tin, hides, Newfoundland cod, timber for building, etc. The best of the old accounts of the trade of Sicily that we have met with is contained in SWINNUME'S *Travels in the Two Sicilies*, 4to ed., vol. ii. p. 401-413.

Palma (Lat. palma, the hand). An ancient measure of length taken from the extent of the hand. There were two different palms; one corresponding to the length of the hand, and the other to the breadth. The Roman palm was about eight and a half English inches. The English palm is understood to be three inches.

Palma Oil (Ger. *Palmol*; Fr. *Huile de palme*, *Huile de Senegal*; It. *Olio di palma*; Sp. *Acete de palma*) is obtained from the fruit of several species of palms, but especially from that of the *Elais Guineensis*, growing on the west coast of Africa, to the south of Fernando Po, and in Brazil. When imported, the oil is about the consistence of butter, of a yellowish color, and scarcely any particular taste; by long keeping it becomes rancid, loses its color, which fades to a dirty white, and in this state is to be rejected. It is sometimes imitated with hog's lard, colored with turmeric, and scented with Florentine iris root. The inhabitants of the coast of Guinea employ palm oil for the same purposes that we do butter. Our supplies of palm oil are almost wholly derived from the west coast of Africa, of which it is the staple article of export.—LEWIS'S *Materia Medica*; THOMSON'S *Dispensatory*.

Candles are made of palm oil and cocoa-nut oil, of which many thousand tons per annum are now employed. This modern substitution of vegetable fat for animal fat is remarkable. It is bringing Central Africa into intimate commercial relations with civilized countries. The palm oil is exported to Africa, but it assumes a solid state in a colder climate. The casks containing it have steam forced into them, by which the oil is melted and made to flow out; and the oil is then purified and bleached to various degrees of whiteness, according to the purpose to which it is to be applied. The whitened cakes of palm oil are cut into slices by a machine; the slices are deposited on mats of cocoa-nut fibre; the mats are piled in heaps, with iron plates between them; the heaps are placed in hydraulic presses, where intense pressure brings the palm oil to the state of dry, thin cakes. After a little more purification, the palm oil is fitted for melting, previous to the making of candles.

Palms, called by Linnaeus, from their noble and stately appearance, the princes of the vegetable kingdom, are a natural order of arborescent endogens, chiefly inhabiting the tropics, distinguished by their fleshy, colorless, six-parted flowers, inclosed within spathe; their minute embryo, lying in the midst of albumen, and remote from the hilum; and rigid, plaited or pinnated, articulated leaves, sometimes called fronds. Wine, oil, wax, flour, sugar, and salt, says Humboldt, are the produce of this tribe; to which Von Martius adds thread, utensils, weapons, food, and habitations. The most common species is the cocoa-nut. Their wounded stems, or spathe, yield in abundance a sac-

the nature of the ground, which not unfrequently consisted of deep marshes, but more from the luxuriance and strength of the vegetation through which it was necessary to penetrate, and the heat, moisture, and unhealthfulness of the climate. Unluckily, the desire to accomplish their task in the shortest time and at the least expense, tempted the engineers to execute the work in a very superficial manner, substituting bridges, viaducts, pillars, etc., of wood for those of stone, mortar, and iron. In a country where the decomposition of vegetable matter is so very rapid this was as false and spurious a species of economy as can well be imagined. Already several miles of the railway have had to be repaired, or rather reconstructed, by the substitution of *lygnum vitæ* and other hard woods for the softer ones that were first used. This, however, will do little more than palliate the evil; and there can be no doubt that eventually stone and iron bridges and viaducts will have to be used instead of wooden ones every where along the line. Trains take about four hours in passing from sea to sea; but were the railway properly finished, the passage might be performed in less than half that time. A station, called Aspinwall, has been erected on Manzanilla Island, in the Caribbean Sea. But it is extremely unhealthy, and there is little prospect of its ever becoming a place of much importance.

—TOMES'S *Panama Railroad*, New York, 1855, *passim*.

But supposing (which is not the case) that this railway were every thing that could be desired, still it is plain that the grand desideratum is the carrying across the isthmus of a water communication between the Atlantic and Pacific oceans. We do not mean by this a canal suitable only for boats, or vessels of comparatively small burden. Such a channel would be of little use, except to the countries contiguous to its termini. What is really wanted is a canal that will admit ships of the largest burden, and bound on the longest voyages. The advantages that would result from having the isthmus perforated by such a channel can not be easily exaggerated. No other project that appears to be within the limits of possibility, perhaps not even the carrying of a ship canal across the Isthmus of Suez, would give so great a stimulus to commerce and navigation. It would remove the barrier which renders the navigation between the eastern and western coasts of America so tedious and difficult. And, by doing this, it would enable ships from Europe to reach the latter and the Pacific in less than half the time they do at present, while it would greatly facilitate the voyage to Australia and China.

And a grand project of this sort is on foot. It is proposed to cut a canal that shall admit ships of 1000 tons burden and upward, between Porto Escoces (lat. 8° 5' N., long. 77° 21' W.), near Point Caledonia, in the Gulf of Darien, on the Caribbean Sea, and the Rio Savana, which falls into the Gulf of San Miguel, on the Pacific. The intervening space (about 38 or 40 miles) is said to be comparatively flat; the ports at each extremity are easy of access, and have deep water; and it is proposed that the canal should be constructed throughout on the same level, and have no locks. The cost of the project is estimated at from 12 to 15 millions sterling. And considering the vast importance of such a work to the United States, to England, and, indeed, to all maritime nations, this expense, heavy as it may appear, should be reckoned a subordinate matter. Were the country through which it is to pass in the possession of England or the United States, it would most probably have been undertaken. But the unsettled state of Central America, and the knotty questions that might eventually arise as to the property and management of the canal, are serious obstacles to its being proceeded with.—See, for ample details on this interesting subject, the work of DR. CULLEN, entitled *Isthmus of Darien Ship Canal*.

The route by which the railroad passes is in every respect the most desirable for this purpose, and the

means by which the character of the country could be best known, as far as its topography and the features essential to the object in view could be seen. It was, in fact, the direct means for the accomplishment of the purpose. It is supposed that the canal will be united with the waters of the Pacific on either side of the city, and that a channel might be dredged to the depth of thirty feet, to meet the navigable waters for ships of large draught. The bay then expands into an ample harbor, where the winds are said never to blow with violence, sufficiently comprehensive for the commerce of the world, and studded with islands, convenient for all the great purposes that the condition of things would call for, by the construction of a canal through the isthmus.

The Isthmus itself seems to present no serious obstacle to science for the construction of a canal. The whole extent, from the Atlantic to the Pacific, is made up of swamps, hills, and plains; and the highest point of land where the railroad passes is not more than 286 feet above the level of the sea. On the whole route, most if not all the hills through which the canal would pass would be required for embankments over the plains and swamps; and there are no insuperable obstacles to piercing the highest part, so as conveniently to make the waters of the Chagres, Obispo, and Rio Grande available for the wants of a canal. In a climate less unfavorable to the white man, the question of "feasibility" would not be raised. It seems to be conceded, from experience, that the African race alone persistently labor in this climate. A few thousand of free blacks might be obtained from the West India Islands; but this resource would be inadequate, as was experienced by the operations on the Panama Road. The want of men to labor would seem to be the great obstacle to the successful accomplishment of a work of so much magnitude.

On the Atlantic side the canal would enter the Bay of Aspinwall. In approaching this point, it would pass a few miles from the Chagres, and enter the bay near the River Mindi. Here, it will be seen, as in the Bay of Panama, extensive dredging for a channel to meet the deep water would be necessary. The bay expands for the distance of about five miles, between two headlands, and is open to the sea. A breakwater would be necessary here. With such an one as would afford the necessary protection against the ocean swell, the Bay of Aspinwall, like the Bay of Panama, would afford ample room for the commerce of Europe as well as America; and in contemplating these two bays with the eye of a seaman, and in reference to the great work in question, it would look as though nature had provided them for the especial convenience of man in his laborious undertakings in the extension of commerce, as a place where all nations may meet, in their varied pursuits on the great highway of the ocean. In a work like that of a canal through the Isthmus of Darien, it is to be supposed that the requirements of commerce and navigation, in its most extended application, would alone be considered; and, taking this for a standard, a canal two hundred feet wide and thirty feet deep would seem to be the appropriate dimensions. With such an avenue from the Atlantic, the stormy and distant seas of the South would be abandoned by Europe as well as America, and we should meet there on neutral ground, pursuing with a common purpose the paths of peace and industry, which by its means, we may suppose, would effect a moral revolution such as the world has never known, and surpassing in importance that which would be effected in the revolution of the commercial world.

Appended is a paper submitted by Colonel G. M. Totten, containing dimensions and other data for the proposed ship-canal across the Isthmus of Panama:

Dimensions and other Data of the proposed Ship-Canal across the Isthmus of Panama.—Length from shore to shore, 45½ miles. Length from five fathoms water

in Navy Bay, on the Atlantic, to three fathoms water in Panama Bay, on the Pacific, 48½ miles. The prism of water to be 150 feet wide at the bottom, 270 feet wide at surface, and 31 feet deep. The locks to be 400 feet in clear length of chamber, and 90 feet in clear width. The summit level will be 150 feet above mean tide of the Atlantic and Pacific oceans. The summit cut will be about four miles long. The deepest cutting on this level will be 136 feet, and the average depth of the cut will be 49 feet. The River Co. yields an ample supply of water for the canal all seasons of the year. The summit level will be supplied by a feeder about twenty-four miles long, which will tap the River Chagres about twenty-one miles above the town of Cruces, where the level of the river is about one hundred and eighty-five feet above mean tide, and about thirty-five feet above the summit level. The cost of this canal, including the requisite harbor improvements at each end, will not exceed \$80,000,000.

—COMMODORE PAULDING'S Report to the Navy Department, United States, 1857.

The following figures will show the comparative distances from New York to San Francisco of the four routes, exclusive of the land travel:

Routes.	Distance on Atlantic	Distance on Pacific	Total.
	Miles.	Miles	Miles
Panama.....	2392	8756	6147
Nicaragua.....	2403	2964	5367
Honduras.....	2102	2535	4637
Tehuantepec.....	2276	2385	4551

The several transit distances, and the total distances from New York to San Francisco, are shown by the following table:

Routes.	Transit Distance.	Total Distance.
	Miles	Miles
Panama.....	51	6198
Nicaragua.....	137	5504
Honduras.....	161	5128
Tehuantepec.....	226	4817

Papal States. This portion of Italy comprises an area of 17,210 square miles, and contained in 1850 a population of 3,096,771 inhabitants. The chief productions of the Papal States are wheat, maize, pulse, hemp, wine, oil, and tobacco. There are numerous mines of iron, lead, sulphur, alum, vitriol, and other volcanic products; but, with the exception of the sulphur mines near Rimini, they are unproductive. The quantity of this article annually manufactured amounts to about 81,000,000 pounds. The manufactures of the Papal States comprise silks, leather, gloves, paper, musical strings, iron and glass ware, a few cotton goods (at Rome), crapes and sausages (at Bologna), and cordage, soap, cream of tartar, and glue. There is no direct trade between the United States and the Papal States—the latter deriving their supplies of cotton, sugar, coffee, cocoa, rum, &c., from the ports of Genoa and Trieste. The foreign commerce of these states is conducted chiefly through the ports of Ancona and Civita Vecchia—the former with the western shores of the Adriatic, and the latter with the Mediterranean ports. The celebrated Roman cement is exported from the port of Civita Vecchia.

Foreign Trade.—In 1850, the foreign trade of Ancona represented \$4,464,000, viz., imports, \$2,976,000; exports, \$1,388,000. This trade was distributed between Austria, England, and its dependencies in Europe, these countries appropriating more than three-fourths of the whole. During the same year the foreign trade of Civita Vecchia amounted to \$3,821,928; viz., imports, \$2,929,314; exports, \$892,614. The countries participating in this trade were France, Sardinia, England, Holland, and the Two Sicilies. The whole foreign commerce of the Papal States in 1850 amounted to \$19,208,680; and in 1851 to \$20,454,240. All foreign vessels are permitted to engage in the coasting trade of the States on the payment of the fol-

lowing dues: A. Chorage, on French, Austrian, and American vessels, three bajocchi per ton—about three cents. Foreign vessels putting into harbor, either for anchorage or through stress of weather, pay half of the above-named duty.—See ITALY.

Clearance Duty.—For each vessel of from 1 to 149 tons, ten bajocchi (ten cents); and for 150 tons and upward, twenty bajocchi (twenty cents). No vessels enjoy an exemption from the custom-house duties on imports and exports. These duties have recently undergone several reductions, applicable chiefly to articles of necessity; on articles of luxury, in which sugar is included, the duties have been proportionably raised.

—Commercial Relations of the United States.

Paper (Ger. and Du. *Papier*; Fr. *Papier*; It. *Carta*; Sp. *Papel*; Rnas. *Bumaga*; Lat. *Charta*; Arab. *Kar*; Pers. *Kaghas*). This highly useful substance is, as every one knows, thin, flexible, of different colors, but most commonly white, being used for writing and printing upon, and for various other purposes. It is manufactured of vegetable matter reduced to a sort of pulp. The term paper is derived from the Greek word *παρῖπος*, *papyrus*, the name of the plant on the inner bark of which (*Liber*, *βιβλος*, whence our word *book*) the ancients used to write. Paper is made up into sheets, quires, and rams, each quire consisting of twenty-four sheets, and each ream of twenty quires.

Historical Sketch of Paper. *Difference between ancient and modern Paper.*—Some of those learned and ingenious persons who have investigated the arts of the ancient world have expressed their surprise that the Greeks and Romans, though they possessed an immense number of books, and approached very near to printing in the stamping of words and letters, and similar devices, should not have discovered the art; the first rude attempts at typography being sufficiently obvious, though much time and contrivance have been required to bring the process to its present state of perfection. But they should rather, perhaps, have wondered that the more civilized nations of antiquity did not invent paper, an invention which, it may easily be shown, necessarily precedes that of printing. But this was an exceedingly difficult task; the more so, that the vast importance of paper could not be appreciated, or even imagined, till after it had been generally introduced. At first, the memory of important events appears to have been handed down by inscriptions cut on rocks, pillars of stone or marble, and the walls of edifices; and this primitive usage is still retained in the monuments in our churches and cemeteries. In a later, though still very remote age, men were accustomed to write upon portable surfaces of various kinds. Every body knows that the Decalogue was written upon tables of stone; and Joshua wrote a copy of the law upon the like materials.—*Josh. c. viii., v. 52.* The Greeks and Romans engraved laws, treaties, contracts, and other important documents, on plates of brass; and it is stated that a fire which broke out in the capitol, in the reign of Vespasian, consumed above 3000 such bronze monuments.—*Nouveau Traité de Diplomatique*, l. 451. But exclusive of plates of this sort, which were necessarily inconvenient, costly, and quite unfit for ordinary use, thin and flexible plates of lead and other metals (*Job. c. xli., v. 23, 24*), thin pieces of wood, skins, parchment, linen, and a variety of similar substances, were used in writing. Cheaper materials, such as the leaves and bark of trees, palms, &c., were also used from a very remote period for the same purpose; but leaves (*χαρται, charte*) being, when dry, apt to split in the direction of the fibres, it was found to be necessary, in preparing them for writing, to glue them together, so that the fibres might cross each other in opposite directions. The texture of the leaf, or sheet, if we may so call it, is thus greatly strengthened; and when it has been smoothed, polished, and fitted for use, it is less inconvenient and better looking than might be supposed. Such, in

fact, la was for Egypt consist reed o banks which plied t pose; it has a bark h Instru ments, gitudl portion ter, to and ot Not. fact, is the principle on which the paper of the ancients was formed. This, however, which was called *Charta Egyptiaca*, from the place of its manufacture, did not consist of leaves, but of the inner bark of the famous reed or rush, the *Cyperus Papyrus*, found along the banks of the Nile, or rather in the pools and ditches which communicate with the river. The ancients applied this useful plant to an immense variety of purposes; but here we shall only notice that from which it has acquired an immortality of renown. The inner bark having been divided by a needle or other sharp instrument into very thin and broad layers or filaments, portions of these were placed side by side longitudinally, and glued together at the ends; another portion being glued cross-wise on the backs of the latter, to give the page the requisite strength. Pliny and other writers have described the process (*Hist. Nat. lib. xlii. c. 11, 12, 13*), which has been further elucidated by Haraduin and other commentators. But the fullest and ablest discussion of this curious subject is contained in the very learned and elaborate work, the *Nouveau Traité de Diplomatique* (l. p. 448-524), where the most interesting particulars respecting the history and manufacture of papyrus, as well as of the greater number of the other writing materials used in antiquity, have been collected and set in the clearest point of view.—See also the *Dictionnaire Diplomatique* of De Vaines, art. PAPIER, li. 165-174. Bruce has given a summary of the authorities in the seventh volume of the octavo edition of his *Travels*; and, not satisfied with this, he attempted to make paper from the papyrus, in which, not being very successful, he imputes his failure to errors in the statements of Pliny; not reflecting that, had he endeavored, trusting to written directions, without experience and traditional art, to make modern paper, or even a pair of shoes, he would most probably have been equally inefficient. Egypt enjoyed for a lengthened period a natural monopoly of this valuable article, and even attempted, in anticipation of a later policy, by prohibiting the growth of the papyrus, except in certain localities, and limiting its supply, to sell its produce at an artificially enhanced price!—AMELTON, *Commerce des Egyptiens*, p. 238. But this policy ceased on the conquest of Egypt by the Romans, who, having imported the plant into Rome, succeeded in preparing from it a very superior article. Pliny enumerates the various kinds of paper, from the coarsest, which was used, like our brown paper, for packing, to the most expensive and finest. The latter, which was made of the innermost filaments, was of a snowy whiteness; and when properly dressed and polished, was easily written upon. The consumption was very considerable; and being, after the foundation of Alexandria, principally made in that city, it formed an important article in her commerce, and furnished employment for many workmen and much capital. Flavius Vopiscus relates that, in the third century, the tyrant Firmus used to say there was so much paper there, and so large a quantity of the fine or size used in its preparation, that he could maintain an army with it: "*Tantum habuisse de chartis, ut publicè sepe diceret, exercitum se alere posse papyrò et glutinò.*" We may doubt whether the value of the paper at present belonging to any single city would do the like. *Charta Egyptiaca* is very ancient, having, notwithstanding the assertion of Varro and Pliny to the contrary (*Hist. Nat. lib. xlii. cap. 11*), been in common use long before the age of Alexander. This is evident from the statement of Herodotus, who, though he lived about a century before that conqueror, tells us that in former times, when papyrus was scarce, the Ionians wrote on the skins of goats and sheep, and that that practice continued to be customary among several barbarous nations.—Lib. v. cap. 68.

Though white, smooth, durable, and not ill adapted for writing, ancient paper was not suited for the printer; by reason of the closeness of the grain, it would

not have received the ink from types more kindly than shavings of wood, and such like materials; and its texture was so very brittle that it would have shivered to pieces under the press. It was, in truth, an inert, stercoral mass ("*viscera nivea virentium herbarum*"), no great invention or ingenuity being discovered in its preparation. Modern paper, on the other hand, is wholly artificial; and the contrivances for its manufacture are marvelous alike for the sagacity evinced in their design and their practical efficiency. Like the paper of antiquity, it is formed of the filaments of various sorts of vegetable substances, derived principally from the tearing to pieces or pounding cotton and linen rags, and similar materials, mixed with water. This process is called beating them into pulp; and when examined with a microscope, the floating filaments are found to be well fitted for adhering together, being jagged and rough, and mixed in every possible way. A portion of this mixture or pulp being, when properly prepared, poured upon moulds or sieves of fine woven wire, the water is drained off, and the suspended fibres falling to the bottom, form a layer or sheet, which, being consolidated by pressure and dried, becomes paper, its strength and goodness depending, of course, in a great measure, on the quality of the rag or other material of which it is made. Paper used to be manufactured by dipping sieves or frames into the pulp, the portion of filaments so lifted up forming the sheet of paper. But the application of rotary motion to the manufacture has effected a total change in the mode in which it was carried on: instead of dipping the sieves or frames into the cistern of pulp, a circular web, or round towel of woven wire, revolves horizontally under the vessel (technically called the vat), receives the deposit, conveys it away, and, by an adjustment of extraordinary delicacy, transfers it uninjured, though as fragile as a wet cobweb, to a similar revolving towel of felt; thus an endless web of paper is spun, as long, at least, as the machine continues to move and pulp is supplied.

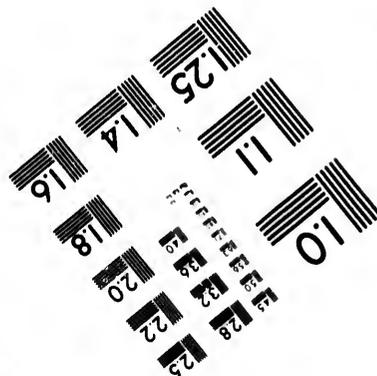

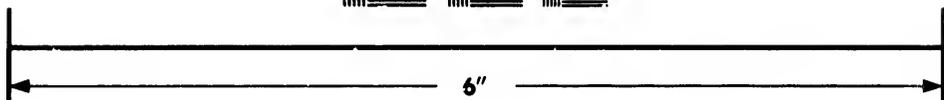

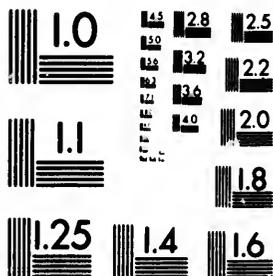

The pensive and spongy texture of paper make it readily imbibe and retain the ink impressed on it by types in printing, and by the pen in writing; its toughness hinders it from being easily torn; and, in a well-bound book, under favorable circumstances, its duration is indefinite, and, for all practical purposes, eternal! It is true that legal documents are sometimes written or printed on parchment, which is less liable to be torn or injured by rubbing; the luxury of typography occasionally, also, exhibits a few impressions of a splendid work upon vellum; and it is further true that these substances were used for writing upon by the ancients; but they are necessarily expensive, and the cost of either far exceeds the means of the great majority of book buyers—so that it would be altogether unprofitable to cast types, to construct presses, and to incur the various and heavy charges of an establishment for printing, unless we possessed a cheaper material on which to print. Almost all the more ancient and valuable existing Greek and Latin manuscripts are written either on parchment or vellum, but generally on the latter. It is singular, however, that while such is the case, all or almost all the very old charters and diplomas are written on papyrus. Indeed, the learned authors of the *Nouveau Traité de Diplomatique* affirm that no parchment charter has been discovered anterior to the sixth century.

It appears to be sufficiently established that paper, fabricated like that now in use, of cotton and other vegetable materials, and of silk, has been manufactured in China from a very remote epoch.—*Nouveau Traité de Diplomatique*. The Arab historians state that similar paper was manufactured in Mecca in the beginning of the eighth century (*ASUNES, Origine e Progressi d' Ogni Letteratura*, and GRINON, ix. 379); and most probably the mode of its production was then also known to the Greeks. It appears to have been

try. In other respects the change would have been of little practical importance. There are extremely few persons in India, as compared with those in England and most European countries, who would have suffered by a fall in the value of money; and government could have readily indemnified itself for any loss it might thereby have incurred. A further substitution of gold for silver will also be probably brought about by using gold coins of less value than formerly. In most countries, for example, gold might be advantageously taken into one-dollar pieces. It would be inconvenient, perhaps, to have gold coins worth less than this; but of this value their employment would be beneficial as well by economizing the use of silver as by their being more convenient and easily carried about. The lessened demand for silver in Europe and the United States; and the greater demand for it in India, arising out of the circumstances now and previously adverted to, have contributed to that immense expectation of silver to the East to which we have already called the reader's attention. But there are no satisfactory reasons for thinking, unless some fresh changes take place in the circumstances under which gold and silver are produced, that this exportation of silver will be of long continuance. It is difficult, indeed, to say how great a quantity of silver might be imported into India without sensibly affecting its value there; but the increase of its value in Europe, arising from the diminution of its supply, will eventually hinder its being sent elsewhere. The apprehensions that were formerly so very prevalent, even among those who should have known better, in regard to an immediate and heavy fall in the value of gold have now in great measure subsided. It appears to be now pretty generally admitted that if a fall should take place, it will only manifest itself by slow degrees; and this conclusion would appear to be pretty well founded.

The supplies of gold from Australia have fallen off very greatly since 1852. In proof of this we subjoin a statement by Mr. Kihl, of Melbourne, showing the comparative produce of the gold fields of Victoria in 1852, 1853, 1854, and 1855.

Year.	Amounted Outward.	Unrecorded Outward.	Total Outward.	Price per oz.	Value.
1852	3,192,333	1,565,835	4,758,168	70s.	21,900,798
1853	3,275,159	896,159	4,171,318	75s.	11,568,782
1854	1,581,434	801,264	2,382,698	80s.	5,770,195

Now supposing that the supplies from the gold fields of New South Wales and other parts raised the total produce of Australian gold in 1854 to \$50,000,000, still that would be little more than half the estimated produce (\$95,000,000) of 1852; a decline which would go far to check any downward tendency, if such there were, in the value of gold. It is affirmed, indeed, in communications from Victoria, that the produce of the gold fields in the current year (1855) will exceed their produce in 1854. This, however, is doubtful; but supposing it to be the case, and that their produce should amount to \$50,000,000, still that would be nearly \$25,000,000 below its amount in 1852. And though it be quite impossible to say whether the yield of the current year (1855) is destined to increase or fall off in time to come, our anticipations are rather in favor of a decline. The great excitement of the gold fields has already pretty well subsided; both in Australia and California. They are found to be a lottery with many great prizes; but in which notwithstanding the blanks very largely predominate. The probability, indeed, seems to be that the deposits of stream gold will in no lengthened period be comparatively exhausted; and that gold in future will have to be principally obtained by the crushing of quartz rocks, an employment which is rarely found to be productive of more than ordinary profits. The supply of silver from Mexico is now (1855) supposed to amount to from \$25,000,000 to \$30,000,000 a year. On the other hand, however, the

supply of the precious metals from Russia has decreased, and somewhat qualifying a former opinion, so that on the whole, it may be concluded that at present no decline need be expected in the value of the precious metals. On the contrary, an increase of their value would seem to be more probable. Most likely, however, it will continue about stationary till it begins to be influenced by some new combination of circumstances. See article France; also to California, Gold, Silver, Comets; also Bankers Magazine, vol. III. (the last essay on the subject by Baron Haussmann), liv. vi. vii. viii. ix. x. xi. xii. New York 1848-1857. See article Insurance, by Robinson, vol. III. Press, the Printing. This great engine was of wide construction from the period of the discovery of the art of printing; up to the close of the 18th century, when many improvements were made. William Goss, a mirror of London, had a press set up at Westminster, 1471. — Brown's Chronicle. The Earl of Stanhope's presses were in general use in 1600. The printing-machine was invented by Koenig in 1811; and Applegath's followed. The Columbian press of Clymer was produced in 1814; and the Albion press, an improvement on the last, came into use a few years after. Printing by means of steam-machinery was first executed in England at the Times-office, London, on Monday, November 28, 1814. Overly's and Applegath's rollers for distributing the ink upon the types were brought into use in 1817. What improvements have been made in the United States within a few years, both in hand and steam-presses? The most celebrated manufacturers probably are R. Hoe & Co., of New York. Their largest presses for newspapers are capable of throwing off over 20,000 sheets per hour, which is so much in advance of any presses in Europe that they have supplied orders from Paris. The presses of Seth Adams & Co., of Boston, are perhaps the best in the world for book printing. See article Books.

Press-gang, the name given in England to a detachment of seamen who (under the command of a lieutenant) are empowered, in time of war, to take any sea-faring men; and oblige them to serve on board the king's ships. See article Sea.

Press of Wind, signifies as much as the then state of the wind, etc., will permit a ship to carry.

Price. By the price of a commodity is meant its value estimated in money; or simply the quantity of money for which it will exchange. The price of a commodity rises when it fetches more, and falls when it fetches less money. Price of freshly-produced Commodities. — The exchangeable value of commodities—that is, their power of exchanging for or buying other commodities—depends, at any given period, partly on the comparative facility of their production, and partly on the relation of the supply and demand. If any two or more commodities respectively required the same outlay of capital and labor to bring them to market, and if the supply of each were adjusted exactly according to the effectual demand—that is, were they all in sufficient abundance, and no more, to supply the wants of those able and willing to pay the outlay upon them; and the ordinary rate of profit at the time—they would each fetch the same price, or exchange for the same quantity of any other commodity. But if any single commodity should happen to require less or more capital and labor for its production; while the quantity required to produce the others continued stationary, its value, as compared with them, would, in the first case, fall; and in the second, rise; and, supposing the cost of its production not to vary, its value might be increased by a falling off in the supply; or by an increase of demand, and conversely. But it is of importance to bear in mind that all variations of price arising from any disproportion in the supply and demand of such commodities as may be freshly produced in indefinite quantities are temporary only; while those that are occasioned by changes

in the cost of their production are permanent, at least as much so as the cause in which they originate. A transient, mounting occasion, a transient rise in the price of black cloth is, but supposing that the fashion of wearing black were to continue, its price would not permanently vary; for those who previously manufactured blue and brown cloths, &c. would henceforth manufacture only black cloth; and the supply, being in this way, increased to the same extent as the demand, the price would settle at its old level. Hence the importance of distinguishing between a variation of price originating in a change of fashion or other accidental circumstance, such, for example, as a deficient harvest, and a variation occasioned by some change in the cost of production. In the former case, prices will, at no distant period, revert to their old level; in the latter the variation will be lasting. When the price of a freely produced commodity rises or falls, such variation may evidently be occasioned either by something affecting its value, or by something affecting the value of money. But, when the generality of commodities rise or fall, the fair presumption is that the change is not in them, but in the money with which they are compared. This conclusion does not, however, apply in all cases, and we believe that most part of that fall in the price of commodities, which has taken place since the peace, and which has been so generally ascribed to a rise in the value of money, occasioned by a decline in the productiveness of the mines, has been caused by the increased productiveness of industry, arising from the abolition of oppressive restrictions on commerce, the opening of new and more abundant sources of supply, and the discovery of new means and improved methods of production.

Price of monopolized Commodities.—Exclusive, however, of the commodities now alluded to, there is a considerable class whose producers or holders enjoy either an absolute or a partial monopoly of the supply. When such is the case, prices depend entirely or principally on the proportion between the supply and demand, and are not liable to be influenced, or only in a secondary degree, by changes in the cost of production. Antique statues, and gems, the pictures of the great masters; wines of a peculiar flavor, produced in small quantities, in particular situations; and a few other articles, exist under what may be called absolute monopolies; their supply can not be increased; and their prices must, therefore, depend entirely on the competition of those who may wish to buy them, without being in the slightest degree influenced by the cost of their production. Monopolies are sometimes established by law; as when the power to supply the market with a particular article is made over to one individual or society of individuals, without any limitation of the price at which it may be sold; which, of course, enables those possessed of the monopoly to exact the highest price for it that the competition of the buyers will afford, though such price may exceed the cost of production in any conceivable degree. Monopolies of this sort used to be common in England, particularly in the reign of Elizabeth; but they were finally abolished by the famous act of the 21 Jan. 1. c. 3—an act which, by establishing the freedom of competition in all businesses carried on at home, has been productive of the greatest advantage.—See MONOPOLY. The corn laws establish a partial monopoly of the supply of Great Britain with corn in favor of the agriculturists; but, as competition is carried to as great an extent in agriculture as in any other business, this monopoly does not enable them to obtain a higher price for their produce than is sufficient to pay the expenses of its production, though, owing to the peculiar circumstances under which England is placed, this price is higher than the price in the surrounding countries. Hence it results that the monopoly is injurious to the public, without being of any advantage to those engaged in the business of agriculture. Neither, indeed, can it

be truly said to be advantageous to the landlord. The rights conveyed by patents sometimes establish a valuable monopoly; for they enable the inventors of improved methods of production to maintain, during the continuance of the patent, the price of the article at a level which may be much higher than is required to afford them the ordinary rate of profit. This advantage, however, by stimulating invention, and exciting to new discoveries, of which it is the natural and appropriate reward, instead of being injurious, is beneficial to the public. There are also partial monopolies, depending upon situation, connection, fashion, &c. These and other inappreciable circumstances, sometimes occasion a difference of 80 per cent. or more in the price of the same article in shops not very distant from each other. Generally speaking, the supply of monopolized commodities is less liable to vary than the supply of those which are freely produced; and their prices are commonly more steady. But there are various exceptions to this rule, and of these the corn monopoly is one. The great variations in the harvests of particular countries, and their average equality throughout the world, exposes a nation which shuts foreign corn out of its ports to destructive vicissitudes of price, from which it would enjoy a comparative exemption were the ports open. Sometimes the expiration of a monopoly—a patent, for example—has occasioned a sudden and extraordinary increase of supply, and consequent fall of price; as falling, of course, a serious loss on the holders of large stocks of goods produced under the monopoly.

New Sources of Supply.—The effects on prices produced by the opening of new markets, or new sources of supply, are familiar to every one. The fall that has taken place in the price of pepper, and of most sorts of commodities brought from Europe from the East, since the opening of the trade in 1614, is a conspicuous proof of what is now stated.

Influence of War on Prices.—The effect of war in obstructing the ordinary channels of commercial intercourse, and occasioning extreme fluctuations in the supply and price of commodities, is well known. In this respect, however, the latter part of the French war is, perhaps, entitled to a pre-eminence. England then dealt with an enemy who had extended his sway over every part of the Continent; and who endeavored, by most means in his power, to shut us out of the Continental markets. Mr. Tooke has given, in his elaborate and valuable work on *High and Low Prices*, a variety of details which strikingly illustrate the effect that the regulations then adopted by the belligerent powers had on prices. "Among the means," says Mr. Tooke, "devised by the ingenuity and enterprise of adventurers to elude or overcome the obstacles presented by the decrees of the enemy, one in particular, which was resorted to on an extensive scale, deserves mention, as illustrating in a striking manner, the degree in which these obstacles were calculated to increase the cost to the consumer. Several vessels laden with sugar, coffee, tobacco, cotton twist, and other valuable commodities, were dispatched from England, at very high rates of freight and insurance, to Salonica, where the goods were landed, and thence conveyed on mules and horses through Servia and Hungary to Vienna, for the purpose of being distributed over Germany, and possibly into France. Thus it might happen that the inhabitants of that part of the Continent most contiguous to this country could not receive their supplies from us without an expense of conveyance equivalent to what it would be if they were removed to the distance of a sea-voyage twice round the globe, but not subject to fiscal and political regulations." And in consequence of these, and other causes of the same sort, Mr. Tooke mentions that the price of sugar in France, and other parts of the Continent, during the latter years of the war, was as high as 5s. and 6s. a pound; that coffee rose to 7s. indigo to 18s., and so on.—But the sums charged for freight and insurance were the most ex-

traordinary. Mr. Tooke states that he has known instances in which the license, freight, and other charges on account of a vessel of about 100 tons burden, making a voyage from Calais to London and back, have amounted to the almost incredible sum of £50,000! A ship, of which the whole cost and outfit did not amount to £4000, earned during the latter period of the war a gross freight of £80,000 on a voyage from Bordeaux to London and back! The freight of indigo from London to the Continent does not at present exceed 1*d.* a pound; whereas it amounted, at the period referred to, to about 4*s.* 6*d.*—*High and Low Prices*, 2d ed. p. 212.

6. *Influence of Taxes on Prices.*—It is unnecessary to dilate on a topic so familiar to every one. When a tax is laid on a commodity, its price necessarily rises in a corresponding proportion; for otherwise the producers would not obtain the ordinary rate of profit, and would, of course, withdraw from the business. The rise in the price of several of the articles in the annexed table is principally to be ascribed to the increase of taxation. These statements will probably suffice to give our readers a general idea of the principles which determine the value of commodities. To go deeper into the subject would involve us in discussions that belong to political economy, and are among the most intricate in that science. The influence of speculation on prices must not, however, be passed over in a work of this sort.

6. *Influence of Speculation on Prices.*—It very rarely happens that either the actual supply of any species of produce in extensive demand, or the intensity of that demand, can be exactly measured. Every transaction in which an individual buys produce in order to sell it again, is, in fact, a speculation. The buyer anticipates that the demand for the article he has purchased will be such, at some future period, either more or less distant, that he will be able to dispose of it with a profit; and the success of the speculation depends, it is evident, on the skill with which he has estimated the circumstances that must determine the future price of the commodity. It follows, therefore, that in all highly commercial countries, where merchants are possessed of large capitals, and where they are left to be guided in the use of them by their own discretion and foresight, the prices of commodities will frequently be very much influenced, not merely by the actual occurrence of changes in the accustomed relation of the supply and demand, but by the anticipation of such changes. It is the business of the merchant to acquaint himself with every circumstance affecting the particular description of commodities in which he deals. He endeavors to obtain, by means of an extensive correspondence, the earliest and most authentic information with respect to every thing that may affect their supply or demand, or the cost of their production; and if he learned that the supply of an article had failed, or that, owing to changes of fashion, or to the opening of new channels of commerce, the demand for it had been increased, he would most likely be disposed to become a buyer, in anticipation of profiting by the rise of price, which, under the circumstances of the case, could hardly fail of taking place; or, if he were a holder of the article, he would refuse to part with it, unless for a higher price than he would previously have accepted. If the intelligence received by the merchant had been of a contrary description—if, for example, he had learned that the article was now produced with greater facility, or that there was a falling off in the demand for it, caused by a change of fashion, or by the shutting up of some of the markets to which it had previously been admitted—he would have acted differently: in this case he would have anticipated a fall of prices, and would either have declined purchasing the article, except at a reduced rate, or have endeavored to get rid of it, supposing him to be a holder, by offering it at a lower price. In consequence of these operations, the prices of commodities, in different places and periods, are brought

comparatively near to equality. All abrupt transitions, from scarcity to abundance, and from abundance to scarcity, are avoided; an excess in one case is made to balance a deficiency in another, and the supply is distributed with a degree of steadiness and regularity that could hardly have been deemed attainable.

It is obvious, from what has now been stated, that those who indiscriminately condemn all sorts of speculative engagements have never reflected on the circumstances incident to the prosecution of every undertaking. In truth and reality they are all speculations. Their undertakers must look forward to periods more or less distant; and their success depends entirely on the sagacity with which they have estimated the probability of certain events occurring, and the influence which they have ascribed to them. Speculation is, therefore, really only another name for foresight; and though fortunes have sometimes been made by a lucky hit, the character of a successful speculator is, in the vast majority of instances, due to him only who has skillfully devised the means of effecting the end he had in view, and who has outstripped his competitors in the judgment with which he has looked into futurity, and appreciated the operation of causes producing distant effects. Even in the securest businesses, such as agriculture and manufactures, there is, and must be, a great deal of speculation. An unlooked-for change of season frequently disappoints the apparently reasonable expectations of those who undertake the former; while the equally capricious variations of fashion have to be encountered by those engaged in the latter; and each is, besides, liable to be affected by legislative enactments, by new discoveries in the arts, and by an endless variety of circumstances which it is always very difficult, and sometimes quite impossible, to foresee. On the whole, indeed, the gains of the undertakers are so adjusted that those who carry them on obtain, at an average, the common and ordinary rate of profit. But the inequality in the gains of individuals is most commonly very great; and while the superior tact, industry, or good fortune of some enable them to realize large fortunes, the want of discernment, the less vigilant attention, or the bad fortune of others, frequently reduces them from the situation of capitalists to that of laborers.

The great cotton speculation of 1825 took its rise partly and chiefly from a supposed deficiency in the supply of cotton, partly from an idea that there was a greatly increased demand for raw cotton in this country and the Continent, and partly from a belief that the stocks on hand were unusually low. Now it is obvious that the success of those who embarked in this speculation depended entirely on two circumstances: viz., first, that they were right in the fundamental supposition on which the whole speculation rested, that the supply of cotton was no longer commensurate with the demand; and, second, that their competition did not raise the price so high as to diminish the consumption by the manufacturers in too great a degree to enable them to take off the quantity to be actually brought to market. If the merchants had been well founded in their suppositions, and if their competition had not raised the price of cotton too high, the speculation would certainly have been successful. But, instead of being well founded, the hypothesis on which the whole thing rested was perfectly visionary. There was no deficiency in the supply of cotton, but, on the contrary, a great superabundance; and though there had been such a deficiency, the excess to which the price was carried must have checked consumption so much as to occasion a serious decline. The falling off in the imports of cotton from America in 1824 seems to have been the source of the delusion. It was supposed that this falling off was not accidental, but that it was a consequence of the price of cotton having been for a series of years so low as to be inadequate to defray the expenses of its cultivation. The result showed

that this calculation was most erroneous. And besides, in entering on the speculation, no attention was paid to Egypt and Italy—countries from which only about 1,400,000 lbs. of cotton were obtained in 1824, but from which no less than 23,800,000 lbs. were obtained in 1825! This unlooked-for importation was of itself almost enough to overturn the combination of the speculators; and, coupled with the increased importation from America and other countries, actually occasioned a heavy glut of the market.

The risk to which merchants are exposed when they either sell off any commodity at a reduced price in anticipation of a fall, or buy at an advanced price in anticipation of a future rise, is a consequence principally of the extreme difficulty of ascertaining the true state of the fact with respect to the grounds on which an abundant or a deficient supply, or an increasing or decreasing demand, may be expected. Rules can here be of no service; every thing depends upon the talent, tact, and knowledge of the party. The questions to be solved are all practical ones, varying in every case from each other; the skill of the merchant being evinced by the mode in which he conducts his business under such circumstances, or by his sagacity in discovering coming events, and appreciating their character and the extent of their influence. Priority, but, above all, accuracy of intelligence, is in such cases of the utmost consequence. Without well-authenticated data to go upon, every step taken may only lead to error. The instances, indeed, in which speculations, apparently contrived with the greatest judgment, have ended in bankruptcy and ruin, from a deficiency in this essential requisite, are so very numerous, that every one must be acquainted with them. Hence the importance of selecting acute and cautious correspondents; and hence, also, the necessity of maturely weighing their reports, and of endeavoring, by the aid of information gleaned from every authentic accessible source, to ascertain how far they may be depended upon. When a few leading merchants purchase in anticipation of an advance, or sell in anticipation of a fall, the speculation is often pushed beyond all reasonable limits by the operations of those who are influenced by imitation only, and who have never, perhaps, reflected for a moment on the grounds on which a variation of price is anticipated. In speculation, as in most other things, one individual derives confidence from another. Such an one purchases or sells, not because he has any really accurate information as to the state of the demand and supply, but because some one else has done so before him. The original impulse is thus rapidly extended; and even those who are satisfied that a speculation, in anticipation of a rise of prices, is unsafe, and that there will be a recoil, but unfrequently adventure, in the expectation that they will be able to withdraw before the recoil has begun.

It may, we believe, speaking generally, be laid down as a sound practical rule to avoid having any thing to do with a speculation in which many have already engaged. The competition of the speculators seldom fails speedily to render an adventure that might have been originally safe extremely hazardous. If a commodity happen to be at an unusually reduced price in any particular market, it will rise the moment that different buyers appear in the field; and supposing, on the other hand, that it is fetching an unusually high price, it will fall, perhaps, far below the cost of production, as soon as supplies begin to be poured in by different merchants. Whatever, therefore, may be the success of those who originate a speculation, those who enter into it at an advanced period are almost sure to lose. To have been preceded by others ought not, in such matters, to inspire confidence; on the contrary, it ought, unless there be something special in the case, to induce every considerate person to decline interfering with it. The maintenance of the freedom of intercourse between different countries, and the more gen-

eral diffusion of sound instruction, seem to be the only means by which those miscalculations, that are often productive of great national as well as private loss, can be either obviated or mitigated. The effects consequent to such improvident speculations being always far more injurious to the parties engaged in them than to any other class, the presumption is that they will diminish, both in frequency and force, according as the true principles of commerce come to be better understood. But, whatever inconvenience may occasionally flow from them, it is abundantly plain that, instead of being lessened, it would be very much increased, were any restraints imposed on the freedom of adventure. When the attention of many individuals is directed to the same line of speculation—when they prosecute it as a business, and are responsible in their own private fortunes for any errors they may commit—they acquire a knowledge of the various circumstances influencing prices, and give by their combinations a steadiness to them which it is easy to see could not be attained by any other means. It is material, too, to bear in mind, as was previously stated, that many, perhaps it might be said *most*, of those who press so eagerly into the market when any new channel of commerce is opened, or when any considerable rise of price is anticipated, are not merchants, but persons engaged in other businesses, or living, perhaps, on fixed incomes, who speculate in the hope of suddenly increasing their fortune. This tendency to gambling seldom fails to break out upon such occasions; but fortunately these are only of comparatively rare occurrence; and in the ordinary course of affairs, mercantile speculations are left to be conducted by those who are familiar with business, and who, in exerting themselves to equalize the variations of price caused by variations of climate and of seasons, and to distribute the supply of produce proportionally to the effective demand, and with so much providence that it may not at any time be wholly exhausted, perform functions that are in the highest degree important and beneficial. They are, it is true, actuated only by a desire to advance their own interests; but the results of their operations are not less advantageous than those of the agriculturist who gives greater fertility to the soil, or of the mechanist who invents new and more powerful machines.

Those desirous of detailed information as to the prices of commodities in Great Britain, in remoter ages, may consult the elaborate tables in the 3d volume of *Sun F. M. EDEN'S work on the Poor*; and the 4th volume of *MACHENSON'S Annals of Commerce*. *AMUTHINON'S Tables of Ancient Coins, Weights, Measures, Prices, etc.*, are well known; but the statements are not much to be depended upon. *The Traité de Métrologie* of M. PAUCOT, 4to, Paris, 1780, is the best work on this curious and difficult subject. See also volumes v. vi. *TOOKE on Prices*, London, 1857; *HUNT'S Merchants' Magazine*, iii. 305 (HILDBURN); *Quarterly Review*, xxix. 214; *American Almanac*, 1836, 101; *Bankers' Magazine*, New York, 1857, 91-94.

“Considerable uneasiness begins to prevail in Paris at the enormous rise that has taken place within the last two years in the prices of food and lodging. It is not only that this state of things drives away the crowds who a few years ago used to resort to Paris to economize, and who spent immense sums in that capital, but, what is of far more importance in a social and political point of view, it creates suffering, and, consequently, discontent among the working classes. In all the capitals of Europe, there has been of late a similar tendency to an increase in prices, partly caused, no doubt, by the uncertainty created by the late war, and by the withdrawal of large numbers of able-bodied men from the ordinary pursuits of agriculture and industry, to swell the ranks of the standing armies kept up by the four great military monarchies of France, Russia, Austria, and Prussia. Perhaps, also, the speculative habits of the present generation have had some share in producing this result.”

The above is from a late London paper. The same remark is pertinent to now circumstances in the United States. The advanced prices charged for all commod-

ties where labor is involved in their production, and where new machinery and new appliances can not be used, are unerring results of an increased volume of the precious metals. According to estimates made by statistical writers who have examined the subject critically, the increase of the precious metals during the six years, 1851-1856, is fully one-third of that existing in the world at the end of the year 1850.

The product of gold in California is thus stated in round numbers:

Years.	Export.	Marginal Addition.	Total.
1848-49	\$8,060,000	\$806,000	\$8,866,000
1850	27,500,000	2,500,000	27,500,000
1851	47,250,000	4,725,000	45,875,000
1852	58,500,000	5,850,000	64,550,000
1853	62,500,000	6,250,000	69,750,000
1854	70,600,000	7,060,000	77,550,000
1855	67,000,000	6,700,000	75,700,000
1856	70,000,000	7,000,000	77,000,000
Total...	\$402,810,000	\$40,381,000	\$443,091,000

Product of gold in California and Australia combined:

Years.	Export.	Marginal Addition.	Total.
1848-49	\$8,060,000	\$806,000	\$8,866,000
1850	23,000,000	2,600,000	27,500,000
1851	45,730,000	4,573,000	50,323,000
1852	107,176,000	10,717,600	117,893,600
1853	112,735,000	11,273,500	125,997,500
1854	115,640,000	11,564,000	127,304,000
1855	124,055,000	12,405,500	137,021,500
1856	133,715,000	13,371,500	147,086,500
Total...	\$672,640,000	\$67,264,000	\$739,904,000

At the same time, the rate of interest has increased from an average one of 3 and 8/10 to 6 and 7 per cent.; and the active demand for capital throughout Europe, in support of heavy undertakings abroad and at home, will probably maintain the current rates for some years to come. We see no present indications of a plethora of capital.

We think it will appear that a greater rise, *pro rata*, has taken place in prices within this short period. In our own country, the prices of market produce, labor, and materials requiring labor for their production, have all increased from thirty to fifty, and in some instances to one hundred per cent. In articles of food in the London markets, the changes in prices between 1851-1857 are shown in the following summary, which we take from "Tooke's History of Prices, during the years 1848-1856," just published in London:

Articles.	January, 1851.	January, 1854.	Feb 1857
Coffee.....	53 a 6s.	53 a 6s.	58 a 6 1/2
Sugar.....	26 a 2s.	21 a 6d.	30 a 4 1/2
Rum, Jamaica.	26 a 5d.	42 a 4d.	44 a 4d

Steel, Swedish	15 a —	17 1/2 a —	20 a —
Tin, tons.....	54 a —	120 a —	143 a —

These facts are important, as demonstrating the progressive advance of prices according to the increased bulk of precious metals. The same result occurred in the century following the discovery of gold in America (1500-1600), although the increased production was far less than it is now. Rents, wages, family supplies, labor generally—all advanced fully one hundred per

cent.; and the probability is that an equal (or greater) ratio of increase will take place between 1850 and 1860. It is true that the present accumulation of precious metals is diffused among a much larger population and over a more extended region of country than in the 16th or 17th centuries; but similar causes will produce similar results, and labor will secure for itself a remuneration commensurate with the increased expense of living.

Fluctuations in Prices.—Mr. Tooke, an English writer of some celebrity, has lately added two volumes on the prices of 1848-1856. From these volumes (published in London in 1857) we extract the following summary view of the changes in prices since the discoveries of gold in California:

Summary of Conclusions with Reference to the Prices of Commodities and State of Trade, 1848-'56.—Without attempting to include in a summary of conclusions all the inferences which arise from the survey of the past few years, we present the following statements as setting forth those results which are best established and most important, viz.: That as regards the great articles of import, such as colonial and tropical produce and commodities largely employed in this country as raw materials of manufacture, the course of prices during the nine years, 1848-'56, may be described in general terms, as follows, viz.: During 1848 and 1849 there was a general, and, in several important instances, a strong tendency to lower prices; that in 1850, partly in consequence of larger consumption and partly in consequence of actual or apprehended failures of supply, prices sensibly, and, in some cases, materially advanced; that in 1851 there was again an extensive and severe decline, attributable almost wholly to excess of supply; that in 1852 there was a manifest tendency toward recovery; that in the first nine months of 1853 the upward tendency of the previous year reached its highest point, establishing and maintaining for nine months a range of prices considerably higher than had prevailed for a long period; that from the autumn of 1853 to the close of 1854, there was a sensible reaction from the previous high rates, except as regards some of the articles immediately affected by operations, or the commissariat consumption of the war; and that in 1855 and 1856 the markets were quiet and firm, exhibiting only such fluctuations as arose out of ordinary changes in supply and demand. In a future part we shall inquire how far the fluctuations of prices now referred to were connected with the influx of the new gold.

That the first effects of the California discoveries of 1848 were felt in England in 1850 and 1851, and manifested themselves in the increased demand for British and foreign articles suitable for the export trade to the United States; that the same effects were still more sensibly felt in the course of 1852; that in 1853 the consumption of British goods in California and the United States generally had become so large and rapid as to counteract almost entirely, as regards England, any prejudicial effect upon the balance of trade of the vast imports of grain, rendered necessary by the serious failure in these islands of the harvest of 1853; that the same large American demand for British exports continued through 1854 and 1855, and had prevailed through 1856, interrupted but casually by the extensive failures and discredit which prevailed in the United States and California during portions of the years 1854 and 1855; and that, as the general result of the trade between England and the United States since 1850, the absorption of British exports either in California itself or in those regions of the North American continent to which the supplies of California gold are chiefly sent in the first instance, has increased so rapidly as to render necessary a constant and large transmission of the precious metals from America to England.

That the effects of the Australian discoveries of the

summer of 1851 were felt in this country in a striking manner early in the following year (1852), manifesting themselves in a sudden and large expansion of the stream of emigration from these islands, and in a sudden and large expansion in the shipment of nearly all descriptions of commodities; that the demand for ships hence arising could not, in the then condition of the mercantile marine, be readily supplied; and the consequence was an enormous increase of the rates of freight, and a demand for new ships so urgent, that considerably higher wages were at once conceded in all the ship-building trades; that the same urgent demands for Australia continued in the early part of 1853, were considerably moderated in 1854, still more reduced in 1855, but in 1856 were again marked by considerable activity. That the movement for higher wages successfully commenced in the autumn of 1852; in the ship-building trades became almost universal in the first half of 1853; and previous to September, in that year, had led to a very general addition of from 12 to 20 per cent. to the wages current in 1851; but that the effect of the bad harvest of 1853, the war of 1854-'55, and the glut of the Australian markets, was to produce a considerable reaction from this advance, especially in the factory districts. That the first and immediate effect of the high prices of colonial and other imported articles in 1852 and 1853, and of the high prices and large demand for manufactured goods in the same years, was to occasion vigorous efforts and a large expenditure of capital, with a view to opening up new fields of supply, and creating extended means of production; and that it is principally to the operation of these causes that the steady and frequently declining course of prices since 1853 is to be attributed.

That as far as trustworthy evidence can be obtained, there are no facts in the experience of the last nine years which justify the conclusion that in England the fluctuation of prices, the course of trade, or the increased demand for goods arising out of the large exports to America and Australia, were immediately preceded by or connected with changes in the amount of the aggregate outstanding circulation of bank-notes. In other words, all the evidence available to us points distinctly and uniformly to the conclusion that the fluctuations of the bank-note circulation were determined and regulated by the consequences flowing from previous applications of capital and credit in particular modes. That further, in a great number of specific instances, it can be shown conclusively that fluctuations of price of the most important kind, and in the largest markets of England, took place either without the occurrence of any change whatever in the bank-note circulation or contemporaneously with the occurrence of a change the precise opposite of that which on *a priori* grounds, or on the grounds on which the currency theory is built, would have been expected to precede or accompany the particular alteration in the markets.

That neither is there any such coincidence between variations in the rate of interest and variations in the markets for produce, as to justify the inference of a direct connection between them in the relation of cause and effect. That the first effect of the gold discoveries on the financial condition of England was the remarkable and prolonged depression in the rates of interest and discount, which prevailed during the twelvemonth preceding the spring of 1853; that this effect on the rate of interest was the immediate consequence of an excessive accumulation, principally in the Bank of England, of the early remittances from California and Australia; and that the influence produced by these accumulations on opinion and credit was greatly extended and aggravated by the maintenance at the Bank of England of a rate of discount so low as 2 per cent., from April, 1852, to January, 1853. That the rise of the rate of discount which commenced in January, 1853, and has been maintained during the subsequent three years, is to be traced in its origin and continu-

ance to extended demand for capital for the purpose of new, distant, and costly enterprises, directed either to the construction of public works, to the extension of old and introduction of new processes, or to the exploration of new fields for the supply of commodities; and that, so far as we can judge from recent experience, the absorption of capital for these and other objects becomes more rapid and extensive with every succeeding year.

That the interruption to the trade of England occasioned by the Russian war of 1854-'55 was comparatively slight, and for four reasons, viz.: 1. Because the theatre of war was in a remote part of the east of Europe; 2. Because the enemy had practically no navy that could molest our commerce; 3. Because the raw materials previously obtained from Russia still continued to arrive through neutral ports or were readily replaced by imports from India and elsewhere; and 4, lastly, because the invention of the telegraph, the existence of steam, and the enormous resources of our mercantile marine and postal services, enable us to accomplish in a few weeks' operations what, at the commencement of the century, would have occupied a long series of months. That further, in addition to and far more powerful than any of the five causes just enumerated, was the effect of the continued influx of gold during 1854 and 1855—but especially during the latter portion of 1855, in averting from England and from France the extreme financial pressure and peril which, in the absence of that influx, must inevitably have been produced by the necessity of providing large and constant remittances of gold to the seat of war; and must inevitably have placed entirely out of question the maintenance of the restrictions of the Bank Chart Act of 1844, and perhaps have even imperiled the maintenance of the act of 1819.

That during the years 1848 and 1849, and part of 1850, the losses and discredit which fell with crushing force on a large portion of the middle classes involved in the railway expenditure, did, beyond question, produce some important effect in limiting the consumption of commodities. That, on the other hand, it was a direct consequence of the railway expenditure of the years 1848, 1849, and 1850, that the working classes were provided with fair employment during a period of interrupted trade, and it was also a direct consequence of the cheapness of food, and the low range of general prices which prevailed to the year 1852, that the working classes were able to command, by means of their wages, a larger amount of sustenance and comfort than had been within their reach probably at any former period of the century.—Took's *History of Prices*, 1857.

Price-current, a list or enumeration of the various articles of merchandise, with their prices, the duties (if any) payable thereon when imported or exported, with the drawbacks occasionally allowed upon their exportation, etc. Lists of this description are published periodically, generally once or twice a week, in most great commercial cities and towns.—For examples, see the *articles* GENOA, HAVRE, TRIESTE, etc. in this work.

Pride of China. The *Melia azedarach*, or Pride of China, is supposed to have been originally a native of Persia, where it was known as long ago as the year 980, by Avicenna, an Arabian physician, who noticed the venomous principle which resides in its fruit; but some botanists are of the opinion that it is also indigenous to Florida and the United States, or at least has become so from habit; for it is found there growing wild in the forests, and attains its fullest magnitude. It is propagated for ornament or use in all the warm countries of the civilized world. It is also cultivated in conservatories in the temperate and colder parts of Europe and America, and even there it often flowers, and ripens its fruit.

Properties and Uses.—The wood of the *azedarach* is

of a reddish color, and is organized in the distribution of its fibres similar to those of the ash. It is sufficiently strong and durable to be employed in civil architecture, and is adapted to various uses in the mechanic arts. It has already been employed for pulleys, which in Europe are usually made of elm, and in America of ash. It is said to make good fuel. The fleshy part of the fruit, like that of the olive, yields a fixed oil, which is bitter, and is considered as anthelmintic, and a narcotic stimulant. The leaves are universally used in India for poultices, and both the flowers and seeds are stimulant. The berries, though said by the Arabian physician, Avicenna, to be poisonous, and the pulp of which was mixed with grease, for the purpose of killing rats and dogs, are often eaten by children in the South without injurious effects. According to Mr. Royle, however, the fruit is considered as poisonous when used in large doses. The bark of the root, when green, has a bitter, nauseous taste, yielding its virtues to boiling water, and may be employed as a cathartic or emetic, and is considered as an efficient vermifuge, and also may be used with advantage in intermittents. In Persia, an ointment is made, for the cure of some cutaneous eruptions, by mulling the leaves with lard. It is also said that a kind of toddy is obtained by fermenting the sap of young and vigorous trees. The nuts are often bored by monks, and strung into beads. Hence the names of *Bead-tree*, and *Patrona di San Domenico*.—*BROWN'S Trees of America*.

Primage and Average. Primage is a charge in addition to the freight. It was originally intended as a gratuity to the captain for his particular care of the goods, and is sometimes called *bat-money*; but it now belongs to the owners or freighters by charter-party of the vessel, unless by special agreement the whole or portion of it is assigned to the captain. It is collected with the freight. The rate or manner of making this charge depends chiefly upon the custom of the department of trade in which the ship is engaged. Very commonly it is a rate, as 5, 10, or even 16 per cent., upon the amount of the freight. In some trades it is a rate per hoghead, etc., and in some cases it is not allowed, the word primage being canceled or omitted, and the words in full being added to the stipulated rate of the freight, as has been noticed in speaking of the forms of bills of lading. The average referred to in the bill of lading is the liability to general contribution for making good any damage which has been occasioned by any step necessary for general preservation. This forms what is called a "general average," and the notice of it is introduced into the bill of lading to avoid any doubt as to liability on the part of the consignee or claimant of the goods.—*See INSURANCE—SHIPS, and SHIPPING.*

Prince Edward Island. Lat. N. 46° and 47° 10'; long. W. 62° and 65°; area, 2184 square miles; length about 135 miles; and breadth from 4 to 34 miles.

The island of Prince Edward, formerly called St. John's, is situated in a recess, on the west side of the Gulf of St. Lawrence, and is separated from New Brunswick and Nova Scotia by the Strait of Northumberland, which at its narrowest part is only nine miles wide. Capital, Charlotte-Town. The colony is divided into three counties: viz., Queen's, 15,425; Prince, 15,142; King's, 32,111; and its total population in 1848 was 62,678.

The population at several periods was as follows:

1802	20,671
1807	22,500
1817	23,306
1833	39,176
1841	47,033
1848	62,678

The quantity of arable land under cultivation was 215,389 acres; and the whole quantity of land occupied was as follows: Held in fee-simple by occupants, 280,649 acres; under lease, 330,293 acres; by written demise,

31,812 acres; by verbal agreement, 38,786 acres; and by squatters, 65,434 acres. The crops represented in the census of the same year consisted of: wheat, 219,787 bushels; barley, 75,521 bushels; oats, 746,383 bushels; potatoes, 781,575 bushels; turnips, 153,938 bushels; clover-seed, 14,900 pounds; and hay, 45,123 tons. The live-stock on the island was as follows: Horses, 12,845; neat cattle, 49,310; sheep, 92,875; and hogs, 19,683. The industrial establishments were embraced under the following branches: 18 breweries and distilleries, 116 grist-mills, 27 carding-mills, 130 saw-mills, and 246 threshing-machines. The commerce of the island in 1851 is exhibited in the following abstract:

Exports, including 89 vessels, 15,721 tons, at \$16 per ton; 1,467,629 feet, and 6316 pieces, boards and deals; shingles, 320,773 M; oats, 366,695 bushels; cattle, 263 head; dried fish, 7037 quintals; pickled fish, 3624 barrels; cyeters, 4377 bushels; and a variety of other products, as timber, scantling, knees, etc., valued in all at.....	\$607,389
Imports, including ship-chandlery, which is exported again in the building and rigging of ships, and not estimated in the value of the shipping.....	\$638,785
Less—say for ship-chandlery.....	62,884
Total commerce.....	\$1,038,290

The shipping employed in this commerce was as follows:

	Entrances.		Clearances.	
	Vessels.	Tons.	Vessels.	Tons.
Great Britain.....	18	4,140	45	10,051
British colonies.....	470	18,042	488	25,273
United States.....	48	3,724	86	6,247
Other countries.....	2	87	2	71
Total in 1851.....	638	24,993	621	41,523
Total in 1850.....	667	26,017	638	40,329

The number of seamen inward, in 1850, was 2082, and in 1851, 2370; outward, in 1850, 2301; and in 1851, 3631.

The following compares the value of the imports and exports for three years:

	1848.	1850.	1851.
Imports.....	\$576,040	\$636,475	\$475,871
Exports.....	\$492,775	\$325,980	\$67,389
Total.....	\$1,068,815	\$962,454	\$543,260

The exports of 1851 include the value of vessels sold to Great Britain and Newfoundland, amounting to \$251,536, which is not included in either 1849 or 1850. In 1849 there were built in the colony 88 vessels, 15,902 tons; and in 1850, 93 vessels, 14,591 tons, valued at \$16 per ton. The total value of articles, the growth, produce, or manufacture of the United States, imported in 1851, was \$77,858, the whole of which, except to the value of \$3200, were carried in British bottoms. In 1850 the value of the same description of articles imported was only \$42,113. The wide difference between the two years arises from the fact that in 1851 the duties on imports were greatly reduced from the rates of the preceding year. With the high rates of duties of 1850, only \$6420 was received on articles of American production; while in 1851, with diminished rates, the duties were increased to \$14,020. The articles exported to the United States in 1851 were as follows: Barley, 17,929 bushels; boards and planks, 12,000 feet; iron, 60 cwt.; cattle, 9 head; firewood, 20 cords; dry fish, 650 quintals; pickled fish, 1780 barrels; hard wood, 74 tons; horses, 3; hackmatack knees, 2215; oats, 222,109 bushels; potatoes, 45,942 bushels; turnips, 5090 bushels; and wool, 1700 pounds. The value of the foregoing, with the value of sundry other articles not enumerated, amounted together to \$119,236. The value of similar articles exported in 1850 was only \$55,886. On the 31st December, 1850, the number of vessels owned and registered in Prince Edward Island was 310, of the burden of 27,932 tons. On the 31st December, 1851, the vessels owned and registered numbered 323, of the burden of 31,410 tons. Prince

Edward Island has valuable fisheries in the Gulf of St. Lawrence, and in the Strait.

Prince Edward Island is chiefly an agricultural colony. Ship-building, however, is carried on to a considerable extent; and new ships have already become a prominent article of export. In the years 1840, 1850, and 1851, there were built in the island, for sale in Great Britain, Newfoundland, or wherever else they might find a profitable market, 270 vessels, with an aggregate of 45,946 tons; giving an annual average of 90 vessels, and 18,815 tons.

	1840.	1850.	1851.
Exports to United States ..	\$32,410	\$55,385	\$119,286
Imports from United States	82,580	41,603	77,868

TONNAGE IN 1850.

	Vessels.	Tons.
Entered from United States	84	2578
Cleared for United States	49	4088
Entered in 1851	48	2724
Cleared in 1851	56	6427

The difference between the imports from the United States in 1850 and 1851 (\$36,256) is accounted for by the reduction of the duties on imports by colonial act, the high duties up to 1851 affecting, to a large extent, the trade with the United States. This reduction of the tariff of Prince Edward Island not only augmented the exports from the United States, but produced a corresponding increase in the imports from that island. Thus, in 1850, the value of exports from Prince Edward Island to the United States was \$55,385; in 1851 it amounted to \$119,286. The trade between the United States and this island being now comparatively free, a still greater increase than that exhibited above may be annually expected.

The revenue, expenditures, and public debt of the colony, in 1851, were as follows:

Revenue.—Customs and imports, £17,769 18s. 7½d.; fines and forfeitures, £110 5s. 1d.; interest on bonds, £161 2s. 0½d.; post-office, £999 2s. 4½d.; land assessments, £2165 1s. 7d.; registers, £159 6s. 2½d.; licenses, £459 10s.; seizures, £44 9s. 8d.; and fees from Secretary's office, £299 15s. 8d. Total, £22,538 14s. 9½d., being an average per head of 7s. 2½d., or of the net customs alone, the average per head was 5s. 8½d.

Expenditures.—Legislature, £1912 4s. 4½d.; education, £2351 14s. 10d.; agricultural societies, £450; miscellaneous, £762 3s. 8½d.; post-office, £1639 10s. 3d.; salaries, £3145 11s. 11d.; compensation to government officers, £774 16s.; public postages, £55 19s. 3d.; crown prosecutions, £793 14s. 4½d.; board of health, £421 15s. 11d.; fish bounties, £370 18s. 9d.; provincial building, £540 15s. 8d.; inquest and shadiall packages, £116 11s. 7½d.; printing and stationery, £794 4s. 2½d.; apprehension of deserters, £378 14s. 2d.; interest on liabilities and debentures, £1626 4s.; drawbacks, £220 16s. 4½d.; sundry fees, etc., £173 12s. 11d.; roads, bridges, and wharves, £5978 3s. 2d.; jails, £610 11s. 8½d.; small disbursements, £867s. 2½d.; markets, £50 1s. 8d.; light-house, £176 7s. 11½d.; public works, £787 6s. 8d.; and buoys and beacons, £65 6s. 8d. Total, £24,173 10s. 11½d., showing a surplus of expenditures amounting to £1634 16s. 2d. The public debt amounted, in the year above stated, to £17,938.—ANDREW'S *Report on Colonial and Lake Trade* (Sen. Doc. 112), 1852-53; MARTIN'S *British Colonies* (London edition); *Report of a Committee (Canadian) on the Income, Expenditure, and Debt of British North America* (11th June, 1853); *U. S. Comm. Rel.*, etc.

Printed Goods. The art of calico-printing is of considerable antiquity, and there exist specimens of Egyptian cotton dyed by figured blocks many hundred years old. A similar process has been resorted to even in the Sandwich Islands, where they use a large leaf as a substitute for the block.—See art. **COTTON.** The copyright of designs secured in England by 2 Vic., 1839.

Printing. See **PRESS, BOOKS, AND NEWSPAPERS.**

Prints, impressions on paper, or some other substance, of engravings on copper, steel, wood, stone, etc., representing some particular subject or composition. Prints, like paintings, embrace every variety of subject; and differ very widely in the manner in which they are engraved. Their prices vary according to the style of the engraving, the fineness of its execution, the goodness of the impression, its rarity, etc. The art seems to have taken its rise in the 15th century.

Prize, or Butlerage, was a right of taking two tons of wine from every ship importing into England twenty tons or more; which was changed by Edward I. into a duty of 2s. for every tun imported by merchant strangers, and called butlerage, because paid to the king's butler. The term is now fallen into disuse.—**BLACKSTONE.**

Privateering. In order to encourage privateering, it is usual to allow the owners of private armed vessels to appropriate to themselves the property, or a large portion of the property, they may capture, and to afford them and the crew other facilities and rewards for honorable and successful efforts. This depends upon the municipal regulations of each particular power; and as a necessary precaution against abuse, the owners of privateers are required, by the ordinances of the commercial states, to give adequate security that they will conduct the cruise according to the laws and usages of war and the instructions of the government, and that they will regard the rights of neutrals, and bring their prizes in for adjudication. These checks are essential to the character and safety of maritime nations. Privateering, under all the restrictions which have been adopted, is very liable to abuse. The object is not fame or chivalric warfare, but plunder and profit. The discipline of the crews is not apt to be of the highest order, and privateers are often guilty of enormous excesses, and become the scourge of neutral commerce. They are sometimes manned and officered by foreigners, having no permanent connection with the country or interest in its cause. This was a complaint made by the United States in 1819, in relation to irregularities and acts of atrocity committed by private armed vessels sailing under the flag of Buenos Ayres. Under the best regulations, the business tends strongly to blunt the sense of private right, and to nourish a lawless and fierce spirit of rapacity. Efforts have been made from time to time to abolish the practice. In the treaty of amity and commerce between Russia and the United States in 1785, it was stipulated that in case of war neither party should grant commissions to any private armed vessels to attack the commerce of the other. But the spirit and policy of maritime warfare will not permit such generous provisions to prevail. That provision was not renewed with the renewal of the treaty. A similar attempt to put an end to the practice was made in the agreement between Sweden and Holland in 1675, but the agreement was not performed. The French Legislature, soon after the breaking out of the war with Austria in 1792, passed a decree for the total suppression of privateering, but that was a transitory act, and it was soon swept away in the tempest of the revolution. The efforts to stop the practice have been very feeble and fruitless, notwithstanding that enlightened and enlarged considerations of national policy have shown it to be for the general benefit of mankind to surrender the licentious practice, and to obstruct as little as possible the freedom and security of commercial intercourse among the nations.—**KENT'S Commentaries.** The reader is referred to the *North American Review*, x. 166 (J. GALLISON); NILES'S *Register*, xiv. 129, xvi. Sup. 29; DE BOW'S *Review*, i. 516. See also **MARITIME LAW**, ante, 1321, et seq.

Letters of Marque and Reprisal are grantable by the law of nations, whenever the subjects of one state are oppressed and injured by those of another, and justice is denied by that state to which the oppressor be-

longs."—CHITTY'S *Comm. Law*, vol. iii. page 604. Before granting letters of marque, government is directed by the 5 Hen. V. c. 7, to require that satisfaction be made to the party aggrieved; and in the event of such satisfaction not being made within a reasonable period, letters of marque and reprisal may be issued, authorizing the aggrieved party to attack and seize the property of the aggressor nation, without hazard of being condemned as a robber or pirate. Such letters are now only issued to the owners or captains of privateers during war, or when war has been determined upon. They may be revoked at the pleasure of the sovereign; and when hostilities terminate, they cease to have any effect. Letters of marque and reprisal were first issued in England by Edward I., for the seizure of the enemy's vessels, and for reprisal and retaliation upon the enemy on the sea.—RYMER'S *Fœdera*. They were first granted in 1295.—BAKER'S *Chron*. They are usually granted in time of war to private armed ships, and do great mischief to the commerce of belligerent nations.—POWELL.

Privateers, ships of war fitted out by private individuals, to amoy and plunder the public enemy. But before commencing their operations, it is indispensable that they obtain letters of *marque and reprisal* from the government whose subjects they are, authorizing them to commit hostilities, and that they conform strictly to the rules laid down for the regulation of their conduct. All private individuals attacking others at sea, unless empowered by letters of marque, are to be considered pirates, and may be treated as such either by those they attack or by their own government.

Policy of Privateering.—The policy of this system is very questionable. It seems to be a remnant of that species of private war exercised by all individuals in early ages, but which gradually disappears as society advances. In wars carried on by land, the property of the peaceable inhabitants who take no part in the operations of the armies is uniformly protected; and it is difficult to discover any solid grounds why the same rule should not be followed at sea. Privateers rarely attack ships of war. Their object is merely to plunder and destroy merchantmen. They cause an infinite deal of mischief to individuals, and aggravate all the miseries of war, without having the slightest influence on the result of the contest. Experience has also shown that it is not possible, whatever precautions may be adopted, to prevent the greatest abuses from being perpetrated by privateers. The wish to amass plunder is the only principle by which they are actuated; and such being the case, it would be idle to suppose that they should be very scrupulous about abstaining from excesses. A system of this sort, if it be ever useful, can be so only to nations who have little trade, and who may expect to enrich themselves during war by fitting out privateers to plunder the merchant ships of their enemies. In all other cases it seems to be productive only of mischief; though it is, of course, most injurious to those states that have the greatest mercantile navy. Instead, therefore, of encouraging the practice of privateering, we think that a due regard to the rights and interests of humanity would suggest to the great powers the expediency of abolishing it altogether. A few efforts have, indeed, been already made toward this desirable object. Thus it was stipulated in the treaty between Sweden and the United Provinces, in 1675, that neither party should, in any future war, grant letters of *marque* against the other. In 1757 Russia abstained from licensing privateers; and in the treaty between the United States and Prussia, in 1785, a stipulation was inserted as to privateers, similar to that in the treaty between Sweden and the United Provinces in 1675. But nothing short of a convention and agreement to that effect among the great powers will be able to effect this desirable object.—MARTENS, *Essai concernant les Armateurs*, 1794. See MARITIME LAW, p. 1322, etc.

Prize. Any thing captured by a belligerent using the right of war: in common language, only ships thus captured, with the property taken in them, are so called. Prizes taken in war are condemned by the proper jurisdiction in the courts of the captors; such condemnation is held to divest the title of the proprietor and confer a new ownership. In order to give jurisdiction to a court of prize, it is deemed necessary, by the law of nations, that the property captured should be in possession of the captors in their own ports, those of an ally, or of a neutral; but no belligerent power has a right to capture in the ports of a neutral country, or within a marine league of her shores; nor does a capture made there render the adjudication valid. Subject to capture is hostile property, i. e., the property of persons domiciled in a hostile country, and neutral property contraband of war.—See CONTRABAND.

Prize Money.—The money arising from captures made upon the enemy is divided into eight equal parts, and is equally distributed by order of government, thus: Captain to have three-eighths, unless under the direction of a flag officer, who in that case is to have one of the said three-eighths; captains of marines and land forces, sea lieutenants, etc., one-eighth; lieutenants of marines, gunners, admirals' secretaries, etc., one-eighth; midshipmen, captain's clerk, etc., one-eighth; ordinary and able seamen, marines, etc., two-eighths.—See PRIVATEERS and LETTERS OF MARQUE.

Prizes.—The right to all captures vests primarily in the sovereign, and no individual can have any interest in a prize, whether made by a public or private armed vessel, but what he receives under the grant of the state. This is a general principle of public jurisprudence, *belli parta cadunt reipublice*, and the distribution of the proceeds of prizes depends upon the regulations of each state; and unless the local laws have otherwise provided, the prizes vest in the sovereign. But the general practice, under the laws and ordinances of the belligerent governments, is to distribute the proceeds of captured property, when duly passed upon and condemned as prize (and whether captured by public or private commissioned vessels), among the captors, as a reward for bravery, and a stimulus to exertion. When a prize is taken at sea, it must be brought with due care into some convenient port, for adjudication by a competent court; though, strictly speaking, as between the belligerent parties, the title passes, and is vested when the capture is complete, and that was formerly held to be complete and perfect when the battle was over, and the *specie recuperandi* was gone. Gratius and many other writers, and some marine ordinances, as those of Louis XIV., and of Congress during the American war, made twenty-four hours' quiet possession by the enemy the test of title by capture. Bynkershoeck says that such a rule is repugnant to the laws and customs of Holland; and he insists that a firm possession at any time vests the property in the captor, and that ships and goods brought *infra presidia* do most clearly change the property. But by the modern usage of nations, neither the twenty-four hours' possession, nor the bringing the prize *infra presidia*, is sufficient to change the property in the case of a maritime capture. A judicial inquiry must pass upon the case, and the present enlightened practice of commercial nations has subjected all such captures to the scrutiny of judicial tribunals, as the only sure way to furnish due proof that the seizure was lawful. The property is not changed in favor of neutral vendee or receptor, so as to bar the original owner, until a regular sentence of condemnation has been pronounced by some court of competent jurisdiction belonging to the sovereign of the captor; and the purchaser must be able to show documentary evidence of that fact to support his title. Until the capture becomes invested with the character of prize by a sentence of condemnation, the right of property is in abeyance, or in a state of legal sequestration. It can not be alienated or dis-

posed of, but the possession of it by the government of the captor is a trust for the benefit of those who may be ultimately entitled. This salutary rule, and one so necessary to check irregular conduct and individual outrage, has been long established in the English admiralty, and it is now every where recognized as the law and practice of nations.

The condemnation must be pronounced by a prize court of the government of the captor, sitting either in the country of the captor or of his ally. The prize court of an ally can not condemn. Prize or no prize, is a question belonging exclusively to the courts of the country of the captor. The reason of this rule is said to be, that the sovereign of the captors has a right to inspect their behavior, for he is answerable to other states for the acts of the captor. The prize court of the captor may sit in the territory of the ally, but it is not lawful for such a court to act in a neutral territory. Neutral ports are not intended to be auxiliary to the operations of the power of war; and the law of nations has clearly ordained that a prize court of a belligerent captor can not exercise jurisdiction in a neutral country. This prohibition rests not merely on the unfitness and danger of making neutral ports the theatre of hostile proceedings, but it stands on the ground of the usage of nations. It was for some time supposed that a prize court, though sitting in the country of its own sovereign, or of his ally, had no jurisdiction over prizes lying in a neutral port, because the court wanted that possession which was deemed essential to the exercise of a jurisdiction in a proceeding *in rem*. The principle was admitted to be correct by Sir William Scott, in the case of the *Henrick* and *Maria*, and he acted upon it in a prior case. But he considered that the English admiralty had gone too far in supporting condemnations in England, of prizes abroad in a neutral port, to permit him to recall the vicious practice of the court to the acknowledged principle; and the English rule is now definitively settled, agreeably to the old usage and the practice of other nations. The Supreme Court of the United States has followed the English rule, and it has held valid the condemnations, by a belligerent court, of prizes carried into a neutral port, and remaining there. This was deemed the most convenient practice for neutrals, as well as for the parties at war; and though the prize was, in fact, within a neutral jurisdiction, it was still to be deemed under the control, or *sub potestate*, of the captor.—KENT'S *Commentaries*, vol. i.

PROA, a narrow canoe about thirty feet long by three feet wide, used in the Ladrones Islands. The lee side is flat, being the mere longitudinal section of the common form, and the head and stern exactly alike. A slight frame-work projects several feet to windward, bearing a small block of wood like a canoe; this float supports the vessel from oversetting to that side, as she would otherwise do, and the frame-work affords support for a weight acting against the pressure of the sail. The vessel is steered by the paddle at either end, and moves with great velocity either backward or forward, being adapted to a side wind in running between two places. The sail is mat, with a boom, upon one mast. *Proa* is also the name for large boats used by the Malays, propelled both by oars and sails.

PRODUCE, PRODUCTION. See articles WHEAT, FLOUR, &c.

