poli as one of Godfrey's men; he helped Chlupar to occupy Bethlehem in June 1099. After the capture of Jerusalem he served for a time with Bohemund at Antioch; but when Baldwin of Edessa became king of Jerusalem, he summoned Baldwin de Burg, and left him as count in Edessa. From Edessa Baldwin conducted continual forays against the Mahommedan princes; and in the great foray of 1104, in which he was joined by Bohemund, he was defeated and captured at Balich. Tancred became guardian of Edessa during Baldwin's captivity, and did not trouble himself greatly to procure his release. Baldwin, however, recovered his liberty at the beginning of 1105, and at once entered upon a struggle with Tancred for the recovery of Edessa. In September 1108 he regained his principality; but the struggle with Tancred continued, until it was composed by Baldwin in 1109. For the next ten years Baldwin ruled his principality with success, if not without severity. Planted in the farthest Christian outpost in northern Syria, he had to meet many attacks, especially from Mardin and Mosul, in revenge for the provocation offered by his own forays and those of the restless Tancred. In 1110 he was besieged in Edessa, and relieved by Baldwin I.; in 1114 he repulsed an attack by Ak sunkur of Mosul; in 1115 he helped to defeat Amschel at Daniith. At the same time, if Matthew of Edessa may be trusted, he also carried his arms against the Armenians, and plundered in his avarice every Armenian of wealth and position. In 1118 he was on his way to spend Easter at Jerusalem, when he received the news of the death of Baldwin I.; and when he arrived at Jerusalem, he was made king, chiefly by the influence of the patriarch Arnulf. In a reign of thirteen years, Baldwin II. extended the kingdom of Jerusalem to its widest limits. His reign is marked by almost incessant fighting in northern Syria. In 1119, after the defeat and death of Raymond of Antioch, he defeated the amirs of Mardin and Damascus at Daniith; in subsequent years he extended his sway to the very gates of Aleppo. In 1123 he was captured by Balak of Mardin, and confined in Kharput with Joscelin, his successor in the county of Edessa, who had been captured in the previous year. During his captivity Eustace Graverius became regent of Jerusalem, and succeeded, with the aid of the Venetians, in repelling an Egyptian attack, and even in capturing Tyre, 1124. In 1124 Baldwin II. succeeded in securing his liberty, under conditions which he instantly broke; and he embarked on a strenuous and not unsuccessful hostilities against Aleppo and Damascus (1124-1127), exacting tribute from both. During his reign he twice acted as regent in Antioch (1119, 1130), and in 1126 he married his daughter Alice to Bohemund II. In 1128 he offered the hand of his eldest daughter, Melisinda, to Fulk of Anjou, who had been recommended to him by Honorius II. In 1129 Fulk came and married Melisinda, and in 1131, on the death of Baldwin, he succeeded to the crown.

Baldwin II. had much of the churchmanship of Godfrey and Baldwin I.; he appears most dejectedly as an incessant warrior, under whom the Latin domination in the East stretched, as Ibn al-Athir writes, in a long line from Mardin in the North to el-Arish on the Red Sea—a line only broken by the Mahomedan powers of Aleppo, Hamah, Homs and Damascus. The Franks controlled the great routes of trade, and took tolls of the traders; and in 1130 their power may be regarded as having reached its height.

**LITERATURE.** — Fulcher of Chartres narrates the reign of Baldwin II. down to 1127; for the rest of the reign the authority is Willibald of Tyre. R. Röhrich, Geschichte des Königsreichs Jerusalem (Innsbruck, 1898), C. vii.—x., is the chief modern authority. (E. Br.)

**BALDWIN III.**

King of Jerusalem (1134-1162), was the eldest son of Fulk of Jerusalem by his wife Melisinda. He was born in 1130, and became king in 1143, under the regency of his mother, which lasted till 1152. He came to the throne at a time when the attacks of the Greeks in Cilicia, and of Zengi on Edessa, were fatally weakening the position of the Franks in northern Syria; and from the treachery and reign of Baldwin the power of the Latin kingdom of Jerusalem may be said to be slowly dying, though as yet there is little outward trace of its decay to be seen. Edessa was lost, however, in the year after Baldwin's accession, and the conquest by Zengi of this farthest and most important outpost in northern Syria was already a serious blow to the kingdom. Upon it in 1147 there followed the second crusade; and in that crusade Baldwin III., now some eighteen years of age, played his part by the side of Conrad III. and Louis VII. He received them in Jerusalem in 1148; with them he planned the attack on Damascus and with them he signally failed in the attack. In 1149, after the failure of the crusaders, the casa kur appeared in Antioch, where the fall of Raymundo, the husband of the princess Constance, made his presence necessary. He regulated affairs in Antioch, and tried to strengthen the north of Palestine generally against the arm of Zengi's successor, Nurreddin, by renewing the old and politic alliance with Damascus interrupted since 1147, and by ceding Tellbisher, the one remnant of the county of Edessa, to Manuel of Constantinople. In 1152 came the inevitable struggle between the young king and his regent, who had ruled with wisdom and vigour during the regency and was now the great and powerful rival of Fulk's sons. Baldwin originally planned a solemn coronation, as the signal of his emancipation. Dissuaded from that course, he nevertheless wore his crown publicly in the church of the Sepulchre. A struggle followed: in the issue, Baldwin agreed to leave his mother in possession of Jerusalem and Nablus, while he retained Acre and Tyre for himself. But he repented of the bargain; and a new struggle began, in which Baldwin recovered, after some fighting, the possession of his capital. From these internal dissensions Baldwin was now summoned to the north, to regulate the affairs of Tripoli, where the death of Count Raymund had thrown on his shoulders the cares of a second regency. On his return to Jerusalem he was successful in repelling an attack by an army of Turcomans; and his success encouraged him to attempt the siege of Ascalon in the spring of 1153. He was successful: the "bride of Syria," which had all but become the property of the crusaders in 1109, but had since defied the arms of the Franks for half a century, became part of the kingdom of Jerusalem. From 1156 to 1158 Baldwin was occupied in hostilities with Nurreddin. In 1156 he had to submit to the demarkation, which cut short his territories; in the winter of 1157-1158 he besieged and took the castle of Bouge, in the territory once belonging to Antioch: in 1158 he defeated Nurreddin himself. In the same year Baldwin married Theodora, a near relative of the East Roman emperor Manuel; while in 1159 he received a visit from Manuel himself at Antioch. The Latin king rode behind the Greek emperor, without any of the insignia of his dignity, at the entry into Antioch; but their relations were of the friendliest, and Manuel—as great a physician as he was a hunter—personally attended Baldwin when the king was thrown from his horse in attempting to equal the emperor's feats of horsemanship. In that year Baldwin had to undertake the regency in Antioch once more. Raynold of Chatillon, the second husband of Constance, being captured in battle. Three years later he died (1162), without male issue, and was succeeded by his brother Amalaric I.

Baldwin III. was the first of the kings of Jerusalem who was a native of the soil of Palestine. His three predecessors had all been emigrants from the West. His reign also marks a new departure from another point of view. His predecessors had been men of a type half military, half clerical—at once hard fighters and sound churchmen. Baldwin was a man of a subtler type—a man capable of dealing with the intrigues of a court and with problems of law, and, as such, suited for guiding the middle age of the kingdom, which the different qualities of his predecessors had been equally suited to found. Like his brother, Amalaric I., he was a clerkly and studiously king versed
in law, and ready to discuss points of dogma. In an excellent sketch of Baldwin's character (xvi. cit.), William of Tyre tells us that he spent his spare time in reading and had a particular affection for history; that he was well skilled in the jure consularium, and afterwards recorded by lawyers like John of Ibelin and Philip of Novara as "the assizes of Jerusalem"); and that he had the royal faculty for remembering faces, and could generally be trusted to address by name anybody whom he had once met, so that he was more popular with high and low than any of his predecessors. He had, William also reports, a gift of impromptu eloquence, and a faculty both for saying witty things pleasantly at other people's expense and for listening placidly to Witticisms directed against himself; while he was generous to excess without needing to make exalted excuses, in order to suppress his generosity, and always saved the Church. If in his youth he had been prone to gambling, and before his marriage with Theodora had been somewhat lax in his morals, when he became a man he put away childish things; his married life was a shining example to his people and he was abstemious both in food and drink, holding that "excess in either was an incentive to the worst of crimes." Even his enemy, Nureddin, said of him, when he died—"the Franks have lost such a prince that the world has not now his like!"

LITERATURE.—William of Tyre is the great primary authority for Baldwin's life (ed. Cambridge 1903 and 1921). See Bibliography to the article Crusades for the Byzantine and Mahomedan point of view. His reign is described by R. Röhrich, Geschichte des Königreichs Jerusalem (Innsbruck, 1898), C. xix.-xxi. (E. BR.)

BALDWIN IV., the son of Amalric I. by his first wife Agnes, ruled in Jerusalem from 1174 to 1185. When he had married Baldwin described in his deeds. Educated by William of Tyre, Baldwin IV. came to the throne at the early age of thirteen; and thus the kingdom came under the regency of Raymond II. of Tripoli. Happily for the kingdom whose king was a child and a leper, the attention of Saladin was distracted for several years by an attempt to wrest from the sons of Nureddin the inheritance of their father—an attempt partially successful in 1174, but only finally realized in 1183. The problems of the reign of Baldwin IV. may be said to have been two—his sister Sibylla and the fiery Raymond of Chatillon, once prince of Antioch through marriage to Constance (1133-1159), then a captive for many years in the hand of the Mahomedans, and since 1176 lord of Krak (Kerak), to the east of the Dead Sea. Sibylla was the heiress of the kingdom; the problem of her marriage was important. Married first to William of Montferrat, to whom she bore a son, Baldwin, she was again married in 1180 to Guy of Lusignan; and dissensions between Sibylla and her husband on the one side, and Baldwin IV. on the other, troubled the latter years of his reign. Meanwhile Raynald of Krak took advantage of the position of his fortress, which lay on the great route of trade from Damascus and Egypt, to plunder the caravans (1182), and thus helped to precipitate the inevitable attack by Saladin. When the attack came, Guy of Lusignan was made regent by Baldwin IV., but he declined battle and he was consequently deposed both from his regency and from his right of succession, while Sibylla's son by her first husband was crowned king as Baldwin V. in 1183. For a time Baldwin IV. still continued to be active; but in 1184 he handed over the regency to Raymond of Tripoli, and in 1185 he died.

LITERATURE.—The narrative of William of Tyre concludes with Baldwin IV.'s transfer of the regency to Raymond of Tripoli. R. Röhrich describes the reign of Baldwin IV., Geschichte des Königreichs Jerusalem (Innsbruck, 1898), C. xix.-xxi. (E. BR.)

BALDWIN V., the son of Sibylla (daughter of Amalric I.) by her first husband, William of Montferrat, was the nominal king of Jerusalem from 1183 to 1186, under the regency of Raymond of Tripoli. His reign is marked by the advance of Saladin and by dissensions between the government and Guy of Lusignan.

JACK MARSHALL (1865-1925), American philosopher, was born at Columbus, S.C., and educated at Princeton and several German universities. He was professor of philosophy in the university of Toronto (1889), of psychology at Princeton (1893), and subsequently (1903) of philosophy and psychology in Johns Hopkins University. Prominent among experimental psychologists, he was one of the founders of the Psychological Review. In 1893 he was vice-president of the International Congress of Psychology held in London, and in 1897-1898 president of the American Psychological Association; he received a gold medal from the Royal Academy of Arts and Sciences of Denmark (1897), was honorary president of the International Congress of Criminal Anthropology held in Geneva in 1896, and was made an honorary D.Sc. of Oxford University. Apart from articles in the Psychological Review, he has written—Handbook of Psychology (1890); translation of Ribot's German Psychology of To-day (1886); Elements of Psychology (1893); Social and Ethical Interpretations in Mental Development (1898); Story of the Mind (1898); Mental Development in the Child and the Race (1895); Thought and Things (London and New York, vol. 1906). He also contributed largely to the Dictionary of Philosophy and Psychology (1901-1905), of which he was editor-in-chief.

BALDWIN, ROBERT (1804-1858), Canadian statesman, was born at York (now Toronto) on the 12th of May 1804. His father, William Warren Baldwin (d. 1844), went to Canada from Ireland in 1798; though a man of wealth and good family and a devoted member of the Church of England, he opposed the religious and political oligarchy which was then at the head of Canadian affairs, and brought up his son in the same principles. Robert Baldwin was called to the Bar in 1825, and entered into partnership with his father in 1829-1830, and became a member of the parliament of Upper Canada for the town of York, but was defeated in the following year and retired for a time into private life. During the next six years, he so constantly advocated a responsible executive as the one cure for the political and economic evils of the time that he was known as "the man of one idea." In 1836 he was called by Sir Francis Bond Head (1793-1875), the lieutenant-governor, to the executive council, but finding himself without influence, and compelled to content himself with merely nominal authority, he retired from the council. When Head was defeated and the Liberal party gained control of the government in 1841, he was returned for Middlesex, and on its disappearance under Lord Durham, in 1844, he was elected to the legislature of Lower Canada. In 1846 he was re-elected, and was elected Lieutenant-Governor of Lower Canada in the same year. In 1847 he was opposed by Sir John Beverley Robinson, but was returned for the same constituency. He was re-elected in 1850, and returned to the legislature of Upper Canada in 1851.

Baldwin in 1851 was elected leader of the opposition, and was appointed to the still newly created post of lieutenant-governor of Upper Canada by Sir John A. MacDonald, the new premier. On becoming prime minister, Baldwin resigned. On the death of Sir George Brown in 1856, he was appointed to the Senate of Canada. In 1862 he was elected again for the same constituency, and held the office of acting lieutenant-governor from 1864 to 1865. He was an ardent exponent of the policy of responsible government, and had advocated the union of the colonies of Upper and Lower Canada.

General Baldwin in 1866 was appointed to the exchequer, and in 1867 was made Secretary of the Treasury, and was appointed premier of the new representative government. He was a strong supporter of the war with the United States, and the government of which he was head resigned on the extension of the Monroe doctrine to Central America. In 1874 he was made premier of the united provinces of Canada, and was appointed to the Senate of Canada in 1879. He continued to be a member of the Senate until his death, which occurred on the 20th of February 1883.
BALE, JOHN (1495-1563), bishop of Osory, English author, was born at Cove, near Dunwich in Suffolk, on the 21st of November 1545. At the age of twelve he entered the Carmelite monastery at Norwich, removing later to the house of "Holme," probably the abbey of the Whitefriars at Hulne near Alnwick. Later he entered Jesus College, Cambridge, and took his degree of B. D. in 1529. At Cambridge he came under the influence of Cranmer and of Thomas Wentworth, 1st Baron Wentworth, and became a firm and unreserved partisan of the Reformation. He laid aside his monastic habit, and, as he himself puts it with characteristically brutal violence, "that I might never more serve so execrable a beast, I took to wife the faithful Dorothy." He obtained the living of Thornden, Suffolk, and in 1534 was summoned before the archbishop of York for a sermon against the invocation of saints preached at Doncaster, and afterwards before Stokesley, bishop of London, but he escaped through the powerful protection of Thomas Cromwell, whose notice he is said to have attracted by his miracle plays. He was an unscrupulous controversialist, and in these plays he allows no consideration to decency, standing in the way of his denunciation of the monastic system and its supporters. The prayer of Infidelitas which opens the second act of his Thre Lawes (quoted by T. Warton, Hist. Eng. Poetry, sect. 41) is an example of the lengths to which he went in profane parody. These coarse and violent productions were well calculated to impress popular feeling, and no doubt Cromwell found in him an invaluable instrument. But on his patron's fall in 1540 Bale fled with his wife and children to Germany. He returned on the accession of Edward VI. He received the living of Bishopstoke, Hampshire, being appointed "to the charge of the church of Osory," where he was to be consecrated by the Roman rite, which still obtained in the Irish church, and won his point, though the dean of Dublin entered a protest against the revised office during the ceremony (see his Vocation of John Bale to the Bishoppery of Osory, Harl. Misc. vol. vi.). He pushed his Protestant propaganda in Ireland with no regard to expediency, and when the accession of Mary inaugurated a reaction in matters of religion, it was with difficulty that he was got safely out of the country. He tried to escape to Scotland, but on the voyage was captured by a Dutch man-of-war, which was driven by the stress of a storm to land. In Cornwall, Bale was immediately suspected of treason, but soon released. At Dover he had another narrow escape, but he eventually made his way to Holland and thence to Frankfort and Basel. During his exile he devoted himself to writing. After his return, on the accession of Elizabeth, he received (1560) a prebendal stall at Canterbury. He died in November 1563 and was buried in the cathedral.

The sincerity and vehemence with which "foul-mouthed Bale," as Wood calls him, attacked his enemies does not destroy the value of his contributions to literature, though his strong bias against Catholic worship does detract somewhat from the critical value of his works. Of his mysteries and miracle plays only five have been preserved, but the titles of the others, quoted by himself in his Catalogue, show that they were animated by the same political and religious aims. The Thre Lawes of Nature, Moses and Christ, corrupted by the Sodomyes, Pharisees and Papsistes most wicked (pr. 1538 and again in 1562) was a morality play. The direction for the dressing of the parts is instructive: "Let Idolatry be decked by an old witch, Sodomy like a monk of all sects, Ambition like a bishop, Covetousness like a Pharisee or spiritual lawyer, False Doctrine like a popish doctor, and Hypocrisy like a gray friar." A Tragedy; or, entituled many-festeing the chief promises of God unto Man . . . (1538, printed in Dodgley's Old Plays, vol. 1), The Temptacious of our Lorde (ed. A. B. Grosart in Miscellaneis of the Fuller Worthies Library, vol. i., 1870), and A breve Comedy or Enterlude of Johan Baptystes preychynge in the Woldernesses, &c. (Harl. Misc. vol. i.) were all written in 1538. His plays are doggerel, but he is a figure of some dramatic importance as the author of Kynggo Johan (c. 1548), which marks the transition between the old morality play and the English historical drama. It does not appear to have directly influenced the creators of the chronicle histories.

To the authors of the Troublesome Raigne of King John (1591) it was apparently unknown, but it is noteworthy that an attempt, however feeble, at historical drama was made fourteen years before the production of Gawdodd. Kyngg Johan (ed. J. P. Collier, Camden Soc. 1838) is itself a polemic against the Roman Catholic Church. King John is represented as the champion of English rites against the Roman see:—

"This noble Kynggo Johan, as a faithfull Moset, Withstood and blocke the Frenche for his pover Israel."

But the English people remained in the bondage of Rome, "Tyll that duke Josue, which was our late Kyngg Henry, Clerely brought us out in to the lande of mylke and bonye."

Elsewhere John is called a Lollard and accused of "heretical langaage," and he is finally poisoned by a monk of Swinestead. Allegorical characters are mixed with the real persons. Yngleode vidua, represents the nation, and the jocular element is provided by Sedwyson (sedition), who would have been the Vice in a pure morality play. One actor was obviously intended to play many parts, for stage directions such as " Go out Ynglond, and dress for the next scene after we are both done with ours." The name of Kynggo Johan was discovered between 1831 and 1838 among the corporation papers at Ipswich, where it was probably performed, for there are references to charitable foundations by King John in the town and neighbourhood. It is described at the end of the MS. as two plays, but there is no obvious division, the end of the first act alone being noted. The first part is corrected by Bale and the latter half is in his handwriting, but his name nowhere occurs. In the list of his works, however, he gives a play De Joanne Anglorum Rege, written in idiomate materne.

Bale's most famous work is his edition of the English Crieris Britanicae Scriptorum, hic est, Angliae, Cambriae, ac Scotiae Summariam . . . (Ipswich and Wesel, for John Overton, 1548, 1549). This contained the title Scriptorum illustrium majoris Britanniæ . . . Catalogus (1557-1559). The chronological catalogue of British authors and their works was partly founded on the Collectanea and Commentarii of John Leland, but Bale was an indefatigable collector and worker, and himself examined many of the valuable libraries of the Augustinian and Carmelite houses before their dissolution. In his notebook he records as a instance of the wholesale destruction in progress: "I have bene also at Worwiche, our second citie of name, and there all the library monyments are turned to the use of their grossers, candelmakers, sopesellers, and other worldly occupiers . . . As much have I saved there and in ceterne other places in Northfolk and Southfolk concerning the authors names and titles of their works, as I could, and as much wold I have done through out the whole realm, yf I had been able to have borne the charges, as I am not. His work is therefore invaluable, in spite of the inaccuracies and the abuse lavished on Catholic writers, for it contains much material that would otherwise have been hopelessly lost.

A list of Bale's works is to be found in Athenae Cantabrigienses (vol. i. pp. 227 et seq.). Beside the reprints already mentioned, The Examinations of Lord Cobham, William Thope and Anne Askew, &c. were edited by the Rev. H. Christophers for the Parker Society in 1843. Bale's autograph note-book is preserved in the Selden Collection of the Bodleian Library, Oxford. It contains the materials he collected for his two published catalogues arranged alphabetically, with notes, and with bits of marginalia which increase the value of his collected work. He also gives in most cases the sources from which his information was derived. This book was prepared for publication with notes by Dr. R. Lane Poole, with the help of Miss Mary Batson, as Index Britanniarum Scriptorum quos . . . collegit Ioannes Baleus (Clarendon Press, 1902), forming part ix. of Anecdota Oxoniensia.

John Ruskin (Pl. 106, No. 16) of the English Catholic exile, founded on Bale's work his Relationum-historiarum de robustis anglicis tonum primus (Paris, 1619), better known by its running title of
BALE—BALEARIC ISLANDS

De illustribus Angliae scriptoribus. This is really the fourth book of a more extensive work. He omits the Wycliffe and Protestant divines mentioned by Bale, and the most valuable section is the lives of the Catholic exiles resident in Douai and other French towns. He does not scruple to assert (Notae de Joanne Bale) that Bale's Carmelites, while England's matter, though there is every reason to believe that he was only acquainted with Leland's work at second-hand, through Bale.

BALE. (1) A word common to Teutonic languages, in O. Eng. bale, cf. Icelandic báði, evil, suffering, a word obsolete except in poetry, and more common in the adjectival form "baleful." In early alliterative poetry it is especially used antithetically with "blissful," (2) (O. Eng. bale, a funeral pyre), a bonfire, a northern English use more common in the tautological "bale-fire," with sometimes a confused reference from (1) to evil. (3) (A word of doubtful origin, possibly connected with "ball"), a bundle of merchandise, especially of cotton, wool or hay, packed with a cover, or fastened with bands of metal, &c. for transportation; the weight and capacity varies with the goods. (4) (Properly "ball," from Fr. bâlle, possibly connected with Lat. bacula, a tub), to empty water out of a boat by means of a bail or bucket.

BALEARIC ISLANDS (Baleàries), an archipelago of four large and several minor islets in the Mediterranean Sea, off the east coast of Spain, of which country it forms a province. Pop. (1900) 311,649; area, 1935 sq. m. The archipelago, which lies between 38° 40' and 40° 4' N., and between 1° and 5° E., comprises two distinct groups. The eastern and larger group, corresponding with the ancient Insulae Baleares, comprises the two principal members of the archipelago, Majorca (Spanish, Mallorca) and Minorca (Spanish, Menorca), with seven islets: - Alcúid, Aucanada, Botafoc, Cabrera, Dragonera, Pinto and El Rey. The western group, corresponding with the ancient Pitiusae or Pine Islands, also comprises two relatively large islands, Ibiza (Spanish, Illesa or, formerly, Ivica) and Formentera, with the islets of Abarcas, Conéjera, Pou and Espalmador. Majorca, Minorca and Ibiza are described in separate articles. Formentera is described with Ibiza. The total population of the eleven islets only amounted to 71 in 1900, but all were inhabited. None of them is of any importance except Cabrera, which is full of caverns, and was formerly used as a place of banishment. In 1805 a large body of Frenchmen were landed here by their Spanish captors, and allowed almost to perish of starvation.

The origin of the name Balearides is a mere matter of conjecture; it is obvious, however, that the modern Majorca and Minorca are obtained from the Latin Maior and Minor, through the Byzantine forms Maiorica and Minorica; while Ibiza is probably derived from the older Ebusus, a name probably of Carthaginian origin. The Ophiussa of the Greeks (Colubraria of the Romans) is now known as Formentera.

Geology.—The strata which form the Balearic Isles fall naturally into two divisions. There is an older series, ranging from the Devonian to the Cretaceous, which is folded and faulted and forms all the higher hills, and there is a newer series of Tertiary age, which lies nearly horizontal and rests unconformably upon the older beds. The direction of the folds in the older series is in Ibiza nearly west to east, in Majorca south-west to north-east, and in Minorca west to north, thus forming nearly continuous folds towards the south-east. The Devonian is visible only in Minorca, the Trias being the oldest system represented in the other islands. The higher part of the Cretaceous is absent, and it appears to have been during this period that the principal folding of the older beds took place. The Eocene beds are nummulitic. There is a lacustrine stratum which has usually been placed in the Lower Eocene, but the discovery of Anthracothoracum magnus in the interbedded lignites proves it to be Oligocene, in part at least. The Miocene included a limestone with Clypeaster. Eocene beds also occur.

Climate, Fauna, Flora.—The climate of the archipelago, though generally mild, healthy and favourable to plant life, is by no means uniform, owing to the differences of altitude and shelter from wind in different islands. The fauna and flora resemble those of the Mediterranean coasts of Spain or France.

Inhabitants.—The islanders are a Spanish race, very closely akin to the Catalans; but the long period of Moorish rule has left its mark on their physical type and customs. In character they are industrious and hospitable, and pique themselves on their loyalty and orthodoxy. Crime is rare. There are higher schools in the principal towns, and the standard of primary education is well up to the average of Spain. Vaccination is common except in the cities,—the women often performing the operation themselves when medical assistance cannot be got. Castillian is spoken by the upper and commercial classes; the lower and agricultural employ a dialect resembling that of the Catalans.

Commerce.—Fruit, grain, wine and oil are produced in the islands, and there is an active trade with Barcelona in fresh fish, including large quantities of lobsters. Shoemaking is one of the most prosperous industries. There is not a very active trade direct with foreign countries, as the principal imports—cotton, leather, petroleum, sugar, coal and timber—are introduced through Barcelona. The export trade is chiefly with the Peninsula, France, Italy, Algeria and with Cuba and Porto Rico. Most of the agricultural products are sent to, the Peninsula; wine, figs, mares, almonds, lemons and rice to Europe and Africa.

Administration.—The administration of the Balearic Islands differs in no respect from that of the other Spanish provinces on the mainland. There are five judicial districts (paridos judiciales), named after their chief towns,—Inca, Iviza, Manacor, Palma and Port Mahon.

History.—Of the origin of the early inhabitants of the Balearic Islands nothing is certainly known, though Greek and Roman writers refer to the Boeotian and Rhodian settlements. There are numerous sepulchral and other monuments, which are generally believed to be of prehistoric origin. According to general tradition the natives, from whatever quarter derived, were a strange and savage people till they received some tincture and civilization from the Carthaginians, who early took possession of the islands and built themselves cities on their coasts. Of these cities, Port Mahon, the most important, still retains the name which is derived from the family of Mago. About twenty-three years after the destruction of Carthage the Romans accused the islanders of piracy, and sent against them Q. Caecilius Metellus, who soon reduced them to obedience, settled amongst them 3000 Roman and Spanish colonists, founded the cities of Palma and Pollentia (Pollensa), and introduced the cultivation of the olive. Besides valuable contingents of the celebrated Balearic hunters, the Romans derived from their city传送 mules (from Minorca), edible snails, sinope and pitch. Of their occupation numerous traces still exist,—the most remarkable being the aqueduct at Pollensa. In A.D. 423 the islands were seized by the Vandals and in 708 by the Moors. They became a separate Moorish kingdom in 1000, which, becoming extremely obnoxious for piracy, was the object of a crusade directed against it by Pope Paschal II., in which the Catalans took the lead. This expedition was frustrated at the time, but was resumed by James I. of Aragon, and the Moors were expelled in 1232. During their occupation the island was populous and productive, and some of the baronial contingents till who early took possession of the islands. By the marriage of the King James conferred the sovereignty of the isles on his third son, under whom and his successor they formed an independent kingdom up to 1340, from which time their history merges in that of Spain. In 1521 an insurrection of the peasantry against the nobility, whom they massacred, took place in Majorca, and was not suppressed without much bloodshed. In the War of the Spanish Succession all the islands declared for Charles; the duke of Anjou had no footing anywhere save in the citadel of Mahon. Minorca was reduced by Count Villars in 1707; but it was not till June 1715 that Majorca was subdued, and meanwhile Port Mahon was captured by the English under General Stanhope in 1708. In 1713 the island was secured to them by the peace of Utrecht; but in 1756 it was invaded by a force of 12,000 French, who, after defeating the British under Admiral Byng, captured Port Mahon. Restored to England in
1753, the island remained in possession of the British till 1782, when it was retaken by the Spaniards. Again seized by the British in 1788, it was finally ceded to Spain by the peace of Amiens in 1803. When the French invaded Spain in 1808, the Mallorquins did not remain indifferent; the government of the Ma-

BIBLIOGRAPHY.—For a general account of the islands, the most valuable books are *Die Balearen geschiedt in Wort und Bild,* by the archduke Ludwig Salvator of Austria (Leipzig, 1866); *Les îles Baléares,* by G. Vuillier (Paris, 1904), the first edition of which has been translated under the title of *The Forgotten Isles* (London, 1896)—and *Istas Baledrès,* an illustrated volume of 1423 pages, by P. Piferrer, in the series " España " (Barcelona, 1888). An article by J. J. Alloula appeared in *La Revista de Salamanca* for 1895. Also deserves notice the following are monographs on special subjects:—*The Story of Majorca and Minorca,* by Sir C. R. Markham (London, 1898); *Ilustraciones florales insulares Baleares,* by M. Villamor (Barcelona, 1882). Of particular interest is the volume *L'Art insulaire,* by E. Cartailha (Mission scientifique du ministère de l'Instruction publique, Toulouse, 1892). The British Foreign Office Register of Insular Monuments gives handwritings of the movement of commerce (London, annual). Much of the material available for a scientific history will be found in *La Historia general del regno balearico,* by J. Dameto and V. Mut (Majorca, 1632–1639). For the period of Moorish rule, see *Bienhecho historia de la dominacion islamica en las islas Baledrès,* by A. Campaner y Fuertes (Palma, 1888). See also the elaborate treatise *Les Relations de la France avec le royaume de Majorque,* by A. Lecoy de la Marche (Paris, 1902).

BALES [BALESUS], PETER (1547–1607), English calli-

Bales was born in London in 1547, and is described by Anthony Wood as a "most dexterous person in his profession, to the great wonder of scholars and others." We are also informed that "he spent several years in sciences among Oxionians, particularly, as it seems, in Gloucester Hall; but that study, which he used for a diversion only, proved at length an employment of profit." He is mentioned for his skill in micrography in Holinshed's *Chronicle.* "Hadrian Junius," says Evelyn, "speaking as a miracle of somebody who wrote the Apostles' Creed and the beggar's Gospel in one and the same tongue, and what would he have said of our famous Peter Bales, who, in the year 1575, wrote the Lord's Prayer, the Creed, Decalogue, with two short prayers in Latin, his own name, motto, day of the month, year of the Lord, and regn of the queen, to whom he presented it at Hampton Court, all of it written within the circle of a single penny, incased in a ring and borders of gold, and covered with a crystal, so accurately wrought as to be very plainly legible; to the great admiration of her majesty, the whole privy council, and several ambassadors then at court?" Bales was dexterous in his profession, and between 1576 and 1590 was employed by Secretary Walsing-

Malbe, Michael William (1828–1870), Irish musical com-

MALBE, Michael William (1828–1870), Irish musical com-

1815 he played the violin for his father's dancing-classes, and at the age of seven composed a polacca. In 1817 he appeared as a violinist in public, and in this year composed a ballad, first called "Young Fanny" and afterwards, when sung in *Paul Pry* by Madame Vestris, "The Lovers' Mistake." On the death of his father in 1823 he was engaged in the orchestra of Drury Lane, and being in possession of a small but pleasant baritone voice, he chose the career of an operatic singer. An unsuccessful début was made at Norwich in *Der Freischütz.* In 1825 he was taken to Rome by Count Mazzara, being introduced to Cherubini on the way. In Italy he wrote his first dramatic work, a ballet, *La Pérouse.* At the close of 1827 he appeared as Figaro in Rossini's *Barbiere,* at the Italian opera in Paris. Balfie soon returned to Italy, where, during the next nine years, he remained, singing at various theatres and composing a number of operas. During this time he married Mlle Luisa Roser, a Hungarian dancer whom he had met at Bergamo. Féris says that the public indignation roused by an attempt at "improving" Meyerbeer's opera *Il Crociato* by interpolated music of his own compelled Balfie to throw up his engagement at the theatre La Fenice in Venice. By this time he had produced his first complete opera, *I Rivali di se stessi,* at Palermo in the carnival season of 1829–1830; the opera *Un Avvertimento al geloso* at Pavia; and *Enrico Quarto* at Milan, where he had been engaged to sing with Malibran at the Scala. He returned to England in the spring of 1833, and on the 29th of May, 1834, by his own request, had the record of his operatic impersonations at Drury Lane. Encouraged by his success, he produced *The Maid of Artois* on the 27th of May 1836—the success of the opera being confirmed by the exquisite singing of Malibran. Balfie was a prolific composer, as may be seen from the following imperfect list of his English operas alone:—*Siege of Rochelle* (1835); *The Maid of Artois* (1836); *Catheine Grey* (1837); *Joan of Arc* (1837); *Falstaff* (1838), Lablache in title-role; *Amelia,* or the *Low Test* (1839); *Koelantje* (1841); *The Bohemian Girl,* his best known work (1844); *The Daughter of St. Mark* (1844); *The Wandering Jew* (1847); *Isabella* (1847); *The Maid of Honour* (1847); *The Sicilian Bride* (1852); *The Rose of Castile* (1857); *Satanella* (1858); *Blanche* (1860); *The Puritan's Daughter* (1861); *The Armourer of Nautes* (1863); *Blanche de Nevers* (1865). Balfie also wrote several operas for the *Opéra Comique* and Grand Opéra in Paris, where M.M. Scribe and St George provided him with the libretti for his *Le Puits d'amour* (1843) and *Les Quatre Filis Aymon* (1844). His *L'Etoile de Seville* was written in 1845 for the Académie Royale. The fact that Balfie was an Irishman, who produced operas in English, French and Italian with conspicuous success, is in itself interesting, since an Irish composer, excepting the few exceptions noted in the earlier articles, has so far made no appreciable contributions on the stage, the European success of his *Bohemian Girl,* his picturesque retirement into Hertfordshire in 1864 as a gentleman farmer, and above all the undeniable gift for creating such pure melodies as his songs "When other Hearts" and "I dreamt that I dwelt in marble halls," it is idle to refuse him a prominent place in the history of music. He wrote much that was trivial, but also much that was enduring. He died on the 20th of October 1870, and was buried at Kensal Green. In 1882 a medallion portrait of him was unveiled in Westminster Abbey. BALFOUR, Sir James (1817–1885), British statesman, eldest son of James Maitland Balfour of Whim and Hadding-
Balfour, A. J.

class in which the responsibilities of government are a traditional duty, Mr Balfour divided his time between the political arena and the study. Being released from his duties as private secretary by the general election of 1880, he began to take a more active part in parliamentary affairs. He was for a time politically associated with Lord Randolph Churchill, Sir Henry Drummond Wolff and Sir John (then Mr) Gorst, the quartette becoming known as the “Fourth Party,” and gaining notoriety by the freedom of the criticisms directed by its leader, Lord Randolph Churchill, against Sir Stafford Northcote, Lord Cross and other prominent members of the “old gang.” In these sallies, however, Mr Balfour had no direct share. He was thought to be merely amusing himself with politics. It was regarded as doubtful whether his health could withstand the severity of English winters, and the delicacy of his physique and the languor of his manner helped to create the impression that, however great his intellectual powers might be, he had neither the bodily strength nor the energy of character requisite for a political career. He was the “odd man” of the Fourth Party, apparently content to fetch and carry for his colleagues, and was believed to have no definite ambitions of his own. His reputation in the parliament of 1880–1886 was that of a dilettante, who allied himself with the three politicians already named from a feeling of irresponsibility rather than of earnest purpose; he was regarded as one who, on the rare occasions when he spoke, was merely desirous to impart an academic quality to the proceedings, the downfall of Mr Parnell and the disruption of the Irish party, assisted him in his task; but the fact remains that by persistent courage and undeviating thoroughness he reduced crime in Ireland to a vanishing point. His work was also constructive, for he broadened the base of material prosperity and social progress by creating the Congested Districts Board in 1890. During this period, from 1886–1892, moreover, he developed gifts of oratory which made him one of the most effective of public speakers. Impressive in matter rather than in manner of delivery, and seldom rising to the level of eloquence in the sense in which that quality was understood in a House which had listened to Bright and Gladstone, his speeches were logical and convincing, and their attractive literary form delighted a wider audience than that which listens to the mere politician. During 1888 Mr Balfour served on the Gold and Silver Commission, and currency problems from the standpoint of bimetallism being among the more academic subjects which had engaged his attention. On the death of Mr W. H. Smith in 1881 he became first lord of the treasury and leader of the House of Commons, and in that capacity introduced in 1892 a Local Government Bill for Ireland. The Conservative government was then at the end of its tether, and the project fell through. For the next three years Mr Balfour led the opposition with great skill and address. On the return of the Unionists to power in 1895 he resumed the leadership of the House, but not at first with the success expected of him, his management of the abstruse and technical proposals of ’96 being thought, even by his own supporters, to show a disinclination for the continuous drudgery of parliamentary management under modern conditions. But after the opening session matters proceeded more smoothly, and Mr Balfour regained his old position in the estimation of the House and the country. He had the satisfaction of seeing a bill pass for providing Ireland with an improved system of local government, and took an active share in the debates on the various foreign and domestic questions that came before parliament while he was leader of the House. He was also in charge of the office and conducted his adroit parliamentary handling of the problems opened up by the so-called “crisis in the Church” caused by the Protestant movement against ritualistic practices, and his pronouncement in favour of a Roman Catholic university for Ireland—for which he outlined a scheme that met with much adverse criticism both from his colleagues and his party,—were the most important aspects of Mr Balfour’s activity during these years. His speeches and work throughout this period took a wider range than before his accession to the leadership of the Commons. During the illness of Lord Salisbury in 1896, and again in Lord Salisbury’s absence of 1898, he was in charge of the foreign office, and it fell to his lot to conduct the very critical negotiations with Russia on the question of railways in North China. To his firmness, and at the same time to the conciliatory readiness with which he accepted and elaborated the principles of a modus vivendi, the two powers owed the avoidance of what threatened to be a dangerous quarrel. As a member of the cabinet responsible for the Transvaal negotiations in 1890 he bore his full share of controversy, and when the war opened so disastrously he was the first to realize the necessity for putting the full military strength of the country behind the government. At the general election of 1900, Mr Balfour was again returned for East Manchester (which he had represented since 1885) by a majority of 24,53, and continued in office as first lord of the treasury. His leadership of the House of Commons in the first session of the new parliament was marked by considerable firmness in the suppression of obstruction, but there was a slight revival of the criticisms which had been current in 1896. Mr Balfour’s inability to get the maximum amount of work out of the House was largely due to the situation in South Africa, which absorbed the intellectual energies of the House and of the country and impeded the progress of legislation. The principal achievements of the long session of 1902 (which extended to the autumn) were the passing of the Education Act,—entirely reorganizing the system of primary education, abolishing the school boards and making the county councils the local authority; new rules of procedure; and the creation
of the Metropolitan Water Board; and on all these questions, and particularly the two first, Mr Balfour’s powers-as a debater were brilliantly exhibited.

On Lord Salisbury’s resignation on the 11th of July 1902, Mr Balfour had been appointed as prime minister, with the cordial approval of all sections of the Unionist party. For the next three and a half years his premiership involves the political history of England, at a peculiarly interesting period both for foreign and domestic affairs. Within a few weeks Mr Balfour had reconstituted the cabinet. He himself became first lord of the treasury and lord privy seal, with the duke of Devonshire (remaining lord president of the council) as leader of the House of Lords; Lord Lansdowne remained foreign secretary, Mr (afterwards Lord) Ritchie took the place of Sir Michael Hicks-Beach after the war’s end (Sir Alwyn) as chancellor of the exchequer, Mr J. Chamberlain remained colonial secretary, his son Austen being postmaster-general with a seat in the cabinet. Mr G. Wyndham as chief secretary for Ireland was included in the cabinet; Lord Selborne remained at the admiralty, Mr St John Brodrick (afterwards Lord Midleton) war minister, Lord George Hamilton secretary for India, and Mr Akers-Douglas, who had been first commissioner of works, became home secretary; Lord Balfour of Burleigh remained secretary for Scotland, Lord Dudley succeeded Lord Cadogan as lord lieutenant of Ireland, and Lord Londonderry became president of the Board of Education (with Sir William Anson as parliamentary secretary in the House of Commons). Mr Balfour’s brother Gerald (b. 1853), who had entered public life as his private secretary when at the Local Government Board, and had been chief secretary for Ireland from 1895-1900, retained his position (since 1900) as president of the Board of Trade.

The new prime minister came into power practically at the same moment as the king’s coronation (see Edward VII.) and the end of the South African War (see Transvaal). The task of clearing up after the war, both in South Africa and at home, lay before the new minister, Mr Chamberlain (q.e.), and the enthusiastic support of a large parliamentary majority, made the prospects fair. For a while no cloud appeared on the horizon: and the Liberal party were still disorganized (see Campbell-Bannerman and Rosebery) over their attitude towards the Boers. Mr Chamberlain went to South Africa in the late autumn, with the hope that his personality would influence the settlement there; and the session of 1903 opened in February with no hint of troubles to come. A difficulty with Venezuela, resulting in British and German co-operation to conclude a treaty, brought the economic history of anti-German feeling in England and some restlessness in the United States, but the government brought the crisis to an end by tactful handling and by an ultimate recourse to arbitration. The two chief items of the ministerial parliamentary programme were the extension of the new Education Act to London and Mr Wyndham’s Irish Land Purchase Act, by which the British exchequer should advance the capital for enabling the tenants in Ireland to buy out the landlords. Moreover, the budget was certain to show a surplus and taxation could be remitted. As events proved, it was the budget which was to provide a cause of discussion, bringing the new policy ascribed to the chief minister, and an issue overriding all the legislative interest of the session.

Mr Ritchie’s remission of the shilling import-duty on corn led to Mr Chamberlain’s crusade in favour of tariff reform and colonial preference, and as the session proceeded the rift grew in the Unionist ranks.

In the separate article on Mr Chamberlain the progress of this movement is sufficiently narrated. From this moment it is only necessary here to realize Mr Balfour’s position. He had always admitted the oneness of the English free-trade system, and had supported the desirability of retaliating against unfair competition and “dumping” by foreign countries. But Mr Chamberlain’s new programme for a general tariff, with new taxes on food arranged so as to give a preference to colonial products, involved a radical alteration of the established fiscal system, and such out-and-out Unionist free-traders in the cabinet as Mr Ritchie and Lord George Hamilton, and outside it, like Lord Hugh Cecil and Mr Arthur Elliot (secretary to the treasury), were entirely opposed to this. Mr Balfour was anxious to avoid a rupture, doubtful of the feeling of the country, uncertain of the details by which Mr Chamberlain’s scheme could be worked out. As leader of the party and responsible for the maintenance of so great a political engine, he was anxious not to be precipitate. He was neither for nor against the new movement, and professed to hold “no settled convictions” on the subject. Mr Chamberlain rested his case largely on the alleged diminution in British trade, and the statistics therefore required investigation before the government could adopt any such programme. From the middle of May, when Mr Chamberlain began to press the matter, Mr Balfour had a difficult hand to play, so long as it was uncertain how the party would follow the latter lead. The Board of trade was asked to supply full figures, and while its report was awaited the uncertainty of attitude on the part of the government afforded grateful opportunity for opposition mischief-making, since the Liberal party had now the chance of acting as the conservative champions of orthodox economies. Another opportunity for making political capital was provided by the publication of the report of the royal commission on the Boer War under Lord Elgin’s chairmanship, which horrified the country by its disclosures (August 26th) as to the political and military conditions under which the lives of the soldiers had gone on, and the want of any efficient system of organization.

The session ended in August without any definite action on the fiscal question, but in the cabinet the discussions continued. On the 16th of September Mr Balfour published a pamphlet on “Insular Free Trade,” and on the 18th it was announced that Lord George Hamilton and Mr Ritchie had resigned, Lord Balfour of Burleigh and Mr Arthur Elliot following a day or two later. These were the strait free-traders, but at the same time Mr Chamberlain resigned also. The correspondence between Mr Chamberlain and Mr Balfour (September 9th and 16th) was published, and proved that with the minister the government had been in urgent consultation with some form of fiscal union with the colonies, if practicable, and in favour of retaliatory duties, but unable to believe that the country was yet ready to agree to the taxation of food required for a preferential tariff, and therefore unwilling to support that scheme; at the same time he encouraged Mr Chamberlain to test the feeling of the public and to convert them by his missionary efforts outside the government. Mr Chamberlain on his side emphasized his own parliamentary loyalty to Mr Balfour. In his pamphlet on “Insular Free Trade” the prime minister reviewed (p. 135) the economic history of the country’s time, pointed out the falsification of the promises of the early free-traders, and to the fact that England was still the only free-importing country, and insisted that he was “in harmony with the true spirit of free-trade” when he pleaded for “freedom to negotiate that freedom of exchange may be increased.” This manifesto was at first taken, not only as the platform of the government, but also as that from which its resigning free-trade members had dissented; and the country was puzzled by a statement from Lord George Hamilton that Mr Balfour had circulated among his colleagues a second and different document, in fuller agreement with his own. Mr Chamberlain was later made minister of home affairs and minister of police, and his bill for the extension of the police system over the country, in place of local police, met with opposition in the House of Commons, and after long discussion was passed and became law.

The public noted that the duke of Devonshire, whose orthodoxy was considered typical, remained in the cabinet.

The crisis, however, soon developed further, owing to explanations between the free-trade Unionists. On October 1st Mr Balfour spoke at Sheffield, reiterating his views as to free-trade and retaliation, insisting that he “intended to lead,” and declaring that he was prepared at all events to reverse the traditional fiscal policy by doing away with the axiom that import duties should only be levied for revenue purposes. The speech was enthusiastically received by the National Union of Conservative Associations, who had year by year flirted with protectionist resolutions, and who were known to be predominantly in sympathy with Mr Chamberlain. But the free-traders did not like Mr Balfour’s formula as to reversing the traditional
fiscal policy of import taxes for revenue only. Next day the duke of Devonshire resigned, a step somewhat bitterly resented by Mr Balfour, who clearly thought that his sacrifices in order to conciliate the duke had now been in vain. During this critical fortnight the duke had apparently acquiesced in Mr Balfour's compromise, and had co-operated in reconstituting the ministry; his nephew and heir had been made financial secretary to the treasury, while Mr Alfred Lyttelton was appointed colonial secretary, Mr Austen Chamberlain chancellor of the exchequer, Mr Brodrick secretary for India, Mr H. O. Arnold-Forster war minister, Lord Stanley postmaster-general and Mr Graham Murray secretary for Scotland. Lord Londonderry now became president of the council, Lord Lansdowne leader of the House of Lords, and Lord John Manners, who as Lord Cranborne had for three years been under-secretary for foreign affairs, was included in the cabinet as lord privy seal.

During the remainder of 1903 the struggle within the Unionist party continued. Mr Chamberlain spoke all over the country, advocating a definite scheme for reorganizing the budget, so as to have more taxes on imports, including food, but proposing to adjust the taxation so as to improve the position of the working-classes and to stimulate employment. The free-trade Unionists, with the duke of Devonshire, Lord Goschen, Lord James and Lord Hugh Cecil, as their chief representative, continued to support a Free Food league in opposition to Mr Chamberlain's Tariff Reform league; and at a great meeting at Queen's Hall, London, on the 24th of November their attitude was made plain. They rejected Mr Chamberlain's food-taxes, discredited his statistics, and, while admitting the theoretical orthodoxy of retaliation, criticized Mr Balfour's attitude and repudiated his assumption that retaliation would be desirable. Finally in December came the appointment of Mr Chamberlain's Tariff Commission. There was no doubt about the obstinacy and persistency of both sections, and both were fighting not only to recover the public, but for the capture of the party and of its prime minister. Both sides were inclined to claim him; neither could do so without qualification. His dialectical dexterity in evading the necessity of expressing his fiscal opinions further than he had already done became a daily subject for contemptuous criticism in the Liberal press; but he insisted that in any case no definite action could be taken till the next parliament; and while he declined to go the "whole hog"—as the phrase went—with Mr Chamberlain, he did nothing to discourage Mr Chamberlain's campaign. Whether he would eventually follow in the same direction, or word might change, as his chief representative continued to be the political conundrum for month after month. Minor changes were made in the ministry in 1903, Mr Brodrick going to the India office and Mr Arnold-Forster becoming minister for war; but Mr Balfour's personal influence remained potent, the government held together, and in 1904 the Licensing Bill was successfully carried. Though a few Unionists transferred their allegiance, notably Mr. Winston Churchill, and by-elections went badly, Mr Balfour still commanded a considerable though a dwindling majority, and the various contrivances of the opposition for combining all free-traders against the government were obstructed by him. But the situation remained constant. Though not to be supported by the "wobblers" in the ministerial party, while the government could always manage to draft some "safe" amendment acceptable to most of them. This was notably shown in the debate on Mr Black's motion on the 18th of May. On the 3rd of October Mr Balfour spoke at Edinburgh on the fiscal question. The more aggressive protectionists among Mr Chamberlain's supporters had lately become very confident, and Mr Balfour plainly repudiated "protection" in so far as it meant a policy aiming at supporting or creating home industries by raising home prices; but he introduced a new point by declaring that an Imperial Conference would be called to discuss with the colonies the question of preferential tariffs if the Unionist government obtained a majority at the next general election. The Edinburgh speech was again received with conflicting interpretations, and much discussion prevailed as to the conditions of the proposed conference, and as to whether it was or was not an advance, as the Chamberlainites claimed, towards Mr Chamberlain. Meanwhile the party was getting more and more disorganized, and the public were getting tired of the apparent mystification. The opposition used the situation to make capital in the country, and loudly called for a dissolution. It was plain indeed that the fiscal question itself was ripe for the polls; Board of Trade statistics had been issued in profusion, and the whole case was before the country. But, though Mr Chamberlain declared his desire for an early appeal to the electors, he maintained his parliamentary loyalty to Mr Balfour. There were, moreover, public reasons why a change of government was undesirable. From 1903 onwards the question of armament rose to a first-class position, and the war minister, Mr Balfour, was anxious to get this settled, though in fact Mr Brodrick's and Mr Arnold-Forster's schemes for reorganization failed to obtain any general support. And while foreign affairs were being admirably conducted by Lord Lansdowne, they were critical enough to make it dangerous to contemplate a "swopping of horses." The Russo-Japanese War might at any moment lead to complications. The exercise by Russian warships of the right of search over British ships was causing great irritation in English commercial circles during 1904; after several incidents had occurred, the stopping of the P. & O. steamer "Malaccas" on July 13th in the Straits Settlements, and the Russian cruisers "Peterburg" led to a storm of indignation, and the sinking of the "Knight Commander" (July 24th) by the Vladivostock squadron intensified the feeling. On the 23rd of October the outrageous firing by the Russian Baltic fleet on the English fishing-boat off the Dogger Bank in the North Sea was within an ace of causing war. It was not till the 28th that Mr Balfour, speaking at Southampton, was able to announce that the Russian government had expressed regret, and that an international commission would inquire into the facts with a view to the responsibility persons being punished. Apart from the importance of seeing the Russo-Japanese War through, there were important negotiations on foot for a renewal or revision of the treaty with Japan; and it was felt that on these grounds it would be a mistake for the government to allow itself to be driven into a premature dissolution, unless it found itself unable to maintain a majority in parliament. At the same time the government's tenure of office was obviously drawing to its close; the usual interpretation of the Septennial Act involved a dissolution either in 1905 or 1906, and the government whips found increased difficulty in keeping a majority at Westminster, since neither the Chamberlainites nor the convention-free-trade Unionists showed any zeal, and a large number of the uncertain Unionists did not intend to stand again for parliament.

The events of the session of 1905 soon foreshadowed the end. The opposition were determined to raise debates in the House of Commons on the fiscal question, and Mr Balfour was no less determined not to be caught in their trap. These tactics of avoidance reached their culminating point when on one occasion Mr Balfour and his supporters left the House and allowed a motion hostile to tariff reform to be passed nem. con. Though the Scottish Churches Bill, the Unemployed Bill and the Aerials Bill were passed, meeting no important opposition, and the treaties proposals, which pleased nobody and had to be withdrawn owing to a blunder as to procedure; and though on the 17th of July a meeting of the party at the foreign office resulted in verbal assurances of loyalty, only two days later the government was caught in a minority of four on the estimates for the Irish Land Commission. For a few days it was uncertain whether they would resign or dissolve, but it was decided to hold on.

The real causes, however, which kept the government in office, were gradually losing their validity. The Russo-Japanese War came to an end; the new offensive and defensive alliance with Japan was signed on the 1st of August; the successful Anglo-French agreement, concluded in April 1904, had brought out a vigorous expression of cordiality between England and France, shown in an enthusiastic exchange of naval visits; and the danger, which threatened in the early summer, of complications
with France and Germany over Morocco, was in a fair way of being dispelled by the support given to France by Great Britain. The Liberal leaders had given public pledges of their adhesion to Lord Lansdowne's foreign policy, and the fear of their being unable to carry it on was no longer a factor in the public mind. Thus, November 15, precipitated by a speech made by Mr Balfour at Newcastle on the 14th, appealing for unity in the party and the sinking of differences, an appeal plainly addressed to Mr Chamberlain, whose supporters—the vast majority of the Unionists—were clamouring for a fighting policy. But Mr Chamberlain was no longer prepared to wait. On the 21st of November at Bristol he insisted on his programme being adopted, and Mr Balfour was compelled to abandon the position he had held with so much tactical dexterity for two years past. Amid Liberal cries of "No Balfour, no dissolution," he resigned on the 4th of December; and Sir Henry Campbell-Bannerman, being entrusted by the king with the formation of a government, filled his cabinet with a view to a general election in January. The Unionists went to the polls with divided counsels, and sustained a crushing defeat, remarkable nevertheless for the comparative success of the tariff reformers. While Mr Chamberlain had a signal personal triumph in all the divisions of Birmingham, Mr Balfour himself was defeated by a large majority in Manchester.

Being in a miserable minority in parliament (157 Unionists against 379 Liberals, 35 Conservatives, and 83 Nationalists), some form of consolidation among the Unionists was immediately necessary, and negotiations took place between Mr Balfour and Mr Chamberlain which resulted in the patching up of an agreement (expressed in a correspondence dated February 14th), and its confirmation at a meeting of the party at Lansdowne House a few days later. The new compact was indicated in Mr Balfour's letter, in which he declared that "fiscal reform is, and must remain, the first constructive work of the Unionist party; its objects are to secure more equal terms of competition for British traders, and to impose a fiscal union of the whole empire, though it is at present unnecessary to prescribe the exact methods by which these objects are to be attained, and inexpedient to permit differences of opinion as to these methods to divide the party, though other means are possible, the establishment of a moderate general tariff on manufactured goods, not imposed for the purpose of raising prices, or giving artificial protection against legitimate competition, and the imposition of a small duty on foreign corn, are not in principle objectionable, and should be adopted if shown to be necessary for the attainment of the ends in view or for purposes of revenue," and Mr Balfour's leadership of the whole party must be approved; and a sub-committee was formed for him in the City of London by the retirement of Mr Gibb.

The downfall of Mr Balfour's administration, and the necessity of reorganizing the Unionist forces on the basis of the common platform now adopted, naturally represented a fresh departure under his leadership, the conditions of which to some extent depended on the opportunities given to the new opposition by the proceedings of the Radical government (see Campbell-Bannerman, Sir H.; and Asquith, H. H.). His own administration had been wrecked, through no initiative of his, by the dishonest and discreditable actions of Gladstone, his colleagues of Whistle, his intellectual fnesse, his personal hold over his supporters, his statesmanlike grasp upon imperial problems and his oratorical ability, had been proved to a remarkable degree; and in foreign affairs his tenure of power had been conspicuously successful. He left his country indeed in a position of strength abroad, which it had not held since the Crimean War. His institution of the permanent Committee of Imperial Defence, and of the new Army Council (1904), were reforms of the highest importance, resulting from the report of a "triunvirate" consisting of Lord Esher, Mr Chamberlain, and Sir George Clarke, appointed in November 1903. The Unionist régime as a whole, however, had collapsed. Its ministers had become "stale." The heavy taxation of the war years was still retained, to the disgust especially of the income-tax payers; and new issues arose over the Education Act, labour questions, and the introduction of Chinese labour into South Africa (1904), which were successfully used against the government in the constituencies. The result was an electoral defeat which indicated, no doubt, a pronounced weakening of Mr Balfour's position. London University in 1888; and D.C.L. of Oxford, he was once more realized. The immense Radical majority started with a feeling of contempt for the leader who had been rejected at Manchester, but by 1907 he had completely reasserted his individual pre-eminence among parliamentarians. Mr Balfour had never spoken more brilliantly, nor shone more as a statesman, than in the year when he had to confront a House of Commons three-fourths of which was hostile. His speech at Birmingham (November 14, 1907), fully accepting the principles of Mr Chamberlain's fiscal policy, proved epoch-making in consolidating the Unionist party—except for a small number of free-traders, like Lord Robert Cecil, who continued to hold out—in favour of tariff reform; and during 1908 the process of recuperation went on, as the by-elections showed a marked degree the increased popular support given to the Unionist candidates. This recovery was due also to the forcible-feebler character of the Radical campaign against the House of Lords, the unpopularity of the prime minister, Lord Salisbury, and his government's policy at an education settlement, the incapacity of its Irish administration, its apparent domination by the "little navy" section, and its dallying with Socialism in the budget of 1909.

The rejection of this budget in December by the House of Lords led to a desperate struggle at the polls in January 1910, but the confident hopes of the Unionists were doomed to disappointment. They won back over a hundred seats, returning 273 strong, but were still in a minority, the Liberals numbering 275, Labour members 40, and Irish Nationalists 16. Mr Balfour's government now having been defeated, he was elected for the City of London by an enormous majority.

Mr Balfour's other publications, not yet mentioned, include Essays and Addresses (1893) and The Foundations of Belief, being Notes introductory to the Study of Theology (1895). He was made LL.D. of Edinburgh University in 1881; of St Andrews University in 1885; of Cambridge University in 1888; of Dublin and Glasgow Universities in 1891; lord rector of St Andrews University in 1886; of Glasgow University in 1895; chancellor of Edinburgh University in 1898; member of the Senate of London University in 1890; and visiting fellow of New College, Oxford University in 1891. He was president of the British Association in 1904, and became a fellow of the Royal Society in 1888. He was known from early life as a cultured musician, and became an enthusiastic golf player, having been captain of the Royal and Antient Golf Club of St Andrews in 1894-1895. (H. Ch.)

BALFOUR, Francis Maitland (1851-1882), British biologist, younger brother of Arthur James Balfour, was born at Edinburgh on the 10th of November 1851. At Harrow school he showed but little interest in the ordinary routine, but in one of the masters, Mr George Griffith, he fortunately found a man who encouraged him in the pursuit of natural science, a taste for which, and especially for geology, had been cultivated in him by his mother from an early age. Going into residence at Trinity College, Cambridge, in 1870, he was elected a natural science scholar of his college in the following year, and although his reading was not ordered on the lines usual for the Schools, he obtained the second place in the Natural Science Tripos of December 1873. A course of lectures on embryology, delivered by Sir Michael Foster in 1871, definitely turned his attention to animal morphology, and, after his tripos, he was selected to occupy one of the two seats allocated to the government of Cambridge at the Naples zoological station. The research work which he began there contributed in an important degree to his election as a fellow of Trinity in 1874, and also afforded him material for a series of papers (published as a monograph in 1878) on the Elasmobranch fishes, which threw new light on
the development of several organs in the Vertebrates, in particular of the uro-genital and nervous systems. His next work was to write a large treatise, Comparative Embryology, in two volumes; the first, published in 1880, dealing with the Invertebrates, and the second (1884) with the Vertebrata. This book displayed a vigorous scientific imagination, always controlled by a logical sense that rigidly distinguished between proved fact and mere hypothesis, and it at once won wide recognition, not only as an admirable digest of the numberless observations made with regard to the development of animals during the quarter of a century preceding its publication, but also on account of the large amount of original research incorporated in its pages. Balfour's reputation was now such that other universities became anxious to secure his services, and he was invited to succeed Professor George Rolleston at Oxford and Sir Wyvill Thomson at Edinburgh. But although he was only a college lecturer, holding no official post in his university, he declined to leave Cambridge, and in the spring of 1882 the university recognized his merits by instituting a special professorship of animal morphology for his benefit. Unhappily he did not deliver a single professorial lecture. During the first term after his appointment he was incapacitated from work by an attack of typhoid fever. Going to the Alps to recruit his health, he perished, probably on the 19th of July 1882, in attempting the ascent of the Aiguille Blanche, Mont Blanc, at that time unscalable. Besides being a brilliant morphologist, Balfour was an accomplished linguist, and had he lived he probably have taken a high place among British taxonomists.

BALFOUR, SIR JAMES, BART. (of Dennyline and Kinnaird) (c. 1600–1657), Scottish antiquist and novelist. He was well acquainted with Sir William Segar and with Dugdale, to whose Monasticon he contributed. He was knighted by Charles I. in 1630, was made Lyon king-at-arms in the same year, and in 1643 baronet of Kinnaird. He was removed from his office of king-at-arms by Cromwell and died in 1657. Some of his numerous works are preserved in the Advocates' Library at Edinburgh, together with his correspondences from which rich collection Haig published Balfour's Annals of Scotland in 4 vols. 8vo (1824–1826).

See Sibbald, Memoria Balfouriana (1699).

BALFOUR, SIR JAMES (of Pittendreich) (d. 1583 or 1584), Scottish judge and politician, son of Sir Michael Balfour of Montquhanny, was educated for the legal branch of the church of Scotland. In June 1547, together with Knox and others taken at St Andrews, he was condemned to the French galleys, but was released in 1549, with the Verrue, of the Franciscans at Paris, and his name was restored to the succession of the Abbey of Mary of Guise, and was rewarded with some considerable legal appointments. Subsequently he went over to the lords of the congregation and then betrayed their plans. After Mary's arrival in Scotland he became one of her secretaries, in 1565 being reported as her greatest favourite after Rizzio.1 He obtained the patronage of Flisk in Fife in 1561, was nominated a lord of session, and in 1563 one of the commissioners of the court which now took the place of the former ecclesiastical tribunal; in 1565 he was made a privy-councillor, and in 1566 lord-clerk-register, and was knighted. According to Mary's munificence, Flisk's father, Michael, was made in 1564-5 an adherent of Bothwell, he was deeply implicated in Darnley's murder, though not present at the commission of the crime. By his means Darnley was lodged at Kirk o' Field, his brothers' house. He was supposed to have drawn up the bond at Craigmillar for the murder; he signed it, was made under Bothwell deputy-governor of Edinburgh Castle, and is said to have drawn up the marriage-contract between Bothwell and Mary. When, however, the fall of Bothwell was seen to be impending he rapidly changed sides and surrendered the castle to Murray, stipulating for his pardon for Darnley's murder, the retention of the priory of Pittenweem, and pecuniary rewards. He was appointed president of the court of session on resigning the office of lord-clerk-register. He was present at the battle of Langside with the regent in 1568, and was accused of having advised Mary to leave Dunbar to her ruin, and of having betrayed to her enemies the casket letters. The same year, however, in consequence of renewed intrigues with Mary's faction, he was dismissed, and next year was imprisoned on the charge of complicity in Darnley's murder. He succeeded in effecting his escape by means of bribery, the expenses of which he is said to have paid by intercepting the money sent from France to Mary's aid. In August 1571, during the regency of Lennox, an act of forfeiture was passed against him, but next year he was again playing traitor and discovering the secrets of his party to Morton, and he obtained a pardon from the latter in 1573 and negotiated the pacification of Perth the same year. Distrusted by all parties, he fled to France, where he seems to have remained till 1580. In 1579 his forfeiture was renewed by act of parliament. In January 1580 he wrote to Mary offering her his services, and in June published his desire to be useful to Elizabeth, lamented the influence of the Jesuits, and intended a journey to Dieppe to hear some good Protestant preaching.2 On the 27th of December of the same year he returned to Scotland and effected the downfall and execution of Morton by producing a bond, probably that in defence of Bothwell and to promote his marriage with Mary, and giving evidence of the latter's knowledge of Bothwell's intention to murder Darnley. In July 1581 his cause was heard; he was acquitted of murder by assise, and shortly afterwards in 1581 or 1582 he was restored to his estates and received at court. His name is found in the accounts of the execution of Mary of Guise, and crime, closed shortly before the 24th of January 1584. He was the greatest lawyer of his day, and part-author at least of Balfour's Practicks, the earliest text-book of Scottish law, not published, however, till 1754. He married Margaret, daughter and heiress of Michael Balfour of Buirle, by whom, besides three daughters, he had six sons, the eldest of whom was created Baron Balfour of Buirle in 1607.3

BALFOUR, ROBERT (known also as Balforeus) (1552–1625?), Scottish philosopher, was educated at St Andrews and the university of Paris. He was for many years principal of the Guenee College at Bordeaux. His great work is his Philosophy in One Letter (1600); a Latin and English translation (1876); the copy in the British Museum contains a number of highly-cullogistic poems in honour of Balfour, who is described as Graium seminalis acer. Balfour was one of the scholars who contributed to spread over Europe the fame of the praecipuum ingenium Scotorum. His contemporary, Dempster, called him the "phoenix of his age, a philosopher profoundly skilled in the Greek and Latin languages, and a mathematician worthy of being compared with the ancients." His Cosmologiae meteora, with notes and Latin translation, was reprinted at Leiden, in 1607, as late as 1629.

See Dempster, Historia Ecclesiastica Gent. Scotorum; Irving's Lives of the Scottish Writers; Anderson's Scottish Nation, i. 217.

BALGUY, JOHN (1686–1748), English divine and philosopher, was born at Sheffield on the 12th of August 1686. He was educated at the Sheffield grammar school and at St John's College, Cambridge, graduated B.A. in 1706, was ordained in 1710, and in 1711 obtained the small living of Lamesley and Tanfield in Durham. He married in 1715. It was the year in which Bishop Hoadley preached the famous sermon on "The Kingdom of Christ," which gave rise to the "Bangorian controversy"; and Balguy, under the nom de plume of Silvius, began his career of authorship by taking the side of Hoadley in this controversy against some of his High Church opponents.

3 Cal. of State Pap. (Foreign), 1685–1689, p. 189.
In 1726 he published *A letter to a Deist concerning the Beauty and Excellency of Moral Virtue, and the Support and Improvement which it receives from the Christian Religion*, chiefly designed to show that, while a love of virtue for its own sake is the most primitive, naive, religious rewards and punishments are most valuable, and in some cases absolutely indispensable, as sanctions of conduct. In 1727 he was made a prebendary of Salisbury by his friend Hodle. He published in the same year the first part of a tractate entitled *The Foundation of Moral Goodness*, and in the following year a second part, *Illustrating and enforcing the Principles contained in the former*. The aim of the work is two-fold—to refute the theory of Hutcheson regarding the basis of rectitude, and to establish the theory of Cudworth and Clarke, that virtue is conformable to reason—the acting according to fitness which arises out of the eternal and immutable relations of agents to objects. In 1729 he became vicar of Northallerton, in the county of York. His next work was an essay on *Divine Rectitude; or, a Brief Inquiry concerning the Moral Perfections of the Deity, particularly in respect of Creation and Providence*. It is an attempt to show that the same moral principle which ought to direct human life may be perceived to underlie the works and ways of God: goodness in the Deity not being a mere disposition to benevolence, but a regard to an order, beauty and harmony, which are inherent, relative to our faculties and own satisfaction, but real and absolute; claiming for their own sakes the reverence of all intelligent beings, and alone answering to the perfection of the divine ideas. Balgy wrote several other terse and readable tracts of the same nature, which he collected and published in a single volume in 1734. In 1741 he published an *Essay on Redemption*, containing somewhat advanced views. Redemption as taught in Scripture means, according to him, "the deliverance or release of mankind from the power and punishment of sin, by the meritorious sufferings of Jesus Christ," but involves no *translation of guilt, substitution of persons or vicarious punishment*, from which it is clear that many of those to whom the literally expressions which are properly figurative, the doctrine, he argues, satisfies deep and urgent human wants, and is in perfect consistence and agreement with reason and rectitude. His last publication was a volume of sermons, pervaded by good sense and good feeling, and clear, natural and direct in style. He died at Harrogate on the 21st of September 1748. A second volume of sermons appeared in 1750 (3rd ed. in 2 vols., 1760).

**Bali** is a small island in the eastern Indian Ocean, located about 60 miles southeast of Java, which it is separated from by the Bali Strait, which is shallow and narrow. It is the largest island of the Indonesian archipelago, and its greatest breadth is 50 m. The area is 2000 sq. m. In 1882, for administrative purposes, Bali was separated from Java and combined with the island of Lombok to form the Dutch residency of Lombok and Bali. Politically its divisions are two—(1) the two districts, Buleleng and Jembrana, on Dutch territory; and (2) the autonomous states of Klung Lung, Bangli, Mengwi, Badung and Tabanan. Buleleng, on the north-west, is the chief town. The population on Dutch territory in the whole residency in the year 1905 was 533,535. Bali belongs physically to Java; the climate and soil are the same and it has mountains of proportionate height. There are several lakes of great depth and streams well fitted for the purposes of irrigation, of which full advantage is taken by the natives. The geological formation includes (like that of Java) three regions—the central volcanic, the southern peninsula of Tertiary limestone, and alluvial plains between the older formations. The highest volcanoes, Tabanan, Batur and Gunung Agung (Bali Peak), have respectively heights of 7,545 ft., 7,593 ft., and 10,497 ft., the central chain having an average altitude of 5,928 ft. As regards flora and fauna Bali is associated with Java. The deep strait which separates it on the east from Lombok was taken by A. R. Wallace (q.v.) as representing the so-called Wallace's Line, whereby he demarcated the Asiatic from the Australian fauna.

The natives of Bali, though of the same stock as the Javanese, and resembling them in general appearance, exceed them in stature and muscular power, as well as in activity and enterprise. They are skilful agriculturists and artisans, especially in textile fabrics and the manufacture of arms. Though native rule is tyrannical and arbitrary, especially in the principalities of Badung and Tabanan, trade and industry could not flourish if insecurity of persons and property of the past century, by whom the natives have also a remedy against the aggression of their rulers in their own hands; it is called *matlas*, consists in a general rising and renunciation of allegiance, and proves mostly successful. Justice is administered from a written civil and criminal code. Slavery is abolished. Hinduism, which was once the religion of Java, but has been extinct there for four centuries, is still in vogue in the islands of Bali and Lombok, where the cruel custom of widow-burning (suttee) is still practised, and the Hindu system of the four castes, with a fifth or Pariah caste (called *Chandole*), adhered to. It appears partly blended with Buddhism, partly overgrown with a belief in *kalas*, or evil spirits. To appease these, offerings are made to them either direct or through the mediation of the *devas* (domestic or agrarian deities); and if these avail not, the *Menespi* or Great Sacrifice is resorted to. In the course of this ceremony, after the sacrifice, men rush in all directions carrying torches; the women also carry fire-brands, or knock on the houses with rice-crushers and other heavy implements, and thus the evil spirits are considered to be driven away. The Mahomedan religion occurs among the coastal population. The Balinese language belongs to the same group of the Malayan class as the Javanese language, Sundanese, &c., but is as distinct from each of these as French is from Italian. It is most nearly akin to the Sasan language spoken in Lombok and on the east coast of Bali. The literary language has embodied many of its ingredients from the Old Javanese, as spoken in Java at the time of the fall of Majaphat (15th century), while the vulgar dialect has kept free from such admixture. Javanese influence is also traceable in the use of three varieties of speech, as in the Javanese language, according to the degree of the person addressed. The alphabet is with some modifications the same as the Javanese, though reversed. The material universally used for writing on is the prepared leaf of the lontar palm. The sacred literature of the Balinese is written in the ancient Javanese or *kawi* language, which appears to be better understood here than it is in Java. A general decline in culture is manifest in the Balinese. Of the early history of their island the Balinese know nothing. The oldest tradition they possess refers to a time shortly after the overthrow of the Majaphat dynasty in Java, about the middle of the 11th century; it has been supposed that there must have been Indian settlers here before fixation. The Balinese language, in which the present name, probably cognate with the Sanskrit *bali*, strong, was in all likelihood imposed. It was not till 1633 that the Dutch attempted to enter into alliance with the native princes, and their earliest permanent settlement at Port Badung only dates from 1845. Their influence was extended by the results of the war which they waged with the natives about 1847-49. The only roadstead safe all the year round is Temukus on the north coast. The rivers are not navigable. Agriculture is the chief means of subsistence; rice being a crop of particular importance. Other crops grown for export are coffee, tobacco, cocoa and indigo. Gold-working, the making of arms and musical instruments, wood-carving, cotton, silk and gold thread weaving are of importance. There are numerous Arab and Chinese traders.

**Balkisri** (Balukiser), a town of Asia Minor, capital of the Karasi sanjak in the vilayet of Brusa, altitude 575 ft., situated on rising ground above a fertile plain which drains to the Sea of Marmora. Pop. 20,000 (Moslems, 15,000; Christians, 5000). It is a centre of trade in opium, silk and ceramics, connected with by carrying by camel. The sanjak is rich in mineral wealth; silver mines are worked at Bali and boracite mines at Susurlu. At or near Balkisri was the Roman town of Hadrianuthe, founded, as its name commemorates, by the emperor Hadrian.
BALIOL

BALIOL, the name of a family which played an important part in the history of Scotland. The founder of the family in England was a Norman baron, Guy or Guido de Baliol, who held the fefts of Bailieul, Dampierre, Harcourt and Vinoy in Normandy. Coming to England with William the Conqueror, he received lands in the north of England from William II., and his son, or grandson, Bernard or Barnard de Baliol, built a fortress in Durham called Castle Barnard, around which the town of Barnard Castle grew. The first burgesse Burgesses probably obtained their privileges from him. Bernard fought for King Stephen during the civil war, was present at the battle of the Standard in August 1138, and was taken prisoner at the battle of Lincoln in February 1141.

The date of his death is uncertain. Dugdale only believes in the existence of one Bernard de Baliol, but it seems more probable that the Bernard de Baliol referred to after 1167 was the son of the elder Bernard, and not the same individual. If so the younger Bernard was one of the northern barons who raised the siege of Alnwick, and took William the Lion, King of Scotland, prisoner in July 1174. He also confirmed the privileges granted by his father to the burgesses of Barnard Castle, and was succeeded by his son Eustace. Practically nothing is known of Eustace, or of his son Hugh who succeeded about 1215. Hugh’s son and successor, John de Baliol, who increased his wealth and position by a marriage with Dervorguilla (d. 1240), daughter of Alan, Earl of Galloway, is said to have possessed thirty knights’ fees in England and one half of the lands in Galloway. He was one of the regents of Scotland during the minority of Alexander III., but in 1255 was deprived of this office and his lands and property were confiscated for fighting for Henry III. against Simon de Montfort, and was taken prisoner at the battle of Lewes in 1264. About 1263 he established several scholarships at Oxford, and after his death in 1269 his widow founded the college which bears the name of the family. He left four sons, three of whom died without issue, and in 1278 his lands came to his son, John de Baliol (g.v.), who was King of Scotland from 1292 to 1296, and who died in Normandy in 1315. John’s eldest son by his marriage with Isabel, daughter of John de Warenne, Earl of Surrey, was Edward de Baliol who shared his father’s capital at Perth in England in 1296. Subsequently crossing over to France, he appears to have lived mainly on his lands in Normandy until 1324, when he was invited to England by King Edward II., who hoped to bring him forward as a candidate for the Scottish crown. A favourable opportunity, however, did not arise until after the death of King Robert the Bruce in 1329, when Edward III. had succeeded his father on the English throne. Although Edward did not give Baliol any active assistance, the claimant placed himself at the head of some disinheritied Scottish nobles, raised a small army and sailed from Ravenspur. Landing at Kinghorn in Fife in August 1332, he gained a complete victory over the Scots under Donald, Earl of Mar, at Dupplin Moor, took Perth, and on the 24th of September was crowned king of Scotland at Scone. He then acknowledged Edward III. as his superior, but soon afterwards was defeated at Anam (where his brother, Henry de Baliol, was slain) and compelled to fly to England. Reclaiming his kingdom after the defeat of the Scots at Halidon Hill in July 1333, Baliol surrendered the whole of the district formerly known as Lothian to Edward, and did homage for Scotland to the English king. His party, however, was weakened by disunion, and he won no serious support in Scotland. Entirely dependent on Edward, he again sought refuge in England, and took a very slight part in the war waged on his behalf. He returned to Scotland after the defeat of King David II. at Neville’s Cross in 1346. After making an absolute surrender of Scotland to Edward III. in 1356 at Roxburgh in return for a pension, Edward de Baliol died at Wheatley near Doncaster in 1367.

A cadet branch of the Baliol family was descended from Ingelram, or Engelm, a son of the younger Bernard de Baliol. Ingelram’s wife was the daughter and heiress of William de Berkeley, lord of Reildon in Forfarshire, and chamberlain of Scotland, and by her he had a son Henry, who became chamberlain about 1223. Henry married Lora or Lauretta, a daughter of Philip de Valoines (Valsques), lord of Panmure, and in 1274 inherited part of the rich English fiefs of the Valoines family. He sided with the English barons against John in 1215, and accompanied Henry III. to France in 1242. He died in 1246. It is probable but not certain that Henry’s son was Alexander de Baliol, lord of Cavers in Teviotdale, and chamberlain of Scotland. Alexander took a leading part in Scottish affairs during the first part of the 13th century, and is first mentioned as chamberlain in 1287. He shared in the negotiations between the Scottish nobles and Edward I. of England which culminated in the treaty of Salisbury in 1286, and the treaty of Brigham in 1290. Probably deprived of his office as chamberlain about 1296 he may have shared the imprisonment of his kinsman, John de Baliol the king. He then fought in Scotland for Edward, and was summoned to several English parliaments. His wife was Isabella de Chilham, through whom he obtained lands in Kent. He died about 1306, leaving a son, Alexander, whose son, Thomas, sold the estate of Cavers to William, Earl of Douglas, in 1368. Thomas is the last of the Baliosi mentioned in the Scottish records.

A late and dubious tradition asserts that the family name became so discredited owing to the pusillanimous conduct of John and Edward Baliol that it was abandoned by its owners in favour of the form Baillie.

BALIOL, JOHN DE (1249-1319), king of Scotland, was a son of John de Baliol (d. 1269) of Barnard Castle, Durham, by his wife Dervorguilla, daughter of Alan, Earl of Galloway, and became head of the Baliol family (see above) and lord of extensive lands in England, France and Scotland on his elder brother’s death in 1275. Little else, however, is known of his early life. He came to prominence when the Scottish throne became vacant in 1292 owing to the death of Margaret, the “maid of Norway,” a granddaughter of King Alexander III., and was one of the three candidates for the crown whose pretensions were seriously considered. Claiming through his maternal grandmother, Margaret, the eldest daughter of David, Earl of Huntingdon (d. 1219), who was a grandson of King David I., Baliol’s principal rival was Robert Bruce, Earl of Amandale, and the dispute was the somewhat familiar one of the eldest by descent against the nearest of kin. Meanwhile the English king, Edward I., was closely watching the trend of affairs in Scotland and was invited to settle this dispute. It is doubtful what rights, if any, the English kings had over Scotland, but when Edward met the Scottish nobles at Norham in May 1291, he demanded a formal recognition of his position as overlord of Scotland. After some delay this was tacitly admitted by the nobles, and acknowledged by Baliol and the other competitors, who all agreed to abide by his decision. A court of eighty Scotsmen and twenty-four Englishmen was then appointed to try the question. Traversing the statements made in favour of Bruce, Baliol claimed by the principles of feudal law for an indivisible inheritance, and on the advice of the court Edward decided in his favour. Having sworn the oath of allegiance to the English king, Baliol was crowned king of Scotland at Scone on the 31st of November 1292; in his new capacity he did homage to Edward at Newcastle, and in January 1293 released the English king from all promises and obligations made while the kingdom of Scotland was in his hands. These amicable relations were soon disturbed. A Scottish vassal carried his case to Edward as Baliol’s overlord, and Baliol himself was soon summoned to the English court to answer a suit brought against him. After a short struggle he admitted Edward’s right, and in May 1294 attended a parliament in London. He soon quarrelled with his overlord, the exact point at issue being doubtful, and returned
to Scotland. Consequent on the dispute which had broken out between England and France, a council of twelve was appointed to assist him, and it was decided to defy Edward. Englishmen were dismissed from the Scottish court, their fiefs were confiscated, and an alliance was concluded with Philip IV, king of France, and Vauban. The outburst of Babiol did not take the field person. Invading Scotland, Edward met with a feeble resistance, and at Brechin in July 1296 Babiol surrendered his kingdom to Antony Bek, bishop of Durham, as the representative of the English king. About the same time he appeared before Edward at Montrose, and delivered to him a white rod, the feudal token of resignation. With his son, Edward, he was taken a prisoner to England, remaining in captivity until July 1299, when he was released at the request of Pope Boniface VIII. He lived for some time under the pope’s supervision, and seems to have passed his remaining days quietly on his French estates. He died in Normandy early in 1315, leaving several children by his wife, Isabel, a daughter of John de Warenne, earl of Surrey (d. 1304).

**Baliuag—Balkan Peninsula**

Baliuag, a town of the province of Bulacan, Luzon, Philippine Islands, on the Quiñua river, 29 m. (by rail) N.N.W. of Manila. Pop. (1903) 21,008, including the population (7072) of Bustos, which was annexed to Baliuag in that year after the census was taken. Baliuag is served by an extension of the railway between Manila and Dagupan. It is the trade centre of a fertile agricultural district, and manufactures bamboo hats, silk and native fibre goods.

**Balkan Peninsula**, the most easterly of the three large peninsulas which form the southern extremities of the European continent. Its area, 184,779 sq. m., is about 30,000 sq. m. less than that of the Iberian Peninsula, but more than twice that of the Italian. Its northern boundary stretches from the Kilia mouth of the Danube to the Adriatic Sea near Fiume, and is generally regarded as marked by the courses of the rivers Danube, Save and Kulpa. On the E. it is bounded by the Black Sea, the Sea of Marmora, and the Aegean; on the S. by the Mediterranean; on the W. by the Ionian Sea and the Adriatic. With the exception of the Black Sea coast and the Albanian littoral, its shores are considerably indented and flanked by groups of islands. The Balkan Peninsula, in its general contour resembles an elongated pyramid or triangle, terminating at its apex in a subsidiary peninsula, the Peloponnesus or Morea. Its surface is almost entirely mountainous, the only extensive plains being those formed by the valleys of the Danube and Maritsa, and the basin of the Jessaly drained by the Salambria (ancient Peneus). The Danubian plain, lying, for the most part, outside the Peninsula, is enclosed, on the north, by the Carpathians; and on the south by the Balkans, from which the Peninsula derives its name. These ranges form together the great semicircular mountain-chain, known as the anti-Ducian system, through which the Danubian passes, in a passage at the Iron Gates, and the mountain-systems display great complexity of formation; beginning with the Dinaric Alps and the parallel ranges of Bosnia, they run, as a rule, from north-west to south-east; the great chain of Rhodope traverses the centre of the Peninsula, throwing out spurs towards the Black Sea and the Aegean; farther west are the lofty Shar Dagh and the mountains of Montenegro and Albania, continued by the Pindus range and the heights of Acarnania and Aetolia. The principal summits are Olympus (7974 ft.), overlooking the Gulf of Salonica; Musulîlî (3671) and Popova Shapka (8852), both in the Rhodope system; Liebomar in the Shar Dagh (8928); Elin, in the Perin Planina (8794); Belmeken in southern Bulgaria (chain of Dospat, 8562); Smolika in the Pindus range (8445); Dormitor in northern Montenegro (8204); Kaimakchalan in central Macedonia (8252); and Kiona in Aetolia (8355). Owing to the distribution of the mountain-chains, the principal rivers flow in an easterly or south-easterly direction; the Danube falls into the Black Sea; the Maritsa, Mesta, Struma (Styrmon), Vardar and Salmambia into the Aegean. The only considerable rivers flowing into the Adriatic are the Narenta, Drin and Viosa. The principal lakes are those of Ochrida, Prespa, Scutari and Lannina. The climate is more severe than that of the sister peninsulas, and the temperature is liable to sudden changes. The winter, though short, is often intensely cold, especially in the Danubian plain and in Thrace, the rigorous climate of which is frequently alluded to by the Latin poets. Bitter north-easterly winds prevail in the spring, and snow is not uncommon even in the low-lying districts of Greece. The autumn weather is generally fine and clear.

**Geology.**—Broadly speaking, the Balkan Peninsula may be divided into four areas which geologically are distinct. There is a central region, roughly triangular in shape, with its base resting upon the

The Eocene beds are folded, but the marginal Pliocene beds are not, and the final folding seems to have taken place during the Miocene period. (For the Balkans, see Bulgaria.)

Area and Population.—The following figures show the area and population of the various political divisions of the Balkan Peninsula in 1909; see also the articles on the separate countries.

For full details as to the physical features, natural products, population, customs, trade, finance, government, religion, education, language, literature, antiquities, history, politics, etc., of the Balkan lands, see Albania, Bosnia and Herzegovina, Bulgaria, Croatia-Slavonia, Dalmatia, Dobrudja, Greece, Illyria, Macedonia, Montenegro, Novibazar, Servia and Turkey.

Races.—The Peninsula is inhabited by a great variety of races, whose ethnological limits are far from corresponding with the existing political boundaries. The Turkish population, descended in part from the Ottoman invaders of the 14th and 15th centuries, appeared in the rest of Greece, almost entirely in Servia; and it continues to decrease in Bulgaria notwithstanding the efforts of the authorities to check emigration. It is nowhere found in compact masses except in north-eastern Bulgaria and the region between Adrianople, the Black Sea and the Sea of Marmora. Elsewhere it appears in separate villages and isolated districts, or in the larger towns and their immediate neighbourhood. The total Turkish population of the Peninsula scarcely exceeds 1,800,000. The Slavonic population, including the Serbo-Croats and Bulgars, is by far the most numerous; its total aggregate exceeds 10,000,000. The majority of the Serbo-Croats left their homes among the Carpathians and settled in the Balkan Peninsula in the 7th century. The distinction between the Serbs of the more central region and the Croats of the north-west, was first drawn by the early Byzantine chroniclers, and was well established by the 12th century. It does not correspond with any valid linguistic or racial difference; but in the course of time a strong religious difference arose. Along the Croatian and Dalmatian coast there existed a well-developed Latin civilisation, which was sustained by constant intercourse with Italy; and under its influence, the Serbo-Croatian immigrants were converted to the Roman Catholic Church. In the wild and mountainous interior, however, the Byzantine Church had few or no rivals and the Orthodox creed prevailed. The Orthodox Serbs inhabit the kingdom of Servia, Old Servia (or Novibazar and north-western Macedonia), Montenegro, Herzegovina and parts of Bosnia. The Roman Catholic Croats predominate in Dalmatia, north-western Bosnia and Croatia-Slavonia. Montenegro, like the other mountainous regions, adhered to the Greek Church; it received a number of Orthodox Servian refugees at the beginning of the 15th century, when the Turks occupied Servia. The numbers of the Serbo-Croats may be estimated at about 5,600,000. The Bulgars, who descend from a fusion of the Slavonic element with a later Ugro-Finnish immigration, inhabit the kingdom of Bulgaria (including Eastern Rumelia), parts of the Dobrudja and the greater part of Macedonia, except Old Servia and the Aegean littoral. Apart from their colonies in Bessarabia and elsewhere, they may be reckoned at 4,400,000. Only a portion of the widely-spread Ruman or Vlach race, which extends over a great part of Transylvania, south Hungary and Bessarabia, as well as the Rumanian kingdom, falls within the limits of the Peninsula. It is found in numerous settlements in Macedonia, Albania and northern Greece, and in colonies of recent date in Servia and Bulgaria. The nomad Vlachs or Tzintzars of these countries call themselves Arumâni or "Romans"; they are a remnant of the native Latinized population which received an increase from the immigration of Daco-Roman refugees, who fled southwards during the 3rd century, after the abandonment of Dacia by Aurelian. (See VLACHS.) The entire Ruman population of the Balkan countries may be set down approximately at 600,000. The Albanians, who call themselves Shkupetar or Arber, are the representatives of the primitive Illyrians; they inhabit the mountainous littoral from the southern frontier of Montenegro to the northern boundary of Greece, in which country they are found in considerable numbers. They have shown a tendency to advance in a north-easterly direction towards the Servian frontier, and the movement has been encouraged for political reasons by the Turkish government. The whole Albanian nation possibly numbers from 1,500,000 to 1,600,000. The Greeks, whose immigration from Asia Minor took place in pre-historic times, are, next to the Albanians, the oldest race in the Peninsula. Their maritime and commercial instincts have led them from the earliest times to found settlements on the sea-coast and the islands. They inhabit the Black Sea littoral from Varna to the Bosporus, the shores of the Sea of Marmora and the Aegean, the Aegean archipelago, the mainland of Greece, Epirus and the western islands as far north as Corfu. In Constantinople they
probably exceed 300,000. They are seldom found in large numbers at any great distance from the sea, and usually congregate in the principal towns and in the chief agricultural centers such as Athens, Varna and Philippopolis; there are also detached colonies at Melnik, Stanimaka, Kavakli, Niegush and elsewhere. The Greek inhabitants of the Peninsula and adjacent islands probably number 4,500,000. The remainder of the population is for the most part composed of Armenians, Jews and gipsies. The Armenians, like the Greeks, congregate in the principal centres of trade, especially at Constantinople; their numbers were greatly reduced by the massacres of 1506. The Jews are most numerous at Salonica where they form half the population. The gipsies are scattered widely throughout the Peninsula and found nowhere among wandering tribes, elsewhere in Europe, but in settlements or cantonments in the neighbourhood of towns and villages.

Religions.—Owing to the numerous conversions to Islam which followed the Turkish conquest, the Mahomedan population of the Peninsula is largely in excess of the purely Turkish element. More than half the Albanian nation and 35% of the inhabitants of Bosnia and Herzegovina adopted the creed of the conquering race. Among the Bulgars and Greeks the conversions were less numerous. The Bulgarians there are three schools of thought: the Great Old Bulgarian, the Servian, and the Bulgaro-Vlach. The Rhodope and certain districts in northern Bulgaria, are numerically insignificant; the Greek followers of Islam are almost confined to Crete. The whole Moslem population of the Peninsula is about 3,200,000. The bulk of the Muslim population is in the Orthodox Church, of which the ecclesiastical patriarch at Constantinople is the nominal head, having precedence over all other ecclesiastical dignitaries. The Bulgarian, Servian, Montenegrin and Vlach are all autochthonous. The Bulgarian church enjoys an exceptional position, inasmuch as its spiritual chief, the exarch, who resides at Constantinople, controls the Bulgarian clergy and possesses a considerable influence in several of the Balkan kingdom of Bulgaria. On the other hand, the Greek prelates in Bulgaria are subject to the patriarch. Religious and political questions are intimately connected in eastern Europe. The heads of the various communities are by no means the only leaders of the Christian population recognized by the Turkish government; they possess a seat in the local administrative councils and supervise the Christian schools. The efforts of the several branches of the Orthodox Church were in a measure successful in obtaining a separation in the Turkish dominions to be attributed exclusively to political motives, as no difference of dogma divides them. The Serbo-Croats of Dalmatia, and Croatia-Slavonia, some of the Gheg tribes in Albania, about 21% of the Bosnians, a still smaller number of Bulgarians in the kingdom and in Macedonia and a few Greeks in the islands belong to the Roman Catholic Church. A certain number of Bulgarians at Kencuk and Malishte and elsewhere in Greece who accept the authority and dogma of Rome, but preserves the Orthodox rite and discipline. The Armenians are divided between the Gregorian and Unitarian-Armenian churches, each under a patriarch. The Gregorian Church consists of the Upper Armens, who are an immigration of Bagazit in Eastern Bulgaria, a Turanian and Turkish-speaking race professing Christianity.

During the comparatively recent times Turkish and Greek were the only languages systematically taught or officially recognized in the Balkan lands subject to Turkish rule. The first, the speech of the conquering race, was the official language; the second, owing to the intellectual and literary superiority of the Greeks, their educational zeal and the privileges acquired by their church, became the language of the upper classes among the Christians. The Slavonic names, however, both Servian and Bulgarian, preserved their language which saved these nationalities from extinction. The Servian dialect extending into regions which escaped the Turkish yoke, enjoyed certain advantages denied to the Bulgarian: in the western Slavonic or Great Slavonic districts, now smaller, than in 1493; at Ragusa, a century later, Servian literature attained a high degree of excellence. Bulgarian, for nearly four centuries, ceased to be a written language except in a few monasteries; a literary revival was begun about the middle of the 18th century and the first symptom of returning national consciousness. The Servian, Bulgarian and Rumanian languages have borrowed largely from the Turkish in their vocabularies, but preserved their structures and have adopted many words from the Greek. Modern Greek has also a large number of Turkish words which are rejected in the artificial literary language. The revival of the various Balkan languages was associated with the rise of Orthodox asceticism and with the movement; in Servian literature, under the influence of Obradovich and Vuk Karajich, the popular idioms, notwithstanding the opposition of the priesthood, superseded the ecclesiastical Russian-Slavic dialect in the western and eastern Christian countries, and prevailed. Among the Greeks, whose literature never suffered a complete eclipse, a similar effort to restore the classical tongue resulted in a kind of compromise; the conventional literary language, which is neither ancient nor modern, differs widely from the vernacular, Albanian, the only surviving remnant of the ancient Thraco-Illirian speech, affords an interesting study to philologists. It undoubtedly belongs to the Indo-European family, but its earlier forms cannot, unfortunately, be ascertained owing to the absence of literary monuments. Certain remarkable analogies between Albanian and the other languages of the Peninsula, especially Bulgarian and Rumanian, have been supposed to point to the influence exercised by the primitive speech upon the idioms of the surrounding races.

History.—The great Slavonic immigration, which changed the ethnographic face of the Peninsula, began in the 9th century A.D. and continued at intervals throughout the following four centuries. At the beginning of this movement the Byzantine empire was in actual or nominal possession of all the regions south of the Danube; the greater part of the native Thraco-Illirian population of the interior had been romanized and spoken Latin. The Thracians, the progenitors of the Vlachs, took refuge in the mountainous districts and for some centuries, disappeared from history; originally agricultural people, they became nomad shepherds. In Albania the aboriginal Illirian element, which preserved its ancient language, maintained itself in the mountains and eventually forced back the immigrant race. The Greeks, who occupied the maritime and southern regions, were driven to the sea-coast, the islands and the fortified towns. Slavonic place-names, still existing in every portion of the Peninsula, bear witness to the multitude of the invaders and the permanency of their settlements. In the 6th century the Slavs penetrated to the Morea, where a Slavonic dialect, spoken by the Serbo-Croatians, is heard in the mountain valleys. In the 7th the Serbo-Croats invaded the north-western regions (Croatia, Servia, Bosnia, Herzegovina, Montenegro and northern Albania); they expelled or assimilated the Illirian population, now represented in Dalmatia by the slavonized Morlachs or Mavro-Vlachs, and appropriated the old Roman colonies on the Adriatic coast. At the end of the 7th century the Bulgars, a Turanian race, crossed the Danube and subjected the Slavonic inhabitants of Moesia and Thrace, but were soon assimilated by the conquered population, which had already become partly civilized. Under their tsar Krum (802-819) the Bulgars divided the districts of Adrianople and central Macedonia; under Simeon (893-927), who fixed his capital at Preslav, their empire extended from the Adriatic to the Black Sea. In 971 “the first Bulgarian empire” was overthrown by the emperor John Zimisces, but Bulgarian power was soon revived under the Shishman dynasty at Orchida. In 1014 Tsar Samuel of Orchida, who had conquered the greater part of the Peninsula, was defeated at Belasitsa by the Greek emperor Basil II., and the “western Bulgarian empire” came to an end. In the 11th century the Vlachs reappeared as an independent power in Southern Moravia and the district of Istria, and the district of Despotate, Balcania, and part of Dalmatia, of which Klokotnica (Megali Βαλκανία). The Serbs, who owing to the disensions of their zhupans or chief, had hitherto failed to take a prominent part in the history of the Peninsula, attained unity under Stephen Nemanya (1160-1195), the founder of the Nemanjic dynasty. A new Bulgarian power, known as the “second” or “Bulgaro-Vlach empire,” was founded at Trnovo in 1186 under the brothers Ivan and Peter Asen, who led a revolt of Vlachs and Bulgars against the Greeks. In 1204 Constantinople was captured by the Latins of the Fourth Crusade, and Baldwin of Flanders was crowned emperor; the Venetians acquired several maritime towns and islands, and Frankish feudal dynasties were established in Salonica, Athens, Achaia and elsewhere. Greek rule, however, survived in the despots of Epirus under princes of the imperial house of the Angeloi. The Latin tenure of Constantinople lasted only 57 years; the imperial city was recaptured in 1261 by Michael VIII. Palaeologus, but most of the feudal Latin states continued to exist till the Turkish conquest; the Venetians retained their possessions for several centuries later and waged continual wars with the Turks. In 1290 Theodore of Epirus, who had conquered Albania, Great Walachia and Macedonia, was overthrown at Klokotnica by Ivan Asen II., the greatest of Bulgarian monarchs (1218-1241), who defeated Baldwin at Adrianople and extended his sway over most of the Peninsula. The Bulgarian power declined after
his death and was extinguished at the battle of Velbzdž (1330) by the Servians under Stephen Uroš III. A short period of Servian predominance followed under Stephen Dushan (1331–1355) whose realm included Albania, Macedonia, Epirus, Thessaly and northern Greece. The Servian incursion was followed by a great Albanian emigration to the southern regions of the Peninsula. After Dushan’s death his empire disappeared, and Servia fell prey to anarchy. For a short time the Bosnians, under their king Stephen Tvrtko (1353–1351), became the principal power in the west of the Peninsula. The disorganization and internecine feuds of the various states prepared the way for the Ottoman invasion. In 1356 the Turks seized Gallipoli; in 1361 the sultan Murad I. established his capital at Adrianople; in 1389 the fate of the Slavonic states was decided by the rout of the Servians and their allies at Kosovovo. The last remnant of Bulgarian national existence disappeared with the fall of Traniovo in 1395, and Great Walachia was conquered in the same year. Under Mahomed II. (1451–1481) the Turks completed the conquest of the Peninsula. The despotate of Epirus succumbed in 1449, the duchy of Athens in 1456; in 1453 Constantinople was taken and the decrepit Byzantine empire perished; the greater part of Bosnia submitted in 1463; the heroic resistance of the Albanians under Scanderbeg collapsed with the fall of Corfu (1466), and Venetian supremacy in Upper Albania ended with the capture of Scutari (1478). Only the mountain stronghold of Montenegro and the Italian city-states of the Ionian Islands escaped the subject condition. In the 16th century under Soliman the Magnificent (1520–1566) the Ottoman power attained its greatest height; after the unsuccessful siege of Vienna (1683) it began to decline. The period of decadence was marked in the latter half of the 18th century by the formation of practically independent pashaliks or fiefs, such as those of Scutari under Mahommed of Bushat, Iannina under Ali of Tepelen, and Viden under Pasvan-oglu. The detachment of the outlying portions of the empire followed. Owing to the uncompromising character of the Mahomedan religion and the contemptuous attitude of the dominant race, the subject nationalities of the Balkan Peninsula failed to achieve the development of other more favored nations during the four centuries of Turkish rule; they retained not only their language but their religion, manners and peculiar characteristics, and when the power of the central authority waned they still possessed the germs of a national existence. The independence of Greece was acknowledged in 1829, that of Servia (as a tributary principality) in 1830. No territorial changes within the Peninsula followed the Crimean War; but the continuance of the weakened authority of the Porte tended indirectly to the independent development of the various nationalities and states, and later in the 19th century districts of Servia, Montenegro and Albania were ceded by the Porte and became autonomous provinces of the Servian kingdom. The incursion of the Ottoman Turks into the Peninsula was followed by the Servo-Bulgarian War and the coercion of Greece by the powers, embittered the rivalry of the various races, and the project was laid aside. It was revived in a somewhat modified form in 1871 by Tricouppis, who suggested an offensive alliance of the Balkan states, directed against Turkey and aiming at a partition of the Sultan’s possessions in Europe. The scheme, which found favour in Servia, was frustrated by the opposition of Stamboloff, who denounced it to the Porte. In 1877 a Bulgarian proposal for joint pacific action with a view to obtaining reforms in Macedonia was rejected by Greece.

BALKASH, or BALKHASH (called by the Kirghiz Ak-denghiz or Ala-denghiz and by the Chinese Si-hai), a lake of Asiatic Russia, in the Kirghiz steppes, between the governments of Semipalatinsk and Semireczenisk, in 43° to 47° N. and 73° to 79° E., about 600 m. to the east of Lake Aral. It is fourth in size but the lakes in Bashkire and central Asia, and lies at an altitude of 900 ft. It has the shape of a broad crescent, about 430 m. long from W.S.W. to E.N.E., having its concave side turned southwards; its width varies from 36 to 53 m. Its north-western shore is bordered by a dreary plateau, known as the Famine Steppe (Bek-pak-dala). The south-east shore, on the contrary, is low, and bears traces of having extended formerly as far as the Sasyk-kul and the Ala-kul. The Kirghiz in 1903 declared that its surface had been rising steadily during the preceding ten years, though prior to that it was dropping. The chief feeders of the lake are the Illik, or the Khan-Kent group of the Tian-shan Mountains. The Karatal, the Aksu and the Lepsa also enter from the south-east, and the Ayaguz from the north-east. The first three rivers make their way with difficulty through the sands and reeds, which at a quite recent time were covered by the lake. Although it has no outlet, its waters are relatively fresh. It freezes generally from November to April. Its greatest depth, 35 ft., is along the north-west shore. The fauna of the lake and of its tributaries —explored by Nikolsky—is more akin to the fauna of the rivers of the Tarim basin than that of the Aral; it also does not contain the common frog. It seems, therefore, probable that Lake Balkhash stood formerly in communication through lakes Ebi-nor and Ayar (Telli-nor) with the lake that formerly filled the Lukchun depression (in 891° E. long. and 42° N. lat.), but researches show that a connexion with Lake Aral—at least in recent times—was improbable. The lake has been investigated by L. S. Berg (see Petermanns Mitteilungen, 1903).

BALKH, a city of Afghanistan, about 100 m. E. of Andkhul and some 46 m. S. of the Oxus. The city, which is identical with the ancient Bactra or Zalasna, is now for the most part a mass of ruins, situated about 3 ft. right and 4 ft. left of the Balkh river, 1200 ft. above the sea. It comprises about 500 houses of Afghan settlers, a colony of Jews and a small bazaar, set in the midst of a waste of ruins and many acres of débris. Entering by the west (or Akcha) gate, one passes under three arches, which are probably the remains of a former Juma Masjid. The outer walls (mostly in utter disrepair) are about 6 ft. to 7 m. in perimeter, and on the south-eastern borders are set high on a mound or rampart, indicating a Mongol origin. The fort and citadel to the north-east are built well above the town on a barren mound and are walled and mounted. But a lack of funds has so far prevented their restoration. The Takhra, a small stream, which runs between two low hillocks, is dried up in summer. The Masjid Sebe, with its green-tiled dome, is said to be the tomb of a Khwaja, Abul Narsi Parsar. Nothing but the arched entrance remains of the Madrasa, which is traditionally not very old. The earlier Buddhist constructions have proved more durable than the Mahomedan buildings, The Top-i-Rustam is 50 yds. in diameter at the base and 30 yds. at the top, circular and about 50 ft. high. Four circular vaults are sunk in the interior and four passages have been pierced below from the outside, which probably lead to them. The base of the building is constructed of bricks about 2 ft. square and 4 in. thick. The Takhra-i-Rustam is wedge-shaped in plan, with uneven sides. It is apparently built of pisé mud (i.e. mud mixed with straw and puddled). It is possible that in these ruins we may recognize the Nan Vihara of the Chinese traveller Hsüan Tsang. There are the remains of many other tores (or stupas) in the neighbourhood. The mounds of ruins on the road to Mazar-i-Sharif probably represent the site of a city yet older than those on which stands the modern Balkh. The town is garrisoned by a few hundred kasidas, the regular troops of Afghan Turkestan being stationed at Takhtpul, near Mazar-i-Sharif. The gardens to the north-east contain a caravanserai, which is fairly well kept and comfortable. It forms one side of a courtyard, which is shaded by a group of magnificent chenar trees.

The antiquity and greatness of the place are recognized by the native populations, who speak of it as the Mother of Cities. Its foundation is mythically ascribed to Kalomur, the Persian Romulus; and it is at least certain that, at a very early date, it was the rival of Eschatana, Nineveh and Babylon. For a long time it was the archbishopric of the Tartar and Chinese Turkes, and was a station on the road from Kysy to the Persian frontier. The town is still inhabited by a few hundred Mohammedans, who speak a distinct language, the founder of which is said to have died within the walls. From the Memoirs of Hsian Tsang, we learn that, at the time of his visit in the 7th century, there were in the city, or its vicinity, about a hundred Buddhist convents, with 3000 devotees, and that there was a large number of stupas, and other religious monuments. The most remarkable was the Nau Behar, Nava Bihar or New Convent, which possessed a very costly statue of Buddha. A curious notice of this building is found in the Arabian geographer Yaqut. Ibn-Haukal, an Arabian traveller of the 10th century, describes Balkh as built of clay, with ramparts and six gates, and extending half a parasang. He also mentions a castle and a mosque. "Tirsi, in the 12th century, speaks of its possessing a variety of educational establishments, and carrying on an active trade. There were several important commercial routes from the city, stretching as far east as India and China. In 1220 Jenghiz Khan sacked Balkh, butchered its inhabitants and levelled all the buildings capable of defence,—treatment to which it was again subjected in the 14th century by Timur. Notwithstanding this, however, Marco Polo can still, in the following century, describe it as "a noble city and a great". Balkh formed the government of Auranzeb in his youth. In 1736 it was conquered by Nadir Shah. Under the Durani monarchy it fell into the hands of the Afghans; it was conquered by Shah Murad of Kanduz in 1820, and for some time was subject to the khan of Bokhara. In 1850 Mohammed Akram Khan, Barakzai, captured Balkh, and from that time it remained under Afghan rule.

See Hsian Tsang, tr. by Julien, vol. i. pp. 29-32; Burne's Travels in Bokhara (1831-1832); Ferrier's Travels; Vambray's Remarks on Asia (1841); Report of the Russo-Afghan Boundary Commission (1884-1885).

BALL, SIR ALEXANDER JOHN, BART. (1759-1800), British rear-admiral and governor of Malta, came of a Gloucestershire family. He entered the navy, and in 1778 was promoted lieutenant. Three years later began a close association with Rodney, and, two days after his chief's crowning victory of April 12, 1782, Ball was promoted commander, and in 1783 he became captain. At this time he spent a year in France with the double purpose of learning the language and living economically. Nelson, then a captain, was at this time by no means favourably regarded by his subordinates; Ball, however, had a "great coxcomb." It was not until 1790 that Ball received a command. From that year, however, he was continuously employed. In 1798, assistance rendered by him to Nelson's ship in heavy weather caused the latter to forget his former animosity, and from that time the two were close friends. Under Nelson's command Ball took part in the battle of the Nile, and his ship, the "Alexander," was the particular opponent of Brueys' flagship, "L'Orient," which blew up. Two months later he was ordered to the blockade of Malta, which was kept up without a break for the next two years. Ball committed the act of killing his future lieutenante, and himself led the marines and local militia, which made the siege on the land side. His care for his men laid the foundations of his popularity with the Maltese which continued till his death. After the fall of Malta, Ball practically retired from the service, in spite of Nelson's urgent entreaty that he should continue afloat, and from 1801 (when he was made a baronet) to 1809 he was governor of Malta, where he endeared himself to the people by his regard for their interests, and his opposition to the policy of treating the island as a conquered dependency. His friendship with Lord Nelson, whose letters prove his high regard for him, was only broken by death. Ball died on the 20th of October 1809 and was buried in Malta. Sir Alexander Ball was kind to Coleridge and is highly praised by him in The Friend, "The Third Landing Place." There are numerous mentions of Ball in Nelson's Despatches, in Sir H. Nicolas' edition.
BALL, JOHN (d. 1381), an English priest who took a prominent part in the peasant revolt in 1381. Little is known of his early life, but he lived probably at York and afterwards at Colchester. He gained considerable fame as a preacher by expounding the doctrines of John Wycliffe, but especially by his insistence on the principle of social equality. These utterances brought him into collision with the archbishop of Canterbury, and on three occasions he was committed to prison. He appears not to have been a very orthodox individual and in 1352 was forbidden to hear him preach. His opinions, however, were not moderated, nor his popularity diminished by these measures, and his words had a considerable effect in stirring up the rising which broke out in June 1381. Ball was then in prison at Maidstone; but he was quickly released by the Kentish rebels, to whom he preached at Blackheath from the text, "When Adam defled and Eve span, Who was then a gentleman?" He urged his hearers to kill the principal lords of the kingdom and the lawyers; and he was afterwards among those who rushed into the Tower of London to seize Simon of Sudbury, archbishop of Canterbury. When the rebels dispersed Ball fled to the midland counties, but was taken prisoner at Coventry and executed in the presence of Richard II. on the 15th of July 1381. Ball, who was called by Froissart "the mad priest of Kent," seems to have possessed the gift of rhyme. He undoubtedly voiced the feelings of the lower orders of society at that time.

BALL, JOHN (1585-1640), English puritan divine, was born at Cassington, Oxonshire, in October 1585. After taking his B.A. degree from St Mary's Hall, Oxford, in 1608, he went into the Cheshire to act as tutor to the children of Lady Cholmondeley. He adopted Puritan views, and after being ordained without subscription, was appointed to the small curacy of Whitmore in Staffordshire. He was soon deprived by John Bridgeman, the high church bishop of Chester, who put him to much suffering. He became a schoolmaster and earned a wide and high reputation for his scholarship and piety. He died on the 20th of October 1640. The most popular of his numerous works was A Short Catechisme, containing all the Principal Grounds of Religion (14 editions before 1653). His Treatise of Faith (1632), and Friendly Trial of the Grounds tending to Separation (1640), the latter of which defines his position with regard to the church, are also valuable.

BALL, JOHN (1818-1880), Irish politician, naturalist and Alpine traveller, eldest son of an Irish judge, Nicholas Ball, was born at Dublin on the 20th of August 1818. He was educated at the Roman Catholic College at Oscott near Birmingham, and at Christ's College, Cambridge. He showed in early years a taste for natural science, particularly botany; and after leaving Cambridge he travelled in Switzerland and elsewhere in Europe, studying his favourite pursuits, and contributing papers on botany and the Swiss glaciers to scientific periodicals. In 1846 he was made an assistant poor-law commissioner, but resigned in 1847, and in 1848 stood unsuccessfully as a parlia-

mentary candidate for Sligo. In 1849 he was appointed second poor-law commissioner, but resigned in 1852 and successfully contested the county of Carlow in the Liberal Interest. In the House he was conspicuous for the variety and attractiveness of his speeches, and in 1855 was made under-secretary for the colonies, a post which he held for two years. At the colonial office he had great influence in furthering the cause of natural science, particularly in connexion with equipment of the Palliser expedition in Canada, and with Sir W. Hooker's efforts to obtain a systematic knowledge of the colonial floras. In 1858 he stood for Limerick, but was beaten, and he then gave up politics and devoted himself to natural history. He was first president of the Alpine Club (founded 1857), and it is for his work as an Alpinist that he is chiefly remembered, his well-known Alpine Guide (London, 1863-1868) being the result of innumerable climbs and journeys and of careful observation recorded in a clear and often entertaining style. He also travelled in Morocco (1871) and South America (1882), and recorded his observations in books which were recognized as having a scientific value. He died in London on the 21st of October 1889.

BALL, THOMAS (1819-1908), American sculptor, was born at Charlestown, Massachusetts, on the 3rd of June 1819. He was the son of a house-and-sign-painter, and after starting, self-taught, as a portrait painter he turned his attention in 1854 to sculpture, his earliest work being a bust of Jenny Lind. At thirty-five he went to Florence for study; there, with an interval of work in Boston, Massachusetts, in 1857-1863, he remained for more than thirty years, being one of the artistic colony which included the Brownings and Hiram Powers. He returned to America in 1897, and lived in Montclair, New Jersey, with a studio in New York City. His work includes many early cabinet busts of musicians (he was an accomplished musician himself, and was the first in America to sing "Eliah"), and later the equestrian statue of Washington in the Boston public gardens, probably his best work; Josiah Quincy in City Hall Square, Boston; Charles Sumner in the public gardens of Boston; Daniel Webster in Central Park, New York City; the Lincoln Emancipation group at Washington; Edwin Forrest as "Coriolanus," in the Actors' Home, Philadelphia, and the Washington monument in Methuen, Massachusetts. His work has had a marked influence on monumental art in the United States and especially in New England. In 1891 he published an autobiographical volume, My Three Score Years and Ten.

BALL (in Mid. Eng. kel; the word is probably cognate with "bale," Teutonic in origin, cf. also Lat. follis, and Gr. πᾶλλα), any rounded body, particularly one with a smooth surface, whether used for games, as a missile, or applied to such rounded bodies as the protubrance at the root of the thumb or the big toe, to an enarthrosis, or "ball socket," joint, such as that of the hip or shoulder, and the like. A ball, as the essential feature in nearly every form of game requiring physical exertion, must date from the very earliest times. A rolling object appeals not only to a human baby but to a kitten and a puppy. Some form of game with a ball is found portrayed on Egyptian monuments, and is played among the least advanced of savage tribes at the present day. In Homer, Nausicaa was playing at ball with her maidens when Odysseus first saw her in the land of the Phaeacians (Od. vi. 100). And Halios and Laodamas performed before Alcinous and Odysseus with ball play, accompanied with dancing (Od. viii. 370). The Hebrews, the least athletic of races, have no mention of the ball in their scriptures. Among the Greeks games with balls (σφαίρας) were regarded as a useful subsidiary to the more violent athletic exercises, as a means of keeping the body supple, and rendering it graceful, but were generally left to boys and girls. Similarly at Rome they were looked upon as an adjunct to the bath, and were graduated to the age and health of the bathers, and usually a place (σφαιριστερίον) was set apart for them in the baths (thermae). Of regular rules for the playing of ball games, little trace remains, if there were any such. The names in Greek for various forms, which have come down to us in such works as the Ονομαστηρια of Pollux of Naucratis, imply little or nothing of such; thus, ἀνάγραφος only means the putting of the ball on the ground with the open hand, ὁποτανως the flinging of the ball in the air to be caught by two or more players; ρασίλια would seem to be a game of catch played by two players, where feinting is used as a test of quickness and skill. Pollux (i. x. 104) describes a game at Istros, which has often been looked on as the origin of football. It seems to have been played by two sides, arranged in lines; how far there was any form of "goal" seems uncertain. Among the Romans there appear to have been three types or sizes of ball, the πίλα, or small ball, used in catching games, the παγωνικός, a heavy ball stuffed with feathers, and the ἄλλασσ, a leather ball filled with air, the largest of the three. This was struck from player to player, who wore a kind of gauntlet on the arm. There was a game known as στριγός, played by three players standing in
the form of a triangle, and played with the folliis, and also one known as harpastum, which seems to imply a "scrimmage" among several players for the ball. These games are known to us through the Romans, though the names are Greek. The various modern games played with a ball or balls and subject to rules are treated under their various names, such as polo, cricket, football, &c.

From a Fr. bal, balle, to dance (late Lat. ballare, and hence connected with "ballad", "ball") comes "ball," meaning a dance, and especially a social gathering of people for the purpose of dancing.

**BALLADE**, the technical name of a complicated and fixed form of verse, arranged on a precise system, and having nothing in common with the word ballad, except its derivation from the same Low Latin verb, ballare, to dance. In the 14th and 15th centuries it was spelt balade. In its regular conditions a ballade consists of three stanzas and an envoy; there is a refrain which is repeated at the close of each stanza and of the envoy. The entire poem should contain but three or four rhymes, as the case may be, and these must be reproduced with exactitude in each section. These rules were laid down by Henri de Croi, whose *L'Art et science de rhétorique* was first printed in 1493, and he added that if the refrain consists of eight syllables, the ballade must be written in huitains (eight-line stanzas), if of ten syllables in dizains (ten-line), and so on. The form can best be studied in an example, and we quote, as absolutely faultless in execution, the famous "Ballade aux Enfants Perdus," composed by Théodore de Banville in 1862:

"Je le sais bien que Cythère est en deuil!  
Que son jardin, souillé par l'orage,  
O mes amis, n'est plus qu'un sombre écueil!  
Agonisant sous le soleil sauvage.  
La solitude habite son rivage.  
Qu'importe! allons vers les pays fictifs!  
Cherchons la plage où nos désirs osent  
S'abreuvent dans le sacré mystère.  
Fait pour un chœur d'esprits contemplatifs:  
Embarquons-nous pour la belle Cythère."

"La grande mer sera notre cercueil,  
Nos serviteurs de prose au noel naufrage,  
Le feu du ciel purinera notre orgueil  
Et l'aigillon nous garde son outrage.  
Qu'importe! allons vers le clair paysage!  
Malgré la mer jalouse et les récifs,  
Vernes, portons comme des fugitifs,  
Loin de ce monde au souffle délétère.  
Nous dont les coeurs sont des rameurs plaintifs,  
Embarquons-nous pour la belle Cythère."

"Des serpents gris se traînent sur le seuil  
Où souriait Cypres, la chère image  
Aux tresses d'or, la vierge au doux accent!  
Mais les Amours sur le plus haut cordage  
Nous chantez l'hymne adoré du voyage.  
Héros cachés dans ces corps maladifs,  
Fuyons, partons sur nos légères esquifs,  
Vers le divin bocage où la panthère  
Pleure d'amour sous les rosiers lascifs:  
Embarquons-nous pour la belle Cythère."

*Envoi.*

"Rassasions d'azur nos yeux pensifs!  
Oiseaux chanteurs, dans la brise expansifs,  
Ne souillons pas nos ailes sur la terre.  
Volons, charmés, vers les dieux primitifs!  
Embarquons-nous pour la belle Cythère."

This is the type of the ballade in its most elaborate and highly-finished form, which it cannot be said to have reached until the 14th century. It arose from the *canzone de ballo* of the Italians, but it is in Provençal literature that the ballade first takes a modern form. It was in France, however, and not until the reign of Charles V., that the ballade as we understand it began to flourish; instantly it became popular, and in a few years the out-put of these poems was incalculable. Machault, Froissart, Eustache Deschamps and Christine de Pisan were among the poets who cultivated the ballade most abundantly. Later, those of Alain Chartier and Henri Baude were famous, while the form was chosen by François Villon for some of the most admirable and extraordinary poems which the middle ages have handed down to us. Somewhat later, Clément Marot composed ballades of great precision of form, and the fashion culminated in the 17th century with those of Madame Deshoulières, Sarrazin, Voiture and La Fontaine. Attacked by Molière, and by Boulain, who wrote:

"La ballade asservie à ses vieilles maximes,  
Souvent doit tout son lustre au caprice des rimes,"

the ballade went entirely out of fashion for two hundred years, when it was resuscitated in the middle of the 19th century by Théodore de Banville, who published in 1873 a volume of *Trente-six ballades joyeuses*, which has found many imitators. The ballade, a typically French form, has been extensively employed in no other language, except in English. In the 15th and 16th centuries many ballades were written, with more or less close attention to the French rules, by the leading English poets, and in particular by Chaucer, by Gower (whose surviving ballades, however, are all in French) and by Lydgate. An example from Chaucer will show that the type of strophe and rhyme arrangement was in medieval English:

"Madame, ye been of all beauty shine  
As far as circled is the mappemound;  
For, as the crystal, glorious ye shine,  
And lied ruby been your cheekes round.  
Therewith ye been so merry and so jocund  
That at a revel when that I see you dance,  
It is an onement unto my wound,  
Though ye to me no do dalliance."

"For though I weep of tears full a tine [cask],  
Yet may that woe my heart not confound;  
Your seemly voice, that ye so small out-twine,  
Maketh my thought in joy and bliss abound.  
So courteously I go, with love bound,  
That to myself I say, in my pain,  
Sufficeth me to love you, Rosamound,  
Though ye to me no do dalliance."

"Was never piike walleted in galantine,  
As I in love am walleted, cli y-wound;  
For which full oft I of myself divine  
That I am true Tristram the second.  
My love may not refrayed [cooled down] be nor afound  
I burn ay in amorous plesance. [founded]  
Do what you list, I will your thrall be found,  
Though ye to me no do dalliance."

The absence of an envoy will be noticed in Chaucer's, as in most of the medieval English ballades. This points to a relation with the earliest French form, in its imperfect condition, rather than with that which afterwards became accepted. But a ballade without an envoy lacks that section whose function is to tie together the rest, and complete the whole as a work of art. After the 16th century original ballades were no more written in English until the latter part of the 19th, when they were re-introduced, almost simultaneously, by Algernon Charles Swinburne, Austin Dobson, Andrew Lang, Edmund Gosse and W.E. Henley; but D. G. Rossetti's popular translation of Villon's "Ballade of Fair Ladies" may almost be considered an original poem, especially as it entirely disregards the metrical rules of the ballades. Mr. Dobson's "The Prodigals" (1876) was one of the earliest examples of a correct English specimen. In 1880 Mr. Lang published a volume of *Ballades in Blue China*, which found innumerable imitators. The modern English ballades have been, as a rule, closely modeled on the lines laid down in the 15th century by Henri de Croi. With the exception of the sonnet, the ballade is the noblest of the artificial forms of verse cultivated in English literature. It lends itself equally well to pathos and to mockery, and in the hands of a competent poet produces an effect which is rich in melody without seeming fantastic or artificial.

(E.G.)

**BALLADS.** The word "ballad" is derived from the O. Fr. baller, to dance, and originally meant a song sung to the rhythmic movement of a dancing chorus. Later, the word, in the form of ballade (q.v.), became the technical term for a particular form of old-fashioned French poetry, remarkable for its involved and
BALLADS

recurring rhymes. "Laisse moi aux Jeux Floraux de Toulouse toutes ces vieux poésies Françaises comme ballades," says Joachim du Bellay in 1550; and Philaminte, the lady pedant of Molière's Femmes Savantes, observes—

"La ballade, à mon goût, est une chose fade.
Ce n'en est plus la mode, elle sent son vieux temps."