Promissory Notes. A promissory note may be defined to be a written engagement by one person to pay another person, therein named, absolutely and unconditionally, a certain sum of money at a time specified therein. The definition given by Mr. Justice Blackstone is, that promissory notes, or notes of hand, are a plain and direct engagement in writing to pay a sum specified at a time limited therein, to a person therein named, or sometimes to his order, or often to the bearer at large. Perhaps this definition may be thought faulty in not stating that the engagement is to be ab-

solute and unconditional. Mr. Justice Bayley more succinctly states, that a promissory note is a written promise for the payment of money at all events. Mr. Chancellor Kent follows the definition of Mr. Justice Bayley; and perhaps each is open to the objection that, while it seeks brevity, it is incomplete, as it does not state that the promise is made by one person to pay the money to another person specified. Although a promissory note is, in contemplation of law, entitled to all the privileges belonging to such an instrument by the Commercial Law, as well as by the Common Law, without being negotiable, yet it is the latter quality which gives it its principal importance and value in modern times, and makes it a circulating credit, so extensively useful and so generally resorted to in the commerce of the world. Promissory notes are now generally made negotiable, by being stated therein to be payable to A or order, or to the order of A, or to A or bearer, or to the bearer generally. Perhaps the silent but steady progress in England, from the simple use of the non-negotiable notes, before the reign of Queen Anne, to the present almost universal negotiability of such instruments in our day, can not be better expressed than by referring to the language of Blackstone, where he adverts to the fact that promissory notes are payable "to a person therein named," and then cautiously adds, or "sometimes to his own order, or oftener to the bearer." The reverse language might be far more justly used in the present day; and it might be correctly stated that promissory notes are now generally negotiable by being payable to order, or to the bearer; and that they are rarely limited to be payable only to a particular person named therein. We may add in this connection, that the person who makes the note is called the maker, and the person to whom it is payable is called the payee; and when it is negotiable by indorsement, and is indorsed by the payee, he is called the indorser, and the person to whom the interest is transferred by the indorsement is called the indorsee. Every indorsee is of course deemed the holder, and so is every person who, by a transfer of a note payable to the bearer, becomes entitled thereto. The Scottish law seems precisely coincident with the English law as to promissory notes, except so far as respects the remedial process thereon; there being some peculiar privileges annexed thereto in Scotland.

It seems scarcely necessary to point out the distinction between bills of exchange and promissory notes in their general structure and character. In a bill of exchange there are ordinarily three original parties, the drawer, the payee, and the drawee, who, after acceptance, becomes the acceptor. In a promissory note there are but two original parties, the maker and the payee. In a bill of exchange, the acceptor is the primary debtor in the contemplation of law to the payee; and the drawer is but collaterally liable. In a promissory note, the maker is, in contemplation of law, the primary debtor. If a note be negotiable, and is indorsed by the payee, then there occurs a striking resemblance in the relations of the parties upon both instruments, although they are not in all respects identical. The indorser of a note stands in the same relation to the subsequent parties as the drawer of a bill, and the maker of the note is under the same liabilities as the acceptor of a bill.

The origin of promissory notes is quite as obscure as that of bills of exchange. There is no doubt that promissory notes in writing (*chirographo*) were well known and in use among the Romans. Of this we have an instance in the Digest: *ab Aulo Augurio Caius Scius mutuum quandam quantitatem accepit hoc chirographo: ille scripsit, me accepisse, et accipi ad illo mutuos et numeratos decem; quos ei reddam kalendis illis proximis cum suis usuris plicitis internos: Quaro, an ex eo instrumento usuras peti possint, et que? Modestinus respondit, si non appareat de quibus usuris convento facta sit, peti eas non posse.* But this instrument never seems

to have been known as a negotiable instrument among the Romans, or as a general medium used in purchases and sales, with that superadded quality; but its negotiability seems to be exclusively the invention of modern times. Probably the origin of negotiable promissory notes is somewhat later than that of bills of exchange, and grew out of the same general causes as the latter, viz., to facilitate the operations of commerce, and to extend the negotiability of debts. Mr. Kyd's remarks on this subject seem at once well founded and satisfactory, at least as conjectures. "As commerce," says he, "advanced in its progress, the multiplicity of its concerns required, in many instances, a less complicated mode of payment than by bills of exchange. A trader, whose situation and circumstances rendered credit from the merchant or manufacturer, who supplied him with goods, absolutely necessary, might have so limited a connection with the commercial world at large that he could not easily furnish his creditor with a bill of exchange on another man. But his own responsibility might be such that his simple promise of payment, reduced to writing for the purpose of evidence, might be accepted with equal confidence as a bill on another trader. Hence, it may reasonably be conjectured, promissory notes were at first introduced." Undoubtedly negotiable promissory notes were well known upon the continent of Europe long before their introduction into England. They were probably first brought into use in England about the middle of the 17th century, although Lord Holt has been thought to assign to them a somewhat later origin. They seem at first to have been called bills of debt, or bills of credit, indifferently. Indeed, as Lord Mansfield has observed, there seems much confusion in the "Reports" in the times of King William and Queen Anne, so that it is difficult, without consulting the records, to ascertain whether the action arose upon a bill or note, as the words "bill" and "note" were used promiscuously. There was a long struggle in Westminster Hall as to the question whether promissory notes were negotiable or not at the Common Law, for there could be no doubt that they were by the Law Merchant, at least as recognized upon the continent of Europe. Lord Holt most strenuously, and with a pride of opinion not altogether reconcilable with his sound sense and generally comprehensive views, maintained the negative. The controversy was finally ended by the statute of 3 and 4 Anne, ch. 9 (1705), (made perpetual by the statute of 7 Anne, ch. 25, sec. 8.) which, after reciting that promissory notes had been held not negotiable, proceeded to enact, "That all notes in writing, made and signed by any person or persons, body politic or corporate, or by the servant or agent of any corporation, banker, goldsmith, merchant, or trader, who is usually intrusted by him, her, or them, to sign such promissory notes for him, her, or them, whereby such person or persons, body politic and corporate, his, her, or their servant or agent as aforesaid, doth or shall promise to pay to any other person or persons, body politic and corporate, his, her, or their order, or unto bearer, any sum of money mentioned in such note, shall be taken and construed to be, by virtue thereof, due and payable to any such person or persons, body politic and corporate, to whom the same is made payable; and also every such note payable to any person or persons, body politic and corporate, his, her, or their order, shall be assignable or indorsable over, in the same manner as inland bills of exchange are or may be, according to the custom of merchants; and that the person or persons, body politic and corporate, to whom such sum of money is or shall be by such note made payable, shall and may maintain an action for the same, in such manner as he, she, or they might do upon any inland bills of exchange, made or drawn according to the custom of merchants, against the person or persons, body politic and corporate, who, or whose servant or agent as aforesaid, signed the same; and that any person or persons, body politic

and corporate, to whom such note, that is payable to any person or persons, body politic and corporate, his, her, or their order, is indorsed or assigned, or the money therein mentioned ordered to be paid by indorsement thereon, shall and may maintain his, her, or their action for such sum of money; either against the person or persons, body politic and corporate, who, or whose servant or agent as aforesaid, signed such note, or against any of the persons that indorsed the same, in like manner as in cases of inland bills of exchange." In most of the States of America this statute has been either expressly adopted by statute, or recognized as part of their Common Law. A few only have deemed it inapplicable to their situation; and in some States the circulation of promissory notes still remains clogged with positive restrictions or practical difficulties, which greatly impede their use, and value, and circulation. Most, if not all commercial nations, have annexed certain privileges, benefits, and advantages to promissory notes, as they have to bills of exchange, in order to promote public confidence in them, and thus to insure their circulation as a medium of pecuniary commercial transactions. In England and America they partake in a very high degree of the character of specialties, and are deemed to import *prima facie*, to be founded upon a valuable consideration, and may be generally declared on without specially stating what the particular consideration is; in which circumstance they differ from other unsealed contracts, whether written or unwritten. Between the original parties the consideration may indeed, as a matter of defense, be inquired into. But where they are negotiable, and in the possession of a bona fide holder for a valuable consideration, without any notice of any inherent infirmity or vice in their original conception, they are binding upon the antecedent parties, and the consideration is not inquirable into, and becomes immaterial. In Scotland they are entitled to all the privileges of bills of exchange, among which, besides the common privileges in England and America, is the privilege of a summary process to enforce payment upon their dishonor, differing from the ordinary process. The like summary process is given by the French law. [And a similar statute has recently been enacted in England.] Helicetus, in the passages already referred to, states that they are indorsable like bills of exchange, and are subject to the law of prescription, and, in case of dishonor, are open to the same process and mode of execution as bills of exchange.—*STORY ON PROMISSORY NOTES. See BILLS OF EXCHANGE AND EXCHANGE.*

Promontory (Latin *pro*, and *mons*, a mountain). In *Geography*, a point of land, whether high or low is indifferently, projecting into the sea.—*See CAPE.*

Protection, in *Commercial legislation*, means the protecting or bolstering up of certain branches of domestic industry by prohibiting the importation of the produce of such branches from abroad, or loading it, when imported, with heavy duties. This policy was at one time universally prevalent. But its extremely injurious influence having been demonstrated over and over again, it has been abandoned by all intelligent statesmen. And notwithstanding the powerful interests by which it was supported, it has nearly disappeared from our legislation; and it will, no doubt, eventually disappear from the legislation of all countries.

Providence, city, the principal port of entry, and semi-capital of Rhode Island; situated in 41° 49' 22" N. lat., and 71° 24' 48" W. long. from Greenwich, and 1° 28' 24" E. long. from Washington. It is 30 miles north of Newport, 42 miles south-southwest from Boston, 70 miles east of Hartford, 173 miles east of New York, and 396 from Washington. Population in 1820, 11,767; in 1830, 16,832; in 1840, 23,171; in 1850, 41,518; in 1854, 50,000. In point of population and wealth Providence is the second city in New England. Its present limits contain about nine square miles. The

compact portion of the city is built on both sides of the Providence River, over which are constructed two broad and substantial wooden bridges, above which the river expands into a broad and beautiful cove.

There are in Providence 26 banks, with an aggregate capital of \$10,419,090; a savings-bank; three insurance companies, with a capital of \$300,000, besides several mutual insurance companies without specified capital. The manufactures of Providence are extensive. The city also contained in 1857, 78 steam-engines, and within 100 rods of the city line are 12 or 15 more, that for all practical purposes belong here; 56 jewelry establishments, employing 1400 hands, and yielding an annual product of \$2,771,600; three bleaching and dyeing works, employing 350 hands, and finishing 50,960,000 yards of goods; 22 manufactories of machinery, steam-engines, boilers, castings, etc., employing 2062 hands; 9450 tons of coal; 11,095 tons of pig-iron; 9801 tons of other iron, and producing annually 33,800 stoves, 9,000,000 pounds of nails and spikes, 80 steam-engines, 220 boilers, 3,584,000 pounds of nuts, etc., and other articles to the total value of \$2,561,000; two screw factories, that yield an annual product of \$1,066,000; two butt factories, that produce \$253,000, and a great variety of smaller manufactories, yielding together an annual product of \$17,400,000.

Providence possesses great commercial facilities, which have been well improved. The harbor, at the head of Narragansett Bay, 33 miles from the ocean, is spacious, and has sufficient depth of water for the largest ships. Somewhat more than 100 vessels belong to the port. The registered tonnage in 1853 was 10,861 tons. Two lines of packets ply regularly to New York, two to Albany, one to Philadelphia, and one to Baltimore. A railroad 41 miles long extends from Providence to Boston, with which it is connected.

Provisions. Under this term, taken in its most extensive sense, in reference to man, may be comprised all those articles used as food by the inhabitants of this and other countries; but commercially it is understood to comprise only fresh and salted butchers' meat, hams and bacon, butter and cheese, eggs, and a few other articles.

—See articles BACON, PORK, WHEAT, FLOUR, &c.

Prunes and Prunelloes, a species of dried plums; of which there are many varieties. The finest are imported from France, in the south of which this fruit is very abundant. The best prunes are packed in hampers or baskets made of white oiled, weighing from six to ten pounds each; the second quality in quarters, and the third in puncheons.

Prussia (one of the Zollverein). The Prussian territory is not much more than two-fifths of the size of that of Austria, and the larger portion of it lies within the limits of the great and comparatively barren plain which extends from the Bohemian and Carpathian Mountains to the Baltic Sea. The smaller and more fertile part of the Prussian territory, called the Grand Duchy of the Lower Rhine, lies in the lower part of the basin of that river, and is separated from the main body of the kingdom by the intervention of Hanover, Saxony, and other German states. There are, besides, several smaller districts scattered in the heart of Germany; and with a territory thus scattered and disjointed, the rank of Prussia as a great state has been sustained only through the superiority of her internal organization, and the wary, temporizing, and even shuffling policy of her government, forced upon them, indeed, by the defenselessness of a kingdom without natural frontiers, or physical centrality, or a people united by language, and national feeling, and interest. Agriculture is the chief occupation of the people; but in the Rhenish provinces the cotton, and in Silesia the linen manufactures, are carried on to a great and increasing extent. Prussia necessarily maintains a large standing army, but has no naval power; the king, however, has recently purchased the port of Jade from the Grand Duke of Oldenburg for the purpose of a naval station, and has begun the formation of a fleet. The kingdom was till recently an absolute monarchy, but has now received a Constitution.

The first treaty of amity and commerce between the United States and Prussia was negotiated in 1785. This was renewed in 1799, and expired in 1815. In 1828 a new treaty was concluded between the two governments, which is still in force. Under the former treaties the vessels of the two high contracting parties were reciprocally allowed to import the goods which were of the produce or manufacture of their respective nations. The latter treaty, however, stipulates entire reciprocity and freedom of commerce. The vessels of each nation are allowed to import into the other the productions of their own or of any other country. The direct trade between the United States and Prussia is, however, very inconsiderable. There is scarcely any article of American production demanded in Prussia, except tobacco, rice, and raw cotton; nor is there any bulky article of Prussian produce wanted in the American markets.

1855	264,714	1,982,313	67,314	1,926,249	640,604	1,942,403

* These returns are for the port of New York only, and for six months. The Department is not in possession of the requisite data to exhibit the general trade for these years. The other years, however, show the general annual value of the indirect trade. † This includes \$305, via Rotterdam.

With Great Britain and France, Prussia maintains an active and annually increasing commercial intercourse. This trade is chiefly conducted through the port of Stettin. In 1852 the general navigation of this port was as follows:

VESSELS ENTERED THE PORT OF STETTIN IN 1852.	
From England	290
" France	20
" United States	5
" Russia	15
" Denmark	40
" Mediterranean	20
Total number of vessels entered	570
VESSELS CLEARED FROM THE PORT OF STETTIN IN 1852.	
For England	130
" France	50
" Denmark	30
" Russia	2
" Belgium	3
" Sweden	4
" Norway	10
" Holland	0
Total number cleared	308

From the United States the imports into this port are: rice, ashes, rosin and turpentine, and whale-oil; though, owing to its high price within the past few years, the article last named has almost ceased to be imported from the United States. Sugar has also disappeared from the list of imports, for the reason that the refineries in the Baltic ports chiefly use beet-root sugar.

The value of imports from the United States into this port for the years 1851, 1852, and 1853, and the duties levied thereon, are thus given in Prussian official reports:

1851	\$329,870—Amount of duty	\$26,160
1852	134,310	13,270
1853	79,833	6,920

The port of Memel is also the centre of no inconsiderable share of the direct trade between the United States and Prussia. From 1st July to 31st December, 1854, there entered this port from the United States, in the direct trade, five vessels, measuring an aggregate tonnage of 2505 tons, and floating 8171 bales of cotton, valued at \$411,500. Outward cargoes consisted of hemp, rope, canvas, yarn, mats, bags, and leather.

At the port of Königsberg there arrived from the United States, from 1st July, 1854, to 1st January, 1855, seven American vessels, floating cargoes in value \$898,000—namely, 9680 bales of cotton, 1700 gallons of oil, and 3600 boxes of sugar. Outward cargoes consisted of hemp, yarn, bristles, feathers, raven's-duck, cordage, horse-hair, soap, and tallow; to the aggregate value of \$740,000.

The general foreign trade of this port is considerable. Its exports consist of grain, woollens, silks, soap, starch, sealing-wax, and refined sugar. Its imports, however, largely exceed in value its exports. The former in 1851 amounted to about 6,000,000 thalers, while the latter only reached a little over 4,000,000.

The harbor of Königsberg admits small vessels only; large ships land at Pillau, which is also the port of Elbing and Braunsberg.

Pantze is the only remaining port of Prussia in which foreign trade is conducted. It is situated on the left bank of the Vistula, three and a half miles

from its outlet at Weichselmünde, and is accessible to vessels drawing from eight to nine feet water. Larger vessels lie in the Neufahrwasser, at the mouth of the river, or in the roads, which afford good anchorage for vessels of any burden. Its exports consist of wheat, rye, barley, oats, peas, flour, linseed, rape-seed, liscuit, provisions, ashes, zinc, bones, timber, staves, hemp, flax, linens, wool, etc. The imports comprise woolen and silken stuffs, and other manufactured goods; colonial products, dyes, wine, oil, spice, fruit, salt, and furs. At Stettin, port dues are: Tonnage duty, 14 silver groschen per last, laden, and one half only if in ballast. This would be about 16 1/2 cents per ton if laden, and 8 1/2 cents per ton if in ballast. Pilotage dues, 2 1/2 thalers per 25 lasts, and 15 silver groschen for every 10 lasts upward. This equals \$1 7/2 per 50 tons, and 3 1/2 cents per every 20 tons upward.

Port Regulations.—The following regulations apply to all the Prussian ports: On a ship arriving in the road or port, the master must submit to the police regulations of the port, which are made known to him or the officer in command; the master is then required to proceed to the custom-house and deliver a complete manifest of the cargo. This manifest or general declaration is required to state clearly if the whole cargo is to be entered at the port, and the part, if any, which is to be carried farther in the ship; that part to be stated under a special head. The merchandise, as per bills of lading, is then entered regularly. The statements for entry are to be drawn up, specifying the description, weight, measure, or quantity, agreeably to a zolltariff for the payment of duties. Excepting various articles imported in an unpacked state, the following measures are to be adopted: For beer in casks, tuns of 100 Prussian quarts; for wines, brandy, and vinegar, in casks (eimers) of 60 Prussian quarts; for herrings, barrels; for burned chalk, tuns of 4 Prussian bushels; for all other packed articles, centners of 110 pounds gross weight. If there be several packages of similar articles, and each package contains an equal quantity, they may be entered together, according to their number and size, and with a general statement of the contents. If the contents of the packages vary, it will be necessary to specify the contents of each. The luggage of passengers must be noted as such in the manifest. If it consist of usual traveling luggage, it will be sufficient to state the several boxes or parcels; but if it include goods, these must be stated according to number and description. The personal property of the master, with the exception of provisions, must be stated like other goods, but omitting the declaration to a consignor; and it must also be stated in the declaration what are the articles which are not in the ship's hold. A form is presented to the master to fill up as his report. It must be filled up exactly according to this form, and written clearly in the German language. This declaration is binding on the master, and each error that may be discovered on the unloading, or on examination, subjects him to a penalty stated in the customs laws. If the master has not a report with him, he may have one prepared in the port by a customs officer; in which case he delivers all his papers to the officer, who stamps and numbers them, the last number being marked as such. The master, at the same time, informs the officer of the goods or luggage

belonging to himself or to passengers, if there be no account of the same; the officer makes out a list thereof, which is signed by the master, and returned, in order to be inserted in the report. If the report has to be prepared on shore, it must be delivered to the customs officers within 24 hours after the arrival of the ship in the road; if not, possession will be taken of the ship at the master's expense. Customs officers may take possession of the ship at once, free of expense. It is required of the master to procure the necessary information for the report, in the arranged manner, on receipt of the cargo. If he does not so prepare himself, the customs officers assume the whole direction of landing the cargo, according to the regular instructions in such cases. Respecting the ship's provisions, if they consist of articles which pay a consumption duty, a separate report is required in duplicate: one is returned to the master after revision, in order that he may take on board an equal quantity of similar provisions when he sails. If he fails in this, or if the sailing is delayed beyond a twelvemonth, the consumption duty must be paid on this provisions remaining on hand. The master is, however, at liberty to deposit the provisions at the custom-house until he sails, subject to the consumption duty if not taken away. Articles not properly forming a part of the cargo are so considered if they undoubtedly appertain to the ship's inventory, and are articles for the use of the voyage. Articles which are not considered as such, are to pay duty if they be subject to a consumption tax; or they may be landed, in order to be deposited in the custom-house. If a vessel remains in the road, and does not enter the port, and only discharges the cargo into lighters, the consumption of provisions in the road is duty free. A report of the provisions is sufficient, and no further control over the same is observed, except in

particular cases when considered necessary. If the master is bound for another destination, and only enters the harbor through distress, then a general inspection is only made, in order that no part of the cargo may be disposed of. A report, however, is to be made of the cargo. In cases of shipwreck, on the salvage of the cargo, the kind and quantity is ascertained, with the assistance of the regular officers, and the cargo shall be placed in security until further directions are issued. The cargo of vessels which winter in Prussian ports must be declared without unnecessary delay, in as far as the ship's papers and the knowledge of the master afford information. An inspection of the outer parts and decks of the vessel, and the stores or articles thereon, takes place at once, and the ports or hatchways of the ship's hold are then locked. Until the declaration, inspection, and locking up of the vessel take place, it is watched at the expense of the captain; which guarding, in particular cases, may continue as long as the customs officers may consider necessary. Ships which only anchor in the roads, and do not enter the port, are not considered within the control of the customs officers; they must not, however, hold intercourse with the shore or the port, without delivering a report and their papers. If the ship remain in the roads longer than 24 hours after the declaration is made, without entering or proceeding to unload, unless the one or the other be prevented by stress of weather, then an officer repairs to the ship, examines the decks, etc., and locks up the hatches, etc., of the hold. To the officers who are on service on board the vessel, proper maintenance is to be allowed, the same as is afforded to travelers of the trading class. The following table exhibits the foreign commerce of the United States with Prussia for 37 years, giving the domestic and foreign exports, the imports, and tonnage.

—See article ZOLL-VENERN for a general account of the foreign commerce.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Prussian Blue, or Prussiate of Iron (Ger. *Berlinerblau*; Fr. *Bleu de Prusse*; It. *Azzurro Prussiano*; Sp. *Azul de Prusia*; Russ. *Лазор Берлинская*), a beautiful deep blue powder, accidentally discovered at Berlin in 1710. It is of considerable importance in the arts, being extensively used by painters; it is manufactured in this country. Many attempts have been made to render Prussian blue available for the dyeing of broad-cloths, but without much success. The difficulty is to diffuse the color equally over the surface; for, from its extraordinary vivacity and lustre, the slightest inequalities strike and offend the eye. Prussian blue resists the air and sun extremely well; but it can not be used in the dyeing of cottons, or any sort of stuff that is to be washed with soap, as the alkali contained in the soap readily dissolves and separates the coloring matter.—**BACONOFF on Colors.** Blue is a favorite color with the Chinese, and in 1810-'11 the imports of Prussian blue into Canton from England amounted to 1899 piculs, or 253,200 lbs. But for some years past the Chinese have not imported a single pound weight. The cause of the cessation of the trade deserves to be mentioned. A common Chinese tailor, who came to England in an East Indiaman, having frequented a manufactory where the drug was prepared, learned the art of making it; and on his return to China he established a similar work there, with such success that the whole empire is now amply supplied with native Prussian blue! The West has derived many important arts from the East; but we incline to think that this is the first well-authenticated instance of any art having ever been carried from the West to the East by a native of the latter. But in all that respects industry, ingenuity, and invention, the Chinese are incomparably superior to every other people to the east of the Indus.

Prussian or German Commercial Union. Next to the efforts of the Prussian government to diffuse the blessings of education, their efforts to introduce a free commercial system into Germany constitute their best claim to the gratitude and esteem of their own subjects, and of the world. Germany, as every one knows, is divided into a vast number of independent, and mostly petty states. Until a very recent period, every one of these states had its own custom-houses, and its own tariff and revenue laws; which frequently differed very widely indeed from those of its neighbors. The internal trade of the country was, in consequence, subjected to all those vexatious and ruinous restrictions that are usually laid on the intercourse between distant and independent states. Each petty state endeavored either to procure a revenue for itself, or to advance its own industry, by taxing or prohibiting the productions of those by which it was surrounded; and customs officers and lines of custom-houses were spread all over the country! Instead of being reciprocal and dependent, every thing was separate, independent, and hostile: the commodities admitted into Hesse were prohibited in Baden, and these prohibited in Wirtemberg were admitted into Bavaria. It is admitted that nothing contributes so much to the growth of industry and wealth in modern times as the perfect freedom of internal industry, and that intimate correspondence among the various parts of the country which renders each the best market for the produce of the other. How different would have been our present condition had each country been an independent state, jealous of those around it, and anxious to exalt itself at their expense! But, until within these few years, this was the exact condition of Germany; and, considering the extraordinary obstacles such a state of things opposes to the progress of manufactures, commerce, and civilization, the wonder is, not that they are comparatively backward in that country, but that they should be so far advanced as they really are.

But, thanks to the intelligence and perseverance of Prussia, this anti-social system has been well-nigh sup-

pressed; and the most perfect freedom of commerce established among the great bulk of the Germanic nations. The disadvantages of the old system had long been seen and deplored by well-informed men; but so many interests had grown up under its protection, and so many deep-rooted prejudices were enlisted in its favor, that its overthrow seemed to be hopeless, or, at all events, exceedingly distant. The address and resolution of the Prussian government, however, triumphed over every obstacle. Being fully impressed with a strong sense of the many advantages that would result to Prussia and Germany from the introduction of a free system of internal intercourse, they pursued the measures necessary to bring it about with an earnestness that produced conviction, and with a determination, *coute qui coute*, to carry their point.

The first treaties in furtherance of this object were negotiated by Prussia with the principalities of Schwarzburg-Sondershausen and Schwarzburg-Rudolstadt, in 1818 and 1819, on the principle that there should be a perfect freedom of commerce between these countries and Prussia; that the duties on importation, exportation, and transit, in Prussia and the principalities, should be identical; that these should be charged along the frontier of the dominions of the contracting parties; and that each should participate in the produce of such duties, in proportion to its population. All the treaties subsequently entered into have been founded on this fair and equitable principle: the only exceptions to the perfect freedom of trade in all the countries comprised within the league or tariff alliance being confined, first, to articles constituting state monopolies, as salt and cards, in Prussia; 2d, to articles of native produce, burdened with a different rate of duty on consumption in one state from what they pay in another; and, 3d, to articles produced under patents conferring on the patentees certain privileges in the dominions of the states granting the patents. With these exceptions, which are not very important, the most perfect freedom of commerce exists among the allied states. Since 1818, when the foundations of the alliance were laid, it has progressively extended, till it now comprises more than three-fourths of the Germanic states, exclusive of Austria. Dual Hesse joined the alliance in 1828, and Electoral Hesse in 1831; the kingdoms of Bavaria, Saxony, and Wirtemberg joined it afterward, as have Baden, Nassau, and almost all the smaller states by which it had not been previously joined, with the exception of Mecklenburg-Schwerin and Mecklenburg-Strelitz. But these, with Hanover, will be very shortly included in the league. In 1852 the tariff alliance comprised—

	German Square Miles.	Population in 1849
Prussia.....	5188	16,689,153
Luxemburg.....	47	189,783
Bavaria and her detached territories.....	1306	4,626,656
Saxony (Kingdom of).....	272	1,894,431
Wirtemberg and the two Hohenzollerns.....	384	1,825,588
Hesse (Electoral).....	203	7,731,564
Hesse (Duchy) and Homburg.....	154	862,917
The Thuringian States.....	237	1,014,954

Brunswick (Duchy of).....	63	247,050
Nassau.....	85	425,684
Frankfort.....	2	71,618
Totals.....	8367	29,800,063

Throughout the whole extent of this immense country, from Aix-la-Chapelle, on the confines of the Netherlands, eastward to Tilsit, on the confines of Russia, and from Stettin and Dantzic, southward to Switzerland and Bohemia, there is nothing to interrupt the freedom of commerce. A commodity, whether for consumption or transit, that has once passed the frontier of the league, may be subsequently conveyed, without let or hindrance, throughout its whole extent. Instead of being confined within the narrow precincts of their own territories, the products of each separate country of the alliance may be sent to every one else;

so that each may apply itself, in preference, to those departments in which it has some natural or acquired advantage; and each has to depend for its success, not on the miserable resource of customs regulations, but on its skill and industry. The competition thence arising is most salutary; and, should the peace of Europe be preserved, we run little risk in saying that all sorts of industry will make more progress among the states comprised within the tariff alliance, during the next ten years, than they did during the half century previous to its being organized. An assembly of representatives from the allied states meets annually, to hear complaints, adjust difficulties, and make such new enactments as may seem to be required. The Prussian tariff has been adopted, with certain modifications. The duties are received into a common treasury, and are apportioned according to the population of each of the allied states. In addition to its other advantages, the new system has reduced the cost of collecting the duties to a mere trifle, compared with its former amount; and has enabled hundreds of custom-houses, and thousands of customs officers, to be employed in the different departments of industry. The existing discrepancy in the weights and measures used in different parts of Germany occasions considerable inconvenience; and we are glad to observe that the equalization of weights and measures, and their reduction to a common standard in all the allied states, is declared to be one of the objects of the league. It is also expressly provided that the tolls, or other charges in lieu thereof, shall in all cases, whether they belong to the public or to private individuals, be limited to the sums required to keep the roads in a proper state of repair; and that the tolls existing in Prussia shall be considered as the highest that are to be levied, and shall not in any case be exceeded.

We are able to lay before the reader the following extract from a work printed by order of the House of Representatives, giving an account of the objects to be attained by the Prussian Commercial League: "Prussia," it is there said, "has evidently taken the lead in this wise and important measure, to which the smaller states have gradually acceded. The whole commercial policy of this enlightened power has been distinguished for its liberality, being founded on the desire of placing her intercourse with all nations on the basis of reciprocity. The commercial league of Germany is intended to carry out this principle, and not to be directed, as has been supposed, against any particular nation; as it is well known that Prussia, in her treaties with maritime powers, has invariably adopted the system of reciprocity, to whatever extent those with whom she negotiates are willing to carry it. The establishment of this community of commercial interests forms a part of the fundamental compact by which the new Germanic Confederation was created, after the dissolution of the Confederation of the Rhine; to be subsequently adopted, however, at the option of such of the co-states as should choose to accede to it. Its effects can not fail to promote commerce, and every other branch of industry, as it removes all those vexatious and endless difficulties which previously obstructed the freedom of intercourse. Navigable rivers and highways are now opened to the unfettered use of the German people; the custom and toll houses, with their officers and barriers, have been withdrawn from the interior, and the whole intercommunication resembles that of the subjects of any one of the states within its own territories. To these benefits may be added the assured prospect of improvement in the finances of the great and smaller sovereignties composing the league. This advantage will grow out of the simplicity or unity of the new system, a saving in the cost of collection, and from the increased consumption which renovated industry and progressive prosperity so invariably cause."*Digest of Customs Laws*, vol. iii. p. 227.

Prussian Duty on Cottons.—The duty on cotton goods

being that in which we are most interested, we have taken some pains to ascertain its real influence. This duty amounts to 50 rix dollars per Prussian quintal on all cotton goods, without respect to quality or price; and, taking the quintal at 113 lbs. avoirdupois, and the rix dollar at 8s., it is equal to £7 10s. per 113 lbs. Now we have learned from statements obligingly furnished to us by a large wholesale house in the city, 1st. That a quintal (113 lbs.) of coarse shirting, worth 4d. per yard, contains 497 yards; it consequently costs £8 6s., and the Prussian or tariff alliance duty of £7 10s. on it is, therefore, equivalent to an *ad valorem* duty of 90 per cent. 2d. That a quintal of superior shirting, worth 1s. a yard, contains 457·65 yards; it consequently costs £22 17s. 7d., making the Prussian duty on such goods 32½ per cent. 3d. That a quintal of printed cottons, worth 1s. 6d. a yard, contains 633 yards; it consequently costs £47 9s., making the Prussian duty on such goods 15½ per cent. 4th. That a quintal of fine printed cottons, worth 2s. 6d. a yard, contains 678 yards; it consequently costs £84 15s., making the Prussian duty on such goods 8½ per cent. It is plain, therefore, that, except on the coarsest and cheapest species of goods, the Prussian or tariff alliance duty is very far from being oppressive; and, as the value of coarse goods is principally dependent on the cost of the raw cotton and the wages of labor, being but little influenced by superiority of machinery, it is not very probable that we should export them largely to Prussia, even were the duty materially reduced. No doubt, however, it would conduce greatly to the interests of the people comprised within the league, though we do not know that it would sensibly affect us, were the duty assessed on an *ad valorem* principle, and made 20 or 30 per cent. on all goods; and we should think that this might be done without any material difficulty. The subjoined translation of the more important clauses of the customs treaty of the 22d of March, 1833, sets the principles on which the alliance is founded in a clear point of view.

Customs Treaty, concluded the 22d March, 1833, between the Kings of Bavaria and Wirtemberg, on the one part; and the King of Prussia, the Prince Electoral Co-regent of Hesse, and the Grand Duke of Hesse on the other part.

1. The existing customs unions between the states above named shall henceforth constitute a general Union, united by a common system of customs and commerce, embracing all the countries which are comprised therein.

II. In this general reunion are also comprised the states which have already adhered, either for the whole of their territory, or for a part, to the system of customs and commerce of one or other of the contracting states, having regard to their special relations, founded upon the conventions of adhesion concluded with the states which have intervened.

III. But there will remain excluded from the general reunion the parts separated from the countries of the contracting states which, because of their situation, are not yet included either in the reunion of the Bavarian or Wirtemberg customs, nor in those of Prussia and Hesse. Nevertheless, the regulations now in force to facilitate the commerce of these territories with the principal country will be maintained. Other favors of this kind can not be accorded without the unanimous consent of the contracting states.

IV. In the contracting states there shall be established uniform laws for the duties of import, of export, and of transit, except such modifications as, without injury to the common object, result necessarily from the particular legislation of each contracting state, or from local interests. Thus, exceptions and modifications to the common tariff may take place, as to rates of duties of entry, of export, and of transit (according as the direction of the routes of commerce may require), established upon articles recognized as of minor conse-

quence in extensive commerce; provided always, that these modifications be preferred by separate states, and that they shall not be disadvantageous to the general interests of the Association. The administration of the duties of import, export, and transit, as well as the organization of the authorities which are engaged therein, in all the states of the Association, shall be established upon a uniform footing, having regard, however, to the particular relations existing in those countries. The laws and ordinances which, according to those principles, ought to be uniform in the contracting states, and which are to constitute the law of the tariff and the regulations of the customs, shall be considered as an integral part of the present treaty, and shall be published at the same time.

V. There can neither be alterations, nor additions, nor exceptions, to the acts above mentioned (Article IV.), but by the unanimous consent of all the contracting parties, and in the form required for the making (confection) of the laws. The preceding applies equally to all the ordinances which would establish, for the administration of the customs, dispositions entirely different.

VI. Liberty of commerce, and community of the receipts of customs, as regulated by the following article, will commence simultaneously with the operation of the present treaty.

VII. Dating from this epoch, all duties of import, of export, and of transit shall cease on the common frontier of the Bavaro-Wirtemberg and Prusso-Hessian customs reunions. All articles of free commerce in one of those territories may be imported freely and without duty into all the others, except only as follows:

A. Articles monopolized by the states (playing-cards and salt) conformable to Articles IX. and X.

B. Indigenous articles, now subject in the interior of the contracting states to different duties, or excepted from all duty in one state, and imported into another, and which according to article II. ought consequently to be subject to a duty of compensation.

Finally, C. Articles which, without prejudice to patent rights or conceded privileges in one of the contracting states, can not be limited or imported, and ought consequently to be excluded during the existence of the patents and privileges from importation into the state which has granted them.

VIII. Notwithstanding the freedom of commerce, and the exemption from duties, established by Article VII., the transport of articles of commerce, subject by the common tariff to duties of import or export on the frontiers of the Association, can not take place between the states of Bavaria and Wirtemberg, and the states of Prussia, of Electoral Hesse, or of Grand Ducal Hesse, and reciprocally, except by the public roads, military routes, and navigable rivers. For this purpose there shall be established on the interior frontiers common *bureaus* of verification, to which the conductors of merchandise must, on exhibiting their licenses, declare what are the articles which they are employed to transport from one territory to another. This disposition will not be applicable to retail commerce in raw materials, nor to the petty commerce of the frontiers or the fairs, nor to the effects of travelers. Process for the verification of merchandise will go no farther than is required for security of the duties of compensation.—See Article VII.

XIII. The contracting parties reciprocally renew their adhesion to the principle that the tolls, or other charges in lieu thereof, shall only be sufficient to defray the expense of maintenance and repairs of the roads, whether the tax be for the state or for private rights. It was thus that has been approved the supplement to the duty of customs, created in Bavaria and Wirtemberg, to replace the duty of tolls, paving, causeways, bridges, and generally of all analogous taxes. The tolls, etc., now existing in Prussia, according to the general tariff of 1828, shall be considered

as the *highest rates*, and shall not be exceeded in any of the contracting states. In accordance with the principle thus announced, the individual duty for closing the gates of cities shall be abolished; as also the duty of paving of causeways, where it still exists; and all paved roads will be considered as causeways of a description liable only to the duty on causeways established by the general tariff.

XIV. The contracting governments agree to unite their efforts to introduce into the states a uniform system of coins, weights, and measures; to commence immediately the requisite negotiations for this purpose; and, subsequently, to direct their efforts toward the adoption of uniform custom-house weights. The contracting states, in the impossibility of establishing this uniformity before this treaty goes into operation, agree, for facilitating the forwarding of merchandise where it has not already been done, to revise their tariff as to weights and measures, assuming for a basis the tariffs of the other contracting states. They will cause such modifications to be published, for the government of the public and of their custom-house *bureaus*. The common tariff (Article IV.) shall be divided into two principal divisions, according to the system of weights, measures, and moneys of Bavaria, and that of Prussia. The declaration of the weights and measures of articles subject to duty shall, in Prussia, be according to Prussian weights and measures; in Bavaria and Wirtemberg, according to those of Bavaria; and in the two Hesses, according to the weights and measures there legally established. In expediting custom-house acts, the quantity of merchandise must be expressed according to the two principal divisions of the common tariff. Until the contracting states agree upon a system of common money, the payment of duties in each state shall be made in the same currency as in use for payment of its other taxes. But from the present time, the gold and silver coins of all the contracting states, with the exception of small money (*scheldennunze*), shall be received into all the *bureaus* of receipt of the Association; and for this purpose tables of value shall be published.

XV. The duties of navigation upon the rivers, comprising therein those which apply to vessels, shall always be mutually acquitted according to the acts of the Congress of Vienna, or of special conventions, upon all the rivers to which these regulations apply, unless other determinations be adopted in this respect. The contracting states agree to enter without delay into negotiations for that which particularly regards the navigation upon the Rhine and the neighboring streams, in order to effect an arrangement by which the import, export, and transit of the productions of all the states of the Union upon said streams shall be, if not absolutely free, at least relieved as far as possible from duties of navigation, under the reserve of charges of reconnaissance. All the advantages granted by one state of the Union to its subjects, in the exercise of the navigation upon said streams, shall extend equally to the navigation of the other associated states. Upon the other streams to which neither the acts of the Congress of Vienna, nor any other treaties apply, the duties of navigation shall be according to the special regulations of the governments interested. Nevertheless, the subjects of the contracting states, their merchandise and vessels, shall throughout be treated on those streams with perfect equality.

XVI. Dating from the day on which the general custom-house regulations of the Union shall come into operation, the duties of public stores (*stapes*), and of transshipments (*umschlagnechte*), which still exist in the territories belonging to the Association, shall cease, and no one shall be liable to forced labor, nor to the discharging and storage of his merchandise, except in cases authorized by the common regulations of the customs or navigation.

XVII. No duties shall be claimed for canals, locks,

bridges, ferries, cranes, weighing, and storage; and the establishments destined to facilitate commerce shall not be allowed rent, except when actually used. Charges can not be increased; and the subjects of the other contracting states shall be on a perfect equality with the subjects of the countries having those establishments. If the establishments for weighing and cranes are only used by the custom-houses, no charge shall be made, if the articles have been previously weighed at a custom-house.

XXVIII. The contracting states engage to continue their common efforts for the encouragement of industry by the adoption of uniform regulations, so that the subjects of each state may enjoy, as extensively as possible, the privilege of seeking work and occupation in every other state. From the coming into operation of the present treaty, the subjects of any one of the contracting states, trading or seeking employ in the territory of any other of those states, shall not be subject to any impost which does not equally affect the native similarly employed. Manufacturers and merchants who are only making purchases for their trade, or travelers who have no goods with them, but simply patterns for the purpose of soliciting commissions, shall not, when thus employed, have any duty to pay in another state, if authorized to carry on such commerce in the state where they have their domicile; or if employed in the service of native manufacturers or merchants. When trading in the markets and fairs, or when they are selling the produce of the soil and fabrics, in any one of the states of the Association, the subjects of the other contracting states shall be treated in all respects as subjects of the same states.

XXIX. The sea-ports of Prussia shall be open for commerce to all the subjects of the states of the Union, on payment of the same duties as are paid by Prussian subjects, and the consuls of the several states in the sea-ports or places of foreign commerce, shall be bound, in cases of need, to assist with their advice and support the subjects of the other contracting states.

XX. To protect against contraband their common custom-house system, and to insure the regular payment of the duty of consumption in the interior, the contracting states have concluded a reciprocal cartel, which shall be enforced as soon as possible, but at the farthest at the same time with the present treaty.

XXI. The community of receipts of the contracting states, stipulated by the present treaty, shall comprehend the product of duties of entry, of export, and of transit, in the Prussian states, the kingdoms of Bavaria and Wirttemberg, the Electorate, and the Grand Duchy of Hesse, comprising therein those countries which have down to the present time acceded to the custom-house system of the contracting states. The following are excluded from the community of receipts, and remain reserved for the particular benefit of the respective governments: 1. The imposts collected in the interior of each state on indigenous products, comprising therein the compensatory duties reserved in Article XI. 2. The toll on rivers, to which are applicable the regulations of the acts of the Congress of Vienna, or special conventions.—Article XV. 3. Duties of paving, of causeways, of bridges, of ferries, of canals, of locks and ports, charges of weighing and storage, as well as similar receipts, whatever may be their name. 4. The fines and confiscations which, beyond the part allowed to informers, remain the property of each government throughout its territory.

XXII. The produce of the duties received into the common treasury shall be divided among the states of the Association, in proportion to the population which may be found in the Union, subject to deduction, 1st. Of the expenses specified in Article XXX; 2d. Of the restitution of erroneous receipts; 3d. Of the restoration of duties and diminutions made in consequence of special common conventions. The population of every state which has entered or may enter into the

Association, by treaty with one or other of the contracting states, under the engagement made by the latter, to make an annual contribution for the participation of the former to the common revenue of the customs, shall be added to the population of the states which make this contribution. There shall be made every three years, dating from a period to be hereafter fixed, an exact enumeration of the population of the associated states: the states shall reciprocally communicate the results thereof.

XXIII. All restitutions of duties not authorized by the legislation of the customs shall remain charged to the treasury of the government which shall have granted it. Conventions, hereafter to be concluded, will regulate in what cases similar restitution may be accorded.

XXIV. In conformity with the object of this association of customs tending to facilitate a freer and more natural commercial intercourse, the favors accorded for the payment of custom-house duties at certain places in which fairs are held, especially the privileges of abatement (*rebat privilegien*), can not be extended to those states of the Association where they do not exist; on the contrary, they shall be restricted and abolished as far as possible, regard being had to the means of subsistence of the places heretofore favored, and to the commercial relations which they have with foreigners; but others can on no account be granted without the general consent of the contracting parties.

XXXIII. There shall every year, on the 1st day of June, be an assembly of plenipotentiaries of the governments of the Union empowered generally to deliberate; and each state may send thither a duly authorized representative. The plenipotentiaries will choose from among themselves a president, who, however, shall have no pre-eminence over the other members. The first assembly shall be held at Munich. At the close of each annual assembly, the place of next meeting will be determined, having reference to the nature of those subjects which will then come under discussion.

XXXIV. The assembly of plenipotentiaries will have under its consideration the following subjects: A. To consider the complaints which may have arisen in any of the states of the Association concerning the execution of the general treaty, of special conventions, of the law, and of custom-house regulations; also of the tariff, when these shall not have been adjusted during the year by correspondence between the different ministers. B. The definite repatriation among the states of the Union of the total common receipts, based upon the observations made by the superior authorities, and verified by the central bureau, as may be rendered necessary by the common interest. C. To deliberate upon propositions and suggestions made by the governments for the perfection of the administration. D. Discussions upon alterations, demanded by any of the contracting states, in the laws, tariffs, and custom-house regulations, as well as in the organization of the administration, and in general upon the development and perfection of the general system of customs and commerce.

XXXV. If, in the course of the year, when the plenipotentiaries are not in session, extraordinary incidents should occur, which require prompt decision on the part of the states of the Union, the contracting parties will consult upon these through their diplomatic agents, or they will order an extra sitting of their plenipotentiaries.

Recent Changes in the German Customs Union.—The discussions in the assemblies of the League have, especially of late years, been a good deal influenced by political considerations. A league, denominated the *Steuer-Verein*, had been formed in opposition to, or in rivalry with, the Prussian League, by Hanover, Oldenburg, and Brunswick. It was evident, however, inasmuch as the interests of these and the other German states were identical, that it would be a great public ad-

vantage were these associations merged into one. But owing to political, commercial, and financial jealousies, this desirable object was of very difficult attainment. Happily, however, these difficulties have been surmounted; and a treaty negotiated between Hanover and Prussia, on the 7th of September, 1851, provided for the incorporation, from the 1st of January, 1854, of the former kingdom, and the other states included in the Steuer-Verein, with the Prussian Union. Some modifications have been introduced by the treaty into the basis of the League, but they are of little importance, except to the parties immediately interested.

Treaty with Austria.—More recently a great deal of discussion has taken place between Russia and the subordinate German states on the one hand, and Austria on the other, in regard to the formation of a Customs Association which should include the latter; and in order to pave the way for this desirable consummation, Austria issued a new tariff on the 23th of November, 1851, in which she made many important modifications in the prohibitive system on which she had previously acted, at the same time that she established a free commercial intercourse between Hungary (which had previously a separate customs establishment) and the other states of the empire. And though this wise and liberal meas-

ure has not yet led to the incorporation of Austria into the Customs Union, it has led to the conclusion of an extremely important commercial treaty between Austria and Prussia, dated the 19th of February, 1853. The contracting parties engage to suppress, with a few specified exceptions, all prohibitions against importing the products of the one into the territories of the other; they next establish a complete freedom of trade between the two countries in all articles of raw produce; and they further stipulate that the duties to be imposed on manufactured products shall be moderate and reasonable. It has a variety of other clauses, all of which have a liberal character. The duration of the treaty is limited to 12 years; but we have little doubt, should peace be preserved, that the advantages of which it will be productive will be so many and so great, that long before the expiration of 12 years its provisions will be still further liberalized, and that it will lay the foundations of a lasting intercourse, of which we can neither foresee the extent nor the beneficial influence.

In consequence of these and other changes the duties in the tariff of the German Customs Union have undergone many modifications. But except on coarse and heavy goods, they continue, speaking generally, to be moderate. We subjoin

AN ACCOUNT SHOWING THE PROPORTION OF THE REVENUES OF THE GERMAN CUSTOMS UNION RAISED IN THE DIFFERENT STATES IN 1851, AND THE DISTRIBUTION THEREOF, ACCORDING TO THEIR POPULATION, FROM THE OFFICIAL RETURNS PUBLISHED AT BERLIN IN 1852.

* The thaler, 60 cents American currency. † Frankfort is regulated by a specific arrangement, and not by population. ‡ A special payment by Prussia, on account of the Union.

Pumice-stone (Gr. *Binstein*; Fr. *Pierre ponce*; It. *Pietra pomice*; Sp. *Piedra pomez*; Lat. *Pumex*), a light, spongy, vitreous stone, found usually in the neighborhood of volcanoes. It is used for polishing metals and marble, and smoothing the surface of wood and pasteboard. It is said to form a good glazo for pottery. The lighter pumice-stones swim on water, their specific gravity not exceeding .914. The island of Lipari, in the Mediterranean, is chiefly formed of pumice-stone, and may be said to be the magazine whence all Europe is supplied with this useful article. There are several species of pumice-stones, but those only that are light and spongy are exported.

Funchoon, a measure of capacity for liquids, containing eighty-four gallons, or one-third of a tun.

Putchook. An article of this name is imported in considerable quantities from the northwest coast of India into China, and is regularly quoted in the Canton price-currents. It is the root of a plant that grows abundantly in Sindh. When burned, it yields a fine smoke, and a grateful and diffusive smell. The Chinese beat it into a fine powder, which they burn as incense in the temples of their gods.—HAMILTON'S *New Account of the East Indies*.

Pyroligneous Acid (Gr. *πυρ*; Lat. *lignum, wood*). This term is generally applied to the acid liquor which passes over along with tar and gaseous products when wood is subjected to destructive distil-

lation. This acid liquor is an impure vinegar, from which acetic acid is obtained as follows: The pyroligneous acid, freed from tar, is saturated with chalk or powdered slaked lime, filtered and evaporated, by which an impure acetate of lime is obtained; this is gently heated, so as to destroy part of its empyreumatic matter without decomposing the acetic acid; it is then mixed with sulphate of soda, which yields, by double decomposition, sulphate of lime and acetate of soda; the acetate of soda is filtered off the sulphate of lime, evaporated, heated, and redissolved and crystallized. In this way a pure crystallized acetate of soda is, by proper management, obtained, which is mixed in a retort or still with a proper proportion of sulphuric acid, and a gentle heat applied, which causes the strong acetic acid to distill over, and sulphate of soda remains behind. This acetic acid is in a high state of concentration; it is lowered by the addition of water, and if intended for the table or for domestic use, as a substitute for other forms of vinegar, it is usually colored with a little burned sugar. The charcoal which is the residue of this distillation of wood is of an excellent quality—that employed in the manufacture of gunpowder is thus prepared. This manufacture of vinegar is now carried on upon a very large scale, and the greater part of the vinegar used for domestic purposes and in the arts, in many of which it is largely consumed, is derived from this source.

Q.

Quadrans, in *English money*, the fourth part of a penny. Before the reign of Edward I. the smallest coin was a *sterling*, or penny marked with a cross, by the guidance of which a penny might be cut into halves for a half-penny, or into quarters, or four parts, for farthings. But, to avoid the fraud of unequal cuttings, that king afterward coined half-pence and farthings in distinct round pieces.

Quadrant, in *Geometry*, the arch of a circle, containing 90°, or the fourth part of the entire periphery.

Quadrant also denotes a mathematical instrument, of great use in astronomy and navigation, for taking the altitudes of the sun and stars, as also for taking angles in surveying. This instrument is variously contrived, and furnished with different apparatus, according to the various uses it is intended for; but they all have this in common, that they consist of a quarter of a circle, the limb of which is divided into 90 degrees. Some have a plummet suspended from the centre, and are furnished with sights to look through. The principal and most useful quadrants are the common surveying quadrant, astronomical quadrant, Adams's quadrant, Cole's quadrant, Gunter's quadrant, Hadley's quadrant, horological quadrant, Sutton's or Collins's quadrant, and the sinical quadrant.

Quarantine, a regulation by which all communication with individuals, ships, or goods, arriving from places infected with the plague, or other contagious disease, or supposed to be peculiarly liable to such infection, is interdicted for a certain definite period. The term is derived from the Italian *quaranta*, forty, it being generally supposed that if no infectious disease break out within 40 days, or six weeks, no danger need be apprehended from the free admission of the individuals under quarantine. During this period, too, all the goods, clothes, &c., that might be supposed capable of retaining the infection are subjected to a process of purification. This last operation, which is a most important part of the quarantine system, is performed either on board ship, or in establishments denominated *lazarettos*.

Policy of Quarantine.—The regulations as to quarantine are entirely precautionary; they have their origin in the belief that various diseases, but especially the plague, are contagious; and supposing such to be the case, the propriety of subjecting those coming from an infected or suspected place to a probation is obvious. Indeed, no government could, until the belief in question be proved to be ill-founded, abstain from enforcing precautionary measures, without rendering itself liable to the charge of having culpably neglected one of its most important duties—that of providing, by every means in its power, for the safety of its subjects. Latterly, however, it has been contended that the plague is never imported—that it is always indigenous; originating in some peculiar state of the atmosphere, or in something peculiar in the condition of the people; and that, consequently, quarantine regulations merely impose a heavy burden on commerce, without being of any real utility. But though there does not seem to be any reason for doubting that infectious diseases have originated in the way described, the fact that they have, in innumerable instances, been carried from one place to another, seems to be established beyond all question. Even if the evidence as to the importation of infectious diseases were less decisive than it is, or the opinions of medical men more divided, it would not warrant the repeal of the restraints on the intercourse with suspected ports. This is not a matter in which innovations should be rashly introduced; wherever there is doubt, it is proper to incline to the side of security. In some cases, perhaps, quarantine regulations have been carried to a needless extent; but they have more frequently, we believe, been improperly relaxed.

Institution of Quarantine.—The notion that the plague was imported from the East into Europe seems to have prevailed in all ages. But it would appear that the Venetians were the first who endeavored to guard against its introduction from abroad, by obliging ships and individuals from suspected places to perform quarantine. The regulations upon this subject were, it is most probable, issued for the first time in 1484.—Brockmann, *History of Inventions*. They have since been gradually adopted in every other country. Their introduction into England was comparatively late. Various preventive regulations had been previously enacted, but quarantine was not systematically enforced till after the alarm occasioned by the dreadful plague at Marseilles in 1720. The regulations then adopted were made conformably to the suggestions of the celebrated Dr. Mead, in his famous "Discourse concerning Pestilential Contagion."

Lazarettos or Pest-houses are establishments constructed to facilitate the performance of quarantine, and particularly the purification of goods. They have usually a port in which ships from a suspected place may anchor; and, when perfect, are provided with lodgings for the crews and passengers, where the sick may be separated from the healthy; and with warehouses, where the goods may be deposited; all intercourse between the lazaretto and the surrounding country being, of course, interdicted, except by permission of the authorities. The lazarettos of Leghorn, Genoa, and Marseilles are the most complete of any in Europe. The facilities they afford to navigation are very great; for, as ships from suspected places may discharge their cargoes in the lazaretto, they are not detained longer than they would be were there no quarantine regulations. The goods deposited in the lazaretto, being inspected by the proper officers, and purified, are then admitted into the market.

Bills of Health.—The period of quarantine varies, as respects ships coming from the same place, according to the nature of their bills of health. These are documents, or certificates, signed by the consul or other competent authority in the place which the ship has left, describing its state of health at the time of her clearing out. A *clean bill* imports that at the time of her sailing no infectious disorder was known to exist. A *suspected bill*, or as it is more commonly called, a *touched bill*, imports that rumors were afloat of an infectious disorder, but that it had not actually appeared. A *fever bill*, or the *absence of clean bills*, imports that the place was infected when the vessel sailed. The duration of the quarantine is regulated by the nature of these instruments. They seem to have been first issued in the Mediterranean ports in 1665, and are obviously of great importance.

By an act of Congress passed February 25, 1799, respecting quarantine and health laws, it is provided that the quarantines and other restraints required by the health laws of any State, respecting any vessel arriving in or bound to any port or district, shall be duly observed by the officers of the revenue of the United States, and by the masters and crews of the revenue cutters, and by the military officers stationed upon the sea-coast; and all such officers of the United States are required faithfully to aid in the execution of such laws. The secretary is authorized, when a conformity to the quarantine and health laws requires it, to prolong the terms limited for the entry of vessels, and the report or entry of their cargoes, and to vary or dispense with any other regulations applicable to such reports or entries, provided that no State is thus enabled to collect a duty of tonnage or import without the consent of Congress, and provided that no part of the cargo be taken out or unladen otherwise than as by law is allowed. When, by the health laws of any State,

any vessel arriving within a collection district is prohibited from coming to the port of entry or delivery for such district, and it is required by such health laws that the cargo of such vessel may be unladen at some other place, the collector, after due report to him of the whole of such cargo, may grant his special permit for unloading, under the care of the surveyor, or one or more inspectors, at some other place where such health laws permit, and upon the conditions which shall be directed by the Secretary of the Treasury; or which such collector may judge expedient for the security of the public revenue; provided that all the articles so unladen shall be deposited at the risk of the parties concerned in such warehouses or inclosures as the collector shall designate, there to remain under the joint custody of such collector and of the owner, or person having charge of such vessel, until the same be entirely discharged, and until the goods so deposited may be safely removed, without contravening such health laws. And when such removal may be allowed, the collector having charge of such goods may grant permits to the respective owners or consignees, their factors or agents, to receive all goods which shall be entered, and whereof the duties accruing shall be secured upon the payment by them of a reasonable rate of storage, which shall be fixed by the Secretary of the Treasury.

Suitable warehouses, with wharves and inclosures, are provided, where goods may be unladen and deposited for any vessel subject to a quarantine, pursuant to the health laws. When, by the prevalence of any contagious or epidemical disease in or near the port of entry for any collection district, it shall become dangerous or inconvenient for the officers of the revenue to discharge their respective offices at such port, the secretary, or, in his absence, the collector, may authorize the removal of the collector, and the other officers employed in his department, to any other more convenient place within or near to such collection district, where such officers may exercise the same authority, and are liable to the same duties, according to existing circumstances, as in such lawful port or district; and of such removal public notice must be given.—BLUNT'S *Shipmasters' Assistant*.

The quarantine laws of the different States are too voluminous to give in detail, and therefore there is here annexed only a synopsis of the quarantine laws in force in New York city.

It is the duty of the pilots to hail all vessels entering into the port of New York, and find whether they are subject to quarantine; and if they are, to bring them to anchor in the quarantine grounds; also, to prevent any violation of the quarantine regulations while they have charge of a vessel, such as communication between a vessel subject to quarantine and the shore, etc., and to report all infringements of regulations to the health officer.

Vessels arriving at the port of New York are subject to quarantine as follows: 1st. All vessels direct from, or touching at any place where yellow fever, bilious malignant, or other pestilential or infectious fever existed at the time of their departure, or on board of which, during the voyage, any case of such fever has occurred, arriving between the 31st day of May and the 1st day of October, shall remain at quarantine for at least 30 days after arrival, and at least 20 days after cargo has been discharged, and shall perform such further quarantine as the health officer shall prescribe. 2d. All vessels arriving between the 1st day of April and the 1st day of November, exclusive of the above-specified; all vessels from a foreign port, on board of which, during the voyage, or while at the port of departure, any person has been sick, or from any place in the ordinary passage from which they pass south of Cape Henlopen, arriving between the 31st day of May and the 10th day of October; and all vessels from any place (including islands) in Asia, Africa, or the Mediterranean, or from any of the West Indian, Bahama, Ber-

muda, or Western Islands, or from any place in America, in the ordinary passage from which they pass south of Georgia, arriving between the 1st day of April and the 1st day of November, are subject to quarantine and other regulations, as the health officer may prescribe. The health officer must board every vessel subject to quarantine or visitation immediately on her arrival, and make his examination.

The powers of the Board of Health are ample to protect the port. The regulations are similar to those generally adopted, and include a fine of \$2000, and imprisonment of twelve months, to any master or crew of a vessel that shall refuse to submit to quarantine, and also a fine of \$500 and imprisonment for any violation of quarantine.

Quarter, the fourth part of any thing. As a term of weight it denotes the fourth of a hundred weight, or 28 pounds; as a dry measure it signifies the fourth of a chaldron.

Quarter, that part of a ship's side which lies toward the stern, or is comprehended between the aftmost end of the main chains and the sides of the stern, where it is terminated by the quarter pieces.

Quarter of a Point, in Navigation, is the fourth part of the distance between two cardinal points, which is 2° 48'.

Quarter Days. The days usually regarded in England and most Continental countries (but not in Scotland) as beginning the four quarters of the year. They are, 1. Lady Day (26th of March); 2. Midsummer Day (June 24th); 3. Michaelmas Day (September 29th); and, 4. Christmas Day (December 25th).

Quarter Deck. The portion of the uppermost deck of a ship between the main and mizen masts. This is the "parade" in men-of-war.

Quarter Master, in the Navy, an inferior officer appointed to assist the mates in their several duties.

Quarters imply the several stations where the officers and crew of a ship of war are posted in time of action.

Quassia (Ger. *Quassienholz*; Fr. *Bois de quassie*; Sp. *Leno de quassia*), a beautiful tall tree (*Quassia amara*), growing in North and South America and the West Indies. The wood is of a pale yellow color, and inodorous. Taste intensely bitter. It affords to water an intensely bitter decoction, which is occasionally used in medicine, and was formerly substituted by some brewers for hops, but is now prohibited under severe penalties. It affords a safe and efficacious fly-water or poison for flies. It is believed that it would succeed well in our Southern States, and form a valuable addition to our forests.

Quebec, the capital of Canada, and of the British possessions in North America, on the northwest bank of the River St. Lawrence, about 840 miles from its mouth, in lat. 46° 48' 49" N., long. 71° 10' 45" W. Population in 1850, 40,233. Quebec is situated on a ridge, or promontory, formed by the St. Lawrence on the south and west, and the River St. Charles on the east. The extremity of this headland, called Cape Diamond, is about 345 feet above the level of the water, and on it the citadel is built. The town extends from the citadel, principally in a northeast direction, down to the water; and is, from the difference of elevation, divided into the upper and lower towns. The fortifications, which are very strong, extend across the peninsula, the circuit within them being about two and three quarter miles. From their situation many of the streets are uneven; they are also, for the most part, narrow; but they are either well paved or Macadamized. The greater number of the houses are built of stone, with slanting roofs. Some of the public buildings are elegant, and well adapted for their purposes. The harbor, or basin, lies between the town and the island of Orleans. It is safe and commodious: the water is about 28 fathoms deep, with a tide rising from 17 to 18 feet; and at springs from 23 to 25 ditto. Que-

bec was founded by the French in 1608. In 1629 it was taken by the English; but was restored in 1632. It was again taken by the English under General Wolfe, who fell in the engagement, in 1759; and was finally ceded to England by the treaty of Paris in 1763. The rapid increase of population in, and of emigration to, Upper Canada has occasioned a proportional increase of intercourse between Quebec and Montreal, and the Canadian ports on Lakes Ontario, Erie, &c. The first steamboat that plied on the St. Lawrence was launched in 1812; but there are now a great many steamers, some of them of large burden, employed in the conveyance of goods and passengers between Quebec and Montreal; and in the trade between Quebec and Halifax, in Nova Scotia. And by means of the Rideau and Welland canals, an uninterrupted line of steam communication is formed between the Atlantic and Amhurstburg, one of the remote settlements of Upper Canada, a distance of more than 1500 miles; which is now extended through Lake Huron to the western extremity of Lake Superior, about 700 miles beyond Amhurstburg; giving to Quebec a command of internal navigation inferior only to that of New Orleans. The navigation at Quebec closes at the end of November or beginning of December, and opens in April. Below Quebec the river is seldom frozen over; but the masses of floating ice, kept in constant agitation by the flux and reflux of the tide, render navigation impracticable. The waters of the St. Lawrence are very pure; and in point of depth and magnitude it is one of the noblest rivers in the world.—BOUCHERRI'S *British Dominions in America*. Quebec is a free warehousing port.

The trade of Quebec is very extensive. It engrosses, with Montreal, almost the entire trade of the province with the mother country, the West Indies, &c. Great numbers of emigrants leave England for Canada; but the larger number subsequently re-emigrate to the United States. It has a regular intercourse, by means of steamers, with Montreal and other ports higher up the St. Lawrence, and with Halifax and other ports on the Atlantic. Still, however, it must not be forgotten that in so far as the United Kingdom is concerned, the trade with Canada and Quebec is, in some degree, forced and factitious, and has not been a source of profit, but the reverse. In former years it was, in fact, mainly a consequence of the discriminating duties laid in British ports on timber from the north of Europe; and but for this preposterous arrangement, the trade between Great Britain and Quebec would have been extremely unimportant. Now, however, some branches of the trade appear to have acquired a solid footing; and notwithstanding the reduction of the discriminating duties in favor of

Baltic timber, the imports into Great Britain from Canada and other parts of British America of red-pine, and of pine and spruce planks, especially the latter, have of late very largely increased. Excepting timber, furs and ashes are the most important articles sent from Canada. A considerable part of the corn and flour exported from Quebec is the growth of the United States. The principal articles of import into Canada consist of corn, cotton, woollens, silk, and other manufactured goods; glass ware, spirits and wines, iron and hardware, sugar and tea, &c. The total value of the imports into Canada (of which, however, by far the largest portion goes to Montreal) in 1848 amounted to £2,107,164 currency (24s. 4d. currency = 20s. sterling). Declared value of British produce and manufactures exported to Canada in 1851, £2,451,584. It is material, however, to bear in mind that little more than half the imports are paid for by the exports; they are, in fact, principally paid for by the Treasury at home, and are to be regarded as the means sent out by England to pay the troops and meet the other heavy expenses she has to incur in the preservation of this unprofitable colony.

ACCOUNT OF THE NUMBER OF VESSELS AND THEIR TONNAGE WHICH ARRIVED AT THE PORT OF QUEBEC, INCLUDING THOSE BOUND FOR MONTREAL, AND FROM SEA, FROM 1846 TO 1853 INCLUSIVE.

Years.	Vessels.	Tons.
1846.....	1448	678,104
1847.....	1173	474,645
1848.....	1044	426,068
1849.....	1064	431,063
1850.....	1470	454,331
1851.....	1185	505,984
1852.....	1655	454,109
1853.....	1188	532,517
1854.....	1315	590,023
1855.....	677	346,449
1856.....	907	471,414

Among the arrivals in 1856 were the following foreign vessels: 88 Norwegian, aggregate tonnage, 17,730 tons; 15 United States, 8596 tons; 8 German, 8015 tons; 6 Prussian, 2056 tons. The total from all countries was 74 vessels, 34,824 tons.

VALUE OF THE EXPORTS AND IMPORTS OF QUEBEC AND MONTREAL.

Years.	Exports.		Imports.	
	Quebec.	Montreal.	Quebec.	Montreal.
1841	£1,727,726	£700,070	£217,916	£2,068,135

Paper Currency.—There is no established government bank in the province; but there are several private chartered banks, of which the Quebec Bank is the principal.—For a complete account of the trade of the Provinces, see CANADA and MONTREAL.

Quercitron Bark. The bark of the *Quercus nigra*, or American oak: it is a highly valuable dye-stuff, and is used in the production of some of the most durable yellows.—For a more full account of this dye-stuff, see articles DYES and OAK.

Quicksilver, or Mercury, one of the metals, and so fusible that it can not be reduced to a solid state but at a degree of cold equal to forty below zero of Fahrenheit's thermometer. Its use in refining silver was discovered A. D. 1649. There are mines of it in various parts, the chief of which are at Almadur or Almeida, in Spain, and at Udria, in Carniola, in Germany, discovered by accident in 1407. A mine was discovered at Ceylon in 1797. Quicksilver was congealed in winter at St. Petersburg in 1769. It was congealed in England by a chemical process, without snow or ice, by Mr. Walker, in 1787.—See *MANUFACTURE*. For notices of quicksilver mines, see *American Journal of Science*, xxviii. 219; *Linnæus's Merchants' Magazine*, xviii. 108.

The exports of quicksilver from California, the production of the California mines, for three years, were as follows, allowing the flasks to hold 75 pounds at a value of 50 cents a pound:

Year	Flasks	Value
1850	18,500	\$705,000
1851	20,168	796,119
1852	28,917	1,084,887
1853	29,170	831,724

The exports of quicksilver of domestic production from the United States, for the year 1856, amounted to \$831,724, and was solely from the port of San Francisco. The exports of foreign quicksilver amounted to \$16,011 of which \$15,589 was from New York. The imports of quicksilver for the same time amounted to \$3625, of which \$2649 was into New Orleans, and the production of the mines of Mexico.

Quicksilver is found in the largest quantities in Spain and California. Almaden, in Spain, has long been famed for its mines of this metal, which, according to Bowles, are the richest in their produce. In China quicksilver is chiefly used in the manufacture of vermilion and other articles of commerce.

The quantity of quicksilver produced from the New Almaden mines, Santa Clara county, California, is about 100 bottles per month, or nearly 1,000,000 pounds per annum. The other quicksilver mines worthy of note are, one at Huancavelica, in Peru; in Hungary, Transylvania, and the district of Deux Ponts, in Germany. There is a mine of cinnabar near Alicante, and another not far from San Felipe, in Spain. Mercury has also been found in China and Japan; and though the amount of the produce is unknown, it is believed to be considerable.

According to Dumas, the following mines yield annually as follows: Almaden, in Spain, from 2,700,000 to 3,456,000 pounds avoirdupois; Idria, 648,000 to 1,080,000 pounds; Hungary and Transylvania, 75,600 to 97,200 pounds; Deux Ponts, 43,200 to 54,000 pounds; Palatine, 19,440 to 21,600 pounds; Huancavelica, 324,000 pounds. The total annual product, including California, can not be less than from 6,500,000 to 7,000,000 pounds.

Quills (Fr. *Plumes à écrire*; Ger. *Penen, Feder kiel*; It. *Penne de scrivere*; Russ. *Stiroli*; Sp. *Canones para escribir*), the hard and strong feather of the wings of geese, ostriches, swans, turkeys, crows, etc., used in writing. They are classified according to the order in which they are fixed in the wing, the second and third quills being the best. Crow quills are chiefly used for drawing. The goodness of quills is judged partly by the size of the barrels, but more by the weight; hence the denomination of quills of 14, 15, etc., loths per mille, each mille consisting of 1200 quills. The quills of the porcupine are much employed by the Indians in North America as personal ornaments; the quills are dyed, and the colors appear to be durable; they are applied both to articles of dress and household furniture.

Quince-tree. The common quince (*Cydonia vulgaris*) is a low tree, seldom exceeding fifteen or twenty feet in height, with a crooked stem, and tortuous, rambling branches. The bark is smooth and brown, approaching to black. The leaves are roundish or ovate; dusky green above, and whitish underneath. The flowers, which put forth in England by the middle of April, and in the middle and northern parts of the United States in May and June, are large, with the petals pale red or white, and the sepals of the same length as the petals. The flowers are succeeded by large fruit of a globular, oblong, or pear-shaped form, of a rich yellow or orange color, when ripe, of an austere taste, and emitting a peculiar and rather pleasant smell.

Geography and History.—The quince is supposed to have been originally a native of Sidon, a city of ancient Crete, near the island of Candia; but it is much more probable that it was only first brought into notice in that city. It is considered at present as indigenous to the south of France, particularly on the borders of the Garonne, and to Germany, on the banks of the Danube. By some the tree is thought to be indigenous to Britain; and Phillips states, in his *Pomarium Britannicum*, that quinces grow in such abundance in some parts of the Wealds of Sussex, as to enable private families to make quince wine in quantities of from one hundred to two hundred gallons in a season.

The quince was known to the Greeks and Romans, and both nations held it in high estimation. Columella says, "Quinces not only yield pleasure, but health." He speaks of three kinds—the "Strutian," the "Must Quince," and the "Orange Quince." Pliny mentions many kinds, some growing wild in Italy, and others in cultivation, so large that they weighed the boughs on which they grew down to the ground. He also says that some were of a green, and others of a golden color, the latter of which were called *chryso-mela*. The only kind that was eaten raw he states to have been raised by grafting the large quince upon the stock of a small variety, called *strutika*. "All kinds of this fruit," continues he, "are grown in boxes, and placed within the waiting-chambers of our great personages, in which men wait to salute these personages as they come forth every morning." It appears from the same author that quinces were used to decorate the images of the gods, which were placed in sleeping-chambers, round the beds; whence it follows that the Romans did not think that there was any thing either injurious or unpleasant in their smell. He gives directions for preserving the fruit, by excluding the air from them, or boiling them in honey; or by plunging them in boiling honey, a practice in use with this and other fruits in Genoa at the present day. He also writes much on the medicinal qualities of this fruit. "Quinces," says he, "when eaten raw, if quite ripe, are good for those who spit blood, or are troubled with hemorrhage." The juice of raw quinces he states to be a sovereign remedy for the swollen spleen, the dropsy, and difficulty of taking breath, particularly to those who can not conveniently breathe except when in an upright position. The flowers of the quince, either fresh or dried, he tells us, are good for inflamed eyes. The root of the tree was used, not only as a medicine, but as a charm against scrofula.

The wood of the quince, when found of sufficient dimensions, is applied to the purposes of turnery; but from its small size this tree is almost entirely cultivated for its fruit, or as stocks on which to graft the mountain ash and the pear. In France, however, this tree is sometimes grown for hedges. The fruit is seldom eaten by itself, but is generally preserved in sirup, or is made into marmalade, or is mixed with apples in tarts.

—BROWN'S *Trees of America*.

R.

Rags (Da. *Lampen, Vadden*; Fr. *Chiffes, Chiffons, Drapcaux, Drilles*; Ger. *Lumpen*; It. *Stracci, Strazze*; Russ. *Trepje; Sp. Tropos, Harapos*), shreds or fragments of worn linen, woolen, or cotton cloth. Though commonly held in little estimation, rags are of great importance in the arts, being used for various purposes, but especially in the manufacture of paper, most of which is entirely prepared from them. As the mode in which rags are collected must be well known to every one, the following statements apply only to the trade in foreign rags.

Woolen Rags.—Woolen and linen rags are imported in considerable quantities from the continent of Europe, particularly from Italy and Sicily. Woolen rags are chiefly used for manure in England, especially in the culture of hops; but rags of loose texture, and not too much worn or decayed, are unraveled and mixed up with fresh wool in the making of yarn—a practice more favorable to the cheapness than to the strength and durability of the fabrics into which this old wool is introduced.

Linen Rags are principally imported from Rostock, Bremen, Hamburg, Læghorn, Great Britain, Ancona, Messina, Palermo, and Trieste. Their export from Holland, Belgium, France, Spain, and Portugal, is strictly prohibited. The imported rags are coarser and inferior in appearance to the English; but, being almost exclusively linen, they are stronger, and bear a price disproportioned to the apparent difference in quality; this disproportion has been materially augmented since the introduction of the process of boiling the rags in ley, and afterward bleaching them with chlorine, has rendered foreign rags fit for making fine paper, and indeed, in some respects, preferable for that purpose, by their affording a greater strength of texture combined with equal whiteness of color. There is considerable variety in the appearance of rags from different ports; but in general those from the north of Europe are darker and stronger than those from the Mediterranean ports. The latter are chiefly the remains of outer garments, and have become whitened by exposure to the sun and air; but since the improvements in bleaching, this does not enhance their value.

IMPORT OF RAGS INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Railroad, or Tramroad, a species of road having tracks or ways formed of iron, stone, or other solid material, on which the wheels of the carriages passing along it run. The object in constructing such roads is, by diminishing the friction, to make a less amount of power adequate either to impel a carriage with a greater velocity; or to urge forward a greater load. The essential requisites of a railroad are two or more smooth parallel surfaces for the wheels to run upon, and formed and placed in such relation as to give the maximum strength and safety with the minimum friction. The friction on a perfectly level railroad, properly constructed, is estimated to amount to from one-tenth to one-seventh only of the friction on an ordinary level road; so that, supposing the same force to be applied in both cases, it would move a weight from 10 to 7 times as great on the former as on the latter. But if there be a very moderate ascent, such as one foot in fifty, which in an ordinary road would hardly be perceived, a great increase of power on the railroad is required to overcome the resistance that is thus occasioned. The reason is, that the ordinary load on a level railroad is about seven times as great as on a common turnpike road; so that when the force of gravity is brought into operation by an ascending plane, its opposing power, being proportioned to the load, is seven times as great as on a common road. Hence the vast importance of having railroads either level or as nearly so as possible. It is also of great importance that railroads should be straight or at least free from any abrupt curves. Carriages being kept on the road by flanges on the wheels, it is obvious that, where the curves are quick, the friction on the sides of the rails, and consequent retardation, must be very great.

The great success, rapid extension, and present necessity of railroads, are in consequence of the appreciation of the value of time and saving of labor, which are the characteristics of the present age. Distance is now measured by the time consumed in its passage; and the saving of cost in the carriage of goods is the aggregate of the saving in time and the saving in labor. We can not in the scope of this article give more than a summary of the history of railroads, and the statistics necessary to show the present condition and progress of railroads.

The aim and advantage of railroads may be stated concisely to be, to obtain with the minimum expenditure of power the maximum result of speed, draught, and safety in the carriage of passengers and freight. To show how this can be done would be to illustrate the whole science of railroad engineering, and does not come within the compass of this work. It will be sufficient to show the improvement over the age before railroads, and the progress since the invention of railroads, we have made up to this time. 1st. As to speed. In 1804 a locomotive was constructed in Wales, that performed the unprecedented feat of drawing ten tons on a tramroad at the rate of five miles an hour. Wood on railroads, in 1825, says: "Nothing can do more harm to the adoption of railroads than the promulgation of such nonsense as that we shall see locomotive engines traveling at the rate of 12, 16, 18, and 20 miles per hour." Ritchie on railways, in 1846, says: "An express train on the Great Western Railway, drawing 60 tons, has traveled for three hours at the rate of 63 miles per hour." And we know that the speed of 100 miles per hour has been obtained several times in the past few years. In 1778 a contract was made to establish a coach for passengers between Edinburgh and Glasgow, a distance of 44 miles. The coach was drawn by six horses, and the journey between the two places, to and fro, was completed in six days. Even so recently as the year 1750, the stage-coach from Edinburgh to Glasgow took 86 hours to make the journey. In the

year 1849 the same journey was made, by a route three miles longer, in one hour and a half. In the year 1763 there was but one stage-coach between Edinburgh and London. This started once a month from each of these cities. It took a fortnight to perform the journey. At the same epoch the journey between London and York required four days. In 1833 there were seven coaches started daily between London and Edinburgh, which performed the journey in 48 hours. In 1849 the same journey was performed by railway in twelve hours.

2l. The great increase of draught, or decrease of friction, needs but brief illustration. It is stated as a result of experiments on the Massachusetts railroads, that the cost of merchandise transportation is 3-095 cents per ton per mile, with an average speed of ten miles an hour. The average cost of transportation of heavy merchandise on the improved Macadamized roads of England is 27 cents per mile, with an average speed of three miles per hour. We see, therefore, that the cost of transportation on railroads has been reduced to 11½ per cent. of the cost of transportation on improved turnpikes, while the speed has been increased 233 per cent. at the same time. 3d. As to the increase of safety. On the French railroads, 212 miles in length, of 1,889,718 passengers, who traveled 816,945 miles in the first half of 1843, not one was either killed or wounded, and only three servants injured. Comparing this with the traveling by horse coaches in the same region, we find that in seven years, from 1834 to 1840, 74 persons were killed, and 2073 were wounded. According to Dr. Lardner, the chances of a passenger meeting with a fatal accident in travelling one mile on a railroad are 65,363,735 to 1. And again, the chances of his meeting with bodily injury in the same distance are 8,512,426 to 1; and also that 366,036,923 passengers must travel one mile in order to cause the death of one railroad employe. On comparing the safety of railroad traveling on the roads of New York with those of Great Britain, it is found that for the last four years there were a greater number of passengers killed and a less number injured upon the roads of New York, in proportion to the number carried, than upon those of Great Britain. In New York one passenger was killed out of every 1,262,165 who traveled, one either injured or killed out of every 341,125. One passenger was killed for every 47,164,426 miles traveled, and one was either injured or killed for every 12,747,142 miles traveled. Excluding all the accidents growing out of the imprudence and fault of the passengers themselves, it appears that one was killed out of every 6,310,828 who traveled, and one was either injured or killed out of every 664,300. Excluding the accidents caused by their own carelessness or imprudence, there was but one passenger killed for every 236,822,132 miles traveled, and but one either injured or killed for every 24,823,382 miles traveled. A vast number more lives would have been lost if the same number of passengers had been conveyed the same number of miles in one-horse wagons or in the old-fashioned four-horse coaches.

"There be three things which make a nation great and prosperous—a fertile soil, busy work-shops, and easy conveyance of men and things from one place to another."—BACON. And we can form some estimate from the foregoing, of what share railroads have had in giving us one of these three elements of prosperity.

History.—Wooden railways were employed as a substitute for common roads, in the colonies of England early in the 17th century.—RITCHIE on Railways, p. 19. The earliest record of their existence is in the life of the Lord-keeper North, wherein it appears that about the year 1670 they were used at Newcastle-on-Tyne, for transporting coal from the mines to the river, and enabled one horse to draw from four to five chaldrons. Subsequently these plates were covered with iron; but the introduction of rails wholly of iron seems not to have taken place till 1768.—HORNLOWER'S Report to

House of Commons in 1811. A projection or flange on the outer side of the rails kept the wheels of the carriages upon them. They were called "Tramroads," and the objections to them were the great amount of friction against the side flange and the wood surface of the plate.