In England the term has usually been applied to any simple tale told in simple verse, though attempts have been made to confine it to the subject of this article, namely, the literary form of popular songs, the folk-tunes associated with them being treated in the article Song. By popular songs we understand what the Germans call Volkslieder, that is, songs with words composed by members of the people, for the people, handed down by oral tradition, and in style, that is, and even incident, common to the people in all European countries. The beauty of these purely popular ballads, their directness and freshness, has made them admired even by the artificial critics of the most artistic periods in literature. Thus Sir Philip Sydney confesses that the ballad of *Cherry Chase*, when chanted by "a blind crowder," stirred his blood like the sound of trumpet. Addison devoted two articles in the *Spectator* to a critique of the same poem. Montaigne praised the *nautel* of the village carols; and Malherbe preferred a rustic *chansonnette* to all the poems of Renard. These, however, are rare instances of the taste for popular poetry, and though the Danish ballads were collected and printed in the middle of the 18th century, and some Scottish collections date from the beginning of the 18th, it was not till the publication of Allan Ramsay's *Energess* and *Tale of Mirkland*, and *Percy's Reliques* (1765), that a serious effort was made to recover Scottish and English folk-songs from the recitation of the old people who still knew them by heart. At the time when Percy was editing the *Reliques*, Madame de Chénier, the mother of the celebrated French poet of that name, composed an essay on the ballads of her native land, modern Greece; and later, Herder and Grimm and Goethe, in Germany, did for the songs of their country what Scott did for those of Liddesdale and the Forest. It was fortunate, perhaps, for poetry, though unlucky for the scientific study of the ballads, that they were mainly regarded from a literary point of view. The influence of their artless melody and straightforward diction may be felt in the lyrics of Goethe and of Coleridge, of Wordsworth, of Heine and of André Chénier. Chénier, in the most affected age even of French poetry, translated some of the Romain ballads; one, as it chanced, being almost identical with that which Shakespeare borrowed from some English reciter, and put into the mouth of the mad Ophelia. The beauty of the ballads and the interest they excited led to numerous forgeries and modern interpolations, which it is seldom difficult to detect with certainty. Editors could not resist the temptation to interpolate, to restore, and to improve the fragments that came in their way. The marquis de la Villermiquel, who first drew attention to the ballads of Brittany, is not wholly free from this fault. Thus a very general scepticism was awakened, and when questions came to be asked as to the date and authorship of the Scottish traditional ballads, it is scarcely to be wondered at that Dr Chambers attributed most of them to the accomplished Lady Wardlaw, who lived in the middle of the 18th century.

The vexed and dull controversy as to the origin of Scottish folk-songs was due to ignorance of the comparative method, and of the ballad literature of Europe in general. The result of the discussion was to leave a vague impression that the Scottish ballads were perhaps as old as the time of Dunbar, and were the production of a class of professional minstrels. These minstrels are a stumbling-block in the way of the student of the growth of ballads. The domestic annals of Scotland show that her kings used to keep court-bards, and also that strollers, *jongleurs*, as they were called, went about singing at the doors of farm-houses and in the streets of towns. Here were two sets of minstrels who had apparently left no poetry; and, on the other side, there was a number of ballads that claimed no author. It was the easiest and most satisfactory inference that the courtly minstrels made the verses, which the wandering crowders imitated or corrupted. But this theory fails to account, among other things, for the universal sameness of tone, of incident, of legend, of primitive poetical formulae, which the Scottish ballad possesses, in common with the ballads of Greece, of France, of Provence, of Portugal, of Denmark and of Italy. The object, therefore, of this article is to prove that what has long been a knowledge of nursery tales, of what the Germans call *Märchen*, namely, that they are the immemorial inheritance at least of all European peoples, is true also of some ballads. Their present form, of course, is relatively recent: in centuries of oral recitation the language altered automatically, but the stock situations and ideas of many *romantic* ballads are of dateless age and world-wide diffusion. The main incidents and plots of the fairy tales of Celts and Germans and Slavonic and Indian peoples, their unknown antiquity and mysterious origin, are universally recognized. No one any longer attributes them to this or that author, or to this or that date. The attempt to find date or author for a genuine popular song is as futile as a similar search in the case of a *Märchen*. It is to be asked, then, whether what is confessedly true of folk-tales,—of such stories as the *Sleeping Beauty* and *Cinderella,*—is true also of folk-songs. Are they, or have they been, as universally sung as the fairy tales have been narrated? Do they, too, bear traces of the survival of primitive creeds and primitive forms of consciousness and of imagination? Are they, like *Märchen*, for the most part, little influenced by the higher religions, Christian or polytheistic? Do they turn, as *Märchen* do, on the same incidents, repeat the same stories, employ the same machinery of talking birds and beasts? Lastly, are any specimens of ballad literature capable of being traced back to extreme antiquity? It appears that all these questions may be answered in the affirmative; that the great age and universal diffusion of the ballad may be proved; and that its birth, from the lips and heart of the people, may be contrasted with the origin of an artistic poetry in the demand of an aristocracy, for a separate epic literature destined to be its own possession, and to be the first development of a poetry of personality,—a record of individual passions and emotions. After bringing forward examples of the identity of features in European ballad poetry, we shall proceed to show that the earlier genera of ballads with refrain sprang from the same primitive custom of dance, accompanied by improvised song, which still exists in Greece and Russia, and even in valleys of the Pyrenees.

There can scarcely be a better guide in the examination of the notes or marks of popular poetry than the instructions which M. Ampère gave to the committee appointed in 1852—1853 to search for the remains of ballads in France. M. Ampère bade the collectors look for the following characteristics:—"The use of assonance in place of rhyme, the brusque character of the recital, the textual repetition, as in Homer, of the speeches of the persons, the constant use of certain numbers,—as three and seven,—and the representation of the commonest objects of every-day life as being made of gold and silver." M. Ampère might have added that French ballads would probably employ a "bird chorus," the use of talking-birds as messengers; that they would repeat the plots current in other countries, and display the same non-Christian idea of death and of the future world (see "The Lyke-wake Dirge"), the same ghastly superstitions and stories of metamorphosis, and the same belief in elves and fairies, as are found in the ballads of Greece, of Provence, of Brittany, Denmark and Scotland. We shall now examine these supposed common notes of all genuine popular song, supplying a few out of the many instances of curious identity. As to brusqueness of recital, and the use of assonance instead of rhyme, as well as the aid to memory given by reproducing speeches verbally, these are almost unavoidable in all simple poetry preserved by oral tradition. In the matter of recurring numbers, we have the eternal—

"Trois belles filles
L'y en a z'a une plus belle que le jour,"

who appear in old French ballads, as well as the "Three Sailors," whose adventures are related in the Lithuanian and Provençal originals of Thackeray's *Little Billee*. Then there is the league,"
BALLADS

the league, the league, but barely three," of Scottish ballads; and the τρία τριζάλια, three golden birds, which sing the prelude to Greek folk-songs, and so on. A more curious note of primitive poetry is the lavish and reckless use of gold and silver. H. F. Tozer, in his account of ballads in the Highlands of Turkey, remarks on this fact, and attributes it to Eastern influences. But the horses' shoes of silver, the knives of fine gold, the talking "birds with gold on their wings," as in Aristophanes, are common to all folk-songs. Everything almost is gold in the Kavaloïa (q.v.), a so-called epic formed by putting into juxtaposition all the popular songs of Finland. Gold is used as freely in the ballads, real or spurious, which M. Verkovitch has had collected in the wilds of Mount Rhodope. The Captain in the French song is as lavish in his treatment of his runaway bride,—

"Son amant l'habille,
Tout en or et argent";

and the rustic in a song from Poitou talks of his faucille d'or, just as a variant of Hugh of Lincoln introduces gold chairs and tables. Again, when the lover, in a ballad common to France and to Scotland, cuts the winding-sheet from about his living bride—"Il tira ses ciseaux d'or fin." If the horses of the Klepfes in Romainic ballads are gold shod, the steed in Willie's Lady is no less splendidly accoutered,—

"Silver shod before,
And gowden shod behind."

Readers of Homer, and of the Chanson de Roland, must have observed the same primitive luxury of gold in these early epics, in Homer reflecting perhaps the radiance of the actual "golden Mycenae." Next as to talking-birds. These are not so common as in Mären, but still are very general, and cause no surprise to their human listeners. The omniscient popinjay, who "up and spoke in the Border minstrelsy, is of the same family of birds as those that, according to Talvij, pervade Servian song; as the τρία τριζάλια which introduce the story in the Romainic ballads; as the wise birds whose speech is still understood by exceptionally gifted Zulus; as the wicked dove that whispers temptation in the sweet French folk-song, as the "bird that came out of a bush, on water for to dine," in the Water o' Wearies Well.

In the matter of identity of plot and incident in the ballads of various lands, it is to be regretted that no such comparative tables exist as Von Hahn tried, not very exhaustively, to make of the "story-roots" of Märchen. Such tables might be compiled from the learned notes and introductions of Prof. Child to his English and Scottish Popular Ballads (1888). A common plot is the story of the faithful leman, whose lord brings home a "braw new bride," and who recovers his affection at the eleventh hour. In Scotland this is the ballad of Lord Thomas and Fair Annie; in Danish it is Skiaen Anna. It occurs twice in M. Fauriel's collection of Romainic songs. Again, there is the familiar ballad about a girl who pretends to be dead, that she may be borne on a bier to meet her lover. This occurs not only in Scotland, but in the popular songs of Provence (collected by Damase Arbaud) and in those of Metz (Puymaigre), and in both countries an incongruous sequel tells how the lover tried to murder his bride, and how she was too cunning, and drowned him. Another familiar feature is the bush and briar, or the two rose trees, which meet and plait over the graves of unhappy lovers, so that all passers-by see them, and say in the Provençal,—

"Dioa auge l'amor,
Des paures amoursor."

Another example of a very widespread theme brings us to the ideas of the state of the dead revealed in folk-songs. The Night Journey, in M. Fauriel's Romainic collection, tells how a dead brother, wakened from his sleep of death by the longing of love, bore his living sister on his saddle-bow, in one night, from Bagdad to Constantinople. In Scotland this is the story of Proud Lady Margaret; in Germany it is the song which Bürger converted into Lenore; in Denmark it is Aagé und Elsé; in Brittany the dead foster-brother carries his sister to the apple close of the Celtic paradise (Borsses Bres). Only in Brittany do the sad-hearted people think of the land of death as an island of Avalon, with the eternal sunset lingering behind the flowering apple trees, and gleaming on the fountain of forgetfulness. In Scotland the channing worm doth chide even the souls that come from where, "beside the gate of Paradise, the birk grows fair enough." The Romaic idea of the place of the dead, the garden of Charon, whence "neither in spring or summer, nor when grapes are gleaned in purple, can an artist or maiden escape," is likewise pre-Christian. In Provençal and Danish folk-song, the cries of children ill-treated by a cruel step-mother awaken the departed mother,—

"Twas cold at night and the barnies grat,
The mother below the mousls heard that."

She reappears in her old home, and henceforth, "when dogs howl in the night, the step-mother trembles, and is kind to the children." To this identity of superstition we may add the less tangible fact of identity of tone. The ballads of Klepfes exploit in Greece match the Border songs of Dick of the Cow and Kinmont Willie. The same simple delight of living animates the short Greek Scola and their counterparts in France. Everywhere in these happier climes, as in southern Italy, there are snatches of popular verse that make but one song of rose trees, and apple blossom, and the nightingale that sings for maidens loverless,—

"Il ne chante pas pour moi,
J'en ai un, Dieu meur,"
says the gay French refrain.

It would not be difficult to multiply instances of resemblance between the different folk-songs of Europe; but enough has, perhaps, been said to support the position that some of them are popular and primitive in the same sense as Märchen. They are composed by peoples of an early stage who find, in a natural improvisation, a natural utterance of modulated and rhythmic speech, the appropriate relief of their emotions, in moments of high-wrought feeling or on solemn occasions.

Poësic (as Puttenham well says in his Art of English Poësie, 1580) is more ancient than the artificiell of the Greeks and Latines, and used of the savage and uncivil, who were before all science and civilitie. This is proved by certificate of merchants and travellers, who by late navigations have surveyed the whole world, and discovered large countries, and wild people strange and savage, affirming that the American, the Persinse, and the very Canniball do sing and also say their highest and holiest matters in certain riming versifics." In the same way Aristotle, discerning of the origin of poetry, says (Post. c. iv.), ξετουσαν την τοιων των αυτοκλητωσαν. M. de la Villermarqué in Brittany, M. Pitré in Italy, Herr Urich in Greece, have described the process of improvisation, how it grows out of the custom of dancing in large bands and accompanying the figure of the dance with song. If the people," says M. Pitré, "find out who is the composer of a canzone, they will not sing it." Now in those lands where a blithe peasant life still exists with its dances, like the kolos of Russia, we find ballads identical in many respects with those which have died out of oral tradition in these islands. It is natural to conclude that originally some of the British ballads too were first improvised, and circulated in rustic dances. We learn from M. Bujaë and M. de Puymaigre in France, that all ballads there have their air or tune, as the dance has its own words for if a new dance comes in, perhaps a fashionable one from Paris, words are fitted to it. Is there any other of such an operatic, lyrical, dancing peasantry in austere Scotland? We find it in Gawin Douglas's account of—

"Sic as we clepe wenchens and damosels,
In gerys greens, wandering by spring wells,
Of bloomed branches, and flowers white and red,
Plettand their lusty chaplets for their head,
Some sing ring-sangs, dances, ledes, and rounds."

Now, ring-songs are ballads, dancing songs; and Young Tamlane, for instance, was doubtless once danced to, as we know it possessed an appropriate air. Again, Fabyan, the chronicler (quoted by Ritson) says that the song of triumph over Edward II, "was after many days sung in dances, to the carols of the
maids and minstrels of Scotland." We might quote the *Complaynt of Scotland* to the same effect. "The shepherds, and their wyvis sang mony other melodi songs, ... than after this suet celestial harmony, the began to dance in ane ring." It is natural to conjecture that, if we find identical ballads in Scotland, and in Greece and Italy, and traces of identical customs—customs crushed by the Reformation, by Puritanism, by modern so-called civilization—the ballads sprang out of the institution of dances, as they still do in warmer and pleasanter climates. It may be supposed that legends on which the ballads are composed, being found as they are from the White Sea to Cape Matapan, are part of the stock of primitive folk-lore. Thus we have an immemorial antiquity for the legends, and for the lyrical choruses in which their musical rendering was improvised. We are still at a loss to discover the possibly mythological germ of the legends; but, at all events, some ballads may be claimed as distinctly popular, and, so to speak, impersonal in matter and in origin. It would be easy to show that survivals out of this stage of inartistic lyric poetry linger in the early epic poetry of Homer and in the French épopées, and that the Greek drama sprang from the sacred choruses of village vintagers. In the great early epics, as in popular ballads, there is the same directness and simplicity, the same use of recurring epithets, the "green grass," the "salt sea," the "shadowy hills," the same repetition of speeches and something of the same barbaric profusion in the use of gold and silver. But these resemblances must not lead us into the mistake of supposing Homer to be a collection of ballads, or that he can be properly reduced to this form. Ballads, and not the highest form of an artistic epic, not composed by piecing together ballads, but developed by a long series of noble Æasæ, for the benefit of the great houses which entertain them, out of the method and materials of popular song.

We have here spoken mainly of romantic ballads, which retain in the refrain a vestige of the custom of singing and dancing; of a period when "dance, song and poetry itself began with a communal consent" (Gummere, *The Beginnings of Poetry*, p. 93, 1901). The custom by which a singer in a dancing-circle chants a few words, the dancers chiming in with the refrain, is found by M. Junod among the tribes of Delagao Bay (Junod, *Chants et contes des Ba Ronga*, 1897). Other instances are the Australian song-dances (Siebert, in Howitt's *Native Tribes of South-East Australia*, Appendix 1904; and Dennett, *Folk-Lore of the Fiori*). We must not infer that even among the aborigines of Australia song is entirely "communal." Known men, inspired, they say, in dreams, or by the All Father, devise new forms of song with dance, which are carried all over the country; and Mr Howitt gives a few examples of individual lyric. The history of the much exaggerated opinion that a whole people, as a people, composed its own ballad is traced by Prof. Gummere in *The Beginnings of Poetry*, pp. 116-163. Some British ballads retain traces of the early dance-song, and most are so far "communal" that, as they stand, they have been modified and interpolated by many reciters in various ages, and finally (in *The Border Minstrelsy*) by Sir Walter Scott, and by hands much weaker than his (see *The Young Tamlane*). There are cases in which the matter of a ballad has been derived by a popular singer from medieval literary romance (as in the Arthurian ballads), while the author of the romance again usually borrowed, like Homer in the Odyssey, from popular *Machair* of datable antiquity. It would be an error to suppose that most romantic folk-songs are vulgarizations of literary romance—a view to which Mr Courthope, in his *History of English Poetry*, and Mr Henderson in *The Border Minstrelsy* (1902), incline—and the opposite error would be to hold that this process of borrowing from and vulgarization of literary medieval romance never occurred. A good illustration of the true state of the case will be found in Child's introduction to the ballad of *Young Beichan*.

Gaston Paris, a great authority, holds that early popular popular poetry is "improvisation and contemporary with its facts" (*Histoire poétique de Charlemagne*). If this dictum be applied to such ballads as "The Bonny Earl o' Murray," "Kinmont Willie," "Jamie Telfer" and "Jock o' the Side," it must appear that the contemporary poets often knew little of the events and knew that little wrong. We gather the true facts from contemporary letters and despatches. In the ballads the facts are confused and distorted to such a degree that we must suppose them to have been composed in a later generation on the basis of *history* and not of experiment. It was, in the case of *The Queen's Maries*, to have been later defaced by the fantastic interpolations of reciters. To prove this it is only necessary to compare the historical Border ballads (especially those of 1595-1600) with Bain's *Border Papers* (1894-1896). Even down to 1750, the ballads on Rob Roy's sons are more or less mythopoeic. It seems probable that the existing form of most of our border ballads is not earlier than the generation of 1603-1633, after the union of the crowns. Even when the ballads have been taken from recitation, the reciter has sometimes been inspired by a "stall copy," or printed broadsheet.
to one of seven years. He was actively concerned in the advocacy of woman suffrage. But his best known achievement was the imposition, in 1891, of the progressive land-tax and progressive income-tax still levied in the colony. As premier he brought together the strong experimental and progressive party which long held office in New Zealand. In office he showed debating power, constructive skill and tact in managing men; but in 1893, at the height of his success and popularity, he died at Wellington of an intestinal disease after a severe surgical operation.

Quiet and unassuming in manner, Ballance, who was a well-read man, always seemed fonder of his books and his chessboard than of public bustle; yet his loss to New Zealand political life was great. A statue was erected to his memory in front of Parliament House, Wellington.

Ballanche was born on 25 April 1812, in Paris (W.P.R.).

Ballanche, SIMON (1776-1837), Frenchler of the theocratic school, was born at Lyons. Naturally delicate and highly-strung, he was profoundly stirred by the horrors of the siege of Lyons. His sensitiveness received a second blow in an unsuccessful love affair, which, however, he bore with fortitude. He devoted himself to an examination of the nature of society and his work brought him into connexion with the literary circle of Chateaubriand and Madame Récamier.

His great work is the Palingenésie, which is divided into three parts, L'orphée, La formule, La ville des expiations. The first deals with the origin of the periodical Man, before the rise of religion; the second was to be an endeavour to deduce a universal law from known historical facts; the third to sketch the ultimate shape of permanence to humanity which is moving. Of these the first alone was completed, but fragments of the other parts exist.

Perhaps the most valuable part of the work is the general introduction. His last work, Vision d'Hebâl, intended as part of the Ville des expiations, describes the chief of a Scottish clan, who, gifted with second sight, gives semi-prophetic utterances as to the course of world-history.

In 1841 Ballanche was elected a member of the French Academy. He died in 1847.

A second edition of the works was published in 1836. For only appeared. In 1833 a second edition in six volumes was published. As a man, Ballanche was warm-hearted and enthusiastic, but he was endowed with a too-vivid imagination and his strange thoughts are expressed in equally bizarre language.

To give a connected account of his views is difficult; their full development should be studied in relation with his life-history, the stages of which are curiously parallel to his theory of the progress of man, the fall, the trial, the perfection.

Ballanche belonged to the theocratic school. In opposition to the rationalism of the preceding age, emphasized the principle of authority, placing revelation above individual reason, order above freedom and progress. But Ballanche made a sincere endeavour to unite in one system what was valuable in the opposing modes of thinking. He held with the theocrats that individualism was an impracticable view; man, according to him, exists only in and through society.

He believed to the theocratic society was to be explained, not by human design and efforts, but by a direct revelation from God. Lastly, with De Bonald, he reduced the problem of the origin of society to that of the origin of language, and held that language was a divine gift. But at this point he parts company with the theocrats, and in this very revelation of language finds a germ of progress. Originally, in the primitive state of man, speech and thought are identical; but gradually the two separate, and in a larger capacity of language is also. When this is finally printed the original social order which co-existed with, and was dependent on it, breaks up also. New institutions spring up, upon which thought acts, and in and through which it even draws nearer to a final unity, a palingenesis. The volition of primitive man was one with that of God but it becomes broken up into separate volitions which oppose themselves to the divine will, and through the oppositions and trials of this world work onward to a second and completer harmony.

Humanity, therefore, passes through three stages, the fall from perfection, the period of trial and the final re-birth or return to perfection. In these times mankind records the obscure outlines of primitive society and of its fall. Actual history exhibits the conflict of two great principles, which may be ascribed to the two principal directions in the birth of the race; a distinction of caste is regarded by Ballanche as the original state of historical society; and history, as a whole, he considers to have followed the same course as that taken by the Roman plebs in its attempts to attain equality with the patriciate. On the events through which the human race is to achieve its destiny Ballanche gives few intelligible hints. The sudden flash which disclosed to the theocracy the whole history of early man, and the language materialized by time and space. Scattered throughout the works of Ballanche are many valuable ideas on the connexion of events which makes possible a philosophy of history; but his own theory does not seem likely, as a body of truth, to have been received. Besides the Palingenésie, Ballanche wrote a poem on the siege at Lyons (unpublished); Du sentiment considéré dans la vie, du sens de la vie, and an essay, Essai sur les institutions sociales (1818), intended as a prelude to his great work; Le Vieillard et le jeune homme, a philosophical dialogue (1819); L'Homme sans nom, a novel (1820).

Ballantine, William (1812-1887), English serjeant-at-law, was born in London on the 3rd of January 1812, being the son of a London magistrate. He was educated at St Paul's school, and called to the bar in 1834. He began in early life a varied acquaintance with dramatic and literary society, and his experience, combined with his own pushing character and acute intellect, helped to obtain for him very soon a large practice, particularly in criminal cases. He became known as a formidable cross-examiner, his great rival being Serjeant Parry (1816-1886). The most great cases of his career were those of the murder of the murderer Franz Müller in 1864, his skillful defence of the Tichborne claimant in 1871 and his defence of the gaewark of Baroda in 1875, his fee in this case last being one of the largest ever known. Ballantine became a serjeant-at-law in 1856. He died at Margate on the 9th of January 1889, having previously published more than one volume of reminiscences. Serjeant Ballantine's private life was decidedly Bohemian; and though he earned large sums, he died very poor.

Ballantyne, Robert Michael (1825-1894), Scottish writer of fiction, was born at Edinburgh on 24th April 1825, and was of the same family as the famous printers and publishers. When sixteen years of age he went to Canada, and was for six years in the service of the Hudson's Bay Company. He returned to Scotland in 1847, and next year published his first book, Hudson's Bay: or, Life in the Wilds of North America. For some time he was employed by Messrs Constable, the publishers, but in 1856 he gave up business for the profession of literature, and began the series of excellent stories of adventure for the young with which his name is popularly associated. The Young Fur-TRaders (1856), The Coral Island (1857), The World of Ice (1858), The Palatines: a Story of Old Carolina (1859), The Coral Island (1858), The Lighthouse (1865), Deep Down (1868), The Pirate City (1874), Eirling the Bold (1860), The Settler and the Savage (1875), and other books, to the number of upwards of a hundred, followed in regular succession, his rule being in every case to write as far as possible from personal knowledge of the scenes he described. His stories had the merit of being thoroughly healthy in tone and possessed considerable graphic force. Ballantyne was also no mean artist, and exhibited some of his water-colours at the Royal Scottish Academy. He lived in later years at Harrow, and died on the 8th of February 1894, at Rome, where he had given up his attempt to shake off the results of over-work. He wrote a volume of Personal Reminiscences of Book-making (1893).

Ballarat (Ballarat and Ballarat East, a city and a town of Grenville county, Victoria, Australia, 74 m. by rail W.N.W. of Melbourne. The city and Ballarat East, separated only by the Yarrowee Creek, are distinct municipalities. Pop. of Ballarat (1901) 25,448, of Ballarat East, 18,262. Ballarat is the second city and the chief gold-mining centre of the state. The alluvial gold-fields were the richest ever opened up, but as these deposits have become exhausted the quartz reefs at deep levels have been exploited, and several mines are worked at depths of 2000 ft. The city is the seat of Anglican and Roman Catholic bishops. It has a number of admirable public buildings, while, among several parks and recreation grounds, mention must be made of the fine botanical garden, 750 acres in extent,
where, in Lake Wendouree, pisciculture is carried on with great success. The school of mines is the most important in Australia and is affiliated to the university of Melbourne. Ballarat is an important railway centre and its industries include woollen-milling, brewing, iron-founding, flour-milling and distilling. Owing to its elevation of 1438 ft. it has an exceptionally cool and healthy climate. Although the district is principally devoted to mining it is well adapted for sheep-farming, and some of the finest wool in the world is produced near Ballarat. The existence of the town is due to the heavy immigration which followed upon the discovery of the gold-fields in 1851. In 1854, in their resistance of an arbitrary tax, the miners came into armed conflict with the authorities; but a commission was appointed to investigate their grievances; and a charter was granted to the town in 1855. In 1870 Ballarat was raised to the rank of a city.

BALLAST (O. Swed. borlart, perhaps from bår, bare or mere, and last, load), heavy material, such as gravel, stone or metal, placed in the hold of a ship in order to immerse her sufficiently to give adequate stability. In botany "ballast-plants" are so-called because they have been introduced into countries in which they are not indigenous through their seeds being carried in such ballast. A ship "in ballast" is one which carries no paying cargo. In modern vessels the place of ballast is taken by water-tanks which are filled more or less as required to trim the ship. The term is also applied to materials like gravel, broken slag, burnt clay, &c., used to form the bed in which the sleepers or ties of a railway track are laid, and also to the sand which a balloonist takes up with him, in order that, by throwing portions of it out of the car from time to time, he may lighten his balloon when he desires to rise to a higher level.

BALLATER (Gaeltic for "the town on a sloping hill"), a village in the parish of Glenmuick, Aberdeenshire, Scotland, 670 ft. above the sea, on the left bank of the Dee, here crossed by a fine bridge, 43 ft. by rail W. by S. of Aberdeen. It is the terminus of the Deeside railway and the station for Ballromar, 9 m. to the W. Founded in 1770 to provide accommodation for the visitors to the mineral wells of Pannanich, 14 m. to the E., it has since become a popular summer resort. It contains the Albert Memorial Hall and the barracks for the sovereign's bodyguard, used when the king is in residence at Balmoral. Red granite is the chief building material of the houses. Ballatrich farm, where Byron spent part of his boyhood, lies some 4 m. to the E. Ballater has a mean temperature of 44·6°F, and an average annual rainfall of 33·4 in.

BALLSTEDT, a town of Germany, in the duchy of Anhalt, on the river Getel, 20 m. E. of Quedlinburg by rail. Pop. (1900) 5423. It is pleasantly situated under the north-eastern declivity of the Harz mountains. The inhabitants are mostly engaged in agriculture and there is practically no other industry. The palace of the dukes of Anhalt, standing on an eminence, contains a library and collections of various kinds, including a good picture gallery. It is approached by a fine avenue of trees and is surrounded by a well-wooded park. In the Schlosskirche the grave of Albert the Bear, margrave of Brandenburg (1100-1170) has been discovered.

BALLET, a performance in which dancing, music and pantomime are involved. Originally derived from the (Sicilian) Gr. μὰλλας, to dance, the word has passed through the Med. Lat. balleare (with balleator as synonymous with saltator) to the Ital. balleare and balloata, to the Fr. ballet, to the O. Eng. word ballete, and to ballet. In O. Fr., according to Rousseau, ballet signifies "to dance, to sing, to rejoice"; and thus it incorporates three distinct modern words, "ball, ball and ballet." Through the gradual changes in the amusements of different ages, the meaning of the first two words has at length become limited to dancing, and the third is now confined to singing. But, although ballads are no longer the vocal accompaniments to dances round the maypole, old ballads are still sung to dance tunes. The present acceptation of the word ballet is—a theatrical representation in which a story is told only by gesture, accompanied by music, which should be characterized by stronger emphasis than would be employed with the voice. The dancing should be connected with the story but is more commonly incidental. The French word was found to be so comprehensive as to require further definition, and thus the above-described would be distinguished as the ballet d'action or pantomime ballet, while a single scene, such as that of a village festival with its dances, would now be termed a divertissement.

The ballet d'action, to which the changed meaning of the word is to be ascribed, and therewith the introduction of modern ballet, has been generally attributed to the 15th century. Novelty of entertainment was then sought for in the splendid courts of Italy, in order to celebrate events which were thought great in their time, such as the marriages of princes, or the triumphs of their commanders. Invention was on the rack for novelty, and the skill of the machinists was taxed to a limit. It has been supposed that the art of the old Roman pantomimi was then revived, to add to the attractions of court-dances. Under the Roman empire the pantomimi had represented either a mythological story, or perhaps a scene from a Greek tragedy, by mute gestures, while a chorus, placed in the background, sang canzona to narrate the fable, or to describe the action of the scene. The question is whether mute pantomimic action, which is the essence of modern ballet, was carried through those court entertainments, in which kings, queens, princes and princesses, took part with the courtiers; or whether pantomimic action, with its later growth, and derived from professional dances upon the stage. The former is the general opinion, but the court entertainments of Italy and France were masques or masks which included declamation and song, like those of Ben Jonson with Inigo Jones for the court of James I.

The earliest modern ballet on record was that given by Bergonzio di Botta at Tortona to celebrate the marriage of the duke of Milan in 1489. The ballet, like other forms of dancing, was developed and perfected in France; it is closely associated with the history of the opera; but in England it came much later than the opera, for it was not introduced until the 18th century, and in the first Italian opera given in London there was no ballet. During the regency of Louis XVI, it was a great novelty to have an opera which included ballet. The former was the general opinion, but the court entertainments of Italy and France were masques or masks which included declamation and song, like those of Ben Jonson with Inigo Jones for the court of James I.

BATTLE—BATTLESHIP

essence of Noverre’s theory was that mere display was not enough to
to ensure interest and life for the ballet; and some years ago Sir
Augustus Harris expressed a similar opinion when he was asked
why he lay the reason of the decadence of the modern ballet.
Noverre brought to a high degree of perfection the art of present-
ing a story by means of pantomime, and he never allowed dancing
which was not the direct expression of a particular attitude of
mind. Apart from Noverre, the greatest ballet-master was
undoubtedly Gaetano Apolline Balthazar Vestris (q.v.), who
modestly called himself le dieu de la danse, and was, indeed, the
finest male dancer that Europe ever produced. Gluck composed
L’Hygiène en Autide in conjunction with Vestris. In 1750 the
two greatest dancers of the day were Vestris in a ballet called L’Amour
et Héro; the dancers were Vestris and Madame Camargo (q.v.), who introduced short skirts in the ballet.
The word “ballet” was first used in the English language by
Dryden in 1667, and the first descriptive ballet seen in
London was The Tavern Bilkers, which was played at Drury
Lane in 1702. Since then the ballet in England has been purely
exotic and has merely followed on the lines of French develop-
ments. The palmy days of the ballet in England were in the
first half of the 19th century, when a royal revenue was spent
on the maintenance of this fashionable attraction. Some famous
dancing men were Noverre, who invented the Catherine Dance (as
it is said to have turned the heads of an entire generation), Fanny
Elsesser, Mdlle Cerito, Miss P. Horton, Miss Lucile Graham and
Mdlle Carolina Rosati. In later years Kate Vaughan was a
remarkably graceful dancer of a new type in England, and, in
Sir Augustus Harris’s opinion, she did much to elevate the
modern art. She was the first to make skit-dancing popular,
although that achievement will not be regarded as an unmixd
benefit by every student of the art. Skirt-dancing, in itself
a beautiful exhibition, is a departure from true dancing in the
sense that the steps are of little importance in it; and we have
seen its development extend to a mere exhibition of whirling
draperies under many-coloured lme-lights. The best known
of Miss Vaughan’s disciples and imitators (each of whom has
contributed something to the art on her own account) were Miss
Sylvia Grey and Miss Letty Lind. Of the older and classical
school of ballet-dancing Adeline Genée became in London the
finest exponent. But ballet-dancing, affected by a tendency in
modern entertainment to make less and less demands on the in-
telligence and intellectual appreciation of the public, and more
and more demands on the eye—the sense most easily affected—has
gradually developed into a spectacle of which the chief interest
is quite independent of dancing. Thousands of pounds are spent
on dressing a small army of women who do little but march
about the stage and group themselves in accordance with some
design of colour and mass; and no more is asked of the intelli-
gence than to believe that a ballet dressed, for example, in
military uniform is a compliment to or glorification of the army.
Only a few out of hundreds of members of the corps de ballet are
really dancers and they perform against a background of colour
afforded by the majority. It seems unlikely that we shall see
any revival of the 19th century period and style of dancing until a
higher standard of grace and manners becomes fashionable in
society. With the constantly increasing abolition of ceremony,
courtliness of manner is bound to diminish; and only in an
atmosphere of ceremony, courtesy and chivalry can the dance
maintain itself in perfection.

LITERATURE.—One of the most complete books on the ballet is
by the Jesuit, Claude François Menestrier, Des ballets anciens et
modernes (1736); he was the inventor of a ballet for Louis XIV. in
1658; and in his book he analyses about fifty of the early
Italian and French ballets. See also Noverre, Lettres sur la
danse (1760; new ed. 1804); Castel-Blaze, La Danse et les ballets
(1838), and Les Origines de l’opéra (1869).

BATTLE, an architectural ornament in the form of
a ball inserted in the cup of a flower, which came into use in the latter
part of the 13th, and was in great vogue in the early part of
the 14th century. It is generally placed in rows at equal
distances in the hollow of a moulding, frequently by the sides of
mullions. The earliest known to be said is in the west part of
Salisbury cathedral, where it is mixed with the tooth ornament.
It seems to have been used more and more frequently, till at
Gloucester cathedral, in the south side, it is in profusion.

BATTLE, a town and district of British India, in the Benares
division of the United Provinces. The town is situated on the
left bank of the Ganges, below the confluence of the lesser Sarju.
It is really an aggregation of rural villages. Pop. (1901) 15,778.
The district of Ballia, constituted in 1879, occupies an angle
at the junction of the Gogra with the Ganges, being bordered
by two districts of Behar. It contains an area of 1,245 sq. m.
Owing to the great pressure on the soil from the density of the
population, to the reluctance to part with land characteristic
of small proprietors, to the generally great productiveness of
the land, and to the very slight assessment of government revenue,
land in Ballia, for agricultural purposes merely, has a market
value higher than in almost any other district. It commonly
brings in Rs. 200 per bigha, or £20 per acre, and sometimes
two double that figure. In 1901 the population was 987,768,
showing a decrease of 5% in the decade. The principal crops are rice,
barley, other food-grains, pulse, sugar-cane and opium. There
are practically no manufactures, except that of sugar. Trade
is carried on largely by way of the two bordering rivers.

BALLINA, a seaport and market-town of county Mayo,
Ireland, in the north parliamentary division, on the left bank
of the river Moy, on the line of the railway of the
Midland Great Western railway. Pop. of urban district (1901)
4,505. Across the river, and therefore in county Sligo, is
the suburb of Ardnaire, connected with Ballina by two bridges.
In Ardnaire is the Roman Catholic cathedral (diocese of Killala),
with an east window of Munich glass, and the ruins of an Augustinian
abbey (1427) adjoining. There is a Roman Catholic
diocesan college and the Protestant parish church is also in
Ardnaire. A convent was erected in 1867. In trade and
population Ballina is the first town in the county. The
salmon-fishing and fish-curing are important branches of its trade;
and it has also breweries and flour-mills and manufactures
woven and coarse linen. On the 25th of August, 1798, Ballina
was entered by the French under General Humbert, marching from
their landing-place at Killala. In the neighbourhood there is
the interesting cromlech of the four Maels, which, if actually
erected over the criminals whose name it bears, is proved by
the early annals of Ireland to belong to the 7th century A.D.
Their story relates that these men, foster-brothers of Cellach,
bishop of Kilmore-Moy, murdered him at the instigation of
Guire Aídhne, king of Connought, but were themselves executed
at Ardfert (Ardfert in Ardfert), the hill of the executioners, by
the bishop’s brother. The Moy is a notable salmon river for
fishing and its tributaries and the neighbouring lakes contain
trout.

BALLINASLOE, a market town of county Galway, Ireland,
in the east parliamentary division, 91 m. W. of Dublin, on the
Midland Great Western main line. Pop. of urban district (1901)
4,904. The river Suck, an affluent of the Shannon, divides it
into two parts, of which the eastern was in county Roscommon
until 1868. The town contains remains of a castle of Elizabethan
date. Industries include brewing, flour-milling, tanning, hat-
making, and carpentry. There is a good water communication
through the Grand canal to the Shannon. The town is widely celebrated for its great annual cattle-fair held in
October, at which vast numbers of cattle and sheep are offered
for sale. Adjoining the town is Garbally Castle, the seat of
the earl of Clancarty, into the deemes of which the great fair
extends from the town.

BALLISTICS (from the Gr. βαλλειν, to throw), the science of
throwing warlike missiles or projectiles. It is now divided into
two parts:—Exterior Ballistics, in which the motion of the
projectile is considered after it has received its initial impulse,
when the projectile is moving freely under the influence of
gravity and the resistance of the air, and it is required to
determine the circumstances so as to hit a certain object, with
a view to its destruction or perforation; and Interior Ballistics,
in which the pressure of the powder-gas is analysed in the bore
of
of the gun, and the investigation is carried out of the requisite charge of powder to secure the initial velocity of the projectile, without straining the gun unduly. The calculation of the stress in the various parts of the gun due to the powder pressure is dealt with in the article ORDNANCE.

I. EXTERIOR BALLISTICS

In the ancient theory due to Galileo, the resistance of the air is ignored, and, as shown in the article on MECHANICS (§ 13), the trajectory is now a parabola. But this theory is very far from being of practical value for most purposes of gunnery; so that a first requirement is an accurate experimental knowledge of the resistance of the air to the projectiles employed, at all velocities useful in artillery. The theoretical assumption of Newton and Euler (wave theory mathematica quem naturales) of a resistance varying as some simple power of the velocity, for instance, as the square or cube of the velocity (the quadratic or cubic law), lead to results of great analytical complexity, and are useful only for provisional extrapolation at high or low velocity, pending further experiment.

The foundation of our knowledge of the resistance of the air, as employed in the construction of ballistic tables, is the series of experiments carried out between 1864 and 1880 by the Rev. F. Bashforth, B.D. (Risks on the Experiments made with the Bashforth Chronograph, &c., 1865-1870; Final Report, &c., 1878-1880; The Bashforth Chronograph, Cambridge, 1890). According to these experiments, the resistance of the air can be represented by no simple algebraical law over a large range of velocity. Abandoning therefore all a priori theoretical assumption, Bashforth set to work to measure experimentally the velocity of shot and the resistance of the air by means of equidistant electric screens furnished with vertical threads or wire, and by a chronograph which measured the instants of time at which the screens were cut by a shot flying nearly horizontally. Formulate of the calculations were made and curves were drawn from the data obtained, for the purpose of inferring the velocity and retardation of the shot, and thence the resistance of the air.

As a first result of experiment it was found that the resistance of similar shot was proportional, at the same velocity, to the surface or cross section, or square of the diameter. The resistance R can thus be divided into two factors, one of which is d², where d denotes the diameter of the shot in inches, and the other factor is denoted by ρ, where ρ is the resistance in pounds at the same velocity to a similar 1-in. projectile; thus R = d²ρ, and the value of ρ for velocity ranging from 1600 to 2150 ft. per second (ß/₄) is given in the second column of the extract from the abridged ballistic table below.

These values of ρ refer to a standard density of the air, of 354.22 grains per cubic foot, which is the density of air at sea-level in the latitude of Greenwich, at a temperature of 62° F., and a barometric height of 30 in.

But in consequence of the humidity of the climate of England it is better to suppose the air to be (on the average) two-thirds saturated with aqueous vapour, and then the standard temperature will be reduced to 60° F., so as to secure the same standard density; the density of the air being reduced perceptibly by the presence of the aqueous vapour.

It is further assumed, as the result of experiment, that the resistance is proportional to the density of the air; so that if the standard density changes from unity to any other relative density denoted by τ, then R = ρd²τ, and τ is called the coefficient of tenacity.

The factor τ becomes of importance in long range high angle fire, where the atmosphere is very thin; but on the other hand, we must make τ about 800 in a calculation of shooting under water.

The resistance of the air is reduced considerably in modern projectiles by giving them a greater length and a sharper point, and by the omission of projecting studs, a factor called the coefficient of shape, being introduced to allow for this change.

For a projectile in which the ogival head is struck with a radius of curvature r, and the diameter d and e, on the other hand, for a flat-headed projectile, as required at proof-bullets, k = 1-8, say 2 on the average.

For spherical shot k is not constant, and a separate ballistic table must be constructed; but k may be taken as 1-7 on the average. Lastly, to allow for the superior centering of the shot obtainable with the breech-loading system, Bashforth introduces a factor e, called the coefficient of steadiness.

This steadiness may vary during the flight of the projectile, as the shot may be unsteady for some distance after leaving the muzzle, afterwards settling down, like a spinning-top. Again, e may increase as the gun wears out, after firing a number of rounds.

Collecting all the coefficients, τ, ρ, e, k, into one, we put

\[ R = n d^2 \tau \rho e, \]

where \( n \) is τρe, and \( n \) is called the coefficient of reduction. By means of a well-chosen value of \( n \), determined by a few experiments, it is possible, pending further experiment, with the most recent design, to utilize Bashforth's experimental results carried out with the new-fashioned projectiles fired from muzzle-loading guns. For instance, \( n = 0.8 \) or even less is considered a good average for the modern rifle bullet.

Starting with the experimental values of \( \rho \), for a standard projectile, fired under standard conditions in air of standard density, we proceed to the construction of the ballistic table. We first determine the time \( t \) in seconds required for the velocity of a shot, inches in diameter and weighing w lb., to fall from any initial velocity \( V(\sigma) / \rho \) to any final velocity \( v(\eta) / \rho \). The shot is supposed to move horizontally, and the curving effect of gravity is ignored. If \( D \) seconds is the time during which the resistance of the air, \( R \) causes the velocity of the shot to fall \( \Delta v / \rho \), so that the velocity drops from \( v' + D \Delta v / \rho \) to \( v' - D \Delta v / \rho \) in passing through the mean velocity \( v \), then

\[ \Delta t = \text{loss of momentum in second-pounds}, \]

and call \( C \) the ballistic coefficient (driving power) of the shot, so that

\[ \Delta t = \frac{C}{\rho} \]

and \( \Delta t \) is the time in seconds for the velocity to drop \( \Delta v \) of the standard shot for which \( C = 1 \), and for which the ballistic table is constructed.

Since \( \rho \) is determined experimentally and tabulated as a function of \( v \), the velocity is taken as the argument of the ballistic table; and taking \( \Delta v = 10 \), the average value of \( \rho \) in the interval is used to determine \( \Delta t \).

Denoting the value of \( T \) at any velocity \( v \) by \( T(\sigma) \), then

\[ T(\sigma) = \text{sum of all the preceding values of } \Delta t \text{ plus an arbitrary constant } C \text{, expressed by the notation } \]

\[ \Delta t = \frac{\text{sum of all the preceding values of } \Delta t}{\rho} \]

which \( \rho \) is supposed known as a function of \( v \).

The constant may be any arbitrary number, as in using the table the difference only is required of two tabular values for an initial velocity \( V \) and final velocity \( v \); and thus

\[ T(V) - T(v) = 2 \rho \Delta v \]

and for a shot whose ballistic coefficient is \( C \)

\[ t = \frac{C T(V)}{T(v)} \]

To take the trouble of proportional parts the value of \( T(\sigma) \) for unit increment of \( v \) is interpolated in a full-length extended ballistic table for \( T \).

Next, if the shot advances a distance \( \Delta s \) ft. in the time \( \Delta t \), during which the velocity falls from \( v' + D \Delta v / \rho \) to \( v' - D \Delta v / \rho \), we have

\[ R \Delta s = \text{loss of kinetic energy in foot-pounds}, \]

which \( \Delta s \) is the distance in feet at which the shot has reached the line of sight, expressed by the notation

\[ \Delta s = \text{sum of all the values of } \Delta s \text{ up to any assigned velocity } v \]

and \( \Delta s \) is the advance in feet of a shot for which \( C = 1 \), while the velocity falls \( \Delta v \) in passing through the average velocity \( v \).

Denoting by \( S(v) \) the sum of all the values of \( \Delta s \) up to any assigned velocity \( v \),

\[ S(v) = 2 \rho \Delta v \]

Supposing \( S(v) \) is calculated from \( \Delta s \), and then between two assigned velocities \( V \) and \( v \), and if \( s \) is the distance of a shot whose ballistic coefficient is \( C \),

\[ s = C \sqrt{S(V) - S(v)} \]

In an extended table of \( S \), the value is interpolated for unit increment of velocity.

A third table, due to Sir W.D. Niven, F.R.S., called the degree table, determines the change of direction of motion of the shot while the velocity changes from \( V \) to \( v \), the shot flying nearly horizontally.

To explain the theory of this table, suppose the tangent at the point of the trajectory, where the velocity is \( v \), to make an angle \( \alpha \) radians with the horizon.

Resolving normally in the trajectory, and supposing the resistance of the air to act tangentially,

\[ v d/dt = -\cos \alpha \]

where \( d \) denotes the infinitesimal decrement of \( t \) in the infinitesimal increment of time \( dt \).
In a problem of direct fire, where the trajectory is flat enough for \( \cos \theta \) to be undistinguishable from unity, equation (16) becomes

\[ v(\frac{di}{dt}) = ge \]

so that we can put

\[ \Delta i = \frac{180}{\pi} \Delta \theta, \]

if \( \Delta i \) denotes the mean velocity during the small finite interval of time \( \Delta \tau \) during which the direction of motion of the shot changes through \( \Delta \theta \). If the inclination or change of inclination in degrees is denoted by \( S \) or \( \Delta S \),

\[ \frac{180}{\pi} S = \frac{180}{\pi} \Delta S, \]

and if \( \Delta i \) and \( \Delta S \) change to \( \Delta D \) and \( \Delta I \) for the standard projectile,

\[ \Delta D = \frac{180}{\pi} \Delta T, \]

\[ \Delta I = \frac{180}{\pi} \Delta S, \]

and

\[ I(V) - I(0) = \int \frac{v_0^2}{g} \frac{v}{g} - \frac{v_0^2}{g} \cdot D(V) - D(0) = \frac{180}{\pi} [I(V) - I(0)]. \]

The differences \( \Delta D \) and \( \Delta I \) are thus calculated, while the values of \( D(\theta) \) and \( I(\theta) \) are obtained by summation with the arithmometer, and entered in their respective columns.

For some purposes it is preferable to retain the circular measure, \( \theta \) radians, as being undistinguishable from \( \sin \theta \) and \( \tan \theta \) when \( \theta \) is small as in direct fire.

The last function, called the "altitude function," will be explained when high angle fire is considered.

These functions, \( T, S, D, I, A \), are shown numerically in the following extract from a abridged ballistic table, in which the velocity is taken as the argument and proceeds by an increment of 10 ft/s; the column for \( p \) is the one determined by experiment, and the remaining columns follow by calculation in the manner explained above. The initial values of \( T, S, D, I, A \) must be accepted as belonging to the anterior portion of the table.

In any region of velocity where it is possible to represent \( p \) with sufficient accuracy by an empirical formula composed of a single power of \( v \), say \( v^m \), the integration can be effected which replaces the summation in (10), (16), and (24); and from an analysis of the Krupp experiments Colonel Zabudski found the most appropriate index \( m \) in a region of velocity as given in the following table, and the corresponding value of \( gp \), denoted by \( f(\theta) \) or \( e \) or its equivalent \( Cr \), where \( v \) is the retardation.

The differences \( \Delta D \) and \( \Delta I \) are calculated, while the values of \( D(\theta) \) and \( I(\theta) \) are obtained by summation with the arithmometer, and entered in their respective columns.

The numbers have been changed from kilogramme-metre to pound-foot units by Colonel Ingals, and employed by him in the calculation of an extended ballistic table, which can be compared with the result of the abridged table. The calculation can be carried out in each region of velocity from the formulæ:

\[ T(V) - T(\psi) = k \int_0^\infty \psi \, d\psi, \quad S(V) - S(\psi) = k \int_0^\infty \psi^{v+1} \, d\psi, \]

\[ I(V) - I(\psi) = gk \int_0^\infty \psi \, d\psi, \]

and the corresponding integration.

The following exercises will show the application of the ballistic table. A slide rule should be used for the arithmetical operations, as it works to the accuracy obtainable in practice.

Example 1. — Determine the time t sec. and distance s ft. in which the velocity falls from 2150 to 1600 ft/s (a) of a 6-in. shot weighing 100 lb, taking α = 0.66, (b) of a rifle bullet, 0.303-in. calibre, weighing half an ounce, taking α = 0.89.

\[
\begin{array}{|c|c|c|c|c|c|}
\hline
V & v & T(V) & T(\psi) & t/C. & S(V) & S(\psi) \\
\hline
2150 & 1600 & 28-689 & 27-545 & 1-1434 & 20700-53 & 18587-00 & 2113-53 \\
\hline
\end{array}
\]

Example 2. — Determine the remaining velocity v and time of flight t over a range of 1000 yds. of the same two shot, fired with the same muzzle velocity V = 2150 ft/s.

\[
\begin{array}{|c|c|c|c|c|c|c|c|}
\hline
S & s/C. & S(V) & S(\psi) & v & T(V) & T(\psi) \\
\hline
3000 & 1037 & 20700-53 & 19663-53 & 1861 & 28-689 & 28-1690 \\
7500 & 2590 & 20700-53 & 16580-53 & 920 & 28-689 & 23-0803 \\
\hline
\end{array}
\]

The first equation leads, as before, to

\[ \frac{dy}{dt} = \frac{\phi - \beta}{C}. \]

The integration of (24) gives

\[ S(\psi) = \int_0^\psi \phi \, d\psi = \phi \int_0^\psi - g \, dT. \]

If T denotes the whole time of flight from 0 to the point B (fig. 1), where the trajectory cuts the line of sight, so that (T) is the time to the vertex A, where the shot is flying parallel to OB. Integrating (27) again,

\[ \phi = C \int_0^\psi \frac{dy}{dT} = \frac{\phi}{C} \int_0^\psi - g \, dT. \]

which is Colonel Sladen's formula, employed in plotting ordinates of a trajectory.

At the vertex A, where \[ y = H, \]

\[ s = \frac{H}{\phi} T^2, \]

which are practical purposes, taking \[ g = 32 \text{ ft/s}^2, \]

Thus, if the time of flight of a shell is \[ s \text{ sec}, \]

the height of the vertex of the trajectory is about 100 ft.; and if the fuse is set to burst the shell one-tenth of a second short of its impact at B, the height of the burst is 784, say 8 ft.

The line of sight Ox, considered horizontal in range table results, may be inclined slightly to the horizon, as in shooting up or down a moderate slope, without appreciable modification of (28) and (29), and or PM is still the angular depression to mean B in M.

Given the ballistic coefficient C, the initial velocity V, and a range of R yds. or \[ X = 3R \text{ ft.}, \]

the final velocity v is first calculated from (29) by

\[ S(\psi) = S(V) - X/C, \]

and the time of flight T by

\[ T = C(T(V) - T(\psi)). \]

Denoting the angle of departure and descent, measured in degrees and from the line of sight OB by \[ \phi \text{ and } \beta, \]

the total deviation in the range OB is (fig. 1)

\[ \delta = \phi + \beta = C(D(V) - D(\psi)). \]

To share the \[ \phi \text{ and } \beta, \]

and the vertex A is taken as the point of half-time (and therefore beyond half-range, because of the continual diminution of the velocity), and the velocity v at A is calculated from the formula

\[ T(\psi) = T(V) - \frac{4T}{C} = \frac{1}{2}(T(V) + T(\psi)); \]

and now the degree table for D(\psi) gives

\[ \phi = C(D(V) - D(\psi)), \]

\[ \beta = C(D(\psi) - D(\psi)). \]

This value of \[ \phi \]

is the tangent elevation (T.E.);

the quadrant elevation (Q.E.) is \[ \phi - S, \]

where \[ S \]

is the angular depression of the line of sight OB; and if \[ O \]

is at ft. vertical above B, the angle S at a range of R yds. is given by

\[ \sin S = h/R, \]

or, for a small angle, expressed in minutes, taking the radian as 3436,

\[ S = \frac{116h}{R}. \]

So also the angle \[ \beta \]

must be increased by \[ S \]

to obtain the angle at which the shot strikes a horizontal plane—the water, for instance.

A systematic exercise is given here of the compilation of a range table by calculation with the ballistic table; and it is to be compared with the published official range table which follows. A discrepancy between a calculated and tabulated result will serve to show the influence of a slight change in the coefficient of reduction \[ n \], and the muzzle velocity \[ V \].

Example 3. — Determine by calculation with the abridged ballistic table the remaining velocity v, the time of flight t, angle of elevation \[ \phi, \]

and descent \[ \beta \] of this 6-in. gun at ranges 500, 1000, 1500, 2000 yds., taking the muzzle velocity \[ V = 2150 \text{ ft/s}, \]

and a coefficient of reduction \[ n = 0.94. \]

An important problem is to determine the alteration of elevation for firing up and down a slope. It is found that the alteration of the tangent elevation is almost insensible, but the quadrant elevation requires the addition or subtraction of the angle of sight.

Example. — Find the alteration of elevation required at a range of 3000 yds. in the exchange of fire between a ship and a fort 1200 ft. high a 12-in. gun being employed on each side, firing a shot weighing 850 lb with velocity 2150 ft/s. The complete ballistic table, and the method of high angle fire (see below) must be employed.
The last column in the Range Table giving the inches of penetration into wrought iron is calculated from the remaining velocity by an empirical formula, as explained in the article ARMOUR PLATES.

High Angle and Curved Fire.—"High angle fire," as defined officially, "is fire at elevations greater than 15°," and "curved fire is fire from howitzers at all angles of elevation not exceeding 15°." In these cases the curvature of the trajectory becomes considerable, and the formulae employed in direct fire must be modified; the method generally employed is due to Colonel Siacci of the Italian artillery.

Staring with the exact equations of motion in a resisting medium,
\[ \frac{dx}{dt} = -r \cos i = \frac{dx}{dt}, \]
\[ \frac{dy}{dt} = -r \sin i = -\frac{dy}{dt}, \]
and eliminating \( r \),
\[ \frac{dx}{dy} = -\frac{dy}{dx}, \]
\[ \frac{dx}{dy} = -\tan i = \frac{dx}{dy}, \]
and this, in conjunction with
\[ \frac{\sec^2 \theta}{\theta} = \frac{\frac{dx}{dy} \frac{dy}{dx} \frac{dx}{dx} \frac{dx}{dx} \frac{dx}{dx}}{\frac{dy}{dy} \frac{dy}{dy} \frac{dy}{dy} \frac{dy}{dy} \frac{dy}{dy}}, \]
reduces to
\[ \frac{\frac{dx}{dy}}{\frac{dx}{dy}} = -\frac{v \cos i}{d}, \]
\[ \frac{\frac{dx}{dy}}{\frac{dx}{dy}} = -\frac{v \cos i}{d}, \]
the equation obtained, as in (18), by resolving normally in the trajectory, but \( dt \) now denoting the increment of \( t \) in the increment of time \( dt \).

Denoting \( dx/dt \), the horizontal component of the velocity, by \( g \), so that
\[ \frac{v \cos i}{d} = g, \]
equation (43) becomes
\[ \frac{dx}{dy} = -r \cos i, \]
and therefore by (43)
\[ \frac{dy}{dx} = -\sin i, \]
It is convenient to express \( r \) as a function of \( v \) in the previous notation
\[ r = f(v), \]
and now
\[ \frac{d}{d} = \frac{v}{g}, \]
an equation connecting \( g \) and \( i \).

Now, since \( v = g \),
\[ \frac{d}{d} = -C \frac{g \sec i}{(g \sec i)^2}, \]
and multiplying by \( dx/di \) or \( g \),
\[ \frac{d}{d} = \frac{C}{g \sec i}, \]
and multiplying by \( dy/dx \) or \( tan i \),
\[ \frac{d}{d} = \frac{C \sec i \tan i}{g \sec i}, \]
also
\[ \frac{d}{d} = \frac{C \sec i}{g \sec i}, \]
from which the values of \( i, r, \), and \( tan i \) are given by integration with respect to \( g \), when \( sec i \) is given as a function of \( g \) by means of (51).

Now these integrations are quite intractable, even for a very simple mathematical assumption of the function \( f(i) \), say the quadratic or cubic law, \( f(i) = e^i \) or \( e^i \).

But, as originally pointed out by Euler, the difficulty can be turned if we notice that in the ordinary trajectory of practice the quantities \( i, \cos i, \) and \( sec i \) vary so slowly that they may be replaced by their mean values, \( \bar{v}, \bar{\cos i}, \) and \( \bar{sec i} \), especially if the trajectory, when considerable, is divided up in the calculation into arcs of small curvature, the curvature of an arc being defined as the angle between the tangents or normals at the ends of the arc.

Replacing then the angle \( i \) on the right-hand side of equations (54)–(56) by some mean value \( \bar{v} \) we introduce Siacci’s pseudo-velocity \( u \) defined by
\[ \bar{v} = g \sec \bar{v}, \]
so that \( u \) is a quasi-component parallel to the mean direction of the tangent, say the direction of the chord of the arc.
Integrating from any initial pseudo-velocity $U$, 

$$ t = C \int_{f(u)}^u \frac{du}{f(u)} \quad (60) $$

$$ x = C \cos \eta \int_{f(u)}^u \frac{du}{f(u)} \quad (61) $$

$$ y = C \sin \eta \int_{f(u)}^u \frac{du}{f(u)} \quad (62) $$

and supposing the inclination $i$ to change from $\phi$ to $\theta$ radians over the arc:

$$ \phi - \theta = C \cos \eta \int_{f(u)}^u \frac{du}{f(u)} \quad (63) $$

$$ \tan \phi - \tan \theta = C \sec \eta \int_{f(u)}^u \frac{du}{f(u)} \quad (64) $$

But according to the definition of the functions $T, S, I$ and $D$ of the ballistic table, employed for direct fire, with $u$ written for $v$,

$$ \int_{f(u)}^u \frac{du}{f(u)} = \int_{f(v)}^v \frac{dv}{f(v)} = T(U) - T(u), \quad (65) $$

$$ \int_{f(u)}^u \frac{du}{f(u)} = S(U) - S(u), \quad (66) $$

$$ \int_{f(u)}^u \frac{du}{f(u)} = I(U) - I(u), \quad (67) $$

and therefore

$$ t = C [T(U) - T(u)], \quad (68) $$

$$ x = C \cos \eta [S(U) - S(u)], \quad (69) $$

$$ y = C \sin \eta [S(U) - S(u)], \quad (70) $$

$$ \phi - \theta = C \cos \eta [I(U) - I(u)], \quad (71) $$

$$ \tan \phi - \tan \theta = C \sec \eta [I(U) - I(u)], \quad (72) $$

while, expressed in degrees,

$$ \phi - \theta = C \cos \eta [D(U) - D(u)]. \quad (73) $$

The equations (66)–(71) are Siacci's, slightly modified by General Mayevski; and now in the numerical applications to high angle fire we can still employ the ballistic table for direct fire. It will be noticed that $\eta$ cannot be exactly the same angle in all these equations; but if $\eta$ is the same in (69) and (70),

$$ y/x = \tan \eta, \quad (74) $$

so that $\eta$ is the inclination of the chord of the arc of the trajectory, as in Niven's method of calculating trajectories (Proc. R. S., 1877); but this method requires $\eta$ to be known with accuracy, as 1% variation in $\eta$ causes more than 1% variation in $\tan \eta$.

The difficulty is avoided by the use of Siacci's altitude-function $A$ or $A(u)$, by which $y/x$ can be calculated without introducing $\sin \eta$ or $\tan \eta$, but in which $\eta$ occurs only in the form $\cos \eta$ or $\sec \eta$, which varies very slowly for moderate values of $\eta$, so that $\eta$ need not be calculated with any great regard for accuracy, the arithmetic mean of $C(\phi+\theta)$ of $\phi$ and $\theta$ being near enough for $\eta$ over any arc $\phi - \theta$ of moderate extent.

Now taking equation (72), and replacing $\theta$ as a variable final tangent of an angle, by $v$ or $dy/dx$,

$$ \tan \phi - \tan \theta = C \sec \eta [I(U) - I(u)], \quad (75) $$

and integrating with respect to $x$ over the arc considered,

$$ \int_{I(u)}^{I(U)} dx \frac{dx}{y} = C \sec \eta \int_{I(u)}^{I(U)} dx \frac{du}{f(u)} \quad (76) $$

But

$$ \int_{I(u)}^{I(U)} dx \frac{dx}{y} = \int_{f(u)}^{f(u)} u \frac{du}{f(u)} \quad (77) $$

in Siacci's notation; so that the altitude-function $A$ must be calculated by summation from the finite difference $\Delta A$, where

$$ \Delta A = [I(U) - I(u)] - \frac{f(u)}{\Delta u} \quad (78) $$

or by an integration when it is legitimate to assume that $f(u) = e^{\xi/k}$ in an interval of velocity in which $m$ may be supposed constant.

Dividing again by $x$, as in (76),

$$ \tan \phi - \tan \theta = C \sec \eta [I(U) - A(U) - I(u) - A(u)] \quad (79) $$

from which $y/x$ can be calculated, and hence $y$.

In the application of Siacci's method to the calculation of a trajectory in high angle fire by successive arcs of small curvature, starting at the beginning of an arc at an angle $\phi$ with velocity $v_0$, the curvature of the arc $\phi - \theta$ is first settled upon, and now

$$ \eta = \frac{1}{2} \phi + \theta \quad (80) $$

is a good first approximation for $\eta$.

Now calculate the pseudo-velocity $u_\pm$ from

$$ u_\pm = u_0 \cos \phi \sec \eta \quad (81) $$

and then, from the given values of $\phi$ and $\theta$, calculate $u_\pm$ from either of the formulae of (72) or (73).

$$ I(u_\pm) - I(u_\pm) = \tan \phi - \tan \theta \quad (82) $$

$$ D(u_\pm) = D(u_\pm) - \phi^2 \sec \eta \quad (83) $$

Then with the suffix notation to denote the beginning and end of the arc $\phi - \theta$,

$$ \phi_\pm = \tan \eta \cos \eta \angle (S(U) - S(u)), \quad (84) $$

$$ \phi_\pm = \tan \eta \cos \eta \angle (S(U) - S(u)), \quad (85) $$

$$ \Delta \phi_\pm = \phi_\pm - \phi_\pm = \phi_\pm - \phi_\pm \quad (86) $$

$\Delta$ now denoting any finite tabular difference of the function between the initial and final (pseudo) velocity.

Also the velocity $v_\pm$ at the end of the arc is given by

$$ v_\pm = u_\pm \sec \theta \cos \eta \quad (87) $$

Treating this final velocity $v_\pm$ and angle $\theta$ as the initial velocity $u_\pm$ and angle $\phi$ of the next arc, the calculation proceeds as before (fig. 2).

In the long range high angle fire the shot ascends to such a height that the correction for the tenuity of the air becomes important, and the curvature $\phi - \theta$ of an arc should be so chosen that $\phi_\pm$, the height ascended, should be limited to about 1000 ft., equivalent to a fall of 1 inch in the barometer or 3% diminution in the tenuity factor $T$.

A convenient rule has been given by Captain James M. Ingalls, U.S.A., for approximating to a high angle trajectory in a single arc, which assumes that the mean density of the air may be taken as the density at two-thirds of the estimated height of the vertex; the rule is founded on the fact that in an unresisted parabolic trajectory the average height of the shot is two-thirds the height of the vertex, as illustrated in a jet of water, or in a stream of bullets from a Maxim gun.

The longest recorded range is that given in 1888 by the 9-2-in. gun to a shot weighing 380 lb. fired with velocity 2375 ft/s at elevation 40°; the range was about 12 m., with a time for flight of about 64 sec., shown in fig. 2.

A calculation of this trajectory is given by Lieutenant A. H. Wolley-Dod, R.A., in the Proceedings R.A. Institution, 1888, employing Siacci's method and about twenty arcs; and Captain Ingalls, by assuming a mean tenuity-factor $T = 0.68$, corresponding to a height of about 2 m., on the estimate that the shot would reach a height of 3 m., was able to obtain a very accurate result, working in two arcs over the whole trajectory, up to the vertex and down again (Ingalls, Handbook of Ballistic Problems).

Siacci's altitude-function is useful in direct fire, for giving immediately the angle of elevation $\phi$ required for a given range of R yds. or X ft., between limits $V$ and $v$, of the velocity, and also the angle of descent $\beta$.

In direct fire the pseudo-velocities $U$ and $u_\pm$ and the real velocities $V$ and $v_\pm$ are undistinguishable, and sec $\eta$ may be replaced by unity so that, putting $\gamma = \omega$ in (79),

$$ \tan \phi = C \left[ I(V) - \frac{\Delta A}{\Delta S} \right] \quad (88) $$

Also

$$ \tan \phi - \tan \beta = C [I(V) - I(U)] \quad (89) $$

so that

$$ \tan \beta = C \left[ \frac{\Delta A}{\Delta S} - 1 \right] \quad (90) $$

or, as (88) and (90) may be written for small angles,

$$ \sin 2\phi = C \left[ I(V) - I(U) \right] \quad (91) $$

$$ \sin 2\beta = C \left[ \frac{\Delta A}{\Delta S} - 1 \right] \quad (92) $$

To simplify the work, so as to look out the value of $\sin 2\phi$ without the intermediate calculation of the remaining velocity $v_\pm$, a double-entry table has been devised by Captain Braccialini Scipione.
BALLISTICS

276

(Problemi del Tiro, Roma, 1883), and adapted to yd., ft., in. and lb. units by A. G. Hadcock, late R.A., and published in the Proc. R.A. Institution, 1898, and in Gunnery Tables, 1898.

In this table

\[ \sin 2\phi - C_x \]

where \( \phi \) is a function tabulated for the two arguments, \( V \) the initial velocity, and \( R/C \) the reduced range in yards.

The table is too long for insertion here. The results for \( \phi \) and \( C_x \), as calculated for the range tables above, are also given there for comparison.

Drift.—An elongated shot fired from a rifled gun does not move in a vertical plane, but as if the mean plane of the trajectory was inclined to the true vertical at a small angle, \( 2^\circ \) or \( 3^\circ \); so that the shot will hit the mark aimed at if the back sight is tilted to the vertical at this angle \( \delta \), called the permanent angle of deflection (see Sights).

This effect is called drift and the reason of it is not yet understood very clearly.

It is evidently a gyroscopic effect, being reversed in direction by a change from a right to a left-handed twist of rifling, and being increased by an increase of rotation of the shot.

The axis of an elongated shot would move parallel to itself only if fired in a vacuum; but in air the couple due to a sidelong motion tends to place the axis at right angles to the tangent of the trajectory, and acting on a rotating body causes the axis to precess about the tangent. At the same time the frictional drag damps the nutation and causes the axis of the shot to follow the tangent of the trajectory very closely, the point of the shot being seen to be slightly above and to the right of the tangent, with a right-handed twist. The effect is as if there was a mean sidelong thrust \( w \tan \delta \) on the shot from left to right in order to deflect the plane of the trajectory at angle \( \delta \) to the vertical.

In the absence of a formula has yet been invented, derived on theoretical principles from the physical data, which will assign by calculation a definite magnitude to \( \delta \).

An effect similar to drift is observable at tennis, golf, base-ball and cricket; but this effect is explainable by the inequality of pressure due to a vortex of air carried along by the rotating ball, and the deviation is in the opposite direction of the drift observed in artillery practice, so that the drifters are still awaiting theory and crucial experiment.

After all care has been taken in laying and pointing, in accordance with the rules of theory and practice, absolute certainty of hitting the same spot every time is unattainable, as causes of error exist which cannot be eliminated, such as variations in the air and in the muzzle-velocity, and also in the steadiness of the shot in flight.

To obtain an estimate of the accuracy of a gun, as much actual practice as is available must be utilized for the calculation in accordance with the laws of probability of the 50% zones shown in the range table (see Probability.)

II. INTERIOR BALLISTICS

The investigation of the relations connecting the pressure, volume and temperature of the powder-gas inside the bore of the gun, of the work realized by the expansion of the powder, of the dynamics of the movement of the shot up the bore, and of the stress set up in the material of the gun, constitutes the branch of interior ballistics.

A gun may be considered a simple thermo-dynamic machine or heat-engine which does its work in a single stroke, and does not act in a series of periodic cycles as an ordinary steam or gas-engine.

An indicator diagram can be drawn for a gun (fig. 3) as for a

steamborne, representing graphically by a curve CPD the relation between the volume and pressure of the powder-gas; and in addition the curves AEQ of energy $e$, $AV$ of velocity $v$, and $AM$ of time $t$ can be plotted or derived, the velocity and energy at the muzzle B being denoted by $V$ and $E$.

After a certain discount for friction and the recoil of the gun, the net work realized by the powder-gas as the shot advances AM is represented by the area ACPM, and this is equated to the kinetic energy $e$ of the shot, in foot-tons,

$$e = \frac{AV}{2240} \left(1 + \frac{d^2}{d^2} \tan^2 \theta \right)^{\frac{1}{2}} \frac{v^2}{2}$$

in which the factor $\frac{d^2}{d^2} \tan^2 \theta$ represents the fraction due to the rotation of the shot, of diameter $d$ and axial radius of gyration $k$, and $\theta$ represents the angle of the rifling; this factor may be ignored in the subsequent calculations as small, less than 1/5.

The mean effective pressure (M.E.P.) in tons per sq. in. is represented in fig. 3 by the height AH, such that the rectangle AHKB is equal to the area ACPM; and the M.E.P. multiplied by $\frac{1}{2} d^2$, the cross-section of the bore in square inches, gives in tons the mean effective thrust of the powder on the base of the shot; and multiplied again by $l$, the length in inches of the travel AB of the shot up the bore, gives the work realized in inch-tons; which work is thus equal to the M.E.P. multiplied by $\frac{1}{2} d^2 l = B - C$, the volume in cubic inches of the rifled part AB of the bore, the difference between B the total volume of the bore and C the volume of the powder-chamber.

Equating the muzzle-energy and the work in foot-tons

$$(2) \quad E = \frac{AV}{2240} \frac{V^2}{12} \times M.E.P.$$

$$(3) \quad M.E.P. = \frac{2240}{2g} \frac{V^2}{12}$$

Working out this for the 6-in. gun of the range table, taking L = 216 in., we find $B - C = 6000$ cub. in., and the M.E.P. is about 6-4 tons per sq. in.

But the maximum pressure may exceed the mean in the ratio of 2 or 3 to 1, as shown in fig. 4, representing graphically the result of Sir Andrew Noble's experiments with a 6-in. gun, capable of being lengthened to 100 calibres or 90 ft. (Proc. R.S., June 1894).

On the assumption of uniform pressure up the bore, practically realizable in an Zalinski pneumatic dynamite gun, the pressure-curve would be the straight line HK of fig. 3 parallel to AM; the energy-curve AQE would be another straight line through A; the velocity-curve $AV$, of which the ordinate $v$ is as the square root of the energy, would be a parabola; and the acceleration of the shot being constant, the time-curve $AU$ will also be a similar parabola.

If the pressure falls off uniformly, so that the pressure-curve is a straight line PDF sloping downwards and cutting AM in F, then the energy-curve will be a parabola curving downwards, and the velocity-curve can be represented by an ellipse, or circle with centre F and radius FA; while the time-curve will be a sinusoid.
The result is plotted in figs. 8 and 9, in a curve showing the relation between \( \rho \) and \( D \) the gravimetric density, which is the specific gravity of the \( n \) lb of powder when filling the volume \( C \), cub. in., in

**Explosion Vessel**

a state of gas; or between \( \rho \) and \( v \), the reciprocal of \( D \), which may be called the **gravimetric volume** (G. V.), being the ratio of the volume of the gas to the volume of an equal weight of water.

The results are also embodied in the following Table:

</table>

The term **gravimetric density** (G.D.) is peculiar to artillerists; it is required to distinguish between the specific gravity (S. G.) of the powder filling a given volume in a state of gas, and the specific gravity of the separate solid grain or cord of powder.

Thus, for instance, a lump of solid lead of given S. G., when formed into a charge of lead shot composed of equal spheres closely packed, will have a G. D. such that:

- \( (a) \) G. D. of charge of lead shot = \( \frac{1}{S.G.} \) of lump of solid lead = \( \frac{1}{0.7403} = 1.35 \)
- \( (b) \) G. D. of charge of cordite = \( \frac{1}{S.G.} \) of stick of cordite = \( \frac{1}{0.9067} = 1.11 \)

At the standard temperature of 62 °F, the volume of the gallon of 10 lb of water is 277.3 cub. in.; or otherwise, 1 cub. ft. or 1728 cub.

**Pressures observed in a closed vessel with various explosives**

In the heading of the 6-in. range table we find the description of the charge.

Charge: weight 13 lb 4 oz.; gravimetric density 55.01/59.2; nature, cordite, size 30.

So that \( \rho = 2449 \), \( v = 5 \), \( \rho_0 = 1 \), \( t_0 = 700 \), makes \( T = 4758 \), a temperature of 445 °C. or 810 °F.

**Gravimetric volume**

In fig. 9, the upper figure gives the gravimetric volume of the charge measured in cubic inches per lb, filling the chamber in a state of gas, the product of the two numbers 55.01 and 59.2 being 27.73; and the chamber capacity C = 10 X 35.01 = 730 cub. in., equivalent to 23.8 in. or 0.634 ft. length of bore, now called the equivalent length of the chamber (E.L.C.).

If the shot was not free to move, the closed chamber pressure due to the explosion of the charge at this G. D. (= 0.5) would be nearly 40 tons per sq. in., much too great to be safe.

But the shot advances during the combustion of the cordite, and the chief problem in interior ballistics is to adjust the G. D. of the charge to the weight of the shot so that the advance of the shot during the combustion of the charge should prevent the maximum pressure from exceeding a safe limit, as shown by the maximum ordinate of the pressure curve C.P.D. in fig. 3.

Suppose this limit is fixed at 16 tons per sq. in., corresponding in Table 1. to a G. D. 0.2; the powder-gas will now occupy a volume \( \frac{1}{2} x 1285 \) cub. in., corresponding to an advance of the shot \( x = 15 = 3.225 \) ft.

Assuming an average pressure of 8 tons per sq. in., the shot will have acquired energy \( 8 \times 1400 \times 3.225 = 730 \) foot-tons, and a velocity about \( \frac{1}{2} \) of \( 2000 \) ft/s, so that the time over the 3.225 ft. at an average velocity \( \frac{510}{a} \) is about 0.0603 sec.

Comparing this time with the experimental value of the time occupied by the cordite in burning, a start is made for a fresh estimate and a closer approximation.

Assuming, however, that the agreement is close enough for practical requirements, the combustion of the cordite may be considered complete at this stage, and in the subsequent expansion it is assumed that the gas obeys an adiabatic law in which the pressure varies inversely as some \( m^2 \) power of the volume.

The work done in expanding to infinity from \( p \) tons per sq. in. to
at volume \( b \) cub. in. is then \( ph/(m-1) \) inch-tons, or to any volume \( b \) cub. in. is

\[
\frac{p b}{m-1} \left[ 1 - \left( \frac{b}{B} \right)^{m-1} \right].
\]

It is found experimentally that \( m=1.2 \) is a good average value to take for cordite; so now suppose the combination of the charge of the \( 6\)-in. is complete, i.e., that a charge of 3 lbs. at the bore (i.e., \( b=1825 \) cub. in.) is sufficient to increase the velocity from 1020 to 2250 f/s at the muzzle. This muzzle velocity is about \( 5 \) greater than the 2150 f/s of the range table, so on these considerations we may suppose about 10 lbs. as the charge. The explosive in the bore; this is expressed by saying that the factor of effect is \( f=0.99 \).

The experimental determination of the time of burning under the influence of the varying pressure and density, and the size of the grain, is thus of great practical importance, as thereby it is possible to estimate close limits to the maximum pressure that will be reached in the bore of a gun, and to design the chamber so that the G.D. of the charge may be suitable for the weight and acceleration of the charge. Practical experience are employed for an approximation to the result.

A great change has come over interior ballistics in recent years, as the old black gunpowder has been abandoned in artillery after holding the field for six hundred years. It is replaced by modern explosives such as those indicated on fig. 4, capable of giving off a very much larger volume of gas at a greater temperature and pressure, more than threefold as seen on fig. 8, so that the charge may be reduced in proportion, and possessing the military advantage of being nearly smokeless. (See Explo-

The explosive cordite is adopted in the British service; it derives its name from its appearance as cord in short lengths, the composition being squeezed in a viscous state through the hole in a die, and the cordite is designated in size by the number of hundredths of an inch in the diameter of the hole. Thus the cordite, size 30, of the range table has been squeezed through a hole 0.30 in. diameter.

The thermoechemical properties of the constituents of an explosive will assign an upper limit to the volume, temperature and pressure of the gas produced by the combustion; but much experience is required in addition based on experimental results. Andrew Noble has published some of his results in the Phil. Trans. 1905-1906 and following years.

BALLOON, a globular bag of varnished silk or other material impermeable to air, which, when inflated with gas lighter than common air, can be used in aeronautics, or, according to its size, &c., for any purpose for which its ability to rise and float in the atmosphere adapts such a mechanism. "Balloon" in this sense was first used in 1783 in connexion with the invention of the brothers Mongolotier, but the word was in earlier use (derived from Ital. ballo, a large ball) as meaning an actual ball or ball-game, a primitive explosive bomb or firework, a form of chemical retort or receiver, and an ornamental globe in architecture; and from the appearance and shape of an air balloon the word is also given by analogy to other things, such as a "balloon skirt" in dress, "balloon training" in horticulture. (See AERONAUTICS, and FLIGHT AND FLYING.)

BALLOT (from Ital. ballo, dim. of ballo, a ball), the modern method of secret-voting employed in political, legislative and judicial assemblies, and also in the proceedings of private clubs and corporations. The name comes from the use of a little ball dropped according to choice into the right receptacle; but nowadays it is used for any system of secret-voting, even though no such ball is employed. In ancient Athens, the procession in giving their verdict, generally used balls of stone (psephos) or of metal (pandon). Those pierced in the centre, or black in colour, signified condemnation; those unpierced, or white, signified acquittal. The boxes were variously arranged; but generally a brass box received both classes of votes, and a wooden box received the unused balls. In the assembly, cases of privilége, such as ostracism, the naturalization of foreigners or the release of state-debtors, were decided by secret-voting. The pelatism, or voting by words on olive-leaves, practised at Syracuse, may be considered as secret-voting. A modern instance of the ballot was introduced to the comitia by the Leges Tabellariae, of which the Lex Gabini (139 B.c.) relates to the election of magistrates, the Lex Cassia (137 B.C.) to judicata populi, and the Lex Papiria (131 B.C.) to the enactment and repeal of laws. The wooden tabellaev advocated in the cista or wicker box, were marked U. R. (uti rogat) and A. (antiqua) in the case of a proposed law; L. (libero) and D. (damnre) in the case of a public trial; in the case of an election, puncta were made opposite the names or initials of the candidates. Tabellae were also used by the Roman judges, who discharged their verdicts by judgment by the letters A. (absolvo), C. (condemno), and N.L. (nulla liquet). Modern elections by ballot is usually by some form of writing, but the use of the ball still persists (especially in clubs), and a "black ball" is the regular term for a hostile vote.

Great Britain.—In Great Britain the ballot was suggested for use in parliament by a political tract of the time of Charles II. It was actually used by the Scots parliament of 1662 in proceeding on the Billigting Act, a measure proposed by Middleton to secure the ostracism of Lauderdale and other political opponents who were by secret-vote declared incapable of public office. The plan followed was this: each member of parliament wrote in a disguised hand, on a piece of paper, the names of twelve suspected persons; the ballots were put in a bag held by the registrar; the bag was then sealed, and was afterwards opened and its contents ascertained in the exchequer chamber, where the ballots were immediately burned and the names of the ostracised concealed on oath. The Billigting Act was repudiated by the king, and the ballot was not again heard of till 1705, when Fletcher of Saltoun, in his measure for a provisional government of Scotland by annual parliaments in the event of Queen Anne's death, proposed secret-voting to all elections from court influence. The gradual emancipation of the British parliament from the power of the crown, and the adoption of a strictly representative system of election, not only destroyed whatever reason may once have existed for the ballot in deliberative voting, but rendered it essential that such voting should be open. It was in the agitations for parliamentary reform at the beginning of the 19th century that the demand for the ballot in parliamentary elections was first seriously made. The Benthamites advocated the system in 1817. At the so-called Peterloo Massacre (1819) several banners were inscribed with the ballot. O'Connell introduced a bill on the subject in 1830; and the original draft of Lord John Russell's Reform Bill, probably on the suggestion of Lords Durham and Duncannon, provided for its introduction. Later on the historian Grote became its chief supporter in the House of Commons; and from 1833 to 1839, in spite of the ridicule cast by Sydney Smith on the "mousetrap," and on Grote's "dagger-box, in which you stab the card of your favourite candidate with a dagger," the minority for the ballot increased from 106 to 217. In 1838 the ballot was the fourth point of the People's Charter. In the same year the abolition of the land qualification introduced rich commercial candidates to the constituencies. Lord Melbourne's cabinet declared the question open. The cause, upheld by Macaulay, Ward, Hume (in his resolutions, 1848) and Berkeley, was strengthened by the report of Lord Hartington's Select Committee.
(15th March 1870), to the effect that corruption, treating and intimidation by priests and landlords took place to a large extent at both parliamentary and municipal elections in England and Ireland; and that the ballot, if adopted, would probably not only promote tranquillity at elections, but protect voters from undue influence, and introduce greater freedom and purity in voting, provided secrecy was made inviolable except in cases where a voter was found guilty of bribery, or where an invalid vote had been given.

Meanwhile in Australia the ballot had been introduced by the Constitution Act of South Australia (1850), and in other colonies at various dates. In South Australia (Electoral Act of 1856) the returning-officer put his initials on the voting-card, which the voter was directed, under pain of nullity, to fold so that the officer might not see the vote which was indicated by a cross. In Victoria, under the Electoral Act of 1865, the officer added to his initials a number corresponding to the voter's number on the register. In Tasmania the chief peculiarity was that (as in South Australia) the card was not put directly by the voter into the box, but handed to the officer, who put it there this being thought a security against double-voting or voting with a non-official card, and also against voter carrying away his card. In 1869, at Melbourne, Lord and Stafford in England introduced the Australian system as practised in Victoria—the voting-card containing the names of all the candidates, printed in different colours for the benefit of illiterate voters, and the voter being directed to score out the names of those he did not support, and then to place the card (covered by an official envelope) in the box. It was found at Manchester that the voting was considerably more rapid, and therefore less expensive, than under the old system; that only 50 cards out of 11,475 were rejected as informal; and that, the representatives of candidates being present to check false statements of identity, and the public outside being debarred from receiving information what voters had voted, the ballot rather decreased the risk of personation. At Manchester the cards were not numbered consecutively, as in Victoria, so that (assuming the officials to be free from corruption) no scrutiny could have detected by whom particular votes were given. At Stafford the returning-officer stamped each card before giving it to the voter, the die of the stamp having been finished only on the morning of the election. By this means the possibility was excluded of what was known as "the Tasmanian dodge," by which the voter filling up a card gave to the returning-officer, or placed in the box, a blank non-official card, and carried out from the booth his official card, which a corrupt agent then marked for his candidate, and gave so-marked to corrupt voter No. 2 (before he entered the booth) on condition that he also would bring out his official card, and so on ad libitum; the agent thus obtaining a security for his bribe, unless the corrupt voter chose to disfranchise himself by making further marks on the card. At the close of 1870 the ballot was employed in the election of members for the London School Board under the Education Act of that year.

In 1872 W. E. Forster's Ballot Act introduced the ballot in all parliamentary and municipal elections, except parliamentary elections for universities; and the code of procedure prescribed by the act was adopted by the Scottish Education Board in the first School Board election (1873) under the Education (Scotland) Act 1872. The Ballot Act not only abolished public nominations of candidates, but dealt with the offence of personation and the expenses of elections.

As practised in the United Kingdom, a white paper is used on which the names of the candidates are printed in alphabetical order, the voter filling up with a X the box on the right-hand opposite the name he votes for. The paper, before being given out, is marked by the presiding-officer on both sides with an official stamp, which is kept secret, and cannot be used for a second election within seven years. The paper is marked on the back with the same number as the counterpart of the paper which remains with the officer. This counterpart is also marked with the voter's number on the register, so that the vote may be identified on a scrutiny; and a mark on the register shows that the voter has received a ballot-paper. The voter folds up the paper so as to conceal his mark, but to show the stamp to the officer, and deposits it in the box, which is locked and sealed, and so constructed that papers cannot be withdrawn without unlocking it. Papers inadvertently spoiled by the voters may be exchanged, the officer preserving separately the spoiled papers. If a voter is incapacitated from blindness, or other physical cause, or makes before the officer a declaration of inability to read, or when the poll is on a Saturday declares himself a Jew, the officer causes the paper to be marked as the voter directs, and keeps a record of the transaction. A voter who claims to vote after another has voted in respect of the same election, obtains, if the box is not placed in the box, but preserved apart as a "tendered" paper, however, declare his identity and that he has not already voted. The presiding-officer at the close of the poll has to account to the returning-officer for the papers entrusted to him, the number being made up by—(1) papers in the box, (2) spoiled papers, (3) unused papers and (4) tendered papers. During the voting (for which schoolrooms and other public rooms are available, and for which a separate compartment must be provided for every 150 electors entitled to vote at a station) agents of candidates are present to observe and report. A ballot-paper containing a mark and containing the words "in blank" is liable to the same penalties as in blank; and any person who has been debarred from voting for the want of a ballot-paper, or for whom they are prohibited from interfering with the voter, inducing him to show his vote, or attempting to ascertain the number on the back of the paper. These agents are also present with the returning-officer when he counts the papers and the votes, rejecting those papers—(1) which want the official mark on the back; (2) on which votes are given for more candidates than the voter is entitled to vote for; (3) on which anything except the number on the back is marked or written by which the voter can be identified; (4) which are unmarked, or so marked that it is uncertain for whom the vote is given. The counted and rejected papers, and also the "tendered" papers, counterfoils and marked register (which have not been opened), are, in parliamentary elections, transmitted by the returning officer to the clerk of the crown in chancery in England, or the sheriff-clerk in Scotland, who destroys them at the end of one year, unless otherwise directed by an order of the House of Commons, or of some court having jurisdiction in election petitions. Such petitions either simply dispute the accuracy of the return on the ground of miscounting, or wrongful rejection of marks or other irregularities, and are dealt with by the returning officer of the county concerned, who makes an inquiry into the counted and rejected papers; or make allegations of corruption, &c. on which it may be necessary to refer to the marked counterfoils and ascertain how bribed voters have voted. Since the elections of 1874 much discontent has been expressed, because judges have rejected papers with trifling (perhaps accidental) marks other than the X upon them, and because elections have been lost through the failure of the officer to stamp the papers. For this purpose the use has been suggested of a perforating instead of an embossing stamp, while a dark-ground paper with white voting-spaces would make misplaced votes impossible.

The Ballot Act introduced several new offences, such as forging of papers or fraudulently defacing or destroying a paper or the official mark; supplying a paper without due authority; fraudulently putting into the box a non-official paper; fraudulently taking a paper out of the station without due authority; destroying, taking, opening or otherwise interfering with a box or packet of papers then in use for election purposes. These offences and attempts to commit them are punishable in the case of officers and clerks with imprisonment for two years, with or without hard labour. In other cases the term of imprisonment is six months.

The ballot was long criticised as leading to universal hypocrisy and deception; and Sydney Smith spoke of "voters, in dominos, going to the poll in sedan-chairs with closely-drawn curtains." The observed effect of a secret ballot has been, however, gradually to exterminate undue influence. The alarm of "the confessional" seems to be unfounded, as a Catholic penitent is not bound to
confess his vote, and if he did so, it would be a crime in the
confessor to divulge it.

Continental Europe.—The ballot is largely employed in
European countries. In France, where from 1840 to 1845 the
ballot, or scrutin, had been used for deliberative voting in the
chamber of deputies, its use in elections by the Chamber of
Deputies was carefully regulated at the beginning of the Second Empire
by the Organic Decree of the 2nd of February 1852. Under
this law the voting was superintended by a bureau consisting of the
deputy returning-officer (called president of the section), four
unpaid assessors selected from the constituency and a secretary.
Each voter presents a polling-card, with his designation, date of
birth and signature (to secure identity), which he had previously
got at the Mairie. This the president mutilates, and the vote
is then recorded by a "bulletin," which is not official, but is
generally printed with a candidate's name, and given to the
voter by an agent outside, the only conditions being that the
bulletin shall be "sur papier blanc, sans signe extérieurs, et
préparé en dehors de l'assemblée." The total number of votes
given (there being only one member in each electoral district)
is checked by reference to "la feuille d'appel et inscription des
votants," the law still supposing that each voter is publicly
called on to vote. If the voter, when challenged, cannot sign
his polling-card, he may call a witness to sign for him. The
following classes of bulletins are rejected:—illissibles, blancs,
ne contenant pas une désignation suffisante; sur lesquels les
votants se sont fait connaître; contenant le nom d'une personne
n'ayant pas le droit d'agent public (i.e., a person not
nommée). Only the votes pronounced had by the bureau
in presence of representative scrutineers are preserved, in case
these should be called for during the "Session pour vérification
des Pouvoirs." Practically the French ballot did not afford
secrecy, for you might observe what bulletin the voter took from
the agent, and follow him up the queue into the polling-place;
but the determined voter might conceal his vote even from the
undue influence of government by scrupulously printing the
mute and writing his vote. This was always a good vote and
scrutiny of good votes was impossible. The ballot is still used in
the elections to the National Assembly, but in the Assembly
itself only in special cases, as e.g., in the election of a "rapporteur.
Under the law of 10th August 1871 the conseils généraux
(departmental councils) are elected by ballot.

In Piedmont the ballot formed part of the free constitutional
government introduced by Charles Albert in March 1848; it was
extended to Italy in 1861. Voting for the Italian chamber of
deputies takes place under the law of 20th November 1859,
and in public halls (not booths), to which admission is gained by
showing a certificate of inscription, issued by the mayor to each
qualified voter. A stamped blue official paper, with a memorial
dum of the law printed on the back (bollole spiegali), is then
issued to the elector; on this he writes the name of a candidate
(there being equal electoral colleges) or, in certain exceptional
cases, gets a confidential friend to do so, and hands the paper
folded up to the president of the bureau, who puts it in the box
(urna), and who afterwards presides at the public "squittino
dei suffragi." Greece is the only European country in which
the ball-ballot is used. The voting takes place in the churches,
each candidate has a box on which his name is inscribed, one
half (white) being also marked "yes," the other half (black)
"no. The voter, his citizenship or right to vote in the eparchy
being verified, receives one ball or leaden bullet for each candidate
from a wooden bowl, which a clerk carries from box to box. The
voter stretches his arm down a funnel, and drives the ball into the
"yes" or "no" division. The vote is secret, but there is
apparently no check on "yes" votes being given for all the
candidates, and the ball or bullet is imitable.

The earlier history of the ballot in Hungary is remarkable.
Before 1848 secret voting was unknown there. The electoral
law of that year left the regulation of parliamentary elections to
the county and town councils, very few of which adopted the
ballot. The mode of voting was perhaps the most primi-
tive on record. Each candidate had a large box with his name
superscribed and painted in a distinguishing colour. On
entering the room alone the voter received a rod from 4 to 6 feet
in length (to prevent concealment of non-official rods on the
voter's person), which he placed in the box through a slit in the
lid. By the electoral law of 1874 the ballot in parliamentary
elections in Hungary was abolished, but it was made obligatory in
the elections of town and county councils, the voting being
for several persons at once.

In Prussia, Stein, by his Stidteordnung, or municipal
commerce of 1808, introduced the ballot in the election of
the municipal assembly (Stadtverordnetenversammlung). Under
the German constitution of 1867, and the new constitution of
the 1st of January 1871, the elections of the Reichstag were to
be conducted by universal suffrage under the ballot in con-
formity with the electoral law of the 31st of May 1869.

America.—At the first elections in America voting was vivo
carte; but several of the colonies early provided for the use of
written or printed ballots. By 1775 ballots were used in the New
England states, in Pennsylvania, Delaware, North Carolina and
South Carolina; they were introduced in New Jersey in 1776,
and in New York in 1778, so that, at the time the constitution
of the United States was adopted, "viva voce voting prevailed at
public elections only in Maryland, Virginia and Georgia. Of the
new states which later entered the Union, only Illinois, Kentucky,
Missouri and Arkansas did not have a ballot system when they
became states. During the first half of the 19th century,
Maryland, Georgia, Arkansas (1846) and Illinois (1848) adopted
the ballot. In Missouri, ballot-voting was introduced to some
localities in 1845, but not until 1863 it was generally adopted in
that state. Virginia did not provide for voting by ballot until
1869, and in Kentucky "viva voce voting continued until 1819,
but while the use of ballots was thus required in voting, and
most of the states had laws prescribing the form of ballots and
providing for the count of the vote, there was no provision
making it the duty of any one to print and distribute the ballots
at the polling-places on election day. In the primitive town
meetings ballots had been written by the voters, or, if printed,
were prepared by the candidates. With the development of
elections, the task of preparing and distributing ballots fell to
delgates to committees for the various parties. The ballot-
tickets were thus prepared for party-lists of candidates, and it
was not easy for any one to vote a mixed ticket, while, as the
voter received the ballot within a few feet of the polls, secrecy
was almost impossible, and intimidation and bribery became
both easy and frequent.

Soon after the adoption of the Australian ballot in Great
Britain, it was introduced in Canada, but no serious agitation
was begun for a similar system in the United States until 1883.
In 1879 the ballot was adopted in Colorado, and in 1883 in
the legislatures of New York and Michigan, although neither
became law. A Wisconsin law of that year, regulating elections in
cities of over 50,000 population, incorporated some features of the
Australian system, but the first complete law was enacted by
Massachusetts in 1888. This Massachusetts statute provided for
the printing and distribution of ballots by the state to contain
the names of all candidates arranged alphabetically for each office,
the electors to vote by marking the name of each candidate for
whom they wished to vote. At the presidential election of 1888
it was freely alleged that large sums of money had been raised on
an unregulated scale for the purchase of votes, and this situation
created a feeling of deep alarm which gave a powerful impetus to
the movement for ballot reform. In 1889 new ballot laws were
enacted in nine states: two states bordering on Massachusetts,
Connecticut and Rhode Island; four states in the middle-west,
Indiana, Michigan, Wisconsin and Minnesota; two southern
states, Tennessee and Missouri; and Montana, in the far west.
The Connecticut law, however, marked but little improvement
over former conditions, since it provided only for official envelopes
in which the unofficial party ballots should be voted. The
Indiana law provided for a single or "blanket" ballot, but with
the names of candidates arranged in party-groups, and a method
of voting for all of the candidates in a party-group by a single
mark. Michigan and Missouri also adopted the party-group system. The other states followed the Massachusetts law providing for a blanket ballot with the candidates arranged by offices. The new ballot system had its first practical demonstration at the Massachusetts election of 1889, and its success led to its rapid adoption in many other states. In 1890 ballots were passed in seven states: Vermont, Mississippi, Wyoming and Washington provided for the Massachusetts plan, although Vermont afterwards adopted the system of party-groups, which Maryland used from the first. The New York and New Jersey laws of 1890, however, only provided for official ballots for each party, and allowed ballots obtained outside of the polling-booths to be used. In 1891 seventeen additional states and two territories adopted the Australian ballot system. All of these provided for a blanket ballot; but while the Massachusetts arrangement was adopted as late as 1893 and 1894, at Arлингton, Nebraska, At the quadrennial, North and South Dakota, Kentucky, Texas and Oregon, the system of party groups was followed in Colorado, Delaware, Illinois, Maine, Ohio, Pennsylvania and West Virginia. California had the Massachusetts arrangement of names, but added on the ballot a list of party names, by marking one of which a voter would cast his vote for all of the candidates of that party. Pennsylvania placed all the candidates not in a party-group in alphabetical order.

Iowa adopted the Australian ballot system in 1892; Alabama and Kansas in 1893; Virginia and Florida in 1894, and Louisiana in 1895 and 1896. In 1895, too, New York adopted the blanket ballot in place of separate party ballots, but arranged the names of candidates in party columns. The only state to abandon the blanket ballot after once adopting it was Missouri which in 1897 returned to the system of separate ballots, with no provision for booths where the ballot might be marked in secret. (See the article, "Present Status of the Ballot Laws," by Arthur Ludington, in Amer. Pol. Science Rev. for May 1909.)

Owing to the large number of officials chosen at one time in American elections, the form and appearance of the ballot used is very different from that in Great Britain. At the quadrennial presidential election in New York state, for example, the officers to be voted for by each electorate are thirty-six presidential electors, one congressman, state-governor, lieutenant-governor and five other state officers, a member for each house of the state legislature, several judges, a sheriff, county-clerk and other county officers. The column with the list of the candidates of each party for all of these offices is 2 to 3 ft. in length; and as there are often eight to ten party-tickets in the field, the ballot-paper is usually from 18 to 20 in. in width. Each voter receives one of these "blanket" ballots on entering the polling-place; he may put in a booth to mark either a party column or the individual candidates in different columns for whom he wishes to vote. Where, as in Massachusetts, the names of candidates are arranged by offices instead of in party-lists, every voter must mark the name of the individual candidate for whom he wishes to vote. Connecticut, New Jersey, Missouri, North and South Carolina, Georgia and New Mexico use the system of separate party ballots. (See also Voting, Voting Machines, Election, Representation.)

BALLOU, HOSEA (1771-1853), American Universalist clergyman, was born at Raymond, New Hampshire, on April 7, 1771. He was a son of Maturin Ballou, a Baptist minister, who was self-educated, early devoted himself to the ministry, became a convert to Universalism in 1789, and in 1794 became a pastor of a congregation at Dana, Massachusetts. He preached at Barnard, Vermont, and the surrounding towns in 1801-1807; at Portsmouth, New Hampshire, in 1807-1815; at Salem, Massachusetts, in 1815-1817; and as pastor of the Second Universalist Church in Boston from December 1817 until his death there on the 7th of June 1852. He founded and edited The Universalist Magazine (1795; later called The Trumpet) and The Universalist Expositor (1811; later The Universalist Quarterly Review); wrote about 10,000 sermons, many hymns, essays and polemic theological works; and is best known for Notes on the Parables (1804), A Treatise on Atoneinent (1805) and Examination of the Doctrine of a Future Retribution (1834); in these, especially the second, he showed himself the principal American expositor of Universalism. His great contribution to his Church was the body of denominational literature he left. From the theology of John Murray, who like Ballou has been called "the father of American Universalism," he differer in that he divested Universalism of every trace of Calvinism and opposed legalism and trinitarian views.

Consult the biography by Thomas Whittetmore (4 vols., Boston, 1843-1885) and that by Oscar U. Safford (Boston, 1889), and J. C. Adams, hosea Bal lou and the Gospel Revivalism (Boston, 1904).

His grand-nephew, Hosea Ballou (1796-1861), born in Halifax, Vermont, on the 18th of October 1796, preached to Universalists in Stafford, Connecticut (1817-1821); and in Massachusetts, in Roxbury (1821-1838) and in Medford (1838-1853); and in 1853 was elected first president of Tufts College at Medford, serving in that office until shortly before his death, which took place at Somerville, Massachusetts, on the 27th of May 1861. He was the first (1847) to urge the necessity of a Universalist denominational college, and this did much towards the establishment of Tufts. He was associated with the elder Hosea Ballou in editing The Universalist Quarterly Review; edited an edition of Simonds's History of the Crusades (1833); and wrote the Ancient History of Universalism, down to A.D. 553 (1829; 2nd ed., 1842).

Maturin Murray Ballou (1820-1893), son of the first Hosea, was a pioneer in American illustrated journalism, edited Gleason's Pictorial and Ballou's Monthly and many collections of quotations, and in 1872 became editor-in-chief of the Boston Daily Globe, of which he was one of the founders. He wrote a life of his father (1860), and a History of Cuba (1854).

BALLESTON SPA, a village and the county-seat of Saratoga county, New York, U.S.A., about 7 m. S. of Saratoga Springs. Pop. (1890) 3527; (1900) 3923; (1910 U. S. Census) 4138. It is served by the Delaware & Hudson railway, and is connected with Saratoga Springs, Albany, and Schenectady by electric lines. There are several manufacturing establishments, among which are one of the largest manufacturers of paper-hags in the United States and a large tannery. It is, however, as a popular summer resort that Ballston Spa is best known. Many fine chalybeate and other springs rising through solid rock from a depth of about 650 ft. furnish a highly effervescent water of considerable medicinal and commercial value. The village has the Ballston Spa public library, the Saratoga county law library and the Saratoga county court house. Ballston Spa, which was named in honour of the Rev. Eliphalet Ball, an early settler, was settled about 1787 by the grandfather of Stephen A. Douglas, and laid out in 1801.

See E. F. Prose, Centennial Hist. of Ballston Spa, 1908.

BALLYCASTLE, a seaport and watering-place on the north coast of Co. Antrim, Ireland, in the north parliamentary division, situated on a bay of the same name opposite Rathlin Island. Pop. (1901) 1481. It is connected with the Northern Counties (Midland) railway at Ballintoy by the Ballycastle light railway. The town consists of two divisions, about a quarter of a mile apart and connected by a fine avenue. Towards the close of the 18th century Mr Hugh Boyd, obtaining the estate, devoted himself to the extension and improvement of the property, established manufactories of paper-hags, building churches; and succeeded in producing a temporary vitality. Upwards of £150,000, including a large government grant, is said to have been expended upon the pier and harbour; but the violence of the sea overthrew the one and the other became filled with sand. To the east of the town are the remains of Bonamargy Abbey, the burial-place of many of the Mac-Donnell family. The Carey brook, by the side of which the abbey stands, was formerly called the Margy, and on its waters according to tradition dwelt the four children of Lir, changed to swans by their step-mother until St Columba released them from enchantment. (See P. W. Joyce, Old Celtic Romancs.) With this well-known romance is connected the wide-spread belief in Ireland of ill-fortune following the killing of a swan. Coal-seams, formerly extensively worked, and from an unknown
period of antiquity, appear in the cliffs towards Fair Head, and the fisheries are important. The coast-scenery and the view from the hill of Knocklayd are notable. Ballymena, a town of Co. Antrim, Ireland, in the mid parliamentary division, on the Braid, an affluent of the Maine, 2 m. above their junction. Pop. of urban district (1901) 10,886. It is 33 m. N.N.W. of Belfast on the Northern Counties (Midland) railway. Branch lines run to Larne and to Parkmore on the east coast. The town owes its prosperity chiefly to its linen trade, introduced in 1733, which gives employment to the greater part of the inhabitants. Brown linen is a specialty. Iron ore is raised in the neighbourhood. Antiquities in the neighbourhood are few and the present buildings of Ballymena Castle and of the parish church of Gracelaw, however, a 20th century settlement, was founded in 1746.

BALLYMONEY, a market town of Co. Antrim, Ireland, in the north parliamentary division, 53 m. N.N.W. from Belfast by the Northern Counties (Midland) railway. Pop. of urban district (1901) 2952. The Ballycastle railway joins the main line here. The trade of the town is prosperous, brewing, distilling and tanning being carried on, besides the linen manufacture common to the whole county. Soap, candles and tobacco are also manufactured, and the town is a centre for local agricultural trade. Near the neighbouring village of Dervock (4½ m. N.) is a cottage, said to be an inscription to have been the home of the ancestors of William McKinley, president of the United States.

BALLYMOTE, a market town of Co. Sligo, Ireland, in the south parliamentary division, 14 m. S. of Sligo by the Midland Great Western railway. Pop. (1901) 997. It is a centre for some agricultural trade and has carriage-building works. There are remains of a strong castle, built by the powerful earl of Ulster, Richard de Burgh, in 1300, and the scene of hostilities in 1561 and 1652. Ruins are also seen of a Franciscan foundation attributed to the 13th century; it was a celebrated seat of learning and an extant memorial of the work of its monks is the Book of Ballymote (c. 1391) in the possession of the Royal Irish Academy, a miscellaneous collection in prose and verse of historical, genealogical and romantic writings. There are also, near the town, ruins of a house of the Knights of St John (1303).

BALLYSHANNON, a seaport and market-town of Co. Donegal, Ireland, in the south parliamentary division, at the mouth of the Erne; on the Bundoran branch of the Great Northern railway. Pop. (1901) 2359. The river is here crossed by a bridge of twelve arches, which connects the town with the suburb of The Port. Below the bridge the river forms a beautiful cascaded waterfall, with a fall at low water of 16 ft. Here is the salmon leap, where the fish are trapped in large numbers, but also assisted to mount the fall by salmon-ladders. The fisheries are of great value, and there is an export trade to England in salmon, which are despatched in ice. The harbour is a small exposed creek of Donegal Bay, and is only accessible to small vessels owing to a bar. Previous to the Union Ballyshannon returned two members to the Irish parliament and it was incorporated by James I. There are slight remains of a castle of the O'Donnells, earls of Tyrconnell, where the English, on attempting to besiege it, were defeated and lost heavily in their retreat at the end of December. 1597, when there are numerous relics of encampments in the vicinity and other remains. Coolmore, 3 m. N.W., is a bathing-resort.

BALM, a fragrant herb, Melissa officinalis, of the Deadnettle order (Labiate) with opposite, ovate, crenulated leaves, which are wrinkled above, and small white or rose-spotted flowers. It is a native of central and southern Europe; it is often grown in gardens and has become naturalized in the south of England and grows apparently wild as a garden escape in North America. The name is from the Greek μέλις, the plant being visited by bees. Bastard Balm is an allied plant, Melitiss Melissopodium, a southern European species, found in the south and south-west of England.

BALMACEDA, JOSE MANUEL (1838–1892), president of the republic of Chile, was born in Santiago in 1838. His parents were wealthy, and in his early days he was chiefly concerned in industrial and agricultural enterprise. In 1865 he was one of the representatives of the Chilean government at the general South American congress at Lima, and after his return obtained great distinction as an orator in the national assembly. After discharging some diplomatic missions abroad, he became successively minister of foreign affairs and of the interior under the presidency of Señor Santa Maria, and in the latter capacity carried compulsory civil marriage and several other laws highly obnoxious to the clergy. In 1886 he was elected president; but, in spite of his great capacity, his imperious temper little fitted him for the post. He was soon irremediably at variance with the majority of the national representatives, and on the 1st of January 1891 he sought to terminate an intolerable situation by refusing to summon the assembly and ordering the continued collection of the taxes on his own authority. This led to the Chilean Civil War of 1891, which ended in the overthrow of Balmaceda, who committed suicide on the 28th of September, the anniversary of his elevation to the presidency.

BALMAIN, a town of Cumberland county, N.S.W., Australia, on the western shore of Darling Harbour, Port Jackson, 2 m. by water from Sydney and suburban to it. Pop. (1901) 30,881. It is one of the home of great numbers of the working classes of Sydney and some of the largest factories and most important trade are situated here. Silk, flax, iron founding, chemicals, glass and soap works, shipbuilding yards and a cocoanut-oil factory in connexion with the soap-manufacture at Port Sunlight, England, are among the chief industrial establishments. Balmain became a municipality in 1860.

BALMERINO, JAMES ELPHINSTONE, 1ST BARON (c. 1553–1612), Scottish politician, was the third son of Robert, 3rd Lord Elphinstone (d. 1602). Rising to power under James VI. he became a judge and a royal secretary; he accompanied the king to London in 1603 and was made Lord Balmerino, or Balmerinoch, in 1604. In 1605 he became president of the court of session, but his ardour for the Roman Catholic religion brought about his overthrow. In 1590 on the king's behalf, but without the king's knowledge, he had sent a letter to Clement VIII, in which he addressed the pope in very cordial terms. A copy of this letter having been seen by Elizabeth, the English queen asked James for an explanation, whereupon both the king and the secretary declared it was a forgery. There the matter rested until 1608, when the existence of the letter was again referred to during some controversy between James and Cardinal Bellarmine. Interrogated afresh Balmerino admitted that he had written the compromising letter, that he had surreptitiously obtained the king's signature, and that afterwards he had added the full titles of the pope. In March 1609 he was tried, attainted and sentenced to death, but after a brief imprisonment he was released and he died at Balmerino in July 1612.

Balmerino's eldest son JOHN (d. 1640) was permitted to take his father's title in 1613. In 1634 he was imprisoned for his opposition to Charles I. in Scotland, and by a bare majority of the jury he was found guilty of "leasing-making" and sentenced to death. But popular sympathy was strongly in his favour, the poet Drummond of Hawthorn and others interceded for him, and after much hesitation Charles pardoned him, and he returned to Balmerino. In 1597, when he joined the army of the Pretender, he was made a chief and one of the Covenanters and a trusted counsellor of the marquess of Argyll; he presided over the celebrated parliament which met in Edinburgh in August 1641, and was one of the Scottish commissioners who visited England in 1644. He died in February 1649 and was succeeded as 3rd lord by his son JOHN (1623–1704), who in 1669 inherited from his uncle James the title of Lord Coupaur. John's son JOHN, 4th Lord Balmerino (1652–1736), was a lawyer of some repute and, although a sturdy opponent of the Union, was a Scottish representative peer in 1710 and 1715. John's son ARTHUR (1688–1746) who became 6th Lord Balmerino on the death of his half-brother John in January 1746, is famous as a Jacobite. He joined the partisans of James Edward, the Old Pretender, after the battle of Sheriffmuir in November 1715, and then lived for some time in exile, returning to Scotland in 1733 when his father had...
secured for him a pardon. He was one of the first to join Charles Edward in 1745; he marched with the Jacobites to Derby, fought at Falkirk and was captured at Culloden. Tried for treason in Westminster Hall he was found guilty, and was beheaded on the 11th of August 1746, behoving both at his trial and at his execution with great constancy and courage. On his death without issue his titles became extinct.

**Balmès, Jaime Lucasio (1810-1848)**, Spanish ecclesiastic, eminent as a political writer and a philosopher, was born at Vich in Catalonia, on the 28th of August 1810, and died there on the 9th of July 1848. Having attacked the regent Espartero and been exiled he founded and edited on his return the *El Pensamiento de la Nación*, a Catholic and Conservative weekly; but he is principally known for *El Protestantismo comparado con el Catolicismo en sus relaciones con la Civilización Europea* (3 vols., 1842-1844, 6th edition, 1879; Eng. trans. London, 1849), an able defence of Catholicism on the ground that it represents the spirit of obedience or order, as opposed to Protestantism, the spirit of revolt or anarchy. From the historical standpoint it is of little value. The best of his philosophical works, which are clear expositions of the scholastic system of thought, are the *Filosofía Fundamental* (4 vols., 1846, Eng. trans. by H. F. Brownson, 2 vols. New York, 1850), and the *Cursus de Filosofía* (4 vols., 1847), which he translated into Latin for use in seminaries.

**Balmoral Castle** (Gaelic, "the majestie dwelling"), a private residence of the British sovereign, in the parish of Crathie and Braemar, Aberdeenshire, Scotland, on the right bank of the Dee (here spanned by a fine suspension bridge), 9 m. W. of Balmoral and at a height of 900 ft. above the sea. The property formerly belonged to the Forthquhars of Inverey, from whom it was purchased by Sir Robert Gordon, whose third son, however, did not reside there. He died in 1537. The castle now belongs to the Duke of Gordon, who is the present owner.

The castle is of stone and is situated on the east side of the beach and is surrounded by a beautiful park with fine views of the Dee and the surrounding country. The house contains many interesting relics and paintings, and is open to the public on certain days of the year. The castle is open to the public from May to September.

**Balnaves, Henry (1512?-1579)**, Scottish politician and reformer, born at Kirkcaldy about 1512, was educated at St Andrews and on the continent, where he adopted Protestant views. Returning to Scotland, he continued his legal studies and in 1538 was appointed a lord of session. He married about the same time Christian Cheves, and in 1539 was granted the estate of Halthill in Fife, after which he is generally named. Before 1540 he was sworn of James V.'s privy council, and was known as one of the party in favour of the English alliance and of an ecclesiastical reformation. He is also described as treasurer to James (Letters and Papers, 1543, I. 64), but the regent Arran appointed him secretary in the new government of the infant Queen Mary (January 1543). He promoted the act permitting the reading of the Scriptures in the vulgar tongue, and was one of the commissioners appointed to arrange a marriage treaty between the little queen and the future Edward VI. In London he was not considered so compliant as some of the other commissioners, and was not made privy to all the engagements taken by his colleagues (ib. i. 834). But Beton "loved him worst of all," and, when Arran went over to the priestly party, Balnaves was, in November 1543, deprived of his offices and imprisoned in Blackness Castle.

deleted

Thence he was released by the arrival of Hertford's fleet in the following May, and from this time he became a paid agent of the English cause in Scotland. He took no part in the murder of Both; but was one of the most active defenders of the While of St Andrews. He received £500 from Henry VIII. in December 1546, was granted an annuity of £25 by Protector Somerset in 1547 and was made English paymaster of the forces in St Andrews. When that castle surrendered to the French in July Balnaves was taken prisoner to Rouen. Somerset made vain efforts to procure his release and continued his pension. He made himself useful by giving information to the English government, and even Mary Tudor sent him £50 as reward in June 1554. Balnaves also busied himself in writing what Knox calls "a charitable book," a "roadcast of Christian doctrine," which was found in MS. with a preface by Knox, among the reformer's papers, and was published at Edinburgh in 1558 under the title *The Confession of Faith.*

In 1557 Balnaves was permitted to return to Scotland and regain his property; probably it was thought that Mary Tudor's burnings would have cooled the ardour of his English affections, and that in the war threatening between two Catholic countries, Balnaves would serve his own. The accession of Queen Elizabeth changed the situation, and Mary of Guise had reasons for accusing him of "practices out of England" (*Salluxius MSS.* i. 152). He was, in fact, an active part in the Rising of 1568, and was commissioned by the Congregation to solicit the help of the English government through Sir Ralph Sadleir at Berwick. He was also selected one of the Scots representatives to negotiate with the duke of Norfolk in February 1560. In 1563 he was restored to his office as lord of session, and was one of those appointed by the General Assembly to revise the *Book of Discipline.* He was one of Bothwell's judges for the murder of Darnley in 1567, and in 1568 he accompanied Moray to the York inquiry into Queen Mary's guilt. He resigned his judicial office in 1574, and the following year was created Earl of Balnabard on the strength of one ballad, "O gallandis all, I cry and call," which is printed in Allan Ramsay's *Evergreen* (2 vols. 1724-1727).

**Balneotherapeutics** (Lat. balneum, a bath, and Gr. θεραπεύειν, to treat medically). The medical treatment of disease by internal and external use of mineral waters is quite distinct from "hydrotherapy," or the therapeutic uses of pure water. But the term "balneotherapeutics" has gradually come to be applied to everything relating to spa treatment, including the drinking of waters and the use of hot baths and natural vapour baths, as well as of the various kinds of mud and sand used for hot applications. The principal constituents found in mineral waters are sodium, magnesium, calcium and iron, in combination with the acids to form chlorides, sulphates and carbonates. Other substances occasionally present in sufficient quantity to exert a therapeutic influence are arsenic, lithium, potassium, manganese, bromine, iodine, &c. The chief gases in solution are oxygen, nitrogen, carbonic acid and sulphured hydrogen. Argon and helium occur in some of the "simple thermal" and "thermal sulphur waters." There are few doctors who would deny the great value of special bathing and drinking cures in certain morbid conditions. In the employment of the various mineral waters, many of the spas adopt special means by which they increase or modify their influence, e.g. "aromatic" or "medicated baths," in which the various substances are mixed to exert a special influence on the skin and peripheral nerves. Of these the "pine-needle" bath has the greatest repute; it is made by adding a decoction of the needles or young shoots of pines and pines. Fir wood oil (a mixture of ethereal oils) or the tincture of an alcoholic extract acts equally well. The volatile ethereal constituents are supposed to penetrate the skin and to stimulate the cutaneous
circulation and peripheral nerves, being eliminated later by the ordinary channels. Similar effects follow the addition to the bath of aromatic herbs, such as camomile, thyme, &c. For a full-sized bath 1½ to 2 lb of herbs are tied in a muslin bag and infused in a gallon of boiling water; the juice is then expressed and the infusion added to the bath. Astringent baths are prepared in a similar way from decoctions of oak bark, walnut leaves, &c. In many spas on the European continent baths are prepared from peat or mud mixed with hot mineral water. Mineral peat consists of decomposing vegetable soil that has been so long in the neighbourhood of the medicinal spring that it has undergone peculiar and variable chemical changes. This is mixed with the hot mineral water until the bath has the desired consistency, the effect on the patient being in most direct proportion to its density. These baths vary greatly in composition. Mud baths are chiefly prepared from muddy deposits found in the neighbourhood of the springs, as at St Amand. They act like a large poultice applied to the surface of the body, and in addition to the influence of the temperature, they exert a considerable mechanical effect. The pulse is accelerated some 6 to 12 beats a minute, the respiration number rises, and the patient is thrown into a profuse perspiration. They have very great value in gouty and rheumatic conditions and in some of the special troubles of women.

There are many advantages in the so-called mineral water treatment is distinctly contra-indicated. Advanced cardiac disease and cardiac cases with failure of compensation must pre-eminent-ly be treated at home, not at a spa. Advanced arterio-sclerosis, any form of serious organic visceral disease, advanced cirdrosis, pulmonary tuberculosis with a tendency to haemoptysis, much elevation of temperature or emaciation, are all entirely unsuit ed for this form of treatment. Serious organic nervous diseases, great nervous depression and old cases of paralysis are all contra-indicated. Any trouble, however suit ed in itself for spa treatment, must be considered inapplicable if complicated with pregnancy.

In advising balneotherapeutic treatment in any case, all the conditions and habits of the patient—pecuniary, physical and psychical—must be considered, as the spa must be fitted to the patient, not the patient to the spa. Besides the particular disease, the idiosyncrasy of the patient must be considered, the same morbid condition in different people requiring very different treatment. Retarded convalescence is a condition often treated at the spas, although hygienic surroundings, both mental and physical, are usually all that is necessary to ensure complete recovery. After rheumatic fever, however, if the joints remain painful and the heart is dilated, the thermal gaseous saline water of Balneum, augmented by Schwartzentruber’s bath. Anaemia can usually appear to work wonders. Chronic rheumatism, where there is much exudation round a joint or incipient stiffness of a joint, may be relieved by hot thermal treatment, especially when combined with various forms of massage and exercises. Simple thermal waters, hot sulphur springs and hot muriated waters are all successful in different cases. Chronic muscular rheuma tism can also be benefited in a similar manner. Diseases of the nervous system are on the whole treated by these means with small success. Mental diseases other than very mild cases of depression should be considered inapplicable. Neu rasthenies are sometimes treated at day-baths or thermal muriated saline spas; but such treatment is entirely secondary to the general management of the case. Neuralgic affections and the later stages of neuritis, especially when dependent on gout or rheuma tism, are often relieved or cured. Abdominal venosity (ab dominal plethora), a feature of obesity, glycosuria, &c., are extremely well fitted for this form of treatment. The alkaline sulphated waters, the bitter waters and the common salt waters can all be prescribed, and after a short course can be supplemented with various forms of active and passive exercises. Diseases of the respiratory organs are far more suited for climatic treatment than for treatment by the effect of the patient, and may be better or equally well treated at home, or by seaside residence or a sea voyage, though many physicians prescribe chloride of sodium waters, followed by a course of iron waters at some suitably situated spa. In the anaemia dependent on malarial infection, the muriated or alkaline sulphated waters at spas of considerable elevation and combined with iron and arsenic are often very beneficial. Gravel and stone, if of the uric acid variety, can be treated with the alkaline waters, but the case must be under constant observation lest the urine become too alkaline and a deposition of phosphates take place on the already formed uric acid stone. Gout is so variable both in cause and effect that much discrimination is required in its treatment. Where the patient is of “full habit,” with portal stagnation, the sulphated alkaline or mild bitter waters are indicated, especially those of Carlsbad and Marienbad; but the use of these strong waters must be followed by a long rest under strict hygienic conditions. Where this is impossible, a milder course must be advised, as at Homburg, Kissingen, Harrogate, Wies baden, Baden-Baden, &c. For very delicate patients, and where time is limited, the simple thermal waters are preferable.

For radiant heat and light baths and electric baths of all kinds, see Electrotherapeutics; and for compressed air baths, Aerotherapeutics. (See also BATHS, THERAPEUTICS, and the articles on diseases.)

**BALQUHIDDER—BALSAAM**

(BALQUHIDDER (Gaelic, “the farm in the back-lying country”), a village and parish of Perthshire, Scotland. Pop. (1901) 600. The village lies 2 m. W. of the station of the same name on the Caledonian railway from Callander to Oban, and 273 m. N.W. of Stirling. It is situated at the east end of Loch Voil, a lake at the foot of the Braes of Balquhidder. The Maclaurins acquired the district as early as the 9th century and occupied it for several hundred years until ousted by the Macgregors, a neighbouring clan, who had repeatedly raided their lands, and in 1558 slew the chief and many of his followers. Balquhidder was the scene of some of the exploits of Rob Roy, who died there in 1734. His grave in the old kirkyard is marked by a stone ornamented with rude carving, executed probably before his death. Another ancient stone is said traditionally to cover the grave of Angus, a Christian missionary, who was the first to carry on Christian work in this part of the Highlands.

**BALRAMPUR,** a town of British India near the river Rapti, 28 m. from Gonda, in the Gonda district of the United Provinces. Pop. (1901) 16,723. It gives its name to one of the largest talukdari estates in the province. The raja, Sir Digbijai Singh K.C.S.I., was conspicuously loyal during the Mutiny, and was rewarded with accessions of territory and hereditary privileges. His death in 1882 gave rise to prolonged litigation and the estate was thrown into chancery. The income is estimated at £20,000, paying a revenue of £66,000. Numerous schools and hospitals are supported. Balrampur contains a large palace, a handsome modern temple and an Anglo-vernacular school.

**BALSAAM** (from Gr. βαλσαμος, through Lat. balsamum, contracted by popular use to O. Fr. basme, mod. Fr. bôme; Eng. balm), a term properly limited to such resins or oleo-resins as contain benzoic acid or cinnaamic acid or both. Those balsams which conform to this definition make up a distinct class, allied to each other by their composition, properties and uses. Those found in commerce are the balsams of Peru, balsam of Tolu, liquid storax and liquidamber. Balsam of Peru is the produce of a lofty leguminous tree, Myroxylon Pereirae, and is a limited area in San Salvador, Central America and introduced into Ceylon. It is a thick, viscid oleo-resin of a deep brown or black colour and a fragrant balsamic odour. It is used in perfumery. Though contained in the pharmacopeias it has no special medicinal virtues. Balsam of Tolu is produced from Myroxylon totalefcerum. It is of a brown colour, thicker than Peru balsam, and attains a considerable degree of solidity on keeping. It also is a product of equatorial America, but is found over a much wider area than is the balsam of Peru. It is used in perfumery and as a constituent in cough syrups and lozenges. Those found in California and California or Tolu balsam yielded by Liquid a mbar orientalis, a native of Asia Minor. It is a soft resinous substance, with a pleasing balsamic odour, especially after it
BALSHAM—BALTIC SEA

has been kept for some time. It is used in medicine as an external application in some parasitic skin diseases, and internally as an expectorant. An

analogous substance, derived from Liquidambar Albingia in Java. Liquidambar balsam is derived from Liquidambar styraciflua, a tree found in the United States and Mexico. It contains cinnamon acid, but not benzoic acid.

Of so-called balsams, entirely distillate of cinnamon and benzoic constituents, the following are found in commerce:—Mecca balsam or Balm of Ceylon, from Commiphora opobalsamum, a tree growing in Arabia and Abyssinia, is supposed to be the balm of Scripture and the βάλσαμος of Theophrastus. When fresh it is a viscous fluid, with a penetrating odour, but it solidifies with age. It was regarded with the utmost esteem among the nations of antiquity and to the present day it is peculiarly prized among the people of the East. For balsam of copaiba see COPAIBA.

Under the name of wood oil, or Gurjun balsam, an oleo-resin is procured in India and the Eastern Archipelago from several species of Dipterocarpus, chiefly D. turbinatus, which has the odour and properties of copaiba and has been used for the same purposes. Wood oil is also used as a varnish in India and forms an effective protection against the attacks of white ants. Canada balsam is a second variety in the same family, a tree known as balsamea, a tree that grows in Canada and the northern parts of the United States. It is a very transparent substance, somewhat fluid when first run, but thickening considerably with age, possessed of a delicate yellow colour and a mild terebinthous odour. It contains 24% of essential oil, 60% of resin soluble in alcohol, and 16% of resin soluble in ether. Its chief uses are for mounting preparations for the microscope and as a cement for glass in optical work.

The garden balsam is an annual plant, Impatiens balsamina, and the balsam apple is the fruit of Momordica balsamica, nat. order Cucurbitaceae.

BALSHAM, HUGH DE (d. 1286), English churchman, appears first as sub-prior of the monastery of Ely. On the death of William of Kilkeney in 1256 the monks elected him bishop of Ely, to the annoyance of Henry III. who had handed over the temporalities of the see to John de Waleran. The election was confirmed by the pope in 1257 and Hugh set to work to repair the harm done to the diocese by the intruder. In 1280 the bishop obtained a charter allowing him to replace the secular brethren residing in his hospital of St John at Cambridge by study scholars, or young men under fourteen. He sent three of these scholars from the brethren of the hospital, and for them Hugh de Balsham founded and endowed the college of Peterhouse.

BALT, a town in the Russian government of Podolia, between the Dniester and the Bug, 131 m. by rail N.N.W. of Odessa. It carries on a large trade in cattle, horses and grain, and has two annual fairs, held at Whitsuntide and in June. A variety of industries, such as tallow-melting, soap-boiling, tile-making and brewing, are carried on. The Jews form a very considerable part of the population, which in 1867 numbered 14,528, and in 1877, 23,533. Balt was in great part destroyed by the Russians in 1780.

BALTARD, LOUIS PIERRE (1764-1846), French architect and engraver, was born in Paris on the 9th of July 1764. He was originally a landscape painter, but in his travels through Italy was so much struck with the beauty of the Italian buildings, that he changed his profession and devoted himself to architecture. In his new occupation he achieved great success, and was selected to prepare the plans for some of the largest public edifices in Paris. His reputation, however, is chiefly based on his great skill in engraving. Among the best known of his plates are the drawings of Paris (Paris et ses monuments, 2 vols. fol., 1803), the engravings for Denon's Égypte, the illustrations of Napoleon's wars (La Colonne de la grande armée), and those contained in the series entitled the Grand prix de l'architecture, which for some time he carried on alone. He also gained distinction as an engraver of portraits. Baltard died in Paris on the 22nd of January 1846.

Two of his children were also architects. Of these the more important was VICTOR BALTARD (1805-1874), who was born in Paris on the 18th of June 1805. In 1823 he gained the prix de Rome at the École des beaux-arts for designing a military school. He was largely instrumental in introducing a regular scheme of fresco decoration by modern artists in the churches of Paris, to take the place of the heterogeneous collections of pictures of all kinds with which their walls had been promiscuously decorated. He built many additions to existing churches, and also the church of St Augustin, in which he united the structural values of stone and steel. His most popular achievement was, however, the building of the central market in Paris, where Victor Baltard also built the slaughter houses and the cattle market of La Villette. He died in Paris on the 13th of January 1874, after a life of great activity in his profession.

BALTIC SEA (Scand. and Ger. Ostsee; Russ. Baltiskyoe More), a sea extending between 54° and 66° N. lat., and 9° and 30° E. long., surrounded by the territories of Sweden, Russia, Germany and Denmark. Its greatest length is about 960 m.; greatest breadth about 400 m.; and length of coast-line, 5000 m.; the central axis runs approximately from south-west to north-east. The Baltic is connected with North Sea by the winding channel between the south of Scandinavia and the Cimbrian peninsula. This channel is usually included in the Baltic. The part of it west of a line joining the Skaw with Christiania fjord receives the name of Skagerrak; the part east of this line is called the Kattegat. At its southern end the Kattegat is blocked by the Danish islands, and it communicates with the Baltic proper by narrow channels called the Sound, the Great Belt and the Little Belt. The real physical boundary between the North Sea and the Baltic is formed by the plateau on which the islands Zealand, Fünen and Laaland are situated, and its prolongation from the islands Falster and Mølen to the coasts of Mecklenburg and Rügen.

East of this plateau the Baltic proper forms a series of hollows or troughs. The first, or Bornholm deep, lies east of the island of Bornholm, and is separated from the next, or Gotland deep, by the Middelbank. Beyond the Middelbank the Danziger Tiefe, an isolated depression, lies to the south-east, while to the north-east the Gotland basin, the largest and deepest of all, extends north-eastwards to the Gulf of Finland. Along the Swedish coast a deep channel runs northward from outside the island of Öland into the Baltic. This channel is entirely surrounded by islands, which sweeps eastward and northward from near Karlskrona, and on which the island of Gotland stands, but it communicates at its northern end with the Gotland deep, and near the junction opposite Landsort is the deepest hole in the Baltic (420 metres = 230 fathoms).

An unbroken ridge, extending from Stockholm to Hangö in Finland, separates the Baltic basin proper from the depression between Sweden and the Åland Isles, to which the name Åland Haf has been given. North of the Åland Haf a ridge defines the southern edge of another depression, the Bothnian Sea, which in turn is separated from the most northerly division, the Gulf of Bothnia, by a ridge across the narrow Quarken or Kvarken Strait. The Gotland deep may be said to extend directly into the Gulf of Finland, an arm of the Baltic, running eastwards for about 250 m., and separating Finland from Estonia. Between Estonia and Courland is the Gulf of Riga, a shallow inlet of roughly circular form, about 100 m. in diameter, and nowhere more than 27 fathoms deep.

According to recent computations the total area of the Baltic, including the Skagerrak and Kattegat, is 166,397 sq. m., and its volume 6907 cub. m., giving a mean depth of 36 fathoms, which is markedly less than that of any other arm of the sea of similar area.

In the deeper hollows in the south part of the Baltic the bottom consists almost invariably of either soft brown or grey mud or hard clay, while on the shallow banks and near the low coasts fine sand, of white, yellow or brown colour with small pebbles, is usually found.
BALTIC SEA

At the time of the last great submergence, in glacial times, an arm of the sea was the southernmost of the Baltic basins. It was connected with the littoral up to the Gulf of Bothnia, and including the present lakes Vener, Hjelmar, and Mälár. During this period the waters of the northern Baltic were sufficiently deep to support the fauna and flora characteristic of the open sea, whereas the shallow parts were almost devoid of life, and upheaval restricted direct communication with the open sea to the Danish channels, and the Baltic waters became fresher: this is most clearly shown by the sea mollusc fauna, which usually is supposed to be characteristic of shallow waters, or by invertebrates like crustaceans, and even seals, became acclimatized. It has been suggested that the presence of the remains of these animals indicates a communication to the north with the Arctic Ocean; but in view of the fact that the distribution of many other species and a number of other factors of a fundamental nature seems an unnecessary assumption. In the next stage of its history the Baltic is transformed by further elevation into a vast freshwater lake, the Ancylus lake of G. de Ceer (named from the remains of the mollusc Ancylus fluviatilis). This lake covered an area of about 220,000 sq. m., including the whole of the present Baltic area and a large part of Finland, with Lake Ladoga. Then followed a subsidence, which not only re-established communication through the Danish channels, but allowed the Baltic to become sufficiently salt for such forms as Cardium edule and Littorina littorea. At this time the Gulf of Bothnia must have suffered greater depression than the Baltic proper, for the deposits of that epoch show a thickness of 100 metres (328 ft.) near Hernösand, but of only 25 metres (82 ft.) in the neighbourhood of Gotland. After this latest phase of the Baltic's history, the Baltic floor is now in the Baltic its present form and physical condition, and appears to be still in progress. Dr R. Sieger has traced a series of isobasic lines, or lines of equal rate of elevation, for portions of Sweden and Finland, which seem to indicate a level at the mouth of the Baltic, from the axis of the Baltic and the Gulf of Finland, but increases in amplitude northwards to the Gulf of Bothnia and in the direction of the main ridge of the massif of southern Sweden. At Stockholm the rate of elevation is approximately 0.47 metre (=1.54 ft.) in a century.

The coast of the Baltic is rocky only in the island-studded region at the head of the Gulf of Bothnia. Elsewhere it is largely sandy, and the littoral generally a typical morainic land, the work of the last great Baltic glacier. The southern margin of the Baltic is of peculiar interest. From Schleswig eastward to Lübeck Bay the coast is pierced by numerous bays, and is bordered for a large part by the North Sea. This is the old channel of the Jutland promontory, or Pomerania by an isthmus which was severed by tectonic movements. Beyond the Oder the coastline is unbroken as far as the Gulf of Danzig. It is then cut into by the estuaries of the Vistula, the Pregel and the Memel. Here the westerly winds have full play, and the coast is rimmed by a continuous line of dunes, which cut off the two great lagoons of the Frisches Haff and Kurisches Haff by sand spits.

The drainage area of the Baltic is relatively large. According to the measurements of Sir J. Murray it extends to 461,450 sq. sea m. (=61,700 sq. English m.). The largest river-basin included in it is that of the Vistula, flowing from the south-west, and the Oder in the south. The narrow parallel troughs, at right angles to the coast, which form the drainage-system of Sweden and Norway, are unimportant. Leveilings from Swinemünde show that the mean level of the surface of the Baltic at that point is 0.093 metres (=305 ft.) below the surface of the North Sea at Amsterdam, and 0.006 metres (=0.216 ft.) below its level at Ostend. A line of levels from Swinemünde through Eger to the Adriatic showed the mean level of the surface of the Baltic to be 0.499 metres (=1.6 ft.) from that of the Adriatic Sea. The mean level of the surface of the Baltic lies about 0.5 metres (=1.6 ft.) from the coast of Holstein to Memel, probably as a result of the prevailing westerly winds; this mean difference is exceeded with strong westerly winds, and diminished with easterly winds. The waves which are raised by these winds are usually short and irregular, often dangerous to navigation. Destructive waves, probably caused by distant earthquakes, called Stübenen (cf. English "bores") have been recorded.

The Gulf of Bothnia is connected with the North Sea by the Baltic proper ordinary tides are scarcely perceptible. There is, however, a distinctly marked annual rise and fall due to meteorological influences having a mean range of about 11-2 cm. (0.44 ft.) at Stockholm, and the maximum occurring at the end of the winter rainy period in August. The circulation of water in the Baltic proper must be considered apart from the circulation in the channels connecting it with the North Sea; and in this relation the plateau connecting the islands Falster and Møen with the coast of Mecklenburg-Vorpommern (Bergen Island) is one of the most important. The deep basins and hollows from Rügen to the Gulf of Bothnia and Finland the upper layers of water, from 30 to 70 metres (16 to 38 fathoms) in thickness, have almost the same salinity throughout. In these waters a vertical circulation is kept up by convection currents. Beneath these layers are masses of saltier water, through which the convection is not possible, and the bottom by conduction. These strata are practically stagnant, deficient in oxygen and surcharged with carbonic acid. Their saltier masses have been originally derived from outside, and in some measure have contributed to the processes which are going on in the Gulf of Bothnia and Mecklenburg, but their horizontal extension is checked by the ridges separating the deep hollows in the Baltic from each other. The interior of the Baltic is generally a very slow and complexly moving water, intermittently, with a long period of flux and reflux.

The circulation in the channels connecting the Baltic proper with the North Sea is of a complex character. It is necessary in the first instance to distinguish clearly between outflowing and inflowing waters; in practice this is easily done, as the outflowing water always contains less than 30 parts pro mille of salt, and the inflowing water more than 32 pro mille. The Baltic receives much more water than it discharges, which is due to the fact that hence a surplus must be got rid of by an outflowing current which may be named the "Baltic Stream." The following general laws may be laid down with regard to this:

1. That the Baltic Stream must be a surface current, because it originates from a rundown of fresh water.
2. That, on account of the earth's rotation, the main part of the Baltic Stream must keep close to the coast of the Scandinavian peninsula.
3. That it must be a periodic stream, because the discharge of the Baltic proper is not in a direct relation with the rise and fall of the tides. Thus in the spring and summer the water from the Baltic is sufficiently abundant to inundate the whole surface of the Kattegat and Skagerrak, but in winter the sources of the Baltic current are for the most part dead, and only the fresh water from the rivers enters the Baltic.

All the waters which enter the Skagerrak or Kattegat as undercurrents can be found at the surface of the North Sea (q.v.). They may be divided according to their origin and salinity as follows:

(a) North water of salinity 5.5 to 8.5.
(b) North Sea water, the predominant water in the North Sea area of 34 to 35 pro mille salinity.

The deepest water stratum in the Skagerrak is certainly of oceanic origin and is said to have been derived from the sea south of Iceland. This stratum is probably not always composed of water derived from the same part or the same depth of the North Atlantic; this water is, as a rule, deficient in oxygen. The North Sea water, of 34 to 35 pro mille salinity, is the water at the surface in the Skagerrak, except along a strip along part of the coast of Jutland, but it is always found as an undercurrent overlying the oceanic water. It enters into all the deep coastal channels, and into the Christiania fjord, but it is not always found in the deep channels of the Kattegat. The principal time of inflow of North Sea water is during spring and summer.

The bank-water of 32 to 34 pro mille salinity is found all along the coasts of Sweden, Norway, and Finland. The water which enters during spring and summer the Gulf of Bothnia and passes through the gaps between Finland and Sweden is therefore made up of Skagerrak water, and is thus of Baltic origin; the water which enters the Baltic proper is made up of water from the North Sea and Kattegat, and is therefore of Atlantic origin. The seasonal changes in the distribution of the bank-waters in different parts of the Baltic are too complex to be easily described; but it is certain that they are of great importance, and various fashions of the region present many remarkable features, which have been investigated in recent years by the Swedish Commission.

On the west and south coasts of Sweden, and in the Skagerrak south-east of Norway, navigation is interfered with by ice only in severe winters, and then the ice is usually drifting, compact sea-ice being very rare. Between Stockholm and Visby navigation usually ceases at the end of December and begins again about the 20th of April. During very severe winters the Åland Sea is covered with thick ice available for traffic. The south part of the Gulf of Bothnia is covered with ice every winter along the coasts, and to a large extent throughout the rest of the Gulf. The ice outside is sometimes restricted from about the middle of November to the beginning of May, though the part of Hernösand has been known to remain open during a very severe winter. The northern part of the Gulf of Bothnia is frozen every winter. In the Gulf of Finland the sea is closed to navigation by ice for about 150 days in the year; but narrow channels are rendered possible throughout the winter by the use of ice-breakers.

Baltimore, George Calvert, 1st Baron (c. 1580–1632), English statesman, son of Leonard Calvert, and Alice, daughter of John Crosland of Crosland, was born at Kipling in Yorkshire and educated at Trinity College, Oxford. After travelling on the continent, there given the post of service secretary to Robert Cecil, afterwards earl of Salisbury. In 1606 he was appointed clerk of the crown in Connaught and Clare, in 1608 a clerk of the council, and was returned to parliament for Rossiney in 1609. He assisted James I. in his discourse against Vorstius, the Armenian theological professor of Leiden, and in 1613 took charge of the Spanish and Italian correspondence. The same year he was sent on a mission to Ireland to investigate grievances. For these services he was rewarded by knighthood in 1617, followed by a secretaryship of state in 1619 and a pension of £200 a year in 1620. He represented successively Yorkshire (1621) and Oxford University (1624) in Parliament where he was acquainted with John Boys, the future Sir John Boys, and afterwards the secretary of state, with whom he was always associated. He had established a small settlement in Newfoundland in 1621, for which under the name of Avalon he procured a charter in 1623, and which he himself visited in 1627. In consequence of disputes and the unsuitable nature of the climate he sailed thence for Virginia, but was forbidden to settle there unless he took the oaths of allegiance and supremacy. He returned home, and died on the 15th of April 1632 before a new concession was secured, the charter of Maryland passing the great seal on the 20th of June 1632 in favour of his son Cecilius, second Lord Baltimore, who founded the colony. Baltimore married Anne, daughter of George Mytton of Urrington, Herefordshire, by whom he had six sons and five daughters. He wrote Carmen funereum in D. Hen. Unionis (1596); The Answer to Tom Tell-Truth . . . (1642) is also attributed to him, and Wood mentions Baltimore as having composed "something concerning Maryland." His letters are to be found in various publications, including Stradford's Letters, Clarendon State Papers and the Calendars of State Papers.

Biog., with reference to the former's Advocate's Assistant; John W. página, Doyle's, The English in America; Discourse on the Life and Character of Sir G. Calvert by J. P. Kennedy (1845), with the Review and the Reply to the same; London Magazine, June 1766; "Sir G. Calvert" by W. Lowndes, in The Spirit of the Age, 14th vol., and in The Nation, vol. 70, p. 95; American Historical Review, 5th vol. 577.

Baltimore, a city and seaport, and the metropolis of Maryland, U.S.A., the sixth city in population in the United States. It is at the head of tide-water on the Patapsco river and its middle and north-west branches where they form an estuary 12 m. from the entrance of their waters into Chesapeake Bay, in lat. 39° 17' N. and long. 76° 37' W., about 172 m. by water from the Atlantic Ocean, 40 m. by rail N.W. from Washington, 26 m. N. by rail from Baltimore, Md., 284 m. N. by rail from Washington, 54 m. N. by rail from New York. Pop. (1880) 434,439; (1900) 928,975, of whom 79,258 were negroes, and 68,600 foreign-born (of these 33,208 were natives of Germany, 10,493 of Ireland, 6090 of Ireland, 3841 of Germany, 2811 of Poland, 2321 of Bohemia and 2042 of Italy); (1910, census) 598,485. It is served by the Baltimore & Ohio, the Philadelphia, Baltimore & Washington (the Pennsylvania system), the Baltimore & Annapolis Short Line, the Baltimore, Chesapeake & Atlantic; the Northern Central; the Western Maryland and the Maryland & Pennsylvania railways; and by street lines running directly to all the more important ports on the Atlantic coast of the United States, to ports in the West Indies and Brazil, to London, Liverpool, Southampton, Bristol, Leith, Glasgow, Dublin, Belfast, Havre, Antwerp, Rotterdam, Bremen, Hamburg and other European ports.

The city extends nearly 6½ m. from E. to W., and except on the W. side a little more than 5 m. from N. to S., covering an area of about 32 sq. m. The ground on which it is built is for the most part gently rolling; originally some portions were swampy and others were marked by precipitous heights, but the swamps have been drained and filled and the heights rounded off. Jones's Falls, a small stream shut in between granite walls several feet in height, crosses the N. boundary line a short distance W. of its middle, flows S. E. to the S.E. corner of the main business quarter, and there meets the north-west branch of the Patapsco, in which lies the harbour, defended at its entrance by the historic Fort McHenry, built at the S.E. extremity of Locust Point, an irregular peninsula extending S.E., on which are grain-elevators and a number of wharves, including those of the Baltimore & Ohio railway.

That part of the city which lies E. of Jones's Falls is known as East Baltimore, and is in turn nominally divided into Fell's Point to the S. and E., now a shipbuilding and manufacturing quarter, and Old Town to the N. and W. In the Old Town still remain a few specimens of eighteenth century architecture, including several old-fashioned post-houses, which used to furnish entertainment for travellers starting for the Middle West by way of the old Cumberland Road beginning at Fort Cumberland, and from Baltimore to Fort Cumberland by a much older turnpike. The more inviting portion of the modern city lies on the western side of Jones's Falls, and the principal residential buildings are in the northern part of the city. A little S. of the centre of the city, Baltimore Street, running E. and W., and Charles Street, running N. and S., intersect; from this point buildings on these two streets are numbered N., S., E. and W., while buildings on other streets are numbered N. and S. from Baltimore Street and E. and W. from Charles Street. Baltimore Street is the chief business thoroughfare; S. of it as well as a little to the N. is the wholesale, financial and shipping district; while West Lexington Street, a short distance to the N., and North Howard and North Eutaw Streets, between Fayette and Franklin Streets, have numerous department and other retail stores. In North Gay Street also, which runs N.E. through East Baltimore, there are many small but busy retail shops. North Charles Street, running through the district in which the more wealthy citizens live, is itself lined with many of the most substantial and imposing residences in the city. Mount Vernon Place and Washington Place, intersecting near the centre of the city, Eutaw Place farther N.W., and Broadway running N. and S. through the middle of East Baltimore, are good examples of wide streets, having squares in the middle, adorned with lawns, flower-beds and fountains.

The buildings of the principal business quarter have been erected since 1904, when a fire which broke out on Sunday the 7th of February destroyed all the old ones within an area of 150 acres. Within a year after the fire, however, 225 places of business were again occupied and 170 more were building. A city ordinance prohibited the erection of any building more than 15 ft. in height, and prescribed a uniform height for those in the same neighbourhood; a large portion of the new buildings are of either three or four storeys, but a few tall ones range from ten to sixteen. The principal materials of which they are built are limestone, granite, marble and bricks, and terra-cotta of various colours.

The city hall, the post-office and the court-house, standing in a row, and each occupying a separate block along E. Fayette Street in almost the exact centre of the city, are three of Baltimore's most imposing buildings, and all of them narrowly escaped destruction by the great fire. The city hall, completed in 1875, in the Renaissance style, consists of a centre structure of four storeys surmounted by an iron dome 260 ft. high, and two connecting wings of three storeys surmounted by a mansard roof; the entire outer facing is of white Maryland marble. The post-office, completed in 1896, is built of Maine granite. The court-house, completed in 1809, is of white marble, with mural paintings by La Farge, E. H. Blashfield and C. Y. Turner. Two of the principal library buildings—the Peabody and the Enoch Pratt—
Baltimore

are faced with white marble. Among the churches may be mentioned the Roman Catholic cathedral, surmounted by a dome 125 ft. high—Baltimore being the seat of a Roman Catholic archbishop; the highest in rank in the United States; the First Presbyterian church (decorated Gothic), with a spire 250 ft. high; the Grace Episcopal church—Baltimore being the seat of a Protestant Episcopal bishop; the First Methodist Episcopal church; and the synagogues of the Baltimore Hebrew Congregations and the Oheb Shalom Congregation. Other notable buildings are the custom-house, the Masonic Temple, the Maryland Clubhouse, the Mount Royal station of the Baltimore & Ohio railway, and the buildings of the Johns Hopkins hospital. There are several good bridges across Jones's Falls, the largest of which is Memorial Bridge, a continuation of N. Charles Street—with Mount Vernon Place stands a white marble monument in honour of George Washington, the oldest of the monuments in his honour in the United States. The corner-stone was laid in 1815 and the monument was completed in 1829. The base is 50 ft. sq. and 24 ft. high; on this stands a Doric column, 25 ft. in diameter at the base and 130 ft. high, which is surmounted by a statue of Washington 16 ft. high. A winding stairway in the interior leads to a parapet at the top. In the square by which the monument is surrounded are also statues of George Peabody by W. W. Story, a replica of the small monument erected to the memory of Edgar Allan Poe, and John Eager Howard by Emmanuel Frémiet; and bronze pieces representing Peace, War, Force and Order, and a figure of a lion by Antoine L. Barye. The Henry Walters collection of paintings, mostly by modern French artists, and of Chinese and Japanese bronzes, ivory carvings, enamels, porcelain and paintings is housed in the Walters Art Gallery at the S. end of Washington Place; at the south-east corner of the square is the Peabody Institute with its conservatory of music and collection of rare books, of American paintings, and of casts, including the Rinheart collection of the works of William H. Rinheart who was a native of Maryland. In Monument Square near the post-office and the court-house is the white marble Battle Monument, erected in 1815 to the memory of those who had fallen in defence of the city in the previous year; it is 52 ft. high, the column being in the form of a bundle of Roman fases, upon the bands of which are inscribed the names of those whom it commemorates; and the whole is surmounted by a female figure, the emblematical genius of the city. To this monument and the one in honour of Washington, Baltimore owes the name The Monument City, frequently applied to it after the model in London. Near the Monument is the street where he is buried; there is another monument to his memory in Druid Hill Park. In Greenmount Cemetery in the north central part of the city are the graves of Junius Brutus Booth, Mme Elizabeth Patterson Bonaparte (1785-1879), the wife of Jerome Bonaparte, Johns Hopkins, John McDonogh and Sidney Lanier.

In 1908 there were in the city under the jurisdiction of the department of public parks and squares 13 parks of 10 acres or more each and 33 squares, and the total acreage of parks was 2185 acres and of squares 86-53 acres. Chief among the parks is Druid Hill Park in the N.W., containing 679-78 acres and famous for its natural beauty. Clifton Park, of 311-26 acres, 2 m. E. of Druid Hill and formerly a part of the Johns Hopkins estate, passed into the possession of the city in 1895. Patterson Park in the extreme S.E., of 125-79 acres, is a favourite resort for the inhabitants of East Baltimore.

Education.—Baltimore ranks high as an educational centre. Johns Hopkins University (q.v.), is a leading institution of the United States for graduate study. The Peabody Institute, founded in 1859 by George Peabody, who for some years a resident of Baltimore, is an important factor in the promotion of science, literature and the fine arts. Goucher College (Methodist, 1888) for women, is one of the best institutions of the kind in southern United States. The older of the two state normal schools, opened in 1867, is located here. Morgan College (Methodist), opened in 1876, offers the advantages of a college education to the coloured young people. Loyola College, founded in 1852, and various other institutions are for the training of the Catholics.

The McDonogh farm school, about 12 m. N.W., with a farm of 835 acres, a printing-office, and carpenter and machine shops prepares poor boys to enter any college in the country. The institution owes its origin to a bequest left by John McDonogh. Among the professional schools are the university of Maryland and Baltimore University—each of which offers courses in law, medicine and dentistry—the Baltimore Medical College, the College of Physicians and Surgeons, the Woman's Medical College, the Baltimore College of Dental Surgery, the Maryland College of Pharmacy (since 1904 part of the university of Maryland), the Baltimore School of Pharmacy, and the St. Mary's Seminary, which, established by the Society of St Sulpice in 1791, is said to be the oldest Catholic theological seminary in the United States. The city also has a Polytechnic Institute, as well as high schools for white and for coloured pupils. The principal libraries are those of Johns Hopkins University, Peabody Institute, Maryland Historical Society, and the Bar Association; and the Enoch Pratt, the New Mercantile, and Maryland Diocesan (Protestant Episcopal).

The charitable institutions of Baltimore are numerous. Several such institutions supported wholly or in part by the state of Maryland (q.v.) are located here, and besides there are scores of others. A representative list includes:—the Charity Organization Society, the primary object of which is to organize the work of the others; the Baltimore Association for the Improvement of the Condition of the Poor, which seeks to discourage indiscriminate alms-giving; the Bay View asylum or city poorhouse; the Children's Aid Society; the Thomas Wilson Fuel-Saving Society, for furnishing coal at low rates; the Woman's Industrial Exchange, for assisting women in need to support themselves; Johns Hopkins hospital, noted for the excellence of its equipment especially for heating and ventilating; Saint Joseph's general hospital; hospital for the women of Maryland of Baltimore city; nursery and child's hospital; Baltimore eye, ear and throat charity hospital; Maryland hospital for the insane; the Sheppard asylum, intended especially for the cure of the insane; the Sheppard and Enoch Pratt hospital; the Baltimore orphan asylum; Saint Vincent's infant asylum; the Thomas Wilson sanatorium for children, intended for children under three years of age, who are suffering from disease, during the warm summer months; the Free Summer Excursion Society, for affording a change of air to the indigent; homes for the incurables; homes for the aged; homes for friendless children; institutions for the blind; and institutions for the deaf and dumb.

Water for the city taken from Jones's Falls and Gunpowder river a few miles N. of the city limits, is brought through tunnels, and is stored in eight reservoirs having an aggregate capacity of 275 million gallons. The whole system is owned by the municipality and can furnish about 300 million gallons daily. After the fire $10,000,000 was appropriated for a new sewage system (begun 1896). In 1900 the Maryland legislature empowered the city to borrow $1,250,000 to establish a municipal lighting plant, but in 1899 the plans were abandoned and the city was left in the hands of a private company.

Commerce.—The harbour, which consists of three parts, is excellent. Its entrance at Fort McHenry is a channel 600 ft. wide, with a minimum draft (1907) of 31 ft. of water. The depth is continued with an increased width for a mile and a quarter to near Fells' Point, where the width is contracted to one-fourth of a mile with a depth of 16 ft. Above this entrance it widens into an ellipse a mile long, half a mile broad and 15 ft. deep. The third or inner harbour has a depth of 14 ft. and penetrates far into the city. Vessels of the largest class can lie at the Locust Point warehouses and Canton, and vessels of 3000 tons can use the inner harbour, W. of the mouth of Jones's Falls. By 1905 $5,000,000 had been appropriated since the great fire for new docks. In 1908 the city ranked fourth among the Atlantic ports of the United States in the amount of its exports ($82,113,496), and fourth in the amount of its imports ($23,722,045).
Baltimore has grown rapidly as a manufacturing city since 1880 is seen from the fact that in that year there were 3683 manufacturing establishments, with a total annual product valued at $75,417,504, after having with 1350 only the same amount of which 2776, the first factory system) in 1900 producing commodities valued at $161,249,240 ($151,546,580, valued in 1905 there were 2163 establishments under the factory system with a total annual product valued at $151,546,580, an increase of 12-2% in the five years. The city ranked eighth among the manufacturing centres of the United States, as regards the value of products, in the three successive censuses of 1880, 1890 and 1900. In 1905 it was ninth. Baltimore is noted particularly as the most important centre in the United States of oyster-canning industry. The output in 1905 ($5,081,541) of the city's establishments for the canning and preserving of fruits and vegetables was 7.7% of that of the whole United States; in 1900 it had been 15% of the country's total. What seems to have been the first oyster-canning establishment in America was built in Baltimore (by a Thomas Kensett) in 1820, and oyster-canning as a distinct industry on a permanent footing was begun here in 1850. The term "cove oysters," now applied to canned oysters everywhere, was originally applied to the oysters found in the coves on the W. side of the Chesapeake Bay, above the mouth of the Potomac. Port Washington's first canning factories began to be built in the southern states, especially in Mississippi. Baltimore was the centre of the oyster-canning industry. Baltimore is also a well-known centre for the manufacture of clothing, in which in 1905 ($23,684,650) it ranked fourth among the cities of the United States; for cigar and cigarette-making (1905, $4,360,360); for the manufacture of foundry and machine-shop products (1905, $6,572,923), of tinware (1905, $5,795,980), of shirts (1905, $5,170,783), of cotton-duck (the output of sail-duck being about three-fourths of the total for the United States), tobacco, spirits, and confectionery, and many other commodities in smaller amounts. The markets, especially the Lexington market, are noted for the abundance and great variety of their produce. The proximity of coal-mines, the abundance and variety of food supplies furnished by the state, the great quantity and variety of the city's manufactured goods, the excellent shipping facilities, and the consequent low cost of living, are prominent features of the physical life of the city.

Goverment.—Although the charter under which Baltimore is governed came into effect as late as 1868, it is only in the last three years that it has been free to meet the needs of the city, after having been under one or other of the political parties. In 1889 the city was annexed to the state and the charter, consisting of two branches. The first branch is composed of one member from each ward, elected for a term of four years; the second branch of two members from each of four districts, and a president elected by the city at large, for a term of four years; a property qualification is prescribed for members of each branch. All municipal officers are elected in May in order to separate municipal from state and national elections. No street franchise can be granted for a longer term than twenty-five years, and the right to regulate the exercise of each and every franchise is reserved to the mayor and council. A board of estimate, composed of the mayor, the city solicitor, the comptroller, the president of the second branch of the city council, and the president of the board of public improvements, has control over appropriations, the council having power to decrease the amount of any item but not to enlarge it. To create a debt for any purpose other than becoming temporary deficiencies to purchased land the mayor and council must first obtain the consent of both the state legislature and the city electorate. The department of education is intrusted to an unalaried board of nine commissioners, appointed by the mayor with the approval of the second branch of the council for a term of six years, three retiring every two years. This board appoints a superintendent, six or more assistant superintendents, and the teachers of the high schools and the Polytechnic Institute, also the other teachers, but only according to the superintendent's recommendation on the basis of merit.

In 1867, the 1350th anniversary of the landing of the Lords Baltimore, the founders of the province of Maryland, but no settlement was made here until nearly 100 years after the planting of the colony; meanwhile at least two other town-sites, on which it was hoped permanent towns might be established, had received the same name, but nothing came of either. Finally, however, while the provincial legislature was still engaged in the practice of directing places to be laid out for towns, where, as events proved there was nothing to give these towns more than a mere paper existence, that body in 1799 directed two such towns, one at the mouth of the Patapsco and the other at Jones's Falls, to be established. In 1800 the charter was granted, one lot of land on the N. side of the Patapsco and lay it out in sixty equal lots as the town of Baltimore. Three years later, at the instance of the same body, Jones-Town (Old Town) was laid out on the opposite side of Jones's Falls, and in 1745 these two towns were consolidated. About the same time the resources of the interior, for which Baltimore was to become a trade centre, were being rapidly developed by the Germans. Prior to 1752, in which year there were only twenty-five houses with two hundred inhabitants, the growth of the city had indeed been slow; but only a year or two later wheat loaded in its harbour was for the first time shipped to Scotland; during the war between the French and the English at this time some of the unfortunate Acadians found new homes here; in 1767 Baltimore was made the county seat; by the beginning of the War of Independence its population had grown to 6755; and in 1780 it was made a port of entry. The city early became an important shipping centre; during both the War of Independence and the War of 1812 many privateers were sent out from it, and in the interval between these wars, the ship-owners of Baltimore had their share in the world's carrying trade, the "Baltimore clipper" being famous among them. In 1794 the charter was renewed, having been governed until then from Annapolis and through commissions with very limited powers; at the same time the Fells' Point settlement, founded about 1730 by William Fells, a ship carpenter, was annexed. During the War of Independence, the Continental Congress, frightened from Philadelphia in 1776, sat for several weeks in a hall in W. Baltimore Street near Liberty Street; during the same war also fortifications were first erected on the site of the present Fort M'Henry. This fort effectively protected the city in 1814 when attacked by the British, and it was during the attack that Francis Scott Key, stationed on one of the British attacking vessels, composed the "Star Spangled Banner." In 1866 all three of the candidates opposed to Lincoln—Douglas, Breckinridge and Bell—were nominated here, and in 1864 President Lincoln was nominated for a second term. The city has been the meeting-place of other important conventions, and is sometimes called "The Convention City." At the outbreak of the Civil War on the 19th of April 1861, the Sixth Massachusetts regiment, while passing through Baltimore, was attacked by a mob and several men were killed on both sides; in the following month the city was subjected to military rule and so continued until the close of the war. From 1866 to 1880 Baltimore was under the control of the American or Know-Nothing party, and suffered greatly from election riots and other disorders, until as a remedy the control of the police system was taken from the mayor and council and exercised by the state government. Soon after the Civil War a Democratic "machine" got firm control of the city,
and although a struggle to overthrow the machine was begun in earnest in 1875 by a coalition of the reform element of the Democratic party with the Republican party, it was not till 1895 that the coalition won its first decisive victory at the polls. Even then the efforts of the Republican mayor were at first thwarted by the council, which passed an ordinance over his veto, taking from him the power of appointment and vesting it in themselves; the Maryland court of appeals, however, soon decided that the council had exceeded its powers, and an important outcome of the reform movement was the new charter of 1898. Annexations of suburban territory in 1888 and 1890 greatly increased the area of the city.

Authors.—J. H. Hollander, Guide to the City of Baltimore (Baltimore, 1893); T. P. Thomas, "The City Government of Baltimore," in Proceedings of the American Academy of Political Science, Baltimore, 1890; St. G. L. Sioussat, "Baltimore, the Monumental City" (in L. P. Powell, Historic Towns of the Southern States, New York, 1900); J. T. Scharf, Chronicles of Baltimore (Baltimore, 1874).

BALTZAR, THOMAS (c. 1630-1663). German violinist, was born at Liibeck. He visited England in 1656 and made a great impression on Evelyn and Anthony Wood. In 1661 he was appointed leader of the king's famous band of twenty-four violins, but his intemperate habits cut short his career within two years. Nothing like his violin-playing had ever been heard in England before, and in all probability the instrumental music of Henry Purcell owes much to its influence.

BA-LUBA, a Bantu negroid race with several subdivisions; one of the most important and cultivated peoples of Central Africa. Their range extends from a latitude of about 20 degrees north to about 15 north, and from 10 east to 30 west. The area of their country varies from 500,000 to 1,000,000 square miles.

The Ba-Luba are divided into two classes of tribes, the northern and southern. The northern tribes are the most civilized and are the most numerous. The southern tribes are less civilized and are the least numerous.

The Ba-Luba have a number of subdivisions, which are called by various names. The most important of these subdivisions are the Ba-Si, the Ba-Cevalo, and the Ba-Keta. Each of these subdivisions is divided into a number of smaller groups, which are called by various names.

The Ba-Luba are agricultural people, and they are divided into a number of classes, according to the size of their farms. The most important of these classes are the farmers, the herders, and the hunters.

The Ba-Luba have a number of settlements, which are called by various names. The most important of these settlements are the villages, the towns, and the cities.

The Ba-Luba have a number of languages, which are called by various names. The most important of these languages are the Luba, the Cevalo, and the Keta.

The Ba-Luba have a number of customs, which are called by various names. The most important of these customs are the circumcision, the scar-tattooing, and the marriage.

The Ba-Luba have a number of accomplishments, which are called by various names. The most important of these accomplishments are the weaving, the carving, and the music.

The Ba-Luba have a number of possessions, which are called by various names. The most important of these possessions are the land, the crops, and the livestock.

The Ba-Luba have a number of institutions, which are called by various names. The most important of these institutions are the government, the church, and the school.

The Ba-Luba have a number of diseases, which are called by various names. The most important of these diseases are the fever, the pneumonia, and the tuberculosis.

The Ba-Luba have a number of natural resources, which are called by various names. The most important of these resources are the timber, the minerals, and the water.

The Ba-Luba have a number of economic activities, which are called by various names. The most important of these activities are the agriculture, the forestry, and the mining.

The Ba-Luba have a number of social activities, which are called by various names. The most important of these activities are the education, the religion, and the social welfare.

The Ba-Luba have a number of political activities, which are called by various names. The most important of these activities are the government, the bureaucracy, and the military.

The Ba-Luba have a number of cultural activities, which are called by various names. The most important of these activities are the art, the literature, and the music.

The Ba-Luba have a number of historical activities, which are called by various names. The most important of these activities are the conquest, the colonization, and the independence.

The Ba-Luba have a number of contemporary activities, which are called by various names. The most important of these activities are the industrialization, the urbanization, and the globalization.

The Ba-Luba have a number of future activities, which are called by various names. The most important of these activities are the development, the modernization, and the democratization.

The Ba-Luba have a number of past activities, which are called by various names. The most important of these activities are the prehistory, the history, and the chronology.

The Ba-Luba have a number of present activities, which are called by various names. The most important of these activities are the current, the ongoing, and the contemporary.
From Domandi, at the junction of the Gomal and Kundar rivers, the boundary between Baluchistan and Afghanistan follows the Northern Kundar stream for about 40 m. to the southwest. It then leaves the river and diverges northwards, so as to include a large plain bounded on the west by Lake Ab-I-Istada, before returning to the skirts of the hills. After about 100 m. of this divergence it strikes the Kadannai river, turning the northern spurs of the Toba plateau (the base of the Kwaja Amran range) and welding itself together with the river of the Kojak. Here, however, the boundary does not follow the river. It deserts for the western edge of the Toba plateau (8000 ft. at this point), till it nears the little railway station of New Chaman. It then follows the western edge of the Chaman district, the border of Chaman, and thenceforward is defined by hill ranges southwards to Nushki. The eastern boundary of this northern section of the Kwaja Amran is the same as it is in the south, and defines the border of British India. This part of Baluchistan thus presents a buffer system of independent tribes between the British frontier and Afghanistan. But the independence of the Pathan people south of the Gomal is not as the independence of the Pathans (Wazirs, Afridis, &c.) who live north of it. It is true that the Indian government interferes as little with the internal jurisdiction of these tribes as with the Anglo-Afghan frontier, but the Pathan range as it does with that of the northern chiefs; but the occupation of a post of posts on the Zhob river, which flanks that range almost from end to end on the west, places the doors of communication between Afghanistan and British India in the hands of these chiefs, and demands their services. It thus tends to the maintenance of peace and order on the southern frontier to a degree that does not exist in the north.

The central range of the Suliman hills is the dominant feature in the geography of northern Baluchistan. The central line or axis of the range lies a little east of the meridian of 70° E., and it is geologically more ancient than the northern or southern chains. Two large valleys of self-contained drainage systems. Towards the northern extremity of the range occur a group of peaks, which together form an oblong block or massif amongst the neighbouring ridges known as Kaisarghar amongst the Shorarud tribesmen who claim it; another massif, the Salang (Solomon's throne), generally, on the frontier, from the fact of a celebrated shrine of that name existing near its southern abutment. The massif of the Takht is a high tableland (about 8000 ft. above sea level) between the border of the Suliman ranges, and the eastern and western sides of the Suliman range is marked by high, sinuous, and steep parallel ridges. The western ridge culminates on the north, in the peak of Kaisarghar (11,300 ft.), and the eastern in a block, or detached headland, on the south, where rests the immense "irrat" or "shrine" (11,070 ft.). This tableland is formed by a huge cap of coral limestone, estimated by Griessbach at from 4000 to 5000 ft. in thickness. At each end the tableland is rent by gorges which deepen, and become more narrow, as they extend on the valley side. There is a block ridge of "Gat" on the north, and of the Dhanan on the south. These two channels carry the rush of mountain streams from the western slopes of the massif right across the axis of the mountains and the valley of the Zhob river. For railways other than the frontier there is no room on these secondary ridges for the most part drain narrow valleys where gradual denudation has washed bare the flat-topped slopes of limestone ridges, and the waters, which, as a consequence, do not flow in wide channels, but collect in small rivulets, by no means untroubled by occasional torrents. Both these central lines of water-course are liable to terrific floods. The drainage of the Bolan and the Nari finally disappears in the irrigated flats of the alluvial valley (Kach Gandava), which extends 130 m. from the Indus to Sibi at the foot of the hills, and which offers (in spite of periodic Indus floods) an opportunity for railway approach to Baluchistan such as occurs nowhere else on the frontier. Kach Gandava, whilst its agricultural development has in no way receded, is now rivalled by many of the valleys of the highlands. Its climate debar it from European occupation. It is a land of dust-storms and poisonous winds; a land where the thermometer never sinks below 18° F. in winter; a land in which there is a deadly monstrosity of dust-coloured scenery for the greater part of the year, with the minimum of rain and the maximum of heat. The Quetta and Pishin plateau to which it leads is the ultimate drink of the alluvial-water-divide of Baluchistan and the bed of the great Kandahar highway. An irregularly-shaped block of upland territory, which includes all the upper Lora tributaries, and the Toba plateau beyond them; resting on the Kwaja Amran (Kojak) Range (with an advanced loop to include the Chaman railway terminus) on the west; reaching south through Shorarud to Nushki; including the main valley systems of the Zhob and the Sibi; and offering to the eye stretching out an arm to embrace the Thal Chotiial valley on the east, and following the main water-divide between the Zhob and Lora on the north, is called British Baluchistan. This area is composed of districts of small, but differing, cultivated character, and smaller, not being brought under the ordinary forms of civil administration in British India. Beyond it, north and south, lies independent Baluchistan, which is under British political control, and includes the districts which are managed by military officers. The degree of independence enjoyed by the various districts of Baluchistan may be said to vary in direct proportion to their
distance from Quetta. No part of Baluchistan is beyond the reach of the political officer, but there are many parts where he is not often seen. The climate of British Baluchistan is dry and bracing—even excessively so. It is free from the leaden fogs of the summer months which hang southwards from Peshawar and Mount Ararat, but with the outer faults looped up at Sibi so as to form the subsidiary festoon of the Sulman and Bagti Hills. Outside the faults lie the horizontal deposits of the Makran coast, which are dry, hot and arid.

The fertile region of Baluchistan is situated about midway between the sources of the Bolan and the Mulla, near a small tributary of the Lor (the river of Pishin and Quetta), about 6800 ft. above sea-level, on the western edge of a cultivated plain in the very midst of hills. (See Kalat.) To the north are the long sweeping lines of the Sarawan ridges, enclosing narrow fertile valleys, and passing away to the south-west to the edge of the Kharian desert. East and south are the rugged borders of Baluchistan, amongst which the Makran and Khorasan, the latter dominating the general rule found in the Mulla, which carries the floods of the Kalat highlands into the Gandava basin and forms one of the most important and the ancient highways of the forgotten Kandahar.

The mountain ranges of Baluchistan consist chiefly of Cretaceous and Tertiary beds, which are thrown into a series of folds running approximately parallel to the mountain ridges. The Cretaceous and Tertiary beds, Jurassic rocks are found to take a considerable part in the formation of the hills of British Baluchistan. Triassic beds lie along the south side of the upper Zob, and Fusulina limestone has also been found there. With the exception of the Tertiary beds the deposits are almost exclusively marine. But in the upper Cretaceous and lower Tertiary, especially in north-western Baluchistan, there is an extensive development of the Secondary and Tertiary, which are probably contemporaneous with the Deccan, which were doubtless intrusive during the Tertiary period, and within the curve of the folded belt a line of recent volcanic cones stretches from western Baluchistan into eastern Persia. In Baluchistan these volcanoes appear to be extinct; though the Koh-i-Talafan, beyond the Persian frontier, still emits vapours at frequent intervals. The lavas and ashes which form these cones are mostly andesitic. These volcanoes occur upon the Makran coast, but it is doubtful whether these are in any way connected with true volcanic agencies.

As far as is known, the mineral wealth of Baluchistan is incon- siderable. Coal has been found in the Tertiary beds along the Haruai route to Quetta, but there are no other minerals of great value. A somewhat thick and viscid form of mineral oil is met with at Khattan in the Marri country; and petroleum of excellent quality is found in the hills of the southern parts of the Surand Range. But these are doubtless of little importance.

**Races.**—Within the Baluchistan half of the desert are to be found scattered tribes of nomads, called Rekis (or desert people), the Mohamadani being the most numerous. They are probably of Arab origin. This central desert is the Itr, Gard, and the Karens of the Arabian geographic and a part of the ancient Kingdom of Kauk forn Kauk, a great many of the modern Persian races have been intermingled with the Itr, and the name is probably of Persian origin. The Baluchis are the more ancient inhabitants of the deserts of the Kau. The Ilan is a desert people, who are thought to have come to the peninsula of Iran. Between the Naushirwans of the Khurt desert and the Masik, and the fish-eating population of the coast, enclosed in the narrow valleys of the Rakshan and Kei tributaries, or about the sources of the Hil, are tribes innumerable, remnants of races which may be recognized in the records of Herodotus, or may be traced in the records of recent immigration. Equally scattered through the whole country, and almost everywhere recognizable is the under the Persian population (Tajik), which is sometimes represented by a locally dominant tribe, but more frequently by a tribe or a clan of the general community. Such are the Dehows or Dehans, and the Sardar, who are mentioned by Herod. i. 125), who extend all along Makran, and, as slaves, are called Nakibs. The Arabs have naturally left their mark most strongly impressed on the ethnography of Baluchistan. All kinds of claims to be of Arab origin and of Koraish extraction. As the Arabs occupied all southern Baluchistan and Seistan from a very early date, and finally spread through the Sind valley, where they remained till the 12th century, their genealogical records have become much obscured and it is probable that there is not one

**Western Baluchistan.**—This province, which includes the district of Malik Shah Koh, is based partly on the central mountainous water-divide already referred to, and partly runs in straight lines through the desert south of the salt swamps of the Gaud and Makran. The charming desert of Makran, which on the south entirely shuts off that valley and the approach to Seistan between the Helmund and the Gaud-i-Zirreh (the only approach from the east of the province), has been largely levelled by the building of the line of desert route between Nushki and Seistan, which is open in all ordinary seasons, to the south, and this route has been largely developed, posts or zars having been established at intervals and wells having been dug along it. There is a promising khafila traffic along it and the railway has been extended from Quetta to Nushki.
now a pure Arab in the country. It is as builders or engineers that they have established their most permanent records, Makran being full of the relics of their irrigation works constructed in times when the climatic conditions of Baluchistan must have been very different from what they are now. Lower Sind also contains a great wealth of architectural remains, which may be found to the west of the Indus as well as in the delta. One particular tribe (the Kalmats), who left their name on the Makran coast and subsequently dominated Bela and Sind, west of the Indus, for a considerable period, exhibit great power of artistic design in their sepulchral monuments. The Dravidian races (Brahuis), who are chiefly represented by the Kambaranis and Mingals or Mongals (the latter are doubtless of Tatar origin), spread through southern Baluchistan as well as the eastern hills, and are scattered irregularly through the mountain tracts south of Kharan. The ancient Orelai mentioned by Arrian are probably represented by the tribe of Hot, who, as original masters of the soil, are exempt from taxation. The name Brahui (according to Belloc) but a corruption of Ba-rohi (or “hillmen”) in a language derived from Sanskrit which would represent the same term by Parva-ka. So that the Persicis (Herod. iii. 92) may be recognized as surviving in the Brahui, and in the name (Parkan) of a mountain-bred stream which is a tributary of the Hingol. Amongst other aboriginal tribes to whom reference is made by very early writers are the Bolendi, who give their name to the Bolida valley, a tributary of the Kej. The Bolendi were once the ruling race of southern Baluchistan, which was originally called Boledist, and it seems possible that this may be the real origin of their name. The other great family of the Brahuis was an Assyrian term for Bael or Bel, the god of the Phoenicians and Druids. The Bolendi ruling family were in 1096 represented by but one living member, a lady, who was a government pensioner. The fast-diminishing Sajidis (Sajitacs) and Saka (Sacees) are others of the more ancient races of Baluchistan easily recognizable in classical geography. Most recent of all are the Gitchkis. The Gitchkis derive from a Rajput adventurer who flourished in the early part of the 17th century. They are now the dominant race in Panjgur and Kej, from whence they ousted the Bolendis. For three generations they remained Hindus; since then there has arisen amongst them a strange new sect called Zikari, with exceedingly loose notions of morality. The sect, however, appears to be fast merging into orthodox Mahomedanism. A Baluch (or rather Makran) race which deserves attention is that of the Gadaras, who once gave the name Gadarosa to Southern Baluchistan. According to Tate the Gadaras are now represented by Sidi half-castes—those Makrani “boys” who are so well known in the mercantile marine as stokers and firemen. It seems unlikely that this modern admixture of Asiatic and African blood represents the “Arabian” (Panjabi, “Arabs”) of Herodotus, which was more probably a direct connexion of the Himaratic Arab builders of “bunds” and revetments who spread eastwards from Arabia. Bellows find in the Gadar the Garuda (eagles) of Sanskrit, who were ever in opposition to the Naga (snakes) of Scythic origin. Southern Baluchistan affords a most interesting field for the ethnographer. It has never yet been thoroughly explored in the interests of ethnographical science. The Baluch character is influenced by its environment as much as by its origin, so that it is impossible to select any one section of the general community as affording a satisfactory sample of popular Baluch idiocyncrasies. They are not a homogeneous race. Peoples of Arab extraction intermixed with people of Dravidian and Persian stock are all lumped together under the name of Baluch. The Marri and Bugti tribes, who occupy the most southern buttresses of the Suliman Mountains, are Rind Baluchis, almost certainly of Arab extraction. They came to Sind either with the Arab conquerors or after them, and remained there mixed up with the original Hindu inhabitants. The Arab type of Baluch extends through the whole country at intervals, and includes all the finest and best of Baluch humanity. Taking the Rind Baluch as the type opposed to the Afridi Pashtun, the Baluch is easier to deal with and to control than the Pathan, owing to his tribal organization and his freedom from bigoted fanaticism or blind allegiance to his priest. The Baluch is less turbulent, less treacherous, less bloodthirsty and less fanatical than the Pathan. His frame is shorter and more spare and wiry than that of his neighbour to the north, though generations have given him to too a bold and mainly bearing. It would be difficult to match the stately dignity and imposing presence of a Baluch chief of the Marri or Bugti clans. His Semitic features are those of an imperfectly civilized and refined type, but he is not at all so refined and lofty as any Arab gentleman. Frank and open in his manners, fairly truthful, faithful to his word, temperate and enduring, and looking upon courage as the highest virtue, the true Baluch of the Derajat is a pleasant man to have dealings with. As a revenue payer he is not so satisfactory, his want of industry and the pride which looks upon manual labour as degrading making him but a poor husbandman. He is an expert rider; horse-racing is his national amusement, and the Baluch breed of horses is celebrated throughout northern India. Like the Pathan he is a bandit by trade which is common to all tribes, and the history of Baluchistan is nothing but a story of successful robberies, of lawless rapine and bloodshed, for which plunder and devastation were accounted a worthy and honourable return. Extensive changes have taken place in the climatic condition of the country—changes which are some of them so recent as to be noted by surveyors who have found the remains of forests many miles in extent now cleared of trees. Ordinary processes of denudation and erosion, acting on those recent deposits which overlie the harder beds of the older series, may have caused these changes. The gradual desiccation of lowland forests may have assisted the efforts of nature; but it is difficult to understand the widespread desiccation of large areas of the Baluch highlands, where evidences of Arab irrigation works and of cultivation still attest to a once flourishing agricultural condition, without appealing to more rapidly destructive principles for the change. There is ample proof throughout the country of alterations of level within the last geologic periods; and there have even been compressions, resulting in a relative rise of the ground, over the crests of anticlinal folds, within historic record. “Proof that this compression is still going on was given on 20th December 1892, when a severe earthquake, believed to have been caused from the sudden yielding of the earth’s crust along what appears to be an old line of fault, west of the Katva Arman range, whereby an adjustment took place indicated by a shortening of some 23 ft., on the railway line which crossed the fault.” Nor is this the only sign of evidences of earth movements. Volcanoes of the coast be overlooked. It is probably to climatic changes (whatever their origin may have been), rather than to the effects of tribal disturbances, that the Arab’s disappearance from the field of trade and agriculture must be attributed. The total area of Baluchistan is 132,315 sq. m. and its population in 1901 was 914,551. The population is largely nomadic. The fact that there may be as many as 15,000 Pathans or Afridis of the Boleh Balan during one month of the annual Baloo migration indicates the dimensions which the movement assumes. The religion of the country is Islam. The Mahommedans that out of every thousand inhabitants 94,403 are Musulman, and only 4706 Hindus, while the balance is made up by Christians, Sikhs and other denominations. Out of the total number 280 in the thousand are literates. The chief languages spoken are vernaculars of Baluchistan, Pushtu, Panjabi, Urdu and Sindhi.
Baluchi language belongs to the Iranian branch of the Aryan subfamily of the Indo-European family. It is divided into two dialects which are so different that speakers of the one are almost unintelligible to speakers of the other. These two dialects are separated by the belt of Brahui and Sind, which occupied the Sindh and Baluchistān region. There is no indigenous literate script, but many specimens of poetry exist in which heroes and brave deeds are commemorated, and a good many of these have been collected from the chiefs of the tribes within the borders of Baluchistān. The Baluchi dialect has been much disputed, but the latest enquiries, conducted by Dr. G. A. Grierson, have resulted in his placing it among the Dravidian languages. It is remarkable to find in Baluchistān a Dravidian tongue, surrounded on all sides by Aryan languages, and with the nearest branch of the same family located so far away as the Gond hills of central India. Brahui has no literature of its own, and such knowledge as we possess of it is due to European scholars, such as Bellew, Trumpp and Caldwell. Numerically the Brahuis are the strongest race in Baluchistān. They number nearly 300,000 souls. Next to them and numbering nearly 200,000 are Pathans. After them there is a group of mixed Baluchis and less than 40,000 Lasis (Lurmis) of Las Bela. There are thirteen indigenous tribes of Pathan origin, of which the Kakars (g.z.) are by far the most important, numbering more than 100,000 souls. The chief of these is the great Lulu, followed in Zhol, Ghulam, Path and Thal-Chotiali, but there are a few of them in Kalat and Chagai also. The most important Baluch tribes are the Marris, the Bughtis, the Bolelis, the Domkis, the Magassides and the Rinds. Owing partly to the presence of partly to the levelling effect of Islam, nothing similar to the Brahmanical system of social precedent is to be found in Baluchistān.

**History**—Of the early history of this portion of the Asiatic continent little or nothing is known. The poverty and natural strength of the country, combined with the ferocious habits of the natives, seem to have equally repelled the friendly visits of inquisitive strangers and the hostile incursions of invading armies. The first distinct account which we have is from Aristotle, who, about 330 B.C., accompanied the march of Alexander through this region, which he calls the country of the Oretes and Gadrosi.1 He gives a very accurate account of this forlorn tract, its general aridity and the necessity of obtaining water by digging in the beds of torrents; describes the food of the inhabitants as dates and fish; and adverts to the occasional occurrence of fertile spots, the abundance of aromatic and thorny shrubs and fragrant plants, and the violence of the monsoon in the western part of Makran. He notices also the impossibility of supporting a large army, and the consequent destruction of the greater part of the men and beasts which accompanied the expedition of Alexander. In the 8th century this country was traversed by an army of the Caliphate.

The precise period at which the Brahuis gained the mastery cannot be accurately ascertained; but it was probably about two and a half centuries ago. The last raja of the Hindu dynasty found himself compelled to call for the assistance of the mountain shepherds, with their leader, Kambar, in order to check the encroachments of a horde of depredators, headed by an Afghan chief, who infested the country and even threatened to attack the seat of government. Kambar successfully performed the service for which he had been engaged; but having in a few years quelled the robbers against whom he had been called in, and finding himself at the head of the only military tribe in the country, he formally deposed the raja and assumed the government.

The history of the country after the accession of Kambar is as obscure as during the Hindu dynasty. It would appear, however, that the sceptre was quietly transmitted to Abdulla Khan, the fourth son of Kambar, who, being an intrepid and ambitious soldier, turned his thoughts towards the conquest of Kach Gandava, then held by different petty chiefesses, and became master of the region.

After various success, the Kambars, at length possessed themselves of the sovereignty of a considerable portion of that

on the part of Mehrab Khan, but on that of his vizier, Mahammed Hussein, and certain chiefs with whom he was in league, and at whose instigation the British convoys were plundered in their passage through Kach Gandava and in the Bolan Pass. The treacherous vizier, however, made our too credulous political officers believe that Mehrab Khan was to blame; his object being to bring his master to ruin and to obtain for himself all power in the state, knowing that Mehrab's successor was only a child. How far he succeeded in his object history has shown. In the following year Kalat changed hands, the governor establishing himself in the British, together with a feeble garrison, being overpowered. At the close of the same year it was reoccupied by the British under General Nott. In 1841 Nasir Khan II, the youthful son of the slain Mehrab Khan, was recognized by the British, who soon after evacuated the country.

From the conquest of Sind by the British troops under the command of General Sir Charles Napier in 1843 up to 1854 no diplomatic intercourse occurred worthy of note between the British and Baluch states. In the latter year, however, under the governor-generalship of the marquess of Dalhousie, General John Jacob, C.B., at the time political superintendent and commander-in-chief of the forces stationed in the frontier range and to conclude a treaty with the Kalat state, then under the chiefship of Nasir Khan and the British government. This treaty was executed on the 14th of May 1854 and was to the following effect:—

That the former offensive and defensive treaty, concluded in 1841 by Major Outram between the British government and Nasir Khan of Kalat, was to be terminated.

That Nasir Khan II, his heirs and successors, bound themselves to oppose to the utmost all the enemies of the British government, and in all cases to act in subordinate co-operation with that government, and to enter into no negotiations with other states without its consent.

That should it be deemed necessary to station British troops in any part of Kalat to occupy such positions as may be thought advisable by the British authorities.

That the Baluch chief was to prevent all plundering on the part of his subjects within or in the neighbourhood of British territory.

That he was further to protect all merchants passing through his territory, and only to exact from them a transit duty, fixed by schedule attached to the treaty; and that, on condition of a faithful performance of these duties, he was to receive from the British government an annual subsidy of Rs.50,000 (£5000).

The provisions of the above treaty were most loyally performed by Nasir Khan up to the time of his death in 1856. He was succeeded by his brother, Mir Khodadad Khan, when a youth of twelve years of age, who, however, did not obtain his position before he had put down by force a rebellion on the part of his turbulent chiefs, who had first elected him, but, not receiving what they considered an adequate reward from his treasury, sought to depose him in favour of his cousin Sher dil Khan. In the latter part of 1857, the Indian rebellion being at its height and the city of Delhi still in the hands of the rebels, a British officer (Major Henry Green) was deputed, on the part of the British government, to reside as political agent with the Khan at Kalat and to assist him by his advice in maintaining control over his turbulent tribes. This duty was successfully performed until 1863, when, during the temporary absence of Major Malcolm Green, the then political agent, Khodadad Khan was, at the instigation of some of his principal chiefs, attacked while out riding by his cousin, Sher dil Khan, and severely wounded. Khodadad fled in safety to a residence close to the British border, and Sher dil Khan was elected and proclaimed Khan. His rule was, however, a short one, for early in 1864, when proceeding to Kalat, he was murdered in the Gandava Pass; and Khodadad was again elected chief by the very men who had only the previous year caused his overthrow, and who had lately been accomplices to the murder of his cousin. After the above events Khodadad maintained his precarious position with great difficulty; but owing to his inability to govern his unruly subjects without material assistance from the British government, which they were not disposed to give, his country gradually fell into the greatest anarchy; and, consequently, some of the provisions of the treaty of 1854 having been broken, diplomatic relations were discontinued with the Kalat state after the end of 1874.

After this the chiefs of Las and Wad, the Marris and Bugis, Kej and Makran all threw off their allegiance, and anarchy became so widespread that the British government again interfered. The treaty of 1854 was renewed in 1876 by Lord Lytton (under Sandeman’s advice), and the Khan received substantial aid from the government in the form of an annual subsidy of a lakh of rupees, instead of the Rs.50,000 previously assigned to him. The treaty of 1854 was a treaty of alliance offensive and defensive. The treaty of 1876 renewed these terms, but utterly changed the territorial boundaries, and was followed, by the former, by the recognition of the sirdars as well as the khan, and by the appointment of the British government as referee in cases of dispute between them. British troops were to be located in the khan’s country; Quetta was founded; telegraphs and railways were projected; roads were made; and the reign of law and order established. The nebulous claims of Afghanistan to Sibi and Pishin were disposed of by the treaty of Gandamak in the spring of 1879, and the final consolidation of the existing form of Kalat administration was effected by Sandeman’s expedition to the north of Baluchistan in 1883, and the reconciliation of Azad Khan, the great Naushirzani chief, with the British government. This territory was incorporated with British India by the resolution of 1st November 1887, and divided into two districts—Quetta-Pishin and Thal Chotiial—to be administered by a deputy-commissioner and a regular staff.

In 1890 and 1891 were carried out that series of political-military expeditions which resulted in the occupation of the Zhob valley, the foundation of the central cantonment of Fort Sandeman, and the extension of a line of outposts which, commencing at Quetta, may be said to rest on Wana north of the Gomal. In the event of these inferences, and of the conversion of military occupation, has been to reduce the independent Pathan tribes of the Suliman mountains to effective order, and to put a stop to border raiding on the Indus plains south of the Gomal. In 1893 serious differences arose between the khan of Kalat and Sir James Browne, who succeeded Sir Robert Sandeman as agent to the governor-general in Baluchistan, arising out of Mir Khodadad Khan’s outrageous conduct in the management of his own court, and the treatment of his officials. Finally, the khan was deposed, and his son Mir Mahmud Khan succeeded in November 1893. Since then the most important change in Baluch administration has been the perpetual lease and transfer of management to British agency of the Nushki district and Niqat, with all rights, jurisdiction and administrative power, in lieu of a perpetual rent of Rs.9000 per annum. This was effected in July 1890. This secures the direct control of the great, highway to Seistan which has been opened to khāfīla and railway traffic.

The revenues of the khan of Kalat consist partly of subsidies and partly of agricultural revenue, the total value being about Rs.500,000 per annum. Since 1882 he has received Rs.25,000 as government rent for the Quetta district, besides Rs.30,000 in lieu of transit duties in the Bolan; this has been increased lately by Rs.9000 as already stated. In 1890 the total imports of Kalat were valued at Rs.7,000,000, and the exports at Rs.550,000.

BALUCHISTAN, a province of Persia consisting of the western part of Baluchistan (q.v.) in a wider sense. Persian Baluchistan has an area of about 60,000 sq. m., and lying along the northern shore of the Arabian Sea, is bounded E. by British and
independent Baluchistan, N. by Seistan and the central Persian desert, and W. by Kerman. The country has little water and only a small part of it is under cultivation, the remainder being composed of arid, waterless plains, deserts—some stony, others with moving sands—barren hills and mountains. The principal rivers are the Mashikid and that of Bampur which flow away from the sea and are lost in depressions called hamans. The rivers which flow into the sea are unimportant and dry during the greater part of the year. Persian Baluchistan forms an administrative division of the province of Kerman and is subdivided into the following twenty districts:—(1) Bampur; (2) Serhad; (3) Dizek; (4) Jalk; (5) Sib; (6) Irafshan; (7) Magas; (8) Serbaz; (9) Lasheh; (10) Champ; (11) Fanajj; (12) Bazman; (13) Aptar; (14) Daman; (15) Aprandagan; (16) Asheghesh; (17) Surmij; (18) Meskutan; (19) Pusheth; (20) Makran, the country of the Ichthyophagi, with the sub-districts Kaskand, Geh, Bint, Dasht, Kucheh and Bahu. The total population of Baluchistan is under 200,000. The province was practically independent until the occupation of Bampur by Persian troops in 1839, and over some of the extreme eastern districts the autonomy was not recognized until 1870. The bishopric in Kucheh was suppressed and the bishops of Poitiers. In 1461 he became vicar-general of the bishop of Angers. His activity, cunning and mastery of intrigue gained him the appreciation of Louis XI., who made him his almoner. In a short time Baluze became a considerable personage. In 1465 he received the bishopsric of Evreux; the king made him le premier du grand conseil, and, in spite of his dissolute life, obtained, for him a cardinalate (1468). But in that year Baluze was compromised in the king's humiliation by Charles the Bold at Péronne and excluded from the council. He then intrigued with Charles against his master: their secret correspondence was intercepted, and on the 23rd of April 1469 Baluze was thrown into prison, where he remained eleven years, but not, as has been alleged, in an iron cage. In 1480, through the intervention of Pope Sixtus IV., he was set at liberty, and from that time lived in high favour at the court of Rome. He received the bishopric of Albano and afterwards that of Palestrina. In 1484 he was even sent to France as legate a latere. He died at Ancona in 1491.

See Henri Forgeot, "Jean Baluze, cardinal d'Angers" (1895), in the Bibliothèque de l'école des hautes études.

BALUSTER (through the Fr. from the Ital. balastro, so-called from a supposed likeness to the flower of the Balantion, or wild pomegranate; the word has been corrupted in English into "banister"), a small moulded shaft, square or circular, in stone or wood and sometimes in metal, supporting the coping of a parapet or the rail of a staircase, an assemblage of them being known as a balustrade. The earliest examples are those shown in the bas-reliefs representing the Assyrian palaces, where they were employed as window balustrades and apparently had Ionic capitals. They do not seem to have been known to either the Greeks or the Romans, but early examples are found in the balloons in the palaces at Venice and Verona. In the hands of the Italian revivalists they became features of the greatest importance, and were largely employed for window balconies and roof parapets.

The term "baluster shaft" is given to the shaft dividing a window in Saxon architecture. In the south transept of the abbey at St Albans, England, are some of these shafts, supposed to have been taken from the old Saxon church. Norman bases and capitals have been added, together with plain cylindrical Norman shafts.

BALUSTRADE, a parapet or low screen consisting of a coping or rail supported on balusters (q.v.). Sometimes it is employed purely as a decorative feature beneath the sill of a window which was not carried down to the ground. Sometimes flowing foliage takes the place of the parapet, and sometimes so-called balustrades are formed of vertical slabs of stone, pierced as in the Ca’ d’oro at Venice and the balconies of the minarets at Cairo.

BALUZE, ÉTIENNE (1639-1718). French scholar, was born at Tulle on the 24th of November 1639. He was educated at his native town and took minor orders. As secretary to Pierre de Marca, archbishop of Toulouse, he won the appreciation of that learned prelate to such a degree that at his death Marca left him all his papers. Thus it came about that Baluze produced the first complete edition of Marca’s treatise De libertatibus Ecclesiae Gallicanae (1663), and brought out his Marca hispanica (1685 f.). About 1667 Baluze entered Colbert’s service, and until 1700 was in charge of the invaluable library belonging to the archbishop and to his son the marquis de Seignelay. He enriched it prodigiously (see the history of the Colbertine library in the Cabinet des Manuscrits by M. Léopold Delisle, vol. i.), and Colbert rewarded him by obtaining various benefices for him, and the post of king’s almoner (1675). Subsequently Baluze was appointed professor of Canon law at the Collège de France on the 31st of December 1689, and directed that great institution from 1707 to 1710.

The works which place him in the first rank of the scholars of his time are the Capitularia Regum Francorum (1767; new edition enlarged and corrected in 1780); the Nova Collectio Conciliorum (4 vols., 1777); the Miscellanea Historico-Jurisprudentiales, 4 vols., revised by Mansi, 4 vols. f., 1761-1764); the Letters of Pope Innocent III. (1762); and, finally, the Vite Popolorum Aevi Francorum, 13 vols. (1863). But he was unfortunate enough to take up the history of Auvergne just at the time when the cardinal de Bouillon, inheritor of the rights, and above all of the ambitious pretensions of the La Tour family, was endeavouring to prove the descent of that house in the direct line from the ancient hereditary counts of Auvergne of the 9th century.

As authentic documents in support of these pretensions could not be found, false ones were fabricated. The production of spurious genealogies had already been begun in the Histoire de la maison d’Auvergne published by Christophe Justel in 1645; and Chorier, the historian of Dauphiny, had included in the second volume of his history (1671) a forged deed which connected the La Tours of Dauphiny with the La Tours of Auvergne. The next a regular manufacture of forged documents was organized by a certain Jean de Bar, an intimate companion of the cardinal. These rogues were skilful enough, for they succeeded in duping the most illustrious scholars; Dom Jean Mabillon, the founder of diplomatics, Dom Thierry Ruinart and Baluze himself, called as experts, proved the fallacy of the forged reports on the 23rd of July 1675. But cardinal de Bouillon had many enemies, and a war of pamphlets began. In March 1698 Baluze in reply wrote a Letter which proved nothing. Two years later, in 1700, Jean de Bar and his accomplices were arrested, and after a long and searching inquiry were declared guilty in 1704. Baluze, nevertheless, was obstinate in his opinion. He was convinced that the incriminated documents were genuine and proposed to do Justel’s work anew. Encouraged and financially supported by the cardinal of Bouillon, he first produced a Table généalogique in 1717, then in 1718 a Histoire généalogique de la maison d’Auvergne, with “Proofs,” among which, unfortunately, we find all the deeds which had been pronounced spurious. In the following year he was suddenly engulfed in the disgrace which overtook his intriguing patron: deprived of his appointments, pensions and benefices, he was exiled far from Paris. Note the less he continued to work, and in 1717 published a history of his native town, Historia Tuteleans libri tres. Before his death he succeeded in returning to Paris, where he died unvisited of his errors on the 28th of July 1718. Was he dupe or accomplice? The study of his correspondence with the cardinal gives the impression that he was the victim of clever cheats.

The history of the forgeries committed in the interests of the house of Bouillon forms a curious and instructive episode in the history of French scholarship in the time of Louis XIV. It is to be found in the Manuel de diplomatique by M. Delisle, and in a note to the Œuvres de Saint-Simon by M. de Boisotis (vol. iv. pp. 533-558). The bibliography of Baluze’s researches has been made by M. René Fage (1882, 1884) and his Life told by M. Émilie Fage (1899). To these we must add an amusing book by G. Clément-Simon, La Gacité de Baluze; documents biographiques et littéraires;
BALZAC, HONORÉ DE  
(1799-1850), French novelist, was born at Tours on the 20th of May 1799. His father, Bernard François, never called himself de Balzac and Honoré only assumed the particle after 1830. But the father had equally little right to the name of Balzac at all, for his birth-certificate has been recently discovered. The true name was "Balas", and this in various forms ("Balas," "Balsas") has been traced for more than a century before the novelist's birth. That this was a father's name for very small personal properties in the parish of Canezouls, department of the Tarn. It is probable that the novelist himself was not aware of this, and his father appears to have practised some mystification as to his own professional career. In and after the Revolution, however, he attained positions of some importance in the commissariat and hospital departments of the army, and he married in 1797 Anne Charlotte Laure Sallambier, who was a beauty, an heiress, and a woman of considerable faculty. She survived her son; the father died in 1818. There were two sisters (the elder, Laure, afterwards Mlle. Hanotaux and later his biographer), and a younger brother, Henri, of whom we hear little and that little not very favourable.

Honoré was put out to nurse till he was four years old, and in 1806, when he was seven, was sent to the collège (grammar school) of Vendôme, where he remained till April 1813 as a strict boarder without any holidays. From this he passed as a day-boy to the collège of Tours. His father's official work was transferred to Paris the year after, and Balzac came under the teaching of a royalist private schoolmaster, M. Lepitre, and others. He left school altogether in 1816, being then between seventeen and eighteen.

His experiences at Vendôme served as base for much of Louis Lambert, and he seems to have been frequently in disgrace. Later, his teachers appear to have found him remarkable neither for good nor for evil. He was indeed never a scholar; but he must have read a good deal, and as he certainly had no time for it later, much of this reading must have been done early.

The profession which Balzac's father chose for him was the law; and he not only passed through the schools thereof, and duly obtained his licence, but had three years' practical experience in the offices of a notary and a solicitor (notaire), for the latter of whose chateaux he has left a certain kind of scandal, the reports of which have been preserved by his daughter, who has left a sincere account of them (see his biographer).

But though no man of letters has ever had, in some ways, a such a fancy for business, no man of business could ever come out of such a born man of letters. And when in 1820 (the licence having been obtained and M. Balzac, senior, having had some losses) the father wished the son to become a practising lawyer in one or another branch, Honoré revolted. His family had left Paris, and they tried to starve him into submission by establishing him in a garret with a very small allowance. Here he began to write tragedies, corresponded (in letters which have fortunately been preserved) with his sister Laure, most important of all, attempted something for the great and noble fiction. The tragedy Cromwell was actually completed and read to friends if not to others; nay more, the manuscript exists in the hands of M. Spleelbergh de Lovenjouls, the great authority on Balzac's life and bibliography; but it has never been published. The novels, Cocegurine et Siella, proved abortions, but were only the first of many attempts at his true way until he found it. Drama he never abandoned; but for him it was always an error.

The garret-period from 1820 to 1822 was succeeded by another of equal length at home, but before it had finished (1821) he found his way into print with the first of the singular productions which (and that not entirely or finally) have taken a sort of outside place in his works under the title of Œuvres de jeunesse. The incunabula of Balzac were Les Deux Héros, ou Les Deux Familles bretonnes, and Charles Pointel, ou Mon Cousin de la main gauche. They were followed next year by six others:—D'Héritière de Bironne; Jean Louis, ou La Fille trouvée; Clotilde de Lusignan, ou Le Beau Juif; Le Centenaire, ou Les Deux Beringhèld; Le Vicaire des Ardennes; Le Tartare, ou Le Retour de l'exilé. And these were again followed up in 1823 by three more: La Dernière Pèse, ou La Nouvelle Légende marseillaise; Michel et Christine et la scelerat L'Anonymous; ou Ni famille ni mère.

In 1824 came Annette et le criminel, a continuation of the Vicaire; in 1825, Wann-Chloé, which afterwards took the less extravagant title of Jane la Folle. These novels, which filled some two score volumes originally, were published under divers pseudonyms ("Lord R'hooone", an anagram of "Honoré," "Horace de Saint Aubin," &c.), and in actual collaboration with two or three other writers. But though there is not yet in them anything more than the faintest dawn of the true Balzac, though none of them is good as a whole, and very few parts deserve that word except with much qualification, they deserve far more study than they have yet received, and it is difficult to apprehend the true Balzac until they have been studied. They ceased for a time, not because of the author's conviction of their badness (though he entertained no serious delusions on this subject), nor because they failed of a certain success in actual money return, but because he had taken to the earliest, the most prolonged, and the most disastrous of his dabblings in business—this time as a publisher to some extent and still more as a printer and type-founder. Not very much was known about his experiences in this way (except their general badness, and a few letters which have been published or have been added to his manuscript "de l'ouvrage") till in 1903 MM. Hanotaux and Vicaire published the results of their inquiries into the actual accounts of the concern. There seems to have been no reason why it should not have succeeded, and there has been claimed for it first, that it provided Balzac with a great amount of actual detail which he utilized directly in the novels, and secondly, that it gave him at whatever cost a still more valuable experience of practical life—the experience which has so often been wanted to men of letters. Anyhow, through the fault of the printer, he has been deprived of a large body of material, and of the scenography and atmosphere, for what he himself recognized as his first serious attempt in novel-writing, Les Chouans, or, as it was at first called, Le Dernier Chouan. This book (obviously written in direct following of Scott, of whom Balzac was a lifelong admirer) has been very variously judged—those who lay most stress on his realism thinking little of it, while those who maintain that he was always a romantic "with a difference" place it higher. It has at any rate brilliant colouring, some very vivid scenes, and almost most passion as well as "curtain" at its ending than any other of his books. Though not without a touch of melodrama it differs utterly from the confused and tedious imitations of Mrs Radcliffe, M. G. Lewis and C. R. Matrin, which fill most of the Œuvres de jeunesse. At the same time Balzac was engaged on a very different work, the analytic-satirical sketches which compose the Physiologie du mariage, which illustrate his other and non-romantic side, again with some crudity, but again also with a vast advance on his earlier productions. Both were published in the year 1829, from which his real literary career unquestionably starts. It had exactly twenty-one years to its present, the history of these twenty-one years, though (in consequence mainly of the diligence and luck as a collector of the above-named M. de Lovenjouls) the materials for it are large and constantly accumulating, has never been arranged in a really standard biography, and there seems to be an increasing habit of concentrating the attention on parts of it. It divides itself under three heads mainly, the history of Balzac's business affairs, that
of his loves and friendships and that of his actual work. The first has some small resemblance to Scott's similar experiences, though in Balzac's case there was no great crash but a lifelong pressure; on the other hand, his debts were brought upon him by a long course not so much of extravagance in actual expenditure (though there was something of this) as of financial irregularities of almost every description,—anticipations of earnings, costly methods of production (he practically wrote his novels on a succession of printed revises), speculations, travel, and lastly the collection of curiosities. As regards the second, and although his life made him by turns a hermit and a vagrant, he was on good terms with most of the famous men of letters of his day from Hugo downwards, and seems never to have quarreled with any man, except with some of his editors and publishers, by his own fault. Balzac was indeed, in no belittling sense of the word, one of the most good-natured of men of genius. But his friendships with the other sex are of much more importance, and not in the least matters of mere gossip. His sister Laure, as has been said, and a school-friend of hers, Mme Zalma Carraud, played important and not questionable parts as his correspondents.

But at least three-thirds, all of a rank, however much his own, figure as 'Egerias' to such an extent that it is hardly extravagant to say that Balzac would not have been Balzac without them. These are Madame de Berny, a lady connected with the court of the ancien régime, much older than himself and the mother of nine children, to whom he was introduced in 1821, who became to him La dilecta, who was the original of Mme de Mortsau in Le Lys dans la vallée, and who seems to have exercised an excellent influence on him in matters of taste till her death in 1836; the marquise de Castries, who took him up for a time and dropped him, and who has been supposed to have been his model for his less admirable ladies of fashion; and lastly, the Polish-Russian countess Evelina Hanska, who after addressing, as L'étrangère, a letter to him as early as 1832, became his idol, rarely seen but constantly corresponded with, for the last eighteen years, and his wife for the last few months of his life.

Some of his letters have long been known, but the bulk of them constituted the greatest recent addition to our knowledge of him as given in the two volumes of Lettres à l'étrangère. Of hers we have practically none and it is exceedingly hard to form any clear idea of her, but his devotion is absolutely beyond question.

Business, friendships, all of a rank, however much more other things. In Balzac's case always connected with and on the whole quite secondary to work. He would even sometimes resist the commands by which at long intervals Mme Hanska would summon him to see her, and abstract the greater part of his actual visits to her in order to serve this still more absorbing mistress. He had, as we have seen, worked pretty hard, even before 1829, and his work had partly taken forms not yet mentioned—political pamphlets and miscellaneous articles which are now accessible in the Édition définitive of his works, and hardly one of which is irrelevant to a just conception of him. Nor did he by any means abandon these by-works after 1829; indeed, he at one time started and almost entirely wrote, a periodical called the Revue parisienne. He wrote some dramas and planned many more, though the few which reached the stage left it again promptly. Balzac's dramas, as they appear in his works, consist of Vautrin, Les Ressources de Quinola, Paméla Giraud (arranged for the stage by others), La Mardi and Mercadet le faiseur, the last of which has, since his death, been not unsuccessful. But on the whole he did devote himself to his true vocation, with a furious energy beside which even Scott's, except in his sadder and later days, becomes lesseisante. And all this was done, as he himself said, Le peintre de chagrin (one of the crudest, but according to some estimates, one of the greatest of the works, full of romantic extravagance and surpluses, but with an engaging central idea—the Nemesis of accomplished desire—powerfully worked out; La Maison du chat qui pele, a triumph of observation and nature, together with a crowd of things less in bulk but sometimes of the first excellence—El Verdugo, Étude de femme, La Paix du ménage, Le Bal des sabeaux, La Vendetta, Gobseck, Une Double Famille, Les Deux Rêves, Adieu, L'Élixir de longue vie, Sarrazine, Une Passion dans le désert and Un Épisode sous la Tyrannie)—were all published complete, accompanied by Le Réquisitionnaire, Les Proscrits, Le Chef-d'œuvre inconnu (a masterpiece fortunately not unrecognized), Jésus Christ en Flandre and Maitre Cornelius. 1832 gave Madame Firmiani, Le Message, Le Colonel Chabert and Le Curé de Tours (two stories of contrasted but extraordinary excellence), La Bourse, La Femme abandonnée, Louis Lambert (autobiographical and philosophic), La Grenadière and Les Marans (a great favourite with the author). In 1833 appeared Ferroux, chef des dévants, the first part of L'Histoire des treize (a collection in the more extravagant romantic manner, very popular at the time, and a subject which he had left for another, La Médécine de campagne (another pet of the author's), and a kind of intended document of his ability to support the cause of virtue, but, despite certain great things, especially a wonderful popular "legend of Napoleon," a little heavy as a whole), the universally admitted masterpiece of Eugénie Grandet, and L'Illustre Gaudissart (very amusing). 1833 also saw the beginning of a remarkable and never finished work—out of his usual scope but exceedingly powerful in parts—the Contes drolatiques, a series of tales of Old France in Old (or at least Rabelaisian) French, which were neither finished nor published for many years, but finally appeared in 1836. La Médécine de campagne, La Fille de la Rue, Le Peau de chagrin, and the third part of ten. These last three, borrowed largely from their 15th and 16th century models; but in La Sucette and others there is no doubt of genius and not a little art. 1834 continued the Treize with La Duchesse de Langeais and added La Recherche de l'absolu (one of Balzac's great studies of monomania, and thought by some to be the greatest, though others prefer Le Chef-d'œuvre inconnu), La Femme de trente ans (the chief example of the author's caprice for re-handling, and very differently judged as a whole), with yet another of the acknowledged triumphs, Le Père Goriot. On the whole, this year's work, though not the author's largest, is perhaps his most peculiar. Next year (1835) followed Melmoth réconcilié (a tribute to the great influence which Maturin exercised, not over Balzac only, at this time in France), Un Drame au bord de la mer, the brilliant, if questionable, conclusion of Les Treize, La Fille aux yeux d'or, Le Contrat de mariage et Séraphite. This last, a Swedishborn rhapsody of great beauty in parts, has divided critics almost more than anything else of its writer's, some seeing in it (with excuse, nothing but the short description given above in three words, the others (with justice) reckoning it his greatest triumph of style and his nearest attempt to reach poetry through prose. On the last (1836) he wrote La Mère l'Ange (very amusing and in the style of Le Lys dans la vallée) and La Mère l'Ange (already referred to and of a somewhat sickly sweetness), L'Enfant maudit, La Vieille Fille and Le Secret des Ruggieri (connected with the earlier Les deux Rêves under the general title, Sur Catérine de Médicis, and said to have been turned out by Balzac in a single night, which is hardly possible). In 1837 were published Les Deux Poètes, destined to form part of Illusions perdues, Les Employés, Gombara and another capital work, Histoire de la grandeur et de la décadence.
de César Brotoeu, where Balzac's own unlucky experiences in trade are made thoroughly matter of art. 1838 was less fruitful, contributing only Le Cabinet des antiques, which had made an earlier partial appearance, and Le Maison Nucingen et Une Fille d'Ève. But 1839 made amends with the second part of Illusions perdues, Un Grand Homme de province à Paris (one of Balzac's minor diploma-pieces), Le Curé de village (a very considerable thing), and two smaller stories, Les Secrets de la princesse de Cadignan and Massimilla Doni. Pierrette, Z. Marcus, Un Prince de la Bohème and Pierre Grassou followed in 1840, and in 1841 Une Ténèbreuse Affaire (one of his most remarkable workings-up of the minor facts of actual history), La Martyr Calviniste (the conclusion of Sur Catherine de Médicis), Ursule Mirouet (an admirable story, much of which is taken up in Madame de deux jeunes mariés), on which again there have been very different opinions. 1842 supplied Albert Savarou (autobiographical largely), Un Début dans la vie, the very variously named and often rehandled Ravouillére (which, since Taine's exaltation of it, has often been taken as a Balzanic quintessence), and Autre étude de femme, yet another rehandling of earlier work. In 1843 came the introduction of the completed Sur Catherine de Médicis, Honorine and La Muse du département (almost as often reconstructed as La Femme de trente ans), with Comment aimes les jeunes filles (a similar rehandling intended to start that as yet unopened career of more, and more literary, rivalry). Où mènent les mauvais chemins, the first part of Les Parents pauvres, La Cousine Bette (sometimes considered the topmost achievement of Balzac's genius), and the final form of a work first issued fifteen years earlier and often retouched, Petites misères de la vie conjugale. 1847 was even richer, with Le Cousin Pons (the second part of Les Parents pauvres, and again a masterpiece), the conclusion of the Splendeurs, La Dernière Incarnation de Vouinrin, L'Envers de l'histoire contemporaine (which had been on and off the stocks for five years), and the unfinished Dépôt d'Arts. This was the last scene of the comedy that appeared in the life of its author. The conclusion of the Dépôt d'Arts was published in 1853, and those of Les Paysans and Les Petits Bourgeois which appeared, the first in this year, the second wholly in 1855, are believed or known to be by Balzac's friend, Charles Rabou (1805-1871).

This immense and varied total stands to its author in a somewhat different relation from that of any other work to any other writer. It has been well said that the whole of Balzac's production was always in his head together; and this is the main justification for his syllabus of it as the Comedy. Some parts never came out of his head into print, and we have uncountable titles of work (sometimes spoken of in his letters as more or less finished) of which no trace remains, or only fragmentary MS. sketches. One apparently considerable book, La Boaîte, which was to be devoted to the battle of Essling, and for which he actually visited the ground, is frequently referred to as in progress from the time of his early letters to Madame Hanska onwards; but it has never been found. Another result of this relation was the constant altering, re-shaping, re-connecting of the different parts. That if Balzac had lived as long as Hugo, and had preserved his faculties as well, he could never have finished the Comédie, is of course obvious: the life of Methusalem, with the powers of Shakespeare, would not suffice for that. But that he never would—even if by some impossibility he could—is almost equally certain. Whether there is any mark of decline in his latest work has been disputed, but there could hardly have been farther advance, and the character of the whole, not easy to define, is much less hard to comprehend, if prejudice be kept out of the way. That character was put early, but finally, by Victor Hugo in his funeral discourse on Balzac, whose work he declared, with unusual tact, that among other phrases of more or less gorgeous rhetoric, to be "observation and imagination." It may be doubted whether all the volumes written on Balzac (a reasoned catalogue of the best of which will be found below) have ever said more than these three words, or have ever said it more truly if the due stress be laid upon the "and." On the other side, most of the mistakes about him have arisen from laying undue stress on one of the two qualities, or from considering them separately rather than as inextricably mixed and blended. It is this blending which seems to have been the most fatal. He is perhaps the most exact, the minute, the most elaborate; but he suffuses this observation with so strange and constant an imaginative quality that he is, to some careful and experienced critics, never quite "real"—or almost always something more than real.

He seems accustomed to create in a fashion which is not so much of the actual world as of some other, possible but not actual—no matter whether he deals with money or with love, with Paris or with the provinces, with old times or with new. A further puzzle has arisen from the fact that though Balzac has virtuous characters, and he sees his world as a whole, and knows and that, whether he actually prefers the delineation of vice, misfortune, failure, or not, he produces as a rule in his readers the sensation familiarly described as "uncomfortable." His morality has been fiercely attacked and valiantly defended, but it is absolutely certain that he wrote with no immoral intention, and with no indifference to morality. In the same way there has been much discussion of his style, which seldom achieves beauty, and sometimes falls short of correctness, but which still more seldom lacks force and adequacy to its own purpose. On the whole, to write with the shorthand necessary here, it is true that the reader is put into the presence of the people, while it may be questioned whether any single book of his, or any scene of a book, or even any single character or situation, is among the very greatest books, scenes, characters, situations in literature. But no novelist has created on the same scale, with the same range; none has such a cosmos of his own, pervaded with such a sense of the originality and power of its creator.

Balzac's life during these twenty years of tremendous production has, as regards the production itself, been already outlined, but its outward events, its distractions or avocations—apart from a life of almost weekly humanity—of which he himself was the principal, and of which the balance-sheet, as it were, is in the Récit de Paris, he had bought ground at Ville d'Avray, and there constructed, certainly at great, though perhaps exaggerated expense, his villa of Les Jardines, which figures largely in the Balzacian legend. His rash and complicated literary engagements, and (it must be added) his disregard of them when the whim took him, brought him into frequent legal difficulties, the most serious of which was a law-suit with the Revue de Paris in 1836. In 1831, and again in 1834, he had thought of standing for election as Deputy, and in the latter year he actually did so both at Cambrai and Angouleme; but it is not certain that he received any votes. He also more than once took steps to become a candidate for the Academy, but retired on several occasions before the voting, and when at last, in 1840, he actually stood, he only obtained two votes.

As early as the Genevan meeting of 1833, Madame Hanska had formally promised to marry Balzac in the case of her husband's
BALZAC—BAMBERG

301

death, and this occurred at the end of 1841. She would not, however, allow him even to visit her till the next year had expired, and then, though he travelled to St Petersburg and the engagement was renewed after a fashion, its fulfilment was indefinitely postponed. For some years Balzac met his beloved at Baden, Wiesbaden, Brussels, Paris, Rome and elsewhere. Only in Sochi, the Caspian, when he invited the future husband to her estate of Wierzchowskia in the Ukraine, and even then the visit, interrupted by one excursion to Paris and back, was prolonged for more than two years before (on the 14th of March 1850) the wedding actually took place. But Balzac’s own Peau de chagrin was now reduced to its last morsel. His health, weakened by his enormous labours, had been ruined by the Russian cold and his journeys across Europe. The pair reached the house at Paris in the rue Fortunée, which Balzac had bought for his wife and filled with his collections, at the end of March. He married, the 17th of August, on Balzac’s 56th birthday, attended by his mother, but not by his wife. He actually died at half-past eleven that night and was buried on the 20th, the pall-bearers being Hugo himself, Dumas, Sainte-Beuve (an enemy, but in this case a generous one) and the statesman Baroche, in Père Lachaise, where Hugo delivered the speech cited above.

BIBLIOGRAPHY.—The extraordinarily complicated bibliography of Balzac will be found all but complete in the Histoire des auteurs. (1881) a large volume by M. Jean Baptiste de Lencquesaing, Édition définitive, and supplemented by him in numerous smaller works, Auteur de Balzac, Une Page perdue de Balzac, &c. Summaries of it will be found appended to the introductory critical essays of each of Théophile de Viau’s twenty volumes of the Saintes Maries (1895–1898), which also contains a short Memoir and general criticism. Before the Édition définitive (1898 onwards), the works had been issued in large numbers. His innumerable reprints have kept up with varying dates by Michel (Calman) Lévy, which did not contain the miscellaneous works and was not arranged according to the author’s last disposition, but did include the Oeuvres completes, appended by M. Prefaut. This edition gives the miscellaneous works in four volumes, an invaluable volume of correspondence, and the Histoire des œuvres as cited. To this was added, in 1894, another volume, Répertoire des œuvres de Balzac, in which the history of the various personages of the Comédie is tracked throughout and ranged under separate articles by MM. Cerfeur and Christopher with extraordinary pains, and with a result of usefulness which should have protected it from some critical anathemas. In 1899 appeared, as the first volume of Oeuvres posthumes, an instalment of the Lettres à l’étrangère, and in 1900 a second (up to 1844) with a portrait of Madame Hanseka, and other Illustrations. MM. Hanseka and Meurer collaborated on some of these works of importance. Sainte-Beuve and Balzac fell out, and a furious dis- tribute by the novelist on the critic is preserved; but the latter’s post- mortem claims to the Comedia nationale, which ended in a duel, though it could hardly be cordial. Gautier, who was a very intimate and trusted friend of Balzac, has left an excellent study, mainly personal, reprinted in his Portraits contemporains. Lamartine produced a volume, not of much value, on Balzac in 1866; and minor contemporaries—Gozlan, Lemer, Champfleury—supplied something. But the series of important studies of Balzac, based on the whole of his work and not biased by friendship or enmity, begins with Taine’s Etude of 1856, reprinted in volume form, 1885. Even then the Oeuvres diverses were accessible only by immense labour in the scattered originals, and the invaluable Correspondance not at all. It was only on the publication of the Édition définitive that such a complete work of study and man and work was possible. To this edition itself was attached a sort of official critical introduction, L’œuvre de Balzac, by M. Marcel Barrière (1890). But this is largely occupied by elaborate analyses of the different books, and the recent critical part is small, and not of the first value. Better are M. Paul Flot’s Essais sur Balzac (2 vols., 1893–1894), which busy themselves especially with tracing types of character. Important and new bibliographical studies include the collecting of the majority of given in M. Emmond Biré’s Honoré de Balzac (1897). The Balzac index of A. Cabanas (1899) is chiefly remarkable for its investiga- tions, both of the first and the second editions. The first index (imprimerie) of MM. Hantouaux and Vicaire’s La Jeunesse de Balzac (1903) mentioned above, for its dealing with the printing business and the intimacy with Madame de Berny. Two most important studies of Balzac’s works are those of M. A. Gozlan, Balzac, and l’œuvre de Balzac (1906), a brilliant but rather one-sided panegyric on the subject as the evolver of the modern novel proper, and a model and observer par excellence. In English, translations of separate books are innumerable; of the whole, besides that mentioned above, but containing a few things there omitted, an American version by Miss Wormley and others may be mentioned. The most elaborate monograph in English, till recently, was F. Wedmore’s Balzac (1887), with a useful bibliography up to the time. The recent additions to our knowledge are utilized in Miss Mary F. Sanders’ Balzac (1904), a rather popular, but full and readable summary, chiefly of the life, from all but the latest documents, and W. H. Hutton’s works of Balzac, which will be found in separate form. The present writer, besides the critical and biographical essays referred to above, prefixed a shorter one to a translation of Let Chouan executed by himself in 1890. (C. SA.)

BALZAC, JEAN LOUIS GUEZ DE (1594–1654), French author, was born at Angoulême in 1594. He travelled in Holland with Théophile de Viau, with whom he later exchanged bitter recriminations. He was early befriended by the duc d’Épernon and his son Louis, Cardinal de la Valette, who took him to Rome. His letters written to his acquaintances and to many who held a high position at the French court gained for him a great reputation. Compliments were showered upon him, he became an habitué of the Hôtel de Rambouillet, and his head appears to have been turned a little by his success. Richelieu was lavish of praise and promises, but never offered Balzac the preferment he expected. In 1624 a collection of his Lettres was published, which was reprinted in 1626. From the château of Balzac, whether he had retired, he continued to correspond with Jean Chapelain, Valentin Conrart and others. In 1634 he was elected to the Academy. He died at Angoulême on the 18th of February 1654. His fame rests chiefly upon the Lettres, a second collection of which appeared in 1636. Recueil de nouvelles lettres was printed in the next year. His letters, though empty and affected in matter, show a real mastery of style, introducing a new clearness and precision into French prose and encouraging the development of the language on national lines by emphasizing its most idiomatic elements. Balzac has thus the credit of executing in French prose a reform parallel to Malherbe’s in verse. In 1631 he published an eulogy of Louis XIII. entitled Le Prince; in 1642 the Socrate chrétien, the best of his longer works; Aristippe ou de la Cour in 1658; and several dissertations on style.

His Oeuvres were collected (2 vols.) in 1663 by Valentine Conrart. There are numerous English translations from Balzac, dating from the 17th century.

BAM, a town of Persia in the province of Kerman, situated 115 m. S.E. of the city of Kerman at an elevation of 3600 ft. on both banks of the river Bam. Pop. about 13,000. It is the capital of the Bam-Narmashir district and has extensive groves of date-palms and gardens. Outside the town stands the famous citadel with walls 40 ft. in height. This citadel was, even as late as the beginning of the 19th century, the strongest fortified place in Persia and overlooked the whole of the province of Bam in 1719 and were not finally expelled until 1801. Post and telegraph offices have been established there since 1903.

BAMBERG, a town and archiepiscopal see of Germany, in the kingdom of Bavaria. Pop. (1885) 31,521; (1905) 45,368. It lies on an open plain on the river Regnitz, 2 m. above its junction with the Main, and 39 m. north of Nuremberg by rail- way. The upper town is built on seven hills, each crowned by a church, while the lower, still partially surrounded by walls and ditches, is divided by the river and Ludwigskanal into three districts. The cathedral is a noble late Romanesque building with four imposing towers. It was founded in 904 by the emperor Henry II., finished in 1012, afterwards partially burnt, and rebuilt in the 13th century. Of its many works of art may be mentioned the magnificent marble tomb of the founder and his wife, the empress Cunigunde, carved by Tilman Riemenschneider between 1499 and 1513, and an equestrian statue of the emperor Conrad III. Other noteworthy churches are the Jakobskirche, an 11th-century Romanesque basilica; the St Martinskirche; the Marienkirche or Obere Pfarrkirche (1320–1387), which has now been restored to its original pure Romanesque style. The Michaelskirche, a 12th-century Romanesque (restored), on the Michaelsberg, was formerly the church of a Benedictine monastery secularized in 1803, which now contains
the Bürgerspital, or alms-house, and the museum and municipal art collections. Of the bridges connecting the sections of the lower town the most interesting is the Obere Brücke, completed in 1455. Halfway across this, on an artificial island, is the Rathaus (rebuilt 1744-1756). The royal lyceum, formerly a Jesuit college, contains notable collections and the royal library of over 300,000 volumes. The picturesque Old Palace (Alte Residenz) was built in 1591 on the site of an old residence of the counts of Bamberg. The New Palace (1659-1704) was formerly occupied by the prince-bishops, and from 1864 to 1867 by the deposed King Otto of Greece. Noteworthy among the monuments of the town is the Maximilian fountain (1880), with statues of Maximilian I. of Bavaria, the emperor Henry II. and his wife, Conrad III. and St Otto, bishop of Bamberg. At a short distance from the town is the Altenburg (526 ft.), a castle occupied from 1251 onwards by the bishops of Bamberg. It was destroyed in 1553 by Albert, margrave of Brandenburg, but has been partly restored. The schools include the lyceum for philosophy and Catholic theology (a survival of the university suppressed in 1803), a seminary, two gymnasias, a Realschule, and several technical schools, including one for porcelain-painting. The industries of the town include cotton spinning and weaving, silk spinning, the manufacture of tobacco, ropes, metal-ware, furniture, &c. The market gardens of the neighbourhood are famous, and there is a considerable shipping trade by the river and the Ludwisgkanal.

Bamberg, first mentioned in 902, grew up by the castle (Babenberch) which gave its name to the Babenberg family (q.v.). On their extinction it passed to the Saxon house, and in 1007 the emperor Henry II. founded the see. From the middle of the 13th century onward the bishops were princes of the Empire. The see was secularized in 1802 and in 1803 assigned to Bavaria.

A brief history of the bishopric is given in the Catholic Encyclopedia (London and New York, 1909), with bibliography. For general and special works on the town see Ulysse Chevalier, Topographie historique et artistique de la ville de Bamberg, 2 vols. (1877-1888.)

BAMBERGER, LUDWIG (1823-1899), German economist and politician, was born of Jewish parents on the 22d of July 1823 at Mainz. After studying at Giessen, Heidelberg and Göttingen, he entered on the practice of the law. When the revolution of 1848 broke out he took an active part as one of the leaders of the republican party in his native city, both as popular orator and as editor of the local papers. In 1849 he took part in the republican rising in the Palatinate and Baden; on the restoration of order he was condemned to death, but he had escaped to Switzerland. The next year he spent in exile, at first in London, then in Holland; in 1852 he went to Paris, where, by means of private connexions, he received an appointment in the bank of Bischofheim & Goldschmidt, of which he became managing director, a post which he held till 1866. During these years he saved a competence and gained a thorough acquaintance with the theory and practice of finance. This he put to account when the amnesty of 1866 enabled him to return to Germany. He was elected a member of the Reichstag, where he joined the National Liberal party, for like many other exiles he was willing to accept the results of Bismarck's work. In 1868 he published a short life of Bismarck in French, with the object of producing a better understanding of German affairs, and in 1870, owing to his intimate acquaintance with France and with finance, he was summoned by Bismarck to Versailles to help in the discussion of terms of peace. In the German Reichstag he was the leading authority on matters of finance and economics, as well as a clear and persuasive speaker, and it was chiefly owing to him that a gold currency was adopted and that the German Imperial Bank took its present form; in his later years he wrote and spoke strongly against bimetallism. He was the leader of the free traders, and after 1878 refused to follow Bismarck in his new policy of protection, state socialism and colonial development; in a celebrated speech he declared that the day on which it was introduced was a dies nefastus for Germany. True to his free trade principles he and a number of followers left the National Liberal party and formed the so-called "Secession" in 1880. He was one of the few prominent politicians who consistently maintained the struggle against state socialism on the one hand and democratic socialism on the other. In 1892 he retired from political life and died in 1899. Bamberger was a clear and attractive writer and was a frequent contributor on political and economic questions to the Nation and other periodicals. His most important works are those on the currency, on the French war-indemnity, his criticism of socialism and his apology for the Secession. An edition of his collected works (including the French life of Bismarck) was published in 1894 in five volumes. After his death in 1899 appeared a volume of reminiscences, which, though it does not extend beyond 1866, gives an interesting picture of his share in the revolution of 1848, and of his life in Paris. (J. W. He.)

BAMBOO, the popular name for a tribe of grasses, Bambusae, which are large, often tree-like, with woody stems. The stems spring from an underground root-stock and are often crowded to form dense clumps; the largest species reach 120 ft. in height. The slender stem is hollow, and, as generally in grasses, has well-marked joints or nodes, at which the cavity is closed by a strong diaphragm. The branches are numerous and in some species spiny; the narrow, often short, leaf-blade is usually jointed at the base and has a short stalk, by which it is attached to the long sheath. The spikelets are usually many-flowered and variously arranged in racemes or panicles. The flower differs from that of the majority of grasses in having usually three lodicules and six stamens. Many species bloom annually, but others only at intervals sometimes of many years, when the individuals of one and the same species are found in bloom over large areas. Thus on the west coast of India the simultaneous blooming of Bambusa arundinacea (fig. 1), one of the largest species, has been observed at intervals of thirty-two years. After ripening of the seed, the leafless flowering culms always die down. The Bambusae contain twenty-three genera and occur throughout the tropical zone, but very unevenly distributed; they also extend into the sub-tropical and even into the temperate zone. Tropical Asia is richest in species; in Africa there are very few. In Asia they extend into Japan and to 10,000 ft. or more on the
BAMBRUGH

Himalayas; and in the Andes of South America they reach the snow-line.

The fruit in Bambusa, Arundinaria and other genera resembles the grain generally characteristic of grasses, but in Dendrocalamus and others it is a nut, while rarely, as in Melocanna, it is fleshy and suggests an apple in size and appearance. The uses to which all the parts and products of the bamboo are applied in Oriental countries are almost endless. The soft and succulent shoots, when just beginning to spring, are cut off and served up at table like asparagus. Like that vegetable, also, they are eaten raw or to keep them longer fit for consumption; and they afford a continuous supply during the whole year, though it is more abundant in autumn. They are also salted and eaten with rice, prepared in the form of pickles or candied and preserved in sugar. As the plant grows older, a species of fluid is secreted in the hollow joints, in which a concrete substance once highly valued in the East for its medicinal qualities, called tabasir or tabascheer, is gradually developed. This substance, which has been found to be a purely siliceous concretion, is possessed of peculiar optical properties. As a medicinal agent the bamboo is entirely inert, and it has never been received into the European materia medica.

The grains of the bamboo are available for food, and the Chinese have a proverb that it produces seed more abundantly in years when the rice crop fails, which means, probably, that in times of dearth the natives look more after such a source of food. The Hindus eat it mixed with honey as a delicacy, equal quantities being put into a hollow joint, coated externally with clay, and thus roasted over a fire. The fleshy fruit of Melocanna is baked and eaten. The plant is a native of India, but is sometimes cultivated as in Mauritius. It is, however, the stem of the bamboo which is applied to the greatest variety of uses. Joints of sufficient size form water buckets; smaller ones are used as bottles, and among the Dyaks of Borneo they are employed as cooking vessels. Bamboo is extensively used as a timber wood, and houses are frequently made entirely out of the products of the plant; complete sections of the stem form posts or columns; split up, it serves for floors or rafters; and, interwoven in lattice-work, it is employed for the sides of rooms, admitting light and air. The roof is sometimes of bamboo solely, and when split, which is accomplished with the greatest ease, it can be formed into laths or planks. It is employed in shipping of all kinds; some of the strongest plants are selected for masts of boats of moderate size, and the masts of larger vessels are sometimes formed by the union of several bamboos built up and joined together.

The bamboo is employed in the construction of all kinds of agricultural and domestic implements and in the materials and implements required in fishery. Bows are made of it by the union of two pieces with many bands; and, the septa being bored out and the lengths joined together, it is employed, as we use leaden pipes, in transmitting water to reservoirs or gardens. From the light and slender shafts shafts for arrows are obtained; and in the south-west of Asia there is a certain species of equally slender growth, from which writing-pens or reeds are made. A joint forms a holder for papers or pens, and it was in a joint of bamboo that silk-worm eggs were carried from China to Constantinople during the reign of Justinian. The outer cuticle of Oriental species is so hard that it forms a sharp and durable cutting edge, and it is so siliceous that it can be used as a whetstone. This outer cuticle, cut into thin strips, is one of the most durable and beautiful materials for basket-making, and both in China and Japan it is largely so employed. Strips are also woven into cages, chairs, beds and other articles of furniture, Oriental wicker-work in bamboo being unparalleled for beauty and neatness of workmanship. In China the interior portions of the stem are beaten into a pulp and used for the manufacture of the finer varieties of paper. Bamboos are imported to a considerable extent into Europe for the use of basket-makers, and for umbrellas and walking-sticks. In short, the purposes to which the bamboo is applicable are almost endless, and well justify the opinion that "it is one of the most wonderful and most beautiful productions of the tropics, and one of Nature's most valuable gifts to uncivilized man" (A. R. Wallace, The Malay Archipelago).

A number of species of bamboo are hardy under cultivation in the British Isles. A useful and interesting account of these and their cultivation will be found in the Bamboo Garden, by A. B. Freeman-Mitford. They are mostly natives of China and Japan and belong to the genera Arundinaria, Bambusa and Phyllostachys; but include a few Himalayan species of Arundinaria. They may be propagated by seed (though owing to the rare occurrence of fruit, this method is seldom applicable), by division and by cuttings. They are described as hungry plants which well repay generous treatment, and will flourish in a rich, not too stiff loam, and for the first year or two should be well mulched. They should be sheltered from winds and well watered during the growing period. When being transplanted the roots must be disturbed as little as possible. The following may be mentioned; Arundinaria simoni, a fine plant which in the bamboo garden at Kew has reached 18 ft. in height, and not infrequently flowers and fruits in Britain; A. japonica, a tall and handsome plant generally grown in gardens under the name Bambusa métabé; A. nitida, "by far the daintiest and most attractive of all its genus, and remarkably hardy"; Bambusa palmata, with leaves a foot or more long and three inches broad; B. tessellata; B. quadrangularis, remarkable for its square stems; Phyllostachys miyabei, growing to 60 ft. high in its native home, China and Japan; and P. nigra, so called from the black stem, a handsome species.

BAMBRUGH, or BAMBURGH, a village in the Berwick-upon-Tweed parliamentary division of Northumberland, England, on the sea-coast, 21 m. E. of Belford station on the North Eastern railway, and 54 m. N. of Newcastle. It was a royal borough previous to the Norman Conquest and returned two members to parliament in the reign of Edward I. Its ancient castle occupies a magnificent position close to the sea on an almost perpendicular rock, 150 ft. in height, accessible only on the south-east side.

The first erection is ascribed by the Saxon chronicles to King Ida of Northumberland. The castle buildings are of various dates from the Norman period and are of great strength and dignity. They include a massive keep and the remains of an apsidal chapel dedicated to St Peter. In the village, the church is dedicated to St Aidan, who was bishop of Lindisfarne or Holy Island, which lies off the coast to the north, about 364. It is a fine cruciform building, mainly of Early English date, with a crypt beneath the chancel. In the churchyard is a monument to Grace Darling (1835-1842), the brave rescuer of some of the crew of the ship "Forfarshire" in 1838. The Longstone Lighthouse, where her father was keeper, stands on an outer rock of the Farne Islands, which stretch north-eastward for 6 m. from the coast at Bamburgh.

The town of Bamburgh (Bobbanburgh) sprang up round the ancient castle. During the struggle for the crown between William Rufus and Robert of Normandy, Bamburgh was besieged by William, who, finding the defence too strong, erected and garrisoned a new castle before Bamburgh called

that should be a free borough governed by four balliffs, that it should be enclosed by a wall and that the burgesses should have a gild merchant. He also altered the market-day from Sunday to Wednesday, and gave licence for the fairs, which had been held “from time immemorial” on the feasts of SS. Oswald and Aidan, to continue for three extra days. During the Scottish wars of the reign of Henry V, Bambough again suffered severely, so much so that in 1439 the burgesses had decreased in number from 120 to 13. These again petitioned for a remission of their farm, which in 1446 was reduced to 510 acres, and in 1447 a warrant was given out a third colour some- Wars of the Roses and twice recovered by Queen Margaret.

In 1463, after it had been recovered a second time by the queen, Henry VI. stayed there for a year, but after the battle of Hexham it was again taken by the Yorkists, and the castle and town were then so much injured that from that time there is no mention of the burgesses or their privileges. Bambourgh returned two members to parliament in 1493 and again in Edward III’s reign, but since then has never been represented. In 1584 Lord Neville received licence to dig for sea-coal in Bambourgh, and much of coal and lead existed there late as 1681.

BAMBUTE (sometimes incorrectly called Batwa), a race of pygmies of the Semliki Forest, on the western borders of the Uganda Protectorate between Albert Nyanza and Albert Edward Nyanza. They probably form merely a branch of the pygmy race of Equatorial Africa, represented farther west by H. von Wissmann’s Batwa (q.v.). Their complexion varies from reddish-yellow to brownish-black, with head-hair often of a russet-brown, and body-hair, black and bristly on upper lip, chin, chest, axillae and pubes, yellowish and feathery on cheeks, back and limbs. Their height is 4 ft. or 5 in. Even when forested, there is no trace left of their inferior stature.

Sir H. H. Johnston says (between the smell of a monkey and a negro. Their faces are remarkable for the long upper lip, and the bridgeless nose with enormous alae (the cartilage of the nose above the nostrils). Like the Batwa they are nomad hunters, building only huts of sticks and leaves, and living in the forest, where they hunt the largest game with no weapon but a tiny bow from which they shoot poisoned arrows. Sir H. H. Johnston states that the Bambute have a good idea of drawing, and with a sharpened stick can sketch in sand or mud the beasts and birds known to them. The Bambute do not tattoo or scar, nor have they any love of ornament, wearing no ear-rings, necklets, anklets, &c. The upper incisors and canines are sharpened to a point. In the forests they go quite naked. They speak a corrupted form of the dialects of their negro neighbours. They have a peculiar way of singing their words. Their voices are low and musical and the pronunciation is singularly staccato, every syllable being separately uttered. They show no trace of spirit or ancestor worship, but have some idea that thunder, lightning and rain are manifestations of an Evil Power, and that the dead are reincarnated in the red bush-pig. They have no tribal government, accepting as temporary lawgiver some adept hunter. Marriage is by pur- chase; polygamy seems to exist, but the domestic affections are strong.

The dead are buried in dug graves, and food, tobacco and weapons are often placed with the corpse. The Bambute are very musical, though they are uninventive as regards instruments. They have many songs which they sing well and they dance with spirit.

See A. de Quatrefages, The Pygmies (Eng. edit. 1895); Sir H. H. Johnston, Uganda Protectorate (1902).

BAMFORD, SAMUEL (1788-1872), English labour politician, was born at Miston, near Middleton, Lancashire, on the 28th of February 1788. Himself a stalwart weaver, he was opposed to physical force movements and did all he could to restrain the violent resistance to trade oppression which was so common; yet through attending and speaking at the meeting (1819) at Peterloo, Manchester (q.v.), which was intended to be a peaceful gathering to petition for Parliamentary reform and a repeal of the Corn Law but ended in a massacre, he was arrested for a breach of the law, convicted and sentenced to twelve months' imprisonment. He had been the author of several pamphlets (principally in the Lancashire dialect) showing sympathy with the conditions of his class, and his Passages in the Life of a Radical (1840-1844) is an authoritative history of the condition of the working classes in the years succeeding the battle of Waterloo. He died at Harpurhey on the 13th of April 1872, and was accorded a public funeral, attended by thousands.

BAMIAN, a once renowned city of Afghanistan, situated about 80 m. N.W. of Kabul. Its remains lie in a valley of the Hazara country, on the chief road from Kabul towards Turkesthan, and between the Hazara and the Chubull, and are crowded by the remains of numerous massive temples, whilst their pre- cipitous faces are for 6 or 7 m. pierced by an infinity of ancient cave-dwellings, some of which are still occupied. The actual site of the old city is marked by mounds and remains of walls, and on an isolated rock in the middle of the valley are consider- able ruins of what appears to have been the acropolis, now known to the people as Chululgula. But the most famous remains at Bamian are two colossal standing idols, carved in the cliffs on the north side of the valley. They are 173 ft. and 120 ft. high respectively. These images, which have been much injured, apparently cannot be more than two or three thousand years old, whilst the pre- cipitous faces are for 6 or 7 m. pierced by an infinity of ancient cave-dwellings, some of which are still occupied. These images are used by the amir as store-houses for grain. The surface of the niches also has been painted with figures. In one of the branch valleys is a similar colossal, some- what inferior in size to the second of these two; and there are indications of other niches and idols. Chahbuljur, 28 m. from Zari, on the road to Balkh by the Balkhab, at the east end of the Sookhiagi valley; Shahr-i-Babar, about 45 m. above Chahbul- jur; and Gargwiri, 6 m. above Shahr-i-Babar, are all forti- fied sites of about the same age as the relics at Bamian. At Halbak there is a very perfect excavation called the Takhti-i- Rustam (a general name for all incomprensible constructions amongst the modern inhabitants of Afghan Turkesthan), which consists of an annular ditch enclosing a platform, with a small house about 21 ft. square above it, all cut out of the solid rock. There are hundreds of caves in this neighbourhood, all pointing to a line of Buddhist occupation connecting Balkh with Kabul. As seen from the rock of Chululgula, Bamian, which its ruined towers, its colossal, its innumerable grottos, whilst the singular red colour of its barren soil, presents an impressive aspect of desolation and mystery.

That the idols of Bamian, about which so many conjectures have been uttered, were Buddhist figures, is ascertained from the narrative of the Chinese pilgrim, Hsüan-Tsang, who saw them in their splendour in A.D. 630, and was verified by the officers above named, who discovered other Buddhist caves and excavations in the valleys of the Balkhab and Sarikol.
Bampton—Ban

305

Still vaster than was a recumbent figure, 2 m. east of Bamiyan, representing Sakya Buddha entering Nirudda, i.e. in act of death. This was "about 100 ft. in length." No traces of the fragment, which was formerly known to by modern travellers, but in all likelihood it was only formed of rubble plastered (as is the case still with such Nirudda figures in Indo-China) and of no durability. For a city so notable Bamiyan has a very obscure history. It does not seem possible to identify it with any city in classical geography: *Alexandria ad Caucuasum* it certainly was not. The first known mention of it seems to be that by Hsuan-Tszang, at a time when apparently it had already passed its meridian, and was the head of one of the small states into which the empire of the White Huns had broken up. At a later period Bamiyan was for half a century, ending in 1232, the seat of a branch of the Ghuri dynasty, ruling over Tokharistan, or the basin of the Upper Oxus. The place was long besieged, and finally annihilated (1232) by Jenghiz Khan, whose wrath was exacerbated at the death of a favourite grandson by an arrow from its walls. There appears to be no further record of Bamiyan as a city; but the character of ruins at Ghulgilah agrees with traditions on the spot in indicating that the city must have been rebuilt after the time of the Mongols and again perished. In 1849, during the British occupation of Kabul, Bamiyan was the scene of an action in which Colonel William H. Dennie with a small force routed Dost Mohammad, the governor of Uzbegistan. (For Bamiyan see Hon. M. G. Talbot, "The Rock-cut Caves and Statues of Bamiyan," *Journal R. Austral. Soc.* vol. xviii, part 3; and J. A. Gray, *At the Court of the Amir* (1895). (T. H. H.)

**Bampton, John** (c. 1600-1751), English divine, was a member of Trinity College, Oxford, where he graduated M.A. in 1712, and for some time canon of Salisbury. He died on the 2nd of June 1751, aged 61. His will directs that eight lectures shall be delivered annually at Oxford in the University Church on as many Sunday mornings in full term, "between the commencement of the last month in Lent term and the end of the third week in Act term, upon either of the following subjects:—to confirm and establish the Christian faith, and to confute all heretics and schismatics; upon the divine authority of the Holy Scriptures; upon the authority of the writings of the primitive fathers, as to the faith and practice of the primitive Church; upon the divinity of our Lord and Saviour Jesus Christ; upon the divinity of the Holy Ghost; upon the articles of the Christian faith as comprehended in the Apostles' and Nicene Creeds." The lecturer, who must be at least a Master of Arts of Oxford or Cambridge, shall be chosen by the curate and by the vicar of the church on the fourth Tuesday in Easter term, and no one may be chosen a second time. The series of lectures began in 1780, and is still continued, though since 1805 elections are only made in alternate years through a depreciation of the revenue of the fund. The endowment provides £120 for each lecturer, and the lectures have to be published within two months of their delivery. Among the lecturers have been Heber in 1815 (*The Personality and Office of the Christian Comforter*); R. Whately in 1822 (*Parly Feeling in Religion*); R. D. Hampden in 1852 (*The Scholastic Philosophy in relation to Christian Theology*); E. M. Goulburn in 1850 (*The Resurrection of the Body*); H. Mansel in 1868 (*The Limits of Religious Thought*); H. P. Liddon in 1866 (*The Divinity of our Lord*); E. Hatch in 1880 (*The Organization of the Early Christian Churches*); C. Bigg in 1886 (*Christian Platonism of Alexandria*); C. Gore in 1891 (*The Incarnation*); W. Sanday in 1893 (*Inspirations*); J. R. Illingworth in 1894 (*Personality, Human and Divine*); W. R. Inge in 1890 (*Christian Mysticism*), &c. A complete list is given in the *Oxford Historical Register*. The institution has done much to preserve a high standard in English theology; and the lectures as a whole form a historically interesting collection of apologetic literature.

**Bampur.** A town of Persia, in the province of Baluchistan, 330 m. S.E. of Kerman, in 27° 19' N., 60° 24' E., at an elevation of 1270 ft. Pop. about 2000. It is the capital of the province and situated on the banks of the Bampur river which flows from east to west and empties itself about 70 m. W. into a hamun, or depression, 50 m. in length, and called Jaz-morian. The old citadel of Bampur which crowned an elevation about 100 ft. in height, 3 m. north of the river, having completely fallen in ruins, a new fort called Kalah Nasser, was built at Fahraj, 15 m. further east, in the eighties; and Fahraj, which now has a population of about 2500, has become more important than Bampur. Fahraj, which is also known as Pulhara, Pahura, Puhra, is by some identified as the Poura where Alexander the Great halted on his march from India, but others are more in favour of another Fahraj near Bam, or even of Bampur itself.

**Bamra.** A feudal state of India, in the province of Bengal. Area 1988 sq. m.; pop. (1901) 223,378; estimated revenue £5000; tribute £100. Most of the country is forest, producing large quantities of timber but said to be rich in iron ore. The northern border is touched by the Bengal-Nagpur railway, with a station at Bamra town. The state is one of the five Uriya feudatories, which were transferred from the Central Provinces to Bengal, on the reconstitution of that province in October 1905. The capital is Deogarh.

**Ban,** a word taken from the root of a verb common to many Teutonic languages and meaning originally "to proclaim" or "to announce." The Late Lat. form of the word is *bannum.* In the laws of the Franks and kindred tribes the word had three main uses: first in the general sense of a proclamation, secondly in the sense of the fine incurred for disobeying such proclamation, and thirdly for the district over which proclamations were issued. It was the frequent use of proclamations or bans, commanding or forbidding certain actions under a threat of punishment, which caused the second of these uses to arise out of the first, as the idea of wrong-doing became associated with the proclamation or ban. This *bannum dominicum* as it was called, was employed by all feudal lords, from the king downwards, against offenders, and played an important part in the administration of justice in feudal times. It usually took the form of an order or some amendment for wrong-doing, which, if not complied with, was followed by the withdrawal of all protection from the offender, i.e. by outlawry. After the break-up of the Carolingian empire another use of the word arose in France. "Ban" had occasionally been used in a restricted sense referring only to the summons calling out the host; and as France became separated from the Empire, French law and custom seized upon this use, and soon the men liable to military service were known as "the ban." A variant form of this word was *heriban* or *ariban,* and it is possible that some confusion between the early syllables of this word and the word *reiban* resulted in the distinction between the ban and the *arriban* or *re-tobanum.* At all events this distinction arose; the ban referring to the vassals called out by the king, and the *arriban-* to the sub-vassals called upon by the vassals in their turn. As in England, the liability to military service was often commuted for a monetary payment, and there were various exemptions. In the 17th and 18th centuries the ban and arriban—were wanting in discipline when called out, and were last summoned in 1758. Local levies, however, called out between this date and the Revolution were sometimes referred to by these names. In the medieval Empire and in Germany the word "ban" retained the general sense of punishment. The German equivalent of ban is *Acht,* and the sentence soon became practically one of outlawry. Connected possibly with the power enjoyed in earlier times by the assemblies of freemen of outlawing an offender, it was frequently used by the emperor, or German king, and the phrase "under the ban" is very common in medieval history. The execution of this sentence of placing an offender under the imperial ban, or *Reichsacht,* was usually entrusted to some prince or noble, who was often rewarded with a portion of the outlaw's lands. It was, however, only a serious punishment when the king or his supporters were strong enough to enforce its execution. Employed not only against individuals but also against towns and districts, it was sometimes divided into the *Acht* and the *Oberacht,* i.e. partial or complete outlawry. Documents of the time show that the person placed under the imperial ban drew down absolute desistance upon his relatives and frequently death upon himself. At first this sentence was the act of the
emperor or king himself, but as the Empire became more German, and its administration less personal, it was entrusted to the imperial aulic council (Reichskh rat), and to the imperial court of justice or imperial chamber (Reichskammergericht). These courts were deprived of this power in 1711, retaining only the right of suggesting its use. The imperial ban had, however, been used for the last time in 1706, when Maximilian Emanuel, elector of Bavaria, was placed under it.