In 1789 was constructed the first public railway in England, at Loughborough, by Mr. William Jessop; and he introduced cast iron edge-rails, and wheels with the flanges cast upon them instead of on the rail. Tramroads were, however, in use up to 1808. The first railroad built in the United States was in 1827, from Quincy to a point on Massachusetts Bay, three miles in length, for the purpose of conveying granite to Boston from the quarries of Quincy. The rails used were of wood. The first passenger railroad was the first 13 miles of the Baltimore and Ohio in 1830, from Baltimore to Elkridge.

Rails.—"In 1803 malleable iron rails were first tried, but not approved of. In 1808 they were introduced into some coal works of Cumberland, and used with complete success."—GILLESPIE on Railways.

Since then they have been formed of a great variety of shapes. The principal are, 1st. The flat rail used on branch coal-roads and on roads where horse-power is used, and where economy is considered essential. 2d. The rail called the "fish-bellied," from the rounded profile of its under side. The form of this rail is indicated by theory as almost perfect for strength; but on account of the unsteadiness, from requiring a high support, it is now generally abandoned. 3d. The Ω rail, or inverted Ω . This rail is admirably adapted for strength and security, but is more complex for rolling than the rail commonly in use, namely, the T rail inverted, Σ ; and has only been used to a moderate extent, and principally in England. 4th. The inverted Σ rail, so called, but more like an Γ in form. This form was found by Professor Barlow to possess the maximum strength from a given quantity of material. This rail is used in England, but has been found to be deficient in stability. The Σ (inverted) rail is the one generally used in this country; and for the facility in rolling, strength, and stability, is decidedly the best form. The weight commonly used is about 60 pounds to the yard; but a heavier rail is more economical in the end; and the weight of rails has been increasing from 35 pounds, the weight first used, to that of sixty pounds to the yard.

Rails were first laid on stone sleepers or blocks, as giving the most solid support; but this plan has gradually been abandoned, as the want of elasticity was the cause of a rapid destruction to the rolling stock. Longitudinal sleepers of wood were also tried; but after much practical experience, the present form of transverse wooden sleepers, laid on broken stone or gravel bed, was adopted as the best foundation, and is now in common use.

Locomotives.—After a full trial of horse-power and stationary steam-engines, the plan of an engine, and when the present locomotive is in many respects only an improvement of, was invented. There has been some controversy as to who should have the credit of the invention. It appears, however, that in 1769 Dr. Robinson, then a student in the University of Glasgow, suggested to Watt the application of the steam-engine to wheel-carriages; and in 1782, Murdoch, to whom Trevithick was a pupil, made a model of a steam-carriage. In 1784 Watt described such an application in his patent.

In 1801 Oliver Evans, of Philadelphia, moved a steam dredging-machine a mile and a half on wheels turned by its own engine. In 1802 Richard Trevithick, in conjunction with Andrew Vivian, both Cornwall engineers, built and took out the first patent for a locomotive; and in 1804 Richard Trevithick built a second locomotive, which on a road in South Wales drew ten tons at the rate of five miles an hour. It

shall be suffered to fall, the company will be secured against one frequent source of immense extravagance—that of carrying freight for nothing, or less than nothing. With this information in hand, it is practicable to construct a tariff of expenses, which should in every case precede the adoption of a tariff of charges.

3d. *The next step in the process should be to ascertain the highest charge which each article will bear.*

4th. *The true charge for each article and each position, it must be apparent, will be found somewhere between the actual cost of transportation and the prohibitory charge.* The next step in the construction of a toll-sheet should then be to form a third tariff, by adding together, for each article and each position, the cost of transportation and the prohibitory charge, and taking half their sum as a near approximation to that charge which will yield the greatest net revenue. Yet there is no fact better susceptible of the strictest mathematical demonstration than this, that the charges which will yield the maximum net revenue on railroads doing a miscellaneous business must be from one to two cents per ton per mile greater than that which will produce the maximum gross revenue. If, then, a company aims to obtain the greatest possible gross revenue, it can only succeed by a great sacrifice of dividends. In fact, the gross revenue may be enormous, and yet be insufficient to pay their expenses.

Railway Legislation.—Notwithstanding the vast advantages which the opening of so many new and improved lines of communication have conferred on the country, we can not help thinking that these advantages might have been much greater, and that, in the instance of railway-legislation, the public interests have been overlooked to a degree that is not very excusable. It is, we admit, no easy matter to decide how far the interference of government should be carried in matters of this sort. But, at all events, this much is obvious, that when government is called upon to pass an act authorizing private parties to execute a railway or other public work, it is bound to provide, in as far as practicable, that the public interests shall not be prejudiced by such act, and that it should be framed so that it should not, either when passed, or at any future period, stand in the way of the public advantage. We believe, however, that a little consideration will serve to satisfy most persons that this important principle has, in the case of railways, and indeed of most descriptions of public works, been, in this country, all but wholly neglected.

Within a few years past the railway interest has become one of the most important in this country, not only on account of the large pecuniary investments which have been made therein, but also on account of the effect which its development has had in increasing the value and changing the relations of property, trade, and commerce, and in modifying the social conditions of our people. These varied interests, and the new circumstances which have been called into existence by the vast and rapid expansion of the railway system, have required additional legal enactments from time to time, but the same supervision and restraints of law which are considered necessary to guard and protect other public interests have not been imposed upon this one to an extent commensurate with its increasing importance. The railroad corporations, in which there is a larger investment than in the banks, over which the law exercises supervision, are permitted to control an immense amount of capital, and interests of the greatest magnitude, with no other check than is afforded by an annual statement of their affairs, notoriously incorrect, and in many cases made so systematically, for the purpose of concealing from the stockholders and the public violations of law and want of fidelity to their trusts.

One of the best guarantees for the faithful performance of duty that can be given to the public and the stockholders by railroad managers is to render, at fre-

quent intervals, full and accurate statements of the results of the operations of the works, and the manner in which these officers have discharged their trusts. It is not difficult to demonstrate that the publication of such ample statements does not, in the long run, injure the interests of any corporation, and that it is the most certain security against malversation in the administration of its affairs.

Under the General Railroad Act of 1850 each of the railroad corporations in the State of New York is required to make an annual report to the State Engineer and Surveyor in the form prescribed, showing its financial condition and cost, its length, and other characteristics; the business done during the year and the expense thereof, a statement of the receipts and payments, and a list of accidents which have occurred involving injury to life or limb; and this officer is required to arrange the information thus furnished, and submit it, together with the reports, to the Legislature. —*Report of the New York State Engineer, 1855.*

Austrian Railroads.—The government of Austria has at length conceded to a public company all the railways that have been completed, and those which are to be constructed, in the Lombardo-Venetian territories, and the Central Italian Railway. The lines already completed by the state are as follows:

	Kilometres.
Venice to Coccaglio.....	204
Milan to Como.....	45
Milan to Treviso.....	32
Verona to Mantua.....	36
Mestre to Casarsa.....	94
Coccaglio to Bergamo.....	26
Total.....	437

The railways to be constructed are as follows:

	Kilometres.
Bergamo to Monza.....	37
Bergamo to Lecco.....	30
Milan to Buffalora.....	52
Milan to Piacenza and Pavia.....	86
Milan to Cesto Calende.....	53
Railroad round Milan.....	6
Mantua to Borgoforta.....	29
Casarsa to Nebresina.....	89
Total.....	355

The length of railways completed is equal to 373 English miles, and the length of those to be constructed is equal to about 228 English miles. The Central Italian Railway concession is for 280 kilometres, so that the entire concession, when complete, will comprise about 680 English miles of railway. The state grants to the company the free use of the line from Nebresina to Trieste, with the joint use of the terminus at Trieste. The company is to pay to the state for the finished railways 80,000,000 francs, or £2,400,000; this sum is to be paid in six instalments within a period of six years, or at the rate of about £400,000 per annum. Should the net profits at the end of this term exceed 7 per cent., the company will have to pay an additional sum to the Austrian government of 16,500,000 francs, or £600,000. The Austrian government guarantees 5 per cent. on the whole capital required, which is estimated at about 250,000,000 francs, or £10,000,000. For the Central Italian Railroad, the company has a guarantee of 6,500,000 francs per annum, or more than 6½ per cent. on the capital.

Of the railways in operation, in progress, and contemplated in Eastern Europe, a brief notice will suffice.

Russia, carried along by the tide of public opinion in Europe, found herself compelled, by a due regard to the interests of her people, to consecrate a part of her exertions and her capital to the construction of the new lines of communication. An attempt was first made to attract private capitalists to these projects, and special advantages were offered to companies who might be disposed to undertake the construction of the lines of railway contemplated in Russia. The emperor, besides guaranteeing to the shareholders a minimum profit of 4 per cent., proposed to give them gratuitously all the lands of the state through which the rail-

ways should pass, and to place at their disposal, also, gratuitously, the timber and raw materials necessary for the way and works which might be found upon the spot. It was further proposed to permit the importation of rails and the rolling stock free of duty. Russian proprietors also spontaneously came forward, and not only agreed to grant such portion of their land as the railways might pass through gratuitously, but further to dispose themselves temporarily of their serfs, and surrender them to the use of the companies on the sole condition that they should be properly supported while employed.

By a special ukase, dated February 18, 1842, it was decreed that the railway which was to unite the two capitals of St. Petersburg and Moscow should be constructed exclusively at the expense of the state, in order to retain in the hands of the government, and in the general interest of the people, a line of communication so important to the industry and the internal commerce of the empire. The local proprietors equally agreed to surrender to government gratuitously the lands necessary for the works of this line.

The system of railways contemplated in Russia is composed of five principal trunk lines, one of which, connecting Warsaw with Craeow, is completed and in operation: the length of this line is 168 miles. The second will connect Warsaw with St. Petersburg; the extent of this would be, when executed, 683 miles. The third will connect St. Petersburg with Moscow; this line is in active progress: its length will be about 400 miles. Besides these, authorization was given to a company, by a ukase dated July, 1843, to construct a railway for the transport of goods between the Wolga and the Don, the length of which would be 105 miles. In the actual execution of this magnificent system of railway communication, no considerable progress has been yet made, with the exception of the line already mentioned between Warsaw and Craeow.

A short line of railway connecting St. Petersburg with Taarok-soela, having an analogy to the Greenwich and Richmond lines, which diverge from London, and the Versailles and St. Germain lines from Paris, was completed and opened for traffic in April, 1838. The traffic on this line has hitherto amounted to about seven hundred passengers per day.

The railway connecting the Don and the Wolga was opened for traffic in 1846; but this line is exclusively for merchandise, and is worked by horses.

In southern Russia a line of railway is projected between Kief and Odessa, the surveys of which have been made by Belgian engineers; but no progress in its construction has yet been effected. A railway has been projected also between St. Petersburg and Cronstadt, and another between St. Petersburg and Baldishport, in Eathonia, to be constructed and worked by a company with a guarantee of 4 per cent. by the government.

In Italy a few short lines of railway only have been executed, connecting the chief states with neighboring places. They are as follows:

	Miles.
Naples to Portici, opened October, 1835	5
Portici to Castellmare, with branch to Nocera	21½
Naples to Capua	23½
Milan to Treviglio	18
Milan to Monza	13
Venice to Vicenza	40
Leghorn to Pisa	12½
Florence to Empoli, Ponte Dera, Pisa, and Sienna	..
Pisa to Lucca and San Salvador	..
Florence to Prato	10½

In the kingdom of Sardinia railways exist as yet only in prospect. It is intended to carry two lines from Turin, one directed on Genoa by Alexandria, and the other on Milan by Verceil and Novara. The political distractions, however, of the last two years have suspended these projects.

Railroads in Spain.—From returns lately made in Spain to the government concerning the railways conceded and at work in that country in 1856, it appears that the whole of the lines open to the public, including that from Madrid to Saragossa, conceded to the Spanish Crédit Mobilier, gave a length of 1955 kilometres (1222 miles). In the concession granted to that company, of the two sections of the railroad from Madrid to Valladolid, and from Burgos to the frontier of France, the first section will leave Madrid, pass by Avila, Arevalo and Medina del Campo, and will stop at Valladolid, where it will join the section already traced out from Valladolid to Burgos.

Railroads in Prussia.—The subjoined is an account of the progress of railways in Prussia since 1810.

Years	Length in Miles.	Outlay in million Dollars.	Over whole Length.		Receipts.		Average Profit per Cent.
			Passengers.	100 lbs. Merchandise.	Passengers	Merchandise.	
1810	1821	101	120,416	1,057,021	\$5,708,227	\$1,545,427	3.82
1860	1871	100	146,273	1,331,594	4,420,172	4,308,229	4.05
1861	1982	112	148,680	1,004,325	4,628,990	4,958,450	5.09
1862	2186	126	145,817	2,171,619	4,463,704	6,811,393	6.75
1863	2262	135	144,597	2,537,401	5,488,166	7,821,683	6.76
1864	2326	141	137,154	2,130,084	5,712,185	9,077,251	5.79
1865	2384	146	143,734	3,546,000	5,950,314	12,205,523	6.41

The number of passengers has remained stationary since 1810, while the receipts for passenger traffic have increased only in proportion to the length of road. The amount of merchandise transported has, on the contrary, increased three-and-a-half fold; and while in 1810 the receipts on merchandise did not equal the receipts from passengers, they amounted in 1855 to more than double the receipts from passenger transport. In 1849, 381,788,585 hundred pounds were transported over every mile of road; in 1855 were transported 1,742,066,432 hundred pounds. While the roads have scarcely increased one-third in aggregate length, the transport of merchandise has increased five-fold.

The lengths above attributed to Prussian roads extend in some cases beyond the Prussian borders. At the end of 1854 there were 2230 miles of railroad in Prussia. At the end of 1855 there were 2313 miles. During the year 1856 about 270 miles of road were opened in Prussia, so that at present in the whole Prussian state there is one mile of railroad to every nine and two thirds square miles. This, however, varies in different provinces—amounting in Rhineland and Westphalia to 5½; in Silesia to 7½; in Brandon-

burg and Saxony to 7½; in Pomerania, Prussia, and Poland, to 22½ square mile. for every mile of railroad. There are already commenced, and to be completed in 12 years, 2650 miles, so that in 12 years Prussia will contain at least 5280 miles of railroad, or one mile for every 4.3 square miles. There will then be one mile of railroad to every 2.3 square miles in Rhineland and Westphalia, to every 4 square miles in Silesia, and to every 4 square miles in Brandenburg and Saxony, and to every 10 square miles in Pomerania, Posen, and Prussia. The cost of building these new roads is estimated at about \$168,000,000, or \$14,000,000 yearly.

Railroads in France.—We extract the following report on the condition and progress of railroads in France during the year 1856, submitted to the Emperor by M. A. Rouher, chief of the Department of Agriculture, Commerce, and Public Works:

"A résumé of these figures, which indicate the great increase of public confidence, also exhibits the fact that the construction of the network of railroads in France has cost, to this period, 3,080,000,000 francs,* of which

* The franc equals 18-6 cents.

With respect to 2284 miles out of the 4571 miles for which parliamentary powers have been obtained, and which have not yet been opened, the powers for the compulsory purchase of the land and the completion of the works have expired. The proportion in which this is distributed through the several years is shown in the following table:

TABLE SHOWING THE PROPORTION OF RAILWAY NOT OPEN FOR TRAFFIC, AUTHORIZED PREVIOUS TO THE END OF 1843 AND IN EACH SUBSEQUENT YEAR, AND WHICH HAVE NOT BEEN ABANDONED BY SUBSEQUENT ACTS; AND THE PROPORTION AS TO WHICH THE TIME ALLOWED FOR THE COMPULSORY PURCHASE OF LAND AND FOR THE COMPLETION OF WORKS HAS EXPIRED WITHOUT THE RAILWAYS BEING COMPLETED, DOWN TO THE END OF 1855.

Year.	Length of Lines authorized by Act, but not opened by subsequent Acts, which have expired on December 31, 1843.		Length of Lines upon which the powers for the compulsory purchase of land and for the completion of works have expired, but which have not been abandoned by subsequent Acts, on December 31, 1855.		Railways for the construction of which parliamentary powers exist.
	Miles.	Miles.	Miles.	Miles.	
Of lines authorized previous to December...	1843
	1844	18	19
	1845	844	253	91
	1846	1470	1184	318
	1847	640	667	73
	1848	328	257	66
	1849	13	13
Of lines authorized in	1850	1	1
	1851	53	3	55
	1852	93	44	49
	1853	316	316
	1854	477	467
	1855	368	353
Total.....	4571	2284	2287

Upon 213 miles out of the 2287 miles for the construction of which parliamentary powers exist, the powers for the compulsory purchase of the land have been allowed to expire without having been exercised; and this increases, therefore, the number of miles which it is not probable will ever be made to 2497 miles.

The total amount of money authorized to be raised by railway companies, by shares and on loan, to the end of 1855, amounted to £374,971,966, of which £297,583,284 had been raised, leaving £77,388,682 to be raised. There are no means of ascertaining how much of this sum is apportioned to the miles of railway for which parliamentary powers have expired, but it may be assumed approximately that from £30,000,000 to £40,000,000 of this amount would have

Years.	Lines in course of Construction.			During the Year.	Money raised by Shares and Loans.	Miles of Railway opened during the Year.
	Miles.	Number of Persons employed.	Average Number employed per Mile.			
May 1, 1844	2958	188,177	63.6
June 30, 1849	1504	108,816	61.0	1849	£29,574,719	569
June 29, 1850	664	58,884	68.15	1851	10,622,067	6.5
June 30, 1851	734	42,163	68.49	1851	7,970,151	207
June 30, 1852	733	35,925	49.69	1852	15,924,753	446
June 30, 1853	683	37,764	55.30	1853	9,155,856	353
June 30, 1854	889	45,491	51.07	1854	12,432,374	368
June 30, 1855	850	38,546	43.60	1855	11,514,490	343

The number of persons employed on the 30th of June, 1855, upon the railways in course of construction amounted to 38,516, being on the average 43.8 per mile. It will be seen from this table that the average number of persons employed per mile has gradually decreased since 1849. This may be ascribed to improvements and the employment of steam-power in railway construction.

The length of line open for traffic in the United Kingdom on the 30th of June, 1855, was 8116 miles, and the number of persons employed thereon amounted to 97,952 persons, or 12.07 per mile. This, as appears from the following table, is a larger number per mile than has been employed in any year since 1848.

been applied to those portions of railway, and that it will not, therefore, be now raised.

Of the 8297 miles open for traffic on the 31st of December, 1855, the proportion constructed on the narrow gauge, broad gauge, mixed gauge, and Irish gauge, is as follows:

	Narrow Gauge.	Broad Gauge.	Mixed Gauge.	Irish Gauge.	Total.
In England...	Miles. 5345	Miles. 667	Miles. 206	Miles. 6218
In Scotland....	1092	1092
In Ireland.....	8	979	987
Total.....	6445	667	206	579	8297

And by the following table is shown the length of lines open for traffic at the same dates:

	Number of Companies having single Lines.	Gauges.				Total.
		Narrow Gauge.	Broad Gauge.	Mixed Gauge.	Irish Gauge.	
In England	85	1064	209	22*	1345
In Scotland	20	561	574
In Ireland..	21	3	570
Total..	126	1320	209	72	568	2160

* Thirty-nine miles of this length is laid with a second line on a narrow gauge.

From the above details it appears that the length of new lines opened for traffic during the year 1855, including 17 miles of line belonging to private individuals, amounted to 243 miles; of these, 235 miles were laid with only one line of rails.

Of the lines opened in 1855, the following are those which appear to be the most important, viz:

The Hereford, Ross, and Gloucester Railway, a broad-gauge line, which affords to Hereford a more direct communication with the metropolis than it previously possessed.

The Wimbledon and Croydon Railway, which affords a communication to the south of London, between the London and Southwestern and the Southeastern Railways, and provides another link in the line of railway communication which encircles the metropolis.

The length of new line reported to be in course of construction on the 30th of June, 1855, was 880 miles; of these about 170 miles were opened before the 31st of December, 1855.

With the view of affording some measure of the comparative progress of railway enterprise, the following table has been prepared, showing the number of miles of railway in course of construction in each year since 1848, and the number of persons employed thereon, together with the amount of money received, and the number of miles of railway opened during the year:

Years.	Lines in course of Construction.			During the Year.	Money raised by Shares and Loans.	Miles of Railway opened during the Year.
	Miles.	Number of Persons employed.	Average Number employed per Mile.			
May 1, 1844	2958	188,177	63.6
June 30, 1849	1504	108,816	61.0	1849	£29,574,719	569
June 29, 1850	664	58,884	68.15	1851	10,622,067	6.5
June 30, 1851	734	42,163	68.49	1851	7,970,151	207
June 30, 1852	733	35,925	49.69	1852	15,924,753	446
June 30, 1853	683	37,764	55.30	1853	9,155,856	353
June 30, 1854	889	45,491	51.07	1854	12,432,374	368
June 30, 1855	850	38,546	43.60	1855	11,514,490	343

The increase in the number of miles for the whole period of eight years, is 98 per cent.

Years.	Lines open for Traffic.

ENGLISH RAILWAY TRAFFIC.

	1855.	1856.	Increase.
Total receipts for goods, passengers, mails, etc.	£21,123,915	£22,915,500	£1,872,155
Length of railways open for traffic, miles	8,240	8,760	520
Average receipt per mile open during the year	£2,668	£2,750	£82

There is thus seen to be an increase, not only in the amount received, but also in the length of railway, and this has been to such an extent that the receipts per mile are likewise greater; and although the later weekly returns for 1856 did not show so large an increase over those of 1855 as those of the earlier portion of the year exhibited, there is still reason to hope that railway property has now overcome many of the difficulties by which it was beset, and that it will henceforth yield a return more commensurate with the advantages it has conferred upon the public than has hitherto been the case.

Among the benefits derived from railways London may reckon the increased importation and diminished price of fuel, which have been the consequence of the better development, as shown by the following return of railway coal traffic:

COALS BROUGHT TO LONDON BY RAIL.

1855.	1856.	Increase.
Tons. 1,137,835	Tons. 1,246,209	Tons. 108,374

But the value of railways in this respect will be better appreciated if the quantities brought in that way are contrasted with those brought by other means of conveyance, for during the same period we find that the canal coal traffic only amounted to

1855.	1856.	Increase.
Tons. 24,651	Tons. 25,401	Tons. 750

And that the whole amount of sea-borne coals brought into London in those years did not exceed

1855.	1856.	Increase.
Tons. 3,016,808	Tons. 3,100,922	Tons. 84,114

From which it appears that the railway coal traffic now bears a very large proportion to the importation by sea, and that during 1856 the increase by rail was greater than in 1855, although there was not then the competition, for purposes of war, in freights which had previously existed; while the canal traffic is so small as scarcely to deserve notice.

The result, as shown by the following table, is that passengers and goods have changed places as the chief elements in the gross earnings. The early railway managers expected—and with reason—that with the railways, as with the coaches, the passengers would be the main resource, and so they were for a few years.

FIVE YEARS, 1852-56.—DETAILS OF THE AVERAGE RECEIPTS FOR PASSENGER TRAFFIC.

Year.	First Class.		Second Class.		Third Class.		Total.	
	Average Payment.	Average per Mile.						
	d.	d.	d.	d.	d.	d.	d.	d.
1852	54-96	2-11	22-32	1-43	12-45	0-87	21-36	1-35
1853	51-30	2-13	20-49	1-44	12-48	0-86	20-40	1-32
1854	47-25	2-10	20-53	1-42	12-43	0-85	19-02	1-29
1855	43-88	2-00	20-16	1-43	12-00	0-86	19-20	1-28
1856	43-30	2-07	20-45	1-44	11-06	0-88	18-74	1-22

NOTE.—In the above table the columns of "Average Payment per Passenger" represent the total average sums paid in each year by each of the passengers conveyed. The columns of "Average Fare per Mile per Passenger" reduce the larger columns to a more convenient measurement.

We find here that the first-class fares have fallen from 2-11d. per mile in 1852 to 2-07d. per mile in 1856, and average payments of each passenger conveyed from 54-96d. in 1852 to 43-30d. in 1856; but in connection with these reduced fares and smaller individual payments, we have already seen that the earnings per mile open have somewhat risen, comparing 1856 with 1852.

But for the last four years, and the more rapidly as the lines open have extended, the goods traffic has shot ahead, and year by year has left the passenger traffic behind.

ENGLAND AND WALES.

EIGHT YEARS, 1849-56.—GROSS RECEIPTS, PER MILE OPEN, FROM EACH CLASS OF PASSENGERS, AND ALSO THE RECEIPTS PER MILE FOR GOODS.

Miles open.	Passengers.				Goods.	Total per Mile.	
	1st.	2d.	3d.	Total.			
4385	1849	406	519	311	1265	1060	2-45
4908	1850	380	468	321	1169	1117	2-316
5217	1851	424	521	373	1330	1188	2-283
5417	1852	379	471	350	1220	1037	2-157
5730	1853	408	474	375	1259	1415	2-394
5992	1854	466	486	407	1354	1734	2-908
6175	1855	400	472	423	1295	1630	2-723
6332	1856	411	476	448	1335	1751	2-819

* These tables include also a fourth-class return, except in the years 1849 and 1850.

But this is not all; for when we come to look closely into the passenger traffic itself, we find the same continuous and confirmed tendency in the common to supersede in importance the dear kinds of service. The receipts from first-class fares have barely maintained the level at which they stood eight years ago. The receipts from second-class fares have seriously fallen off; namely, from £518 per mile in 1849 in the 4355 miles open, to £476 per mile in 1856, with 6332 miles open. But with the third-class fares a precisely opposite class of changes has taken place. With scarcely a single exception of consequence during the eight years, the receipt per mile from third-class fares has gone on increasing, until, in 1856, the receipt of £448 per mile is quite 33 per cent. above receipt of £331 per mile in 1849. The percentage proportions to the total passenger traffic in 1849 and 1856 of the receipts per mile of the three classes of fares, were as follows, viz.:

Years.	First Class.	Second Class.	Third Class.
1849	Per Cent. 32	Per Cent. 41	Per Cent. 27
1856	32	35	33

While, therefore, in 1849 the common kinds of passenger service contributed a little more than a fourth part of the total passenger receipts, that proportion had been raised to quite a third part in 1856; the first-class proportion remaining the same, but the second-class proportion falling from 41 to 35 per cent.

But there is more evidence to be adduced.

We have seen in the foregoing table the gross results per mile of railway open. Let us now examine somewhat more in detail the relation between those larger results and the rate of fares and average payment by each person conveyed, and these further details will be found in the following table, but extending to the five years 1852-56:

In the second class the fares have risen slightly—that is, from 1-43d. in 1852 to 1-44d. in 1856; and the average payments have slightly fallen from 22-82d. to 20-45d., but the average earnings per mile have remained almost unchanged.

In the third class the fares have fallen, and so have the individual payments; but the earnings, as we have already seen, have increased largely.

We may venture, then, to infer that, so far as the evidence before us applies, three general conclusions seem to be justified at this stage of the inquiry, and these conclusions are:

1st. That the revenue of railways during the last eight years—that is, during the period since the railway system had arrived at maturity in England and Wales—has been derived year by year in a larger proportion from common as distinguished from dearer kinds of service, and especially in the rapid relative growth of goods traffic.

2d. That during the same period a precisely similar result has taken place in the passenger traffic by increase of receipts from third-class passengers, and the decline or non-increase of receipts from first and second class passengers.

3d. That as regards nearly all classes of passengers, the increase of passenger traffic per mile of railway has been accompanied by a reduction in the rates of fares, and also by a reduction in the average payments of each person conveyed; in other words, a larger revenue has been obtained by means of smaller individual contributions.

Railroads in Canada.—The gigantic railway enterprises now in progress in Canada are intended to embrace a railway system traversing nearly the entire length of the province from east to west, with branch feeders running into the main-trunk line, and carrying off traffic to the leading American cities and Atlantic sea-board.

Besides the government aid to this complete railway system through Canada, these undertakings are understood to receive substantial support from United States interests, the great Western country, as well as the northeastern States of the Union, being directly interested in the success of these Canadian lines; more expeditious routes between the agricultural districts of the West and their centres of trade being opened up by them. One of the most valuable features of these railways to Canada will be their affording the province increased facilities of trade during winter, and uninterrupted communication with ocean traffic when inland navigation is closed.

The most important line of this comprehensive railway system is the Grand Trunk railway. The entire length of this line, when completed, will be 1112 miles. Its eastern terminus is at Trois Pistoles, in Lower Canada. Thence upward it proceeds along the south shore of the St. Lawrence, passing opposite to Quebec, and, continuing thus westward, reaches Montreal. Before reaching Montreal, the line effects a junction at Richmond, in the eastern townships, with a line of railway to Portland, on the Atlantic, in the State of Maine. The part of the line between Montreal and Portland, a distance of 292 miles, is now open. The communication between Portland and Quebec was opened in 1854.

At Montreal, one of the most stupendous structures of modern times will carry the railway across the River St. Lawrence, which is here two miles in width. This gigantic undertaking is now in course of construction, under the superintendence of Mr. Robert Stephenson, whose name is associated with the well-known Britannia tubular bridge. The Victoria tubular bridge of Canada will, however, far surpass Mr. Stephenson's earlier work. The total span of the arches will be 6168 feet, besides piers on either side, running into the river, each about half a mile long. The span of the centre arch is 360 feet. The number of arches is 25, and, with the exception of the centre one, each has a span of 242 feet. The tube, which is of iron, is 25 feet high and 18 feet wide. The other parts of the work, including the half mile of piers on either side, are wholly of solid masonry. The height from the water level of the river to the floor of the iron tube will be 60 feet. In order to impart some idea of the strength of this stupendous work, it may be mentioned that

each buttress is calculated to resist the pressure of 70,000 tons of ice. The estimated cost of the Victoria tubular bridge is stated to be \$7,000,000.

From Montreal the Grand Trunk line follows the north bank of the St. Lawrence, touching the towns of Cornwall, Prescott, and Brockville, to the city of Kingston, on Lake Ontario. This distance from Montreal to Kingston is about 180 miles, about 120 of which, from Montreal to Prescott, was opened in October, 1855.

A branch line of 55 miles, connected with this part of the main trunk, was fully completed during 1851, from Bytown to Prescott, opposite to the American port of Ogdensburg, where an important connection has been formed with United States lines of railway. Another line of about 80 miles was also constructed in connection with this section of the Grand Trunk from Montreal to Kingston. This is one from Bytown to Montreal, following the course of the Ottawa, and joining the Grand Trunk at Vaudreuil, close to the Ottawa, and to the junction of that river with the St. Lawrence.

The Grand Trunk line, proceeding westward from Kingston, skirts the shores of Lake Ontario, passing the Bay of Quinte, through the towns of Belleville, Cobourg, and Port Hope to Toronto, the capital of Upper Canada. The length of this section of the line, from Kingston to Toronto, is about 200 miles; the length of the line from Montreal to Toronto being 300 miles.

A branch of this section of the Grand Trunk from Kingston to Toronto, extending to 30 miles from Cobourg to the town of Peterborough, on the River Ottawa, was opened during the year 1856. Another line is also in construction from Belleville to Peterborough. The most important line branching from this main section of the Grand Trunk, 45 miles of which are already open, is that from Toronto northward, passing Lake Simcoe, and thence continuing to the great Georgian Bay, on Lake Huron. From Toronto the Grand Trunk railway proceeds directly westward through the fertile peninsula of Upper Canada, passing the towns of Guelph and Stratford, and terminating at the flourishing town of Sarnia, at the head of the River St. Clair and southeastern extremity of Lake Huron. The entire length of the Grand Trunk line, which is now being pushed toward completion, namely, that from St. Thomas, 40 miles below Quebec, to Guelph, in Upper Canada, was completed in September, 1856. The remaining portions of the system will not be so actively proceeded with. The direct distance from Trois Pistoles to Sarnia is 850 miles.

At Toronto another important railway system commences, known as the Great Western. This railway commences from a joint station at Toronto in connection with the Grand Trunk railway, and skirts the head of Lake Ontario to Hamilton, a distance of 45 miles. It thence proceeds westward through the heart of the settled parts of the great peninsula, situated between the lakes Ontario, Erie, and Huron, passing through Brantford, London, and Chatham, and terminates at Windsor, on the River Detroit, directly opposite to the American city of Detroit, in the State of Michigan. At this point an important connection takes place with United States railways.

The Great Western line, besides its terminus at Hamilton, diverges to the Falls of Niagara. The Great Western railway is now open from Windsor to Hamilton and Niagara Falls, a distance of 220 miles. That portion of it from Hamilton to Toronto, 45 miles in length, was opened in the year 1851.

We have now (returning to Lower Canada) to mention the St. Lawrence and Champlain railway, which connects the south bank of the St. Lawrence, opposite to Montreal, with the head of Lake Champlain, at Rouse's Point, a distance of 45 miles. At Rouse's Point this railway connects with the system of railways

to Albany, Boston, New York, and other parts of the United States. The Plattsburg railway commences at Caughnawaga, on the south shore of the St. Lawrence, opposite to Lachine, and runs to the town of Plattsburg, on Lake Champlain, a distance of 28 miles. The Montreal and Lachine railway, a short line of 9 miles, connects the city of Montreal with the upper part of the island at the village of Lachine. This railway, as also a portion of the St. Lawrence and Champlain line, have been in active operation for several years.

The average cost of the construction of railways in Canada will be about \$17,500 per mile. The average fares are from two to three cents per mile, according to distance of journey. The electric telegraphs in Canada convey messages at much more moderate charges than in England.

The control of the Post-office of Canada was transferred from imperial to colonial authorities in 1851.

RAILROADS IN CANADA.—1857.

Name of Road.	Length, Miles.
Buffalo and Lake Huron (Buffalo to Paris).....	54

United States.—To give a complete history of the railroad system of the United States would exceed our limits of space. We therefore confine ourselves to a brief summary of the history, with the statistics necessary to show the present condition of the railroads in the United States.

The first railroad constructed in the United States was the Quincy road, built in 1827. The first passenger railroad was the Baltimore and Ohio, which was opened with horse power for fifteen miles in 1830. The Mohawk and Hudson river road was opened for public travel with horse power in the summer of 1831. Locomotives were first used in this country in 1831, on the Mohawk and Hudson railroad, and in 1832 upon the Baltimore and Ohio, and on the South Carolina railroad. In 1828 there were but three miles of railroad in the United States; now there are twenty-five thousand miles!

The superstructure of some of our first railroads was made by placing a thin flat bar of iron on longitudinal timbers, which rested on stone blocks, protected from displacement by frost by filling the trenches below them with small broken stone. In some cases the iron bar was placed on continuous stone sills.

The first change made in the rails used was the substitution of bars of greater thickness; then succeeded the T rail, of nearly the present form, weighing fifty pounds per lineal yard, resting on longitudinal sills; subsequently the weight of iron rail was successively increased to sixty, seventy, and seventy-five pounds; cross-ties were used, which were placed on longitudinal sills, and finally these sills were removed and gravel ballasting substituted. The first cars used were coach bodies of the ordinary form, placed on four-wheeled frames; afterward the bodies were enlarged and the form changed, and finally the bodies were adapted to contain sixty passengers, placed on two separate trucks attached loosely to the bodies, so as to permit them separately to adapt themselves to the curves and inequalities of the track. The motive power at first was horses, and on steep inclinations stationary steam pow-

er. The first locomotive engine used weighed but six tons, and these have been successively increased to ten, sixteen, twenty, and twenty-six tons, while on some of the freighting roads engines of forty tons weight (including the tenders) have been introduced. The foregoing list of changes shows how imperfect a machine the railroad was when many of them in this country were first commenced, and how many radical changes have been necessary in the construction of their ways and works. The present state of perfection in the machine renders it probable that new substitutions of its important and expensive parts will annually become more rare, but yet it may be safely assumed that some expenses of this character will continue to accrue and must be provided for in estimating the cost of our railroads or their value as an investment.—*Report of the New York State Engineer, 1855.*

In the conception and construction of our system of railroads there was no well-digested plan in regard to the position of the principal termini, or the route for the trunk lines, or the mutual relation of the main lines to each other. The result is that the system is imperfect as a whole, though admirable in many of its parts. We have many roads built only in rivalry to others; some parallel, others having the same termini. The same expenditures properly directed would have given us a complete system, with fewer miles constructed, but of a more durable character. The want of plan is in consequence of our system having been built by States not separated by topographical divisions, and by private companies having a view more to immediate profit than to the future success of and connection with the system. One of the greatest resulting evils is the constant break of gauge, which makes necessary the frequent transhipment of both passengers and freight; thereby increasing cost and delay. The gauges in common use comprise from 4 feet 8½ inches, the *chance* width of the first "tram wagon," which the first "trams" were made to fit; to 4 feet 10, 5 and 6 feet, all empirical gauges; and each having respective merits which were advocated by their introducers. Whatever may have been these claims, it is unfortunate that one was not universally agreed upon; and there is no risk in asserting that even at this late date the saving in time to passengers and in injury to freight during five years would be more than an equivalent for the cost of all necessary changes in the rolling stock, and superstructure consequent on the adoption of a common gauge. Our railroads have been so much indebted to fortuitous circumstances for their position and relation to each other, that the principal claim to a system that we can advance is based on topographical divisions. And having this division in view, we will proceed to describe briefly our railroads as a system.

The objects to be gained by our first railroads were to open an outlet from the fertile regions of the West, and to get access to the interior as a market for the manufactures of the sea-board. The principal results are the four great trunk lines, which are the boast of the country, and which have done more to develop the West and enrich the East than was dreamed by the "enthusiasts" who were followers of De Witt Clinton. Two of the four trunk lines, the New York and Erie, and the New York Central railroads, directed their first slow course to the great American chain of lakes, expecting to be content to end there, and not to enter into a contest with an inland sea. But with the aid of the frosts of winter, they found themselves fit rivals, and have extended their lines with such vigor, that the branches of these trunk lines have tapped the Mississippi, and are hastening on to the Pacific. Their connection with every town and hamlet in the Mississippi valley is the best foundation for a continuation of the progressive prosperity of New York. The other two lines, the Pennsylvania Central and the Baltimore and Ohio railroads, had no further aim than to pass the barrier of the Alleghanies, and then receive their pros-

parity from the Ohio River. But a river that, according to John Randolph, "was dry half the year, and frozen the other half," was not a dependence; and now even the Mississippi River is not a satisfying one. We can briefly say that these four trunk lines, with their direct connections, constitute the Northern half of the system. The other single roads, not connections, north of a line of the Ohio valley, however important in themselves, are only local roads. South of the line of the Ohio valley, the Virginia Central and the Charleston and Memphis railroads, with their direct connections, constitute a similar portion of the Southern half of the railroad system. The remaining East and West trunk line to be described is the one from New York city, in a direct line west. This railroad, now nearly completed, is almost a necessity to the passenger traffic, being the shortest route west from New York city. These roads, in conveying the produce of the interior to the sea-board, and in opening the West for settlement, form a much more important part of the system than the roads running north and south, and having as their principal business the interchange of the products of the North and South. The roads, running north and south, are divided by the Alleghany Mountains. The eastern half is made up of a trunk road and its branches, running parallel to the sea-coast from Bangor to Mobile, having at present but one short break in Alabama. The freight business of these roads is necessarily limited, and confined principally to costly freight, as the coasting trade is the natural carrier of heavy freight. The passenger business is the principal source of profit; and as these roads run through the most populous sections of the country, they have ample employment. The trunk road west of the Alleghany Mountains is made up of the Illinois Central and other roads in the Mississippi valley, converging to the mouth of the Ohio River, added to the yet unfinished trunk road from the mouth of the Ohio to Mobile and New Orleans. These roads until lately have not been necessary, as the Mississippi and branches have generally afforded all the internal communication necessary. The interchange of the products of the South and West, and giving rapid communication over the West, makes these roads now a necessity. We can see then, that, notwithstanding the want of unity of action from the first, the system is gradually becoming more perfect, and that the completion of the trunk lines running west to the Pacific will not let us lose the proud boast that we can now truly make of having the noblest system of internal improvement in the world.

New York State.—The following exhibit of the condition of the railroads in New York State is in part a synopsis of the report made to the New York Legislature in 1855 by the state engineer, and contains many important suggestions in regard to the future management of our railroads, coupled with much valuable information as to the condition of the state system.

The returns of the railroad corporations of New York State do not comply with the law in stating the amount of depreciation of the works and rolling stock. The returns of the railroads of Massachusetts, in most cases, show a small allowance made for the depreciation of the iron rails, engines, and cars. It is contended by many skillful managers that if the works and rolling stock are kept in thorough repair, they are in as good condition at the end of each year as they were at the end of the preceding year, and therefore that there can be no depreciation. The difficulty lies in determining the fact whether the repairs have been kept up in this thorough manner. The expense for repairs of iron rails, after allowing for the value of the old material, is equal to the cost of an entire renewal once in fourteen years; that for cross-ties to a renewal once in eight years; for wooden bridges once in ten years; and for wooden stations once in thirty years. This deterioration may be represented in another form, by stating it as equal to from 2 to 4 per cent. annually on the whole cost of the road.

Railroads are also subject to one item of expense which is rarely directly stated: viz., the necessary substitution of improvements in the way and works before the original ones have been worn out by use. The railroad, considered as a machine, is of recent invention. Its power, capacity, and endurance have not even yet been fully ascertained. As the two former are developed, the substitution of improved forms for increasing its efficiency, either in capacity, speed, or economy, becomes necessary, and these substitutions are more extensive than they are in other machines of older date or use.

The returns of the railroad corporations show continued large additions every year to the construction account of even our oldest and best built roads. The reported increase of cost during the year 1855 was chiefly in consequence of an extension of the double track, a larger equipment, and station facilities for the accommodation of the increased freight traffic. The increase of the cost of the road on the New York and Erie was 20 per cent. during the years 1854, 1855, and on the Central it was greater than 25 per cent. during the same period. The reported earnings and net earnings of these roads have increased by a much larger percentage than the cost of the roads as above stated, while the reported expenses of operating have increased by about the same percentage as the earnings. The freight earnings have increased more than the passenger earnings; but the average receipts per ton per mile were less in the year 1855 than the preceding one, especially on the Central road, although the rates of charges have been increased on both roads. The average receipts per ton per mile for the year 1855, were two and a half cents on the Erie, and a little more than three cents on the Central, while the average the preceding year on the latter was nearly three and a half cents. The freight tariff has been nearly alike on each of these roads for the last two years; it is, therefore, evident that the business of the Erie road embraces a larger portion than that of the Central of those articles which pay the least rates, and that the latter road has been performing a much larger proportion of its business at low rates this year than formerly. On comparing the reported receipts, expenses, and business of our three principal freight roads, it will be seen that the passenger business on the Erie is reported as giving a net profit of 47 per cent., with an average charge of one and seven-tenths cents per passenger per mile; on the Central, a net profit of 41 per cent., and a charge of one and nine-tenths cents, and on the Northern Railroad a net profit of two per cent., with an average charge of two and seven-eighths cents per passenger per mile; and that the freight business on the first is reported as giving a net profit of 51 per cent., with an average charge of two and six-tenths cents per ton per mile; on the second a net profit of 48 per cent., with an average charge of three and seven-tenths cents; and on the third a net profit of 34 per cent., with an average charge of two and one-fourth cents per ton per mile. The character of the business, the grades, and other circumstances of these several roads, do not furnish any sufficient reason for these discrepancies. The actual cost of transportation upon railroads will probably never be accurately determined from their reports, until they have been run a few years with the construction account closed, and no money borrowed. The expenses of operating the road, as stated in the reports, are about one and a quarter cents per ton per mile on the Erie, and one and six-tenths cents on the Central; but, as before stated, these reports do not show accurately the cost of this service. More reliable testimony on this subject is afforded by the recent action of the railroad conventions. At the one held at New York, embracing the officers of the four great lines between the Atlantic and the West, a joint report was submitted by the superintendents of the several roads, in which they state

that "experience has proved that the lowest rates at which ordinary freight can be carried to pay interest and expenses will average about two cents per ton per mile for heavy agricultural products, three cents for groceries, and four cents for dry goods." At a subsequent convention of the railroad companies of Ohio and Indiana, similar rates were adopted. The above charges applied to the business of our two great lines would yield an average of a little less than three cents per ton per mile, and would serve to show that some of the business done on each of these roads does not even pay "interest and expenses." Sufficient information has been elicited from the railroads of this and other States, and from the actions of the conventions, and from other sources of information, to warrant the belief that a considerable portion of the freight business now done by our railroads yields no profit at the present rates, when due allowance is made for the increase of capital which it requires for the increased wear and depreciation of the works, and for the occupation of the track to the injury of the other business.

The reports of the year 1855 show an increased expense in operating the roads, over that of the preceding year. An examination of the reports of a number of railroads in New England and elsewhere, shows, for the last five years, an annual increase in their cost of from 2 to 5 per cent. per annum; an increase in their receipts of from 12 to 20 per cent.; and an increase in their expenses of from 20 to 40 per cent. per annum.

Deductions from the reports of the railroads in the State of New York, 1855, have been made, showing the comparative cost of construction, of maintenance, and of operating each of the roads of the State, and have been arranged as follows:

The total length of road known to be in operation in New York in 1855 was..... 2738½ miles.
 In addition to which there is second track in operation..... 808 "
 Making a total length of track in operation..... 3526½ "
 The whole length of completed and projected roads..... 4436 "

The capital stock, as by charters, of 64 roads (4486 miles), is..... \$114,492,300 00
 The amount of the above subscribed..... 84,972,587 00
 The amount of capital stock paid in on 63 roads (4406 miles)..... 69,478,458 52
 The amount of funded debt of 63 roads..... 68,230,997 42
 The amount of floating debt do..... 8,504,818 43

The expenditures on the roads which are completed are as follows:

For grading and masonry, 16 roads, 1623½ miles \$20,742,000 21
 For bridging 16 roads, 1623½ miles..... 1,802,424 87
 For superstructure, 21 roads, 2100½ miles..... 26,737,876 67
 For grading, bridging, and superstructure, 21 roads, 2100½ miles..... 68,822,911 21
 For station buildings, engine houses and shops, 22 roads, 2127½ miles..... 5,642,750 87
 For land damages and fences, 22 roads, 2127½ miles..... 9,127,350 92
 For locomotives, 11 roads, 2053½ miles..... 5,748,722 83
 For cars of all kinds, 19 roads, 2119 miles..... 9,726,243 12
 For engineering and agencies, 23 roads, 2183½ miles..... 3,335,062 60
 Total expenditure for construction and equipment, 2749½ miles..... 115,537,193 73
 The expenditure for the construction and equipment of 28 roads (1600 miles), which are in progress and partly completed, including those which reported in 1855, but not in 1856..... 13,112,451 29

The number of locomotives in use is..... 668
 do. passenger and emigrant cars..... 1008
 do. freight and baggage cars..... 7808

The miles run by the passenger trains Miles run. Miles of road.
 For the year was..... 7,024,100 on 2437
 Miles run by freight trains for the year..... 4,368,677 on 2411
 Total miles run by trains..... 11,892,867 on 2437
 Number of passengers carried in the cars 12,360,440 on 2437
 Number of miles traveled by all the passengers..... 470,025,821 on 2437
 Number of tons of freight carried in the cars..... 2,950,809 on 2437
 Number of miles, or total movement of freight one mile..... 861,707,051 on 2376

The average cost of construction and equipment per mile of road on those railroads which have reported these items has been as follows:

Grading and masonry on 19 roads, 1623½ miles..... \$12,778 40
 Bridging 19 " 1623½ " " 1,171 96
 Superstructure 21 " 2100½ " " 12,600 00
 Grading, bridging, and superstructure on 21 roads, 2100½ miles..... 30,453 40
 Station buildings, engine houses, and shops on 22 roads, 2127½ miles..... 2,870 27
 Land damages and fences on 22 roads, 2127½ miles..... 4,290 17
 Locomotives 17 " 2053½ " " 2,792 38
 Cars of all kinds 19 " 2119 " " 3,186 66
 Engineering and agencies 23 " 2183½ " " 1,094 70
 The total average expenditure for construction and equipment on 25 roads, 1340½ miles long, was..... 49,356 06

The average cost per mile of a single track is as follows:

Grading, masonry, and bridges on 19 roads, 2340½ miles..... \$9,676 37
 Superstructures on 21 roads, 2823 miles..... 9,400 48
 Grading, bridges, and superstructure on 21 roads, 2823 miles..... 22,604 18
 Station, engine houses, and shops on 22 roads, 2841 miles..... 1,772 80
 Land and fencing on 22 roads, 2841 miles..... 8,203 41
 Engineering and agencies on 20 roads, 2963½ miles..... 1,145 94
 The total average expenditure for construction and equipment on 25 roads, with 3112½ miles of track, was..... 36,760 45

There is one locomotive for every 3½ miles of road in use. There is one passenger or emigrant car for every 2½ miles. There is one freight or baggage car for every 32-100th mile. The average mileage of the passengers for each mile run by the train is 69. The distance traveled by each passenger is 394 miles; or, if we exclude the Harlem road, the travel on which is principally in the city of New York, 51 miles. The speed of the express trains, when in motion, per hour, is 36 miles. The number of tons of freight for each mile run by the trains is 71. The distance each ton of freight was moved, 107 miles. The speed of the freight trains when in motion, per hour, is 16 miles. The weight of the freight trains, exclusive of the freight, is 175 tons.

The proportions of the tonnage of each description of freight carried on nineteen roads, 2228 miles, are as follows:

Of the product of the forest, 14 per cent. of the whole tonnage.
 " animals..... 15 " "
 Vegetable food..... 22 " "
 Other agricultural products..... 4 " "
 Manufactures..... 12 " "

The average receipts per mile of road were:

Passengers	\$4,674 16
Freight	3,776 72
Other sources	427 28
Total	\$8,278 16
And the expenses	\$4,710 14

From this we see that the expenses were 56 per cent. of the gross receipts, which is below the average throughout the country.

The expenses of operating the road were 57 per cent. of the whole receipts.

The average receipts per mile run by the trains were as follows:

From passengers	\$1 32
" freight	2 02
" other sources	1 67
Total	\$9 97

The average receipts per passenger per mile were 1 06 cents. Per ton of freight

Per passenger or per ton	2 28
Expenses	1 38

On 16 roads, 225 1/2 miles long, the number of passengers carried, as reported, was 12,256,714
 The actual number of travelers was probably about 16,000,000
 The number of miles traveled on same roads was 477,611,422

Comparison of the Returns of several Railroads.—From the statistics of the net income and general economy of the principal railroads in New York and Massachusetts, we can elucidate many facts of the greatest importance in railroad management. Among these may be noticed the following: The average number of passengers and the number of tons of freight carried each mile run is the same; that is, on an average there are daily carried an equal number of passengers and freight an equal distance on the road. The largest number of passengers carried each mile run is by the Hudson River Railroad, which has as a rival the best navigable river in the world. The largest number of tons carried per mile run is by the New York and Erie Railroad, which is the principal through freight road for the products of the West; and this road also shows the largest net income per mile. The ratio between the total receipts per mile and the net income per mile is far from being constant, or the last from being dependent on the first. There is, however, a relation between the net income per mile of a road and the expenses per mile; that is, the net income per mile of a railroad bears a very nearly constant ratio to an inverse of the

expenses per mile run; thereby making it evident that, *ceteribus paribus*, the interests of the stockholder are advanced more by reducing the expenses per mile run, than by increasing the business of the road. The receipts for passengers or freight carried per mile is given by adding the expenses and the net income carried per mile. It is shown from this comparison that on an average the net income from passengers carried per mile is 50 per cent. of the receipts, or equal to the expenses; while the net income from freight is only 34 per cent. of the expenses. From this we see that the tariff of freight should be increased 16 per cent., that it shall be in a just proportion to the passenger tariff.

The tables also show that the net income from passengers and mails per mile run is generally greater on the Massachusetts railroads than on the New York railroads, and that the net income from freight per ton per mile is greater on the New York railroads. The general tariffs are not materially different in the two States, but the expenses of freight are fully 50 per cent. greater in Massachusetts than in New York. The net income per mile is the greatest on the New York and Erie Railroad, which is a freight road.

STATISTICS OF THE INCOME AND ECONOMY OF THE PRINCIPAL RAILROADS IN NEW YORK AND MASSACHUSETTS.

Railroad to the Pacific.—The proposed railroad to the Pacific involves so many questions as to feasibility and cost, requiring to determine much more accurate data than we now possess, that it is better to give only the statistics that have up to this time been obtained, and abstain from arguments in favor of any route.

SAVED ROUTES FOR A RAILROAD FROM THE MISSISSIPPI OR ITS TRIBUTARIES TO THE PACIFIC OCEAN.—FROM THE REPORT OF THE SECRETARY OF WAR.

Description of Route.	Distance by straight Lines.	Distance by proposed Route.	Sum of Ascend and Descend.	Estimated Cost.	Through arable Lands.	Through sterile Lands.
	Miles.	Miles.	Feet.		Miles.	Miles.
1. Route near 47th and 49th parallels, from St. Paul to Vancouver	1455	1864	18,100	\$190,781,000	374	1430
a. Extension thence to Seattle	45	161	1,000	10,000,000	101
2. Near the 41st and 43d parallels, via South Pass from Council Bluffs to Benicia	1410	3022	29,120	116,095,000	602	1400
3. Near the 35th and 39th parallels, from Westport to San Francisco, by the Coo-she-to-pa and Tah-ee-chay-pah Passes	1740	3060	49,936	So great that road is impracticable.	620	1460
b. Same, from Westport to San Francisco by the Coo-she-to-pah and Madelin Passes	1740	3200	56,514	do.	670	1620
4. Near the 35th parallel, from Fort Smith to San Pedro	1360	1892	48,812	169,210,985	414	1476
c. Near the 35th parallel, from Fort Smith to San Francisco	2174	59,670	169,210,905	441	1530

From an examination of the above table it will be found that the construction of railroads has made greater progress in 1856 than in any previous year. The number of miles in operation on the 31st of December, 1856, is 24,476, against 21,069 at the close of

the year 1855, being an increase of 3407 miles for the year. We add to the last two columns of the following table the population and wealth of the several States, as estimated by the Secretary of the Treasury.

MILES OF RAILROAD IN OPERATION ON THE 31ST DECEMBER, 1856.

States.	1855.	1856.	Increase.	Population, 1856.	Wealth, 1856.

Estimated increase of property since 1850	1,500,000,000
	\$11,317,611,072

The above table, condensed, presents the following points:

Miles opened in five years ending 1852	131
" " " " " " " "	1,291
" " " " " " " "	2,465
" " " " " " " "	1,430
" " " " " " " "	6,288
" " " " " " " "	18,960

The greatest progress has been made by the eight Western States; next by the Southern States; while the Northeastern States have made but trifling additions to their public works.

	1855.	1856.	Increase.
Miles.	Miles.	Miles.	
6 Eastern States	3,405	3,575	170
4 Middle "	5,228	5,700	472
13 Southern "	5,226	6,304	1,078
8 Western "	7,219	8,897	1,678
Total	21,128	24,476	3347

The Secretary of the Treasury has prepared a statement showing the cost of railroads in the United States in 1855, from which we make the following summary. Returns not having been received from a number of companies, these figures are only approximate.

Capital paid in.....	\$483,286,946
Funded debt.....	503,187,973
Floating debt.....	49,126,868
Expanded in 1855.....	\$776,551,877
Required to finish the roads.....	813,829,237
Total estimated cost.....	\$1,090,881,114
Miles finished.....	19,636
Miles unfinished.....	16,063
Total length.....	35,706
Receipts for the year.....	\$91,182,683

According to these figures, the average cost per mile would only amount to \$30,000, whereas experience proves that \$35,000 is nearer the truth. Assuming this estimate, the total cost of the 36,000 miles, when finished, would amount to \$1,260,000,000.

The average cost of a portion of our railroad system has been as follows:

	Costing.	Per Mile.
30 roads in New York.....	\$80,000,000	\$16,314
38 " " Massachusetts.....	60,000,000	44,482
12 " " the South and West.....	50,000,000	45,653

It is estimated that at least three-fourths of the money which has been expended upon railroads in this country has been furnished by our own citizens, and the remainder (chiefly for bonds) has been obtained from foreign investments.

In conclusion, we may add, that, in reviewing the progress of railroads in the United States, their effect upon the prosperity of the country, and their future prospects, are much beyond the wildest dreams of the originators of the system. The number of miles built in the first ten years of our railroad history, beginning in the year 1828, was 1843, of which New York State built 18 per cent. The number of miles built in the second ten years, or from 1838 to 1848, was 2889, of which New York built 15 per cent. From 1848 to 1856 the number built was 18,794, of which New York built 9 per cent. At the present time New York has over 11 per cent of the total length of railroads, and ranks next to Illinois in number of miles. Our railroad history has had two eras—the first from 1828 to 1848, when there was in the number of miles built an average increase of 268 miles per year; and the second from 1848 to 1856, having an average increase of 2150 miles per year. In many of the States the development of the railroad system is quite equal to the wants of the people; but in many others, Kentucky being the most notable instance, it is much less.

The cost of these 26,000 miles of railroad built at the end of the year 1857 is estimated at \$920,000,000, or an average of \$35,000 @ \$36,000 per mile; and, if the rails had been laid with American iron, produced by domestic labor, it would have been the most productive investment the country ever made.

The Railroad Systems of Europe and the United States.
—Among the greatest achievements are the opening up of new fields of supply, and the deepening of old channels of consumption. They have brought into profitable use mines, forests, quarries, arable and grazing districts, fisheries, harbors, and rivers, previously inaccessible.

But still greater even than these achievements are the advantages arising from the cheap and rapid conveyance of passengers over long distances. Every enterprise is now carried on with perhaps ten times as much dispatch, and with ten times less trouble than forty years ago; and the facility of personal superintendence is certainly twenty times greater than it was then. It is not difficult, therefore, to comprehend that to accelerate even by a few years the completion in a country of an extensive system of railroads, is to confer upon it advantages the real value of which it is impossible to represent in terms of money; and we shall find, in the considerations connected with this mode of viewing the facts, a correction of many prevalent errors relative to the cost of English railroads.

Let us see what was the comparative progress which,

at the end of 1854, had been made by the countries of Central and Western Europe, and by the United States, in providing themselves with railways.

Railways.—General summary of the comparative extent of railway open at the close of 1854, in different countries:

Countries.	Area in English Square Miles.	No. of Miles of Railway open in 1854.	Miles of Rail open to each 100 Square Miles of Area.
England and Wales.....	57,800	6,100	10.2
Scotland.....	89,240	1,040	3.5
Ireland.....	31,970	900	2.8
France.....	119,310	8,040	6.7
Germany.....	265,000	2,616	1.4
Belgium.....	11,000	530	4.8
Massachusetts.....	484,000	8,840	1.8
New York.....	7,800	1,300	10.0
Pennsylvania.....	47,000	2,700	5.8
Ohio.....	46,000	2,000	4.3
Illinois.....	100,500	6,050	5.4
Indiana.....	40,000	3,050	7.7
Illinois.....	33,500	1,540	4.4
Illinois.....	55,400	2,800	5.0
Twenty-two other States of the Union.....	129,200	7,300	5.6
Totals.....	1,251,040	8,200	0.6
Totals.....	2,181,040	82,383	1.5

It appears by these figures that the only country or State possessing a greater extent of railway (compared with territorial area) than England and Wales was the State of Massachusetts; but the area of Massachusetts is only an eighth part the area of England and Wales.

In France and Germany the progress has been less than a seventh of our own. Even in Belgium, and New York, and Pennsylvania, the progress has been barely a third of ours. In Scotland the progress has been twice as rapid as in Germany; and if fair allowance be made for the lake and mountain surface of Scotland, the progress in it will exceed the progress of Belgium, and of those Western States of the Union where railways are made with a cheapness and facility unknown any where else.

We may now recapitulate the conclusions which seem to be established by the facts and statements before us, viz.:

1. That of the three hundred millions sterling actually expended in railways to the close of 1855, in the United Kingdom, fully one half, or one hundred and fifty millions sterling, were expended during the five years, 1816, '47, '48, '49, and '50, and that of the 8300 miles of railway open and at work at the close of 1855, fully one half, or 4150 miles, were completed and brought into operation for the first time during the five years now enumerated.

2. That the consequence of so prodigious an outlay in so small a space of time has been to place the United Kingdom, but especially England, so far in advance of other countries in the possession of an extensive railway system, that, adopting the fair test of comparing territorial area with railway mileage, England has a comparative mileage three times greater than Belgium, New York, and Pennsylvania, and seven times greater than France and Germany.

3. That the introduction on the largest scale into this country, and in degrees more limited into other countries, of a change so extensive, absolute, and fundamental in the means of transit, has already led, and in a short time will lead still further, to important modifications in the conditions affecting the supply of and the demand for large classes of commodities—these modifications tending generally to reductions of price, as a consequence of diminished cost of production or reduced expenses in conveyance to market.

4. That as regards the 150 millions sterling expended in this country in the five years, 1846-'50, its operation was to give employment, during periods,

first, of dear food (1846-47), and second, of extreme commercial difficulty (1847-48-49), to a body of artisans and others, varying from upward of a million to half a million of persons.

5. That on the other hand, the calls by the process of which the 150 millions were gradually raised from the middle and wealthier classes, who were the holders of railway shares, operated like an income tax, nearly the whole amount of which was provided by the resort to severe economy, or by additional exertions to produce augmented resources.

6. That the retrenchments and increased exertions of the contributors of calls, taken in the aggregate, more than counterbalanced the consumption of the army of laborers employed in railway works, and also the expenditure for the purpose of those works on imported materials; and hence that even during the five years, 1846-'50, of an average annual expenditure of thirty millions sterling, the balance of trade was, as a general result, constantly in our favor.

7. That during the five years in question the average annual return yielded by the (say) 200 millions actually expended in railway undertakings was less than 2 per cent. per annum; that beyond the failure of annual return there was a depreciation of market price equal to about 50 per cent. below par value; and that while the ultimate recovery of the country, with comparative ease, from the effects of so severe a strain, abundantly indicates its resources; still the depression and losses experienced by so large a portion of the middle class during 1846-'50, and even later, may be considered to have been, to some extent, a cause of the dullness of trade and the low range of prices which prevailed during the two or three last years of the period.

8. That, on the other hand, the cessation after 1850 of an annual heavy demand for calls, the rapid increase of dividends on the capital previously expended, the still more rapid advance of the market price of railway stock, and, more powerful still, the effect upon production and consumption of several thousand miles of railway communication, may be regarded as explaining in some important degree the comparative prosperity and ease which have prevailed since 1851.

9. That finally, while it is quite true that the railway excitement of 1841-'45 was in many respects irrational and disgraceful, and in numerous individual cases the source of crime and ruin, still it enabled this country to pass, almost at one step, and by a single sharp and effectual effort of self-denial on the part of the middle classes, into the possession of the most complete system of railways, as possessed by any country; that while these railways have cost more to their projectors than would have been expended by less precipitate adventurers, there is no sufficient reason to believe that the inordinate cost falls as a perpetual burden upon the frequenters of the lines; in other words, that the cost of the line and the rates of toll, which can alone attract customers, have no necessary or close dependence on each other. And hence, that, eccentric and exceptional as may have been, in many cases, the efforts of private enterprise, as displayed in the formation of railways in this country, no denial can be given to the broad and beneficial result. That to private enterprise we are indebted for being a generation in advance of the rest of Europe as regards the new means of internal transit.—Tooke's *History of Prices*.

We give a summary showing the number of miles and cost of the railroads of the world. This summary is of later date than the separate statements given before, and of course shows an increase. There is a discrepancy between the number of miles in operation in Germany, according to the authority of Tooke, and the following. This is explained by the fact that many of the railroads stated by Tooke as belonging to Germany should be placed in the column of French and Belgian railroads.

The following table also exhibits the low cost of American railroads compared to those of Europe.

COMPARATIVE TABLE OF RAILROADS IN OPERATION.

Countries.	English Miles.	Cost in Dollars.	Cost per Mile.
United States (1857)	20,000	920,000,000	\$30.00
Great Britain (1850)	8,207	1,487,916,420	170.00
France (1850)	4,078	616,118,906	150.00
Germany (1850)	3,213	228,000,000	71.00
Prussia (1850)	1,390	145,000,000	65.00
Belgium (1856)	1,095	93,500,000	90.00
British Provinces	823	41,600,000	50.00
Cuba	350	16,100,000	45.00
Panama	47	7,000,000	150.00
South America	60	4,500,000	75.00
Russia	422	42,000,000	100.00
Sweden	75	7,000,000	100.00
Italy	170	17,000,000	100.00
Spain	60	6,000,000	100.00
Africa	25	3,100,000	125.00
India	100	15,000,000	150.00
Total	48,074	\$4,655,355,415	\$79.00

Raisins (Fr. *Raisins secs*, *ou passés*; Ger. *Rosinen*; It. *Uve passe*; Port. *Passas*; Russ. *Issum*; Sp. *Pasas*), the dried fruit of the vine. They are produced from various species of vines; deriving their names partly from the place where they grow, as Smyrnas, Valencias, etc.; and partly from the species of grape of which they are made, as muscatels, blooms, sultanas, etc. Their quality appears, however, to depend more on the method of their cure than on any thing else. The finest raisins are cured in two methods; either by cutting the stalk of the bunches half through, when the grapes are nearly ripe, and leaving them suspended on the vine till the watery part is evaporated, and the sun dries and candies them; or by gathering the grapes when they are fully ripe, and dipping them in a ley made of the ashes of the burned tendrils; after which they are exposed to the sun to dry. Those cured in the first way are most esteemed, and are denominated raisins of the sun. The inferior sorts are very often dried in ovens.—*Тюссонов's Disp.*

Raisins are imported in casks, barrels, boxes, and jars. The finest come in jars and quarter boxes weighing about 25 lbs. Some of the inferior sorts are brought to us in mats. Malaga raisins are in the highest estimation. The muscatels from Malaga fetch fully a third more than any other description of raisins.

The value of raisins imported into the United States for the fiscal year 1856-'57 was \$937,400, viz:

Whence imported.	Pounds.	Value.
France on the Mediterranean	564,150	\$21,551
Spain on the Mediterranean	14,489,800	816,770
Turkey in Asia	154,840	14,635
Chili	331,200	67,500
All others	159,625	9,706
Total in 1856-'57	15,699,624	\$371,460
Total in 1855-'56	14,006,407	864,219
Increase	1,693,217	\$77,241

Rake, to. The sea term for *incline*, and applies to the masts, stem, and stern-post, etc.; the bowsprit, instead of raking, is said to *steer*. Masts generally rake aft, and in peculiar rigs only forward. The rake of the mast has an influence on the sailing of the vessel, and the masts of some schooners rake excessively. The principal effect seems to be to diminish the effect common to all the sails, of depressing the ship's head. To rake a ship, is to fire into her head or stern in the direction of her length, or along her decks. It is similar to what engineers term *cutlading*.

Rake of a Ship, is all that part of her hull which hangs over both ends of her keel. That which is before is called the *fore-rake* or *rake forward*, and that part which is at the setting on of the stern-post is called the *rake-aft* or *afterward*.

Rangoon, a commercial port and town of the Burmese dominions, about 20 miles from the sea, on the left bank of the eastern branch of the Irrawaddy, in lat. 16° 42' N., long. 96° 20' E. The town and suburbs extend lengthwise about one mile along the

bank of the river, belong about three-fourths of a mile in depth; but the houses are very unequally scattered over this area. The fort, or rather wooden stockade, which contains the town, properly so called, is a regular square about 14 feet high, composed of heavy beams of teak timber. It appears, from a census taken a short time previously to the commencement of the war in 1824, that the population was 18,000, which probably is not far from its present amount, though it has been stated considerably higher. The foreign trade is principally regulated by the treaty between Great Britain and the Court of Ava, 1826.

Rangoon is the chief, and indeed almost the only port of foreign trade in the Burmese dominions, which extend from between the 15th and 16th, up to the 26th and 27th degrees of N. lat., and from the 93d to the 98th degree of E. long., containing an area of about 184,000 square miles, with a population of about 4,000,000. Its situation is extremely convenient for commercial purposes, being situated so near the sea, and commanding the navigation of the Irrawaddy, which extends to Ava, the capital, a distance of nearly 500 miles. Rangoon is accessible to ships of even 1200 tons burden; the navigation, although somewhat intricate, being safe and practicable with the assistance of the ordinary native pilots.

The town has many advantages for ship-building. At neaps the tide rises and falls about 18 feet; and at springs from 25 to 30 feet. The principal teak forests are, at the same time, at a comparatively short distance, and there is a water conveyance for the timber nearly the whole way. Ship-building has, in fact, been carried on at Rangoon since 1786, and in the 38 years before the British captured it there had been built 111 square-rigged vessels of European construction, the total burden of which amounted to above 35,000 tons. Several of these were of from 800 to 1000 tons. Under the direction of European masters, the Burmese were found to make dexterous and laborious artisans; in this respect greatly surpassing the natives of British Indian provinces. There are two considerable markets, where the ordinary necessaries of life, according to Burmese usage, are cheap and abundant: these are rice, excellent fish, and poultry.

Money.—The Burmese currency consists, for small payments, of lead; for larger ones, of gold and silver, but chiefly of the latter. There are no coins. At every payment the metal must be weighed, and very generally assayed—a rude and very inconvenient state of things. The weights used in the weighing of money are the same as those used on ordinary occasions; the kyat or tical, and the paiktha or vis, being by far the most frequent. Silver may be considered as the standard. Gold is generally held to be about 17 times more valuable than silver. The weighing and assaying of the metals used as currency gives employment to a class of persons as brokers, money-changers, and assayers. Every new assay costs the owner, if the metal be silver, 2½ per cent.—1½ per cent. being the established commission of the assayers, while 1 per cent. is lost, or supposed to be lost, in the operation. If it be repeated 40 times, it follows that the original amount is wholly absorbed!—a fact which shows the enormous waste of metal arising out of this rude substitute for coin.

All grains, pulses, certain fruits, natron, salt, and lime, are bought and sold by measure: other commodities by weight.—For an account of the weights and measures, see article BURMAH.

Commerce.—A considerable intercourse is carried on between the Burmese and Chinese dominions by an annual caravan, of which the merchants are all Chinese. The imports from China consist of manufactured articles, the chief export from Burma being cotton wool. The trade with foreign countries seaward is carried on with the ports of Chittagong, Dacca, and Calcutta, in Bengal; Madras and Masulipatan, on the Coromandel

coast; the Nicobar Islands, in the Bay of Bengal; Ponang, in the Straits of Malacca; and occasionally with the Persian and Arabian Gulfs. The largest trade is with Calcutta, owing to the great consumption of teak timber in the latter, and the facility with which she supplies the demand of the Burmese for Indian and British cotton goods. The articles exported to foreign countries from Rangoon are the following: Teak wood, terra Japonica, or catechu, stick-lac, beeswax, elephants' teeth, raw cotton, orpiment, commonly called in India hortal, gold, silver, rubies, sapphires, and horses, or rather the small, hardy pony of the country, which is much esteemed, particularly at Madras. By far the most important of these commodities is teak timber; the quantity of this wood annually exported is said to be equal to 7600 full-sized trees, which for the most part consist of what India ship-builders call *shindis*, which are planks hewn out of the log with the adze at an immense waste. The teak forests of Pegu are by far the most abundant in India. The teak is nowhere to be found in the low alluvial lands to which the tide reaches, but abounds in the high lands beyond its influence. It seems to be very generally disseminated throughout the Burmese dominions. In the territory ceded to the British in Martaban, there are some fine forests, the timber of which is cut down for exportation, and where it is believed that saw-mills have very recently been established by some European settlers. The most accessible and extensive forests of teak in the Burmese dominions are in the province of Sarawadi, about 150 miles to the north of Rangoon, with which there is a water communication. The principal imports into Burma are cotton piece goods from India and Britain, British woolens, iron, steel, quicksilver, copper, cordage, borax, sulphur, gunpowder, saltpetre, fire-arms, coarse porcelain, English glass-ware, opium, tobacco, cocoa and area nuts, sugar, and spirits. Of these by far the most important is cotton piece goods. The Burmese have few cotton manufactures of their own, and appear, from very early times, to have been furnished with the principal part of their supply from the Coromandel coast. To these were afterward added the cheaper fabrics of Bengal; and both are now, in a great measure, superseded by British manufactures, the use of which has spread very rapidly since the opening of the trade in 1814.

Rape, a biennial plant of the turnip kind (*Brassica napus*, Linn.), but with a woody fusiform root scarcely fit to be eaten. It is indigenous, flowers in May, and ripens its seeds in July. It is cultivated in many parts of England, partly on account of its seed, which is crushed for oil, and partly for its leaves as food for sheep. The culture of rape for seed has been much objected to by some, on account of its supposed great exhaustion of the land; but Mr. Loudon says that, where the soil and preparation are suitable, the after-culture properly attended to, and the straw and offal, instead of being burned, as is the common practice, converted to the purposes of feeding and littering cattle, it may, in many instances, be the most proper and advantageous crop that can be employed by the farmer. The produce, when the plant succeeds well, and the season is favorable for securing the seed, amounts to from 40 to 50 bushels an acre. The seed is crushed in mills constructed for that purpose.—*LOUDON'S Encyc. of Agriculture.* See OIL and LENSED.

The value of rapeseed and hemp-seed oil imported into the United States for the fiscal year 1856-57 was \$11,601, viz.:

Countries.	Bushels.	Value.
England.....	6,768	\$5 278
France.....	9,441	5,713
Others.....	976	610
Total.....	17,315	\$11,601

Ratans, or **Canes**, the long slender shoots of a prickly bush (*Citranus rotang*, Linn.), one of the most

useful plants of the Malay peninsula and the Eastern islands. They are exported to Bengal, to Europe, and, above all, to China, where they are consumed in immense quantities. For cane work they should be chosen long, of a bright pale-yellow color, well glazed, and of a small size; not brittle, or subject to break. They are purchased by the bundle, which ought to contain 100 ratans, having their ends bent together, and tied in the middle. In China they are sold by the picul, which contains from 9 to 12 bundles. Such as are black or dark colored, snap short, or from which the glazing flies off on their being bent, should be rejected. When stowed as damage, they are generally allowed to pass free of freight.—MILNURN'S *Oriental Commerce*, etc. "The ratan," says Mr. Crawford, "is the spontaneous product of all the forests of the Archipelago; but exists in great perfection in those of the islands of Borneo, Sumatra, and of the Malayan peninsula. The finest are produced in the country of the *Botaks* of Sumatra. The wood-cutter who is inclined to deal in this article proceeds into the forest without any other instrument than his *parang* or cleaver, and cuts as much as he is able to carry away. The mode of performing the operation is this: he makes a notch in the tree at the root of which the ratan is growing, and cutting the latter, strips off a small portion of the outer bark, and inserts the part that is peeled into the notch. The ratan now being pulled through as long as it continues of an equal size, is by this operation neatly and readily freed from its *epidermis*. When the wood-cutter has obtained by this means from 300 to 400 ratans—being as many as an individual can conveniently carry in their moist and undried state—he sits down, and ties them up in bundles of 100, each ratan being doubled before being thus tied up. After drying, they are fit for the market without further preparation. From this account of the small labor expended in bringing them to market, they can be sold at a very cheap rate. The Chinese junks obtain them in Borneo at the low rate of 6 Spanish dollars per 100 bundles, or 6 cents for each 100 ratans, or 27 for 1d. The natives always vend them by tale; but the European residents and the Chinese sell them by weight, counting by piculs. According to their quantity, and the relative state of supply and demand, the European merchants dispose of them at from 1½ to 2½ dollars the picul. In China the price is usually about 3½ dollars per picul, or 75 per cent. above the average prime cost. In Bengal they are sold by tale, each bundle of about 100 ratans bringing about 20½d."—*Indian Archipelago*, vol. iii. p. 423.

Ratlines, small lines which traverse the shrouds of a ship horizontally, at regular distances, from the deck upward, forming a variety of ladders whereby to climb or to descend from any of the mast-heads.

Raze, a ship of war cut down to a smaller size.

Real, in the Spanish monetary system, is of two sorts; viz., a *real of plate*, and a *real vellon*. The former is a silver coin, varying in value from 10 to 12½ cents.—*See COINS*. A real vellon is a money of account, worth about 5 cents. Formerly, by authority of Congress, the value of a real of plate was put at 10 cents, and a real vellon of Spain at 5 cents.

Realejo. The port of Realejo, on the Pacific, lat. 12° 34' N., long. 87° 4' W., to which it is proposed to bring the canal from Lake Leon, is said to be one of the best that is any where to be met with. The port of Realejo consists chiefly of a salt-water creek, into which several small streams of water empty themselves. The entrance is protected by an island about two miles long, which leaves at each end a channel where ships can enter the harbor, but extending opposite the main land, forming the port in such a manner as to protect it entirely from any wind that could possibly blow, and also entirely breaking the swell which enters the outer bay of Couchagua from the ocean. The north entrance is about a quarter of a mile wide, and that at the south

of the island rather narrower, both being entirely free from rocks or hidden dangers, and having in no part less than five fathoms depth of water. At one of these openings vessels can at all times enter with a leading wind, from whatever quarter it may blow. The inside consists of a noble basin of water, nowhere less than four fathoms deep, with a bottom of mud, where two hundred ships of the line might lie at all times in the most perfect security. One of the branches of the creek extends inland to within three leagues of the Lake of Leon or Managua. The intermediate country is a gentle slope, where undoubtedly should enter one of the ends of the canal to connect the Pacific and Atlantic oceans. The difficulties to be encountered in crossing the chain of hills between the Lake of Nicaragua and San Juan del Sud would be entirely avoided by bringing the canal through the Lake of Leon (connected as it is with that of Nicaragua by a river that might be rendered navigable at a moderate cost) into the above-named branch of the Realejo harbor, thus securing the great advantage of an excellent harbor at each end of the canal, besides many others which are certainly not to be met with either at Panama, Tehuantepec, or any other place. The town of Realejo is about two leagues distant from the part of the creek where vessels lie; but there is sufficient depth for small vessels to come within a mile of the town, and a very little labor would make it accessible to large ships; but an enlightened government would probably prefer moving the town to the opposite side of the reach, where vessels lie, where there is a site extremely suitable for the purpose, and where a quay might easily be erected capable of accommodating any number of ships. In the time of the Spanish government several vessels, some of 300 to 400 tons, were built at Realejo, where the wood is very superior and durable. The port of San Juan del Sud, to which place it was proposed to bring the canal, seems inferior to Realejo in most respects. The Gulf of Papagayo, where the port is situated, is very difficult to enter for a sailing vessel for five months in the year.—*See NICARAGUA* and PANAMA.

Ream, a quantity of paper. The ream of writing-paper consists of twenty quires, each of twenty-four sheets; usually consisting of eighteen quires of twenty-four sheets each, and the two outside (or broken) quires of sixteen to twenty sheets each; but the ream of printing-paper, or, as it is sometimes called, the *printer's ream*, extends to twenty-one and a half quires, or 516 sheets. Two reams of paper make a *bundle*.

Receipt is an acknowledgment in writing of having received a sum of money, or other valuable consideration. It is a voucher either of an obligation or debt discharged, or of one incurred.

Reckoning, in *Navigation*, the estimated place of a ship, calculated from the rate as determined by the log, and the course as determined by the compass, the place from which the vessel started being known. *Dead reckoning* means the same as *reckoning*, due allowance being made for drift, lee-way, currents, etc.

Red River is the first large river which enters the Mississippi, 311 miles above its mouth, and rises at about lat. 34° N. in the *Llana Estacada*, or Great Staked Plain. It is formed by several head branches, and receives several tributaries, the largest of which are Blue River and Fabe Washita. A greater part of its course is through rich prairies of a red soil, which colors the water of the river, and hence the origin of its name. Its shores are covered with grass, and abound with grape-vines, which produce an excellent fruit. About one hundred miles above Natchitoches commences what is denominated the *Raft*, which consists of a swampy expansion of the river to the width of twenty or thirty miles, and has a length of sixty or seventy miles. The river divides into a great number of channels, many of which are shallow, and these channels have been obstructed by fallen trees, brought

down by floods from its upper parts. At a great expense, this raft has been so far removed by the United States government that steamboats pass through it. Boats sometimes pass the raft by leaving the river above it, in a channel which flows out of it into some neighboring lake, and following the outlet of this lake until it joins the river below the raft. This raft has been a serious obstruction, as the river would otherwise be navigable for steamboats four hundred miles, and the lands on its borders are highly fertile, and desirable for cultivation for a great distance above the raft. Below the raft, and four miles above Natchitoches, the whole volume of the river is again united, but very soon divides into many channels, and fills an immense number of bayous and lakes that lie parallel to it. In its lower parts the main channel of the river is narrower than above the raft.