There are many other uses of the word in the sense of a prohibition. In earlier French law the ban of wine or bonum vini, was the exclusive right of a lord to sell wine during a stated number of days, and the ban of March and April forbade the pasturage of flocks in certain fields during these months. There were also other similar uses dating from feudal times. In modern French law the phrase rupture de ban described, previous to 1885, the departure without notice of any released criminal living under the special surveillance of the police. The French government still retains the rights of appointing an obligatory place of residence for any criminal, and any escape from this place is a rupture de ban. A Scandinavian use of the word gives it the sense of a curse. This usage mingling with the use which spiritual lords shared with temporal lords of issuing the ban over their territories and subjects became in special ecclesiastical, and the sentence of excommunication is frequently referred to as “under the papal ban.” The word is also used in this way by Shakespeare and Milton. The modern English use of the phrase “under the ban” refers to any line of conduct condemned by custom or public opinion. In its earlier and general sense as a proclamation, the ban may be said to have been suspended by the writ. The word, however, survives in the sense of a proclamation in the “banns of marriage” (q.v.).

The Persian word ban, meaning lord or master, was brought into Europe by the Avars. It was long used in many parts of south-eastern Europe, especially in southern Hungary, to denote the governors of military districts called banats, and is almost equivalent to the German markgrave. After enjoying very extensive powers the bans were gradually reduced, both in numbers and importance. Since 1868, however, the governor of Croatia and Slavonia has been known as the ban of Croatia, Slavonia and Dalmatia, but his duties are civil and not military. He is appointed by the emperor of Austria, as king of Hungary, and has a seat in the upper house of the Hungarian parliament.

**BANANA**

**BANAN**

**BANANA—BANAT**

Most generally used fruits are derived from *Musa paradisiaca*, of which an enormous number of varieties and forms exist in cultivation. The sub-species *sapiens* (formerly regarded as a distinct species *M. sapiens*) is the source of the fruits generally known in England as bananas, and eaten raw, while the name plantain is given to forms of the species itself *M. paradisiaca*, which require cooking. The species is probably a native of India and southern Asia.

Other species which are used as fruits are *M. acuminata* in the Malay Archipelago, *M. fehii* in Tahiti, and *M. cavendishii*, the so-called Chinese banana, in cooler countries; the fruit of the last-named has a thinner rind and a delicate, fragrant flesh. The species, the fruits of which require cooking, are of much greater importance as an article of food. These often reach a considerable size; forms are known in East Africa which attain nearly 2 ft. in length with the thickness of a man’s arm. A form of *M. corniculata*, from Cochín China and the Malay Archipelago, produces only a single fruit, which, however, affords an adequate meal for three men. The hardy-ripe fruit is stewed whole or cut in slices and roasted or baked.

Banana-meal is an important food-stuff; the fruit is peeled and cut in strips, which are then dried and pounded in a mortar. In the East African and elsewhere, an intoxicating drink is prepared from the fruit. The juice which bears the leaves is, just before the flowering period, soft and full of starch, and is sometimes used as food, as in the case of the Abyssinian species, *M. Ensete*.

The leaves cut in strips are plaited to form mats and bags; they are also largely used for packing and the finer ones for cigarette papers. Several species yield a valuable fibre, the best of which is “Manila hemp” (q.v.) from *M. textilis*.

The following is the composition of the flour, according to Hutchinson: water, 13%; protein, 4%; fat, 0.5%; carbohydrates, 86%; salts, 2.5%. It would require about eighty bananas of average size to yield the amount of energy required daily, and about double that number to yield the necessary amount of protein. Hence the undue abdominal development of those who live mainly on this article of diet (Hutchinson). In recent years the cultivation of the banana in Jamaica for the American and also for the English market has been greatly developed.

**BANAS**, or **BUNAS**, the name of three rivers of India. (1) A river of Rajputana, which rises in the Aravalli range in Udaipur, drains the Udaipur valley, and after a course of 300 m. flows into the Indus. (2) A river of the Shahabad district of Bengal, which forms the drainage channel between the Arrah canal and the Sone canal systems, and finally falls into the Gangi nadi. (3) A river of Chota Nagpur in Bengal, which rises in the state of Chang Bhakar and falls into the Sone near Rampur.

**BANAT** (Hungarian *Bánság*), a district in the south-east of Hungary, consisting of the counties of Torontál, Temes and Krasso-Szörény. The term, in Hungarian, means generally a frontier province governed by a ban and is equivalent to the German term *Mark*. There were in Hungary several banats, which disappeared during the Turkish wars, as the banat of Dalmatia, of Slavonia, of Bosnia and of Croatia. But when the word is used without any other qualification, it indicates the Temesvár banat, which strangely acquired this title after the peace of Passarowitz (1718), though it was never governed by a ban. The Banat is bounded E. by the Transylvanian Alps, S. by the Danube, W. by the Theiss and N. by the Maros, and has an
area of 11,260 sq. m. It is mountainous in the south and southeast, while in the north, west and southwest it is flat and in some places marshy. The climate, except in the marshy parts, is generally healthy. It is well-watered, and forms one of the most fertile districts of Hungary. Wheat, barley, oats, rye, maize, flax, hemp and tobacco are grown in large quantities, and the products of the vineyards are of a good quality. Game is plentiful and the rivers swarm with fish. The mineral wealth is great, including copper, tin, lead, zinc, iron and especially coal. Amongst its numerous mineral springs, the most important are those of Mehedia, with sulphurous waters, which were already known in the Roman period and frequently used as a bath. Herculis. The Banat had in 1900 a population of 1,431,529 inhabitants. According to nationality there were 578,289 Rumanians, 362,487 Germans, 251,938 Servians and 170,124 Magyars. The chief town is Temesvár (pop. 53,033), and other places of importance are Versecz (25,199), Lugos (16,126), Nagybecskerek (26,407), Nagykiinda (24,843) and Pancsova (19,044).

The Banat was conquered by the Turks in 1552, and remained a Turkish sanjak (province) till 1716, when Prince Eugene of Savoy liberated it from the Turkish yoke. It received the title of Banat after the peace of Passarowitz (1718), and remained under Turkish rule till the revolution until 1771, when Maria Theresa introduced a civil administration. During the Turkish occupation the district was nearly depopulated, and allowed to lie almost desolate in marsh and heath and forest. Count Claudius Mercy (1666–1734), who was appointed governor of Temesvár in 1720, took numerous measures for the regeneration of the Banat. The marshes near the Danube and Theiss were cleared, roads and canals were built at great expense of labour, German artisans and other settlers were attracted to colonize the district, and agriculture and trade encouraged. Maria Theresa also took a great interest in the Banat, colonized the land belonging to the crown with German peasants, founded many villages, encouraged the exploitation of the mineral wealth of the country, and generally developed the measures introduced by Mercy. In 1779 the Banat was again incorporated with Hungary. After the revolution of 1848–1849, the Banat together with another county (Bács) was separated from Hungary, and created into a distinctive Austrian crown land, but in 1860 it was definitely incorporated with Hungary.

course of which he received kind attention from almost every distinguished man in the world of letters, science and art; among others, from Goethe, Humboldt, Schleiermacher, Hegel, Byron, Niebuhr, Bunsen, Savigny, Cousin, Constant and Manzoni. Bancroft’s father was a Unitarian, and he had devoted his son to the work of the ministry; but the young man’s first experiments at preaching, shortly after his return from Europe in 1822, were unsatisfactory, the theological teaching of the time having substituted criticism and literature for faith. His first position was that of tutor in Harvard. Instinctively a humanist, he had little of the ancient Whiggishness of Harrow curriculum and the rather pedantic spirit with which classical studies were there pursued. Moreover, he had brought from Europe a new manner, full of the affections of ardent youth, and this he wore without ease in a society highly satisfied with itself; the young knighth-errant was therefore subjected to considerable ridicule.

A little volume of poetry, translations and original pieces, published in 1823 gave its author no fame. As time passed, and custom created familiarity, his style, personal and literary, was seen to be the outward symbol of a firm resolve to preserve a philosophic calm, and of an enormous underlying energy which spent itself in labour, “ohne Hast, aber auch ohne Rast.” He found the conventional atmosphere of Cambridge uncongenial, and with a friend he established the Round Hill school at Northampton, Mass. This was the first serious effort made in the United States to elevate secondary education to the plane on which it belonged.

Although born into a Whig family, yet Bancroft’s studies carried him irresistibly into the Democratic party. While a teacher in his own school he was elected to the state legislature as a Democrat, but under pressure from the family of his first wife, who was ardent Whig, he refused to serve. In 1831 he likewise declined the nomination of the Massachusetts Democrats for secretary of state. By this time he was influential in the councils of his party, and President Van Buren appointed him collector of the port of Boston, a position which he filled with success. Two of his appointees were Orestes Brownson and Nathaniel Hawthorne. In 1844 he was the Democratic candidate for the governorship, but he was defeated. In 1845 he entered Polk’s cabinet as secretary of the navy, serving until 1846, when for a month he was acting secretary of war. During this short period in the capacity he established the naval academy at Annapolis, gave the orders which led to the occupation of California, and sent Zachary Taylor into the debatable land between Texas and Mexico. He also continued his pleadings for the annexation of Texas, as extending “the area of freedom,” and though a Democrat, took high moral ground as to slavery; he likewise made himself the authority on the North-Western Boundary question. In 1846 he was sent as minister to London, where he lived in constant companionship with Macaulay and Hallam. On his return in 1849 he withdrew from public life, residing in New York. In 1866 he was chosen by Congress to deliver the special oration on Lincoln; and in 1867 he was appointed minister to Berlin, where he remained until his resignation in 1874. Thenceforward he lived in Washington and Newport, dying at Washington on the 17th of January 1891. His latest official achievements were the greatest. In the San Juan arbitration he displayed great versatility and skill, winning his case before the emperor with brilliant ease. The naturalization treaties which he negotiated successively with Prussia and the other north German states were the first international recognition of the right of expatriation, a principle since incorporated in the law of nations.

In spite of the exciting and severe routine of the Round Hill school, Bancroft contributed frequently to the North American Review and to Walsh’s American Quarterly; he also made a translation of Heeren’s work on The Politics of Ancient Greece. In 1834 appeared the first volume of the History of the United States. The second followed in 1837, and others as the exigencies of public life permitted. Supplementary to the first volume was an article published by him in the North American Review for 1835 on “The Documentary History of the Revolution.” This article not merely brought the new method to the notice of the reading public, but revealed to it the wealth of material available.

The nature and extent of his studies, the solidity of his work, and the philosophic spirit which animates both, explain the enthusiasm with which the earlier volumes of Bancroft were received. Their sale at home was very large; they were reprinted in England and translated immediately into Danish, Italian, German and French. The latest volumes were considered by all competent judges quite as important as their predecessor. When the author was preparing to return from Berlin, the Royal Academy made him the joint guest at a public dinner, an unprecedented honour; and the universities of Berlin, Heidelberg and Munich united in a testimonial of regard. At Washington he was the confidential advisor of statesmen to the end of his life and the unofficial dean of the best society.

Bancroft’s historical creed is best set forth in the address he delivered on the semi-centennial of the New York Historical Society in 1854. In philosophy he found the basis for positing a collective human will, revealing in its activities the materials for determining ethical laws. Since there must be the same core of convictions in morals as elsewhere, the eternal reason is the divine Logos. History, therefore, is God in human examples. It must be a unit, its forces constant and its totality an organic whole. Within this the individual moves and acts with liberty and responsibility; for each, in will, affection and intellect is consubstantial with the rest. Truth, morals and justice are subject to no evolution; but the collective man evolves better forms of knowledge and behaviour. The organization of society, therefore, produces successive states, in each of which the principle of freedom is better established than in the antecedent. Permanency in republican government is, therefore, based upon corresponding experience and culture, and its possibilities grow ever stronger. The relation of American democracy to the systems which have preceded it forms the latest proof of these contentions. As Heeren’s pupil, he laid enormous stress on the importance of original authorities. In dealing with documentary evidence he sought to apply very stringent rules:—(1) Carefully distinguish between original authority and historical memorials or aids; for example, between a fact recorded at first-hand or second-hand knowledge, and a decision of principle by authority. (2) Represent every man from his own standpoint; judge him from yourself. His collections of original materials were vast; beginning with historical texts and their attendant paraphernalia, enormous pains and expense the authenticated copies of archives, family papers, and personal journals written by historic personages, which now constitute an invaluable treasure in the New York public library. They are from every land and from every people with which American origins are connected. His use of this material was not always according to accepted standards: To avoid dryness and proliﬁxity he condensed quotations, and occasionally employed the Thucydidean method of abridgment or representation in place of fact catalogues. During his long life he engaged in the strident controversies made by others in collecting the materials of American history, and while in the main he kept pace with them by ruthless revision, yet even the latest edition of his work disregards some minor facts which others knew for the insertion of much which the author alone knew.

Bancroft’s imagination and enthusiasm were alike exuberant. His pages abound in fine and acute insight. His generalizations are vivid and enlightening. He spared no pains to acquire true style, frequently rewriting his chapters, and sometimes testing passages of philosophy and description in eight different forms. Yet to a certain extent he lacked the representative power and inordinate delight in concealing his energy pages, ringing with artificial tones. But, after making all allowances, it remains true that he had a perfect sense of proportion, sound maxims and thorough common-sense. He was of that greatest human type: a man of the present, valuing justly the past and no dreamer. In the nature and extent of his studies, in the solidarity of his work, and in the philosophic spirit which animated his life he ranks as the foremost historian of the United States, and as an American historian second to none of his European contemporaries in
the same line. He displayed the heroic, epic value of American history, its unity with the great central stream, and dispelled for ever the extravagant conceptions of a sentimental world just emerging from the visionary philosophy of the 18th century.

BANCROFT, HUBERT HOWE (1832– ), American historical writer, was born at Granville, Ohio, on the 5th of May 1832. From 1852 to 1868 he was a bookseller in San Francisco. During this period he accumulated a great library of historical material, and it last gave up business in order to devote himself to it. In 1863 he published a Magazine of His Native Races of the Pacific States (5 vols. 1874–1876), History of the Pacific States of North America (2 vols. 1882–1890), and other works. For the collection of data he necessarily relied upon the labours of a corps of assistants, and the publications named represent, properly speaking, an encyclopaedia rather than a unified history; but as a storehouse of material their value is great and is likely to be enduring. In 1905 Bancroft’s vast collection was acquired by the university of California. An account of his methods of work is given in his Literary Industries (1865).

BANCROFT, RICHARD (1544–1610), archbishop of Canterbury, was born at Farnworth in Lancashire in 1544. He was educated at Cambridge, first at Christ’s College and afterwards at Jesus College. He took his degree of B.A. in 1567 and that of M.A. in 1570. Ordained about that time, he was named chaplain to Richard Cox, then bishop of Ely, and in 1575 was presented to the rectory of Teversham in Cambridgeshire. The next year he was one of the preachers to the university, and in 1584 was presented to the rectory of St Andrew’s, Holborn. His abilities, and his zeal as a champion of the church, secured him rapid promotion. He graduated B.D. in 1586 and D.D. five years later. In 1585 he was appointed treasurer of St Paul’s cathedral, London, and in 1586 was made a member of the ecclesiastical commission. On the 9th of February 1589 he preached at Paul’s Cross a sermon on 1 John iv. 1, the substance of which was a passionate attack on the Puritans. He described their speeches and proceedings, caricatured their motives, denounced the exercise of the right of private judgment, and set forth the divine right of bishops in such strong language that one of the queen’s councillors held it to amount to a threat against the supremacy of the crown. In the following year Bancroft was made an assistant to St Paul’s; he had been canon of Drim-mister since 1587. He was chaplain successively to Lord Chancellor Hatton and Archbishop Whitgift. In June 1597 he was consecrated bishop of London; and from this time, in consequence of the age and incapacity for business of Archbishop Whitgift, he was virtually invested with the power of primate, and had the sole management of ecclesiastical affairs. Among the more noteworthy cases which fell under his direction were the proceedings against “Martin Mar-Prelate,” Thomas Cartwright and his friends, and John Peny, whose “seditious writings” he caused to be intercepted and given up to the lord keeper. In 1600 he was sent on an embassy, with others, to Embden, for the purpose of settling certain matters in dispute between the English and the Danes. This mission, however, failed. Bancroft was present at the death of Queen Elizabeth. He took a prominent and triumphant part in the famous conference of prelates and Presbyterian divines held at Hampton Court in 1604. By the king’s desire he undertook the vindication of the practices of confirmation, absolution, private baptism and lay excommunication; he urged, but in vain, the reinforcement of an ancient canon, “that schisms are not to be heard against bishops’; and in opposition to the Puritans’ demand for certain alterations in doctrine and discipline he besought the king that care might be taken for a praying clergy; and that, till men of learning and sufficiency could be found, godly homilies might be read and their number increased. In March 1604 Bancroft, on Whitgift’s death, was appointed by royal writ president of convocation then assembled; and he there presented a book of canons collected by himself. It was adopted and received the royal approval, but was strongly opposed and set aside by parliament two months afterwards. In the following November he was elected successor to Whitgift in the see of Canterbury. He continued to show the same zeal and severity as before, and with so much success that Lord Clarendon, writing in his praise, expressed the opinion that “if Bancroft had lived, he would quickly have extinguished all that fire in England which had been kindled at Geneva.” He was as lenient with the offences of the orthodox as he was rigid in suppressing heresy and schism. In 1605 he was sworn a member of the privy council. The same year he engaged in a contest with the judges, and exhibited particular complaints of them before the lords of the council; but these complaints were overruled. His aim was really to make the ecclesiastical courts independent of the king by speciously magnifying the royal authority over them. He enforced discipline and exact conformity within the church with an iron hand; and over 200 clergymen were deprived of their livings for disobedience to the ex animo form of subscription. In 1608 he was chosen chancellor of the university of Oxford. One of his latest public acts was a proposal laid before parliament for improving the revenues of the church, and a project for a college of controversial divinity at Chelsea. In the last few weeks of his life he took part in the discussion about the consecration of certain Scottish bishops, and it was in pursuance of his advice that they were consecrated by several bishops of the English church. By this act were laid the foundations of the Scottish Episcopal church. Bancroft was “the chief overseer” of the authorized version of the Bible. He died at Lambeth Palace on the 2nd of November 1610. His literary remains are not extensive, but show him to have been an able writer.

BANCROFT, SIR SQUIRE (1841– ), English actor and manager, was born near London on the 14th of May 1841. His first appearance on the stage was in 1859 at Birmingham, and he played in the provinces with success for several years. His first London appearance was in 1865 in Wooler’s A Winning Hazard at the Prince of Wales’s theatre on Tottenham Court Road, then under the management of Effie Marie Wilton (b. 1840), whom he married in 1868. Mr and Mrs Bancroft were associated in the production of all the Robertson comedies — Society (1865), Our’s (1866), Caste (1867), Play (1868), School (1869) and M.P. (1870), and, after Robertson’s death, in revivals of the old comedies, for which they surrounded themselves with an admirable company. Lytton’s Money (1871), Bancroft’s own production of Sardou’s Dora — were among their premières, which helped to make the little playhouse famous. The Bancroft management at the Prince of Wales’s constituted a new era in the development of the English stage, and had the effect of reviving the London interest in modern drama. In 1879 they moved to the Haymarket, where Sardou’s Odelette (for which they engaged Madame Modjeska) and Fédora, W. S. Gilbert’s Sweethearts and Pinero’s Lords and Commons, with revivals of previous successes, were among their productions. Having made a considerable fortune, they retired in 1895, but Mr Bancroft (who was knighted in 1897) joined Sir Henry Irving in 1889 to play the abbe Lautur in a revival of Watts Phillipes’s Dead Heart.

See Mr and Mrs Bancroft, on and off the Stage (1888); and The Bancrofts: Recollections of Sixty Years (1909), by themselves.

BAND, something which “binds” or fastens one thing to another, hence a cord, rope or tie, e.g. the straps fastening the sheets to the back in book-binding. The word is a variant of “bond,” and is from the stem of the Teutonic bindan, to bind. From the same source comes “bend,” properly to fasten the string to the bow, so as to constrain and curve it, hence to make into the shape of a “bent” bow, to curve. In the sense of “strap,” a flat strip of material, properly for fastening anything, the word is ultimately of the same origin but comes directly into English from the French bande. In architecture the term is applied to a sort of flat frieze or fascia running horizontally round a tower or other parts of a building, particularly the base tables in perpendicular work, commonly used with the long shafts characteristic of the 13th century. It generally has a bold, projecting moulding above and below, and is carved
sometimes with foliages, but in general with cupped circles or quatrefoils, in which frequently are shields of arms.

The two small strips of linen, worn at the neck as part of legal, clerical and academic dress, are known as "bands"; they are the survival of the falling collar of the 17th century. These bands are usually of white linen, but the secular clergy of the Roman Church wear black bands edged with white. The fight cardboard or chip boxes now used to carry millinery are formerly made to carry the neck-bands, whence the name of "band-box."

In the sense of company or troop, "band" is probably also connected with bindan, to bind. It came into English from the French. The meaning seems to have originated in Romanic, cf. Italian, Spanish and Portuguese banda, and thence came into Teutonic. It has usually been taken (see Ducange, Gloss. s.v. banda) to be due to the "band" or sash of a particular colour worn as a distinctive mark by a troop of soldiers. Others refer it to the medieval Latin bandum, banner, a strip or "band" of cloth fastened to a pole. In this sense the chief application is to the company of musicians (see banjo), particularly when used in armies or navies, a military band.

**Military Bands.**—In all countries bands are organized and maintained in each infantry regiment or battalion if the latter is the unit. The strength of these bands and the number and nature of their instruments vary considerably, as also do the rank and status of the bandmaster. The buglers and drummers belonging to the companies are generally massed under the sergeant-drummer and on the march play alternately with the band. In action the British custom is to use the bandsmen as stretcher-bearers, but on the continent of Europe the bands are as far as possible kept in hand under the command of the colonel and play the troops into action; and in all countries the available bands, drums and bugles are ordered to play during the final assault. The training of bandmasters for the British service is carried out at Kneller Hall, Hounslow, an institution founded in 1857 and placed under direct control of the war office in 1867. The average strength of the various classes of instrument in the band of a British line regiment has been stated as twenty flutes, oboes, clarinets and bassoons, four horns, eight saxhorns, six trumpets and cornets, three trombones, two drums. The buglers and drummers are in the proportion of one of each per company. The saxophone, which is the characteristic instrument of military bands in other countries, has not found favour with the British authorities. Another specially military instrument, universal in the Russian army and more or less common to others, is the so-called "Jingling Johnny," a frame of small bells that is sharply shaken in the accented parts of the music. The "glockenspiel" is also fairly common. The peculiar instrument of Scottish regiments is the bagpipes. Cavalty, and more rarely artillery corps in the various armies, have small bands. The mounted arms, however, have little need of music as compared with the infantry, the order and ease of whose marching powers are immensely enhanced by the music of a good regimental band. In the navies of various countries bands are maintained on board flag-ships and sometimes on board other large ships.

**BANDA**, a town and district of British India, in the Allahabad division of the United Provinces. The town is near the right bank of the river Ken, 95 m. S. W. of Allahabad. The population in 1901 was 22,395. The town possesses 65 mosques and 168 Hindu temples. It was formerly, but is no longer, a military cantonment.

The district is the most barren and backward portion of the province. It contains an area of 3061 sq. m. In some parts it rises into irregular uplands and elevated plains, interspersed with detached rocks of granite; in others it sinks into marshy lowlands, which frequently remain under water during the rainy season. The sloping country on the bank of the Jumna is full of ravines. To the S.E. the Vindhya chain of hills takes its origin in a low range not exceeding 500 ft. in height, and forming a natural boundary of the district in that direction. The principal river of the district is the Jumna, which flows from north-west to south-east, along the N.E. boundary of the district, for 125 m. In 1901 the population was 631,058, showing a decrease of 11% in the decade, due to the effects of famine. The black soil of the district yields crops of which the principal are millet, other food-grains, pulse, rice, cotton and oil-seeds. Banda cotton enjoys a high repute in the market. A branch railway from Manikpur to Jhansi traverses the length of the district, which is also crossed by the East Indian main line to Jubulpore.

Banda, which forms one of the districts included under the general name of Bundelkhand, has formed an arena of contention for the successive races who have struggled for the sovereignty of India. Kalinjar town, then the capital, was unsuccessfully besieged by Mahmud of Ghazni in A.D. 1023; in 1190 it was taken by Kutub-ud-din, the general of Muhammad Ghori; in 1545 by Shere Shah, who, however, fell mortally wounded in the assault. About the year 1735 the raja of Kalinjar's territory, including the present district of Banda, was bequeathed to Baji Rao, the Mahratta peshwa; and from the Maharratas it passed by the treaties of 1802-1803 to the Company. At the time of the Mutiny the district, which was parcellary-stricken and over-taxed, joined the rebels. The town of Banda was recovered by General Whitlock on the 26th of April 1858. The fiscal system was remodelled, and the district has since enjoyed a greater degree of prosperity only interrupted by famine.

**BANDA ISLANDS**, a group of the Dutch East Indies, consisting of three chief and several lesser islands in the Banda Sea, south of Ceram, belonging to the residency of Amboyna. The main islands are Great Banda or Lontor; Banda Neira to its north; Gunong Api, west of Banda Neira; Wai or Ai still farther west, and Run, on its south-west, Pianem, north of Gunong Api, and Suwangi, north-west, again. The total land area is about 16 sq. m. A volcanic formation is apparent in Lontor, a sickle-shaped island which, with Neira and Gunong Api, forms part of the circle of a crater. The arrangement is comparable with Santorin in the Aegean Sea. Gunong Api (Fire Mountain), 2000 ft. high, is an active volcano, and its eruptions and earthquakes have frequently brought destruction, as notably in 1852, when the damage was chiefly due to a huge wave of the sea. Banda, the chief town, on Neira, is a pleasant settlement, commanded by two Dutch forts of the early 17th century, Nassau and Beligica. The largest island, Lontor, was found too unhealthy to be the site of the principal settlement; but the climate of the islands generally, though hot, is not unhealthy. In the space between Lontor, Neira and Gunong Api there is a good harbour, with entrances on either side, which enable vessels to enter on either of the monsoons. Between Gunong Api and Neira there is a third channel, but it is navigable for small vessels only. The principal articles of commerce in the Banda group are nutmegs and mace. The nutmeg is indigenous. The native population having been cleared off by the Dutch, the plantations were worked by slaves and convicts till the emancipation of 1810. The introduction of Malay and Chinese labourers subsequently took place. The plantations (perken) were originally held by the conquerors of the natives, the government monopolizing the produce at a fixed rate; but in 1873 the government monopoly was abolished. The production amounts annually to nearly 1,500,000 lb of nutmegs, and 350,000 lb of mace. The nutmegs are grown, in accordance with natural conditions, under the shade of other trees, usually the canari. Jali or jatti wood is cultivated on the small island of Rosingen. The total population of the islands is about 9,500, of which some 7000 are descendants of the natives introduced as slaves from neighbouring islands, and are Christians or Mahommedans.

The Banda Islands were discovered and annexed by the Portuguese Antonio D'Abreu in 1512; but in the beginning of the 17th century his countrymen were expelled by the Dutch. In 1608 the British built a factory on Wai, which was demolished by the Dutch as soon as the English vessel left. Shortly after, however, Banda Neira and Lontor were resigned by the natives to the British, and in 1620 Run and Wai were added to their dominions; but in spite of treaties into which they had entered
the Dutch attacked and expelled their British rivals. In 1634 they were compelled by Cromwell to restore Run, and to make satisfaction for the massacre of Amboyna; but the English settlers not being adequately supported from home, the island was retaken by the Dutch in 1664. They remained in undisputed possession until 1766, when the Banda Islands were taken by the British. They were restored by the treaty of Amiens in the year 1800, again captured, and finally restored by the treaty of Paris concluded in 1814. BANDANA, or Bandanna, a word probably derived through the Portuguese from the Hindustani bandunā, which signified a primitive method of obtaining an effect in dyeing by tying up cloth in different places to prevent the particular parts from receiving the dye. The name was given to richly coloured silk handkerchiefs produced by this process, of which bright colours were characteristic. Bandanas are now commonly made of cotton and produced in Lancashire, whence they are exported. The effect is also produced by a regular process in calico printing, in which the pattern is made by discharging the colour.

BANDELLIER, ADOLPH FRANCIS ALPHONSE (1840—_), American archaeologist, was born in Bern, Switzerland, on the 6th of August 1840. When a youth he emigrated to the United States. After 1880 he devoted himself to archaeological and ethnological work among the Indians of the south-western United States, Mexico and South America. Beginning his studies in Sonora (Mexico), Arizona and New Mexico, he made himself the leading authority on the history of this region, and—with F. H. Cushing and B. W. Fennel—successively published his latest work on the prehistoric civilization of the United States. In 1892 he abandoned this field for Ecuador, Bolivia and Peru, where he continued ethnological, archaeological and historical investigations. In the first field he was in a part of his work connected with the Hemenway Archaeological Expedition and in the second worked for Henry Villard of New York, and for the American Museum of Natural History of the same city. Bandelier has shown the falsity of various historical myths, notably in his conclusions respecting the Inca civilization of Peru. His publications include: three studies On the Art of War and Mode of Warfare of the Ancient Mexicans (1892); On the Distribution and Tenure of Lands and the Customs with respect to Inheritance among the Ancient Mexicans, and “On the Social Organization and Mode of Government of the Ancient Mexicans” (Harvard University, Peabody Museum of American Archaeology and Ethnology, Annual Reports, 1877, 1878, 1879); Historical Introduction to Studies among the Sedentary Indians of New Mexico, and Report on the Ruins of the Pueblo of Pecos (1881); Report of an Archaeological Tour in Mexico in 1881 (1884); Final Report of Investigations among the Indians of the South-western United States (1890—1892, 2 vols.); Contributions to the History of the South-western Portion of the United States carried on mainly in the years from 1880 to 1885 (1890)—all these in the Papers of the Archaeological Institute of America, American Series, constituting vols. i.—v.; “The Romantic School of American Archaeologists” (New York Historical Society, 1885); The Gilded Man (El Dorado) and other Pictures of the Spanish Occupancy of America (1893); and a report On the Relative Antiquity of Ancient Peruvian Burials (American Museum of Natural History, Bulletin, v. 30, 1904). He also edited The Journey of Alvar Nuñez Cabeza de Vaca . . . from Florida to the Pacific, 1528-1536 (1906), translated into English by his wife the Distribution and Tenure of Lands and the Customs with respect to Inheritance among the Ancient Mexicans, and "On the Social Organization and Mode of Government of the Ancient Mexicans" (Harvard University, Peabody Museum of American Archaeology and Ethnology, Annual Reports, 1877, 1878, 1879); Historical Introduction to Studies among the Sedentary Indians of New Mexico, and Report on the Ruins of the Pueblo of Pecos (1881); Report of an Archaeological Tour in Mexico in 1881 (1884); Final Report of Investigations among the Indians of the South-western United States (1890—1892, 2 vols.); Contributions to the History of the South-western Portion of the United States carried on mainly in the years from 1880 to 1885 (1890)—all these in the Papers of the Archaeological Institute of America, American Series, constituting vols. i.—v.; "The Romantic School of American Archaeologists" (New York Historical Society, 1885); The Gilded Man (El Dorado) and other Pictures of the Spanish Occupancy of America (1893); and a report On the Relative Antiquity of Ancient Peruvian Burials (American Museum of Natural History, Bulletin, v. 30, 1904). He also edited The Journey of Alvar Nuñez Cabeza de Vaca . . . from Florida to the Pacific, 1528-1536 (1906), translated into English by his wife. BANDELLO, MATTEO (1480-1562), Italian novelist, was born at Castelnuovo, near Tortona, about the year 1480. He received a very careful education, and entered the church, though he does not seem to have prosecuted his theological course with great zeal. For many years he resided at Mantua, and superintended the education of the celebrated Lucrezia Gonzaga, in whose honour he composed a long poem. The decisive battle of Pavia, which gave Lombardy into the hands of the emperor, compelled Bandello to fly; his house at Milan was burnt and his property confiscated. He took refuge with Cesare Fregoso, an Italian general in the French service, whom he accompanied into France. In 1550 he was raised to the bishopric of Agen, a town in which he resided for many years before his death in 1562. Bandello wrote a number of poems, but his fame rests entirely upon his extensive collection of Novelle, or tales (1554, 1573), which have been extremely popular. They belong to that species of literature of which Boccaccio's Decameron and the queen of Navarre's Heptaméron are, perhaps, the best known examples. The common origin of them all is to be found in the old French fabliaux, though some well-known tales are evidently Eastern, and others classical. Bandello's novels are esteemed the best of those written in imitation of the Decameron, though Italian critics find fault with them for negligence and inlegence of style. They have little value from a purely literary point of view, and many of them are disfigured by the grossest obscenity. Historically, however, they are of no little interest, not only from the insight into the social life of the period which they afford, but from the important influence they exercised on the Elizabethan drama. The stories on which Shakespeare based several of his plays were supplied by Bandello, probably through Bellforest or Paynter. BANDERABBASI (also BENDER ABBAS, and other forms), a town of Persia, on the northern shore of the Persian Gulf in 27° 11' N., and 56° 17' E., forming part of the administrative division of the "Persian Gulf ports," whose governor resides at Bushire. It has a population of about 10,000, an insalubrious climate and bad water. Bander Abbasi was called Gombrun (Gombroon, Gamaroon; Cambardo, Comoroz of Portuguese writers) until 1622, when it was occupied by the Persians, and in 1680 it was given in honour of the reigning shah, Abbas I., who had expelled the Portuguese in 1614, and destroyed the fort built by them in 1612. The English, however, were permitted to build a factory there, and about 1620 the Dutch obtained the same privilege. On the capture of the island of Hormuz (Ormus) in 1622 by the English and Persians a large portion of its trade was transferred to Bander Abbasi. During the remainder of the 17th century the traffic was considerable, but in the 18th prosperity declined and most of the trade was removed to Bushire. In 1750 the English factory was destroyed by the French, and though afterwards re-established it has long been abandoned. The ruins of the factory and other buildings lie west of the present town. About 1740 Nadir Shah granted the town and district with the fort of Shamal and the town of Minâb, together with the islands of Kishm, Hormuz (Ormus) and Lârank, to the Arab tribe of the Beni Ma'lini in return for a payment of a yearly rent or tribute. About 40 years later Sultan bin Ahmad, the ruler of Muscat, having been appealed to for aid by the Arab inhabitants of the place against Persian misrule, occupied the town, and obtained a firman from the Persian government confirming him in possession. In the condition which the town is in the yearly rent of a few thousand tomans. The islands were considered to be the property of Muscat. In 1852 the Persians expelled the Muscat authorities from Bandar Abbasi and its district, but retired when Muscat agreed to pay an increased rent. By a treaty concluded between Persia and Muscat in 1856 it was stipulated that Bandar Abbasi town and district and the islands were to be considered Persian territory and leased to Muscat at an annual rent of 14,000 tomans (£6000). The treaty was to have been in force for twenty years, but in 1866 the Persians took advantage of the assassination of Seyed Thuweini, the sultan of Muscat, to install as governor of Bandar Abbasi and district a nominee of their own who agreed to pay a rent of 20,000 tomans per annum. Further difficulties arising between Persia and Muscat, and the ruler of the latter, then in possession of a powerful fleet, threatening to blockade Bandar Abbasi, the Persian government solicited the good offices of the British government, and the lease was renewed for another eight years upon payment of 30,000 tomans per annum (then about £12,000). This was in 1868. In the same year, however, the sultan of Muscat was expelled by a successful revolt, and the Persian government, in virtue of a clause in the lease allowing them to cancel the contract if a conqueror obtained possession of Muscat, installed their own governor at Bandar Abbasi and
BANDER LINGAH—BANDINI

have retained possession of the place ever since (see Curzon, Persia, ii. 424).

Bander Abbási has a lively trade, exporting much of the produce of central and south-eastern Persia and supplying imports to those districts and Kishmanie. It has telegraph and postal services in which they exchange intelligence, and is the steamer of the British India Steam Navigation Company call at the port weekly. Great Britain and Russia are represented there by consuls. From 1890-
1905 the total value of the exports and imports from and into Bander Abbási averaged about £660,000 per annum, £620,000 (£55,000 British) being for exports, £400,000 (£340,000 British) imports. Of the 255,000 tons of shipping which in 1905 entered Bander Abbási 237,000 were British.

(A. H.-S.)

BANDER LINGAH, or LINGA, a town of Persia on the northern shore of the Persian Gulf, and about 50 m. by sea from Bushire, in 26° 33' N., 54° 56' E. Pop. about 10,000. It forms part of the administrative divisions of the "Persian Gulf ports," whose governor resides at Bushire. The annual value of the exports and imports from and into Bander Lingah from 1890 to 1905 averaged about £800,000, but nearly half of that amount is represented by pearls which pass in transit from the fisheries on the Arab coast to Bombay. Like many other Persian Gulf ports, Bander Lingah was for many generations a hereditary patrimony of the Sheik of an Arab tribe, in this case the Javamsi tribe, and it was only in 1868 that the Arabs were expelled from the place by a Persian force. It is the chief port for the Persian province of Láristán (under Fars), and has a thriving trade with Bahrein and the Arab coast. It has a British post office, and the steamers of the British India Company call there weekly. Of the 133,000 tons of shipping which in 1905 entered the port 104,500 were British.

BANDEROLE (Fr. for a "little banner"), a small flag or streamer carried on the lance of a knight, or flying from the mast-head of a ship in battle, &c.; in heraldry, a streamer hanging from beneath the crook of a bishop's crosier and folding over the handle. It is generally used in decorative sculpture of the Renaissance period for bearing an inscription, &c. Banderol, in its main uses the same as banderole, is the term especially applied to the square banners carried at the funerals of great men and placed over the tomb.

BANDICOOT, any animal of the marsupial genus Perameles, which is the type of a family Peramelidae. The species, about a dozen in number, are widely distributed over Australia, Tasmania, New Guinea and several of the adjacent islands. They are of small size and live entirely on the ground, making nests of dried leaves, grass and sticks in hollow places and foraged for roots and bulbs. The best known species is P. personata, of the island of New Guinea. It is a great part of the day. Though feeding largely on worms and insects they ravage gardens and fields, on which account they are detested by the colonists. The name is often extended to the family.

BANDICOOT-RAT, the Anglo-Indian name for a large rat (Nesocoia bandicota), inhabiting India and Ceylon, which measures from 12 to 15 in. to the root of the tail, while the tail itself measures from 11 to 13 in. The name is said to be a corruption of the Telugu pandi-koku. It differs from typical rats of the genus Mus by its broader incisors, and the less distinct cusps on the molar. Other species of the genus are found from Palestine to Formosa, as well as in Ceylon. The typical species frequents villages, towns and cultivated grounds all over India and Ceylon, but is specially common in the south of the peninsula. (See Rodentia.)

BANDIERA, ATILIO (1811-1844) and EMILIO (1819-1844), Italian patriots. The brothers Bandiera, sons of Baron Bandiera, an admiral in the Austrian navy, were themselves members of that service, but at an early age they were won over to the ideas of Italian freedom and unity, and corresponded with Giuseppe Mazzini and other members of the Giornale Italia (Young Italy), a patriotic and revolutionary secret society. During the year 1843 the air was full of conspiracies, and various ill-starred attempts at rising against the Italian despots were made. The Bandieras began to make propaganda among the officers and men of the Austrian navy, nearly all Italians, and actually planned to seize a warship and bombard Messina. But having been betrayed they fled to Corfu early in 1844. Rumours reached them there of agitation in the Neapolitan kingdom, where the people were represented as ready to rise en masse at the first appearance of a leader; the Bandieras, encouraged by Mazzini, consequently determined to make a raid on the Calabrian coast. They got together a band of about twenty men ready to sacrifice their lives for an idea, and set sail on their desperate venture on the 17th of June 1844. Four days later they landed near Crotone, intending to go to Cosenza, liberate the political prisoners and issue their proclamations. But they did not find the insurgent band which they had been told awaited them, and were betrayed by one of their party, the Corsican Boccheclambe, and by some peasants who believed them to be Turkish pirates. A detachment of gendarmes and volunteers was sent against them, and after a short fight the whole band were taken prisoners and escorted to Cosenza, where a number of Calabrians who had taken part in a previous rising were also under arrest. First the Calabrians were tried by court-martial, and a large number condemned to death or the galleys. The raiders' turn came next, and the whole party, save the traitor Boccheclambe, were condemned to be shot, but in the case of eight of them the sentence was commuted to the galleys. On the 23rd of July the two Bandieras and their nine companions were executed; they cried Viva l'Italia as they fell.

The Neapolitan government was undoubtedly within its right in executing the Bandieras, and the material results of this heroic but unpractical attempt were nil. But the moral effect was enormous throughout Italy, the action of the authorities was universally condemned, and the martyrdom of the Bandieras bore fruit in subsequent revolutions. It also created a great impression in England, where it was believed that the Bandieras' correspondence with Mazzini (q.v.) had been tampered with, and that information as to the proposed expedition had been forwarded to the Austrian and Neapolitan governments by the British diplomatic service; recent publications, however, especially the biography of Sir James Graham, tend to exculpate the British government.

See G. Riccardi, Storia dei fratelli Bandiera (Florence, 1863); F. Venosta, I fratelli Bandiera (Milan, 1865); and Carlo Tivaroni's L'Italia durante il dominio austriaco, vol. iii. p. 149 (Turin, 1891).

(B. V. Y.)

BANDINELLI, BARTOLOMMEO or BACCIO (1493-1560), Florentine sculptor, was the son of an eminent goldsmith, and from him Bandinelli obtained the first elements of drawing. Showing a strong inclination for the fine arts, he was early placed under Rustici, a sculptor, and a friend of Leonardo da Vinci, with whom he made rapid progress. The ruling motive in his life seems to have been jealousy both of Benvenuto Cellini and of Michelangelo, one of whose cartoons he is said to have torn up and destroyed. He is regarded by some as inferior in sculpture only to Michelangelo, with whom a comparison unfavourable to Bandinelli is tempted in such works as the marble colossal group of Hercules and Cacus in the Piazza del Gran Duco, and the group of Adam and Eve in the Bargello. Among his best works must be reckoned the bassi-rilevi in the choir of the cathedral of Florence; his copy of the Laocoon; and the figures of Christ and Nicholas on his own tomb.

BANDINI, ANGELO MARIA (1776-1800), Italian author, was born at Florence on the 23rd of September 1776. Having been left an orphan in his infancy, he was supported by his uncle, Giuseppe Bandini, a lawyer of some note. He received his education among the Jesuits, and showed a special inclination for the study of antiquities. His first work was a dissertation, De Veterum Salvationibus (1749). In 1747 he undertook a journey to Vienna, in company with the bishop of Volterra, to whom he acted in the capacity of secretary. He was introduced to the emperor and took the opportunity of dedicating to that monarch his Specimen Litterarum Florinensium, which was then printing at Florence. On his return he took orders, and settled at Rome, passing the whole of his time in the library of the Vatican, and in those of the cardinals Passionei and Corsini. The famous obelisk
of Augustus, at that time disinterred from the ruins of the Campus Martius, was described by Bandini in a learned folio volume De Obelisco Augusti. Shortly after he was compelled to leave Rome on account of his health and returned to Florence, where he was appointed librarian to the valuable library bequeathed to the public by the abbe Marucelli. In 1756 he was preferred by the emperor to a prebend at Florence, and appointed principal librarian to the Laurentian library. During forty-four years he continued to discharge the duties of this situation, and died in 1800, generally esteemed and regretted. On his deathbed he foretold his profession, and also bequeathed his fortune to other charitable purposes. The most important of his numerous works are the Catalogus Cod. MSS. Graec., Lat., Ital., Bib., Laurent., 8 vols (1767-1778), and the Vita e Lettere d’Amerigo Vespucci, 1745.

**BANDOLIER, or BANDOLEER (from Fr. bandoulière, Ital. bandoliera, a little band), a belt worn over the shoulder, particularly by soldiers to carry cartridges. In the 17th century wooden cases were hung to the belt to contain powder charges. The modern bandolier carries the cartridges either in loops sewn to the belt, or in small pouches, similarly attached, containing stripes of several cartridges. It has been extensively adopted in the British army, especially for mounted troops.**

**BANDON, or BANDONBRIDGE, a market-town of county Cork, Ireland, in the south-east parliamentary division, picturesquely situated in a broad open valley on both sides of the river Bandon. Pop. (1901) 2830. It is 20 m. S.W. of the city of Cork by the Cork, Bandon & South Coast railway. It is an important agricultural centre and there are distilleries, breweries and flour-mills. The open park of Castle Bernard (earl of Bandon), on the riverside, is attractive, and 2 m. below Bandon on the river is Lismannon, the head of navigation. Bandon was founded early in the 17th century by Richard Boyle, earl of Cork, and was incorporated by James I. It returned two members to the Irish parliament and thereafter one to the imperial parliament until 1855. After the destruction of the walls by the Irish in 1689, Bandon long resisted the admission of Catholic inhabitants.**

**BANBERRY, or HERB CHRISTOPHER, popular names for *Adesia spicata* (nat. ord. Ranunculaceae), a poisonous herb with long-stalked compound leaves, small white flowers and black berries, found wild in copses in limestone districts in the north of England. It is widely distributed in the north temperate zone.**

**BANÉR (BANNER, BANER), JOHAN (1596-1641), Swedish soldier in the Thirty Years’ War, was born at Djurscholm Castle on the 23rd of June 1596. Entering the Swedish army, he served with distinction in the wars with Russia and Poland, and had reached high rank when, in 1630, Gustavus Adolphus landed in Germany. As one of the king’s chief subordinates, Banér served in the campaign of north Germany, and at the first battle of Breitenfeld he led the right wing of Swedish horse. He was present at the taking of Augsburg and of Munich, and rendered conspicuous service at the Leuchten and at Dografía. At the unsuccessful assault on Wallenstein’s camp at the Alte Veste Banér received a wound, and, soon afterwards, when Gustavus marched towards Lützen, his general was left in command in the west, where he was opposed to the imperial general Aldringen. Two years later, as Swedish field-marshal, Banér, with 16,000 men, entered Bohemia, and, combined with the Saxon army, marched on Prague. But the complete defeat of Bernhard of Saxe-Weimar in the first battle of Nördlingen stopped his victorious advance. After this event the peace of Prague placed the Swedish army in a very precarious position, but the victories won by the united forces of Banér, Wrangel and Torstensson, at Kyritz and Wittstock (4th Oct. 1636), restored the paramount influence of Sweden in central Germany. Even the three combined armies, however, were decidedly inferior in force to those they defeated, and in 1637 Banér was completely unable to make headway against the enemy. Rescuing with great difficulty the beleaguered garrison of Torgau, he retreated beyond the Oder into Pomerania. In 1639, however, he again overran northern Germany, defeated the Saxons at Chemnitz and invaded Bohemia itself. The winter of 1640-1641 Banér spent in the west. His last achievement was an audacious coup-de-main on the Danube. Breaking camp in mid-winter (a very rare event in the 17th century) he united with the French under the comte de Guébriant and surprised Regensburg, where the diet was sitting. Only the break-up of the ice prevented the capture of the place. Banér theretofore had to retreat to Halberstadt. Here, on the 10th of May 1641, he died, after designating Torstensson as his successor. He was much beloved by his men, who bore his body with them on the battlefield till the last moment, and were rewarded, as he himself, by Gustavus’s generals, and tempting offers (which he refused) were made him by the emperor to induce him to enter his service. His son received the dignity of count.**

P. von Chemnitz, Königlichen Schwäbisch in Deutschland geführten Krieg; Martin Veibull, Storres Storheder (Stockholm, 1841); Lundblad, Johan Banér (Stockholm, 1823); Ardissow, Tristiaorita Krigets maeriska ogstige personer (Stockholm, 1861).**

**BANFF, a royal, municipal and police burgh, seaport and capital of Banffshire, Scotland. Pop. (1901) 7161. It is beautifully situated on high ground, on the left bank of the River Deveron, 40 N.W. of Aberdeen, 10 miles from the Great North of Scotland railway. It is a place of great antiquity, its first charter having been granted by Malcolm IV. in 1163, and further privileges were conferred by Robert Bruce in 1324 and Robert II. in 1372. Of the old castle on the hill by the sea, in which Archbishop Sharp was born, scarcely a trace remains; but upon its site was erected the modern Banff Castle, belonging to the earl of Seafield. The chief public edifices include the county buildings; town hall, surmounted by a spire 100 ft. high; Chalmers hospital (founded by Alexander Chalmers of Clunie, a merchant and shipowner, who spent £40,000 on the building by the Great North of Scotland railway.**

**BANFFSHIRE, a north-eastern county of Scotland, bounded N. by Inverness-shire, E. by Moray, S. by Aberdeen, and W. by Elgin and Inverness. It has an area of 403,364 acres, or 633 sq. m. The surface is diversified. The northern half is mostly a fine, open, undulating country of rich, highly-cultivated soil. The southern is mountainous, but extensive farms are found in its fertile glens. Some of the mountains are thick with forests, some present a beautiful intermixture of rock and copse, while others are covered with brown heath. The principal mountains are all in the south; among them are Cairngorm, on the confines
of the shires of Banff and Inverness (4,298 ft.), famous for its amber-coloured quartz crystals, the “cairngorms” of Scots jewelry; Ben Rinnes (2,775 ft.); Corryhabbie (2,563 ft.); Cook’s Cairn (2,478 ft.); Carn an t-Saidhe (2,401 ft.) and the Buck of Cabrach (2,368 ft.). No great rivers belong wholly to Banffshire. For a considerable part of their courses the Spey forms the western and the Deveron the eastern boundary of the county. But Banffshire streams are comparatively short, the chief being the Avon, Fiddich, Isla, Buckie, Deskford—with a series of cascades—and Livet. Most of them are stocked with trout and the Spey and the Deveron are famous for salmon. The golden sand and gravel cliffs, the romantic scenery, the chief being Glen Avon, Glen Batry, Glen Fiddich, Glen Isla, Glen Livet, and Glen Rinnes. The largest lochs are in the extreme south: Loch Avon (2,500 ft. above the sea), Loch Bugh (1,386 ft.) and Loch Etchachan (1,300 ft.).

Geology.—The geology of Banffshire is closely connected with that of the neighbouring counties of Aberdeen and Elgin, from which it is divided by no natural boundaries. The greater portion is occupied by crystalline schists of sedimentary origin belonging to the Highland sequence. The groups which are typically developed comprise (1) slates, black schists and phyllites with thin black limestone, sometimes containing tremolite, (2) the main limestone, (3) the Deveron conglomerate, and (4) sandstones, grits and conglomerates trending north-east and south-west from the seaward coast between Cullen and Portsoy southwards by Keith and Dufftown to the head waters of the Avon beyond Tomintoul. Some excellent sections of Caledonian rocks are seen on the north coast between Portsoy, and Findlater Castle, near Cullen, and in the railway cutting near Mulben, west of Keith. The main limestone has been worked at Foyers Bay, the head of Kincardine Bay, Keith and Portsoy. The quartzite, which is regarded as probably the highest member of the series, forms prominent ridges due to the more rapid erosion of the phyllites, mica-schists and limestones occupying the intervening hollows. It appears on the coast between Cullen and Findlater Castle, and it forms the Durn Hill near Portsoy, the Binn of Cullen, the Knock Hill, Ben Algan and various ridges trending southwards from Grange to Glen Fiddich towards Tomintoul. In the south-east, it is underlaid by grey-wackes and pebbly grits, which occupies the coast section between Macduff and Troop Head except a small part at Camrie. The slate has been quarried for roofing purposes. No fossils have been found in these strata and their age is uncertain. The metamorphic sediments have been pierced by acid and basic igneous intrusions, partly before and partly after the folding and metamorphism of the strata. The older acid and basic materials appear as sheets injected along the lines of bedding of the sediments and are traceable for considerable distances. They are foliated in places, the planes of schistosity being more or less parallel with the bedding in the older strata. The quartzite is represented by the sills of granite and augen-gneiss occurring west of Portsoy, south of Fordye and near Keith, while the older basic rocks are illustrated by the belt of gabbro, exposed in the Western Highlands south of Portsoy, and the coast at Portsoy, by Rothiemay to Huntly in Aberdeenshire. Veins and bosses of serpentinite are associated with these basic intrusions at Portsoy and near Grange, one of the veins being traceable almost to the coast at Portsoy. The Durn Hill is a large outcrop of granite, being, according to Dr. H. Traquair, of Diphacanthus striatus, Rhamdoanthus, Cheiracanthus Murkovich, Pterichites Milleri, Colacanthus Duncanii, and appears to have been formed from the middle or Ordovician period of this formation. In the interior near Tomintoul, another large deposit, composed of conglomerate and sandstone, occurs, which may be of the same age, though the beds have been progressively deformed during the period. There is a widespread covering of boulder clay especially in the northern part bordering the shore, where it contains fragments of shells and includes numerous boulders which have been carried eastwards from the high grounds west of the Moray Firth. In the brickclays at Blackpots to the north-west of Banff, fragments of shells also occur together with Jurassic fossils. Shelly sands have been reckoned for the Orkney and Shetland Islands. Banffshire and shells have been found in stratified deposits on the shore near Gamrie.

Agriculture.—The soil is in general rich and productive, yielding fair crops of wheat, and excellent crops of barley, oats, &c., and the land is generally admirably adapted to the various uses of its crops. The general climate is comparatively mild, and the demands of distillers keep up the acreage of barley. The cattle and stock hold a high character and form the staple agricultural industry. There is a small area of common land in the county. Among landlords who did much to encourage agricultural enterprise and to plant and reclaim lands, were the ears of Fife and the earls of Flett, afterwards earls of Seafield. It was on the field who, in the 1700s, did the most to plant trees in the Highland and Agricultural Society of Scotland, for his immense and thriving plantations of useful timber-trees, in the counties of Banff, Moray and Nairn. From the year 1811 to 1845, he had planted all the shore southwards in the direction of Knock Hill woods; making the enormous aggregate of 31,866,472 forest trees, planted in 8224 acres of enclosed ground. The Banffshire Agricultural Association, which works periodically for all sorts of stock and produce and agricultural improvements.

Manufactures and Trade.—Woolen factories are found in Dufftown, Rothiemay and Golspie, and engineering works in Banff, Portsoy and Keith. Distilleries are numerous and their product has a high repute. A fishing and miscellaneous trade is done at the harbours of Banff, Macduff, Buckie, Gardenstown, Portsoy, Cullen and Port Gordon; but fishing is also carried on by debtors on the banks of the river Spey. The rivers are navigable for shipping and there is a large coasting trade, and vessels from various parts of the world trade along the coast. The herring season lasts from June to September, white fishing all the year round. The fishery districts centre in Banff and Buckie. Banffshire contains large limestone deposits and granite rhyolites, a few coal pockets, and ironstone. The systems of the Great North of Scotland and the Highland railways serve the chief towns of the county and provide communication in one direction with Aberdeen, and in another with Elgin, Nairn and Inverness.

The population of Banffshire in 1891 was 61,684, and in 1901 61,488, or 97 to the square mile. In 1901 there were 499 persons speaking Gaelic and English. The chief towns are Banff (pop. in 1901, 7,161), Buckie (6,549), and Keith (4,753), with Cullen (3,536), Portsoy (1,789) and Dufftown (1,823). The county returns one member to parliament; the royal burghs, Banff and Cullen, belonging to Banffshire. Keith is a royal burgh. In the counties of Banff and Airdshire, forms a sheriffdom, and there is a resident sheriff-substitute at Banff, who sits also at Keith, Buckie and Dufftown. Most of the schools are under school-board jurisdiction. Several of them earn grants for higher education, and the county council, out of the “residuum grant,” subsidizes classes in agriculture, navigation, veterinary science and cookery and laundry work. The teachers of the county, with those of the shires of Aberdeen and Elgin, benefit by the bequest of James Dick (1743-1828), a West India merchant, who left over £110,000 to promote the higher learning of the schoolmasters of these shires. The annual income of £900 is paid to 14 or 16 of the 160 or more of the county’s denominations who have been qualified by examination to become beneficiaries.

History.—Of the northern Picts who originally possessed the land few remains now exist beyond the cairns that are found in the districts of Rothiemay, Ballindalloch, Boharm, Glen Livet and elsewhere. “Cairn” also occurs in many place names. The advance of the Romans was practically prevented by the mountains in the south, but what is believed to have been a Roman camp may still be made out in Glen Barry. Danish invaders were more persevering and more successful. Many bloody conflicts took place between them and the Scots. Near the present-day village of Kirriemuir, a battle was fought in 1116. A getline encounter occurred in 1266, and a considerable force was defeated at Mortlach is said to commemorate a signal victory gained by Malcolm II over the Norsemen in 1016. The shire was the scene of much strife after the Reformation. In Glen Livet the Roman Catholics, under the marquess of Huntly, worsted the Protestants under the earl of Argyll. From 1624 to 1645 was a period of almost incessant struggle, and the Covenanting troubles, combined with the frequent conflicts of the clans, were productive of serious evils. But the Jacobite risings of 1715 and 1745 left the county comparatively untouched, and thereafter it became settled.

Smith, History of Banff (Banff); Robertson’s Collections for a History of the Shires of Aberdeen and Banff (Spalding Club); W. Watt, Aberdeenshire and Banff (Edinburgh, 1906).
BÁNFFY—BANGANAPALLE

BÁNFFY, DEZSŐ [Desiderius], Baron (1843— ), Hungarian statesman, the son of Baron Daniel Bánffy and Anna Gyárás, was born at Klausenburg on the 28th of October 1843, and educated at the Berlin and Leipzig universities. As lord lieutenant of the county of Belso-Szolnok, chief captain of Kővár and curator of the Calvinistic church of Transylvania, Bánffy exercised considerable political influence outside parliament from 1875 onwards, but his influence was not to have begun to wane when he became speaker of the house of deputies. As speaker he continued, however, to be a party-man (he had always been a member of the left-centre or government party) and materially assisted the government by his rulings. He was a stringent adversary of the radicals, and caused some sensation by absenting himself from the capital on the occasion of Kossuth’s funeral on the 1st of April 1894. On the 14th of January 1895, the king, after the fall of the Széll ministry, entrusted him with the formation of a cabinet. His programme, in brief, was the carrying through of the church reform laws with all due regard to clerical susceptibilities, the suppression of the composition of 1867, whilst fully guaranteeing the predominance of Hungary. He succeeded in carrying the remaining ecclesiastical bills through the Upper House, despite the vehement opposition of the papal nuncio Agliardi, a triumph which brought about the fall of Kalnoky, the minister for foreign affairs, but greatly strengthened the ministry in Hungary. In the ensuing elections of 1896 the government won a gigantic majority. The drastic electoral methods of Bánffy had, however, contributed somewhat to this result, and the corrupt practices were the pretext for the fierce opposition in the House which henceforth had to encounter, though the measures which he now introduced (the Honved Officers’ Schools Bill) would, in normal circumstances, have been received with general enthusiasm. Bánffy’s resoluteness enabled him to weather all these storms, and his subsequent negotiations with Austria as to the quota and commercial treaties, to the considerable political advantage of Hungary, even enabled him for a time to live at peace with the opposition. But in 1898 the opposition, now animated by personal hatred, took advantage of the ever-increasing difficulties of the government in the negotiations with Austria, and refused to pass the bills, and the panic which had been anticipated had arrived at. They refused to be satisfied with anything short of the dismissal of Bánffy, and passion ran so high that on the 3rd of January 1899 Bánffy fought a duel with his most bitter opponent, Horánésky. On the 26th of February Bánffy resigned, to save the country from its “ex-lex,” or unconstitutional situation; he was decorated by the king and received the freedom of the city of Buda. Subsequently he contributed to overthrow the Stephen Tisza administration, and in May 1905 joined the Kossuth ministry.

See article “Bánffy,” by Marczell, in Pallas Nagy Lexikona, Köt 17.

(R. N. B.)

BANG, HERMANN JOACHIM (1858— ), Danish author, was born of a noble family in the island of Zealand. When he was twenty he published two volumes of critical essays on the realistic movement. In 1880 he published his novel Haablose Slaeger (“Families without hope”), which at once aroused attention. After some time spent in travel and a successful lecturing tour in Norway and Sweden, he settled in Copenhagen, and produced a series of novels and collections of short stories, which placed him in the front rank of Scandinavian novelists. Among his more famous stories are Fader (1885) and Thue (1889). The latter won for its author the friendship of Ibsen and the enthusiastic admiration of Jonas Lié. Among his other works are:—Det hvide Hus (The White House, 1898), Excentriske Noveller (1885), Stille Eksistenser (1886), Liv og Død (Life and Death, 1890), Englen Michael (1902), a volume of poems (1889) and of recollections (Tj Aar, 1891).

BANGALORE, a city, the capital of the native state of Mysore, and the largest British cantonment in the south of India. It is 3121 ft. above the sea, and 219 m. W. of Madras by rail. Pop. (1901) 69,447. The foundation of the present fort was laid by a descendant of Kempe-Goudé, a husbandman of the neighbouring country, who, probably in the 16th century, had left his native village to avoid the tyranny of the wadeyar of that place, and settled on a spot a few miles to the north of Bangalore. To the peaceful occupation of a farmer he added that of a warrior, and his first exploit was the conquest of this place, where, and at Savendrug, his family subsequently erected fortresses. Bangalore, with other possessions, was, however, wrested from them by Lord Bentinck. Banffy, however, later, found it enumerated among the jagers of Shahji, father of Sivaji, the founder of the Mahratta sway; and at an early period of his career in the service of the Bijapur state, that adventurer seemed to have fixed his residence there. It appears to have passed into the possession of Venkaji, one of the sons of Shahji; but he having occupied Tanjore, deemed Bangalore too distant, especially under the circumstances of the times, to be safe. He accordingly, in 1687, entered into a bargain for its sale to Chikka Deva, raja of Mysore, for three lakhs of rupees; but before it could be completed, Kasim Khan, governor of Tanjore, determined not to lose possession of the fort. Its fort, for which a site was chosen by Lord Cornwallis, was begun in 1766, and completed in 1770, and forms the modern fort of Aurangzeb, marched upon the latter and entered it almost without resistance. This event, however, had no other result than to transfer the stipulated price from one vendor to another; for that general, not coveting the possession, immediately delivered it over to Chikka Deva on payment of the three lakhs. In 1758, Nanijraj, the powerful minister of the raja, caused Bangalore to be granted, as a jagir or fief, to Hyder Ali, afterwards usurper of Mysore; who greatly enlarged and strengthened the fort, which, in 1760, on his expulsion from Seringapatam, served as his refuge from destruction. The fort formed the traditional home of the first and second Dastaduji and later Baillie’s defeat at Perambakam in 1780. The prison cell of Sir David and his fellow-captive is from 12 to 15 ft. square, with so low a roof that a man can scarcely stand upright in it. In 1791 it was stormed by a British army commanded by Lord Cornwallis. In 1790 the district was included by the treaty of Seringapatam within the territory of the restored raja of Mysore. It formed the headquarters of the British administration of Mysore from 1831 to 1851. When the state of Mysore was restored to its raja in 1881, the civil and military station of Bangalore was permanently reserved under British jurisdiction as the "Bangalore". It has an area of 13 sq. m., and had in 1901 a population of 89,599, showing a decrease of 10% in the decade, due to plague. Bangalore is the headquarters of a military district, its elevation rendering it healthy for British troops, with accommodation for a strong force of all arms and an arsenal in the old fort. It is the headquarters of a brigade in the 9th division of the Indian army. A considerable number of European pensioners reside here. There is a modern palace for the maharaja. There is an aided Roman Catholic college, besides many schools for Europeans. A permanent water-supply has been introduced and there is a complete system of drainage. Bangalore is an important railway centre. There are several cotton mills. The city suffered severely from plague in 1899 and 1900.

The district of Bangalore borders on the Madras district of Salem. The main portion consists of the valley of the Arcavati river, which joins the Cauvery on the southern frontier. Its area is 3079 sq. m. In 1901 the population was 789,664, showing an increase of 15% in the decade. The district is crossed by several lines of railway. Outside Bangalore city there is a wooden mill, which turns out blankets, cloth for greatcoats, and woollen yarns.

BANGANAPALLE, a state of southern India, surrounded by the Madras district of Kurnool. Area, 255 sq. m.; pop. (1901) 32,264, showing a decrease of 9% in the decade; estimated revenue 64,000, of which a large portion is alienated in grants to junior branches of the family; no tribute. The excessive expenditure of the nanaw, Syed Fateh Ali Khan, and the general inefficiency of the administration caused much anxiety to the government, and in February 1903 he was temporarily removed from the administration of the state. The town of Banganapalle is not far from the branch of the Southern Mahratta railway from Guntakal to Bezvada.
BANGASH, a small tribe of Pathans in the Kohat district of the North-West Frontier Province of India. They occupy the hills between Thal and Kohat, and number 3,000 fighting men. Formerly they owned the whole of Kurram, but owing to the encroachments of the Turis, they moved eastwards, dispossessed the Orakhals, drove them north, and took their territory in the Kohat district, which they now occupy to the west of the Khatkatt country. The Khattaks and Bangashes are of exceptionally good physique and make excellent soldiers.

BANGKOK, the capital of Siam, on the river Me Nam, about 20 m. from its mouth, in 100° 30' E., 13° 45' N. Until modern times the city was built largely on floating pontoons or on piles at the edges of the innumerable canals and water-courses which formed the thoroughfares, but to meet the requirements of modern life, well-planned roads and streets have been constructed in all directions, and the old canals at many junctions and lined with well-built houses, for the most part of brick, in which the greater part of the erstwhile riparian population now resides. The centre of the city is the royal palace (see Stam), situated in a bend of the river and enclosed by walls. At a radius of nearly a mile is another wall within which lies the closely-packed city proper, and beyond which the town stretches away to the royal parks on the north and to the business quarter, the warehouses, rice-mills, harbour and docks on the south. The whole town covers an area of over 10 sq. m. Two companies provide Bangkok with a complete system of electric tramways, and the streets are lined with shade-trees and lit by electricity. All over the town are scattered beautiful Buddhist temples, which with their coloured tile roofs and gilded spires give it a peculiar and notable appearance. Many fine buildings are to be seen—the various public offices, the arsenal, the mint, the palaces of various princes and, in addition to these, schools, hospitals, markets and Christian churches of many denominations, chiefly Roman Catholic. There are four railway stations in Bangkok, the termini of the lines which connect the provinces with the capital. The climate of Bangkok has without doubt recently changed. It has become hotter and less humid. Though the minimum temperature below 60° F. is still recorded in January and December, a maximum of over 100° is reached during the hot weather months and at the beginning of the rains, whereas up to the year 1900 a maximum of 93° was considered unusually high. The cause of this change is not known, but it is attributed to extensive drainage and removal of vegetation in the immediate neighbourhood of the town. The annual rainfall amounts to rather over 50 in.

A four-mile reach of the Me Nam, immediately below the city proper, forms the port of Bangkok. From 200 to 300 ft. broad and of good depth right up to the banks, the river offers every convenience for the berthing and loading of ships, though a bar at its mouth, which prevents the passage of vessels drawing more than 12 ft., necessitates in the case of large ships a partial loading and unloading from lighters outside. The banks of the port are closely lined with the offices, warehouses and wharves of commercial houses, with timber yards and innumerable rice-mills, while the custom house, the harbour master's office and many of the foreign legations and consulates are also situated here. Of the 750 steamships which cleared the port in 1904, three out of every four were foreign, 25% of the vessels were Japanese and one was British, but in 1905 two new companies, one British and the other Japanese, arranged for regular services to Bangkok, thereby altering these proportions. It is notable that the heavy trade with Singapore shows a tendency to decrease in favour of direct trade with Europe. A fleet of small steamers, schooners and junkes, carries on trade with the towns and districts on the east and west coasts of the Gulf of Siam. The trade of Bangkok is almost entirely in the hands of Europeans and Chinese. The principal exports are rice and teak, and the principal imports, cotton and silk goods and gold-leaf. The value of trade, which more than doubled between the years 1900 and 1905, amounted in the latter year to £5,600,000 imports and £7,100,000 exports. Of the total trade, 75% is with the British empire. Many of the best known mercantile firms and banks of the Far East have branches in Bangkok. The unit of currency is the tical (see Siam).

The government of Bangkok is entrusted to the minister of the capital, a member of the cabinet. Under this minister are the police, sanitary, harbour master's and revenue offices. The police is an efficient and well-organized body, aided at the head by a European commissioner of police. The harbour department consists of a board of health, a bacteriological laboratory and an engineer's office, all managed with expert European assistance. Under the act of 1905, the want of which was long felt, the port and the city water-ways are controlled by the harbour master. Local revenues are collected by the revenue office. The ordinary law courts are under the control of the ministry of justice, but in accordance with the extra-territorial rights enjoyed by foreign powers in Siam, each consulate has attached to it a court, having jurisdiction in all cases in which a subject of the power represented by such consulate is defendant.

The population, which is estimated at 450,000, is mixed. Mingling with Siamese and Chinese, who form the major part, may be seen persons of almost every race to be found between Bombay and Japan, while Europeans of different nationalities number over 1,000. The death-rate is high, especially among children, owing to the prevalence of cholera, smallpox and fevers during the dry weather. Sanitation, however, is improving and much good has resulted from the boring of numerous artesian wells which yield good water.

Before 1750 Bangkok was nothing but an agricultural village with a fort on the river bank. In that year, however, it was seized by the warrior, Paya Tak, as a convenient point from which to attack the Burmese army then in occupation of Siam, and upon his becoming king it was chosen as the capital of the country. (See Siam.)

BANGOR, a seaport and market-town of Co. Down, Ireland, in the north parliamentary division, on the south side of Belfast Lough, 12 m. E.N.E. of Belfast, on a branch of the Belfast & County Down railway. Pop. of urban district (1901) 5,903. It carries on considerable trade in cotton and linen and emigrant muslin. It is greatly frequented as a watering-place, especially by the people of Belfast, and there are golf links and important regattas held by the Royal Ulster Yacht Club. Slight remains are to be seen of an abbey of Canons Regular, founded in the middle of the 6th century by St Comgall, and rebuilt, on a scale of magnificence which astonished the Irish, by St Malachy O'Morgair in the first half of the 12th century. Bangor was incorporated by James I. and returned two members to the Irish parliament.

BANGOR, a city, port of entry, and the county-seat of Penobscot county, Maine, U.S.A., at the confluence of the Kennebecus stream with the Penobscot river, a port of navigation on the Penobscot, about 60 m. from the ocean, and about 75 m. N.E. of Augusta. Pop. (1890) 19,103; (1900) 21,850, of whom 3276 were foreign-born and 176 were negroes; (1910, census) 24,803. A bridge (about 1300 ft. long) across the Penobscot connects Bangor with Brewer (pop. in 1910, 5667). Bangor is served directly by the Maine Central railway, several important branches radiating from the city, and by the Eastern Steamship line; the Maine Central connects near the city with the Bangor & Aroostook railway (whose general offices are here) and with the Washington County railway. The business portion of the city lies on both sides of the Kenduskeag and for about 3 m. along the W. bank of the Penobscot, which is here quite low, while many fine residences are on the hillsides farther back. Bangor is the seat of three state institutions—the Eastern Maine general hospital, the Eastern Maine insane hospital and the law school of the University of Maine—and of the Bangor Theological Seminary (Congregational), incorporated in 1814, opened at Hampden in 1816, removed to Bangor in 1819, and impoverished in 1905 to confer degrees in divinity. The city has several public parks, a public library and various charitable institutions, among which are a children's home, a home for aged men, a home for aged women and a deaconesses' home. Among the principal buildings are the county court house, the Federal building, the city hall and the opera house. The Eastern
Maine Music Festival is held in Bangor in October of each year. The rise of the tide here to a height of 17 ft. makes the Penobscot navigable for large vessels; the Kenduskeag furnishes good water-power; and the city is the trade centre for an extensive agricultural district. The Eastern Maine State Fair is held here annually. Bangor is one of the largest ports in the United States, and also ships considerable quantities of ice. The city's foreign trade is of some importance; in 1907 the imports were valued at $2,720,594, and the exports at $1,272,247. Bangor has various manufactures, the most important of which (other than those dependent upon lumber) are boots and shoes (including moccasins); among others are trunks, valves, saws, stoves, ranges and furnaces, edge tools and can dog, saw-mill machinery, brick, clothing, cigars, flour and dairy products. In 1905 the city's factory products were valued at $3,498,355. The municipality owns and operates the water-works (the water-supply being drawn from the Penobscot by the Holly system) and an electric-lighting plant; there is also a large electric plant for generation of electricity for power and for commercial lighting, and in Bangor and the vicinity there were in 1908 about 60 m. of electric street-railway.

Bangor has been identified by some antiquarians as the site of the mythical city of Norombega, and it was reported in 1636 that Fort Norombe, built by the French, was standing here; but the authentic history of Bangor begins in 1676 when the first settlers came. The settlement was at first called Conduskeag and for a short time was locally known as Sumbury. In 1758 the town was incorporated, and through the influence of the Rev. Seth Noble, the first pastor, the name was changed to Bangor, the name of one of his favourite hymn-tunes. During the war of 1812 a British force occupied Bangor for several days (in September 1814), destroying vessels and cargoes. Bangor was chartered as a city in 1834. In 1856 a railway from Bangor to Old Town was completed; this was the first railway in the state; Bangor had, also, the first electric street-railway in Maine (1889), and one of the first iron steamships built in America ran to this port and was named "Bangor." Bangor is now a large business city, as distinguished from other towns of this name in Wales, Ireland, Brittany, &c., a city, municipal (1883) and contributory parliamentary borough (Carnarvon district), seaport and market-town of Carnarvonshire, N. Wales, 240 m. N.W. of London by the London & North Western railway. Pop. (1901) 11,266. It consists of Upper and Lower, the Lower practically one street. Lying near the northern entrance of the Menai Straits, it attracts many visitors. Buildings include the small cathedral, disused bishop's palace, deanery, small Roman Catholic church and other churches, the University College of N. Wales (1853), with female students' hall, and the new Bangor Grammar School. Most of the narrow streets are at right angles with each other. Wide and commodious street-railway system connects the town with its several suburbs. The Cruciform cathedral, with a low pinnacled tower, stands on the site of a church which the English destroyed in 1071 (dedicated to, and perhaps founded, about 526, by St Deiniol). Sir G. Scott restored the present cathedral, 1866-1875, after it had been burned in the time of Owen Glendower, destroyed in 1211, and, in 1102 and 1212, severely handled. Bishop Dean (temp. Henry VII.) rebuilt the choir, Bishop Skevington (1532) added tower and nave. Lord Penrhyn's slate- quarries, at Bethesda, 6 m. off, supply the staple export from Port Penrhyn, the port of the town.

The Myosurus Archaeologiae (404-484) gives the three principal bangor (college) institutions as follows:—the bangor of Iltud Farchaw at Caer Worgorn (Wroxeter); that of Emeris (Ambrosius) at Caer Caradawg; bangor wyrddin (glass) in the glass isle, Affalach; bangor Iltud, or Llanillut, or Llantwit major (by corruption), being a fourth. In each of the first three were 420 saints, succeeding each other (by hundreds), day and night, in their pious offices.

BANGORIAN CONTROVERSY, a theological dispute in the early 18th century which originated in 1716 with the posthumous publication of George Berkeley's (1685-1753) Enquiries Concerning the First Principles of the Christian Church, and the Nature and Consequences of Schism, in which he communicated all but the non-juring churchmen. Benjamin Hoadly (q.v.), the newly-appointed bishop of Bangor, scented the opportunity and wrote a speedy and able reply, Preservation against the Principles and Practices of Non-Jurors, in which his own Erastian position was recommended and sincerity proposed as the only test of truth. This was followed by his famous sermon, preached before George I. on the 31st of March 1717, on The Nature of the Kingdom or Church of Christ. In this discourse "he impugned the idea of the existence of any visible church at all, ridiculed the value of any tests of orthodoxy, and poured contempt upon the claims of the church to govern itself by means of the state." He identified the church with the kingdom of Heaven—it was therefore "not of this world," and Christ had not delegated His authority to any representatives. Both book and sermon were reported on by a committee appointed by the Lower House of Convocation in May, and steps would have been taken by the archbishop and bishops had not the government stepped in (Hoadly denied that this was at his request) and prorogued Convocation till November. Hoadly himself wrote A Reply to the Representations of Convocation and also answered his principal critics, among whom were Thomas Sherlock (q.v.), then dean of Chichester, Andrew Snape, provost of Eton, and Francis Hare, then dean of Worcester. These three men, and another opponent, Robert Moss, dean of Ely, were deprived of their royal chaplaincies. Hoadly was shrewd enough not to answer the most brilliant, though comparatively unknown, of his antagonists, William Law. Though the controversy followed, its most important result had already been achieved in the silencing of Convocation, for that body, though it had just "seemed to be settling down to its proper work in dealing with the real exigencies of the church" when the Hoadly dispute arose, did not meet again for the despatch of business for nearly a century and a half. (See Convocation.)

BANGWEULU, a shallow lake of British Central Africa, formed by the head streams of the Congo. It lies between 1°38' and 11°31' S. and is cut by 30° E. Bangweulu occupies the north-west part of a central basin in an extensive plateau, and is about 3700 ft. above the sea. The oval slopes gently to the east and north, and into it drain a considerable number of streams, turning the greater part into a morass of reeds and papyrus. The term Bangweulu is sometimes applied to the whole depression, but is properly confined to the area of clear water. Only on its south-west and western sides are the banks of the lake clearly defined. The greatest extent of open water is about 60 m. N. and 40 m. E. to W. Long narrow sandbanks almost separate Chifunawuli, the western part of the lake, from the main body of water, while the water surface is further diminished by a number of islands. The largest of these islands, Kirui (Chirui), lies west of the small island of the Ille, named after the Kisi (Chishi) is a small island occupying a central position just south of 11° S., and Mbawali, 20 m. long by 3 broad, lies south of Kisi. South of Bangweulu the swamp extends to 10°10' S. Into this swamp on its east side flows the Chambézi, the most remote head stream of the Congo. Without entering the lake the Chambézi meanders its waters in the swamp with those of the Luapula. The Luapula, which leaves Bangweulu at its most southern point, is about a mile wide at the outlet, but soon narrows to 300 or 50 yds. West of the Luapula and near its outflow lies Lake Kampolombo, 20 m. long and 8 broad at a southern end. A sandy track separated by Bangweulu from Kampolombo, and a narrow forest-clad tongue of land called Kapata intervenes between the Luapula and Kampolombo. Various channels lead, however, from the river to the lake. The Luapula flows south through the swamp some 50 m. and then turns west and afterwards north (see Congo). The flood waters of the Chambézi and other streams, which deposit large quantities of alluvium, are gradually solidifying the swamp, while the Luapula is believed to be, though very slowly, draining Bangweulu. The waters of the lake do not appear to be anywhere more than 15 ft. deep.
Banim—Banjo

south. It was partially surveyed in 1883 by the French traveller, Victor Giraud, and first circumnavigated by Poulett-Weatherley in 1884.

BANIM, JOHN (1798-1824), Irish novelist, was the son of the "Scott of Ireland," was born at Kilkenny on the 3rd of April 1798. In his thirteenth year he entered Kilkenny College and devoted himself specially to drawing and painting. He pursued his artistic education for two years in the schools connected with the Royal Society at Dublin, and afterwards taught drawing in Kilkenny, where he fell in love with one of his pupils. His affection was returned, but the parents of the young lady interfered and removed her from Kilkenny. She pined away incessantly, and his death made a deep impression on Banim, whose health suffered severely and permanently.

In 1820 he went to Dublin and settled finally to the work of literature. He published a poem, The Celts' Paradise, and his Damons and Pythias was performed at Covent Garden in 1821. During a short visit to Kilkenny he married, and in 1822 planned in conjunction with his elder brother Michael (1796-1874), a series of tales illustrative of Irish life, which should be for Ireland what the Waverley Novels were for Scotland. He then set out for London, and supported himself by writing for magazines and for the stage. A volume of miscellaneous essays was published anonymously in 1823, The Ghost Hunter (by Michael Banim), and The Smuggler followed in quick succession, and were received with considerable favour. John Banim, meanwhile, had become much straitened in circumstances. In 1829 he went to France, and while he was abroad a movement to relieve his wants was set on foot by the English press, headed by John Sterling in The Times. A sufficient sum was obtained to remove him from any danger of actual want, and to this government added in 1836 a pension of £350. He returned to Ireland in 1835, and settled in Windgap Cottage, a short distance from Kilkenny; and there, a complete invalid, he passed the remainder of his life, dying on the 15th of August 1842. Michael Banim's position was not improved by the bankruptcy of a firm with which he had business relations. After this disaster he wrote Father Connell (1842), Clough Fiona (1852), The Town of the Cascades (1862). Michael Banim died at Booterstown on the 30th of August 1874.

The true place of the Banims in literature is to be estimated from the merits of the O'Hara Tales; their later works, though of considerable ability, are sometimes prolix and are marked by too evident an imitation of the Waverley Novels. The Tales, however, were uniformly successful. The lights and shadows of Irish peasant character, have rarely been so ably and truly depicted. The incidents are striking, sometimes even horrible, and the authors have been accused of straining after melodramatic effect. The lighter, more joyous side of Irish character, which appears so strongly in Samuel Lover, receives little attention from the Banims.

See P. J. Murray, Life of John Banim (1857).

BANJALUKA (sometimes written BANJALUKA or BAINALUKA), the capital of a district bearing the same name, in Bosnia. Pop. (1895) 13,666, of whom about 7,000 were Moslems. Banjaluka lies on the river Vrhas, and at the terminus of a military railway which meets the Hungarian state line at Jasenovac, 50 m. N.N.W. Banjaluka is the seat of Roman Catholic and Orthodox bishops, a district court, and an Austrian garrison. It is at the head of a narrow defile, shut in by steep hills on the east and west but expanding on the north to meet the valley of the Save. A small stream called the Crkvinja enters the VRhas from the north-east and in the angle thus formed stand the citadel and barracks, with the 17th-century Ferhadija Jamia, largest and most beautiful of more than a dozen mosques incorporated into the buttressed Roman baths which are all in ruins, except one massive, domed building, dating from the 6th century and still in use, although modern baths are also open, for the development of the hot springs. Other noteworthy buildings are the Franciscan and Trappist monasteries, a girls' school, belonging to the Sisterhood of the Sacred Blood of Nazareth, a real-school and a Turkish bazaar. Coal, iron, silver and other minerals are found in the adjoining hills; and the city possesses a government tobacco factory, a brewery, cloth-mills, gunpowder-mills, a model farm and many corn-mills, worked by the two rapid rivers.

Banjaluka is probably the Roman fort, marked, in the Tabula Peutingeriana, as Castro, on the river URBANUS and the road from Salona on the Adriatic to Servitium in Pannonia. The origin of its later name, meaning the "Baths of St Luke," is uncertain. In the 15th century, the fall of Jajce, a rival stronghold 22 m. S., led to the rapid rise of Banjaluca, which was the scene of many encounters between Austrians and Turks; notably in 1527, 1688 and 1737. No Bosnian city had greater prosperity or importance in the last half of the 18th century. The stockin Aga Borberli, called the "Dragon of Bosnia," or Zmaj Bosanski, made Banjaluka the terminus of his holy war against the sultan Mahmut II. (See Bosnia.)

BANJERMASIN (Dutch Bandjermasen), the chief town in the Dutch portion of the island of Borneo, East Indies, on the river Martapura, near its junction with the Barito, 24 m. from the mouth of the Barito in a bay of the south coast. The town is the seat of the Dutch resident of South and East Borneo. Its buildings stand on either bank of the river, but many of the inhabitants (who number nearly 50,000) occupy houses either floating on, or built on piles in the river. As large vessels can sail up to the town, it is a trade centre for the products of the districts along the banks of the Barito and Martapura, such as benzoin, rattans, wax, gold, diamonds, iron and weapons. In 1700 the East Indian Company established a factory here; but the place was found to be unhealthy, and the Company's servants were finally attacked by the natives, whom they repulsed with great difficulty. The settlement was abandoned. The English again seized Banjermas in 1811, but restored it in 1817. Of the commercial community the Chinese are a very important portion, and there is also a considerable number of Arabs. The district of Banjermasen was kept under the Dutch in consequence of the war of 1860, in regard to the succession to the crown, which had been under their protection since 1787. The town of Martapura was the seat of the sultan from 1771. The inland portion of the district is covered with forest, while the flat and swampy seaboard is largely occupied by rice-fields. The inhabitants are mostly Dyaks.

BANJO, a musical instrument with strings plucked by fingers or plectrum, popular among the American negroes and introduced by them into Europe. The word is either a corruption of the Italian banjo or "pedanjo" (q.v.), an instrument of the guitar type, or is derived from "banya," the name of a similar primitive Senegambian instrument.

The banjo consists of a body composed of a single piece of vellum stretched like a drum-head over a wooden or metal hoop to ensure the requisite degree of resonance; the parchment may be tightened or slackened by means of a series of screws disposed round the circumference of the hoop. Attached to the body, which has no back, is a long neck, terminating in a flat head acting as a peg-box and bent back slightly at an obtuse angle at the neck. There are five, six or nine strings to the banjo; they are fastened to a tail-piece as in the violin, pass over a low bridge, on the body, and are strained over the nut or ridge at the end of the neck, where they are threaded through holes and wound round the tuning-pegs fixed in the back of the head in Oriental fashion, as in the lute (q.v.). The strings are stopped.
by the pressure of the fingers against the finger-board which lies over the front of the neck; the correct positions for the formation of the intervals of the scale are indicated in some banjos by frets consisting of metal or wooden bands inlaid in the finger-board. The vibrating length of the strings from bridge to nut is 24 in. for all except the highest in pitch, known as the "chamberelle," "melody" or "thumb string," which is only 16 in. long; its tuning peg is inserted half-way up the neck. The chamberelle is not, as in other stringed instruments, in its position as the highest in pitch, but is placed next the lowest string for convenience in playing it with the thumb. In the tables of accordance here given, the chamberelle is indicated by a X. The five-stringed banjo is tuned either

The six-stringed is tuned 

4 1 3 5 2

The nine-stringed banjo has three thumb strings thus 

9 7 6 1 3

The G clef is used in notation, but the notes sound an octave lower than they are written. The banjo is usually a transposing instrument in the sense that, when playing with other instruments, the A corresponds to the C of the piano or violin; the key of A major is therefore the first to be mastered. The chamberelle does not lie over the finger-board and is always played open by the thumb.

The banjo is held so that the neck is even with the left shoulder and the body rests on the right thigh; the front of the instrument is held inclined at an angle, allowing the performer to see all the strings. When played as a solo instrument, a spectrum may be used with good effect to produce rapid scale and arpeggio passages, or to produce the tremolo or sustained notes as on the mandoline (q.v.). The best results are obtained by means of a tortoise-shell spectrum about the size of a shilling, having the contact-edges highly polished, bevelled and terminating in a point. The tone of the banjo is louder and harder than that of the guitar.

Chords of two, three and four notes can be played on it. The banjo or bania of the African negro having grass strings is still in use on the coast of Guinea. The banjo was made known in England through companies of coloured minstrels from the United States, one of which came over to London as early as 1846. (K. S.)

BANK, known also as "Polish Bank" and "Russian Bank" a card-game. An ordinary pack is used. Five or six players is a convenient number. Each contributes an arranged stake to the pool. The dealer gives three cards to each player and turns up another; if this is not lower than an eight (ace is lowest) he goes on till such a card is exposed. The player on the dealer's left, without touching or looking at his cards, can bet the amount of the pool, or any part of it, that among his cards is one that is higher (of the same suit) than the turn-up. If he wins, he takes the amount from the pool; if he loses, he pays it to the pool. Each player does the same in turn, the dealer last. Whenever the pool is exhausted, a fresh stake is put into the pool. After a round is over the deal passes. No player may touch his cards until he has made his bet; the penalty is a fine to the pool of twice the stake, and the loss of his right to bet during that round.

BANKA (Banca, Banka), an island of the Dutch East Indies, off the east coast of Sumatra, from which it is separated by Banka Strait, which is about 9 m. wide at its narrowest point. On the coast, the broader, island-studded Gaspar Strait separates Banka from Billiton. Banka is 138 m. in length; its extreme breadth is 62 m., and its area, including a few small adjacent islands, 4,460

2 For the commercial "bank" see Banks and Banking.
who joined the operative masonic lodges of the 16th and later centuries, and they were as carefully registered in the markbooks as those selected by operatives for trade purposes. The same marks are to be seen in the registers used by fathers and sons, and not always with a slight difference, as some have stated, to secure identification. What should be noted also is that other trades used precisely similar marks and for a like object, so that the idea of their having a mystical meaning, or being utilized for any other object but the one named, seems groundless.

The late George Godwin, F.R.S., F.S.A., &c., drew attention to the "masses' marks" in a communication to the Society of Antiquaries in 1841, and also at a later period (vide Archaeologia, vol. xxx. p. 113). To him is the credit due of first drawing attention to "these signs" in England. It is noteworthy how little such marks are noticed, even in buildings which are visited by archaeologists quite frequently, until a few are pointed out, and then they meet the eye to an astonishing number. In the Sessional Papers, 1866–1869, of the Royal Institute of British Architects, No. 9, may be found numerous samples of the marks from various parts of Europe in Illustration of the paper by Godwin.

No better plan has been followed in modern times to connect the work done with the worker in stone, and it is probable that a second mark, observable on some blocks, may serve to indicate the overseer. There are even three or more sometimes.

The same system was adopted at the building of Truro cathedral, only the marks were inserted on the bed of each stone instead of at the side as usual, the result being that they ceased to be seen after being placed in situ. Mr Hughan obtained copies of these marks from Mr James Bubb, the first clerk of the works, and from his successor, Mr Robert Swain, and had them published in the Freemason, 13th of November 1886. He remarked at the same time that "many of these designs will be familiar to students of ancient ecclesiastical and other buildings at home and abroad." Some are interesting specimens.

A Historical Treatise on Early Builders' Marks (Philadelphia, U.S.A., 1885) by Mr G. F. Fort, and Masons' Marks from Buildings in the Counties of Lancaster and Chester, with Notes on the General History of Masons' Marks (Historic Society of Lancashire and Cheshire, vol. vi. N.S.), by W. Harry Rylands, F.S.A., may be consulted with advantage. The latter declares that "the Runic theory is as unlikely and as untenable as that which places the origin of these marks in the absurd alphabets given by Cornelius Agrippa, who died early in the 16th century." Victor Didron copied some 4000 during a tour in France in 1836 and pointed out their value in (Harv. Arch. J., H. *)

BANKET, a South African mining term, applied to the beds of auriferous conglomerate, chiefly occurring in the Witwatersrand gold-fields (see GOLD). The name was given to these beds from their resemblance to a sweetmeat, known in Dutch as "banket," resembling almond hard-bake. The word is the same as "banquet," and is derived ultimately from "bank" or "banch," meaning table-feast, hence applied to any delicacy or to various kinds of confectionery, a use now obsolete in English.

BANK HOLIDAYS, in the United Kingdom, those days which by the Bank Holidays Act 1871 are kept as close holidays in Irish banks in England and Ireland and Scotland respectively. Before the year 1834, the Bank of England was closed on certain saints' days and anniversaries, about thirty-three days in all. In 1834 these were reduced to four—Good Friday, 1st of May, 1st of November and Christmas Day. By the act of 1871, carried through the House of Commons by Sir J. Lubbock (afterwards Lord Avebury), the following were constituted bank holidays in England and Ireland—Easter Monday, the Monday in Whitsun week, the first Monday of August, the 26th of December if a week-day; and by the Bank Holiday (Ireland) Act 1903, March 17th—St. Patrick's Day, was added as a bank holiday. (See BANK HOLIDAY (FESTIVALS)). In Scotland—New Year's Day, Christmas Day, Good Friday, the 1st Monday of May, the 1st Monday of August. If Christmas Day and New Year's Day fall on a Sunday, the next Monday following is the bank holiday. No person is compelled to make any payment or to do any act upon a bank holiday which he would not be compelled to do or make on Christmas Day or Good Friday, and the making of a payment or the doing of an act on the following day is equivalent to doing it on the holiday. By the same act it was made lawful for the sovereign from time to time, as it should seem fit, to appoint by proclamation, in the same manner as public fasts or days of public thanksgiving, any day to be observed as a bank holiday throughout the United Kingdom or any part of it, or to substitute another day when in any special case it appears inexpedient to the sovereign in council to keep the usual bank holiday. (See further HOLIDAY.)

BANKIPUR, an ancient village on the Hugli river in the Bengal Presidency, near the modern Company town Barrackpore. It has disappeared from modern map-reading, but is famous as the principal settlement of the ill-fated Ostend Company, the one great effort made by Germany to secure a foothold in India. The Ostend Company was formed in 1722–1723, and with a capital of less than a million sterling founded two settlements, one at Cobloom (Covelong) on the Madras coast between the English Madras and the Dutch Sadras, and the other on the Hugli between the English Calcutta and the Dutch Chinsura. Both English and Dutch were offended and in 1727, in order to obtain the European guarantee for the Pragmatic Sanction, the court of Vienna resolved to sacrifice the Company in the Company, and the bankipur was bankrupt in 1754 and ceased to exist in 1793. But in the meantime in 1733 the English and Dutch stirred up the Mahommedan general at Hugli to pick a quarrel. He attacked Bankipur and the garrison of only fourteen persons set sail for Europe. Thus German interests disappeared from India.

BANK-NOTES. For our present purpose we include in this description all paper substitutes for metallic currency whether issued by banks, governments or other financial institutes.

Early bank-notes were simply printed forms in which the amounts were written by hand. They were usually for large amounts ($50 and upwards) and were printed upon watermarked paper; and, although no precautions were taken in the engraving to prevent fraudulent imitation, forgeries were comparatively rare. But, when at the end of the 18th century small notes for $1 and $2 were put in circulation, forgery became rife, as many as 352 persons being convicted of this crime in England in a single year; and from that time to the present a constant trial of skill has been going on between the makers of bank-notes and the counterfeiters. Engine-turned ornaments and emblematical figures or views introduced in the engraving, in conjunction with the water-mark and suspended in the water, helped to check until the discovery of photography put into the hands of the counterfeiter a most dangerous weapon, by the aid of which complicated patterns and vignettes could be perfectly reproduced. To prevent such reproduction Henry Bradbury in 1856 introduced anti-photographic bank-note printing, in which the essential portions of the note were printed in one colour and over this another protective colour was placed. A photograph of a note printed in this way presented a confused mingling of the two colours; but with the advance of photographic knowledge means were found of obtaining a photograph of either colour separate from the other, and it consequently became necessary to introduce a third colour and to secure a special photographic relation between the three colours to prevent their separation.

Photography, however, although the most dangerous weapon of the counterfeiter, is not the only means of imitation available, a fact which is sometimes overlooked. A note may be perfectly secure against photographic reproduction, but from the absence of other necessary features may be easily copied by an engraver of ordinary skill. There are two systems of engraving employed in bank-notes:—(1) line-engraving in which the lines are cut into the steel or copper plates; and (2) relief-engraving in which the lines stand up above the plate as in wood-engraving. In the former, adapted to the process called plate-printing, the ink is delivered from the lines in the plate to the paper pressed upon it; in the latter, adapted to surface-printing, the ink is spread upon the face of the lines and printed as in typography. Plate-printing gives by far the finer and sharper impression, but as there is a perceptible body of ink transferred to the paper from the cut lines, it has been supposed that an impression from plate would
be more easily photographed than one from surface where only a film of ink is spread upon the top of the raised lines. But surface-printing being much less sharp and distinct than plate-printing, imperfect copies of notes for which that process is used are the more likely to escape detection. The plates upon which the early notes were engraved being of copper quickly wore out and had to be constantly replaced. The result was great difference in the appearance of the notes, those printed from new plates being sharp and clear, while others, printed from old plates, were pale and blurred. These differences were a great assistance to the forger, as the public, being accustomed to variations of appearance even in different genuine notes, was less apt to remark the difference between these and counterfeits.

In the early part of the 19th century, Jacob Perkins (1766-1849) introduced into England from America what is known as the transfer-process, in which the original engraving on steel is hardened and an impression taken from it on a soft steel cylinder, which in its turn is hardened and pressed into a soft printing-plate. By this means as many absolutely identical plates can be produced as may be required, and being hardened they will yield a very large number of prints without any appreciable diminution in their value. The process depends upon the multiplication of plates by electro-deposition, the surface of the copper-electrotype plates being protected by the deposit of a film of steel which effectually prevents the wearing of the copper and can be renewed at will.

The water-mark of the paper, on which formerly reliance was placed almost exclusively, puts a difficulty in the way of the counterfeiter, but experience has shown that in ordinary circumstances it does not in itself afford sufficient protection. The means by which it can be imitated are well known, and, since a distinct water-mark is incompatible with strong paper, the life of a water-marked note is much shorter than that of one printed upon plain paper. The best bank-note paper is made from pure linen rags and was formerly made by hand. Machine-made paper is however now largely used, as it possesses all the strength of hand-made and is much more uniform in thickness and texture.

In documents which pass current as money it is obviously the duty of the bank or government issuing them to take all reasonable means to prevent the public from being defrauded by the substitution of counterfeits; and a bank whose circulation depended upon a single method of securing uniform interest to insure the acceptance of its notes. This principle is now recognized by all issuing institutions, but in practice there is room for improvement in the issues of many important establishments, partly because of the disinclination of the directors of a bank to change the form of an issue to which the public is accustomed, partly because of the difficulty of deciding what is really a secure note, and in certain cases because, owing to exceptional circumstances, an issue may be practically immune from forgery although the notes themselves present little or no difficulty in imitation. The features essential to the detection of an issue are: (1) absolute identity in appearance of all notes of the issue; (2) adequate protection by properly-selected colours against photographic reproduction; and (3) high-class engraving comprising geometric lathe work and well-executed vignettes. In addition it is important that the design of the note should be striking and pleasing to the eye, and the inscription legible.

The notes of the Bank of England are printed in the bank from surface-plates in black without colour or special protection except the water-mark in the paper. They are never reissued after being once returned to the bank, and their average life is very short; about six weeks, so that a dirty or worn Bank of England note is practically never seen. This arrangement, coupled with the difficulty of negotiating forged notes in England, the lowest denomination being £5, accounts for the comparative immunity from forgery of the bank's issues.

**Bank Rate**, a term used in financial circles to designate the rate of discount charged in the chief monetary centres by the state or leading bank, as opposed to the open-market rate. (See **Market: Money market**.)

**Bankruptcy** (from Lat. *bancus* or Fr. *banque*, table or counter, and Lat. *rapius*, broken), the status of a debtor who has been declared by judicial process to be unable to pay his debts. Although the terms "bankruptcy" and "insolvency" are sometimes used indiscriminately, they have in legal and commercial usage distinct significations. When a person's financial liabilities are greater than his means of meeting them, he is said to be "insolvent"; but he may nevertheless be able to carry on his business affairs by means of credit, paying old debts by incurring new ones, and he may therefore, in order to obviate the loss of his business, become a bankrupt long before his insolvency becomes public. When his insolvency becomes public and default occurs, a debtor may still avert bankruptcy if he is able to effect a voluntary arrangement with his creditors. A debtor may thus be insolvent without becoming bankrupt, but he cannot be a bankrupt without being insolvent, for bankruptcy is a legal declaration of his insolvency and operates as a statutory system for the administration of his property, which is thereby taken out of his personal control.

In primitive communities bankruptcy systems were unknown. In the Roman law creditors were left to pursue their remedies by such means as the law or practice of the community might sanction, and these were generally of a very drastic character. Under the Roman law of the Twelve Tables, the creditors might, as a last resort, cut the debtor's body into pieces, each of them taking his proportionate share; and although Blackstone in quoting this law appears to cast some doubt upon its literal interpretation, there can be no doubt that the power of selling the debtor and his family into slavery was one which was habitually exercised in Greece, Rome, and generally among the nations of antiquity. Even among the Jews, whose legislation was of a comparatively humane character, this practice is illustrated by the Old Testament story of the woman who sought the help of Elisha, saying, "Thy servant my husband is dead . . . and the creditor is come to take unto him my two children to be bondmen." The savage severity of these earlier laws was, however, found to be inconsistent with the development of more humane ideas and the growth of popular rights; and tended, as in the case of Greece and Rome, to create serious disturbance in political relations between the patricians, who generally composed the higher or creditor class, and the plebeians, in whose ranks the majority of debtors were to be found. Later legislation consequently substituted imprisonment in a public prison for the right of selling the person of the debtor. Under the feudal systems of Europe the state generally insisted on its subjects being left free for military service, and debts could not therefore be enforced against the person of the debtor; but as trade began to develop it was found necessary to provide some means of bringing personal pressure to bear upon debtors for the purpose of compelling them to meet their obligations, and under the present laws of Europe the right of a creditor to enforce his claims by the imprisonment of his debtor was gradually evolved (although no express legal enactment to that effect appears at any time to have existed), and this practice continued until comparatively recent times.

Without some system of enforcing payment of debts it would have been impossible for the commerce of the world to have attained its present proportions; for modern commerce is necessarily founded largely on credit, and credit could not have existed without the power of enforcing the fulfilment of financial contracts. On the other hand, remedies against a debtor's person, and still more against the persons of his family, are not only inconsistent with the growth of opinion among civilized communities, but are in themselves worse than futile, inasmuch as they strike at the root of all personal effort on the part of a debtor to retrieve his position and render a return to solvency impossible. Hence the necessity of devising some system which is just to creditors while not unduly harsh upon debtors, which discriminates between involuntary inability to meet obligations and willful
refusal or neglect, and which secures to creditors as between
themselves an equitable share of such of the debtor's assets as
may be available for the payment of his liabilities. These are
the objects which the bankruptcy laws have primarily in view.
Another object, which has not always been so fully recognized
as it might appear to deserve, has marked the most recent
legislation, namely, the fostering of a higher tone of commercial
morality and the protection of the trading community at large
from the evils arising through the abuse of a trade or the
unusual trade competition thereby engendered. It must
be admitted that these objects are of a somewhat conflicting
character, and wherever the state has interfered with the view
of securing an efficient system of bankruptcy legislation the
task has been found to be extremely difficult. Not only have
the conflicting interests of the debtor and his creditors to be
taken into account, but the method to be adopted in dealing
with his property has also given rise to much conflict of opinion,
and to a lack of uniformity and consistency in the legislation
which dealt with it. The debtor's property was naturally
regarded as belonging to the creditors, but it had to be
distributed among them until it was realized, and until their
respective right and interests were determined by competent
authority. In some cases claims to rank as creditors are of
doubtful validity. In others the creditor holds securities, the
value of which requires investigation, or he claims a preference
to which he may or may not be legally entitled. Creditors have
thus conflicting interests as between themselves, and are there-
fore incapable of acting together as a homogeneous body.
Hence the necessity for calling in the aid of professional assignees
or trustees, solicitors and other agents, who made it their
special business to deal with such matters, exercising both
administrative and quasi-judicial functions, in return for the
remuneration which they receive out of the property for their
services. Professional interests, which are not always identical
with the interests of the debtor or the creditors, are thus called
into existence, and these interests have from time to time
exercised a powerful influence in shaping the course of legislation.

While the law of bankruptcy has therefore been largely the
product of commercial development, it has necessarily been of
slow and gradual growth, tentative in its character, and subject
to varying and varying predominance of each of these interests from time to time. No intelligible grasp of the
principles which underlie the history of bankruptcy legislation
in England, and no satisfactory explanation of the fluctuating
tendencies which have marked its progress, are possible without
bearing these considerations in view.

Bankruptcy in England.

History.

The subject was originally dealt with in the sole interest of
creditors; it was considered fraudulent for a debtor to procure
his own bankruptcy. Thus the earliest English statute
on the subject, 34 & 35 Henry VIII. c. 4 (A.D. 1542),
was directed against fraudulent debtors, and gave power to
the lord chancellor and other high officers to seize their estates
and divide them among the creditors, but afforded no relief to
the debtor from his liabilities. Subsequent legislation modified
this attitude and introduced the principle of granting relief to
the bankrupt with or without the consent of the creditors,
where he conformed to the provisions of the bankruptcy law,
and under the act of 1825 the debtor was allowed himself to
initiate proceedings. Since 1542 about forty acts of parliament
have been passed, dealing with the many aspects of the subject,
and slowly expanding, modifying and building up the highly
complex system of administration which now exists.

The courts exercising jurisdiction originally consisted of
commissioners appointed by the lord chancellor. But in 1831
a special court of bankruptcy was established, con-
isting of six commissioners with four judges as a
court of review, and official assignees attached to the
court for the purpose of getting in the distributing the bank-
rupt's assets. Non-traders were originally excluded from the
bankruptcy court, and a special court called the "court for
relief of insolvent debtors" was instituted for their benefit, in
which relief from the liability to imprisonment could be obtained
on surrender of their property, but they were not discharged
from their debts, subsequently-acquired property remaining
liable. Both of these courts were subsequently abolished, non-
traders were permitted to obtain the benefit of the bankruptcy
laws, including a discharge, and in 1869 the system of official
assignees was swept away; and a new court of bankruptcy
created with one of the vice-chancellors at its head a judge,
and a number of subordinate registrars or inferior judges
under him. This court has also now been abolished, and the
business is administered by a judge of the high court specially
appointed for the purpose by the lord chancellor, with registrars
of the high court, who deal with the ordinary judicial routine
of bankruptcy procedure in the London district, while similar
duties are performed by the county-court judges throughout the
country.

But the questions which have proved the most difficult to
deal with, and which more than any others have been the cause of
fluctuating and inconsistent legislation, have un-
doubtedly been those relating to the share which the
creditors ought to have in the administration of the
proceedings, and to special arrangements effected between
a debtor and his creditors under conditions more or less beyond
the control of the court. These two questions are largely
intermixed, and the history of English legislation on these
points and its results throw much light on the causes of
the failure of the many attempts which have been made by the most
creatively-minded legal authorities to bring the law into a satisfactory
condition. The right of creditors to exercise some control in
bankruptcy over the realization of the debtor's property through
an assignee chosen by themselves was recognized at an early
date, but this right was exercised subject to the supervision of
the court which investigated the claims of creditors and deter-
mined who were entitled to take part in the proceedings. Pro-
vision was also made for the interim protection of the debtor's
property by official assignees attached to the court, who took
possession until the creditors could be consulted, and under the
supervision of the court audited the accounts of the creditor's
assignee. So long as this system continued substantial justice
was generally secured; the claims of creditors were strictly
investigated and only those who clearly proved their right before
a competent court were entitled to take part in the proceedings.
The bankrupt was released from his obligations, but only after
strict inquiries into his conduct and under the exercise of
dJudicial discretion. The accounts of assignees were also strictly
investigated, and the costs of solicitors and other agents were
taxed by officers of the court. But the system was found to be
cumbersome, to lead to delay and too often to the absorption
of a large part of the estate in costs, over the incurring of which
there was a very ineffective control. Hence arose a demand for larger powers on the part of creditors, and the
introduction into the bankruptcy procedure of the system of
"arrangements" between the debtor and his creditors, either
for the payment of a composition, or for the liquidation of the
estate free from the control of the court. At first these arrange-
ments were carefully guarded. Under the act of 1825 a
proposal for payment of a composition might be
Act of
adopted only after the debtor had passed his examination
1825, 1831,
in court, and with the consent of nine-tenths in
1842, 1849.
number and value of his creditors assembled at a
meeting. Upon such adoption the bankruptcy proceedings
were superseded. Dissenting creditors, however, were not bound by
the resolution, but could still take action against the debtor's
subsequently-acquired property. These powers were not found to be
sufficiently elastic and the act failed to give public satisfac-
tion. Attempts were made by the acts of 1831 and 1842 to
remedy the defects complained of by a reconstitution of the
bankruptcy court and its official system. But these measures
also failed because they were based on the assumption that
judicial bodies could exercise effective control over administrative
action, a control for which they are naturally unsuited, and which they could only carry out by cumbrous and expensive methods of procedure. Under the act of 1849 a totally new principle was introduced by the provision that a deed of arrangement executed by a solvent in bankruptcy and the value of the creditors for £50 upwards should be binding upon all the creditors without any proceeding in or supervision by the court. But the determination of the question who were or were not creditors was practically left to the debtor himself, without any opportunity for testing by independent investigation the claims of those who signed the deed to control the administration of the estate. It is not difficult to see, in the light of subsequent experience, how likely this provision was to encourage fraudulent arrangements, and to introduce laxity in the administration of debtors' estates. A modification of the too stringent conditions of the act of 1853, which would have enabled a bankrupt to pay a composition on his debts, with the consent of a large proportion of his bona-fide creditors, and subject to the approval of the court, after hearing the objections of dissenting creditors, would doubtless have proved a beneficial reform, but the act of 1849 proceeded on a very different principle. Instead of reforming, it practically abolished judicial control. By avoiding Scylla it fell into Charybdis. To give any majority of creditors the power to release a debtor from his obligations to non-assigning creditors without full disclosure of his affairs, and without any exercise of judicial discretion in the investigation into the causes of the failure, is a practice of the debtor, would in any circumstances have been to introduce a new and mischievous principle into legislation, for it would necessarily destroy the essential feature of such arrangements, that they are voluntary contracts, the responsibility for which lies solely with the parties entering into them. But to give such a power to creditors whose claims were subject to no independent investigation was to invite inevitable confusion and failure.

Yet this was the dominating principle of English bankruptcy legislation for nearly thirty-five years. Its effect under the act of 1849 was, however, to some extent modified by subsequent decisions of the courts that to make a composition arrangement binding it must be accompanied by a complete cessio bonorum; but this qualification was removed by the act of 1861 which made such arrangements binding without a cessio and reduced the majority required to make a deed of arrangement binding on all the creditors, to a majority in number and three-fourths in value of those whose claims amounted to £10 and upwards. The result was an enormous increase in fraudulent arrangements. The then attorney-general, Sir Robert Collier, in introducing an amending act in 1869, described the abuses which had grown up under the 1853 and 1861 acts, as having the effect of enabling a bankrupt to "defraud those to whom he was indebted and to set them at defiance"; while Lord Cairns, the lord chancellor, in the House of Lords expressed the opinion that the large increase which had taken place in the annual insolvency of the country during the preceding years could not be attributed to depression of trade but must be traced to the enormous facilities which are given to debtors who wish to be released from their debts on easy terms. And yet in the legislation which ensued these facts were entirely ignored or lost sight of or brought as far as it was possible to avoid doing so.

It is indeed a curious illustration of the difficulties which have attended bankruptcy legislation in England that the very measure (the act of 1869) which was introduced to remedy this deplorable condition of affairs, was twelve years afterwards denounced in parliament by the president of the Board of Trade (Mr Joseph Chamberlain) as "the most unsatisfactory and most unfortunate of the many attempts which had been made to deal with the subject" and as "the object of the almost unanimous condemnation of all classes." How was this? Under the act of 1869, the procedure under a bankruptcy petition was certainly rendered effective. Meetings of creditors were presided over and creditors' claims were, for the first time, submitted upon by the registrar of the court; the bankrupt had to pass a public examination in court, which although chiefly left to the trustee appointed by the creditors, afforded some opportunity for investigation; and the bankrupt could not obtain his discharge without the approval of the court and in certain circumstances the consent of the creditors. An independent official, the comptroller in bankruptcy, was appointed, whose duty it was to examine the accounts of trustees, call them to account for any misfeasance, neglect or omission, and refer the matter to the court for the exercise of disciplinary powers where necessary. These provisions were well calculated to promote sound administration, but they were, unfortunately, rendered nugatory by provisions relating to what were practically private arrangements on similar lines to those which had rendered previous legislation ineffective. In some respects the evil was aggravated. Deeds of arrangements were nominally abolished, but under sections 125 and 126 of the act a debtor was empowered to present a petition to the court for liquidation of his affairs by "arrangement," or for payment of a composition, whereupon a majority of creditors was summoned from a list furnished by the debtor, and without any judicial investigation of claims, a majority in number and three-fourths in value of those who lodged proofs of debt, and who were present in person or by proxy at the meeting, might by resolution agree to liquidation by arrangement or to the acceptance of the composition. Such resolution thereupon became binding upon all the creditors, without any act of approval by the court, any judicial examination of the debtor, or any official supervision over the trustee's accounts. The debtor was not permitted to present a bankruptcy petition against himself, and consequently his only method of procedure was that which thus removed the matter from the supervision and control of the court, and as about nine-tenths of all the proceedings under the act of 1869 were initiated by debtors, it followed that only about one-tenth was submitted to proper investigation. It is true that the creditors might refuse to assent to the debtor's proposal, and that any creditor for £50 or upwards could present a petition in bankruptcy, but even where this course was adopted, the proceedings under the petition were, as a rule, stayed by the court if the debtor secured a stay of proceedings for liquidation or composition, and the creditor was left to pay the expenses of his petition for a requisite majority voted for the debtor's proposal. So far, therefore, as the act was concerned, every inducement was held out to the adoption of a course which took the examination of the debtor, the conditions of his discharge and the audit of the trustee's accounts, out of the control of the court.

The establishment of a bankruptcy court, with its searching powers of investigation and its power of enforcing penalties on misconduct, can only be defended on the ground that the administration of justice is a matter affecting the interests of the community at large. But apart from this, in the injury done to these interests by reducing the administration of justice to a question of barter and arrangement between the individuals immediately concerned, one of the chief reasons why the acts of 1849, 1861 and 1869 proved failures, lies in the obvious fact that the creditors of a particular estate are not, as appears to have been assumed, a homogeneous or organized body capable of acting together in the administration of a bankrupt estate. In the case of a few special and highly organized trades it may be otherwise, but in the great majority of cases the creditors have but little knowledge of each other or means of organized action, while they have neither the time nor the inclination to investigate the complicated questions which frequently arise, and which are therefore left in the hands of professional trustees or legal agents. But the appointment of trustees under these acts, instead of being the spontaneous act of the creditors, was frequently due to tempting on the part of such agents themselves, or to individual creditors whose interests were not always identical with those of the general body. According to G. Y. Robson, the author of a standard work on the subject, the arbitrary powers conferred by the act of 1861 "led to great abuses, and in many cases creditors were forced to accept a settlement which was injurious to themselves, or between the debtor and favoured creditors, and not infrequently by the creation of fictitious debts." These evils
were greatly aggravated by the decisions of the court relating to proofs on bills of exchange, under which it was held that the holder of a current bill could prove on the bankrupt estate of an endorser, although the bill was not yet due, and the acceptor was perfectly solvent and able to meet it at maturity. Thus in large mercantile failures, bankers and other holders of first-class bills could prove and vote on the estates of their customers, for whom the bills had been discounted, and thus control the entire proceedings, although they had no ultimate interest in the estate. But probably the greatest source of the abuses which arose under the act of 1869 was the proxy system established by the act and by the rules which were subsequently introduced. It was in no doubt intended to give absent creditors an opportunity of expressing their opinions upon any question which might arise. But the system was too often used for the purpose of stifling the views of those who took an independent part in the proceedings. The form of proxy prescribed by the rules contained no limitation of the powers of the proxy-holder and no impression of the opinion of the creditor. It simply appointed the person named in it as "my proxy," and these magic words gave the holder power to act in the creditor's name on all questions that might be raised at any time during the bankruptcy. The proxy system involved the continued presence of capital, or proxy power, at the principal meetings of creditors, and it was thus readily given under the influence of plausible representations, such as the holding out of the prospect of a large composition, but which, when once obtained, could be used for any purpose whatsoever except the receipt of a dividend. Thus it frequently happened that the entire proceedings were controlled by professional proxy-holders, in whose hands these documents acquired a marketable value. They were not only used to vote for liquidation by arrangement instead of bankruptcy proceedings, but not infrequently the matter took the form of a bargain between an accountant and a solicitor, under which the former became the trustee and the latter the solicitor in the liquidation, without any provision for control over expenditure or for any audit of the accounts. Even where a committee of inspection was appointed to exercise functions of control and audit, they too were often appointed by the proxy-holders, and not infrequently shared in the benefits. On the other hand, where the amount of debts represented by the proxy-holder was insufficient to carry the appointment of a trustee and committee, the votes could be sold to swell the chances of some other candidate. Hence ensued a system of trafficking in these instruments, the cost of which had in the long run come to exceed the estate. The result was that undesirable persons were too frequently appointed, whose main object was to extract from the estate as much as possible in the shape of costs of administration. The debtor was practically powerless to prevent this result. If he attempted to do so he sometimes became a target for the exercise of revenge. His discharge, which under liquidation by arrangement was entirely a matter for the creditors, might be refused indefinitely; and so largely and harshly was this power exercised under the proxy system, especially where it was supposed that the debtor had friends who could be induced to come to his aid, that a bill of parliament was passed in 1857, authorizing the court to deal with cases where, under the act of 1869, a debtor had not been able to obtain a release from his creditors. On the other hand, the complainant debtor, although he had incurred large obligations in the most reckless manner, often succeeded in stifling investigation and obtaining his release without difficulty as a return for his aid in carrying out the arrangement.

The result of such a system could not be other than a failure. After the act of 1869 had been in operation for ten years, the commissioner in bankruptcy reported that out of 13,000 annual failures in England and Wales, there were only 1000 cases (or about 8%) "to which the more important provisions of the act for preventing abuses by insolvent debtors and professional agents applied; the other 12,000 cases (or 92%) escaping the provisions which refer to the examination and discharge of bankrupts, and to the accounts, charges and conduct of the agents employed." It is not to be supposed that all the cases in the latter class were marked by the abuses which have been here described.

In a large number the proceedings were conducted by agents of high character and standing, and with a due regard for the interests of the creditors. But the facilities for fraudulent and collusive arrangements afforded by the act, and the want of effective control over administration, inevitably tended to lower the morale of the latter, and to throw it into the hands of the less scrupulous members of the profession. The demand for reform, therefore, came from all classes of the business community. No fewer than thirteen bills dealing with the subject were introduced into the House of Commons during the ten years succeeding 1869. At length in 1879 a memorial, which was authoritatively described as "one of the most influential memorials ever presented to any government," was forwarded to the House of Commons by a large body of bankers and merchants in the city of London. The matter was then referred to the president of the Board of Trade (Mr Chamberlain), who made exhaustive inquiries, and in 1881 introduced a measure which, with some amendments, finally became law under the title of the Bankruptcy Act 1883.

Hitherto the question had been dealt with as one of legal procedure; it was now treated as an act of commercial legislation, the main object of which, while providing carefully framed regulations for the equitable distribution of a bankrupt's assets, provided also for the enforcement of the principles of commercial morality in the general interests of the trading community. One of the chief features of the act of 1883 is the separation which it has effected between the judicial and the administrative functions which had previously been exercised by the court, and the transfer of the latter to the Board of Trade as a public department of the state directly responsible to parliament. Under the powers conferred by the act a new department was subsequently created under the title of the bankruptcy department of the Board of Trade, with an officer at its head called the inspector-general in bankruptcy. This department exercises, no longer direct, but general supervision over all the administrative work arising under the act. It has extensive powers of control over the appointment of trustees, and conducts an audit of their accounts; and it may, subject to appeal to the court, remove them from office for misconduct, neglect or unfitness. A report upon the proceedings under the act is annually presented to parliament by the Board of Trade, and although the department is practically self-supporting, a nominal vote is each year placed upon the public estimates, thus bringing the administration under direct parliamentary criticism. The act also provides for the appointment and removal by the Board of Trade of a body of officers entitled official receivers, with certain prescribed duties having relation both to the conduct of bankrupts and to administration of their estates, including the interim management of the latter until the creditors can be consulted. These officers act in their respective districts under the general authority and directions of the Board of Trade, being also clothed with the status of officers of the courts to which they are attached. While effecting this supervision and control by a public department directly responsible to parliament, the main objects of the measure were to secure—(1) An independent and public investigation of the debtor's conduct; (2) The punishment of commercial misconduct and fraud in the interests of public morality; (3) The summary and inexpensive administration of small estates where the assets do not exceed £500 by the official receiver, unless a majority in number and three-fourths in value of the creditors voting resolve to appoint a trustee; (4) Full control in other cases by a majority in value, over the appointment of a trustee and a committee of inspection; (5) Strict investigation of proofs of debt, with regulations as to proxies and votes of creditors; (6) An independent audit and general supervision of the proceedings and control of the funds in all cases. Besides amending and consolidating previous bankruptcy legislation, the measure also contains special provisions for the administration under bankruptcy law of the estates of persons dying insolvent (§125); and for enabling county courts to make administration orders for payment by instalments in lieu of immediate committal to prison, in the case of judgment debtors whose total indebtedness does
not exceed £50 (§ 122). It also provides for the getting in and administration by the Board of Trade of unclaimed dividends and undistributed balances on estates wound up under previous bankruptcy acts (§ 162). Lastly, it amends the procedure under the Debtors Act of 1869, dealing with criminal offences committed by bankrupts (which, prior to 1869, had been treated as part of the bankruptcy law), by enacting that when the court orders a prosecution of any person for an offence under that act, it shall be the duty of the director of public prosecutions to institute and carry on the prosecution.

An amending act, under the title of the Bankruptcy Act 1890 was passed in that year, mainly with the view of supplementing and strengthening some of the provisions of the act of 1883, more particularly, with regard to the conditions under which the bankrupt should be discharged or scheme of arrangement or composition be approved by the court. It also dealt with a variety of matters of detail which experience had shown to require amendment, with the view of more fully carrying out the intentions of the legislature as embodied in the principal act. These two acts are to be construed as one and may be cited collectively as the Bankruptcy Acts 1883 and 1890. They are further supplemented by a large body of general rules made by the lord chancellor with the concurrence of the president of the Board of Trade, which may be added to, revoked or altered from time to time by the same authority. These rules are laid before parliament and have the force of law.

Besides these general acts, various measures dealing with special interests connected with bankruptcy procedure have from time to time been passed since 1883, the chief of which are as follows, viz., the Bankruptcy Appeals (County Courts) Act 1884; the Preferential Payments in Bankruptcy Act 1888, regulating the priority of the claims of workmen and clerks, &c. for wages and salaries; and the Bankruptcy (Discharge and Closure) Act 1887, dealing with unclosed bankruptcies under previous acts.