Red Sea, or Arabian Gulf, an inland sea between Africa and Asia (Arabia), lat. 12° 40' to 30° N., long. 32° 30' to 43° 39' E. Length, northwest to southeast, upward of 1400 miles; breadth varies to nearly 200 miles. At its southern extremity it communicates with the Indian Ocean by the strait Bab-el-Mandeb. In its northern part it bifurcates into the Gulfs of Suez and Akabah, which inclose the peninsula of Sinai. Depth varies; average about 100 fathoms. It abounds with islands and coral reefs, and is supposed by some to have derived its name from the large quantities of red coral and pink-colored fuel which it yields; while it is more probably derived from the ancient *Idumea*, "Sea of Edom," or "Red Sea." The country almost every where around it is mountainous. The southeast monsoon blows constantly for eight months of the year, and during the remainder the northwest monsoon. From October to May, when south winds prevail, the water rises in the northern part of the sea, which then attains an elevation much higher than the Mediterranean. The navigation is difficult, owing to sudden changes of wind and heavy gales. Principal ports are Mocha, Hodeida, Lohela, Jiddah, and Yembo on the Arabian side, and Suez, Kossair, Suakin, and Massowah on the Egyptian, Nubian, and Danakil coasts.

Reef, a term in navigation. When there is a heavy gale of wind the seamen commonly roll up part of the sail below, that by this means it may become the narrower, and not draw so much wind; and this contracting or taking up the sail they call a *reef*, or *reefing a sail*; so also when a *top-mast is sprung*, as they call it, that is, when it is cracked, or almost broken in the cap, they cut off the lower piece that was nearly broken off, and setting the other part, now much shorter, in the step again, they call it a *reefed top-mast*.

Regatta, a word used originally by the Venetians to signify a grand fête in which the gondollers contended for superiority in rowing their gondolas; but the term has been adopted into all the modern languages, in which it signifies a brilliant species of boat-race.

Registry, in *Commercial navigation*, the registration or enrollment of ships at the custom-house, so as to entitle them to be classed among, and to enjoy the privileges of national ships.—See *SITTERS*.

The United States have imitated the policy of other commercial nations in conferring peculiar privileges upon American-built ships, and owned by citizens. The object of the Registry Act is to encourage our own trade, navigation, and ship-building, by granting unusual and exclusive privileges of trade to the flag of the United States, and by prohibiting the communication of those immunities to the shipping and mariners of other countries. The provisions are well calculated to prevent the commission of fraud upon individuals, as well as to advance the national policy. The registry of vessels at the custom-house, and the memorandums of the transfers, add great security to title, and bring the existing state of our navigation and marine

under the view of the general government. By these regulations the title can be correctly traced back to its origin. The acts of Congress of 31st of December, 1792, and 18th February, 1793, constitute the basis of the regulations in this country for the foreign and coasting trade, and for the fisheries of the United States; and they correspond very nearly to the provisions of the British statutes in the reign of George III.

These acts relate to all ships employed at sea, which may be divided into five classes: 1. Ships of the United States employed in foreign trade, which are entitled to be *registered*. 2. Ships of the United States employed in the coasting trade or fisheries, which are entitled to be *enrolled and licensed*. 3. Ships built out of the United States, but owned by citizens, which are entitled to a *certificate of ownership*; but if wrecked in the United States and repaired to the extent of three-quarters of their value, they may be registered. 4. Ships built in the United States, but owned wholly or partly by foreigners, which are entitled to be *recorded*. 5. Ships built out of the United States, and owned by foreigners, which are considered alien vessels to all intents and purposes.—See *KENT'S Comm.*, vol. iii.

Vessels actually registered, and vessels duly qualified for carrying on the coasting trade and fisheries, or one of them, are alone denominated and deemed *ships or vessels of the United States*, entitled to the benefits and privileges appertaining to such vessels; and they continue to enjoy the same no longer than they continue to be wholly owned and commanded by a citizen or citizens of the United States. Vessels built within the United States, and vessels captured by citizens in war, and condemned as prizes, or seized and condemned for a breach of revenue laws, and wholly belonging to citizens, may be registered. No citizen who usually resides in a foreign country can, during such residence, entitle himself to have registered a ship owned in whole or in part by him, unless he be a consul, or an agent or partner in some house of trade or partnership, consisting of citizens actually carrying on trade with the United States. An American vessel, transferred by parcel while at sea to an American citizen, and resold to her original owners on her return to port, does not lose her privileges as an American vessel.

If one of two partners obtain a registry of a vessel by swearing that he and his partner, of the city of New York, are the owners, when in fact his partner is domiciliated abroad, the vessel is liable to forfeiture.

No ships can be registered, or if registered, can be entitled to the benefit thereof, if owned, in whole or in part, by a naturalized citizen, residing for more than one year in the country from which he originated, or for more than two years in any foreign country, unless he is a consul or public agent. But such ships may be registered arw on a *bona fide* sale to any citizen resident within the United States.

No registered ship, which has been seized or captured and condemned by a foreign power, can be registered anew, except regained by the original owner at the time of capture or seizure, or by his executors or administrators; but such a ship is deemed a *foreign vessel*, though purchased or owned by any other citizen. Ships entitled to be *recorded* and entitled to the benefits of *recorded ships* in the United States are ships built in the United States, and belonging wholly or in part to foreigners. Vessels entitled to be enrolled are vessels of twenty tons or upward, possessing the same qualifications and requisites as are made necessary for registering ships, i. e., they must be built within the United States, and be owned wholly by citizens. If under twenty tons, they are entitled to a *license*. No ships, unless enrolled and licensed, are deemed entitled to the privileges of American vessels employed in the coasting trade or fisheries; and if any not enrolled or licensed be found engaged in the coasting trade or fisheries, having on board any foreign articles or distilled spirits other than sea stores, they are subject to forfeit-

ure, unless the vessel be at sea at the expiration of the time for which the license was granted; in which case the forfeiture is not incurred, provided the master prove the fact, and deliver his license to the collector of the district in which he shall first arrive, within forty-eight hours after his arrival.

In the United States no vessels are required to be registered. But to entitle them to the privileges of the United States they must be registered; otherwise they are deemed alien ships. As is before stated, vessels engaged in the coasting trade or fisheries are liable to forfeiture if they have foreign goods on board, unless they are enrolled or licensed.—BLUNT'S *Shipmasters' Assistant*.

It is further provided by the act of March 2, 1797, that whenever any vessel is transferred by process of law, and the register, or certificate of enrollment or license, is retained by the former owner, a new one may be obtained upon the usual terms, without the return of the outstanding paper. Vessels captured and condemned by a foreign power, or by sale to a foreigner, whereby there becomes an actual divesture of the title of the American citizen, are to be considered as foreign vessels, and not entitled to a new register, even though they should afterward become American property, unless the former owner regain his title, by purchase or otherwise, and then the law allows of the restoration of her American character by a sort of *ius postliminii*. Every registered or unregistered vessel owned by a citizen of the United States, and going to a foreign country, and an unregistered vessel, sailing with a sea-letter, is entitled to a passport, to be furnished by the collector of the district. But no sea-letter, certifying any vessel to be the property of a citizen of the United States, can be issued, except to ships duly registered, or enrolled and licensed, or to vessels wholly owned by citizens of the United States, and furnished with or entitled to sea-letters, or other custom-house documents.

The English registry acts of 26 Geo. III. and 34 Geo. III. c. 68, required the certificate of registry to be truly recited at length in every bill of sale of a British ship to a British subject; otherwise such bill of sale was declared to be utterly null and void, to all intents and purposes; and this was held to be necessary, even though the ship was at sea at the time, and the vendee took the grand bill of sale and possession of the ship immediately on her arrival in port. The laws of the United States do not go to that rigorous extent; and the only consequence of a transfer without a writing containing a recital at length of the certificate of registry is, that the vessel can not be registered anew, and she loses her privilege as an American vessel, and becomes subject to the disabilities incident to vessels not registered, enrolled, or licensed as the statute prescribes. But where an American registered vessel was in part sold, by parol, while at sea, to an American citizen, and again resold, by parol, to her original owner on her return into port and before entry, that transaction was held not to deprive the vessel of her American privileges, or subject her to foreign duties, for in that case no new register was requisite. It would have been, except in date, a duplicate of the old one, and perfectly useless.

If a ship be owned by American citizens, and be not documented according to the provisions of the registry acts, it is not liable to any forfeitures or disabilities which are not specially prescribed. The want of a register is not a ground of forfeiture, but the cause only of loss of American privileges. Every vessel, wherever built, and owned by an American citizen, is entitled to a custom-house document for protection, termed a passport, under the act of June 1, 1796; for it applies to "every ship or vessel of the United States going to any foreign country." As our registry acts do not declare void the sale or transfer, and every contract or agreement for transfer of property in any ship, without an instrument in writing, reciting at large the certifi-

cate of registry; and as they have not prescribed any precise form of indorsement on the certificate of registry, and rendered it indispensable in every sale, as was the case under the British statutes of 26 Geo. III. c. 69, and 34 Geo. III. c. 68, we are happily relieved from many embarrassing questions which have arisen in the English courts relative to the sale and mortgage of ships.

There have been great difficulty and some alternation of opinion in the English courts in the endeavor to reconcile the strict and positive provisions of the statute with the principles of equity, and the good faith and intention of the contracting parties. It has even been a question of much discussion whether the statutes of 26 and 34 Geo. III. had not destroyed the common-law right of conveying a ship by way of mortgage, like other personal property; and whether the mortgagee had not a complete title beyond the power of redemption after the transfer of the legal title according to the prescribed form of the indorsement on the certificate of registry. The language, in many of the cases, was in favor of the conclusion that there could be no equitable ownership of a ship distinct from the legal title, and that upon a transfer under the forms of the registry acts the ship becomes the absolute property of the intended mortgagee, and that the terms and the policy of the registry acts were incompatible with the existence of any equity of redemption. But these opinions or dicta have been met by a series of adjudications which assume the laws to be otherwise, and that the registry acts related only to transactions between vendor and vendee, and to cases of real ownership; and that an equitable interest in a ship might exist by operation of law, and by the contract of the parties, distinct from the legal estate; and that, notwithstanding the positive and absolute terms of the indorsement upon the certificate of register, a mortgage of a ship is good and valid, according to the law as it existed before the registry acts, provided the requisites of the statutes be complied with. The opinion of Sir Thomas Plumer, in *Thompson vs. Smith*, contained a very clear and masterly vindication of the validity of the mortgage of a ship consistently with the preservation of the forms of the registry acts. He effectually put to flight the alarming proposition that, since the registry acts, there could be no valid mortgage of a ship; and he insisted that the defeasance annexed to the bill of sale ought to be fully indorsed as part of the instrument on the certificate of registry, if the ship be mortgaged in port; or, if mortgaged while at sea, a copy of the whole transmitted to the custom-house; and that though the defeasance should not be noticed in any of the forms adhered to at the office of the customs, and the instrument should be registered as an absolute bill of sale, the mortgagor's right of redemption would not suffer by the omission. But as no such questions can possibly arise under the registry acts of Congress, these discussions in the English courts are noticed only as a curious branch of the English jurisprudence on this subject.

The registry is not a document required by the law of nations as expressive of a ship's national character. The registry acts are to be considered as forms of local or municipal institutions for purposes of public policy. They are imperative only upon the voluntary transfer of parties, and do not apply to transfers by act or operation of law. They are said to be peculiar to England and to the United States, whose maritime and navigation system is formed upon the model of that of Great Britain. But by various French ordinances, between 1681 and the era of the new code, it was requisite that all vessels, in order to be entitled to the privileges of French vessels, should be built in France, under some necessary exceptions, and should be owned exclusively by Frenchmen, and foreigners were prohibited from navigating under the French flag; and a Frenchman forfeited his privileges as such owner by marrying a foreign wife,

or residing abroad, unless in connection with a French house. The register is not of itself evidence of property, unless it be confirmed by some auxiliary circumstance to show that it was made by the authority or assent of the person named in it, and who is sought to be charged as owner. Without proof to connect the party with the register as being his direct or adopted act, the register has been held not to be even *prima facie* evidence to charge a person as owner; and even then it is not conclusive evidence of ownership. The cases of the *Mohawk Insurance Company vs. Eckford*, decided in the New York Court of Common Pleas in 1828, and *Ring vs. Franklin*, in the Superior Court of that city in 1829, went upon the same ground that the register, standing in the name of a person, did not determine the ownership of a vessel, though it might, perhaps, be presumptive evidence in the first instance. An equitable title in one person might legally exist consistently with the documentary title at the custom-house in another.—*KENT'S Comm.*, vol. iii. p. 196. See articles TONNAGE, SHIPPING, &c.

Relieving Tackles. Temporary tackles attached to the end of the tiller in bad weather to assist the helmsman; and in case of accident happening to the tiller ropes. They are also strong tackles from the wharf to which the ship is hove down, passed under her bottom and attached to the opposite side, to assist in righting her afterward, as well as to prevent her from oversetting entirely.

Report. In *Commercial navigation*, a paper delivered by the masters of all ships arriving from parts beyond seas to the custom-house, containing an account of the cargo on board, &c.

Repousse, or Chasing. The repoussed work of French silversmiths, which is equivalent to *chasing*, is a very remarkable mode of decorating gold and silver plate. It is effected entirely by the hammer. The workman has a plain flat sheet of silver to work upon, and before him is a carefully executed wax model of the article to be produced; the silver plate rests upon a soft bed of pitch or other composition, and with a small hammer the workman produces indentations over the surface corresponding with the device to be produced. A small steel punch is employed occasionally; and if any of the indentations are carried too far, the plate is reversed, and a little counter-hammering applied. Many of the shields, salvers, dishes, and other articles in the Great Exhibition, displayed fine examples of this kind of work; and there was an equestrian statue of Queen Elizabeth produced almost entirely by this remarkable process.

Reprisals. Where the people of one nation have unlawfully seized and detained property belonging to another state, the subjects of the latter are authorized, by the law of nations, to indemnify themselves by seizing the property of the subjects of the state aggressing. This is termed making reprisals; and commissions to this effect are issued from the Admiralty.—See PRIVATEERS.

Resin (Gr. *ῥητινη*; from *ῥεω*, I flow). A proximate principle common in the vegetable kingdom, the ultimate components of which are carbon, oxygen, and hydrogen. There are many varieties of resin. Their general characters are fusibility and inflammability; solubility in alcohol, insolubility in water. They are generally separable into two distinct portions by the action of cold and of hot alcohol. They are valuable as ingredients in varnishes, and several of them are used in medicine. They are often naturally blended with modifications of gum, in which case they constitute the series of *gum resins*. The specific gravity of the resins varies between 1.0 and 1.4. They become negatively electric by friction. The commonest resin in use, usually called *rosin*, is obtained by distilling turpentine: the volatile oil passes over, and the resin remains in the still.—See GUMS and OILS.

Respondentia, in *Commercial law*, signifies the

hypothecation of the cargo of a ship, on conditions similar to those upon which the ship and freight may be pledged—the latter being called a bottomry bond. The security of the cargo may, indeed, be given by the master of the vessel, in addition to that of the ship and freight, should the last two be deemed sufficient security by the lender of the money; but, notwithstanding the cargo may in this case form the principal part of the security, still such loan will be commonly said to be bottomry; and is more strictly on bottomry and respondentia. The right which a master possesses of thus pledging the cargo is undoubted, and is a natural consequence of the power which is invested in him of disposing of part of the cargo in case of extreme necessity, and which is to be exercised by him for the benefit, to the best of his judgment, of all concerned. The master of the ship is not, however, justified in selling the whole of the cargo, for that would defeat the object of the voyage which the repairs are intended to carry into effect; nor is he permitted to hypothecate the cargo without the ship, or without the ship and freight. A bottomry bond may include a respondentia bond, or they may be given separately. Generally all laws applicable to respondentia are equally so upon bottomry, but the reverse is not in all countries the case. By custom, the holder of the bottomry and respondentia bond after judgment first receives the freight and sells the ship, and, if those do not satisfy his claim and the expenses of legal proceedings, then to have recourse upon the cargo; but this course is not always imperative; he may sell the cargo, and leave the ship and freight. In such case the owners of the vessel are responsible for any loss which the owners of the cargo may sustain, over and above the proportion of general average charges on the cargo and the bottomry premium thereon.

A respondentia or bottomry bond is an assignable instrument, and is usually transmitted to an agent in the place named as the termination of the voyage, with legal authority for him to receive the money, or institute legal proceedings for enforcing payment. The general rule is, that the power of the master to give bottomry or respondentia bonds exists only after the voyage has commenced, and is to be exercised in some port where the owner does not reside. But it is not indispensable to the validity of a hypothecation that the ship and cargo be in a foreign port. The law looks more to the difficulty of communication between the master and owner. And a hypothecation may be made in another port of the same country, if communication with the owner is subject to great difficulty and delay. The bottomry or respondentia bond is to be paid before any prior insurance, and it supersedes a previous mortgage on the ship. If there is more than one bottomry bond, they take precedence in an inverse order to their dates. The last bond given is entitled to priority of payment over all others.

The position taken by Lord Mansfield, that the lender on bottomry or respondentia is not liable to contribution in case of general average, has been much and justly questioned. It is contrary to the maritime law of France, and of other parts of Europe, and in Louisiana there is a decision against it. It seems conclusive that if the lender on bottomry owes the preservation of the security of his money to any sacrifice of ship or cargo, he should contribute to a general average or jetsam.—See BOTTOMRY and RESPONDENTIA, and MARITIME LOANS. See also *KENT'S Comm.* vol. iii.; *PANSON'S Maritime Law*.

Revenue and Expenditure. Though not properly belonging to a work of this sort, we believe we shall do an acceptable service to our readers by laying before them the following comprehensive Table of the revenue and expenditure of the world, which we have compiled from LEONE LEVI'S *Commercial Law*. For an exhibit of the revenue and expenditure of the United States from 1789–1857, see article UNITED STATES.

REVENUE AND EXPENDITURE OF THE PRINCIPAL COUNTRIES IN THE WORLD.

Rivers,

Rhode Island, one of the United States of America, and the smallest State in the Union, being about 49 miles long and 29 broad, containing 1200 square miles, of which 130 is included in Narraganset Bay. Population in 1790 was 58,825; in 1800, 69,122; in 1810, 76,981; in 1820, 88,059; in 1830, 97,212; in 1840, 108,890; and in 1850, 147,645.

Early History.—The country round the Narraganset Bay and to the west of it is in the first old works and maps generally named *Narragansets*, or the *Narragansett Country*. The colonists at Plymouth discovered and entered this country already in the first years of the existence of their town. Roger Williams was the first settler in this territory. He and some other dissenters and refugees from Massachusetts founded here the towns of Providence, Newport, and Portsmouth. They united all in one government in the year 1648, under the name "Incorporation of Providence Plantations," or, as they are styled in King Charles First's patent of that year, "Incorporations of Providence Plantations in our Narragansett Bay, in New England." In the year 1655 Cromwell writes to this colony under the following address or title: "To our well-beloved inhabitants of Rhode Island, together with the rest of the Providence Plantations;" and this, I believe, is the first time that the name Rhode Island is applied to a greater extent of the territory of a province. As the name of an island it was, however, already for some time in existence.

Origin of the Name.—This island, the largest in Narraganset Bay, was called by the Indians Aquidday, or Aquednet, or Aquetneck, which is said to signify Garden Island. In the first volume of the *Colonial Records*, p. 120, in the proceedings of the General Court of Election, or General Assembly, March, 1644, is the following: "It is ordered by this Court, that the Island commonly called Aquetneck, shall be from henceforth called the Isle of Rhodes, or Rhode Island." Some ancient authors write the name "Island of Rhodes," and it has been suggested that the name was derived of the old Grecian island of this name. It is in this respect a curious fact that already the old French navigator Verrazano, the first modern explorer who touched this part of the American coast, pronounced the name of Rhodes in connection with this bay. He discovered in these waters an island (supposed by some to be the island now known as Martha's Vineyard), which he compares, in respect to size and appearance, to the island of Rhodes, in the Mediterranean. This was read in Hacklyt, and it is possible that John Clark and his companions (the first settlers on Aquetneck) took occasion from this circumstance to name their island. The name was afterward given to the whole country round Narraganset Bay, which also was sometimes called Rhode Island Bay. In the year 1663 the colonists of that country obtained from Charles I. a charter which incorporated their community under the name of the "Colony of Rhode Island and Providence Plantations." The Narraganset country, lying south of Warwick, was also sometimes called *The King's Province*. The present legal and official name is still *Rhode Island and Providence Plantations*, but commonly the name is made shorter, *State of Rhode Island*.—J. G. KOHL.

Physical Features, etc.—This State on the north and west is hilly and broken, but becomes gradually level toward the sea. The islands in Narraganset Bay are distinguished by their pleasing and diversified scenery and fertile soil. The climate is healthy, particularly on the islands, where the sea-breezes have the effect not only of mitigating the heat in summer, but moderating the cold in winter, and rendering the climate truly delightful. The rivers, though not large, furnish many fine mill seats, which are extensively used for manufacturing purposes. The principal are Pawtucket, Providence, Pawtuxet, Pawcatuck, and Wood Rivers. Narraganset Bay is a fine body of water,

and contains a number of beautiful and fertile islands. Among them is Rhode Island, which gives name to the State. Iron ore and anthracite coal are found to some extent; marble, limestone, freestone, and other building stone. There were in this State in 1850, 356,487 acres of land improved, and 197,451 of unimproved land in farms; cash value of farms \$17,070,802, and the value of implements and machinery \$497,201. **Live Stock.**—Horses, 6168; milch cows, 28,698; working oxen, 8189; other cattle, 9375; sheep, 44,296; swine, 19,500; value of live stock, \$1,532,687.

Agricultural Products, etc.—Wheat, 49 bushels; rye, 28,409; Indian corn, 599,201; oats, 215,232; barley, 18,875; buckwheat, 1245; peas and beans, 6840; potatoes, 651,029; value of products of the orchard, \$68,994; produce of market gardens, \$98,298; pounds of butter made, 995,670; of cheese, 816,508; maple sugar, 28 pounds; molasses, 4 gallons; beeswax and honey, 6847 pounds; wool, pounds produced, 120,692; flax, 85; hops, 277; hay; tons of, 74,818; clover seeds, 1928 bushels; other grass seeds, 3708 bushels; and were made 1018 gallons of wine; value of home-made manufactures, \$26,495; of slaughtered animals, \$667,486.

Manufactures, etc.—There were in the State in 1850, 153 cotton factories, with a capital invested of \$6,675,000, employing 4950 males and 5916 females, producing 96,725,612 yards of sheetings, etc., and 1,902,080 pounds of thread and yarn, valued at \$6,447,120; 45 woolen factories, with a capital of \$1,013,000, employing 987 males and 771 females, manufacturing 8,612,409 yards of cloth and 46,000 pounds of yarn, valued at \$2,381,825; 20 establishments, with a capital of \$428,800, employing 800 persons, and making 8558 tons of castings, etc., valued at \$728,705; 1 establishment, with a capital of \$208,000, employing 220 persons, manufacturing 2650 tons of wrought iron, valued at \$222,400; 29 flouring and grist mills, 51 saw-mills, 8 tanneries, 20 printing-offices, 5 daily, 2 semi-weekly, and 12 weekly publications. Capital invested in manufactures, \$12,923,178; value of manufactured articles, \$20,000,000.

The principal places in the State are Providence, city, Newport, each of which is alternately used as the capital, and Bristol. There were in September, 1857, 100 banks in the State, with a paid capital of \$21,000,000. There were built and in operation January, 1856, 145 miles of railroads; tonnage, 1853, 41,150 tons.

Principal Ports.—Newport is situated on the southwest shore of Rhode Island, twenty-eight miles south from Providence, and five miles from the ocean. The harbor is one of the best in the United States, and is well defended. Its site is beautiful, and of late years it has been much resorted to in the summer season. Its shipping is mainly employed in the whale fisheries and coasting trade; its manufactures are various, and of considerable extent. The tonnage of Newport in 1856 was 11,646 tons, and in 1857, 12,308 tons.

Providence, a city, and principal port of entry in Rhode Island, situated in lat. 41° 49' 22" N., long. 71° 24' 28" W. Providence has great commercial facilities, which have been well improved. The harbor is at the head of Narraganset Bay, thirty-three miles from the ocean, is spacious, and has sufficient depth of water for the largest ships. The tonnage of Providence was 19,305 tons in 1856, and in 1857, 22,943 tons.

Bristol, between Mount Hope Bay and Narraganset Bay, has a good harbor, and great facilities for navigation. The tonnage in 1856 was 2902 tons, and in 1857, 15,152 tons.

The public revenue of Rhode Island for the fiscal year ending April 30, 1857, was \$206,400; viz., direct tax, \$52,407; tax on banks, \$83,604; licenses of peddlers and auctioneers, \$6221; insurance companies, \$4820; from courts, \$10,118; interest, \$36,100; miscellaneous, \$14,634.

Nine months to June 30, and the fiscal year from this time being July 1.

Rhodes, a sea-port of Asiatic Turkey, capital of the island of Rhodes, at its northeast extremity, thirteen miles southeast the nearest promontory of Asia Minor. Lat. of mole 36° 26' 9" N., long. 28° 13' E. Population about 15,000, of whom 6000 are Turks, and 8000 Jews. On the northeast side two piers project to inclose a harbor, having in its centre from sixteen to eighteen feet water, and on its north side is another port of nearly equal depth.

Rhubarb (Du. *Rhubarber*; Fr. *Rubarbe*, *Rubarbe*; It. *Rabarbaro*, *Reo-barbaro*; Sp. *Rubarbo*; Russ. *Rewen*; Arab. *Rawend*; Chin. *Ta-hueng*), the root of a plant, a native of China and Tartary. Three varieties of rhubarb are known in the shops; viz., Russian, Turkey, and East Indian or Chinese rhubarb. The first two resemble each other in every respect. They are, in fact, the same article, being both derived from Tartary. The portion destined for the Petersburg market being selected and sorted at Kiachta, acquires the name of Russian rhubarb; while the portion that is sent from Tartary to Smyrna and other places in Turkey is called Turkey rhubarb. The best pieces only are sent to Petersburg; and according to the contract with the government, on whose account it is bought, all that is rejected must be burned; and that which is approved undergoes a second cleaning before being finally packed up for Petersburg. The best pieces of Russian and Turkey rhubarb are roundish, and perforated with a large hole, of a reddish or yellow color on the outside, and when cut or broken exhibit a mottled texture, and alternate streaks of red and gray. Its odor is peculiar, and its taste nauseous, bitter, and astringent. It should not be porous, but rather compact and heavy. East Indian or Chinese rhubarb is in oblong flat pieces, seldom perforated; has a stronger odor, and is more nauseous to the taste than the other; it is heavier, more compact, breaks smoother, and affords a powder of a

redder shade. — THOMSON'S Dispensatory; AINSLIE'S *Mat. Indica*, etc.

The palmetted rhubarb (*Rheum palmatum*) is a perennial native of Russia and some parts of Asia, whence the dried root is imported into this country for medicinal purposes. Large quantities of the roots are also annually collected for exportation in the Chinese provinces, within the lofty range of the Himalayas. The best is that which comes by the way of Russia, as greater care is taken in the selection; and, on its arrival at Kiachta, within the Russian frontiers, the roots are all carefully examined, and the damaged pieces destroyed. This is the fine article of the shops, improperly called "Turkey" rhubarb. That of the best quality occurs in small pieces, with a hole in the middle of each, made in the fresh root, to facilitate the operation of drying. The color is a lively yellow, streaked with white and red. Its texture is dense, and, when reduced to powder, it is entirely yellow. The Chinese rhubarb, called by the natives *Ta Hoangor Hainong*, is cultivated chiefly in the province of Cheseek. As imported, it is known by the name of "East Indian" rhubarb, and comes in larger masses, more compact and hard, heavier, less friable, and not so fine in the grain as the other, and having less of an aromatic flavor. This species has been introduced into England, where it has been extensively cultivated; and there is little doubt, therefore, of its proving perfectly hardy in many parts of our own country. Large quantities are annually imported, the cost of which might be saved if its culture were successfully presented here, and we might thus add to our productive resources. In the middle and cooler parts of the United States, the seeds may be sown in March, in a gentle hot-bed, and, when the roots are about an eighth of an inch in diameter, they may be carefully drawn up, preserving the tap-root, and planted in a fine, rich, and

deep soil, but not too much so, lest the roots become too fibrous. The largest specimens of this drug have generally been allowed to grow six or seven years; the roots are then very large, sometimes weighing from thirty to fifty pounds. The Chinese take up their rhubarb in winter. Pallin says that the Tartars take up theirs in April and May; but Forster, in his *History of Voyages in the North*, with more reason, affirms that the roots are dug up in winter, because they then contain the entire juice and virtue of the plant, as those taken up in summer are of a light, spongy texture, and unfit for use. In Tartary, after being thoroughly cleansed, and the small radicles cut off, the roots are cut transversely into pieces of a moderate size; these are then placed on long tables or boards, and turned three or four times a day, in order that the yellow, viscid juice may incorporate with the substance of the root. If this juice be suffered to run out, the roots become light, and of but little value; and if they are not cut within five or six days after they are dug up, they become soft, and rapidly decay. Four or five days after they are cut, holes are made through them, and they are hung up to dry, exposed to the air and wind, but sheltered from the sun. Thus in about two months the roots are completely cured. The loss of weight in drying is very considerable, seven parts in weight of the green root yielding only one part of that which is perfectly dry. The Chinese method is somewhat different. They peel the roots, cut them into slices, and dry them on stone slabs, under which fires are kindled; but as this process is not sufficient to dry them perfectly, they make a hole through each of the pieces, and suspend them on strings—some say exposed to the sun, while others assert that they are hung in the shade.

Rhumb, a circle on the earth's surface, making a given angle with the meridian of the place, marking the direction of any object through which it passes. The divisions of the compass card are called rhumbs.—See MERCATOR'S CHART.

Rhumb Line. In *Naval affairs*, the track of a ship which cuts all the meridians at the same angle; called also the *loxodromic curve*. This being the simplest curve, is the route universally pursued; but a ship sailing on this curve never looks direct for her port until it comes in sight. A great meridian circle would be the shortest distance between any two points; but in order to follow such a circle, the course of the ship would have to be constantly changing, and with such variations as to make it practically impossible.

Ribbons, or **Ribands** (Fr. *Ruben de Soie*; Ger. *Band*; It. *Nastro di Seta*; Sp. *Cinta de Seda*), a name given to silken bands of various widths and colors, much used by females for head-dresses and other purposes. They are both plain and figured, and are sometimes distinguished into sarcenet, satin, etc., according to the manner in which they are made. They are also frequently ornamented by having what is called a *pearl edge* given to them. Ribbons are woven in pieces, each 35 yards in length. The finest are made entirely of Italian silk; the next in quality, of a mixture of Italian and Bengal silk; and the commoner sorts, altogether of Bengal silk. The great seat of the manufacture of ribbons is Coventry, where they are now made of quality equal to the finest of the productions of the Lyons weavers: they are also made at Congleton, Derby, Macclesfield, Leeh, and other places.—See SILK.

Rice (Fr. *Riz*; It. *Riso*; Arab. *Arus*; Hind. *Chawl*), one of the most valuable of the cereal grasses, the *Oryza sativa* of botanists. It is raised in immense quantities in India, China, and most Eastern countries; in the West Indies, Central America, and the United States; and in some of the southern countries of Europe. It, in fact, occupies the same place in most intertropical regions as wheat in the warmer parts of Europe, and oats and rye in those more to the north.

Forming, as it does, the principal part of the food of the most civilized and populous Eastern nations, it is more extensively consumed than any other species of grain. It is light and wholesome, but is said to contain less of the nutritive principle than wheat. When rough, or in its natural state in the husk, it is called *paddy*. There is an immense variety in the qualities of rice. That which is principally exported from Bengal has received the name of *cargo rice*. It is of a coarse reddish cast, but is sweet and large grained, and is preferred by the natives to every other sort. It is not kiln-dried, but is parboiled in earthen pots or caldrons, partly to destroy the vegetative principle, so that it may keep better, and partly to facilitate the process of husking. Patna rice is more esteemed in Europe than any other sort of rice imported from the East. It is small-grained, rather long and wiry, and remarkably white. But the rice raised on the low marshy grounds of South Carolina is unquestionably very superior to any brought from any part of India. It may, perhaps, be worth mentioning that rice, like wheat, oats, and barley, is not indigenous to America. It was first raised in South Carolina from seeds brought from Madagascar, near the end of the 17th century. Its culture increased so rapidly that in 1724 no fewer than 18,000 barrels, or barrels, were exported.—PRINCE'S *Statistics*, 1835. According to the returns under the census of 1840, the total annual produce of rice in the United States was estimated at 80,841,422 lbs., whereas under the census of 1850 it was estimated at 215,812,000 lbs., or above 96,000 tons, of which 159,030,613 lbs. were raised in South Carolina; and in 1850, 213,540,000 lbs.

The produce of lands naturally or artificially irrigated is, as far as rice is concerned, from five to ten times greater than that of dry land having no command of water; and hence the vast importance of irrigation in all countries where this grain is cultivated. But it is worthy of remark that, owing to the not unfrequent occurrence of severe droughts, there is a greater variation in the crops of rice than in those of any other species of grain. Those who, like the Hindoos, depend almost entirely on it for subsistence, are consequently placed in a very precarious situation. There can be no doubt that famines are at once more frequent and severe in Hindostan than in any other country, Ireland excepted.

Cultivation in the United States.—Rice is the chief food, perhaps, of one-third of the human race; possesses the advantage attending wheat, maize, and other grains, of preserving plenty during the fluctuations of trade; and is also susceptible of cultivation on land too low and moist for the production of most other useful plants. Although cultivated principally within the tropics, it flourishes well beyond, producing even heavier and better filled grain. Like many other plants in common use, it is never found wild (it is to be understood that the wild rice, or water oat, *Zizania aquatica*, which grows along the muddy shores of our tide-waters, is a distinct plant from the common rice, and should not be confounded with it), nor is its native country known. Linnæus considers it as a native of Ethiopia, while others regard it of Asiatic origin. At the Industrial Exhibition in London there were displayed many curious samples and varieties of rice, grown without irrigation, at elevations of 3000 to 6000 feet on the Himalayas, where the dampness of the summer months compensates for the want of artificial moisture. At the exhibition above alluded to, American rice received not only honorable mention for its very superior quality, but the Carolina rice, exhibited by E. J. Heriot, was pronounced by the jury "magnificent in size, color, and clearness," and to it was awarded a prize medal. The jury were free to admit that the American rice, though originally brought from the Old World, is now much the finest in quality. The common variety is cultivated throughout

the torrid zone, wherever there is a plentiful supply of water, and will mature, under favorable circumstances, in the Eastern Continent, as high as the forty-fifth parallel of north latitude, and as far south as the thirty-eighth. On the Atlantic side of the Western Continent it will flourish as far north as latitude thirty-eight degrees, and to a corresponding parallel south. On the western coast of America it will grow as far north as forty or more degrees. Its culture is principally confined to India, China, Japan, Ceylon, Madagascar, Eastern Africa, the south of Europe, the southern portions of the United States, the Spanish Main, Brazil, and the Valley of Parana and Uruguay.

Rice was first introduced into Virginia by Sir William Berkeley in 1647, who received half a bushel of seed, from which he raised sixteen bushels of excellent rice, most or all of which was sown the following year. It is also stated that a Dutch brig from Madagascar came to Charleston in 1694, and left about a peck of paddy (rice in the husk) with Governor Thomas Smith, who distributed it among his friends for cultivation. Another account of its introduction into Carolina is, that Ashby was encouraged to send a bag of seed rice to that province, from the crops of which sixty tons were shipped to England in 1698. It soon after became the chief staple of the colony. Its culture was introduced into Louisiana in 1718, by the "Company of the West."

The present culture of rice in the United States is chiefly confined to South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas. The yield per acre varies from twenty to sixty bushels, weighing from forty-five to forty-eight pounds when cleaned. Under favorable circumstances, as many as ninety bushels to an acre have been raised. Another variety is cultivated in this country, to a limited extent, called Cochín-China, dry or mountain rice, from its adaptation to a dry soil without irrigation. It will grow several degrees further north or south than the Carolina rice, and has been cultivated with success in the northern provinces of China, Hungary, Westphalia, Virginia, and Maryland; but the yield is much less than that of the preceding, being only fifteen to twenty bushels to an acre. It was first introduced into Charleston from Canton, by John Bradly Blake, in 1772. The amount of rice exported from South Carolina in 1724 was 18,000 barrels; in 1731, 41,957 barrels; in 1740, 90,110 barrels; in 1747-'48, 56,000 barrels; in 1754, 104,682 barrels; in 1760-'61, 100,000 barrels; from Savannah in 1755, 2299 barrels, besides 237 bushels of paddy, or rough rice; in 1760, 8283 barrels, besides 208 bushels of paddy; in 1770, 22,120 barrels, besides 7064 bushels of paddy; from Philadelphia in 1771, 258,875 pounds. The amount exported from the United States in 1770 was 150,529 barrels; in 1791, 96,980 tierces; in 1800, 112,056 tierces; in 1810, 131,841 tierces; in 1820-'21, 88,221 tierces; in 1830-'31, 116,517 tierces; in 1840-'41, 101,617 tierces; in 1845-'46, 124,007 tierces; in 1846-'47, 144,427 tierces; in 1850-'51, 105,600 tierces.

PRODUCTION OF RICE IN THE UNITED STATES IN THE YEAR 1850.

State.	Rough Rice, lbs.
Alabama	2,312,292
Arkansas	65,179
Florida	1,076,000
Georgia	28,950,091
Kentucky	6,688
Louisiana	4,425,349
Mississippi	2,719,856
Missouri	790
North Carolina	5,465,868
South Carolina	150,990,618
Tennessee	268,854
Texas	38,203
Virginia	11,164
Total.	315,318,097

It will be seen from this table that South Carolina produced in 1850 75 per cent. of the total production, and Georgia 18 per cent.

STATEMENTS RELATIVE TO THE QUANTITY AND VALUE OF RICE EXPORTED ANNUALLY FROM 1831 TO 1850, INCLUSIVE.

Fiscal Year.	Barrels.	Tierces.	Value.	Average per Hectare.
1831	88,221	81,404,367	\$10,94	
1832	87,700	1,030,469	17 84

Of these exports, 1856-'57, there was exported from the following ports,

Boston	\$198,319
New York	795,009
Baltimore	195,053
Charleston	898,708
Savannah	138,137
Other ports	148,174
Total	\$2,290,400

Rice Paper. This substance is said to be a membrane of the *Artocarpus incisa*, or bread-fruit tree. It is brought from China in small pieces, dyed of various colors, and is used as a material for painting upon, and for the manufacture of several fancy and ornamental articles. It is sometimes erroneously stated to be prepared from rice.—See *PARAN*.

Richmond, city and port of entry, and capital of Henrico county, and of the State of Virginia, is situated on James River, at the falls, at the head of tide-water, and is in 37° 30' N. lat., and 77° 31' W. long. from Greenwich, and 0° 27' W. long. from Washington. It is 23 miles north from Petersburg, and 117 south by west from Washington. The population in 1800 was 5737; in 1810, 9785; in 1820, 12,067; in 1830, 16,060; in 1840, 20,153; in 1850, 27,670; and in 1851, 30,000. It is beautifully located on the west side of the river, between 50 and 60 miles above City Point, and 150 miles above the mouth of the river.

Four lines of railroad here connect, viz., Richmond, Fredericksburg, and Potomac; Richmond and Petersburg; the Central Railroad of Virginia; and the Danville Railroad; and here terminates the James River and Kanawha Canal. Vessels drawing 10 feet of water come to Rockets, about a mile below the centre of the city; and those drawing 15 feet, to Warwick, three miles below the city. The falls in James River are obviated by the canal, and above them it is navigable for boats 220 miles. Regular lines of packets connect the city with New York and other places, and it is connected by steamboats to Norfolk. The principal articles of exportation are wheat, flour, and tobacco. The exports amount to about \$3,000,000 annually. The tonnage of the port in 1853 was 11,460 tons. The manufactures of Richmond are also extensive.

Riding, in *Naval affairs*, is the state of a ship's being retained in a particular station by means of one or more cables with their anchors, which for this purpose are sunk into the bottom of the sea, etc., in order to prevent the vessel from being driven at the mercy of the wind or current. A rope is said to *ride* when one of the turns by which it is wound about the capstan or windlass lies over another, so as to interrupt the operation of wearing.

Riding Ahead, the position of a ship which lies across the direction of wind and tide, when the former is so strong as to prevent her from falling into the current of the latter.

Riding between the Wind and the Tide, the situation of a vessel at anchor when the wind and tide act upon her in direct opposition, in such a manner as to destroy the effort of each other upon her hull; so that she is in a manner balanced between their reciprocal force, and rides without the least strain on her cables. When a ship does not labor heavily, or feel a great strain when anchored in an open road or bay, she is said to ride easy. On the contrary, when she pitches violently into the sea, so as to strain her cables, masts, or hull, it is called *riding hard*, and the vessel is termed a *bad rider*.

Riga, a city of European Russia, the capital of Livonia, on the Duna, about 9 miles from the sea, lat. 56° 56' 5" N., long. 24° 0' 4" E. Population in 1842, excluding garrison, 60,000. A light-house has been erected on Fort Comet, on the western side of the mouth of the river. It has two lights: the first, elevated about 104 feet (English) above the level of the sea, may be seen, under favorable circumstances, at the distance of 4 leagues; and the second, elevated about 24 feet, may be seen at the distance of 2½ leagues.

The bar at the mouth of the river has usually from 12 to 13 feet water; and vessels drawing more than this frequently load and unload part of their cargoes by means of lighters at Bolderaa, a small town on the west side of the river, near its mouth. There is a fair-way beacon without the bar, in 5 fathoms water; and within, the channel is buoyed with black and white buoys; the black being left on the right or starboard side when entering, and the white on the larboard. Vessels bound for Riga take pilots at Bolderaa, who carry them to their anchorage. No ballast is allowed to be discharged, except at Poderaque. Regulations as to clearing, etc., similar to those at Petersburg.—*Coutier sur les Phares*, 2d edit.; and *Regulations published by the Russian Authorities*.

Trade.—Owing to its advantageous situation near the mouth of a great navigable river, the trade of Riga is very extensive; being of the Russian towns on the Baltic, in this respect second only to Petersburg. The trade is chiefly carried on by foreign merchants, particularly by the English. The principal exports are flax and hemp, linseed and hemp seed, timber, corn, tobacco, hides, wool, tallow, etc.; the imports are salt, sugar, coffee, and groceries of all sorts, herrings, indigo, dye-woods, cotton and cotton twist, silks, wines, etc. The most trade is extensive. The burghers of Riga send persons who are called *mast brokers* into the provinces to mark the trees, which are purchased standing. They grow mostly in the districts which border on the Dnieper, are sent up that river to a landing-place, transported 30 versts to the Duna, when, being formed into rafts of from 50 to 200 pieces, they descend the stream to Riga. The tree which produces the largest masts is the Scotch fir. Those pieces which are from 18 to 25 inches in diameter are called *masts*; under those dimensions, spar, or, in England, Norway masts, because Norway exports no trees more than 18 inches in diameter. Great skill is required in distinguishing those masts that are sound from those which are in the least internally decayed. They are usually from 70 to 80 feet in length. The best kind of flax shipped from Riga is grown in White Russia, and is called *Druna rakitzer*; its color is very white, and the threads long, fine, and loose, but it has sometimes black spots; the next quality, coming from the province of Trockie, in Lithuania, is called *Lithuanian rakitzer*, and is very little inferior to *Druna*, but its color is a little brown; of this kind the best sort is *Thiesenhausen*. The best kind of Courland flax shipped from Riga is *Marlenburg*; that grown in Livonia is inferior. There are two kinds of linseed; that of the last crop, which is used for sowing; and that of former years, for crushing. To prevent deception, the year of its growth is stamped on the barrel by sworn inspectors (*brackers*). Hemp seed is mostly shipped for Holland.

Money.—For the moneys of Riga, see *PETENBURG*.

Weights and Measures.—The commercial pound is divided into 2 marks, or 32 loth; and also into halves, quarters, etc. It contains 6482 English grains. Hence 100 lbs. of Riga = 92.17 lbs. avoirdupois = 41.8 kilog. = 86.32 lbs. of Hamburg = 84.64 lbs. of Amsterdam. The *lisponnd* = 20 lbs.; the *shippond* = 20 *lisponnds*. The loof is the measure for grain: 48 loofs = 1 last of wheat, barley, or linseed; 45 loofs = 1 last of rye; and 60 loofs = 1 last of oats, malt, and beans. According to Kelly, the loof = 1.9375 Winchester bushel; and, consequently, the last of wheat = 11.625 quarters. Kelkenbrecher does not value the loof quite so high as Kelly. The fuder, the measure for liquids, is divided into 6 ahms, 24 ankers, 120 quarts, or 720 stoofs. The anker = 10 English wine gallons. The foot of Riga = 10.79 English inches. The ell = 2 feet; the clafter = 6 feet.

Like most of the rivers falling into the Baltic, the Duna has a bar, varying, according to seasons, from 12 to 15 feet of water. Large vessels usually discharge and take in their cargoes either at the roads or in the Bolderaa harbor, near the mouth of the river,

Ring, an ornament of gold and silver, of a circular figure, and usually worn on the finger. The antiquity of rings is known from Scripture and profane authors. Judah left his ring or signet with Tamar. When Pharaoh committed the government of all Egypt to Joseph, he took his ring from his finger and gave it to Joseph. After the victory which the Israelites obtained over the Midianites, they offered to the Lord the rings, the bracelets, and the golden necklaces, and the golden ear-rings, that they had taken from the enemy. The Israelitish women wore rings, not only on their fingers, but also in their nostrils and their ears. St. James distinguishes a man of dignity by the ring of gold which he wore on his finger. At the return of the prodigal son, his father orders him to be dressed in a new suit of clothes, and to have a ring put upon his finger. The ring chiefly was used to seal with. The

patents and orders of princes were sealed with their rings or signets; and it was this that secured to them their authority and respect. The episcopal ring, which makes a part of the pontifical apparatus, and is esteemed a pledge of the spiritual marriage between the bishop and his Church, was used at a remote period. The fourth council of Toledo, held in 633, appoints that a bishop condemned by one council, and found afterward innocent by a second, shall be restored by giving him the ring, staff, etc.

Rio de Janeiro, the capital of Brazil, on the Atlantic, in lat. $22^{\circ} 54' 15''$ S., long. $48^{\circ} 15' 50''$ W. Population, 1,000,000. The harbor of Rio is one of the finest in the world, both as respects capaciousness and security for all sorts of vessels. In coming from the northeast it is usual to make Cape Frio, in lat. $23^{\circ} 1' 18''$ S., long. $42^{\circ} 3' 19''$ W., being about 4 leagues

nearly east of Rio. The entrance to the harbor is marked by a remarkable hill in the form of a sugar-loaf, 900 feet high, close to its west side; while on the east, or opposite side of the bay, at the distance of about 1 1/2 mile, is the fort of Santa Cruz. But the wood-cut in the preceding page, taken from a chart published by order of the Brazilian authorities, gives a much better idea of this noble harbor than could be obtained from any description.

Harbor.—Vessels bound for Rio, coming from the north, should, after rounding Cape Frio, steer due west, keeping about 8 leagues from the coast, until they come within 5 or 6 miles of the *Ilha Rasa*, or Flat Island, lying almost due south from the mouth of the harbor, at the distance of about 3 leagues. A light-house, the lantern of which is said to be elevated nearly 800 feet above the level of the sea, was erected on this island in 1829. The light is a revolving one, finishing its revolution in 3 minutes, and exhibiting alternately a white and a red light. There is also a light-house in the fort of Santa Cruz, the light of which is fixed, and elevated about 50 feet above the level of the sea.

—*Coutier sur les Phares*, 3d ed. Having got within 5 or 6 miles of the Ilha Rasa, ships may enter by day or by night, the dotted line in the cut marking the fair-way into the harbor. There are no pilots to be met with; and as there are no hidden dangers of any kind, their services are not wanted. On entering, vessels must pass within half of Fort Santa Cruz, to be ready to answer any questions that may be put to them. They then proceed to Fort Vilganhon, below or opposite to which they must bring to, or come to anchor, allowing no boats to come along side but those of the government until they have received *pratique*, when they will be permitted to proceed to the usual place of anchorage for the merchant shipping. The sea-breeze generally sets in about 11 A.M., and lasts till about sunset. It is strong enough to enable ships to overcome the ebb. High water at full, and change at 2 in the afternoon.

Anchorage Dues.—1. From and after 1st July, 1852, the anchorage duty upon vessels trading between foreign ports and the ports of Brazil will be reduced to 300 reis the ton; and the same class of duty now levied upon coasting vessels shall be abolished. 2. That part of the provisions of April 26, July 20, and November 15, 1844, which has not been altered by this decree will continue in force.

Money, Weights, and Measures.—All payments are made in paper money, which has been over-issued, and is excessively depreciated. But in ordinary cases the par of exchange may now be assumed at about 81d. sterling per patriotic dollar, of 1620 reis paper. Weights and long measures are the same as those of Lisbon, the arroba being 32 1/2 lbs. avoirdupois; but measures of capacity are different, a medida being equal to .6854 imperial gallon, and an alqueire to 1.11 ditto.

Trade.—The trade of Rio is extensive, and has increased rapidly of late years. It is now by far the greatest mart for the export of coffee. The shipments of this important article, which in 1830 amounted to 396,785 bags, have increased with such unexampled rapidity, that in 1848 they amounted to 1,710,707 bags, that is (taking the bag at 160 lbs.), or 278,713,320 lbs., or 122,193 tons; being about equal to all the exports of coffee from all the other parts in the world. It has not, however, been so large since. Sugar was formerly an important article of export from Rio, but latterly it has rapidly decreased, and only amounted to 5979 cases (13 cwt. each) in 1849. It is probable, however, that here, as in Cuba and other places, the late low prices of coffee may have produced a reaction in favor of sugar, the exports of the latter having risen in 1850 to 13,047 cases. The other great articles of export from Rio are hides, rice, tobacco, rum, tapioca, ipecacuanha, manioc or manihot, flour, and other inferior articles. The export of cotton has entirely ceased; and that of gold, diamonds, etc., is mostly clandestine. Diamonds are principally exported from Bahia. We subjoin an

ACCOUNT OF THE EXPORTS OF NATIVE PRODUCE FROM RIO DE JANEIRO DURING EACH OF THE SIX YEARS ENDING WITH 1852.

Years	Coffee.		Sugar.		Hides.		Horns.		Rosewood.		Leather.		Rice.		Rum.		Tobacco.		Ipecacuanha.		Tapioca.

The principal article of import consists of cotton goods, the value of which amounts to full one-third of the total value of the imports. Next to cottons are woolen, linen, and silk manufactures; wines, jewelry, and iron-mongery; flour, meat, fish, butter, and other articles of provision; spirits, salt, earthen-ware, paper, and a host of articles. The importation of ready-made furniture from the United States is also extensive.

About 56 per cent. of the entire commerce of Brazil passes through the port of Rio de Janeiro. Neither is conveyed, from all the ports on the coast, from Bahia almost to the frontiers of the Argentine Republic, all the produce intended for exportation or home consumption. Farina, beans, bacon, dried and salt meat, hides, horns, tallow, rice, tobacco, sugar, coffee, cotton—in a word, all the produce and manufactures of the different provinces are made tributary, either by land or water conveyance, to the wealth and commercial greatness of the Brazilian metropolis. A numerous fleet of vessels is employed in the coasting trade, in supplying the different ports along the coast with the various productions of the soil and industry of America and Europe. The chief foreign exports from Rio de Janeiro are—coffee (more than half of the whole going to the United States), sugar, cotton, hides, tobacco, otter skins, etc.

Tonnage employed in the trade of 1841: Total vessel, 1705, of 416,000 tons—of which, from and to the

United States, there were 289 vessels, of 77,000 tons. Tonnage, etc., of 1841, compared with that of 1840:

1841.....	1705 vessels:	416,000 tonnage.
1840.....	1640 "	399,200 "
Excess over 1840.....	65 "	16,800 "

The increase of the foreign commerce of Rio de Janeiro is better illustrated by the following returns:

COMMERCIAL MOVEMENT OF RIO DE JANEIRO IN 1846.

Countries.	Imports of Rio.	Exports from Rio.	Total France.
England and Possessions.....	52,900,000	24,230,000	77,130,000
United States.....	20,440,000	39,756,000	59,196,000
France.....	20,720,000	9,800,000	30,520,000
Hance Towns.....	5,020,000	13,330,000	18,350,000
Portugal.....	8,920,000	4,950,000	13,870,000
Spain.....	4,710,000	1,630,000	6,340,000
Switzerland.....	4,490,000	—	4,490,000
Belgium.....	2,670,000	4,320,000	6,990,000
L'ugway and La Plata.....	2,180,000	1,580,000	3,760,000
Sardinia.....	2,000,000	2,000,000	4,000,000
Sweden and Norway.....	1,740,000	2,710,000	4,450,000

Africa, Austria, Denmark, Turkey, Russia, the Two Sicilies, Prussia, Netherlands, Chili, and other countries, participate in this foreign trade to an extent ranging in value from 6,000,000 francs to 4,000,000 each, making the total trade for

1846.....	256,640,000 francs=	47,735,040 dollars.
1845.....	236,800,000 "	= 44,044,500 "
Increase over 1845.....	19,840,000 "	= 3,690,540 "

All foreign nations shared equally in the large augmentation which the returns of 1846 exhibit over those of 1845. Some of the causes that contributed to this increase have been already adverted to. The true cause, however, to which all others are but auxiliary, is the admitted capacity of Brazil to multiply her staple productions, particularly coffee, to the fullest extent of the foreign demand, if she will only avail herself of the abundant resources with which nature has so bountifully supplied her.

The quantity of coffee exported increased 23,764,000 kilogrammes (of 2.20 lbs. avoirdupois). Sugar, on the other hand, diminished 8,098,000 kilogrammes. The exports of coffee during the year 1846 were:

To	Quantity	Value
To England	89,000,000 kilogrammes	89,000,000
United States	"	83,000,000
Hanse Towns	"	10,000,000
Austria	"	5,000,000
France	"	4,000,000
Belgium	"	3,000,000
Sweden and Norway	"	2,500,000
Denmark	"	3,400,000
Portugal	"	1,500,000
Russia	"	1,900,000
Other countries	"	1,600,000
Total value	51,000,000 francs	108,000,000

The course of exchange, which varied from 813 to 374 reas per franc, ruled in 1846 at 835 reas per franc, or 18-6 cents—equal to 55 cents per 1000 reas. The following table gives the number of vessels, and their tonnage, engaged in the trade of 1848, with the countries whence they came:

Countries whence.	No. of Vessels.	Tonnage.
Brazilian ports	72	16,500
United States	866	28,600
England and Possessions	415	89,700
La Plata and Uruguay	197	45,500
Portugal	218	44,500
Africa	140	28,500
Hanse Towns	97	23,500
Spain	102	20,400
France	95	19,080
Austria	45	9,300
Belgium	85	9,000
Sardinia	83	6,700
Chili	28	5,850

Sweden and Norway	21	4,300
Other countries	80	17,400
Total in 1848	1977	440,640
Do. in 1845	1762	689,070

Tonnage to and from the United States in 1846: vessels 864, of 95,000 tons. Tonnage in 1848: vessels 328, of 73,900 tons. Increase in 1846 over 1843, vessels 83, tonnage 18,700.

SUMMARY OF THE TRADE OF RIO DE JANEIRO IN 1848.

Total imports..... 134,560,000 francs.
Total exports..... 134,080,000 "
Total imports and exports..... 268,640,000 "

Tonnage, etc. — Entered, 213,900 tons; cleared, 191,200 tons; total, 405,100 tons, of which from and to the

United States	89,000 tons.
Great Britain	65,000 "
Portugal	47,000 "
France	18,400 "
Other countries	188,700 "
Total	405,100 "

Course of exchange at Rio de Janeiro in 1848: 359 reas per franc, or 50 cents (nearly) per milrea.

The navigation of the port of Rio de Janeiro in 1851 is exhibited in the following table:

ARRIVALS.		
Arrivals from foreign Ports.	Vessels.	Tons.
With cargo for port	847	237,667
Other destinations	51	16,158
On way to California	23	10,428
In ballast for foreign countries	107	49,715
In ballast for home ports	17	5,479
Total in 1851	1215	319,847
Total in 1850	1080	294,616

DEPART. URS.

Clearance to foreign Ports.	Vessels.	Tons.
With products of country	805	188,239
With foreign products	11	87,427
For California	6	2,488
In ballast for foreign countries	78	83,490
In ballast for home ports	80	86,063
Total in 1851	1180	434,666
Total in 1850	1080	396,671

The leading articles imported in 1851 were as follows: Cottons, 42,560, woolens, 5488, linens, 5695, silks, 1088, and mixed goods, 1263 packages; codfish, 54,602 quintals; coals, 42,007 tons; ale and porter, 23,704 barrels; flour, 283,893 barrels; candles, sperm, 90, composition, 6052, and tallow, 26,561 boxes; wines, Portugal, 14,083, Mediterranean, 7644, and Bordeaux, 4421 pipes; butter, 25,561 firkins; cordage 480 coils, etc. The produce of the country exported in the same year consisted of: Coffee, 2,033,743 bags; hides, 147,296; sugar, 7824 cases; rum, 3892 pipes; rice, 8229 bags; horns, 266,949; tobacco, 26,755 rolls of 96 lbs. each; rosewood, 36,547 pieces; half-tanned hides, 12,744; tapoca, 17,737 barrels, etc. The arrivals coastwise in 1851 were 1935 sail vessels, and 359 steamers, with an aggregate of 221,647 tons; and the departures were 1863 sail vessels, and 880 steamers, with an aggregate of 225,002 tons. The total imports and exports of the empire in 1851 exhibit an increase of 33 per cent. over the average of the four preceding years. Could Brazil be induced to abolish the heavy export duties which she so largely on her staple productions, the increase would very much exceed this figure. The article of coffee alone would in a short period fully make up for any deficiency in her revenue caused by the abolition of these duties, in the increased demand for that article for foreign markets. Besides, the stimulus which would in consequence be imparted to that branch of agricultural labor would present an incidental benefit which could hardly escape the observation of a sagacious legislator.

The subjoined figures show the amount of export duties levied at Rio de Janeiro from 1846 to 1851. [Milrea = 55 to 56 cents United States currency.]

1846-47	3,966,000 milreas.
1847-48	4,118,000 "
1848-49	8,284,000 "
1849-50	3,780,453 "
1850-51	4,706,696 "

For many years the United States occupied the first rank in the navigation of Rio de Janeiro. It will be perceived from the preceding table that England claims the precedence in 1854, a fact which is attributed to the falling off in that year in the importation of flour from the United States. The new line of steamers, established in 1853 between Liverpool and Rio de Janeiro, touching at the same places as the Southampton line—namely, Lisbon, Madeira, Teneriffe, St. Vincent, Pernambuco, and Bahia—notwithstanding, the fears as to its success, continued, in 1854, its monthly service with activity and profit. Besides these two lines of steamers, a company, composed of Brazilian and Portuguese merchants, has established a line between Lisbon and Rio, touching at the same points; but this line had in 1854 but one steamer in service, the voyages of which, however, proved very successful.

The port of Rio de Janeiro is becoming yearly more important as the centre of South Atlantic commerce. The number and tonnage of vessels which entered in 1855 were augmented a third when compared with 1845, and more than a half over the number and tonnage of vessels in 1835. From 1850 to 1854 the average increase during the five years was nearly a fifth. The following statement exhibits this progressive movement:

Years.	Vessels.	Tons.
1835.....	572	184,012
1845.....	878	158,949
Average 1850-'54.....	1,285	214,238
1855.....	1,285	389,872

These figures exhibit the results of foreign navigation only. The coasting trade is shown as follows:

Years.	Vessels.	Tons.
1835.....	1219	118,117
1845.....	2042	168,873
Average 1850-'54.....	2390	230,238
1855.....	3068	318,220

The employment of steamboats in the navigation of Rio de Janeiro is yearly extending. In 1845 the number of steamboats engaged in the trade of the port of Rio was 239. In 1855 the number reached 431. Fourteen companies, owning thirty-nine steamboats, with an aggregate of 2428 horse power, keep up the communications between Rio de Janeiro and the other maritime towns of the empire. There are also four tow-boats, with an aggregate of 187 horse power. The following tabular statement exhibits the value of leading importations into Rio de Janeiro in 1854:

1st.—MERCHANDISE.	
Liquors, wines, tea, &c.....	17,000,000 francs.
Provisions, flour, butter, &c.....	24,000,000 "
Lamp-oil, fat, tallow, &c, &c.....	4,000,000 "
Hatters' wares, dry goods, lace, fancy wares, &c.....	9,000,000 "
Tissues of cotton.....	31,000,000 "
" " wood.....	7,000,000 "
" " iron.....	5,000,000 "
" " paper, books, &c.....	4,000,000 "
Skins and leather, shoes, &c., saddlery, &c.....	4,000,000 "
Iron wares, willow wares, woods, furniture, &c.....	8,000,000 "
Pottery wares, porcelain, &c.....	3,000,000 "
Watches, jewelry, hardware, &c.....	10,000,000 "
Coal, metals, manufactured and wrought, &c.....	11,000,000 "
Salt-petre, powder, arms, sea-stores.....	5,000,000 "
Sundries.....	19,000,000 "

2d.—COUNTRIES FROM WHICH IMPORTED.	
AFRICA.....	350,000 francs.
AMERICA:	
United States.....	18,000,000 "
Buenos Ayres.....	1,400,000 "
Montevideo.....	1,000,000 "
Chili.....	700,000 "
CENTRAL EUROPE:	
England and Possessions.....	56,000,000 "
Austria.....	2,000,000 "
Belgium.....	5,000,000 "
France.....	32,000,000 "
Switzerland.....	4,000,000 "
SOUTHERN EUROPE:	
Spain.....	5,000,000 "
Portugal.....	14,000,000 "
Sardinia.....	5,000,000 "
Sicily and Naples.....	400,000 "
Turkey and Levant.....	300,000 "
NORTHERN EUROPE:	
Holland.....	1,300,000 "
Hanse Towns.....	12,000,000 "
Denmark.....	5,000,000 "
Sweden and Norway.....	5,000,000 "
Prussia.....	1,700,000 "
Fisheries.....	100,000 "
Other places.....	4,000,000 "

As regards the export trade of Rio de Janeiro in 1854, the returns at hand are not so minute. Of coffee, however, the chief article of export from the Brazilian market, there were exported this year 1,987,632 bags, weighing an aggregate of 318,021,120 lbs., of which 899,900 bags, or 143,984,000 lbs., were sent to the United States. The quantity exported the previous year was 1,637,663 bags, or 262,026,080 lbs. The quantity of sugar exported was less than that of 1853—namely, 5905 hhd. and 1739 barrels.

The following *resumé* exhibits the total results of 1854:

	Imports.	Exports.	Total.
Value in 1854.....	171,000,000	167,000,000	338,000,000
Value in 1853.....	104,000,000	101,000,000	325,000,000
Increase in 1854.....	7,000,000	6,000,000	13,000,000

The total flour imports at Rio for 1856 were 317,404 barrels, of which 301,729 barrels were from the United States. Of this amount 151,716 barrels were shipped coastwise or re-exported after reaching Rio.

Total import, 1857.....	317,404
Stock in all hands January 1, 1856.....	80,800
Shipped coastwise and re-exported, 1856.....	151,716
Stock in all hands January 1, 1857.....	61,000
	211,716

Consumption of 1856..... bbls. 185,687

The imports of flour from all sources last year exceeded those of the preceding year 16,536 barrels, while the imports from the United States show an increase for the same period of 74,423 barrels. In fact, the tables for ten years show a somewhat irregular but decisive transfer of the flour trade almost entirely to the hands of the United States.

The total exports of coffee from Rio for the year 1856 show as follows:

To the United States.....	1,169,181 bags.
To Europe.....	880,885 "
To other points.....	49,120 "
Total.....	2,099,186 "

Exports of 1855.....

To the United States.....	1,139,135 bags.
To Europe.....	1,242,826 "
Elsewhere.....	24,848 "
Total.....	2,406,809 "

Exports of 1854.....

To the United States.....	891,705 bags.
To Europe.....	1,064,682 "
Elsewhere.....	37,319 "
Total.....	1,993,706 "

The total exports of sugar for 1856 were: Cases, 2364; barrels, 25,981; showing a decrease from the preceding year of 2361 cases and 12,155 barrels. The export of hides for 1856 was 64,861 pieces, showing a large decline from the two preceding years.

Of the coffee exports to the United States in 1856,

Baltimore received 188,011 bags; New York, 562,248; Philadelphia, 91,985; Boston, 5001; and New Orleans, 404,502.

The foreign commercial arrivals in 1856 number 1050 vessels, of 335,886 tons, of which thirty-two were from Baltimore, thirty from New York, twenty-eight from Richmond, fifteen from New Orleans, fourteen from Boston, eleven from Philadelphia, two from Charleston, two from the Rio Grande, and one from Wilmington. The number of foreign departures in 1856 was 995 vessels, of 426,908 tons, of which 640 were with produce, 34 with foreign merchandise, 140 with their inward cargoes, and 182 in ballast proceeded to other ports of the empire. The coasting trade outward was conducted, exclusively of 803 steamboats, by 2276 vessels, of 253,736 tons burden. The coasting trade inward was conducted by 2222 sailing vessels and 805 steamboats, of 276,997 tons.

The revenue collected at the custom-house of Rio exhibits an increase corresponding with that of the import trade of this port. This is shown by the following comparative statement of receipts:

1855	3,588,000 milreas.
1845	8,048,000 "
1856	13,071,000 "

The last year (1856) does not exhibit the maximum. This was reached in 1852, the amount that year exceeding 14,775,600 milreas, or over \$7,000,000.

Immigration.—The immigration returns of Rio furnish the following statistics:

Year.	Entered.	Departed.
1851	9,585	1544
1852	6,870	1987
1853	9,645	1981
1854	8,673	1773
Aggregate	34,773	7181
Annual average	8,693	1796

The immigrants are very generally Portuguese,

who are employed in the mechanic trades, in commercial pursuits, as domestics, etc. Some hundreds are sent to the new colonies, where they constitute almost the only aid which Brazilian agriculture receives annually from foreigners. There arrived in 1851 and in 1852 a large number of German settlers, engaged in Europe by the agents of the colonial directors. On their arrival these colonists became dissatisfied, and hence German immigration has almost entirely ceased. In 1861, there arrived of this class of immigrants 2958 persons; in 1852, 1347 persons; in 1853, 349 persons; and in 1854, only 295.

General Remarks.—On the 80th of April, 1854, the first railroad in Brazil was thrown open to the public, the inauguration taking place in the presence of their Imperial Majesties, and an immense concourse of the leading personages of the empire. The general navigation and commerce of the southern provinces, as well as the general trade between them and the United States, are decreasing; owing, it is alleged, to the settlement of the difficulties that existed on the River Plata. The more liberal tariff, both on imports and exports, attracts a large bulk of the trade of these provinces to that quarter. A treaty between the United States and Brazil is regarded as the only means of promoting the general commerce and navigation between the two countries. There exists no commercial treaty between the United States and Brazil; but Brazilian vessels, with their cargoes, are admitted on an equal footing with vessels of the United States as respects tonnage and import duties, and all other charges.

The ports of Brazil open to direct foreign trade are: Para, Maranhim, Pernambuco, Fortaleza (Ceara), Amaty (Ceara), Rio Grande North, Parahiba, Pernambuco, Maceyo (Alagoas), Lanageiras (Sergipe), Bahia, Espirito Santo, Rio de Janeiro, Santos, Parangan, St. Catherine, Rio Grande, Sao Borja (R. G. South), Porto Alegre (R. G. South).

COMMERCE OF THE UNITED STATES WITH COAST OF BRAZIL AND DEPENDENCIES, FROM OCTOBER 1, 1820, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Anchorage Dues.—300 reas (about 16½ cents) per ton of Brazilian measurement. Vessels arriving and departing in ballast pay only half anchorage; and those calling merely for supplies are exempt from anchorage duty. Vessels which make more than two voyages to ports of Brazil during a twelvemonth are exempt from the payment of anchorage dues on all voyages over that number within the same year; vessels, therefore, pay no more than 600 reas annually (33½ cents), be the number of voyages what it may. For passports to leave, from 4 to 8 milreas (from \$2 22 to \$4 44); for pilotage inward 80 milreas (\$16 67), but no obligation to take pilots inward; for pilotage outward 70 milreas (\$38 88), and for canoe-hire, 6 milreas (\$3 33). No vessel is allowed to leave port without a pilot, nor to get under weigh after sunset, or before sunrise. Hospital money, 4 milreas on the vessel (say \$2 22), and 640 reas (or about 36 cents) for each of the crew. The charge for stamps varies, being not less than \$1. A consular return from Pernambuco, under date of January, 1855, gives each specific item of charges upon an American bark of 200 tons burden which entered that port laden with flour, and leaving with a cargo of sugar. The total, inward and outward, including the charges for lightorage, labor, craneage, etc., which are not on government account, amounted to \$571 45. Of this there was paid on government account \$192 45—the remainder belonging to the other class of charges.

Tariff.—The market prices in Brazil are taken as the basis for the duties imposed by the present tariff. The dispatch by invoice will take place when the goods imported have no fixed duties in the tariff, or when they are subject only to a tax for warehousing and clearing out.

For the dispatch of goods subject to *ad valorem* duties the merchant or consignee is obliged to show a declaration stating the prices of his goods, and the original invoice duly certified. In want of the original invoice may be presented two certificates by two brokers, or, in the absence of brokers, of two merchants of the place, showing the current prices of the goods.

The value of the goods subject to *ad valorem* duties will be that of the Brazilian market, as before said; deductions made of the respective duties, or the value of the original invoice, with the addition of 10 per cent.—*United States Com. Relations.*

Remarks on the Trade of Brazil.—This vast empire comprehends the great eastern section of South America. Its length from north to south is computed at about 2600 miles, and its greatest breadth at 2540 miles. The entire area comprises about 2,973,400 square miles, or over ten times the area of Texas, and about seventy times that of Portugal. The climate is generally favorable to agricultural pursuits, the soil being fertile, and in many parts of the empire, particularly in the provinces, abounding with valuable mineral resources. The staple productions of Brazil are such as must necessarily attract an extensive foreign trade; though it is stated that anterior to 1809 she had no direct intercourse with other nations—the mother country, under the policy which dictated her colonial system, excluding from the ports of her extensive colony all foreign flags. The dangers which menaced, and the domestic troubles which agitated Portugal at this period, resulted in the flight of the royal family to Brazil. With the court were introduced new tastes, new ideas, and a more liberal policy in regard to foreign intercourse. The ports of Brazil were at once opened to foreign commerce, and since that period the culture of the staple productions has kept pace with the increased demands of foreign markets. The great staple of Brazil is coffee, though vegetables, fruits, wheat, barley, rice, maize, and tobacco are extensively produced in the southern or temperate provinces; while within the tropics the chief productions are mandioc, rice, bananas, plantains, beans, sweet potatoes, coffee, sugar, cotton, and cocoa—the last four for

exportation. The forests supply the very best timber for ship-building, and almost every variety of wood for cabinet-work and dyeing purposes; among the latter, Brazil-wood, rosewood, and Campeachy-wood are important articles of commerce. Travelers who have minutely explored the interior of Brazil describe no less than 219 varieties of timber, and many of them largely enter into the commercial resources and domestic wealth of that empire. Since the acknowledgment of its independence, the commercial regulations of Brazil have been marked by a spirit of liberality and of freedom from unnecessary and exclusive restrictions. The duties on imports and exports are based upon the valuation principle, and are designed solely with a view to supply the necessary revenues for the support of the government; and the port, pilot, and other navigation charges seldom exceed the actual requirements of a just and liberal intercourse with foreign nations. Indeed, the commercial policy of Brazil seems eminently adapted to a country of such boundless extent and so sparsely populated, as labor is sure to find a remunerative reward, in whatever mode it may seek to develop the exhausted resources of the empire, in the free competition to which it invites the enterprise and exchanges of foreign nations. The entire population amounts to about six millions—being two persons to the square mile; of which at least three-fifths are blacks. The commercial treaties negotiated by the government of Brazil with foreign countries are generally based upon the principle of reciprocity. That with the United States was concluded December 12, 1828, and established between the two countries freedom of commerce and entire reciprocity of trade and navigation—certain special favors being reserved to Portugal, owing to the former relations between that country and Brazil. This treaty contained the usual stipulation requiring twelve months' notice to be given by either party desiring to terminate the same; and such notice having been given by the government of Brazil, and the twelve months having expired, the treaty is no longer of force. The commercial relations between the two countries were, however, placed upon a footing of similar reciprocity to that guaranteed by the treaty, by virtue of the proclamation of the President of the United States, bearing date November 4, 1847, issued conformably to the provisions of an act of Congress passed on the 24th day of May, 1828.

As the trade between the two countries is placed much on the same footing of reciprocity as that guaranteed by the treaty, it is deemed not irrelevant to present a synopsis of the provisions of that treaty, so far as they relate to commerce.

The contracting parties are placed on the footing of the most favored nation in respect to commerce and navigation, the relations between Portugal and Brazil excepted. Free commercial intercourse, on the basis of perfect equality and reciprocity between the citizens and subjects of the two countries, is established, the coasting trade being reserved by each government to its own flag. The vessels of both countries are placed on the same footing in the ports of each, as to the importation, exportation, or re-exportation of foreign goods, from or to any foreign country; the United States agreeing to consider a vessel as Brazilian when the proprietor and captain are subjects of Brazil and the papers are in legal form. The contracting parties agree that no higher or other duties shall be imposed on the importation of any articles, the produce or manufactures of either country, into the ports of the other, than are or shall be payable on the like articles, being the produce or manufactures of any other foreign country; and export duties shall be the same in each to the ports of the other as when the articles are exported to any other foreign country. It is agreed that it shall be wholly free for all merchants, commanders of ships, and other citizens or subjects of both countries, to manage themselves their own business in all the ports

and places subject to the jurisdiction of each other, as well with respect to the consignment and sale of their goods and merchandise by wholesale or retail, as with respect to the loading, unloading, and sending off their ships; they being in all these cases to be treated as citizens or subjects of the country in which they reside, or, at least, to be placed on a footing with the subjects or citizens of the most favored nation. Vessels in distress, pursued by pirates or enemies, etc., belonging to either of the contracting parties, to be received and protected in the ports, rivers, bays, etc., of the other.

Foreign Commerce of Brazil.—From official documents, it appears that of the whole commerce of Brazil, Rio de Janeiro holds 56 per cent.; Bahia 12 per cent.; Pernambuco 12 per cent.; Alagoas, Santo Paulo, and Santo Pedro do Sul, 8 per cent.; Para, Maranhão, and Santa Catarina, each 4 per cent. The species of merchandise which constitutes the leading imports into Brazil are cottons; of which Rio de Janeiro, Bahia, and Pernambuco usually receive in value about \$47,000,000; woollens about \$10,000,000; silks, \$8,000,000. After these rank next in commercial importance provisions, flour (the great bulk of which comes from the United States); wines and other liquors; metals, crude and manufactured; watches, jewelry, arms, ammunition, etc. etc. The principal exports are coffee (which is shipped from Rio) and sugar, (principally from Bahia and Pernambuco). Full a moiety of the former goes to the United States, and the latter chiefly to England, Trieste, and the Hanse Towns. The precious metals next follow in the rank of exports; then diamonds, skins (otter), hides, cotton, and tobacco. The two last, as well as sugar, though not to so great an extent, are either stationary or declining, as respects the quantities annually exported.

The following comparative statements give the figures for two years, 1851 and 1852:

	1851.	1852.
Imports.....	\$32,300,000	\$34,200,000
Exports.....	\$1,920,000	\$2,680,000
Total.....	\$34,220,000	\$36,880,000

The proportion which the United States had in the trade of these two years, appear as follows: Exports, 1851, 29 per cent.; 1852, 37 per cent. Imports, 1851, 12 per cent.; 1852, 9 per cent.

Fiscal Years.	Imports.		Exports.		DUTIES OF				Total.
	Reas.	Spec.	Reas.	Spec.	Navigation.	Internal and Extraordinary.	Reas.	Spec.	
1842-50.....	17,890,920/000	3,789,433/000	3,455,990/000	2,125,311/000	2,125,311/000		24,081,970/000		24,081,970/000

At the port of Rio Janeiro in 1851-52.....	14,074,900/000	2,655,648/000	282,845/000	1,733,347/000	1,733,347/000		15,667,744/000		15,667,744/000

Coffee.—Coffee is the leading staple of Brazil. Formerly, and for many years, San Domingo was the source from which Europe derived its supplies of this article—the quantity exported from that island at one time having reached as high as 77,000,000 lbs.; and had not the revolution broken out in 1792, it was estimated that there would have been exported that year about 84,000,000 lbs. That event, combined with other obvious causes, produced a total cessation in the supplies from this source. Being driven from St. Domingo, the culture of coffee at once became a leading branch of industry in Cuba, Jamaica, Surinam, and Java, and was at a subsequent period introduced with much success into Brazil. After the flight of John VI. from Portugal to Brazil, in 1808-9, the port of Rio de Janeiro was opened to foreign trade, and coffee soon became one of the leading staples of export. At that period the annual crop did not exceed 30,000 bags, or 4,800,000 lbs. In 1820 it reached as high as 100,000 bags, or 16,000,000 lbs. In 1817 and 1821 the supply was so small, that in the market of London it rose as high as 37½ cents per lb. This of course stimulated its cultivation in Brazil. The ruin of San

The French official report, from which the preceding summary is derived, states that there were received from the United States 230,000 barrels of flour, and from Europe 80,000 barrels; of which 15,000 barrels were shipped from Marseilles, and the remainder from Trieste and Antwerp. Butter, salt, dried beef from the Plata, gin, dried and preserved fruits, fish-oil, linseed oil, &c., maintained the figures of the preceding year; but in the articles of beer, soap, wax and other candles, tea, and codfish, there was a diminution. The following statement shows the relative share assigned to each country in the general importation of 1852:

	Imports.	Exports.
Great Britain.....	38,100	12,000
France.....	18,100	14,000
United States.....	11,100	35,000
Germany, Belgium, Holland, and Switzerland.....	19,100	25,000
Portugal, Spain, and Italy.....	12,100	13,000

The following tabular statement will be interesting as exhibiting the custom-house revenues of Brazil for the periods designated, and the sources whence derived. The present value of the reas in United States currency is, 1000 reas or 1 milrea=55 cents.

Domingo transferred, also, the culture of indigo to British India, and its culture was at the same period abandoned in Brazil. Previously to the revolution in Hayti there was exported from that island 76,835,219 lbs.; in 1818 the exports fell to about 25,000,000 lbs.; and now they do not exceed thirty-five or forty millions. In 1804, the year in which the emancipation act went into effect, Jamaica exported to England 18,268,888 lbs. of coffee; five years later, the quantity had fallen to 9,423,197 lbs. The decline in the cultivation of coffee in this island, and the unrestricted supply of African slave labor in Brazil, combined to give a powerful impulse to its culture in that empire. Hence, in 1830, the crop reached as high as 400,000 bags, or 61,000,000 lbs. The coffee-growing districts in Brazil are divided into Serra Abaixo (below the mountains) and Serra Acima (above the mountains). The cost of transporting the coffee from the plantation to market is about 2 cents per lb.; and the actual cost of production is stated to be about 4½ cents per lb. The quantity produced in the empire, year by year, is not officially ascertained; but it has been approximated with sufficient exactness for practical purposes.

The exportations of cotton from Braziil in 1843-'44 and 1853-'54 are stated by Brazilian official authorities as follows:

In 1853-'54.....	98,420,820 pounds.
In 1843-'44.....	26,066,100 "
Increase in ten years.....	2,364,160 "

In 1851-'52 the exportation amounted to 31,983,050 lbs., of which quantity Great Britain received 26,881,201 lbs., Spain 2,291,578 lbs., Portugal 1,896,286 lbs., and France 889,048 lbs. Of the total exportations in 1852-'53, Great Britain received, as appears from the same authorities, 22,675,122 lbs., Spain 2,351,279 lbs., Portugal 2,673,766 lbs., and France 548,611 lbs. The exports to Great Britain from Brazil began in 1781; and from that period to the present time the large bulk—at least four-fifths—of Brazilian grown cotton goes to that kingdom.—*Comm. Rel. U. S.*

The commerce of Brazil has sustained great injury from the wretched state of the currency and of the finances; the value of the former, which consists almost wholly of paper, being excessively depreciated and liable to extreme fluctuations, and the revenue being inadequate to meet the expenditure. Latterly, however, vigorous efforts have been made to increase the revenue; and it is hoped that in the event of the finances being placed on a better footing, measures may also be taken to improve the currency. We subjoin an account of the debt, etc., of the empire in 1851:

Foreign debt.....	£6,157,000
Local funded debt, 62,370,000,000 reis, at exchange 24d.....	7,540,000
Treasury bills amounting about 2,000,000,000 reis, at exchange 24d.....	240,000
Estimated amount of notes in circulation (paper money) throughout the empire, 54,000,000,000 reis.....	6,700,000
	£21,667,000

or, in round numbers, the debts and liabilities of Brazil may be stated at £20,500,000 sterling. The foreign capital in the empire is computed to be about £10,000,000 sterling.

"The quantity of precious stones shipped is now very considerable. In most cases they are sent to a losing market; being, in fact, more valuable in Brazil than in London or Paris. Aquamarines (*see* *BNZYL.*) of a very large size have been found. In January, 1811, one was found in the Biberão das Americanas, near the diamond district, which weighed 15 lbs.; and in the same place, in the October following, one was discovered weighing 4 lbs. Topazes of fine quality, but seldom large, amethysts and chrysolites, are also articles of exportation; and at times some fine specimens of these gems are to be met with in the jewelers' shops. Correctly speaking, there are no trading companies in Rio de Janeiro; there is a society for effecting maritime assurances, but no other. The Bank of Brazil has had very extensive concessions made in its favor, and ought to be in a flourishing state. It has power of issuing notes; and all disputed moneys and property of the deceased and absent (*mortuos e ausentes*) must be placed in its hands, and 2 per cent. per annum charged for the care and trouble. This, in addition to the interest which might be obtained for the deposit, would alone, in an active mercantile country, form no inconsiderable revenue. Specie is prohibited from being carried coastwise; merchants who wish to deposit cash in one of the northern ports, where the largest purchases are made, are therefore forced to take hand bills, and pay a premium for them, varying from 3 to 5 per cent. Some enormous capitals have been amassed; but generally the speculations of the native merchants are conducted on a very limited scale. The legal rate of interest is 6 per cent.; but money can seldom be obtained under 12."—*CALDLEIGH'S Travels in South America*, vol. 1, p. 53-59.

River. A river is a current of fresh water flowing in a bed or channel from its source to the sea. The term is appropriated to a considerable collection of

waters formed by the conflux of two or more brooks, which deliver into its channel the united streams of several rivulets, which have collected the supplies of several rills trickling down from numberless springs, and the torrents which carry off from the sloping grounds the surplus of every shower.

Rivers form one of the chief features of the surface of this globe, serving as voiders of all that is immediately redundant in our rains and springs, and also as boundaries and barriers, and even as highways, and in many countries as plentiful store-houses. They also fertilize our soil by laying upon our warm banks the richest mould, brought from the high mountains, where it would have remained useless for want of genial heat.

Rix Dollar (a corruption of German *reichsthaler*, or *dollar of the empire*). A silver coin of different values in different countries.—*See* *COTNS.* By authority of Congress, the value of a rix dollar of Denmark is put at 100 cents, and the rix dollar of Bremen at 74 cents.

Road, in Navigation, a bay or place of anchorage, at some distance from the shore, whither vessels occasionally repair to receive intelligence, orders, or necessary supplies, or to wait for a fair wind. The excellence of a road consists in its being protected from the reigning winds and the swell of the sea, in having a good anchoring-ground, and being at a competent distance from the shore. Those which are not sufficiently protected are termed *open roads*.

Roads, pathways formed through the country with more or less art and care, for facilitating the transit of individuals, carriages, etc., between different places. They are of every variety of form—from rude, narrow, rugged, and unformed paths, carried over mountains, interrupted by every petty rivulet, and almost impracticable to any but foot-passengers, to smooth, broad, and level ways, formed of solid materials, winding round or cut through mountains, and carried over swamps and rivers at an immense expense, and admitting of the easy passage of carriages and of all sorts of goods. The laying out of improved roads, and their construction, forms an important part of what is denominated the science of civil engineering. But as it would be quite foreign to our purpose to enter into any details as to the formation of roads, we shall satisfy ourselves with laying before the reader the following statements as to their importance in a commercial point of view.

Importance and Utility of improved Roads.—Next to the introduction of money, and weights and measures, the formation of good roads and bridges gives the greatest facility to commerce, and contributes more powerfully, perhaps, than any thing else to the progress of improvement. They have been denominated national veins and arteries; and the latter are not more indispensable to the existence of individuals than improved communications are to a healthy state of the public economy. It were vain to attempt to point out in detail the various advantages derived from the easy means of communication. There is not a single district that is not indebted to others for a large part of its supplies, even of some of the bulkiest commodities. Besides the coals, metals, minerals, timber, corn, etc., conveyed from one part of the empire to another by sea, immense quantities are conveyed from place to place in the interior by roads and canals; and every improvement effected in the means of conveyance has obviously the same effect upon the cost of commodities that have to be conveyed, as an improvement in the methods by which they are raised or manufactured. Wherever the means of internal communication are deficient in a country, the inhabitants must unavoidably disperse themselves over the surface. Cities were originally founded by individuals congregating more, perhaps, for the sake of mutual defense and protection than for any other cause. But in countries where good government is established, and property is secure, men resort to cities only from a sense of the advantages they afford. The

scale on which business is conducted in them presents facilities that can not be elsewhere afforded for making a fortune; and the extent to which the subdivision of employments is carried opens a field for the exercise of all sorts of talent; at the same time that it improves and perfects all sorts of arts, whether subservient to industrious or scientific pursuits, or to those of pleasure and dissipation. It is this that attracts the aspiring, the industrious, the gay, and the profligate, to cities—that fills them with the best and the worst part of the species. The competition that takes place in a great town, the excitement that is constantly kept up, the collision of so many minds brought into immediate contact, and all endeavoring to outstrip each other in their respective departments, develops all the resources of the human mind, and renders a great city a perpetually radiating focus of intelligence and invention. There are, however, considerable clogs upon the continued increase of cities. The food and fuel made use of by the inhabitants, and the raw products on which their industry is to be exerted, must all come from the country; and according as the size of a city increases, the distances from which its supplies have to be brought become so much the greater, that ultimately the cost of their conveyance may be so great as to balance or exceed the peculiar advantages resulting from a residence in town. Hence the impossibility of a large or even a considerable city existing any where without possessing extensive means of communication either with the surrounding country or with other countries; and hence, too, the explanation of the apparently singular fact, of almost all large cities having been founded on or near the sea, or a navigable river.

The influence that the growth of a large town has upon agriculture is great and striking. "In the neighborhood," says Paley, "of trading towns, and in those districts which carry on a communication with the markets of trading towns, the husbandmen are busy and skilful, the peasantry laborious; the land is managed to the best advantage, and double the quantity of corn or herbage (articles which are ultimately converted into human provision) raised from it, of what the same soil yields in remoter and more neglected parts of the country. Wherever a thriving manufactory finds means to establish itself, a new vegetation springs up around it. I believe it is true that agriculture never arrives at any considerable, much less at its highest, degree of perfection, when it is not connected with trade; that is, when the demand for the produce is not increased by the consumption of trading cities."—*Moral Philosophy*, book vi. c. 11. But the fact of their being mainly conducive to the growth of cities is not the only advantage which improved roads confer upon agriculture. Without their aid it would be impossible to carry to distant places sufficient supplies of such bulky and heavy articles as lime, marl, shells, and other manures necessary to give luxuriance to the crops of rich soils, and to render those that are poor productive. Not only, too, would inferior roads lessen the market for farm produce, and consequently the quantity raised, but a larger proportional number of horses or other cattle would be required to convey the diminished produce to market. It is plain, therefore, that good roads are both directly and indirectly a prime source of agricultural improvement; directly, by increasing the quantity and reducing the cost of manure, and by increasing the quantity and reducing the cost of conveying farm produce to market; and indirectly, by providing for the growth and indefinite extension of cities and towns, that is, of the markets for agricultural produce. Increased speed of conveyance is one of the principal advantages that have resulted from the formation of good roads, the invention of steam-packets, etc. Suppose that it takes two days to travel by an uneven, ill-made road between any two places, and that, by improving the road, the journey may be accomplished in one day; the effect is the same

as if the distance were reduced one half; and there is not only a great saving of time to travelers, but also a great saving of cost, from the more speedy conveyance of commodities. This latter is a point of much more importance than is commonly supposed. It is not possible to form any correct estimate of the value of the products that are constantly in the act of being carried from place to place. It is certain, however, that it is very great; and every additional facility of conveyance, by bringing such products more rapidly to their destination, and enabling them to be sooner applied to the purposes for which they are intended, renders large quantities of capital available for industrious purposes that would otherwise be locked up.—*See articles RAILROADS and CANALS.*

Rolling. In *Naval language*, the lateral oscillation of a vessel. This motion, which is often very great when the vessel is running before the sea, endangers the masts, strains the sides, and loosens the decks at the water-ways; it is also liable to cause the guns to break adrift. When the centre of gravity is too low, the oscillations begin and end violently. The changes in the stowage necessary to modify the nature or extent of the roll are made by seamen from experimental knowledge.

Rolling Tackle. A tackle or pulley hooked to the weather quarter of a yard, and to a lashing or strap round the mast near the slings or parrel of the yard. The object of it is to keep the yard constantly on or to leeward, thereby depriving it of play and friction when the ship rolls to windward.

Rope consists of hemp, hair, etc., spun into thick yarn, of which several strings are twisted together by means of a wheel. When made very small, it is called a cord; and when very thick, a cable. All the different kinds of this manufacture, from a fishing-line or whip-cord to the cable of a first-ratn ship of war, go by the general name of cordage.—*See CABLE.*

Roses (Oil, Essence, or Attar of), an oil obtained by distilling the leaves of damask roses. It is limpid, of a light orange color, and has an extremely grateful and powerful perfume. This, which is the most expensive article of Oriental luxury, used to be principally made at Tunis and Ghazipore, in India. But though it be still very extensively produced at these places, and more especially at the latter, what may be called the foreign demand for the oil is now almost wholly supplied by the districts of Eski Zara and Hassaniik, in Bulgaria. There the culture of roses is carried on upon a very large scale. Inasmuch, however, as it is said to require about 300,000 roses to yield an ounce of oil, the quantity produced does not exceed 4500 lbs. In a good, and 3000 lbs. in an ordinary year. The genuine article fetches an enormous price; and is in consequence very generally, or rather, we should say, uniformly adulterated. When the adulteration is effected by means of the oil of geraniums and other fine volatile oils, the fraud is not easily detected except by *convalescence*, unless the foreign matter be in excess. Sometimes it is alleged that attar of roses has been sold as genuine when above 80 per cent. of other oils was mixed up with it. That which is hawked about the streets of Constantinople and Smyrna is seldom any thing better than olive oil scented with roses. Some of the more expert dealers in the article will tell within 2 per cent. the foreign oil in any parcel given them to examine. The value of the exports of this curious product from Turkey has been estimated at from \$400,000 to \$500,000 a year.—*BLANQUI, Voyage en Bulgarie; HUNT'S Merch. Mag.*

Rose-wood (Ger. *Rosenholz*; Fr. *Bois du rose, de Rhode*; It. *Legno rodie*; Sp. *Leno de rosa*; Port. *Pão de rosado*) is produced in Brazil; the Canary Islands; in Siam, whence it is pretty largely exported by the Chinese; and in other places. It is in the highest esteem as a fancy wood. The width of the log imported into this country averages about 22 inches, so that

It must be the produce of a large tree. Rose-wood has a slightly lustrous, somewhat pungent, balsamic taste, and fragrant smell, whence its name. It should be chosen sound, heavy, of the deepest color, in the largest pieces that can be procured, and of the most irregular, knotty grain. The small, light-colored, and large shivered pieces should be rejected. The more distinct the darker parts are from the purple red, which forms the ground, the more is the wood esteemed. It is usually cut into veneers of nine to an inch.—Mittun's *Orient. Comm.*, etc.

Rosin. This substance is obtained from different species of fir; as the *Pinus abies*, *sylvestris*, *larix*, *balsamea*. It is well known that a resinous juice exudes from the *Pinus sylvestris*, or common Scotch fir, which hardens into tears. The same exudation appears in the *Pinus abies*, or spruce fir. These tears constitute the substance called *thus*, or frankincense. When a portion of the bark is stripped off these trees, a liquid juice flows out, which gradually hardens. The juice has obtained different names, according to the plant from which it comes. The *Pinus sylvestris* yields common turpentine; the *larix*, Venice turpentine (see TURPENTINE); the *balsamea*, balsam of Canada. All these juices, which are commonly distinguished by the name of turpentine, are considered as composed of two ingredients; namely, oil of turpentine and rosin. When the turpentine is distilled, the oil comes over, and the rosin remains behind. When the distillation is continued to dryness, the residuum is known by the name of common rosin, or *colophonium*; but when water is mixed with it while yet fluid and incorporated by violent agitation, the mass is called *yellow rosin*. During winter, the wounds made in the fir-trees become incrustated with a white, brittle substance, called *barras* or *galipot*, consisting of rosin united to a small portion of oil. The yellow rosin, made by melting and agitating this substance in water, is preferred for most purposes, because it is more ductile, owing, probably, to its still containing some oil. The uses of rosin are numerous and well known.—THOMSON'S *Chemistry*. See NAVAL STORES.

Rostock, the principal city of the Grand Duchy of Mecklenburg Schwerin, on the Warnow, about 9 miles above where it falls into the Baltic, lat. 54° N., long. 12° 12' E. Population in 1837, 18,067. A large fair for merchandise is annually held at Whitaunder; and there are wool fairs at other seasons of the year. The outpost of Rostock is at Warnemunde, at the mouth of the Warnow. The depth of water at the latter varies from 10½ to 12 feet; but when the west pier, now in the course of being constructed, has been completed, it is expected that the depth of water will be from 12 to 14 feet. The depth of water in the river from Warnemunde up to Rostock is usually from 8 to 9 feet; so that vessels drawing more than this must be lightened to get up to the latter. Rostock has a good harbor and commodious quays.

Imports.—The principal articles of import are sugar, coffee, and other colonial products; cottons, woolens, and hardware, with coal, earthen-ware, salt, iron, horses, etc., from England; hemp, flax, tallow, oil, sail-cloth, etc., from Russia; alum, deals, timber, lime, tar, etc., from Sweden; herrings and fish oil from Norway; wine, brandy, molasses, drugs, etc., from France; with rice, rum, groceries, etc., from Copenhagen and Hamburg. The total value of the imports by sea may be estimated at about £250,000.

Exports.—These consist chiefly of very good red wheat, barley, peas, rape-seed, and a few oats; with wool, rags of a very superior quality, oil-cake, rape-oil, bones, etc. The exports of wheat amounted in 1840 to 97,565 quarters, and in 1841 to 124,267. In 1840, the exports of peas from Rostock only were 9503 quarters; but from the duchy they amounted to 43,013 quarters; but at an average their export does not exceed from 20,000 to 25,000 quarters. The export of bones amounted during the same year to 1,550,000 lbs.

At an average, the value of the exports may be estimated at £300,000.

Shipping.—The port of Rostock in 1840 had 230 ships, of the burden of 85,892 tons, which trade with most European nations, the United States, and Brazil. In 1835 there entered the port 540 ships (burden not stated), of which 215 belonged to Mecklenburg, 152 (mostly small craft) to Denmark, 83 to Sweden, 27 to Hanover, 18 to Prussia, 12 to Russia, 19 to Holland, 10 to Lübeck, 2 to Hamburg, and 1 each to France and England. It is only, in fact, when our ports are open to the importation of foreign corn that British ships are met with in considerable numbers in the ports of Mecklenburg.

Port Charges.—These are the same on native and privileged ships, among which are included those of England, France, America, Prussia, Norway, etc. The port charges on a vessel of 100 tons burden are as follows, viz.:

	Privileged.		Not privileged.	
	Rix Dol.	Sch.	Rix Dol.	Sch.
Inward with cargo	10	9	10	2
Outward ditto	25	44	39	6
Inward in ballast	12	6	12	6
Outward ditto	19	36	31	10
Ditto without either	17	33	25	42

Duties.—These are extremely moderate. On most imported articles they amount to only 3 per cent. *ad valorem*. An export duty of about 6d. per quarter is charged on corn, and of about 4s. 8d. per hhd. on wine. Wool is not subject to any duty on export. Goods imported in vessels not privileged pay 50 per cent. additional on the above duties; that is, they pay 4½ instead of 3 per cent. *ad valorem*.

Wismar, the second sea-port town of Mecklenburg, at the confluence of the River Stör with the sea, in lat. 53° 49' 25" N., long. 11° 36' 15" E. Population 11,000. The harbor of Wismar is commodious and safe, being nearly land-locked by the islands of Poel and Walfisch. Close to the town there is from 8 to 8½ feet water; in the inner roads there is from 12 to 13 feet; and in the outer from 16 to 20 feet water. The port charges on a native or privileged vessel of 100 tons amount to about 80 rix dollars. The articles of import and export are the same at Wismar as at Rostock; but owing to the proximity of Lübeck, from which Wismar is not more than 27 miles distant, her foreign trade is comparatively limited. About 35 ships, of the burden of 4800 tons, belong to this port. Three cleared from it in 1835 227 ships, of which 11 were English. The duties at Wismar are somewhat higher than at Rostock, being 4½ per cent. *ad valorem* on colonial products, and from 4d. to 8d. per quarter on corn exported. It is believed, however, that they will shortly be reduced to the Rostock level.

Trade of the Duchies.—Mecklenburg is essentially an agricultural, wool-growing, grazing, and breeding country. In soil places it is sandy and barren; but it is for the most part very fertile, and the crops and pastures are both luxuriant. Having few manufactures, her imports necessarily consist principally, as already stated, of manufactured goods, and her exports of raw produce. Owing, however, to the circumstance of the southwestern part of the province being bounded by the Elbe, and approaching to within about 30 miles of Hamburg, almost all the manufactured goods, as well as a very large proportion of the colonial products used by the population (550,000), are imported by way of Hamburg. Hence, in Mecklenburg, as in Prussia, the direct foreign trade carried on by the sea frontier forms but a very small part of the entire trade of the country. It is impossible, however, to form any precise estimate of what the latter may amount to. Probably there is no European country so little fettered by customs regulations as Mecklenburg. The duties on articles imported by sea amount only, as already stated, to about 3 per cent. *ad valorem*; and those entering by the land frontier are subject merely to a tri-

flag charge, (account of toll, of which we have not seen any account. It is impossible, indeed, that any commercial system can be bottomed on more liberal principles; and this enlightened policy, and her situation near the mouth of the Elbe, and on the western frontier of the Prussian league, give to Mecklenburg far greater importance, as a commercial state, than is indicated by the amount of her population or her internal consumption.

Rotterdam, on the north bank of the Maese, in lat. 51° 55' 19" N., long. 4° 29' 14" E. Population in 1850, 82,000? Rotterdam is the second commercial city of Holland. It is more advantageously situated than Amsterdam, being nearer the sea; and the canals

which intersect it are so deep as to admit of the largest vessels coming up to the quays and warehouses of the merchants. Its commerce during the last fifteen years has increased more rapidly than that of any town in Holland. The exports and imports are similar to those of Amsterdam. The white Zealand wheat shipped here is of a peculiarly fine quality; and it is the best market for madder and Geneva. Geneva is sold by the same; but it used, for the convenience of smuggling to England, to be divided into ankens and half ankens. The legitimate imports of Geneva from Holland in 1851 amounted to 155,895 gallons. Rotterdam has a regular and frequent intercourse, by means of steamers, with London, Liverpool, Hull, Leith, Havre, Hamburg, etc.

IMPORTS FOR THE SEVEN YEARS ENDING WITH 1852, AT ROTTERDAM, OF THE UNDER-MENTIONED ARTICLES OF FOREIGN AND COLONIAL PRODUCE.—(FROM THE MONTHLY MARKET REVIEW, JANUARY 1, 1853.)

—See HOLLAND AND AMSTERDAM.

* The stocks in Amsterdam include the quantities on hand at Zaandam.

Rouble, a Russian coin. (For the silver rouble, see COINS, division *Russian*;) the value of the paper rouble is variable.) By the official valuation of the paper rouble, in the payment of taxes, a few years since, one silver rouble was equal to three roubles sixty copecks paper. By authority of Congress, the value of the Russian rouble formerly was fixed at 75 cents.

Rouge (Fr. *Fard*). The only cosmetic which can be applied without injury to brighten a lady's complexion is that prepared, by the following process, from safflower (*Carthamus tinctorius*). The flowers, after being washed with pure water (till it comes off colorless, are dried, pulverized, and digested with a weak solution of crystals of soda, which assumes thereby a yellow color. Into this liquor a quantity of finely-carded white cotton wool is plunged, and then so much lemon juice or pure vinegar is added as to supersaturate

the soda. The coloring matter is disengaged, and falls down in an impalpable powder upon the cotton filaments. The cotton, after being washed in cold water, to remove some yellow coloring particles, is to be treated with a fresh solution of carbonate of soda, which takes up the red coloring matter in a state of purity. Before precipitating this pigment a second time by the acid of lemons, some soft powdered talc should be laid in the bottom of the vessel, for the purpose of absorbing the fine rouge, in proportion as it is separated from the carbonate of soda, which now holds it dissolved. The colored mixture must be finally triturated with a few drops of olive oil, in order to make it smooth and mellow. Upon the fineness of the talc, and the proportion of the safflower precipitate which it contains, depend the beauty and value of the cosmetic. The rouge of the above second precipitation is received

sometimes upon bits of fine-twisted woolen stuff, called *crepons*, which ladies rub upon their cheeks.

Row, to propel a boat by oars. Rowing is reckoned the most favorable application of human strength; the whole force is, however, not effective on the oar, as the part inside the actual fulcrum, which is in the water, acts as a backwater. Some nations take short strokes, which they rise up in making; a long stroke sitting, to say the least, saves much exertion. As the theory of rowing involves the resistance of fluids, it is necessarily defective.

Royal, in *Naval affairs*, the sail above the top-gallant sail. The term *royal* is also applied, in artillery, to a kind of small mortar.

Royal Exchange, London. The foundation of the original edifice was laid by Sir Thomas Gresham, June 7, 1566, on the site of the ancient Tun prison. Queen Elizabeth visited this Exchange in January, 1571, and by the sound of trumpets her herald named it the *Royal Exchange*.—**HUMK**. This grand fabric was totally destroyed by the great fire in 1666, precisely a century after its erection. Charles II. laid the foundation of the next edifice, October 23, 1667, which was completed by Mr. Hewkesmoor, a pupil of Sir Christopher Wren, in about three years; and it was repaired and beautified in 1769. This last also became a prey to a destructive fire, January 10, 1838, and was burned to the ground, with a number of public offices and adjoining houses. The new Royal Exchange, commenced in 1840, under the direction of Mr. Tite, was opened by the queen in state, accompanied by her ministers and a grand civic procession, October 28, 1844.

Ruby, a precious stone, very highly esteemed; but under this name a variety of minerals have not unfrequently been sold, which differ essentially in their characters. The *Oriental ruby* is, in fact, a red variety of the sapphire. When perfect, its color is a cochineal red, presenting a richness of hue the most exquisite and unrivaled: it is, however, in general more or less pale, and often mixed with blue: hence it occurs rose red, peach-blossom red, and lilac blue, passing into the smethyst. It is harder than any other mineral, except the diamond. Easily frangible. Specific gravity from 3.916 to 4.283. Infusible before the blowpipe. Oriental rubies of 10 carats are extremely rare and valuable. One of 22 grains was sold for £160. Rubies in lots, Indian cut, or small sizes, and of different qualities, are at all times to be had, and sell at from 15s. to 65s. a carat; but a perfect stone of a carat, or 6 grains, may be deemed rare, and falls little short of the value of the diamond: nay, in some cases, rubies of 2, 3, or 4 carats, if very fine, are much scarcer, and even more valuable than diamonds of equal weight. The finest ruby in England, or perhaps in Europe, is in the collection of the late Mr. Hope, the author of "Anastasio." There are two other species of ruby, the *Spinelle* and *Balaia*. When perfect, the spinelle is a gem of great value and scarcity. Its color is a fine full carmine or rose red, but it never presents that rich mellow tinge that attends the Oriental ruby. It is also inferior to the latter in hardness and specific gravity. Stones of 3 carats and upward are very rare and valuable.

The *Balaia ruby* is a pale variety of the spinelle. It varies in color from light red to yellowish red. Though not so rare as the spinelle, it is by no means common. It is much admired for its agreeable tinge of color; and, when pure and perfect, fetches a very high price, though considerably less than the other varieties. Rubies are not found in any considerable quantity except in Ava.—**MA NE ON Diamond**; **THOX SON'S Chemistry**.

Rudder. A heavy flat piece or frame of wood, hung upon the stern-post by means of pintles and gudgeons, for the purpose of steering the ship. The rudder is turned round the stern-post as an axle, by the tiller, which enters the rudder-head. In vessels

drawing much water the rudder is deep and narrow; in flat-bottomed vessels it is shallow and broad. When carried to a considerable breadth, as in the Chinese vessels, it is pierced with holes, which preserves an increased leverage with a diminished direct resistance from the water. When the rudder is broken off by the ship getting aground, or by a heavy sea, a temporary one is made by a topmast and other spars placed parallel, and loaded at the bottom with pigs and ballast, and confined to the stern-post by hawsers leading on each side of the keel.

Rudder Coat.—A covering of tarred canvas loosely put round the rudder-head to keep the water from entering by the aperture, while it admits of the rudder being turned freely round.

Rudder Pendants.—Strong pieces of rope ending in chains, by which the rudder, if unshipped, is held to the ship's quarter.

Rudder Shock.—A piece of wood fitting between the head of the rudder and the rudder-hole, to prevent the play of the rudder in case of the tiller being removed.

Rum, a well-known and highly esteemed spirituous liquor imported from the West Indies, of which it forms one of the staple products. It is obtained by means of fermentation and distillation from molasses, the refuse of the cane juice, and portions of the cane, after the sugar has been extracted. The flavor and taste peculiar to rum are derived from the essential oils carried over in distillation. When the distillation has been carelessly performed, the spirit contains so large a quantity of the grosser and less volatile part of the oil as to be unfit for use till it has attained a considerable age. When it is well rectified, it mellow much sooner. Rum of a brownish transparent color, smooth oily taste, strong body and consistence, good age, and well kept, is the best. That which is clear and limpid, and has a hot pungent taste, is either too new, or mixed with other spirits. Jamaica rum is the first in point of quality; the Leeward Island rum, as it is called, being always inferior to it, both in flavor, strength, and value. The price of the latter is usually 20 per cent. below that of the former. It is customary, in some of the West India Islands, to put sliced pineapples in puncheons of rum: this gives the spirit the flavor of the fruit; and hence the designation *pine-apple rum*. Rum is also produced in and imported from the Mauritius and the East Indies; but that of the latter is more nearly allied to arrack than to genuine rum.

We know nothing about the origin of the word *rum*, or the time at which the manufacture of the spirit commenced. At present the manufacture is chiefly carried on in the islands belonging to Great Britain. Dr. Ure states that in Jamaica the wort is made by adding together 120 gallons of molasses, 1000 gallons of the spent wash of a former distillation, 720 gallons of the skimmings of the sugar boilers, and 160 gallons of water; so that there is in the wort nearly 12 per cent. of solid saccharine matter. Other proportions, however, are used, bringing the proportion of saccharine matter up to nearly 15 per cent.; as, for instance, 100 gallons of molasses, 300 gallons of skimmings, 200 gallons of spent wash, and 400 gallons of water. The proportions vary in almost every estate, so that no certain rule can be laid down. The fermentation is in general conducted very slowly (apparently very unnecessarily so), occupying from nine to fourteen days. The saccharine matter is, therefore, very imperfectly converted into alcohol, and the yield of spirit is usually so low as 115 gallons of proof-spirit for every 1200 gallons of wash. On some estates, and depending on the price of sugar in the market, the greater proportion of the sugar is converted into rum; and the same imperfect fermentation being followed, the average yield is said to be only 200 gallons of rum for every three hogsheads of sugar, whereas the proportion ought to be very nearly double. It is from the skimmings, which

are rich in aroma, that the peculiar flavor of rum is derived; for it is a curious fact that sugar and molasses distilled in this country yield a spirit entirely destitute of all rum flavor, and in nothing distinguishable from the ordinary spirit derived from grain. Any depth of color may be given to the rum by the addition of molasses or caramel, though it is commonly but erroneously stated that the color of the rum is derived from the oak casks.—See SPIRITS and WINE.

The manufacture of rum entirely of sugar or molasses is not carried on in Great Britain. The number of gallons of rum manufactured in Great Britain during the year ending January 5, 1854, of a mixture of sugar or molasses with unmalted grain, was as follows:

England	989,010 gallons.
Scotland	915,831 "
Ireland	4,005 "
Great Britain	1,908,846 "

Rupee, a silver coin current in the East Indies, equal to from 50 to 60 cents. By authority of Congress, the value of the rupee of British India was fixed at 44 cents, and the sicca rupee of Bengal and the rupee of Bombay at 50 cents.

Russia. This extensive empire comprises the whole northern portion of the eastern hemisphere, from the frontiers of Posen and the Gulf of Bothnia on the west, to the Pacific Ocean and Behring's Straits on the east. It includes the greater part of the ancient kingdom of Poland, Finland, Astrakhan, and Kazan, conquered from the Tartars; the Crimea, Little Tartary, Bessarabia, and a portion of Moldavia, taken from Turkey.

The Russian empire embraces nearly one-half of the surface of Europe. It chiefly consists of an enormous plain, being little diversified by rising ground, except toward the Ural and the Caucasus in the south and east, and in the province of Finland in the northwest. The northern part of the country is a cold and barren region of heaths and marshes; the central provinces are rich and fertile; the southern, more steppes, or grassy, sandy, and salt plains, which afford, however, in their hollows, along the river-courses, abundance of excellent pasturage for cattle and horses. The population is chiefly agricultural or nomadic; and the manufactures that are to be found in some places are more indebted to the fostering care of the government, and the high import duties, or absolute prohibition of

foreign wares, than to native enterprise, for their origin and continuance. Russia is an immense military power, so far as that depends on the numbers of her armies; but the want of national wealth is such a drawback on military enterprise as she has not yet been able to overcome.

The origin of the Russians as a distinct branch of the Slavonians is a moot point among archaeologists. They seem to have borne at one time the name of Antes, consisting of several tribes that formed a sort of confederation. In the 9th century, Ruric the Varangian established himself in Novgorod the Great; and his successors, extending their dominion by conquest, established their capital at Kieff, where the dynasty reached the zenith of its power under Vladimir the Great, who introduced Christianity among his subjects, according to the creed and ritual of the Greek Church, A.D. 988. His empire was subsequently overthrown by the Poles and Lithuanians, and the greater part of it remained subject to Poland till the accession of the house of Romanoff. The eastern provinces beyond the Dnieper were conquered by Tartars, and remained under their dominion till the 16th century. The city of Moscow was founded by Andrey I. in A.D. 1156. In the middle of the 15th century, Ivan Vasilowitz, Duke of Moscow, recovered his independence, and having subdued a number of petty chieftains, and added the duchies of Tver and Novgorod to his dominions, assumed the title of Grand Duke. His grandson, of the same name, subdued the Tartar kingdoms of Kazan and Astrakhan, and assumed the title of Czar or Great King.

During the last three centuries the successive dukes and czars of Moscow and emperors of all the Russias have followed the same policy of extending their dominions by every possible means, fair or foul. They have now declared themselves the heads and protectors of all the Slavonic races, and of the orthodox Greek Church, and seem to make no secret of their deep-laid project of unscrupulous aggrandizement. Their vast dominion now extends in length through 202° of longitude, and in breadth through 88° of latitude, and is supposed to contain about 65,000,000 of inhabitants, of whom five-sixths are in Europe.

The following is believed to be a correct estimate of the extent and population of this vast empire:

AREA AND POPULATION OF RUSSIA.		
Natural Divisions.	Area in English Square Miles.	Population in 1852.
Great Russia	328,751	20,493,371
Little Russia	159,141	11,776,865
New Russia	96,636	3,255,612
White Russia	70,349	2,937,496
Western provinces	47,076	2,870,607
Baltic provinces	30,610	1,761,907
Northern provinces	536,228	1,429,029
Ural provinces	447,758	10,770,151
Cossack districts	123,776	1,196,736
Poland	41,230	5,156,648
Finland	139,800	1,449,190
Total in Europe	2,923,473	63,012,146
Caucasian provinces	86,578	2,800,000
West Siberia	2,681,147	3,500,000
East Siberia	2,122,000	237,000
American possessions	371,459	15,000
Total extra European	5,261,075	6,648,000
Grand total	7,284,548	69,660,146

The rivers of Russia are usually divided into five groups or systems, corresponding to the seas in which they have their embouchures; viz. the Arctic Ocean, the Baltic Sea, the Black Sea, the Caspian Sea, and the Pacific Ocean. The first division comprises the Dwina, Mezon, and Petchora, in Europe; the Obi, Jenisei, and Lena, with numerous other small rivers, in Asia: the three last have a course of from 2000 to 2500 miles. The rivers which fall into the Baltic, though possessing much more commercial importance to Russia, are of inferior magnitude. The principal are—the Neva, which has St. Petersburg at its mouth, the Duna, and the Niemen. The rivers which fall into the Black Sea are of

equal importance with those just named, and exceed them in length of course and volume of water. The principal among these are the Dniester, Dnieper, Bug, Don, and Kuban. The Volga, in the basin of the Caspian Sea, is the largest and most important of the rivers of Russia. This extensive river has its sources in the government of Twer, about 180 miles south by east from St. Petersburg. Its course is about 1000 leagues, while that of the Danube is only about 450. It is of vast importance to the internal commerce of Russia. Its affluents, which are connected by several canals with the Neva, establish a communication between the Caspian and the Baltic, White, and Black seas. Two other rivers—the Ural and the Emba—have their embouchures in the Caspian Sea.

Staples.—The products of Russia vary with the difference of soil and climate. Cereals of every kind are raised in great abundance; but rye, being the common food of the peasantry, is produced in much greater quantities than any other sort of grain. The most productive provinces are Orel, Kasan, Nijni Novgorod, Penza, Tambov, and Kursk. The total annual production of grains in European Russia (including Poland) may be estimated in ordinary years at 1,495,000,000 bushels, at a value of about \$720,416,665. Flax and hemp are also extensively cultivated, and constitute a leading export of Russia. Tobacco is cultivated in the southern provinces, and of late years much attention has been given to the cultivation of beet-root. In 1848, the quantity of sugar manufactured from this article was estimated at 92,240,000 lbs. Tallow and wool are also important articles in the export trade of Russia; of the latter, the exports amount annually to about 18,000,000 lbs. The climate of Russia is not, however, well adapted to the production of fine wool; and although much attention has been given to the improvement of the breed of sheep, Russia can not enter into competition with Australia in supplying foreign markets with this article. The quantity of wool furnished by the Cape of Good Hope colony, from 1840 to 1852 inclusive, was 48,869,748 lbs.; furnished by Australia in same period, 266,008,416 lbs.; by Cape colony, in 1852, 7,772,505 lbs.; by Australia, in 1852,

32,500,000 lbs.; number of sheep in Cape colony, 4,496,000; number of goats in Cape colony, 1,093,000; number of sheep in Russia in Europe, 35,666,598; number of goats in Russia in Europe, 1,188,173.

Manufactures.—The manufactures of Russia are not generally in a very advanced condition. In some departments of manufacturing industry, however, Russia excels all other countries. Every attempt to imitate her leather, especially such as is used for book-binding purposes, has proved a failure; and Russia still continues to enjoy, as she doubtless ever will, an undisputed monopoly in supplying foreign markets with this valuable production. Her glass manufactures are also highly esteemed. Single plates have been manufactured at the St. Petersburg glass-works which have readily sold for \$3000. Her other manufactures are sail-cloth, cordage and canvas, tick, felt, mats, pot-sheer, soap, candles, caviar, isinghins, spirits, and some minor articles for domestic consumption. The cotton manufactures of Russia have made rapid progress during the past twenty years; and, instead of the vast quantities of cotton yarns formerly imported, she now imports largely of the raw material. In 1832 the quantity of raw cotton imported was 116,000 poods (3,170,000 lbs.); in 1852 it ascended to 1,746,000 poods (62,928,000 lbs.), of which she received from the United States 10,475,168 lbs. The total manufactures of Russia employ 6,064,700 persons, of which number 4,500,000 are engaged in the manufacture of flax and hemp. The total annual value of Russian manufactures is estimated at about 486,000,000 silver roubles (\$364,500,000). Moscow is the grand centre of this branch of industrial pursuits, and is inhabited almost exclusively by manufacturers and artisans.

The following table, translated from Russian official returns, will exhibit the number and character of manufactures in Russia, the number of workmen employed, and the quantity and value of their productions, in the year 1852. It is proper to remark, that the table gives only the principal manufactures which enter into the export trade of Russia. Those consumed in the country, and numerous minor manufactures, are omitted in the following summary:

RUSSIAN MANUFACTURES, ETC.

Denomination of Manufactures.	Number of Factories.	Quantities manufactured.	Value of Manufactures in Silver Roubles.*	Number of Workmen.
Manufactures of wooleus (cloths)	414	13,446,266 archines and 180,057 pieces of woollen cloths; 12,854 poods of woollen yarn	19,121,833	80,443
Manufactures of wooleus (linseus)	130	861,763 pieces and 1,611,614 archines of woollen linseus: 8800 poods of yarn	5,231,457	13,506
Manufactures of cotton yarns, thread, etc.	75	1,136,326 poods of cotton thread, 88,150 pieces and 85,500 archines of linseus	15,047,898	30,576
Manufactures of cottonades	449	3,770,080 pieces, 8,764,331 archines, 118,317 dozen linseus, and 5230 poods of thread	14,208,540	51,451
Dyeing factories	343	6,785,988 archines, 4,411,007 pieces, 23,476 dozen, 166,936 poods	15,425,334	25,867
Factories for weaving	112	278,196 pieces, 170,044 archines, 1096 dozen linseus, 1800 poods of thread	2,239,099	12,450
Manufactures of silks and brocades	632	5,302,567 archines, 1,270,191 pieces, 3601 dozen of linseus, 888 poods of silk thread	5,672,252	15,982
Manufactures of cables	143	757,544 poods	1,946,042	3,403
Manufactures of paper	177	1,888,365 reams, 50,484 poods, 716,134 sheets, 40,000 packages of pasteboard	3,928,576	14,942
Manufactures of tobacco	345	182,732 poods of tobacco, 308,053,256 pieces, 451,535 boxes and packages of cigars and cigarettes	4,687,005	4,861
Foundries and forges	115	5,258,406 poods and 64,274 pieces of cast iron, 629,027 poods of iron, and 39,731 poods of steel	3,674,000	27,579
Manufactures of hardware	280	2,537,773 poods, 228,610 pieces, and 5370 archines of iron wire	2,254,909	13,542
Manufactures of copper	149	133,026 poods and 1,261,192 pieces	1,506,015	4,253
Manufactures of chemicals	102	514,142 poods	2,121,122	1,764
Manufactures of soap	203	2,418,238 poods of sugar, and 149,800 poods of sirup	19,815,403	45,711
Manufactures of sugar	614	47,224,816 pieces of glass dishes, plates, etc., 89,013 covers, and 150,190 plates or sheets of glass	3,387,868	11,550
Manufactures of glass and crystals	181	2,141,808 poods	5,270,053	4,511
Tallow factories	834	1,174,854 poods	4,408,484	2,008
Candle factories	43	284,673 poods	1,875,578	1,264
Wax-candle factories	15	4,286,321 pieces	9,134,741	14,665
Tauernies	2,052		19,043,551	51,714
Other manufactures	3,148			
Total	10,888		161,151,708	470,911
Total in 1851	10,126		157,380,500	465,916

* The silver rouble is equal to 76 cents. † The archine is equivalent to 29 inches. ‡ The pood is equal to 36 lbs.

The large manufacturing establishments are located in the government of Moscow. The 1244 factories of this government give employment to 114,628 workmen, the annual value of whose productions amounts to \$68,146,606. In the government of St. Petersburg there are 477 factories, employing 24,581 workmen; annual value of productions, \$24,728,555. Before the commencement of the late European war, the foreign commerce of this vast empire was very extensive. In 1852 the imports reached the sum of 114,778,829 silver roubles, and the exports amounted to 100,864,052 silver roubles. This trade gave employment to 17,162 vessels, measuring an aggregate of 1,559,200 lasts.* Previous to the war, the exports of Russia from the ports of the Black Sea alone amounted to 80,000,000 bushels of grain annually. There is no official or reliable information at hand which would indicate the diminution which Russian trade has experienced from the blockading measures of the allied powers. It is certain that not half the usual quantity of hemp, flax, and tallow can pass from the territories of Russia. There is at all times a considerable overland trade across Prussia, but the heavy expenses attending the transportation of merchandise over this route must necessarily confine its consumption to the wealthier classes. The value of coffee, salt, sugar, etc., has been augmented to the most exorbitant figure; and these enhanced prices, with the expenses of land transportation super-added, must, in the event of prolonged hostilities, drive these articles out of general use altogether. These are, however, but the unavoidable effects of war; and as the philanthropist must hope that peace shall soon return, and the channels of commerce be again reopened, so the commercial statistician must regard these interruptions to the peaceful trade of the world as but temporary and unfix'd, and treat only of the permanent commercial regulations, and relations with foreign nations, of such countries as may come within the scope of his official duties. The commercial relations of the United States with Russia are regulated by the treaty of October 6 [18], 1832. Its stipulations provide for entire reciprocity and perfect commercial equality between the two countries. It has been observed in good faith by both governments, and its provisions and spirit faithfully adhered to. The principal articles of export from Russia are tallow, grain, hemp, and flax; timber; potashes; leather; fox, hare, and squirrel skins; canvas and coarse linen; cordage, caviare, wax, isinglass, furs, tar, etc. The principal imports are sugar, cotton, cotton stuffs and yarns; machinery for mills, factories, etc.; hardware and iron; coffee, indigo, and other dye-stuffs; woolens, oils, spices, wine, tea, lead, tin, coal, and salt; linens, silks, etc. The principal ports for foreign commerce are St. Petersburg and Niga, on the Baltic; Archangel, on the White Sea; Ketch and Taganrog, on the Sea of Azof; and Astrakhan and Baku, on the Caspian. The interior commerce of the empire has its principal entrepôt at Moscow; and Kiachta is the centre of the trade with China. This trade with China is strictly one of barter. The interchange takes place at the town named above, lying on the Salenga, and at some distance from the great lake Baikal. The Russian merchandises and wares are here deposited in warehouses, which are visited by the Chinese merchants, with whom the interchange is effected.

None (says McCulloch, in a work published in 1854) but native Russians are allowed to engage in the internal trade of the country; and hence a foreigner who imports goods into Russia must sell them to Russians only, and at the port where they arrive. The merchants engaged in the foreign trade are mostly foreigners, of whom the English are the principal. Every Russian carrying on trade must be a burgher, and have his name registered in the Burghers' Book. These

burghers are divided into three guilds. Foreign merchants or guests are permitted to enroll their names in the city register, on the payment of from \$900 to \$950 per annum. *The Journal of the Manufactures of the Empire*, 1846, published in Russia, gives the following information relative to these guilds:

Number of merchants of the 1st guild	800
" " " 2d "	2,283
" " " 3d "	37,461
" of foreign merchants	34
Total	40,828
Burghers possessing licenses, 1st class	5
" " " 2d "	34
" " " 3d "	2,881
" " " 4th "	4,222
Total	7,147
General total of those engaged in trade	47,975

Declared capital of those engaged in commerce:

First guild	\$6,675,000
Second guild	10,273,500
Third guild	64,621,800
Declared capital of foreign merchants	852,500
Total capital invested in trade	\$87,022,800

In the whole of European Russia about 7,000,000 tchetverts of grain are employed in the distillation of 64,000,000 vedros (208,000,000 imperial gallons) of brandy, nearly all for home consumption.

The tariff regulations of Russia have during the past few years undergone several modifications. Under the tariff of 1841, the duties on most kinds of manufactures were equivalent to a prohibition. This tariff was entirely remodeled in 1850; and in June, 1854, various other alterations and changes were made, reducing still lower the duties prescribed by the tariff of 1850. These alterations and reductions are given down to the 23d June, 1854, the date of the last change in the Russian tariff; for which see Tariffs of Northern Europe, "Russia," Part II. Prior to the year 1850, there was a separate tariff for Poland; but the imperial ukase, promulgating the tariff of 1850, observes, in reference to this kingdom: "In our constant solicitude for the promotion of commerce and industry, we have judged it expedient, with a view to facilitate the interior, as well as the exterior, relations between our faithful subjects of the empire of Russia and the kingdom of Poland, to establish a uniform tariff of customs applicable to the empire and kingdom alike, and to suppress the customs-line which has heretofore separated them." The only other separate tariff now in force in Russia is that which applies to the ports of the Black Sea. For the purpose of comparison with subsequent tables, giving the commercial movements of Russia for later periods, the following table is annexed, exhibiting the total commerce of the empire with foreign countries, by land and sea, from 1832 to 1842, both inclusive:

Years.	Imports.		Exports.		Total.
	France.	Other.	France.	Other.	
1832	190,287,000	205,634,000	446,081,000		
1833	211,984,000	265,193,000	477,187,000		
1834	240,044,000	248,491,000	488,535,000		
1835	245,542,000	231,720,000	487,262,000		
1836	261,879,000	304,093,000	565,972,000		
1837	277,062,000	280,335,000	557,397,000		
1838	273,290,000	330,018,000	603,308,000		
1839	274,375,000	371,843,000	646,218,000		
1840	300,766,000	324,307,000	625,073,000		
1841	317,718,000	345,629,000	663,347,000		
1842	338,000,000	331,000,000	669,000,000		

If to the total for 1841 we add for specie imported, and the commerce of Poland and Finland, neither of which is included in the above table—about 100,000,000 francs in all—we shall have for that year a general total of nearly 760,000,000 francs, or \$141,360,000. A comparison of the Russian official reports from 1832-'38 (annual average) to 1842, as above condensed, shows that the general commerce of Russia has increased; viz., imports 46 per cent., exports 22 per cent.

Revenue from customs and other sources in 1839	105,000,000 francs
" " " " " "	1340, 109,420,000
" " " " " "	1341, 109,550,000

* The last is about two tons.
 † While this report was in press the result of the conferences at Paris was officially proclaimed.

 to 50 lbs.

The amounts derived from the different branches of customs in 1841 were,

Duties from custom-house	100,172,000 francs.
" entrepôts	894,000 "
Excise on salt in the Crimea	500,000 "
Other duties	2,184,000 "
Total	103,550,000 "

An analysis of the foregoing figures will show that the duties amount to about 84 per cent. on the total value of imports. The following table exhibits the total value of products exported from Russia in European commerce from 1841 to 1850, and the share assigned to each country:

Years.	Annual Value.	Proportion to each Country.		Years.	Annual Value.	Proportion to each Country.	
	Silver Roubles.	To England	Per Cent.		Silver Roubles.	To England	Per Cent.
1841	74,817,000	To France	5	1846	88,308,000	To France	9
1842	72,309,000	To Prussia	6	1847	94,113,000	To Prussia	6
1843	71,809,000	To Turkey	6	1848	75,988,000	To Turkey	6
1844	80,615,000	To Holland	5	1849	88,134,000	To Holland	5
1845	78,809,000	To Italy	5	1850	88,881,000	To United States	3
		To other countries	21			To other countries	23

The following table exhibits in detail the principal foreign merchandise entering into the import trade of Russia, and also the value or quantities imported, in the years 1849, 1850, and 1851:

Description of Merchandise.	1849.	1850.	1851.
Coffee..... poods	231,147	185,196	228,803
Raw sugar	9,088,808	1,079,931	1,829,377
Olive oil	668,809	548,000	579,180
Wines and other liquors, value in..... roubles	7,815,539	8,090,926	7,006,635
Fruits	8,492,041	8,013,198	5,045,118
Cotton, raw..... poods	1,554,919	1,200,739	1,312,356
Cotton, white spun	279,108	108,303	138,065
Dye-stuffs..... roubles	5,421,839	5,438,777	6,800,944
Silk..... poods	16,994	15,513	11,031
Wool..... roubles	50,544	67,200	67,443
Tissues, or woven goods: Of cotton..... roubles	4,448,840	3,999,515	4,480,221
Of silk	4,448,037	4,205,157	4,456,311
Of flax	679,041	587,906	962,043
Of wool	3,301,688	1,993,705	1,738,804
Machinery, etc.	3,547,271	2,074,805	2,880,110

The augmentation which the official returns of Russia exhibit in cottons, dye-stuffs, wool, machinery, and tools, evince the progressive condition of Russian manufactures. It has already been shown that in 1832 the quantity of raw cotton imported into Russia was only 116,600 poods; in 1851 it reached 1,312,356 poods; and in 1852 it ascended to 1,748,000 poods of 36 lbs. each. In 1845 the importation of cotton yarns (chiefly from England) reached 600,045 poods; in 1851 this amount fell to 138,065 poods, making a difference of 467,980 poods, or 16,847,280 lbs. The activity and progress of the cotton manufactures of Russia explain this great falling off in the quantity of cotton yarns imported, as the annual diminution of the latter will be found to be proportionate to the annual augmentation in the quantity of the former. An analysis of the returns of trade between Russia and the United States will also show an increase in the quantities of raw cotton imported by the former, corresponding with the diminished importation of cotton yarns; our raw cotton supplying to a great extent the different factories in Russia. The following table, compiled from the United States official authorities, exhibits the quantities and value of this staple exported to Russia direct from the United States:

Years.	Cotton exported to Russia from United States.	Value.
1844	9,767,766 lbs.	\$241,484
1850	4,938,705 "	540,322
1851	10,099,448 "	1,307,164
1852	20,410,108 "	1,062,346
1853	21,284,503 "	2,254,345
1854	2,914,154 "	801,293
1855	448,577 "	48,047

* The war was formally declared March 31, 1864.

The diminished quantity exported to Russia in 1854 shows the effect of the war on the direct trade between the two countries. This, however, can be more fully shown by the following comparative table, exhibiting the general trade between the two countries in 1853, 1854, and 1855:

TOTAL VALUE OF DOMESTIC PRODUCE EXPORTED FROM THE UNITED STATES TO RUSSIA.

In 1853	\$2,312,175
In 1854	335,321
In 1855	48,943

Cotton absorbed \$48,647 of this last sum. Besides the domestic produce exported to Russia in 1855, there was also exported foreign produce to the amount of \$20,114.

In 1854, exports to Russia from the United States consisted principally of two articles: Rice, \$21,723 in value; and cotton, \$801,293.

In 1853 we sent—Spermaceti oil, \$7160; lumber, \$1485; dye-stuffs, \$6618; hams and bacon, \$441; ship-bread, \$8268; rice, \$5564; cotton, \$2,254,345; tobacco, leaf, \$14,109; tobacco, manufactured, \$1164; sundries, \$18,991; total, \$2,813,175.

We here give the export trade of Russia for the years 1850 and 1851. The table includes only the principal articles exported, which are usually denominated Russian staples:

EXPORTS OF PRINCIPAL STAPLES FROM RUSSIA IN 1850 AND 1851.

Articles.	1850.	1851.
Corn..... silver roubles.	19,207,138	19,593,251
Red hides	1,052,329	1,288,121
Raw hides	1,007,296	833,603
Flax..... poods.	4,807,618	3,015,730
Hemp	3,723,933	3,042,422
Timber..... roubles.	2,797,076	3,519,263
Copper..... poods.	114,976	110,965
Iron..... "	177,056	708,054
Potash	477,308	507,330
Tallow	3,313,873	2,995,438
Hemp and flaxseed... tchetwertz.*	1,005,173	968,734
Wool..... poods.	611,002	470,074
Hortles	83,538	74,075

The exports from Poland are not included in the above table.

The foreign trade of Russia, though interrupted in its usual course in 1854 by the war, still exhibits considerable importance, as is shown by the following summary of official returns:

TOTAL EXPORTS.

To Europe from Russia proper	\$33,056,623
" from Poland	7,684,034
To Asia	1,431,014
To Finland	1,431,021
Total	\$43,002,722

EXPORT OF COIN (GOLD AND SILVER) IN 1854.

To Europe from Russia proper	\$6,448,434

From Asia	72,803
Total	\$4,726,014

Trade with Finland.—The exports of merchandise to

* Tchetwertz—nearly six bushels.

† A supreme ukase of February 27, 1854, prohibited the exportation of gold coin. Silver coin has been exported only by ship-masters, carriers, and passengers, in the quantities allowed by law.

Finland amounted to \$1,461,022; the imports from thence amounted to \$248,691.

The trade beyond the Caucasus, in 1854, was confined to Persia. The total imports amounted to \$2,645,965; exports, \$378,297; total trans-Caucasian trade, \$3,024,262.

The value of goods imported at the port of Astrakhan was \$784,742; of which raw cotton amounted to 138,189 silver roubles, or \$103,686.

The total trade on the frontiers of Orenburg and Siberia, in 1854, amounted to: Imports, \$3,890,571; exports, \$2,415,270; total, \$6,305,841.

Trade of Kiachta.—Total amount of goods taken by the Chinese, \$4,380,104; being woollens, \$1,875,875; cottons, \$1,145,620; linen goods, \$119,991; jewelry (gold and silver), \$745,966; furs, \$185,997; dressed skins, and red leather, \$72,830; miscellaneous, \$234,325.

EXPORTS OF WOOL FROM RUSSIA.

In 1841, average annual exportation	430,181
In 1845, " " " "	733,583
In 1847, " " " "	601,636
In 1850, " " " "	617,069

M. de Tegoborski gives the following account of the exports of flax and hemp from Russia from 1822 downward:

Years.	Flax and Cottilla of Flax.	Hemp and Cottilla of Hemp.	Total of Flax and Hemp.
	Poods.—Average of four years.	Poods.—Average of four years.	Poods.—Average of four years.
1822-1823	1,906,641	2,938,678	4,845,314
1827-1831	2,639,078	2,605,420	5,000,075
1832-1836	2,493,922	2,905,420	5,505,342
1837-1841	3,125,537	3,260,817	6,386,354
1842-1846	5,668,706	2,802,419	6,466,175
1847-1850	4,616,755	2,919,781	7,436,536

The total custom-house receipts at Kiachta were \$2,146,778.

Total tonnage at the different ports in 1354: entered, 226,774 lasts; cleared, 268,477.

The amounts of duties in 1854 were as follows:

On imports and exports, and tonnage duties	\$13,531,521
Duties for benefit of various cities	202,028
Excise on Crimean salt	260,476
For bridge on the Neva	105,825
Warehouses and storage duties	146,648
For the Odessa Lyceum	17,391
Total	\$14,654,465

In the kingdom of Poland the custom-house receipts amounted to \$993,978.

The Asiatic commerce of Russia centres at three principal points. Kiachta, at which place the operations with China are conducted, is the most important of these. Considerable trade is also prosecuted with the Tartars in Central Asia. Astrakhan, on the Caspian Sea, is the entrepôt for this trade. The land route is from Astrakhan, through a barren and desert country, to Khiva. Steam vessels are now established between Novgorod, Astrakhan, the Caucasian provinces, and Persia.

In 1854 a steam navigation company was organized at Astrakhan for the purpose of opening a regular steam communication between the ports of the Caspian Sea. Up to 1852 there were but a few small government steamers employed on the waters of the Caspian. The steamers of this new company will offer abundant facilities for commercial movements. Not being obliged to winter at Astrakhan, they can be kept afloat the entire year, and thus maintain regular communications, not only with the trans-Caucasian ports of Russia and the eastern ports of the Caspian, but also with the Persian coast.

* This trade is exclusively a trade of barter with the Chinese.

In 1848 the entire commerce of Russia with Asia is thus summed up in official returns:

Exports	9,144,500 silver roubles.
Imports	13,471,750 "
Total	\$22,616,250 "

If to the above we add the European commerce of Russia, we shall have for that year nearly 710,000,000 francs, or \$132,060,000.

The general navigation of Russia, for a series of years, is found in official returns, as follows:

Ports of	Vessels entered.				Vessels cleared.			
	1845.	1846.	1847.	1848.	1845.	1846.	1847.	1848.

Total	5798	7195	11,366	6401	5640	7110	11,424	6107
Laden	3037	3030	3,063	3010	2519	7025	10,068	6438
In ballast	2869	4165	8,308	3391	1223	1385	4356	7111

ENTERED AND CLEARED.

	1843	1846.	1847	1848.
Vessels entered	5,026	7,125	11,366	6,401
Vessels cleared	5,340	7,513	11,424	6,197
Total	11,366	14,538	22,790	12,598
Tonnage entered	567,792	654,236	968,034	601,540
Tonnage cleared	572,911	672,564	999,234	588,997
Total	1,140,613	1,327,100	1,967,318	1,250,537

The preceding figures demonstrate the increasing activity of Russian maritime commerce. It is proper to observe, however, that the years of 1846 and 1847 are exceptional, as the commerce of these years was simulated by circumstances which were, happily, of a transient character; and they can not, therefore, form a basis for legitimate comparison. The movements in grain alone, in 1847, augmented Russian exports upward of 640,000 tons, equivalent to an increase of 50 per cent.

COMMERCIAL SHIPPING.

	Ships arrived.		Ships sailed.	
	1850.	1851.	1850.	1851.
Baltic ports	8,423	9,710	3,545	8,751
White Sea ports	547	721	541	668
Southern ports	2,510	2,885	2,450	2,599
Caspian ports	220	227	285	306
Total	6,700	7,923	6,801	7,944
Of which				
With goods	3,659	3,258	6,433	6,891
In ballast	3,121	4,070	368	521

	1,262,740	1,168,792	1,162,164	1,162,573

The greatest number of ships were English and Russian, viz.: of the former there arrived 1875; and of the latter, 1019. Of ships arrived under other flags were: Turkish, 978; Dutch, 586; Greek, 444; Swedish, 866; Mecklenburg, 329; Russian, 299; Danish, 223; Sardinian, 210; Austrian, 191; and of other nations, 807.

These arrivals and departures were thus distributed in 1852:

Ports of	Arrived.	Cleared.
The Baltic	3627	3607
The White Sea	827	845
The Black and Azof Seas	5929	6389
The Caspian Sea	272	290
Total	8655	8507

The following table exhibits the national character of the vessels arrived:

Nationality.	No. of Vessels.	Nationality.	No. of Vessels.
England	2920	Austria	196
Russia	1125	Prussia	380
Turkey	1073	Denmark	391
Greece	660	Mecklenburg	291
Holland	513	Hanover	258
Sweden	470	France	196
Sardinia	453	Other countries	453

Steam Navigation.—The steam navigation of Russia has largely increased since 1850. In that year there visited the port of Cronstadt 82 steamers, viz.: From London, 8; Hull, 13; Dunkirk, 7; Lübeck, 26; Stettin, 24; Kiel, 2; Havre, 2; Total, 82. Two steamers maintain a regular communication between Riga, Hull, and Stettin, making monthly, sometimes semi-monthly, trips. The frigate-built steamers the *Odessa*, the *Crimea*, and the *Odessa and Kherson*, make annually 33 trips between Odessa and Constantinople, and the steamer *Peter the Great* 19 between Odessa and Galatz. Regular communication is also kept up between St. Petersburg and the ports of Finland and of the Baltic; also between Odessa, Kherson, Nicolaiief, and other ports in the south of Russia. These steamers usually make 104 voyages yearly. Two steamers connect the ports of the Sea of Azof; and communication between the ports of Russia and those of Persia is regularly maintained by national steamers. The prospectus of the new Russian Steam Navigation and Traffic Company, the statutes of which received the emperor's sanction on the 3d of August, is published very conspicuously in the *Journal de St. Petersburg*. This company, which, by the extent of its resources, and by its importance to "the regeneration of the internal and foreign trade of Southern Russia," is regarded as one likely to take rank above all other existing Russian companies, will have a capital of six millions of rubles to begin with, divided into 20,000 shares of 300 rubles each. At a future period this capital may be raised to nine millions, by the creation of 10,000 new shares, if agreed to by a general meeting of shareholders. By the 25th statute of the company, none but Russian subjects are capable of holding shares, the laws of the empire prohibiting any foreigners from taking part in the coasting trade between the Sea of Azof and the Russian Black Sea ports, which is an essential part of the company's undertaking. Like the Russian American Company, it is to be placed under the special protection of the imperial government. The objects of its establishment are defined as being "the development of the trade of Southern Russia, and of the commercial as well as the postal communications by steamboats between that part of the empire and foreign countries."

The company is bound to keep up certain lines of communication. Between Odessa and Constantinople, Athens, Smyrna, Rhodes, Beyrout, Jaffa, and Alexandria, its steamboats are to ply three times a month, as well as between Odessa, the Sea of Azof, and the Caucasian coast. If it should be deemed advisable, boats from Odessa may touch at the ports of the Crimea, and also at those of the Anatolian coast, before proceeding to Constantinople, or a line may be established from Odessa, taking in Galatz and the ports of the Principalities, and ending at Constantinople.

The company are bound, moreover, to provide for eighteen voyages in the year from Odessa to Trieste, calling at Constantinople, Syria, the Ionian Isles, and Ancona, as well as for eighteen voyages in the year from Odessa to Marseille, stopping at Constantinople, the Piræus, Messina, Naples, Leghorn, and Genoa.

The government will cede to the company, at a price to be fixed by valuation, all the steamboats belonging to the department which has conducted hitherto the postal and commercial intercourse between the different ports of New Russia, together with the wharves, warehouses, and stores belonging to that department.

The company is to be aided by the government with a subvention, calculated at so much per mile, allowed upon the voyage actually made by the company's vessels. This allowance during the first ten years will be at the rate of 5 rubles 22 kopecks for the Levant voyages, 3 rubles 40½ kopecks for the Marseille, and 4 rubles 7½ kopecks for the Trieste voyages; the allowance for the Black Sea trips will be somewhat lower. After the first ten years the subsidy will decrease regularly in each year. Above this mileage, an annual grant of 64,000 rubles is secured during twenty years.

Commerce with the trans-Caucasian Provinces and on the Caspian Sea.—The trade with the trans-Caucasian countries consists in the importation of Asiatic produce, for which European and colonial merchandise is sent in return. Silk is the principal article of import from this region, and is chiefly destined for European markets. The transit through Persia, of merchandise destined for the trans-Caucasian countries, is becoming more active each succeeding year. The establishment of regular steam packets on the Black Sea, as well as the steamboats belonging to the Volga Steamboat Company, have contributed to make Astrakhan a place of considerable importance to Russian commerce. The yearly increasing commerce of this port attests the importance of these lines of communication. In 1856 there was received from trans-Caucasian countries merchandise valued at 954,625 silver rubles, showing an increase over the imports of the preceding year of 290,482 rubles. This augmentation is to be attributed to the increased demand for the silk of these countries. In 1850 this article alone covered 239,110 rubles, while the quantity in market in 1849 reached only 69,840. The imports into Astrakhan in 1850 amounted to 453,039 rubles, against 189,694 rubles in 1849.

From Russian official statistics for 1853, the following extracts are translated:

"The position of Astrakhan on the Volga, the convenience of its port, and its proximity to the Caspian Sea, are the chief foundations of its commercial importance. The advantage of water transportation of merchandise over land conveyance, draws to this market the larger bulk of all the trade of the neighboring territory. The imports and exports of Astrakhan are thus given for 1853:

Imports	788,389 silver rubles.
Exports	1,190,148 "
Total	1,978,537 "

"This sum is, however, largely augmented, if we add the amount of the internal trade, or trade with the neighboring provinces of Astrakhan. Official returns show this trade to have been in 1853, 28,666,732 francs, or 5,446,790 dollars. The imports at Astrakhan are silk, cottons, dry fruits, and sundries. The exports are cotton tissues, iron, grains, copper, sugar, tea, and hides."

Commerce by the Lines of Orenburg and Siberia.—The commercial movements of Russia with Central Asia are prosecuted with much activity. The value of merchandise exchanged with the Tartars of this portion of Asia in 1850 reached nearly 6,000,000 rubles, showing an increase over the total trade of 1849 of 600,000 rubles. The principal imports were tea (19,070 poods), which passed through the western frontiers of China, amounting in value to 512,482 rubles (equal to 60 cents per pound nearly). In 1861 this trade maintained still greater activity. The value of merchandise imported across the lines of Orenburg and Siberia reached 3½ millions of rubles; and the exchanges, consisting of cotton and woolen cloths, loaf-

sugar, raw and tanned hides, amounted to 2,746,822 roubles. This exhibits an increase over 1850, viz.:

	Silver Roubles.
Imports from China by the frontiers of Orenburg and Siberia	210,404
Exports to China by the frontiers of Orenburg and Siberia.....	3,092,509

The principal imports were black and other teas (755,930 lbs., valued at \$487,891, or nearly 58 cents per pound), raw and spun cotton, etc.

Commerce with China at Kiachta in 1851.—This trade, as already remarked, is strictly a barter of merchandise. It takes place from the 6th of February to the 6th of April each year. In 1851 the export trade consisted of woolen cloths, value \$3,267,053 silver roubles; cotton cloths, value 1,193,713 silver roubles; Russian leather, 240,938 silver roubles; corals, 259,527 silver roubles; making a total of 4,961,226 roubles, or \$3,720,920. The imports (merchandise received in barter) were tea (122,839 chests and 26,269 small packages). For the interior of Russia there were imported at Kiachta 121,249 half chests, and 30,849 small packages of tea. The duties levied on these imports at the Kiachta custom-house amounted to 4,685,433 roubles, or \$3,504,076; an excess of \$280,560 over the receipts of 1850, and of \$615,225 over those of 1849. The duties, cost of transportation, and other incidental expenses between Kiachta and Moscow, amount to about 100 per cent. on the original cost. This would make the cost price of tea in Moscow \$1 per pound. The profit, however, is realized on the merchandise bartered, on which high and arbitrary prices are usually fixed. The tea in small packages is consumed in Siberia.

Official returns, received since the above was prepared, afford materials for bringing down a report of trade at this important point to a later period. From these it appears that the number of chests of tea (black and green) deposited by the Chinese merchants at Kiachta during the trading season of 1852 reached 100,000. There also arrived 1000 packages for consumption in Siberia. The number of pounds per chest varies; they average, however, about 60 lbs. to a chest of black tea, and about 90 lbs. to the chest of family tea. Besides tea, the Chinese also exchange sugar and sugar-candy; but these articles are usually consumed in the vicinity of Kiachta.

Of late years the Russian traders have derived immense profits from the barter of velvets and velvetens, which are in great demand among the Chinese.

The trade of 1853 presented some novel features. The announcement that 180,000 chests of tea were in transitu for Kiachta threw the market, at this point, into the greatest confusion. The merchants received weekly advices as to the state of the market at Moscow, and the great decline which teas had experienced at that time left no alternative to the merchants, in view of the heavy arrivals of teas daily expected, than to raise the prices of Russian merchandise 50 per cent. Any other course would have annihilated the profitable trade so long carried on at this place. The arrivals, however, did not exceed 67,000 chests, and the market maintained its usual tranquillity.

General Summary.—The following summary of the navigation of the different ports of Russia, in 1851 and 1852, is abstracted from official returns:

1851.—Vessels arrived.....	7,325
" cleared.....	7,949
Total tonnage, lasts.....	700,300
1852.—Vessels arrived.....	8,655
" cleared.....	8,507
Total tonnage, lasts.....	768,900

Navigation of the Volga in 1852.—The importations at Rybinsk, by the Volga, in 1852, reached in value \$75,449,000 francs, and the exportations 101,621,000 francs. The excess of exports over imports is explained by the fact that Rybinsk exports by water only, and imports by land as well as by water. The returns of imports by land are inaccessible to the statistician; but it is supposed that they would equalize the values of the imports and exports of this market.

Rybinsk is one of the most important markets in the interior of Russia. In the import trade there are employed 32 steamboats belonging to the Volga-Kama Steamboat Company; 681 canal-boats; and 8141 barks, flat-boats, etc., propelled by sails and oars. The export trade of Rybinsk (i.e., the re-exportation of merchandise) employs: By the Volga, 5765 vessels of 11 kinds; Mologa, 1779; Shekana, 2221; total, 7765.

Steam Company of the Volga.—From the report of the general meeting of this company, held 27th February [11th March], 1852, the information is gleaned, that the company was organized in 1843 with a capital of 1,400,000 roubles (\$975,000), divided into 5200 shares of 250 roubles (\$187 50) each; that it now owns (in 1852) five iron steamers, which navigate the Volga; namely, the *Sampson* and the *Hercule*, each of 77; the *Kama*, of 50; the *Volga*, of 42; and the *Oka*, of 17 horse-power. Besides these, the company owns nineteen barks and three large batanux. The capital invested in property (vessels, etc.) amounts to 1,200,000 roubles (\$900,000). In 1852 the company received for freights 384,806 roubles 90 kopecks (\$251,104 42½), besides 3215 roubles 60 kopecks (\$2411 70) interest on capital invested, which brings up their total receipts to 388,021 roubles 50 kopecks (\$253,516 12½).

	Roubles.	Kopecks.	Dollars.	Cts.
Total expenses during the year.....	171,038	45	=	134,278 58½
Total receipts.....	398,021	50	=	253,516 12½
Net receipts during the year.....	188,533	05	=	119,237 53½

This net amount was thus distributed:

	Roubles.	Kopecks.	Dollars.	Cts.
To stockholders, at 20 roubles per share.....	104,000	00	=	73,000 00*
Premium to the directors.....	7,043	45	=	5,001 30½
For reserved capital.....	47,003	00	=	33,273 42½
Total.....	158,046	45	=	111,274 73½

Extra Duties.—In addition to the rates given in the tariff, special duties are levied for the benefit of cities, etc., as follows:

At the Port of Archangel.—For the benefit of the town, ½ per cent. on the value of all imports and exports.

At Odessa.—For the benefit of the town: On wheat exported by sea, 1 cent per 5½ bushels. For the benefit of the lycium, 1½ cent per 5½ bushels, on all kinds of corn exported.

At the Port of Taganrog.—For the benefit of the city: On all merchandise passing through the scales, imported, ½ cent per 56 lbs. Exported, ½ cent per 36 lbs. On wines imported, ½ cent per 2½ gallons.

At the Port of Mariopol.—For the benefit of the city: Imports, ½ cent per peod, dry measure; ½ cent per peod, liquid measure.

St. Petersburg.—For the bridge on the Neva: On all imports, 2 per cent. on amount of duties.

Moscow.—For a similar purpose to the foregoing: On all imports via St. Petersburg, 2 per cent. on amount of duties.

The custom-houses of St. Petersburg, Archangel, and Riga allow foreign goods, imported by privileged merchants, to remain in bond without paying duty, or to be re-exported, during twelve months; if imported by others, six months.

Progress of Cotton Manufactures in Russia.—It has already been remarked, that the manufacture of cotton in the Russian empire is progressing with extraordinary activity. The number of spindles in Russia exceeds 350,000, producing annually upward of 10,800,000 lbs. of cotton yarns. The manufacture of cotton velvets, especially, is becoming highly import-

* A simple calculation will show this to be equal to 3 per cent. on the capital invested. The dividend for the year 1851 was not so large (only seven roubles, or \$5 25 per share), and consequently stock fell to 120 @ 130 roubles per share (\$90 @ \$97 50). In 1853 it again became firm, and commanded a premium.

ant to the direct trade between the United States and Russia, the raw material being almost exclusively supplied, either in the direct or indirect trade, by the former country. Formerly cotton velvets were supplied to the Chinese exclusively by the British. The Chinese now prefer the Russian manufacture; hence it has become a leading staple of barter at the Russian-frontier markets of China.

No foreign nation is allowed to participate in the coasting or internal trade of Russia—*Ordinance, September 9, 1845*. The treaties between Russia and other maritime states all contain the same terms as that between Russia and the United States of December 18, 1832; viz., the vessels of friendly nations, with cargoes in ballast, are to be regarded quite as the domestic, as to export or import, and to port or other duties, or taxes of any kind whatever; but the coasting trade is interdicted from the ports of Russia, and iron can be probably exported to the United States; and from the United States iron and coal may be advantageously imported into Russia, and vice versa.

The following table exhibits the quantities of raw and spun cotton imported into Russia during the years designated:

Years.	Raw Cotton.	Cotton Twists.	
		White.	Colored.
1840	Kilogrammes. * 11,903,000	Kilogrammes. 8,128,300	Kilogrammes. 31,000
1841	14,119,000	6,732,000	57,000
1842	20,171,000	6,825,000	56,000
1843	25,370,000	4,572,000	67,000
1844	19,610,000	4,765,000	50,000
Total	91,202,000	28,592,100	281,000
Annual average	18,253,500	5,704,400	56,200

* 100 kilogrammes=220 pounds.

The imports of raw cotton from the United States to Russia for designated periods have already been given, and it has been noticed that the circulation of cotton twists is in a ratio corresponding with the augmentation in the importation of raw cotton. Below is annexed a table, exhibiting the direct trade and navigation between the United States and Russia during the years designated.—*Comm. Rel. U. S.*

COMMERCE OF THE UNITED STATES WITH RUSSIA FROM OCTOBER 1, 1820, TO JULY 1, 1857.

Years ending	Exports.			Imports.		Whereof there was in		Tonnage cleared.	
	Domestic.	Foreign.	Total.	Total.	Export.	Import.	American.	Foreign.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Principal Ports.—Odessa, a sea-port of southern Russia, on the northwest coast of the Black Sea, between the rivers Dniester and Bug, in lat. 46° 28' 54" N., long. 36° 43' 22" E. The bay or roadstead of Odessa is extensive, the water is deep, and the anchorage is good—the bottom being fine sand and gravel; it is, however, exposed to the southerly winds, which render it less safe in winter. The port, which is artificial, being formed of two moles, one of which projects a considerable distance into the sea, and has deep water, with room for three hundred ships.

St. Petersburg, the capital of Russia, situated at the confluence of the River Neva with the eastern extremity of the Gulf of Finland, in lat. 59° 56' 23" N., long. 30° 18' 45" E. Cronstadt, situated on a small island about twenty miles west of St. Petersburg, may in some

measure be considered as the port of the latter. Almost all vessels bound for St. Petersburg touch here, and those drawing above eight feet of water load and unload at Cronstadt—the goods being conveyed to the city in lighters. The water to Cronstadt is ample, there being from twenty-four to thirty-six feet of water.

Russian Possessions in America.—The territory belonging to the Russian American Company comprehends the northwestern portion of North America, extending from Behring's Straits eastward to the meridian of Mt. St. Elias, along both the Arctic and Pacific oceans, and from that mountain southward along the coast chain of hills till it touches the coast in 54° 40' N. lat., forming an area of 391,000 square miles. The Aleutian Islands, though comprised in the Asiatic government of Irkutsk, may be considered as belonging to

this region. The settlement originated with an association of merchants, formed at Irkutsk, who obtained from the Emperor Paul the exclusive privilege of trading for peltries in the Aleutian Islands and adjacent coasts. This privilege was extended by the Emperor Alexander over all Russian America, and the charter was renewed by Nicholas in 1849. The capital and principal factory was first established at Kotlik, but the increasing scarcity of sea otters led the then governor to lay the foundation of New Archangel, which has now become the chief depot. The Russian dominion over the vast solitudes of the interior is only nominal: the interior, indeed, is a *terra incognita*, and inhabited by tribes who scarcely know the name of their lords. At the present day the Russians occupy only the islands off his coast. New Archangel, the capital, is situated on the island of Sitka, in lat. 57° 30' N., and long. 135° 13' W. It is a town of some 1000 inhabitants, and contains the Boards and warehouses of the company. The whole country is under the surveillance of a governor, who derives his authority from the company at Irkutsk. The total population of Russian America is estimated at 60,000 or 70,000, including aborigines. The commerce of this country is chiefly confined to the exportation of furs to Canton, and the import of provisions and agricultural supplies from the Puget's Sound Agricultural Company. It is of little value, being less than \$300,000 a year, and is constantly declining, consequent on the decline of the seal and otter. Bodega, on the coast of California, was formerly a Russian settlement. The British lease the continental part of Russian America for hunting purposes.

Shipping and ship-building are considerably increasing in Finland. The causes are to be sought in the increasing commerce and the general prosperity of the country, in the high prices which have been paid in the last years for the principal exports—wood articles—especially in Southern Europe, and in the high freights paid by foreigners for the employment of Finnish vessels. To encourage shipping and ship-building in Finland, the Russian government has allowed that all materials and articles which are used in ship-building, and are to be had cheaper in foreign countries, may be imported into Finland free of duty. American improvements in ship-building have, in part, already been introduced, and will probably be more generally adopted.—*Comm. Rel. U. S.*

Russia Company, a regulated company in Great Britain for conducting the trade with Russia. It was first incorporated by charter of Philip and Mary, sanctioned by act of Parliament in 1566. The statute 10 and 11 William III., ch. 6, enacts, that every British subject desiring admission into the Russia Company shall be admitted on paying £5; and every individual admitted into the company conducts his business entirely as a private adventurer, or as he would do were the company abolished.

Russia Leather (*Fr. Cuir de Russie*; *Ger. Juffen*; *It. Cuojo di Russia*; *Pol. Jachta*; *Russ. Jufft, Youft*; *Sp. Muscovita*), the tanned hides of oxen and other kine, denominated by the Russians *youfts*, or *juffs*—a designation said to be derived from their being generally manufactured in pairs. The business of tanning is carried on in most towns of the empire, but principally at Moscow and St. Petersburg. Russia leather is soft, has a strongly prominent grain, a great deal of lustre, and a powerful and peculiar odor. It is principally either

red or black: the former is the best, and is largely used in this and other countries in book-binding; for which purpose it is superior to every other material. The black is, however, in very extensive demand in Russia, large quantities being made up into boots and shoes. The process followed by the Russians in the preparation of this valuable commodity has been frequently described; but notwithstanding this circumstance, and the fact that foreigners have repeatedly engaged in the business in Russia, with the intention of making themselves masters of its details, and undertaking it at home, the efforts made to introduce the manufacture into other countries have hitherto entirely failed. One of the best tests of genuine Russia leather is its throwing out a strong odor of burned hide upon being rubbed a little.—RICARD, *Traité Général du Commerce*, tome i. p. 275, ed. 1781.

We extract from Mr. BORRISOW's work on the *Commerce of St. Petersburg* the following details with respect to this article: Russia leather forms one of the principal export commodities of St. Petersburg. But since the ports of the Black Sea have been opened, the exports of leather from this port have considerably decreased; Italy, the principal consumer, supplying its wants from Odessa and Taganrog more easily, and more expeditiously than from St. Petersburg. The whole of the exportation from the latter is to Prussia, Germany, and England. Frankfort-on-the-Maine and London are of great importance as respects the trade in Russia leather, on account of the fairs held in these cities, which are never bought on contract, but always on the spot at cash prices. It nevertheless often happens that agents—in order to secure a lot of juffs, pay a certain sum in advance, and settle for the amount at the first market prices; no prices being fixed for the months of January, February, March, and sometimes even April. Juffs are assorted or bracketed when received, according to their different qualities, into *Gave, Rosval, Malja, and Domashna*. The three first sorts are again divided into *heavy and light Gave, heavy and light Rosval, etc.* Domashna is the worst, and consequently the cheapest sort. It often happens that juffs are bought unsorted, and then the prices are regulated according as the quantity of Domashna contained in the lot is greater or less. Persons well acquainted with the nature of Russia leather prefer purchasing it in this state. Juffs are sold by the pood, which consists, as it is commonly expressed, of 4, 4½, 5, 5½, and 6½ hides. By this is understood, that so many hides make a pood, calculated upon the whole lot; and it is to be observed that the lightest juffs are esteemed the best in quality. Heavy juffs, or those of 4 and 4½ hides, are shipped for Italy; the Germans, on the contrary, prefer the lighter sort. Juffs are packed in rolls, each containing 10 hides; and from 10 to 15 of these rolls are packed together in a bundle, which is well secured by thick matting. There are red, white, and black juffs; but the red are most in demand. Their goodness is determined by their being of a high red color, of equal size, and unmixed with small hides: they must also be free from holes, well stretched, and equally thin. In a well-finished lot no thick head or feet parts should be found. If spots resembling flowers are seen on the red hides, it is an additional sign of their good quality, and they are then called *bloused juffs*. The inside should be clean, soft, and white, and, when taken in the hand, should feel elastic. The best connoisseurs of Russia leather can nearly determine the quality by the smell alone. Great attention must be paid, in shipping juffs, to secure them from being wetted, as damp air alone is sufficient to injure them. Sixty rolls of juffs make a last; 88 poods net weight, when shipped for Italy, make a last; and 44 poods a ton. The exports of juffs from Russia in 1841 amounted to 177,838 poods, and 150,951 pieces, worth together 1,538,191 silver rubles.