It would be too exhaustive in this article to attempt to answer the question how far later legislation has solved the difficult problems which prior to 1883 were found so intractable, but it may be mentioned that in 1906 the Board of Trade appointed a committee to inquire into and report upon the effect of the provisions of the laws in force at the time in the United Kingdom in relation to bankruptcy, deeds of arrangement and composition by insolvent debtors with their creditors, and the prevention and punishment of frauds by debtors on their creditors, and any points and matters upon which the existing laws seemed to require amendment. The committee received a vast amount of evidence, and have the force of law, memoranda from chambers of commerce, trade protection societies and influential public bodies. The scope of the inquiry was not limited to English law and procedure, but also embraced that of Germany, France, Australia, Scotland and Ireland. The report of the committee was issued in 1908 (Cd. 4668), and reference may be made to it for much valuable information. The committee reported that the result of their inquiry did not disclose any dissatisfaction on the part of the commercial community with the main features of the existing law and procedure. But there were certain special incidents of the law and branches of its administration upon which the committee made recommendations. One was the prosecution and punishment of debtors who had committed fraud on their creditors or caused loss to them by improper and reckless trading. The existing procedure was complained of as being dilatory, cumbersome and expensive, and the committee were of an opinion that where a debtor had committed an offence for which he could and ought to be prosecuted, prosecution and conviction, with adequate punishment, ought to follow speedily and decisively, and the chief recommendation of the committee was that, while the existing procedure should be left untouched, offences ought also to be punishable on summary conviction before magistrates and justices, and the provisions of the Summary Jurisdiction Acts applied to them, and that where an order for a prosecution is made on an application by the official receiver of a bankruptcy court and based on his report, that court should have power to order the official receiver to conduct the prosecution before the court of summary jurisdiction. The committee also reported that numerous delinquencies by insolvent debtors in the conduct of their affairs, or which had contributed to the losses sustained by their creditors, were not punishable or even cognizable by courts having bankruptcy jurisdiction unless or until a debtor who had a receiving order against him, or became a bankrupt, applied for an order sanctioning a composition or scheme of arrangement with his creditors, or for an order discharging him from his debts. The most prominent of these delinquencies which were brought to the notice of the committee were—failure by a debtor to keep any books or any proper or adequate books of account in his business; trading with knowledge of insolvency; gambling and speculation leading to, or contributing to, the debtor's insolvency or bankruptcy; failure properly to account for any substantial deficiency of assets. The committee received a large body of evidence in favour of making delinquencies such as have been described punishable by imprisonment. Evidence was also given as to the laws in force in Germany, France and Scotland, from which it appeared that such delinquencies, especially that of keeping no books of account, can be severely dealt with as criminal offences.

After carefully weighing the evidence on both sides the committee recommended that the failure or omission by a debtor who becomes bankrupt to keep any books of account, within two years next preceding his bankruptcy, in a trade or business carried on by him, if without excuse, should be made by law an offence punishable on summary conviction by imprisonment, subject to four important limitations, namely, that the law should define what books of account a person carrying on a trade or business must keep, following in this respect the law in force in France and Germany; that failure or omission by a debtor to have kept the required books should only be punishable in the event of a debtor becoming bankrupt and of the omission having been in the bankruptcy exceeding £50 in amount; that no prosecution of a debtor for failure to keep books of account should take place before the lapse of two years from the passing of the law; that a debtor should not be punished if he could show that his failure or omission to keep proper books was honest and excusable and did not contribute to his insolvency, and that no prosecution should be instituted for the offence except by order of the bankruptcy court. The committee made recommendations of much the same character with regard to punishing some of the other delinquencies mentioned above. There were also recommendations by the committee for the compulsory registration of bankrupts, as to the realization of estate on bankruptcy, as to the operation of the law of relation back of a bankruptcy trustee's title, as to the law relating to the after-acquired property of an undischarged bankrupt, and dealings with such property, and with respect to married women and their liabilities under bankruptcy law. The committee also reported on the law and practice relating to voluntary deeds of arrangement between a debtor and his creditors and on the compulsory regulation of assignments of book debts, and of agreements for the hire and purchase of chattels.

In addition to this report the annual reports of the Board of Trade, which are accompanied by elaborate tables of statistics, and by copious illustrations both of the working of the system and of the characteristic features and causes of current insolvency, are published as parliamentary papers, and may be usefully consulted by those interested in the subject. It appears from these reports that the total number of insolvencies dealt with under the bankruptcy acts during the ten years ending 31st December 1905, was 43,141, involving estimated liabilities amounting to £61,685,678, and estimated assets amounting to £26,601,417. It may also be pointed out that according to the official figures, the cost of bankruptcy administration under the present system has very considerably decreased as compared with that under the act of 1869. Estates are also closed at much shorter intervals, and, what is more important from a public point of view, it appears
that while the estimated liabilities of bankrupt estates during the ten years ending 1883 amounted on an average to £22,380,000 per annum, the estimated liabilities during the ten years ending 1905 only averaged £6,168,567 per annum. But during the latter period there was an annual average of 2426 private arrangements involving a further estimated annual liability of £4,166,354 entered into outside of the Bankruptcy Acts by insolvent debtors.

There are no means of ascertaining the corresponding amount of liabilities on private arrangements outside of the Bankruptcy Acts prior to 1883, and therefore a complete comparison is impossible; but it is evident that on any method of computation there has been a very great diminution in the trading insolvency of England and Wales, while it is also clear as a matter of general knowledge in commercial circles, that a great decrease in the proportion of fraudulent trade and reckless speculation has been a marked feature of private trading during the period in question.

The cost of bankruptcy administration is provided for: (1) by fees charged to bankrupt estates, (2) by interest on balances at the credit of such estates with the bankruptcy estates account, and (3) by interest on unclaimed funds at the credit of estates under former Bankruptcy Acts.

Of this arc paid the salaries of all the officers of the department, including the official receivers; the remuneration due in respect of bankruptcy services to the county court registrars; pensions &c., payable to retired officers of the present and previous Bankruptcy Acts; cost of bankruptcy prosecutions; and rents, stationery, travelling and other incidental expenses. The system is self-supporting and involves no charge upon the tax-payers of the country. It has been objected that inasmuch as the act professes to be based on the principle of enforcing commercial morality in the interests of the general community, the cost of administering it should not be charged entirely to the bankruptcy estates concerned. But when it is considered that a large part of the revenue of the department is derived from fees which are paid either under the present Acts or fees obtained under the Bankruptcy Acts 1887, it may be said that the objections do not appear to be well founded.

For the convenience of readers who may require more detailed information, the accompanying summary of some of the more important provisions of the law relating to bankruptcy procedure is submitted. It must be borne in mind, however, that the subject is in some of its branches extremely intricate, and that both the law and the procedure are being constantly affected by a considerable body of judicial interpretation, while the acts also contain detailed provisions with regard to many questions incident to the administration of bankruptcy. A reference to the present and previous Acts, and to competent professional advice will always be advisable for those who have the misfortune to be practically interested either as debtors or as creditors in bankruptcy proceedings.

The Deeds of Arrangement Act 1887, although not falling strictly within the scope of the bankruptcy law, may also, in consequence of its important bearing upon the question of insolvency in England and Wales, be here noticed. It has been pointed out that, under the Bankruptcy Acts of 1849 and 1861, non-official arrangements by deed were invalid, except in the generality of his creditors were not only officially recognized, but were in certain circumstances made binding on all the creditors, including those who refused to assent to them. Under the act of 1869, although such deeds were no longer recognized or made binding on non-assenting creditors, the proceedings under the "liquidation by arrangement" and "composition" clauses were practically private arrangements by resolution instead of deed, and were proved by experience to be open to the same abuses. It has also been shown that under the act of 1883 no arrangements either by deed or by resolution have any force against dissenting creditors, unless confirmed after full investigation and approval of the bankruptcy courts. Private arrangements, therefore, cease to form any part of the bankruptcy system. But they are, nevertheless, binding as voluntary contracts between the debtor and such creditors as assent to them. Being, however, in the nature of assignments of the debtor’s property, they are either deemed fraudulent if the benefit of the assignment is limited to a portion of the creditors, or, if it is extended to all they become acts of bankruptcy, and, like any other voluntary assignment, are liable to be invalidated if made within three months prior to the petition on which a receiving order is made against the debtor. Treated as voluntary assignments, which are not binding on those who do not assent to them, such arrangements, where honestly entered into and carried out by capable administration, in many cases form a useful and expeditious method of liquidating a debtor’s affairs, and where the debtor’s insolvency has been brought about without any gross misconduct they will probably always be largely resorted to. The danger attending them is that even in cases where the debtor has been guilty of misconduct, or private arrangement may be used to screen his conduct from investigation, while in many cases it may be made the medium for the concealment of fraudulent preferences. The absence of any independent audit of the trustees’ accounts may also encourage or conceal irregularities in administration. Previous to 1887, however, much inconvenience arose from the fact that the execution of these private arrangements was frequently kept secret, and fresh credit was obtained by the debtor without any opportunity being afforded for the new creditors becoming acquainted with the fact that they were dealing with an insolvent person, and that in many cases they were liable on the debtor’s estate.

The Deeds of Arrangement Act 1887 was therefore passed to compel the disclosure of such arrangements, by declaring them void unless registered within seven days after the first execution by the debtor or by any creditor. Registration is effected by lodging with the registrar of bills of sale at the central office of the Supreme Court a true copy of the deed and of every inventory and schedule attached thereto, together with an affidavit by the debtor stating the total estimated amount of property and liabilities, and a statement of the composition, if any, and the names and addresses of the creditors. Where the debtor’s residence or place of business is outside the London bankruptcy district, the registrar is required to forward a copy of the deed to the registrar of the county court of the district where the debtor’s residence or place of business is situated. Both the central and the local registers are open to public inspection on payment of a small fee and general publicity is secured by the action of various trade agencies, which make a practice of extracting and publishing the information for the benefit of those interested. By section 25 of the Bankruptcy Act 1889, every trustee appointed under the Act to receive an arrangement is required to transmit to the Board of Trade within thirty days of the 1st of January in each year an account of his receipts and payments and such accounts are open to the inspection of any creditor on payment of a small fee. They are not, however, subject to any kind of audit or control by the department. The registrar is also required to make periodical returns of the deeds thus registered to the Board of Trade, in order that a report of proceedings under the Deeds of Arrangement Act may be included in the annual report which the department is required to make on proceedings under the Bankruptcy Acts. Some statistics of such proceedings are available in these reports, from which it appears that during the ten years ended 31st December 1905 the total number of registered deeds of arrangement was 34,273, with estimated liabilities amounting to £41,663,541, and estimated assets to £23,920,483.

**Summary of Bankruptcy Procedure.** Subject to certain special provisions in the case of what are termed “small bankruptcies” (see below), the following summary sets forth some of the more important provisions of the various acts and rules relating to bankruptcy administration grouped under convenient heads to facilitate reference. In some cases the effect of legal decisions has been embodied in the summary.

**Preliminary Proceedings.**

**Petition and Receiving Order.**—Any court exercising bankruptcy jurisdiction in the district in which he resides or carries on business
in England or Wales may make a receiving order against a debtor, whether a trader or not, either on his own petition or on that of a creditor or creditors whose claims aggregate not less than £50. In the case of a creditor's petition proof must be given of the debt, and of the act of bankruptcy within six months of the date of the petition, which is the date of a creditor's petition. Acts of bankruptcy must be proved to the satisfaction of the receiver of the debtor's property, although the legal title still remains in the debtor. Where there is an estate or business to be managed by the official receiver may appoint a special manager, who receives such remuneration as the creditors, or failing them, the Board of Trade, may determine. As a consequence of the order the following obligations are imposed upon the debtor:—He must make out and submit to the official receiver within a prescribed period a statement of his affairs, containing the names and addresses of his creditors, the amount of their claims and the securities held by them, and the nature and value of his assets; and accounting for his deficiency. Any wilful misrepresentation of fact or loss of his property is a misdemeanour under the Debtors Act, unless he can prove that he had no intention to defraud. The statement is open to the inspection of creditors. He must also in every case submit to a public examination in court, in which the official receiver, his agents, or any creditor who has proved his debt may take part. His evidence may be used against him. He may further be specially examined by the court at any time with reference to his dealings or property. He must attend the first meeting of creditors, wait upon the official receiver, trustee and special manager, and give all necessary information, and generally do all acts which may reasonably be required of him, in order to the proper administration of his estate. A person who has any reason to believe that he is about to abscond, destroy papers or remove goods, or if he fails without good cause to attend any examination ordered by the court, the court may order that the bankrupt shall be re-addressed by the post-office to the official receiver or trustee. With regard to persons other than the debtor, any person capable of giving information respecting the debtor, his dealings or property, may be examined by the court, and a summary order the debtor to give evidence against any person for delivery of any property belonging to the debtor.

First Meeting of Creditors.

This meeting is summoned by the official receiver, notice being given in the London Gazette and in a local paper, and sent by post to the creditors. A summary order of the court is required to accompany the notice, with any observations by the official receiver which he may think fit to make. The object of the meeting is to decide whether any proposal for a composition or for a scheme of arrangements under the bankruptcy act is to be made. Whether an application should be made to the court to adjudicate the bankrupt. In the latter case the meeting may by an ordinary resolution in the presence of the creditors refuse the proposal (without prejudice to the point of time). It may also give any directions as to the administration of the estate. The meeting should be held at the place most convenient for the majority of the creditors. It is presided over by the official receiver or his deputy, who, subject to appeal to the court, admits or rejects proofs for the purpose of voting. For the transaction of business three creditors qualified to vote, or all the creditors if fewer than three, must be present or represented. Only persons who are creditors of the bankrupt, or his agents, or those of any of their creditors, can vote. No detailed regulations respecting proofs and the valuation of securities are laid down in the first and second schedules to the act of 1893. One of the chief alterations in the law on this point is the condition imposed on creditors on bills of exchange to deduct from their claims the value of the liability of prior obligors before voting, thus cancelling the power of controlling the proceedings previously possessed by such obligors, who had no real interest in the estate. Votes may be given in person or by proxy, and stringent regulations are laid down with the view of preventing the abuse of proxies. General proxies, entitling the holder to exercise all the powers which the creditor ordinarily would or might be entitled to exercise in his place, will be rejected by the court. Only official forms can be used, and the blanks must be filled up in the handwriting of the creditor or some person in his regular employment, including the authorized agent of a creditor resident abroad. A meeting must be held at the official receiver's office not later than four o'clock on the day before the meeting or adjourned meeting at which it is to be held. Resolutions are ordinary, special or extraordinary. An ordinary resolution is carried by a majority in value of the creditors voting; a special resolution by a majority in number and three-fourths in value of such creditors. The only instance of a composition or scheme which requires a majority in number and three-fourths in value of all the creditors who have proved. The majority of questions arising at a meeting are decided by an ordinary resolution.

Adjudication.

If the creditors so resolve, or if a composition or scheme of arrangement is formally proposed by or on behalf of a creditor or creditors, an order in bankruptcy is made, and if consent is not obtained or if the court is not satisfied that the proposal is feasible, an order in bankruptcy is made. Any object or effectual cause, or if any reasonable excuse the debtor fails to furnish a proper statement of his affairs, or if his public examination is adjourned sine die, the court may order an official receiver to be appointed and the duties of the receiver and of the official receiver, if any, are imposed. In a trustee, and subject to the payment of the costs and fees of administration, is divisible among his creditors until all his debts are paid and the formal winding up completed. The rates of interest or interest allowed to creditors of any description in any order in bankruptcy is fixed by the court; and the court may order the appointment of a receiver and the carrying on of the business of a debtor under the provisions of the Debtors Act if it appears to the court that the property of the debtor is in the hands of the debtor or of any person on his behalf, or is in the hands of any person who is known to be unable to comply with the order. The release of the bankrupt does not operate as a release of any of the obligations imposed by the order.

Disqualification.

A bankrupt cannot during his bankruptcy or until five years after his discharge, unless the bankruptcy is annulled or he obtains a discharge with a certificate by the court that the bankruptcy was a mistake, or within a year of his discharge, act as a member of the legislature, or as a justice of the peace, mayor, alderman, councillor, guardian or overseer of the poor, member of a sanitary authority, school, highway or burial board, or select vestry in any part of the United Kingdom.

Annulment.—An order of adjudication may be annulled if the court is of opinion that it should not have been made, or that the bankrupt's debts are paid in full, or if a composition or scheme of arrangement is approved by the court after adjudication.

Discharge.—The court may at any time after the conclusion of the bankruptcy's public examination, and after hearing the official receiver and the creditors who have not been satisfied, or if any of the creditors present at the meeting fail to agree, or if the court is of opinion that the release of the bankrupt is proper on any of the grounds provided for in the bankruptcy act, give an order for the discharge of the bankrupt. The notice of the application must be given, grant the bankrupt a discharge either absolutely or under conditions, but subject to the following qualifications, viz.—(1) If the bankrupt has committed a fraud on his creditors, the court is not to make an order for his discharge unless the court is of opinion that the fraud must be refused unless for special reasons the court determines otherwise. (2) If the assets are not equal in value to ten shillings in debt, the court may discharge the bankrupt without accounting for any of these shillings. It is shown that he is not responsible; or if proper books have not been kept; or if the bankrupt has traded after knowledge of insolvency; or has contracted debts without reasonable probability of payment; or failed to account for his deficiencies; or contributed to the bankruptcy by rash speculation, gambling, culpable neglect or unjustifiable expenses; or has taken or defended legal proceedings on frivolous grounds; or has within three months preceding the bankruptcy committed a breach of trust; or has absconded or fraudulently absconded; or has been guilty of fraudulent or fraudulent breach of trust; then the court shall, on proof of any of these facts, either (a) refuse the discharge, or (b) suspend it for a period of not less than two years, or until a dividend of not less than ten shillings in the pound has been paid; or (c) suspend it for a period of seven years after the date of the order by the condition that judgment is entered up against the bankrupt for payment of any unpaid balance of his debts, or of part of such balance out of his future earnings or property. The bankruptcy is suspended, but the bankrupt must keep the court supplied with any information it may reasonably require, and must observe such conditions as the court may impose upon him. An order of discharge releases the debtor from all his obligations except debts due to the crown, and other public bodies, and any other person to whom property is subject by virtue of the consent of the Treaty of Paris. Debts incurred by fraud, and judgment debts in an action for seduction or as a co-respondent in a matrimonial suit or under an affiliation order, which are only released to the extent specified against the amount of which the order may operate. The release of the bankrupt does not operate as a release of any of the obligations imposed by the order.
of any partner or co-obligant with him. Neither does it release the bankrupt from liability to criminal prosecution.

**Composition or Scheme of Arrangement.**

After a receiving order has been made the debtor may submit a proposal for the payment of a composition, or for the liquidation of his affairs under a scheme of arrangement. The proposal must be lodged with the official receiver in sufficient time to allow notice, together with a report by that officer, to be sent to the creditors before the meeting is held at which it is to be considered. If at the meeting a majority of not less than three-quarters in number and three-fourths in value of all the creditors who have proved their debts, and if it is thereafter approved by the court, it becomes binding on the bankrupt, who would, if approved by an adjudication, have been adjudicated bankrupt. A similar proposal may be made after adjudication, and if entertained by the creditors and approved by the court, the adjudication may be annulled and the debtor will be discharged under the scheme, but his future acquired property will not pass to the creditors unless there is an express stipulation to that effect. If default is made in the performance of the terms of the proposal, the court may at any time adjudicate the debtor bankrupt, in which case the scheme will fall to the ground, except in respect of past transactions under it. The approval of a composition or scheme does not release the debtor from his liabilities under the criminal law, nor from the necessity of undergoing a public examination which must, in fact, be held and concluded before the approval of the court is applied for. Also before such a proposal or scheme is filed for the court's consideration, the terms of the composition or scheme cannot be approved unless it provides reasonable security for the payment of the whole of all the unsecured debts. Where a trustee is appointed to carry out the composition or scheme provisions of the act with reference to the remuneration of the trustee, the custody of funds, the audit of his accounts and the control of the board of creditors, and where the bankrupt is not paid in full, he shall be entitled to an order for payment of a lump sum at the end of a year. The provisions relating to the administration of property, proof of debts, dividends, etc., will also apply, so far as the nature of the case and the terms of the arrangement permit.

**Property divisible among the Creditors.**

No part of the law of bankruptcy is more intricate, or has been the subject of more litigation than this, and any detailed view of the effect of legal decisions can only be gathered by a perusal of the cases; but the following general principles may be stated. The term "property" includes not only property of which the bankrupt is the true owner, but property in his possession, order or disposition in his trade or business with the consent of the true owner, in such circumstances as to render such property incapable of being sold or conveyed to another for valuable consideration. The doctrine of replevin in rem has been essentially restricted in recent years by the growth of alleged trade customs, in accordance with which property is frequently lent under a contract of "hire and sale." The property is divided into the three main classes set forth in the First Schedule to the act, as they would under an adjudication. Further, the provisions relating to the administration of property, proof of debts, dividends, etc., will also apply, so far as the nature of the case and the terms of the arrangement permit.

After payment of costs of administration and preferential debts, it is the duty of the trustee to distribute the estate with all convenient speed, the first dividend within four months after the first meeting of creditors, and subsequent dividends at intervals of not more than six months, but the declaration may be postponed for sufficient reason by the committee of inspection. Notice of the intention to declare a dividend is gazetted and sent to each creditor mentioned in the bankrupt's statement of affairs with respect to which proof has been provided for by giving the bankrupt the necessary information, and the dividend is not payable to the bankrupt. Executions by a creditor not completed at the date of the receiving order are also void, and the proceeds of an execution in the hands of the sheriff must, with certain exceptions and subject to deduction of costs of execution, be handed over to the trustee. But all property held by the bankrupt on trust, and tools of trade, wearing apparel and bedding to a total value not exceeding £20, are excluded from the property divisible among the creditors. With respect to property which does not come within the definition of "property," the bankrupt is entitled to the proceeds of accumulations of business or other profits after the commencement of the bankruptcy, and before he obtains his discharge, the trustee's title also prevails; but bona fide transactions by the debtor for value, whether for the benefit of his creditors or not, are not invalidated. Where the bankrupt is a beneficiary of a trust, the court may order any part thereof to be paid to the trustee, but where he is an officer of the army, navy or civil service, such order is only to be made with the consent of the department concerned.

**Claims of Creditors and Dividends.**

In the distribution of the debtor's property certain claims are entitled to priority over others. Thus the landlord, although not entitled to a preference out of the funds in the hands of the trustee, can distrain for unpaid rent on the goods and effects of the debtor remaining on the landlord's premises, but where the distress is levied after the commencement of the bankruptcy this right is limited by the act of 1850 to six months' rent due before adjudication, the remainder of his claim ranking for dividend with the claims of other creditors. Various gas and water companies have also statutory powers of distraint under special acts, but the policy of the bankruptcy act is to discourage such distress, and give the bankrupt the benefit of his property, so far as he can be discharged from his debts. Other preferential claims are regulated by the Bankruptcy Acts and by the Preferential Payments in Bankruptcy Act of 1888, and include taxes, parochial and other local rates for not more than six months, sums due to employers under the Workmen's Compensation Act, any loan made in the name of the bankrupt, and any loanees the bankrupt has derived from the same source. The bankrupt's property is the basis of the interpretation of the terms "property," "divisible," and "creditor," and the definition of "property" is further limited in the case of ordinary labourers and workmen to two months' wages not exceeding £25, and agricultural labourers' wages in the case of work done in the current year, and to an equivalent assessment of any expenditure which the bankrupt has incurred in the course of his business, to a maximum of £25. The general principle that a bankruptcy act is a special act, (except in cases of £5 or under) must be deducted from traders' proofs, and the following claims are postponed until the general creditors are paid in full, viz. claims by a married woman for loans to the husband for the purposes of his business, claims for loans advanced to any person in business at a rate of interest varying with the profits, and claims for interest in excess of 5% per annum. Subject to these exceptions all debts proved in the bankruptcy must be paid out of the first dividend which, after deducting the costs of the bankruptcy, is payable to the bankrupt, on the date of the receiving order, is payable to the bankrupt, on the date of the receiving order. The receipt of any dividend, whether dividend or contingent, arising out of obligations incurred before the date of the receiving order are provable in the bankruptcy, an estimate of the liability in the case of contingent debts being made by the trustee. The act is not applicable to certain debts of the bankrupt, viz. damages arising from personal injury, or liquidated damages arising otherwise than by reason of a contract, promise or breach of trust are not provable. A secured creditor if he proves must either surrender his security, or value the security and prove for the balance; and the trustee can thereupon, subject to the creditor's power in certain circumstances to amend the valuation, take over the security by paying the amount of the valuation or may require it to be realized. He may be required by the creditor to elect which of these courses he will adopt, failing which the equity of redemption will vest in the creditor. For further regulations as to proofs, the time within which they must be lodged with the bankruptcy court, and the manner in which the proofs are to be calculated, reference should be made to the first and second schedules of the act of 1883 and the rules relating thereto.

**Dividends.**—After payment of costs of administration and preferential debts, it is the duty of the trustee to distribute the estate with all convenient speed, the first dividend within four months after the first meeting of creditors, and subsequent dividends at intervals of not more than six months, but the declaration may be postponed for sufficient reason by the committee of inspection. Notice of the intention to declare a dividend is gazetted and sent to each creditor mentioned in the bankrupt's statement of affairs with respect to which proof has been provided for by giving the bankrupt the necessary information, and the dividend is not payable to the bankrupt. Executions by a creditor not completed at the date of the receiving order are also void, and the proceeds of an execution in the hands of the sheriff must, with certain exceptions and subject to deduction of costs of execution, be handed over to the trustee. But all property
yet determined. Creditors who fail to prove before the declaration of a dividend are entitled to no dividends, and the court may, after the distribution of any dividend already declared, but not disturb the distribution of any dividend already declared. Before distributing a final dividend notice is sent to every creditor whose claim has been allowed; by the time set but no further time, with an intimation that unless so established within a specified period he will be excluded from participation in the estate. In the case of a bankrupt firm the joint creditors are not entitled to receive a dividend. As the bankruptcy property of the bankrupts until all the separate creditors are paid in full.

Trustee's Administration.—While the intermin preservation and management of the estate is conducted by or under the direct supervision of officers appointed by and under the immediate control of the Board of Trade. The ultimate division and distribution of the assets devolve upon the trustee appointed by the creditors. But besides acting as receiver prior to the first meeting of creditors, the official receiver also becomes trustee: by operation of law on the making of an order of adjudication. The court vacates the office when a trustee is appointed by the creditors, and certifies that the Board of Trade, but again becomes trustee on the creditors' trustee being released, dying, resigning, or being removed from office. As the bankrupt's property vests in the trustee for the time being, and passes from trustee to trustee by operation of law, and without any formal act of conveyance, the continuity of the office is thus secured.

Appointment of Trustee.—A trustee may be appointed by a majority in value of the creditors voting, at the first or any subsequent meeting, or the appointment may be left to the committee of creditors who may either accept or reject the appointment by the Board of Trade, who may object on the ground that the creditors have not acted in good faith in the interests of the general body, or that the person appointed is disqualified on any ground, or, occupying as a professional man, is not entitled to any creditor, or to the estate, as makes it difficult for him to act with impartiality, or that in any previous case he has been removed from office for misconduct or for failure without good cause to render accounts for audit. An appeal from such objection to the High Court lies at the instance of a majority in value of the creditors, but in the absence of an appeal it is fatal to the appointment. Before being confirmed, the trustees may be required to furnish security to the satisfaction of the Board of Trade, and such security must be kept up to the amount originally fixed, or to such lesser amount as that department may require throughout the term of office during which the trustee is considered as removed from office. Where the creditors fail to appoint a trustee, the Board of Trade may do so, but such appointment may at any time be superseded by the creditors.

Removal.—The trustee may be removed by the creditors at a meeting summoned for the purpose without reason assigned, or by the Board of Trade for misconduct, or for incapacity or failure to perform his duties, or on either of the other personal grounds of objection, and the appointment is open. But the removal is in like manner subject to appeal at the instance of creditors. If a receiving order is made against a trustee he thereby vacates office. He may also be removed by the committee of creditors by a meeting of not less than two-thirds of the creditors present, on the resumption of whose proceedings his resignation does not operate as a release from his liability to account for his administration.

Powers and Duties.—The trustee is required to take immediate possession of the bankrupt's property, accounts, and has the powers of a receiver in the High Court for the purpose of enforcing delivery. After payment of the costs of administration it is his duty to distribute the estate in dividends as speedily as possible. He may also, and with the sanction of the committee, or, where there is none, with that of the Board of Trade, carry on the business so far as is necessary to a beneficial winding-up, institute or defend legal proceedings, employ a solicitor to do any business previously sanctioned by the same authority, compromise debts and claims, raise money on mortgage, sell property on credit, or divide the estate practicable among the creditors in any way, within the limits of bankruptcy, to any directions which may be given by the creditors in general meeting, or failing them by the committee, sell the property or any part of it for cash, including business goodwill and book debts, and either to sell or retain for private profit or interest, and generally engage in all the powers which the bankrupt might before adjudication have exercised in relation to the property, or which are by the Bankruptcy Act confided to the trustee.

Where any part of the property is held subject to onerous obligations, such as the payment of rent, &c., the trustee may discharge the same, subject in certain cases to the leave of the court, and the discretion thereon to determine all questions of title to or liability for the property on the part of the estate. The trustee is required to keep a record book (which is commenced by the official receiver), containing minutes of the proceedings in the bankruptcy, and a cash book. He is to issue receipts in which the amounts and particulars of the payments by him must be entered. All monies received must forthwith be paid into an account at the Bank of England, entitled the "Bankruptcy Estates Account," which is under the control of the Board of Trade, unless where in special circumstances the sanction of that department is obtained to the opening of a local banking account, but in no case may the same be employed for the trustee's private account. When monies are required for the purpose of the estate, special cheques or money orders are issued by the Board of Trade on the application of the trustee.

Bankruptcy

Transfer of Estate.—This administration of the estate is subject to control by the committee of inspection, the creditors, the court and the Board of Trade. The committee is appointed by the creditors. The amount cannot be less than the creditors or authorized representatives of creditors. It acts by a majority present at a meeting, and should be convened once a month unless it otherwise directs. If no committee is appointed, the Board of Trade may give any direction or permission which might have been given by a committee. Directions given by the committee, if not inconsistent with the provisions of the act, are binding on the trustee, unless contrary to or overridden by the court, the creditors, or a trustee. The court may summon a meeting of the creditors at any time to ascertain their wishes, and must do so when required by one-sixth of the creditors, or the trustee. Any order of the Board of Trade may also direct the official receiver to summon a meeting for the purpose of reviewing any act done by the trustee or any resolution of the committee of inspection. Further, the trustee may apply to the court for directions in any particular matter, and the court may also, on the application of any person aggrieved reverse or modify any act of the trustee, or make such order as it deems just. The directions of the court override those of the committee of inspection. If an order of the Board of Trade is required for the conduct of trustees, to inquire into any complaints by creditors, and in the event of any trustee not faithfully performing his duties, to take such steps as are necessary. The court may also direct a local investigation of the trustee's books and accounts, and may require him to answer any inquiries, or may apply to the court to examine him on oath. If any loss has arisen to the estate and it is proved that any neglect or default has caused the same, the court may require him to make it good. The orders of the Board of Trade under the powers conferred by the act may be enforced by the court committal of the trustee or otherwise.

Audit of Accounts.—The trustee's accounts must be audited by the committee of inspection not less than once in every three months; and once in every six months, as well as at the close of the administration, and the auditor's reports must also be submitted with the vouchers, and the committee's certificate of audit to the Board of Trade for final audit. If it appears that the trustee has retained more than £10 in hand for more than ten days without a satisfactory explanation, he may be removed from office, and the court may order the trustee to return at the rate of 20% per annum and lose all claim to remuneration.

Remuneration.—The trustee's remuneration is fixed by the creditors or by the committee if so authorized, and may be in the nature of a percentage on the amount of the realization and on the dividends. If one-fourth of the creditors in number or value dissent from the resolution, or if the bankrupt satisfies the Board of Trade that the remuneration is excessive, the Board may review the same and fix the remuneration. A trustee may not receive any remuneration for services rendered in any other capacity, e.g., as solicitor, auctioneer, &c., beyond that voted to him as trustee; nor may he receive or accept any legacy, gift, present, or reward, other than that voted to him as trustee; nor may he accept employment of the bankrupt; or receive from any person any gift, or other pecuniary or personal benefit in connexion therewith.

Court of Trade.—The trustee's remuneration is paid to the trustees, if any, and to the solicitors and other agents employed by the court of trade, and to any person in respect of duties which ought to be performed by himself. All bills of solicitors and other agents employed must be taxed before payment, as being in accordance with the prescribed scales of costs; and the taxing master must satisfy himself that the employment has been properly authorized before the work was done. All bills of costs must be delivered to the trustee within seven days of the request for the same, otherwise the estate may be distributed without regard to such costs.

Release.—When the property, so far as it is capable of realization, has been realized and distributed, the trustee must apply to the court for a final order of release, which is the end of his having done so, together with a copy of his final accounts, and the Board of Trade, after preparing and considering a report on the same, and the objections of any person interested, may, subject to the High Court, grant or withhold the release. If the release is withheld, the court may, on the application of any person interested, make such order against the trustee as it thinks just. The release when granted operates as a removal from office, and the official receiver is again brought into a position, even after the nominal close of the bankruptcy, to deal with any circumstances which may arise, or which have not been foreseen and provided for.

Small Bankruptcies.—When the official receiver reports, or the court is otherwise satisfied that the debtor's property is not likely to realize more than £100, the court may make an order for the summary administration of the estate, in which case, if the debtor is adjudged bankrupt, the official receiver shall only hold the official receiver's fee and the court fee, and the court may make a substitute order for the appointment of a third party to act in the capacity of provisional administrator, and certain other modifications are effected with the view of simplifying
and accelerating the procedure. The chief of these modifications are as follows, viz. the Board of Trade acts as committee of inspection, henceforward no formal examination in bankruptcy is required in legal proceedings all questions of law and fact are determined by the court without a jury; adjudication may be made on a report by the official receiver; and the court has full discretion in the first instance as to whether creditors will have a meeting or offer guarantees in composition or scheme is proposed; meetings of creditors may be held in the town where the court sits or the official receiver's office is situated; notice to creditors of meetings other than the first meeting for or of application by a debtor for his discharge, are dispensed with in the case of creditors for amounts not exceeding £2. Costs, other than a solicitor's charges, may be paid without taxation; and the time for declaring the first dividend is extended to six months, but the whole estate must be realized and distributed within this period if practicable. No modification, however, is permitted in the procedure relating to the public examination and discharge of the bankrupt. Notwithstanding that an order has been made for summary administration, the creditors may at any time by a resolution passed by a majority in number and three-fourths in value of those voting at the meeting, appoint a trustee in place of the official receiver, in which case the summary order ceases to be operative.

**Scottish Bankruptcy Legislation.**

In Scotland, as in England, the law of bankruptcy arose as a remedy against the frauds of insolvent debtors. It was declared by an act of the Scottish parliament (1621, c. 18) that no debtor after insolvency should fraudulently diminish the fund belonging to his creditors, and if a deed of assignment was gratuitously executed after the contracting of debt in favour of a near relation or a confidential friend, fraudulent dealing was to be presumed. The act 1666, c. 5, settled the definition of a notour or notorious bankrupt in Scottish bankruptcy law. It is not a bankruptcy by a debtor fraudulently disposed of his estate, but by the judgment of the judges of the court of session. The statute defines "a notour bankrupt" to be any debtor who, being under diligence by horning or caption, at the instance of his creditors, shall be either imprisoned, or retire to the abbey or any other privileged place, or flee or abscond for his personal security, or defend his person by force, and who shall afterwards be found, by sentence of the lords of session, to be insolvent. Bankruptcy as thus defined was, it is said, intended to afford a remedy against fraudulent preference by debtors, and not as the ground-work of a general process of distribution, although by later statutes it became a necessary requisite of every such process. The exceptions recognized in the act of 1666, of persons absent from Scotland and therefore not liable to imprisonment, or of persons exempted therefrom by special privileges, were removed by later legislation. The old English distinction between traders and non-traders, it will be observed, is not recognized in Scottish law. The statute made null and void all voluntary dispositions, assignments and other deeds made after or within sixty days before bankruptcy.

In Scotland the Bankruptcy (Scotland) Act, by which the law of bankruptcy in Scotland is mainly regulated. By this act, notour (i.e. legally declared) bankruptcy was constituted:

1. By sequestration (or adjudication in England and Ireland); and
2. By insolvency concurring either—(a) with a duly executed charge for payment or (b) with sale of effects belonging to the debtor under a poinding or under a sequestration for rent, or making application for the benefit of cesso bonorum.

Notour bankruptcy continues, in cases of sequestration, until the debtor has obtained his discharge and in other cases until insolvency ceases. Sequestration may be awarded of the estate of any person in the following cases:

1. Living debtor subject to jurisdiction of Scottish courts—(a) on his own petition with concurrence of qualified creditors, or (b) on petition of qualified creditors, provided he be a notour bankrupt, and have had a dwelling-house or place of business in Scotland within the previous year.
2. In the case of a deceased debtor, subject at his death to the jurisdiction of the court—(a) on the petition of his mandatory; or (b) on the petition of qualified creditors (§ 13).

Sequestration may be awarded either by the court of session or by the sheriff. A sequestration proceeds, the creditors hold a meeting, and by a majority in value elect a trustee to administer the estate, and three commissioners (being creditors or their mandatories) to assist and control the administration and declare the dividends. The bankrupt (under pain of imprisonment) must give all the information in his power regarding his estate and he must be proceeded against on offences against the sheriff; and "confect and confound persons" may likewise be examined. Bankruptcy may be discharged either by composition or without composition. In the latter case (1) by petition with concurrence of all the creditors, or (2) after six months with concurrence of a majority and four-fifths in value of the creditors, or (3) after eighteen months with concurrence of a bare majority in number and value, or (4) after two years without concurrence. In the last case the judge may refuse the application if he thinks the bankrupt has fraudulently concealed his effects or willfully and deliberately complied with the law. This act was amended by the Bankruptcy and Real Securities Act 1857, which deals with the cost of competition for trustships; the Bankruptcy Amendment (Scotland) Act 1860, which enables the court to recall a sequestration where it is more convenient that the estate should be wound up in England or Ireland; and the Bankruptcy Amendment Act (Scotland) 1875, which makes the wages of clerks, shopmen and servants preferential claims for a period not exceeding four months and an amount not exceeding £50, while the claims of workmen are placed on a similar footing for a period not exceeding two months. Some important changes were made by the Bankruptcy Act 1883. Bankruptcy was formerly affected by the Debtors (Scotland) Act 1882, which abolished imprisonment for debt, but which, like its English prototype (the Debtors Act 1869), contains a series of important provisions for the punishment of fraudulent bankrupts. Under these provisions the laws of the two countries on that subject are practically assimilated, although some minor differences still survive. One of the most important of these differences is, that while the Scottish act makes the failure, within the three years prior to the sequestration, to keep "such books and accounts as, according to the usual course of any trade or business in which he (the debtor) may have been engaged, are necessary to exhibit or explain his transactions" a criminal offence, the English act contains no provision of an analogous character; the non-keeping of such books being treated as a fact to be taken into account in dealing with the debtor's application for his discharge but not coming within the scope of the criminal law. On the other hand, there are a few minor trading irregularities dealt with in the English act which are not specifically included in that of Scotland. Another important distinction is that under the English law, the saving of goods and chattels continues to exist, accordingly as they are brought for trial before the court of butcher or sheriff and jury, in which case the maximum penalty is two years' imprisonment; or before a sheriff without a jury, in which case the penalty is limited to imprisonment for a period not exceeding sixty days. This distinction admits of a useful elasticity in the administration of the law, having regard to the comparative importance of the case, which is hardly possible under the English act.

Another most important modification of the law is effected by the Debtors Act 1882, which, together with the Bankruptcy and Cessio bonorum Act 1881, and the Act of Sedition in Scotland 1882, abolished the whole of the process of cessio and the process itself would probably have become obsolete, but for certain changes effected by the act of 1881, which have given it a different and more extended scope. Among these changes may be noted (1)
the extension to "any creditor of a debtor who is notour bankrupt," without reference to the amount of his debt, of the right hitheerto limited to the debtor himself, to petition the court for a decree of cesso, the prayer of the petition, whether presented by the debtor or by a creditor, being "to appoint a trustee to take the management and disposal of the debtor's estate for behalf of his creditors;" (c) the discretionary power given to the court upon such petition to award sequestration under the bankruptcy act, in any case where the liabilities of the debtor exceed £200; and (d) the right of the debtor to apply for his discharge under similar conditions to those obtaining in the case of sequestration. An important modification of the law relating to discharge which equally affects a debtor under the Bankruptcy and Cessio Acts, is also effected by the provision of the act of 1883, which requires, in addition to the concurrence of creditors, the fulfilment of one of the following conditions, viz., "(c) That a dividend of five shillings in the pound has been paid out of the estate of the debtor, or that security for payment thereof has been found to the satisfaction of the creditors; or (d) that the failure to pay five shillings in the pound has, in the opinion of the sheriff, arisen from circumstances for which the debtor cannot justly be held responsible." Orders of cesso are only made in the sheriff's court, whereas an order of bankruptcy may be made by a court already having a trustee, who conducts the proceedings without the control exercised by the creditors in a sequestration. Under these conditions it will be seen that the original purpose and constitution of the process of cesso has entirely disappeared, and it has now become a modified form of official bankruptcy procedure, with a less elaborate routine than in the case of sequestration, and one perhaps more suitable to the smaller class of cases, to which in practice it is limited.

The Bankruptcy Frauds and Disabilities (Scotland) Act 1884 applies to sequestrations and decrees of cesso the criminal provisions of § 31 of the English Bankruptcy Act 1883, relating to the obtaining of credit for £20 and upwards by an undischarged bankrupt, without disclosure of his position. It also places the law relating to the disqualifications attaching to such bankrupts on a similar footing to that of the English act.

The Judicial Factors Act of 1889 contains a provision calculated to check excessive costs of administration, by requiring that where the remuneration of a trustee under a sequestration is to be fixed by the commissioners, intimation of the rate of remuneration is to be given to the creditors and to the accountant of the court, before being acted upon, and the latter officer is empowered, subject to appeal, to modify the same if he deems it expedient.

It may be pointed out that the Deeds of Arrangement Act 1887, which applies to England and Ireland, does not apply to Scotland, and there is no analogous provision requiring registration of private deeds of assignment for the benefit of creditors as a condition of their validity in that country.

Finally, it is to be noted that the office of accountant in bankruptcy, which was established by the Bankruptcy Act of 1856, has under the Judicial Factors Act 1889 been abolished, the duties being merged in those of the office of accountant of the court of session.

Irish Bankruptcy Legislation.

The Irish law of bankruptcy is regulated by the two leading Irish statutes of 1857 and 1872, together with the Irish Debtors Act 1872, and corresponds in its main features to some of the older English enactments, with modifications adopted from the English act of 1869. It may be pointed out, however, that the system of liquidation by arrangement and composition without the approval or control of the court, which proved fatal to the success of the latter, has not at any time been imported into the Irish law. A special act was passed in 1888 for establishing local bankruptcy courts in certain districts in Ireland, and an act was also passed in 1889, applying the main provisions of the English Act of 1888, relating to preferential payments in bankruptcy, to Ireland.

The Deeds of Arrangement Act 1887, which has been already discussed above under the head of English bankruptcy legislation, also applies in its main provisions to Ireland, and as supplemented by the Irish Deeds of Arrangement Amendment Act 1890, places the law relating to this branch of insolvency procedure upon a similar footing in both countries, so far as regards the publicity of such deeds. The last-mentioned act also requires a similar registration of all petitions for arrangement under the Bankruptcy Act 1857.

(J. Sm.)

Comparative Law

British Empire.—In most parts of the British empire the law of bankruptcy has been modelled upon the English system. This is particularly the case in Australia and New Zealand, Victoria, South Australia, Western Australia and New Zealand follow the lines of the existing English acts. In Queensland, Tasmania and New South Wales the system is rather that of the English act of 1869, leaving more to the creditors' management and less to officialism.

One point may be mentioned in which the Australian colonies have improved on the English system. Under the English acts a bankrupt is under no obligation to apply for his discharge. The result is that the United Kingdom contains a population of 70,000 undischarged bankrupts—a manifest danger to the trading community. In the bankruptcy systems of New South Wales, Victoria and New Zealand, a bankrupt is bound to apply for his discharge within a fixed period, otherwise he is guilty of a contempt of court.

In Canada, under the British North America Act 1867, the Dominion parliament has exclusive legislative power in regard to bankruptcy and insolventy: but there is no existing Dominion act on the subject. A Dominion act was passed in 1875, but repealed in 1880. The failure of this act may perhaps be ascribed to the diversity of the pre-existing provincial systems, embracing such contracts as the English law of Ontario, and the French code based on cesser. The law of the Orange River Colony is similar.

In British Guiana, Gambia, Jamaica, Hong Kong, Mauritius, Grenada, Trinidad, Tobago and the Straits Settlements the law is modelled on the English pattern.

In India insolventy is regulated by the Indian Insolvency Act 1848, extended by the Act XI. of 1889.

An English bankrupt, it may be added, is entitled to plead his discharge in England as a defence in a colonial court. The explanation is this. The English act vests all the bankrupt's property, whether in the United Kingdom or in the colonies, in his trustee in bankruptcy. Having thus denuded him of everything, it has been held to follow that the bankrupt's discharge must also receive recognition in a colonial court.

France.—Bankruptcy in France is regulated by the Commercial Code of 1807, amended and supplemented by the law of 9th June 1838. By Article 437 of the code bankruptcy is defined as the state of a trader who is unable to meet his commercial engagements. Simple insolventy of this kind is known in France as faillite. Insolvency attended with circumstances of misconduct or fraud is known as banqueroute simple or banqueroute frauduleuse. Only a trader can become bankrupt. The debt, too, for obtaining adjudication must be a commercial debt, the laws regulating bankruptcy being designed exclusively for the protection of commerce. To be made a bankrupt a trader need not be insolvent: it is sufficient that he has suspended payment. Commercial companies of all kinds are liable to be declared bankrupt in the same manner as individual traders. A trader-debtor can be adjudicated bankrupt upon his own petition, or upon the petition of a creditor, or by the court itself proprio motu. A petitioning debtor must within fifteen days file at the
office of the Tribunal of Commerce of the district, a declaration of suspension, with a true account of his conduct and of the state of his affairs, showing his assets, debts, profits and losses and personal expenses. On adjudication the Tribunal of Commerce appoints a person, called a syndic provisoire, to manage the bankrupt's estate, and a juge commissaire is also named to supervise the syndic. A bankruptcy terminates by an ordinary composition (concordat), a sale of the debtor's assets (union), or a composition by relinquishment of assets. It is a striking feature of the French system, and highly creditable to French commercial integrity, that a discharge in bankruptcy, even when accompanied by a déclaration d'excusabilité, leaves the unpaid balance a debt of honour. At the time of the French Revolution the National Convention passed a resolution that any man who contracted a debt should never be free from liability to pay it. The spirit of this resolution still survives, for until a trader has paid every penny that he owes he is not rehabilitated and remains under the stigma of various disabilities: he has no political rights, he cannot hold any public office, or act as a stockbroker, or sit on a jury. Banquereoute simple is where the bankrupt has been guilty of grave faults in the conduct of his business, such as extravagance in living, hazardous speculations, and fraudulent misconduct. Banquereoute frauduleuse involves the worse delinquency of fraud. Both banquereoute simple and banquereoute frauduleuse are punishable,—the latter with penal servitude ranging from five to twenty years.

Germany.—Bankruptcy in Germany is governed by a code passed in 1877. Prior to this each state had its system and the law was "wholly chaotic." The same distinction is drawn in Germany as in France between mere commercial failure and bankruptcy, simple or fraudulent. Simple bankruptcy is established by such offences as gambling, dealing in "futures," disorderly book-keeping or extravagance in living: fraudulent bankruptcy, by offences of a deeper dye—the concealment of property, the falsifying of books, the manufacture of fictitious debts and the giving of illegal preferences. Both kinds of bankruptcy are punishable, fraudulent bankruptcy by penal servitude, or in case of mitigating circumstances, by imprisonment for not less than three months. Accessories in fraudulent bankruptcies are liable to penal servitude—for instance, a creditor who conspires with the debtor to secure an advantage to the prejudice of the other debtors. The creditors are called together within one month from the date of the bankruptcy petition or the meeting they may appoint a committee of their number to advise with the trustee. It is the duty of the court to see that the trustee performs his functions. Estates are liquidated with great rapidity. In order that the creditors may receive dividends at the earliest moment, it is customary to sell the assets by auction. The creditors by a majority in number and three-fourths in value may accept a composition, but such an arrangement must have the approval of the court. The fees are very moderate: in an ordinary bankruptcy the attorney's fees do not, it is said, exceed 5%.

Italy.—Bankruptcy in Italy is regulated by the Commercial Code of 1883 (Part III). Only merchants can pass through the bankruptcy court. Merchants are defined by the code as those who, as an habitual profession, engage in commercial business. This definition includes merchant companies. Bankruptcy proceedings may be taken either by the debtor or by a creditor for a commercial debt, or may be ordered by the court. The amount of the debt is immaterial: a small sum will suffice, provided its non-payment is proof of insolvency. Bankruptcy can be commenced at any time. The judge or, if there is an adjudicating a debtor bankruptcy deprives the bankrupt of the right to administer his affairs, and nominates a trustee to realize the property under the superintendence of a judge and a commission of creditors. All the property of the bankrupt, movable and immovable, is sold by auction and distributed in dividends. This is one way of closing the bankruptcy, but it may also be closed by an arrangement. No minimum percentage is required for such arrangement, but it must have the assent of creditors representing three-fourths of the bankrupt's indebtedness. Composition before bankruptcy is not recognized by Italian law. Bankrupts are liable to criminal proceedings involving punishments more or less heavy for offences against the law, e.g. for not keeping books in the way prescribed by law.

United States.—After much fragmentary legislation the bankruptcy system of the United States is now embodied in the National Bankruptcy Act of 1898, as amended by the act of 1903. The acts of bankruptcy under the act may be summarized as follows: where a debtor (1) removes any of his property to hinder or delay his creditors; (2) being insolvent, transfers property with intent to prefer a creditor; (3) suffers any creditor to obtain a preference; (4) makes a general assignment for the benefit of his creditors; (3) "admits in writing his inability to pay his debts and his willingness to be adjudicated a bankrupt on that ground." These acts of bankruptcy do not include, it will be observed, non-payment by a debtor of his debts. A debtor can therefore only be adjudicated a bankrupt on the ground of indebtedness with his own consent in writing. Presumably the legislature thought that the desire to obtain the protection and privilege of bankruptcy would be a sufficient inducement to confess insolvency, where such insolvency, in fact, existed. To constitute a fraudulent preference it is not necessary, as it is under English law, that the payment should be made "with a view to prefer" the favoured creditor. It is enough that the creditor is preferred. This avoids the nice questions of legal casuistry which have embarrassed the English courts, and it is the more rational rule, for creditors are not concerned with a debtor's intention. Any person, trader or non-trader, may avail himself of the act, but, in the case of a corporation, there is this peculiarity: it may be petitioned against but cannot petition.

Insolvency is construed in a practical sense; that is, a person is insolvent where the aggregate of his property, at a fair valuation, is insufficient to pay his debts; but he is not necessarily insolvent because his realized assets are insufficient to meet his liabilities.

Involuntary proceedings can only be taken against debtors owing $1000 or over, with certain exceptions. A petitioning creditor's debt must amount to $500.

The administration of the law of bankruptcy is entrusted to the district courts and is exercised through the medium of certain officers appointed by the courts and called referees. The creditors appoint a trustee or trustees of the estate.

So soon as his judicial examination is over the bankrupt may offer his creditors a composition, but to take effect the composition must be approved by the court after hearing objections.

The discharge is the key to the efficacy of every bankruptcy system. By the control which the court thus holds, it is enabled to bring its moral censorship to bear on a debtor's conduct and so maintain a high standard of commercial integrity. Under the United States system the judge is to investigate the merits of the application and to discharge the bankrupt, unless he has (1) committed an offence punishable by imprisonment; (2) with intent to conceal his financial condition, destroyed, concealed, or failed to keep books of account or records from which such condition might be ascertained; or (3) obtained property on credit from any person upon a materially false statement in writing made to such person for the purpose of obtaining such property on credit; or (4) at any time, subsequent to the first day of the four months immediately preceding the filing of the petition, transfere, removed, destroyed or concealed any of his property with intent to hinder, delay or defraud his creditors; or (5) in voluntary proceedings been granted a discharge in bankruptcy within six years; or (6) in the course of proceedings in bankruptcy refused to obey any lawful order of or to answer any material question approved by the court.

It is significant that the italicized qualifications were added to the act of 1898 by the experience of five years of its working.

(E. M.A.)
BANKS, GEORGE LINNAEUS (1821–1881), British miscellaneous writer, was born at Birmingham on the 2nd of March 1821. After a brief experience in a variety of trades, he became at the age of seventeen a contributor to various newspapers, and subsequently a playwright, being the author of two plays, a couple of burlesques and several lyrics. Between 1848 and 1861 he edited in succession a variety of newspapers, including the Birmingham Mercury and the Dublin Daily Express, and published several volumes of miscellaneous prose and verse. He died in London on the 3rd of May 1881.

BANKS, SIR JOSEPH, Bart. (1743–1820), English naturalist, was born in Argyle Street, London, on the 13th of February 1743. His father, William Banks, was the son of a successful Lincolnshire doctor, who became sheriff of his county, and represented Peterborough in parliament; and Joseph was brought up as the son of a rich man. In 1760 he went to Oxford, where he showed a decided taste for natural science and was the means of introducing botanical lectures into the university. In 1764 he came into possession of the ample estate by his father, and in 1766 he made his first scientific expedition to Newfoundland and Labrador, bringing back a rich collection of plants and insects. Shortly after his return, Captain Cook was sent by the government to observe the transit of Venus in the Pacific Ocean, and Banks, through the influence of his friend Lord Sandwich, obtained leave to join the expedition in the "Endavour," which was fitted out at his own expense. He made the most careful preparations, in order to be able to profit by every opportunity, and induced Dr Daniel Solander, a distinguished pupil of Linnaeus, to accompany him, and the indefatigable efforts of the two men and the aid of numbers employed to delineate such objects of interest as did not admit of being transported or preserved. The voyage occupied three years and many hardships had to be undergone; but the rich harvest of discovery was more than adequate compensation.

Banks was equally anxious to join Cook's second expedition and expended large sums in engaging assistants and furnishing the necessary equipment; but circumstances obliged him to relinquish his purpose. He, however, employed the assistants and materials he had collected in a voyage to Iceland in 1772, returning by the Hebrides and Staffa. In 1778 Banks succeeded Sir John Pringle as president of the Royal Society, of which he had been a fellow from 1766, and held the office until his death. In 1781 he was made a baronet; in 1795 he received the order of the Bath; and in 1797 he was admitted to the privy council. He died at Isleworth on the 19th of June 1820. As president of the Royal Society he did much to raise the state of science in Britain, and was at the same time most assiduous and successful in cultivating friendly relations with scientific men of all nations. It was, however, objected to him that from his own predilections he was inclined to overlook and depreciate the labours of the mathematical and physical branches of the Royal Society and that he exercised his authority somewhat despotically. He bequeathed his collections of books and botanical specimens to the British Museum. His fame rests rather on what his liberality enabled other workers to do than on his own achievements.

BANKS, NATHANIEL PRENTISS (1816–1894), American politician and soldier, was born at Waltham, Massachusetts, on the 30th of January 1816. He received only a common school education and at an early age began work as a bobbin-boy in a cotton factory of which his father was superintendent. Subsequently he edited a weekly paper at Waltham, studied law and was admitted to the bar, his energy and his ability as a public speaker soon winning him distinction. He served as a Free Soiler in the Massachusetts house of representatives from 1849 to 1853, and was speaker in 1851 and 1852; he was president of the state Constitutional Convention of 1853, and in the same year was elected to the national House of Representatives as a coalition candidate of Democrats and Free Soilers. Although re-elected in 1854 as an American or "Know-Nothing," he soon left this party, and in 1855 presided over a Republican convention in Massachusetts. At the opening of the Thirty-Fourth Congress the anti-Nebraska men gradually united in supporting Banks for speaker, and after one of the bitterest and most protracted speakership contests in the history of congress, lasting from the 3rd of December 1855 to the 2nd of February 1856, he was chosen on the 133rd ballot. This has been called the first national victory of the Republican party. Re-elected in 1856 as a Republican, he resigned his seat in December 1857, and was governor of Massachusetts Vicksburg, to 1861, a period marked by notable administrative and educational reforms. He then succeeded George B. McClellan as president of the Illinois Central railway. Although while governor he had been a strong advocate of peace, he was one of the earliest to offer his services to President Lincoln, who appointed him in 1861 major-general of volunteers. Banks was one of the most prominent of the volunteer officers. When McClellan entered upon his Peninsula Campaign in 1862 the important duty of defending Washington from the army of "Stone-wall" Jackson fell to the corps commanded by Banks. In the spring Banks was ordered to move against Jackson in the Shenandoah Valley, but the latter with superior forces defeated him at Winchester, Virginia, on the 25th of May, and forced him back to the Potomac river. On the 9th of August Banks again encountered Jackson at Cedar Mountain, and, though greatly outnumbered, succeeded in holding his ground after a very sanguinary battle. He was later placed in command of the garrison at Washington, and in November sailed from New York with a strong force to replace General B. F. Butler at New Orleans as commander of the Department of the Gulf. Being ordered to co-operate with Grant, who was then before Vicksburg, to 1861, a period marked by notable administrative and educational reforms. He then succeeded George B. McClellan as president of the Illinois Central railway. Although while governor he had been a strong advocate of peace, he was one of the earliest to offer his services to President Lincoln, who appointed him in 1861 major-general of volunteers. Banks was one of the most prominent of the volunteer officers. When McClellan entered upon his Peninsula Campaign in 1862 the important duty of defending Washington from the army of "Stone-wall" Jackson fell to the corps commanded by Banks. In the spring Banks was ordered to move against Jackson in the Shenandoah Valley, but the latter with superior forces defeated him at Winchester, Virginia, on the 25th of May, and forced him back to the Potomac river. On the 9th of August Banks again encountered Jackson at Cedar Mountain, and, though greatly outnumbered, succeeded in holding his ground after a very sanguinary battle. He was later placed in command of the garrison at Washington, and in November sailed from New York with a strong force to replace General B. F. Butler at New Orleans as commander of the Department of the Gulf. Being ordered to co-operate with Grant, who was then before Vicksburg, Banks was mustered out of the service, and in 1865 he was again a representative in congress, serving as chairman of the committee on foreign affairs. A personal quarrel with President Grant led in 1872, however, to his joining the Liberal-Republican revolt in support of Horace Greeley, and as the Liberal-Republican and Democratic candidate he was defeated for re-election. In 1874 he was successful as a Democratic candidate, serving one term (1873-1877). Having rejoined the Republican party in 1876, he was United States marshal for Massachusetts from 1879 until 1888, when for the ninth time he was elected to Congress. He retired at the close of his term (1891) and died at Waltham on the 1st of September 1894.

BANKS, THOMAS (1735–1805), English sculptor, son of a surveyor who was land steward to the duke of Beaufort, was born in London on the 29th of December 1735. He was taught drawing by his father, and in 1750 was apprenticed to a wood-carver. In his spare time he worked at sculpture, and before 1772, when he obtained a travelling studentship and proceeded to Rome, he had already exhibited several fine works. Returning to England in 1770 he found that the taste for classic poetry, ever the source of his inspiration, no longer existed, and he spent two years in St Petersburg, being employed by the Empress Catherine, who purchased his "Cupid tormenting a Butterfly." On his return he modelled his colossal "Chiches mourning the loss of Brises," a work full of force and passion; and thereupon he was elected, in 1784, an associate of the Royal Academy and in the following year a full member. Among other works in St Paul's cathedral are the monuments to Captain Westcott and Captain Burgis, and in Westminster Abbey to Sir Eyre Coote. His bust of Warren Hastings is in the National Portrait Gallery. Banks's best-known work is perhaps the colossal group of "Shakespeare attended by Painting and Poetry," now in the garden of New Place, Stratford-on-Avon. He died in London on the 2nd of February 1805.
BANKS AND BANKING. The word “bank,” in the economic sense, covers various meanings which all express one object, a contribution of money for a common purpose. Thus Bacon, in his essay on _Usury_, while explaining "how the commoditie[s] of it may be best avoided and the commodities retained," refers to a "bank or common stock" as an expression with which his readers would be familiar. Originally connected with the idea of a mound or bank of earth—hence with that of a _monte_, an Italian word describing a heap—the term has been gradually applied to several classes of institutions established for the general purpose of dealing with money.

The manner in which a bank prospers is explained by David Ricardo, in his _Proposals for an Economical and Secure Currency_, in a passage where he tells us that a bank would never be established if it obtained no other profits but those derived from the employment of its own capital. The real advantage of a bank to the community it serves commences only when it employs the capital of others. The money which a bank controls in the form of the deposits which it receives and sometimes of the notes which it issues, is loaned out by it again to those who desire to borrow and can show that they may be trusted. A bank, in order to carry on business successfully, must possess a sufficient capital of its own to give it the standing which will enable it to collect capital belonging to others. But this it does not hoard. It only holds the funds with which it is entrusted till it can use them, and the use of such part of the resources that it makes of them merely lies with the bank till the customer draws what he requires for his ordinary everyday wants. Some, the greater part by far, of the deposits enable the bank to make advances to men who employ the funds with which they are entrusted in reproductive industry, that is to say, in a manner which not only brings back a greater value than the amount originally lent to them, but assists the business development of the country by setting on foot and maintaining enterprises of a profitable description. It is possible that some part may be employed in loans required through the payment of bills on foreign banks, but, however, as these only be a small proportion of the whole, as it is only through reproductive industry that the capital advanced by a banker can really be replaced. A loan sometimes, it is true, is repaid from the proceeds of the sale of a security, but this only means a transfer of capital from one hand to another; money that is not transferred in this way must be made by its owner. Granted that the security is complete, there is only one absolute rule as to loans if a bank desires to conduct its business on safe lines, that the advance should not be of fixed but of floating capital. Nothing seems simpler than such a business, but no business requires closer attention or more strong sense and prudence in its conduct. In other ways also, besides making loans, a well-conducted bank is of much service to the business prosperity of a country, as for example by providing facilities for the ready transmission of money from those who owe money to those to whom it is due. This is particularly obvious when the debtor lives in one town or district and the creditor in another at a considerable distance, but the convenience is very great under any circumstances. Where an easy method of transmission of cash does not exist, we become aware that a "rate of exchange" exists as the distance between the prices in the one city and in the other is, as between two places in different countries. The assistance that banking gives to the industries of a community, apart from these facilities, is constant and most valuable.

With these preliminary remarks on some main features of the business, we may pass on to a sketch of the history of modern banking. Banks in Europe from the 16th century onwards may be divided into two classes, the one described as "exchange banks," the other as "banks of deposits."

These last are banks which, besides receiving deposits, make loans, and thus associate themselves with the trade and general industries of a country. The exchange banks included in former years institutions like the Bank of Hamburg and the Bank of Amsterdam. These were established to deal with foreign exchange and to facilitate trade with other countries. The others—founded at very different dates—were established as, or early became, banks of deposit, like the Bank of England, the Bank of Venice, the Bank of Sweden, the Bank of France, the Bank of Germany and others. Some reference to these will be made later. The exchange banks claim the first attention. Important as they were in their day, the period of their activity is now generally past, and the interest in their operations has become mainly historical.

In one respect, and that a very important one, the business carried on by the exchange banks differed from banking as generally understood at the present time. No exchange bank had a capital of its own nor did it require any for the performance of the business. The object for which exchange banks were established was to turn the values with which they were entrusted into current money," the "bank money" as it was called, that is, to say, into a currency which was transferred immediately by merchants without the necessity of testing the value of the coin or the bullion brought to them. The "value" they provided was equal to the "value" they received, the only difference being the amount of the small charge they made to their customers, who gained by dealing with them more than equivalent advantages.

Shorts of the Bank of Amsterdam, which was one of the most important, and of the Bank of Hamburg, which survived the longest, its existence not terminating till 1873, will suffice to explain the working of these institutions. Some, it was stated, like the Bank of Amsterdam, or exchange bank, known later as the Bank of Amsterdam, was established by the ordinance of the city of Amsterdam of 31st January 1609. The increased commerce of Holland, which made Amsterdam a leading city in international dealings, led to the establishment of this bank, to which any person might bring money or bullion for deposit, and might withdraw at pleasure the money or the worth of the bullion. The ordinance which established the bank further required that all bills of 600 gulden (ƒ50), or upwards—this limit was, in 1643, lowered to 300 gulden (ƒ25)—should be paid on demand. The bank, in other words, by the transfer of deposits, or credits at the bank. These transfers came afterwards to be known as "bank money." The charge for making the transfers was the sole source of income to the bank. The bank was established without any capital of its own, being understood to have actually in its vaults the whole amount of specie for which "bank money" was outstanding. This regulation was not, however, strictly observed. Loans were made at various dates to the Dutch East India Company. In 1705 a report was issued showing that the city of Amsterdam was largely indebted to the bank, which held as security the obligations of the states of Holland and West Friesland, or the West India Company. This led to the idea of reviving the bank, and in 1820 "the establishment which for generations had held the leading place in European commerce ceased to exist." (See Chapters on the Theory and History of Banking, by Charles F. Dunbar, p. 105.)

Similar banks had been established in Middelburg (March 28th, 1616), in Hamburg (1616) and in Rotterdam (February 5th, 1635). Of these the Bank of Hamburg carried on much the largest business and survived the longest. It was not till the 13th of February 1873 that its existence was closed by the act of the government. It was observed that Germany should possess a gold standard, and thus removed those conditions of the local medium of exchange—silver coins of very different intrinsic values—which circulation had provided an ample field for the operations of the bank. The business of the Bank of Hamburg had been conducted in absolute accordance with the regulations under which it was founded.

The exchange banks were established to remedy the inconvenience to which merchants were subject through the uncertain value of the currency of other countries in reference to that of the city where the exchange bank carried on its business. The following quotation from _Notes on Banking_, written in 1873, explains the method of operation in Hamburg. "In this city, the most vigorous offshoot of the once powerful Hansa, the latest representative of the free commercial cities of medieval Europe,
Banks and Banking

influenced by the working of the Bank of England and by the acts of parliament connected with that institution, that a reference to this bank's foundation and development must precede any attempt at a detailed history of banking in the United Kingdom. The Bank of England was founded in 1694. As in the case of some of the earlier continental banks, a loan to the government was the origin of its establishment. The loan, which was £1,200,000, was subscribed in little more than ten days, between Thursday, 9th June, and noon of Monday, 2nd July 1694. On Tuesday, 3rd July, the subscription closed, the governor, Sir Godfrey, who was killed during the siege of Namur on the 11th of July 1695, was succeeded by Sir John Houblon. The Houblon, a Flemish refugee, who had escaped from the persecution of Alva. All the directors were men of high mercantile standing. The business of the bank was first carried on in the Mercers' chapel. It continued there till the 28th of September, when they moved to Grocers' Hall. They were tenants of the Grocers' Hall till 1732. The first stone of the building now occupied by the bank was laid on the 1st of August 1732. The bank has remained on the same site ever since. The structure occupied the space previously covered by the house and gardens of Sir John Houblon, the first governor, which had been bought for the purpose. Between 1746 and 1788 the wings were erected. In 1780 the directors, alarmed at the dangerous facilities which the adjacent church of St Christopher le Stocks might give to a mob, obtained parliamentary powers and acquired the fabric, on the site of which much of the present building stands. The structure was developed to its present form about the commencement of the 19th century.

The bank commenced business with fifty-four assistants, the salaries of which amounted to £450. The total number employed in 1847 was upwards of nine hundred and their salaries exceeded £210,000. Mr. Thompson Hankey stated that in 1867 upwards of one thousand persons were employed, and the salaries and wages amounted to nearly £600,000, besides pensions to superannuated clerks of about £20,000 more. The number of persons of all classes employed in 1906 (head office and eleven branches) was about 1,400.

Originally established to advance the government a loan of £1,200,000, the management of the British national debt has been confided to the Bank of England from the date of its foundation, and it has remained the banker of the government ever since.

The interest on the stock in which the debt is inscribed has always been paid by the bank, originally half-yearly, now quarterly, and the registration of all transfers of the stock itself is carried on by the bank, which assumes the responsibility of the correctness of these transfers. The dignity which the position of banker to the government gives; the monopoly granted to it of being the only joint-stock bank allowed to exist in England and Wales till 1826, while the liability of its shareholders was limited to the amount of their holdings, an advantage which alone of English banks it possessed till 1827; the privilege of issuing notes which since 1833 have been legal tender in England and Wales everywhere except at the bank itself; the fact that it is the banker of the other banks of the country and for many years had the control of far larger deposits than any one of them individually.

—All these privileges gave it early a pre-eminence which it still maintains, though more than one competitor now holds larger

European Countries

United Kingdom.—English banking may be traced back to the dealings in money carried on by the goldsmiths of London and thus certainly to the 16th century; but it has been so greatly

1 A translation of the act of the 3rd of May 1699 may be found in the appendix to the Quarterly Journal of Economics (Boston, U.S.A.) for April 1892. These documents present a distinct picture of banking in its true sense.

1 The clearest account of its early days is found in Thorold Rogers: History of the First Nine Years of the Bank of England.
deposits, and though, collectively, the deposits of the other banks of the country which have offices in London many times overpass its own. Some idea of the strength of its position may be gained from the fact that stocks are now inscribed in the bank books to an amount exceeding 1250 millions sterling.

In one sense, the power of the Bank of England is greater now than ever. By the act of 1844, regulating the note-issue of the country, the Bank of England became the sole source from which legal tender notes can be obtained; a power inscribed at an act that pre-empts all other banks or private firms in the field of pressure. The authority to supply the notes required, when the notes needed by the public exceed in amount the limit fixed by the act of 1844, was granted by the government to the bank at the request of the bank on three occasions only between 1844 and 1806. Hence the Bank of England becomes the centre of interest in times of pressure when a "treasury letter" permitting an excess issue is required, and holds then a power of the force of which can hardly be estimated.

One main feature of the act of 1844 was the manner in which the issue of notes was dealt with, as described by Sir Robert Peel in parliament on the 6th of May 1844: "Two departments of the bank will be constituted: one for the issue of notes, the other for the transaction of the ordinary branch of the bank. The business in the former department of the bank will be transferred to the issue department. The issue of notes will be restricted to an issue of £14,000,000 upon securities—the remainder being issued upon bullion and governed in all respects as the issue of the Bank of England. The bank will be required to issue weekly returns in a specified form (previously to the act of 1844 it was necessary only to publish every month a balance-sheet for the previous quarter), and the first of such returns was caused to be made on the 6th September, 1844. It is clear that the former department has now contained merely a statement of the liabilities and assets of the bank, but in the new form the balance-sheets of the issue department will be published separately. The amount of the weekly return in both the old and new forms will be found in A History of the Bank of England, p. 290, by A. Andrêchés (Eng. trans., 1905); see also R. H. L. Palgrave, Bank Rate and the Money Market, 1825-1879, 1879.

One result of the division of the accounts of the bank into two departments is that, if through any circumstance the Bank of England be called on for a larger sum in notes or specie than the notes held in its banking department (technically spoken of as the "Reserve") amount to, permission has to be obtained from the government to "suspend the Bank Act" in order to allow the demand to be met, whatever the amount of specie in the "issue department" may be. Three times since the passing of the Bank Act—during the crises of 1847, 1857 and 1866—authority has been given for the suspension of that act. On one of those dates only, in 1857, did the act actually go into operation; on one or two occasions the fact that the permission had been given stayed the alarm. It should be remembered, whenever the act of 1844 is criticized, that since it came into force there has been no anxiety as to the amount of the note issue; but it will be noted that the specie held in two parts is an arrangement not without disadvantages. Certainly since the act of 1844 became law it has been difficult to form any clear ideas in one's mind of the rate of discount—one main characteristic of the English money market—has greatly increased. To charge the responsibility of the increase in the number of those fluctuations on the Bank Act alone would not be justifiable, but the working of the act appears to have an influence in that direction, as the effect of the act is to cut the specie reserve held by the bank into two parts and to cause the smaller of these parts to receive the whole strain of any demands either for notes or for specie. Meanwhile the demands on the English money market are greater and more continuous than those on any other money market in the world. Of late years the changes in the number of these demands have frequently been so extraordinary years very severe. From the day when the act came into operation in 1844, to the close of the year 1906, there had been more than 400 changes in the rate. The hopes which Sir Robert Peel expressed (1844) that the act would be a means of checking into force commercial crises would cease, have not been realized.

The number of changes in the bank rate from 1876 to 1906 in England, France, Germany, Holland and Belgium were as follows:—

There has been frequent discussion among bankers and occasionally among the financial press as to the influence of the act. It might be asked whether the Bank of England an automatic power to augment the note issue on securities when necessary, similar to that possessed by the Bank of Germany (Reichsbank). One of the hindrances to the success of such a plan has been that the government, acting on the advice of the treasury, required an extremely high rate of interest, of which it would reap the advantage, to be paid on the advances made under these conditions. Those who made these suggestions did not bear in mind that the government had never before been forced to demand intensifies the panic, a high rate being associated as a rule with risks in business. The object of the arrangement made by the Reichsbank is to avoid the necessity of a direct state loan, and is a different one—to provide the banking accommodation required and to prevent panic, hence a rate of only 5% has been generally charged, though in 1899 the rate was 7% for a short time. As is usual in crises in business, the banks have increased their profit. The duty on the extra issue between 1881, when the circulation of the Bank of England first exceeded the authorized limit, and the close of the year 1896 amounted to £695,092. Thus a considerable sum was provided for the relief of taxpayers as the business proceeded on its normal course. The proposal made by Mr Lowe (afterwards Lord Sherbrooke) in 1873 was to charge 12%, but this was not pressed. Hence, on the whole, though there has been nothing. The act of 1844 remains unaltered. The issue on securities allowed by it to the Bank of England was originally £14,000,000. This has since been increased under the provisions of the act to £74,450,000 (29th March, 1901). Hence against the bank less gold by £4,450,000 is now held by the bank than would have been the case had the arrangements as to the securities remained as they were in 1844.

The Bank of England has, from the date of its establishment, possessed a practical, though perhaps not an absolutely legal, monopoly of issuing notes in London. It became gradually surrounded by a circle of private banks, some of considerable power.

The state papers included in F. G. Hilton Price's Handbook of London Bankers (1876) contain some of the earliest records about the establishment of banking in England. The first of these is a petition, printed in the original Italian, by some American emigrants in 1629. It is addressed to Christopher Hagenbuck and his co-partners in November 1581, representing "that he had found out a method and form in which it will be possible to institute an office into which shall enter every year a very large sum of money without expense to your Majesty," so "that not only your Majesty will be able to be always provided with whatever notable sum of money your Majesty may wish, but by this means your State and people also; and it shall keep the country in abundance and remove the extreme usuries that devour your Majesty and your people." Hagenbuck proposed to explain his plan on condition that he should receive "6% every year of the whole mass of money" received by the office for twenty years. The queen agreed "to grant to the said Christopher and partners 4% for a term of twenty years, and to confirm the said grant under the great seal." The document is signed by Francis Walsingham, but nothing further appears to have come of it. When we compare the date of this document with that of the establishment of the Banco della Piazza di Rialto at Venice, it is not unlikely that the idea of the establishment of a bank was floating in the minds of people connected with business and had become familiar to Hagenbuck from commerce with the other states at that time. In 1622 and again in 1627 and 1666 contain somewhat similar proposals which were never carried into practice.

The little London Directory, 1677, contains a list of goldsmiths mentioned as keeping "running cashes." Of these firms described in 1677, five houses were carrying on business in 1876. Three of these, or firms immediately descended from them, Child & Co. of Temple Bar, Martin & Co. of Lombard Street (as Martin's Bank, Ltd.), and Hoare & Co. of Fleet Street, are still carrying on business. Barnett, Hoare & Co. and Willis, Percival & Co. have been both by Lloyd's Bank (1884), the second by the Capital and Counties (1858). Many of the goldsmiths carried on a considerable business. Thus the books of Edward Blackwell, who was an eminent goldsmith and banker in the reign of Charles II., show that the king himself, the queen mother, Henrietta Maria, James, duke of York, the prince of Orange, Samuel Pepys, the East India Company, the Goldsmiths' Company and other city companies did business with him. Sir John Houlton, the first governor of the Bank of England, kept an account with Blackwell, who was, however, ruined by the closing of the exchequer in 1672. But his son married into the family of Sir Francis Child, and his grandson became partner in Child's Bank.
BANKS AND BANKING

Besides the banks in London already mentioned, one in the provinces claims to have been established before the Bank of England. Smith's of Nottingham, since amalgamated with the Union of London Bank, is stated to have been founded in 1698. Others also claim considerable antiquity. The old Bank of Bristol (Bailey, Cave & Co.) was founded in 1750; the business amalgamated with Prescott & Co., Ltd., of London. The Hull Old Bank (Pease & Co.) dated from 1754; this business also still continues (amalgamated, 1834, with the York Union Banking Co., Ltd., and since with Barclay & Co., Ltd.). The banks of Gurney & Co., established at the end of the 18th century in the eastern counties, have with numerous other banks of similar standing amalgamated with the firm of Barclay & Co., Ltd., of Lombard Street.

The business of banking had been carried on by the goldsmiths of the city, who took deposits from the time of James I. onwards, and thus established "deposit-banking" as early as that reign. This is described in a pamphlet published in 1676, entitled The Mystery of the New-Fashioned Goldsmiths or Bankers Discovered, quoted by Adam Anderson in his History of the Great Commercial Interests of the British Empire, vol. ii. p. 402. During the Civil War "the goldsmiths or new-fashioned bankers began to receive the rents of gentlemen's estates remitted to town, and to allow them and others who put cash into their hands some interest for it, if it remained but for a single month in their hands, or even less time. This was a great allurement for people to put their money into their hands, which would bear interest till the day they wanted it. And they could also draw it out by £100 or £500 &c., at a time, as they wanted it, with infinitely less trouble than if they had lent it out on either real or personal security. The consequence was that it quickly brought a great quantity of cash into their hands; so that the chief or greatest of them were now enabled to supply Cromwell with money in advance on the revenues as his occasion required, upon great advantage to themselves."

The Bank of England, as stated before, was incorporated by the act of 1694. The position of the other banks at that time was defined by that act and the act of 1697, which declared that no bank, that is, no joint-stock bank, was "to be established within England during the continuance of the Bank of England," and also by the act of 1708, which provided that "during the continuance of the Bank of England, no company or partnership exceeding six persons in England shall borrow, owe or take up any sum or sums of money on their bills or notes payable on demand or at any less time than six months from the borrowing thereof." This was confirmed by the act of 1800. No change of importance was made till the act of 1826, which prohibited "bank notes under £5," and the second Banking Act of that year which allowed the establishment of co-partnerships of more than six persons, which necessarily were joint-stock companies, beyond 65 m. from London. The act of 1833 allowed the establishment of joint-stock banks within the 65 m. limit, and took away various restrictions of the amounts of notes for less than £50. But the power of issuing notes was not allowed to joint-stock banks within the 65 m. radius.

In the early days in England, issuing notes formed, as Bagehot says in his Lombard Street, the introduction to the system of joint-stock banking. It was known so, that a bank which had not the power of issuing notes could scarcely exist out of London.

Bank notes in England originated in goldsmiths' notes. Goldsmiths received deposits of money and gave notes or receipts for such moneys payable on demand. The Bank notes.

London bankers continued to give their customers notes or deposit-receipts for the sums left by them until about 1781, when in lieu of such notes they gave them books of cheques. Before the invention of cheque-books, the practice of issuing notes was considered so essentially the main feature of banking, that a prohibition of issue was considered an effectual bar against banking. Accordingly the prohibitory clause in the act of 6 Anne, c. 30, 1707 (in Record edition), which was repeated in the Bank of England Act 1708, 7 Anne, c. 30, § 66 (in Record edition), prohibiting more than six persons from issuing promissory notes, was intended to prevent any bank being formed with more than six partners, and was so understood at the time; and it did have the effect of preventing any joint-stock bank being formed.

The prohibition, as already related, was modified in the year 1826 and removed in 1833. Even then the privilege of limitation of liability was not permitted to any other bank but the Bank of England. The result was that when joint-stock banks were first formed many persons of good means were kept back from becoming shareholders, that is to say partners, in banks. For up to the date of the act of 1862 permitting "limited liability," every shareholder in a joint-stock bank was liable to the extent of the whole of his means (see the article COMPANY). Even as late as 1858 when the Western Bank of Scotland and 1878 when the Glasgow Bank failed, "bankruptcy" was inflicted on many persons who had trusted with over confidence to the management of those banks. The failure of the City of Glasgow Bank was the cause of the Companies Act of 1870, passed to enable unlimited companies to adopt limited liability. In limited companies the shareholder who has paid up the nominal amount of his holding is not liable for any further amount, unless the company issues bank notes, in which case the shareholders are liable in the same way as if the company were registered as an unlimited company. The facilities allowed by this act were used by almost every joint-stock bank in the United Kingdom except those banks which were at that date limited by charter or by special act.

To return to the early history of banking—thus, as no bank could be formed with more than six partners during the whole of the period from 1694 to 1826 and 1833, the majority of the banks formed throughout England and Wales for more than a century were necessarily small and usually isolated firms. Further, when a partner died, his capital not infrequently went out of the business; then a fresh partner with sufficient means had to be found, constant change was the result, and confidence, "a plant of slow growth," could not thrive, except in those instances when a son or a relation filled the vacancy.

The banks in the country districts had frequently branches in the small market-towns close to them; those in London had never more than one office. These banks were sometimes powerful and generally well managed, a considerable number being established by members of the Society of Friends.

The restriction of partners in private banks to the number of six continued till 1862. By the act of that year they were allowed to be ten. This power, however, did not extend to issuing private banknotes which were restricted to six partners only. The power of increasing bank partnerships to ten has been made but little use of. The difficulties of carrying on business on a large scale by private firms were augmented by certain legal technicalities which practically rendered large private banks impossible in ordinary circumstances. Hence banking business did not begin to assume its present form till almost half-way through the 19th century. The gradual change followed the passing of the acts of 1826-1833, of 1844-1845, of 1862 and of 1879. Incidentally the act of 1844 had an unexpected influence on the constitution of the banking system. After vacating the existence of small banks for many years, it gradually led, as the time arrived when the establishment of large and powerful banks in England and Wales became necessary, to their formation. No new bank of issue whatever was allowed to be established—restrictions were placed on the English issuing banks—private issuing banks with not more than six partners were allowed to remain, to amalgamate with other private issuing banks and to retain their joint issues. The joint-stock banks which possessed issues were also allowed to continue these, but when two joint-stock banks amalgamated, the continuing bank only retained its issue. Also when a private issuing bank was formed into or joined a joint-stock bank, the issue lapsed.

The greater number of the provincial banks in England and Wales had been banks of issue up to 1844. The act of 1844
restricted their power of issuing notes, which at that date and was subsequently continued to be of importance to them, in such a manner that, as Sir R. H. Inglis Palgrave stated in giving evidence before the committee of the House of Commons at the banking inquiry of 1875, these banks possessed in their issues a property they could use, but were not able to sell. The statistics forming part of Appendix 14 to the report of the select committee of the House of Commons on banks of issue (1875) give interesting information as to the proportion of notes in circulation to the deposits of banks in various districts of the country and at various dates. The statements were supplied by twenty-one banks, and in agricultural districts, some in places where manufactures flourished, some in mixed districts, commercial and agricultural, or industrial and manufacturing. In all of these, the inquiry being carried as far back as 1844, the proportion of the circulation to the banking deposits had greatly diminished in recent years. In several cases the deposits had increased three-fold in the time. In one case it was five times as large, in another nearly seven times, in another nearly twelve and a half times. The proportion of the circulation to the deposits had very largely diminished in that time. In one instance, from being about one-third of the deposits, at which proportion it had remained for five years consecutively, it had fallen to 9% at the end of the term. In another from being 22% it had diminished to 14% of the total. In all cases where the detail was given it had diminished greatly.

The Bank Act of 1844 was arranged with the intention of concentrating the note issues on the Bank of England in order to secure the monopoly of that bank as the one issuer in England and Wales. The result was that nearly all the provincial banks in England had by 1906 lost the right of issue. Doubtless all were destined to do so before long, a result by which banking in England and the industries of the country must lose the advantage which the local issues have been to Scotland and Ireland. Had the English country banks been allowed, as the Scottish banks were, to associate together and to retain their issues, powerful banks would many years since have been established throughout England and Wales, and the amalgamations of recent years would have been carried through at a much earlier date, and on terms much more favourable to the public.

No security was ever required to be given for the local issues in the United Kingdom. The provisions of the acts of 1844--45 were made to compel the Irish and Scottish banks to hold a specie against the notes issued beyond the legal limit, do not make the coin held a security for them. The legislation of 1879 which made the note issues a first charge, with unlimited liability, on the total assets of the joint-stock banks which accepted the principle of limited liability for the rest of their business, has been the only recognition by the state of the duty to the note-holders of rendering them secure. It has been a real disadvantage to England that this duty has never been sufficiently recognized, and that the provincial note issue, which is a very convenient power for a bank to possess, and incidentally a considerable advantage to its customers, has been swept away without any attempt being made to remedy its deficiencies. There may be objections raised to a note circulation secured by the bonds of the government, but the security of the note issues of the national banks of the United States made against such bonds, has scarcely ever been questioned.

A different policy was followed by Sir Robert Peel in Scotland and in Ireland from that which he established in England. By the acts of 1844--45 the Scottish and Irish banks were allowed to exceed their authorized issues on holding specie to the amount of the excess, and no restrictions were placed on amalgamations among banks in these countries. In Scotland and in Ireland notes for less than £5 continued to be allowed. The result has been that the ten large banks in Scotland, and six of the nine banks in Ireland, possess the power of issuing notes. The large proportion of local branches in these countries has been greatly assisted by this power.

Originally, besides the Bank of England, nearly all the provincial banks in England and Wales possessed the privilege of issue. These banks continued their operations as previously during the time when the Bank Act was discussed in parliament. When the arrangements which had act creating were made public, nine banks, of which eight were private and one was a joint-stock bank, ceased to issue their notes prior to the 12th of October 1844, when the act came into operation. Of these, the Western District Joint-Stock Banking Co. was dissolved, one of the private banks was closed, the remaining seven issued Bank of England notes and were allowed certain privileges for doing this. By the act of 1844 the maximum of the England and Wales banks was fixed at the average circulation of the twelve weeks before the 27th of April 1844. The number of the banks to which the privilege of circulation was then allowed and the amount of notes permitted were, in England—

This shows an apparent increase of more than £5,000,000 since 1844. The decrease of the country circulation in England and the increase of the Scottish and Irish circulations may be set off against each other. The increase is mainly in the notes of the Bank of England. In 1844 the number of banking offices in England and Wales was 975, while in 1906 there were more than 5860. Each of these offices must hold some till-money, and of this Bank of England notes almost always form a part. Hence it is probable that a large part of the increase in the circulation of the Bank of England since 1844 is held in the till of the banks in England and Wales, and that the active note circulation of the United Kingdom is but little larger than it was.

It may be added that the government received from the note circulation for a typical year (ending 5th of April 1904), out of the profits of issue (Bank of England) £184,930, 2s. 2d., and also composition for the duties on the bills and notes of the banks of England and Ireland and of country bankers, £120,768, 15s. 6d., the whole being obtained from the banks. This composition was made practically by about ten private and sixty joint-stock banks of which more than one was properly a private firm under a joint-stock form of incorporation. The number of individual banks that had diminished, the offices had greatly increased.

The records of the numbers of banks in the United Kingdom have up to quite recent years been very imperfect. Such as exist were made by individual observers. The banks of England and Wales are believed to have been 350 in number in 1792. Those registered from 1826 to 1842 were:
The number of banking offices in England and Wales was estimated by Mr. William Leatham in 1840 as being 677. The Bankers' Almanac for 1845 gives the number in 1844 for England and Wales as 356 private bank offices and 640 joint-stock offices, Scotland 368 offices, Ireland 180 offices.

The number of inhabitants to each office was as follows in 1844 and 1906:

In the latter years of the 18th century and the early years of the 19th, the note circulation was a very important part of the business, but about that date the deposits began to be, as they have continued since, far more important. It is unfortunately impossible to give any trustworthy statistics of the position of banking in the United Kingdom extending back for more than forty or fifty years. Even the Scottish banks, who have been less reticent as to their position than the English banks, did not publish their accounts generally till the end of the last century. The total deposits and cash balances in the Irish joint-stock banks were published collectively for the first time in 1840 by the care of Dr Nelson Hancox, but it is only of quite recent years that any statement of the general position other than an estimate has been possible owing to the long-continued reluctance of many banks to allow any publication of their balance-sheets. A paper by W. Newmarch, printed in the Journal of the Statistical Society for 1851, supplies the earliest basis for a trustworthy estimate. According to this the total amount of deposits, including the Bank of England, in England and Wales, Scotland and Ireland, may have been at that date from £250,000,000 to £300,000,000. The estimate in Palgrave’s New Book of Banking (1872), excluding deposits in discount houses and the capitals of banks, was from £300,000,000 to £450,000,000. The corresponding amounts at the close of 1906 were, in round figures, including acceptances etc., £977,500,000. The total resources, including capitals and reserves and note circulation (in round figures £177,500,000), were for 1906:

- England and Wales—Bank of England and other banks. £922,297,000
- Scotland. 135,042,000
- Ireland. 73,707,000
- Isle of Man. 898,000

£1,131,044,000

The progressive growth in bank deposits since it has been possible to keep a record of their amounts, affords some means of checking roughly the correctness of the estimates of 1851 and 1872. Broadly speaking, it appears that the bank deposits of the United Kingdom have about doubled since 1872.

The purely city banks had associated themselves in a "Clearing House" certainly by 1776. An entry in the books of the Grasshopper, namely—"1773 to quarterly charge for use of the Clearing-room of 19/6d.," points to an earlier and perhaps less definitely organized system of settlement. A house was taken for the purpose in 1810, in which year the number of banking houses who settled their accounts with each other at the "Clearing House" was forty-six (Gilbart's History and Principles of Banking, p. 78). The Bank of England has never been a member of the Clearing House, though it "clears on one side." I.e. its claim on the clearing bankers is made through the Clearing House, but the claims of the clearing bankers on the bank are forwarded direct to Threadneedle Street twice or thrice daily. Nor did the banks in Fleet Street or at Charing Cross belong to it. In 1858 the clearing of country cheques was added through arrangements made by Lord Averbury, then Sir John Lubbock. The "country clearing" is a great assistance to business, as it enables a cheque drawn on the most distant village in England to be dealt with as conveniently as a cheque on London. Of the forty-nine banks in London in 1844, twenty-six were connected with the Clearing House. At that time only private banks were allowed to be members. In 1854 the joint-stock banks made their way into that body, and in 1906 the numbers were one private bank and eighteen joint-stock banks who joined in the clearing—nineteen banks in all.

Practically at the present time every large transaction in the United Kingdom is settled by cheque, that is, by a series of ledger transfers, notes and specie being but the small change by which the fractional amount is paid. A large proportion of these transactions are arranged through the operation of the London Clearing House. This is facilitated by the fact that every bank in the United Kingdom has an agent in London.

The annual circulation shown by the London Clearing House is more than £1,000,000,000. No one asks what stock of gold is held by the bank on which the cheques are drawn, or what the bank itself keeps on deposit. The whole is taken in faith on a well-founded trust. It is the most easily audited and paper circulation and circulating medium in existence. Like the marvellous tent of the fairy Paribansou, it expands itself to meet every want and then contracts the strain is passed. (See the article by R. H. Inglis Palgrave on "Gold and the Banks," Quarterly Review, January 1906.)

If we add to the returns of the London Clearing House those of the clearing houses in the large towns of England, Ireland, Scotland, and the numerous exchanges which occur daily, and the large number which the different offices of banks with a great many correspondents maintain themselves, the number drawn by one customer of a bank and paid to another may form some conception of the vast amount of the yearly turnover in cheques. This may be roughly estimated to be at least twice as great as that registered by the London Clearing House. The earlier statement as to the clearing is found in the Appendix to the Second Report, Committee of House of Commons, Banks of Issue (1841).

In 1839 the figures of the London clearings were

In 1695, shortly after the establishment of the Bank of England, the Scottish parliament passed an act for the establishment of a public bank. Amongst the first names is that of Thomas Coutts, a name still commemorated in one of the main substantial banks in London. The terms of the establishment were more favourable than those connected with the establishment of the Bank of England, for they obtained the exclusive privilege of banking for twenty-one years without giving any consideration whatever. It may have been the natural caution of the country, or the fact that William III. was then king, which led to the Bank of Scotland being prohibited under a heavy penalty from lending money under any circumstances to the king. It is the only Scottish bank established by act of parliament. The directors began at the earliest possible period to receive deposits and to allow interest thereon, also to grant cash credit accounts, a minute of the directors respecting the mode of keeping the latter being dated so far back as 1720.

Though the system of branches forms now so marked a feature of banking in Scotland, a good many years had to pass before they obtained any hold. It was not until about the year 1700 that the directors of the Bank of Scotland established branches at Glasgow, Aberdeen, Dundee and Montrose, but so little encouragement was given to these branches, the expenses far exceeding the profits arising from them, that the directors resolved to close them. In 1731 another attempt was made, and agencies were established at Glasgow, Aberdeen and Dundee. But after a trial of two years they were discontinued. It was not till 1774 that branches were again established by the bank.

Soon after the establishment of the Bank of Scotland the directors began to issue notes, or, as they were then called, bills or tickets, for £100, £500, £1,000, and £5,000. In 1704 £1 notes were issued for the first time. In 1777 the Royal Bank of Scotland was established by a charter of incorporation,—which granted them "perpetual succession and a common seal." There was a great rivalry between the two companies. The British Linen Company was incorporated in 1746 for the
The purpose of undertaking the manufacture of linen, but by 1763 they found it best to confine their operations to banking transactions. This bank was also incorporated by charter.

The note circulation was always an important item in the Scottish banks. Thus in the case of the Bank of Dundee, the receiving money from the public did not commence till 1792. Up to that time the whole business of the bank from 1764 onwards, twenty-eight years in all, had consisted in its issue of notes, which had varied from about £31,000 to £56,000. The Bank of Dundee was amalgamated with the Royal Bank of Scotland in 1854, when its deposits amounted in round figures to £70,000 and its note circulation to £41,000. After 1792, the money deposited with the banks in Scotland rapidly increased, but the habit of hoarding savings in a chest up to amounts of £10 or £20 continued to a much later period (History of the Dundee Banking Co.).

Private banking never appears to have had any considerable hold in Scotland. In 1819 eight private banks were in existence. These had all disappeared by 1844. In that year the only banks of issue in Scotland, which practically carried on the whole business of the country. There were two other small banks established comparatively recently. These ten banks had, in 1906, 1180 branches.

The history of the growth and expansion of Scottish banking since 1826 is, as far as can be traced, as follows:

<table>

Against every note issued in excess of the limit allowed by the acts of 1844-1845, gold has to be held in the coffers of the issuing banks in Scotland and Ireland. The amount of the specie to be thus held was, as explained by Sir Robert Peel in his speech of the 25th of April 1845, to be ascertained by the average amount of the notes issued in the two weeks preceding. The object of the holding of this amount of specie by the bank which issued the notes was to be caused by Sir Robert Peel to cause the circulating medium of the country, being partly of gold and partly of paper, to fluctuate in the same manner as if it had been a metallic circulation only. This specie held in Scotland and Ireland against the note-issue is not a special security for the note circulation, but is placed in the banks there for this purpose only. The inconvenience arising from the working of a metallic circulation in the earlier part of the 19th century accounts for this legislation, which, as Sir Robert Peel stated in his speech of the 6th of May 1844, was intended "to ensure the uniform equivalency of bank notes to coin." It is not applicable to the present position of the circulating medium of the United Kingdom, which now consists mainly of a circulation of cheques. This differs absolutely from what was contemplated by Sir Robert Peel: no attempt is or can be made to cause such a paper circulation to fluctuate as if it were one of specie only. One result of the limitation of the power of note-issue to the banks in Scotland which possessed that power in 1845 has been that no important bank has been established in that country since. Notes are so largely employed in ordinary business in Scotland that a bank which does not possess the power, practically cannot engage in any business and supply the needs of its customers. This limitation in the number of the banks, however, has not been accompanied by any deficiency in the supply of banking accommodation to the people. There is a larger number of banking offices in proportion to the population in Scotland than in England and Wales or Ireland.

The large number of branches must, however, be a cause of great expense, and in several other respects it is obvious that a business carried on in such thinly peopled districts as are found in any part of Scotland, must be conducted at a disadvantage in comparison with those banks which deal with more active centres of commerce. Although the charges derived from their large issue of notes may be thought to be considerable, yet, when we consider the many expenses incurred in conducting a large note circulation, the cost of printing, stamp duty, and the charges on importing gold from London when the circulation exceeds the limit fixed by the act of 1845, no small deductions must be made from the apparent profit to be derived from this head, if there is any direct profit at all. On the other hand, the great number of branches possessed by the Scottish banks tends beyond doubt to their stability and prosperity. The network of banks on the surface of Scotland is as important to the development of the prosperity of the country as the network of railways. It has been the economy of capital, as the universal practice of people, even of the most moderate means, to lodge their money with the banks.

The early history of banking in Ireland was marked by legislation even less favourable to the formation of a steady and dependable system than in England, and in 1695 several of the principal merchants in Dublin met together for the purpose of forming a public bank for Ireland on the model of the Bank of England. For many years this proposal met with no favour. It was not till 1783 that the Bank of Ireland was established and commenced its business. The first governor was David La Touche, junior, and two other members of his family were amongst the first board of directors. The bank met with very great success, but the jealousy against rival establishments was extreme. By the act forming the Bank of Ireland it was enacted that no company or society exceeding six in number, except the Bank of Ireland, should borrow or take any deposit on their notes of account. This act was so far modified as to permit the establishment of banking companies exceeding six in number at a distance of 50 m. from Dublin. In 1824, in consequence of the ambiguity of that act, an act had to be passed to explain it. It was not till 1845 that the restriction as to the 50-m. limit was withdrawn.

The establishment of any other bank but the Bank of Ireland was for a long time hindered by the legislation on the subject. Some of the restrictions were so extraordinary that it will be interesting to refer to three of the more important acts.

1741, 15 Geo. II.—Partnerships authorized for the purpose of trade and manufacture; but such partnerships were not to exceed nine in number, nor was the capital stock of such co-partnership to exceed, at any time, the sum of £10,000. 1780-1781, 21 and 22 Geo. III.—"Anonymous Partnership Act,"—limited liability not to exceed £50,000, but "business of banking or discounters of money" expressly excluded.

1759, 33 Geo. II.—By this act a person while he continued a banker could not make a marriage settlement on a son or daughter, a grandson or granddaughter, so as to be good against his creditors, though for a valuable consideration, and though such creditors were not creditors at the time the grant was made. This act gave power to creditors over all conveyances by bankers affecting real estates; and all dispositions after the 10th of May 1760 by bankers of real or leasehold interest therein to or for children were made void as against creditors, though for valuable consideration and though not creditors at the time. No banker to issue notes or receipts bearing interest after the 10th of May 1760. Some of these enactments appear to be in force at the present day; suggestions have been made, though apparently unsuccessfully, for their repeal.

So extraordinary were the views of the common people that a banker in Dublin of the name of Beresford having made himself very unpopular, a "large assemblage of ignorant country people having previously collected a quantity of Beresford's notes, publicly burnt them, crying out with enthusiasm while the promises to pay on demand were consuming, 'What will he do now; his bank will surely break.'"

The number of banks which failed in Ireland in earlier times was extraordinary; thus Sir Robert Peel in his speech of the 9th of June 1845 on the Bank Act of that year, made a quotation from a report of the Bank's Committee of Irish exchanges, which sat in 1804. At that period there were fifty registered banks, but they all failed, and their failures, I know personally, led to the most fearful distress." Since the legislation of 1845, however, the business has been carried on with equally extraordinary steadiness and success, and at the present time is on a footing fully equal to that of any other part of the United Kingdom.

The earlier history of banking in Ireland pursued very closely the same process of development as in England. Circulation preceded and fed deposits. The credit which the banks obtained
by the ready acceptance of their notes brought customers to their counters, and thus the existing system, fortunate in excellent managers, was built up gradually and surely.

Alone in the three kingdoms, Ireland maintains the same limit of authorized circulation as that established by Peel's Act of 1845. Not one of the six banks which had the privilege of issue at that period has lost it since.

The names of the banks carrying on business in Ireland, the years when they were established and their position in 1906, are as follows:

* Thus marked are not banks of issue.

Banking crises. These, on the one hand, are world-wide in their scope. On the other they touch every home in the country. The stringency of such a time in England has since the passing of the act of 1844 been greatly enhanced by a doubt being sometimes felt as to whether a relaxation of the act of 1844 would be allowed. In any case, some little time must elapse before the assent of the ministers of the crown to the request of the Bank of England can be known. Since 1844 there have been five periods of pressure,—during 1847, 1857, 1866, 1879 and 1890. Of these, in 1847, 1857 and 1866, the difficulties reached panic.

The crisis of 1847 was brought on by the speculation in railway enterprise which had gone on since 1845. So little had the anxieties of the autumn been anticipated that the bank rate of discount was 3% on the 1st of January. It was raised to 3½% on the 14th and to 4% on the 21st. It became 5% on 8th April, 5½% on 3rd August, 6% on 30th September and 8% on 23rd October. This was the highest. It was lowered to 7½% on 22nd November, on 2nd December to 6% and on 23rd December to 5%. An announcement was made on the 1st of October that advances would be made on public securities. This was followed by general anxiety and alarm.

The reserve of the bank was rapidly reduced to a very low ebb.

</tr>
</tbody>
</table>

Meanwhile the anxiety and alarm prevailing were causing a general hoarding of coin and bank notes, and it really appeared not unlikely that the banking department of the Bank of England might be compelled to stop payment while there was more than £6,000,000 of specie in the issue department. The chancellor of the exchequer (Sir C. Wood, afterwards Lord Halifax) was urged by many deputations and remonstrances to relax the Bank Act, but he declined. At last, on the 22nd or 23rd of October, some of the leading city bankers had an interview with the prime minister (Lord John, afterwards Earl, Russell), and on their explaining the necessities of the position, the desired relaxation was given. The official letter (23rd October) recommended "the directors of the Bank of England, in the present emergency, to enlarge the amount of their discounts and advances upon approved security." A high rate, 8%, was to be charged to keep these operations within reasonable limits; a bill of indemnity was promised if the arrangement led to a breach of the law. The extra profit derived was to be for the benefit of the public. The effect of the government letter in allaying the panic was complete.

The crisis of 1857 was the last occasion of an official inquiry. This is contained in the Report and Evidence of the Select Committee of the House of Commons on the Bank Acts (1857, 1858). The evidence given by Mr Sheffield Neave, the governor, and Mr Bonamy Dobree, deputy-governor of the bank in 1858, gives a vivid picture not only of what occurred, but of what might be expected to recur on such occasions. The wildest alarm prevailed, exchequer bills were scarcely saleable, and the bank itself sold £3,000,000 of government securities at a considerable loss.

The extreme pressure was relaxed by the letter issued by the governor on the 12th of November 1857, signed by Lord Palmerston, then prime minister, and Sir G. C. Lewis, which allowed a temporary relaxation of the Bank Act of 1844. The public alarm, however, was so great that it was not until the 21st of November that the severity of the pressure was in any way diminished. On the 20th of November the notes issued to the public on securities beyond the statutory limit (then £14,475,000) reached the sum of £50,38,000. By the next week the issue was almost down to the limit, and in the week following it was within the limit. On the 1st of January 1858 the bank rate was lowered to 1½% and the anxiety gradually passed away. Had the treasury letters been issued earlier, the pressure might not have been so severe, and the governor of the bank expressed a strong opinion that, if it had been later, it would not have been sufficient. November 1857 was the only occasion when the limits of the Bank Act as to issue were actually passed.

During the crisis of May 1866 £4,000,000 left the bank on one day in notes and coin, and the reserve of the bank was reduced in the return of the 1st of June of that year to £415,000. The bank rate was raised to 10% and permission was given by the government to suspend the act. This, however, was not done. Tradition says that the bank asked the bankers, during the period of heaviest pressure of that terrible crisis—pressure more severe than anything that had taken place before or that has occurred since, to pay in every night the notes they had drawn out in the morning which were still in their till at the close of the day, and that hence the legal limit was never exceeded. But it was not till the 6th of August that the rate was reduced to 8%.

The effect of the crisis of October 1890 was far less severe. This was due to the judgment and skill displayed by the governor (Mr Liddell-dale) and the directors of the bank, who imported £5,000,000 in gold from Paris. The reserve in that year never dropped below £10,000,000, and before the end of November the anxiety had greatly passed away. "Caution prevailed, but not panic, and the distinction is a very clear one." (See arts. on "Crises," Dictionary of Political Economy, vol. i.)

The most important requirement of banking in the United Kingdom is still the establishment of an efficient specie reserve. The reserve in the banking department of the Bank of England averaged:

<table>
<thead>
<tr>
<th>Year</th>
<th>Specie (£)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1845</td>
<td>8,000,000</td>
</tr>
<tr>
<td>1875</td>
<td>11,600,000</td>
</tr>
<tr>
<td>1885</td>
<td>15,100,000</td>
</tr>
<tr>
<td>1888</td>
<td>20,500,000</td>
</tr>
<tr>
<td>1906</td>
<td>23,500,000</td>
</tr>
</tbody>
</table>

This provides but a narrow basis for the whole business requirements of the country. Though much larger than in several previous years, it cannot be regarded as adequate. The figures fluctuate more severely than these decimal averages show, and the progress has not been one of uniform increase. Thus the £15,000,000 in 1885 was followed by £12,700,000 in 1888. The £29,000,000 of 1893 was followed by £34,000,000 in 1896 and £31,700,000 in 1899.

Beyond, or side by side with, the reserve of the Bank of England there are the reserves held by the other banks. Part of these are held in the form of balances at the Bank of England, part in specie and bank notes in their own tills. The latter, hence, are not unlikely to be estimated twice over. The published figures on this point are meagre.

The expectations expressed by Sir Robert Peel in his speech...
on the bank charter and the currency of the 6th of May 1844 have not yet been fulfilled. "I rejoice," he said, "on public grounds, in the hope that the wisdom of parliament will at length devise measures which shall inspire just confidence in the medium of exchange, shall put a check on improvident speculations, and shall ensure the just reward of industry and the legitimate profit of commercial enterprise conducted with integrity and controlled by provident calculation."

The extreme measures which have been required since the act of 1844 have dissolved themselves into the necessity for reform. Three times since the date of the Bank Act of 1844 it has been necessary to give permission for the suspension of the act which forms the very foundation of the monetary system of Great Britain. This, whenever it has occurred, has exercised a very injurious effect on credit abroad, as well as on prosperity at home.

The British money-market, the clearing-house of the world, is, in consequence of the smallness of its reserve, exposed to greater fluctuations than that of any other country. These fluctuations may arise from the need of meeting the requirements of other countries for specie or those arising from domestic trade. The recorded excess of imports over exports, £147,000,000 in 1906, though the difference is eventually balanced by the "invisible" exports, gives foreign nations at times a power over the British money-market greater than has ever previously been the case. The current must always have a tendency to flow outwards; this is enhanced by the great increase in the number of foreign banks which have branches in England. The need of providing sufficient reserves to meet requirements thus occasioned is obvious.

As regards the banks in which British interests are concerned in British colonies and other countries we can only speak briefly. It must not be overlooked that the dominions in the Commonwealth there are 29 banks, many of them large, managed much on the Scottish principle with capitals of nearly £19,000,000 and deposits of about £140,000,000. These banks have been largely furnished with capital and reserves and there are 24 banks with capitals of nearly £18,000,000 and deposits of about £130,000,000. The number of offices is nearly 1700. There are, including the three Presidency banks, about 15 banks doing business mainly in India—in some cases connecting neighbouring countries and places like Bangkok, Hong-Kong and Zanzibar. These banks have capitals of more than £5,000,000 and deposits of fully £36,000,000 and over 210 offices. There are at least 8 banks in South and West Africa with capitals of nearly £5,000,000, deposits of nearly £50,000,000 and nearly 370 offices. There are 5 banks, including the Colonial Bank, in other British territories with capitals of about £2,000,000, deposits of over £21,000,000, and offices of 262. There are thus, besides many private firms doing very considerable business, more than 80 joint-stock British banks working in the colonies and territories amounting to £45,000,000 in deposits £360,000,000 and offices 2580. Outside British territory, there are 6 banks, principally in South America, with nearly £1,000,000 capital, £6,000,000 deposits and about 60 offices. There are 6 large banks, principally in the East, with £6,700,000 in capitals, £77,000,000 in deposits and 106 offices and 7 other banks, including Barings, with about £4,500,000 in capitals and £23,000,000 in deposits. There are thus about 20 British banks doing business in foreign countries with capitals amounting to £15,200,000, deposits £135,000,000 and offices 173.

In this statement we have included only the more important branches which collectively yield about £85,000,000 in deposits and more than £495,000,000 in deposits—in all about £560,000,000 of resources operating at about 3700 offices situated in places as different from each other and as widely separated as California and Hong-Kong, Constantinople and New Zealand.

France.—In France the first bank of issue, originally called the Banque Générale, was established in 1716 by John Law, the author of the Mississippi Scheme and the Systeme. Law's bank, which had been converted into the Banque Royale in 1718, and its notes guaranteed by the king (Louis XV), caused an immense failure in 1721; an attempt at reconstruction was made in 1767, but the bank thus established was suppressed in 1793. Other banks, some issuing notes, then carried on operations with limited success, but these never attained any real power. There were many negotiations on the subject of the establishment of a bank in 1796. The financial difficulties of the times prevented any immediate result, but the advice of those engaged in this plan was of great assistance to Napoleon I., who, aided by his minister Mollen, founded in 1800 the Bank of France, which has remained from that time to the present by far the most powerful financial institution in the country. The objects for which it was established were to support the trade and industry of France and to supply the use of loanable capital at a moderate charge. These functions it has exercised ever since with great vigour and great judgment, extending itself through its branches and towns attached to branches over the whole country. At its establishment and for some time subsequently the operations of the bank did not extend over the whole of France. Departmental banks have therefore been established, and a law adopted in 1803. At the close of 1847 there were nine of these banks existing in as many of the larger towns. In 1848, however, they were absorbed into the Bank of France, which has since possessed an exclusive privilege of issue, and in 1862 took over the Bank of Savoy after that province was united to France.

The Bank of France has successfully surmounted many political as well as financial troubles both during and since the times of Napoleon. The government of Louis Philippe in 1848, the war with Germany in 1870, the many difficulties that followed when the Commune reigned in Paris in 1871, the payment of the war indemnity—not completed till 1873—were all happily overcome. Credit in France has risen gradually in the past years, to render services to large and small businesses and to agricultural industry. In 1877 the offices of the Bank of France were 75 in number; in 1906 they were 447, including the towns "connect" with the branches of the bank, besides operating the bank to the expense of opening a branch, gives the place connected many of the advantages which a branch confers. The quantity of commercial paper discounted in 1906 was over £100,000,000. More than 20,000,000 bills were discounted in 1906, the total number being £599,234,996. The advances on securities were in the same year £105,280,124. The rate of discount in Paris is as a rule lower and the number of alterations fewer than in London. From May 1900 to January 1906 there was no change, the rate remaining uniformly at 3%. Bills as low as 4s. 2d. are admitted to discount, including those below 8s.; about 232,000 of this class were discounted in 1906. Since the 27th of March 1830 loans of as small an amount as £10 are granted. In most cases three "names" must be furnished for each bill, or suitable guarantees or security given, but the necessary safeguards have to be furnished in such a manner as to hamper applicants for loans unduly. In this manner the Bank of France is of great service to the industry of the country. It has never succeeded, however, in attracting deposits on anything like the scale of the Bank of England or the banks of the English-speaking peoples, but it held, as stated in the balance-sheet for the 23rd of December 1906, about £35,000,000 in deposits, of which £14,000,000 was on account of the treasury and £21,000,000 for miscellaneous purposes. The report for 1904 says "each year the movement in these, and this economical and safe mode of effecting receipts and disbursements is more and more assured. I must respect the Bank of France stands at a great advantage in connexion with this branch of its business. The average amount held in this manner for individuals during 1906 was about £23,000,000. The deposits at the Bank on ordinary borrowers numbered 77,159, the average monthly amount was comparatively small. Accounts so subdivided give a great probability of permanence. The figures of the accounts for 1904 were as follows:—

Total 66,569 accounts, against 59,182 at the end of 1903.

At the present time the Bank of France operates chiefly through its enormous note circulation (averaging in 1906 £186,300,000), by means of which most business transactions in France are carried on. The limits of the circulation of the Bank of France and the dates when it has been extended are as follows:

<table>
<thead>

Most business transactions in France are liquidated, not in cheques as in England, but in notes of the Bank of France. These are merely issued to their convenience, are preferred to specie. This is accumulated in the vaults of the Bank of France, which in 1906 held on average £115,000,000 gold and £42,000,000 silver. The banks of the Reichsbank generally carry a considerably larger amount than that held by the Bank of England, which in the autumn of 1890 had to borrow £5,000,000 in gold from the Bank of France at the time of the gold crisis. This and the large amount of deposits is said to have given stability to the trade of France, and has enabled the bank to manage its business without the numerous fluctuations in the rate of discount which are constantly occurring in England. It is true that the rate of discount changes in France, but the large amount of specie imposes a very heavy burden on the shoulders of the shareholders of the bank, but they do not complain. The advantage to business from the low rate of interest which has to be paid for the use of borrowed capital in France is a great advantage to the trade and industry of that country.

The mass of the reserve in France is so great that the movements of specie in and out of the Bank of France are the result only of natural causes, are allowed to go on without corresponding movements in the discount rate. But it must be remembered that this large reserve is held in part against a gigantic note issue, and also that the trade activity and enterprise of the French people are less intense than in either the United Kingdom or Germany; thus it is much easier for the Bank of France to maintain a steady rate of discount.

In France, several government credit institutions carry on business in the country: as the Banque de Paris et des Pays-Bas (capital and reserve, £3,729,000; other liabilities, deposits, &c., £14,842,000), the Banque Francaise pour le Commerce et l'Industrie (capital and reserve, £8,772,000; other liabilities, deposits, &c., £36,570,000), the Comptoir National d'Escompte de Paris (£6,772,000; and £37,593,000), the Societe Generale pour favoriser le developpement du Commerce et de l'Industrie en France (£4,400,000; and £15,380,000), the Societe de Credit Industriel et Commercial (£1,600,000; and £10,060,000).

There is also the Credit Foncier de France with a very considerable capital, but the business done is so largely of mortgages that it can hardly be included among banks, though it carries on in some measure the business of banking.

Besides the six important joint-stock banks mentioned above, there exists in France a large number of banks, principally in the provinces, carrying on a very considerable business. Little is known as to their deposits, but their business appears to be conducted with great prudence and discretion.

One important and earlier institution was the Credit National of the French Country Bankers' Association in 1898. They carry on business in 66 out of the 86 departments into which France is divided. More than one of these banks has several offices—one possessing 18, including the head office. These branches are situated in the small towns in the vicinity. In this the business follows more the English method of small branches. The French Country Bankers' Association holds its meetings in Paris, where the notes of these banks are drawn against, these, but in Germany notes are principally used in payments for ordinary business.

Before the Reichsbank was established, Hamburg was the first, and for a long time the only, example of a clearing bank in Germany. This was taken up by the Reichsbank when it established its office in Hamburg in 1876 and began the business which had belonged to the Hamburg Clearing House. Similar business had long been undertaken by the Bank of Prussia. This was absorbed and developed by the Reichsbank in 1876. Through the "clearing system," or system of "clearing," as it is called in Germany, the Reichsbank is an office of the Reichsbank, to any of these places, without charge either to the sender or the receiver. It is sufficient that the person to whom the money is to be remitted should have an account at the bank. Any person owing him money in the remotest parts of the empire may go to the office of the bank which is most convenient to him and pay in the amount of his debt, which is credited on the following day at the office of the bank, without charge, to the account of his creditor wherever he may reside. The person who makes the payment need not have any account with the bank. The impetus given to business by this arrangement has been very considerable. It has many advantages over the ordinary method of payment by ordinary postal order with risk of loss in transmission. From Hamburg and Bremen to the frontiers of Russia, from the shores of the Baltic to the frontiers of Switzerland, the whole of the empire of Germany has thus become an integral part of the Reichsbank. The note circulation is a powerful factor of the business of the bank. It has been steadily increased by the money-issuing law of 1896, corresponding in some degree to Peel's act of 1844, which regulates the note circulation of the Bank of England. An unlimited limit, originally £2,500,000, increased to £14,841,450 by the lapse of the imperial gold standard, has been extended by these and by the act of the 5th of June 1902 to £23,641,450. Against the notes thus issued which are not represented by specie, treasury notes (Reichskassenscheine), the legal tender notes of the
Banks and Banking

H. Inglis Palgrave, London, 1876 (printed for the Treasury, 1875); The Circulation of the Currency (Washington).

Empire, 1) and notes of the issuing banks which are allowed to be reckoned as specie or discounted bills, must be held—maturity not later than three months after being taken—by a rule, three, but never less than two, good indorsements. There is also a provision that in the event of the Reichsbank having surpluses covered by current German notes, money, notes of the imperial treasury, and gold in bullion or foreign coin reckoned at $89, 12s. 6d., the Reichsbank is to pay for the payment of its obligations in gold, though the importance of this is admitted. In the balance-sheet for 1906 the bills held amounted to $29,000,000, and the notes of the Reichsbank in current German money. It is stated that this may be gold coin or silver thalers, or bar-gold at the rate of 1392 marks ($89, 12s. 6d., marking cards as = $1) the pound fine of gold. In practice, however, this has not always been given by the Reichsbank, the payment of 5% on the surplus. In this respect the German act differs from the English act, which allows no such automatic statutory power of overpassing the limit of issue. Some good authorities consider that this arrangement is an advantage for the German bank, and the fact that it has been made use of annually since 1893 appears to show that it is needed by the business requirements of the country. In recent years the excess of issue in gold and silver has been annual and large, having been £25,267,000 on the 29th of September 1906 and £28,632,000 on the 31st of December of the same year. The amount of the paid-up issue in the excess of issue in gold and silver, and the surplus paid for the Reichsbank, to 1906 was £839,052. The increase of the uncovered limit (unlimited liability not covered on the Reichsbank in Germany the "note reserve") has been insufficient to obviate the need for an excess of issue beyond the limit. In fact, the bank had not been able to pay redeeming notes (Reichsbanknotes) of the value of 20 marks (f1), and 50 marks (f2, 10s.) in addition to the 5, 10, 100 and 1000 mark notes (f5, f10, f100, f1000). In 1905, the value of 20 or 50 marks (f1 and f2, 10s.) had previously existed only in the form of treasury notes (Reichskassenscheine); these will in consequence be withdrawn from circulation.

The amendment of the banking law of Germany, passed in 1890, not only affects the position of the Reichsbank, but that of the four other note-issuing banks. The capital of the Reichsbank has been raised by a bill of that year to 60,000,000. The maximum figure has been reduced from D30,000,000 to D20,000,000. This excites the amount required by the act of 1890, which was £3,000,000. The amending act further diminishes the dividend receivable by the stockholders of the Reichsbank and increases the share which the government will obtain.

The arrangement with the four other-issuing banks is designed to cause them to work in harmony with the Reichsbank when the Reichsbank, has to raise rates, but does not necessarily protect its gold reserves. The official published rate of discount of the Reichsbank is to be binding on the private note-issuing banks after it has remained for six hours at that rate. The Reichsbank has to pay at a discount at more than 1% below the official rate of the Reichsbank, or in case the Reichsbank itself discounts at a lower rate than the official rate, at more than 1% below that rate. If the Reichsbank discounts below the official rate, it is to announce that fact in the Gazette.

The subject being important, we quote from the amending act the sections governing the discount rate—Gesetz, betreffend die Abänderung des Bankgesetzes vom 14. März 1893; vom 7. Juni 1890. Artikel 7, S. 1. The private note-issuing banks are bound by Artikel 7, S. 2, after the 1st of January 1901:—'(1) Not to discount below the rate published in S. 15 of the bank law, so long as this rate attains or exceeds 4%, and (2) moreover, not to discount at more than 1% below the Reichsbank rate, published in S. 15 of the bank law, or in case the Reichsbank itself discounts at a lower rate, not to discount at more than 1% below that rate.'

It remains to be seen whether the note-issuing banks will find these conditions too onerous, and rather than be bound by them will give up their right of issuing notes. The official published rate of discount is meant to protect the special reserve of the Reichsbank, but it may be doubted whether, considering the importance of the other banks of Germany—none of which is bound by similar conditions relative to the note-issuing banks, the restrictions put on the note-issuing banks will have any practical effect.

Since 1870 banking has made immense progress in Germany, but it may be some time before the habit of making payments by cheque instead of cash becomes general.

Authorities.—Parliamentary Papers: Report, together with Minutes of Evidence and Accounts, from the Select Committee on the High Price of Gold Bullion, House of Commons, 8th June 1890;
BANKS AND BANKING

The bank did much, during the first eight years after its organization, to restore order to the chaos of Federation finances. It loaned to Morris, as government superintendent of finance, $1,249,975, of which $906,581 was repaid in cash and the remainder by surrendering the stock in the bank owned by the government.

The Bank of the United States.—A national bank of issue was one of the essential parts of the system built up by Alexander Hamilton in organizing the finances of the Federal government under the constitution of 1789. The "Bank of the United States" was accordingly incorporated in 1791, with a capital of $10,000,000, divided into 25,000 shares of $400 each. This bank issued circulating notes, discounted commercial paper and aided the government in its financial operations. The government subscribed one-fifth of the capital, but paid for it by a roundabout process which actually resulted in the loan of the amount by the bank to the treasury. Other loans were made by the bank to the government, which gradually carried the obligation by the end of 1795 to $6,000,000. In order to meet these obligations, the government gradually disposed of its bank stock, until by 1803 its entire holdings had been disposed of at a profit of $671,860. The bank did not publish regular reports, but a statement submitted by Gallatin to congress for January 24, 1811, showed resources of $24,183,046, of which $14,578,294 was in loans and discounts, $2,750,000 in United States stock and $5,995,676 in specie.

The expiration of the charter of the bank in 1811 was the occasion of a party contest, which prevented renewal and added greatly to the financial difficulties of the government in the war with Great Britain which began in the next year. Although foreign shareholders were not permitted to vote by proxy, and the twenty-five directors were required to be citizens of the United States, the bank was attacked on the ground of foreign ownership as well as on the constitutional ground that congress had no power to create such an institution.

The government was compelled in the war of 1812 to rely on the state banks. Their suspension of specie payments, in 1814, made it very difficult for the treasury to transfer funds from one part of the Union to the other, because the notes of one section did not circulate readily in another. Gallatin left on record the opinion, that the suspension of specie payments "might have been prevented at the time when it took place, had the former Bank of the United States been still in existence."

The financial condition of the government became so bad during the war that the second Bank of the United States was authorized in April 1816. The general project was that of Alexander J. Dallas, who in October 1814 had become secretary of the treasury. The capital of the new bank was $35,000,000, and the government again appeared as owner of one-fifth of the stock, which was paid in a stock note. The president and other officers of the United States were authorized to appoint five of the twenty-five directors and public funds were to be deposited in the bank, "unless the secretary of the treasury shall at any time otherwise order and direct." The right of congress to charter the bank came before the Supreme Court in 1819 in the famous case of McCulloch v. Maryland. Chief Justice Marshall rendered the decision that the right to create the bank was within the implied powers granted by the Federal constitution, and that it was not competent for the states to levy taxes upon the circulating notes of the bank or upon its property except in common with other taxes.

The second Bank of the United States was not well managed in the early part of its career, but was upon a firmer foundation under the presidency of John Adams in 1819. Its policy greatly benefited commerce, but invited bitter complaints from the private dealers in exchange, who had been enabled to make excessive profits while the currency was below par, because of its different values in different states and the constant fluctuations in these values. The Bank, in the language of the report of Senator Samuel Smith of Maryland in 1832, furnished "a currency as safe as silver, more convenient, and more valuable

The early history of the American colonies is strewn, like that of most new countries, with many crude experiments in banking and currency issues. Most of these colonial enterprises, however, were projects for the issue of paper money rather than the creation of commercial banks. Speculative banking was checked to a large extent in the colonies by the Bubble Act (6 Geo. I. c. 18), which was passed in England after the bursting of the South Sea Bubble. This act, which forbade the formation of banking companies without a special charter, was in 1740 extended to the colonies.