Rye (*Ger. Roggen, Rocken*; *Du. Rog, Rogge*; *Fr.*

At here. and to the mple. water. by unpre- ced, ex- merid- heific ng the 19 40' The e gov- ing to

Seigle; It. *Segale*, *Segala*; Sp. *Centeno*; Rnas. *Rosch*, *Sef*, *Jar*; Lat. *Secale*, according to some, is a native of Crete; but it is very doubtful if it can now be found wild in any country. It has been cultivated from time immemorial, and is considered as coming nearer in its properties to wheat than any other grain. It is more common than wheat in many parts of Europe, being a more certain crop, and requiring less culture and manure. It is the bread corn of Germany and Russia.—London's *Encyc. of Agriculture*.

Rye is supposed by some authorities to be a native of the Caspian Caucasian desert; and has been cultivated in the north of Europe and Asia from time immemorial, where it constitutes an important article of human subsistence, being generally mixed with Lurley or wheat. Its introduction into western Europe is of comparatively recent date, as no mention is made of it in the *Ortus Sanitatis*, published at Augsburg in 1485, which treats at length of barley, millet, oats, and wheat.

The production of rye has decreased 4,457,000 bushels in the aggregate; but in New York it is greater than in 1840 by about 40 per cent. Pennsylvania, which is the largest producer, has fallen off from 6,613,373 to 4,805,160 bushels. Perhaps the general diminution in the quantity of this grain now produced may be accounted for by supposing a corresponding decline in the demand for distilling purposes, to which a large part of the crop is applied.

Rye was cultivated in the North American colonies soon after their settlement by the English. Gorges speaks of it as growing in Nova Scotia in 1622, as well as of barley and wheat. Plantagenet enumerates it among the productions of North Virginia (New England) in 1648, and alludes to the mixing of it with

maize in the formation of bread. It was also cultivated in South Virginia by Sir William Berkeley previous to that year.

Geographically, rye and barley associate with one another, and grow upon soils the most analogous, and in situations alike exposed. It is cultivated for bread in northern Asia, and all over the continent of Europe, particularly in Russia, Norway, Denmark, Sweden, Germany, and Holland; in the latter of which it is much employed in the manufacture of gin. It is also grown to some extent in England, Scotland, and Wales. In this country it is principally restricted to the Middle and Eastern States, but its culture is giving place to more profitable crops.

The three leading varieties cultivated in the United States are the Spring, Winter, and Southern, the latter differing from the others only from dissimilarity of climate. The yield varies from 10 to 80, or more, bushels per acre, weighing from 48 to 56 lbs. to the bushel.

This grain has never entered largely into our foreign commerce, as the home consumption for a long period nearly kept pace with the supply. The amount exported from the United States in 1801 was 392,276 bushels; in 1812, 82,705 bushels; in 1813, 140,136 bushels. In 1820-'21 there were exported 23,523 barrels of rye flour; in 1830-'31, 19,100 barrels; in 1840-'41, 44,031 barrels; in 1846-'46, 38,530 barrels; in 1846-'47, 48,892 barrels; in 1850-'51, 44,132 barrels.

During the year ending June 1, 1850, there were consumed, of rye, about 2,144,000 bushels in the manufacture of malt and spirituous liquors.

According to the census returns of 1840, the product of the country was 18,645,567 bushels; in 1850, 14,188,687 bushels. Of this amount there was exported from New York \$2,022,362.

Sable (Ger. *Zobel*; Fr. *Zibelline*; It. *Zibellino*; Russ. *Sokol*), an animal of the weasel tribe, found in the northern parts of Asiatic Russia and America, hunted for the sake of its fur. Its color is generally of a deep glossy brown, and sometimes of a fine glossy black, which is most esteemed. Sable skins have sometimes, though very rarely, been found yellow, and white. The finer sorts of the fur of sables are very scarce and dear. A single skin of the darker color, though not above four inches broad, has been valued as high as \$60. The sable (*Mustela zibellina*, Linn.) is principally a native of the northern regions of Asia; it is hunted and killed for the Russian market, either by a single ball, a blunt arrow, or trap, by exiles or soldiers sent for that purpose, in the deserts of Siberia. The skin is in the highest perfection from November to February. A nearly allied animal, called the "fisher," inhabits North America, and is similarly sought after and destroyed for its fur.—See FUR TRADE.

Saddles (Fr. *Selles*; Ger. *Sattel*; It. *Sella*; Russ. *Silla*; Sp. *Selles*), seats adapted to horses' backs, for the convenience of the rider.

Safflower, or Bastard Saffron (Ger. *Safflor*; Du. *Safflor*, *Basterd Saffran*; Fr. *Cartame*, *Saffran bastard*; It. *Zaffron*; Sp. *Alazor*, *Azafran bastardo*; Russ. *Polcroi*, *Proutoi schafran*), the flower of an annual plant (*Carthamus tinctorius*, Linn.) growing in India, Egypt, America, and some of the warmer parts of Europe. It is not easily distinguished from saffron by the eye, but it has nothing of its smell or taste. The flowers, which are sometimes sold under the name of *saffranon*, are the only parts employed in dyeing. They yield two sorts of coloring matter: one soluble in water, and producing a yellow of but little beauty; the other is *resinous*, and best dissolved by the fixed alkalies: it is this last which alone renders safflower so valuable in dyeing; as it affords a red color exceeding in delicacy and beauty, as it does in costliness, any which can be obtained even from cochineal, though much inferior to the latter in durability. The color of safflower will not bear the action of soap, nor even that of the sun and air for a long time; and being very costly, it is principally employed for imitating upon silk the fine scarlet (*ponceau* of the French) and rose colors dyed with cochineal upon woolen cloth.

The fine rose color of safflower, extracted by crystallized soda, precipitated by citric acid, then slowly dried, and ground with the purest tale, produces the beautiful *rouge* known by the name of *rouge végétale*. Safflower should be chosen in flakes of a bright pink color, and of a small somewhat resembling tobacco. That which is in powder, dark-colored, or oily, ought to be rejected.—Hasselquist's *Voyages*, Engl. ed. p. 352; Bancroft's *Permanent Colors*, vol. i. p. 286-289; Milner's *Orient. Commerce*.

Saffron (Ger. *Saffran*; Du. *Safran*; It. *Zafferano*; Sp. *Affron*; Fr. *Azafran*; Russ. *Schafran*), a sort of cake prepared from the stigmas, with a proportion of the style, of a perennial bulbous plant (*Crocus sativus*, Linn.). When good, saffron has a sweetish, penetrating, diffusivo odor; a warm, pungent, bitterish taste; and a rich, deep orange-red color. It should be chosen fresh, in close, tough, compact cakes, moderately moist, and possessing in an obvious degree all the above-mentioned qualities. The not staining the fingers, the making them oily, and its being of a whitish yellow or blackish color, indicate that it is bad, or too old. Saffron is used in medicine and in the arts; but in England the consumption seems to be diminishing. It is employed to color butter and cheese, and also by painters and dyers.—Thomson's *Dispensatory*; London's *Encyclopedia of Agriculture*.

Sagapenum (Arab. *Sigbenu*), a concrete gum-resin, the produce of an unknown Persian plant. It

is imported from Alexandria, Smyrna, &c. It has an odor of garlic, and a hot, acrid, bitterish taste. It is in agglutinated masses, of an olive or brownish yellow color, slightly translucent, and breaking with a horny fracture. It softens and is tenacious between the fingers, melts at a low heat, and burns with a crackling noise and white flame, giving out abundance of smoke, and leaving behind a light spongy charcoal. It is used only in medicine.—Thomson's *Dispensatory*.

Sago (Malay *Sagu*; Jav. *Sagu*), a species of meal, the produce of a palm (*Metroxylon Sagu*) indigenous to and abundant in such of the Eastern Islands as produce sago, where it supplies a principal part of the farinaceous food of the inhabitants. It is produced in China, Japan, Malacca, and the South Sea Islands. The tree, when at maturity, is about 90 feet high, and from 18 to 22 inches in diameter. Before the formation of the fruit, the stem consists of an external wall about two inches thick, the whole interior being filled up with a sort of spongy medullary matter. When the tree attains to maturity, and the fruit is formed, the stem is quite hollow. Being cut down at a proper period, the medullary part is extracted from the trunk, and reduced to a powder like saw-dust. The filaments are next separated by washing. The meal is then laid to dry; and, being made into cakes and baked, is eaten by the islanders. For exportation, the finest sago meal is mixed with water, and the paste rubbed into small grains of the size and form of coriander seeds. This is the species principally brought to England, for which market it should be chosen of a reddish hue, and readily dissolving in hot water into a fine jelly. Within these few years, however, a process has been invented by the Chinese for refining sago, so as to give it a fine pearly lustre; and the sago so cured is in the highest estimation in all the markets. It is a light, wholesome, nutritious food. It is sent from the islands where it is grown to Singapore, where it is granulated and bleached by the Chinese. The export trade to Europe and India is now principally confined to that settlement.—AINSLIE'S *Mat. Indica*; CRAWFORD'S *East. Archipelago*; BELL'S *Review of the Commerce of Bengal*.

Sahara, or the Great Desert (Arab. *Zahra*), a vast region of northern Africa, extending between lat. 16° and 33° N., and long. 17° W., and 23° 10' E. Bounded east by Egypt and Nubia, south by Senegambia and Nigritia, west by the Atlantic, and north by Barbary. It consists of an elevated table-land, covered with large blocks of stone, hard-baked earth, gravel, and loose sand; and in many places it is incrustated with salt. It is the greatest desert on the globe, but numerous oases and habitable spots are scattered over its surface, the largest of which are Gadames and Tuat. It is traversed in many directions by caravan routes; travelers on which undergo the most intense sufferings from thirst, and from exposure to the *simoom*, or hot, dry wind from the south and east, which usually lasts 10 or 12 hours; during its continuance the air is impregnated with fine sand, and the sun is barely perceptible. Rain appears to fall in torrents at intervals of 5, 10, or 20 years, and many places of the desert bear evidence of its action even for a much longer period. The heat is excessive during the summer, but in winter the evenings are cool, and during night frequently cold. Palm-trees grow on the borders of the Sahara, and the chief products of its oases are dates and gums.

Sail, in Navigation, an assemblage of several breadths of canvas sewed together by the lists, and edged round with cord, fastened to the yards of a ship to make it drive before the wind. The edges of the cloths or pieces of which a sail is composed are generally sewed together with a double seam, and the whole is skirted round the edges with a cord, called the bolt-ropes. Although the form of sails is extremely different, they

are all, nevertheless, triangular or quadrilateral figures; or, in other words, their surfaces are contained either between three or four sides. The former of these are sometimes spread by a yard, as lateen sails, and otherwise by a stay, as stay-sails, or by a mast, as shrouds-of-mutton sails; in all which cases the foremost leech or edge is attached to the said yard, mast, or stay, throughout its whole length. The latter, or those which are four-sided, are either extended by yards, as the principal yards of a ship; or by yards and booms, as the studding-sails, drivers, ring-tails, and all those sails which are set occasionally; or by gaffs and booms, as the mainsails of sloops and brigantines.

Sail is also a name applied to any vessel seen at a distance under sail, and is equivalent to ship.

To set sail, is to unfurl and expand the sails upon their respective yards and stays, in order to begin the action of sailing.

To make sail, is to spread an additional quantity of sail, so as to increase the ship's velocity.

To shorten sail, is to reduce or take in part of the sails, with an intention to diminish the ship's velocity.

To strike sail, is to lower it suddenly. This is particularly used in saluting or doing homage to a superior force, or to one whom the law of nations acknowledges as superior in certain regions.—See BLUNT'S Coast Pilot; BLUNT'S Ship-master's Assistant, New York, 1857; BOWDITCH'S Navigation.

Sailing, the movement by which a vessel is wafted along the surface of the water by the action of the wind upon her sails. When a ship changes her state of rest to that of motion, as in advancing out of a harbor, or from her station at anchor, she acquires motion very gradually, as a body which arrives not at a certain velocity till after an infinite repetition of the action of its weight. The first impression of the wind greatly affects its velocity, because the resistance of the water might destroy it: since the velocity being but small at first, the resistance of water which depends upon it will be very feeble. But as the ship increases her motion, the force of the wind on the sails will be diminished; and, on the contrary, the resistance of the water on the bow will accumulate in proportion to the velocity with which the vessel advances. Thus the repetition of the degrees of force, which the action of the sail adds to the motion of the ship, is perpetually decreasing; while the new degrees added to the effort of resistance on the bow are always augmenting. The velocity is then accelerated in proportion as the quantity added is greater than that which is subtracted; but when the two powers become equal, when the impression of the wind on the sails has lost so much of its force as only to act in proportion to the opposite impulse of resistance on the bow, the ship will then acquire no additional velocity, but continue to sail with a constant, uniform motion. The great weight of the ship may, indeed, prevent her from acquiring the greatest velocity; but when she has attained it, she will advance by her own intrinsic motion, without gaining any new degree of velocity, or lessening what she has acquired. She moves then by her own proper force *in vacuo*, without being afterward subject either to the effort of the wind on the sails, or to the resistance of the water on the bow. If at any time the impulsion of the water on the bow should destroy any part of the velocity, the effort of the wind on the sails will revive it so that the motion will continue the same. It must, however, be observed, that this state will only subsist when these two powers act upon each other in direct opposition, otherwise they will mutually destroy one another. The whole theory of working ships depends upon this counter action, and the perfect equality which should subsist between the effort of the wind and the impulsion of the water.

The effect of sailing is produced by a judicious arrangement of the sails in the direction of the wind. Accordingly, the various modes of sailing are derived

from the different degrees and situations of the wind with regard to the course of the vessel.

Sailing also implies a particular mode of navigation, which is formed on the principles and regulated by the laws of trigonometry. Hence we say, Plain Sailing, Mercator's, Middle-latitude, Parallel, and Great-circle Sailing.

Saint Christopher, or Saint Kitt's, one of the British West India Islands, leeward group; lat. (Fort Smith) 17° 17' 7" N., long. 60° 42' 2" W. Length, northwest to southeast, 20 miles; breadth, 5 miles. Area, 68 square miles. Population about 25,000. The soil is particularly adapted to sugar.

Staple Productions.—Sugar, rum, molasses, arrow-root, fruits, and vegetables. The United States export to this island, and the other islands which compose this consular district, flour, grain, lumber (principally pitch-pine), and provision of all kinds. American tonnage employed in the trade with this island in 1853: 31 vessels, with an aggregate tonnage of 5070. There are no British vessels regularly engaged either in the foreign or coasting trade of this island. Hence American ships are frequently chartered to convey sugar, molasses, and other products to England, where, by reason of a protective duty on foreign similar products, they find the best market. In addition to the staples of this island, United States vessels export large quantities of old metals (as brass, iron, copper, lead) and hides. A large portion of the revenue of this island is derived from an export duty on its staple productions.

Port Regulations.—All vessels on entering pay a tonnage duty of 36 cents per ton, and a fee of \$4 to the colonial secretary. There is no pilotage tax, as the port of St. Christopher is open and free from all obstacles, such as reefs, etc. The official returns for six months, from 1st July to 31st December, 1854, will sufficiently exhibit the extent of trade between the United States and St. Christopher.

Imports from United States \$81,556
Exports to United States 14,714
Balance in favor of the United States 66,842

Saint Croix, the southernmost and largest of the Virgin Islands, and the most important of the Danish possessions. Area, 100 square miles. Population (1845), 25,600.

The commercial intercourse between this island and the United States depends partly on the mother country, and partly on local legislation fixed for the time. There are no privileges allowed other countries which are not allowed the United States. Goods may be re-shippee in American vessels. The money currently passing here is dollars and cents. Danish weight is about 10 per cent. heavier than English. The trade to this island is now less than one-third of what it was before the emancipation. Oftentimes there is not an American vessel in port for months together. The supplies come generally through St. Thomas, which is a free port, and yet under the same government.—For Geology of St. Croix, see SILLIMAN'S JOURN. XXXV. 64.

Saint Helena, an island in the south Atlantic Ocean, belonging to Great Britain, about 800 miles southeast from Ascension, and nearly 1200 miles from the coast of Lower Guinea. Lat. of observatory, 15° 55' S., long. 5° 44' E. Area, 30,000 acres. Population in 1850, 7000, of whom nearly one-half were whites. It is of volcanic origin, and consists of rugged mountains, interspersed with numerous ravines, in one of which, on its northwest shore, is James Town, the residence of the principal authorities. Its centre is a table-land, with an elevation of 1800 feet, but from which several mountain rise to a greater elevation, Diana's Peak being 2700 feet. Climate mild. Mean temperature of year, 61°-3; winter, 58°-4; summer, 63°-8. The island is watered by numerous brooks, and about a fifth part of its surface is fertile, yielding the products both of European and tropical countries. Goats are plentiful in the uplands; but supplies of provisions are mostly procured from abroad, the island lying in the homeward track of ships returning from India. St. Helena is chiefly noted as the place of exile of Napoleon Bonaparte, whose residence, Longwood, was on the elevated plateau of the interior. He lived there from 1816 till his decease, May 6th, 1821.

The United States have a consul resident at this island, which is frequently visited by our ships to and from Asia, India, Cape of Good Hope, etc. By act of 3 and 4 William IV, the island of St. Helena, and all forts, factories, and public edifices, were vested in His Majesty, and the island shall be governed by orders in council.

The average aggregate values of imports at this island from the United States are: For the year 1851, \$6429; for the year 1852, \$8377; for the year 1853, \$30,809; for the six months ending 30th June, 1854, \$12,254. Value of oil and whalebone transhipped by American vessels to the United States, \$16,525. There are no privileges permitted to the commerce of other nations which are denied to the United States; but, on the other hand, there are privileges granted solely to vessels of the United States, such as the reduction of custom charges on the transhipment of oil, whalebone, and empty oil casks, as per proclamation of September, 1853, and the remission of port charges to whaling vessels calling here within three months after their first arrival, as per notice of July, 1854, which accommodations have had their effect in the increase of the American fleet at this port. The port charges are levied alike on all foreign vessels as on British. There are no charges on national vessels, either British or foreign, and all are alike furnished with water free of charge. There is no Chamber of Commerce, and the rates of exchange depend on the parties agreeing; generally, however, they are private bills, and are taken at par; the commissariat, however, charges 1½ per cent. There are no duties except on wines, spirits, and beer; only a wharfrage tax on all goods landed from Great Britain or any foreign country. There are no price-current sheets issued, the market being unstable; and the supplies from abroad (almost entirely from England) being irregular, every thing, as a general thing, bears a high value. The American whaling fleet, after once entering this port and paying the custom fees, may return to the island at any time within three months, for water or any other supplies whatsoever, without being subject to the payment a second time of the tonnage or other custom fees; and that every facility will be given for the accommodation of the fleet.

Saint Johns, a sea-port, and capital of the island and British colony of Newfoundland, North America, near the extremity of the most eastern of the numerous

peninulas which project from the eastern portion of the island; lat. 47° 33' 6" N.; long. 52° 43' W. Population in 1850, 19,000; in 1852, 21,000 (resident), 6000 fishermen. The trade of St. Johns consists chiefly in supplying the fishermen, most of whom are Roman Catholics, with clothing, provisions, and fishing and hunting gear. The harbor of St. Johns is excellent, although narrow at the entrance; the channel, from point to point, being only 360 fathoms wide. The tide rises 5 feet, neap-tides 3½ feet, but very irregularly, being much influenced by the winds. Goods may be transhipped in United States vessels to any place out of this colony without restriction of any sort. The weights and measures are the same as in England. The moneys are in a great degree the same, namely; sovereigns, with Spanish and Mexican dollars, which, however, are now fast disappearing. The current value of the sovereign is 24 shillings, equal to \$4 80, and of the dollar 5 shillings, or 100 cents.

The average wholesale prices of the exports to the United States since July 1, 1853, have been as follows: Seal oil, 60 cents per gallon; cod oil, 55 cents per gallon; codfish, \$2 50 per quintal; herrings, \$2 40 per barrel. Salmon, not quoted above, varies from \$12 to \$20 generally for the tierce of 310 pounds. These articles are rarely sold at retail in this market. The average rate of exchange was 4 to 5 per cent. discount from this colony to the United States. The true par of exchange is 2 per cent. The duties are on imports from all countries alike, as follows: Bread, 6 cents per bag of 112 lbs.; flour, 35 cents per barrel; pork, 72 cents per barrel; beef, 48 cents per barrel; butter, 48 cents per cwt.; manufactured tobacco, 4 cents per lb.; tea, 6 cents per lb. On all unenumerated goods 5 per cent. *ad valorem*; and in this port an additional duty is levied of 10 per cent. on the duties above.

Saint Lawrence river, United States and Canada, forms the outlet of the great lakes Superior, Huron, Michigan, Erie, and Ontario, and, after a course of more than 2000 miles, flows into the Gulf of St. Lawrence. It forms the boundary, with the middle of the lakes through which it passes, between the United States and Canada, until it arrives at the 45th degree of north lat. It has different names in different parts of its course. From its mouth to Lake Ontario it is called the St. Lawrence; between Lakes Ontario and Erie, Niagara River; between Lakes Erie and St. Clair, Detroit River; between Lakes St. Clair and Huron, St. Clair River; and between Lakes Huron and Superior, St. Mary's River. It is navigable for ships of the line 400 miles, to Quebec; and for ships of 600 tons to Montreal. The distance from Montreal to Lake Ontario is nearly 200 miles. From Quebec to Montreal it has an average breadth of two miles. At its mouth, the Gulf, from Capo Rosier to Mingau settlement, in Labrador, is 105 miles in length. The elevation from tide-water to Lake Ontario (exceeding two hundred feet) is overcome by seven canals of various lengths, from 12 miles to one mile (but in the aggregate only forty-one miles of canal), having locks two hundred feet in length between the gates, and forty-five feet in width, with an excavated trunk from one hundred to one hundred and forty wide on the water-surface, and a depth of ten feet water. From Lake Ontario to Lake Erie an elevation of three hundred and thirty feet is surmounted by a canal twenty-eight miles in length, with about thirty cut stone locks one hundred and fifty feet long, by twenty-six and a half feet wide, designed for propellers and sail craft. These locks will pass a craft of about five hundred tons burden, while those on the St. Lawrence have a capacity double this amount. The total cost of this navigation may be set down at \$12,000,000. The St. Lawrence Canal was designed for paddle-steamers, which are required as tugs, or to ascend against the current; but from the magnitude of the rapids, and their regular inclination, the aid of the locks is not required in de-

scending the river. At some of the rapids there are obstacles preventing the descent of deeply-laden craft, but the government are about to give the main channel in all the rapids a depth of ten feet water, when the whole descending trade by steam will keep the river, leaving the canals to the ascending craft.—See CANADA and MONTREAL.

The relative position of the United States and Great Britain in respect to the navigation of the great northern lakes and the River St. Lawrence, appears to be similar to that of the United States and Spain, previously to the cession of Louisiana and Florida, in respect to the Mississippi; the United States being in possession of the southern shores of the lakes, and the River St. Lawrence to the point where the northern boundary line strikes the river; and Great Britain of the northern shores of the lakes, and the river in its whole extent to the sea, as well as of the southern banks of the river, from the latitude of 45° to its mouth. The claim of the people of the United States of a right to navigate the St. Lawrence to and from the sea was, in 1826, the subject of discussion between the American and British governments.

The navigation of the continuous waters of the United States and Canada is provided for in the following articles of the treaty of June 5, 1854: The third article, whose operation may be affected at the will of the American government, by a suspension of this privilege, as stipulated for in the fourth article, on the part of Great Britain, provides for a reciprocal trade, free of duty, between the United States and the British colonies, in the articles of their respective growth and produce, as enumerated in the schedule thereto annexed.

"It is agreed that the citizens and inhabitants of the United States shall have the right to navigate the River St. Lawrence and the canals in Canada, used as the means of communication between the great lakes and the Atlantic Ocean, with their vessels, boats, and crafts, as fully and freely as the subjects of Her Britannic Majesty, subject only to the same tolls and other assessments as now are or may hereafter be exacted of Her Majesty's said subjects; it being understood, however, that the British government retains the right of suspending this privilege, on giving due notice thereof to the government of the United States.

"It is further agreed, that if at any time the British government should exercise the said reserved right, the government of the United States shall have the right of suspending, if it think fit, the operation of Article 3, of the present treaty, in so far as the province of Canada is affected thereby, for so long as the suspension of the free navigation of the River St. Lawrence or the canals may continue.

"It is further agreed, that British subjects shall have the right freely to navigate Lake Michigan with their vessels, boats, and crafts, so long as the privilege of navigating the River St. Lawrence, secured to the Americans by the above clause of the present article shall continue; and the government of the United States further engages to urge upon the State governments to secure to the subjects of Her Britannic Majesty the use of the several State canals on terms of equality with the inhabitants of the United States."—WHEATON'S *International Law*. For correspondence on navigation of St. Lawrence, see *American Annual Register*, ii. 1-7; NILES'S *Register*, xxxiii. 411.

Saint Louis, city, Missouri, capital of St. Louis county, is situated on the right bank of the Mississippi, in lat. 38° 37' 28" N., and long. 90° 15' 16" W. from Greenwich, and is one of the largest and most flourishing cities in the great valley of the Mississippi. It is 1200 miles above New Orleans, and 1350 miles above the mouth of the river. About 180 miles south of the city the Ohio comes in to the Great Father of Waters, from its eastern sources in the Alleghanies, after a course of 1000 miles, while a short distance above its mouth the Cumberland and the Tennessee pour their

streams into La Belle Riviere. To the northward, 17 miles, the Missouri pours out its turbid stream into the Mississippi, and the waters flow down to the very front of the city, before the clear waters of the Mississippi yield themselves to the embraces of the great rivers of the West, coming down from the snows of the Rocky Mountains 2000 miles away. At a distance of 33 miles to the northward, the Illinois—now connected with the lakes by the Illinois and Michigan Canal—comes in from the northeast, and is navigated by St. Louis boats as far as the junction of the canal and river at La Salle, 290 miles from St. Louis. St. Louis is the centre of a great railroad system, radiating to all parts of the Union. The system, as at present planned, may be stated as follows: The Pacific Road with its branches; This road runs from St. Louis to the Merrimac River; the main line then crosses the divide between the Merrimac and the Missouri to Jefferson City, the capital of the State; thence leaving the river, it runs directly to the mouth of the Kansas River, to be extended to the Pacific, through the great chain of the Rocky Mountains. This road is 311-60 miles in length, and is finished to Jefferson City. The Ohio and Mississippi Railroad, from Cincinnati to St. Louis, was opened in 1857, 336 miles in length.

The steamboat tonnage of this city will appear from the following table. For the year ending June 30, 1853, the following cities stood entered on the books of the custom-house, as follows:

Cities.	1850.	1851.	1853.
St. Louis	24,975	34,065	45,544
Cincinnati	10,900	14,187	10,191
Nashville	3,770	8,587	3,414
Louisville	14,820	12,977	14,166

thus showing an increase at the rate of 11,000 tons per year. For the year ending December 31, 1853, the sugar landed at St. Louis was 50,774 hhd's., 13,993 bbl's., 46,257 boxes and bags; molasses, 64,933 bbl's. and hhd's. For this article St. Louis is the great central supply mart. By the government returns, all the sugar shipped from New Orleans for 1852 was 50,733 hhd's., and 6634 bbl's., while St. Louis imported 50,774 hhd's., and 13,993 bbl's. The whole imports of coffee into the United States in 1853 were 199,089,823 lbs., and of this St. Louis imported 16,714,720, or about one-twelfth. To show the business of the years 1852-1857, we give the receipts of certain articles:

Articles.	1852.	1853.	1857.
Tobacco	14,053	10,102	5,167
"	12,595	10,528	12,111
Hemp	40,122	43,350	7,350
Lead	409,314	442,218	162,500
Flour	131,333	200,203	203,061
Wheat	1,591,880	2,077,427	2,800,000
Coro	344,720	459,192	1,243,000
Oats	523,081	464,092	68,000
Barley and malt	47,294	62,857	114,000

Lard	42,515	35,168	55,000
"	11,515	16,880	15,000
Whisky	46,446	51,207	125,000
Hides	57,148	101,549	150,000
Hanging	3,080	2,326
Hale rope	42,121	58,487	44,000

Flour manufactured at St. Louis in 1851, 408,699 hhd's.; 1852, 383,184 hhd's.; 1853, 457,076 hhd's.; to this must be added receipts by wagons from country mills, 80,229 barrels, making the sum total of the flour manufactured and brought to St. Louis, 737,499 barrels. The flour manufactured in St. Louis in the year 1856 was 678,000 barrels; and in 1857, 662,000. There are sixteen flour-mills within the limits of the city. The number of steamboat arrivals in 1857 was 3115, with an aggregate tonnage of 964,700 tons. Foreign goods imported in St. Louis for the year ending December 31:

	1851.	1852.	1853.
Goods, etc.	\$873,672 59	\$1,030,473 09	\$1,400,981 40
Duties	239,318 69	290,168 85	357,616 34

—See MISSISSIPPI RIVER.

ward, 17 into the Russian empire, situated at the confluence of the River Neva with the eastern extremity of the Gulf of Finland, in lat. 59° 56' 23" N., long. 30° 18' E. Population, 480,000. This flourishing emporium was founded by Peter the Great, whose name it bears, in 1703. In the same year, the first merchant ship that ever appeared on the Neva arrived from Holland; and the czar, to mark his sense of the value of such visitors, treated the captain and crew with the greatest hospitality, and loaded them with presents. In 1714, 16 ships arrived at St. Petersburg; in 1730 the number had increased to 180; and so rapid has been the progress of commerce and civilization in Russia since that period, that at present from 1200 to 1500 ships annually enter and clear out from St. Petersburg! It is much to be regretted that, although favorable to commerce, the situation of St. Petersburg is in other respects far from good. The ground on which it stands is very low and swampy; it has on different occasions sustained great injury from inundations; and the country round is, generally speaking, a morass and forest, so that almost every thing required for the subsistence of the inhabitants must be brought from a distance. No one less bold and daring than Peter the Great would have thought of selecting such a situation for the metropolis of his empire; and none possessed of less power and resolution could have succeeded in overcoming the all but insuperable obstacles which the nature of the country opposed to the completion of his gigantic schemes.

Cronstadt, situated on a small island about 20 miles west of St. Petersburg, may, in some measure, be considered as the port of the latter. Almost all vessels bound for St. Petersburg touch there; and those drawing above 8 feet water load and unload at Cronstadt; the goods being conveyed from and to the city in lighters, the charges of which vary according to the demand at the time. The merchants' harbor at Cronstadt is fitted to contain about 600 ships; but it is exposed to the westerly winds. Cronstadt is strongly fortified, and is the principal station of the Russian fleet. Vessels bound for St. Petersburg must pass by the narrow channel to the south of the island, commanded by the fortifications of Cronstadt on the one side, and of Cronslot on the other.

Money.—Accounts are kept at St. Petersburg, and throughout Russia, in roubles of 100 copecks.

The only gold coin at present struck is the $\frac{1}{2}$ imperial, or 3-rouble piece, = 16s. sterling very nearly. The silver rouble, worth 3s. 2½d. sterling very nearly, was declared, by a ukase issued in 1839, to be worth $\frac{3}{4}$ paper roubles.

But another ukase, issued on the 14th June, 1843, directs that the old bank-note roubles in circulation, amounting to the sum of 595,776,310, being equal, at the exchange of $\frac{3}{4}$, to 170,221,803 silver roubles, should be called in, and replaced by an issue of 170,221,000 *billets de credit*, to be exchangeable at the pleasure of the holder for silver roubles. This is a most important regulation, and if it be fully carried out, the distinction between silver and paper roubles will disappear; at the same time that additional security will be given to all sorts of industrious undertakings, and to the credit of the government.

Weights and Measures.—The Russian weights are the same for gold, silver, and merchandise: viz.,

3 Solotniks = 1 Loth. | 40 Pounds = 1 Pood.
 32 Loths = 1 Pound. | 10 Poods = 1 Berkovitz.

The Russian pound contains, according to Kelly, 6318½ English grains. Hence 100 lbs. Russian = 90·26 lbs. avoirdupois = 40·93 kilog. The pood = 36 lbs. 1 oz. 11 drs., but among merchants it is reckoned = 36 lbs. According to Nelkenbrecher, 100 lbs. Russian = 90·19 lbs. avoirdupois = 40·9 kilog. = 82·8 lbs. of Amsterdam = 84·414 of Hamburg.

The principal measure for corn is the chetwert, divided into 2 osmins, 4 pajocks, 8 chetwericks, or 64 ger-

nitz. The chetwert = 5·77 imperial bushels. Hence 100 chetwerts = 72·12 imperial quarters.

In liquid measure, | 3 Wedrus = 1 Auker.
 11 The shurky = 1 Krashka. | 0 Ankora = 1 Orkhof.
 8 Krashka = 1 Wedru. | 2 Oxhoft = 1 Pipa.
 40 Wedrus = 1 Sorokovy. | In long measure,
 The Wedro = 84 English | 16 Werhok = 1 Arshen.
 who gallons. | 3 Arshen = 1 Saahen.
 18½ Bottles = 1 Wedro. | 500 Saahen = 1 Vorst.

1 sahen = 7 English feet. 1 arshen = 28 English inches. 100 Russian feet = 114½ English feet. The verst, or Russian mile, = 5 furlongs 12 poles. The English Inch and foot are used throughout Russia, chiefly, however, in the measuring of timber.—K. L. LY'S *Cambist*, art. *Russia*; NELKENBRECHER, *Journal Universel*.

The following regulations for the importation of foreign goods are strictly enforced. All goods imported must be accompanied by the following documents:

1. The declaration of the captain, according to the form ordered by the custom-house.

2. An attestation from the Russian consul, and, where there is no consul, from the custom-house of the place, of the quantity and quality of the goods, and a declaration that they are not the produce, manufacture, or property of an enemy's country.

3. Bills of lading of all goods, in which the weight, measure, or quantity of each package must be specified. In case the bills of lading are not exactly after this regulation, the goods pay double duty as a fine. In case more is found than specified in the bill of lading, the surplus is confiscated; if less is found, the duty must be paid on the quantity specified. Of wine, it is not sufficient to specify the number of pipes or hogsheads only, but also their contents in gallons, etc. Of lemons, the number in each box must be specified. Of manufactured goods, the measure of each piece must be specified, and the number of pieces in each bale. It is indifferent whether the gross or the net weight be specified. If the packages be all of the same weight, measure, or contents, a general specification will do; as, for example, 100 casks alum, of 17 lipound each. Of dye-woods the weight of the whole need only be mentioned. Of goods of small bulk, as pepper, etc., it is sufficient to state the weight of every five or ten bales, but with specification of the numbers. There must not be any erasures or blots in the bill of lading. All goods not accompanied by these documents, or where the documents are not according to the above regulations, will be sent back. Bills of lading may be made out either to some house or to order.

The following charges have been fixed by the merchants of St. Petersburg:

Commission on sales and purchases	Per Ct	2
Extra charges on all goods	1	1
Commission and extra charges for goods delivered up	2	2
Brokerage on sales and purchases	1	1
DUTY ON BILLS.		
Ditto on freight, per ton, 60 copecks	1	1
Stamps	1	1
Charges on duty, paid inward	4	4
Ditto, paid outward	4	4
Commission for collecting freight, or average inward	3	3
Commission for procuring freight outward	2	2
For clearances, 40 roubles		
Dues to be paid to the Church, 10 roubles each vessel.		
Clearing of ships of or under

Bills drawn in Russia, and payable after date, are allowed 10 days' grace; but if payable at sight, 3 days only. Sundays and holidays are included in both cases. The Julian calendar, or old style, is still retained throughout Russia. This is 12 days later than the new style; and in leap-years, 13 days, after the month of February.

Port Charges.—The regular charges which ships have to pay at the ports of St. Petersburg and Cronstadt comprise the following fixed dues and expenses; viz., lastage, passes, clearing at Cronstadt, address money, St. Petersburg and Cronstadt church money, Cronstadt expedition and allowance to the Russian Company's agent, for all which a charge is made in the ship's account in one sum, proportionally to the ship's register tonnage, according to the following scale: viz.,

Tons Register.	Silr. Roub.	Tons Register.	Silr. Roub.

Trade, etc.—St. Petersburg has the most extensive foreign trade of any city in the north of Europe. This arises from its being the only great maritime outlet on the Gulf of Finland, and from its vast and various communications with the interior of the country. Few countries have such an extent of internal navigation as Russia. The iron and furs of Siberia, and the teas of China, are received at St. Petersburg by rivers and canals via the Caspian; but owing to the great distance of those countries, and the short period of the year during which the rivers and canals are navigable, they take three years in their transit. Immense quantities of goods are also conveyed during winter upon the ice, in sledges, to the different ports, and to the nearest *pristans*, or places in the interior where barks are built for river or canal navigation. They are put on board in anticipation of the period of sailing, that the barks may be ready to take advantage of the high water, by floating down with the current as soon as the snow and ice begin to melt. The cargoes carried up the river into the interior during summer are pri-

pally conveyed to their ultimate destinations by the sledge roads during winter. The conveyance by the latter is generally the most expeditious; and it, as well as the internal conveyance by water, is performed at a very moderate expense. The barks that come from the interior are mostly of a very rude construction, flat-bottomed, and seldom drawing more than 20 or 30 inches water. When they arrive at their destination, they are sold or broken up for fire-wood. Those that leave the ports for the interior are of a superior description, and are comparatively few in number; the commodities imported being at an average, of much greater value relatively to their bulk and weight than those that are exported.

Principal Articles of Export.—The principal articles of export are tallow, hemp, and flax; grain, particularly wheat; linseed, timber, copper; lides, potashes, bristles, hemp-seed oil, furs, leather; fox, hare, and squirrel skins; canvas and coarse linen, cordage, caviare, wax, isinglass, quills, tar, etc. Tallow, both for candles and soap, is more largely exported from this than from any other port in the Baltic or elsewhere, and is an article of great commercial importance.—See TALLOW. Hemp is of good quality, though inferior to that of Riga: it is assorted, according to its quality, into *clean*, or *brsts*; *outshot*, or *seconda*; and *half-clean*, or *thirds*. The first sort should be quite clean, and free from spills; the second is less so; and the third, or *half-clean*, contains a still greater portion of spills, and is, besides, of mixed qualities and colors. Russian flax is much esteemed for the length of its fibre; it is naturally brownish, but becomes very white after the first bleaching. Three qualities are distinguished; viz., 12 head, 9 head, and 6 head. Iron of good quality, and preferable to that from the other Russian ports, is of two kinds, old and new sables, the former being the best. It used to be exported in considerable quantities; but the shipments are now much reduced.

Commerce.—The total value of the exports of St. Petersburg in 1852 amounted to nearly \$30,000,000. A considerable augmentation was experienced in certain descriptions of merchandise. The quantities of wool and copper more than tripled, and of wheat and flax-seed oil more than doubled the quantities exported during the year 1850. Potashes increased 50 per cent.; on the other hand, oats decreased ½, peltries ¾, iron ¼, tallow 25 per cent.; flax-seed, hemp, and woven goods more than 10 per cent. Sugar, tobacco, salt, wines, silk, and cotton yarns also fell much below the usual importations. An augmentation, however, was noted in the importation of fruits, rice, raw cotton, and Champagne wine.

Notwithstanding a heavy expenditure was applied by the Russian government to the improvement of St. Petersburg as the commercial emporium of Russia, still, owing to the numerous difficulties encountered, and the severity of the climate allowing but six months in the year for the continuance of these works, the result by no means realized the expectations of the government. The consequence was, that the low waters in the rivers, and the almost total absence of water in the canals, kept back the produce usually forwarded from the interior. It was not until toward the end of July that the trade of St. Petersburg exhibited any briskness. During the month of May, several British vessels arrived and cleared in ballast; but in the latter part of July and August freight offered in great abundance, although the arrivals were numerous. From this period the trade continued unusually brisk until early in November, when the navigation closed.

Subjoined is a statement of the principal exports from St. Petersburg in 1852:

TALLOW. To England.....	1,561,982 pounds.
Other countries.....	172,844 “
Total.....	2,037,826 “
Average price:	
31 roubles 71 kopecks per berkowitz = 7½ cents per lb., nearly.	

FLAXSEED. To England	145,860 tchetwerts.
Other countries	57,534 "
Total	203,394 "
Average price, 83½ cents per bushel, nearly.	
FLAX. To England	513,730 poods.
Other countries	57,102 "
Total	571,832 "
Average price for best, 4½ cents per pound, nearly.	
Hemp—1st quality. To England	1,000,976 poods.
United States	125,350 "
Germany	80,828 "

Sweden, etc.	16,486 "
France	6,292 "
United States	3,974 "
Total	215,389 "
" 3d quality—To England	118,649 "
Germany	118,274 "
Sweden, etc.	22,521 "
United States	7,081 "
France	746 "
Total	267,271 "
Average price, 1st quality, 5 cents per pound, nearly.	
2d " 4½ " " "	
3d " 4½ " " "	
CLORNS—canvas for sails.*	
To United States	4,914 pieces.
Germany	3,785 "
England	1,610 "
France	5 "
Total	10,395 "
" Flemish woolens:	
To Germany	4,030 "
United States	1,304 "
France	7 "
Total	5,341 "
" Raven's-duck:	
To Germany	7,871 "
United States	7,850 "
Sardinia	3,448 "
England	1,978 "
Italy	298 "
France	80 "
Total	20,625 "
Average prices:	
Sail-cloth (best quality), 18 roubles per plecto = \$19 00	
Flemish woolens " 9 " " = 6 75	
Raven's-duck " 6 r. 50 kop. " = 4 87½	
BRISTLES. To England	42,443 poods.
United States	8,439 "
France	7,495 "
Sweden	194 "
Other countries	62,146 "
Total	121,317 "
Average price:	
Okalka, 40 a 47 r. per pood = \$30 a \$25 25 per 36 pounds, or 97½ cents per pound; second quality do., 30 r. per pood = \$22 50 per 36 pounds, or 62½ cents per pound.	
Sonchaya, 20 r. per pood = \$16 00 per 36 pounds, or 41½ cents per pound; 2d quality do., 10 r. per pood = \$7 50 per 36 pounds, or 20½ cents per pound.	
HORSE TAILS AND HAIR:	
To Germany	2,867 poods.
United States	2,078 "
France	1,760 "
England	1,413 "
Sweden, etc.	1,912 "
Total	9,756 "
Average price:	
3 r. 50 kop. per pood = \$2 62½ per 36 lbs., or 7½ cents per lb.	
ISTINGLASS.† To England	2,545 poods.
Germany	1,169 "
France	761 "
Total	4,475 "
Average price:	
1st quality, 140 r. per pood = \$105 per 36 pounds, or \$2 92 per pound, nearly; 2d quality, 100 a 120 r. per pood = \$75 a \$90 per 36 pounds, or \$2 08½ a \$2 50 per pound.	

* Sail-cloth is of variable length and width. The pieces of Flemish woolens are usually 50 archins long, by 1½ wide. Raven's-duck usually the same length, but only one archin wide.

† The supply of this article was so small, and the demand so brisk, as to create the most active competition. This is usually the case.

WOOL. To England	40,260 poods.
France	41,363 "
Germany	17,530 "
Italy	3,105 "
Total	102,258 "

Prices ranged at 9, 10, and 12 roubles per pood = \$0 75, \$1 50, and \$9 per 36 pounds, or 18½, 20½, and 25 cents per pound.

The foregoing were the principal exports from St. Petersburg in 1852, and they are given in detail, inasmuch as they constitute, together with iron, copper, timber, grains, Russian leather, quilts, etc., the leading staples of this great commercial emporium.

Navigation of the Neva in 1852.—The following table exhibits the navigation of the Neva (i. e. of St. Petersburg and Cronstadt) in 1852:

Nationality.	Vessels.	Tonnage.	Per Centage on the Whole.
English	1150	326,448	54.22
Russian	222	62,570	10.59
Prussian	205	44,306	7.50
Dutch	365	38,915	6.58
United States	66	27,284	4.52
Swedish	112	16,522	2.85
Danish	152	16,200	2.76
French	113	13,913	2.35
Sardinian	42	11,612	1.96
Norwegian	84	9,256	1.57
Lübeck	69	7,180	1.20
Hanoverian	118	7,052	1.20
Mecklenburg	54	6,244	1.06
Oldenburg	64	5,709	.97
Bremen	10	1,008	.27
Hamburg	14	1,536	.26
Portuguese	2	272	.04
Total	100.00

It is proper to observe that the percentage is predicated upon the actual entries. Seventy-six of the vessels mentioned in the table wintered at St. Petersburg, and do not, of course, enter into the calculation. These were:

English	21	Lübeck	6
Bremen	1	Norwegian	2
Danish	6	Prussian	3
French	1	Russian	7
Hanoverian	2	Swedish	3
Dutch	24	Total vessels	76
Aggregate tonnage	12,034

Messenger*, xv. 427; *Democratic Review*, xi. 151; *British and Foreign Review*, viii. 33; *Blackwood's Magazine*, lxx. 151; *Foreign Quarterly*, xxviii. 398. For an account of the commercial policy of Russia and the general statistics of trade, see *Russia*.

Saint Thomas, a Danish West India Island, Virgin group, three miles west of St. Johns. Latitude of west extremity, 18° 20' N., long. 64° 55' W. Area, 43 square miles. Population (1847), 12,800. Soil poor. The principal products are sugar and cotton.

The commercial intercourse of the United States with this island is dependent partly on the action of Denmark, and partly on the colonial government. The present commercial regulations are not fixed for a definite period, but may be changed at any time by the recommendation of the colonial council, approved by the Ministry and King of Denmark. There is, however, no change contemplated. By the existing laws and regulations, all nations, including the mother country, are placed on the same footing in their commercial intercourse with this island, except as to the tonnage duties on vessels entering and clearing at this port, which are: on all European vessels, 45 cents per ton; on all others, including American, 19 cents. The distinction is probably made to encourage the introduction of provisions, rather than the dry goods, fancy articles, and liquors imported from Europe. The transshipment in vessels of the United States of goods to ports in Denmark, the Danish colonies, or to a foreign port, is permitted without any privileges or restrictions not granted to or imposed on Danish vessels, or the vessels of any other nations. The moneys, weights,

and measures known and in common use in this island are the same as those established by the supreme law of the mother country, yet the gold and silver coins of the United States and the doubloons of Mexico are also in common use; the latter is worth \$16. The notes of the "Bank of St. Thomas" (a private institution not incorporated) and the notes of the Colonial Bank, issued in \$5, \$10, \$50, and \$100, redeemable in gold and silver, according to the standard value of the currency of the United States, form also a considerable part of the colonial circulation.

The navigation between the United States and St. Thomas, as shown by Consular Returns, was: entered in 1851, 375 vessels, 71,410 tons; cleared, 366 vessels, 69,847 tons; total, 741 vessels, 141,257 tons. Entered in 1852, 368 vessels, 69,490 tons; cleared, 361 vessels, 68,451 tons; total, 829 vessels, 137,941 tons.

St. Thomas is the central station for packets in general, and for the steam communication between Southampton and the West Indies.

Sal Ammoniac. The manufacture of this salt may be traced to the remotest era. Its name is derived from Ammonia, or the temple of Jupiter Ammon, in Egypt, near to which the salt was originally made. Sal ammoniac exists ready formed in several animal products. The dung and urine of camels contain a sufficient quantity to have rendered its extraction from them a profitable Egyptian art in former times, in order to supply Europe with the article. In that part of Africa, fuel being very scarce, recourse is had to the dung of these animals, which is dried for that purpose by plastering it upon the walls.

Salep, a species of powder prepared from the dried roots of a plant of the orchis kind (*Orchis mascula*, Linn). That which is imported from India is in white oval pieces, hard, clear, and pellucid, without smell, and tasting like tragacanth. As an article of diet, it is said to be light, blood, and nutritious.—AINSLIE'S *Mat. Indica*; MILNEBURN'S *Oriental Commerce*.

Salmon (Ger. *Lachs*, *Salm*; Fr. *Saumon*; It. *Sermone*, *Salmone*; Sp. *Salmon*; Russ. *Leugis*). This excellent fish is too well known to require any description. It is found only in northern seas, being unknown in the Mediterranean and other warm regions. In this country it is an article of much value and importance. It is said to be exceedingly abundant in Japan and Kamtschatka.

Great Britain.—Such salmon as are taken in estuaries or rivers are, of course, the property of those to whom the estuaries or rivers belong, the fisheries in them frequently letting for very large sums; but of late very considerable quantities of salmon have been taken in bays and in the open sea, where the fishing is free to any one who chooses to engage in it. The London market, where the consumption is immense, has been since 1790 principally supplied from the Scotch rivers. The Tweed fishery is the first, in point of magnitude, of salt in the Kingdom; the lake is sometimes quite unproductive, several hundreds having been frequently

taken by a single sweep of the net! Salmon are dispatched by steamers or fast-sailing vessels from the Spey, the Tay, the Tweed, and other Scotch rivers, for London, packed in ice, by which means they are preserved quite fresh. When the season is at its height, and the catch greater than can be taken off fresh, it is salted, pickled, or dried, for winter consumption at home, and for foreign markets. Formerly, such part of the Scotch salmon as was not consumed at home was pickled and kitted after being boiled, and was in this state sent up to London under the name of Newcastle salmon; but the present method of disposing of the fish has so raised its value, as to have nearly deprived all but the richer inhabitants in the environs of the fishery of the use of salmon. There are considerable fisheries in some of the Irish and English rivers, but inferior to those of Scotland. The Scotch salmon fisheries seem to have attained their maximum value toward the end of the last war, when the fisheries in the Tweed were let for from £15,000 to £18,000 a year! and those of the Tay, Dee, Spey, etc., were proportionally valuable. But the value of the Scotch salmon fisheries has, speaking generally, declined greatly of late years; in consequence, partly and principally, of a diminished supply of fish in the rivers, but in some degree, also, from the greater facility of the communication between London and Liverpool, and the consequent importation of Irish salmon into the London markets.—*General Report of Scotland*, vol. III. p. 327.

This fishery in Canada, at the present time, is very small. In 1786, however, the export was considerable. In parts of the country where, in former years, the catch was large, a few barrels of pickled salmon only were shipped in 1848. In the Gulf of St. Lawrence there were once extensive establishments for the prosecution of this business; but some have been broken up, and others have become unprofitable. Streams that half a century ago afforded sufficient for domestic consumption, and thousands of barrels for export, now yield only hundreds of barrels, and the quantity is rapidly diminishing.

Nova Scotia.—The loyalists, who went to this colony at the peace of 1783, depended very much upon this fishery, and carried it on to advantage. The quantity of salmon exported for some years was sufficient to purchase many articles of comfort, and to save them at times from the miseries of pressing want. The salmon has entirely disappeared in some parts of the colony, and has ceased to be plentiful in all of its rivers and streams. The export of salmon caught in the colony is not large. The whole produce of the fishery in 1851 appears to have been but 1669 barrels.

Newfoundland.—The fishery is still worthy of attention, as reference to the accompanying statistics will show. The export in 1843 was even larger than in 1811.

Labrador.—Captain Henry Atkins, of Boston, who made a voyage to Davis's Straits in the ship *Whale* in 1729, and who visited the coast a second time in 1758, found salmon very abundant. In Salmon River both he and his men caught many while wading, and with their hands. They took all they had salt to cure, and one that measured four feet ten inches in length. Atkins's account, after his return, seems to have induced no attention to the fishery on the part of his townsmen. In 1811 the exports amounted to 2130 tierces of the pickled fish, of the value of \$35,650.

New Brunswick.—The loyalists and other early settlers found the salmon in almost every river and stream in the colony. At present it is never seen in some, is becoming scarce in most, and is of importance as an article of export in the St. Johns alone.

The catch at Salmon Falls, in the St. Croix, thirty years ago, was two hundred in a day, on the average, for three months in a year. A person standing on a "jam of logs" caught there at one time one hundred and eighteen with a dip-net; and a boy fifteen years

old took about five hundred in a season. But such has been the decline, that it is said only two hundred were taken during the entire year of 1850 by all who engaged in the business on the river. It is stated that the dams erected across the river have produced this change in the fishery, and facts appear to sustain the position. The few salmon that now appear in the Oromocto, the Nashwaak, the Maduxnakag, and the Mispech, as well as in Emerson's and Gardner's creeks, in Great Salmon River and Goose Creek, is attributed to the same cause. In two or three of the streams of minor size, where no obstructions exist, and where the water is not muddy, the pursuit is still attended with some success and profit.

In some other places, the fishery, but for the wanton and lawless destruction of the fish, without reference to its condition or the season of the year, might be carried on advantageously.

To the people of the city of St. Johns the annual catch of salmon is a source of gain. The fisheries of the harbor, by a provision in the city charter, belong to the citizens, or "freemen." The fishing grounds or stations are lotted out, and sold at auction every year for the benefit of those who are entitled to them under the charter. The practical fishermen are the purchasers. The lots are of unequal value, and some merely nominal. The number of salmon taken at St. Johns in 1850 was estimated at 32,000, which sold, whether large or small, at the contract price of one dollar each—except a small part for city consumption—to be packed in ice and sent to Boston. Drift-nets and weirs are used in the fishery, though the former are prohibited by law. Fishermen deprecate the use of torch and spear; but both are sometimes seen in the hands of lumbermen and gentlemen sportsmen. The salmon is found on the St. Johns, two hundred miles from the sea, and on several of its tributaries nearer to the ocean. On the Nerepis, one of its branches, on which no mill-dams have been erected, there is a fishery of note—from 1500 to 2000 being taken annually.

It will be seen that the exportation of cured salmon from New Brunswick ceased entirely in 1818—the whole catch, not required for consumption, having been packed in ice, and shipped fresh.

—SABINES' American Fisheries.

Salonica, a large city and sea-port of European Turkey, at the northeast extremity of the gulf of the same name, lat. 40° 38' 47" N., long. 22° 57' 13" E. Population estimated at 60,000 to 75,000.

This city, originally called Therna, and afterward Thessalonica, is celebrated both in sacred and profane history. It was visited by St. Paul, who has addressed two of his epistles to the Thessalonians. In the days of its prosperity it had an amphitheatre, an extensive hippodrome, numerous temples and triumphal arches, the ruins of which sufficiently attest its ancient splendor.—CLARKE'S *Travels*, vii. 441—478, 8vo ed.

Being the principal emporium of Macedonia, Salonica has always had a considerable trade; and to this circumstance may be ascribed its continued and comparatively prosperous existence, notwithstanding the many vicissitudes it has undergone.

There is no port at Salonica, but there is excellent anchorage in the roads opposite to the town. The access to them is by no means difficult, and pilots are seldom employed. Vessels anchor very near the walls of the town, though it is prudent not to come too close in, owing to the number of small craft at anchor. The depth of water a cable's length from the shore varies from 3½ to 4, and at two cables' length from 7 to 8 fathoms, whence to Cape Carabourum it varies from 12 to 17 fathoms. There is very little rise. Owing to the rivers which empty themselves into the Gulf, the currents setting out are at times strong, and in light winds sufficient to impede the way of the vessel. Next to Constantinople, Salonica is the most important port of Turkey in Europe. In 1850 its maritime commerce reached upward of \$3,500,000; viz., about \$2,000,000 for imports, and \$1,500,000 for exports.

The foreign trade of this port is chiefly engrossed by the British and French flags. The imports consist chiefly of cheap cottons and woollen cloths, and various other manufactures. Its exports are wheat, barley, maize, timber, wool, sponge, raw silk, wine, sesamum seed, tobacco, and staves. Colonial produce and manufactured goods are applied to this port—the former

William III. In 1798 they amounted to 5s. a bushel; but were subsequently increased to 15s. a bushel, or about *thirty times* the cost of the salt! So exorbitant a duty was productive of the worst effects; and occasioned, by its magnitude, and the regulations for allowing salt duty free to the fisheries a vast deal of smuggling. The opinion of the public and of the House of Commons having been strongly pronounced against the tax, it was finally repealed in 1823.

The duty on salt imported into the United States is 15 per cent. by the act of March 3, 1857.

United States.—The following comprehensive account of the manufacture and consumption of salt in this country was written in answer to a request for the statistical information it contains, for the use of a committee of the British Parliament. Its author is a prominent salt merchant of New York, and thoroughly conversant with the subject:

New York, April 23, 1857.

DEAR SIR,—I have received your letter of the 20th instant, in which you solicit information respecting the manufacture of salt, the quantity made in the United States at each of the works, the rates of freight to the principal ports, the toll paid on domestic and also on foreign salt on our State canals, etc.

The interest I feel in the salt trade of this country prompts me to take some pains to give you the required information. Yet the short time I have had since the receipt of your letter precludes me from answering your several inquiries with perfect satisfaction to myself in regard to their accuracy.

I will, however, venture to give you the following statistics, which, from the best information I have been able to obtain, I believe to be mainly correct:

ESTIMATED QUANTITY OF SALT MANUFACTURED IN THE UNITED STATES PER ANNUM.	
	Bushels.
In the State of Massachusetts (mostly in vats built along the sea-shore).....	46,000
In the State of New York (Onondaga County), about.....	6,000,000
In the State of Pennsylvania (Alleghany and Kiskiminetz rivers).....	900,000
In the State of Virginia (Kanawha and Kings Works).....	3,500,000
In the State of Kentucky (Hooch Creek).....	250,000
In the State of Ohio (Muskingum, Hoeking River)	500,000
In the State of Ohio (Pomeroy and West Columbia).....	1,000,000
In the State of Illinois.....	50,000
In the State of Michigan.....	10,000
In the State of Texas.....	20,000
In the State of Florida.....	100,000
Total.....	12,876,000

There are salt lakes in the United States territories—one in the southwesterly part of Texas and one or more in Utah—where salt of good quality is found in great abundance. Nearly all of the salt manufactured in the United States is made by boiling, excepting what is made in Massachusetts, Florida, and the Solar Works at Onondaga. The amount of salt manufactured at the Solar Works of Onondaga in 1856 was 709,391 bushels. The amount of salt manufactured in kettles in Onondaga in 1856 was 5,258,419 bushels. When the works (at Onondaga) are generally running, they require 3,000,000 gallons of brine daily, and the supply is not less than 2,000,000 gallons per day for six months. The annual report of V. W. Smith, Esq., the State Superintendent of the Onondaga salt springs, which I herewith hand you, furnishes valuable information in regard to the manufacture of salt, the saline deposits within our State, and such other general information pertaining to this necessary article of animal subsistence, as to render it one of the most accurate and interesting public documents published in our country.

The wells in the Virginia salt springs are about 900 feet deep. The wells at Pomeroy and West Columbia are from 1000 to 1200 feet deep. The estimated quantity of foreign salt consumed in the United States and territories is about 13,500,000 bushels per annum. The amount of salt consumed in the United States (for va-

rious uses) is about sixty pounds to each inhabitant. The consumption in France is estimated at 21½ pounds; in Great Britain at 25 pounds for each inhabitant. The cost of manufacturing salt by boiling in Onondaga, as per estimate, during five consecutive years, averages about \$1 per barrel of 280 pounds. The freight charged on our canals on domestic salt, in barrels of 280 pounds each, from Onondaga to Buffalo, 198 miles, is about 15 cents per barrel over the toll paid to the State, which is one mill on 1000 pounds per mile in the canals. To Oswego, 35 miles, the freight is about six cents per barrel over the toll.

The freight on foreign and domestic salt from Albany to Buffalo, 364 miles, is about \$3 per ton (of 2000 pounds) over the toll. Freight from Albany to Oswego, about 209 miles, is \$2 per ton over toll. The freight from New York city to Oswego and Buffalo via Albany is precisely the same as though shipped at Albany, although 148 miles farther.

The toll on foreign salt on our State canals is five mills on 1000 pounds per mile. The freight on a barrel of salt from Oswego to the principal ports on Lake Erie (average distance about 450 miles) is 12 cents per barrel. The freight to the principal ports on Lake Michigan, distance about 1000 miles, is 25 cents per barrel. The freight from ports on Lake Erie (say Cleveland and Toledo) to the Ohio River and Cincinnati is 50 cents per barrel. The freight from Chicago to the Mississippi River and St. Louis is 50 cents per barrel. The minimum price of salt at the Onondaga works in 1849, '50, and '51 was from 70 to 90 cents per barrel; in 1852, \$1 per barrel; in 1853, \$1 12; in 1854, \$1 25; in 1855, \$1 30; and in 1856, \$1 40 per barrel. The solar salt costs about the same price to manufacturers as boiled salt. The solar salt weighs about 70 pounds to the bushel (measure). The boiled salt weighs about 56 pounds to the bushel, varying, however, according to the position of the kettles, to a weight considerably above and also considerably below this standard. The duty paid to the State of New York on salt manufactured at Onondaga is always reckoned on 56 pounds (the statute bushel), and covers the expense incurred by the State for pumping up the water and delivering it to the premises of the manufacturers.

A salt block at Onondaga, of the largest size, is made of brick about 12 to 15 feet wide, four to five feet high, and forming two parallel arches, extending the whole length of the block. Over and within the top of these arches are placed common cast-iron kettles, holding about 50 to 70 gallons of brine, placed close together in two rows the whole length of the arches. A fire built in the mouth of the arches passes under each kettle into a chimney, built generally 50 to 150 feet high, averaging from 50 to 70 kettles in each block. A single block with one row of kettles is about half of this width. The quantity of salt made in one of these double blocks in the year (say eight months) averages 20,000 to 25,000 bushels of 56 pounds. The cost of a bushel of salt produced at Kanawha is about 17½ cents. The price of freight on a sack of Liverpool salt from New Orleans to Louisville averages about 35 cents per sack. A good portion of the coarse, hard salt imported into the United States from the most southerly islands of the West India group is kiln-dried, cleansed, ground very fine, and put in small packages for culinary or dairy use. The amount of coarse and fine salt imported into the United States from foreign countries for the year ending June 30, 1856, was 15,435,864 bushels. The amount of domestic salt exported during the year ending June 30, 1856, was 638,458 bushels. The amount of foreign salt exported during the year ending June 30, 1856, was 126,427 bushels.

Yours, truly,

SAMUEL HOTALING.

Patents were issued by the United States Patent Office in 1856—1. For improvement in apparatus for evaporating salt. 2. Improvement in apparatus for solar salt evaporation. 3. Improvement in salt evaporators.

The whole amount of salt inspected on the Onondaga salt springs during the year 1856 was 5,968,810 bushels. This is about 120,000 bushels short of the inspection of 1855, but exceeds, however, that of any previous year, being 130,000 more bushels than were returned in 1854. In the ordinary course of events, considering the increase of population in the Western markets for Onondaga salt, and the additional facilities of

transportation constantly brought into use, the inspection for 1856, according to the official Reports, ought to have reached 6,500,000 bushels. The two principal causes producing the deficiency may be found in a more stringent state of the money market during the whole season, and in the enhancement of the price of salt at the works—\$1 40 per barrel in 1856 against \$1 30 in 1855. The amount of salt actually manufactured in 1856, and either sold and shipped or remaining in original hands, is considerably in excess of the manufacture of any former year. The inspection indicates very accurately the amount of sales, as no more is inspected during the manufacturing season than what is required to fill orders. The arrivals of Onondaga salt at Oswego in 1856 were 3,483,987 bushels, against 3,039,593 in 1855—an increase of 444,394 bushels. The arrivals at Buffalo in 1856 were 1,081,767 bushels, against 1,947,928 in 1855—a decrease of 866,171 bushels. The arrivals at all the lake ports in 1856, compared with those in 1855, show a decrease of 211,778 bushels.

Saltpetre, or Nitrate of Potash (Ger. *Salpeter*; Fr. *Nitre, Salpêtre*; It. *Nitro, Salnitro*; Sp. *Nitro, Salitre*; Russ. *Selenitra*; Lat. *Nitrum*; Arab. *Ublir*; Hind. *Shoruk*), a salt well known in commerce, and of great importance. It may be regarded both as a natural and an artificial production; being found on the surface of the soil in many parts of India, Egypt, Italy, etc.; but in these and other places all that is known in commerce is obtained by an artificial process, or by lixiviating earth that has been formed into nitre beds. The saltpetre consumed in England is brought from Bengal in an impure state, but crystallized in bags, each containing 164 lbs. Saltpetre forms the principal ingredient in the manufacture of gunpowder, and is used in various arts. It is also of great utility in the commerce of India, from its furnishing a large amount of dead weight for the shipping engaged in it. Saltpetre possesses considerable antiseptic power, that which is of the best quality and well refined is in long, transparent crystals; its taste is sharp, bitterish, and cooling; it flames much when thrown upon burning coals; it is very brittle; specific gravity, 1.933. It is not altered by exposure to the air.

Beckmann contends, in a long and elaborate dissertation (*Hist. of Invent.*), that the ancients were unacquainted with saltpetre, and that their *nitrum* was really an alkaline salt. But as saltpetre is produced

naturally in considerable quantities in Egypt, it is difficult to suppose that they could be entirely ignorant of it, though it would appear that they had confounded it with other things. It has been known in the East from a very early period. Beckmann concurs in opinion with those who believe that gunpowder was invented in India, and brought by the Saracens from Africa to the Europeans, who improved its manufacture, and made it available for warlike purposes.

The Mammoth Cave in Kentucky was used as a place for the manufacture of saltpetre during the war of 1812. The soil in the cave is thoroughly impregnated with saltpetre; but in consequence of the difficulty of transportation, the manufacture has been abandoned.

IMPORTS OF SALTPETRE INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence imported.	Crude.		Refined, or partly refined.

Salvage, as the term is now understood, is an allowance or compensation made to those by whose exertions ships or goods have been saved from the dangers of the seas, fire, pirates, or enemies.

The property and justice of making such an allowance must be obvious to every one. It was allowed by the laws of Rhodes, Oleron, and Wisly; and in this respect they have been followed by all modern maritime states. At common law, the party who has saved the goods of another from loss or any imminent peril has a *lien* upon them, and may retain them in his possession till payment of a reasonable salvage.

Salvage upon Losses by Perils of the Sea.—In fixing the rate of salvage, regard is usually had, not only to the labor and peril incurred by the salvors, but also to the situation in which they may happen to stand in respect of the property saved, to the promptitude and alacrity manifested by them, and to the value of the ship and cargo, as well as the degree of danger from which they were rescued. Sometimes as large a proportion as a *half* of the property saved has been allowed as salvage; and in others not more than a *tenth*.

Parties entitled to salvage are all those who have contributed to the safety, either by personal exertions or by summary sacrifices, provided it did not fall within the course of their regular duty to make the exertions or sacrifice. Thus neither the master nor seamen of the ship in danger have any title to it; nor have any passengers for any ordinary assistance they may give; but it is not the duty of passengers to remain on board in time of danger, nor to incur any responsibility by undertaking the management of the ship; and if by doing the one or the other they contribute to the safety of the ship, they may be entitled to salvage.

If, before the service is rendered, a bargain is made for the amount to be paid for the assistance, this amount settles the claim for salvage; so if two ships sail as consorts, as is customary with whaling ships, on the terms of rendering each other mutual assistance, neither can claim salvage for assistance rendered to the other. All the officers and crew of a British ship are under

obligations to assist ships in distress; they are, nevertheless, to receive salvage for their services, subject to the conditions expressed in the British statutes. The owners, also, of a ship which has saved another are, besides being remunerated for stores or other matters contributed, or injury done to their ship, entitled to salvage for the detention of their ship, the risk of vacating their insurance, etc.—See SHIPPING.

The salvage is to be paid by those who would have borne the loss had there been no assistance, in the proportion to the benefit they have received. If the ship was in the course of earning freight, the freight must contribute. The wearing apparel, etc., of the master and crew are not liable for salvage.

The subject of salvage was largely discussed in our courts in a case of recapture. The District Court of New York allowed as salvage one half the value of the ship. The Circuit Court reversed the decree, and denied all salvage. The Supreme Court of the United States corrected both decrees, and allowed one sixth part of the net value, after deducting the charges. The court in that case admitted the rule to be, that a neutral vessel, captured by a belligerent, was entitled to be discharged without paying salvage, on the ground that no beneficial service was thereby rendered, as the neutral, acting properly, would of course be discharged by the courts of the sovereign of the captor; and they admitted likewise the exception to the rule when belligerent captors and courts were notorious for their unprincipled rapacity. This rule and the exception have been frequently declared in the English admiralty. The rule of British jurisprudence in respect to recaptured property of British subjects to allies, until it appears that they act upon a less liberal principle, and then the allies are treated according to their own measure of justice. The same rule has been adopted by statute in this country, and is founded on the immutable basis of reciprocal justice. Though the contract of seamen be not dissolved by shipwreck, and it be their duty to remain and labor to preserve the wreck and fragments of the ship and cargo, yet they may be entitled to recompense, by way of salvage, for their peculiar services. The wages recovered in the case of shipwreck are in the nature of salvage, and form a lien on the property saved. The character of seamen creates no incapacity to assume that of salvors; and were it otherwise, it would be mischievous to the interests of commerce, inconsistent with natural equity, and would be tempting the unfortunate mariner to obtain by plunder and embezzlement, in a common calamity, what he ought to possess upon principles of justice. The allowance of salvage in such cases is and ought to be liberal; not less, in any case, than the wages would have amounted to; and even an additional recompense should be made in cases of extraordinary danger and distinguished gallantry, when the service was much enhanced by the preservation of life, and the great value of the property at stake.—KENT'S Commentaries, vol. iii.—See INSURANCE.

Sample, a small quantity of a commodity exhibited at public or private sales, as a specimen. Sugars, wool, spirits, wine, coffee, and indeed most species of merchandise, are sold by sample. If an article be not, at an average, equal to the sample by which it is sold, the buyer may cancel the contract, and return the article to the seller.

Sandal-wood, the wood of a tree (*Santalum album*, Linn.) having somewhat the appearance of a large myrtle. It is of a deep yellow color, and yields an agreeable perfume. The tree, when cut down, is usually about nine inches in diameter at the root, but sometimes considerably more. After being felled, it is barked, cut into billets, and buried in a dry place for about a couple of months, during which time the white ants eat off the outer wood, without touching the heart, which is the sandal. It is then taken up and sorted, according to the size of the billets. The deeper the

color, and the nearer the root, the higher is the perfume. Reject such pieces as are of a pale color, small, decayed, or have white wood about them; and take especial care that it be not mixed with wood resembling sandal, but without its perfume.—MILBURN'S *Orient. Commerce*.

Sandal-wood is extensively employed by the Hindus as a perfume in their funeral ceremonies. But the Chinese are its principal consumers.

Manufacture it into fans, and small articles of furniture, and use it, when ground into powder, as a cosmetic. During the year ending the 31st of December, 1848, there were imported by British vessels into Canton 20,732 piculs of sandal-wood, valued at \$207,400; and the imports in some years are more than twice this amount. The average importation into Calcutta is about 200 tons a year. It grows principally in Malabar, in the mountainous country at a little distance from the low sea-coast; in Timor; and in the Feejee Islands in the South Sea. Calcutta is principally supplied from Malabar, while China derives the larger portion of her supplies from Timor and the other islands. It is seldom brought to Europe, except by individuals for their own use, or as presents for their friends.—BELL'S *External Com.*; *DuRoi*; *CRAWFORD'S Indian Archipelago*.

Sandals, a species of slippers worn by the ancient Jews, Greeks, and Romans. They consisted of a sole with a hollow part at one extreme, to embrace the ankle and leave the upper part of the foot bare. Originally sandals were made of leather; but they afterward became articles of great luxury, being made of gold, silver, or other precious stuff, and most beautifully ornamented.

Sandarach, a resinous substance, commonly met with in loose granules a little larger than a pea, of a whitish yellow color, brittle, inflammable, of a resinous smell, and acrid, aromatic taste. It exudes, it is said, in warm climates, from cracks and incisions in the common juniper bush. It is used as a varnish, dissolved in spirits of wine.—*AYRSIE'S Mat. Indica*.

San Domingo. The old Spanish part of the island of San Domingo, or the Dominican Republic, embraces the territory as settled by the treaty of limits between Spain and France in 1777. According to those limits, its area would comprise about two-thirds of the whole island, or over 18,000 square miles. The population of the republic reaches about 126,500 souls, composed of Spaniards, creoles, and blacks. The population, however, is stated by some authorities to exceed 250,000; but this is probably too large. The natural productions of the republic are all kinds of valuable wood, copper, iron, salt, coal, &c. Its soil is very fertile, but its climate is unhealthy, and at certain seasons exceedingly fatal to foreigners. The chief staples of the republic are mahogany, lignum-vita, dye-woods, tobacco, honey, and hides. The imports from the United States consist of assorted cargoes, flour, &c.; but most usually our vessels enter the ports of the republic ballast.

The tariff of duties is based upon a fixed value assigned to each class of merchandise, on which a duty of 25 per cent. is levied. The general scope of these duties may be illustrated by selecting from the latest tariff the article of flour. The tariff valuation of this article is \$5 per barrel of from 175 to 200 lbs.; the duty on which, at 25 per cent., would be \$1 25. These duties are permanent (so long as the tariff continues unaltered), and are in no manner dependent on the fluctuation of prices. The tonnage duty on American vessels is \$1 per ton in port, and 50 cents per ton for the coast, being 50 per cent. more than is charged on the vessels of such nations as have recognized the independence of the republic, or have entered into treaties with its government. The effect of this, as well as of other discriminations against the American flag, has been to give to the flags of treaty nations, especially to that of Great Britain, a large share of the carrying

trade between the United States and the Dominican Republic. In 1834 a treaty of amity, commerce, and navigation was agreed upon and executed by plenipotentiaries of the two governments duly appointed for that purpose; but, objections being made to some of its stipulations by the Dominican Legislature, it was not confirmed. An amendment, defining the rights of Dominican citizens in the United States, was proposed, to which the commissioner of the United States objected, and thus the matter is understood to stand at the present time. The following tabular statements exhibit the trade and navigation of the Dominican Republic during a period of four years, ending with 1852, together with an analysis of the trade and navigation of each of the ports, San Domingo and Porto Plata, during the year last designated:

TRADE AND NAVIGATION OF THE DOMINICAN REPUBLIC.

The following is a summary of the trade between the United States and the port of San Domingo during the last six months of 1854, viz.:

Number of vessels entered and cleared 28, with an

aggregate of 2520 tons; of these, four entered in ballast, and ten with assorted cargoes. The homeward cargoes consisted of mahogany, lignum-vitæ, hides, and honey, and amounted in value to \$26,270. During the same period there entered six vessels under British colors, measuring in all 518 tons: one French vessel of 130 tons; one Danish of 125 tons, and one Dominican of 68 tons; total number of foreign vessels (exclusive of American) nine, with an aggregate tonnage of 850 tons. During the first six months of 1855 there entered and cleared 40 vessels from the United States (under the American flag), measuring in the aggregate 3375 tons; of these, 13 entered in ballast, and 7 with assorted cargoes, including one laden in part with flour. Value of cargoes, inward, \$27,650; value of cargoes, homeward, \$44,664. Homeward cargoes consisted of mahogany, lignum-vitæ, satin-wood, fustic, hides, and honey.

The commerce of San Domingo with the United States for the year 1857 was as follows:

Exports to San Domingo	\$44,340
Imports from San Domingo	109,874
Tonnage cleared from United States—American	1020
“ “ “ “ Foreign	918
Total	2838

The latest revision of the Dominican tariff bears date 18th June, 1853. The valuation of several articles, including domestic cottons, boys' shoes, etc., has been reduced; while in a few others, including women's shoes, there is an increase—on the latter article from \$7 to \$8 per dozen, which will raise the duty from \$1 75 to \$2 per dozen. The financial and political difficulties now experienced in the Dominican Republic can hardly fail to be felt in the general movements of its foreign commerce.

The reader is referred to the article HAYTI for the comparative statement of the commerce of the United States with the island of San Domingo—embracing the empire of Hayti and the Dominican Republic—exhibiting the value of exports to and imports from each country, and the tonnage of American and foreign vessels arriving from and departing to each country, during the years designated.

A Dominican vessel arriving in the United States from a port in the Dominican Republic is liable to a tonnage duty of \$1 per ton, that being the duty imposed on the tonnage of vessels of the United States arriving in said republic; but the cargo is not liable to a discriminating duty of 10 per cent., no such duty being levied by the Dominican Republic on the cargoes of United States vessels arriving in the ports of that republic.—See HAYTI. For Political Relations of England with San Domingo, see FRASER'S *Mag.* xlii. 133; same article, *Living Age*, xxvii. 126; *Edinburgh Review*, xvii. 372.

Sandwich Islands. A group of eleven islands in the Pacific Ocean. They were discovered by Captain Cook in 1778. Many voyagers report that the natural capacity of the natives seems in no respect below the common standard of mankind. It was in one of these islands that this illustrious circumnavigator fell a victim to the sudden resentment of the natives, Feb. 14, 1779. Tamehameha, chief of Hawaii, becomes king of the group, 1800. Rihorihō, his son, succeeds him, 1819. Idolatry abolished, 1819. Rihorihō and his queen died in England, 1824. Kanikeouli, 20 years of age, king, 1824. Mission established by the American Board, 1820. In 1832 there were 900 schools and 50,000 pupils in the islands. Treaty with the French, made with admiral Dupetit-Thouars, 1837. Another, enforcing the introduction of Catholic missionaries, etc., 1839. Tamehameha III, becomes king, Dr. G. P. Judd, an American, prime minister. In 1831 there were 14 ships, 2630 tons, belonging to the islands—which are important to the United States as a whaling station.

This remote but interesting group is situated in the

midst of the Pacific Ocean, in about lat. 21° N., and long. 157° W. It comprises eight inhabited and four uninhabited islands, Owhyhee, where Captain Cook was killed, being the most considerable. They are of volcanic formation, and mountainous, some of the peaks rising in Owhyhee to between 13,000 and 14,000 feet in height! The population in 1847 is said to have amounted to above 112,000, of which nearly 40,000 belonged to Owhyhee. But it is a curious fact that the native population has been rapidly decreasing for some years past, and does not now probably exceed a third part of its amount at the epoch of their discovery. The islanders are honorably distinguished among the Polynesian nations by the advances they have made in civilization; and particularly by their progress in manufactures, navigation, and commerce. Christianity was introduced by the American missionaries in 1820, and is now the religion of the state; schools have been established, churches have been built, and the forms of religion are pretty well observed. European usages have become fashionable; and the costume of the better classes, women as well as men, closely resembles that of the Americans.

The following table exhibits the population of the principal islands, according to the census of December, 1853:

Islands.	Natives.	Foreigners	Total
Hawaii	24,198	259	24,457

The staple exports of the islands are: Sugar, molasses, sirup, coffee, goat-skins, sweet potatoes, wool, hides, salt, tallow, beef, pulu,* and arrow-root. Agriculture has made but little progress, and will never, probably, occupy the natives to any great extent. There are many excellent tracts suitable for the production of coffee, wheat, vines, etc.; but the means of subsistence are so easily procured, that the inhabitants have but few inducements, even did they not lack the industry and enterprise, to become extensive agriculturists.

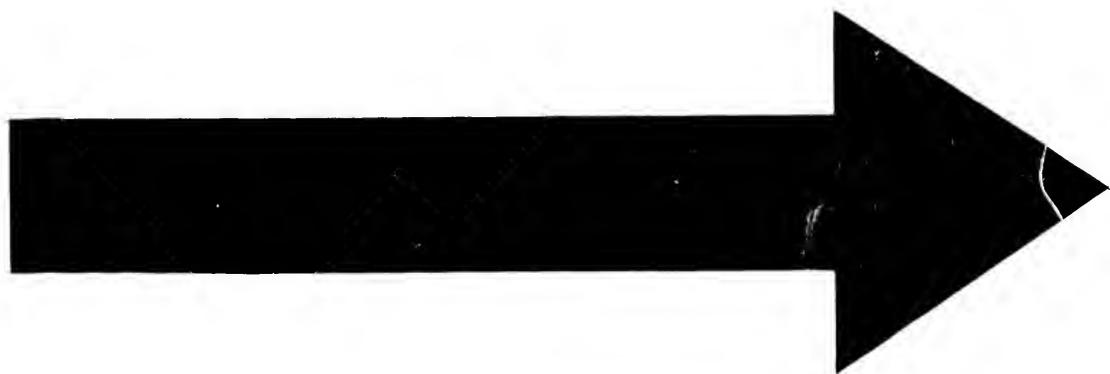

There are large tracts of good grazing land scattered throughout the island, and the growth of cattle is a leading, perhaps the most profitable, branch of agricultural industry. There are also numerous sheep ranges, on which are tended about 12,000 sheep; but the business is not encouraging.