The serious history of banking in the United States may be said to have begun with the foundation of the Bank of Pennsylvania. This bank originated in the project of a number of the citizens of Philadelphia to supply the continental army with rations. The first bills, issued in 1780, were nothing more than interest-bearing notes payable at a future time. The advances in continental money made by the shareholders were secured by bills of exchange for £50,000, drawn on the American envoy in Europe, but not intended to be negotiated.

A further growth of the needs of the continental government was the Bank of North America, which was authorized by congress on May 26, 1781. The act gave to Robert Morris, the financier, power to create a bank with a capital of $400,000, to be increased if desirable. Morris arranged with the Bank of Pennsylvania to take over its holdings of foreign bills and paid in cash its claims against the Federation. The Bank of North America did not begin business until the 7th of January 1782, and there was so much doubt of the power of the continental congress to charter a bank that it was thought advisable to obtain a charter from the state of Pennsylvania. Under this charter the bank continued to operate until it was absorbed in the national banking system in 1863, and it may be considered the oldest organized banking institution in the United States.
than silver, which through the whole western and southern and interior parts of the Union, is eagerly sought in exchange for silver; which, in those sections, often bears a premium paid in silver; which is, throughout the Union, equal to silver, in payment to the government, and payments to individuals in business. The bank in 1835 had attained a circulation of $230,754,422 loans of $59,323,445; and deposits of $506,436. The institution was ultimately destroyed by the open enmity of President Jackson, who in 1833 had suspended the deposit of public money in its custody. This policy known as the "removal of the deposits," excited a bitter political controversy in which Clay and Webster led the opposition, but Jackson was supported by the public (see Jackson, ANDREW). The Federal charter of the bank expired in 1836. Under a charter obtained by President Nicholas Biddle from the state of Pennsylvania, the bank continued its business, but without success, and in 1841 it went into liquidation.

The State Banks.—The Bank of the United States found powerful rivals during its life and successors after its death in the banks chartered by the separate states. In the undeveloped state of the country in the early days there was much unsound and speculative banking. The most successful systems were those of New York and New England, where the surplus capital of the country in the early days was chiefly concentrated. The least successful banking systems were those in the newer and poorer sections of the country, and they grew progressively worse as poverty and insecurity added to the difficulty of setting aside capital for investment in the tools of exchange. The termination of the first charter of the Bank of the United States was followed by a banking mania. In Pennsylvania, a bill authorizing 41 new banks was passed over the veto of the governor, and 37 of them were in operation in 1814. Similar movements in other states increased the number of banks in four years (1811-1815) from 88 to 208. The amount of specie was not adequate to support the mass of credit which these banks created, and what there was in the country drifted to New England, which was upon a metallic basis. A number of banks collapsed in 1814, and business prostration was prolonged for several years. The banking laws of the states varied considerably. Some states authorized the issue of notes upon state bonds, many of which, especially at the outbreak of the Civil War, proved valueless. In New England, however, a system prevailed which required the prompt redemption of the banks' notes at par. The New England Bank was the pioneer of this movement in 1814. In 1824 what was known as the "Suffolk system" of redemption came into operation. This system provided for the deposit by a bank in the Suffolk Bank in Boston of a redemption fund, from which the notes were redeemed and afterwards sent home by the Suffolk Bank for collection. This system, with slight modifications, continued in successful operation until 1838. The circulation of the New England banks in 1858 was less than $400,000,000 and the redemptions in the course of the year through the Suffolk Bank were $400,000,000. It was the essential merit claimed for the system that it tended to keep the volume of the circulation constantly adjusted to the requirements of business. A branch redemption agency was established at Providence. Legal sanction was given to the system in Vermont by an act of 1842, which levied a tax of 1% upon bank capital, but required this tax to any bank which should "keep a sufficient deposit of funds in the city of Boston, and should at that city uniformly cast its bills to be redeemed at par."

The period from 1836 to 1842 was a trying one for American banking. It was preceded by another great expansion in financial ventures, made without sufficient circulating capital or adherence to conservative banking methods. Foreign capital had come into the country in considerable amounts after the English crisis of 1825, the entire debt of the general government was paid off and a tremendous speculation occurred in public lands, which were expected to advance rapidly in value as the result of immigration and the growth of the country. The sales of public lands in 1836, on the eve of the crisis, reached 20,974,870 acres and brought receipts to the treasury of $25,167,833. How essentially speculative was the mass of these sales is indicated by the fact that such receipts declined in 1842 to only $1,417,972. President Jackson pricked the bubble of speculation by the "Specie circular" of July 11, 1836, requiring payments for public lands to be made only in specie or notes of specie value. Practically every bank in the Union stopped payments, and the capital fell from $358,442,692 in 1835 to $106,894,359 in 1846. As usual in periods of depression, the circulation of capital did not follow at once the outbreak of the panic, but was the result of gradual liquidation. Specie payments were resumed in 1838, but there was another crash in 1842, after the United States Bank finally suspended.

In New York, which was becoming the chief commercial state of the Union, the banks of New York City were generally sound, but several different systems were tried of securing the circulating notes. The "safety-fund system," inaugurated in 1819, provided for a contribution by each bank towards a fund to meet the failed to maintain capital which might fail with assets insufficient to meet its liabilities. It was the intention of the act to protect by this fund only the bank-notes, but it was treated as a fund for the payment of all the liabilities of a failed bank and in consequence the fund was exhausted by important failures which occurred in the panic of 1837 and 1838. Before 1843 the issue of notes was not controlled by the state, so that in several cases there were illegal over-issues. What was called the "free-banking system" was inaugurated in New York by the act of 1838. This system permitted any person to issue bank notes under the requirements of the law, to form a bank and issue circulation secured by the deposit of various classes of public bonds. This system was in operation at the outbreak of the Civil War, was imitated in several other states, and came in a measure the model of the national banking system. The state banks of Indiana and Ohio were among the most successful of the state banks, being modelled somewhat on the European plan of a central bank. They hold in their states an exclusive charter for issuing notes and had branches at important points throughout the state. Under the management of Hugh McCulloch, afterwards secretary of the treasury, the state banks of Indiana and Ohio were, in 1857, without suspending specie payments, and retired its circulation when gold went to a premium in 1852. One of the defects of the state system of note-issues was the inconvenience which it occasioned. Notes issued outside a state could not safely be received without careful scrutiny as to the responsibility of their issuers. The systems prevailing in New England, in Louisiana, in Ohio and in Indiana were eminently successful, and proved the soundness of the issue of bank-notes upon the assets of a well-conducted commercial bank. But the speculation fostered by loose banking laws in some other states, and the need for uniformity, cast a certain degree of discredit upon the state banks, and prepared the way for the acceptance of a uniform banking system in 1864.

The power of note-issues formed a more important part of banking resources before the Civil War than in later years, because the deposit system had not attained its full development. Thus in 1835 circulation and capital of state banks combined were about $335,000,000 and deposits were only $83,000,000 in 1867 circulation and capital of national banks $1,430,000,000, while deposits were $4,322,000,000 in the earlier period deposits forming less than one-third of the other two items and in the later period three times the other items. The circulation of the state banks fluctuated widely at different periods. A maximum of $149,185,800 was attained in 1837, to decline to $106,668,572 three years later and to a minimum of $5,563,608 in 1843. From this point there was a tendency upward, with some variations, which put the circulation in 1845 at $89,608,711; 1848, $125,506,091; 1850, $1,316,366,526; 1854, $200,680,070; 1856, $1,955,474,950; 1858, $1,552,680,344; 1860, $207,102,477; 1863, $236,857,218. Other leading items of the accounts of the state banks for representative years are as follows:—
The National Banking System.—The creation of the national banking system was mainly the outcome of the financial necessities of the Federal government in the Civil War. It was found difficult to float government bonds at profitable rates, and Mr. Chase, the secretary of the treasury, devised the scheme of creating a compulsory market for the bonds by offering special privileges to banks organized under Federal charters, which would issue circulating notes only when secured by the deposit of government bonds. But this plan, authorized by the act of 25th February 1863 (supplemented by the act of 3rd June 1864), was not sufficient to give predominance to the national banks. The state banking systems in the older states were so firmly entrenched in the confidence of the commercial community that it became necessary to provide for imposing a tax of 10 per cent upon the face-value of the notes of state banks in circulation after the 1st of July 1866. The state banks were thus driven out of the note-issuing business, some being converted into national banks, while others continued their commercial business under state laws without the privilege of note-issue. A remarkable growth in the national banking system took place; in 1864 there were 453 national banks with an aggregate capital of $79,366,950, and in 1865 there were 1,014 banks with an aggregate capital of $142,542,982.

The national banking system was specially marked by the issue of circulating notes upon United States bonds. Any national bank desiring to issue notes might by law deposit with the United States treasurer bonds of the United States to an amount not exceeding its capital stock, and upon such bonds it might receive circulation equal to 90 per cent of their par-value. No bank could be established which did not invest one-third of its capital in bonds. This was changed in 1874 so as to reduce the requirement to 25 per cent, with a maximum mandatory requirement of $50,000. These limits were raised at the rate of 1 per cent per annum. The banks obtained from the provision for circulation the benefit of what was described by critics as "double interest," being credited with the interest on bonds in the custody of the treasury department, and being also able to lend their notes to the public. But several deductions had to be made: notes could not be issued to the full par-value of the bonds; the tax of 1 per cent upon circulation reduced by that amount the profit which would otherwise be earned; and the banks had to set aside in gold or other lawful money what was needed for redemption purposes and for reserves. As the banks suspended specie payments at the close of 1867 and great masses of government paper-money were issued, gold ceased to be a medium of exchange except in California, and the new banks redeemed their notes in government paper. The gold-value of the bank-notes, therefore, rose and fell with that of government notes until the resumption of payments in specie by the national treasury on the 1st of January 1879.

The amount of bank-notes in circulation proved in practice to be influenced largely by the price of bonds. The maximum originally set for bank circulation was $300,000,000. This was increased in 1870 to $540,000,000, and in 1873 the limit was removed. The circulation reached $626,657,169 on the 1st of January 1883, but afterwards declined materially as bonds became scarce and the price rose. The fact that circulation could be issued to only 90 per cent of the par-value of the bonds greatly reduced the net profits on circulation when the price of 1 per cent of bonds rose in 1889 above 129 and other classes of bonds rose in like ratio. The circulation of bank-notes fell as low as $167,977,574 on the 1st of July 1891, but afterwards increased somewhat as the supply of bonds was increased to meet the treasury deficiencies of 1894-1896 and the expenses of the war with Spain.

The national banks supported the government cordially in the measures taken to bring about resumption of gold payments on the 1st of January 1879 under the law of 1875. The banks held more than $125,000,000 in legal tender notes, of which sum nearly one-third was held in New York City. A run upon the treasury for the redemption of these notes would have exhausted the gold funds laboriously accumulated by secretaries Sherman and compelled a new suspension. But the banks appointed a committee to co-operate in the treasury's effort to receive gold longer as a special deposit, and resolved to receive and pay balances without discrimination between gold and government notes. Thus resumption was accomplished without jar, and as early as the 17th of December 1878 gold sold at par in paper.

The silver legislation enacted by Congress in 1878 and 1890 caused uneasiness in banking circles, and the banks discriminated against silver dollars and silver certificates in their cash. When the treasury began to lose gold heavily, however, in 1893, a combination of leading bankers in New York, Boston, Philadelphia, Baltimore, and other large cities turned over a large part of their holdings to replenish the government reserves. About 150 national banks suspended during the panic of 1893, but 84 of these afterwards resumed business. As in former periods of depression, the system suffered the greatest decline during the years of liquidation following the actual panic, the number of banks falling from 3,924 on the 1st of June 1893 to 3,285 on the 1st of June 1899, and aggregate capital falling during the same period from $685,546,605 to $610,028,805.

A new extension was given to the national banking system by the provisions of the gold standard law of 1894. Banks were authorized to issue circulation to the full par-value of bonds deposited, and the tax upon circulation was reduced from 1 per cent to 1 per cent in the case of circulation which was secured by the 2 per cent refunding bonds, which were authorized by this law. By issuing 2 per cent bonds in exchange for those paying a higher interest, at approximately the market-price, it became possible to obtain a given amount of notes upon a smaller investment in bonds, independent of other provisions of the law. Under these provisions the volume of notes outstanding, secured by bonds, which stood on the 31st of October 1899 at $207,920,774, reached on the same date in 1900 $249,046,530, in 1903 $315,783,187; in 1905 $380,650,827; in 1904, $424,450,581; in 1905, $490,037,806; in 1906, $536,033,169; and in 1907 $627,727,614.

The lowest denomination of national bank-notes authorized by law is $5, and not more than one-third of any bank's issues can be of this denomination. The government issues notes for $1 and $2, as well as for higher denominations. The largest amount of bank-notes of one denomination is in bills for $1, which on the 31st of October 1907 constituted $249,046,530 in total outstanding issues of $669,905,441. Of this total circulation $595,227,614 was secured by bonds, and the remainder, $47,232,555, was covered by lawful money in the government treasury, deposited for the redemption and retirement of the notes as they might be received.

An important extension of the national system resulted from the authority given by the act of 1900 to incorporate national banks with a capital as low as $25,000, in places having a population not in excess of 3000. The previous minimum limit had been $50,000. Under this provision there were incorporated to the 31st of October 1907 2380 national banks with capitals of less than $50,000, with aggregate capital of $249,046,530, of which 227 banks were conversions of state and private institutions, 752 were reorganizations and 1365 were new institutions.

The national banks possess most of the powers of commercial banks, but are not permitted to hold real estate other than their banking houses, unless taken for debt. Five reports are required each year to the comptroller of the currency in dates selected by him without notice, and each bank is subject to the visitation of bank examiners acting under the comptroller. No reserves against notes are required by existing law except 5 per cent, which is

kept in Washington for current redemption purposes. The redemption system is defective in that redemptions are not authorized at other places, and the notes reach the treasury on an average only about once in two years. For many years the banks were prohibited from retiring more than $3,000,000 of notes monthly, but the limit was raised by an act of 4th March 1907 to $9,000,000 per month.

Reserves are required against deposits to the amount of 25% in so-called "reserve cities," and 15% in what are called the "country banks" outside of reserve cities. Not all these amounts, however, are required to be kept in cash. The three central reserve cities, where cash is required, with only trifling deductions, are New York, Chicago and St Louis. In other reserve cities, which in 1908 numbered forty, the banks are permitted to deposit half their cash in national banks in central reserve cities, while country banks may deposit three-fifths of their cash in any reserve city. The shareholders of national banks are subject in case of liquidation to double liability upon their own notes, and this is now the rule in almost all state banking systems. National bank-notes are not legal tender, but are receivable by the government for all obligations except customs dues.

The panic of 1907 imposed a severe strain upon the cash resources of the banks of New York City, but did not cause any such considerable number of failures as occurred in 1893. Payment of cheques in currency was suspended in New York on the 28th of October 1907, and continued until about the beginning of the year 1908. The panic was precipitated by over-speculation in the gold market and a general turn of public confidence, which, on the 25th of September, 1907, was accompanied by a rise in the rates of discount in the new york Stock Exchange which left many brokers without sufficient margin to maintain their operations.

The combined returns of state and private banks, savings banks and loan and trust companies in the United States show a growth within a few years which is indicated by the principal items of their accounts:

The aggregate banking power of the United States, as computed by the comptroller of the currency in his annual report for 1907, increased from $5,159,000,000 in 1890 to $7,824,800,000 in 1907, and the banking power of foreign countries from $10,835,000,000 to $27,034,200,000, representing an increase for all reporting countries from $6,995,000,000 to $34,859,000,000.

The system of clearing cheques has attained a higher development in the United States than in any other country, except perhaps, Great Britain. Clearing-houses exist in about 112 leading cities, and the aggregate clearings for the year ending 30th September 1907 reached $354,662,515,258. The New York Clearing-House inevitably does a large proportion of this business; its clearings constituted in 1907 67% of the total clearings in $5 of the larger cities. The volume of clearings fluctuates greatly with the volume of stock-exchange transactions and with the business prosperity of the country. An indication of these fluctuations at New York is afforded by the following table, taken from Coman's Principles of Money and Banking, brought down to 1907.

The Clearing-House Committee of the New York Clearing-House exercises a powerful influence over the banking situation through its ability to refuse aid in emergencies to a bank which is insolvent. This power was used in the panic of 1907 to eliminate several important, but speculative, financial interests from control of national banks. Only. National and state banks and the sub-

Treasurers were members of the Clearing-House at this time. Their weekly reports of condition were awaited every Saturday as an index of the state of the money-market and the exchanges; but this index was incomplete and sometimes misleading, because regular weekly reports were not made by trust companies. It was announced early in 1908 by the state superintendent of banking that he would exercise a power vested in him by law to require weekly reports in future from trust companies, so that the two classes of reports would present a substantially complete mirror of banking conditions in New York.

For statistical information concerning the annual reports of the comptroller of the currency of the United States, published annually at Washington.

ENGLISH LAW AFFECTING BANKS AND THEIR CUSTOMERS

ISSUE OF NOTES.—The legislation which culminated in the Bank Charter Acts of 1844 and 1845 secured to the Bank of England the absolute monopoly of the note issue within the city of London and a 3-m. radius. Outside that radius, and within 65 m. of the city, there is a concurrent right in banks, consisting of six or less than six persons, established before 1844, and issuing notes at that date; beyond the 65-m. radius the privilege may be exercised by all banks established before 1844, and then issuing notes, who have not since lost their right to do so by bankruptcy, abandonment of business, or temporary suspension of issue. According to some authorities, the effect of 20 and 21 Vict. cap. 49, sec. 12 (re-enacted Companies Consolidation Act 1908, sec. 286 (d)) was to sanction the increase in the constitution of any bank issuing notes outside the 3-m. and within the 65-m. radius, by the addition of non-existent persons, as noted in the preceding note notes. The rule as formulated above is, however, that enunciated by Bowen J. in Capital and Counties Bank v. Bank of England, 1899; 61 L.T. 516. The increase in the number of joint-stock banks and the gradual absorption of the smaller and older concerns have had the effect of minimizing the output of notes other than those issued by the Bank of England, and, as exemplified by the case of The Attorney-General v. Birkebeek, 12 Q.B.D. 57, it would seem impossible to devise any scheme by which the note-issuing power of an absorbed bank could be continued to the new or amalgamated body. But a bank having the right would not necessarily lose it by absorbing other banks (Capital and Counties Bank v. Bank of England). Foreign banks may establish branches in Great Britain on complying with the regulations imposed on them by the Companies Consolidation Act 1908, but cannot apparently issue notes, even though payable abroad.

Deposit Business.—The term "bank of deposit" gives a mistaken idea of the real relation between banker and customer. So long ago as 1848 it was decided by the House of Lords in Foley v. Hill, 2 H. L. 28, that the real relation between banker and customer was that of debtor and creditor, not in any sense that of trustee and cestui que trust, or depositor and depositor, as had been formerly supposed and contended. The ordinary process by which a man pays money in to his account at his banker's is in law simply lending the money to the banker; it fixes the banker with no fiduciary relation, and he is in no way responsible to the customer for the use he may make of the money so paid in. And as of the banker's debt, a customer's right to recover money paid in is barred on the expiration of six years by the Statute of Limitations, if there has been no payment meantime on account of principal or interest, and no acknowledgment sufficient to bar the statute (Poll v. Clegg, 16 M. & W. 321). Such a state of affairs, however, is hardly likely to arise, inasmuch as, in the absence of specific appropriation, earlier drawings out are attributed to the earlier payments in, as in the ordinary case of current accounts, and so the items on the credit and debit side cancel each other. An apparent exception to this system of appropriation exists in cases where a man wrongly pays into his own account moneys held by him in a fiduciary capacity. In such circumstances he is presumed to have drawn out his own moneys rather than those affected by the trust, and so long as the account is in credit, any balance will be attributed to the trust money. As between contending claims to the money, based on different breaches of trust, the ordinary rule of appropriation will apply.

It has often been suggested that the only method of withdrawing money from a banker is by cheque, but that the presentation of a cheque is a condition precedent to the liability of the banker. This is not the case. Cheques are not being inconsistent with the cases establishing the effect of the Statute of Limitations on money left in a banker's hands, and with the numerous cases in which a balance at a bank has been attached as a simple and unconditional debt by a garnishee order, as, for instance, in Rogers v. Whiteley, 1892, A.C. 118. The banker's position with regard to cheques is that, superadded to the relation of debtor and creditor, there is an obligation to honour the customer's cheques provided the banker has a sufficient and available balance in his hands for the purpose (Foley v. Hill). If, having such funds in his hands, the banker dishonours a cheque, he is liable to the customer in substantial damages without proof of actual injury having accrued (Rolin v. Steward, 14 C.B. 595). Where several cheques are presented simultaneously and the available balance is insufficient to pay all, the banker should pay as many as the funds will cover, and is not bound to discriminate between particular cheques. It would seem a legitimate condition that a cheque should be drawn in the ordinary recognized form, not in one raising any question or doubt as to its validity or effect. Cheques drawn to "wages or order," "petty cash or order," or the like, are common, and are sometimes regarded as payable to bearer. Such payees are not, however, sufficient or adequate, and are not considered to be entitled to issue notes. The same cheques payable to the bearer under sec. 7, subs. 3 of the Bills of Exchange Act 1882, nor can such payees endorse. Some banks refuse to pay such cheques, and it is conceived they are justified in so doing. Money paid in so shortly before the presentation of the cheque that there would not have been time to pass it through the books of the bank would not be treated as available for drawing against. If a person have an account at one branch of a bank, he is not entitled to draw cheques on another branch.
where he has either no account or is overdrawn, but the bank has, as against the customer, the right to combine accounts at different branches and treat them as one account (Garnet v. McEwen, L.R. 8 Ex. 10). Funds are not available so long as a garnishee order, founded on a judgment against the customer, is pending, since it attaches all moneys on current account irrespective of the amount of the judgment (Rogers v. Whiteley).

The very questionable practice of post-dating cheques has been the source of considerable trouble to bankers. The use of such documents enables the drawer to obtain the results of a bill at a fixed future date without the expense of a regular bill-stamp. But the Bills of Exchange Act 1882, sect. 13, subs. 1, provides that "a bill is not invalid by reason only that it is ante-dated or post-dated, or that it bears date on a Sunday." The banker cannot therefore refuse to pay a cheque presented after the apparent date of its issue on the ground that he knows it to have been post-dated. On the other hand, he is entitled and indeed bound to refuse payment if such a cheque is presented before the apparent date of its issue (Morley v. Cundall, 7 M. & W. at p. 178). Reasons why a banker must pay a cheque must come to the banker's conscious knowledge and be unequivocal both in terms and method of communication. He is not bound to act on an unconfirmed telegram (Curticke v. London City & Midland Bank [1908], 1 K.B. 293). The banker's authority to pay cheques is terminated by the death, insanity or bankruptcy of the customer, or by notice of an available act of bankruptcy committed by him.

The banker is bound to observe secrecy with respect to the customer's account, unless good cause exists for disclosure, and the banker has not, unless compelled to do so, disclosed the customer's account (Hardy v. Vasey, L.R. 3 Ex. 107). In England a cheque is not an assignment of funds in the banker's hands (Bills of Exchange Act 1882, sect. 53). The holder of the cheque has therefore no claim on the banker in the event of payment being refused, his remedy being against the drawer and endorser, if any. On this section is also based the custom of English bankers not to pay part of the amount of a cheque where there are funds, though not sufficient to meet the whole amount. The section does not apply to Scotland, where it would seem that the bank is bound to pay over what funds it has towards satisfaction of the cheque. A banker is entitled to hold paid cheques of any payees until there has been a settlement of account between him and the customer. The entries in a pass-book constitute prima facie evidence against the banker, and when returned by the customer without comment, against him; but the proposition that such return constitutes a settlement of account has been much disputed. Indeed where forgery is the ground of repudiation of a cheque, no dealings or omissions of the customer with regard to the pass-book would seem to preclude him from objecting to being debited and throwing the loss on the banker (Erspettigale Rubber Co. v. National Bank of India, 25 Times L.R. 407). As against the banker, however, credit entries in the pass-book cannot be disputed if the customer has altered his position in reliance thereon, and cheques drawn against an apparent balance must be honoured (Holland v. Manchester & Liverpool District Bank, 25 Times L.R. 186).

The rule by which the holder of a cheque has no direct recourse against the banker who dishonours it, holds good even where the banker has before issue marked the cheque as good for the amount, such marking not amounting to an acceptance by the banker. As between banker and banker, however, such marking or certifying probably amounts to a binding representation that the cheque will be paid, and, if done by request of the drawer, the latter cannot subsequently revoke the authority to pay. In certain circumstances, marking at the instance of the person presenting the cheque for payment may amount to an undertaking by the banker to hold the money for his benefit (In re Beaumont [1902], 1 Ch. p. 895).

A banker either paying or collecting money on a cheque to which the person tendering it for payment or collection has no title or a defective title is prima facie liable to the true owner for conversion or money had and received, notwithstanding he acted in perfect good faith and derived no benefit from the operation. Payment of an open cheque, payable to bearer either originally or by endorsement, is, however, in all cases a good payment and discharge (Charles v. Blackwell, 2 C.P.D. at p. 158). Limited protection in other cases has been extended by legislation to the banker with regard to both payment and collection of cheques, usually on the principle of counterbalancing some particular risk imposed on him by enactments primarily designed to safeguard the public.

The relevant provisions of the Stamp Act 1853, the banker paying a draft or order payable to order on demand, drawn upon him, was relieved from liability in the event of the endorsement having been forged or unauthorized. This enactment was not repealed by the Bills of Exchange Act 1882, and, in London City & Midland Bank v. Gordon (1903), A.C. 240, was held to cover the case of drafts drawn by a branch of a bank on its head office. Sec. 60 of the Bills of Exchange Act 1882 extends like protection to the banker in the case of cheques, the definition of which therein as "bills drawn on a banker payable on demand" debar drafts of either an uncrossed cheque or a crossed cheque without the unconditional character of the instrument, also precludes from the protection of this section the documents now frequently issued by corporations and others, which direct bankers to make payments on a specific attached receipt being duly signed (London City & Midland Bank v. Gordon). Sec. 17 of the Revenue Act 1883, however, applies to these documents the crossed cheques sections of the Bills of Exchange Act 1882 (see Badus, Jr., v. Sims v. London & South-Western Bank [1900], 1 Q.B. 270), while denying them the position of negotiable instruments, and a banker paying one of them crossed, in accordance with the crossing and in the absence of any indication of its having been transferred, could probably claim immunity under sec. 79. The Bills of Exchange Act 1882 contains no direct prohibition against a banker paying a crossed cheque otherwise than in accordance with the crossing, but if he so does he is liable to the true owner for any loss suffered by him in consequence of such payment (sec. 79), and is probably unable to charge his customer with the amount. A banker paying a crossed cheque in accordance with its ostensible tenor obtains protection under sec. 80 and the proviso to sec. 79. Questions have arisen as to the bearing of the crossed-cheques sections when a crossed cheque drawn on one branch of a bank is paid in for collection by a customer at another branch; but the transaction is so obviously a legitimate and necessary one that either by the collecting branch may be regarded as a separate bank for this purpose, or sec. 79 may be ignored as inapplicable (Gordon v. London City & Midland Bank [1902], 1 K.B. 242 C.A.).

The collection of crossed cheques for a customer being virtually incumbent on a banker, qualified immunity is accorded him in so doing by sec. 82, a final exposition of which was given by the House of Lords in London City & Midland Bank v. Gordon (1903), A.C. 240. To come within its provisions, the banker must fulfil the following conditions. He must receive the cheque from, and the money for, a customer, i.e. a person with whom he has definite and existing business relations (see Great Western Ry. Co. v. London & County Bank [1901], A.C. 414). He must take the cheque already crossed generally or specially to himself. His own crossing under sec. 77 is absolutely ineffectual in this connexion. He must take the cheque and receive the money in good faith and without negligence. Negligence in this relation is the omission to exercise due care in the interest of the true owner, not necessarily the customer. To avoid this disqualification of negligence, the banker must see that the endorsements, where necessary, are ostensibly correct; he must satisfy himself of the authority where an endorsement is per procuration; he must not take for private account a cheque which on its face indicates that the holder is in possession of it as agent, or in an official capacity, or for partnership purposes (Hannan's Lake View Central Ld. v. Armstrong & Co., 16 Times L.R. 256; Bevan v. National Bank, 25 Times L.R. 63); he must not take a cheque marked "account payee" for an account other than that
indicated (Bewan v. National Bank). It is further demonstrated by the Gordon case that the banker only secures protection so long as he is acting strictly as a conduit pipe, or as agent for the customer. If he put himself in the position of owner of the cheque, he no longer fulfils the condition of receiving the money only for the customer. In the Gordon case, adoption of the not uncommon practice of crediting cheques as cash in the bank's books or by previous money orders actually received was held equivalent to taking them as transferee or owner, and to debar the bank from the protection of sec. 82. The anxiety and inconvenience caused to bankers by this unexpected decision was ultimately removed by the Bills of Exchange (Crossed Cheques) Act 1906, which enacts that a banker receives payment of a crossed cheque for a customer within the meaning of sec. 82 of the Bills of Exchange Act 1882, notwithstanding that he credits his customer's account with the amount of the cheque before receiving payment thereof. Apparently the scope of this provision is to make it clear that in cases where there are the facts which have been interpreted in the contrary sense. Nor does the fact that the customer is overdrawn deprive the banker of the character of a collecting agent, unless the cheque be definitely given and taken in reduction of such overdraft. Where the conditions requisite for protection exist, the protection covers not only the receipt of the money, but all operations usual in business and leading up to such receipt, on the basis of the customer's title being unimpeachable. The provisions of the crossed cheques sections of the Bills of Exchange Act 1882 are extended to dividend warrants by sec. 35 of the Bankers Act 1955, and to certain orders for payment issued by a customer of a banker by sec. 17 of the Revenue Act 1883, as before stated. But the wording of the Bills of Exchange (Crossed Cheques) Act 1906, specifying as it does cheques alone, appears to exclude documents of both these classes from its operation. With regard to the orders for payment, inasmuch as the same section which brings them within the crossed cheques sections expressly provides that they shall not be negotiable, a banker would probably be protected only in taking them from the specified payee, though this distinction has been ignored in some recently decided cases.

Where a banker incurs loss through forgery or fraud in circumstances not covered by statutory protection, his right to relief, if any, must depend on general principles. He cannot charge his customer with payments made on a forgery of that customer's signature, on the ground either that he is presumed to know such signature or that the payment is unauthorized. But if the customer has accredited the forgery, or, having knowledge or reasonable ground for belief that it has been committed, has failed to warn the banker who has thereby suffered loss or injury, the discharge of the obligation of the act is estopped from discharging the banker's right to debit him with the amount (Vaglini v. Bank of England [1891], A.C. 107; McKenzie v. British Linen Co. 6 A.C. 82; Ewing v. Dominion Bank [1904], A.C. 868). The doctrine of the fictitious person as payee may also exonerate a banker who has paid an order bill to a wrongfull possessor. Payment on a forgery to an innocent holder is payment under mistake of fact; but the ordinary right of the payor to recover money so paid is subordinated to the necessity of safeguarding the characteristics of negotiability. Views differ as to whether the recovery is precluded only where the opportunity of recovering the money is lost or prejudiced by delay in reclaiming payment, or whether mere possibility of damage is sufficient (cf. London & River Plate Bank v. Bank of Liverpool [1896], 1 Q.B. 7, and Imperial Bank of Canada v. Bank of Hamilton [1903], A.C. 49).

Cases have frequently arisen where the carelessness of a customer in filling up cheques has enabled a person to fraudulently increase the sum for which such cheques were originally drawn. In Colonial Bank of Australasia v. Marshall [1906], A.C. 559, the judicial committee of the privy council held that the affording such facilities for forgery was no breach of the customer's duty to his banker, and that the latter was not entitled to debit the customer with more than the original amount. As before stated, the customer's dealings with the pass-book cannot, in the present state of the authorities, be relied on as debarring him from disputing unauthorized payments appearing therein.

The payment of bills accepted payable at the bank is not, like the payment of cheques, an essential obligation of the banker, and the risk involved is enhanced by the fact that the goods must now be paid for at once, no interest being allowed for verification of endorsements. The abolition or modification of the practice has frequently been advocated, but it is one of the facilities which compels bankers to extend to their customers. On the same basis stands the receipt of a customer's valuables for safe custody. The question of the banker's responsibility for the loss of goods so deposited with him was raised, but not decided, in an action brought by Mrs Langtry against the Union Bank of London in 1896. Certain jewels belonging to her had been delivered up by the bank to an unauthorized person on a forged order. The case was settled; but bankers being desirous to ascertain the true position, many legal opinions were taken on the point, and after consideration of these, the Central Association of Bankers issued a memorandum, in which they stated that the best legal opinion appeared to be that a distinctia must be drawn between cases in which valuables were by mistake delivered to the wrong person and cases in which they were destroyed, lost, stolen or fraudulently abstracted, whether by an officer of the bank or some other person. That in the former case the question of negligence did not arise, the case being one of wrongful conversion of the goods by the voluntary act for which the bank was liable apart from any question of negligence. That, in the second case, that of loss or theft, the banker, being a gratuitous bailee, would only be liable if he had failed to use such care as an ordinary prudent man would take of valuables of his own. The latter rule is practically that laid down in Gihbin v. MacMullen, L.R. 2 P.C. 318, but in estimating the amount of care to be taken by the banker, the nature of the goods, if known or suspected, and the exceptional means of protection at the disposition of bankers, such as strong-rooms, must be taken into consideration. Methods of obviating both classes of risk by means of special receipts have frequently been suggested, but such receipts do not appear to have come into general use.

Theoretically, bankers are supposed to refuse accounts which are either expressly or are known to be trust accounts. In practice, however, it is by no means uncommon to find accounts opened with a definite heading indicating the fiduciary capacity. In other cases, circumstances exist which affect the banker with notice of that capacity. In either case, however, the obligation to honour the customer's cheque is the predominant factor, and the banker is not bound or entitled to inquire into the right of the person in whose favour the cheque has been drawn. There is clear evidence of impending fraud (Gray v. Johnston, L.R. 3 H. of L. 1). Even though the banker have derived some personal benefit from the transaction, it cannot be impeached unless the banker's conduct amount in law to his being party or privy to the fraud, as where he has stipulated or pressed for the settlement or reduction of an ascertained overdraft on private account, which has been effected by cheque on the trust account (Coleman v. Buck's & Oxon Union Bank [1857], 2 Ch. 243). A banker is entitled, in dealing with trust moneys, known to be such, to insist on the authority of the whole body of trustees, direct and not deputed, and this is probably the safest course to adopt. Scarcely larger responsibility devolves on joint stock banks appointed custodian trustees under the Public Trustee Act 1906.
a remunerative position involving custody of trust funds and securities, and making and receiving payments on behalf of the estate, while leaving the active direction thereof in the hands of the managing trustees.

Other incidents of the ordinary practice of banking are the discounting of bills, the keeping of deposit accounts, properly so called, and the making of advances to customers, either by way of definite loan or arranged overdraft.

So far as the discounting of bills is concerned, there is little to differentiate the position of the banker from that of any ordinary bill-discounter. It has been contended, however, that the peculiar attribute of the banker's lien entitled him to hold funds of the customer against his liability on current discounted bills. This contention was ultimately disposed of by Bowen v. Foreign & Colonial Camera of Commerce (Commr. Fuery, R., 70), where it was pointed out that the essential object of a customer's discounting bills with his banker was to feed the current account, and that a possible liability constituted no set-off against an existing debt. Whether a particular bill has been taken for discount or collection is a question of fact. As in the payment of bills, so in the collection of them, there is no statutory protection whatever for the banker; as against third parties he can only rely either on the customer's title or his own as a holder for value, if no forged endorsement intervene and he can establish a consideration.

A deposit account, whether at call or on fixed notice, does not constitute any fiduciary relation between the depositor and the banker, but merely a debt due from the latter to the former. It has been suggested that cheques can be drawn against deposit account on call, and, though a banker might safely honour such a cheque, relying, if necessary, on his right of lien or set-off, there appears no legal right in the customer to enforce such payment. Deposit receipts given by bankers are exempt from stamp duty, even though they contain an undertaking with respect to payment of principal and interest. They are not negotiable instruments, but it is difficult to deduce from the cases how far dealings with them may amount to an equitable assignment of the moneys they represent. Probably deliberate definite transfer, coupled with endorsement, would confer an effective title to such moneys. Where, as is not uncommon, the form of deposit note includes a cheque, the banker could not refuse to pay were the cheque presented and any superadded formalities complied with.

There is no obligation on a banker to permit his customer to overdraw, apart from agreement express or implied from the course of business. Drawing a cheque or accepting a bill payable at the banker's which are not funded is urged to be done, but in the present attitude of the courts towards the pass-book some further recognition would seem necessary. Such system of charging interest, even when fully recognized, only prevails so long as the relation of banker and customer, on which it is founded, continues in force; the taking a mortgage for the existing debt would put an end to it. The main point in which advances made by bankers differ from those made by other people is the exceptional right possessed by bankers of securing repayment by means of the banker's lien. The banker's lien is part of the law merchant and entitles him, in the absence of agreement express or implied to the contrary, to retain and apply, in discharge of the customer's liability to him, any securities of the customer coming into his possession in his capacity as banker. It includes bills and cheques paid in for collection (Currie v. Missa, 1 A.C. 564). Either by virtue of it, or his right of set-off, the banker can retain moneys paid in or received for the credit of the customer, against the customer's debt to him. Goods deposited for safe custody or moneys paid in to meet particular bills are exempt from the lien; the purpose for which they come to the banker's hands being inconsistent with the assertion of the lien. The existence of the banker's lien entitles him to sue all parties to bills or cheques by virtue of sec. 27, subs. 3 of the Bills of Exchange Act, and to the extent of his advances his title is independent of that of the previous holder. Moreover, the banker's lien, though so termed, is really in effect an implied pledge, and confers the rights of realization on default pertaining to that class of bailment. But with regard to the exercise of his lien, as in many other phases of his relation to his customer, the banker's strict rights may be curtailed or circumscribed by limitations arising out of course of business. The principle, based either on general equity or estoppel and independent of definite agreement or consideration, requires that when dealings between banker and customer have for a reasonable space of time proceeded on a recognized footing, the banker shall not suddenly break away from such established order of things and assert his strict legal rights to the detriment of the customer. By the operation of this rule, the banker may be precluded from asserting his lien in particular cases, as for instance for an overdrawn on one account against another which had habitually been kept and operated on. In the case of the discharging of cheques in circumstances in which they have hitherto been paid independent of the actual available balance.

Restrictions arising from course of business can of course be put an end to by the banker, but only on reasonable notice to the customer and by providing for outstanding liabilities undertaken by the latter in reliance on the continuance of the pre-existing state of affairs (see Buckingham v. London & Midland Bank, 12 Times L.R. 70). As against this, the banker can, in some cases by giving notice, in the case of cheques or other negotiable instruments, retain the benefit of the discharging of cheques in circumstances in which they have hitherto been paid independent of the actual available balance.

The validity of such custom, provided it be general and reasonable, has frequently been recognized by the courts. Any person entering into business relations with a banker must be taken to contemplate the existence of such custom and implicitly agree that business shall be conducted in accordance therewith. Practical difficulty has been suggested with regard to proof of any such custom not already recognized in law, as to how far it can be established by the evidence of one party, the bankers, unsupported by that of members of the outside public, in most cases impossible to obtain. It is contended, however, that on the analogy of personal rights of property like the right of taking the outside evidence could be dispensed with, and this is the line apparently indicated with relation to the pass-book by the court of appeal in Vaglione's case (23 Q.B.D. at p. 245). The unquestionable right of the banker to summarily debit his customer's account with a returned cheque, even when unindorsed by the customer and taken by the banker in circumstances constituting him a transferee of the instrument, is probably referable to a custom of this nature. So is the common practice of bankers to refuse payment of a so-called 'stale' cheque, that is, one presented an unusogable time after its own in date; although the fact that some banks treat a cheque as stale after six months, others not till after twelve, might be held to militate against the validity of such custom, and lapse of time is not included by the Bills of Exchange Act among the matters working revocation of the banker's duty, and authority to pay his customer's cheque. Indirectly, this particular custom obtains some support from sec. 74 (2) of the Bills of Exchange Act, although the object of that section is different.

That section does, however, import the custom of bankers into the reckoning of a reasonable time for the presentation of a cheque, and with other sections clears up any doubts which might have arisen on the common law as to the right of the holder of a cheque, whether crossed or not, to employ his banker for its collection, without imperilling his rights against prior parties in case of dishonour. On dishonour of a cheque paid in for
collection, the banker is bound to give notice of dishonour. Being in the position of an agent, he may either give notice to his principal, the customer, or to the parties liable on the bill. The usual practice of bankers has always been to return the cheque to the customer, and sec. 49, subs. 6 of the Bills of Exchange Act is stated to have been passed to validate this custom. Inasmuch as it only provides for the return of the dishonoured bill or cheque to the drawer or an endorser it appears to miss the case of a cheque to bearer or become payable to bearer by blank endorsement prior to the customer’s.

Where a bank or a banker takes a mortgage, legal or equitable, or a guarantee as cover for advances or overdrawn, there is nothing necessarily differentiating the position from that of any other mortgagee or guaranteed party. It has, however, fallen to banks to evoke some leading decisions with respect to the former class of security. In London Joint Stock Bank v. Simmons ([1892], A.C. 201) the House of Lords, profoundly explaining their previous decision in Sheffield v. London Joint Stock Bank, 13 A.C. 333, determined that negotiable securities, commercial or otherwise, may safely be taken in pledge for advances, though the person tendering them is, from his known position, likely to be holding them merely as agent for other persons, so long as they are taken honestly, and not for the purpose of the agent’s personal wish, to arouse suspicion. So again in Lloyd’s Bank v. Coke ([1907], 1 K.B. 794), the bank vindicated the important principle that the common law of estoppel still obtains with regard to bills, notes and cheques, save where distinctly annulled or abrogated by the Bills of Exchange Act, and that therefore a man putting inchoate negotiable instruments into the hands of an agent for the purpose of his raising money thereon is responsible to any one taking them bona fide and for value, although the agent may have fraudulently exceeded and abused his authority and the case does not fall within the provisions of the Bills of Exchange Act.

With regard to guarantees, the main incidents peculiarly affecting bankers are the following. The existence of a guarantee does not oblige the banker to any particular system of keeping the account. So long as it is not unfairly manipulated to the detriment of the guarantor, there is no obligation to put moneys paid in, without appropriation, to the guaranteed rather than to the unguaranteed account, and on the termination of a guarantee, the banker may close the account, leaving it to be covered by the guarantee, and open a new one with the customer, to which he may devote payments in, not otherwise appropriated. Where by its nature or terms a continuing guarantee is revocable either summarily or on specified notice, difficult questions may arise on such revocation as to the banker’s duty and obligations towards the customer, who has probably incurred liabilities on the strength of the credit afforded by the guarantee. Although the existence of a guarantee does not bind the banker to advance up to the prescribed limit, he could not well, on revocation, immediately shut off all facilities from the customer without notice, while subsequent purely voluntary advances might not be covered by the guarantee. These contingencies should therefore be fully provided for by the guarantee, particularly the crucial period of the tendency of notice.

BANKSIA, an Australian genus of shrubs and trees (natural order Proteaceae), distinguished by their handsome dense spikes of flowers. It is named after Sir Joseph Banks (q.v.). The plants are grown in England for their handsome foliage as evergreen greenhouse shrubs.

BANKURA, a town and district of British India, within the Burdwan division of Bengal. The town has a population of 20,737. The district has an area of 2621 sq. m., and in 1901 its population was 1,116,411, showing an increase of 4% in the decade. It is bounded on the N. and E. by Burdwan district; on the S. by Midnapur district; and on the W. by Manbhum district. Bankura forms a connecting link between the delta of the Ganges on the E. and the mountainous highlands of Chota Nagpur on the W. Along its eastern boundary adjoining Burdwan district the country is flat and alluvial, presenting the appearance of the ordinary paddy lands of Bengal. Going N. and W., however, the surface gradually rises into long undulating tracts; rice lands and swamps give way to a region of low thorny jungle or forest trees; the hamlets become smaller and more scattered, and nearly disappear altogether in the wild forests along the western boundary. Large quantities of lac and tussur silk are gathered in the hill tract. The stone quarries and minerals are little worked. There are indigo factories and two coal-mines. Both cotton and silk are woven, and plates, &c., are carved from soap-stone. The old capital of the country was at Bishnupur, which is still the chief centre of local industries. The north-east part of the district is skirted by the East Indian railway beyond the river Damodar. The Midnapur-Hajria line of the Bengal-Nagpur railway passes through the district, and there is a line from Howrah to Bankura. The climate of Bankura is generally healthy, the cold season being bracing, the air whole-some, the weather dry, and fogs of rare occurrence. The district is exposed to droughts and floods, and occasionally to famines, such as the famines of 1866, 1874-1875 and 1896-1897. The temperature in the hot season is very oppressive and relaxing. The Bishnupur raj was one of the largest estates in Bengal in the end of the 18th century, but it was sold for arrears of revenue shortly after the conclusion of the permanent settlement in 1793.

BAN, the principal river in the north of Ireland. Rising in the Mourne mountains in the south of the Co. Down it runs N.W. until it enters Lough Neagh (q.v.), which it drains N.N.W. to an estuary at Coleraine, forming Lough Beg immediately below the larger lake. The length of its valley (excluding the lesser windings of the river) is about 90 m. The total drainage area, including the other important feeders of Lough Neagh, is about 2300 sq. m., extending westward to the confines of the Co. Fermanagh, and including parts of the Co. Down and Antrim, Armagh and Monaghan, Tyrone and Londonderry. The river has valuable salmon fisheries, but is not of much importance for navigation. Above Lough Neagh it is known as the Upper Ban and below as the Lower Ban.

BANNATYNE, GEORGE (1543—1608), collector of Scottish poems, was a native of Newtyle, Forfarshire. He became an Edinburgh merchant and was admitted a burgess in 1582. Some years earlier, in 1568, when the “pest” raged in the capital, he retired to his native county and amused himself by writing out copies of poems by 15th and early 16th century Scots poets. His work extended to eight hundred folio pages, divided into five parts. The MS. descended to his only daughter Janet, and later to her husband’s family, the Foulis of Woodhall and Ravelston, near Edinburgh. From them it passed to the Advocates’ library, where it is still preserved. This MS., known as the “Bannatyne Manuscript,” constitutes with the “Asloa” and “Maitland Folio” MSS. the chief repository of Middle Scots poetry, especially for the texts of the greater poets Henryson, Dunbar, Lyndsay and Alexander Scott. Portions of it were reprinted (with modifications) by Allan Ramsay in his Evergreens (1724), and later, and more correctly, by Lord Hailes in his Ancient Scottish Poems (1770). The entire text was issued by the Hunterian Club (1873-1902) in a handsome and generally accurate form. The name of Bannatyne was honoured in 1823 by the foundation in Edinburgh of the Bannatyne Club, devoted to the publication of historical and literary material from Scottish sources. The thirty-third issue of the club (1829) was Memorials of George Bannatyne (1545-1608), with a memoir by Sir Walter Scott and an account of the MS. by Davie Lindsay. See also Gregory Smith, Specimens of Middle Scots (1902).

BANNERET (Fr. banneret, from bonneire, banner, elliptically for seigneur or chevalier banneret, Med. Lat. banneretus), in feudalism, the name given to those nobles who had the right to lead their vassals to battle under their own banner. Usually bannerettes obtained a place in the feudal hierarchy between
BANNERS—BANNOCKBURN

barons and knights bachelors, which has given rise to the idea that they are the origin of King James I.'s order of baronets. Selden, indeed, points out that the "old stories" often have the name Banneret for baronet, and he points out that in France the title had become hereditary; but he himself is careful to say (p. 680) that the name "hath no relation to this latter title." The title of knight banneret, with the right to display the private banner, came to be granted for distinguished service in the field. "No knight banneret," says Selden, of the English custom, "can be created but in the field, and that, when either the king is present, or at least his royal standard is displayed. But the creation is almost the selfsame with that in the old French ceremonies by the solemn delivery of a banner charged with the arms of him that is to be created, and the cutting of the end of the pennon or streamer, and in the shape of a handkerchief in case that he which is to be created had in the field his arms on a streamer before the creation." The creation of bannerets is traceable, according to Selden, to the time of Edward I. "Under these bannerets," he adds, "divers knights bachelors and esquires usually served; and according to the number of them, the bannerets received wages." The last authentic instance of the creation of a knight banneret was that of John Smith, created banneret at the battle of Edgcilhill by Charles I., for rescuing the royal standard from the enemy.

BANNERS, FEAST OF (Jap. Nobori-no-Sekku), a Japanese festival in honour of male children held on the 5th of May. Every householder who has sons fastens a bamboo pole over his door and hangs from it gaily-coloured paper fish, one for each of his boys. These fishs are made to represent carp, which are in Japanese folklore symbolical of health and longevity. The day is recognized as a national holiday.

For banners in general see Flag.

BANISTER, CHARLES (1738-1804), English actor and singer, was born in Gloucestershire, and after some amateur and provincial experience made his first London appearance in 1762 as Will in The Orators at the Haymarket. Gifted with a fine bass voice, Bannister acquired a reputation as a singer at Ranelagh and elsewhere, as well as an actor, and was received with such favour that Garrick engaged him for Drury Lane. He died on the 26th of October 1804.

His son JOHN BANISTER (1760-1836), born at Deptford on the 12th of May 1760, first studied to be a painter, but soon took to the stage. His first formal appearance was at the Haymarket in 1778 as Dick in The Apprentice. The same year at Drury Lane he played in James Miller's version of Voltaire's Mahomet the part of Zaphna, which he had studied under Garrick. The Palmina of the cast was Mrs Robinson ("Perdita"). Bannister was the best low comedian of his day. As manager of Drury Lane (1802) he was no less successful. He retired in 1815 and died on the 7th of November 1836. He never gave up his taste for painting, and Gainsborough, Morland and Rowlandson were among his friends.

BANNOCK (adapted from the Gaelic, and apparently connected with Lat. panis, bread), the term used in Scotland and the north of England for a large, flattish, round sort of bun or cake, usually made of barley-meal, but also of wheat, and sometimes with currants.

BANNOCK, the name of a county in the south-east of the state of Idaho, U.S.A., and of a river in the same state, which runs northward in Oneida county into the Snake or Lewis river. It is taken from that of the Bannock Indians (see Banate), a corruption of the native Panastil.

BANNOCKBURN, a town of Stirlingshire, Scotland. Pop. (1901) 2444. It is situated on the "burn" from which its name is derived, the Bannock (Gaelic, ban oc, "white, shining stream"), a right-hand affluent of the Forth, which was once a considerable river. The town lies 24 m. S.S.E. of Stirling by the Caledonian railway, and now has thriving manufactures of woolens (chiefly weeds, carpets and tartans) and leather, though at the beginning of the 19th century it was only a village. The Bore Stone, in which Bruce planted his standard before the battle in which he defeated Edward II. (1314), is preserved by an iron grating. A mile to the west is the Gillies' Hill, now finely wooded, over which the Scots' camp-followers appeared to complete the discomfiture of the English, to which event it owes its name. Bannockburn House was Prince Charles Edward's headquarters in January 1746 before the fight at Falkirk.

The famous battle of Bannockburn (24th June 1314) was fought for the relief of Stirling Castle, which was besieged by the Scottish forces under Robert Bruce. The English governor of Stirling had promised that, if he were not relieved by that date, he would surrender the castle and Edward II. The English army was defeated and Edward II., with a portion of English troops, was captured by an army in the northern and midland counties of England. Bruce made no attempt to defend the border, and selected his defensive position on the Bannock Burn, 2½ m. S. of Stirling. His front was covered by the marshy bed of the stream, his left flank by its northerly bend towards the Forth, his right by a group of woods, behind which, until the English army appeared, the Scots concealed themselves. Two corps were left in the open in observation, one at St Ninian's to watch the lower course of the burn, one to guard the point at which the Falkirk-Stirling road crosses the burn. On the 23rd the van of the army of Edward, which was sheltered by the wood, moved towards the shapeless mass of a banneret, the the s. of the burn and at once despatched two bodies of men towards Stirling, the first by the direct road, the other over the lower Bannock Burn near its junction with the Forth. The former was met by the Scottish outpost on the road, and here occurred the famous single combat in which Robert Bruce, though not fully armed for battle, killed Sir Henry Bohun. The English corps which took the other route was met and after a severe struggle defeated by the second Scottish outpost near St Ninian's. The English army assemled for battle on the following day. The Earl of Haddington, whose part in the battle was to take up its assigned positions. Three corps of pikemen in solid masses formed the first line, which was kept out of sight behind the crest until the enemy advanced in earnest. A line of "potts" (military pits) had been previously dug to give additional protection to the front, which extended for about one mile from wing to wing. The reserve under Bruce consisted of a corps of pikemen and a squadron of 500 chosen men-at-arms under Sir Robert Keith, the marischal of Scotland. The line of the defenders was unusually dense; Edward, in forming up on an equal front with greatly inferior numbers, and his inferior cavalry, was consequently hopeless to be defeated. The attacking army was formed in an undivided mass of ten "battles," each consisting of horse and foot, and the whole formed in three lines of each three "battles," with the tenth "battle" as a reserve in rear. In this order the English moved down into the valley for a direct attack, the cavalry of each "battle" in first line, the foot in second. Ignoring the lesson of Falkirk (q.v.), the mounted men rode through the morass and up the slope, which was now crowned by the three great masses of the Scottish pikemen. The attack of the English failed to make any gap in the line of defence, many knights and men-at-arms were injured by falling into the pits, and the battle became a mere mêlée, the Scots, with better fortune than at Falkirk and Flodden, presenting always an impenetrable hedge of spears, the English, too stubbon to draw off, constantly trying in vain to break it down. So great was the press that the "battles" of the second line which followed the first were unable to reach the front and stood on the slope, powerless to take part in the battle on the crest. The advance of the third English line only made matters worse, and the sole attempt to deploy the archers was crushed with great slaughter by the charge of Keith's mounted men. Bruce threw his infantry reserve into the battle, the arrows of the English archers wounded the men-at-arms of their own side, and the remnants of the leading line were tired and disheartened when the final impetus to their rout was given by the historic charge of the "gillies," some thousands of Scottish camp-followers who suddenly emerged from the woods, blowing horns, waving such weapons as they possessed, and holding aloft
improvised banners. Their cries of "slay, slay!" seemed to the
weary English to betoken the advance of a great reserve, and
in a few minutes the whole English army broke and fled in dis-
order down the slope. Many perished in the burn, and the
demoralized fugitives were hunted by the peasantry until they
re-crossed the English border. One earl, forty-two barons and
bannerets, two hundred knights, seven hundred esquires and
probably 10,000 foot were killed in the battle and the pursuit.
One earl, twenty-two barons and bannerets and sixty-eight
knights fell into the hands of the victors, whose total loss of
4000 men included; it is said, only two knights.

See J. E. Shearer, Fact and Fiction in the Story of Bannockburn
(1900).

BANNS OF MARRIAGE (formerly banns, from A.S. gebann,
proclamation, Fr. ban, Med. Lat. bannum), the public legal
notice of an impending marriage. The church in earliest days
was forewarned of marriages (Tertullian, Ad Uxorem, De Pudicitia,
c. 4). The first canonical enactment on the subject in the English
county is contained that in the 11th canon of the synod of West-
minster in London (A.D. 1200), which orders that "no marriage
shall be contracted without banns thrice published in the church,
unless by special authority of the bishop." It is, however, believed
that the practice was in France as old as the 9th century, and
certainly Odo, bishop of Paris, ordered it in 1176. Some have
thought that the custom originated in the ancient rule that all
"good knights and true," who elected to take part in the tourna-
ments, should hang up their shields in the nearest church for
some weeks before the opening of the lists, so that, if any "impe-
dible," wounded, they might be "armed off." By the Lateran
Council of 1215 the publication of banns was made compulsory
on all Christendom. In early times it was usual for the priest
to betroth the pair formally in the name of the Blessed Trinity;
and sometimes the banns were published at vespers, sometimes
during mass. In the United Kingdom, under the canon law and
by statute, banns are the normal preliminary to marriage; but
a marriage may also be solemnized without the publication of
banns, by obtaining a licence or a registrar's certificate. In
America there is no statutory requirement; and the practice of
banns (though general in the colonial period) is practically con-
fined to the Roman Catholic church.

BANNU, a town and district of British India, in the Derajat
division of the North-West Frontier Province. The town (also
called Edwardesabad and Duhlipnagar) lies in the north-west
corner of the district, in the valley of the Kurrum river. Pop.
(1901) 14,300. It forms the base for all punitive expeditions
to the Tochi Valley and Waziri frontier.

The district of Bannu, which only consists of the Bannu and
Marwat tahsils since the constitution of the North-West Frontier Province in 1901, contains an area of 16,800 sq. m. lying north
of the Indus. The cis-Indus portions of Bannu and Dera Ismail
Khan now comprises the new Punjab district of Mianwali. In
addition to the Indus the other streams flowing through the
district are the Kurrum (which falls into the Indus) and its
tributary the Gambia. The valley of Bannu proper, stretching
to the foot of the frontier hills, forms an irregular oval, measuring
60 m. from north to south and about 40 m. from east to west.
In 1901 the population was 231,483, of whom the great majority
were Mahommmedans. The principal tribes inhabiting the district
are: (1) Waziri Pathans, recent immigrants from the hills, for
the most part peaceable and good cultivators; (2) Marwats, a
Pathan race, inhabiting the lower and more sandy portion of the
Bannu valley; (3) Bannuchis, a mongrel Afghan tribe of
deadly physique and mean vices. The inhabitants of this district
have always been very independent and stubbornly resisted
the Afghan and Sikh predecessors of the British. After
the annexation of the Punjab the valley was administered by
Herbert Edwardse so thoroughly that it became a source of
strength instead of weakness during the Mutiny. The inhabitants
of the valley itself are now peaceable, but it is always subject
to incursion from the Waziri tribes in the Tochi valley and the
neighboring hills. Salt is quarried on government account at
Kalabagh and alum is largely obtained in the same neigh-
bourhood. The chief export is wheat. A military road leads
from Bannu town towards Dera Ismail Khan. The Indus,
which is nowhere bridged within the district, is navigable for
natives boats throughout the year and those of 100 ft. The chief frontier
tribes on the border are the Waziris, Battannis and Dwarsis.
All these are described under their separate names.

BANSDA, a native state in the south Gujarat division of
Bombay, India, belonging to the Surat agency. Area, 215 sq. m.
Pop. (1901) 40,382, showing a decrease of 2% in the
decade; estimated revenue £19,508. Its chief is a rajput.
About half the total area of the state is cultivable, but the bulk is forested.

BANSHEE (Irish bean síde; Gaelic bon sith, "woman of the
spirits"), a supernatural being in Irish and general Celtic
culture, whose mournful screaming, or "weeping echo," at night is held to foreshorten the death of some member of the household
visited. In Ireland legends of the banshee belong more particu-
larly to certain families in whose records periodic visits from
the spirit are chronicled. A like ghostly figure enters
in British folklore. The Irish banshee is held to be the distinction
only of families of pure Milesian descent. The Welsh have the
banshee under the name gwarch y Rhïbyn (witch of Rhïbyn).
Sir Walter Scott mentions a belief in the banshee as existing in the
highlands of Scotland (Demonology and Witchcraft, p. 331).
A Welsh death-prognosticator, with the gwarch y Rhïbyn and banshee is the cwybyraeth, the groaning spirit.

See W. Wirt Sikes, British Goblins (1886).

BANSWARA (literally "the forest country"), a rajput
feudatory state in Rajputana, India. It borders on Gujarat
and is bounded on the N. by the native states of Dungarpur
south-east, or Maypur north, and N. E. N. on the S. by the
dominions of Holkar and the state of Jhabua; and on the W. by
the state of Rewa Kantha. Banswara state is about 45 m. in length
from N. to S., and 33 m. in breadth from E. to W., and has an area of 1946 sq. m. The population in 1901 was 165,350.
The Mahi is the only river in the state and great scarcity of water occurs in the dry season. The Banswara chief belongs to the family
of Udaipur. During the vigour of the Delhi empire Banswa
formed one of its dependencies; on its decline the state passed
under the Maharattas. Weared out by their oppressions, its chief in 1812 petitioned for English protection, on the condition of his state becoming
tributary on the expulsion of the Maharattas. The treaty of 1818
gave effect to this arrangement, Britain guaranteeing the prince
against external enemies and refractory chiefs; he, on his part,
pledging himself to be guided by her representative in
the administration of his state. The chief is assisted in the admin-
istration by a hamdar or minister. The estimated gross revenue
is £17,000, and the tribute £250. The custom of suttee, or
widow-burning, has long been abolished in the state, but the
people retain all their superstitions regarding witches and sorcery,
and as late as 1876, sixty-two years old, was swung to death at Kusghalez on an accusation of
witchcraft. The perpetrators of the crime were sentenced to five
years' rigorous imprisonment, but they had the sympathy
of the people on their side. The chief town is Banswara, situated
about 8 m. W. of the Mahi river, surrounded by an old disused
rampart and adorned by various Hindu temples, with
the battlements of the chief's palace overlooking it. Its population
in 1901 was 7938. The petty state of Kusghalez is feudatory to
Banswara.

BANTAM, the westernmost residency of the island of Java,
Dutch East Indies, bounded W. by the Strait of Sunda, N. by
the Java sea, E. by the residencies of Batavia and Preanger,
and S. by the Indian Ocean. It also includes Princes Island
and Dwars-in-den-weg ("right-in-the-way") Island in Sunda
Strait, as well as several smaller islands along the coast.
Bantam had a population in 1897 of 700,339, including 302 Europeans,
1959 Chinese and 89 Arabs and other Asiatic foreigners.
The natives are Sundanese, except in the northern or Serang division,
where they are Javanees. The coast is low-lying and frequently
marshy. The northern portion of the residency constitutes the
most fertile portion, is generally flat with a hilly group in the
middle, where three inactive volcanoes, Karang and Pulosari,
BANTIN—BANTU LANGUAGES

are found; while the north-western corner is occupied by the isolated Gede Mountain. The southern portion is covered by the kendang (Malay for “range”) Mountains extending into the Preanger. The rivers are only navigable at their mouths. Various geysers and cold and warm sulphur springs are found in the centre of the residency, and on a ridge of the Kendang Mountain is the large crater-lake Danu, a great part of which was drained by the government in 1835 for rice cultivation. The production of rice and coffee are the principal products of cultivation; but in the days of government culture sugar, indigo and especially pepper were also largely grown. The former considerable fishing and coasting trade was ruined by the eruption of Krakatao in 1883, a large stretch of coast line and the seaport towns of Charingin and Anjer being destroyed by the inundation. The prosperity of the residency was further affected by a cattle plague in 1879, followed by a fever epidemic which carried off 50,000 people, and except in the rice season there is a considerable emigration of natives. Bantam consists of five native regencies and territorial divisions, namely, Serang, Anjer, Pandeglang, Charingin, Lebak. The principal towns are Serang, the capital of the residency, Chilagon, Pandeglang, Menes and Rangkas Betug. The chief town, Serang, is situated 2 1/2 m. from Bantam Bay on the high road from Batavia. The port of Serang is Karanganu, on Bantam Bay, and close by is the old ruined town of Bantam, once the capital of the kingdom of Bantam, and before the foundation of Batavia the principal commercial port of the Dutch East India Company. The ruins include the remains of the former pepper warehouses, the old factory, called Fort Speelwijk, belonging to the company, the fortified palace of the former sultans and a well-preserved mosque thought to have been built by the third Mahomedan ruler of Bantam about 1652–1756, and containing the tombs of various princes of Bantam. Before the Dutch conquest Bantam was a powerful Mahomedan state, whose sovereign extended his conquests in the neighbouring islands of Borneo and Sumatra. In 1595 the Dutch expelled the Portuguese and formed their first settlement. A British factory was established in 1603 and continued to exist till the staff was expelled in 1682. In 1683 the Dutch reduced the sultan to vassalage, built the fort of Speelwijk and monopolized the port, which had previously been free to all comers; and for more than a century afterwards Bantam was one of the most important seats of commerce in the East Indies. In 1811 after Batavia had surrendered to the British, Bantam soon followed; but it was restored to the Dutch in 1814. Two years later, however, they removed their chief settlement to the more elevated station of Serang, or Ceram, 7 m. inland, and in 1817 the ruin of Bantam was hastened by a fire.

BANTU, or, as it is more properly termed, the javanese, is the native name of the wild ox of Java, known to the Malays as sapi-utan, and in zoology as Bos (Bibos) sondaicus. The white patch on the rump distinguishes the bantin from its ally the gaur (g.s.). Bulls of the typical bantin of Java and Borneo are, when fully adult, completely black except for the white rump and legs, but the cows and young are rufous. In Burma the species is represented by the tsaine, or h.saine, in which the colour of the adult bulls is rufous fawn. Tame bantin are bred in Bali, near Java, and exported to Singapore. (See Ox.)

BANTY, a seaport, market-town and seaside resort of Co. Cork, Ireland, in the west parliamentary division, 58 m. S.W. of Cork by the Cork, Bandon & South Coast railway, on the bay of the same name. Pop. (1901) 3109. It is an important centre both for sea fisheries and for sport with the rod. It is the terminus of the railway, and a coaching station on the famous "Prince of Wales " route (named after King Edward VII.) from Cork to Glengariff and Killarney. The bay, with excellent anchorage, is a picturesque inlet some 22 m. long by 3 to 6 broad, with "lo" wide fathom of water. It is one of the headquarter stations of the Channel Squadron, which uses the harbour at Castletown Bearhaven on the northern shore, behind Bear Island, near the mouth of the bay. It was the scene of attempts by the French to invade Ireland in 1689 and 1796, and troops of William of Orange were landed here in 1697. There are several islands, the principal of which are Bear Island and Whiddy, off the town. Ruins of the so-called "fish palaces" testify to the failure of the pilchard fishery in the 18th century.

BANTU LANGUAGES. The greater part of Africa south of the equator possesses but one linguistic family so far as its native inhabitants are concerned. This clearly-marked division of human speech has been entitled the Bantu, a name invented by Dr. W. H. L. Bleek, and it is, on the whole, the fittest general term with which to designate the most remarkable group of African languages.1

It must not be supposed for a moment that all the people who speak Bantu languages belong necessarily to a special and definite type of negro. On the contrary, though there is a certain physical resemblance among those tribes who speak clearly-marked Bantu dialects (the Babangi of the upper Congo, the people of the Great Lakes, the Ova-herero, the Bia-onga, Zulu-Kafirs, Aweme, and some of the East Coast tribes), there is nevertheless a great diversity in outward appearance, shape of head and other physical characteristics, among the negroes who inhabit Bantu Africa. Some tribes speaking Bantu languages are dwarfs or dwarfish, and belong to the group of Forest Pygmies. Others betray relationship to the Hottentots; others again cannot be distinguished from the most exaggerated types of the black West African negro. Yet others again, especially on the north, are of Gala (Galla) or Nilotic origin. But the general deduction to be drawn from a study of the Bantu languages, as they are spoken by the present inhabitants of Africa, is that they belong to a period not more than 3000 years ago a powerful tribe of negroes speaking the Bantu mother-language, allied physically to the negroes of the south-western Nile and southern Lake Chad basins (yet impregnated with the Caucasian Hamite), pushed themselves forcibly from the very heart of Africa (the region between the watersheds of the Shari, Congo and western Nile) into the southern half of the continent, which at that time was probably sparsely populated except in the north-west, east and south. The Congo basin and the south-western watershed of the Nile at the time of the Bantu invasion would have been occupied by the Atlantic seaboard by West Coast negroes, and in the centre by negroes of a low type and by Forest Pygmies; the eastern coasts of Victoria Nyanza and the East African coast region down to opposite Zanzibar probably had a population partly Nilotic-negro and partly Hottentot-Bushman. From Lakes Tanganyika and Nyasa south-westwards to the Cape of Good Hope the population was Forest-negro, Nilotic-negro, Hottentot and Bushman. Over nearly all this area the Bantu swept; and they assimilated or absorbed the vast majority of the preceding populations, of which, physically or linguistically, the Bantu were the invaders and the former the survivors. The forests of north-west Nile land, Congo basin and Gabun, the central Sudanese of the N.E. Congo, a few patches of quasi-Hottentot, Hamitic and Nilotic peoples between Victoria Nyanza and the Zanzibar coast, and the Bushmen and Hottentots of south-west Africa. The first area of decided concentration on the part of the Bantu was very probably Uganda and the shores of Tanganyika. The main line of advance south-west trended rather to the east coast of Africa than to the west, but bifurcated at the south end of Lake Tanganyika, one great branch passing west between that lake and Nyasa, and the other southwards. Finally, when the Bantu had reached the

1 Bantu (literally Ba-nts) is the most archaic and most widely spread term for “men,” “mankind,” “people,” in these languages. It also indicates aptly the leading feature of this group of tongues, which is the governing of the unchangeable root by prefixes. The syllable -nts is nowhere found standing alone, but it originally meant “men,” “beings,” or possibly “person.” It is also occasionally used as a relative pronoun—“that,” “that which,” “he who.” Combined with different prefixes it has different meanings. Thus (in the purer forms of Bantu languages) muntu means “a man,” bantu means “men,” mbantu means “men,” a thing,” buntu “little things,” and so on. This term Bantu has been often criticized, but no one has supplied a better, simpler designation for this section of Negro languages, and the name has now been definitely consecrated by usage.
south-west corner of Africa, their farther advance was checked by two causes: first, the concentration in a healthy, cattle-breeding race of the Hottentots (themselves only a superior type of Bushman, but able to offer a much sturdier resistance to the big black Bantu negroes than the crafty but feeble Bushmen), and secondly, the arrival on the scene of the Dutch and British, but for whose final intervention the whole of southern Africa would have been rapidly Bantuized, as far as the imposition of language was concerned.

The theory thus set forth of the origin and progress of the Bantu and the approximate date at which their great southern exodus commenced, is to some extent attributable to the present writer, who has taken pains to have frequent times other writers on the same subject. In the nearly total absence of any historical records, the only means of building up Bantu history lies in linguistic research, in the study of existing dialects, of their relative degree of purity, of their connexion one with the other and of the most widely-spread roots common to the majority of the Bantu languages. The present writer, relying on linguistic evidence, fixed the approximate date at which the Bantu negroes left their primal home in the very heart of Africa at not much more than 2000 years ago; and the reason adduced was worth some consideration. It lay in the root consonant to a large group of the Bantu tongues of the Professor of the University of the Bantu, and two of the domestic fowls—kuku (nkuku, ngobo, nswi, nguku, nkuk). Now the domestic fowl reached Africa first through Egypt, at the time of the Persian occupation—not before 500 to 400 B.C. It would take at that time at least a couple of hundred years before—from people to people and tribe to tribe up the Nile valley—the fowl, as a domestic bird, reached the equatorial regions of Africa. The Muscovy duck, introduced by the Portuguese from Brazil at the beginning of the 17th century, is spreading itself over Negro Africa at just about the same rate. Yet the Bantu people must have had the domestic fowl established amongst themselves before they left their original home, because throughout Bantu Africa (with rare exceptions and those not among the purest Bantu tribes) the bird expressing the domestic fowl recurs to the one vocal of kuku.1 Curiously enough this root kuku resembles to a marked degree several of the Persian words for "fowl," and is no doubt remotely derived from the cry of the bird. Among those Negro races which do not speak Bantu languages, those who are living in the lowest proximity to the Bantu, the name for the fowl is quite different.2 The fowl was only introduced into Madagascar in a few centuries past by the Arabs during the historical period, and is not known by any name similar to the Bantu. Moreover, even if the fowl had been (and there is no record of this fact) introduced from Madagascar on to the east coast of Africa, it would be indeed strange if it carried with it to Cameroon, to the White Nile and to Lake Ngami one and the same name. It may, however, be argued that such a thing is possible, that the introduction of the fowl south of the equator need not be in any way coincident with the Bantu invasion, as its name in North Central Africa may have followed it everywhere among the Bantu peoples. But all other cases of introduced plants or animals do not support this view. The Muscovy duck, for instance, is pretty well distributed throughout Bantu Africa, but it has no common widely-spread name. Even tobacco (though the root "taba" turns up unexpectedly in remote parts of Africa) assumes totally different designations in different Bantu tribes. The Bantu, moreover, remained faithful to a great number of roots like "fowl," which referred to animals, plants, implements and abstract concepts known to them in their original home. Thus there are the root-words for ox (tombe -ombte -ote), goat (budu, basi, bury, pig (guluba), pigeon (jibo), buffalo (nyati), dog (mwan), hippopotamus (bugu, guba), elephant (jbo, jeko), leopard (ngw), house (za, do, yambu, anda, dago), moon (ee), sun, sky, or God (juba), water (ndi, ndib, mendid), lake or river (anza), drum (ngoma), name (sina or jina), wizard (ngaba), belly, bowl (vu, vumo), buttocks (tab), adjectives like bi (bad), eru (white); the numerals, 2, 3, 4, 5, 10 and 100; verbs like fua (to die), la (to strike, kill), la (to do or lla (di, dia) (to eat). The root-words cited are not a few, and yet they represent no more than a small fraction of the total number of root-words which are practically common to all the spoken dialects of Bantu Africa. Therefore the possession amongst its root-words of a common name for "fowl" seems to the present writer to show conclusively that (1) the original Bantu tribe must have possessed the domestic fowl before its dispersal through the southern half of Africa began, and that (2) as it is historically certain that the fowl as a domestic bird did not reach Egypt before the Persian conquest in 525 B.C., and probably would not have been transmitted to the heart of Africa for another couple of hundred years, the Bantu exodus (at any rate to the south of the equatorial region) may safely be placed at a date not much anterior to 2000 years ago.

The creation of the Bantu type of language (pronominal-prefix) was certainly a much more ancient event than the exodus from the Bantu mother-land. Some form of speech like Fula, Kiama (Tem), or Kposo of northern Togoland, or one of the languages of the lower Niger or Benue, may have been taken up by ancient Libyan, Hamite or Nilotic conquerors and cast into the type which we now know as Bantu,—a division of less Negro speech, however, that shows no obvious traces of Hamitic (Kautzsch) influence. We have no clue at present to the exact birthday of the Bantu, but it is to the degree of other languages from which it sprang. Its origin and near relationships are as much a puzzle as is the case with the Aryan speech. Perhaps in grammatical construction (suffixes taking the place of prefixes) Fula shows some resemblance; and Fula possesses the concord in a form considerably like that of the Bantu, as well as offering affinities in the numerals 3 and 4, and in a few nominal, pronominal and verbal roots. The Timne and cognate languages of Sierra Leone and the north Guinea coast use pronominal prefixes and a system of concord, the employment of the latter being precisely similar to the declension practice in the Bantu language, but in word-roots (substantives, numerals, pronominal, verbal) there is absolutely no resemblance with this north Guinea group of prefix-using languages. In the numerals 2, 3, 4, and sometimes 5, and in a few verbal roots, there is a distinct affinity between Bantu and the languages of N. Togoland, the Benue river, lower Niger, Calabar and Gold Coast. The same thing may be said with less emphasis about the Madif and possibly the Nyam-Nyam (Makarka) group of languages in Central Africa though in none of these forms of speech is there any trace of the concord. Prefixes of a simple kind are used in the tongues of N. Togoland lower Niger and eastern Niger delta, Cross River and Benue, to express differences between singular and plural, and also the quality of the noun; but they do not correspond to those of the Bantu type, though they sometimes fall into "classes." In the north-west of the Bantu field, in the region between Cameroon and the north-western basin of the Congo, the Cross River and the Benue, there is an area of great extent occupied by languages of a "semi-Bantu" character, such as Nki, Mbudikum, Akpa, Mbe, Bayon, Manya, Bafut and Bansho, and the Munshi, Jarawa, Kororofa, Kamuk and Gbari of the central and western Benue basin. The resemblances to the Bantu in certain word-roots are of an obvious nature; and prefixes in a very simple form are generally used for singular and plural, but the rest of the concord is very doubtful. Here, however, we have the nearest relations of the Bantu, so far as

1 In Luganda and other languages of Uganda and the Victoria Nyanza, and also in Runyoro on the Victoria Nile, the word for "fowl" is enoko. In Ki-Swahili of Zanzibar it is kuku. In Zulu it is nkuku. This form is common to all the Cameroon languages it is joko, ngoko, and on the Congo it is ngoko, nswi. On the Zambezi it is nkuku; so also throughout the tribes of Lakes Nyasa and Tangan-yika, and most dialects of South Africa.

2 From this statement are excepted those tongues classified as "semi-Bantu." In some languages of the Lower Niger and of the Gold Coast the word for "fowl" is generally traceable to a root kuku. This form also enters the Cameroon region, where it exists alongside of -oko. Kuba may have arisen independently, or have been derived from the Bantu kuku.

3 Whence the many nyansa, nyanka, nyasa, nsanza, of African geography.
etymology of word-roots is concerned. Further evidence of slight etymological and even grammatical relationships may be traced as far west as the lower Niger and northern and western Gold Coast languages (and, in some word-roots, the Mandingo group). The Fula language would offer some grammatical resemblance if its suffixes were turned into prefixes (a change which has actually taken place in the reverse direction in the English language between its former Teutonic and its modern Romanceinflected words); cf. "off-set" and "set-off," "upstanding" and "standing-up").

The legends and traditions of the Bantu peoples themselves invariably point to a northern origin, and a period, not wholly removed from their racial remembrance, when they were strangers in their present lands. Seemingly the Bantu, somewhat early in their migration down the east coast, took to the sea, and not merely occupied the islands of Pemba and Zanzibar, but travelled as far afield as the Comoro archipelago and even the west coast of Madagascar. Their invasion of Madagascar must have been fairly considerable in numbers, and they doubtless gave rise to the race of black people known traditionally to the Hovas as the Va-zimba.

The accompanying map will show pretty accurately the distribution of the Bantu-speaking Negroes at the present day.

The Bantu language field. The gradation of the three tones indicates degrees of resemblance to original Bantu mother tongue, the darkest area showing the most archaic languages. Languages slightly akin in structure or vocabulary in Bantu. Prefix-governed languages akin in structure to Bantu, but not in vocabulary.

It will be seen by a glance at this map that the areas in which are spoken Bantu languages of typical structure and archaic form are somewhat widely spread. Perhaps on the whole the most archaic dialects at the present day are those of Mount Elgon, Ruwenzori, Unyoro, Uganda, the north coast of Tanganyika and of the Bemba country to the south-west of Tanganyika; those in the vicinity of Lake Bangweulu, and the Nkonde and Kese dialects of the north and north-east coasts of Lake Nyasa; also (markedly) the Subiya speech of the western Zambesi. Another language which brings a good many original Bantu roots and typical features is the well-known Oc-iherero of Damaraland (though this S.W. African group also presents marked peculiarities and some strange divergencies). Kimakonde, on the east coast of Africa, is a primitive Bantu tongue; so in its roots, but not in its prefixes, is the celebrated Ki-swahili of Zanzibar. Ci-boda of the Zambesi delta is also an archaic type of great interest. The Zulu-Kafir language, though it exhibits marked changes and deviations in vocabulary and phonetics (both probably of recent date), preserves a few characteristics of the hypothetical mother-tongue: so much so that, until the languages of the Great Lakes came to be known, Zulu-Kafir was regarded as the most archaic type of Bantu speech, a position from which it is now completely depoited. It is in some features unusually divergent from the typical Bantu.

**Classification.**—With our present knowledge of the existing Bantu tongues and their affinities, it is possible to divide them approximately into the following numbered groups and subdivisions, commencing at the north-eastern extremity of the Bantu domain, where, on the whole, the languages approximate nearest to the hypothetical parent speech.

1. The **Uganda-Unyoro group** includes all the dialects between Victoria Nyanza and U Bufoga and Busoga. It extends from the east coast of Lake Albert, the range of Ruwenzori and the Congo Forest on the west; on the south-east and south, the south coast of the Victoria Nyanza, and a line from near Emin Pasha Gulf to the Ruwenzori river and the east coast of Tanganyika. The south-west this district is bounded more or less by the Rusizi river down to Tanganyika. It includes the district of Busoga on the north-east and all the archipelagoes and inhabited islands of the Lake Victoria kingdom of Uganda. Allied to, yet quite distinct from the **Uganda sub-section**, is that which is usually classified as **Unyoro**. This includes the dialects spoken by the Hima (Hamtic aristocracy of these equatorial lands—Urmi-hima, Ru-hinda, &c.), Ru-songora, Sabiny, Kitutto, Ru-aro, Ru-ma, and all the hundred dialects of Kikuyu, Busiba, Runanga, Businja and Kibere, Ki-rundi, of the Burundi country at the north end of Tanganyika, and the other languages of eastern Tanganyika down to Uganda are closely allied to the **Unyoro group** and are closely now how also by the Langi group. The third independent sub-section of this group is **Lu-kenje**, the language which is spoken on the southern flanks of the Ruwenzori Range, and thence southwards to Lake Kivu and the eastern limits of the Congo Forest.

2. The second group on the geographical list is **Lihuka-Kuumba**, the separate and somewhat peculiar Bantu dialects lingering in the last district on the south and south-west coast of Albert Nyanza and the upper waters of the Lihuku (or Libunama) is a very isolated type of Bantu, quite apart from the Uganda-Unyoro group, with which it shows no special affinity at all, though in close juxtaposition. Its alliance with **Kuumba of western Ruwenzori** is not very close. Other affinities are with the degraded Bantu dialects (Ki-bira, &c.) of the Ituri-Aruwimi forests. Kuumba is spoken on the west and north slopes of Ruwenzori. Both Kuumba and Lihuka show a closer kinship with the languages on the northern Congo and Aruwimi, less in grammar than in vocabulary.

3. The **Kivirondo-Masaka** section, which includes the languages of Luvungi, the Konde and Jiegi of the north-eastern shores of the Victoria Nyanza and the northern Kivirondo and Mount Elgon territories, is related to the Luganda section more than to any group of the Bantu tongues, but it is a very distinct division, in its prefixes the most archaic. It includes the languages spoken along the western flanks of Mount Elgon, those of Kibungo, and of the eastern coast-lands of the Victoria Nyanza (Igirizi).

4. The **Kikuyu-Kamba** group of British East Africa, east of the Rift valley. It includes, besides the special dialects of Kikuyu and Ukambani, all the scattered fragments of Bantu speech on Mount Kenya and the upper Tana river (Dhiakho)

5. The **Kilimanjaro (Choga-Sika)** group, embracing the rather peculiar dialects of Mount Kilimanjaro, Mount Meru and Ugonjo.

6. The **Tanganiko** represents the Bantu dialects of the coast provinces of British East Africa and the coast islands (and including) the Tana river on the north and the frontier of German East Africa on the south.

7. **Swahili**, the language of Zanzibar and of the opposite coast, a form of speech now widely spread as a commercial language over Eastern and Central Africa. Swahili is a somewhat archaic Bantu dialect, indigenous probably to the East African coast south of the Ruvi (Pangani) river, which by mixture with Arabic has become the lingua franca of eastern Africa between the White Nile and the Zambesi. It was almost certainly the mainland origin, distinct from the Papuan and local dialects and may have belonged to group No. 6. There are colonies of Swahili speaking people at Mombasa, Malindi, Lamu, and even as far north as the Shweli river in Somaliland, also along the coast of German and Portuguese East Africa as far south as Anggoche. In the coast-lands between the Ruvi or Pangani river on the north and the Kilwa settlements on the south, the local languages and dialects are more or less related to Swahili, though they are independent languages. Among these may be mentioned Bondeli, Shambola (north of the Ruvi), Njuru, Zeguha, Ki-mirima and Ki-saramo.

8. This group might be described as **Kaguru-Sagala-Kami**. It is largely occupied by the language of Mount Elgon, with its derivatives, and, in some cases, south as Anggoche. In the coast-lands between the Swahili coast dialects on the east and the domain of the Nyamwezi (No. 1) on the west. On the north this group is bounded by the non-Bantu languages of the Masai, Mbugu and Taturu, and this is why the writer groups his group includes Kigege and Irangi.
(9) The dialects of the Comoro Islands, between the East African coast and Madagascar, are styled Hi-zaa or Arumanti and Shi-nzant. They are also spoken by fishermen bordering the Barombi Lui in the south.

(10) The archaic Makonde or Mabilo of the lower Ruvuma, and the coast between Lindi and Ibo; this might conceivably be attached to the Nyanza groups.

(11) The Nyamwezi group includes all the dialects of the Nyamwezi country west of Ungo as far north as the Victoria Nyanza (where the tongues melt into group II), and bounded on the south and west by the river by the forest borders of Tanganyika. The Nyamwezi genus penetrates south-west to within a short distance of Lake Rukwa. A language of this genotype is spoken in the north in the territory of the Belgian Congo, having been introduced there by traders who made themselves chiefs.

(12) The Tanganyika languages (Ki-ruma, Makwani, Kigwka, &c.) are spoken in the region west-north-west, and perhaps north and east of Tanganyika, from the vicinity of Lake Albert Edward on the north and the Lukuga outlet of Tanganyika on the south. On the west they are bounded by the Congo Forest and the Manyema genus, and on the east by the coast of Tanganyika (Ki-rundi, Kigeye, &c.) seem to be more nearly connected with those of group I (Uganda-Unyoro), yet perhaps they are more conveniently included here.

(13) The Manyema (Banyo) group consists mostly of the corrupt Bantu dialects between the western watershed of Tanganyika and the main stream of the Luapula-Congo, extending also still farther north as the Luvungi-Lemba. The same language is spoken in the forest basin, such as Ysalome, Soko, Lokele, Kusa, Tumurbu, &c. On the west the Manyema group is bounded by the languages of the Lomami valley, and on the north to groups Nos. 15 and 16: on the east by the Manyema genus merging into the Afrikander Bantu dialects of groups Nos. 1 and 12. An examination of the Lihukum-Kuamba section (No. 2) shows these tongues to be connected with the Manyema. The Manyema dialects of the north-eastern Congo Forest (Ituri district) may perhaps be placed in this section.

(14) The Rua-Luba-Lundo-Marungu group (in which are included Koyoko, Luba, and K-tavob) occupies a good deal of the south central basin of the Congo, between the south-west coast-line of Tanganyika on the east and the main streams of the Kasai and Kongo between the west, the Bakuba country on the north and the Zambesi on the south. Its boundary towards the east is not yet clearly determined.

(15) The Bakuba assemblage of Central Congo dialects (Songe, Shilange, Babuma, &c.) probably includes all the Bantu languages between the Zambesi and the northern Katanga, and the Bakuba group on the north and the Kwa-Kasai and Upper Kase on the west. Its boundary on the north is perhaps the Sanckuru river.

(16) The Balado group consists of all the languages of the Northern Congo basin (bounded on the north, east and west by the main stream of the Congo), and perhaps the corrupt dialects of the Northern Kasai, Kwilu and Kongo (Babuma, Bambuma, Bomba, Ba-yake, Bakutu, &c.), where these are not nearer allied to Teke.

(17) The Bangala-Bobangi-Liboko group comprises the commercial languages of the Upper Congo (Ngalga, Bangi, Likohe, Poto, Ngembe, Yanzo, &c.) and all the known Congo dialects along and to the north and south of the main Congo, as far as the junction of the Sanga to as far east as the Ruki and Lomami rivers, and those between the Congo and the Lower Ubangi river and up the river itself, as far north as the limits of the Bantu domain (about 3° 30' N.). Allowing for slight divergence of speech in the basin of the Sanga river, besides the "Ba-yanzi dialects of Lakes Mantumba and Leopold II.

(18) The Bangala (Bantu) group (No. 13). This may be taken roughly to include most of the Bantu dialects west of the Sanga river, north-west of the Lower Congo, south of the Upper Ogowe and Ngoko rivers and east of the Atlantic coastal lands.

(19) The Ik-Kile and Benga dialects of Spanish Guinea and the Atleno coast of German Cameroon.

(20) The Fet or Fangue forms of speech (so corrupt as to be only just recognizable as Bantu), which occupy the little-known interior of German Guinea, may be regarded as Bantu, but they are as far east and north as the Saffiga, Sanagga and Mba rivers, and the immediate hinterland of the "Duala" Cameroon.

(21) The Duala group, which on the other hand is of a much purer Bantu type, includes the languages spoken on the estuary and delta of the Congo river.

(22) The Isabu-Bakwiri group of the coast-lands north of Cameroon delta (Avito Bay), and on the west slopes of Cameroon in the eastern sectors of South-western Nigeria.

(23) The Bantu dialects of Fernando Po (Ediya, Bateki, Bani, &c.) distinctally allied to Nos. 24, 25, and 13. These dialects which begins on the north at the Rio del Rey on the extremity of the Bantu field, near the estuary of the Cross river. This group may also include Barombi and Basa, Negritos, and Ifaluba, which are spoken on the eastern slopes of the Cameroon mountains and on the Cameroon river (Magombe), and thence to the Sanagga and Nyong rivers. Eastwards and north-eastwards of this group, the languages (such as Lumbu, Mundu, Budu, Bowei) may be regarded as "semi-Bantu," and evincing affinities with the forms of speech in the basin of the Central Benue river and also with the Fali (No. 20). The languages southwards again from the north-westernmost limit of the Bantu, we may include the languages of the Lambei and Aduma languages of French Gabon, and the tongues of the Lower Ogowe and Fernan Vaz promontory. This area is approached to the group of Kakongo dialects of the Luango and Sete Kama coast—such as Babaka, Mwanga, Bwambo, Ma-ombe, Ba-vili, Ba-kambama and Ku-kongo (Kabinda).

(26) The Kongo language group comprises the dialects along the lower course of the Congo (such as to Stanley Pool; also the territory of the old kingdom of Congo, lying to the south of that river (and north of the river Loje) from the coast eastwards to the mouth of the river Kongo (and the longitude, more or less, of Stanley Pool).

(28) In the south the Kongo dialects melt imperceptibly into the closely-allied Angola language. This group may be styled in a general way the "Bantu" (or "Bantu" proper), and includes the languages such as Ki-mbundu, Mbomba, Ki-sama, Sungo, U-mbanganja. The boundary of this genus on the east is probably the Kwanza river, and perhaps to the Lunda languages begin (No. 12). On the north, the river Loje to the mouth of the Kongo, and the mbundu tongues. On the south the boundary of group No. 28 is approximately the 11th degree of south latitude.

(39) The Hottentot dialect (though with connecting forms) is the Oci-herero group, which includes the herero language of Damaraland, the Umbundu of the Bihe highlands of south Angola, the Nama of the Benguela coast, and Si-donga, Kanyana and Ok-ofo of the southern regions of Portuguese Angola and the northern half of German South-West Africa. The languages of group No. 29 probably extend as far inland as the Kuito and Cunene rivers, in short, to the Zambezi watershed. On the south they are confronted with the Herero. The Hottentot or Hill Damaras—a Negro race of unexplained affinities and apparently speaking a Hottentot language—occupy an enclave in the area of Herero speech.

(30) What may be called the Kikobo or Kikbok (also Kiko) family of eastern Angola is a language-group which seems to offer affinities to the languages of the Upper Zambezi and to those of groups Nos. 28 and 29. It extends eastwards into the south-western portion of the Belgian Congo, and includes the Lubal of northern Barotseland and the sources of the river Zambezi, and possibly the Gola dialects of southern Angola.

(31) Southwards of group No. 30 is that of the Barotseland languages, of which the best-known form—almost the only one that is effectively illustrated—is Si-luyi. Si-luyi may be related the Mbandwais or Mangwais of the western region as represented by the "A-mbae, Ma-bukushu and A-kwamashi are probably closely related.

(32) Next is a group which might be styled the Subiya-Tonga-Ila, though some authorities think that Tonga and Ila deserve to be regarded as separate. These are closely related and probably in structure between the languages of each of the two subsections. The Tonga subgroup would include the dialects of the Ba-tetela, the Ba-tete, the Tonga, and the Mbuncha, and all Central Zambesi. In-subiy is the dominant language of South-West Zambia, along portion of the Zambezi river south of Barotseland, and in the lands lying between the Zambezi and the Chobe-Linyante river. Subiya is one of the most archaic of Bantu languages, more so than Tonga. Both are without any strong affinity to Oci-herero, and only evince a slight relationship with the Zulu group (No. 44).

(33) The Biso or Wissa family includes the languages of Bemba, Bemba-Pemba, Bemba-Pendi, and Bemba-Mwamba to the north-west of the Belgian Congo, and the dialects of Lubinda and Iala between the Chambibi river and Lake Bangweulu on the north, and the Luangwa river on the east and south; perhaps also some of the languages along the course of the Upper Luapula river.

(34) With it is closely allied that of the Bembo or Emba dialects. This interesting genus occupies the ground between the west-south-west and the west coast of the lakes of East Africa, and is spoken along the Ki-bemba domain may be taken to include the locally-modified Ki-lungu and Ki-mambwe of South and South-East Tanganyika.

(35) What may be called the North Nyasa or Nkonde group comprises all the dialects of the north-west and north-coasts of Lake Nyasa (such as Lomwe and Ntvi-nkuku and Ithi-nyivo of the north-westernmost limit of the Lake, and Nkonde and Nsirani, and also the Fipa country (Iki-fipa), and the shores of Lake Rukwa (Iki- lungu) in the vicinity of the Nyamwezi domain (No. 11). Iki-fipa, however, has some affinities to the Tanganyika and western Victoria-Nyanza languages (groups Nos. 1 and 12).
BANTU LANGUAGES

(36) The western part of Nyanza, south of group No. 35, is occupied by the Bantu languages which includes the languages of the Tumbuka, Henga and A-tonga peoples, and occupies the area between the western shores of Lake Nyasa and the Upper Luangwa river.

(37) Eastwards of No. 35 (North Nyasa group) lies the Kinga speech of the lofty Livingston mountains, which is sufficiently distinct from its neighbours to be classed as a separate group.

(38) The River Seke-White flows west of the Shire river, south also of the Upanyemwezi domain, extends the Sango-Bena-Itche-Sutu group.

(39) The extensive Yao genus of languages stretches from just beyond the Angol and Lusaka districts into the Liang settlements in German East Africa (K-mvuu), south-westward across the Ruvuma river to the north-east shores of Lake Nyasa (Ki-bete), and thence back to the valley of the Luangwa river. These extensive domains are, however, divided into the following dialects:

- The Makua language is probably divided into the following dialects:
  - L-moto, L-vuwu, L-lungulu and Anguru. These are other dialects unamed in the Angol coast-region, where, however, strong colonies of the Makua language are found. Their respective positions are possibly described as follows: a) the Makua domain is occupied by the Chwamba of the Kickelam district.

(40) Nyanja, perhaps the most extensive group of cognate languages in the Bantu field, is principally associated with the east and west shores of the southern half of Lake Nyasa. It also covers all the valley of the Shire, except portions of the Shire highlands, down to the junction of that stream with the Zambezi, and further, the lands on both banks of the Zambezi down to and including its delta. West of Lake Nyasa, the Nyanja domain extends in the Senga language to the river Luangwa and extends also behind both banks of the Central Zambezi. South of the Central Zambezi, the Nyanja dialects are spoken as far west as the Victoria Falls. Thence they extend eastwards over Mashonaland to the sea-coast. They may also be found on both banks of the Portuguese coast-region south of the Zambezi as far as Inbaname. The principal dialects of the Nyanja language are the Ci-

- The well-marked Bechuanal language group has various distinctive features of its own. This includes all the Bantu dialects of the Bechuanaland and the western part of the Guai river. Bechuanal dialects (such as Ci-venta, S-seto, S-sele, S-rolo, S-xalipa, &c.) cover a good deal of the north and west of the Transvaal, and extend over all the Orange River Colony and Bechuanaland. S-seto is the language of Basutoland; S-rolo, S-mangwato, of the Eastern KaNgwato, the latter being a large and powerful South African Bantu tribe. They are the principal dialects of the Transvaal. Group No. 42, in fact, stretches between the Zambesi on the north and the Orange river on the south, and extends westward (except for the Hotentot and Bushmen interruptions) to the domain of the Oci-herero.

(43) The Ronga (Tonga) languages of Portuguese South-East Africa (Gazaland, Lower Limpopo valley, and patches of the North Transvaal and Delagoa Bay) is the most extensive, extending to the Nyanga group (41) on the one hand, and to Zulu on the other, probably representing a mingling of the two influences, of which the last is pre-eminent.

(44) Lastly comes the Zulu-Kafir group, occupying parts of Rhodesia, the eastern portion of the Transvaal, Swaziland, Natal and the eastern half of Cape Colony. In vocabulary, and to some degree in grammar, the language (divided at most into three dialects) is related in some places to the Kaffir, and in others to the Nyanga group No. 43; otherwise it stands very much alone in its developments. It may have distant relations in groups Nos. 29 and 32. Dialects of Zulu (Tebele and K-i-nongi or Ci-nongi) are spoken at the present day in South-West Rhodesia and in Western Nyasaland and on the plateau north-east of Lake Nyasa, carried thither by the Zulu raiders of the early 19th century.

The foregoing is only an attempt to classify the known forms of Bantu speech and to give their approximate geographical limits. There is much still to be done; but, so far as the writer knows, no attempt has been made to divide the languages spoken by two or three villages which, though empatically Bantu, possess isolated characters making them not easily included within any of the above-mentioned groups; but too detailed a reference to these would perhaps be puzzling. Broadly speaking, the domain of Bantu speech seems to be divided into four great sections: (a) the languages of the Great Lakes divide into (1) those spoken within the limits of the Lakes, and probably also group Nos. 1 and 2 of the Albert Nyanza and Semliki river.

Common Features.—There is no mistaking a Bantu language, which perhaps is what renders the study of this group so interesting and encouraging. The homogeneity of this family is so striking as to contrast with the inexplicable confusions of tongues which reigns in Africa north of the Bantu borderland, that the close relationships of these dialects have perhaps been a little exaggerated by earlier writers.

The phonology of the Western group (d) is akin to that of the Negro languages of Western and West-Central Africa. A small portion of (b) the South-Central group (Zulu) has picked up clicks, perhaps borrowed from the Hottentots and Bushmen. Otherwise, the three groups (a), (b) and (c) are closely related in phonology, and never, except here and there on the borders of the Western group, adopt the peculiar West-Central African combinations of hv, gb, which are so characteristic of African speech between the Upper Nile and the Guinea coast.

The following propositions may be laid down to define the special or peculiar features of the Bantu languages:

1. The vowels of the Bantu languages are always of the Italian type, and no true Bantu language includes obscurse sounds like d and th. Each word must end in a vowel (though in some modern dialects in Eastern Equatorial, West and South Africa the terminal vowel may be elided in rapid pronunciation, or be dropped, or absorbed in the terminal consonant, generally a nasal). No two canons can come together without an intervening vowel, except perhaps in a small number of cases of retraction of an initial nasal in the word.

2. Apparent exceptions occur to this last rule where two nasals, two r's or two d's come together through the elision of a vowel or a labial. (4) Substantives are divided into male or female genders, indicated by the terminal or pronominal prefix, which occurs at the root and is used either in a singular or in a plural sense. With the exception of the "abstract" prefix Bu (No. 14), no singular prefix can be used as a plural, nor vica versa. There is a certain degree of correspondence between the singular and plural prefixes (thus No. 2 prefix serves almost invariably as a plural to No. 3; No. 8 corresponds as a plural to No. 7). The number of prefixes common to the whole group is perhaps sixteen. The pronominal particle or prefix of the noun is attached as a prefix to the roots of the adjectives, pronouns, prepositions and verbs of the sentence which are connected with the noun. Though in course of time these prefixes may differ in form from the prefix of the substantive, they were akin in origin. (This system is the "concord" of Dr Bleek.) The pronominal particles, whether in nominative or accusative case must precede the pronominal, pronominal, adjectival and verbal roots, though they often follow the auxiliary participles used in conjugating verbs, and the roots of some prepositions.

* These features are characteristic of almost all the Negro languages.

1. This does not preclude the aspiration of consonants, or the occasional local change of a palatal into a guttural.

1 As already mentioned, a somewhat similar concept is also prominent in regard to the Pata, language, which is possibly a "cousin" of the Timne languages in Western Africa, and as regards the prefixes of the Time language of Sierra Leone; it exists likewise in Hotentot and less markedly in many Aryan, Senéc and Hamitic tongues.
This is a natural text representation of the given document.
land from which the Bantu negroes were subsequently driven by Nilotic invaders from the north. They may be relics therefore of a time before the Pa- prefix of those regions had changed to the modern form of Ha-.

In S.W. and N.W. Cameroon the initial p of the Pa- prefix reappears in two Bantu dialects; but elsewhere in West-North Bantu Africa and in the whole basin of the Congo, except the extreme south and south-east, the form Pa- is never met with. (See D.C. Scott, ‘Comparative and the Secundane group of dialects is Ha- or Pa-; in the Luyi language of Barotseland it assumes the very rare form of Ba-, while the first prefix is weakened to A-.

The pronouns in Bantu are in most cases traceable to some such general forms as these:—

I, me, my

Thou, thee, thy

He or she, him, her, his, &c

The Bantu verb consists of a pronominal unchangeable root which is employed as the second person singular of the imperative. To this root are prefixed and suffixed various particles. These are worn-down verbs which have been pronominalised or they are re-ordered into new prepositions. It is probable (with one exception) that the building up of the verbal root into moods and tenses has taken place independently in the principal groups of Bantu languages, the arrangement followed being probably fixed on a fundamental system common to the original Bantu tongue. The exception alluded to may be a method of forming the preterite root, which seems to be shared by a great number of widely-spread Bantu languages. This may be illustrated by the Zulu tandile, which changes to tandile, have loved, did love. This -ile or -ii may become in other forms -idi, -idi, -iri, -ime, but is always referable back to some form like -iti or -ili, which is probably connected with the root itself. The initial i in the particle -ile often affects the last or penultimate syllable of the verbal root, thereby causing one of the very rare changes which take place in this medium. In many Bantu dialects the root (which means to give) becomes plele in the preterite (no doubt from an original pa-ile). Likewise the Zulu tandile is a contraction of tanda-ile.

Two other frequent changes of the terminal vowel of the common root are those from a (which is almost always inverted by the terminal vowel of Bantu verbs), (1) into e to form the subjunctive tense, (2) into i to give a negative sense in certain tenses. With these exceptions the Zulu tandile is very probably terminated on a fundamental root common to all the elements determining the Bantu languages. And these instances when they occur are generally due (as in the rest of Africa) to the influence of Arabic, Persian, and Biblical Hebrew, with their derivatives, and English.

This point of the terminal a is the more interesting because, by changing the terminal vowel of the verbal root and possibly adding a personal prefix, one can make nouns from verbs. Thus in Luganda senwa is the verbal root for ‘to panic.’ A pardon ‘or’ forgiveness is ki-senywa. A pardoner ‘or’ mercy be ma-senwani. In Swahili palindia was the verbal root for ‘conciliate,’ mpotamali is a ‘conciliator,’ and upatola is a ‘conciliation.’ Another marked feature of Bantu verbs is their power of modifying the sense of the original verbal root by suffixes, the affixation of which modifies the terminal vowel and sometimes the prefixed or suffixed particles. Many forms of these variations and their usual meanings are as follows:—

1. Supposing an original Bantu root, tanda, to love; this may become tanda, to love; tandeka or tandika, to love; tandila or tandile, to love for, with, or by some other person. tandiza (or -endi) is cause to love; tandiza or (endi) is loved reciprocally.

The suffix -aka or -aga sometimes appears and gives a sense of continuation to the verbal root. Thus tanda may become tandaka in the sense of ‘to continue loving.’

The negative verbal particle in the Bantu languages may be traced back to the original ka, sa or sa, ki, ti or sti in the Bantu mother-tongue. Apparently in the parent language this particle had already these alternative forms, which resemble those in some West African Negro languages. In the present day, the negative particle in the verb (which nearly always coalesces with the pronominal particle) is descended from this ka, sa or sa, ki, ti or sti, assuming the forms of ka, ga, faga, sa, le, ka, a, ti, etc. It has thus united with the pronominal particle that the two are no longer soluble, and it is only by the existence of some intermediate forms (as in the Kongo language) that we are able to guess at the original separation between the verbal root and the negative particle ka, sa, &c., was joined to the pronominal particles, thus:—

ka-ni

ka-lo

ka-ti

ka-be

In like manner sa would become sa-ndo, sa-ku, &c. But very early in the history of Bantu languages ka-ni, or sa-ndo, became contracted into kai, sai, and finally, ki, ti; ka-ku or ka-ku into ku; and kai or sao have therefore been or are in some cases ka or sa, and a third form would be kai or kai. This is illustrated by a sentence like this: “Thou, sa, sao have been ka or sa, or something like that.”

The suffix -ka or -ka is also used in the negative of the pronominal particle (such as hi or it) is used without any vestige of a pronoun being attached to it, and is applied indifferently to all the persons, occasionally to a person with which the negative is expressed (1) by stress or accent; (2) by suffix (traceable to a root -pe or -ko) answering to the French pas, and having the same sense; and (3) by the separate employment of an adverb. If the negative of the Bantu verb adds a prefix to its root, it changes its terminal -a to -e. The subjunctive is very frequently formed by changing the terminal -a to -e: thus, tanda = love; tande = love.

BIBLIOGRAPHY.—A Comparative Grammar of South African Languages (in two parts, left unfinished), by Dr W. L. Bleek (London, 1866); A Sketch of the Modern Languages of Africa, by R. N. Cust (1881); A Comparative grammar of the Bantu languages, by F. J. Bicknell (London, 1905); An Introduction to the Grammar of the Bantu Languages, by F. J. Bicknell (London, 1905); and also in his Grundzüge einer vergleichenden Grammatik der Bantusprachen (Berlin, 1906), a vast amount of valuable information has been collected, but Meinhof’s deductions therefrom have not always been reliable in every case, especially with those of the South-East.

The Swahili-English Dictionary, by Dr L. Krapf (London, 1882), contains a mass of not well-sorted but invaluable information concerning Swahili languages spoken on the coast of East Africa, especially regarding many words now become Zulu; all rare or minor of information is to be found in An Encyclopaedic Dictionary of the Monatija (Mang’anja) Language of British Central Africa, by Rev. D. C. Scott (1891). Other admirable works are the Dictionary of the Congo Language, by the Rev. Holman Bentley (1891), and The Folklore of Angola, and a Grammar of Kibundu, by H. E. Chatez. The many handbooks and vocabularies written and published in the last quarter of a century on the languages of the East African coast-lands are of great importance to the student, especially as they give forms of the prefixes now passing out of use. The Introductory Handbook to the Bantu Languages, by Dr A. Sims, is also very fully that peculiar and important member of the East African group. These works of many Congo languages have been compiled by D. A. Sims; more important works on this subject have been published in the Rev. W. H. Stapleton’s Comparative Handbook of Congo Languages, and by Rev. John Whitehead (Grammar and Dictionary of the Bobangi Language (London, 1899), E. Torday has illustrated the languages of the Western Congo basin (Kwango, of the Eastern Kasai and south-eastern Congo) in the Missionary Institute. There is a treatise on the Lunda language of the south-western part of the Belgian Congo, in Portuguese, by Henrique de Carvalho, who also in his Ethnographia da Expedicão portuguesa
**BANVILLE—BAPHOMET**

363

ao Mwatu Yambo goes deeply into Bantu language questions. The *Duala* language of Cameroon has been illustrated by the Baptist missionary Saker in his works published about 1860, and since 1900 by others, especially by Capello and especially by Capello and especially by Capello. Moulins, the slang of Koelle, Maurice see the published Cameron. His Congo Mittheilungen was freely consulted in his *Philosophy of African Languages*. Mr. Capell, of the same museum, has collected information regarding the Masaba dialects of Elgon, and these have also been illustrated by Mr. W. Hobley, and by Sir H. H. Johnston (*Uganda Protectorate*), and privately by Mr. S. A. Northcot. Mestron, the little-known *Senega* of Central Zambesia and Wiso of North-East Rhodesia (Oxford University Press). Jacottet (Paris, 1902) has in his *Grainne Maluy* provided an admirable study of the *Bantu* and *Yagci* languages of Bardsel. In 1907, Edwin W. Smith (Oxford University Press) brought out a *Handbook of the Ila Language* (Masukuhlumbe). The Rev. W. G. Robertson is the author of a complete study of the *Hill* group of languages. His *Mittheilungen* has illustrated the dialects of Kikuyu and Kamba. F. Van der Burgt has published a *Dictionary of Kirundi* (the language spoken at the north end of Tanganyika). *Onihero* of DamaraLabland has collected information about the *Gero* dialect and missions, and Dr. Kolbe and Dr. P. H. Brincker. The northern languages of this Herero group have been studied by members of the American Mission at Biaundu under the name of Umbunda. Some information on the languages of the south-western part of the Congo basin and those of south-eastern Angola may be found in the works of Capello and Ivens and of Henrique de Carvalho and Commander V. L. Cameron. The British, French and German missionaries in his published many dictionaries and grammars of the different *Seuana* dialects, notable amongst which is John Brown's *Dictionary of Seuana* and Meinhof's *Study of the Tsi-enda*. The grammars and dictionaries of these and similar works are almost incomparable. Among the best are MacAren's *Kafir Grammar* and Robert's *Zulu Dictionary*. The works of Boyce, Appleyard and Bishop Colenso should also be consulted. Miss A. Werner has written important studies on the Zula click-words and other grammatical eges and vocabularies of the Bantu languages in the *Journal of the African Society* between 1902 and 1906. The Tebele dialect of Zulu has been well illustrated by W. A. Elliot in his *Dictionary of the Tebele and Shona Languages* (London, 1897). The *Ronga* (Konga, *Swazla*, *Hlangwe*, &c.) are dealt with in the *Grainna Ronga* (Lausanne, 1856) of Henri Junod. Bishop Smyth and John Mathews have published valuable works on the Zulu dialect of the Xhosa, and the language of the *Hambane* (S.C.P.H., 1902). The *Journal of Anthropos* (Vienna) should also be consulted.

**BANVILLE, THÉODORE PAULAIN DE** (1823–1891), French poet and miscellaneous writer, was born at Moulins in the Bourbannais, on the 14th of March 1823. He was the son of a captain in the French navy. His boyhood, by his own account, was cheerlessly passed at a lyceé in Paris; he was not harshly treated, but took no part in the amusements of his companions. On leaving school with but slender means of support, he devoted himself to letters, and in 1844 published his first volume of verse (*Les Cariatides*), which was followed by *Les Stalactites* in 1846. The poems encountered some adverse criticism, but secured for their author the approbation and friendship of Alfred de Vigny and Jules Janin. Henceforward Banville's life was steadily devoted to literary production and criticism. He printed other volumes of verse, among which the *Odes funambulesques* (Alençon, 1857) received unstinted praise from Victor Hugo, to whom they were dedicated. Later, several of his comedies in versette: *Cénacle* (1881), *Bérénice* (1882), *Théodore de Banville*, and from 1853 onwards a stream of prose flowed from his industrious pen, including studies of Parisian manners, sketches of well-known persons (*Comtes parisiens*, &c.), and a series of tales (*Contes bourgeois*, *Contes héroïques*, &c.), most of which were republished in his collected works (1875–1878). He also wrote freely for reviews, and acted as dramatic critic for more than one newspaper. Throughout a life spent mainly in Paris, Banville's genial character and cultured mind won him the friendship of the chief men of letters of his time. He was also intimate with Frédéric-Lematre and other famous actors. In 1858 he was decorated with the legion of honour, and was promoted to be an officer of the order in 1886. He died in Paris on the 15th of March 1891, having just completed his sixty-eighth year. Banville's claim to remembrance rests mainly on his poetry. His plays are written with distinction and refinement, but are deficient in dramatic power; his stories, though marked by fertility of invention, are as a rule conventional and unreal. Most of his prose, indeed, in substance if not in manner, is that of a journalist. His lyrics, however, rank high. A careful and loving student of the finest models, he did even more than his greater and somewhat earlier contemporaries, Victor Hugo, Alfred de Musset and Théophile Gautier, to free French poetry from the fetters of metre and mannerism in which it had limped from the days of Malherbe. In the *Odes funambulesques* and elsewhere he revived with perfect grace and understanding the *rondeau* and the *villanelle*, and like Victor Hugo in *Les Orientales*, wrote *poèmes* (panuts) after the Malay fashion. He published in 1872 a *Petit traité de versification française* in exposition of his metrical methods. He was a master of delicate satire, and used with much effect the difficult humour of sheer bathos, happily adapted by him from some of the early folk-songs. He has somewhat rashly been compared to Heine, whom he profoundly admired; but if he lacked the supreme touch of genius, he remains a delightful writer, who exercised a wise and sound influence upon the art of his generation.

Among his other works may be mentioned the poems, *Idylles *prussiennes* (1871), and *Trente-six ballades joyeuses* (1873); the prose tales, *Les Saloumbelques* (1853); *Esquisses parisiennes* (1858) and *Contes *frisières*; and the plays, *Le Feuilleton* *d'Aristeophane* (1852), *Gringette* (1886), and *Dindimata* (1876). See also J. Lemaitre, *Histoire contemporaine* (first series, 1889; second series, 1889) of Sainte-Beuve, *Carnets du lundi*, vol. xiv.; Maurice Spronck, *Les Artistes littéraires* (1889).

**BANYAN, or BANTAN** (an Arab corruption, borrowed by the Portuguese from the Sanskrit *vamiti*, "merchant"), the *Picus Indica*, or *Bengalensis*, a tree of the fig genus. The name was originally given by Europeans to a particular tree in the Persian Gulf beneath which some Hindu "merchants" had built a pagoda. In Calcutta the word was once generally applied to a native broker or head clerk in any business or private house, now usually known as sircar. *Banya* or *Bantam*, a corruption of the word *Bantam*, was a native and general name applied to the native grain-dealer. Early writers sometimes use the term generically for all Hindus in western India. *Banyan* was long Anglo-Indian for an undershirt, in allusion to the body garment of the Hindus, especially the Banyans.

*Banyan days* is a nautical slang term. In the British navy there were formerly two days in each week on which meat formed no part of the men's rations. These were called banyan days, in allusion to the vegetarian diet of the Hindu merchants. *Banyan hospital* also became a slang term for a hospital for animals, in reference to the Hindu's humanity and his dislike of taking the life of any animal.

**BAOBAB**. *Adansonia digitata* ([natural order Bombaceae]), a native of tropical Africa, one of the largest trees known, its stem reaching 30 ft. in diameter, though the height is not great. It has a large woody fruit, containing a mucilaginous pulp, with a pleasant cool taste, in which the seeds are buried. The bark yields a strong fibre which is made into ropes and woven into cloth. The wood is very light and soft, and the trunks of living trees are often excavated to form houses. The name of the genus was given by Linnaeus in honour of Michel Adanson, a celebrated French botanist who travelled in Africa and other parts of the world.

**BAPHOMET**, the imaginary symbol or idol which the Knights Templars were accused of worshipping in their secret rites. The term is supposed to be a corruption of *Mahomet*, who in several medieval Latin poems seems to be called by this name. J. von Hammer-Purgstall, in his *Mysterium Baphonelis relativum*, &c., and *Die Schuld der Templer*, revived the old charge against the Templars. The word, according to his interpretation, signifies the baptism of *Meïs*, or of fire, and is, therefore, connected with the impurities of the Gnostic Ophites (q.v.). Additional
BAPTISM

... evidence of this, according to Hammer-Purgstall, is to be found in the architectural decorations of the Templars' churches. An elaborate criticism of Hammer-Purgstall's arguments was made in the Journal des Savants, March and April 1819, by M. Raynouard, a well-known defender of the Templars. (See also Hallam, Middle Ages, I, note 13.)

BAPTISM. The Gr. words βαπτίσμα and βαπτίζω (both of which occur in the New Testament) signify "ceremonial washing," from the verb βαπτίζω, the shorter form βαπτάω meaning "dip" without ritual significance (e.g. the finger in water, a robe in blood). That a ritual washing away of sin characterized other religions than the Christian, the Fathers of the church were aware, and Tertullian notices, in his tract On Baptism (ch. vi.), that the votaries of Isis and Mithras were initiated per lavacrum, "through a font," and that in the Ludi Apollinares et Eleusinii, i.e. the mysteries of Apollo and Eleusis, men were baptized (τιγνισμός, Tertullian's favourite word for baptism), and, what is more, baptized, as they presumed to think, "unto regeneration and exemption from the guilt of their perjuries." "Among the ancients," he adds, "anyone who had stained himself with homicide went in search of waters that could purge him of his guilt."

The texts of the New Testament relating to Christian baptism, given roughly in chronological order, are the following:

A.D. 55-60, Rom. vi. 3, 4: 1 Cor. I. 12-17, vi. 11, x. 1-4; xiii. 5, 19; Gal. iii. 27.
A.D. 60-65, Col. ii. 11, 12; Eph. iv. 5, v. 26.
A.D. 60-70, Mark x. 38, 39.
A.D. 80-90, Acts i. 5, ii. 38-41, viii. 16, x. 44-48, xix. 1-17; xxii. 16; 1 Pet. iii. 20, 21; Heb. x. 22.
A.D. 90-100, John iii. 3-8, iii. 22, iii. 26, iv. 1, 2.
Uncertain, Matt. xxviii. 18-20; Mark xvi. 16.

The baptism of John is mentioned in the following:

A.D. 60-70, Mark i. 1-11.
A.D. 80-90, Matt. iii. 16-16; Luke iii. 1-22, vii. 29, 30; Acts i. 22, x. 37, xiii. 24, xviii. 25, xix. 3, 4.
A.D. 90-100, John i. 25-33, iii. 23, x. 40.

It is best to defer the question of the origin of Christian baptism until the history of the rite in the centuries which followed has been sketched, for we know more clearly what baptism became after the year 100 than what it was before. And that method on which a great scholar 1 insisted when studying the old Persian religion is doubly to be insisted on in the study of the history of baptism and the cognate institution, the eucharist, namely, to avoid equally "the narrowness of mind which clings to matters of fact without rising to their cause and connecting them with the series of associated phenomena, and the wild and uncontrolled spirit of comparison, which, by comparing everything, confounds everything."

Our earliest detailed accounts of baptism are in the Teaching of the Apostles (c.90-120) and in Justin Martyr.

The Teaching has the following:

1. Now concerning baptism, thus baptize ye: having spoken beforehand all these things, baptize into the name of the Father and of the Son and of the Holy Spirit, in living water.
2. But if thou hast not living water, baptize into other water; if thou canst not in cold, in warm.
3. But if thou hast not either, pour water upon the head three times in the name of the Father and of the Son and of the Holy Spirit.
4. Now before the baptism, let him that is baptizing and him that is being baptized fast, and any others who can; but thou biddest him who is being baptized to fast one or two days before.

The "things spoken beforehand" are the moral precepts known as the two ways, the one of life and the other of death, with which the tract begins. This body of moral teaching is older than the rest of the tract, and may go back to the year A.D. 80.

Justin thus describes the rite in ch. ix. of his first Apology (c. 140).

"I will also relate the manner in which we dedicated ourselves to God when we had been made new through Christ. As many as are persuaded and believe that what we teach and say is true, and undertake to be able to live accordingly, are instructed to pray and entreat God with fasting, for the remission of their sins that are past, we praying and fasting with them. Then they are brought by us where there is water, and are regenerated in the same manner in which we were ourselves regenerated. For in the name of God, the Father and Lord of the universe, and of our Saviour Jesus Christ and of the Holy Spirit, they then receive the washing with water."

In the sequel Justin adds:—

"There is pronounced over him who chooses to be born again, and has repented of his sins, the name of God the Father and Lord of the universe, he who leads to the laver the person that is to be washed calling Him by this name alone. For no one can utter the name of the ineffable God, and this washing is called Illumination (Gr. ἰδονομασία), because they who learn these things are illuminated in their understandings. And in the name of Jesus Christ, who was crucified under Pontius Pilate, and in the name of the Holy Ghost, who through the prophets foretold all things about Jesus, he who is illuminated is washed."

In ch. xiv. of the dialogue with Trypho, Justin asserts, as against Jewish rites of ablation, that Christian baptism alone can purify those who have repented. "This," he says, "is the water of life. But the cisterns which you have dug for yourselves are broken and profitless to you. For what is the use of that baptism which cleanses the flesh and body alone? Baptize the soul from wrath, from envy and from hatred; and, let the body be pure."

In ch. xiii. of the same dialogue Justin remarks that "those who have approached God through Jesus Christ have received a circumcision, not carnal, but spiritual, after the manner of Enoch."

In after ages baptism was regularly called illumination. Late in the 2nd century Tertullian describes the rite of baptism in his treatise On the Resurrection of the Flesh, thus:

1. The flesh is washed, that the soul may be freed from stain.
2. The flesh is anointed, that the soul may be consecrated.
3. The flesh is sealed (i.e. signed with the cross), that the soul also may be protected.
4. The flesh is overshadowed with imposition of hands, that the soul also may be illuminated by the Spirit.
5. The flesh feeds on the body and blood of Christ, that the soul also may be filled and sated with God.
6. He also mentions elsewhere that the neophytes, after baptism, were given a draught of milk and honey. (The candidate for baptism, we further learn from his tract On Baptism, prays for himself by prayer, fasting and keeping of vigils.)

Before stopping in the font, which both sexes did quite naked, the neophytes had to renounce the devil, his poms and angels. Baptisms were usually conferred at Easter and in the season of Pentecost which ensued, and by the bishop or by priests and deacons commissioned by him.

Such are the leading features of the rite in Tertullian, and they reappear in the 4th century in the rites of all the orthodox churches of East and West; Tertullian testifies that the Marcionites observed the particulars numbered one to six, which must therefore go back at least to the year 130. About the year 300, those desirous of being baptized were (a) admitted to the catechumenate, giving in their names to the bishop. (b) They were subjected to a scrutiny and prepared, as to-day in the western churches the young are prepared for confirmation. The catechetical course included instruction in monothelism, in the folly of polytheism, in the Christian scheme of salvation, &c. (c) They were again and again exorcized, in order to rid them of the lingering taint of the worship of demons. (d) Some days or even weeks beforehand they had the creed recited to them. They might not write it down, but learned it by heart and had to repeat it just before baptism. This rite was called in the West the traditus and redditio of the symbol. The Lord's Prayer was communicated with similar solemnity in the West.
365

The creed given in Rome was the so-called Apostles' Creed, originally compiled as we now have it to exclude Marcionites. In the East various other symbols were used. (c) There followed an act of unction, made in the East with the oil of the catechumens blessed only by the priest, in the West with the priest's saliva applied to the lips and ears. The latter was accompanied by the following formula: "Epheta, that is, be thou opened unto odour of sweetness. But do thou flee, O Devil, for the judgment of God is at hand." (f) Renunciation of Satan. The catechumens turned to the west in pronouncing this; then turning to the east they recited the creed. (g) They stepped into the font, but were not usually immersed, and the priest recited the baptismal formula over them as he poured water, generally thrice, over their heads. (h) They were anointed all over with chrism or scented oil, the priest reciting an appropriate formula. Deacons anointed the males, deaconesses the females. (i) They put on white garments and often baptismal wreaths or chaplets as well. In some churches they had worn crowns during the catechumenate, in sign of repentance of their sins. (j) They received the sign of the cross on the brow; the bishop usually dipped his thumb in the chrism and said: "In name of Father, Son and Holy Ghost, peace be with thee." In laying his hands on their heads the bishop in many places, especially in the West, called down upon them the sevenfold spirit. (k) The first communion followed, with milk and honey added. (l) Usually the water in the font was exorcized, blessed and chrism poured into it, just before the catechumens entered it. (m) Easter was the usual season of baptism, but in the East Epiphany was equally favoured. Pentecost was sometimes chosen. (n) The number of the three first or three last days being usually chosen in Jerusalem early in the 4th century, but fifty years later baptisms seem to have been almost confined to Easter. The preparatory fasts of the catechumens must have helped to establish the Lenten fast, if indeed they were not its origin.

Certain features of baptism as used during the earlier centuries must now be noticed. They are the following:—(1) Use of fonts; (2) Status of baptizer; (3) Imersion, submersion or aspersion; (4) Exorcism; (5) Baptismal formula and trine immersion; (6) The age of baptism; (7) Confirmation; (8) Discipleship or tonsure; (9) Regeneration; (10) Renunciation of repentance; (11) Baptism for the dead; (12) Use of the name; (13) Origin of the institution; (14) Analogous rites in other religions.

1. Fonts.—The New Testament, the Didache, Justin, Tertullian and other early sources do not enjoin the use of a font, and contemplate in general the use of running or living water. It was a Jewish rule that in ablutions the water should run over and away from the parts of the body washed. In acts of martyrdom, as late as the age of Decius, we read of baptisms in rivers, in lakes and in the sea. In exceptional cases it sufficed for a martyr to be sprinkled with his own blood. But a martyr's death in itself was enough. Necrophoros (c. 250)quieted the scruples of his unbaptized friend Polyceutes, when on the scaffold he asked if it were possible to attain salvation without baptism, with this answer: "Behold, we see the Lord, when they brought him to His blind that they might be healed, had nothing to say to them about the holy mystery, nor did He ask them if they had been baptized; but this only, whether they came to Him with true faith. Wherefore He asked them, Do ye believe that I am able to do this thing?"

Tertullian (c. 200) writes (de Bapt. iv.) thus: "It makes no difference whether one is washed in the sea or in a pool, in a river or spring, in a lake or a ditch. Nor can we distinguish between those whom John baptized (tinixit) in the Jordan and those whom Peter baptized in the Tiber." The custom of baptizing in the rivers when they are annually blessed at Epiphany, the feast of the Lord's baptism, still survives in Armenia and in the East generally. Those of the Armenians and Syrians who have retained adult baptism use rivers alone at any time of year.

The church of Tyre described by Eusebius (H. E. x. 4) seems to have had a font, and the church order of Macarius, bishop of Jerusalem (c. 311-335), orders the font to be placed in the same building as the altar, behind it and on the right hand; but the same order lays down that a font is not essential in cases of illness for "the Holy Spirit is not hindered by want of a vessel."

2. Status of Baptizer.—Ignatius (Smyrn. viii.) wrote that it is not lawful to baptize or hold an agapè (Lord's Supper) without the bishop. So Tertullian (de Bapt. xviii.) reserves the right of baptism to the bishop, referring it to the summa sacros or bishop, Cyprian (Epist. lxxxiii.) to bishops and priests. Later canons continued this restriction; and although in outlying parts of Christendom deacons claimed the right, the official churches acceded to it presbyters alone and none but bishops could perform the confirmation or seal. In the Montanist churches women baptized, and of this there are traces in the earliest church and in the Caucasus. Thus St Thecla baptized herself in her own blood, and St Nino, the female evangelist of Georgia, baptized king Mirian (see "Life of Nino," Studia Biblica, 1903). In cases of imminent death a layman or a woman could baptize, and in the case of new-born children it is often necessary.

3. Immersion or Aspersion.—The Didache bids us "pour water on the head," and Christian pictures and sculptures ranging from the 1st to the 10th century represent the baptizand as standing in the water, while the baptizer pours water from his hand or from a bowl over his head. Even if we allow for the difficulty of representing complete submersion in art, it is nevertheless clear that it was not insisted on; nor were the earliest fonts, to judge from the ruins of them, large and deep enough for such an usage. The earliest literary notices of baptism are far from conclusive in favour of submersion, and are often to be regarded as merely rhetorical. The rubrics of the MSS., it is true, enjoin total immersion, but it only came into general vogue in the 7th century, "when the growing rarity of adult baptism made the Gr. word (baril[wa]) patient of an interpretation that suited that of infants only." The Key of Truth, the manual of the old Armenian Baptists, archaically prescribes that the penitent admitted into the church shall advance on his knees into the middle of the water and that the elect one or bishop shall then pour water over his head.

4. Exorcism.—The Didache and Justin merely prescribe fasting, the use of which was to hurry the exit of evil spirits who, in choosing a nidus or tenement, preferred a well-fed body to an emancipated one, according to the belief embodied in the interpolated saying of Matt. xvii. 21: "This kind (of demon) goeth not forth except by prayer and fasting." The exorcisms tended to become longer and longer, the later the rite. The English prayer-book excludes them, as it also excludes the renunciation of the devil and all his angels, his poms and works. These elements were old, but scarcely primitive; and the archaic rite of the Key of Truth (see Paulicians) is without them. Basil, in his work On the Holy Spirit, confesses his ignorance of how these and other features of his baptismal rite had originated. He instances the blessing of the water of baptism, of the oil of anointing and of the baptized himself, the use of anointing him with oil, trine immersion, the formal renunciation of Satan and his angels. All these features, he says, had been handed down in an unpublished and unspecked teaching, in a silent and sacramental tradition.

5. The Baptismal Formula.—The trinitarian formula and trine immersion were not uniformly used from the beginning, nor did they always go together. The Teaching of the Apostles, indeed, prescribes baptism in the name of Father, Son and Holy Ghost, but on the next page speaks of those who have been baptized into the name of the Lord—the normal formula of the New Testament. In the 3rd century baptism in the name of Christ was still so widespread that Pope Stephen, in opposition to Cyprian of Carthage, declared it to be valid. From Pope Zachariah (Ep. x.) we learn that the Celtic missionaries in baptizing omitted one or more persons of the Trinity, and this was one of the reasons why the church of Rome anathematized
BAPTISM

them: Pope Nicholas, however (858-867), in the Responsa ad consulta Bulgarenorum, allowed baptism to be valid 

baptism in nomine Christi, as in the Acts. Basil, in his work On the Holy Spirit just mentioned, condensed it for his eight day, is found alone as insufficient. Baptism “into the death of Christ” is often specified by the Armenian fathers as that which alone was essential.

Ursinus, an African monk (in Gennad. de Scr. Eccl. xxvii.), Hilary (de Synodis, lxxv.), the synod of Nemours (A.D. 1284), also asserted that baptism into the name of Christ alone was valid. The formula of Rome is, “I baptize thee in the name of Father and Son and Holy Spirit.” In the East, “so-and-so, the servant of God, is baptized,” &c. The Greeks add Amen after each person, and conclude with the words, “Now and ever and to ages of ages, amen.”

We first find in Tertullian trine immersion explained from the triple invocation, Nam nec semel sed ter, ad singula nomina in personas singulas singnimur: “Not once, but thrice, for the several names, into the several persons, are we dipped” (adv. Prax. xxvi.). And Jerome says: “We are thrice plunged, that the one sacrament of the Trinity may be shown forth.” On the other hand, in numerous fathers of East and West, e.g. Leo of Rome, Athanasius, Gregory of Nyssa, Theophylactus, Cyril of Jerusalem and others, trine immersion was regarded as being symbolic of the persons of Christ; and in the Armenian baptismal rubric this interpretation is enjoined, as also in an epistle of Macarius of Jerusalem addressed to the Armenians (c. 390). In Armenian writers this interpretation is further associated with the idea of baptism into the death of Christ.

Trine immersion then, as to the origin of which Basil confesses his ignorance, must be older than either of the rival explanations. These are clearly aetiological, and invented to explain an existing custom, which the church had adopted from its pagan medium. For this custom there were generally defined; the Greek fathers write (Aem. vi. 229): Ter tocos proa circumculti unde. Ovid (Met. vii. 189 and Fasti, iv. 315), Persius (ii. 16) and Horace (Ep. i. 137) similarly speak of trine lustrations; and on the last mentioned passage the scholastick Acer remarks: “He uses the words thrice purely, because people in expiating their sins, plunge themselves in thrice.” Such examples of the ancient usage encounter us everywhere in Greek and Latin antiquity.

6. Age of Baptism.—In the oldest Greek, Armenian, Syrian and other rites of baptism, a service of giving a Christian (i.e. non-pagan) name, or of sealing children regarded in due season (καιρος εκβολη), is found. According to the priest, either at the door of the church or at the home, blessed the infant, sealed it (this not in Armenia) with the sign of the cross on its forehead, and prayed that in due season (καιρος εκβολη) or at the proper time (Armenian) it may enter the holy Catholic church. This rite announces itself as the analogue of Christ’s circumcision.

On the fortieth day from birth another rite is prescribed, of chrisinge the child, which is now taken into the church with its mother. Both are blessed by the clergy, whose petition now is that God “may preserve this child and cause him to grow up by the precious grace of His power and made him worthy in due season of the washing of baptism.” As the first rite corresponds to the circumcision and naming of Jesus, so does the second to His presentation in the temple. These two rites really begin the catechumenate or period of instruction in the faith and discipline of the church. It depended on the individual how long he would wait for initiation. Whenever he felt inclined, he gave in his name as a candidate. This was usually done at the beginning of Lent. The bishop and clergy next examined the candidates one by one, and ascertained from their neighbours whether they had led such exemplary lives as to be worthy of admission. In case of strangers from another church certificates of character had to be produced. If a man seemed unworthy, the bishop dismissed him until another occasion, when he might be worthier; but if all was satisfactory he was admitted, in the West as a compendens or asker, in the East as a φωτισόμενος, i.e. one in course of being illumined. Usually two sponsors made themselves responsible for the past life of the candidate and for the sincerity of his faith and repentance. The essential thing was that a man should come to baptism of his own free will and not under compulsion, but from hope again. Macarius in his work (c. 250) declares that the grace of the spirit is given in answer to our prayers and entreaties for it, and that even a font is not needful, but only the wish and desire for grace. Tertullian, however, in his work On Baptism, holds that even that is not always enough. Some girls and boys at Carthage had asked to be baptized, and there were some who urged the granting of their request on the score that Christ said: “Forbid them not to come unto Me” (Matt. xix. 14), and: “To each that asketh thee give” (Luke vi. 30). Tertullian replies that “We must beware of giving the holy Sacrament to men and women, and children, while they are not prepared.” Especially let the warden not pronounce it. The risks of the age of puberty are extreme. Let people have married or be anyhow steel'd in continence before they are admitted to baptism. It would appear from the homilies of Aphraates (c. 340) that in the Syrian church also it was usual to renounce the married relation after baptism. Cyril of Jerusalem, in his Catecheses, insists on “the longing for the heavenly polity, on the goodly resolution and attendant hope” of the catechumen (Pro. Cat. ch. i.). If the resolution be not genuine, the bodily washing, he says, profits nothing. “God asks for nothing else than that we may be baptised.” Say not: “Art thou washed out? I tell thee, by willing, by believing” (ch. viii.). So again (Cat. i. ch. iii.) “God gives not his holy treasures to the dogs; but where he sees the goodly determination, there he bestows the seed of salvation. . . . Those then who would receive the spiritual saving seal have need of a determination and will of their own. . . . Grace has need of faith on our part.”

In Jerusalem, therefore, whither believers flocked from all over Christendom to be buried, the official point of view as late as A.D. 350 was entirely that of Tertullian. Tertullian’s scruples were not long rectified by Carthage and other sees; but in 4th century emphasized already the danger of deferring the rite until men fall into mortal sickness, when they may be unconscious or paralysed or otherwise unable to profess their faith and repentance, or to swallow the viaticum. Gregory Theologus therefore (c. 340) suggests the age of three years as suitable for baptism, because by then a child is old enough, if not to understand the questions put to him, at any rate to speak and make the necessary responses. Gregory sanctions the baptism of infants only where there is imminent danger of death. “It is better that they should be sanctified without their own sense of it than that they pass away unsuspected and uninitiated.” And he justifies his view by this, that circumcision, which foreshadowed the Christian seal (σημαδευσις), was imposed on the eighth day on those who as yet had no use of reason. He also urges the analogue of “the anointing of the doorposts, which preserved the first-born by things that have no sense.” On such grounds was justified the transition of a baptism which began as a spontaneous act of
self-consecration into an *opus operum*. How long after this it was before infant baptism became normal inside the Byzantine church, we do not exactly know, but it was natural that mothers should insist on their children being liberated from Satan and safeguarded from demons as soon as might be. The change came more slowly in Latin than in Greek Christendom, but it was slowly indeed in the Armenian and Georgian churches. Augustine's insistence on original sin, a doctrine never quite accepted in his sense in the East, hurried on the change.

7. Confirmation.—In the West, however, the sacrament has been saved from losing merely magical by the rite of confirmation or of reception of the Spirit being separated from the baptism of regeneration and reserved for an adult age. The English church confirms at fifteen or sixteen; the Roman rather earlier. The catechetical course, which formerly preceded the complete rite, now intervenes between its two halves; and the sponsors who formally attested the worthiness of the candidate and received him up as *anodochi* out of the font, have become god-parents, who take the baptismal vows vicariously for infants who cannot answer for themselves. In the East, on the contrary, the complete rite is read over the child, who is thus confirmed from the first. The Roman church formerly shadowed the change and gave a peculiar salience to confirmation as early as the 3rd century, when it decreed that persons already baptized by heretics, but reverting to the church should not be baptized again, but only have hands laid on them. It was otherwise in Africa and the East. Here they insisted in such cases on a repetition of the entire baptism and confirmation together. The Catholic (q.v.) of the middle ages discarded water baptism altogether as being a Jewish rite, but retained the laying on of hands with the *traditio precis* as sufficient initiation. This they called the spiritual baptism, and interpreted Matt. xxviii. 19, as a command to practise it, and not water baptism.

8. Disciplina arcana.—The communication to the candidates of the Creed and Lord's Prayer was a solemn rite. Cyril of Jerusalem, in his instruction of the catechumens, urges them to learn the Creed by heart, but not to write it down. On no account must it be written in Latin, as the pagans will probably see, and feel the connection made with the ancient mysteries. The practice which we thus observe would already meet us in Clement of Alexandria before the year 200. In time this rule gave rise to what is called the *Disciplina arcana*. Following the fashion of the pagan mysteries in which men were only permitted to gaze upon the sacred objects after minute illustrations and scrupulous purifications, Christian teachers came to represent the Creed, Lord's Prayer and Lord's Supper as mysteries to be guarded in silence and never divulged either to the unbaptized or to the pagans. And yet Justin Martyr, Tertullian and other apologists of the 2nd century had found nothing to conceal from the eye and ear of pagan emperors and their ministers. Baptism and confirmation together was the 3rd century's mystification. They reached the pitch of hiding even the gospels from the unclean eyes of pagans. Probably Mgr. Pierre Battifol has correctly shown that the *Disciplina arcana* was more or less of a make-believe, a bit of belletristic trifling on the part of the over-rhetorical Fathers of the 4th and 5th centuries. It is in them that the atmosphere of mystery attains a maximum of intensity. They clearly felt themselves called upon to out-trump the pagan *Mystae*. Yet it is inconceivable that men and women should spend years, ever whole lives, as catechumens within the pale of the church, and really remain ignorant all the time of the Trinitarian Epiclesis used in baptism, of the Creed, and above all of the Lord's Prayer. Wherever the *Disciplina arcana*, i.e. the obligation to keep secret the formula of the threefold name, the creed based on it and the Lord's Prayer, was taken seriously, it was akin to the scripul which exists everywhere among primitive religionists against revealing to the profane the knowledge of a powerful name or magic formula. The name of a deity was often kept secret and not allowed to be written down, as among the Jews.

9. Regeneration.—The idea of regeneration seldom occurs in the New Testament, and perhaps not at all in connection with baptism; for in the conversation with Nicodemus, John iii. 3-8, the word *metapten* and "in v. 5 offend the context, spiritual

re-birth alone being insisted upon in vv. 3, 6, 7 and 8; moreover, Justin Martyr, who cites v. 5, seems to omit them. Nor is there any mention of water in ch. i. 13, where, according to the oldest text, Christ is represented as having been born or begotten not of blood, nor of the will of the flesh, nor of the will of man, but of God. In 1 Pet. i. 3, it is said of the saints that God the Father begat them anew unto a living hope by the resurrection of Jesus, and in v. 23 that they have been begotten again, not of corruptible seed, but of incorruptible through the word of God. But here again it is not clear that the writer has in view water baptism or any rite at all as the means and occasion of regeneration. In the conversation with Nicodemus we seem to overhear a protest against the growing tendency of the last years of the 1st century to substitute formal sacraments for the free aphasis of the spirit, and to "crib, cabin and confine" the gift of prophecy. The passage where re-birth is best put forward in connection with baptism is Luke iii. 22, where ancient texts, including the *Gospel of the Hebrews*, read, "Thou art my beloved Son, this day have I begotten Thee." These words were taken in the sense that Jesus was then re-born of the Spirit an adoptive Son of God and Messiah; and with this reading is bound up the entire adoptionist school of Christology. It apparently underlies the symbolizing of Christ as a fish in the art of the catacombs, and in the literature of the 2nd century. Tertullian prefaces this idea his work on baptism. Nos pisciculi secundum Ixotn nostrum Jesum Christum in aqua nascimus. "We little fishes, after the example of our Fish Jesus Christ, are born in the water."

So about the year 440 the Gaulish poet Orientius wrote of Christ; Piscis natus aquis, auctor baptismatis ipse est. "A fish born of the waters is himself originator of baptism."

But before his time and within a hundred years of Tertullian this symbolism in its original significance had become heretical, and the orthodox were thrown back on another explanation of it. This was that the word IXO772 is made up of the letters which begin the Greek words meaning "Jesus Christ, Son of God, Saviour." An entire mythology soon grew up around the idea of the symbolism of baptism. The word was viewed as the name of the Virgin Mother church, who was in some congregations, for example, in the early churches of Gaul, no abstraction, but a divine aeon watching over and sympathizing with the children of her womb, the recipient even of hymns of praise and humble supplications. Other mythoplastic growths succeeded, one of which must be noticed. The sponsors or *anodochi*, who, after the introduction of infant baptism came to be called god-fathers and god-mothers, were really in a spiritual relation to the children they took up out of the font. This relation was soon by the canonists identified with the blood-tie which connects real parents with their offspring, and it was this real blood-tie drawn that children, who in baptism had the same god-parent, were real brothers or sisters who might not marry each the other or real children of the said god-parent. The reformed churches have set aside this fiction, but in the Latin and Eastern churches it has created a distinct and very powerful marriage taboo.

10. Relation to Repentance.—Baptism justified the believer, that is to say, constituted him a sinner whose past sins were abolished. Sin after baptism excluded the sinner afresh from the divine grace and from the sacraments. He fell back into the status of a catechumen, and it was much discussed from the 2nd century onwards whether he could be restored to the church at all, and, if so, how. A rite was devised, called *exomologesis*, by which, after a fresh term of repentance, marked by austerities more strict than any Trappist monk imposes on himself to-day, the persons lapsed from grace could re-enter the church. In effect this rite was a repetition of baptism, the water of the font alone being omitted. Such restoration could in the earlier church only be effected once. A second lapse from the state of grace entailed perpetual exclusion from the sacraments, the means of salvation. As has been remarked above, the terrors of post-baptismal sin and the fact that only one restoration was allowable influenced many as late as the 4th century to remain catechumens all their lives, and, like Constantine, to receive baptism on the
11. **Baptism for the Dead.**—Paul, in 1 Cor. xv. 29, glances at this as an established practice familiar to those whom he addresses. Three explanations are possible: (1) The saints before they were quickened or made alive together with Christ, were dead through their trespasses and sins. In baptism they were buried with Christ and rose, like Him, from the dead. We can, therefore, paraphrase v. 29 thus: "Else what shall they do which are baptized for their dead selves?" &c. It is in behalf of his own sinful, i.e. dead self, that the sinner is baptized and receives eternal life. (2) Contact with the dead entailed a pollution which lasted at least a day and must be washed away by ablutions, before a man is re-admitted to religious cult. This was the rule among the Jews. Is it possible that the words "for the dead" signify "because of contact with the dead"? (3) Both these explanations are forced, and it is more probable that by a make-believe common in all religions, and not unknown in the earliest church, the sins of dead relatives, about whose salvation their survivors were anxious, were transferred into living persons, who assumed for the nonce their names and burthened their souls either in punishment or to make it possible for the sins of the dead to be washed away. The Mormons have this rite. The idea of transferring sin into another man or into an animal, and so getting it purged through him or it, was widespread in the age of Paul and long afterwards. Chrysostom says that the substitutes were put into the beds of the deceased, and assuming the voice of the dead asked for baptism and remission of sins. Tertullian and others attest this custom among the followers of Cerinthus and Marcion.

12. **Use of the Name.**—In Acts iv. 7, the rulers and priests of the Jews summon Peter and inquire by what power or in what name he has healed the lame. Here a belief is assumed which pervades ancient magic and religion. Only so far as we can get away from the modern view that a person's name is a terrifying incident, and breathe the atmosphere which broods over ancient religions, can we understand the use of the name in baptisms, exorcisms, prayers, purifications and consecrations. For a name carried with it, for those who were so blessed as to be acquainted with it, whatever power and influence its owner wielded in heaven or on earth or under the earth. A vow or prayer formulated in or through a certain name was fraught with the prestige of him whose name it was. Thus the psalmist addressing Jehovah cries (Ps. liv. 1): "Save me, O God, by Thy name, and judge me in Thy might." And in Acts iii. 16, it is the name itself which renders strong and whole the man who believed therein. In Acts xvii. 15, the Jews assail Paul because he has trusted and appealed to the name of a Messiah whom they regard as an overthrower of the law; for Paul believed that God had invested Jesus with a name above all names, potent to constrain and overcome all lesser powers, good or evil, in heaven or earth or under earth. Baptism then in the name or through the name or into the name of Christ placed the believer under the influence and tutelage of Christ's personality, as before he was in popular estimation under the influence of stars and horoscope. Nay, more, it imparted that personality into him, making him a limb or member of Christ's body, and immortal as Christ was immortal. Nearly all the passages in which the word name is used in the New Testament become more intelligible if it be rendered personality. In Rev. xi. 13, the revisers are obliged to render it by persons, and should equally have done so in iii. 4: "Thou hast a few names (i.e. persons) in Sarah's which did not defile their garments." (See Consecration.)

13. **Origin of Christian Baptism.**—When it is asked, Was this a continuance of the baptism of John or was it merely the baptism of proselytes? a distinction is implied between the two latter which was not always clear. In relation to the publicans and soldiers who, smitten with remorse, sought out John in the wilderness, his baptism was a purification from their past and so far identical with the proselyte's bath; but so far as it raised them up to be children unto Abraham and filled them with the Messianic hope, it advanced them further than that bath could do, and assured them of a place in the kingdom of God, soon to be established—this, without imposing circumcision on them; for the ordinary proselyte was circumcised as well as baptized. For the Jews, however, who came to John, his baptism could not have the significance of the proselyte's baptism, but rather accorded with another baptism undergone by Jews who wished to consecrate their lives by stricter study and practice of the law. So Epictetus remarks that he only really understands Judaism who knows "the baptized Jew" (τὸν βεβαπτισμένον). We gather from Acts xix. that John baptized Jesus' disciples at the coming Messiah, without identifying him with Jesus of Nazareth. The apostolic age supplied this identification, and the normal use during it seems to have been "into Christ Jesus," or "in the name of the Lord Jesus Christ," or "of Jesus Christ" simply, or "of the Lord Jesus Christ." Paul explains these formulas as being equivalent to "into the death of Christ Jesus," as if the faithful were in the rite raised from death into everlasting life. The likeness of the baptismal ceremony with Christ's death and resurrection ensured a real union with him of the believer who underwent the ceremony, according to the words of Paul, "He that is baptized into Christ is become a partaker of the body of Christ;" (1 Cor. xii. 27). But opinion was still fluid about baptism in the apostolic age, especially as to its connexion with the descent of the Spirit. The Spirit falls on the disciples and others at Pentecost without any baptism at all, and Paul alone of the apostles was baptized. So far was the affluence of the Spirit from being conditioned by the rite, that in Acts x. 44 ff., the gift of the Spirit was first poured out upon the Gentiles who heard the word preached so that they spoke with tongues, and it was only after these manifestations that they were baptized with water in the name of Peter. We can divine from this passage why Paul was so eager himself to preach the word, and left it to others to baptize.

But as a rule the repentant underwrought baptism in the name of Christ Jesus, and washed away their sins before hands were laid upon them unto reception of the Spirit. Apostolos, who only knew the baptism of John (Acts xviii. 24), needed only instruction in the prophetic gnosis at the hands of Priscilla and Aquila in order to become a full disciple. On the other hand, in Acts xix. 1-7, twelve disciples, for such they were already accounted, who had been baptized into John's baptism, i.e. into the name of him who had followed John,-strokes the words of Acts xix. 2, according to the name of the coming Messiah, not "into Christ Jesus," but "into the Spirit," and Paul said to the Spirit, "I am not worthy of God's name to be His servant," and Paul, speaking of his being raised to the ministry, says, "I am not fit to be called an apostle, because I persecuted and smote the church of God," which is the same as saying that he was baptized into the Spirit.

At Ephesus, however, the people believed, practised, and received the sacrament in the name of Jesus Christ. In the name of the coming Messiah, without identifying him with Jesus of Nazareth. The apostolic age supplied this identification, and the normal use during it seems to have been "into Christ Jesus," or "in the name of the Lord Jesus Christ," or "of Jesus Christ" simply, or "of the Lord Jesus Christ." Paul explains these formulas as being equivalent to "into the death of Christ Jesus," as if the faithful were in the rite raised from death into everlasting life. The likeness of the baptismal ceremony with Christ's death and resurrection ensured a real union with him of the believer who underwent the ceremony, according to the words of Paul, "He that is baptized into Christ is become a partaker of the body of Christ;" (1 Cor. xii. 27). But opinion was still fluid about baptism in the apostolic age, especially as to its connexion with the descent of the Spirit. The Spirit falls on the disciples and others at Pentecost without any baptism at all, and Paul alone of the apostles was baptized. So far was the affluence of the Spirit from being conditioned by the rite, that in Acts x. 44 ff., the gift of the Spirit was first poured out upon the Gentiles who heard the word preached so that they spoke with tongues, and it was only after these manifestations that they were baptized with water in the name of Peter. We can divine from this passage why Paul was so eager himself to preach the word, and left it to others to baptize.

Baptism was not only a sign of repentance, but also of membership in the Christian church and a token of spiritual union with Christ. It was a public confession of faith, a symbol of spiritual regeneration, and a sacramental sign of the new covenant. The practice of baptism continued through the centuries, with slight variations in its form and meaning, and was essential for admission into the Christian community.
i.e., here used of children and parents, we realize how far off was St Paul from the positions of Augustine.

The question arises whether Jesus Himself instituted baptism as a condition of entry into the Messianic kingdom. The fourth gospel (iii. 22, and iv. 1) asserts that Jesus Himself baptized on a greater scale than the Baptist, but immediately adds that Jesus Himself baptized not, but only His disciples, as if the writer felt that he had too boldly contradicted the older tradition of the other gospels. Nor in these is it recorded that the disciples baptized during their Master's lifetime; indeed the very contrary is implied. There remain two texts in which the injunction to baptize is attributed to Jesus, namely, Mark xvi. 16 and Matt. xxviii. 19-20. Of these the first is part of an appendix headed "of Ariston the elder," an old Armenian codex, and taken perhaps from the last compendium of Baptists as to the other text, it has been doubted by many critics, e.g., Neander, Harnack, Dr Armitage Robinson and James Martineau, whether it represents a real utterance of Christ and not rather the liturgical usage of the region in which the first gospel was compiled. The circumstance, unknown to these critics when they made their conjectures, that Eusebius Pamphili, in nearly a score of citations, substitutes the words "in My Name," for the words "baptizing them into the name of the Father and of the Son and of the Holy Ghost," renders their conjectures superfluous. Aphraates also in citing the verse substitutes "My Name" for the "name" or "paraphrase of "in My Name." The first gospel thus falls into line with the rest of the New Testament.

34. Analogous Rites in other Religions (see also Purification).

—The Fathers themselves were the first to recognize that "the devil too had his sacraments," and that the Eleusinian, Isisic, Mithraic and other Mystæ used baptism in their rites of initiation. But it is not to be supposed that the Christians borrowed from these or from any Gentile source any essential features of their baptismal rites. Baptism was long before the advent of Jesus imposed on proselytes, and existed inside Judaism itself. It is therefore impossible to determine the primitive rite of baptism, with its threefold renunciation, resembles the ceremony of Roman law known as emancipatio, by which the paria potestas (or power of life and death of the father over his son) was extinguished. Under the law of the XII. Tables the father lost it, if he three times sold his child. This suggested a regular procedure, according to which the father sold his son thrice into mancipium, while after each sale the fictitious vendee enfranchised the son, by manumissio vindicta, i.e. by laying his rod (vindicta) on the slave and claiming him as free (vindictio in libertatem). Then the owner also laid his rod on the slave, declaring his intention to enfranchise him, and the master had to confirm the owner's declaration. The third manumission thus gave to the son and slave his freedom. It is possible that this common ceremony of Roman law suggested the triple abrenunciatio of Satan. Like the legal ceremony, baptism freed the believer from one (Satan) who, by the mere fact of the believer's birth, had power of death over him. And as the legal manumission dissolved a son's previousagnatic relationships, so, too, the person baptized gave up father and mother, &c., and became one of a society of brethren the bond between whom was not physical but legal and moral, and the rite of adoption in baptism as a son and heir of God was almost certainly taken by Paul from Roman law.

The ceremony of turning to the west three times with renunciation of the Evil One, then to the east, is exactly paralleled in a rite of purification by water common among the Malays and described by Skey in his book on Malay magic. If the Malay rite is not derived through Mahomedanism from Christianity, it is a remarkable example of how similar psychological conditions can produce almost identical rites.

The idea of spiritual re-birth, so soon associated with baptism, was of wide currency in ancient religions. It is met with in Philo of Alexandria and was familiar to the Jews. Thus the proselyte is said in the Talmud to resemble a child and must bathe in the name of God. The Jordan is declared in 2 Kings v. 10 to be a cleansing medium, and Naaman's cure was held to pre-figure Christian baptism. Jerome relates that the Jew who taught him Hebrew communicated to him a teaching of the Rabbi Baraqa, that the inner man who rises up in us at the fourteenth year after puberty (i.e. at 29) is better than the man who is born from the mother's womb.

In a Paris papyrus edited by Allur. Dieterich (Leipzig, 1903) under the title of Eines Mithrausliturgie, an ancient mystic describes his re-birth in impressive language. In a prayer addressed to "First birth of my birth, first beginning (or principle) of my beginning, first spirit of the spirit in me," he prays "to be restored to his deathless birth (genesis), albeit he is let and hindered by his underlying nature, to the end that according to the pressing need and spur of his longing he may gaze upon the deathless principle with deathless spirit, through the deathless water, as those who were in the abyss of the orient, with spirit derived from the living bread. And because the Master's spirit is held in the air; it was the very keynote of all the solemn initiations and mysteries—Mythraic, Orphic, Eleusinian—through which repentant pagans secured pardon and eternal bliss. Yet there is not much evidence that the church directly borrowed many of its ceremonies or interpretations from outside sources. They for the most part originated among the believers, and not improbably the outside cults borrowed as much from the church as it from them.

Authorities.—The following ancient works are recommended: Tertullian, De Baptismo (edition with intro. J. M. Lupton, 1909); Cyril of Jerusalem, Catecheses; Basil, De Spiritu Sancto; Constitutio Apostolicae; Gregory Nazianzen, Orat. 40; Gregory Nyss., Oratio in eos qui differunt baptismum; Sacramentary of Serapion of Thamus; Augustine, De Baptismo contra Donatistas; Iac. Cour, Ritualia Graecorum (gives the current Greek rites); F. C. Conybeare, Ritualis Armenorum (the oldest forms of Armenian and Greek rites); Gerard G. Vossius, De Baptismo (Amsterdam, 1648); Edmond Marteau, De Ani. Ecclesiæ Ritibus (gives Western rites) (Bassani, 1788). The modern literature is infinite; perhaps the most exhaustive works are W. F. Höfling, Das Sacrament der Taufe (Erlangen, 1889); Jos. Bingham’s Antiquities (London, 1834), and W. Wall, On the Sacrament of Baptism (London, 1870); and The Acts of the Apostles (Göttingen, 1894), details the corresponding rites of the Greek mysteries, also A. Dieterich, Eine Mithras Liturgie (Leipzig, 1903); J. A. L. Thesig, Thesauri Liturgici (Freiburg im Br. 1881); J. Duhem, Les rites de la sanctification des chrétiens (Paris, 1868); Mgr. P. Batiffol, Études historiques (Paris, 1904); J. C. W. Augusti, Denkwürdigkeiten (Leipzig, 1829-1831); J. M. F. Duval, Écésitique (Paris, 1843); Labrol and Duco, Leçons de l’Église (Paris, 1902) (a summary of all liturgical passages given in the early Fathers); Corbel, Histoire du sacrement de baptême (2 vols, Paris, 1881-1882).

BAPTISTE, NICOLAS ANSELME (1761—1835), French actor, was born in Bordeaux on the 18th of June 1761, the elder son of Joseph François Anselme, a popular actor. His mother played leading parts in tragedy, and both his parents enjoyed the profound respect of the public. The Baptiste coat as a young and heir of God was almost certainly taken by Paul from Roman law.

The ceremony of turning to the west three times with renunciation of the Evil One, then to the east, is exactly paralleled in a rite of purification by water common among the Malays and described by Skey in his book on Malay magic. If the Malay rite is not derived through Mahomedanism from Christianity, it is a remarkable example of how similar psychological conditions can produce almost identical rites.

The idea of spiritual re-birth, so soon associated with baptism, was of wide currency in ancient religions. It is met with in Philo of Alexandria and was familiar to the Jews. brigands, and as Count Almaviva in Beaumarchais' La Mère coupable. His success in this was so great that the directors of the Théâtre de la République—who had already secured Talma, Dugazon and Madame Vestris—had to obtain his services, and, in order to get him at once (1793), paid the 20,000 francs for which he was obliged to surrender on breaking his contract. Later he, as well as his younger brother, became sociétaire. Nicolas took all the leading parts in comedy and tragedy. As he grew older his special forte lay in noble fathers. After a brilliant career of thirty-five years of uninterrupted service, he retired in 1838. But, after the revolution of 1830, when the Théâtre Français was in precipitants, the brothers Baptiste came to the rescue, reappeared on the stage and helped to bring back its prosperity. The elder died in Paris on the 1st of December 1835. The younger brother, Paul Eustache Anselme, known as Baptiste cadet (1765-1839), was also a comedian of great talent, and had a long and brilliant career at the Comédie Française, where he made his début in 1792 in L'Amour et l'Intérêt.

BAPTISTERY (Baptistium, in the Greek Church Φωτιστήρ), the separate hall or chapel, connected with the early Christian Church, in which the catechumens were instructed and the sacrament of baptism administered. The name is also given to a kind of chapel in a large church, which serves the same purpose. The baptistery proper was commonly a circular building, although sometimes it had eight and sometimes twelve sides, and consisted of an ante-room (προωρίσιον οίκος) in which the catechumens were instructed, and where before baptism they made their confession of faith, and an inner apartment where the sacrament was administered. In the inner apartment the principal object was the baptismal font (κολομβάριον, or piscina), in which those to be baptized were immersed thrice. Three steps led down to the floor of the font, and over it was suspended a gold or silver dove; while on the walls were commonly pictures of the scenes in the life of John the Baptist. The font was at first always of stone, but latterly metals were often used. Baptisteries belong to a period of the church when great numbers of adult catechumens were baptized, and when immersion was the rule. We find little or no trace of them before Constantine made Christianity the state religion, i.e. before the 4th century; and as early as the 6th century the baptismal font was built in the porch of the church and then in the church itself. After the 9th century few baptisteries were built, the most noteworthy of later date being those at Pisa, Florence, Padua, Lucca and Parma. Some of the older baptisteries were very large, so large that we hear of councils and synods being held in them. It was necessary to make them large, because in the early Church it was customary for the bishop to baptize all the catechumens in his diocese (and so baptisteries are commonly found attached to the cathedral and not to the parish churches), and also because the rite was performed only thrice in the year. (See BAPTISTEM.) During the months when there were no baptisms the baptistery doors were sealed with the bishop's seal. Some baptisteries were divided into two parts to separate the sexes; sometimes the church had two baptisteries, one for each sex. A fireplace was often provided to warm the neophytes after immersion. Though baptisteries were forbidden to be used as burial-places by the council of Auxerre (578) they were not uncommonly used as such. Many of the early archbishops of Canterbury were buried in the baptistery there. Baptisteries, we find from the records of early councils, were first built and used to correct the evils arising from the practice of private baptism. As soon as Christianity made such progress that baptism became the rule, and as soon as immersion gave place to sprinkling, the ancient baptisteries were no longer necessary. They are still in general use, however, in Florence and Pisa. The baptistery of the Lateran must be the earliest ecclesiastical building still in use. A large part of it remains as built by Constantine. The central area, where is the basin of the font, is an octagon around which stand eight porphyry columns, with marble capitals of a delicate and classical form; outside these are an ambulatory and outer walls forming a larger octagon. Attached to one side, towards the Lateran basilica, is a fine porch with two noble porphyry columns and richly carved capitals, bases and entablatures. The circular church of Santa Costanza, also of the 4th century, served as a baptistery and contained the tomb of the daughter of Constantine. This is a remarkably perfect structure with a central dome, columns and mosaics of classical fashion. Two side niches contain the earliest known mosaics of distinctly Christian subjects. In one is represented Moses receiving the Old Law, in the other Christ delivers to St Peter the New Law—a charter sealed with the X P monogram.

Another baptistery of the earliest times has recently been excavated at Aquileia. Ruins of an early baptistery have also been found at Salona. At Ravenna exist two famous baptisteries encrusted with fine mosaics, one of them built in the middle of the 5th century, and the other in the 6th. To the latter date also belongs a large baptistery decorated with mosaics at Naples.

In the East the metropolitan baptistery at Constantinople still stands at the side of the mosque which was once the patriarchal church of St Sophia; and many others, in Syria, have been made known to us by recent researches, as also have some belonging to the churches of North Africa. In France the most famous early baptistery is that of the Cathedral of Mire in Passy. Other examples exist at Riez, Fréjus and Aix. In England, a detached baptistery is known to have been associated with the cathedral of Canterbury.

See Hele's Concîilium, passim; Du Cange, Glossary, article "Baptistium"; Eusebius, Hist. Eccl. x. 4; Bingham's Antiq. of the Christian Church, i. 16.

BAPTISTS, a body of Christians, distinguished, as their name imports, from other denominations by the view they hold respecting the ordinance of baptism (q.v.). This distinctive view, common and peculiar to all Baptists, is that baptism should be administered to believers only. The mode of administration of the ordinance has not always been the same, and some Baptists (e.g. the Mennonites) still practise baptism by pouring or sprinkling, but among those who will here be styled modern Baptists, the mode of administration is also distinctive, to wit, immersion. It should, however, be borne in mind that immersion is not peculiar to the modern Baptists. It has always been recognized by Paedobaptists as a legitimate mode, and is still practised to the exclusion of other modes by a very large proportion of paedobaptist Christendom (e.g. the Orthodox Eastern Church). We shall distinguish here between two main groups of Baptists in Europe: the Anabaptists, now practically extinct, and the modern Baptists whose churches are in nearly every European country and in all other countries where white men reside.

I. THE ANABAPTISTS

The great spiritual movement of the 15th and 16th centuries had for its most general characteristic, revolt against authority. This showed itself not merely in the anti-papal reformation of Luther, but also in the anti-feudal rising of the peasants and in a variety of anti-ecclesiastical movements within the reformation areas themselves. One of the most notable of these radical anti-ecclesiastical movements was that of the Zwickau prophets, (Marcus Stübner, Nikolaus Storch and Thomas Münzer): the most vigorous and notorious that of the Münster Anabaptists. Although they have been called the "harbingers" of the Anabaptists, the characteristic teaching of the Zwickau prophets was not Anabaptism. (See, however, ANABAPTISTS.) For although Münzer repudiated infant baptism in theory, he did not relinquish its practice, nor did he insist on the re-baptism of believers. The characteristic teaching of the Zwickau movement, so closely linked with the peasant rising, was that the Peasants' Struggle was laid upon the "inner word." Divine revelation, said Münzer, was not received from the church, nor from preaching, least of all from the dead letter of the Bible; it was received solely and directly from the Spirit of God. It is this daring faith in divine illumination that brings the Zwickau teachers most nearly into touch with the Anabaptists. But if they are not typical of Anabaptism, still less are the later representatives of the movement in the last sad months at Münster.

The beginnings of the Anabaptist movement proper were in
Zürich, where Wilhelm Reubli (1480–1554), Konrad Grebel (d. 1526), Felix Manz (d. 1527) and Simon Strumpf separated from Zwingli and proposed to form a separate church. They repudiated the use of force, advocated a scriptural communism of goods, and asserted that Christians must always exercise love and patience towards each other and so be independent of worldly tribunals. But their most radical doctrine was the rejection of infant baptism as unscriptural. They rapidly gained adherents, among whom was Hans Brödli, pastor of Zollikon. Their refusal, however, to baptize infants, and the formation of a separate church as the outcome of this refusal, brought upon them the condemnation of Zwingli, and a number of them were banished. This act of banishment, however, drove Jörg Blaurock, Konrad Grebel and others to take the step which definitely instituted “Anabaptism”: they baptized one another and then partook of the Lord’s Supper together. This step took them much farther than the repudiation of paedobaptism. It formed a new religious community which sought to fashion itself on the model of primitive Christianity, rejecting all tradition and accretions later than New Testament records. Its members claimed to get back to the simple church founded on brotherly love. The result was that their numbers grew with astonishing rapidity, and scholarly saints like Balthasar Hubmaier (ca. 1480–1528) and Hans Denck (ca. 1495–1527) joined them. Hubmaier brought 110 new adherents with him, and in 1525 himself baptized 300 converts. This baptism, however, was not immersion. Blaurock and Grebel baptized each other, and many adherents, kneeling together in an ordinary room, were thus baptized. Sometimes the water was sprinkling or pouring. In all this the Anabaptists had maintained one central article of faith that linked them to the Zwickau prophets, belief in conscience, religious feeling, or inner light, as the sole true beginning or ground of religion; and one other article, held with equal vigour and sincerity, that true Christians are like sheep among wolves, and must on no account defend themselves from their enemies or take vengeance for wrong done. Very soon this their faith was put to fiery test. Not only were Catholics and Protestants opposed to them on doctrinal grounds, but the secular powers, fearing that the new teaching was potentially as revolutionary as Müntzer’s radicalism had been, soon instituted a persecution of the Anabaptists. On the 7th of March 1526 the Zürich Rath issued an edict threatening all who were baptized anew with death by drowning, and in 1529 the emperor Charles V., at the diet of Spires, ordered Anabaptists to be put to death with fire and sword without even the form of ecclesiastical trial. A cruel persecution arose. Manz was drowned at Zürich and Michael Sattler (ca. 1495–1527) burned to death after torture in 1527; Hubmaier was burned in 1528 and Blaurock in 1529, and Sebastian Franck (1490–1542) asserts that this, and of all such Anabaptist martyrs, was an error: for Anabaptists were perfectly afraid of fire, and nothing was more abominable to them than burning in the fire. Two testimonials followed from this persecution. First, the development of a self-contained and homogeneous community was made impossible. No opportunity for the adoption of any common confession was given. Only a few great doctrines are seen to have been generally held by Anabaptists—such as the baptism of believers only, the rejection of the Lutheran doctrine of justification by faith as once-sided and the simple practice of the breaking of bread. This last, the Anabaptist doctrine of the Lord’s Supper, was to the effect that brothers and sisters in Christ should partake in remembrance of the death of Christ, and that they should thereby renew the bond of brotherly love as the basis of neighbourly life. In the second place, the persecution deprived the Anabaptists of the noble leaders who had preached non-resistance and at the same time provoked others to an attitude of vengeance which culminated in the horrors of Münster. For Melchior Hofmann (ca. 1498–1543 or 1454) having taken the Anabaptist teaching to Holland, there arose in Haarlem a preacher of vengeance, Jan Matthiison or Matthyssoyon (Matthys) (d. 1534) by name, who, prophesying a speedy end of the world and establishment of the kingdom of heaven, obtained many adherents, and despatched Boelkander and de Knep to Münster. Here the attempt was made to realise Matthys’s ideals. All who did not embrace Anabaptism were driven from Münster (1533), and Bernt Knippendorf (ca. 1495–1536) became burgomaster. The town was now besieged and Matthias son was killed early in 1534. John (Johann Bockelson) of Leiden (1510–1536) took his place and the town became the scene of the grossest licence and cruelty, until in 1535 it was taken by the besieging bishop. Unhappily the Anabaptists have always been remembered by the crimes of John of Leiden and the revolts of Münster. They should really be known by the teaching and martyrdom of Blaurock, Grebel and Hubmaier, and by the gentle learning and piety of Hans Denck—of whom, with many hundred others, “the world was not worthy.”

For the teaching of the Anabaptists, see ANABAPTISTS.

Reference has already been made to the reason why a common Anabaptist confession was never made public. Probably, however, the earliest confession of faith of any Baptist community is that given by Zwingli in the second part of his Elenchus contra Catholicae, published in 1527. Zwingli professes to give it entire, translating it, as he says, ad verbum into Latin. Whatever opinion may be held as to the orthodoxy of the seven articles of the Anabaptists, the vehemence with which they were opposed, and the epithets of abuse which were heaped upon the unfortunate sect that maintained them, cannot fail to astonish those used to toleration. Zwingli, who details these articles, as he says, that the world may see that they are “fanatical, stolid, audacious, impious,” can scarcely be acquitted of unfairness in joining together two of them,—the fourth and fifth,—thus making the article treat “of the avoiding of abominable pastors in the church, and the use of infant baptism,” as “errors.” He says that there is nothing about pastors in the fourth article, and nothing about abominations in the fifth, and though in a marginal note he himself explains that the first two copies that were sent him read as he does, but the other copies make two articles, as in fact they evidently are. It is strange that the Protestant Council of Zürich, which had scarcely won its own liberty, and was still in dread of the persecution of the Romanists, should pass the decree which instituted the cruel persecution of the Anabaptists.

After Münster had fallen the harassed remnants of the Anabaptists were gathered together under Menno Simons, who joined them in 1537. His moderation and piety held in check the turbulence of the more fanatical amongst them. He died in 1561 after a life passed amidst continual dangers and conflicts. His name remains as the designation of the Mennonites (q.v.), who eventually settled in the Netherlands under the protection of William the Silent, prince of Orange.

Of the introduction of Anabaptist views into England we have no certain knowledge. Fox relates that “the registers of London make mention of certain Dutchmen counted for Anabaptists, of whom ten were put to death in sundry places the year before, anno 1525; another ten were repented and were banished.” In 1536 King Henry VIII. issued a proclamation together with articles concerning faith agreed upon by Convocation, in which the clergy are told to instruct the people that they ought to repute and take “the Anabaptists’ opinions for detestable heresies and to be utterly condemned.” Thomas Fuller (1608–1661) tells us from Stow’s Chronicles that, in the year 1538, “four Anabaptists, three men and one woman, all Dutch, bare faggots at Paul’s Cross, and three days after a man and woman of their sect was burnt in Smithfield.” In the reign of Edward VI., after the return of Erasmus to Zürich, John Hooper (bishop of Gloucester and Worcester, d. 1555) writes to his friend Bullinger in 1549, that he reads “a public lecture twice in the day to so numerous an audience that the church cannot contain them,” and adds, “the Anabaptists flock to the place and give me much trouble.” It would seem that at this time they were united together in communities separate from the established Church. Latimer, in 1552, speaks of them as segregating themselves from the company of other men. In the sixth examination of John Philpot (1516–1555) in 1555 we are told that Lord Riche said to him, “All heretics do boast of the Spirit of God, and every one would have a church by himself, as Joan of Kent and the Anabaptists.” Philpot was imprisoned
soon after Mary’s accession in 1553; and it is very pleasing to find, amidst the records of intense bitterness and rancour which characterized these times, and with which Romanist and Protestant alike assailed the persecuted Anabaptists, a letter of Philip’s, to a friend of his, “prisoner the same time in Newgate,” who held the condemned opinions. His friend had written to ask his judgment concerning the baptism of infants. Philip in a long reply, whilst maintaining the obligation of infant baptism, yet indulges the correspondent, cap. 1553; and at the close of his argument he says, “I beseech thee, dear brother in the gospel, follow the steps of the faith of the glorious martyrs in the primitive church, and of such as at this day follow the same.”

Many Anabaptist communities existed in England toward the end of the 16th century, particularly in East Anglia, Kent and London. Their most notable representative was Robert Cooke, but they were more notorious for heretical views as to the Virgin Mary (see Anabaptists). Many for their anti-paedobaptism.

It was for these views that Joan Boucher of Kent was burnt in 1559. There is no doubt that these prepared the way for the coming of the modern Baptists, but “the truth is that, while the Anabaptists in England raised the question of baptism, they were almost entirely a foreign importation, an alien element; and the rise of the Baptist churches was wholly independent of them.”

II. THE MODERN BAPTISTS

1. GREAT BRITAIN AND IRELAND.—If the Anabaptists of England were not the progenitors of the modern Baptist church, we must look elsewhere for the beginnings of that movement. Although there were doubtless many who held Baptist views scattered among the Independent communities, it was not until the time of John Smith or Smyth (d. 1612) that the modern Baptist movement in England broke away from Brownism. Smyth was appointed preacher of the city of Lincoln in 1600 as an ordained clergyman, but became a separatist in 1605 or 1606, and, soon after, emigrated under stress of persecution with the Gainsborough Independents to Amsterdam. With Thomas Helwys (ca. 1560–ca. 1616) and Morton he joined the “Ancient” church there, but, coming under Mennonite teaching in 1609, he separated from the Independents, baptized himself (hence he is called the “Se-baptist”). Helwys and others probably according to the Anabaptist or Mennonite fashion of pouring. These then formed the first English Baptist Church which in 1611 published a declaration of faith of English people remaining at Amsterdam in Holland. The article relating to baptism is as follows:—

“that every church is to receive in all their members by baptism upon the confession of their faith and sins, wrought by the preaching of the gospel according to the primitive institution and custom of the apostles, and therefore chrstianity is constituted in two clear manner, or of any other persons, are not according to Christ’s testament. That baptism or washing with water is the outward manifestation of dying unto sin and walking in newness of life; and therefore in no wise appertained to infants.” They held “that no church ought to challenge any prerogative over any other”; and that “the magistrate is not to meddle with religion, or matters of conscience nor compel men to this or that form of religion.” This is the first known expression of absolute liberty of conscience in any confession of faith.

Smyth died in Holland, but in 1612 Helwys returned to England with his church and formed the first Baptist church worshipping on English soil. The church met in Newgate Street, London, and was the origin of the “General” Baptist denomination. Helwys and his followers were Arminians, repudiating with heat the Calvinistic doctrine of predestination. They thus differed from other Independents. “They also differed on the power of the magistrate in matters of belief and conscience. It was, in short, from their little dingy meeting house ... that there flashed out, first in England, the absolute doctrine of Religious Liberty.” (Prof. Bussher, the author of “Religious Peace: or a Plea for Liberty of Conscience,” was a member of this church.

The next great event in the history of the Baptists (though it should be mentioned that the last execution for heresy in England by burning was that of a Baptist, Edward Wightman, at Lichfield in 1612) is the rise of the first Calvinistic or Particular Baptist Church. This was the Jacob church in Southwark, which numbered among its members John Lothrop or Lathrop (d. 1653), Praise-God Barbon (ca. 1596–1679), Henry Jessey (1601–1663), Hanserd Knollys (ca. 1599–1601) and William Kiffin (1616–1701). It was a simple church organized about the same time as several other Baptist churches. From this six other churches sprang, five of which were Baptists. Before the Jacob church, however, had itself become Baptist, it dismissed from its membership a group of its members (the church having grown beyond what was regarded as proper limits) who, in 1633, became the First Particular Baptist Church.

Thus there were now in existence in England two sets of Baptists whose origins were quite distinct and who never had any real intercourse as churches. They differed in many respects. The General Baptists were Arminian, owing to the influence of John Smyth. The Particular Baptists were Calvinist, springing as they did from the Independents. But on the question of Baptism both groups, while they utterly rejected the baptism of infants, were as yet unpledged to immersion and rarely practised it. The development of their doctrine as to baptism was marked along three lines of dispute:—(1) who is the proper administrator of baptism? (2) who are the proper subjects? and (3) what is the proper mode? Eventually agreement was reached, and in 1644 a Confession of Faith was published in the names of the Particular Baptist churches of London, now generally known, commonly (though falsely) called Anabaptist. The article on baptism is as follows:—“That a moral ordinance of the New Testament given by Christ to be dispensed only upon persons professing faith, or that are disciples, or taught, who, upon a profession of faith, ought to be baptized.” “The way and manner of dispensing this ordinance the Scripture holds out to be dipping or plunging the whole body under water.” They further declare (particularly in order that they may avoid the charge of being Anabaptists) that “a civil magistracy is an ordinance of God, which they are bound to obey. They speak of the ‘breathing time’ which they have had of late, and their hope that God would, as they say, ‘incline the magistrates’ hearts so far to tender our consciences as that we might be protected by them from wrong, injury, oppression and molestation’; and then they proceed: “But if God withhold the magistrates’ allowance and furthermore herein, yet we must, notwithstanding, proceed together in Christian communion, not daring to give place to suspend our practice, but to walk in obedience to Christ in the profession and holding forth this faith before mentioned, even in the midst of all trials and afflictions, not accounting our goods, lands, wives, children, fathers, mothers, brethren, sisters, but to walk in the open doors of Christ’s church, that we may finish our course with joy; remembering always that we ought to God rather than men.” They end their confession thus: “If any take this that we have said to be heresy, then do we with the apostle freely confess, that after the way which they call heresy worship we the God of our fathers, believing all things which are written in the Law and in the Prophets and Apostles, desiring from our souls to disclaim all heresies and opinions which are not after Christ, and to be stedfast, unmovable, always abounding in the work of the Lord, as knowing our labour shall not be in vain in the Lord.” The “breathing time” was not of long continuance. Soon after the Restoration (1660) the meetings of nonconformists, were continually disturbed and preachers were fined or imprisoned. One instance of these persecutions will, perhaps, be more impressive than any general statements. In the records of the Broadmead Baptist Church, Bristol, we find this remark: “On the 29th of November 1685 our pastor, Brother Fowmes, died in Gloucester jail, having been kept there for two years and about nine months a prisoner, unjustly and maliciously, for the testimony of Jesus and preaching the gospel. He was a man of great learning, of a sound judgment, an able preacher, having great knowledge in divinity, law, physic, etc.; a bold and patient sufferer for the Lord Jesus and the gospel he preached.”
The Revolution of 1688, and the passing of the Act of Toleration in 1690, the history of the persecution of Baptists, as well as of other Protestant dissenters, ends. The removal of the remaining disabilities, such as those imposed by the Test and Toleration Acts repealed in 1828, has no special bearing on Baptists more than on other nonconformists. The ministers of the "three denominations of dissenters"—Presbyterians, Independents and Baptists,—resident in London and the neighbourhood, had the privilege accorded to them of presenting on proper occasions an address to the sovereign in state, a privilege which they still enjoy under the name of "the General Body of Protestant Dissenting Ministers of the three Denominations." The "General Body" was not organized until 1727.

The Baptists, having had a double origin, continued for many years in two sections, those who, in accordance with Arminian views held the doctrine of "General Redemption," and those who, agreeing with the Calvinistic theory, held the doctrine of "Particular Redemption"; and hence they were known respectively as General Baptists and Particular Baptists. In the 18th century many of the General Baptists gradually adopted the Arian, or, perhaps, the Socinian theory; whilst, on the other hand, the Calvinism of the Particular Baptists in many of the churches became more rigid, and approached or actually became Antinomianism. In 1770 the orthodox portion of the General Baptists, mainly under the influence of Dan Taylée (1738), forming the Society of Separated Churches, united under the name of the General Baptist New Connection, since which time the "Old Connection" has gradually merged into the Unitarian denomination. By the beginning of the 19th century the New Connection numbered 40 churches and 3,400 members. The old General Baptists "still keep up a shadowy legal existence." Towards the end of the 18th century many of the Particular Baptist churches became more moderate in their Calvinism, a result largely attributable to the writings of Andrew Fuller. Up to this time a great majority of the Baptists admitted none of the sacraments as necessary to a Christian's salvation, the principal exception being the churches in Bedfordshire and Hertfordshire, founded or influenced by Bunyan, who maintained thatdifference of opinion in respect to water baptism was no bar to communion. At the beginning of the 19th century this question was the occasion of great and long-continued discussion, in which the celebrated Robert Hall (1764—1831) took a principal part. The practice of mixed communion gradually spread in the denomination. Still more recently many Baptist churches have considered it right to admit to full membership persons professing faith in Christ, who do not agree with them respecting the ordinance of baptism. Such churches thus, in the main, take their practice on the ground that they ought to grant to all their fellow-Christians the same right of private judgment as they claim for themselves. It may not be out of place here to correct the mistake, which is by no means uncommon, that the terms Particular and General as applied to Baptist congregations were intended to express this difference in their practice, whereas these terms related, as has been already said, to the difference in their doctrinal views. The difference now under consideration is expressed by the terms "strict" and "open," according as communion (for these are the terms used to describe the communication) is for the strict confined to persons who, according to their view, are baptised.

In 1811, largely under the influence of Dr John Cliforn, a leading General Baptist, the two denominations, Generali and Particular, were united, there being now but one body called "The Baptist Union of Great Britain and Ireland." This Union, however, is purely voluntary, and some Baptist churches, a few of them prosperous and powerful, hold aloof from their sister churches so far as organization is concerned.

There are other Baptist bodies outside the Baptist Union, besides certain isolated churches throughout England there are many "strict" Baptist churches which really form a separate denomination. For the most part they are linked together according to geographical distribution in associations, such as the "Metropolitan Association of Strict Baptist Churches," and the "Suffolk and Norfolk Association of Particular Baptist Churches." In the latter case the name "particular" is preferred, but the association holds alof from other Baptist churches because its principles are "strict." There is, however, no national Union. Indeed, the Strict Baptists are themselves divided into the "standard" and "vessel" denominations—names derived from the "Gospel Standard" and "Earthly Vessel," the organs of the rival groups.

The Baptist character is that of a "strict" and narrow type, which has its rigorous adherence to a type of Calvinistic theology now generally obsolete, and their insistence upon baptism as the condition of Christian communion. Their loose organization makes it impossible to obtain accurate statistics, and their small number of churches and members, makes it impossible to describe the entire body. There is a strict Baptist Missionary Society (founded 1860, re-founded 1897) which conducts mission work in South India. The income of this society was £1,140 in 1905. It comprises 730 church members, 87 pastorate, 72 pastor's wives.

The Baptists early felt the necessity of providing an educated ministry for their congregations. Some of their leading pastors had trained at one or other English or Scottish theological seminaries. Others had by their own efforts obtained a large amount of learning, amongst whom Dr John Gill was eminent for his knowledge of Hebrew, as shown in his Exposition of the Holy Scriptures, a work in 9 vols.folio, 1746-1766. Edward Terrill, who died 1685, left a considerable part of his estate for the instruction of young men desiring to be trained for the ministry, under the superintendence of the pastor of the Broadmead Church, Bristol, of which he was a member. Another member of the same purpose were made, and from the year 1720 the Baptist Academy, as it was then called, received young men as students for the ministry among the Baptists. In 1770 the Bristol Baptist Association was formed, and about the year 1811 the present Baptist College at Manchester was established at the expense of the Baptist Society of the north of England. In the north of England a similar education society was formed in 1804 at Bradford, Yorkshire, which has since been removed to Rawdon, Yorkshire. By the year 1746 the Baptist College at Manchester had been removed to Regent's Park in 1856. The Pastors' College in connexion with the Metropolitan Tabernacle was instituted in 1856, and in 1866 the present Baptist College at Manchester was opened at the expense of the Baptist Society of London. Besides these, which were voluntary colleges not under denominational control, the General Baptists maintained a college since 1797, which, since the amalgamation of the Baptist bodies, has become also a voluntary institution, though previously supported by the General Baptist Association. It is called the "Midland Baptist College," and is situated in Nottingham. There is also a theological society for educational instruction, organized in 1873, in Wales and one in Ireland. The total number of students in these institutions is about 210.

The Baptists were the first denomination of British Christians to take part in a way that work of ministering to the heathen, which became so prominent a feature in the religious activity of the 19th century. As early as the year 1784 the Northamptonshire Association of Baptist churches resolved to recommend that the first Monday of each month should be set apart for prayer for the spread of the gospel. Shortly after, in 1792, the Baptist Missionary Society was formed at Kettering in Northamptonshire. It was connected by way of York (1793) and London (1794—1832), the prime mover in the work, in which he urged two points: "Expect great things from God; attempt great things for God." In the course of the following year Carey sailed for India and Japan, and was joined by J. L. Paton in 1795. Thus was the Baptist mission established at Serampore. The great work of Dr Carey's life was the translation of the Bible into the various languages and dialects of the world, a work which now extends not only in the East, but in the West Indies, China, Africa (chiefly on the Congo river), and Europe.

In regard to church government, the Baptists agree with the Congregationalists that each separate church is complete in itself, and has, therefore, power to choose its own ministers and to make such regulations as it deems to be most in accordance with the purpose of its existence, that is, the advancement of the kingdom of Christ. A comparatively small section of the denomination maintain that a "plurality of elders or pastors is required for the complete organization of every separate church. This is the distinctive peculiarity of those churches in Scotland, in the north of England, and in the north of Ireland are known as 'associations.' The largest church of this section, consisting of approximately 500 members, originated in Edinburgh in 1765, before which date only one Baptist church—that of Keiss in Caithness, formed about 1750—was in existence. As the greater number of the churches are united in association voluntarily formed, all of them determined by geographical limits. The associations, as well as the churches not in connexion with them, are united for the sake of mutual aid and mutual help. The Baptist General Union, founded in 1815 by the Particular Baptists. This union, however, exerts no authoritative action over the separate churches. One important part of the work of the union is the collection of information respecting the various churches in the United Kingdom: Baptist churches, 3046; chapels, 4124; sittings, 1450,352; members, 424,008; Sunday school teachers, 58,687; Sunday scholars, 578,341; local preachers, 5615; and parliamentarians, 5615.

At the beginning of the 20th century the Baptist Union collected a "Twentieth Century Fund" of £500,000, which has largely assisted the formation of new churches, and gives an indication of
the unity and virility of the denomination. A still stronger evidence to the same effect was given by the Religious Census taken in 1860. While this only applied to London, its results are valuable as showing the comparative strength of the Baptist Church. These results are to be compared with those of the Baptists recorded in the Anglicans in the following three particulars:—(1) Percentage of attendances at public worship contributed by Baptists, 10-81 (London County), 10-70 (Greater London); (2) aggregate of attendances, 54,497; (3) number of places of worship, 443.

2. The Continent of Europe. — During the 15th century when we have called the modern Baptist movement made its appearance in nearly every European country. In Roman Catholic countries Baptist churches were formed by missionaries coming from either England or America: work in France began in 1632, in Italy missions were started in 1666 (Spiez Mission) and in 1884 (Baptist Missionary Society, which also has a mission in Brittany), and in Spain in 1888. In Protestant countries and in Russia the Baptist movement began without missionary intervention from England or America. J. G. Oncken (1800-1884) formed the first church in Hamburg in 1834, and thereafter Baptist churches were formed in other countries as follows:—Denmark (1839), Holland and Sweden (1848), Switzerland (1849), Norway (1860), Austria and Rumania (1860), Hungary (1871), and Bulgaria (1884). Baptist churches also began to be formed in Russia and Finland in the 'fifties and 'sixties.

3. British Colonies. — In every colony the Baptists have a considerable place. There are unions of Baptist churches in the following colonies:—New South Wales, Victoria, S. Australia, Western Australia, Queensland, New Zealand, Tasmania, Canada (Ontario) and S. Africa. The work in S. Africa is assisted by the Baptist South African Missionary and Colonial Aid Society, having its seat in London.

The Baptist World Alliance was formed in 1905, when the first Baptist World Congress was held in London. The preamble of the constitution of this Alliance sufficiently indicates its nature:—"Whereas, in the providence of God, the time has come when it seems fitting more fully to manifest the essential oneness in the Lord Jesus Christ, as their God and Saviour, of the churches of the Baptist order and faith throughout the world, and to promote the spirit of fellowship, service and co-operation among them, while recognizing the independence of each particular church and not assuming the functions of any existing or purpose is to form a Baptist alliance, extending over every part of the world." This alliance does in fact include Baptists in every quarter of the globe, as will be seen from the following statistics:—

1 The figures for Russia include only the German-speaking Baptists. Estimates have been made which vary from 60,000 to 100,000.

In 1909 the comparative totals were roughly:—72,088 churches; 7,480,940 members. In both sets of figures the Disciples of Christ (U.S.A.) are included.

(N. H. M.)

4. United States of America. — The first Baptist Church in America was that founded in the Providence settlement on Narragansett Bay under the leadership of Roger Williams in 1635. Having been sentenced for his opinions (October 1635) by the Massachusetts Court because of his persistence in maintaining separatist views deemed unsettling and dangerous, to escape deportation to England he betook himself (January 1636) to the wilderness, where he was hospitably entertained by the natives who gave him a tract of land for a settlement. Having been joined by a few friends from Massachusetts, Williams founded a commonwealth in which absolute religious liberty was combined with civil democracy. In the firm conviction that churches of Christ should be made up exclusively of regenerate members, he and his adherents appeared to him not only valueless but a perversion of Christian faith. About March 1639, with eleven others, he decided to restore believers' baptism and to form a church of baptized believers. Ezekiel Holliman, who had been with him at Plymouth and shared his separatist views, first baptized Williams and Williams baptized the rest of the company. Williams did not long continue to find satisfaction in the step he had taken. Believing that the ordinances and apostolic church organization had been lost in the general apostasy, he became convinced that it was necessary for any man or company of men to undertake their own restoration without a special divine commission. He decided to petition the church to withdraw from the church and to assume the position of a seeker. He continued on friendly terms with the Baptists of Providence, and in his writings he expressed the conviction that their practice came nearer than that of other communions to the first practice of Christ.

In November 1637 John Clarke (1609-1676), a physician, of religious zeal and theological acumen, arrived at Boston, where, instead of the religious freedom he was seeking, he found the dominant party in the Antinomian controversy on the point of banishing the Antinomian minority, including Mrs Anne Hutchinson (q.v.) and her father, John Wheelwright (c.1590-1679), and William Coddington (1601-1678). Whether from sympathy with the persecuted or aversion to the persecutors, he cast in his lot with the former and after two unsuccessful attempts at settlement assisted the fugitives in forming a colony on the island of Aquidneck (Rhode Island), procured from the Indians through the good offices of Williams. By 1641 there were, according to John Winthrop, "professed Anabaptists" on the island, and Clarke was probably their leader. Robert Lenthall, who joined the Newport company in 1640 when driven from Massachusetts, probably brought with him antipaedobaptist convictions. Mrs Scott, sister of Mrs Hutchinson, is thought to have been an aggressive antipaedobaptist when the colony was founded. Mark Lucar, who was baptized by immersion in London in January 1642 (N.S.) and was a member of a Baptist church there, reached Newport about 1644. A few years later we find
him associated with Clarke as one of the most active members of the Newport church, and as the date of the organization is uncertain, there is some reason to suspect that he was a conscientious member and that as a baptized man he took the initiative in baptizing and organizing. At any rate we have in Lucar an interesting connecting link between early English and American Baptists.

The Providence church maintained a rather feebie existence after William's withdrawal, with Thomas Olney (d. 1682), William Wickenden, Chah Brown (d. 1665) and Gregory Dexter as leading members. A schism occurred in 1652, the last three with a majority of the members contending for general redemption and for the laying on of hands as indispensable to fellowship, Olney, with Wickenden and others, maintaining the laying on of hands as an ordinance. Olney's party became extinct soon after his death in 1682. The surviving church became involved in Socinianism and Universalism, but maintained a somewhat vigorous life and through Wickenden and others, exerted considerable influence at Newport, in Connecticut, New York and elsewhere. Dexter became, with Williams and Clarke, a leading statesman in Rhode Island and Providence Plantations.

The Newport church extended its influence into Massachusetts and in 1649 a group of Baptists at Rehoboth, with Olney's connivance, was organized. The intolerance of the authorities rendered the prosecution of the work impracticable and these Massachusetts Baptists became members of the Newport church. In 1653 Clarke, Holmes and Joseph Crandall of the Newport church made a religious visit to Lynn, Mass. While holding a meeting in a private house they were arrested and were compelled to attend the church services of the standing order. For holding an unlawful meeting and refusing to participate quietly in the public service they were fined, imprisoned and otherwise maltreated. While in England on public business in 1654, Clarke published his News from New England, which contained an impressive account of the proceedings against himself and his brethren at Lynn, and an earnest and well-reasoned plea for liberty of conscience.

Henry Dunster (1621-1659), the first president of the college at Cambridge (Harvard), had by 1653 become convinced that "visible believers only should be baptized." Being unwilling to hold his views in abeyance, he relinquished his administration in 1654, under circumstances of considerable hardship, the work that he greatly loved.

In 1663 John Myles (1621-1683), a Welsh Baptist who had become one of Cromwell's Tryers, was sent to America by the Massachusetts authorities, but the law prohibiting the importation of English Baptists was suspended. In 1668 he returned to England and was imprisoned for his efforts to organize a church. While in England he published in 1670 a tract in defense of the Baptist position, which was widely circulated.

In 1679, after the death of Dunster, Thomas Dungan, a Baptist, was appointed as chaplain to the Massachusetts General Court. He continued to preach in public and to organize Baptist meetings, and in 1681 he was appointed a member of the Massachusetts legislature. He died in 1682, but his influence continued to be felt in the colony.

In 1683, a Baptist congregation was organized in Charlestown, and in 1688 a Baptist church was established in New Haven. The latter was organized by Dr. John Clark, who had come to America in 1681 from England. The church grew rapidly and became one of the leading Baptist churches in America.

In 1690, a Baptist church was established in Providence, Rhode Island, under the leadership of William B. Lawler. This church quickly became one of the largest and most influential in the colony.

In 1692, a Baptist church was established in New York, under the leadership of Dr. John Clark. This church later became the Baptist Church in New York City, one of the largest and most influential Baptist churches in America.

In 1693, a Baptist church was established in Boston, under the leadership of Dr. John Clark. This church later became the First Baptist Church in Boston, one of the largest and most influential Baptist churches in America.

In 1694, a Baptist church was established in New Haven, under the leadership of Dr. John Clark. This church later became the First Baptist Church in New Haven, one of the largest and most influential Baptist churches in America.

In 1695, a Baptist church was established in Philadelphia, under the leadership of Dr. John Clark. This church later became the First Baptist Church in Philadelphia, one of the largest and most influential Baptist churches in America.

In 1696, a Baptist church was established in New York, under the leadership of Dr. John Clark. This church later became the First Baptist Church in New York, one of the largest and most influential Baptist churches in America.

In 1697, a Baptist church was established in Boston, under the leadership of Dr. John Clark. This church later became the First Baptist Church in Boston, one of the largest and most influential Baptist churches in America.

In 1698, a Baptist church was established in Providence, Rhode Island, under the leadership of William B. Lawler. This church later became the First Baptist Church in Providence, one of the largest and most influential Baptist churches in America.

In 1699, a Baptist church was established in New Haven, under the leadership of Dr. John Clark. This church later became the First Baptist Church in New Haven, one of the largest and most influential Baptist churches in America.

In 1700, a Baptist church was established in Philadelphia, under the leadership of Dr. John Clark. This church later became the First Baptist Church in Philadelphia, one of the largest and most influential Baptist churches in America.

In 1701, a Baptist church was established in New York, under the leadership of Dr. John Clark. This church later became the First Baptist Church in New York, one of the largest and most influential Baptist churches in America.
Connecticut had increased its congregations and membership, and before the beginning of the 18th century had inaugurated annual associational meetings. But the fact that the Great Awakening in America was conducted on Calvinistic principles was insufficient to prevent their heartly co-operation. The churches of the Philadelphia Association were organized and engaged to some extent in missionary endeavour, but they showed little interest in the Edwards-Whitefield movement. And yet the Baptists ultimately profited by the Great Awakening beyond almost any of the denominations. In many New England communities a majority in the churches of the standing order bitterly opposed the new evangelism, and those who came under its influence felt constrained to organize "Separate" or "New Light" churches. These were forever persecuted by the dominant party and were denied even the scanty privileges that Baptists had succeeded in gaining. As the chief objection of the "Separates" to the churches of the standing order was their refusal to insist on personal regeneration as a term of membership, many of them were led to feel that they were inconsistent in requiring regenerate membership and yet administering baptism to unconscious infants. In several cases entire "Separate" churches reached the conviction that the baptism of infants was not only without Scriptural warrant but was a chief cornerstone of state-churchism, and the multiplication of Baptist churches throughout the southern colonies were in great measure due. The feeble Baptist cause in Virginia and North Carolina had been considerably strengthened by missionaries from the churches of the Philadelphia Association, including Benjamin Griffith, John Gano (1727-1804), John Thomas, Benjamin Miller, Samuel Eaton, John Garrard and David Thomas, and several churches, formed or reformed under their influence, united with the association. In 1776 the Ketotexon Association was formed by this group of churches. The Virginia colonial government, in a ridiculously intolerant, gave a limited toleration to Baptists of this type; but the "Separate" Baptists were too enthusiastic and too much alive to the evils of state control in religious matters to be willing to take out licences for their meetings, and soon came into sharp conflict with the authorities. Stearns was an evangelist of great power. With Marshall, his brother-in-law, and about a dozen fellow-believers he settled at Sandy Creek, North Carolina, and in a few years had built up a church with a membership of more than six hundred. Marshall afterward organized and ministered to a church at Abbots's Creek about 30 m. distant. From these centres "Separate" Baptist influence spread throughout North and South Carolina and across the Georgia border, Marshall himself finally settling and forming a church at Kiokee, Georgia. From North Carolina as a centre "Separate" Baptist influence permeated Virginia and extended into Kentucky and Tennessee. The Sandy Creek Association came to embrace churches in several colonies, and Stearns, desirous of preserving the harmonious working of the churches that recognized his leadership, resisted with vehemence all proposals for the organization of other associations.

From 1750 to 1770 the growth of the "Separate" Baptist body in Virginia and the Carolinas was phenomenal. Evangelists like Samuel Harris (1724-1794) and John Waller (1741-1802) stirred whole communities and established Baptist churches where the Baptist name had hitherto been unknown. The Sandy Creek Association, with Stearns as leader, undertook to "unfellowship ordinations, ministers and churches that acted independently," and provoked such opposition that a division of the association became necessary. The General Association of Virginia and the Congaree Association of South Carolina now took of their places side by side with the Sandy Creek. The Virginia "Separate" Baptists had more than doubled their numbers in the two years from May 1771 to May 1773. In 1774 some of the Virginia brethren became convinced that the apostolic office was meant to be perpetuated and induced the association to appoint an apostle. Samuel Harris was the unanimous choice and was solemnly ordained. Waller and Elijah Craig (1743-1800) were made apostles soon afterward for the northern district. This arrangement, soon abandoned, was no doubt suggested by Methodist superintendency. In 1775 the Methodist influence was still in the ascendant in the two Baptist associations. Jeremiah Walker for universal redemption. Schism was narrowly averted by conciliatory statements on both sides. As a means of preserving harmony the Philadelphia Confession of Faith, a Calvinistic document, with provision against too rigid a construction, was adopted and a step was thus taken toward harmonizing with the "Regular" Baptists of the Philadelphia type. When the General Association was subdivided (1783), a General Committee, made up of delegates from each district association, was constituted to consider matters that might be for the good of the whole society. Its charter work was to continue until the resignation in 1784 of the Rev. Thomas Walker, president of the Princeton Seminary. In 1785 the "Separate" Baptists had had the heartly co-operation of the "Regular" Baptists in their struggle for religious liberty and equality. In 1787 the two bodies united and agreed to drop the names "Separate" and "Regular." The success of the Baptists of Virginia in securing step by step the abolition of everything that savoured of religious oppression, involving at last the disestablishment and the disendowment of the Episcopal Church, was due in part to the fact that Virginia Baptists were among the foremost advocates of American independence, while the Episcopal clergy were loyalists and had made themselves obnoxious to the people by using the authority of Great Britain in extorting their titles from unwilling parishioners, and that they secured the co-operation of free-thinking statesmen like Thomas Jefferson and James Madison and, in most measures, that of the Presbyterians.

The Baptist cause in New England that had profited so largely from the Great Awakening failed to reap a like harvest from the War of Independence. The Baptist bodies, independent, in large part, could not escape the national outbreak, and the Baptist parishes, reduced in part to their original size, still professed their independence. In 1776, with the prospect of war, the Massachusetts Baptist Association, through its secretary, Dr. John Lord, expressed the patriotic and popular party. Baptists lost favour by threatening to appeal to England for a redress of their grievances at the very time when resistance to English oppression was being determined upon. The result was slowness of growth and failure to secure religious liberty. Though a large proportion of the New England Baptists co-operated heartily in the cause of independence, the denomination failed to win the popularity that comes from successful leadership.

About 1762 the Philadelphia Association began to plan for the establishment of a Baptist institution of learning that should serve the entire denomination. Rhode Island was finally fixed upon, partly as the abode of religious liberty and because of its intelligent, influential and relatively wealthy Baptist constituency, the consequent likelihood of procuring a charter from its legislature, and the probability that the co-operation of other denominations in an institution under Baptist control would be available. James Manning (1738-1791), who had just been graduated from Princeton with high honours, was thought of as a suitable leader in the enterprise, and was sent to Rhode Island (1763) to confer with leading men, Baptist and other. As a result a charter was granted by the legislature in 1764, and after a few years of preliminary work at Warren (where the first degrees ever bestowed by a Baptist institution were conferred in 1769), Providence was chosen as the home of the college (1770). Here, with Manning as president and Hezekiah Smith (1737-1805), his class-mate at Princeton, as financial agent and influential supporter, the institution (since 1804 known as Brown University) was for many years the only degree-conferring
institution controlled by Baptists. The Warren Association (1767) was organized under the influence of Manning and Smith on the model of the Philadelphia, and became a chief agency for the conservation of denominational life, the promotion of denominational education and the securing of religious liberty. Hezekiah Smith was a highly successful evangelist, and through his labours scores of churches were constituted in New England. As chaplain in the American Revolutionary Army he also exerted a widespread influence.

The First Church, Charleston, which had become almost extinct through Arminianism in 1746, entered upon a career of remarkable prosperity in 1749 under the leadership of Oliver Hart (1723–1795), formerly of the Philadelphia Association. In 1751 the Charleston Association was formed, also on the model of the Philadelphia, and proved an element of denominational strength. The association raised funds for domestic missionary work (1755 onward) and for the education of ministers (1756 onward). Brown University shared largely in the liberality of members of this highly-cultivated and progressive body. Among the beneficiaries of the education fund was Samuel Stillman (1737–1807), afterward the honoured pastor of the Boston church. The most noted leader of the Baptists of South Carolina during the four decades following the War of Independence was Richard Furman (1755–1825), pastor of the First Church at Charleston. He was a remarkable figure, a widely-graced missionary and speedily the most influential Baptist in the Southern states, and some of his letters prove that he was one of the chief actors in the denominational organization on that coast. His labours contributed largely to the numerical progress of Baptists in South Carolina from 1787 to 1812 (from 1620 members to 11,352) was due to the "Separate" Baptist movement under Stearns and Marshall far more than to the activity of the churches of the Charleston Association. Both these types of Baptist life permeated Georgia, the latter making its influence felt in Savannah, Augusta and the more cultivated communities, the former evangelizing the masses. Many negro slaves became Baptists in Virginia, the Carolinas and Georgia. In most cases they became members of the churches of the white Baptists; but in Richmond, Savannah and some other towns they were encouraged to have churches of their own.

By 1812 there were in the United States 173,972 Baptist church members, the denominational numerical strength having considerably more than doubled since the beginning of the 19th century.

**Foreign Missions.—**Baptists in Boston and vicinity, Philadelphia and Charleston, and a few other communities had from the beginning of the 19th century taken a deep interest in the missionary work of William Carey, the English missionary, and his coadjutors in India, and had contributed liberally to its support. The conversion to Baptist views of Adoniram Judson (46) (1788–1850) (1812), who had just been sent, with others, by the newly-formed American Board of Commissioners for Foreign Missions to open up missionary work in India, marks an epoch in American Baptist history. Judson appealed to his American brethren to support him in missionary work among the heathen, and Rice returned to America to organize missionary societies to awaken interest in Judson’s mission. In January 1813 there was formed in Boston "The Baptist Society for the Propagation of the Gospel in India and other Foreign Parts." Other societies in the Eastern, Middle and Southern states speedily followed. The desirability of a national organization soon became manifest, and in May 1814 thirty-three delegates representing eleven states, met in Philadelphia and organized the "General Missionary Convention of the Baptist Denomination in the United States of America for Foreign Missions." As its meetings were to be held every three years it came to be known as the "Triennial Convention." A Board of Commissioners was appointed with headquarters in Philadelphia (transferred in 1826 to Boston). The need of a larger supply of educated ministers for home and for mission work alike soon came to be profoundly felt, and resulted in the establishment of Columbian College, Washington (now George Washington University), with its theological department (1812), intended to be a national Baptist institution. Destitution on the frontiers led the Triennial Convention to engage extensively in home mission work (1817 onward), and in 1832 the American Baptist Home Mission Society was constituted for the promotion of this work. The need of an organ for the dissemination of information, and the quickening of interest in the missionary and educational enterprises of the Triennial Convention, led Rice to establish the *Later Day Luminary* (1816) and the *Columbian Star* (weekly journal) (1822). From the first the attempt to arouse the denomination to organized effort for the propagation of the gospel met with much opposition, agents of the Convention being looked upon by the less intelligent pastors and churches as highly-paid and irresponsible collectors of money to be used they knew not how, or for purposes of which they disapproved. The fact that Rice was unduly optimistic and allowed the enterprises of the Convention to become almost hopelessly involved in debt, and was unable to secure the necessary funds to sustain them, to meet the exigencies of his educational and journalistic work, intensified the hostility of those who had suspected from the beginning the good faith of the agents and denied the scriptural authority of boards, paid agents, paid missionaries, &c. So virulent became the opposition that in several states, as Tennessee and Kentucky, the work of the Convention was for years excluded, and a large majority in each association refused to receive into their fellowship those who advocated or contributed to its objects. Hyper-Calvinism, ignorance and avarice cooperated in making the very name "missions" odious, and the trial involved the Convention in a desperate struggle with a spirit of religious pluralism, and a spirit-endowed minority. Sunday-schools and prayer-meetings as human institutions, the aim of which was to intercede with the divine order, and the receiving of salaries for ministerial work as serving God for hire or rather as serving self. To counteract this influence, Baptist State Conventions were formed by the friends of missions and education, only contributing churches, associations, missionary societies and individuals being invited to membership (1821 onward—Massachusetts had effected state organization in 1802). These became highly efficient in promoting foreign and domestic missions, Sunday-school organization, denominational libraries, etc.

Nearly every state soon had its institutions of learning, which aspired to become universities.

Before 1844 the sessions of the Triennial Convention had occasionally been made unpleasant by harsh anti-slavery utterances by Northern members against their Southern brethren and somewhat acrimonious rejoinders by the latter. The controversy between Francis Wayland and Richard Fuller (1804–1876) on the slavery question ultimately convinced the Southern brethren that separate organization for missionary work was advisable. The Southern Baptist Convention, with its Home and Foreign Missionary Boards, and (later) its Sunday-school Board, was formed in 1845. Since then Northern and Southern Baptists, though in perfect fellowship with each other, have found it best to carry on their home and foreign mission work through separate boards and to hold separate annual meetings. In the late 19th and early 20th centuries the Southern Baptist Convention for America was formed for the promotion of fellowship, comity and denominational *esprit de corps*, but this organization is not to interfere with the sectional organization of an educational, and a publication board, and with M’Master University (Arts, Theological and
Academic departments) as its educational institution; those of Manitoba and the North-west, with Brandon College as its educational institution; and those of British Columbia, Canadian Baptists numbered 120,000 in 1909, and are considered the best general educational institutions.

BAR, FRANÇOIS DE (1538-1606), French scholar, was born at Seizencourt, near St Quentin, and having studied at the University of Paris entered the order of St Benedict. He soon became prior of the abbey of Anchin, near Pecquencourt, and passed much of his time in the valuable library of the abbey, studying ecclesiastical history, especially that of Flanders. He also made a catalogue of the manuscripts in Anchin and annotated many of them. During the French Revolution his manuscripts passed to the library of Douai. Bar died at Anchin on the 25th of March 1606.

BAR, a town of Russia, in the government of Podolia, 50 m. N.E. of Kamenets, on an affluent of the Bug, Pop. (1807) 10,614. It was formerly called Rov. Its present designation was bestowed upon it in memory of Bari in Italy (where she was born) by Boné Sforza, the consort of Sigismund I. of Poland, who rebuilt the town after its destruction in 1452 by the Tatars. From 1672 to 1699 it remained in possession of the Turks. In 1768 a confederation of the Polish nobles (see next article) against the Russians was formed in the town, which was shortly after taken by storm, but did not become finally united to Russia till a very insignificant force against them under the grand hetman Ksawery Branicki and two generals, who captured Bar. Nevertheless, a simultaneous outbreak of a *jacquerie* in Little-Russia contributed to the extension of the confederation throughout the eastern province of Poland and even in Lithuania. The confederates, thereupon, appealed for help abroad and contributed to bring about a war between Russia and Turkey. So serious indeed was the situation that Frederick II. advised Catherine to come to terms with the confederates. Their bands under Ignaty Malchewsky, Michael Pac and Prince Charles Radziwill ravaged the last in every direction, won several engagements over the Russians, and at last, utterly ignoring the king, sent envoys on their own account to the principal European powers. In 1770 the Council of the Confederation was transferred from its original seat in Silesia to Hungary, from whence it conducted diplomatic negotiations with France, Austria and Turkey with the view of forming a league against Russia. The court of Versailles sent Dumouriez to act as commander-in-chief of the confederates, but neither as a soldier nor as a politician did this adventuror particularly distinguish himself, and his account of his perambulations is very unfair to the confederates. But other blunders, he pronounced King Stanislaus a tyrant and a traitor at the very moment when he was about to accede to the Confederation. The king thereupon reverted to the Russian faction and the Confederation lost the confidence of Europe. Nevertheless, its army, thoroughly reorganized by Dumouriez, gallantly maintained the hopeless struggle for some years, and it was not till 1776 that the last traces of it disappeared.

BAR (D. *barra, Late Lat. *barra, origin unknown), in physical geography, a ridge of sand or silt crossing an estuary under water or raised by wave action above sea-level, forming an impediment to navigation. When a river enters a tidal sea its rate of flow is checked and the material it carries in suspension is deposited in a shifting bar crossing the channel from bank to bank. Where the channel is only partly closed, a spur of this character is called a "spit." A bar may be produced by tidal action only in an estuary or narrow gulf (as at Port Adelaide) where the tides sweep the loose sand backwards and forwards, depositing it where the motion of the tide is checked. It may also be formed by the ridge of Lynn Beach, which separates it from Lynn Harbor, and ties Nahant to the mainland by a bar formed in this way.

BAR, THE. This term, as equivalent to the profession of barrister (q.v.), originated in the partition or bar dividing the English law-courts into two parts, for the purpose of separating the members and officials of the court from the prisoners or suitors, their advocates and the general public. Theoretically, this division of the court is still maintained in England, those who are entitled to sit within the bar instead of, as formerly, appearing at the bar itself. In criminal trials the accused still stands forward at the bar. There is also a "bar" in parliament. In the House of Commons it remains literally a bar—a long brass rod hidden in a tube from which it is pulled out when required to mark the technical boundary of the House. Before it appear those members having violated the rules of the House; below it also sit three members who have been returned at bye-elections, to await their introduction to the House and the taking of the oath of allegiance. In the House of Lords the place where Mr Speaker and the members of the House of Commons stand when summoned by Black Rod is called "the bar." The "call to the bar" in England, by which a law student at one of the Inns of Court is converted into a barrister, is dealt with under INNS OF COURT. The exclusive privilege of calling to the bar belongs to those bodies, which also exercise disciplinary power over their members; but it was widley held by members of the bar in recent years that the benchers or governing body with their self-elected members did not keep a sufficiently watchful eye on the ministrations of the profession. Consequently, in 1883, a bar committee was formed for the purpose of dealing with all matters relating to the profession, such as the criticizing of proposed legal reforms, and the expression of opinions on matters of professional etiquette, conduct and practice. In 1894 the committee was dissolved, and succeeded by the general council of the bar, elected on a somewhat wider basis. It is composed of a due proportion of king's counsel and outer benchers, and elected by the clerk-papers sent to all barristers having an address in the *Law List* within the United Kingdom. Its expenses are paid by contributions from the four Inns of Court. Its powers are not disciplinary, but it would draw the attention of the benchers to any gross violation of the professional etiquette of the bar.

Each state in America has its own bar, consisting of all attorneys-at-law residing within it who have been admitted to practice in its courts. Generally attorneys are admitted in one court to practice in all courts. Each of these courts is the court of its own district or county; a state cannot practise in a court of the United States unless he has been admitted to it, or to one of the same class in another district or circuit. He cannot appear in the Supreme Court of the United States unless specially admitted and sworn as an attorney of that court, which is done on motion in case of any one who has practised for three years in the highest courts of his state and is in good standing at its bar. In most of the states there is a state bar association, and in some cities and counties local bar associations. These consist of such members of its bar as desire to associate, the object being to guard and advance the standards of the profession. Some own valuable libraries. These associations have no official recognition, but their influence is considerable in
recommending and shaping legislation respecting the judicial establishment and procedure. They also serve a useful purpose in instituting or promoting proceedings to discipline or expel unworthy attorneys from the bar. There is an American Bar Association, founded in 1878, composed of over 35,000 members of different states of like character and position. Some of these associations publish annually a volume of transactions. The rights, duties and liabilities of counsellor-at-law are stated under ATTORNEY. As members of the bar of the state in which they practise they are subject to its laws regulating such practice, e.g. in some states they are forbidden to advertise for divorce cases (New York Penal Code [1892 § 148a] (1905, People v. Taylor [Colorado], 75 Pac. Rep. 614). It is common throughout the United States for lawyers to make contracts for "contingent fees," i.e. for a percentage of the amount recovered. Such contracts are notchanterous and are upheld by the courts, but will be set aside if an unconscionable bargain be made with the client (Deering v. Schey [N.Y.], 58 App. D. 322). So also by the U.S. Supreme Court (Wright v. Tebbets, 91 U.S. 257; Taylor v. Benis, 110 U.S. 4). The reason for upholding such contracts is that otherwise poor persons would be denied all the security of law for protecting their property or rights. In fact such contracts are seldom set aside, though no doubt the practice is capable of abuse.

BARA BANKI, a town and district of British India in the Fyzabad division of the United Provinces. The town, which forms one municipality with Nawabganj, the administrative headquarters of the district, is 17 m. E. of Lucknow by railway. The population of Bara Banki alone in 1901 was 30,200. There is some trade in sugar and cotton.

The district has an area of 1758 sq. m. It stretches out in a level plain interspersed with numerous jhils or marshes. In the upper part of the district the soil is sandy, while in the lower part it is clayey and produces finer crops. The principal rivers are the Gogra, forming the northern boundary, and the Gunti, flowing through the middle of the district. In 1856 it came, with the rest of Oudh, under British rule. During the Sepoy war of 1857-1858 the whole of the Bara Banki taluks joined the mutineers, but offered no serious resistance after the capture of Lucknow. The cultivators are still, for the most part, tenants-at-will, rack-rented and debt-ridden. In 1901 the population was 1,73,323, showing an increase of 4% over the 1891 census. The principal crops are wheat, rice, and other food-grains, sugar-cane and opium. Both the bordering rivers are navigable; and the district is traversed by two lines of the Oudh and Rohilkhand railway, with branches. Trade in agricultural produce is active.

BARABO, a city and the county-seat of Sauk county, Wisconsin, U.S.A., about 37 m. N.W. of Madison, on the Baraboo river, a tributary of the Wisconsin. Pop. (1890) 4605; (1900) 5751, of whom 732 were foreign-born; (1905) 5855; (1910) 6324. The city is served by the Chicago & North-Western railway, which maintains here an engine house and extensive machine shops, and of which it is a division headquarters. Baraboo has an attractive situation on a series of hills about 1000 ft. above sea-level. In the vicinity are Devil's Lake (3 m. S.) and the famous Dells of the Wisconsin river (near Kilbourn, about 12 m. N.), two summer resorts with picturesque scenery. The principal public buildings are the court-house (in a small public park), the public library and a high school. Dairying and the growing of small fruits are important industries in the surrounding region; and there is a large nursery here. Stone quarried in the vicinity is exported, and the city is near the centre of the Sauk county iron range. Among the manufactures are woollen goods, towels, canned fruit and vegetables, dairy products, beer, and circus wagons (the city is the headquarters of the Ringling and the Gollmar circuses). The first permanent settlement here was made in 1839. Baraboo was named in honour of Jean Baribault, an early French trapper, and was chartered as a city in 1882.

BARABA, a name for the complex Nubian races of the Egyptian Sudan, whose original stock is Hamitic-Berber, long modified by negro crossings. The word is variously derived from Berber, i.e. people of Berber, or as identical with Barabara, figuring in the inscription on a gateway of Tethmosis I. as the name of one of the 113 tribes conquered by him. In a later inscription of Rameses II. at Karnak (c. 1300 B.C.) Barabara is given as that of a southern conquered people. Thus it is suggested that Barabara is a real ethinical name, confused later with Greek and Roman barbarus, and revived in its proper meaning subsequent to the Moslem conquest. A tribe living on the banks of the Nile between Wadi Halfa and Assuan are called Barabara. (See further NUBIA.)

BARACALDO, a river-port of north-eastern Spain, in the province of Biscay; on the left bank of the river Nervion or Ansa (in Basque, Ibaizabal), 5 m. by rail N.W. of Bilbao. Pop. (1900) 15,013. Few Spanish towns have developed more rapidly than Baracaldo, which nearly doubled its population between 1880 and 1900. During this period many immigrant labourers settled here; for the ironworks and dynamite factory of Baracaldo prospered greatly, owing to the increased output of the Biscayan mines, the extension of railways in the neighbourhood, and the growth ofshipbuilding trade. When the mouth of the Nervion river Baracaldo is covered with maize, pod fruit and vines.

BARACOA, a seaport city of N.E. Cuba, in Santiago province. Pop. (1907) 5633. The town lies under high hills on a small circular harbour accessible to small craft. The country round about is extremely rugged. The hill called the "Anvil of Baracoa" (about 3000 ft.) is remarkable for its extremely regular formation. It completely dominates the city's background, and is a well-known sailors' landmark. The town is the trading centre of a large plantation region behind it and is the centre of the banana and cacao export trade. There is a fort dating from the middle of the 18th century. Baracoa is the oldest town in Cuba, having been settled by Diego Velazquez in 1512. It held from its foundation the honours of a city. From 1512 to 1524 it was the capital of the island, and from 1528 to 1522 its church was the cathedral of the island's first diocese. Both honours were taken from it to be given to Santiago de Cuba; and for two centuries after this Baracoa remained an obscure village, with little commerce. In the 16th century it was repeatedly plundered by pirates until it came to terms with them, gave them welcome harbourage, and based a less precarious and more lasting foundation of trade. Until the middle of the 18th century Baracoa was almost without connexion with Havana and Santiago. In the wars of the end of the century it was a place of deposit for French and Spanish corsairs. At this time, too, about 5000 fugitive immigrant families from Santo Domingo greatly augmented its industrial importance. In 1807 an unsuccessful attack was made upon the city by an English force. In 1826 the port was opened to foreign commerce.

BARAHONA DE SOTO, LUIS (1532-1595), Spanish poet, was born about 1535 at Lucena (Cordova), was educated at Granada, and practised as a physician at Cordova. His principal poem is the Primera parte de la Angélica (1560), a continuation of the Orlando furioso; the second part was long believed to be lost, but fragments of it have been identified in the anonymous Diálogos de la montería, first printed in 1890; the Diálogos also embody fragments of a poem by Barahona entitled Los Principios del mundo, and many graceful lyrics by the same writer have been published by Francisco Rodriguez Marin. Cervantes describes Barahona as "one of the best poets not only in Spain, but in the whole world"; this is friendly hyperbole. Nevertheless Barahona has high merits: poetical imagination, ingenious fancy, and an exceptional mastery of the methods transplanted to Spain from Italy. His Angélica has been reproduced in facsimile (New York, 1904) by Archer M. Huntington.

See F. Rodriguez Marin, Luis Barahona de Soto, estudio biográfico, bibliográfico, y crítico (Madrid, 1903); Diálogos de la montería, edited by F. R. de Uhagón (Madrid, 1890).

BARANTE, AMABLE GUILLAME PROSPER BRUGIERE, BARON DE (1782-1866), French statesman and historian, the son of an advocate, was born at Riom on the 10th of June 1782. At the age of sixteen he entered the École Polytechnique at
Paris, and at twenty obtained his first appointment in the civil service. His abilities secured him rapid promotion, and in 1806 he obtained the post of auditor to the council of state. After being employed in several political missions in Germany, Poland and Spain, during the next two years, he became prefect of Vendôme. At the time of the return of Napoleon I. he held the prefecture of Nantes, and this post he immediately resigned. On the second restoration of the Bourbons he was made councillor of state and secretary-general of the ministry of the Interior. After filling for several years the post of director-general of indirect taxes, he was created in 1819 a peer of France and was prominent among the Liberals. After the revolution of July 1830, M. de Barante was appointed ambassador to Turin, and five years later to St Petersburg. Throughout the reign of Louis Philippe he remained a supporter of the government; and after the fall of the monarch, in February 1848, he withdrew from political affairs and retired to his country seat in Avuvergne. Shortly before his retirement he had been made grand cross of the Legion of Honour. Barante’s Histoire des Bourdaines de la maison de Valois, which appeared in a series of volumes between 1824 and 1828, procured him immediate admission to the French Academy. Its narrative qualities, and purity of style, won high praise from the romantic school, but it exhibits a lack of the critical sense and of scientific scholarship. Amongst his other literary works are a Tableau de la littérature française au dix-sixième siècle, of which several editions were published; Des communes et de l’aristocratie (1831); a French translation of the dramatic works of Schiller; Questions constitutionnelles (1850); Histoire de la Convention nationale, which appeared in six volumes between 1833 and 1835; Histoire du Directoire de la République française (1852); Études historiques et biographiques (1857); La Vie politique de M. Royer-Collard (1861). The version of Hamlet for Guizot’s Shakespeare was his work. He died on the 22nd of November 1866.

The souvenirs were published by his grandson (Paris, 1890–99). See also the article by Guizot in the Revue des deux Mondes, July 1867.

Barasat, a subdivisional town in the district of the Twenty-four Parganas, Bengal, India. For a considerable time Barasat town was the headquarters of a joint magistracy, known as the “Barasat District,” but in 1861, on a redistribution of boundaries Barasat district was abolished by order of government, and was converted into a subdivision of the Twenty-four Parganas. Pop. (1901) 8634. It forms a striking illustration of the rural character of the so-called “towns” in Bengal, and is merely an agglomeration of 41 separate villages, in which all the operations of husbandry go on precisely as in the adjacent hamlets.

Baratier, Johann Philipp (1721–1746), German scholar of precocious genius, was born at Schwabach near Nuremberg on the 10th of January 1721. His early education was most carefully attended to by his father, and when he was about six years old translated from the Hebrew Tudea’s Itinerarium. In his fourteenth year he was admitted master of arts at Halle, and received into the Royal Academy at Berlin. The last years of his short life he devoted to the study of history and antiquities, and had collected materials for histories of the Thirty Years’ War and of Antitrinitarianism, and for an Inquiry concerning Egyptian Antiquities. His health, which had always been weak, gave way completely under these labours, and he died on the 5th of October 1740. He had published eleven separate works, and left a great quantity of manuscript.

Baratynski, Jewgenij Abramovich (1800–1844), Russian poet, was educated at the royal school at St Petersburg and then entered the army. He served for eight years in Finland, where he composed his first poem Eda. Through the interest of friends he obtained leave from the tsar to retire from the army, and settled in 1827 near Moscow. There he completed his chief work The Gipsy, a poem written in the style of Pushkin. He died in 1844 at Napoleon, whither he had gone for the sake of the milder climate.

A collected edition of his poems appeared at St Petersburg, in 2 vols. in 1835; later editions, Moscow 1869, and Kazan 1884.

Barbar. (1) (From Lat. bara, a beard), a term used in various senses, of the folds of mucous membrane under the tongue of horses and cattle, and of a disease affecting that part, of the wattles round the mouth of the barbel, of the backward turned points of an arrow and of the piece of folded linen worn over the neck by nuns. (2) (From Fr. barbe, meaning “from Barbary”), a name applied to a breed of horses imported by the Moors into Spain from Barbary, and to a breed of pigeons.

Barbacena, an inland town of Brazil, in the state of Minas Geraes, 150 m. N.N.W. of Rio de Janeiro and about 3500 ft. above sea-level. The surrounding district is chiefly agricultural, producing coffee, sugar-cane, Indian corn and cattle, and the town has considerable commercial importance. It is also noted for its healthiness and possesses a large sanatorium much frequented by convalescents from Rio de Janeiro during the hot season. Barbacena was formerly a principal distributing centre for the mining districts of Minas Geraes, but this distinction was lost when the railways were extended beyond that point.

Barbados, or Barbadoes, an island in the British West Indies. It lies 78 m. E. of St Vincent, in 13° 4’ N. and 59° 37’ W.; is 21 m. long, 14 m. at its broadest, and 166 sq. m. (106,470 acres) in extent (roughly equaling the Isle of Wight). Its coasts are encircled with coral reefs, extending in some places 3 m. seaward. In its configuration the island is elevated but not mountainous. Near the centre is its apex, Mount Hillaby (1100 ft.), from which the land falls on all sides in a series of terraces to the sea. So gentle is the incline of the hills that in driving over the well-constructed roads the ascent is scarcely noticeable. The only natural harbour is Carlisle Bay on the south-western coast, which, however, is little better than a shallow roadstead, only accessible to light draught vessels.

Geology. —The oldest rocks of Barbados, known as the Scotland series, are of shallow water origin, consisting of coarse grists, brown sandstones and sandy clays, in places saturated with petroleum and traversed by veins of manjack. They have been folded and denuded, so as to form the foundation on which rest the later beds of the island. Upon the denuded edges of the Scotland beds lies the Oceanic series. It includes chalky limestones, siliceous earths, red clay, and, at the top, a layer of mudstone composed mainly of volcanic dust. The limestone contains Globigerina and other Foraminifera, the siliceous beds are made of Radiolaria, sponge spicules and diatoms, while the red clay closely resembles the red clay of the deepest parts of the oceans. There can be no doubt that the Scotland series was laid down in deep water. The Oceanic series is generally overlaid directly, and unconformably, by coral limestones; but at Bissex Hill, at the base of the coral limestones, and resting unconformably upon the Oceanic series, there is a Globigerina marl. The Coral Limestone series lies indifferently upon the older beds. Although of no great thickness it covers six-sevenths of the island, rising in a series of steps or platforms to a height of nearly 1100 ft.

Even the Scotland series probably belongs to the Tertiary system, but owing to the want of characteristic fossils, it is impossible to determine with any degree of certainty the precise correlation of the Tertiary formations. Jeffreys and Harrison ascribe the Scotland beds to the Eocene or Oligocene period, the Oceanic series to the Miocene, the Bissex Hill marls to the Pliocene, and the coral limestones partly to the Pliocene and partly to the Pleistocene. But these correlations rest upon imperfect evidence.

Sandstone, and clays suitable for brick-making, are found in the district of Scotland, so called from a fancied resemblance to the Highlands of North Britain. The only other mineral product is manjack, a species of asphalt, also found in this district and to some extent exported.

Climate, &c.—The climate of Barbados is pleasant. The
 seasons are divided into wet and dry, the latter (extending from December to the end of May) being also the cold season. The temperature ranges from 70° F. to 86° F., rarely, even on the cold Indoys falling below 60° F. The average annual rainfall is about 60 in., September being the wettest month. For eight months the invigorating N.E. trade winds temper the tropical heat. The absence of swamps, the porous nature of the soil, and the extent of cultivation account for the freedom of the island from miasma. Fever is unknown. The climate has a beneficial effect on pulmonary diseases, especially in their earlier stages, and is remarkable in arresting the decay of vital power consequent upon old age. Leprosy occurs amongst the negroes, and elephantiasis is so frequent as to be known as "Barbados elephantiasis," a name given to it by Sir Peter Ligon, who first introduced in the middle of the 17th century, and owing to the cheapness of labour, the extreme fertility of the soil and the care bestowed on its cultivation, became the staple product of the island. Cotton growing has recently become of importance. The few other industries include rum distilleries and factories for chemicals, ice and tobacco. A railway 28 m. long runs from Bridgetown partly round the coast. The island is a place of call for almost all the steamships plying to and from the West Indies, and is a great centre of distribution. There is direct communication at frequent intervals with England, the United States, Canada and the other West Indian islands.

Population and Administration.—The greater part of the inhabitants belong to the Church of England, which exceeds in numbers the combined total of all other denominations. The island is the see of a bishop, who, with the clergy of all creeds, is paid by the government. The chief educational establishment is Codrington College, founded by Colonel Christopher Codrington, who in 1710 bequeathed two estates to the Society for the Propagation of the Gospel. It trains young men for holy orders and is affiliated to the university of Durham. Harrison College and Trafalgar School, the island's two girls' schools. There are several second grade and a large number of primary schools. The colony possesses representative institutions but not responsible government. The crown has a veto on legislation and the home government appoints the public officials, excepting the treasurer. The island is administered by a governor, assisted by an executive council, a legislative council of 9 nominated members, and a house of assembly of 24 members elected on a limited franchise. Barbados is the headquarters of the Imperial Agricultural Department of the West Indies. It has a cathedral, St Michael's, which also serves as a parish church. In Trafalgar Square stands the earliest monument erected to the memory of Nelson. There are a good many buildings, shops, pleasure grounds, a handsome military parade and exquisite beaches. Pilgrim, the residence of the governor, is a fine mansion about a mile from the city. Fontabelle and Hastings are fashionable suburban watering-places with good sea-bathing. Speightstown (1500) is the only other town of any size.

History.—Opinions differ as to the derivation of the name of the island. It may be the Spanish word for the hanging branches of a vine which strike root in the ground, or the name may have been given from a species of bearded fig-tree. In the 16th-century maps the island is variously rendered St Bernardo, Bernados, Barbudoso, Barndos and Barnodo. There are more numerous traces of the Carib Indians here than in any other of the Antilles. Barbados is thought to have been first visited by the Portuguese. Its history has some special features, showing as it does the process of peaceful colonization, for the island, acquired without conquest, has never been out of the possession of the British. It was touched in 1605 by the British ship "Olive Blossom," whose crew, finding it uninhabited, took possession in the name of James I; but the first actual settlement was made in 1625, at the direction of Sir William Courten under the patent of Lord Leigh, afterwards earl of Marlborough, to whom the island had been granted by the king. Two years later, a compromise having been effected with Lord Marlborough, a grant of the island was obtained by the earl of Carlisle, whose claim was based on a grant, from the king, of all the Caribbean islands in 1624; and in 1628 Charles Wogan was granted similar rights.

In the same year sixty-four settlers arrived at Carlisle Bay and the present capital was founded. During the Civil War in England many Royalists sought refuge in Barbados, where, under Lord Willoughby (who had leased the island from the earl of Carlisle), they offered stout resistance to the forces of the Commonwealth. Willoughby, however, was ultimately defeated and exiled. After the Restoration, to appease the planters, doubtful as to the title under which they held the estates which they had converted into valuable properties, the proprietary or patent interest was abolished, and the British government took in hand the supervision of the island. The British government claimed by the Virginia charter a monopoly on the importation of provisions from the American colonies, and in 1778 the distress became so acute that the British government had to send relief. For three years after the peace of Amiens in 1802 the colony enjoyed uninterrupted calm, but in 1805 it was only saved from falling into the hands of the French by the timely arrival of Admiral Cochrane. Since that date, however, it has remained unthreatened in the possession of the British. The rupture between Great Britain and the United States in 1812 caused privatizing to be resumed, the trade of the island being thereby almost destroyed. This led to an agitation for the repeal of the monopoly, and in 1818-19 the efforts to secure this were successful. The abolition of slavery in 1834 was attended by no ill results, the slaves continuing to work for their masters as hired servants, and a period of great prosperity succeeded. The proposed confederation of the Windward Islands in 1876, however, provoked riots, which occasioned considerable loss of life and property, but secured for the people their existence as a separate colony.

Barbados, St. James, St. Peter, and St. Andrew parishes. Hurricanes are the scourge of Barbados, those of 1796, 1831, and 1868 being so disastrous as to necessitate relief measures on the part of the home government.

Barbara, Saint, a virgin martyr and saint of the Roman Catholic and Orthodox Eastern Churches, whose festival day is December 4th. Her legend is that she was imprudent in a tower
by her father who was opposed to her marriage; that she was converted to Christianity by a follower of Origen, and that when her father learnt this, he beheaded her. The place of her martyrdom is variously given as Heliopolis, as a town of Tuscany, and as Nicomedia, Bithynia, about the year 235. St Barbara is the patron saint of armurers and gunsmiths, and her protection is sought specially against lightning.

BARBARA (Gr. Βαρβαρος) (Hermolaus Barbarus) (1454-1493), Italian scholar, was born at Venice on the 21st of May 1454. At an early age he went to Rome, where he studied under Pomponius Laetus. He completed his education at the university of Padua, where he was appointed professor of philosophy in 1477. Two years later he revisited Venice, but returned to Padua when the plague broke out in his native city. He was sent on various missions to persons of high rank, amongst them Pope Innocent VIII., by whom he was nominated to the important office of patriarch of Aquileia (1491). The Venetian senate, however, refused to ratify the appointment, which, contrary to the wishes of papal legates, had accepted it, but fixed its obtaining its sanction. He was banished and forced to resign the patriarchate, under the threat of being punished vicariously by the confiscation of his father’s property. Barbarus remained at Rome, in receipt of a small pension from the pontifical government, until his death (probably from the plague) on the 14th of June 1493 (according to some, two years later). He edited and translated a number of classical works, of which the most important were: Castigationes Plinianae (1492), in which he boasted of having made 3000 corrections in the text of Pliny’s Natural History; Thomistius’ Paraphrases of certain works of Aristotle (1486); Aristotle’s Rhetorica (published in 1544); Castigationes in Pompianum Molam (1493).

BARBAROSA (“Redbeard”), the name given by the Christians to a family of Turkish admirals and sea rovers of the 16th century, — Arouj and Khizir (alias Khair-ed-Din) and Hassan the son of Khair-ed-Din. As late as 1840, Captain Walsin Esterhazy, author of a history of the Turkish rule in Africa, ventured the guess that “Barbarossa” was simply a mispronunciation of Bâbâ Arouj, and the supposition has been widely accepted. But the only proper name not applied to Arouj by contemporaries. His name is given in Spanish as a Term in civil law, and is only called “Harrach” or “Orliche.” The contemporary Arabic chronicle published by S. Rang and F. Denis in 1837 says explicitly that Barbarossa was the name applied by Christians to Khair-ed-Din. It was no doubt a nickname given to the family on account of their red or tawny beards (Lat. barba). The founder of the family was Yakub, a Roumeliot, probably of Albanian blood, who settled in Mitylene after its conquest by the Turks. He was a coaster trader and skipper, and had four sons — Elias, Isaak, Arouj and Khizir, all said to have been born after 1482. Khizir became a pirate and took a trade. Elias and Arouj took to sea roving. In an action with a galley of the Knights of Saint John, then established at Rhodes, Elias was killed and Arouj taken prisoner; the latter was ransomed by a Turkish pasha and returned to the sea. For some time he served the Mamelukes who still held Egypt. During the conflict between the Mamelukes and the sultan Selim I., he considered it more prudent to transfer himself to Tunis. The incessant conflicts among the Berber princes of northern Africa gave him employment as a mercenary, which he varied by piratical raids on the trade of the Christians. At Tunis he was joined by Khizir, who took, or was enrolled with, the name of Khair-ed-Din. Isaak soon followed his brothers, Arouj and Khair-ed-Din joined the exiled Moors of Granada in raids on the Spanish coast. They also pushed their fortunes by fighting for, or murdering and supplanting, the native African princes. Their headquarters were in the island of Jerba in the Gulf of Gabes. They attempted in 1532 to take Bougie from the Spaniards, but were beaten off, and Arouj lost an arm, shattered by an arquebus shot. In 1534 they took Jijel from the Genoese, and after a second beating at Bougie in 1535 were called in by the sultan of Algiers to aid him against the Spaniards. They occupied the towns and murdered the native ruler who called them in. The Spaniards still held the little rocky island which gives Algiers its name and forms the harbour. In 1548 Arouj was drawn away to take part in a civil war in Tlemcen. He promptly murdered the prince he came to support and seized the town for himself. The rival party then called in the Spaniards, by whom Arouj was expelled and slain while fleeing at the Rio Salado. Khair-ed-Din clung to his possessions on the coast and appealed to the sultan Selim I. for help back to Constantinople. When he died in the palace at Constantinople he was succeeded as beylerbey of northern Africa by his son Hassan. Hassan Barbarossa, like his father, spent most of his life in the Levant, but was occasionally in Africa when the influence of his family was required to suppress the disorders of the Turkish garrisons. He left it for the last time in 1567, and is said by Hammer-Purgstall to have been present at Lepanto in 1571. His last years are obscure.

AUTHORITIES.—The History of the Ottoman Empire, by Joseph von Hammer-Purgstall (French translation by J. J. Hellert, 1825-1843) contains accounts of the Barbarossas, but requires to be corrected by other authorities. See La Fondation de la régence d’Alger, by Charles d’Alger (1887); and the Grandes Chroniques: les Batailles de la Méditerranée, by Jacobin (1887), which is the most complete account of the Barbarese raids. The Maritime Wars of the Turks, by Hajji Khalifa (translated by J. Mitchell for the Oriental Translation Fund, 1831), is said to have been written on the occasion of the Algerian insurrection in 1840, at the instance of Sultan Muhammad.

BARBROUX, CHARLES JEAN MARIE (1757-1793), French revolutionist, was educated at first by the Oratorians of Marseilles, then studied law, and became a successful advocate. He was appointed secretary (grefier) to the commune of Marseilles, and in 1792 was commissioned to go to the Legislative Assembly and demand the accusation of the directory of the department of Bouches-du-Rhône, as accomplice in a royalist movement in Arles. At Paris he was received in the Jacobin club and entered into relations with J. P. Brissot and the Rolands. It was at his instigation that Marseilles sent to Paris the battalion of volunteers which contributed to the insurrection of the 10th of August 1792 against the king. Returning to Marseilles he helped to repress a royalist movement at Avignon and an ultra-Jacobin movement
at Marseilles, and was elected deputy to the Convention by 775 votes out of 776 voting. From the first he posed as an opponent of the Mountain, accused Robespierre of aiming at the dictatorship (25th of September 1792), attacked Marat, and proposed to break up the commune of Paris. Then he got the act of accusation against Louis XVI. adopted, and in the trial voted for his death “without appeal and without delay.” During the final struggle between the Girondists and the Mountain, he refused to resign as deputy and rejected the offer made by the sections of Paris to give hostages for the arrested representatives. He succeeded in escaping, first to Caen, where he organized the civil war, then to Barbary-Saint-Emilion near Bordeaux, where he wrote his Mémoires, which were published in 1822 by his son, and re-edited in 1866. Discovered, he attempted to shoot himself, but was only wounded, and was taken to Bordeaux, where he was guillotined when his identity was established.

BARBARY, the general designation of that part of northern Africa bounded E. by Egypt, W. by the Atlantic, S. by the Sahara and N. by the Mediterranean, comprising the states of Morocco, Algeria, and Tunisia, and the island of Sicily, and in which the name is derived from the Berbers, the chief inhabitants of the region.

BARBARY APE, a tailless monkey inhabiting Algeria, Morocco, and the rock of Gibraltar (where it may have been introduced), and referable to the otherwise Asiatic group of macaques, in which it alone represents the subgenus Inius. This monkey, Inius inius, is light yellowish-brown above and yellowish-white below, with the naked part of the face flesh-coloured. It is entirely terrestrial in habits, at least on Gibraltar, and goes about in droves.

BARBARY PIRATES. The coast population of northern Africa has in past ages been addicted to piratical attacks on the shores of Europe opposite. Throughout the decline of the Roman empire, the barbarian invasions, the Mahomedan conquest and the middle ages, piracy always existed by the side of the great strife of peoples and religions. In the course of the 14th century, when the native Berber dynasties were in decadence, piracy became particularly flagrant. The town of Bougie was then the most notorious haunt of these “skimmers of the sea.” But the savage robber powers which, to the disgrace of Europe, infested the commerce and the coasts, not only of the Mediterranean but even for a time of the name is derived from the Berbers, the chief inhabitants of the region.

the rest to respect its trade and its subjects. In 1853 the British admiral, Robert Blake, was sent to teach them a lesson, and he gave the Tunisians a severe beating. A long series of expeditions was undertaken by the British fleet during the reign of Charles II., sometimes single-handed, sometimes in combination with the Dutch. In 1682 and 1683 the French bombarded Algiers. On the second occasion the French blew the French cannon from a gun during the action. An extensive list of such punitive expeditions could be made out, down to the American operations of 1805–1815. But in no case was the attack pushed home, and it rarely happened that the aggrieved Christian state refused in the end to make a money payment in order to secure peace. The frequent wars among them gave the pirates numerous opportunities of breaking their engagements, of which they never failed to take advantage.

After the general pacification of 1815, the suppression of African piracy was universally felt to be a necessity. The insolvency of a Tunisian squadron which sacked Palma in the island of Sardinia and carried off 158 of its inhabitants, roused widespread indignation. Other influences were at work to bring about their extinction. Great Britain had acquired Malta and the Ionian Islands and had now many Mediterranean subjects. She was also engaged in pressing the other European powers to join with her in the suppression of the slave trade which the Barbary states practised on a large scale and at the expense of Europe. The suppression of the trade was one of the objects of the congress of Vienna at which M. de Talleyrand was called to act for Europe, and in 1816 Lord Exmouth was sent to obtain treaties from Tunis and Algiers. His first visit produced diplomatic documents and promises and he sailed for England. While he was negotiating, a number of British subjects had been brutally ill-treated at Bona, without his knowledge. The British government sent him back to secure reparation, and on the 27th of August, in combination with a Dutch squadron under Admiral Van de Capellen, he administered a smashing bombardment to Algiers. The lesson terrified the pirates both of that city and of Tunis into giving up over-seas expeditions and making fresh promises. But they were not reformed and were not capable of reformation. Algiers renewed its piracies and slave-taking, though on a smaller scale, and the measures to be taken with it were discussed at the conference or congress of Aix-la-Chapelle in 1818. In 1824 another British fleet under Admiral Sir Harry Neal had again to bombard Algiers. The great pirate city was not in fact thoroughly tamed till its conquest by France in 1830.

AUTHORITIES.—The Histoire d’ Alger of H. D. de Grammont (Paris, 1815) may be consulted by the authorities. Sir R. L. Playfair’s Sources of Christianedom (London, 1884) gives the history of the British commonwealth in Algiers. The main authorities for the early history of the Barbary states are:—Luis del Marmol Carvajal, Descripcion de Africa (Cadiz, 1571); Diego de Haedo, Topografia de Argel (Valladolid, 1612); and Père Pierre Dan, Histoire de Barbary et de ses corsaires (Paris, 1637). The treatable treatises of Ad. Jurien de la Gravière, all published in Paris, Doris et Barboulez (1886), Les Corsaires barbaresques (1887), Les Chamarier de Maile (1887), and La Guerre de Chypre (1888), deal with the epoch of the beylers and the regular wars. For American work see Gardner Weld Allen, Our Navy and the Barbary Corsairs (New York, 1905). (D. H.)

BARBAULD, ANNA LETITIA (1743–1820), English poet and miscellaneous writer, was born at Kidwelly-Harcout, in Lyme Regis, the daughter of Jonathan Barbauld, a Unitarian clergyman, and his wife, Elizabeth, the daughter of John Aikin, a Presbyterian minister and schoolmaster, taught her daughter Latin and Greek. In 1758 Mr Aikin removed his family to Warrington, to act as theological tutor in a dissenting academy there. In 1773 Miss Aikin published a volume of Poems, which was very successful, and co-operated with her brother, Dr John Aikin, in a volume of Miscellaneous Pieces in Prose. In 1774 she married Rochemont Barbauld, a member of a French Protestant family settled in England. He had educated in the academy at Warrington, and was minister of a Presbyterian church at Palgrave in Suffolk, where, with his wife’s help, he established a boarding-school. Her admirable Hymns in Prose and Early Lessons were written for their pupils. In 1785 she left England for the continent with her husband, whose health was seriously impaired. On their return two years later, Mr Barbauld was appointed to a church at Hampstead. In 1802 they removed to Stoke Newington. Mrs Barbauld became well known in London literary circles. She collaborated with Dr Aikin in his Evenings at Home; in 1795 she published an edition of Akenside’s Pleasures of Imagination, with a critical essay; two years later she edited Collins’s Ode; in 1804 she published a selection of papers from the English Essayists, and a selection from Samuel Richardson’s correspondence, with a biographical notice; in 1810 a collection of the British Novelists (50 vols.) with biographical and critical notices; and in 1811 her longest poem, Eighteen Hundred and Eleven, giving a gloomy view of the existing state and future prospects of Britain. This poem anticipated Macaulay in contemplating the prospect of a visitor from the antipodes regarding at a future day the ruins of St Paul’s from a broken arch of Blackfriars Bridge. Mrs Barbauld died on the 9th of March 1815; her husband had died in 1808. A collected edition of her works, with memoir, was published by her niece, Lucy Aikin, in 2 vols., 1825.

See A. L. le Breton, Memoir of Mrs Barbauld (1874); G. A. Ellis, Life and Letters of Mrs A. L. Barbauld (1874); and Lady Thackeray Ritchie, A Book of Sibyls (1883).

BARBECUE (Span. barbacoa), originally a framework on posts placed over a fire on which to dry or smoke meat; hence, a gridiron for roasting whole animals, and in Cuba an upper floor on which fruit or grain is stored. In the United States the word means an open-air feast, either political or social, where whole animals are roasted and eaten and hogheads of beer and other vast quantities of food and drink consumed.

BARBED WIRE, a protective variety of fencing, consisting usually of several strands of wire twisted together with sharp spikes or points clinched or fastened into the strands.

In the United States, barbed wire for fencing was originally suggested to meet conditions existing in the western states, by reason of the large cattle-raising industry in sections where timber was scarce. Prior to its introduction, a No. 9 round or oval wire fence was popular on the frontier of the United States and in South America, as a fencing material. Large amounts were used annually for this purpose, but iron lacked strength, and single wire strand was not fully satisfactory on account of stretching in warm and contracting in cold weather, and of thus being broken. Cattle would rub against a smooth fence, and this constant pressure loosened the posts and broke the wire. To overcome this defect, ingenious people—the most successful being farmers—themselves to find a way by which wire could be used and at the same time be free from destruction by the wind, which was intended to confine. This investigation resulted in the invention of barbed wire. Soon after, the iron wire was used for barbed wire was revolutionized.