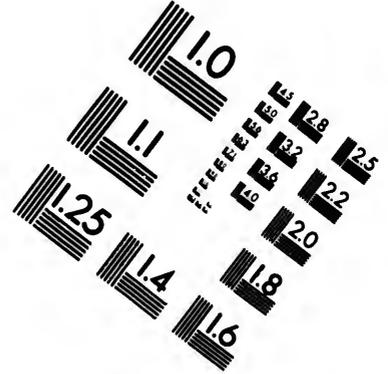

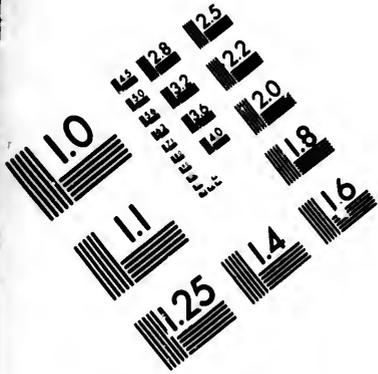

The eminently advantageous position of the Sandwich Islands, lying on the great route between America and China, invited at an early period the enterprise and capital of several European and American settlers, and led to the establishment of a somewhat active trade. They constitute a common centre between the three principal whaling grounds of the Northern Pacific—one on the equator, the other near Japan, and the third toward the Behring Sea.

The island of Honolulu, on the south side of the principal of Woahoo, in lat. 21° 18' 8" N., long. 157° 55' W. Population about 8500, of whom about 1200 are Englishmen, Americans, and other foreigners. The harbor, to which the place owes all its importance, has a narrow entrance, but it is easy of access at all times of the tide to vessels not drawing more than 18 feet water. The bar at its mouth being narrow, and composed of soft coral, it might easily be made accessible even for line-of-battle ships.

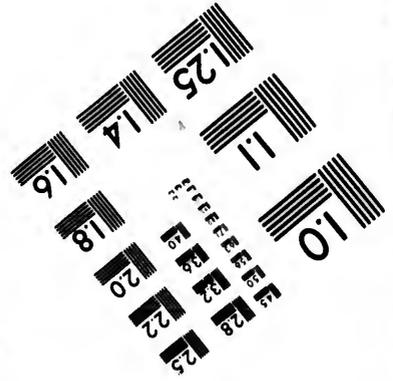

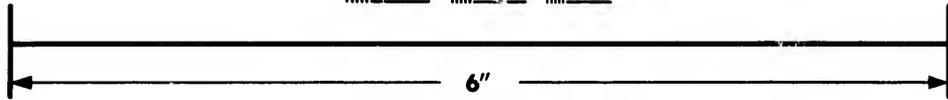

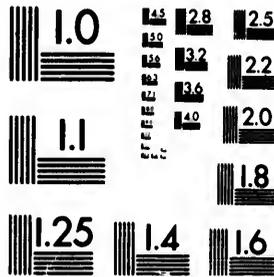

Commercial relations between the United States and the Sandwich Islands had existed for many years before the treaty of 1849. As far back as 1832, when the native population of the islands amounted to 130,815 (nearly double its present number), it appears that the

soon after introduced into Europe, but it is doubtful whether this were done by the Arabians or Greeks. The mode of fabricating paper from cotton and other vegetable materials being once discovered, its fabrication from linen rags was a comparatively easy, and in Europe, where cotton was then extremely scarce, an all but necessary step. It is singular, however, that we have no positive information either as to the country where, or the epoch when, paper from rags began to be manufactured in Europe. *Mais on ne peut reculer son invention plus tard, qu'au Treizieme siecle, ni son usage ordinaire au-delà du Quatorzieme.* — *Nouveau Traité*, etc., i. 524. In fact, Egyptian paper, or paper made of papyrus in the manner described above, continued to be partially employed down to the middle of the eleventh century, though parchment was then the principal material used in writing. It is curious to observe how very shortly the introduction of paper preceded the invention of printing, to which, indeed, as already seen, it was an indispensable preliminary. Muratori attributes the ignorance of the barbarous ages principally to the scarcity and high price of paper, and the superior intelligence of modern times to its abundance and cheapness. — *ANDRES*, i. 200. And whatever opinion may be entertained as to the first part of this statement, there can be no question that the latter is perfectly well founded.

Not only are we in the dark as to the history of modern paper, but we are unable to make any very satisfactory conjectural estimate of the mode in which it was invented. It is all but certain that the invention must have been suggested by accident, or by observing the effects produced by the accidental drying of triturated vegetable matter, or in some such way; and that the hint thus afforded was gradually improved upon. It is not possible to imagine that the invention should have been wholly the result of design; for we can not conceive how any one without any previous knowledge should have proposed to himself to produce paper by pounding rags, or other vegetable matter, mixing the mass in water, and then pressing and drying the deposit. But, without indulging in unprofitable conjectures, it is at all events certain that, however and by whomsoever discovered, no invention has been of greater importance. *Charia usu maxime humanitas vita constat et memoria.* — *PLINY*, *Hist. Nat.* lib. xiii. cap. 11. The processes by which the most worthless and vilest materials are converted into such admirable substances as paper and glass are probably the greatest triumphs of human talent and ingenuity. They have more than realized the dreams of the alchemists, and have been incomparably more advantageous than if we had become acquainted with a means of transmuting the inferior metals into gold.

In 1813, Dr. Colquhoun estimated the value of paper annually produced in Great Britain at £2,000,000; but Mr. Stevenson, an incomparably better authority upon such subjects, estimated it at only half this sum. From information obtained from those engaged in the trade, we incline to think that the total annual value of the paper manufactured in the United Kingdom, exclusive of the duty, may at present amount to about £1,600,000 or £1,700,000. There are about 700 paper-mills in England, and from 70 to 80 in Scotland. The number in Ireland is but inconsiderable. Of these mills, we believe, very few have lately been unemployed. It was formerly customary to collect the rags used in the manufacture into large heaps, in order that, by their heating and fermentation, they might be the more easily reduced to filaments. But this injured the rags; and it is now the practice to tear them to pieces, without any such preparation, by powerful machines constructed for the purpose. During the present century this manufacture has been singularly promoted by the combined influence of science, ingenuity, and mechanical skill. These have been successfully exerted in the preparation of the pulp; the conversion of the pulp

into paper, and the provision of materials; and in none has their influence been more remarkable than in the last. This is evident from the fact that, while the manufacture has been more than doubled since 1820, the demand for Continental rags and other foreign materials has actually been reduced within that time, in consequence of the immense home supply we derive from substances previously regarded as worthless, and treated as refuse. The sweepings of cotton and flax mills, owing to the grease and dirt with which they are mixed up, were, until within these few years, of no value whatever, except as manure. The chemical and mechanical processes by which these materials are purified, whitened, and made available for the production of paper, without their strength being impaired, are not only exceedingly interesting in themselves, but are of great national importance; and, by reducing the cost of paper, have done ten times more to lower the price of books, and diffuse literature, than all the efforts of all the societies that ever existed.

The first idea of a machine for converting pulp into paper originated in France, the inventor being an ingenious workman of the name of Louis Robert. A model of this machine was brought to England by M. Leger Didot; and though at first it was far from giving an assurance of success, it sufficed to induce English capitalists and engineers, particularly Mr. Donkin, to follow up the scheme; and in the course of a few years they brought it to a high degree of perfection.

The following tabular statement exhibits the aggregate quantities, values, and prices per pound of rags imported into the United States from all countries, distinguishing in a separate column the quantities received from Italy during a period of ten consecutive years, from 1846 to 1855:

Years.	Rags imported from all Countries.		Rags imported from Italy.		Aggregate Values.	
	Pounds.	Value.	Pounds.	Value.	Dollars.	Cents.
1846.....	9,807,700	\$ 6,042,985	5,002,985	3,252,000	985,000	6 50
1847.....	8,154,886	6,529,284	6,529,284	6,529,284	904,177	9 73
1848.....	17,014,587	13,808,080	13,808,080	626,190	930	3 68
1849.....	14,941,286	11,000,608	11,000,608	624,237	5 61	
1850.....	20,696,876	16,861,266	16,861,266	747,167	8 01	
1851.....	26,094,701	18,512,673	18,512,673	992,876	8 46	
1852.....	18,288,458	19,220,670	19,220,670	622,876	8 42	
1853.....	22,766,000	14,171,292	14,171,292	985,466	4 91	
1854.....	32,015,763	24,240,999	24,240,999	1,007,826	8 0	
1855.....	40,818,516	28,948,612	28,948,612	1,224,413	8 06	
Aggregate.....	206,888,718	148,300,165	148,300,165	\$7,528,721		
Ann. average.....	20,688,871	14,830,016	14,830,016	752,872		

From the preceding table it will be seen that during the decennial period ending with 1855 the aggregate quantity of rags imported into the United States from all parts was 206,631,954 lbs., while the aggregate quantity received from Italy reached as high as 148,300,155 lbs. The annual average for the period designated will, however, furnish a more statistical basis for ascertaining the relative importance of Italy compared with all other countries as the principal source of supply upon which the United States must rely, with any degree of certainty, for an article the consumption of which is so rapidly increasing there; even during the past year, an alarming deficiency of the manufactured material was seriously apprehended by the conductors of our periodical and newspaper journals. The average annual quantity imported into the United States from all countries during the period designated was 20,988,371 lbs.; and the average annual quantity received from Italy was 14,830,015 lbs. Thus it is shown that instead of one-fifth Italy actually furnishes nearly two-thirds of all the rags imported into the United States. — *See RAGS.*

The consumption of paper in the United States is equal to that of France and England combined. In other words, the 28,000,000 inhabitants of the United States consume as much paper as the 64,000,000 inhabitants of France and England. This is very near-

ly correct. The statistics, however, will prove interesting. The number of paper-mills in operation in England in 1885 was 750, and the annual value of the paper manufactured reached as high as \$8,000,000. At that period, however, the manufacture of paper was burdened with an excise duty amounting to more than three times as much as the total wages of the hands employed in making it, and the quantity annually produced did not exceed 50,000,000 lbs. of first-class and 16,000,000 lbs. of second-class paper, requiring a supply of about 100,000,000 lbs. of rags.

Improvements in machinery and mode of manufacture, and the application of steam, have reduced the number of mills in Great Britain and Ireland to 880, according to the latest statistical returns; while the quantity of rags annually consumed has risen to 201,600,000 lbs., or over 100 per cent. We have compiled from a recent, though in this country a rare Dublin publication on statistics, the following tabular statement, showing the quantity of paper manufactured, consumed, and exported in Great Britain for a period of nine years, ending with 1854:

COMPARATIVE STATEMENT SHOWING THE QUANTITIES OF PAPER MANUFACTURED, CONSUMED, AND EXPORTED IN GREAT BRITAIN FROM 1846 TO 1854.

Years.	Pounds of Paper manufactured in Great Britain.	Pounds of Paper retained for Consumption in Great Britain.	Pounds of Paper exported from Great Britain.
1846	137,400,000	123,600,000	4,888,000
1847	131,900,000	116,100,000	5,832,000
1848	121,800,000	110,800,000	5,180,000
1849	132,100,000	123,100,000	5,068,000
1850	141,000,000	133,200,000	7,162,000
1851	160,900,000	149,500,000	5,505,000
1852	154,400,000	147,100,000	7,238,000
1853	177,600,000	164,300,000	13,296,000
1854	177,900,000	161,700,000	16,112,000

France turns into paper annually about 235,200,000 lbs. of rags, producing about 158,800,000 lbs. of paper. In the United States there are 750 paper-mills, which work up each year about 405,000,000 lbs. of rags. Assuming (the usual estimate) that 1½ lb. of rags yields 1 lb. of paper, we have the following comparative statement for the United States, and France and Great Britain combined:

	Pounds of Rags annually consumed.	Pounds of Paper annually manufactured.	Pounds of Paper per Capita.
United States.....	405,000,000	270,000,000	10.80
Great Britain and France combined.....	436,800,000	291,900,000	4.85

From this statement it appears that the United States consumes 81,800,000 lbs. of rags, and manufactures 21,200,000 lbs. of paper, less than Great Britain and France combined, while the quantity of paper manufactured *per capita* of the population of the former is more than double that assigned to the combined population of the two latter. The quantity of paper imported in Great Britain and France and added to

the stock for consumption might vary slightly, but not materially, the above results. The preceding statement, however, omits the quantities annually imported and exported by each of the countries respectively, items without which no calculation as to consumption can be accurately made. The importation of paper of all kinds into France in 1858 did not exceed 837,104 lbs., while the exports amounted to 17,058,657 lbs. This gives an excess of exports over imports to be supplied from the stock of domestic manufacture, of 16,716,553 lbs. Deduct this from 156,800,000 lbs. the quantity manufactured, and we have left for consumption 140,083,447 lbs., or 8.89 lbs. *per capita* of the population.

During the same year there were imported into England, according to the Report on Trade and Navigation, 909,250 lbs. of paper. The report gives this quantity for the last six months of the year only; assuming that the importation during the first six months was equal to that for the last as above given, and the total importation would reach, say 200,000 lbs. The quantity exported, we have seen, was 13,296,874 lbs., leaving an excess of exports over imports of 13,696,874 lbs. Recent and important improvements have been made, by the use of refuse tanned leather, bark of the cotton-stalk, pulp from the fibres of endogenous plants, as raw materials for the manufacture of paper.—*Scientific Ann.*

Paper Boxes.—The manufacture of boxes from paper, or rather pasteboard, has become a very large one, from the custom of so many manufacturers selling their goods in these boxes. It is said that in Paris four thousand persons are employed in this trade alone. The trade is divided into six branches. The first comprises the most elaborately-finished, and ornamented boxes, for the display of artificial flowers, rich velvets, ribbons, silks, trimmings, medals, miniatures, and corbeilles for wedding presents. The second class consists of boxes and small ornaments for confectioners. The third kind are used for packing toys and trinkets of small size. The fourth kind are for perfumery, fans, gloves, etc. The fifth comprises large boxes for shawls and ribbons for exportation. The sixth are pill-boxes, water-boxes, and others of the smallest kind. The French productions in this department of manufactures are superior to any other in neatness of execution and taste of ornamentation.

Chinese Paper.—The Chinese make a filamentous kind of paper much superior to ancient papyrus; it obtains in England the name of rice-paper; but sufficient is now known of it to show that this is by no means a correct designation. Dr. Livingstone introduced Chinese rice-paper in England about half a century ago; it had great favor as a material for artificial flowers. It was many years afterward that information was obtained concerning the mode adopted by the Chinese in making these small but very expensive sheets of paper. There is a leguminous plant growing in China and India, the stem of which is cut into pieces eight or ten inches in length; and these are cut by the Chinese into one continuous spiral film, on the same principle as the modern mode of veneer cutting, but by the dexterous use of hand-tools. These laminae, being spread out and pressed flat, form thin sheets, which, after being dyed and otherwise prepared, constitute the rice-paper of the Chinese.

The same ingenious people make paper of bamboo. The bamboo stems, when about three or four inches thick, are cut into pieces four or five inches long. These, when softened in water, are washed, cut into filaments, dried and bleached in the sun, boiled, beaten to a pulp, and made into thin sheets of paper. This is truly paper, which the former examples are not; and the art must have made a considerable advance before such a method could have suggested itself.

Paper-hangings.—Stamped paper for this purpose was first made in Spain and Holland about A.D. 1555. Made of velvet and floss for hanging apartments, about 1620. The manufacture of this kind of paper rapidly improved in Great Britain from early in the eighteenth century; and it has now been brought to great perfection. Since this important and elegant substitute for the ancient "hangings" of tapestry or cloth came into use about 200 years ago, the manufacture has undergone a gradual succession of improvements, and has now reached a high state of beauty and perfection. The patterns on these papers are sometimes produced by stencil plates, but more commonly by blocks, each color being laid on by a separate block cut in wood or metal upon a plain or tinted ground. The patterns are sometimes printed in varnish or size, and gilt or copper leaf applied; or bisulphuret of tin (*aurum musivum*) is dusted over so as to adhere to the pattern; and in what are called *stock papers*, dyed wools minced into powder are similarly applied. Powdered stearite, or French chalk, is used to produce the peculiar gloss known under the name of *satins*. Striped papers are sometimes made by passing the paper rapidly under a trough, which has parallel slits in its bottom through which the color is delivered; and a number of other very ingenious and beautiful contrivances have lately been applied in this important branch of art. The invention of the paper machine, by which any length of paper may be obtained, effected a great change in paper-hangings, which could formerly only be printed

upon separate sheets, and were much more inconvenient to print as well as to apply to the walls. **Papier-mache**, a name given to articles manufactured of the pulp of paper, or of old paper ground up into a pulp, bleached, if necessary, and moulded into various forms. This article has lately been used upon an extensive scale, for the manufacture of mouldings, rosettes, and other architectural ornaments; pilasters, capitals, and even figures as large as life, have also been made of it. It is lighter, more durable, and less brittle and liable to damage than plaster, and admits of being colored, gilt, or otherwise ornamented. Another article, sometimes goes under the same name which is more like pasteboard, consisting of sheets of paper pasted or glued and powerfully pressed together, so as to acquire, when dry, the hardness of board, and yet to admit, while moist, of curvature and flexure: tea-trays, waiters, snuff-boxes, and similar articles are thus prepared, and afterward carefully covered by Japan or other varnishes, and often beautifully ornamented by figures or landscapes and other devices, etc., occasionally inlaid with mother of pearl. A mixture of sulphate of iron, quicklime, and glue, or white of egg, with the pulp for papier-mache, renders it to a greater extent water-proof; and the further addition of borax and phosphate of soda contributes to make it almost fire-proof. The chief papier-mache' manufactory in England is that of Blefeld, in Wellington Street, Strand, who has recently published a concise history of the manufacture, embellished with numerous illustrations. There are manufactories of papier-mache' goods now established in Massachusetts. For the imports of articles of papier-mache, see **PARA**.

Para, or Belem, a sea-port city of Brazil, capital of the province, 70 miles from the Atlantic, latitude of Fort St. Pedro 1° 28' S., long. 48° 30' 5" W. Population estimated at 10,000, mostly of European descent. It stands on elevated ground, on the south shore of the Bay of Guajara, on the right bank of the Para, or Tocantins, and has a fine appearance from the river. Chief edifices, the governor's palace, cathedral, several other churches, convents, barracks, arsenal, episcopal palace and seminary, formerly a Jesuits' college; a prison, and an unfinished theatre. Vessels of large draft can lie near the city, and the cocoa, caoutchouc, isinglass, rice, and drugs, exported from Brazil are chiefly from Para. It has also a trade in cotton, vanilla, annette, dye-woods, honey, wax, and a great variety of other vegetable and animal products. The trade is mostly with Liverpool, London, Barbadoes, Cayenne, and the North American and other Brazilian ports. The River Para, bounding the island of Marajo southward, extends between long. 48° 10' and 50° 40' W., receives the Tocantins and Annapu from the south, and is connected northwestward with the Amazon.

Para enjoys an advantage possessed by no other seaport town in Brazil—that of an unobstructed intercourse by water with the interior. The commercial resources of this province, and the admirable trading position of the city, are unsurpassed; but inhabitants are wanting to develop these elements of commerce and civilization. In 1840, some American citizens established several saw-mills at Maguary, in the vicinity of Para; but whether they met with better success than did the Glasgow merchants, whose property to the amount of \$350,000 was pillaged in the same place during a revolt in 1835, has not been ascertained. The cotton of Para has been highly prized. Caoutchouc, the use of which was first discovered in 1785 by French academicians sent to Brazil to make astronomical observations, is abundant, and is extensively manufactured into shoes, etc. Were this article admitted into the United States, as in England, free of duty, it would become one of the staple exports to this country. A well-informed American merchant, residing at Para, addressed a letter on this subject to one of the officers of Lieutenant Herndon's expedition to the Amazon,

urging the disadvantages under which American commerce labors, as compared with that of Great Britain, in the caoutchouc trade.—See "Letter from the Secretary of the Treasury, transmitting copy of circular letter and replies thereto," in reference to the Tariff, March 8, 1854. This article is now becoming the chief staple of the provinces of Para; and so various and multiform are the uses to which it is applicable, both in the arts and in domestic economy—so important as an article of commerce has it already become, that, even against the import duty of 10 per cent. in the United States, it constitutes almost 50 per cent. of our trade with Para. The following statement exhibits the quantities of India-rubber imported from Para into the United States during the years designated:

Year	Quantity	Value
1850	1,500,000
1851	2,330,000
1855	2,740,000	\$1,660,000

The exports from Para to foreign countries consist of caoutchouc, cotton, rice, castor-oil, copaliva, aniseed oil, cocoa, cloves, cinnamon, hides, horns, isinglass, Peruvian bark, etc. From 1816 to 1827, the exports from this province averaged annually \$850,131. The following summary exhibits the total trade of Para for 1845: Inward—Vessels, 69; tonnage, 11,186; value of cargoes, \$495,940; of which there entered from the United States: Vessels, 28; tonnage, 6920; value of cargoes, \$236,200. Cleared to all countries—Vessels, 70; tonnage, 11,445; value of cargoes, \$737,525. To the United States—Vessels, 27; tonnage, 6623; value of cargoes, \$261,620. In this province, the sugar and coffee plantations do not produce sufficient for home consumption, and supplies are usually imported from the neighboring provinces. The imports from foreign countries consist of cotton goods, silks, hardware, wines, spirits, salt, flour, salt provisions, gunpowder, etc. The only manufactures are ordinary cotton cloths for sacks and hammocks, and India-rubber shoes; but these manufactures seem not to thrive, from a want of skill to direct them.

TOTAL NUMBER OF VESSELS, WITH THEIR TONNAGE, ENGAGED IN THE TRADE BETWEEN PARA AND FOREIGN COUNTRIES, AND VALUE OF EXPORTS AND IMPORTS, ETC., IN 1845 AND 1850.

Year	Vessels	Tons	Exports	Imports
1845	Entered	85	15,898	Imports, 3,256,000
	Cleared	88	12,029	Exports, 4,881,000
1850	Entered	96	16,877	Imports, 5,109,000
	Cleared	92	10,433	Exports, 7,402,000

STAPLE PRODUCTIONS OF PARA, RELATIVELY CONSIDERED, WITH RESPECT TO THE QUANTITIES ANNUALLY EXPORTED:

Caoutchouc	33,600 arrobas.
Cocoa	200,000 "
Cotton	6,120 "
Hides	15,600 pieces.
Copaliva	3,800 pots.
Rice	130,000 arrobas.
Rice in the husk	20,000 alqueires.
Sugar	81,330 arrobas.
India-rubber shoes	122,000 pairs.

The above are the leading exports from Para; but, besides these, the province produces various kinds of lumber admirably adapted for ship-building purposes, and a great variety of textile plants, medicinal drugs, and dye-woods of the richest qualities. The present population of Para is about 205,000, though the province is said to be capable of maintaining some millions of inhabitants. With such a population, its natural resources might be more fully developed, and Para thus placed, in point of position and commercial importance, in the very first rank of Brazilian ports.—*Commercial Relations with the United States.*

Paraguay, a republic or consularship of South America, extends from lat. 21° to 27° 20' S., and long. 54° to 58° 40' W. The space thus inclosed forms a very compact territory, nearly in the shape of a parallelogram, about 430 miles long, north to south, with an average

breadth of about 200 miles, and contains an area of about 86,000 square miles. Population 300,000. Capital, Asuncion. The name Paraguay at one time was used in a very extensive sense, so as to include the whole of the immense regions of South America, between lat. 16° S., and the Strait of Magellan, and between Chili and Peru on the west, and Brazil on the east, now confined to the republic properly so called. On the north the limits of this state with Brazil are not definitely settled, but in other directions it has the advantage of great natural boundaries; the Parana on the east and south, and its tributary the Paraguay on the west. The whole surface thus belongs to the basins of these two rivers, a mountain range of considerable elevation stretching between them north to south, so as to form their water-shed, and send the drainage in opposite directions, but nearly in equal portions. The distance of the water-shed from the river scarcely anywhere exceeds 100 miles, and hence the tributaries by which the drainage is conveyed are more remarkable for their number than their magnitude. By far the largest is the Tibimari, which, owing to an easterly bend in the water-shed, has its course considerably prolonged, and being augmented by several large affluents from the north, becomes a noble stream before it reaches the Paraguay. The surface is mountainous in the centre, and also in the northeast, where a ramification, known by the name of the Sierra de Maracay, or Cordillera de Maracaca, breaks off from the central chain, and proceeding east to the banks of the Parana, interrupts the navigation of that river, and forms one of the most remarkable cataracts in the world.

Paraguay is one of the finest countries in the world. It is almost inclosed by rivers, and the interior is also bountifully watered. The exterior waters are navigable, and constitute the great avenues which are destined to become the highways of the commerce of a magnificent interior country. Unlike the open countries surrounding it, Paraguay is well wooded, and among its trees are many valuable in the arts and manufactures. It also abounds in medicinal products, as rhubarb, snraparilla, jalap, assafra, dragon's blood, copaliva, nux vomica, liquorice, ginger, etc., all of the finest quality. Of dye-stuffs, too, there is an immense variety; as cochineal, indigo, vegetable vermilion, saffron, etc. Many of the forest trees yield valuable gums, and they comprise some of the most delicious perfumes and incense that can be imagined. Others, again, are like amber, hard, brittle, and insoluble in water. The *seringa*, or rubber-tree, the product of which is now almost a monopoly with Para, and the *palosanto*, which produces the gum guaiacum, crowd the forests, and the sweet-flavored vanilla is abundant. Upon the hills the celebrated yerba maté flourishes luxuriantly. The cultivated products are sugar-cane, cotton, tobacco, rice, mandioca, Indian corn, etc. On the plains thousands of cattle range, and large quantities of hides, hair, horns, bones, tallow, etc., are lost for want of transportation. The country is not celebrated for its minerals; but in all that constitutes an agricultural country, rich lands, a fine climate, and abundance of water, it has no equal. Hitherto, however, it has been shut out from the world by the arbitrary will of despotism; and its future commerce can only be measured from its resources and facilities. The recent revolutions in the states of the Plata have opened the magnificent rivers of this country, and there is certainly no further impediment to commercial enterprise.

This state, formerly a province of Buenos Ayres, withdrew from the connection in 1811, and the Spanish-American revolution breaking out about that date secured it from molestation. The policy of its rulers has been the exclusion of foreigners from the country, and under Dr. Francia, so celebrated in connection with its annals, the utmost despotism was exercised. The tyrant dying in 1840 the government was changed in its character, and a more liberal policy obtained,

and ultimately it has become in form an elective republic. As early as 1842, Paraguay acceded to the opening of its rivers to foreign commerce; but until the overthrow of Rosas, the tyrant of Buenos Ayres, who exercised authority over the estuary of the Plata, the concession was of no value. The successors of Rosas have now fully conceded free ingress and egress with the sea. These important revolutions in the policy of the two countries will eventuate in the development of the vast resources of the southeastern and middle portions of South America—countries which are unsurpassed in agricultural wealth and valuable commercial staples. For further information, see *American Statistical Annual*; *American Whig Review*, vi. 245 (U. S. Consul HOPKINS); *North American Review*, xxvi. 444 (A. H. EVERETT); *Dublin University*, xii. 474; *Quarterly Review*, xxvi. 277.

The commercial policy of Paraguay, however, is not of that liberal character to attract foreign merchants to its ports. In addition to the expense of purchasing stamped paper, by means of which every official transaction in the republic is conducted, and without which foreign merchants can not enter the markets, the internal taxes are such as to discourage efforts to develop the resources of the country, and, as a consequence, to oppress its commercial industry. The aggregate of these taxes bearing specially upon commerce is stated to amount to 26 per cent. on the value of every article sent to market. They consist of *diecimos* (tithes), 10 per cent.; export duty, 10 per cent.; and on rent of lands (almost wholly owned by the state, and fixed at a high valuation) 6 per cent. If to this be added an import duty of 20 per cent. on almost every article which the United States could send to the markets of Paraguay, it can be readily comprehended why the name of this republic does not appear among those of other foreign nations the details of whose commerce are minutely set forth in the annual Report on Commerce and Navigation, prepared by the Department of the Treasury of the United States. The "stamps," to which allusion has been made, are divided into eight classes: those of the first class cost 25 cents; of the second, 87½ cents; of the third, \$1; of the fourth, \$2; of the fifth, \$3; of the sixth, \$8; of the seventh, \$16; of the eighth, \$26. Permission to discharge or to load a vessel of 21 tons, or 2000 tons, can only be obtained on a stamp of this last description; so that to unload a cargo valued at \$100 will cost \$26—all the same as if it were worth \$100,000; and in like manner as if taking cargo on board. The foreign trade of Paraguay is conducted chiefly through the ports of the Argentine Confederation, especially that of Buenos Ayres, and those of the Republic of Uruguay. The exports consist of yerba maté (with which the hills of the country are literally covered), tobacco, cigars, woods, hides, hair, leather, molasses, rum, white starch, mandioca, peanuts, beans, and oranges; of which latter article not less than 30,000 bushels are said to be exported per month. The exports from the United States which would most readily find a market in Paraguay are cotton domestics, calicoes, plain cloths, clocks, boots and shoes, gunpowder and shot, saddlery, and agricultural implements.

If the navigation of the River Vermejo, an affluent of the Paraguay, were opened to foreign commerce, or were even permitted to the Argentine flag, the United States would, it is believed, soon enjoy the entire foreign trade of the upper provinces of the Argentine Confederation. This privilege, however, is refused by the government of Paraguay, notwithstanding the River Vermejo, in its entire course, lies within the territories of the sister republic. Hitherto a selfish and illiberal policy excluded foreign vessels from the port of Albuquerque, a place 1600 miles above Asuncion, the capital of Paraguay, in the Brazilian province of Mato Grosso, which the government of that empire has declared open to the commerce of the world. Brazilian vessels were not permitted to descend the River Paraguay, which

takes its rise in this province, nor are foreign vessels allowed to ascend higher than the city of Asuncion; thus cutting off all trade with the richest portions of Bolivia and the fertile province of Mato Grosso, in Brazil. The claim of Paraguay to exercise jurisdiction over both banks of this river, by prohibiting its navigation above Asuncion, and by closing the navigation of the Vermejo, both to the citizens of the Argentine Republic and to foreigners, has never been admitted.

A treaty between Paraguay and Brazil was duly signed and ratified June 14, 1856, by which it is stipulated that the waters of the Upper Paraguay shall henceforth be open to general navigation and commerce. This will bring not only the produce of the Brazilian province of Mato Grosso, but also the agricultural and mineral wealth of Bolivia, to an Atlantic market. The value of these mineral resources may be inferred from the fact that there are stated to exist in this region upward of a thousand valuable mines unworked, it having been found impossible hitherto to convey machinery thither, across the mountains, from the Pacific coast. A highway to the spot is now opened from the Atlantic, as broad as the Mississippi, and equally accessible. The rich province of Mato Grosso, with its diamonds, gold, silver, and copper, is also brought in connection with the good and contiguous sea-ports, Buenos Ayres and Montevideo, by the Paraguay River; and Cujaba, its capital, in the centre of the mining districts, can easily be reached from Asuncion. Dianantino, about two hundred miles from Cujaba, sends its produce to Santarem, on the Amazon, and thence to Para. This tedious and circuitous route is now superseded, as the Paraguay connects these markets with the estuary of the Plata. A Paraguayan journal, "*La Nacional*," of August 11, 1856, publishes the subjoined regulations: "All vessels from foreign ports to the Brazilian ports above shall take pilots at Asuncion, Concepcion, the junction of the Apa, and Olimpo. The vessels that descend that river from the upper Paraguay are obliged to take pilots from Olimpo, the junction of the Apa, and Concepcion; and the wages of the said pilots are to be agreed upon at the captain of the port's bureau in Asuncion."

In 1853, the United States steamer *Water Witch*, of 400 tons burden, and nine feet draught, was dispatched, under the command of Lieutenant Thomas J. Fage, to make an exploration and survey of the tributaries of the River La Plata. The results of this expedition will, doubtless, contribute in an eminent degree to the advancement of commerce and the promotion of science. The navigation of the Paraguay River, which empties into the Parana at the distance from Buenos Ayres of 800 miles, was extended to the parallel of 18° south latitude; making the entire distance of the rivers Parana and Paraguay, through which this small sea-steamer had passed from Buenos Ayres to Corumba (an interior military port of Brazil), equal to about 1700 miles. There is no doubt that the navigation of the Paraguay, during the season of high water, could have been carried by the *Water Witch* to a still greater extent; but at the time of this exploration any further ascent was prohibited by Brazil. Permission was, however, subsequently granted by the imperial government, but refused by that of Paraguay. The expedition was thus restricted to a more limited exploration of the upper waters of this river than had been anticipated. It is to be hoped that the time is not far distant when all such prohibitions will be removed, and this interesting region of unknown country brought to the knowledge of the world.

The navigation of the Paraguay has thus been extended beyond Asuncion, to the distance of 650 miles. This fact has induced the Brazilian government to avail itself of this important channel of communication, by steam, with her north western province, Mato Grosso, in which is found the most valuable diamond region of the empire.

An expedition was dispatched by the French government, a few years since, for the exploration of the Parana and Paraguay rivers; and the following passage is translated from a report made in March, 1855, by Captain Picard, to whose charge it had been committed: "When we consider the excellent means of communication which nature has opened to the provinces of the Argentine Confederation and the Republic of Paraguay, we can not but regret to see them unemployed and deserted. The absence of population, continued civil war, and the administrative policy of Paraguay, have, so far, been the chief obstacles to progress. Let us indulge the hope that the day is not distant when the aspect of things will change, and these magnificent countries will flourish under the blessings of a more advanced civilization."

Paraguay can hardly be said to possess a merchant marine. In 1851 there were distributed, between the two ports of Asuncion and Villa del Pilar, 12 vessels, averaging each about 42 tons. In 1852 there were 11 of the same description, and in 1853 only 9. Besides these, there is one brig belonging to the government, which is said to monopolize almost exclusively the commerce of the state. The foreign vessels engaged in the trade of Paraguay in 1852 were 81, with an aggregate of 4582 tons, from the Argentine provinces south, below the Paraguay River, and three American vessels, tonnage not known. All these vessels trade with the ports of Asuncion and Villa del Pilar, which, with the port of Encarnacion, on the Parana, were alone open to foreign commerce. There is no treaty between the United States and Paraguay. With England a treaty was ratified November 2, 1853, by the second article of which the Republic of Paraguay concedes to the merchant flag of Great Britain the free navigation of the River Paraguay as far as Asuncion, the capital of the republic, and of the right side of the Parana, from where it belongs to her, as far as the city of Encarnacion. It stipulates, also, that British subjects shall be at liberty, with their ships and cargoes, freely and securely to come to, and to leave, all the places and ports of the said territories; hire houses and warehouses; and trade in all kinds of produce, manufactures, and merchandise of lawful commerce, subject to the usages and established customs of the country; also, that they may discharge the whole or part of their cargo at the ports of Pilar and where commerce with other nations may be permitted, or proceed with the whole or part of their cargo to the port of Asuncion, according as the captain, owner, or other duly authorized person shall deem expedient; and that, in the same manner, shall be treated and considered such Paraguayan citizens as shall arrive at the ports of Great Britain with cargoes in Paraguayan or British vessels.

There is an American company established in Paraguay, under a charter from the State of Rhode Island, which has been engaged in commercial operations for some time, under the title of "The United States and Paraguay Navigation Company." The chief object of this company is to introduce steam navigation on the rivers of Paraguay; but how far it has progressed in the accomplishment of this object, information is not at hand. The only direct trade, however, yet opened between the United States and this republic consists of some shipments of cigars and samples of wood made by this company. All other articles of Paraguayan produce which reach the United States come through the ports of Buenos Ayres or Montevideo, and are included in the custom-house returns to the Treasury Department of exports from the republics to which these places respectively belong.

The government of Paraguay puts forth no statistics relative to the commercial movements of the republic, and it is said to be quite impossible to obtain information on the subject from its administrative officials. Complete commercial statistics, which may be viewed as strictly accurate, can not, therefore, be looked for in

this Digest; but the subjoined statements, derived from a Memoir prepared in 1853 by M. L. Geoffroy, an attaché of the mission extraordinary sent by France to the Plata and Paraguay, are, no doubt, reliable, so far as they extend.

EXPORTS OF ASUNCION FROM JULY, 1851, TO DECEMBER 31, 1852.

Tobacco—329,000 arrobas, at 12 reals (or \$1 50) per arroba of 25 pounds	\$348,500
Yerba mate—175,000 arrobas, at 50 reals per arroba	437,500
Hides—Dry, 100,000, at 10 reals each	125,000
" Tanned, 35,000, at \$3 each	105,000
Wool—Cedar, 50,000 yards, at 4 reals	20,000
" Cabinet, a stock-load of 7000 to 8000 arrobas	6,000
Hair—600 quintals, at \$3 per quintal	4,300
Sweetmeats—30,000 arrobas, at 4 reals per arroba	15,000
Cigars—2,000,000, at \$2 per 1000	4,000
" 250,000, at \$5 per 1000 (in boxes of 100)	1,250
Sundry products—White wax, rum, molasses (several cargoes), common wood (Urunday and Lapacho), several cargoes of oranges, maize, pulses, etc.; cotton, 1,500 arrobas; tiger-skins, 500, at \$3 each; India rubber, other-skins, hammocks, baskets, etc.; fringed napkins, lace, etc.	97,900
Total	\$1,094,850

It is believed that the above total might be increased at least one-third, could exact statements be obtained. If we add the export duties of 10 and 6 per cent. on the articles exported—yerba and wool, which are government monopolies, and are exempt from duty, being excepted, and which would amount to about \$70,000—and \$20,000 in silver, exported in contraband, and \$10,000 for sundry charges—we have \$1,500,000, or an amount equal to the value of imports during the same period. Indeed, such is the scarcity of money in circulation, that the trade is necessarily one of barter; so that the figures which represent the value of imports may also, generally, give the value of exports.

Measures.—The arroba equals 25 lbs.; the cubic vara about 20½ cubic feet; the pesada 36 lbs.; the almude about three-fourths of a bushel; the asumbre about one quart; the frasco about half a gallon; the fanega about four bushels. It may be observed, that these denominations of weight and measure represent different quantities in different countries, and even in the same countries, as regards different articles.

IMPORTS AND EXPORTS OF ASUNCION FROM 1851 TO 1854.

Yrs.	Imports.	Exports.	Total.	Duties paid.
1851	No data.	\$341,580	No data.	No data.
1852	\$549,157	474,499	\$1,023,656	\$128,276
1853	430,658	621,582	1,052,240	56,554
1854	635,523	777,457	1,412,980	123,280

Among the Importations of 1854, tissues and wines hold the first rank, or, rather, they constitute four-fifths of the total value of imports.

Navigation.—Transportation by land being extremely difficult, the commercial movements already analyzed were effected by water—by the Paraguay, an affluent of the Parana. From the opening of the port of Asuncion in July, 1851, to December, 1852, there arrived about 120 sloops, of 6000 arrobas, on an average, for each. A cargo of 7000 arrobas equals 60 tons, which would give an average of from 40 to 80 tons for each vessel. From January 1, to February 28, 1853, there arrived at Asuncion 80 Sardinian vessels. These vessels, the owners of which, or the greater part of them, were Sardinians, sailed under the Uruguayan or Paraguayan flag. There arrived also, up to March 10, 1853, at this port, 19 sloops. In 1854 there arrived 160 merchant vessels, averaging each 50 tons burden. Of these, 2 were British, 81 were under the flag of the republic, 116 belonged to the Argentine Confederation, and 11 to Uruguay.

The customs tariff of Paraguay, now in force in that republic, is that promulgated by a decree given at Asuncion, January 2, 1846.—Commercial Relations of the United States.

Parallels of Latitude, on the Terrestrial Sphere, are small circles parallel to the equator; but in the Celestial Sphere they are parallel to the ecliptic.

Paramaribo, the capital town of Dutch Guiana, on the west bank of the Surinam, five miles from its mouth in the Atlantic, lat. 5° 49' N., long. 55° 22' W. Estimated population, 20,000, mostly blacks. It is regularly and well built; streets unpaved, but ornamented with rows of tamarind and orange trees; and it has Lutheran, Calvinistic, Roman Catholic, and English churches, Portuguese and German-Jewish synagogues, and is the centre of the trade of the colony. Fort Zeelandia, north of the town, is the residence of the governor. In a hospital for lepers, on the right bank of the Coppename, 450 patients are maintained at the expense of the colony. The Kwatta Canal, begun in 1846, is the first public work executed by free laborers.

Parano (sometimes rendered, though incorrectly, by *desert* or *head*). The name given in South America to a mountainous district covered with stunted trees, exposed to the winds, and in which a damp cold perpetually prevails. Under the torrid zone the Paramos are generally from 10,000 to 12,000 feet in height. Snow often falls on them, but remains only a few hours; in which respect they are distinguished from the *Nevados*, which enter the limits of perpetual snow. The Paramos are almost constantly enveloped in a cold, thick fog; so that when a thick, small rain falls, accompanied with a depression of the temperature, they say at B.ota, or at Mexico, *cae un paramo*. Hence has been formed the provincial word *paramarise*—to be as cold as if one were on a paramo. —HUMBOLDT'S *Pers. Nor.* li. p. 252.

Parasang, a Persian measure of length; according to Herodotus, equal to 80 stadia, and (reckoning eight stadia to the English mile) equal to 8½ English miles. The length of the parasang was reckoned differently by different authors; and such are the discrepant estimates of the ancients that some have assigned it the length of 60 stadia. The word is supposed to be derived from the Persian *sang*, signifying a stone.

Parcel, a term indifferently applied to small packages of wares, and to large lots of goods. In this latter sense, 20 hogheads of sugar or more, if bought at one price, or in a single lot, are denominated "a parcel of sugar."

Parcels, Bill of, of an account of the items composing a parcel.

Parchment and Vellum. The former consists of the skins of sheep and goats, and the latter of those of calves; prepared in such a manner as to render them suitable for being written upon, for covering books, and other purposes. The consumption of these articles is very considerable. In this and most other countries it is customary to use them instead of paper in the drawing up of a great variety of deeds and other legal instruments. They are also extensively used, especially in Italy, in the binding of books. The finest copies of the magnificent classics which issued from the Dutch presses in the 17th century, and the early part of the 18th, were all bound in vellum. Parchment is coarser than vellum, and not so well adapted for writing upon. The qualities of both articles differ very widely; so much so that the best parchment is preferable to inferior or even middling vellum. The goodness of each depends partly on the quality of the skins of which they are made, and partly, and indeed in a very high degree, on the care and skill with which they are manufactured.

The history of these articles is involved in some obscurity. Varro and Pliny (*Hist. Nat. lib. xiii. cap. 11*), who have been generally followed, state that they were originally manufactured at Pergamus, in Asia Minor, the capital city of Eumenes II., one of Alexander's successors, during the reign of that prince; and that parchment owes to this circumstance its classical name of *charta Pergamena*. But there seems to be little if any foundation for this statement. We have seen, in the preceding article on paper, that Herodotus,

who flourished rather more than a century before Alexander the Great, states distinctly, that, previously to his era, when paper (*charta Egyptiaca*) was scarce, the Ionians were accustomed to write on the skins of sheep and goats, and that that practice was then followed (*viz.*, in his time) by several barbarous nations. —Lib. v. cap. 58. And it is all but certain, seeing that the practice of writing on skins had been in use for at least 2½ centuries, and probably much more, previously to the era of Eumenes, that their preparation would, in the course of that lengthened period, be so much improved as to render them little different from parchment. It is probable, indeed, that their manufacture may have been improved in Pergamus; but we incline to think that parchment owes its name rather to the extensive demand for it in that city, in consequence of Eumenes having amassed a large and valuable library, than to any thing else. He was, in fact, compelled to use parchment and vellum in the copying of books, as his contemporary Ptolemy Philadelphus had prohibited the exportation of paper. —PLINY, *ubi supra*.

The scarcity of parchment during the Middle Ages, and in antecedent times, led to the practice of obliterating the writing on old parchments, by rubbing them with pumice-stone, immersing them in boiling water, and such like devices; and there can be no manner of doubt that the prevalence of this practice has been most injurious to literature, and that it has most probably occasioned the total destruction of some of the noblest *chefs-d'œuvre* of antiquity. In the Middle Ages, these were erased that room might be made for some worthless treatise on scholastic theology or logic! Sometimes, however, it happens that the ancient writing is not so much obliterated but that it may still be read; and to that circumstance the recent discovery of a portion of Cicero's treatise *De Republica* is to be ascribed. It had been offered to make room for a commentary of St. Augustine on the Psalms. Parchments that have been erased in this way are called *Palmipesta* (from *πάλιν*, again, and *πύα*, to efface or clean), or repeatedly cleaned parchments; because they have been repeatedly cleaned, renewed, or prepared for writing upon. If the learned world is ever to be gratified by the recovery of the lost comedies of Menander, or the lost books of Polybius, Livy, and Tacitus, it will most probably be by finding them under some homely or such like trash. —*Nouveau Traité de Diplomatie; Des de Vaines*.

Paris (anc. *Lutetia Parisiorum*), the capital of France, and, after London, the largest and most populous city in Europe; lat. (observatory) 48° 56' 22" N., long. 79° 28' 02" E. from the national observatory, Washington, and long. 2° 20' 30" E. from London. Population in 1851, 1,021,530. Situated 193 feet above the level of the sea, on both sides and on two islands of the Seine, 111 miles from its mouth. It has recently, and at the expense of about \$100,000,000, been surrounded with fortifications, consisting of a wall 33 feet in height, bastioned and terraced, lined with a fosse about 20 feet deep, and embracing both banks of the Seine, with a continuous inclosure, and of outworks composed of 14 detached forts. These fortifications take in much of the suburbs, and even of the surrounding country; but the proper limits of the town are traced by an interior wall, erected at a much earlier date, for fiscal purposes. In this wall are 50 gates or barriers, which form the proper entrances of Paris, and at which the *octroi*, or duties on goods brought into it, are levied. Many of these barriers are magnificent structures. Among others may be specified the *Barrière de Neuilly*, consisting of two pavilions, and having in front the splendid triumphal arch *De Pétoille*; the *Barrières de Vincennes*, de *St. Martin*, de *Fontainebleau*, de *Rouilly*, de *Chartres*, and de *Passy*. Outside the barriers and their connecting wall is a large zone, finely planted, which nearly makes the circuit of the town, and forms an excellent, though not very

upon

be copartners; and, in making the marriage contract, the kind and extent of copartnership is agreed upon, the form of the stipulation for this purpose being particularly pointed out by the French code. It was between the parties to the marriage contract that the general copartnerships above-mentioned were most frequently formed. In this respect, however, the Roman law, and those codes derived principally from it, leave the parties at liberty to agree upon a universal copartnership or a limited one, or a separate property.

Copartnerships are usually confined to the prosecution of a particular branch of business, and it very often happens that each copartner is concerned in other branches. The term *general copartnership* is also applied to one formed for trade generally, or business generally, without limitations; but where the joint interest extends only to a particular concern, as, for instance, the freighting of a ship, it is called a *special copartnership*. And so a partnership is called *special* when the parties enter into stipulations modifying and restraining the right and powers of the members, instead of leaving them to the operation of the laws generally applicable to such associations; and this is the usual meaning of such copartnerships. Another description is that of *limited copartnerships*, in which one or more partners put in a certain amount of capital, which is liable for the contracts of the firm; but beyond this the party or parties are not liable. This sort of partnership is particularly provided for in the French code, and is not unfrequent in France. It is a very useful provision of the law that allows of such associations, for it enables persons of fortune, and retired from business, to put a part of their capital at risk in trade, without risking their whole property; and it accordingly operates very favorably upon the enterprise of the community; for a young man who has only his talents and industry to put into a concern can thus more easily obtain the capital necessary to give his activity and enterprise scope, and every community ought to open all practicable channels for the intellectual and physical exertions of its members. This species of copartnership has accordingly been partially introduced into the United States, being provided for in the code of Louisiana, which is modeled on the French code, and having been introduced also into the laws of New York by a statute, the provisions of which were closely copied from the French code—the first instance (as Chancellor Kent remarks in his Commentaries) in which any other foreign law than the English had been adopted in the particular structure and provisions of an American statute, in those States of whose codes the English law is the basis. This species of partnerships has also been authorized by statute in Massachusetts, Rhode Island, Connecticut, Vermont, New Jersey, Pennsylvania, Maryland, South Carolina, Georgia, Alabama, Florida, Mississippi, Indiana, and Michigan. We will now proceed to a more extended account of limited partnerships.

The condition of a limited partnership is that the name of the person whose liability is thus limited must be used in the firm, and particular provisions are made as to paying in the amount of capital stipulated; and another suitable provision in such case is the provision for some registry by which it may appear to those who wish to make the inquiry what amount such partner pays in. Some partnerships are *secret*; that is, some one agrees, upon terms, to share profits with ostensible partners without any notice to the public of his being a member of the firm. Each partner has a joint interest in the whole personal property, and, unless the articles stipulate otherwise, may transfer it.

Each partner may also bind the whole firm by his contract made in the course of the business of the firm, unless it be otherwise agreed between them; and even when it is otherwise agreed, still, if a party with whom a partner contracts has a legal right, from the manner in which the joint affairs are managed, to presume that

a partner is authorized to contract for and to bind his copartners in regard to the subject of any contract, the firm will be bound by such contract. But if the party contracted with has notice that, by the articles of copartnership, a partner has not authority to make a contract, the company will not be bound by it. So if a partner contracts, in the partnership name, in a manner which the party contracted with knows is not within the business of the firm—as if he makes a negotiable note in the name of the firm for his own separate debt—the contract will not bind the firm to the party thus contracted with; but still, if this contract, being transferable in its nature, and holding out on the face of it the responsibility of the whole firm, is negotiated to those who have no notice that the paper was made for the private accommodation of the partner who signed the partnership name, the company will be bound in respect to such assignee; that is, the firm having given notice to the world that they are copartners in a certain branch of business, every one has a right to presume that all acts done by each of them in regard to it are authorized by the terms of their contract, or the circumstances of the case, unless he has notice to the contrary. But certain acts are not authorized by the general powers of copartners, and those no one partner can be presumed to have power to do; as, for instance, one partner is not merely, as such, authorized to make a deed in the name of the other, or to act as his attorney; and he can not, accordingly, convey land belonging to the members of the company; for, though it may have been acquired and paid for with the property of the firm, yet when acquired, it belongs to the members in common, if the title be in them all, and each member can himself convey only his share; and in order to the conveyance of that of another, he must be especially empowered. But a partner may release a debt due to the firm if it be done fairly, and without collusion between him and the debtor. It has been held, however, that one partner can not by deed submit a question to arbitration. A partnership may be dissolved by its own limitation, the death, bankruptcy, or insanity of a member, or by the breaking out of a war between the countries to which the members belong.

A question is also made whether a member may dissolve the copartnership voluntarily before the time for which it was formed expires, and the opinion seems to be that he may do so by giving sufficient notice to this effect; and this seems to be necessarily incident to new associations; for, though he would, in such case, be answerable to his copartners for the breach of his agreement, yet it would be exceedingly inconvenient if a partner were irrevocably bound to give his copartners the right of his credit, and of disposing of his property, after all his confidence in them had ceased. In case of mismanagement by any partner having charge of the partnership effects, so that the other partners are liable to be materially injured, they may make application to a Court of Chancery to appoint a receiver to take charge of the concerns of the company, and wind up its affairs, in case the partnership has already been dissolved, or in case there appears sufficient reason to dissolve it. But where there is no ground for such application to a Court of Chancery, and the company is dissolved by the death of one partner, the joint property will survive to the other partner, who may dispose of it, and collect and pay the debts of the concern, and will be liable to account to the personal representatives of the deceased partner for his proportion of the surplus property. In case of the decease of a partner, his personal representatives do not become copartners with the surviving partners, but the affairs of the concern must be settled with reference to the time of the death of the deceased partner.—E. A.

Limited Partnership in New York.—1. According to the Revised Statutes of the State of New York, limited partnership for transaction of any mercantile, mechanical, or manufacturing business within the State may

be formed of two or more persons; but the provisions of the act will not authorize any such partnership for the purpose of banking or making insurance. 2. Such partnerships may consist of one or more persons, who shall be called general partners, and who shall be jointly and severally responsible, as general partners now are by law; and one or more persons who shall contribute, in actual cash payments, a specific sum as capital to the common stock, who shall be called special partners, and who shall not be liable for the debts of the partnership beyond the fund so contributed by him or them to the capital. 3. The general partners only shall be authorized to transact business and sign for the partnership, and to bind the same. 4. The persons desirous of forming such partnership shall make, and severally sign, a certificate, which shall contain: I. The name or firm under which such partnership is to be conducted. II. The general nature of the business to be transacted. III. The names of all the general and special partners interested therein, distinguishing which are general and which are special partners, and their respective places of residence. IV. The amount of capital which each special partner shall have contributed to the common stock. V. The period at which the partnership is to commence, and the period at which it shall terminate. 5. The certificate shall be acknowledged by the several persons signing the same, before the Chancellor, a Justice of the Supreme Court, a Circuit Judge, or a Judge of the County Courts; and such acknowledgment shall be made and certified in the same manner as the acknowledgment of conveyance of land. 6. The certificate so acknowledged and certified shall be filed in the office of the clerk of the county in which the principal place of business of the partnership shall be situated, and shall also be recorded by him at large in a book to be kept for the purpose, open to public inspection. If the partnership shall have places of business situated in different counties, a transcript of the certificate, and of the acknowledgment thereof, duly certified by the clerk in whose office it shall be filed, under his official seal, shall be filed and recorded in like manner in the office of the clerk of every such county. 7. At the time of filing the original certificate, with the evidence of the acknowledgment thereof, as before described, an affidavit of one or more of the general partners shall also be filed in the same office, stating that the sums specified in the certificate to have been contributed by each of the special partners to the common stock have been actually and in good faith paid in cash. 8. No such partnership shall be deemed to have been formed until a certificate shall have been made, acknowledged, filed, and recorded, nor until an affidavit shall have been filed, as above directed; and if any false statement be made in such certificate or affidavit, all the persons interested in such partnership shall be liable for all the engagements thereof as general partners. 9. The partners shall publish the terms of the partnership, when registered, for at least six weeks immediately after such registry, in two newspapers, to be designated by the clerk of the county in which such registry shall be made, and to be published in the senate district in which their business shall be carried on; and if such publication be not made, the partnership shall be deemed general. 10. Affidavits of the publication of such notice, by the printers of the newspapers in which the same shall be published, may be filed with the clerk directing the same, and shall be evidence of the facts therein contained. 11. Every renewal or continuance of such partnership beyond the time originally fixed for its duration shall be certified, acknowledged, and recorded, and an affidavit of a general partner be made and filed, and notice be given in the manner herein required for its original formation; and every such partnership which shall be otherwise renewed or continued shall be deemed a general partnership. 12. Every alteration which shall be made in the names of the partners, in the nature of

the business, or in the capital or shares thereof, or in any other matter specified in the original certificate, shall be deemed a dissolution of the partnership; and every such partnership which shall in any manner be carried on after any such alteration shall have been made, shall be deemed a general partnership, unless renewed as a special partnership, according to the provisions of last section. 13. The business of the partnership shall be conducted under a firm, in which the names of the general partners only shall be inserted, without the addition of the word "Company," or any other general term; and if the name of any special partner shall be used in such firm, with his privacy, he shall be deemed a general partner. 14. Suits in relation to the business of the partnership may be brought and conducted by and against the general partners, in the same manner as if there were no special partners. 15. No part of the sum which any special partner shall have contributed to the capital stock shall be withdrawn by him, or paid or transferred to him, in the shape of dividends, profits, or otherwise, at any time during the continuance of the partnership; but any partner may annually receive lawful interest on the sum so contributed by him, if the payment of such interest shall not reduce the original amount of such capital; and if, after the payment of such interest, any profits shall remain to be divided, he may also receive his portion of such profits. 16. If it shall appear that, by the payment of interest or profits to any special partner, the original capital has been reduced, the partner receiving the same shall be bound to restore the amount necessary to make good his share of capital with interest. 17. A special partner may, from time to time, examine into the state and progress of the partnership concerns, and may advise as to their management; but he shall not transact any business on account of the partnership, nor be employed for that purpose as agent, attorney, or otherwise. If he shall interfere contrary to these provisions, he shall be deemed a general partner. 18. The general partners shall be liable to account to each other, and to the special partners, for their management of the concern, both in law and equity, as other partners now are by law. 19. Every partner who shall be guilty of any fraud in the affairs of the partnership shall be liable civilly to the party injured to the extent of the damage, and shall also be liable to an indictment for a misdemeanor, punishable by fine or imprisonment, or both, in the discretion of the court by which he shall be tried. 20. Every sale, assignment, or transfer of any of the property or effects of such partnership, made by such partnership when insolvent, or in contemplation of insolvency, or after, or in contemplation of the insolvency of any partner, with the intent of giving a preference to any creditor of such partnership or insolvent partner, over other creditors of such partnership, and every judgment conferred, lien created, or security given by such partnership under the like circumstances, and with the like intent, shall be void, as against the creditors of such partnership. 21. Every such sale, assignment, or transfer of any of the property or effects of a general or special partner, made by such general or special partner when insolvent, or in contemplation of insolvency, or after, or in contemplation of the insolvency of the partnership, with the intent of giving to any creditor of his own, or of the partnership, a preference over creditors of the partnership, and every judgment conferred, lien created, or security given by any such partner under the like circumstances, and with the like intent, shall be void, as against the creditors of the partnership. 22. Every special partner who shall violate any provision of the two last preceding sections, and who shall concur in and assent to any such violation by the partnership, or by any individual partner, shall be liable as a general partner. 23. In case of the insolvency or bankruptcy of the partnership, no special partner shall, under any circumstances, be allowed to

claim as a creditor until the claims of all the other creditors of the partnership shall be satisfied. 24. No dissolution of such partnership by the acts of the parties shall take place previous to the time specified in the certificate of its formation, or in the certificate of its renewal, until a notice of such dissolution shall have been filed and recorded in the clerk's office in which the original certificate was recorded, and published once in each week for four weeks in a newspaper printed in each of the counties where the partnership may have places of business, and in the State papers.—Known as *Luvi's Commercial Law of the World*.

Analysis of the general Law of Partnerships.—Partnership in Great Britain is a contract entirely free, and subject to no formalities; it belongs to the parties themselves to regulate the conditions; the law is merely circumscribed in protecting the rights of third parties, and to see them respected. Partnership in common law is divided into three classes—universal, general, and limited or special. They are also divided into private partnerships and public companies. Public companies are divided into unincorporated companies or associations, and incorporated companies, and corporations chartered by government. By the law of Scotland partnerships are divided into ordinary partnerships, joint-stock companies, and public companies. In the first firm is a distinct person at law, and the partners, although jointly and severally liable for all the debts and contracts of the firm, are so as guarantors of the firm. This is general partnership. Special partnership is one contracted for a particular branch of business.

There are principles connected with the law which are identical in every country; namely, that all members of an ostensible partnership, or in collective name, are responsible in solidum; but differences appear in points regarding the continuation or cessation of partnership after the decease of one of the partners. In Prussia or Frankfurt, the heirs continue the partnership until the end of the year, and if they do not give notice of their retirement, or if they are not excluded by the other partners, they do not cease to form part of it. In France partnership ends of full right at the instant of the death of a partner, unless by contrary agreement this last regulation has been generally adopted. It is the same for that by which the profits distributed among partners are not to be returned to the partnership fund, whatever may happen afterward, unless there be fraud, and the provision is added, that a partner who brings in only his labor can not, in any case, return the dividends which he has received.

Almost every legislation except that of Great Britain recognizes the existence of three kinds of commercial partnerships: 1st. Ostensible partnerships (in collective name); 2d. Partnerships in *commandite*; 3d. Anonymous partnerships.

The Portuguese code specifies each kind of partnership, indicating their rules at some length. In effect, besides the partnership anonymous, dormant, or secret, and in collective name, that of capital and labor is made prominent; in this case the partner with capital alone is responsible beyond his investment, in consequence of which the law characterizes this association as irregular. Then come partnerships in participation, with limited or unlimited capital, called *Parceria*, either for an indivisible object, or for a determinate end; but in all cases it is necessary that it should refer to a commercial operation, and that there be at least one merchant either dormant or ostensible. There are in this code some regulations worthy of being noted; namely, that a contract which would free the provider of funds from all obligations, when he has a share in the profits, is null, but then he becomes an interested party, and not a partner. A contract is declared usurious which should allow to a lender of money the profits besides the interests, without subjecting him to the losses,

which is very proper and just; because the principle of equality ought to govern, above all, matters of partnership; consequently this last clause ought to be annulled if it existed. In general, a minor, even not a trader, may not be a partner; but he has power to make use of the privilege of restitution in case of loss. If, at his coming of age, he has not declared that he wishes to retire, he becomes responsible for all further acts of the partnership.

It is most essential in partnership in collective name that the partners should all be responsible in solidum. In this the Dutch code is equal in all points to the French code; but the former code contains a derogation from this rule surprising at first, because it says that a collective partner who has become *commanditaire* is not responsible in solidum. The reason of this extraordinary regulation is founded upon the usage which permits the continuation of ancient commercial houses, known under the names of their founders, although these have still their capital invested in them; true it is that third parties ought to have been acquainted with it by the liquidation of the preceding house, or by the publication of the dissolution.

In the Spanish code there is a regulation different from any other legislation in matter of constitution of anonymous partnerships, by subjecting the articles, not to the examination of the government, but of the tribunals of commerce. The Spanish code and that of Portugal prescribe a measure the same as that of the Code Napoleon, which consists in making interests to run in full right, on the investments of the partners, from the day in which they ought to be made. With regard to the nomination of managers of partnership, in France the law has no provision for it. In Wurtemberg and in Spain, when the manager is nominated by the articles, it is allowed, should his action be injurious to the interests of the company, to add another member. In Russia it is prohibited to confer by the articles the management of the partnership on certain parties for all its duration and without a renewal.

All legislation is silent upon the interests of the capital invested by the shareholders. It is, in fact, clear that an investment of funds in a partnership is not an employment, but a sum bestowed for mere operations, and which can only allow to raise sums on the realized profits, either every year, or at the time when balance-sheets are drawn up according to law, or at any other time, periodical or not. But in Hungary the *commanditaires*, improperly called partners, because they are then only considered as lenders of money, may stipulate for interests beyond the legal rate which the other partners ought to pay, even if they should suffer losses. It is the same in Prussia.

With regard to the emission of shares and their transference, the Hungarian code contains very important regulations. It says that all persons may buy shares, but it proscribes shares to the bearer—a regulation which was reproduced in the Russian code and in the Wurtemberg code. It says also that no investment of capital can be made nor interests claimed before the constitution of the partnership, and that only when all shares are disposed of the shareholders may establish the articles. Lastly, there is the remarkable regulation, that when the majority of shareholders have voted for a change or modification in the articles, of a nature to alter the object of the partnership, the minority have power to retire.

The Russian code prescribes several very curious measures. The sale of shares, or promises of shares on credit, is prohibited. A portion of the profits must be taken to constitute a reserve fund; the unreclaimed dividend, after ten years, is united to the social fund, or may be divided among the other shareholders. Lastly, if the directors are divided in their deliberations, the dissenting minority may exact that mention be made of their opinion in the verbal process. The same code indicates the mode of terminating disputes:

between shareholders or directors they may, with their consent, be decided by the general meeting, or by arbitrators; when third parties are concerned, it stands always with the tribunal of arbitration to decide as a forced jurisdiction. In France the same clause is equally precise. But various modern legislations inserted regulations against this mode; thus the code of Wurtemberg permits parties to derogate from it; the Hungarian code says that disputes among partners shall be brought before the Tribunal of Commerce; and if it regards bills of exchange, or in case of insolvency, they shall be adjudicated upon by the ordinary tribunals. The Lombardo-Venetian code does not reproduce the section of the French code, called *On Disputes among Partners*. The recent codes of Nassau and Sardinia do not contain any regulation on this matter. In England, when a reference is depending, made, or determined, it may be a bar; but the agreement of the parties does not oust either courts of law or equity, as the former will not allow their jurisdiction to be ousted by any private arrangement, and equity will not decree a specific performance thereof.

The law of merchants differs from the common law in the power of binding a partner by deed.

Lord Kenyon said, in *Harrison v. Jackson*, 7 S. R. 210: "The law on merchants is part of the law of the land, and in mercantile transactions it never was doubted but that one partner might bind the rest. But the power of binding each other by deed is now for the first time insisted on. A general partnership agreement, though under seal, does not authorize the partners to execute deeds for each other, unless a particular power be given for that purpose. Yet in common law a partner has power to bind his copartner by deed."

Although, in the words of Hobart, C. J., "The custom of merchants is part of the common law of the United Kingdom, of which the judges ought to take notice; and if any doubt arise to them about their custom, they may send for the merchants to know their custom, as they may send for the citizens to know their law;" yet, on the other hand, Lord Holt says, "We take notice of the laws of merchants that are general, not of those that are particular usages."—See *Westminster Review*, xx. 58; *American Quarterly Review*, xlii. 48; *Huxta's Merchant's Magazine*, xxiv. 68, xxxiii. 457, xxxv. 730. See also LEONE LEVI'S *Commercial Law of the World*, Ato.; London, 1864; and KERR'S *Commentaries*, vol. iii.

Partners of the Mast, the wood-work round the mast at the deck, to strengthen and support the deck against the pressure of the mast. The term is also applied to the similar supports round the capstan and pumps.

Partridge Wood, a variegated wood imported from Martinique; it is said to be the produce of the *Heisteria coccoloba*.

Passengers, in *Commercial navigation*, are individuals conveyed for hire from one place to another on board ship. Passage ships are those peculiarly appropriated to the conveyance of passengers. Passage ships are generally placed under certain regulations; and the extent to which emigration is now carried renders it of the utmost importance that these regulations should be carefully compiled. The greater number of emigrants are in humble life; few among them know any thing of ships, or of the precautions necessary to insure a safe and comfortable voyage; they are also, for the most part, poor, and exceedingly anxious to economize, so that they seldom hesitate to embark in any ship, however unfit for the conveyance of passengers, or inadequately furnished with provisions, if it be cheap. Unprincipled masters and owners have not been slow to take advantage of this; and in order to prevent the frauds that would otherwise be practised on the unwary, it has been found indispensable to lay down some general regulations as to the number of

passengers to be taken on board ships as compared with their tonnage; the quantity of water and provisions as compared with the passengers, etc. But this is no very easy task. If the limitations be too strict, that is, if comparatively few passengers may be carried, or if the stock of provisions to be put on board be either unnecessarily large or expensive, the cost of emigration is proportionally enhanced, and an artificial and serious impediment is thrown in the way of what should be made as easy as possible, consistent with security. But, on the other hand, if too many passengers be allowed, their health is liable to suffer; and should the supply of provisions be inadequate, or the quality bad, the most serious consequences may ensue.

In some respects passengers may be considered as a portion of the crew. They may be called on by the master or commander of the ship, in case of imminent danger either from tempest or enemies, to lend their assistance for the general safety; and in the event of the vessel declining, may be punished for disobedience.

The principle has been recognized in several cases; but as the authority arises out of the necessity of the case, it must be exercised strictly within the limits of that necessity.—*Boyes v. Daddiffe*, 1 Campbell, 58. A passenger is not, however, bound to remain on board the ship in the hour of danger, but may quit it if he have an opportunity; and he is not required to take upon himself any responsibility as to the conduct of the ship. If he incur any responsibility, and perform extraordinary services in relieving a vessel in distress, he is entitled to a corresponding reward. The goods of passengers contribute to general average.—*ASSORTON*

Law of Shipping.

Passenger Act of the United States.—It is the duty of the Secretary of State, by the second paragraph of the 18th section of the act approved 3d of March, 1856, to give notice, in the ports of Europe and elsewhere, of the provisions of the act to regulate the carriage of passengers in steamships and other vessels.

The special attention of United States consular officers is called to this act, and also to the instructions which have been issued by the Treasury Department in reference to it. It will be observed that, while this act prescribes spaces of certain clear superficial feet of deck to each passenger (other than cabin passengers), it moreover fixes a maximum, by restricting the number of such passengers allowed to be carried in any such vessel in the proportion of one to every two tons of said vessel's tonnage measurement, excluding children under the age of one year in the computation, and computing two children over one and under eight years of age as one passenger. It follows that though a vessel might afford clear spaces of the dimensions indicated for a greater number of passengers than one to every two tons of her tonnage measurement, yet if the number shall exceed that allowed by her tonnage measurement the penalties imposed by the law would attach; or if her tonnage measurement should allow a greater number of passengers than according to the clear spaces prescribed by law she could carry, yet if the number shall exceed that allowed by the clear spaces prescribed by law the penalties imposed by the law would equally attach. In other words, the one rule, as to the number of passengers a vessel is entitled to carry, is a limitation upon the other. The tonnage of each vessel, according to custom-house measurement, must, therefore, be ascertained, as well as the measurement of the spaces allotted to passengers, in order to determine the number of passengers she is entitled to carry.

In order to determine the number of passengers a vessel is entitled to carry in accordance with the spaces prescribed by this act, the height between decks must be measured, not from the bottom edge of the carlines or deck beams, but from the under surface of the upper deck to the top floor below; and no space shall be con-

sidered available for passengers that has not, when measured in this manner, the height called for by the law, as the case may be; nor shall any space in the vessel of a less width than four feet be measured; provided, however, if the vessel shall, in accordance with the provisions of the first section of this act, carry any portion of her cargo, or any other article or articles, on any of the decks, cabins, or other places appropriated for the use of passengers, in lockers or inclosures prepared for the purpose, the height between decks shall be measured from the bottom edge of the carlines, or deck beams, to the upper surface of said lockers or inclosed spaces, which shall be deemed and taken to be the deck or platform from which measurement shall be made for all the purposes of this act, and the spaces occupied by said lockers or inclosed spaces shall be deducted from the spaces allowable for the use of passengers. For example: the spaces in the main and poop decks, or platform, and in the deck houses, if any there be, will be 18 x 6 = 96 feet; lower deck, 18 x 6 = 108 feet; two-deck vessels, 14 x 7 1/2 = 105 feet. The encumbering by merchandise or stores, not the personal baggage of the passengers, except in lockers or inclosures prepared for the purpose, of any part of the space occupied by the passengers, will vitiate the whole space, unless the part so encumbered be separated from that so occupied by a substantial bulkhead. The deck or platform must be of a permanent nature, flush, and impervious to the water.

Passport. A warrant of protection and authority to travel, granted to persons moving from place to place by the competent officer. The word appears to be derived from the maritime usage of some Continental countries of giving similar authorities from the admiral of a naval station to vessels leaving harbors within his jurisdiction. As passports are not required in our own country, the only species known to our travelers is that of foreign passports, which, for traveling on the continent of Europe, are usually made out by the resident minister or consul of the country he intends first to visit, or by the State Department. They are subject to *visa*, or inspection; by the proper authorities at the place where the traveler disembarks, and also at other places where he may reach, according to the police regulations of each particular country, and on passing the frontiers of states. Austria is, we believe, the only European state which at this time requires absolutely the *visa* of an ambassador or minister of her own for travelers entering her domains by land. In France, and in many Continental countries, home passports are necessary for the native traveler. According to the letter of the French law (since 1790), a Frenchman can not pass the limits of the canton in which he is domiciled without a passport; but in practice it is not required within the extent of the department.

Legally speaking, the strict formalities of an internal passport in France require the direction of a journey to be specified, and its exact execution attested by the *visas* and signatures of the police authorities at every place mentioned in it; and these laws are, from their severity, so incapable of complete execution, that it is a common saying that no man but a rogue is ever entirely *en règle* with respect to his passport, suspicious characters being usually the most particular in their attention to formalities, for fear of detention. A Frenchman traveling without a properly-authenticated passport is liable to arrest and detention for a period not exceeding a month. The fees fixed in France are two francs for a passport to travel at home, and ten to go abroad.

By the twenty-first section of the act of August 18, 1866, the Secretary of State of the United States is authorized to grant and issue passports, and cause passports to be granted, issued, and verified in foreign countries by such diplomatic or consular officers of the United States, and under such rules as the President shall designate and prescribe, for and on behalf of the Unit-

ed States, and no other person shall grant, issue, or verify any such passport; nor shall any passport be granted or issued to or verified for any other persons than citizens of the United States; nor shall any charge be made for granting, issuing, or verifying any passport, except in a foreign country; and in any case the fee allowed therefor shall not exceed the sum of one dollar, nor shall any such charge be made for more than one such verification in any foreign country; and if any person acting or claiming to act in any office or capacity under the United States, or any of the States of the United States, who shall not be lawfully authorized so to do, shall grant, issue, or verify any passport, or other instrument in the nature of a passport, to or for any citizen of the United States, or to or for any person claiming to be or designated as such in such passport or verification; or if any consular officer who shall be authorized to grant, issue, or verify passports, shall knowingly and willingly grant, issue, or verify any such passport to or for any person not a citizen of the United States, the person so offending shall be deemed and taken to be guilty of a misdemeanor, and on conviction thereof shall be imprisoned not exceeding one year, or fined in a sum not to exceed five hundred dollars, or both; and may be charged, proceeded against, tried, convicted, and dealt with therefor in the district where he may be arrested or in custody. It is likewise made the duty of all persons who shall be authorized, pursuant to the provisions of the act, to grant, issue, or verify passports, to make return of the same to the Secretary of State; and such returns shall specify the names and all other particulars of the persons to whom the same shall be granted, issued, or verified, as embraced in such passport.

From the foregoing provisions of the act it will be seen that passports can only be issued by the Secretary of State, and such diplomatic and consular officers of the United States in foreign countries as he may expressly authorize, and they can be granted to citizens of the United States only. Passports will be granted by the Secretary of State, and by the diplomatic representatives of the United States in foreign countries, free of charge; but when issued by a consular general or consul, the fee of one dollar, as prescribed in these instructions, is to be collected in every case. As passports granted by the Secretary of State secure to the bearers facilities from foreign governments not accorded to those issued by diplomatic officers, consuls general, or consuls, it will always be to the interest of travelers to procure their passports before leaving the United States, and this course is earnestly recommended by the Department of State. In any country where there is a diplomatic representative of the United States, no consular general or consul is authorized to issue passports, except in the absence of such representative from the place of his location. Whenever he may be so absent, authority is given to consuls general and consuls only to issue passports; but in all cases the said consuls general or consuls, as the case may be, will report to the Department of State the names of the persons to whom passports have been issued by them, together with the evidence of their being citizens of the United States, and a copy of the same report will be forwarded to the legation of the United States, if there be any in the country. In case there should be no diplomatic representative accredited to the country in which a consular general or consul may reside, then these officers are authorized to grant passports, having regard to the general instructions to consular officers in reference thereto; they will transmit, in all cases, to the Department of State the information in regard to citizenship required by this section.

Whenever a foreign government shall require the *visa* of a passport of any citizen of the United States, it shall be given by the consular officer of the United States at the place where it is demanded, and he shall, for each passport so *viséd*, collect and account for the

fee prescribed in these instructions, noting on the passport that this has been done; and no charge shall thereafter be made by any officer of the United States for any *visa* of that passport in the same country. Passports are granted upon the ground of international courtesy, and as affording evidence to the diplomatic and other agents in foreign countries that the bearer thereof is a citizen of the United States, and entitled to full protection as such. A passport, in proper form, must contain a description of the bearer, with his signature; it must also request all whom it may concern to permit the bearer thereof, being a citizen of the United States, safely and freely to pass, and, in case of need, to give him all lawful aid and protection while so doing. It must be signed by the diplomatic representative, consul general, or consul, and sealed with the seal of the legation or consulate. Consuls general and consuls are expressly instructed that when an application is made for a passport by a native citizen of the United States, before granting it, the applicant must file in the consulate an affidavit stating that fact, and also his age and place of birth; this must be signed and sworn to by himself and one other citizen of the United States named therein, to whom he is personally known, and to the best of whose knowledge and belief the declaration made by him is true. If the applicant be a naturalized citizen, a passport can only be granted upon his exhibiting a certificate of naturalization, or a certified copy thereof; an authenticated copy of which must be transmitted by the consul general or consul to the Department of State. When the applicant is accompanied by his wife, children, or servants, or by females under his protection, it will be sufficient to state the names and ages of such persons and their relationship to the applicant.

UNITED STATES CONSULAR PASSPORT.

CONSULATE OF THE UNITED STATES OF AMERICA.	
To all to whom these presents shall come, greeting:	
Age, years,	I, the undersigned, consul of the United
Sex,	States of America for _____, and the dependencies
Forehead,	thereof, hereby request, all
Eyes,	whom it may concern, to permit safely and
Nose,	freely to pass, _____, a citizen of the

Paste (Fr. *pâte*). In Gem Sculpture, a preparation of glass, calcined crystal, lead, and other ingredients, for imitating gems. This art was well known to the ancients, and, after being long lost, was restored, at the end of the fifteenth century, by a Milanese painter. Some modern artists have succeeded in obtaining a composition possessing a hard, fine, and brilliant lustre or appearance; but *pastes*, or mock diamonds, as they are called, depend most for brilliancy on the art displayed in setting the foil or tinsel behind them. Several recipes have been given by M. Fontanlen; but the most useful, and that generally employed for the production of artificial diamonds, is the following: Take of litharge 20 parts, of silice 12, of nitre 4, of borax 4, and of white arsenic 2 parts. These ingredients are to be well mixed together in a crucible and melted; the fused metal is thrown into water; and should any of the lead employed be reduced to the metallic state, it becomes separated by this process, and the glass is remelted for use. For the finer kinds, rock crystal is used instead of flint or sand, as it occurs in a much purer state; i. e., more free from the admixture of metallic oxids, which give to vitreous compounds their different colors. In place of the above,

Loyel recommends the following ingredients to form a compound having the same specific gravity as the Oriental diamond, and on this account considered superior, as it more nearly approaches the gem with regard to its refractive and dispersive powers; but, like the former, it requires to be kept for some two or three days in a fused state, in order to expel the superabundant alkali and to perfect the refining. A moderate degree of heat fuses it. The following is its composition: Take of, white sand purified by being washed, first in muriatic acid and afterward in pure water until all traces of acid are removed, 100 parts; red oxyd of lead (minium) 150 parts; calcined potash 80 to 85 parts; calcined borax 10; and oxyd of arsenic 1 part.—See the *Polytechnic Journal* for July, 1841.—The term paste is also applied to the earthy mixture for pottery and porcelain; also to dough, and to the solution of starch or wheat flour, made by first mixing it with a proper portion of cold water, and then adding boiling water under constant stirring, so as to form an even solution. Alum is often added to paste to strengthen it.—BRANDÉ'S *Dictionary*.

Pastel (Lat. *pastillus*). In painting, a crayon formed with any color and gum water, for painting on paper or parchment. The great defect of this mode of painting is its want of durability.

Patents. A patent, according to the definition of Mr. Philps, is a grant by the State of the exclusive privilege of making, using, and vending, and authorizing others to make, use, and vend, an invention.

The first act of Congress on this subject was passed April 10th, 1790, and it authorized the Secretary of State, the Secretary of War, and the Attorney General, or any two of them, to grant patents for such new inventions and discoveries as they should deem sufficiently useful and important. That act extended equally to aliens, and the board exercised the power of refusing patents for want of novelty or utility. This act was repealed, and a new act passed on the 21st February, 1798. It confined patents to the citizens of the United States, and they were to be granted by the Secretary of State, subject to the revision of the Attorney General. The act gave no power to the Secretary of State to refuse a patent for want of novelty or usefulness, and the granting of the patent became a mere ministerial duty. The privilege of suing out a patent was, by the act of 17th April, 1800, extended to aliens of two years' residence in the United States. The act of July 18th, 1832, only required the alien to be a resident at the time of the application, and to have declared his intention, according to law, to become a citizen.

But as every person was entitled to take out a patent, on complying with the prescribed terms, without any material inquiry, at least at the Patent Office, respecting the usefulness and importance of the invention or improvement, a great many worthless and fraudulent patents were issued, and the value of the privilege was degraded, and in a great degree destroyed. It became necessary to give a new organization to the Patent Office, and to elevate its character, and confer upon it more efficient power. This was done by the act of Congress of July 4th, 1836, which repealed all former laws on the subject, and re-enacted the patent system with essential improvements. A Patent Office is now attached to the Interior Department, and a commissioner of patents appointed. Applications for patents are to be made in writing to the commissioner, by any persons having discovered or invented any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement on any art, machine, manufacture, or composition of matter, not known or used by others before his discovery or invention thereof, and not at the time of his application for a patent in public use or on sale, with his consent or allowance, as the inventor or discoverer. The applicant must deliver a written description of his invention

or discovery, and of the manner and process of making, constructing, using and compounding the same, in full, clear, and exact terms, avoiding unnecessary prolixity, so as to enable any person skilled in the art or science to which it appertains, or in most nearly connected, to make, construct, compound, and use the same; and he must, in the case of a machine, fully explain the principle and the application of it, by which it may be distinguished from other inventions; and he must particularly specify the part, improvement, or combination which he claims as his own invention or discovery. He must accompany the same with drawings and written references, where the nature of the case admits of drawings or specimens of ingredients, and of the composition of matter sufficient in quantity for the purpose of experiment, where the invention or discovery is of a composition of matter. He must likewise furnish a model of his invention, in cases which admit of representation by model. The applicant also must make oath or affirmation that he believes he is the original and first inventor or discoverer of the art, machine, composition, or improvement for which he solicits a patent, and that he does not know or believe that the same was ever before known or used, and he must further state of what country he is a citizen.

If the applicant be a citizen, or an alien of one year's residence, he is to pay to the Treasury of the United States \$80; and if a British subject, \$500; and all other applicants, \$300. The original and true inventor is not to be deprived of the right to a patent for his invention, by reason of his having previously taken out letters patent therefor in a foreign country, and the same having been published at any time within six months next preceding the filing of his specification and drawing. The executors and administrators of persons dying before a patent is taken out, may apply and take it out in trust for the heirs or devisees, on due compliance with the terms of the statute. Patents are assignable, and may be granted in whole or in part by writing, to be recorded in the Patent Office. If invalid by reason of defective specifications, or by claiming too much, the patent may be surrendered, and a new patent taken out for the unexpired period, provided the error did not arise from any fraudulent intention. If the patentee be an alien, he forfeits his exclusive right, if he fails for eighteen months from the date of the patent to continue on sale to the public on reasonable terms the invention or discovery covered by the patent. The patentee does not lose his patent if it satisfactorily appears to the court, that at the time of his application he believed himself to be the first inventor or discoverer of the thing patented, though the invention or discovery, or any part thereof, had been before known or used in a foreign country; provided it does not appear that the same, or any substantial part thereof, had before been patented or described in any printed publication.

These are the principal existing statute provisions on the subject, and though the act of Congress of 1836 has made considerable alterations in the pre-existing law respecting the organization of the Patent Office, and the limitations on the granting of patents, yet the essential and established doctrines concerning patents heretofore declared in the decisions of the courts remain unaffected. The act of 1793 declared that simply changing the form or the proportions of any machine or composition of matter in any degree was not a discovery. And also, that the person who had discovered an improvement in the principle of any machine, or in the process of any composition of matter, might obtain a patent for such improvement, but that he could not thereby make, use, or vend the original discovery, nor could the first inventor use the improvement. These declaratory provisions are omitted in the law of 1836, and I presume the construction was considered to be necessarily the same without the provision. In an age distinguished for an active and ar-

dent spirit of improvement in the arts of agriculture and manufactures, and in the machinery of every kind applied to their use, the doctrine of patent rights has attracted much discussion, and become a subject of deep interest both here and in Europe.—KENT'S *Commentaries*, vol. II. p. 488; DUNLAP'S *Digest Laws U. S.*

Patras, or **Patrasco**, a sea-port in the northwest corner of the Morea, near the entrance of the Gulf of Lepanto; lat. 38° 14' 26" N., long. 21° 40' 20" E. Population variously estimated from 7000 to 8000. The port lies a little to the northward of the town; but the part fronting it is unsafe, and exposed to heavy seas, particularly in winter. Vessels, therefore, go a little farther up the gulf, where there is a mole or quay, and where they can lie close to the wharf. Patras has a more extensive trade than any other port of Greece. The principal exports are currants, oil, valonia, wine, raw silk, raw cotton, wool, skins, wax, &c. Of these, currants are by far the most important. The fruit is larger, and freer from sand and gravel, than that of the Ionian Islands. They are shipped in casks of various sizes; but as the weight of the cask is included in that of the fruit, it is said to be, for the most part, heavier and stronger than necessary. Morea currants are preferred in most countries, except England; but there the currants of Zante are held in equal, or perhaps greater, estimation. The export of currants from Patras may average from 70,000 to 80,000 cwts. a year; but the produce of the crop varies extremely in different seasons. Lately the culture of currants in the Morea has been very greatly extended. Owing to the increase of their quantity, their price has been much reduced. But their cultivation would not withstand being extremely profitable were it not for the extraordinary risks by which it is attended. It is seldom, indeed, that the entire crop can be housed without serious damage; and very frequently it is all but entirely lost. This was the case with the crop of 1852, the loss of which occasioned much distress. The crops of oil, the next great article of export from Patras, are, if possible, still more fluctuating than those of currants. The imports at Patras, as at the other Greek ports, consist principally of sugar, coffee, and other colonial products; plain and printed cotton stuffs, woolen goods, salted fish, iron, tin plates, hardware, coal, cordage, hemp, deals, &c. Imported articles are brought principally from the Ionian Islands, Malta, Venice, Leghorn, Marseilles, and Trieste; but, from the want of authentic details, it is quite impossible to form any accurate estimate of their amount either as respects Patras or any other Greek port.

Commerce.—The Greeks have particularly distinguished themselves by the spirit and success with which they have engaged in naval and mercantile enterprises. Their commerce, next to their freedom, was the grand source of the prosperity of Athens, Corinth, and other Greek cities of antiquity. And in this respect the modern Greeks have been no unsuccessful imitators of their illustrious progenitors. The great articles of export from Greece consist of currants, silk, figs, wool, olive oil, valonia, wine, sponge, wax, tobacco, &c.; the principal imports being manufactured cotton and woolen goods, corn, with a great variety of subordinate articles, principally from England, but partly also from France and Germany. The mercantile navy of Greece was estimated in 1850 at 4000 vessels, of the aggregate burden of 150,000 tons, employing about 80,000 seamen. The Greeks have, in fact, attained to the distinction of being the carriers, factors, and traders of the Levant.

The advantage resulting to Greece from her being the seat of extensive trade is not so great as might have been anticipated. The import and export trade of the country is subjected to many troublesome regulations; there are no roads, which, however, are less wanted here than in most other countries. of the population, but little removed from barbarism, using only those made at home; agriculture is also in the most backward condition, and is almost wholly carried on under the *metayer* system. Still, however, some improvements are taking place, especially in the islands; and it is probable that the progress toward a better state of things will be gradually accelerated. It is deeply to be regretted that Candia, or Crete, was not either added to the new kingdom of Greece, or made independent. The Christian nations of Europe, that this famous island, where European civilization first struck its roots, should be assigned to the barbarians by whom it is now laid waste! It is as well entitled to the favorable consideration of England, France, and Russia, as any part of Continental Greece; and we hope that measures may yet be devised for rescuing it from the atrocious despotism by which it has been so long weighed down.—See GIBSON. For Commerce, etc., of Modern Greece, see *Living Age*, ii. 557; *Niles's Register*, xxv. 842 (DANIEL WEBSTER'S SPEECH); *Hunt's Merchants' Magazine*, vii. 109; *De Bow's Review*, xiii. 124; *Democrat's Review*, viii. 204 (GEORGE SUMNER).

Patterns are specimens or samples of commodities, transmitted by manufacturers to their correspondents, or carried from town to town by travelers, in search of orders.

Pawnbrokers and Pawnbroking.—A pawnbroker is a species of banker, who advances money, at a certain rate of interest, upon security of goods deposited in his hands; having power to sell the goods, if the principal sum and the interest thereon be not paid within a specified time. The origin of borrowing money by means of pledges deposited with lenders is referred, as a regular trade, to Perousa, in Italy, about A.D. 1458; and soon afterward in England. The business of pawnbrokers was regulated 30 Geo. II., 1756. Licenses were issued 24 Geo. III., 1788. In London there are 394 pawnbrokers; and in England, exclusively of London, 1137.

Advantages and Disadvantages of Pawnbroking.—The practice of impledging or pawning goods, in order to raise loans, is one that must necessarily always exist in civilized societies, and is in many cases productive of advantage to the parties. But it is a practice that is extremely liable to abuse. By far the largest proportion of the *bona fide* borrowers of money on pawn consist of the lowest and most indigent classes; and were the lenders not subjected to any species of regulation, advantage might be taken (as, indeed, it is frequently taken, in despite of every precaution) of their necessities, to subject them to the most grievous extortion. But, besides those whose wants compel them to resort to pawnbrokers, there is another class, who have recourse to them in order to get rid of the property they have unlawfully acquired. Not only, therefore, are pawnbrokers instrumental in relieving the pressing and urgent necessities of the poor, but they may also, even without intending it, become the most efficient allies of thieves and swindlers, by affording them ready and convenient outlets for the disposal of their ill-gotten gains. The policy of giving legislative protection to a business so liable to abuse has been doubted by many.

But though it were suppressed by law, it would always really exist. An individual possessed of property which he may neither be able nor willing to dispose of, may be reduced to a state of extreme difficulty; and in such case, what can be more convenient or advantageous for him than to get a loan upon a deposit of such property, under condition that if he repay the loan and the interest upon it within a certain period, the property will be returned? It is said, indeed, that the facilities of raising money in this way foster habits of imprudence; that the first resort for aid to a pawnbroker almost always leads to a second; and that it is impossible so to regulate the business as to prevent

the ignorant and the necessitous from being plundered. That this statement, though exaggerated, is to a certain extent true, no one can deny. On the other hand, however, the capacity of obtaining supplies on deposits of goods, by affording the means of meeting pressing exigencies, in so far tends to prevent crime, and to promote the security of property; and it would seem as if the desire to redeem property in pawn would be one of the most powerful motives to industry and economy. At the same time, too, it must be borne in mind that it is not possible, do what you will, to prevent those who are poor and uneducated from borrowing; and that they must in all cases obtain loans at a great sacrifice, and be liable to be imposed upon. But the fair presumption is, that there is less chance of any improper advantage being taken of them by a licensed pawnbroker than by a private and irresponsible individual. Although, however, the business had all the inconveniences, without any portion whatever of the good which really belongs to it, it would be to no purpose to attempt its suppression. It is visionary to imagine that those who have property will submit to be reduced to the extremity of want, without endeavoring to raise money upon it. Any attempt to put down pawnbroking would merely drive respectable persons from the trade, and throw it entirely into the hands of those who have neither property nor character to lose. And hence the object of a wise Legislature ought not to be to abolish what must always exist, but to endeavor, so far at least as is possible, to free it from abuse, by enacting such regulations as may appear to be best calculated to prevent the ignorant and the unwary from becoming the prey of swindlers, and to facilitate the discovery of stolen property.

Obligations under which Pawnbrokers should be placed.—For this purpose it seems indispensable that the interest charged by pawnbrokers should be limited; that they should be obliged to give a receipt for the articles pledged, and to retain them for a reasonable time before selling them; that the sale, when it does take place, should be by public auction, or in such a way as may give the articles the best chance for being sold at a fair price; and that the excess of price, if there be any, after deducting the amount advanced, and the interest and expenses of sale, should be paid over to the original owner of the goods. To prevent pawnbrokers from becoming the receivers of stolen goods, they should be liable to penalties for making advances to any individual unable to give a satisfactory account of the mode in which he became possessed of the property he is desirous to pawn; the officers of police should at all times have free access to their premises; and they should be obliged carefully to describe and advertise the property they offer for sale.

Law as to Pawnbrokers.—It may appear singular that pawnbrokers should hardly have been named in any legislative enactment till after the middle of last century. It was enacted by the 30 Geo. II. that a duplicate or receipt should be given for goods pawned, and that such as were pawned for any sum less than £10 might be recovered any time within two years on payment of the principal and interest; but the rate of interest was not fixed.

Of the pledge of Mortgage and Chattels.—There is a material distinction to be noticed between a pledge and a mortgage. A pledge, or pawn, is a deposit of goods redeemable on certain terms, and either with or without a fixed period of redemption. Delivery accompanies a pledge, and is essential to its validity. The general property does not pass, as in the case of a mortgage, and the pawnee has only a special property. If no time of redemption be fixed by the contract, the pawnor may redeem at any time; and though a day of payment be fixed, he may redeem after the day. He has his whole lifetime to redeem, provided the pawnee does not call upon him to redeem, as he has a right to do at any time, in his discretion, if no time for redemption

be fixed; and if no such call be made, the representatives of the pawnor may redeem after his death. As early as the time of Glanville, these just and plain principles of the law of pledges were essentially recognised, and it was declared, that if the pledge was not redeemed by the time appointed, the creditor might have recourse to the law, and compel the pawnor to redeem by a given day, or be forever foreclosed and barred of his right. And if no time of redemption was fixed, the creditor might call upon the debtor at any time, by legal process, to redeem or lose his pledge. The distinction between a pawn and mortgage of chattels is equally well settled in the English and American law; and a mortgage of goods differs from a pledge and pawn in this, that the former is a conveyance of the title upon condition, and it becomes an absolute interest at law, if not redeemed by a given time, and it may be valid in certain cases without actual delivery. According to the civil law, a pledge could not be sold without judicial sanction, unless there was a special agreement to this effect; and this is, doubtless, the law at this day in most parts of Europe. The French Civil Code has adopted the law of Constantine, by which even an agreement at the time of the original contract of loan, that if the debtor did not pay at the day, the pledge should be absolutely forfeited, and become the property of the creditor, was declared to be void. While on this subject of pledges, it may be proper further to observe, that the pawnor, by bill in chancery, may bar the debtor's right of redemption and have the chattels sold. This has been done frequently in the case of stock bonds, plate, or other personal property pledged for the payment of debt. But without any bill to redeem, the creditor, on a pledge or mortgage of chattels, may sell at auction, on giving reasonable opportunity to the debtor to redeem, and appraising him of the time and place of sale; and this is the more convenient and usual practice. While the debtor's right in the pledge remains unextinguished, his interest is liable to be sold on execution; and the purchaser, like any other purchaser or assignee of the interest of the pawnor, succeeds to all his rights, and becomes entitled to redeem. —See KERR'S Commentaries, vol. iv.

Italy, France, &c.—The practice of advancing money to the poor, either with or without interest, seems to have been occasionally followed in antiquity.—BROCKMANN, vol. iii. But the first public establishments of this sort were founded in Italy, under the name of *Monti di Pietà*, in the 14th and 15th centuries. As it was soon found to be impossible to procure the means of supporting such establishments from voluntary contributions, a bull for allowing interest to be charged upon the loans made to the poor was issued by Leo X. in 1521. These establishments, though differing in many respects, have universally for their object to protect the needy from the risk of being plundered by the irresponsible individuals to whom their necessities might oblige them to resort, by accommodating them with loans on comparatively reasonable terms. And though their practice has not, in all instances, corresponded with the professions they have made, there seems no reason to doubt that they have been, speaking generally, of essential services to the poor. From Italy these establishments have gradually spread over the Continent. The *Mont de Piété*, in Paris, was established by a royal ordinance in 1777; and after being destroyed by the Revolution, was again opened in 1797. In 1864 it obtained a monopoly of the business of pawnbroking in the capital. Loans are made by this establishment upon deposits of such goods as can be preserved, to the amount of two-thirds of the estimated value of all goods other than gold and silver, and to four-fifths of the value of the latter. No loan is for less than 3 francs. The advances are made for a year, but the borrower may renew the engagement. Interest is fixed at the rate of one per cent. per month.

The *Mont de Piété* has generally in deposit from

600,000 to 650,000 articles, worth from twelve million to thirteen million francs. The expense of management amounts to from 60 to 65 centimes for each article; so that a loan of 3 francs never defrays the expenses it occasions, and the profits are wholly derived from those that exceed 3 francs. At an average the profits amount to about 260,000 francs; of which only about 155,000 are derived from loans upon deposit, about 125,000 being the produce of other funds at the disposal of the company. In some respects, particularly the lowness of interest upon small loans, and the greater vigilance exercised with respect to the reception of stolen goods, the *Mont de Piété* has an advantage over the pawnbroking establishments in this country. It may be doubted, however, whether it is, on the whole, so well fitted to attain its objects. The limitation of the loans to 3 francs would be felt to be a serious grievance here, and it can hardly be otherwise in France; nor is it to be supposed that the servants of a great public establishment will be so ready to assist poor persons, having none but inferior articles to offer in security, as private individuals anxious to get business. And such, in point of fact, is found to be the case, not in Paris only, but in all those parts of the Continent where the business of pawnbroking is confined to a few establishments. And hence; though the question be not free from difficulty, it would seem that, were the modifications already suggested adopted, our system would be the best of any. For further information with respect to this curious and interesting subject, the reader is referred to the *Traité de la Bienfaisance Publique* of Deferando, lib. 1-55; besides giving a succinct historical notice of *Monts de Piété*, the learned author has discussed most part of the knotty questions connected with the proper organization of these establishments, and with their influence on society, with equal sagacity and ability.—See *Dankers' Magazine*, New York, August, 1850, p. 170; August, 1851, p. 124 (Sir F. HEAD); Standard Lib. Cy. London, 1849.

Peach-tree (*Amygdalus persica*). It is not certain in what part of the globe the peach-tree was originally produced; for although we have early accounts of its being brought to Europe from Persia, it does not follow from thence that it was one of the natural productions of that country. Pliny relates that it had been stated to have possessed venomous qualities, and that its fruit was sent into Egypt by the kings of Persia, by way of revenge, to poison the natives; but he treats this story as a mere fable, and considers it the most harmless fruit in the world; that it had the most juicy, and the least smell of any fruit, and yet caused thirst to those who ate of it. He expressly states that it was imported by the Romans from Persia; but whether it was indigenous to that country, or sent thither from a region still nearer to the equator, we have no information. He adds that it was not long since peaches were known in Rome, and that there was great difficulty in rearing them. He also informs us that this tree was brought from Egypt to the Isle of Rhodes, where it could never be made to produce fruit; and from thence to Italy. He says, moreover, that it was not a common fruit either in Greece or Natolia. No mention, however, is made of it by Cato. Pownall, in his *Roman Provinces*, makes it a Phœcean importation to Marseilles; and evidently it was cultivated in France at an early period, as Columella, in his account of this fruit, says:

"Those of small size to ripen make great haste; such as great Gaul bestows, observes due time and season, not too early, nor too late."

The peach is said to have been first cultivated in Britain about the middle of the 18th century. Gerard describes several varieties of it as growing in his garden, in 1597. Teaser mentions it in his list of fruits in 1577; and in all probability it was introduced when the Romans had possession of that country.

The peach was introduced into North America by

the first of the 16th century, with such trees. In land, Virginia is a patent planter to sand or middle States; greatest; in the open Vermont, so delicate it is also to, in Carolina is Florida, if well cultivated to a large Mississippi same little indigenous of foreign before the vicinity of and other speech is numerous fine quality American abundance speaks in fruit, with neighborhood; and as an article those moved from the Plata, seen peach perfect tolerable they grew quantities use, and by cattle. The roseate h owing to it is little tries where tained, he played for color may its leaves low color, some, and poisonous sugar con tritious, a preserved it is slight takes it is taken too When ste relaxative for the as The leave liquorist, have also fatal consequences they should preservat other kind in the int

the first European settlers, probably toward the close of the 16th or early in the 17th century, where it is cultivated in extensive plantations, which often grow with such luxuriance as to resemble forests of other trees. In New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and several other States, much attention is paid to its culture, and the fruit is of an excellent quality. It is no uncommon circumstance for a planter to possess a peach orchard containing one thousand or more of standard trees. It is only in the Middle States of the Union where this fruit arrives at the greatest perfection. In favorable seasons, it matures in the open air as far north as Maine, New Hampshire, Vermont, and the Falls of Niagara; but its pulp is not so delicious as when grown some degrees farther south; it is also trained against walls at Montreal and Toronto, in Canada, where, in some seasons, fruit of a fine quality is obtained. In the Carolinas, Georgia, and Florida, the trees make much foliage and wood; still, if well cultivated and properly pruned, the fruit grows to a large size, and is juicy and well flavored. On the Mississippi, particularly in Louisiana, which lies in the same latitude as that part of Asia where this species is indigenous, it grows spontaneously, but is regarded as of foreign origin, having been introduced from Spain before that river was explored by the French. In the vicinity of Boston, Salem, New York, Philadelphia, and other populous cities of the United States, the peach is reared against walls and in hot-houses by numerous opulent citizens, and fruit of a large size and fine quality is produced. In some other parts of the American continent it also readily grows, and in great abundance. Sir Francis Head, in his *Rough Notes*, speaks in raptures of the beauty and luxuriance of this fruit, which was scattered over the corn-fields in the neighborhood of Mendoza, on the east side of the Andes; and the same traveler noticed dried peaches used as an article of food on the more elevated parts of those mountains, to which they must have been carried from the plains below. On the banks of Rio de la Plata, from Montevideo to Buenos Ayres, we have seen peach-trees growing spontaneously in the greatest perfection, and in such abundance as to form a considerable portion of the fuel of the provinces in which they grew. The fruit there is of a fine quality, large quantities of which are annually dried for domestic use, and the chief part of the remainder is consumed by cattle, or is suffered to decay upon the ground.

The wood of the peach-tree is hard, compact, of a roseate hue, and is susceptible of a fine polish; but owing to its inferior size and comparative scarcity, it is but little used in the arts, or for fuel, except in countries where other kinds of wood are rare. When obtained, however, of suitable dimensions, it may be employed for similar purposes as that of the almond. A color may also be extracted from it called *rose-pink*. Its leaves yield, by distillation, a volatile oil of a yellow color, containing hydrocyanic acid. Its bark, blossoms, and kernels of the fruit, also possess the same poisonous property. From the quantity of gum and sugar contained in the delicious pulp, the peach is nutritious, and is employed as a dessert, both fresh and preserved. From the malic acid contained in its juices, it is slightly refrigerant, and if eaten in moderate quantities it is generally considered as wholesome; but if taken too freely it is liable to disorder the bowels. When stewed with sugar, it may be given as a mild relaxative to convalescents. The kernels may be used for the same purpose as those of the bitter almond. The leaves are sometimes employed by the cook, the liquorist, and the confectioner, for flavoring; and they have also been substituted for Chinese tea; but, as fatal consequences have sometimes followed these uses, they should be looked upon with precaution. The preservation of peaches, plums, cherries, apricots, and other kinds of fruit in sirup occupies a prominent rank in the industry and commerce of France and of Ma-

orca, and doubtless could be profitably carried on in those parts of the United States where these fruits are cultivated in abundance. To those who are desirous of entering into the business on an extensive scale, we would recommend the *Nouveaux Manuel du Limonadier, du Glacier, du Chocolatier, et du Confiseur*, par MM. Cardelli, Lionnet-Clémandot, et Julia de Fontenelle, published at Paris in 1838; or, what would be still better, the employment of an intelligent confiseur who is practically acquainted with all its manipulations.—*Brown's Trees of America.*

Pearl, a name given to the upper corner of those sails which are extended by a gaff, or by a yard which crosses the mast obliquely, as the mizen-yard of a ship, the main-yard of a bylander, &c. The upper extremity of these yards and gaffs is also denominated the *peak*.

Pear-tree (*Pyrus Communis*). The common pear-tree is indigenous to Europe, Western Asia, the Himalayas, and to China; but not to Africa nor America. It is found wild in most of the counties of Britain, as far north as Forfarshire; on the continent of Europe, from Sweden to the Mediterranean; and in Asia, as far east as China and Japan. It is always found on a dry soil, and more frequently on plains than on hills or mountains; and solitary, or in small groups, rather than in woods and forests. The varieties cultivated for their fruit succeed both in the temperate and transition zones of the two hemispheres, and it has been remarked that this tree, as well as the apple and the cherry, will grow in the open air wherever the oak will thrive.

The wood of the common pear-tree is heavy, strong, compact, of a fine grain, and slightly tinged with red. In common with that of all the Rosaceae, it is liable to have its natural color changed by steeping in water, which, therefore, ought to be avoided when intended for particular purposes in the arts. When green, it weighs nearly eighty pounds to a cubic foot, and from forty-nine to fifty-three pounds when dry. According to Du Hamel, it is, next to the true service (*Pyrus arbus*), the best wood that can be employed in wood-engraving, for which purpose, however, it is far inferior to that of the box. Yet it is allowed to be very hard and homogeneous, easy to cut, and, when perfectly dry, is not liable either to crack or warp. For the coarser kinds of engraving, such as large plans or diagrams, show-bills, &c., it serves a very good purpose. When it can be obtained, in Europe, it is much used by turners and pattern-makers; also for joiners' tools; and, as it can readily be stained, it is sometimes made into various articles, dyed black, in imitation of ebony. As fuel, the wood of this tree is excellent, producing a vivid and durable flame, accompanied by an intense heat. According to Withering, the leaves afford a yellow dye, and may be employed to impart a greenish shade to blue cloths. But the most important uses of the pear-tree are those which arise from its fruit. When ripe, it is employed at the table as a dessert, either raw, stewed, or preserved in sirup, and occasionally it is used in tarts. In most of the countries where it grows this fruit is very generally dried in ovens, or in the sun, in which state, when stewed, it is excellent, either as a substitute for puddings and pie, or as forming part of the dessert.

Another purpose to which the pear is applied is for making perry. It is extensively cultivated for this object in various parts of Britain, France, and Germany, where the trees are sometimes planted in rows eighteen or twenty yards apart, in order to admit a free access of light and air. Perry is made in the same manner as cider. The pears should be gathered before they begin to fall, and should be ground as soon after as possible. Should the perry not be sufficiently clear, when racked off, it may be fined in the usual manner of clarifying cider, by singlass, in the proportion of about half an ounce to a barrel. The kinds of pears

used for making this liquor in Herefordshire are such as have an austeric juice, as the "Squash," the "Old-field," the "Barland," the "Huff-cap," the "Sack," the "Red," and the "Longland" varieties. Pears were considered by the Romans as an antidote to the effect of eating poisonous mushrooms; and up to the present time perry is said to be the best remedy that can be employed for the same purpose. In Britain and France an agreeable wine is made from a mixture of crab-apples and pears, which in the latter country is called *piquette*. Pears, in general, produce flatulency, and consequently are unfit for weak stomachs; but when they are quite ripe, and contain a sweet juice, they seldom prove noxious, unless eaten to excess. Pears that are to be kept for winter use should hang as long on the trees as the state of the weather will admit. They should then be kept in heaps, in an open, dry situation, for about ten days, then wiped with a dry woolen cloth, and, lastly, packed up close from the air and moisture. But to keep the fruit in its greatest perfection, small earthen jars may be selected about the size of the pear, which should be packed separately, in clean oat chaff or wheaten bran, then tied down with oiled paper or skin, and cemented tight with wax or pitch. These jars should then be packed in a cask, chest, or some other secure place, with their bottoms upward, where they should remain until required for use.—BROWN'S *Trees of America*.

Pearl-sash. See POTASH.

Pearls (Du. *Paerlen*; Fr. *Perles*; Ger. *Perlen*; It. *Perle*; Lat. *Margaritæ*; Rus. *Shemptschug, Perli*; Sp. *Perlas*; Arab. *Looloo*; Cyng. *Mootoo*; Hind. *Mootie*), are well-known globular concretions found in several species of shell-fish, but particularly the mother-of-pearl *C. ster* (*Concha margaritifera*, Linn.). Pearls should be chosen round, of a bright, translucent, silvery whiteness, free from stains and roughness. Having these qualities, the largest are of course the most valuable. The larger ones have frequently the shape of a pear; and when these are otherwise perfect, they are in great demand for ear-rings. Ceylon pearls are most esteemed in England. The formation of the pearl has embarrassed both ancient and modern naturalists to explain, and has given occasion to a number of vain and absurd hypotheses. M. Réaumur, in 1717, alleged that pearls are formed like other stones in animals. An ancient pearl was valued by Pliny at £80,000 sterling. One which was brought, in 1574, to Philip II., of the size of a pigeon's egg, was valued at 14,400 ducats, equal to £18,996. A pearl spoken of by Boetius, named the *Incomparable*, weighed thirty carats, equal to five pennyweights, and was about the size of a muscadine pear. The pearl mentioned by Tavernier as being in possession of the Emperor of Persia was purchased of an Arab in 1633, and is valued at a sum equal to £110,400.—HAYDN.

Value of Pearls.—Pearls were in the highest possible estimation in ancient Rome, and bore an enormous price. *Principium culmenque omnium rerum pretii, margaritæ tenent.*—PLINY, *Hist. Nat.* Their price in modern times has very much declined; partly, no doubt, from changes of manners and fashions, but more probably from the admirable imitations of pearls that may be obtained at a very low price. According to Mr. Milburn, a handsome necklace of Ceylon pearls, smaller than a large pea, costs from £170 to £300; but one of pearls about the size of peppercorns may be had for £15. The pearls in the former sell at a guinea each, and those in the latter at about 1s. 6d. When the pearls dwindle to the size of small shot, they are denominated *seed pearls*, and are of little value. They are mostly sent to China. One of the most remarkable pearls of which we have any authentic account was bought by Tavernier at Catiffa, in Arabia, a fishery famous in the days of Pliny, for the enormous sum of £110,000! It is pear-shaped, regular, and without blemish. The diameter is '63 inch at the large' part,

and the length from two to three inches. Much difference of opinion has existed among naturalists with respect to the production of pearls in the oyster; but it seems now to be generally believed that it is the result of disease, and is formed in the same manner as bescar (see BEZOAR), pearls, like it, consisting of successive coats spread with perfect regularity round a foreign nucleus. In fact, the Chinese throw into a species of shell-fish (*mytilus cynosu*, or swan muscle), when it opens, five or six very minute mother-of-pearl beads strung on a thread; and in the course of a year they are found covered with a pearly crust, which perfectly resembles the real pearl.—MILBURN'S *Oriental Commerce*; AINSLIE'S *Materia Indica*.

Pearl Fisheries.—The pearl oyster is fished in various parts of the world, particularly on the west coast of Ceylon; at Tuticoreen, in the province of Tinnevelly, on the coast of Coromandel; at the Bahrein Islands, in the Gulf of Persia; at the Sooloo Islands; off the coast of Algiers; off St. Margarita, or Pearl Islands, in the West Indies, and other places on the coast of Colombia; and in the Bay of Panama, in the South Sea. Pearls have sometimes been found on the Scotch coast, and in various other places. The pearl fishery of Tuticoreen is monopolized by the East India Company, and that of Ceylon by government. But these monopolies are of no value; as in neither case does the sum for which the fishery is let equal the expenses incurred in guarding, surveying, and managing the banks. It is, therefore, sufficiently obvious that this system ought to be abolished, and every one allowed to fish on paying a moderate license duty. The fear of exhausting the banks is quite ludicrous. The fishery would be abandoned as unprofitable long before the breed of oysters had been injuriously diminished; and in a few years it would be as productive as ever. Besides giving fresh life to the fishery, the abolition of the monopoly would put an end to some very oppressive regulations enacted by the Dutch more than a century ago.

Persian Gulf.—The most extensive pearl fisheries are those on the several banks not far distant from the island of Bahrein, on the west side of the Persian Gulf, in lat. 26° 50' N., long. 51° 10' E.; but pearl oysters are found along the whole of the Arabian coast, and round almost all the islands of the Gulf. Such as are fished in the sea near the islands of Karak and Corgo contain pearls said to be of a superior color and description. They are formed of eight layers or folds, while others have only five, but the water is too deep to make fishing for them either very profitable or easy. Besides, the entire monopoly of the fishery is in the hands of the Sheik of Bushire, who seems to consider these islands as his immediate property. "The fishing season is divided into two portions—the one called the short and cold, the other the long and hot. In the cooler weather of the month of June, diving is practised along the coast in shallow water; but it is not until the intensely hot months of July, August, and September, that the Bahrein banks are much frequented. The water on them is about seven fathoms deep, and the divers are much inconvenienced when it is cold; indeed, they can do little when it is not as warm as the air, and it frequently becomes even more so in the hottest months of the summer. When they dive, they compress the nostrils tightly with a small piece of horn, which keeps the water out, and stuff their ears with beeswax for the same purpose. They attach a net to their waists, to contain the oysters; and aid their descent by means of a stone, which they hold by a rope attached to a boat, and shake it when they wish to be drawn up. From what I could learn, two minutes may be considered as rather above the average time of their remaining under water. Although severe labor, and very exhausting at the time, diving is not considered particularly injurious to the constitution; even old men practice it. A person

usually dives from twelve to fifteen times a day in favorable weather; but when otherwise, three or four times only. The work is performed on an empty stomach. When the diver becomes fatigued, he goes to sleep, and does not eat until he has slept some time. At Bahrain alone the annual amount produced by the pearl fishery may be reckoned at from £200,000 to £240,000. If to this the purchases made by the Bahrain merchants or agents at Abcootaboo Sharga, Ras-ul Khymack, etc., be added, which may amount to half as much more, there will be a total of about £300,000 or £360,000; but this is calculated to include the whole pearl trade of the Gulf; for it is believed that all the principal merchants of India, Arabia, and Persia who deal in pearls make their purchases, through agents, at Bahrain. I have not admitted in the above estimate much more than one-sixth of the amount some native merchants have stated it to be, as a good deal seemed to be matter of guess or opinion, and it is difficult to get at facts. My own estimate is in some measure checked by the estimated profits of the small boats. But even the sum which I have estimated is an enormous annual value for an article found in other parts of the world as well as here, and which is never used in its best and most valuable state except as an ornament. Large quantities of the seed pearls are used throughout Asia in the composition of majoons, or electuaries, to form which all kinds of precious stones are occasionally mixed, after being pounded, excepting, indeed, diamonds; these being considered, from their hardness, as utterly indigestible. The ma-jeon in which there is a large quantity of pearls, is much sought for and valued, on account of its supposed stimulating and restorative qualities. The Bahrain pearl fishery boats are reckoned to amount to about 1500, and the trade is in the hands of merchants, some of whom possess considerable capital. They bear hard on the producers or fishers, and even those who make the greatest exertions in diving, hardly have food to eat. The merchant advances some money to the fishermen at cent. per cent., and a portion of dates, rice, and other necessary articles, all at the supplier's own price; he also lets a boat to them, for which he gets one share of the gross profits of all that is fished; and, finally, he purchases the pearls nearly at his own price, for the unhappy fishermen are generally in his debt, and therefore at his mercy."—*Manuscript Notes communicated by Major D. WILSON, late political Resident at Bushire.*

The fishery at Algiers was farmed by an English association in 1826, but we are ignorant of their success. The pearl fisheries on the coast of Colombia were at one time of very great value. In 1587 upward of 697 lbs. of pearls are said to have been imported into Seville. Philip II. had one from St. Margarita which weighed 250 carats, and was valued at 150,000 dollars. But for many years past the Colombian pearl fisheries have been of comparatively little importance. During the mania for joint-stock companies, in 1825, two were formed; one, on a large scale, for prosecuting the pearl fishery on the coast of Colombia; and another, on a smaller scale, for prosecuting it in the Bay of Panama and the Pacific. Both were abandoned in 1826. The best fishery ground is said to be in from six to eight fathoms water. The divers continue under water from a minute to a minute and a half, or at most two minutes. They have a sack or bag fastened to the neck, in which they bring up the oysters. The exertion is extremely violent; and the divers are unhealthy and short-lived.—For further information, see *Huiz's Merchants' Magazine*, xviii, 565.

Pearl shells, commonly called *Mother-of-pearl shells*, are imported from various parts of the East, and consist principally of the shells of the pearl oyster from the Gulf of Persia and other places, particularly the Sooloo Islands, situate between Borneo and the Philip-

plines the shores of which afford the largest and finest shells hitherto discovered. On the inside the shell is beautifully polished, and of the whiteness and water of pearl itself; it has the same lustre on the outside, after the external laminae have been removed. Mother-of-pearl shells are extensively used in the arts, particularly in Inlaid work; and in the manufacture of handles for knives, buttons, toys, snuff-boxes, etc. The Chinese manufacture them into beads, fish, counters, spoons, etc.; giving them a finish to which European artists have not been able to attain. Shells for the European market should be chosen of the largest size, of a beautiful pearly lustre, thick and even, and free from stains. Reject such as are small, cracked or broken, or have lumps on them. When stowed loose as dunnage, they are sometimes allowed to pass free of freight.—*MILBURN'S Oriental Commerce.* The imports during the three years ending with 1842 amounted, at an average, to about 950,000 lbs. a year.

Artificial Pearls.—These are small globules or pear-shaped spheroids of thin glass, perforated with two opposite holes, through which they are strung, and mounted into necklaces, etc., like real pearl ornaments. They must not only be white and brilliant, but exhibit the iridescent reflections of mother-of-pearl. The liquor employed to imitate the pearly lustre is called the *essence of the East (essence d'Orient)*, which is prepared by throwing into water of ammonia the brilliant scales, or rather the *lamelle*, separated by washing and friction, of the scales of a small river fish, the blay, called in French *ablete*. These scales digested in ammonia, having acquired a degree of softness and flexibility which allow of their application to the inner surfaces of the glass globules, they are introduced by suction of the liquor containing them in suspension. The ammonia is volatilized in the act of drying the globules. It is said that some manufacturers employ ammonia merely to prevent the alteration of the scales; that when they wish to make use of them, they suspend them in a well-clarified solution of isinglass, then pour a drop of the mixture into each bead, and spread it round the inner surface. It is doubtful whether, by this method, the same lustre and play of colors can be obtained as by the former. It seems, moreover, to be of importance for the success of the imitation, that the globules be formed of a bluish, opalescent, very thin glass, containing but little potash and oxyd of lead. In every manufactory of artificial pearls there must be some workmen possessed of great experience and dexterity. The French are supposed to excel in this ingenious branch of industry. False pearls were invented in the time of Catherine de Medici, by a person of the name of Jaquin. They are made of small globules of glass, blown by the ordinary lamp. The pearly lustre is communicated by introducing by means of a blow-pipe a small quantity of nacreous substances obtained from the surface of the scale of a small fish very common in the Seine and the Rhine, and also in the Thames. This substance preserved with sal ammoniac in a liquid state is commonly sold under the name of "Oriental essence." After having covered the inside of the pearl with this liquid, a coating of wax is added, which is colored to the required shade. The manufacture of pearls is principally carried on in the department of the Seine in France. There are also manufactories in Germany and Italy, but to a small extent. In Germany, or rather Saxony, a cheap but inferior quality is manufactured. The globe of glass forming the pearl in inferior ones being very thin, and coated with wax, they break on the slightest pressure. They are known by the name of German fish pearls. Italy also manufactures pearls by a method borrowed from the Chinese; they are known under the name of Roman pearls, and a very good imitation of natural ones: they have on their outside a coating of the nacreous liquid. The Chinese pearls are made of a kind of gum, and are covered likewise with the same liquid. In the year

1684 a French artisan discovered an opaline glass of a nacreous or pearly color, very heavy and fusible, which gave to the beads the different weights and varied forms found among real pearls; gum instead of wax is now used to fill them; by which they attain a high degree of transparency; and the glassy appearance has been lately obliterated by the use of the vapor of hydro-fluoric acid. This acts in such a manner as to deaden the surface, and remove its otherwise glaring look.—*Ux's Dictionary*.

Peas (Ger. *Erbsen*; Fr. *Pois*; It. *Piselli*, *Bisi*; Sp. *Pesoles*, *Guisantes*; Russ. *Goroch*). The pea is one of the most esteemed of the leguminous or pulse plants. There are many varieties; but the common garden pea (*Pisum sativum*), and the common gray or field pea (*Pisum arvense*), are the most generally cultivated; being reared in large quantities in all parts of the country. But since the introduction of the drill husbandry, the culture of the pea as a field-crop has been to a considerable extent superseded by the bean. Sometimes, however, it is drilled along with the latter; for, being a climbing plant, it attaches itself to the bean, so as to admit the ground being hoed, at the same time that the free admission of air about its roots promotes its growth. It is not possible to frame any estimate of the consumption of peas. The field pea is now hardly ever manufactured into meal for the purpose of being made into bread, as was formerly the case in many parts of the country; but there is reason to think that the garden pea is now more extensively used than ever.—*LONDON'S Encyclopedia of Agriculture*; BROWN on *Rural Affairs*.

Various kinds of use, from the facility with which they are produced in almost every country of the globe, and the highly nutritive properties which they usually possess, have been a favorite food for man and animals among all nations, and in every age of the world. Thus we find that the Athenians employed sodden beans in their feasts dedicated to Apollo, and that the Romans presented them as an oblation in their solemn sacrifices called *Fabaria*. Pliny informs us that they offered bean-meal cakes to certain gods and goddesses in these ancient rites and ceremonies; and Lempriere states that bacon was added to beans in the offerings to Cama, not so much to gratify the palate of that goddess as to represent the simplicity of their ancestors. The bean came originally from the East, and was cultivated in Egypt and Barbary in the earliest ages of which we have any records. It was brought into Spain and Portugal in the early part of the eighth century, whence some of the best varieties were introduced into other parts of Europe, and finally into the United States. The first beans introduced from Europe into the British North American colonies were by Captain Gasmold, in 1602, who planted them on the Elizabeth Islands, near the coast of Massachusetts, where they flourished well. They were also cultivated in Newfoundland as early as 1622; in New Netherlands in 1644; and in Virginia prior to 1648. French, Indian, or kidney beans were extensively cultivated by the Indians of New York and New England long before their settlement by the whites; and both beans and peas (calavances), of various hues, were cultivated by the natives of Virginia prior to the first landing of Captain John Smith. Among these were embraced the celebrated cow-pea (*Phaseolus*), or Indian pea, at present so extensively cultivated at the South for feeding stock, as well as for the purposes of making into fodder, and for plowing under, like clover, as a fallow crop.

The varieties of beans at present cultivated in the United States, as field and garden crops, are too numerous to admit of repetition in this report. For field culture, the common small white, the red-eyed China, the turtle-soup, the Mohawk, and the refugee are preferred; for garden culture, the Mohawk, the early six-weeks, the early Valentine, the yellow six-weeks, the black Valentine, the royal white kidney,

the Carolina, or Sewee, the cranberry, the London horticultural, and the Dutch case-knife. The yield usually varies from thirty to sixty bushels per acre, weighing sixty-three pounds to the bushel. The common pea is supposed to have been indigenous to the South of Europe, and was cultivated both by the Greeks and Romans. Its introduction into the British North American colonies probably dates back to the early periods of their settlement by Europeans, as it is enumerated in several instances among the cultivated products of this country by our early historians. The cultivation of the pea as a field crop is principally confined to the Middle, Eastern, and Western States, the varieties of which are distinguished as the early and the late ripening. The early varieties are generally small and dark-colored, among which the gray and grass are the most common. The yield varies from twenty-five to forty bushels per acre, weighing sixty-four pounds to the bushel. The marrow-fats are among the richest of the field peas, which are much preferred for good lands. The small yellow are thought to be best for poorer soils. A very prolific "bush pea" is cultivated in the Southern States, bearing pods six or seven inches in length, which hang in clusters, and are filled with fine white peas, much esteemed for the table, either green or dry. The amount of peas exported from Savannah in 1755 was 400 bushels; in 1770, 601 bushels; from Charleston, in 1754, 9162 bushels; from North Carolina, in 1753, 10,000 bushels; annually from Virginia, before the Revolution, 5000 bushels; annually from the United States, twenty years preceding 1817, 90,000 bushels. The amount of beans annually exported during the last-named period, from 20,000 to 40,000 bushels.—*Patent Office Report*.

Peat, a well-known inflammable substance, employed in many parts of the world as fuel. There are two species of peat. The first is a yellowish brown or black peat, found in moorish grounds in Scotland, Ireland, and Germany. When fresh, it is of a viscid consistence, but hardens by exposure to the air. It consists, according to Kirwan, of clay mixed with calcareous earth and pyrites; sometimes, also, it contains common salt. While soft, it is formed into oblong pieces for fuel, after the pyriticous and stony matters are separated from it. By distillation, it yields water, acid, oil, and volatile alkali, the ashes containing a small proportion of fixed alkali, and being either white or red, according to the proportion of pyrites contained in the substance. The oil which is obtained from peat has a very pungent taste, and an empyreumatic smell, less fetid than that of animal substances, but more so than that of mineral bitumens. It congeals in the cold into a pitchy mass, which liquefies in a small heat; it readily catches fire from a candle, but burns less vehemently than other oils, and immediately goes out upon removing the external flame; and in rectified spirit of wine it dissolves almost totally into a dark, brownish red liquor. The second species is found near Newbury, in Berkshire. In the *Philosophical Transactions* for the year 1757, we have an account of this species, the substance of which is as follows: Peat is a composition of the branches, twigs, leaves, and roots of trees, with grass, straw, plants, and weeds, which having lain long in water, is formed into a mass soft enough to be cut through with a sharp spade. The color is a blackish brown, and it is used in many places for fuel. There is a stratum of this peat on each side of the Kennel, near Newbury, in Berke, which is from about a quarter to half a mile in width, and many miles in length. The depth below the surface of the ground is from one foot to eight. Great numbers of entire trees are found lying irregularly in the tree peat. These are chiefly oaks, alders, willows, and fir, and appear to have been torn up by the roots; many horses' heads, and bones of several kinds of deer, the horns of the antelope, the heads and tusks of bears, and the heads of beavers, are also found imbedded in it.

Peck, a dry measure for grain, pulse, &c. The standard, or imperial peck, contains two gallons, or 534.55 cubic inches. Four pecks make a bushel, and four bushels a comb.—See *WEIGHTS AND MEASURES*.

Peculation, the term, in the Roman law, for the embezzlement of public money belonging either to the government or to communities. Under *peculation*, also, was comprised the adulteration of gold, silver, or any metal belonging to government. Connected with it, by a law of the dictator, Cæsar, were the *crimen de residuis* (if a person had received public money for a particular purpose, and did not apply it for the same), and the *sacrilgium* (the theft or misappropriation of money or other things sacred to a god). In most governments the embezzlement of public money by public officers is severely punished. Peculation and treason were, by the French charter of 1814, the only crimes for which a minister was impeachable.—E. A.

Pellitory, the root of a perennial plant (*Parnassia pyrethrum*), a native of the Levant, Barbary, and the south of Europe. The root is long, tapering, about the thickness of the finger, with a brownish cuticle. It is imported packed in bales, sometimes mixed with other roots, from which, however, it is easily distinguished. It is inodorous. When chewed, it seems at first to be insipid, but after a few seconds it excites a glowing heat, and a pricking sensation on the tongue and lips, which remains for 10 or 12 minutes. The pieces break with a short, resinous fracture; the transverse section presenting a thick, brown bark, studded with black, shining points, and a pale yellow radiated inside. It is used in medicine as a stimulant.—*THOMSON'S Dispensatory*.

Peltry is the name given to the skins of different kinds of wild animals found in high northern latitudes, particularly in North America, such as the beaver, sable, wolf, bear, &c. When the skins of such animals have received no preparation they are termed *peltry*; but when the inner side has been tanned by an aluminous process they are denominated *furs*.

Pencils (Ger. *Pinself*; Du. *Penseelen*; Fr. *Pinceaux*; It. *Pennelli*; Sp. *Pinceles*). The word pencil is used in two senses. It signifies either a small hair brush employed by painters in oil and water colors—they are of various kinds, and made of various materials, some being formed of the bristles of the boar and others of camel's hair, the down of swans, &c.—or a slender cylinder, of black-lead or plumbago, either naked or inclosed in a wooden case, for drawing black lines upon paper. The last sort, which is the one to be considered here, corresponds nearly to the French term *crayon*, though this includes also pencils made of differently-colored earthy compositions. The best black-lead pencils of this country are formed of slender parallelepipeds, cut out by a saw from sound pieces of plumbago, which have been previously calcined in close vessels at a bright red heat. These parallelepipeds are generally inclosed in cases made of cedar wood, though of late years they are also used alone, in peculiar pencil-cases, under the name of ever-pointed pencils, provided with an iron wire and screw, to protrude a minute portion of the plumbago beyond the tubular metallic case, in proportion as it is wanted.

Pendant, or **Pennant**, a sort of long and narrow banner displayed from the mast-head of a ship-of-war, and usually terminating in two ends or points, called the *swallow's tail*. It denotes that the vessel is in actual service. *Broad pendant* is a kind of flag terminating in one or two points, used to distinguish the chief of a squadron. *Pendant* is also a short piece of rope, fixed on each side, under the shrouds, upon the heads of the main and foremasts.

Penknives (Germ. *Federmesser*; Fr. *Canifs*; It. *Temperini*; Sp. *Corta plumas*), small knives, too well known to need any particular description, used in making and mending pens. The best penknives are manufactured in London and Sheffield.

Pennsylvania, one of the central United States, lies between 39° 43' and 42° N. lat., and between 74° and 80° 40' W. long. It is 807 miles long and 180 broad, containing 47,000 square miles. Population in 1700 was 434,873; in 1800, 602,545; in 1810, 810,001; in 1820, 1,049,813; in 1830, 1,847,672; in 1840, 1,723,083; and in 1850, 2,811,786. The Allegheny Mountains cross the State from southwest to northeast, and there are many smaller ranges on each side of the principal ridge and parallel to it. The southeastern and northwestern parts of the State are either level or moderately hilly. The soil is generally fertile, and much of it is of a superior quality; the best land on the southeast is on both sides of the Susquehanna. Between the head-waters of the Allegheny and Lake Erie the soil is very fertile. The anthracite coal region is immense. The Mauch Chunk, Schuylkill, and Lyken's Valley coal-fields extends from the Lehigh River across the head-waters of the Schuylkill, and is 65 miles in length, with an average breadth of five miles. The Lackawanna coal-field extends from Carbondale, on the Lackawanna, to 10 miles below Wilkesbarre, on the Susquehanna. The Shamokin field has been less explored. Iron ore exists in nearly every county, and in the vicinity of Pittsburgh vast quantities are manufactured. Beds of copper and lead exist, and quarries of marble and building-stone abound. There are in the south part valuable mineral springs. There were in the State, in 1850, 8,628,619 acres of improved and 6,294,728 acres of unimproved land in farms; cash value of farms, \$407,876,099; and the value of implements and machinery, \$14,722,541. *Live Stock*.—Horses, 350,898; asses and mules, 2259; milch cows, 580,224; working oxen, 61,527; other cattle, 562,105; sheep, 1,822,357; swine, 1,040,366; total value of live stock, \$41,500,053.

Early History of Pennsylvania.—The territory of this State was, before the year 1681, for the greater part comprised under the name *Northern Virginia*, and after 1610 under the name of *New England*. When Penn, in the year 1681, obtained from Charles II. a grant of a great tract of land, between 40° and 42° N. lat., he himself wished to give to it the name of *New Wales*; but the king, against Penn's wish, called it, in honor of Penn, *Pennsylvania*. The name is to be found for the first time in the King's charter of the 4th of March, of the year 1681. In the year 1682 Penn, desirous of approaching his province to the sea-coast, bought from the Duke of York the whole tract of land and settlements along the west side of Delaware Bay, the so-called *three lower counties*. This tract of land remained, however, in connection with Pennsylvania only until the year 1776, when the inhabitants of these lands declared themselves independent and founded the State of Delaware. By this the State of Pennsylvania was again excluded from the sea-coasts, and as a nearly entirely inland State the history of its limits is not of a great interest for our hydrographical researches.—J. G. KOHL.

The Delaware River washes the entire eastern border of the State, and is navigable for ships to Philadelphia. The Lehigh, after a course of 75 miles, enters it at Easton. The Schuylkill, 130 miles long, unites with it six miles below Philadelphia. The Susquehanna is a large river, which rises in New York, flows south through this State, and enters the Chesapeake Bay in Maryland. It is much obstructed by falls and rapids. The Juniata rises among the Allegheny Mountains, and, after a course of 180 miles, enters the Susquehanna 11 miles above Harrisburg. The Allegheny River, 400 miles long, from the north, and the Monongahela, 300 miles long, unite at Pittsburgh, and form the Ohio. The Youghiogheny is a small river which flows into the Monongahela.

Agricultural Products.—Wheat, 15,367,691 bushels; rye, 4,805,160 bushels; Indian corn, 19,835,214 bushels; oats, 21,538,166 bushels; barley, 165,584 bushels;

buckwheat, 2,103,602 bushels; peas and beans, 55,281 bushels; potatoes, 5,980,732 bushels; sweet potatoes, 52,172 bushels. Value of products of the orchard, \$723,989; produce of market gardens, \$688,714. Pounds of butter made, 39,878,418; of cheese, 2,505,084; maple sugar, 2,326,525; molasses, 50,852 gallons; beeswax and honey, 800,509 pounds; wool, pounds produced, 4,481,070; flax, 530,807; silk cocoons, 265; hops, 22,088; tobacco, 612,651; hay, tons of, 1,842,970; hemp, 44 tons; clover seeds, 125,030 bushels; other grass seeds, 58,910 bushels; flax seed, 41,728 bushels; and made, 26,500 gallons of wine. Value of home-made manufactures, \$749,123; value of slaughtered animals, \$8,219,848.—*Census Report, 1850.*

Manufactures.—There were in the State in 1850, 136 cotton factories, with a capital invested of \$4,671,015, employing 4283 males and 4374 females, producing 59,632,000 yards of sheeting, etc.; 5,808,561 pounds of yarn, valued at \$5,812,128; 254 woolen factories, with a capital invested of \$1,776,268, employing 1747 males and 753 females, manufacturing articles valued at \$2,703,400; 178 establishments making pig iron, with a capital invested of \$8,357,525, employing 9264 persons, producing 322,752 tons pig iron, etc., valued at \$6,170,020; 820 establishments, with a capital of \$3,422,924, employing 4783 persons, and making 57,810 tons of castings, etc., valued at \$5,854,861; 131 establishments, with a capital of \$7,620,066, employing 6771 persons, manufacturing 182,508 tons of wrought iron, valued at \$8,992,907; 2360 flouring and grist mills, 2986 saw mills, 1540 tanneries; 103 printing-offices, 328 newspapers, 25 daily, three tri-weekly, one semi-weekly, 275 weekly, eight semi-monthly, 12 monthly, and two quarterly publications. Capital invested in manufactures, \$91,463,210; value of manufactured articles, \$154,041,698.

Canals.—The State of Pennsylvania as early as the

year 1791 initiated a system of inland water communication. William Penn, it is said, first conceived the idea. In 1792 two companies were formed, to build the Schuylkill and Susquehanna, and Delaware and Schuylkill canals. They constructed fifteen miles and abandoned the work. In 1821 the enterprise was renewed, and completed in 1827, when other works were started, and nearly all the present canals authorized and their routes surveyed. The State has now 848 miles of canals, which cost \$24,168,000, according to an estimate considered to be under rather than above the mark. Private companies have built 485 miles of canal, costing \$21,955,000. The State has therefore 1333 miles of canal, costing upward of \$46,000,000. Besides these it has 2164 miles of railroad, which cost some \$58,000,000. The totals of these important improvements added together, make 8407 miles, and their cost foots up \$104,000,000. Their value to the State is not represented by their cost, for without them Pennsylvania would be a wilderness. They unite her to the Great West, to the southern part of our State, and to the great metropolis; and enable her to send her coal and iron to distant parts, enriching her beyond estimate.

The following is presented as a comparison of the anthracite coal trade of Pennsylvania for two years:

	1852.		1850.

vation is imputed. "By consent of the whole realm, the measure of the king was made, that is to say, an English penny of silver, called a sterling, round, and without any clipping, shall weigh thirty-two wheat corns, taken from the middle of the ear. And twenty pence of silver do make one ounce. And twelve ounces of silver do make one pound. And eight pounds of silver do make a gallon of wine. And eight gallons of wine do make a London bushel, which is the eighth part of a quarter." This general arrangement for money weights and measures was that of the Eastern nations, by which Europe had been overrun. The term "sterling" of the Norman French was transmuted on the English tongue, first to "asterling," and finally to "sterling."—*Report of Dr. J. H. GIBSON, United States Mint, North Carolina. See POUND.*

Penny-Post. First set up in London and its suburbs by a Mr. Murray, upholsterer, A.D. 1681. Mr. Murray afterward assigned his interest in the undertaking to Mr. Doekwa, a merchant, 1683; but on a trial at the King's Bench bar in the reign of Charles II., was adjudged to belong to the Duke of York as a branch of the general post, and was thereupon annexed to the revenue of the crown.—*DRELAUNE, 1690.* This institution was considerably improved in and round London, July, 1794, *ad seq.*, and was made a twopenny-post. A penny-post was first set up in Dublin in 1774.—*See Post-office.*

Pennyweight, a Troy weight, containing twenty-four grains, each grain weighing a grain of wheat, gathered out of the middle of the ear and well dried. The name took its rise from the circumstance that this was anciently the weight of one of our silver pennies.

Pens (Fr. *Plumes à écrire*; Ger. *Schreibfedern*; It. *Penne da Scriverre*; Russ. *Pera Stvolii*), well-known instruments for writing, usually formed of the quills of the goose, swan, or some other bird. Metallic pens have been occasionally employed for a lengthened period; but it is only within these few years that they have been extensively introduced. They are now, however, manufactured in vast quantities, and of an immense variety of forms. But though they have superseded to a very considerable extent the use of quills, and have some peculiar advantages, it does not appear possible to give them the elasticity of the quill, nor to fit them so well for quick and easy writing on common descriptions of paper. Quills are said to have been first used for pens in A. n. 559; but some say not before 635. Quills are for the most part plucked with great cruelty from living geese; and all persons, from convenience, economy, and feeling, ought to prefer metallic pens, which came into use in 1830.—*PILLIPPA.*

For the manufacture of steel pens the best metal, made from Dannemora or hoop (.) iron, is selected and laminated into slips about three feet long and four inches broad, of a thickness corresponding to the desired stiffness and flexibility of the pens. These slips are subjected to the action of a stamping-press, somewhat similar to that for making buttons. The point destined for the nib is next introduced into an appropriate gauged hole of a little machine, and pressed into the semi-cylindrical shape; where it is also pierced with the middle slit, and the lateral ones, provided the latter are to be given. The pens are now cleaned, by being teased about among each other, in a tin cylinder, about three feet long, and nine inches in diameter; which is suspended at each end upon joints to two cranks, formed one on each of two shafts. The cylinder, by the rotation of a fly-wheel, acting upon the crank-shafts, is made to describe such revolutions as agitate the pens in all directions, and polish them by mutual attrition. In the course of four hours several thousand pens may be finished upon this machine. When steel pens have been punched out of the softened sheet of steel by the appropriate tool, fashioned in the desired form, and hardened by ignition in an oven and sudden quenching in cold water, they are best tempered

by being heated to the requisite spring elasticity in an oil bath. The heat of this bath is usually judged of by the appearance to the eye; but this point should be correctly determined by a thermometer, according to the scale; and then the pens would acquire a definite degree of flexibility or stiffness, adapted to the wants and wishes of the consumers. They are at present tempered too often at random.

IMPORTS OF METALLIC PENS INTO THE UNITED STATES FOR THE FISCAL YEAR ENDING JUNE 30, 1866.

New Granada	70
Total value	\$114,165

Pepper (Fr. *Poivre*; Ger. *Pfeffer*; Du. *Peper*; It. *Pepe*; Sp. *Pimenta*; Russ. *Peres*; Lat. *Piper*), the berry or fruit of different species of plants, having an aromatic, extremely hot, pungent taste, used in seasoning, &c. The following sorts of pepper are met with in commerce; *Black Pepper* (Fr. *Poivre*; Ger. *Schwarzen Pfeffer*; It. *Pepe negro*; Sp. *Pimenta*); *Bana*, *Mercha*; Hind. *Gol-mirch*; Malay, *Lada*; Jav. *Marika*), the fruit of a creeping plant (*Piper nigrum*), one of the pepper genus, of which there are upward of 80 species. It is cultivated extensively in India, Slam, the Eastern Islands, &c. It requires the support of other trees, to which it readily adheres. It climbs to the height of 20 feet, but is said to bear best when restrained to the height of 12 feet. It begins to produce at about the third year, and is in perfection at the seventh; continues in this state for three or four years; and declines for about as many more, until it ceases to be worth keeping. The fruit grows abundantly from all the branches, in long small clusters of from 20 to 50 grains; when ripe, it is of a bright red color. After being gathered, it is spread on mats in the sun, when it loses its red color, and becomes black and shriveled as we see it. The grains are separated from the stalks by hand rubbing. That which has been gathered at the proper period shrivels the least; but if plucked too soon, it will become broken and dusty in its removal from place to place. The vine produces two crops in the year; but the seasons are subject to great irregularities. Pepper should be chosen of a pungent aromatic odor, an extremely hot and acrid taste, in large grains, firm, sound, and with few wrinkles—for of these it always has some. Reject that which is shriveled, or small grained, or which on being rubbed will break to pieces. In point of quality, the pepper of Malabar is usually reckoned the best; but there is no material difference between it and that of Sumatra, and the other islands. In the market of Bengal, where they are set on equal terms, the produce of Malabar is generally about two per cent. higher than the other. In Europe there is generally a difference of $\frac{1}{2}$ d. per lb. in favor of Malabar; but in China they are held in equal estimation. Black pepper sold ground is said to be often adulterated with burned crust of bread.

White Pepper is made by blanching the finest grains of the common black pepper by steeping them for a while in water, and then gently rubbing them, so as to remove the dark outer coat. It is milder than the other, and is much prized by the Chinese; but very little is imported into England.

Cayenne Pepper is the produce of several varieties of the *Capsicum*, an annual plant, a native of both the Indies. The best is brought from the West Indies ready prepared, and is made from the *Capsicum baccatum* (bird pepper). It has an aromatic, extremely pungent, acrimonious taste, setting the mouth, as it were, on fire, and the impression remaining long on the palate. It is sometimes adulterated with muriate of soda; and sometimes with a very deleterious substance, the red oxyd of lead; but this fraud may be detected by its weight, and by chemical tests.

nal (*Piper longum*), a native of Malabar and Bengal. The fruit is hottest in its immature state, and is therefore gathered while green, and dried in the sun. It is imported in entire spikes, which are about one and a half inch long. It has a weak aromatic odor, an intensely fiery, pungent taste, and a dark gray color. The root of long pepper is a favorite medicine among the Hindoos. The quantities of the last three species of pepper imported are quite inconsiderable. — *Mitchell's Oriental Commerce*; *Ainslie's Materia Indica*; *Thomson's Dispensatory*, etc.

Trade in Pepper.—Pepper is extensively used, all over Europe and the East, as a condiment. It was originally imported into England by way of the Levant; and for many years after the establishment of the East India Company it formed the most important article of their imports. In nothing has the beneficial effect of opening the Indian trade been so unequivocally displayed as in the instance of pepper. The private traders have resorted to new markets, and discovered new sources of supply, which had hitherto been wholly unexplored; so that there has been not only a very great increase in the quantity of pepper brought to market, but also a very great fall in its price, which does not now exceed a third part of what it amounted to in 1814!

Supply of Pepper.—The following instructive details with respect to the supply of pepper are taken from the *Singapore Chronicle*, to which they were contributed by John Crawford, Esq., than whom there can be no more competent authority as to such subjects. Of all the products of the Eastern Islands, and of the countries immediately in their neighborhood, in demand among strangers, black pepper is the most important, both in value and quantity. The pepper countries extend from about the long. of 96° to that of 115° E., beyond which no pepper is to be found; and they reach from 5° S. lat. to about 12° N., where it again ceases. Within these limits we have Sumatra, Borneo, the Malayan peninsula, and certain countries lying on the east coast of the Gulf of Siam. The whole produce of the island of Sumatra is estimated not to fall short of 168,000 piculs of 133½ lbs. each; the southwest coast being said to produce 150,000, and the northeast coast 18,000 piculs. The pepper ports on the northeast coast of Sumatra are Lankat and Dell, with Sardang. The first two produce 15,000 piculs, and the latter 3000 annually. The cultivation is carried on by the Battanation in the interior. The ports on the southwest coast, and the amount of their produce, as given in a recent estimate, are as follows: viz., port and district of Trunah, 40,000; district of Pulo Dua, 4000; ditto of Cluat, 30,000; coast from Tampat Tuan to Susu, 80,000; port of Susu, 1000; Kuala Batta, 20,000; Anabalu, 2000; districts to the north of Anabalu, 20,000; making in all, 150,000 piculs. Here it is of importance to remark that the culture and production are extremely fluctuating. During the last pepper season, there obtained cargoes on the west coast of Sumatra, 27 American ships, six country traders, four large French ships, besides the ships belonging to the East India Company, which generally take away 500 tons. Nearly the whole of this trade is in the hands of Europeans or Americans; the pepper finds its way to Europe, to America, and in a small proportion to China. The northeast coast of Sumatra, from Pedler down to the Carlhona, is estimated, as already mentioned, to produce 18,000 piculs. Prince of Wales Island is the principal depot for this, from whence the greatest part is exported to India and China. The produce of Prince of Wales Island itself is about 16,000 piculs. Of the islands at the mouth of the Straits of Malacca and Singapore, Bingtang, on which Rhlo is situated, and adjacent islands, produce 10,000 piculs; and Lingga about 2000. A large proportion of this is brought to Singapore, which exported last year about 21,000 piculs; some part to Bengal and China, but

principally to Europe direct, in free traders. The west coast of the Malayan peninsula produces no pepper, with the exception of about 4000 piculs afforded by the territory of Malacca. On the east coast of the peninsula, the production of pepper is very considerable. The ports of Patani and Calantan—chiefly the latter—yield about 16,000 piculs annually, and Tringano about 8000. A portion of this is brought to Singapore and Penang; but we believe the greater proportion goes direct to China in junks, of which three large ones frequent Tringano annually, and one Calantan. The Amerienna, too, occasionally visit these ports. In the year 1821, three vessels of considerable burden obtained cargoes. The east coast of the Gulf of Siam, from the lat. of 10½° to that of 12½° N., affords an extensive produce of pepper. This coast is scarcely known, even by name, to the traders of Europe. The principal ports here are Chantibun, Tungyal, Pong-som, and Kam-pop—the first two being under the dominion of Siam, and the latter under that of Kamboja. The whole produce is estimated at not less than 60,000 piculs; 40,000 of which are brought at once to the capital of Siam as tribute to the king, and the whole finds its way to China in junks. It remains only to estimate the produce of the island of Borneo. The whole produce of Borneo is estimated at about 20,000 piculs; of which a large share is carried to China direct in junks, some by Portuguese vessels; and about 7000 piculs are now annually brought by the native craft of the country itself to Singapore in the course of that free trade which is happily flourishing at this settlement. The data which have been stated will enable us to estimate the whole production of the Malayan Archipelago, including that of the peninsula of Malacca, and that of the east coast of the Gulf of Siam, at 308,000 piculs; and as there is no other part of the world that affords pepper, excepting the western coast of the peninsula of India, and this affords but 30,000 piculs, or less than one-tenth part of what the places we have enumerated produce, we have, accordingly, at one view the whole production of the earth, being 338,000 piculs, or 45,066,666 lbs. avoirdupois. The average price of pepper has been lately about nine Spanish dollars a picul; so that the whole value drawn into India from Europe, China, and the New World, on account of this single commodity, is 3,042,000 dollars. The quantity given in this statement may appear enormous; but if meted out to the whole population of the globe, or to 1,000,000,000 of people, it would be found that the average annual consumption of an individual would amount to no more than 323 grains. Mr. Crawford has more recently supplied a revised estimate of the annual production of pepper as follows:

Sumatra (west coast)	20,000,000
" (east coast)	8,000,000
Islands in the Straits of Malacca	5,000,000
Malay peninsula	8,735,338
Borneo	2,666,667
Siam	8,000,000
Malabar	4,000,000
Total	53,000,000

Perfume (Fr. *parfûm*), a term used to denote the volatile effluvia from any body affecting the organ of smelling, or the substance emitting those effluvia. Perfumes were in general use among the ancients (see the *Quarterly Review*, vol. xxiii.); and in France, Germany, Spain, and Portugal, and even, though not to so considerable an extent, in England, they are regarded almost as necessities. In general they are made of musk, ambergris, civet, rose, and cedar woods, orange flowers, jessamines, jonquilla, tuberoses, and other odoriferous flowers. Aromatic drugs, such as storax, frankincense, benzoin, cloves, etc., enter into the composition of a perfume; and many perfumes are composed of aromatic herbs or leaves, as lavender, marjoram, sage, thyme, etc.

Perfumery. Many of the wares coming under this name were known to the ancients, and the Scriptures abound with instances of the use of incenses and perfumes. No such trade as a perfumer was known in Scotland in 1763.—*CHEESE.* A stamp tax was laid on various articles of perfumery in England, and the vender was obliged to take out a license, in 1786. At the corner of Beaufort Buildings, in the Strand, resided Lilly the perfumer, mentioned in the *Spectator*.—*LEIGN.*

Some of the most exquisite of perfumes are obtained from the most offensive substances. In olden times the most delicate perfumes were distilled from flowers, whose names they bore; but chemistry has shown how to obtain them from other sources. To give one example, a peculiarly fetid oil, called fusel-oil, is formed during the making of brandy and whisky. Now this loathsome oil, by a particular mode of treatment, is made to yield the fragrant oil of pears; by another process, oil of apples; and by others, oil of grapes and oil of cognac. The oil of pine-apples is produced from sugar and putrid cheese. The oil of bitter almonds is a resultant from aquafortis and the offensive oils from gas tar. The dainty *eau de mille fleurs* is made from the drainage of cow-houses. And in all these cases, there is not the same kind of fraud which is practiced in ordinary adulterations; for though the perfumes are not actually, in the present state of things, produced from the flowers and fruits which give them their names, yet they are really identical, or nearly so, in chemical composition with the original perfumes; nature mixes the ingredients in one case, man in the other, but the ingredients are the same. The passion for perfumes is increasing. British India and Europe consume about 150,000 gallons of handkerchief odors yearly; and the English revenue from *eau de Cologne* is about 8000 pounds sterling a year. The total revenue from imported perfumes in England is estimated at about £40,000 sterling per annum. The largest revenues of the estates on the borders of the Mediterranean are those which proceed from the sale of the orange blossoms and Parma violets. The house of Faguer, 83 Rue de Richelieu, and many of the other perfumers of Paris, pay a yearly sum, varying from 10 to 20,000 francs, to the proprietors, for their whole crop of orange blossoms or violets. The *fleurs de citronnier* of Faguer is one of the favorite and most delightful odors used for scenting the pocket handkerchief.

Periodical Publications. These, as the name implies, are publications which appear at fixed periods or stated intervals, and consequently include newspapers, monthly and other magazines, quarterly reviews, and journals, and all such books as appear at monthly or other intervals. But the term "periodical publications" is usually understood in a more confined sense, or as comprising only magazines and such political, literary, and scientific journals as appear at regular intervals, without including newspapers or works published in parts. Even when thus restricted, this is a very extensive and important department of literature. No doubt a vast deal of trash gets into print by

the agency of magazines that might not otherwise see the light; but most part of these publications contain at the same time some superior articles; and a few are ably conducted and embrace a wide range of topics. Since the establishment of the *Edinburgh Review* in 1802, the quarterly journals, especially those that embrace politics and literature, have risen to great eminence, and have had a powerful influence over the public mind. At present, however, and for some time past, the influence of this class of journals has been declining. An ably conducted daily paper is, at this moment, by far the most powerful engine the press can bring into the field.—*See* NEWSPAPERS. For further information refer to *American Almanac*, 1835, p. 97, 256; 1836, p. 92; *North American Review*, xxxix. 277 (J. G. PALFREY); *Southern Literary Messenger*, II. 593; *Westminster Review*, I. 206, II. 463; *Edinburgh Review*, xxxviii. 349; *American Quarterly Observer*, III. 135.

Pernambuco Province. This is one of the most important provinces in Brazil. It abounds with many good harbors, and possesses an exceedingly fertile soil. Its chief staples are sugar, cotton, and hides. Of these its average annual exports from 1840 to 1845 were as follows: Sugar, 34,177 tons; cotton, 32,279 bags (160 lbs. each); hides, 72,500. The city of Pernambuco maintains the third rank in the empire. There are in this province about six hundred "engenhos," or sugar estates, each covering about one square league. On each engenho are produced annually about fifty cases of white, and five of brown, or muscovado sugar—or forty tons of the former, and four and a half tons of the latter—equal to about 24,000 tons of white, and 2550 tons of brown, for the whole province. The province is estimated to be capable of yielding 396,800 tons of white, and 40,800 tons of muscovado sugar. Imports from the United States consist chiefly of cotton domestics. Fabrics of this kind, thirty yards in length, and twenty-seven to twenty-eight inches in width, are in demand, and bring much better prices than similar goods from England. Of late years the manufacturers of Lancashire have imitated these cloths, and have succeeded in sharing the advantages which the American article had secured. In printed cottons Manchester and Glasgow almost monopolize the markets of Pernambuco. The quality as well as the cheapness of their goods have secured this privilege. The importation of butter, hitherto almost exclusively in the hands of the French, might be advantageously shared by the citizens of the United States.

The production of cotton has diminished, owing mainly to the expense attending its transportation to market; but the production of sugar has increased. From 1828 to 1831, the average annual export was 1,607,389 arrobas, and in the years 1841 to 1844 it was augmented to 2,083,212 arrobas; being an annual increase of 475,823 arrobas, or 6797½ tons. The number of hides exported during the two periods of four years above-named increased in a still greater ratio than sugar. From 1828 to 1831 the annual average export was 60,272 hides; and during the latter four years, from 1841 to 1844, the same average augmented to 122,573 hides per annum; showing an annual increase of 62,301 hides. It has already been observed that if the export duty levied upon the produce of Brazil transmitted to foreign parts were modified or repealed, a vast augmentation in agricultural productions would unquestionably follow. sugar continues, and a similar duty on cotton, coffee, tobacco, rum, hides, and, with one or two unimportant exceptions, on all other articles produced in the country, the producing interests must remain crippled, and exportations either continue to be stationary or decrease. The cotton and sugar-growing districts suffer most under these heavy taxes upon their industry and capital. The planters are obliged to carry cotton and sugar to Pernambuco by horse conveyance, a distance of from twenty to one hundred leagues, during the dry season, when food and water are difficult to be obtained. These charges are such, in addition to those imposed by law, that when the planter reaches market his cotton hardly yields him net four cents per lb. and so with his sugar, and all other heavy produce.

The navigation and trade of Pernambuco in 1845 stood as follows: Inward from all nations—Vessels, 242; tonnage, 49,796; value of cargoes, \$4,136,075. Of which from the United States: Vessels, 35; tonnage, 617; value of cargoes, \$602,075. Outward to all nations—Vessels, 226; tonnage, 48,539; value of cargoes, \$4,567,870. Of which to the United States: Vessels, 19; tonnage, 3218; value of cargoes, \$283,460. During the year 1845 two United States vessels went south with cargoes; two were sold, and four remained in port. This will, to a certain extent, account for the difference between the values of imports and exports to and from the United States, as above shown.

The vessels from the United States imported as follows:

Cottons	1018 packages.
Silks	3
Woolens and silks	1
Flour	24,918 barrels.
Do.	648 half-barrels.

And on return voyage home, exported—

Sugar	9,104 barrels.
Do.	23,410 bags.

Total quantity of sugar produced and entered in the market of Pernambuco in the years 1844 and 1845:

In 1844	Arrobas, 2,140 688 = Pounds, 68,634,027
In 1845	2,405,824 = 79,006,371

Of which were sent, in 1845, to the United States, 184,417 arrobas 26 lbs. (= at 32 lbs. to arroba) 5,901,344 lbs.

Hides.—Total number exported to all countries: In 1841, 124,074; in 1845, 163,935. Of which to the United States, 10,888.

1840	95,849	2,101,008	132,993
1841	26,900	2,261,609	130,434
1842	21,357	1,906,936	125,290
1843	35,906	2,017,522	104,328
1844	41,385	2,146,083	124,074
1845	24,562	2,565,824	163,935

Number of vessels to and from the United States in Pernambuco in 1846: Vessels, 117, of 30,801 tons.

VALUES OF IMPORTS FROM AND EXPORTS TO ALL COUNTRIES.

Imports	1845	1844
Exports	France, 24,567,000	17,436,000
	20,327,000	19,851,000

Value of imports and exports from the United States in 1845: Imports, 1,928,000 francs; exports, 641,000 francs; total, 2,569,000 francs.

PRODUCTS EXPORTED TO ALL COUNTRIES IN 1846, COMPARED WITH 1847, IN FRANCS.

Years.	Sugar.	Hides.	Cotton.	Toba.
1846	15,107,000	2,750,000	1,065,000	644,000
1847	17,478,000	1,124,000	1,838,000	89,000

From the preceding table it will be seen that the market at Pernambuco was more brisk in 1847 than during the preceding year. Sugar is the leading article in this market, and is exported to England, Trieste, Genoa, Portugal, the north of Europe, and to the United States. The total exports of sugar from Brazil are thus distributed throughout the ports of the empire. The exports for 1846 are taken as a basis for calculation:

	Kilo.	Pounds.
Bahia	62,447,000	137,383,400
Pernambuco	40,570,000	87,234,000
Rio de Janeiro	8,244,000	17,922,800
Total kilo and pounds.	111,261,000	232,539,200

EXPORT OF SUGAR FROM PERNAMBUCO FROM 1852 TO 1854.

Exported to	1851-'52.	1852-'53.	1853-'54.
	Tons.	Tons.	Tons.
Great Britain	11,838	15,006	18,065
France—Nantes	1,273
Havre	1,194	856	206
Marseilles	2,277	5,799	2,735
Northern Europe	1,416	2,046	1,663
Genoa	1,726	4,824	2,545
Trieste	5,315	6,079	2,426
Gibraltar (for a market)	8,62	4,744	3,044
Portugal and possessions	6,511	4,083	2,076
United States	6,633	10,487	2,738
La Plata	2,564	3,448	4,205
Valparaiso	584	1,849	1,901
Australia	423
Brazilian ports	6,274	5,816	6,009
Total	47,156	64,822	60,540

The sugar produced in the province of Pernambuco amounts to about 80,000 tons a year, of which 60,000 are exported to foreign countries, 5000 coastwise, and 15,000 are retained for home consumption. There are about 1000 eugenhos or sugar estates, 257 of which have been established within the last ten years. They average in extent about two square miles, and their crops vary from 200 tons as a maximum to 30 as a minimum; or at an average of about 75 tons each. Very few eugenhos possess 150 slaves, and the smallest not more than 10 or 12; the average number of slaves employed on each eugenho is about 50, so that 50,000 may be said to be her employed in sugar cultivation. They are badly treated and hard worked.

Pernambuco has many of the privileges of a sovereign state; it has its own president, provincial and municipal chambers, levies a portion of its own taxes, and maintains a militia which can not be removed from the province. It sends four senators and fifteen representatives to the imperial government—elected, the former for life, and the latter for four years, by almost universal but indirect suffrage. The imperial revenue levied within the province in 1849-'50 amounted to £542,423; in 1850-'51 to £690,626; and as these sums are derived chiefly from imports and exports, and no additional duties have been imposed, the increase is a proof of its commercial prosperity. The details of the latter year's general revenue were as follows:

Duties upon imports	£426,105
Duties upon exports	61,705
Port charges	7,183
Post-office, crown lands, etc.	84,737
Extraordinaries	1,066
Deposits for charities, realisation unclaimed estates	3,573
Remittance of funds to the imperial treasury	185,354
Total	£690,526

In 1841 the receipt of imperial taxes from the province of Pernambuco amounted to only £275,852 11s. 2d.; so that in the course of ten years it has nearly trebled. Provincial taxes are levied upon sugar, coffee, tobacco, cattle, horses, spirits, passports, licenses for potteries, saw-mills, cigar shops, auctions, etc.; upon houses, legacies, inheritances, slaves, the tolls of bridges, etc., etc. Total amount in 1850-'51, £173,997 5s. The municipal

taxes are derived from the stamping of weights and measures, licenses to public houses, and places of entertainment, etc. They amounted in 1850-'51 to 128,650 reals, or £12,506 11s. 3d., making the total taxation of the province as follows:

Imperial taxes.....	£690,526
Provincial.....	178,997
Municipal.....	12,506
Total.....	£877,030