The history of barbed wire fencing is of recent date. In the United States—the real home of this industry—patents were taken out by Lucien B. Smith, Kent, Ohio, in 1867; by William B. Kirby, of St. Paul, Minn; by John Wilson close by New York City, in 1871; and by Michael Kelly, of New York, a year later. The practical beginning of the industry, however, was in the patents issued to Joseph F. Glidden, De Kalb, III., in 1874, on barbed fence wire, and during the same year, to Joseph F. Glidden and Phineas W. Vaughan, for a machine to manufacture the same. These inventions were the foundation of the system of patents under which barbed wire has been protected and sold. The development of the barbed wire industry would hardly have been possible without steel. Iron wire, used for fencing prior to the introduction of steel, was not suitable, seeing that iron does not possess sufficient tensile strength and lacks homogeneity, qualities which Bessemer and open-hearth steels possess in a high degree.

The advantages of galvanized-barbed wire fencing are that it is almost imperishable, is no burden on the posts; does not
oppose the wind with enough surface to rack the posts, thus allowing water to settle around them and rot them; is economical, not only in the comparative cheapness of its first cost, but also in the thrift of land covered by it; and is effective as a barrier against all kinds of stock and a protection against dogs and wild beasts. Cattle, once discovering what it is, will not press against it, nor even go near it, and thus it becomes an effective means of dividing the farmer’s ranch into such fields as he may desire. It is quickly and cheaply constructed, and has the advantage of freedom from harbouring weeds. It affords no impediment to the view. A man can see across his farm, and ascertain what is going on in every portion within the scope of vision, as plainly as if there were no fences. It does not contribute to the formation of snow drifts as do other kinds of efficient fence. This makes it a favorite form of fencing for railroads and along highways.

Finally, barbed wire composed of two wires twisted together, once firmly put in place, will retain its taut condition through many seasons without repair. The fact of the wire being twisted allows it to adapt itself to all the varying temperatures.

The introduction of barbed wire met with some opposition in America on supposed humanitarian grounds, but ample and extended tests, both of the economy and the humanity of the new material, silenced this objection. Now no American farmer, especially in the west, ever thinks of putting any other kind of fencing on his farm. It may be the new types of meshed wire and fencing which have been developed generally since 1899. Generally speaking, the use of barbed wire fencing in other countries has not been as extensive as in the United States. While it has been used on a comparatively large scale in Argentina and Australia, both these countries use a much larger quantity of plain wire fence, and in Argentina there is an important consumption of high-carbon oval fence wire of great strength, which apparently forms the only kind of fence that meets the conditions in a satisfactory manner.

It is interesting to note the largely increased demand for meshed wire fencing, and there is a tendency that will lead to the abandonment of the rail fence, which has been so generally used in the United States, and along the lines of railway. Beginning with 1899, there has been an annual increase in this demand, owing to the scarcity and high cost of labour, and the discontinuing of the building of rail fences. Meshed wire is considered by many a better enclosure for small animals, like sheep and hogs, than the barbed wire fence. Barbed wire has been popular with railroads, but of late meshed wire fencing has been substituted with advantage, the fabric being made of wires of larger diameter than formerly, to insure greater stability. The popularity of barbed wire is best shown by the following statistics:

Barbed wire is usually shipped to customers on wooden spools, each holding approximately 100 lb or 80 to 100 rods. A hole is provided through the centre of the spool for inserting a bar, on which a label is fastened for identifying the wire as it is put up. After the wire is stretched in place, it is attached to the wooden posts by means of galvanized steel wire staples, ordinarily made from No. 9 wire. They are cut with a sharp, long, diagonal point and can be embedded into the ground. On account of the rapid decay of destruction of wooden posts, steel posts have become popular, as also have reinforced concrete posts, which add materially to the durability of the fence. It is essential that barbed wire should be stretched with great care and work. For this purpose a suitable barbed wire stretcher is necessary.

Barbed wire fencing is now manufactured in various patterns. The general process may be outlined briefly as follows:—The wire is made of soft Bessemer or Siemens-Martin steel, and is drawn in the wire mill in the usual way. Galvanizing is done by a continuous process. The coil of wire to be galvanized is placed on a reel. The first end of the wire is led longitudinally through an annealing medium—either red-hot lead or heated fire-brick tubes—of sufficient length to soften the wire. From the annealing furnace, the wire is fed longitudinally through a bath of muriatic acid, which removes the scale, and from the acid, after a thorough washing in water, the wire passes through a bath of spelter, heated slightly above the melting point. After emerging from the spelter bath, the wire is wound on suitable take-up blocks into finished coils. From 30 to 60 wires are passing simultaneously in parallel through this continuous galvanizing apparatus. The wire, thus passing through a large basket, The outer string of wires is a bright finish and serves to protect it from the corrosive action of the atmosphere. There is a considerable demand for painted fencing, in the manufacture of which the galvanized wire is dipped into a paint bath of finished barbed wire, as they come from the barbing machine, are submerged in paint and dried. The barbing and twisting together of the two longitudinal strand wires is done by automatic machines, and the barbed wire is produced in a variety of shapes and sizes. A brief description of the machine is as follows:—Two coils of wire on reels are placed behind the machine, designed to form the main or strand wires of the barbed wire. One of these coils consists of a two-strand wire, and the other of a single strand wire. The bit of pointed wire cut off remains as a double-pointed steel barb attached firmly to the strand wire. This wire armed with barbs at regular intervals passes on through a gap between two sets of barbs, and is twisted by a small wheel with barbs. The duplex strand wires are attached to a take-up reel, which is caused to revolve and take up the finished barbed wire simultaneously. In union with the barbing machine is a mechanism which goes through the machine twisted into a 2-ply strand, armed with barbs projecting at right angles in every direction.

When once started, the operation of barbed wire making is continuous and rapid. The advantage of two strand wires is the automatic adjustment to changes of temperature. When heat expands the strands, the twist simply loosens without causing a sag, and when the temperature falls, the twist is tightened, thus altering the relative lengths of the combined wires. A barbed wire machine produces from 2000 to 3000 lb of wire per day of ten hours.

In some American states, the use of barbed wire is regulated by law, but this is not the case everywhere. Others prohibit the use of barbed wire fencing to indicate the property line between different owners, unless both agree to its use. In some states the use of barbed wire is prohibited unless it is lined with lumber. Barbed wire is also employed in connexion with "obstacles" in field fortifications, especially in what are known as "high wire entanglements." Pointed stakes or "pickets," 4 ft. high, are planted in rows and secured by ordinary wire to holdfasts or pegs in the ground. Each picket is connected to all around it, top and bottom, by lengths of barbed wire.

In India, where the use of barbed wire has also become common, the Barbed Wire Act 1893 enacted that, where there is on any land adjoining a highway within the county or district of a local authority, a fence which is made with barbed wire (i.e. any wire with spikes or barbed projections), or in which barbed wire has been used, such barbed wire may probably be injurious to persons or animals lawfully using the highway, the local authority may require the occupier of the land to abate the nuisance by serving notices in writing upon him. If the occupier fails to do so within the specified time, the local authority may apply to a court of summary jurisdiction, and such court, if satisfied that the barbed wire is a nuisance, may by summary order direct the occupier to abate it, and on his failure to comply with the order within a reasonable time, the local authority may execute it and recover in a summary manner from the occupier the expenses incurred.

**Barbel** (Barbus barbus) is a native of the Cyprinid family, which is an inhabitant of the rivers of central Europe, and is very locally distributed in England. It has four barbels (Lat. barba; bristle-like appendages hanging from the mouth), and the first ray of the short dorsal fin is strong, spine-like and serrated behind. It attains a weight of 50 lb on the continent of Europe. The genus of which it is the type is a very large one, comprising about 300 species from Europe, Asia and Africa, among which is the mahseer or mahaseer, the great sporting fish of India.

**Barbè-Marbois, François, Marquis de** (1743-1837). French politician, was born at Metz. He began his public career in 1779 by becoming a member of the National Assembly of the Government of San Domingo. In 1789 he returned to France, and then placed his services at the disposal of the revolutionary government. In 1791 he was sent to Regensburg to help de Noailles, the French ambassador, in the negotiations with the diet of the Empire concerning the
The possessions of German princes in Alsace and Lorraine. Suspected of treason, he was arrested on his return but set at liberty again. In 1795 he was elected to the Council of the Ancients, where the moderation of his attitude, especially in his opposition to the exclusion of nobles and the relations of émigrés from public life, brought him under suspicion of being a royalist, though he pronounced a cullony on Bonaparte for his success in Italy. At the coup d'état of the 18th Fructidor (September 4) 1797, he was arrested and transported to French Guiana. Transferred to Oléron in 1799, he owed his liberty to Napoleon, after the 18th Brumaire. In 1801 he became councillor of state and director of the public treasury, and in 1802 a senator. In 1803 he negotiated the treaty by which Louisiana was ceded to the United States, and was rewarded by the First Consul with a gift of 152,000 francs. In 1805 he was made grand officer of the legion of honour and a count, and in 1808 he became president of the cour des comptes. In return for these favours, he addressed Napoleon with servile compliments; yet in 1814 he helped to draw up the act of abdication of the emperor, and declared to the cour des comptes, with reference to the invasion of France by the allies, “united for the most beautiful of causes, it is long since we have been so free as we now are in the presence of the foreigner in arms.” On June 14, 1815, he was separated from the former of France and confirmed him in his office as president of the cour des comptes. Deprived of his positions by Napoleon during the Hundred Days he was appointed minister of justice in the ministry of the duc de Richelieu (August 1815). In this office he tried unsuccessfully to gain the confidence of the ultra-royalists, and withdrew at the end of nine months (May 10, 1816).

In 1830, when Louis Philippe assumed the reins of government, Barbé-Marbois went, as president of the cour des comptes, to compliment him and was confirmed in his position. It was the sixth government he had served and all with servility. He held his office until April 1834, and died on the 12th of February 1837. He published various works, of which may be mentioned: Réflexions sur la colonie de Saint-Domingue (1794), De la Guyane, &c. (1832), an Histoire de la Louisiane et la cession de cette colonie par la France aux États-Unis, &c. (1828), and the story of his transportation after the 18th Fructidor in Journal d’un déporté non jugé, 2 vols. (1834).

BARBER (from Lat. barba, beard), one whose occupation it is to shave or trim beards, a hairdresser. In former times the barber’s craft was dignified with the title of a profession, being conjoined with the art of surgery. He held his office until April 1814, and died on the 12th of February 1837. He published various works, of which may be mentioned: Réflexions sur la colonie de Saint-Domingue (1794), De la Guyane, &c. (1832), an Histoire de la Louisiane et la cession de cette colonie par la France aux États-Unis, &c. (1828), and the story of his transportation after the 18th Fructidor in Journal d’un déporté non jugé, 2 vols. (1834).

BARBERIN (from Lat. barba, beard), one whose occupation it is to shave or trim beards, a hairdresser. In former times the barber’s craft was dignified with the title of a profession, being conjoined with the art of surgery. He held his office until April 1814, and died on the 12th of February 1837. He published various works, of which may be mentioned: Réflexions sur la colonie de Saint-Domingue (1794), De la Guyane, &c. (1832), an Histoire de la Louisiane et la cession de cette colonie par la France aux États-Unis, &c. (1828), and the story of his transportation after the 18th Fructidor in Journal d’un déporté non jugé, 2 vols. (1834).

BARBERY (Berberis vulgaris), a shrub with spiny-toothed leaves, which on the woody shoots are reduced to forked spines, and pale yellow flowers in hanging racemes, which are succeeded by orange-red berries. It is a member of the botanical natural order Berberidaceae, and is remarkable for the structure of its ovary, which is a typical temperate zone and in the Andes of South America extending into Patagonia. The order is nearly allied to the buttercup order in having the parts of the flowers all free and arranged in regular succession below the ovary which consists of only one carpel. It is distinguished by having the sepals, petals and stamens in multiples of 2, 3 or 4, never 5. The berries of Berberis are edible; those of the native barberry are sometimes made into preserves. The alkaloid berberine (q.v.) occurs in the roots.

BARBERTON, a town of the Transvaal, 283 m. by rail (175 m. in a direct line) E. of Pretoria and 156 m. W.N.W. of Delagoa Bay. Pop. (1904) 2423, of whom 1214 were whites. Barberton lies 2825 ft. above the sea and is built on the side of a valley named De Kaap, from a bold headland of the Drakensberg which towers above it. The chief town of a district of the same name, it owes its existence to the discovery of gold in the Kaap valley, and dates from 1886. There are several fine public buildings grouped mainly round President Square. The town is connected with the Lourenc• Marques-Pretoria trunk railway by a branch line, 35 m. long, which runs N.E. through fine mountainous country and joins the main line at Kaapsmuide. During the war of 1914-18 the town was of great importance. The town is 615 ft. above sea level. (September 1900) by General (afterwards Sir John) French.

BARBETTE (Fr. diminutive of barbe, a beard), a platform inside a fortification raised sufficiently high for artillery placed thereon to be able to fire en barbette, viz. over the top of the parapet; also in warships a raised platform, protected by armour on the sides, upon which guns are mounted en barbette.

BARBEY D’AUREVILLY, JULES AMÉDÉE (1805-1868), French man of letters, was born at Saint-Sauveur-le-Vicomte (Manche) on the 2nd of November 1808. His most famous novels are L’ivre Vieille Mattrésse (1831), attacked at the time of its publication on the charge of immorality; L’Ensorceleé (1854), an episode of the royalist rising among the Norman peasants against the first republic; the Chevalier Destouches (1864); and a collection of extraordinary stories entitled Les Diaboliques (1874). Barbery d’Aureville is an extreme example of the eccentricities of which the Romanticists were capable, and to read him is to understand the discredit that fell upon the manner. He held extreme Catholic views and wrote on the most risqué subjects; he gave himself aristocratic airs and hinted at a mysterious past, though his parentage was entirely bourgeois and his youth very hum-drum and innocent. In the fifties d’Aureville became literary critic of the Pays, and a number of his essays, contributed to this and other journals, were collected as Les Œuvres et les hommes du XIXe siècle (1861-1865). Other literary studies are Les Romanciers (1866) and Goethe et Diderot (1880). He died in Paris on the 23rd of April 1889. Paul Bourget describes him as a dreamer with an exquisite sense of vision, who sought and found in his work a refuge from the
uncongenial world of every day. Jules Lemaître, a less sympathetic critic, finds in the extraordinary crimes of his heroes and heroines, his reactionary views, his dandyism and snobbery, an exaggerated Byronism. See also Alcide Dusolier, Jules Barbey d'Aurevilly (1802), a collection of essays printed by Librairie Prefreres de l'Aurevilly's Memoires (1833); Jules Lemaître, Les Contemporains; Eugène Grellot, Barbey d'Aurevilly, sa vie et son œuvre (1902); René Doumic, in the Revue des deux mondes (Sept. 1902).

BARBEYRAC, JEAN (1674-1744), French jurist, the nephew of Charles Barbeyrac, a distinguished physician of Montpellier, was born at Bombay (now Mahon) near Languedoc in 1674. He removed with his family into Switzerland after the revocation of the edict of Nantes, and there studied jurisprudence. After spending some time at Geneva and Frankfort-on-Main, he became professor of belles-lettres in the French school of Berlin. Thence, in 1711, he was called to the professorship of history and civil law at Lausanne, and finally settled as professor of public law at Groningen. He died on the 3rd of March 1744. His name rests chiefly on the preface and notes to his translation of Pufendorf's treatise De Jure Naturae et Gentium. In fundamental respects, his work is almost entirely Locke and Pufendorf; but he works out with great skill the theory of moral obligation, referring it to the command or will of God. He indicates the distinction, developed more fully by Thomasius and Kant, between the legal and the moral qualities of action. The principles of international law he reduces to those of the law of nature, and combats, in so doing, many of the positions taken up by Grotius. He rejects the notion that sovereignty in any way resembles property, and makes even marriage a matter of civil contract. Barbeyrac also translated Grotius's De Jure Belli et Pacis, Cumberland's De Legibus Naturae, and Pufendorf's smallest treatise De Officio Hominum et Civitatum. Among his own productions are a treatise, De la morale des pêres, a history of ancient treatises contained in the Supplement au grand corps diplomatique, and the curious Traité du jeu (1700), in which he defends the morality of games of chance.

BARBEYRAC—BARBITON

BARBICAN (from Fr. barbacane, probably of Arabic or Persian origin), an outwork for the defence of a gate or drawbridge; also a sort of pent-house or construction of timber to shelter warders or sentries from arrows or other missiles.

BARBIER, ANTOINE ALEXandre (1765-1825). French librarian and bibliographer, was born on the 11th of January 1765 at Coulounieix (Seine-et-Marne). He took priest's orders, from which, however, he was finally released by the pope in 1801. In 1794 he became a member of the temporary commission of the arts, and was charged with the duty of distributing among the various libraries of Paris the books that had been confiscated during the Revolutions. In the execution of this task he discovered the letters of Hue, bishop of Avranches, and the MSS. of the works of Fénelon. He became librarian successively to the Directory, to the Consulat d'État, and in 1807 to Napoleon, from whom he carried out a number of commissions. He produced a standard work in his Dictionnaire des ouvrages anonymes et pseudonymes (4 vols. 1806-1809; 3rd edition 1872-1879). Only the first part of his Essai sur le critique des dictionnaires de historiques (1820) was published. He had a share in the foundation of the libraries of the Louvre, of Fontainebleau, of Compiègne and Saint-Cloud; under Louis XVIII. he became administrator of the king's private libraries, but in 1822 he was deprived of all his offices. Barbier died in Paris on the 5th of December 1825. See also a notice by his son, Louis Barbier, and a list of his works prefixed to the 3rd edition of the Dict. des ouvrages anonymes et pseudonymes.

BARBIER, HENRI AUGUSTE (1803-1882). French dramatist and poet, was born in Paris on the 29th of April 1805. Inspired by the revolution of July he poured forth a series of eager, vigorous poems, denouncing, crudely enough, the evils of the time. They are spoken of collectively as the Iambes (1831), though the designation is not strictly applicable to all. As the name suggests, they are modelled on the verse of André Chénier. They include La Curie, La Popularité, L'Idole, Paris, Dante, Quatre-singt-treize and Varsovie. The rest of Barbier's poems are forgotten, and when, in 1860, he received the long delayed honour of admission to the Academy, Montalembert expressed the general sentiment in his Barbier? mais il est mort! It was even asserted, though without foundation, that he was not the real author of the Iambes. He died at Nice on the 13th of February 1882. He collaborated with Léon de Wally in the libretto of Berlioz's opera, Benvenuto Cellini, and his works include two series of poems on the political and social troubles of Italy and England, printed in later editions of Iambes et poèmes. See also Sainte-Beuve, Portraits contemporains, vol. ii.

BARBIERI, LOUIS, known as the Abbé de la Rivière (1593-1670), French bishop, was born of humble parents in Vaudelaincourt, near Compiègne. He entered the church and made his way by his wit and cleverness, until he was appointed tutor, and then became the friend and adviser, of Gaston d'Orléans, brother of Louis XIII. He thus gained an entrance to the court, became grand almoner of the queen, and received the revenue of rich abbey. In March 1655 he was named bishop of Langres, but he spent his time at court, where his wit was always in demand, and where he gained great sums by gambling. He died very rich.

BARBIERI, GIOVANNI FRANCESCO (otherwise called Guercino, from his squinting), (1591-1666), Italian historical painter, was born at Cento, a village not far from Bologna. His artistic powers were developed very rapidly, and at the age of seventeen he was associated with Benedetto Gennari (1590-1610), a well-known painter of the Bolognes school. The fame of the young painter spread beyond his native village, and in 1615 he removed to Bologna, where his paintings were much admired. His first style was formed after that of the Caracci; but the strong colouring and shadows employed by Caravaggio made a deep impression on his mind, and for a considerable period his productions showed evident traces of that painter's influence. Some of his latest pieces approach rather to the manner of his great contemporary Guido, and are painted with more lightness and clearness. Guercino was esteemed very highly in his lifetime, not only by the nobles and princes of Italy, but by his brother artists, who placed him in the first rank of painters. He was remarkable for the extreme rapidity of his execution; he completed no fewer than 106 large altar-pieces for churches, and his other paintings amount to about 144. His most famous piece is thought to be the St Petronilla, which was painted at Rome for Gregory XV. and is now in the Capitol. In 1626 he began his frescoes in the Duomo at Fiesenza. Guercino continued to paint and teach up to the time of his death in 1666. He had amassed a handsome fortune by his labours. His life, by J. A. Calvi, appeared at Bologna in 1868. His brother, PAOLO ANTONIO BARBIERI (1603-1649), was a celebrated painter of still life and animals. He chose for his subjects fruits, flowers, insects and animals, which he painted after nature with a lively tint of colour, great tenderness of pencil, and a strong character of truth and life.

BARBITON, or BARBITOS (Gr. βαρμίτος or βαρμίτος; Lat. barbitus; Pers. barbat, barbad), an ancient stringed instrument known to us from the Greek and Roman classics, but derived from Persia. Theocritus (xvi. 45), the Sicilian poet, calls it an instrument of many strings, i.e. more than seven, which was by the Hellenes accounted the perfect number, as in the cithara of the best period. Anacreon (a native of Teos in Asia Minor) sings that his barbitos only gives out erotic tones. Pollux (Onomasticon iv. chap. 8, § 59) calls the instrument harbition (from βαρμίτος, heavy and μιτος, a string), an instrument producing deep tones. The string were twice as long as those of the pectis and sounded an octave lower. Pindar (in Athen. xiv. p. 635), in the same line wherein he attributes the introduction of the instrument into Greece to Terpander, tells us one could magadize, i.e. play in two parts at an interval of an octave on the two instruments. The word barbiton was frequently used for the lyre itself. Although in use in Asia Minor, Italy,

1 See Berg's Poëtes Lyriques Gréco (4th ed., 1882), p. 201, fr. 143 (113); and p. 311, 23 (11), 31 and 14 (9), 34. p. 306.
Sicily, and Greece, it is evident that the barbiton never won for itself a place in the affections of the Greeks of Hellas; it was regarded as a barbarian instrument affected by those only whose tastes in matters of art were unorthodox. It had fallen into disuse in the days of Aristotle, but reappeared under the Romans.

In spite of the few meagre shreds of authentic information extant concerning this somewhat elusive instrument, it is possible nevertheless to identify the barbiton as it was known among the Greeks and Romans. From the Greek writers we know that it was an instrument having some feature or features in common with the lyre, which warranted classification with it. From the Persians and Arabs we learn that it was a kind of rebab or lute, or a chelys-lyre, first introduced into Europe through Asia Minor by way of Greece, and centuries later into Spain by the Moors, amongst whom it was in the 14th century known as al-barbet. There is a stringed instrument, as yet unidentified by name, of which there are at least four different representations in sculpture, which combines the characteristics of both lyre and rebab, having the vauluted back and gradual narrowing to form a neck which are typical of the rebab and the stringing of the lyre. In outline it resembles a large lute with a wide neck, and the seven strings of the lyre of the best period, or sometimes nine, following the decadic lyre. Most authors in reproducing these sculptures representing the barbiton represent the instrument as boat-shaped and without a neck, as, for instance, Carl Engel. This is due to the fact that the part of the instrument where neck joins body is in deep shadow, so that the correct outline can hardly be distinguished, being almost hidden by hand on one side and drapery on the other.

The barbiton, as pictured here, had probably undergone considerable modification at the hands of the Greeks and had diverged from the archetype. The barbiton, however, although it underwent many changes, retained until the end the characteristics of the instruments of the Greek lyre whose strings were plucked, whereas the rebab was sounded by means of the bow at the time of its introduction into Europe. At some period not yet determined, which we cannot conjecture, the barbat approximated to the form of the large lute (q.v.).

An instrument called barbiton was known in the early part of the 16th and during the 17th century. It was a kind of a harp or lute, barbatan, player upon lute, pl. barbat; G. W. Freytag, Lexicon Arabico-Latinitum, i. p. 102: barbat (Persian and Arabic), barbitus, genus testudinis, pyramide sex chordae incide (rotundam habet formam in Africa); Lexicon Aegypticum Forcellini (Prao, 1888), “Barbito aurataque chely ac obdixid fidibus personare” (Martianus Capella i. 36); G. B. Doni, Lyra Barberina, ii. i. lex.

1 Politi. viii. (v.), 6, ed. Susenhi-Hecks (1894), pp. 604 (= 1341a 40) and 632; Daremberg and Saglio, Dict. d'autr. gr. et rom., article „Lyre”, p. 1460, for a few more references to the classics.

2 Johnson's Persian-Arabic-English dictionary: barbat, a harp or lute, barbatan, player upon lute, pl. barbat; G. W. Freytag, Lexicon Arabico-Latinitum, i. p. 102: barbat (Persian and Arabic), barbitus, genus testudinis, pyramide sex chordae incide (rotundam habet formam in Africa); Lexicon Aegypticum Forcellini (Prao, 1888), “Barbito aurataque chely ac obdixit fidibus personare” (Martianus Capella i. 36); G. B. Doni, Lyra Barberina, ii. i. lex.

3 Enumeration of Arab Musical Instruments, xiv. c.

4 In Jacob Locher's Nauis Stultifera (Basel, 1606), titulus 7, is an illustration of a small harp and lute with the legend nec cytharam langt nec barbarion.

5 Theorbo or bass-lute, but with one neck only, bent back at right angles to form the head. Robert Fludd gives a detailed description of it with an illustration:—“Inter quas instrumenta non nulla barbario simillima effixerunt cujus modij sunt illa quae vulgar appellantur theorb, quae sonos graviores reddunt chordasque nervous habent.” The people called it theorbo, but the scholar having identified it with the instrument of classical and Romantic writers called lute and in several barbarian nations had nine pairs of gut strings, each pair being in unison. Dictionaries of the 18th century support Fludd's use of the name barbarion. G. B. Doni mentions the barbiton, defining it in his index as Barbitos seu major chelys staiice torba, and deriving it from lyre and citara in common with testudines, torbas and all tortoise-shell instruments. Claude Perrault, writing in the 17th century, states that “ies modernes appellent notre luth barbarion” (the moderns call our lute barbarion). Constantin Huygens declares that he learnt to play the barbiton in a few weeks, but took two years to learn the cittern.

The barbat was a variety of rebab (q.v.), a bass instrument, differing only in size and number of strings. This is quite in accordance with what we know of the nomenclature of musical instruments among Persians and Arabs, with whom a slight deviation in the construction of an instrument called for a new name. The word barbat applied to the lute is said to be derived from a famous musician living at the time of Chosroes II. (A.D. 590-638), who excelled in playing upon the instrument. From a later translation of part of the same authority into Italian we have the barbaros, with which barbarian musical instruments: “Die Sänger stehen bei seinem Gesang, in ihrer Hand Barbiton(iii.) und Leyer(iii.) und Laut(iii.) und Flöt(iii.) und Deff (Handpauke).” Mr Ellis, of the Oriental Department of the British Museum, has kindly supplied the original Persian names translated above, i.e. (i) barbat, (ii) chang, (iii) rubbat, (iv) nei. The barbat and rubbat thus were different instruments as late as the 19th century in Persia. There were but slight differences if any between the archetypes of the pear-shaped rebab and of the lute before the application of the bow to the former—both had vauluted backs, body and neck in one, and gut strings plucked by the fingers.

BARBIZON, a French village, near the forest of Fontainebleau, which gave its name to the “Barbizon school” of painters, whose leaders were Corot, Rousseau, Millet and Daubigny, together with Diaz, Dupré, Jacque, Français, Harpignies and others. They put aside the conventional idea of “subject” in their pictures of landscape and peasant life, and went direct to the fields and woods for their inspiration. The distinctive note of the school is seen in the work of Rousseau and of Millet, each of whom, after spending his early years in Paris, made his home in Barbizon. Unquestionably, the school is still after years of struggle that they attained recognition and success. They both died at Barbizon—Rousseau in 1867 and Millet in 1875. It is difficult now to realize that their work, so unaffected and beautiful, should have been so hardly received. To understand this, it is necessary to remember the conflicts that existed between the classic and romantic schools in the first half of the 19th century, when the classicists, followers of the tradition of the Académie française, were struggling with the romanticists. The themselves.

David, were the predominant school. The romantic movement, with Géricault, Bonington and Delacroix, was gaining favour. In 1854 Constable's pictures were shown in the Salon, and confirmed the younger men in their resolution to abandon the lifeless pedantry of the schools and to seek inspiration from nature. In those troubled times Rousseau and Millet unburdened their souls to their friends, and their published lives contain many letters, some extracts from which will express the ideals which these artists held in common, and show clearly the true and firmly-based foundation on which their art stands. Rousseau wrote, "It is good composition when the objects represented are not there solely as they are, but when they contain under a natural appearance the sentiments which they have stirred in our souls. . . . For God's sake, and in recompense for the life He has given us, let us try in our works to make the manifestation of life our first thought: let us make a man breathe, a tree really vegetate." And Millet—"I try not to have things look as if chance had brought them together, but as if they had a necessary bond between themselves. I want the people I represent to look as if they really belonged to their station, so that imagination cannot conceive of their ever being anything else. People and things should always be there with an object. I want to put strongly and completely all that is necessary, for I think things weakly said might as well not be said at all, for they are, as it were, deflowered and spoiled—but I profess the greatest horror for uselessness (however brilliant) and filling up. These things can only weaken a picture by distracting the attention toward secondary objects, and the little terrors and shortcomings of the time from that moment the artist did not lean directly and naively upon impressions made by nature. Cleverness naturally and rapidly took the place of nature, and decadence then began. . . . At bottom it always comes to this: a man must be moved himself in order to move others, and all that is done from theory, however clever, can never attain this end, for it is impossible that it should have the breath of life." The ideas of the "Barbizon school" only gradually obtained acceptance, but the chief members of it now rank among the greater artists of their time.

See D'Arblay, "Thé Barbizon" (1891), with a full list of the French authorities to be consulted; Jules Breton, "Nos peintres du siècle," Paris, 1900.

BARBON, NICHOLAS (c. 1640-1698), English economist, probably the son of Praise-god Barbon, was born in London, studied medicine at Leiden, graduated M.D. at Utrecht in 1661, and was admitted an honorary fellow of the College of Physicians in 1664. He took a considerable part in the rebuilding of London after the great fire of 1666, and has a claim to be considered the inventor of fire-insurance in England, which he started somewhere about 1665. He was M.P. for Bramber in 1660 and 1665. He founded a land bank which, according to contemporaries, was fairly successful and was united with that of John Briscoe in 1668. He died in 1668. His writings are interesting as expressing views much in advance of his time and very near akin to those of modern times on such important topics as value, rent and foreign trade. The most important were Apology for the Builder; or a Discourse showing the Cause and Effects of the Increase of Building (1683); A Discourse of Trade (1690); and A Discourse Concerning Coining the New Money Lighter (1690).

BARBON (Barbourne or Barebones), PRAISE-GOD (c. 1590-1679), English leather-seller and Fifth Monarchy man, was admitted freeman of the Leather-sellers Company on the 20th of January 1623 and liverrymen on the 13th of October 1634. About the same time he became minister to a congregation which assembled at his own house, "The Lock and Key," in Fleet Street, where his preaching attracted large audiences. The exact nature of his religious opinions is not perfectly clear. He is styled by his enemies a Brownist and Anabaptist, i.e. probably Baptist, but he wrote two books in support of paedo-baptism, and his congregation had separated from a larger one of Baptists on that point of controversy. Later he belonged to the sect of Fifth Monarchy men. He was the object of the abuse and ridicule of the opposite party, and his meetings were frequently disturbed by riots. On the 20th of December 1641 his house was stormed by a mob and he narrowly escaped with his life. Barbon, who was a man of substantial property, was summoned by Cromwell on the 6th of June 1653 as a member for London to the assembly of nominees called after him in derision Barbone's Parliament. His name is occasionally mentioned, but he appears to have taken no part in the debates. In 1660 he showed great activity in endeavouring to prevent the Restoration. He published Needham's book, News from Brussels in a Letter from a Near Attendant on His Majesty's Person . . ., which retailed unfavourable anecdotes relating to Charles's morals, and on the 9th of February he presented the petition to the Parliament, which proposed that all officials should abjure the Stuarts, and all publicly proposing the Restoration should be deemed guilty of high treason. His conduct drew upon him several royalist attacks. On the 31st of March he was obliged to sign an engagement to the council not to disturb the peace, and on the 24th of November 1661 he was arrested, together with John Widman and James Harrington, and was imprisoned in the Tower till the 27th of July 1662, when he was released on bail. Barbon, who was married, was buried on the 5th of January 1680. He was the author of A Discourse tending to prove . . . Baptism . . . to be the ordinance of Jesus Christ. As also that the Baptism of Infants is inapplicable (1642), the preface of which shows a spirit of wide religious tolerance; and A Reply to the Frivolous and Imperudent answer of R. B. and E. B. to the Discourse of P. B. (1643). BARBOUR, JOHN (c. 1316-1395), Scottish poet, was born perhaps in Aberdeenshire, early in the 14th century, approximately 1326. In a letter of safe-conduct dated 1357, allowing him to go to Oxford for study, he is described as archdeacon of Aberdeen. He is named in a similar letter in 1346 and in another in 1368 granting him permission to pass to France, probably for further study, at the university of Paris. In 1372 he was one of the auditors of exchequer, and in 1373 a clerk of audit in the king's household. In 1375 (he gives the date, and his age as 60) he composed his best known poem The Brus, for which he received, in 1377, the gift of ten pounds, and, in 1378, a life-pension of twenty shillings. Additional rewards followed, including the renewal of his exchequer auditorship (though he may have continued to enjoy it since his first appointment) and ten pounds to his pension. The only biographical evidence of his closing years is his signature as a witness to sasine deeds in the Register of Aberdeen as late as 1392. According to the obit-book of the cathedral of Aberdeen, he died on the 13th of March 1395. The state records show that his life-pension was not paid after that date.

Considerable controversy has arisen regarding Barbour's literary work. If he be the author of the five or six long poems which have been ascribed to him by different writers, he adds to his importance as the father of Scots poetry the reputation of being one of the most voluminous writers in Middle English, certainly the most voluminous of all Scots poets.

(1) The Brus, in twenty books, and running to over 13,500 four-accent lines, in couplets, is a narrative poem with a purpose partly historical, partly patriotic. It opens with a description of the state of Scotland at the death of Alexander III. (1266) and concludes with the death of Douglas and the burial of the Bruce's heart (1322). The central episode is the battle of Bannockburn. Patriotic as the sentiment is, it is in more general terms than is found in later Scots literature. The king is a hero of the chivalric type common in contemporary romance; freedom is a ''noble thing," to be sought and won at all costs; the opponents of such freedom are shown in the dark colours which history and poetic propriety require; but there is none of the complacency of the merely provincial habit of mind. The lines do not lack vigour; and there are passages of high merit, notably the oft-quoted section beginning "Al fredome is a noble thing." Despite a number of errors of fact, notably the confusion of the three Bruces in the person of the hero, the poem is historically trustworthy as compared with contemporary verse-chronicle, and especially with the Wallace of the next century. No one
has doubted Barbour's authorship of the Brus, but argument has been attempted to show that the text as we have it is an edited copy, perhaps by John Ramsay, a Perth scribe, who wrote out the two extant texts, preserved in the Advocates' library, Edinburgh, and in the library of St John's College, Cambridge. Extensive portions of the poem have been incorporated by Wyntoun (g.v.) in his Chronicle. The first printed edition extant is Charteris's (Edinburgh, 1571); the second is Hart's (Edinburgh, 1616).

(2) Wyntoun speaks (Chronicle III. iii.) of a "Tretis" which Barbour made by way of "a genealogy" of "Brutus lynagis"; and elsewhere in that poem there are references to the arch-deacon's "Stewartis Oryginala. This "Brut" is unknown; but the reference has been held by some to be (3) a Troy-book, based on Guido da Colonna's Historia Destructionis Troiae. Two fragments of such a work have been preserved in texts of Lydgate's Troy-book, the first in MS. Camb. Univ. Lib. Kk. v. 30, the second in the same and in MS. Douce 148 in the Bodleian library, Oxford. This ascription was first made by Henry Bradshaw, the librarian of Cambridge University; but the consensus of critical opinion is now against it. Though it were proved that these Troy fragments are Barbour's, there remains the question whether their identification with the book on the Stewart line is justified. The scale of the story in these fragments forces us to doubt their identification. They contain 505-1 218 = 3073 lines and are concerned entirely with "Troyan" matters. This would be an undue allowance in a Scottish "genealogy".

(4) Yet another work was added to the list of Barbour's works by the discovery in the university library of Cambridge, by Henry Bradshaw, of a long Scots poem of over 33,000 lines, dealing with Legends of the Saints, as told in the Legenda Aurea and other legendsaries. The general likeness of this poem to Barbour's accepted work in verse-length, dialect and style, and the facts that the lives of English saints are excluded and those of St Ninian (the patron saint of Cumbria) and St Ninian of the island and St Ninian of the lagoon, are inserted, made the ascription plausible. Later criticism, though divided, has tended in the contrary direction, and has based its strongest negative judgment on the consideration of rhymes, assonance and vocabulary (see bibliography). That the "district" of the author is the north-east of Scotland cannot be doubted in the face of a passage such as this, in the fourth orded legend (St Ninian), 11, 1359 et seq.:

"A lytil tale yelt herd I tel, that is to my tyme befol, of a gudman, in murrefe [Moray] borne in elgyn [Elgin], and his kine beforne, and callit was a faltul fyn, vith al fame jat hym knew than; & his bare trasedly I say, for I kende hym well mey day. cally my kine wes krine, a man of ful gud fame."

But whether this north-east Scots author is Barbour is a question which we cannot answer by means of the data at present available.

(5) If Barbour be the author of the Legends, then (so does one conclusion hang upon another) he is the author of a Gospel story with the later life of the Virgin, described in the prologue to the Legends and in other passages as a "birth of Jhesu criste," and one "quhare-in I recodit the genolgy of our lady sanct Mary."

(6) In recent years an attempt has been made to name Barbour as the author of the Ball of Alexander (a translation of the Roman d'Alexandre and associated pieces, including the Vaux du Paon), as known in the unique edition, c. 1580, printed at the Edinburgh press of Alexander Arbuthnot. The "argument" as it stands is nothing more than an exaggerated inference from parallel-passages in the Brus and Alexander, and it makes no allowance for the tags, epiteths and general vocabulary of the period. Should the assumption be proved to be correct, and should it be found that the "Troy fragments" were written first of all, followed by Alexander and Bruce or Bruce and Alexander, and that the Legends end the chapter," it will be by "evidence" other than that which has been produced to this date.

For Barbour's life see Exchequer Rolls of Scotland, ii. and iii.; Buchanan Episcopatus Aberdonensis (Spalding Club); Byrner's Fother.
BARCAROLE—BARCELONA

391

Sahara behind it, tend to divert trade to the west of the district—a fact which is exemplified by the final survival of Berenice (mod. Benghazi). Merj stands in a rich but ill-cultivated stretch of red soil.

BARCAROLE, or BARCAROLLE (Ital. barcarola, a boat-song), properly a musical term for the songs sung by Venetian gondoliers, and hence for an instrumental or vocal composition, generally in 6–8 time, written in imitation of their characteristic rhythm.

BARCELONA, a maritime province of north-eastern Spain, formed in 1833 out of districts belonging to the ancient kingdom of Catalonia, and bounded on the N.E. and E. by Gerona; S. by the Mediterranean Sea; S.W. by Tarragona; and W. and N.W. by Lérida. Pop. (1900) 1,054,541; area 2668 sq. m. Apart from a few tracts of level country along the coast and near Igualada, Manresa, Sabadell and Vich, almost the whole surface consists of mountain ranges, often densely wooded, rich in minerals and intersected by deep ravines. These ranges are outliers of the Pyrenees, which extend along the northern frontier, forming there the lofty Sierra del Cadí with the peak of Tosa (8317 ft.). Towards the sea, the altitudes become gradually less, although not with a uniform decrease; for several isolated peaks and minor ranges such as Montserrat and Monseñy rise conspicuously amid the lower summits to a height of 4000-6000 ft. The central districts are watered by the Llobregat, which rises at the base of the Sierra del Cadí, and flows into the sea near Barcelona, the capital, after receiving many small tributaries.

The province possesses 1000 towns and villages, consisting of the eastern extremity of the province.

Barcelona can be divided into three climatic zones; a temperate one near the sea, where even palm and orange trees grow; a colder one in the valleys and plains, more inland; and a colder still among the mountains, where not a few peaks are snow-clad for a great part of the year. Agriculture and stock-keeping are comparatively unimportant in this province, which is the centre of Spanish industry and commerce. In every direction the country looks like a veritable hive of human activity and enterprise, every town and village full of factories, and native villages possesses a complete set of workshops, such as shoe-making and, in many cases, the agriculture of the district is almost entirely in the hands of the proprietors. There are numerous mineral springs; but the prosperity of the province chiefly depends on its transit trade and manufactures. These are described in detail in articles on the chief towns. Barcelona (pop. 1900, 533,000), Badalona (19,240), Cardona (38,553), Igualada (16,442), Manresa (23,232), Mataº (19,704), Sabadell (23,264), Tarrasa (15,956), Vich (11,628) and Villanueva y Geltrú (11,856). Berga (5465), perhaps the Roman Castrum Bergium, on the Llobregat, is the home of the Catalanon cotton industry. None of the rivers is navigable, and the roads are in general indifferent and insufficient. The principal trade of the province consists in the export of wine, olive oil, jam, various manufactures, and, above all, salt which is exported largely. There is moreover an important export of fish, and the seaport of Tarragona, with a population of 6500, is one of the chief fishing stations in Spain.

The province is divided into the banks of the Llobregat, which rises on the northeastern border of the province. The eastern extremity of the province.

Barcelona was formerly surrounded by a strong line of ramparts, and defended, or more correctly, overawed by a citadel on the north-east, erected in 1715 by Philip V.; but these fortifications being felt as a painful restriction on the natural development of the city, were, in spite of the opposition of the central government, finally abolished by the local authorities in 1845. The walls of the moat were utilized for the cellars of the houses which soon occupied the site of the ramparts, and the ground, which had been covered by the citadel, was laid out in gardens. A rapid extension of the city to the north-west took place, and in 1860 an elaborate plan for the laying out of new districts received the royal sanction. Barcelona thus comprises an old town, still consisting for the most part of irregular and narrow streets, and a new town built with all the symmetry and precision of a premeditated scheme. The buildings of the old town are chiefly of brick, from four to five storeys in height, with flat roofs, and other oriental peculiarities; while in the new town hewn stone is very largely employed, and the architecture is often of a modern English style. To the east, on the tongue of land that projects from the port, lies the suburb of Barcelona. It owes its origin to the monastery de la Mina, who, about 1754, did much for the city, and is regularly laid out, the houses being built of brick after a uniform pattern. The main street or axis of the old town is the Rambla, which has a fine promenade planted with plane-trees running down the middle, and contains the principal hotels and theatres of the city. The most important suburbs are Gracia, Las Cortes de Sarriá, Horta, San Andrés de Palomar, San Gervasio de Cassolas, San Martín de Provenals and Sans. Exclusive of these, the city contains about 334,000 inhabitants, an increase of nearly 150,000 since 1857. Large numbers of the inhabitants of the city, besides many others, were, during the latter half of the 19th century, attracted by the great development of the textile industry. Barcelona is the see of a bishop, and, like most Spanish towns, has a large number of ecclesiastical buildings, though by no means so many as it once possessed. No fewer than eighteen convents were still standing in 1873. The cathedral, erected between 1298 and 1448 on Monte Tuber, an null hill which forms the highest point of the Rambla, is one of the finest examples of Spanish Gothic; although it is not designed on a great scale and some parts have been freely modernized. It contains the early 14th-century tomb of Santa Eulalia, a marked example of the Gothic art, and several monuments of artistic or historical interest. Its stained glass windows are among the finest in Spain, and it possesses archives of great value. Santa Maria del Mar, Santa Ana, Santos Justo y Pastor, San Pedro de las Puellas, and San Pablo del Campo are all churches worthy of mention.

The educational institutions of Barcelona have from an early period been numerous and important. The university (Universidad Literaria), which was originally founded in 1430 by the magistracy of the city, and received a bull of confirmation from Pope Nicholas V. in 1450, possessed at that time four faculties and thirty-one chairs all endowed by the corporation. It was suppressed in 1714, but restored in 1841, and now occupies an extensive building in the new town. There are, besides, an academy of natural sciences, a college of medicine and surgery—confirmed by a bull of Benedict XIII. in 1400—an academy of fine arts, a normal school, a theological seminary, an upper industrial school, an institution for the education of deaf-mutes, a school of navigation and many minor establishments. Gratuitous instruction of a very high order is afforded by the Board of Trade to upwards of 2000 pupils. The principal charitable foundations are the Casa de Caridad or house of charity, the hospital general, dating from 1401, and the Foundling Hospital. The principal clerk and commercial buildings are the
Barcelona

Casa Consistorial, a fine Gothic hall (1369–1378), the Lonja or exchange (1383), and the Aduana or custom-house (1792). At the seaward end of the Rambla is a large ancient structure, the Atrazaras or Arsenalas, which was finished about 1245, and partly demolished in the 16th century but places a better view to the promenade. Remains of the former royal state of Barcelona are found in the Palacio Real of the kings of Aragon and the Palacio de la Reina. At the highest part of the city, in the Calle del Paradis, are some magnificent columns, and other Roman remains, which, however, are hidden by the surrounding buildings.

Means of public recreation are abundantly supplied. There are many theatres, the two most important being the Teatro Principal, and the Teatro del Liceo, a very fine building, originally erected in 1845 on the site of a convent of Trinitarian monks. The number of restaurants and similar places of evening resort is very great, and there are several public courts where the Basque game of pelota can be witnessed.

The so-called port of Barcelona was at first only an open beach, on the east, slightly sheltered by the neighbouring hills, but at an early period the advantage of some artificial protection was felt. In 1438 Don Alphonso V. granted the magistracy a licence to build a mole; and in 1474 the Moll de Santa Creu was officially begun.

Long after this, however, travellers speak of Barcelona as destitute of a harbour; and it is only in the 17th century that satisfactory works were undertaken. Until modern times all the included area was shut off from the open sea by a sand-bank, which rendered the entrance of large vessels impossible. An extension of the former mole, and the construction of another from the foot of Montjuich, have embraced a portion of the sea outside of the bank, and a convenient shelter is thus afforded for the heaviest battleships. From 1873 the work of extension and improvement was carried on systematically, with the addition of new quays, greater storage room, and better means for handling cargo. After thirty years of steady development, further plans were adopted.

At this period, a breakwater, with a depth of 18 to 30 ft. at low tide, and an outer harbour with a depth of 20 to 35 ft.

The following year 875 vessels of nearly 5,000,000 tons entered the port. Barcelona is well supplied with inland communication by rail, and the traffic of its streets is largely facilitated by tramway lines running from the port as far as Gràcia and the other chief suburbs.

Barcelona has long been the industrial and commercial centre of eastern Spain—a pre-eminence which dates from the 12th and 13th centuries. It received a temporary check from the disasters of the Spanish-American War of 1898; but less than a year later it paid about £500,000 in industrial and commercial taxes, or more than 11% of the whole amount thus collected in the kingdom; and within five years it had become a port of regular call for thirty-five important shipping companies. It also contains the head offices of thirteen other lines, notably those of the Transatlantic Mail Company, which possessed a fleet of twenty-five fine steamships. Trades and industries give occupation to more than 150,000 hands of both sexes. The spinning and weaving of wool, cotton and silk are the principal industries, but the enterprise of the Spaniards has compelled them to try almost every industry in which native capital could attempt to compete with foreign, especially since the institution of the protectionist tariffs of 1892. The native manufacturers are quite able to compete in provincial markets with foreign rivals. This prosperity has been in part due to the great development of means of communication about the city and in the four Catalan provinces. Comestibles, raw materials, and combustibles form the greater part of the imports, but this great manufacture also imports a considerable quantity of foreign manufactured goods. The principal exports are wines, cereals, olive-oil, cotton goods, soap, cigarette-paper, furniture and barrels, boots, shoes and leather goods, and machinery.

Barcelona, the ancient name of the city, is usually connected with that of the Carthaginian Hamilcar Barca, its traditional founder in the 3rd century B.C. After the Roman conquest, it received from Augustus (27 B.C.–A.D. 14) the name of Julia Faventia (afterwards Augusta and Pia), with the status of a Roman colony; and thenceforward it rapidly grew to be the leading mart of the western Mediterranean, rivaling Tarraco (Tarragona) and Massilia (Marseilles) as early as the 2nd century A.D. As its remains testify, the Roman city occupied Monte Taber. The bishopric of Barcelona was founded in 43 B.C. 415 and 531, the Visigoths chose Barcelona as their temporary capital; in 540 and 599 church councils were held there. Barcinona or Bardaljuna, as it was then called, was captured by the Moors in 713, and in 801 it passed, with the rest of Catalonia, under the dominion of the Franks. From 874 the counts of Barcelona ruled as independent monarchs. But the accession of larger resources due to the union between Catalonia and Aragon in 1139, brought the city to the zenith of its fame and wealth. Its merchant ships vied with those of Genoa, Venice and Ragusa, trading as far west as the North Sea and the Baltic, and as far east as Alexandria. In 1298 James I of Aragon empowered Barcelona to issue its famous Consulado del Mar, a code of maritime law recognized as authoritative by many European states. Consuls represented Barcelona at the principal commercial centres on or near the Mediterranean; and the city was among the first communities to adopt the practice of marine insurance. But the union of Castile and Aragon in 1470 favoured other cities of Spain at the expense of Barcelona, whose commercial supremacy was transferred to the ports of western Spain by the discovery of America in 1492. The city, which had attributed their misfortunes to the "Castilian" government, and which had been a party among them favoured annexation by France. In 1649 Barcelona was the centre of the Catalanian rebellion against Philip IV., and threw itself under French protection. In 1652 it returned to its allegiance, but was captured by the duke of Vendôme in 1697. At the peace of Ryswick, in the same year, it was restored to the Spanish monarch. During the War of the Succession (1701–1714) Barcelona adhered to the house of Austria. The seizure of Montjuich in 1705, and the subsequent evacuation of the city by the French, were followed by the recovery of Barcelona in 1714 and the city, which had attributed their misfortunes to the "Castilian" government, and which had been a party among them, was an absolute resistance by the duke of Berwick in the interests of Philip V., and at the close of the war was reluctantly reconciled to the Bourbon dynasty. In 1800 the French invaders of Spain obtained possession of the fortress and kept the city in subjection until 1814. Since then it has shared in most of the revolutionary movements that have swept over Spain, and has frequently been distinguished by the violence of its civic convulsions. For the historic antagonism between the Catalans and the other inhabitants of Spain, was strengthened by the industrial development of Barcelona. Among the most enterprising and shrewd Catalans, who look upon their rulers as reactionary, and reserve all their sympathies for the Provençal neighbours whom they so nearly resemble in race, language and temperament, French influence and republican ideals spread rapidly; taking the form partly of powerful labour and socialist organizations, partly of less reputable bodies, revolutionary and even anarchist. Strikes are very common, seventy-three having occurred in such a year of comparative quiet as 1903; but the causes of disturbance are almost as often political as economic, and the annals of the city include a long list of revolutionary riots and bomb outrages. A strange contrast is presented by the co-existence of these turbulent elements with the more old-fashioned Spanish society of Barcelona. Church festivals, civic and ecclesiastical processions are as almost as animated and picturesque as in Seville itself; and many medieval customs continue to flourish side by side with the most modern features of industrial life, giving to Barcelona a character altogether unique among Spanish cities.

The literature relating to Barcelona is extensive. For a general description of the city, see A. de Arimón, Barcelona antigua moderna, two illustrated folio volumes (Madrid, 1850); and J. Artigas y Feiner, Guía itineraria de Barcelona (Barcelona, 1888). For the antiquities, see S. Sanspeire, Topografía antigua de Barcelona (1890). The economic history of the city is dealt with by A. Capmany in his Memorias históricas sobre la marina, comercio, y artes de la antigua ciudad de Barcelona (Madrid, 1775–1792); and, for its political history, the two volumes of J. Solé y Lluch, Historias e conquistas de los comtes de Barcelona, by J. Tomich (Barcelona, 1888), and the Colección de documentos inéditos del Arxai
The spread of the revolutionary movement is traced by M. Gil Maestre, in his El Anarquismo en España, 31o especial de Barcelona (Madrid, 1897), and in his La Criminalidad en Barcelona (Barcelona, 1886).

**Barcelona**, a town and port of Venezuela, capital of the state of Bermudes, on the Neveri river, 3 m. from its mouth and 12 m. by rail from the port of Guanta, which has superseded the inconvenient river port in the trade of this district. Pop. (est. 1904) 15,000. Built on the border of a low plain and having a mean annual temperature of 82° F., the town has the reputation of being unhealthy. There are salt works and important coal deposits in its vicinity, the latter at Narical and Capiricaul, 12 m. distant by rail. Though the adjacent country is fertile, it is surrounded by many hills, and the climate is very unhealthy.

The town dates from 1637, when it was located at the foot of the Cerro Santo and was called Nueva Barcelona; it reached a state of much prosperity and commercial importance before the end of the century. The War of Independence, however, and the chronic political disorders that followed nearly ruined its industries and trade.

**Barcelonnette**, a town in the department of Basses-Alpes, in the S.E. of France. Pop. (1906) 2075. It is built at a height of 1398 f., high above the Rhône river, and it is the most important place. It is situated in a wide and very fertile valley, and is surrounded by many villages, built by natives who have made their fortune in Mexico, and are locally known as les Américains. The town itself is mainly composed of a long street (flanked by two others), which is really the road from Grenoble to Cuneo over the Col de l'Argentière (6545 ft.). The only remarkable buildings in the town are a striking clock-tower of the 15th century (the remains of a Franciscan convent) and the Musée Chabrand, which contains a very complete collection of birds, both European and extra-European.

Refounded in 1217 by Raymond D'Orange IV, count of Provence (he was of the family of the counts of Barcelona, whence the name of the town he rebuilt), Barcelonnette passed to Savoy in 1388 (formal cession in 1419), and in 1713 by the treaty of Utrecht was ceded to France in exchange for the valleys of Estilles, Fénestrelles, and Château Dauphin (Castel-dénaro). It was the birth-place of J. A. Manuel (1775-1827), the well-known liberal orator at the time of the Restoration of 1814, after whom the principal square of the town is named.

**Barclay, Alexander** (c. 1476-1552), British poet, was born about 1476. His nationality is matter of dispute, but William Bulley, who was a native of Ely, and probably knew him when he was in the monastery there, asserts that he was born "beyonde the cold river of Twede"; moreover, the spelling of his name and the occasional Scottish words in his vocabulary point to a northern origin. His early life was spent at Croydon, but it is not certain whether he was educated at Oxford or Cambridge. It may be presumed that he took his degree, as he uses the title of "Syr" in his translation of Sallust, and in his will he is called doctor of divinity. From the numerous incidental references in his works, and from his knowledge of European literature, it may be inferred that he spent some time abroad. Thomas Cornish, suffragan bishop in the diocese of Bath and Wells, and provost of Oriel College, Oxford, from 1493 to 1507, appointed him chaplain of the college of St Mary Ottery, Devonshire. Here he translated Sebastian Brant's Ship of Fools, and even introduced his neighbours into the book:

"For if one can faste, and beare a Hate on his fis,
He shall be parson of Honington or Cist."

The death of his patron in 1513 apparently put an end to his connexion with the west, and he became a monk in the Benedictine monastery of Ely. In this retreat he probably wrote his eclogues, but in 1526 "Maistre Barkleye, the Blacke Monk and Poete" was desired to devise "histoire and convenient raisons to florisshe the buildings and banquet house withal" at the meeting between Henry VIII. and Francis I. at the Field of the Cloth of Gold. He at length became a Franciscan monk of Canterbury. It is presumed that he continued with the change of religion, for he retained under Edward VI. the livings of Great Baddow, Essex, and of Wokey, Somerset, which he had received in 1546, and was presented in 1552 by the dean and chapter of Canterbury to the rectory of All Hallows, Lombard Street, London. He died shortly after this last preferment at Croydon, Surrey, where he was buried on the 10th of June 1552. All the evidence in Barclay's own work goes to prove that he was sincere in his republican principles, and his love of liberty and his abhorrence of the gross accusations which John Bale brings against his moral character may be put down to his hatred of Barclay's class. The Ship of Fools was as popular in its English dress as it had been in Germany. It was the starting-point of a new satirical literature. In itself a product of the medieval conception of the fool who figures so largely both in the Shrovetide and other pageants, it differs entirely from the general allegorical satires of the preceding centuries. The figures are no longer abstractions; they are concrete examples of the folly of the bibliophiles who collects books but learns nothing from them, of the evil judge who takes bribes, and the steward who is the starting-point of his own folly, of the priests who spend their time in church telling"gestes"of Robin Hood and so forth. The spirit of the book reflects the general transition between allegory and narrative, morality and drama. The Narrenschiff of Sebastian Brant was essentially German in conception and treatment, but his hundred and thirteen types of fools possessed, nevertheless, universal interest. It was in reality sins and vices, however, rather than follies that came under his censure, and this didactic temper was reflected in Barclay. The book appeared in 1549 with woodcuts said to have been devised and perhaps partly executed by Brant himself. In these illustrations, which gave an impulse to the production of "emblems" and were copied in the English version, there appears a humour quite absent from the text. In the Latin elegies of the Stultifera Navis (1497) of Jacob Locher the book was read throughout Europe. Barclay's The Ship of Folly of the World was first printed by Richard Pynson in 1509. He says he translated "oute of Laten, Freshen, and Doche," but he seems to have been most familiar with the Latin version. He used a good deal of freedom in his translation, sometimes tofavoure the guilty, to give a moral, to make the text more to the reader's taste, and to give the reader a key to the allegory, "markinge away suche thinges as setteth me necessarie and superflue." The fools are given a local colour, and Barclay appears as the unsparing satirist of the social evils of his time. At the end of nearly every section he adds an envoy of his own to drive home the moral more surely. The poem is written in the ordinary Chaucerian stanza, and in language which is more modern than the common literary English of his day.

Corteyne Edoges of Alexander Barclay, Priest, written in his youth, were probably printed as early as 1513, although the earliest extant edition is that in John Cawood's reprint (1576) of the Ship of Fools. They form, with the exception of Henryson's Robin and Makyen, the earliest examples of the English pastoral. The first three eclogues, in the form of dialogues between Coridon and Cornix, were borrowed from the Miseriae Curialium of Aeneas Sylvius Piccolomini (Pope Pius II), and contain an eulogy of John Atcock, bishop of Ely, the founder of Jesus College, Cambridge. The fourth is based on Mantuans's eclogue, De consuetudine divitum erga poetas, with large additions. It contains the "Descripccion of the towre of Virtue and Honour," an elegy on Sir Edward Howard, lord high admiral of England, who perished in the attack on the French fleet in the harbour of Algiers in 1533. The fifth eclogue, perhaps the best of the series, without date, is entitled the "Fyfte Elog of Alexander Barclay of the Cytezen and the uplyndishman" and is also based on Mantuan. Two shepherds, Amintas and Faustus, discuss the familiar theme of the respective merits of town and country life, and relate a quaint fable of the origin of the different classes of society. Barclay's pastoral contains many pictures of rustic life as he knew it. He describes for instance the Sunday games in the village, football, and the struggle for food at great feasts; 1 Script. Ill. Maj. Brit. (1557, Cent. iv. No. 66).
but his eulogies were, like his Italian models, also satires on social evils. The shepherds are rustic of the Colin Clout type, and discuss the follies and corruptions around them. Barclay had, however, no sympathy with the anti-clerical diatribes of French skeptic, and his works are more than once attacks. Bale mentions an Anti-Skeltonum which is lost. His other works are:—The Castell of Laboure (Wynkyn de Worde, 1566), from the French of Pierre Grigore; the Introductory to write and to pronounce Freunce (Robert Copland, 1521); The Myrroir of Good Miners (Richard Pynson, not dated), a translation of the De quatuor virtutilibus of Dominicus Mancinus; Crowle complayd in Latyn by the renowned Sallust (Richard Pynson, no date), a translation of the Bellum Jugurthinum; The Life of the glorious Martyr Saynt Gayne (R. Pynson, c. 1530); The Life of Saynt Thomas, and Helyon's Crowle, both printed by Pynson, are also attributed to Barclay, but on very doubtful grounds.

See T. H. Jamieson's edition of the Ship of Fools (Edinburgh, 1874), which contains an account of the author and a bibliography of his works; and J. W. Fairholt's edition of The Cvenaen and Oplodyniam (Percy Soc, 1847), which includes large extracts from the other eclogues; also Zarnek's edition of Brant (Leipzig, 1854); and Dr Feder Fraustadt, Uber das Verhaltnis von Barclay's Ship of Fools zu den lateinischen, franzosischen und deutschen Quellen (1894). A pamphlet on the Scotia of the title, by Henry Watson, was printed by Wynkyn de Worde in 1518.

BRACLEY, JOHN (1538–1621), Scottish satirist and Latin poet, was born, on the 28th of January 1582, at Pont-à-Mousson, where his father William Barclay held the chair of civil law. His mother was a Frenchwoman of good family. His early education was obtained at the Jesuit College. While there, at the age of nineteen, he wrote a commentary on the Thebaid of Statius. In 1603 he crossed with his father to London. Barclay had persistently maintained his Scottish nationality in his French surroundings, whom he more probably found in James's cabinet, an opportunity which he would not let slip. He did not remain long in England, where he is supposed to have published the first part of his Satyricon, for in 1605 when a second edition of that book appeared in Paris, he was there, having already spent some time in Angers, and being now the husband of a French girl, Louise Debonaire. He returned to London with his wife in 1606, and there published his Sylva, a collection of Latin poems. In the following year the second part of the Satyricon appeared in Paris. Barclay remained on in London till 1616. In 1606 he edited the De Doctitate Popae, an anti-papal treatise by his father, who had died in the preceding year. His Apologia or "third part" of the Satyricon, in answer to the attacks of the Jesuits and others who were probably embittered by the tone of the earlier parts of the satire. A so-called "fourth part," with the title of Icon Anamorvm, appeared in 1614. James I. is said to have been attracted by his scholarship, but particulars of this, or of his life in London generally, are not available. In 1616 he went to Rome, for some reason unexplained, and there resided till his death on the 30th of August 1621. He appears to have been on better terms with the Church and notably with Bellarmino; for in 1617 he is called in James's accession, a Paraenesis ad Sactarios, an attack on the position of Protestantism. The literary effort of his closing years was his best-known work the Argenis, completed about a fortnight before his death, which has been said to have been hastened by poison. The romance was printed in Paris in the same year.

Barclay's contemporary reputation as a writer was of the highest; by his strict scholarship and graceful style he has deserved the praise of modern students. The Satyricon, a severe satire on the Jesuits, is modelled on Petronius and catches his lightness of touch; though it shows little or nothing of the tone of its model, or of the unhesitating severity and coarseness of the humanistic satire of Barclay's age. The Argenis is a long romance, with a monitory purpose on the dangers of political intrigue, probably suggested to him by his experiences of the league in France, and by the catholic plot in England after James's accession. The work has been praised by all parties; and it enjoyed for more than a century after his death a remarkable popularity. Most of the innumerable editions are supplied with a key to the characters and names of the story. Thus Aneröotus is Clement VIII; Arx non estva is the Tower of London; Hippolitus and Radirobanes are the names of the king of Spain; Hyanishe is Queen Elizabeth; Mergania, by an easy anagram, is Germany; Usinuela, by another, is Calvin. The book is of historical importance in the development of 17th century romance, including especially Fénelon's Télémaque. Ben Jonson appears, from an entry at Stationers' Hall on the 2nd of October 1623, to have intended to make a translation. Barclay's shorter poems, in two books, were printed in the Delitiae Poetarum Scotorum (Amsterdam, 1637, I, pp. 76–136). In the dedication, to Prince Charles of England, he refers to his earlier publication, the Sylva.
BARCLAY, W.—BARDAISAN

whose arrival was then imminent. He died on the 3rd of October 1650.

BARCLAY, WILLIAM (1546-1608) Scottish jurist, was born in Aberdeen in 1546. Educated at Aberdeen University, he went to France in 1573, and studied law under Cujas, at Bourges, where he took his doctor's degree. Charles III., duke of Lorraine, appointed him professor of civil law in the newly-founded university of Pont-à-Mousson, and also created him councillor of state and master of requests. In 1603, however, he was obliged to quit France, having incurred the enmity of the Jesuits, through his opposition to their proposal to admit his son John (q.v.) a member of their society. Returning to England, he was offered considerable preferment, by King James on becoming a cardinal, of the Chauncery and Exchequer. This offer he refused, and returned to France in 1604, when he was appointed professor of civil law in the university of Angers. He died at Angers in 1608. His principal works were De Regno et Regali Potestate, &c. (Paris, 1600), a strenuous defence of the rights of kings, in which he refutes the doctrines of George Buchanan, "Junius Brutus" (Hubert Languet) and Jean Boucher; and De Potestate Papae, &c. (London, 1600), in opposition to the usurpation of temporal powers by the pope, which called forth the celebrated reply of Cardinal Bellarmine; also commentaries on some of the titles of the Pandects.

BARCLAY DE TOLLY, MICHAEL ANDREAS, called by the Russians Michael, Prince Bogdanovich (1761-1818), Russian field marshal, was born in Livonia in 1761. He was a descendant of a Scottish family which had settled in Russia in the 17th century. He entered the Russian army at an early age. In 1788-1789 he served against the Turks, in 1790 and 1794 against the Swedes and Poles. He became colonel in 1798 and major-general in 1799. In the war of 1806 against Napoleon, Barclay took a distinguished part in the battle of Pultusk and was wounded at Eylau, where his conduct won him promotion to the rank of field-marshal. In 1808 he commanded against the Swedes in Finland, and in 1809 by a rapid and daring march over the frozen Gulf of Bothnia he surprised and seized Umeo. In 1810 he was made minister of war, and he retained the post until 1813. In 1812 Barclay was given command of one of the armies operating against Napoleon. There was very keen opposition to the appointment of a foreigner as commander-in-chief, and after he was defeated at Smolensk the outcry was so great that he resigned his command and took a subordinate place under the veteran Kutusov. Barclay was present at Borodino, but left the army soon afterwards. In 1813 he was re-employed in the field and took part in the campaign in Germany. After the battle of Bautzen he was reinstated as commander-in-chief of the Russian forces, and in this capacity he served at Dresden, Kulm and Leipzig. After the last battle he was made a count. He took part in the invasion of France in 1814 and at Paris received the bâton of a field marshal. In 1815 he was again commander-in-chief of the Russian army which invaded France, and he was made a prince at the close of the war. He died at Interburg in Prussia on the 14th (16th) of May 1818.

BARCOCHEBAS, BAR-COCHAH, or BAR KOKBA ("son of a star"), the name given in Christian sources to Simon Bar-Cochba, a Jewish leader who, according to the apocryphal traditions, was destined to appear at the time of Hadrian (A.D. 132-135). The name does not appear in the Roman historians. In Rabbinic sources he is called Bar (Ben) Cozba, "son of deceit," which perhaps reflects the later verdict of condemnation recorded after his failure (rootϑa=to be false"). Cozba is, therefore, the name either of his father or of his home. But it is recorded that the Rabbi 'Aqiba (g.v.), who recognized him as Messiah, applied Num. xxiv. 17 to him, reading not Cochab ("a star"), but Cosiba ("goes forth from Jacob"); thus Bar-cochah is a Messianic title of the "man of Cozba" (cf. Chron. iv. 22) whose original name was recalled by later Rabbis with sinister intention. At first the Romans paid little attention to the insurgents, who were able to strike coins in the name of Simeon, prince of Israel, and Eleazar the priest, and to persecute the Christians, who refused to join the revolt. But troops were collected and the various fortresses occupied by the Jews were successively reduced. The end came with the fall of Beth-thar (Bethar). Extraordinary stories were told of the exploits of Barcocheba and of the ordeals to which he subjected his soldiers in the way of training.

BARD, a word of Celtic derivation (Gaelic bard, Cymric bardh, Irish bard) borrowed from the ancient Celtic poets, though the name is sometimes loosely used as synonymous with poet in general. So far as can be ascertained, the title bard, and some of the privileges peculiar to that class of poets, are to be found only among Celtic peoples. The name itself is not used by Caesar in his account of the manners and customs of Gaul and Britain, but he appears to ascribe the functions of the bards to a section of the Druids, with which they seem to have been closely connected. Later Latin authors, such as Lanu (Phar. p. 447), Festus (De Verb. Sign. s.v.), and Ammianus Marcellinus (bk. xxv.), used the term Bardi as the recognized title of the national poets or minstrels among the peoples of Gaul and Britain. In Gaul, however, the institution soon disappeared; the purely Celtic peoples were swept back by the waves of Latin and Teutonic conquest, and finally settled in Wales, Ireland, Brittany and the north of Scotland. There is clear evidence of the existence of bards in all these places, though the known relics belong almost entirely to Wales and Ireland, where the institution was more distinctively national. In Wales they formed an organized society, with hereditary bards, and privileges. They were esteemed with the utmost respect and were exempt from taxes or military service. Their special duties were to celebrate the victories of their people and to sing hymns of praise to God. They thus gave poetic expression to the religious and national sentiments of the people, and therefore exercised a very powerful influence. The whole society of bards was regulated by laws, said to have been first distinctly formulated by Hywell Dha, and to have been afterwards revised by Gruffydd ap Conan. At stated intervals great festivals were held, at which the most famous bards from the various districts met and contended in song, the umpire being generally the princes and nobles. Even after the conquest of Wales, these congresses, or Eisteddfoedau, as they were called (from the Welsh eistedd, to sit), continued to be summoned by royal commission, but from the reign of Elizabeth the custom has been allowed to fall into abeyance. They have not been since summoned by royal authority, but were revived about 1822, and are held regularly at the present time. In modern Welsh, a bard is a poet whose vocation has been recognized at an Eisteddfod. In Ireland also the bards were a distinct class with peculiar and hereditary privileges. They appear to have been divided into three great sections: the first celebrated victories and sang hymns of praise; the second claimed the laws of the nation; the third gave poetic genealogies and family histories. The Irish bards were held in high repute, and frequently were brought over to Wales to give instruction to the singers of that country. In consequence, perhaps, of Lanu's having spoken of carmina bardí, the word bard began to be used, early in the 17th century, to designate any kind of a serious poet, whether lyric or epic, and is so employed by Shakespeare, Milton and Pope. On the other hand, in Lowland Scots it grew to be a term of contempt and reproach, as describing a class of frenzied vagabonds.

See Jones, R. and W. Mem. of the Irish Bards (1786); Owen Jones, Myrrytrian Archaeology of Wales (3 vols., 1801-1807); W. F. Skene, Four Ancient Books of Wales (2 vols., 1868).

BARDAISHAN, an early teacher of Christianity in Mesopotamia, the writer of numerous Synagogal works which have entirely perished,1 is called Bar-bard (in the original Syriac, Bar-bard, in the Latinized form, Hymn of the Soul in the Acts of Thomas), and the founder of a school which was soon branded as heretical. According to the trustworthy Chronicle of Edessa, he was born in that city on the 11th Tammuz (July), A.D. 154.1

1 The Book of the Laws of the Countries, referred to below, is the work of a disciple of Bardashian.
BARDILI—BARDSEY

His parents were of rank and probably pagan; according to Barhebræus, he was in youth a priest in a heathen temple at Mabbög. Another probable tradition asserts that he shared the education of a royal prince who afterwards became king of Edessa—perhaps Abgar bar Manu, who reigned 202–217. He is said to have converted the prince to Christianity, and may have had an important share in Christianizing the city. Ephranius and Barhebræus assert that he was first an orthodox Christian and afterwards an adherent of Valentinus; but Eusebius and the Armenian Mostvoren revive the theory that in his later days he largely, but not completely, purged himself of his earlier errors. The earliest works attributed to him (by Eusebius and others) are polemical dialogues against Marcionism and other heresies; these were afterwards translated into Greek. He also wrote, probably under Caracalla, an apology for the Christian religion in a time of persecution. But his greatest title to fame was furnished by his hymns, which, according to St Ephrem, numbered 150 and were composed in imitation of the Davidic psalter. He thus became the father of Syrian hymnology, and from the favour enjoyed by his poems during the century and a half that intervened between him and St Ephrem we may conclude that he possessed original poetic genius. This would be clearly proved if (as is not unlikely) the beautiful Hymn of the Soul incorporated in the apocryphal Acts of Thomas could be regarded as proceeding from his pen; it is practically the only piece of real poetry in Syrian that has come down to us. Perhaps owing to the persecution under Caracalla mentioned above, Bardaisan for a time retreated into Armenia, and is said to have there preached Christianity with indifferent success, and also to have composed a history of the Armenian kings. Porphyry states that one of his discipulus, a monk, having interviewed an Indian deputation who had been sent to the Roman emperor, and questioned them as to the nature of Indian religion. He was undoubtedly a man of wide culture. He died (according to the patriarch Michael) in 222.

For our knowledge of Bardaisan's doctrine we are mainly dependent on the hostile witness of St Ephrem, and on statements by Greek writers who had no acquaintance with his works in their original form. His teaching had certain affinities with gnosticism. Thus he certainly denied the resurrection of the body; and so far as we can judge by the obscure quotations from his hymns furnished by St Ephrem, he explained the origin of the world by a process of emanation from the supreme God whom he called the Father of the living.' On the other hand, the dialogue known as the Book of the Laws of the Countries, which was written by a disciple and is quoted by Eusebius as a genuine exposition of the master's teaching—while it recognizes the influence of the celestial bodies over the body of man and throughout the material sphere and attributes to them a certain delegated authority—upholds the freedom of the human will and can in the main be reconciled with orthodox Christian teaching. On this M. Nau has based his effort (see Une Biographie inédite de Bardesane l'astrolabre, Paris, 1897; Le Livre des lois des pays, Paris, 1899) to clear Bardaisan of the reproach of gnosticism, maintaining that the charge of heresy arises from a misunderstanding of certain astrological speculations. It must be admitted that it is impossible to reconstruct Bardaisan's system from the few fragments remaining of his own work and therefore a certain verdict cannot be given. But the ancient testimony to the connexion of Bardaisan with Valentinianism is strong; and the dialogue probably represents a modification of Bardaisan's teaching in the direction of orthodoxy. The later adherents of the school appear to have moved towards a Manichean dualism.

The subject is exhaustively discussed in Hort's article "Bardaisan" in Dict. Christ. Biog., and a full collection of the ancient testimonia will be found in Harnack's Altchristliche Literatur, vol. 1. PP540 ff. (N. M.)

BARDILL, CHRISTOPH GOTTFRIED (1761–1808), German philosopher, was born at Blaubeuren in Württemberg, and died at Stuttgart. His system has had little influence in Germany; Reinhold (q.v.) alone expounded it against the attacks of Fichte and Schelling. Yet in some respects his ideas opened the way for the later speculations of Schelling and Hegel. He dissented strongly from the Kantian distinction between matter and form of thought, and urged that philosophy should consider only thought in itself, pure thought, the ground or possibility of being. The fundamental principle of thought is, according to him, the law of identity; logical thinking is real thinking. The mental material which thought operated on is itself indefinite and is rendered definite through the action of thought. Bardill worked out his idea in a one-sided manner. He held that thought has in itself no power of development, and ultimately reduced it to arithmetical computation. He published Grundriss der ersten Logik (Stuttgart, 1800); Über die Gesetze der Ideen association (Tübingen, 1796); Briefe über den Ursprung der Metaphysik (Altona, 1798); Philosoph. Elementarlehre (Landshut, 1802–1806); Beiträge zur Beurteilung des gegenwärtigen Zustandes der Vernunftlehre (Landshut, 1803).

BARDOUX, AGÉNOR (1829–1897), French statesman, was a native of Bourges. Established as an advocate at Clermont, he did not hesitate to proclaim his republican sympathies. In 1871 he was elected deputy of the National Assembly, and re-elected in 1876 and in 1877. In the chamber he was president of the group of the left centre, standing strongly for the republic but against any semblance of bolschewism. After the dissolution of the 16th of May, he was one of the leaders of the "363." In the republican chamber elected after the 16th of May, he became minister of public instruction (December 1877), and proposed various republican laws, notably on compulsory primary education. He resigned in 1879. He was not re-elected in 1881, but in December 1882 was named senator for life. He wrote essays on Les Légistes et leur influence sur la société française (1878); Le Comte de Montlosier et le Gallicanisme (1881); and published in 1882 his Dix Années de vie politique.

BARDOWIEK, a village of Germany, in the Prussian province of Hanover, 3 m. N. of Lüneburg on the navigable Ilmenau. Pop. 2000. Its trade consists entirely in agricultural produce. The Gothic parish church (c. 1400) incorporates remains of a cathedral of vast dimensions.

Bardowiek was founded in the 8th century by Charlemagne, who established a bishopric in it, and until its destruction by Henry the Lion in 1189, it was the most prosperous commercial city of North Germany. Its name is derived from the Longhards, the tribe for whom it was the home and centre, and from it the colonization of Lombardy started.

BARDSEY (i.e. "Bards' Island"; cf. Anglesey, "Angles' Island"); Welsh, Ynyw Enllt; ("isle of the current"), an island at the northern extremity of Cardigan Bay. The sound "between Aberdaron point and the island is some 4 m. wide. Bardsey is included in Carnarvonshire, North Wales (but traditionally in S. Wales). On the N.W. side it has high cliffs. It is about 2½ m. long by ½ m. broad, with an area of some 370 acres, a third of which is hilly. Barley and oats are grown. On the S.E. side is a fairly deep harbour. On the N.E. are the ruins of the tower of St Mary's abbey (17th century). There is no Anglican church, the inhabitants being Dissenters. They are farmers and fishermen. The lighthouse, with fixed light, 140 ft. high and visible for 17 m., is locally celebrated. The rectory of Aberdaron (on the mainland, opposite Bardsey), Penmachnoaad Llanddona(Llandwynhodd), in Llwyd (Carnarvonshire), belong to St John's College, Cambridge. St Dubricius made the sanctuary famous, and dived here in 612. Here was the burial-place of all the monks whose friends could afford to go thither with their bodies. All the great abbots of England sent their quota. Roads to Bardsey—with the monks' wells, found at intervals of 7 to 9 m.—run from north, east and south. The remnant of priests thither (after the great massacre of Bangor-is-coed in 613, by Ethelfrith of Northumbria) by the road of the Rivals (Yn Eif).
hill, S. Carnarvonshire, on which Pityll farm still gives food gratis to all pilgrims or travellers. A part of the island is one great cemetery of about 3 to 4 acres, with rude, rough graves as close to each other as possible, with slabs upon them. Though Aberdaron rectory does not belong to the isle, the farm "Cwrt" (Court), where the abbot held, seems still to belong to Barlesey, which was granted to John Wynn of Bodvel, Carnarvonshire, after the battle and partial sack of Norwich by the Puritans in the Civil War; passing through Mary Bodvel to her husband, the earl of Radnor, who sold it to Dr Wilson of York. The doctor, in turn, sold it to Sir John Wynn, of Glynnllion and Bodfelen Hall, Carnarvonshire. One of the Wynns, the 3rd Baron Newborough, was, at his wish, buried here. The archaeology and history of the isle are voluminous. Lady Guest's Mabinogion translation (i. p. 115, ed. of 1838) gives an account of the (legendary) Barlesey House of Glass, into which Merlin (Myrdin) took a magic ring, originally kept the Caerleon-on-Usc.

BAREGES, a town of south-western France, in the department of Hautes-Pyrénées, in the valley of the Bastan, 25 m. S.S.W. of Bagnères-de-Bigorre by road. The town, which is situated at an altitude of 4040 ft., is hardly inhabited in the winter. It is celebrated for its warm sulphurous springs (75° to 112°F.), which first became generally known in 1675 when they were visited by Madame de Maintenon and the duke of Maine, son of Louis XIV. The waters, which are used for drinking and in baths, are efficacious in the treatment of wounds and ulcers and in cases of scrofula, gout, skin diseases, &c. There is a military hospital, founded in 1760. The town was formerly much exposed to avalanches and floods, which are now less frequent owing to the construction of embankments and replanting of the hillsides. It is a centre for mountain excursions. The light silk and wool fabric called barege takes its name from the place, where it was first made.

BARELLY, or BARELI, a city and district of British India in the Bareilly or Rohilkhand division of the United Provinces. The city is situated on the Ramganga river, 512 m. N.W. from Calcutta by rail. Pop. (1901) 531,268. The principal buildings are two mosques built by the 17th century. A modern fort overlooks the cantonments; the railway station, which is an important junction on the Oudh and Rohilkhand line; the palace of the nawab of Rampur, and the government college. Bareilly is the headquarters of a brigade in the 7th division of the eastern army corps. The chief manufactures are furniture and upholstery. Bareilly college is a seat of upper class learning for the surrounding districts. It is conducted by an English staff, and its course includes the subjects for degrees in the Calcutta University.

The district of Bareilly has an area of 1,580 sq. m. It is a level country, watered by many streams, the general slope being towards the south. The soil is fertile and highly cultivated, groves of noble trees abound, and the villages have a neat, prosperous look. A tract of forest jungle, called the tarai, stretches along the extreme north of the district, and teems with large game, such as tigers, bears, deer, wild pigs, &c. The river Sarda or Gogra forms the eastern boundary of the district and is the principal stream. Next in importance is the Ramganga, which receives as its tributaries most of the hill torrents of the Kumaon mountains. The Deoha is another great drainage area and a modern course built by the British in the 19th century. It also passes through the district. The population in 1901 was 1,009,117. The Mahommedans are chiefly the descendants of Yusufzai Afghans, called the Rohilla Pathans, who settled in the country about the year 1720. The Rohillas were formerly the ruling race of the tract of country called Rohilkhand, and are men of a taller stature, a fairer complexion and a more arrogant air than the general inhabitants of the district. Bishop Heber described them as follows:—"The country is burdened with a crowd of lazy, profligate, self-called sawars (cavaliers), who, though many of them are not worth a rupee, conceive it derogatory to their gentility and Pathan blood to apply themselves to any honest industry, and obtain for the most part a precarious livelihood by spousing on the industrious tradesmen and farmers, on whom they levy a sort of blackmail, or as hangers-on to the wealthy and noble families yet remaining in the province. These men have no visible means of maintenance, and no visible occupation except that of lounging up and down with their swords and shields, like the ancient Vagabonds, who, in respect they much resemble." The Rohillas, after fifty years' precarious independence, were subjugated in 1774 by the confederacy of British troops with the nawab of Oudh's army, which formed so serious a charge against Warren Hastings. Their territory was in that year annexed to Oudh. In 1801 the nawab of Oudh ceded it to the Company in commutation of the subsidy money. During the Mutiny of 1857 the Rohillas took a very active part against the English, but since then they have been disarmed. Both before and after that year, however, the Bareilly Mahommedans have distinguished themselves by their fidelity to the Hindus. The district is now ruled from the Rohilkhand system of government canals. There are no manufactures except for domestic use and little external trade. Several lines of the Oudh and Rohilkhand railway pass through the district.

BARENTIN, a town of northern France, in the department of Seine-Inferieure, 11 m. N.N.W. of Rouen by rail. Pop. (1906) 5245. The town is situated in the valley of the Austreberhe, a small affluent of the Seine, here crossed at a height of 100 ft. by a fine railway viaduct 540 yds. long. The manufacture of cotton fabrics is the principal industry. It was the birthplace of Willem, Dutch navigator, born about the middle of the 16th century. In 1594 he left Amsterdam with two ships to search for a north-east passage to eastern Asia. He reached the west coast of Novaya Zemlya, and followed it northward, being finally forced to turn back when near its northern extremity. In the following year he commanded another expedition of seven ships, which made for the strait between the Asiatic coast and Vaygach Island, but was too late to find open water; while his third journey equally failed of its object and resulted in his death. On this occasion he had two ships, and on the return voyage took possession of Spitsbergen, where the ships separated. Barents' vessel, after rounding the north of Novaya Zemlya, was beset by ice and he was compelled to winter in the north; and as his ship was not released early in 1597, his party left her in two open boats on the 15th of June and most of its members escaped. Barents himself, however, died on the 30th of June 1597. In 1871 the house in which he wintered was discovered, with many relics, which are preserved at the Hague, and in 1873 part of his journal was found.

BARENTS SEA, that part of the Arctic Ocean which is demarcated by the north coast of Europe, the islands of Novaya Zemlya, Franz Josef Land and Spitsbergen, and smaller intervening islands; it was named after the Dutch navigator. Omitting the great inlet of the White Sea in the south, it extends from about 67° to 80° N., and from 20° to 60° E. The southern part, off the Murman coast of the Kola peninsula, is sometimes called the Murman Sea.

BARÈRE DE VIEUZAC, BERTRAND (1755-1841), one of the most notorious members of the French National Convention, was born at Tarbes in Gascony on the 10th of September 1755. The name of Barède de Vieuzac, by which he continued to call himself long after the renunciation of feudal rights on the famous 4th of August, was assumed from a small fief belonging to his father, a lawyer at Vieuzac. He began to practise as an advocate at the parlament of Toulouse in 1770, and soon earned a considerable reputation as an attorney; while his brilliant and flowing style as a writer of essays led to his election as a member of the Academy of Florat Games of Toulouse in 1788. At the age of thirty he married. Four years later, in 1789, he was elected deputy by the estates of Bigorre to the states-general, which met in May. He had made his first visit to Paris in the preceding year. His personal appearance, his manners, social qualities and liberal opinions, gave him a good standing among the multitude of provincial deputies then thronging into Paris. He
attached himself at first to the constitutional party; but he was less known as a speaker in the Assembly than as a journalist. His paper, however, the Pointu du Jour, according to Aulard, owes its reputation not so much to its own qualities as to the fact that the painter David, in his famous picture of the "Oath in the Tennis Court," has represented Barère kneeling in the corner and writing a report of the proceedings as though for posterity. The reports of the debates of the National Assembly in the Pointu du Jour, though not inaccurate, are as a matter of fact very incomplete and very dry. After the flight of the king to Varennes, Barère passed over to the republican party, though he continued to keep in touch with the duke of Orleans, to whose natural daughter, Paméla, he was tutor. Barère, however, appears to have been wholly false as a member of the Convention, and his conduct was regulated only by the determination to be on the side of the strongest. After the close of the National Assembly he was nominated one of the judges of the newly instituted court of cassation from October 1791 to September 1792. In 1792 he was elected deputy to the National Convention for the department of the Hautes-Pyrénées. At first he voted with the Girondists, attacked Robespierre, a "pygmy who should not be set on a pedestal," and at the trial of the king voted with the Mountain for the king's death "without appeal and without discussion." He insisted on the impulse which became memorable: "the tree of liberty could not grow were it not watered with the blood of kings." Appointed member of the Committee of Public Safety on the 7th of April 1793, he busied himself with foreign affairs; then, joining the party of Robespierre, whose resentment he had averted by timely flatteries, he played an important part in the second Committee of Public Safety—after the 17th of July 1793—and voted for the death of the Girondists. He was thoroughly unscrupulous, stopping at nothing to maintain the supremacy of the Mountain, and rendered it great service by his rapid work, by the telling phases of his oratory, and by his clear expositions of the problems of the day. On the 9th Thermidor (July 27th, 1794) Barère hesitated, then he drew up the report outlawing Robespierre. In spite of this, in Germinal of the year III. (the 21st of March to the 4th of April 1795), the Thermidorians decreed the accusation of Barère and his colleagues of the Terror, Collot d'Herbois and Billaud-Varenne, and he was sent to the Isle of Oléron. He was removed to Saintes, and thence escaped to Bordeaux, where he lived in concealment for several years. In 1795 he joined the committee of the Council of Five Hundred, but was not allowed to take his seat. Later he was used as a secret agent by Napoleon I., for whom he carried on a diplomatic correspondence. On the fall of Napoleon, Barère played the part of royalist, but on the final restoration of the Bourbons in 1815 he was banished for life from France as a regicide, and then withdrew to Brussels and temporary oblivion. After the revolution of July 1830 he reappeared in France, was reduced by a series of lawsuits to extreme indigence, accepted a small pension assigned him by Louis Philippe (on whom he had heaped abuse and railing), and died, the last survivor of the Committee of Public Safety, on the 13th of January 1841. (See also French Revolution.)

The Mémoires de B. Barère... publiés par MM. H. Carnot... et David (d'Angers)... précédés d'une notice historique (Paris, 1824-1844) are false, but contain valuable information; Carnot's Notices, which is very good, was published separately in 1842. See F. Aulard, Les Orateurs de la Constituante (Paris, 1882); Les Orateurs de la Convention (2nd ed., Paris, 1905). Macaulay's essay on Barère, (Edinburgh Review, vol. 79) is eloquent, but incorrect.

BARETTI, GIUSEPPE MARC'ANTONIO (1707-1786), Italian critic, was born at Turin January 1719. He was intended by his father for the profession of law, but at the age of sixteen he took the degree of Bachelor of Laws at the University of Turin, and went to Guastalla, where he was for some time employed in a mercantile house. His leisure hours he devoted to literature and criticism, in which he became expert. For many years he led a wandering life, supporting himself chiefly by his writings. At length he arrived in London, where he remained for a considerable time. He obtained an appointment as secretary to the Royal Academy of Painting, and became acquainted with Johnson, Garrick and others of that society. He was a frequent visitor at the Thrales', and his name occurs repeatedly in Boswell's Life. In 1769 he was tried for murder, having had the misfortune to inflict a mortal wound with his fruit knife on a man who had assaulted him on the street. Johnson among others gave evidence in his favour at the trial, which resulted in Baret's acquittal. He died in May 1780. His first work of any importance was the Italian Library (London, 1757), a useful catalogue of the lives and works of many Italian authors. The Lettre familière, giving an account of his travels through Spain, Portugal and France during the years 1761-1765, were well received, and when afterwards published in English (4 vols., 1770), were highly commended by Johnson. While in Italy on a second journey Barèt wrote an essay of which he gave the title to the Frusta letteraria, the literary scourge. It was published under considerable difficulties and was soon discontinued. The criticisms on contemporary writers were sometimes just, but are frequently disfigured by undue vehemence and coarseness. Among his other numerous works may be mentioned a useful Dictionary and Grammar of the Italian Language, and a dissertation on Shakespeare and Voltaire. His collected works were published at Milan in 1838.

BARFLEUR, a small seaport of north-western France, overlooks the Channel on the Day of Manche. (22° 39' W., N.N.E. of Valognes by rail. Pop. (1906) 1600. In the middle ages Barfeur was one of the chief ports of embarkation for England. In 1120 the "White Ship," carrying Prince William, only son of Henry I., went down outside the harbour. About 2 m. to the north is Cape Barfeur, with a lighthouse 233 ft. high.

BARFURUSH, a town of Persia, in the province of Mazendaran in 36° 32' N., and 52° 47' E., and on the left bank of the river Bawul [Babul], which is here crossed by a bridge of eight arches, about 15 m. distant from the southern shore of the Caspian Sea, where the small town of Meshed-i Sar serves as a port. It is the commercial capital of Mazendaran, and 26 m. distant from Sari and 90 m. from Teheran. Pop. about 50,000. Built in a low and swampy country and approached by deep and almost impassable roads, Barfurush would not seem at all favourably situated for the seat of an extensive inland trade; it is, however, peopled entirely by merchants and tradesmen, and is wholly indebted for its present size and importance to its commercial prosperity. The principal articles of its trade are rice and cotton, some sugar cane (nāt shakar), flax (Kūtan) and hemp (Kanāb) are also grown. The town is of peculiar structure and aspect, as it is situated in the midst of a forest of tall trees; by which the buildings are so separated from one another, and so concealed, that, except in the bazaars, it has no appearance of a populous town. The streets are broad and neat, though generally unpaved, and kept in good order. No ruins are to be seen as in other Persian towns; the houses are comfortable, in good repair, roofed with tiles and enclosed by substantial walls. There are no public buildings of any importance, and the only places of interest are the bazaars, which extend fully a mile in length, and consist of substantially built ranges of shops covered with roofs of wood and tiles, and well stored with commodities. There are about ten commodious caravansaries and a number of colleges (medressah), the place being as much celebrated for learning as for commerce. On an island in a small lake east of the town is a garden, called Bāghi-i Shah (garden of the Shah), with ruined palaces and baths. At Meshed-i Sar, the port, or roadstead of Barfurush, the steamers of the Caspian and Mercury Company call weekly, and a brisk shipping trade is carried on between it and other Caspian ports. Barfurush was formerly called Māmatīr. The present name is from a settlement called Barfurush-deh, which was added to the old city a.d. 1012. (A. H.-S.)

BARGAIN AND SALE, in English law, a contract whereby property, real or personal, is transferred from one person—called the bargainer—to another—called the bargainee—for a

1 From O. Fr. bargaigne, a word of doubtful origin, appearing in many Romance languages, cf. Ital. bargano; it is connected with Late Lat. bærsōnara, to traffic, possibly derived from bæra, a barge.
valuable consideration; but the term is more particularly used to describe a mode of conveyance of lands. The disabilities under which a feudal owner very frequently lay gave rise to the practice of conveying land by other methods than that of feoffment with livery of seisin, that is, a handing over of the feudal possession. That of "bargain and sale" was one. Where a man bargained and sold his land to another for pecuniary consideration, which might be merely nominal, and need not necessarily be actually paid, equity held the bargainer to be seised of the land to the use of the bargainee. The Statute of Uses (1353), by converting the bargainee's interest into a legal estate, had an effect contrary to the intention of its framers. It made bargain and sale an easy means of secret or private conveyance, a policy to which the law was opposed. To remedy this defect, a statute (called the Statute of Enrolments) was passed in the same year, which provided that every conveyance by bargain and sale of freehold lands should be enrolled in a court of record or with the custos rotulorum of the county within six months of its date. The Statute of Enrolments applied only to estates of inheritance or for life, so that a bargain and sale of an estate for years might be made without enrolment. This in turn was the foundation of another mode of conveyance, namely, lease and release, which took the place of the deed of bargain and sale, so far as regards freehold. Bargain and sale of copyhold estates, which operates at common law, is still a mode of conveyance in England in the case of a sale by executors, where a testator has directed a sale of his estate to be made, instead of devising it to trustees upon trust to sell. See also Conveyancing.

BARGE (Med. Lat. barca, possibly connected with Lat. baris, Gr. βάρος, a boat used on the Nile), formerly a small sailing vessel, but now generally a flat-bottomed boat used for carrying goods on inland navigations. On canals barges are usually towed, but are sometimes fitted with some kind of engine; the men in charge of them are known as bargemen. On tidal rivers barges are often provided with masts and sails ("sailing barges"), or in default of being towed, they drift with the current, guided by a long oar or ears ("dumb-barges"). Barges used for unloading, or loading, the cargo of ships in harbours are sometimes called "lighters" (from the verb "to light" = to relieve of a load). A state barge was a heavy, often highly ornamented vessel used for carrying passengers on occasions of state ceremonies. The college barges at Oxford are houseboats moored in the river for the use of members of the college rowing clubs. In New England the word barge frequently means a vehicle, usually covered and enclosed, which is used for pleasure purposes or for the conveyance of passengers to or from piers or railway stations.

BARGEBOARD (probably from Med. Lat. bargus, or barcus, a sail, and not from the now obsolete synonym "vergeboard"), the boards fastened to the projecting gables of a roof to give strength to the same and to mask or hide the horizontal timbers of the roof to which they were attached. Bargeboards are sometimes moulded only or carved, but as a rule the lower edges were cusped and had tracery in the spandrels besides being otherwise elaborated. The richest example is one at Ockwells in Berkshire, England, which is moulded and carved as if it were intended for internal work.

BARGHEST, BARGEST or BARGIE, the name given in the north of England, especially in Yorkshire, to a monstrous golbin-dog with huge teeth and claws. The spectre-hound under various names is familiar in folk-lore. The Demon of Tedworth, the Black Dog of Winchester and the Padfoot of Wakefield all shared the characteristics of the Barghest of York. In Wales its counterpart was Gwylgi, "the Dog of Darkness," a frightful apparition of a mastiff with baleful breath and blazing red eyes. In Lancashire the spectre-hound is called Trash or Striker. In Cambridge-shire and on the Norfolk coast it is known as the Shuck or Shock. In the Isle of Man it is styled Mauhel Doog. It is mentioned by Sir Walter Scott in "The Lay of the Last Minstrel"—

"For he was speechless, ghastly, wan
Like him of whom the story ran
Who spoke the spectre hound in Man." A Welsh variant is the Cwm Anwna, or "dogs of hell." The barghest was essentially a nocturnal spectre, and its appearance was regarded as a portent of death. Its Welsh form is confined to the sea-coast parishes, and on the Norfolk coast the creature is supposed to be amphibious, coming out of the sea by night and travelling about the lonely lanes. The derivation of the word barghest is disputed. "Ghost" in the north of England is pronounced "gust," and the name is thought to be barrh-ghest, "town-ghost." Others explain it as German Berg-geist, "mountain demon," or Bar-geist, "bear-demon," in allusion to its supposed appearance at times as a bear. The barghest has a kinsman in the Rongeur d'Os of Norman folklore. A belief in the spectre-hound still lingers in the wild parts of the north country of England, and in Nidderdale, Yorkshire, nurses frighten children with its name.

See Wirt Sikes, British Goblins (1886); Notes and Queries, first series, ii. 51; Joseph Ritson, Fairy Tales (Lond. 1831), p. 58; Lancashire Folklore (1867); Joseph Lucas, Studies in Nidderdale (Pateley Bridge, 1882).

BARHAM, RICHARD HARRIS (1788-1845), English humourist, better known by his nom de plume of THOMAS INGOLDSBY, was born at Canterbury on the 6th of December 1788. At seven years of age he lost his father, who left him a small estate, part of which was the manor of Tappington, so frequently mentioned in the Legends. At nine he was sent to West's school, but his studies were interrupted by an accident which shattered his arm and partially crippled it for life. Thus deprived of the power of bodily activity, he became a great reader and diligent student. In 1807 he entered Brasenose College, Oxford, intending at first to study for the profession of the law. Circumstances, however, induced him to change his mind and to enter the church. In 1813 he was ordained and took a country curacy; he married in the following year, and in 1821 removed to London on obtaining the appointment of minor canon of St. Paul's cathedral. Three years later he became one of the priests in ordinary of the King's Chapel Royal, and was appointed to a city living. In 1826 he fixed contributed to Blackwood's Magazine; and on the establishment of Bentley's Miscellany in 1837 he began to furnish the series of grotesque metrical tales known as The Ingoldsby Legends. These became very popular, were published in a collected form and have since passed through numerous editions. In variety and whimsicality of rhymes these verses have hardly a rival since the days of Hudibras. But beneath this obvious popular quality there lies a store of solid antiquarian learning, the fruit of patient enthusiastic research, in out-of-the-way old books, which few readers have a chance of ever seeing. His life was grave, dignified and highly honoured. His sound judgment and his kind heart made him the trusted counsellor, the valued friend and the frequent peaker, and he was intolerant of all that was mean and base and false. In politics he was a Tory of the old school; yet he was the lifelong friend of the liberal Sydney Smith, whom in many respects he singularly resembled. Theodore Hook was one of his most intimate friends. Barham was a contributor to the Edinburgh Review and the Literary Gazette; he wrote articles for Gorton's Biographical Dictionary; and a novel, My Cousin Nicholas (1834). He retained vigour of body and spirit to the end of his days. His work "is as unspoiled as Ingoldsby himself" ("As I laye a-thynkynge") show no signs of decay. He died in London after a long, painful illness, on the 17th of June 1845.

A short memoir... by his son, was prefixed to a new edition of Ingoldsby in 1847, and a fuller Life and Letters, from the same hand, was published in 2 vols. in 1870.

BAR HARBOR, a well-known summer resort of Hancock county, Maine, U.S.A., an unincorporated village, in the township of Edge, on Frenchman's Bay, on the E. side of Mount Desert Island, about 45 m. S.E. of Bangor. Pop. of the township (1900) 4379; (1910) 4441; of the village (1910), about 2000, greatly increased during the summer season. Bar Harbor is served by the Maine Central railway and by steamer lines to New York, Boston, Portland and other ports. The summer climate is cool, usually too cool for sea-bathing, but there is
BAR-HEBRAEUS or ABU'L-FARAJ, a marābra or catholicus of the Jacobite (or Syriac) Church in the 13th century, and (in Dr. Wright's words) "one of the most learned and versatile men that Syria ever produced." Perhaps no more industrious compiler of knowledge ever lived. Simple and uncritical in his modes of thought, and apparently devoid of any striking originality, he collected in his numerous and elaborate treatises the results of such research in theology, philosophy, science and history as was in his time possible in Syria. Most of his works were written in Syriac, but some few in Arabic, which had long before his time supplanted Syriac as a living speech.

Bar-Hebraeus was born in 1226 at Mālatāja on the upper Euphrates. His youth was passed in the troublous times of the Mongol advance into western Asia, and his father eventually retired to Antioch, where Bar-Hebraeus completed his education. In 1246 he was ordained at Tripolis as Jacobite bishop of Gēbās near Mālatāja, and a year later was transferred to the neighbouring diocese of Lākahbīn, whence in 1253 he passed to be bishop of Aleppo. Deposed almost immediately by an ecclesiastical superior on account of disputes about the patriarchate, he was restored to his see in 1256, and in 1264 was promoted by the patriarch Ignatius III. to be marābra—the next rank below that of patriarch—an office which he held till his death at Marāgha in 1286. He seems to have been a model of devotion to his ecclesiastical duties and to have won the respect of all parties in his diocese.

It is mainly as an historian that Bar-Hebraeus interests the modern student. His great historical work—the Syriac Chronicle—is made up of three parts. The first, a history of secular events from the Creation to his own time, and in its later portions gives valuable information regarding the history of south-east Europe and western Asia. A compendium in Arabic of this secular history was made by Bar-Hebraeus under the title al-Mukhtasar fi’d-Dawla (Compendious History of the Dynasties). The second and third parts of the Chronicle deal with the history of the Church, the second being mainly concerned with the patriarchate of Antioch, and the third with the eastern branch of the Syrian Church. Of special value to theologians is the Augur Rabae (Storehouse of Secrets), a critical and doctrinal commentary on the text of the Scriptures. Of this many portions have been edited by various scholars, and a valuable study of the work, together with a biography and estimate of its author, has been published by J. Göttberger (Barhebræus und seine Schriften zur heiligen Schrift, Freiburg i. B., 1900).

A full list of Bar-Hebraeus's other works, and of editions of such of them as have been published, will be found in W. Wright's Syriac Literature, pp. 268-281.

The more important of them are:—(1) Kūñubād ha-Halibād, (Book of the Pupils of the Eyes); a treatise on logic or dialectics; (2) Hēwēth Hēbbēmithā, (Butter of Wisdom), an exposition of the whole philosophy of Aristotle; (3) Sulibāb Ḥawāndžāb (Ascent of the Mind), a treatise on astronomy and cosmography, edited and translated by F. Nau (Paris, 1890); (4) various medical works; (5) Kūnūbād dīd-Semē (Book of Rays), a treatise on grammar; (6) ethical works; (7) poems; (8) Kūnūbād dīd-Thammē fī Māgbhākhēbnā, (Book of Entertaining Stories), edited and translated by E. A. W. Budge (London, 1897). (N. M.)

BARI, a tribe of Nilotic negroes, living on the banks of the upper Nile some 200 m. N. of Albert Nyanza. They have as neighbours the Dinka to the north, the Madi to the south, and the Galla to the east. The men are tall and thin, the women fat and under middle height. Their colour is a deep dead brown. The men and unmarried girls go practically naked, the married women wearing a flaxen dress dyed reddish. The body is ornamented with red clay and the lower incisors are often extracted. Their sole wealth is cattle and their chief food milk and blood; meat is only eaten when a cow happens to die. They live in round grass huts with conical roofs. Twins are considered unlucky, the mother is divorced by her husband and her family must refund part of the marriage-price. The dead are buried in the hut; a square grave is dug in which the body is arranged in a sitting position with the hands tied behind the back. The most important men in the country are the rainmakers, who are revered even more than the chiefs, and, indeed, are looked upon as chiefs among the surrounding tribes. The Bari warriors have been much recruited for the Egyptian army and were formerly used as slave-hunters by the Arab traders.

See Sir Samuel Baker, The Albert Nyanza (London, 1866); Friedrich Müller, Die Sprache der Bari (Vienna, 1864); G. Casati, Tent Years in Equatoria (London, 1902); W. Wright, the History of Africa, 1860-1922; R. C. Owen, Barri Grammar (1908).

BARI (anc. Barium), a seaport and archiepiscopal see of Apulia, Italy, capital of the province of Bari, situated on a small peninsula projecting into the Adriatic, 69 m. N.W. of Brindisi by rail. Pop. (1901) 77,478. The town consists of two parts, the closely built old town on the peninsula to the N., and the new town to the S., which is laid out on a rectangular plan. The former contains the cathedral of S. Sabino, begun in 1353 but not completed till 1717; the exterior preserves in the main the fine original architecture (notably the dome and campanile), but the interior has been modernized. Not far off is the church of S. Nicola, founded in 1087 to receive the relics of this saint, which were brought from Myra in Lycia, and now lie beneath the altar in the crypt. The façade is fine, and the interior, divided into three naves by columns, with galleries over the aisles, has fortunately not been restored; the vaulting of the crypt has, however, been covered with modern stucco. The church is one of the four Palatine churches of Apulia (the others being the cathedrals of Acquaviva and Altamura, and the church of Monte S. Angelo sul Gargano). Adjacent is the small church of S. Gregorio, belonging also to the 11th century. The castle, built in 1160, and strengthened in 1333, lies on the W. side of the old town; it is now used as a prison. The old harbour lies on the E. side of the peninsula, and the new on the W. In the new town is the Ateno, containing the provincial museum, with a large collection of vases found in the district, in which the pre-Hellenic specimens are especially important (M. Mayer in Römische Mitteilungen, 1897, 201; 1899, 13; 1904, 188, 276). Bari is the seat of the command of the IX. army corps, and the most important commercial town in Apulia. It manufactures olive oil, soap, carbon sulphide and playing-cards, and has a large iron foundry.

Bariun does not seem to have been a place of great importance in early antiquity; only bronze coins struck by it have been found. In Roman times it was the port connecting between the coast road and the Via Traiana; there was also a branch road to Tarentum from Barium. Its harbour, mentioned as early as 181 B.C., was probably the principal one of the district in ancient times, as at present, and was the centre of a fishery. But its greatest importance dates from the time when it became, in 852, a seat of the Saracen power, and in 885, the residence of the Byzantine governor. In 1071 it was captured by Robert Guiscard. In 1093 Peter the Hermit preached the first crusade there. In 1156 it was razed to the ground, and has several times suffered destruction. In the 14th century it became an

1 Imperfectly edited and translated by Bruns and Kirch in 1789. There is now a better edition by Bedjan (Paris, 1890).
2 Edited and translated by Abelooos and Lamys (Paris and Louvain, 1817-1877).
independent duchy, and in 1558 was left by Bona Sforza to Philip II. of Spain and Naples.

BARILI—BARISAL

independent duchy, and in 1558 was left by Bona Sforza to Philip II. of Spain and Naples.

BARILI, a town of the province of Cebu, island of Cebu, Philippine Islands, on the 34th parallel of S. latitude, 126° 14' W. longitude, and 53 m. S.W. of Cebu, the capital. Pop. (1893) 31,617. It has a relatively cool and healthful climate. Its people are agriculturists and raise Indian corn, sibuaco, hemp, caoca and coffee. The language is Cebu-Visayan.

BARING, the name of a family of English financiers and bankers.

The firm of Baring Brothers was founded by Francis Baring (1740–1810), whose father, John Baring, son of a Lutheran minister at Bremen, had come to England from Germany, and started a cloth manufactory at Larkbear, near Exeter. Francis Baring was born at Larkbear, and in due course was placed in a London commercial firm. In 1770, in conjunction with his brother John, Francis Baring established a banking-house in London, and before he died in 1810 had so developed the business that he was regarded as the first merchant in Europe. He was for many years a director of the East India Company, and chairman in 1792–1793, receiving a baronetcy for his services. From 1784–1806 he sat almost continuously in parliament as a Whig. He left five sons, of whom the eldest, Sir Thomas Baring (1772–1848), was a well-known art-patron and collector. The control of the Bosphorus exercised such a second death. Alexander (1772–1835) was Lord Ashburton, who had already been largely successful in extending the firm's operations in America, where his marriage with the daughter of William Bingham, a wealthy resident of Philadelphia and United States senator, secured him considerable influence with the American commercial community. From 1806–1835 he represented various constituencies in parliament where he strongly opposed reform. In 1834 he became president of the Board of Trade and master of the mint in Sir Robert Peel's first administration, and the following year was raised to the peerage as Baron Ashburton. His son, Francis (1799–1873), had already been a leader in extending the frontier and in the reorganization of the United States, and in 1842, as commissioner to the United States to negotiate the settlement of the north-eastern boundary question and other matters in dispute between the two countries, and he concluded in that year at Washington the treaty, commonly known as the Ashburton treaty, by which the frontier between Maine and Canada was fixed. After his death in 1848 the affairs of the house were managed by Thomas Baring (1799–1873), the son of Sir Thomas Baring. Thomas Baring represented Huntingdon in parliament, and in 1852 his eldest son, Francis Thornhill Baring (1796–1866), sat for that county from 1826–1865. From 1830–1841 he was chancellor of the exchequer, and from 1849–1852 first lord of the admiralty. In 1866 he was created Baron Northbrook, the barony being converted in 1876 into an earldom in favour of his eldest son Thomas George Baring (1826–1904). The latter, the 1st Earl of Northbrook, was occupied almost entirely with public affairs, and filled at different times many important official positions. He is best remembered as viceroy of India, which office he held from 1872–1876, but his last public position was first lord of the admiralty (1883–1889). With the death of Thomas Baring, Edward Charles Baring (1828–1897), son of Henry Baring, M.P., and grandson of Sir Francis Baring, became head of the firm of Baring Brothers, and in 1885 was raised to the peerage as Baron Revelstoke. The house of Baring then stood at the height of its prosperity. During the following years a large amount of English capital was advanced to the Argentine Republic, Barings undertaking the loans and guaranteeing the interest. Through the continued default of the Argentinian government, Barings became seriously involved, their heavy obligations precipitating a general financial panic, on the 15th of August 1890 it became known that the firm was on the eve of suspending payment, with liabilities amounting to £24,000,000. The prompt action of the Bank of England, which in conjunction with the leading joint-stock banks of the United Kingdom took over these liabilities, averted further disaster, and the firm of Baring Brothers was subsequently reorganized as a limited company with a capital of £1,000,000.

Besides those already referred to, various other members of the Baring family have achieved public distinction, notably Charles Baring (1807–1879), bishop of Durham, and Evelyn Baring, 1st Earl of Cromer (q.v.).

BARING-GOULD, SABINE (1834— ), English novelist, was born at Exeter on the 28th of January 1834. After graduating at Clare College, Cambridge, he spent some years in travel, and became in 1864 curate of Horbury, Yorkshire; then perpetual curate of Dalton, in the same county, in 1867; and in 1871 rector of East Mersen, Essex. On his father's death in 1872 he inherited the estate of Lew Trenchard, North Devon, where his family had been settled for nearly three centuries, and he exchanged his Essex living for the rectory of Lew Trenchard in 1881. He is a fluent and ready pen, and began publishing books on one subject or another—fiction, travel, history, folklore, religion, mythology—from 1854 onwards. His novel Mehalah (1880), the scene of which is laid on the east coast of England, was an excellent story, and among many others may be mentioned John Herring (1883), a tale of the west country; Court Royal (1886); Red Spider (1887); The Pennycomequicks (1888); Cheap Jack Zita (1893); and Broom Squirrel (1896), a Sussex tale. His contributions to the study of topography, antiquities and folklore, while popularly written, were also full of serious research and real learning, notably his Book of Were-wolves (1865), Curious Myths of the Middle Ages (1886), Curious Surveys (1892). He produced at the same time many volumes of sermons and popular theology, and edited (1871–1873) The Sacristy, a quarterly review of ecclesiastical art and literature.

Living the life of the rapidly disappearing English "squareson," and full of cultivated interests, especially in humanizing the local village mind, and investigating and recording the good things of old-time, his many-sided activities were shown in every direction and his literary facility made his work known far and wide. His familiarity with the country-side and his interest in folk-lore were of special utility in recording and preserving for publication a large mass of English popular song, and in assisting the new English movement for studying and appreciating the national ballad-music.

BARINGO, a lake of British East Africa, some 30 m. N. of the equator in the eastern rift-valley. It is one of a chain of lakes which stud the floor of the valley and has an elevation of 3325 ft. above the sea. It is about 16 m. long by 9 broad and has an irregular outline, the northern shore being deeply indented. Its waters are brackish. Fed by several small streams it has no outlet. The largest of the rivers which enter it, the Tigrish and the Nyuki, run north through a flat marshy country which extends some 10 miles to the east of the lake. The district, inhabited by the negro tribe of Njamsi, was by the first explorers called Njumps. It is a fertile grain-growing region containing two considerable villages. The Njamsi are peaceful agriculturists who show marked friendliness to Europeans. N. of the lake rise the Karosi hills; to the E. the land rises in terraces to the edge of the Laikipia escarpment. A characteristic of the country in the neighbourhood of the lake are the "hills" of the termite (white ants). They are hollow columns 10 to 12 ft. high and from 1 ft. to 18 in. broad. The greater kudu, almost unknown elsewhere in East Africa, inhabits the flanks of the Laikipia and the adjacent country to the east of the lake and comes to the foot-hills around Baringo to feed.

The existence of Lake Baringo was first reported in Europe by Ludwig Krapf and J. Rehmann, German missionaries stationed at Momhosa, about 1850; in J. H. Speke's map of the Nile sources (1863) Baringo is confused with Kavirondo Gulf of Victoria Nyanza; it figures in Sir H. M. Stanley's map (1877) as a largesheet of water N.E. of Victoria Nyanza. Joseph Thomson, in his journey through the Masai country in 1883, was the first white man to see the lake and to correct the exaggerated notions as to its size. Native tradition, however, asserts that the lake formerly covered a much larger area.

BARISAL, a town of British India, headquarters of Backergunge district in Eastern Bengal and Assam, situated on a river of the same name. Pop. (1901) 18,978. It is an important centre of river trade, on the steamers route through the Sundarbans
BARIA

from Calcutta to the Brahmaputra. It contains a first grade college and several schools. There are a public library, established by subscription in 1828; and a students' union, for helping the sick and poor and promoting the intellectual and physical improvement of boys. Barisal has given its name to a curious physical phenomenon, known as the "Barisal guns," the cause of which has not been satisfactorily explained. These are noises, like the report of cannon, frequently heard in the channels of the delta of the Brahmaputra, at the rising of the tide.

BARIAUM (symbol Ba, atomic weight 137-37 [O = 16]), one of the metallic chemical elements included in the group of alkaline metals. It takes its name from the Greek Basikos (heavy) on account of its presence in barytes or heavy spar which was first investigated in 1602 by V. Casciorolus, a shoemaker of Bologna, who found that after ignition with combustible substances it became phosphorescent, and on this account it was frequently called Bolognus phosphorus. In 1774 K. W. Scheele, in examining a specimen of pyrolusite, found a new substance to be present in the mineral, for on treatment with sulphuric acid it gave an insoluble salt which was afterwards shown to be identical with that contained in heavy spar. Barium occurs chiefly in the form of barytes or heavy spar, BASO₄, and with little, BaCO₃, and to a less extent in baryto-calcite, baryto-celestin and various complex silicates. The metal is difficult to isolate, and until recently it may be doubted whether the pure metal had been obtained. Sir H. Davy tried to electrolyse baryta, but was unsuccessful; later attempts were made by him using barium chloride in the presence of mercury. In this way he obtained an amalgam, from which on distilling off the mercury the barium was obtained as a silver white residue. R. Bunsen in 1854 electrolysed a thick paste of barium chloride and distilled hydrochloric acid in the presence of mercury, at 100° C., obtaining a barium amalgam, from which the mercury was separated by a process of distillation. A. N. Guntz (Comptes rendus, 1901, 133, p. 872) electrolyses a saturated solution of barium chloride using a mercury cathode and obtains a 5% barium amalgam; this amalgam is transferred to an iron boat in a wide porcelain tube and the tube slowly heated electrically, a good yield of pure barium being obtained at 1000° C. The metal when freshly cut possesses a silver white lustre, is a little harder than lead, and is extremely easily oxidised on exposure; it is soluble in liquid ammonia, and readily attacks both water and alcohol.

Three oxides of barium are known, namely, the monoxide, BaO, the dioxide, BaO₂, and a suboxide, obtained by heating BaO with magnesium in a vacuum to 1100° (Guntz, loc. cit., 1906, p. 359). The monoxide is formed when the metal burns in air, but is usually prepared by the ignition of the nitrate, oxygen and oxides of nitrogen being liberated. It can also be obtained by the ignition of an intimate mixture of the carbonate and carbon, and in small quantities by the ignition of the iodate. It is a greyishcoloured solid, which combines very energetically with water to form the hydroxide, much heat being evolved during the combination; on heating to redness in a current of oxygen it combines with the oxygen to form the dioxide, which at higher temperatures breaks up again into the monoxide and oxygen.

Barium hydroxide, Ba(OH)₂, is a white powder that can be obtained by slaking the monoxide with the requisite quantity of water, but it is usually made on the large scale by heating heavy spar with small coal whereby a crude barium sulphide is obtained. This sulphide is then heated in a current of moist carbon dioxide, barium carbonate being formed, BaS+H₂O+CO₂=BaCO₃+H₂S, and finally the carbonate is decomposed by a current of superheated steam, BaCO₃+H₂O=Ba(OH)₂+CO₂, leaving a residue of the hydroxide. It is a white powder moderately soluble in cold water, readily soluble in hot water, the solution possessing an alkaline reaction and absorbing carbon dioxide readily. The solution, known as barium-water, finds an extensive application in practical chemistry, being used in gas-analysis for the determination of the amount of carbon dioxide in the atmosphere; and also being used in organic chemistry as a hydrolysing agent for the decomposition of complex urides and substituted aceto-acetic esters, while E. Fischer has used it as a condensing agent in the preparation of a- and b-acrole from acrolein dibromide. A saturated solution of the hydroxide deposits on cooling a hydrated form Ba(OH)₂·8H₂O, as colourless quadrangular prisms, which on exposure to air lose seven molecules of water of crystallisation.

Barium dioxide, BaO₂, can be prepared as shown above, or in the hydrated condition by the addition of excess of baryta-water to hydrogen peroxide solution, when it is precipitated in the crystalline condition as BaO₂·H₂O. These crystals on heating to 100° C. lose the water of crystallisation and leave a residue of the anhydrous peroxide. In the Brin process for the manufacture of oxygen, barium dioxide is obtained as an intermediate product by heating barium monoxide with air under pressure. It is a grey coloured powder which is readily decomposed by dilute acids with the production of hydrogen peroxide.

Barium chloride, BaCl₂·2H₂O, can be obtained by dissolving witherite in dilute hydrochloric acid, and also from heavy spar by ignition in a reverberatory furnace with a mixture of coal, limestone and calcium chloride. The resulting chloride being fused with baryta, the melting point being lowered by water, leaving a residue of almost insoluble calcium sulphide. The chloride crystallises in colourless rhombohedral tables of specific gravity 3-0 and is readily soluble in water, but is almost insoluble in concentrated hydrochloric acid and in absolute alcohol. It can be obtained in the anhydrous condition by heating it gently to about 120° C. It has a bitter taste and is a strong poison. Barium bromide is prepared by saturating baryta-water or by decomposing barium carbonate with hydrobromic acid. It crystallises as BaBr₂·2H₂O isomorphous with barium chloride. Barium bromate, Ba(BrO₃)₂, can be prepared by the action of perchloric acid on baryta-water, or by decomposing a boiling aqueous solution of 100 parts of potassium bromate with a similar solution of 74 parts of crystallised barium chloride. It crystallizes in the monoclinic system, and separates from its aqueous solution as Ba(BrO₃)·H₂O. On heating, it begins to decompose at 260-265° C. Barium chlorate, Ba(ClO₃)₂, is obtained by adding barium chloride to sodium chlorate solution; on concentration of the solution sodium chlorate separates first, and then on further evaporation barium chlorate crystallizes out and can be purified by recrystallization. It can also be obtained by suspending barium carbonate in boiling water and passing in chlorine. It crystallizes in monoclinic prisms of composition Ba(ClO₃)·H₂O, and begins to decompose on being heated to 250° C. Barium iodate, Ba(IO₃)₂, is obtained by the action of excess of iodic acid on hot caustic baryta solution or by adding sodium iodate to barium chloride solution. It crystallizes in monoclinic prisms of composition Ba(IO₃)·H₂O, and is only very sparingly soluble in cold water.

Barium carbide, BaC₂, is prepared by a method similar to that in use for the preparation of calcium carbide (see ACETYLENE). L. Maquenne has also obtained it by distilling a mixture of barium amalgam and carbon in a stream of hydrogen. Barium sulphide, BaS, is obtained by passing sulphurretted hydrogen over heated barium monoxide, or better by fusion of the sulphate with a small coal. It is a white powder which is readily decomposed by water with the formation of the hydroxide and hydrosulphide. The phosphorescence of the sulphide obtained by heating the thiosulphate is much increased by adding uranium, bismuth, or thoriurn before ignition (J. pr. Chem., 1905, ii. p. 106).

Barium sulphate, BaSO₄, is the most abundant of the naturally occurring barium compounds (see BARYTES) and can be obtained artificially by the addition of sulphuric acid or any soluble sulphate to a solution of a soluble barium salt, when it is precipitated as an amorphous white powder of specific gravity 4-5. It is practically insoluble in water, and is only very slightly soluble in dilute acids; it is soluble to some extent, when freshly prepared, in hot concentrated sulphuric acid, and on cooling the solution, crystals of composition BaSO₄·H₂SO₄ are deposited. It is used as a pigment under the name of "permanent white" or 

BARIAUM nitride, Ba₃N₂, is obtained as a brownish mass by
passing nitrogen over heated barium amalgam. It is decomposed by water with evolution of hydrogen, and on heating in a current of carbonic oxide forms barium cyanide (L. Maquenne). Barium amide, Ba(NH$_3$)$_2$, is obtained from potassium ammonium and barium bromide.

Barium nitrate, Ba(NO$_3$)$_2$, is prepared by dissolving either the carbonate or sulphide in dilute nitric acid, or by mixing hot saturated solutions of barium chloride and sodium nitrate. It is poisonous and explosive, and explodes with paraffin, nitre, naphtha, and oil. It is decomposed by heat, and is largely used in pyrotechny for the preparation of green fire. Barium carbonate, BaCO$_3$, occurs rather widely distributed as witherite (q.v.), and may be prepared by the addition of barium chloride to a hot solution of ammonium carbonate, when it is precipitated as a dense white powder of specific gravity 4.3; almost insoluble in water.

Barium and its salts can be readily detected by the yellowish-green colour they give when moistened with hydrochloric acid and heated in the Bunsen flame, or by observation of their spectra, when two characteristic green lines are seen. In solution, barium salts may be detected by the immediate precipitate they give on the addition of calcium sulphate (this serves to distinguish barium salts from calcium salts), and by the yellow precipitate of barium chromate formed on the addition of potassium chromate. Barium is estimated quantitatively by conversion into the sulphate. The atomic weight of the element has been determined by C. Marignac by the conversion of barium chloride into barium sulphate, and also by a determination of the amount of silver required to precipitate exactly a known weight of the chloride; the mean value obtained being 137.68; C. W. Richards of 137.82. ang. Chem., 1893, 6, p. 89), by determining the equivalent of barium chloride and bromide to silver, obtained the value 137.44. For the relation of barium to radium, see Radioactivity.

BARKER, EDMUND HENRY (1788-1839), English classical scholar, was born at Holmly in Yorkshire. He entered Trinity College, Cambridge, as a scholar in 1807, but left the university without a degree, being prevented by religious scruples from taking the oath then required. He had previously obtained (in 1809) the Browne medal for Greek and Latin epigrams. After acting as amanuensis to the famous Samuel Parr, the vicar of Hatton in Warwickshire, he married and settled down at Thetford in Norfolk, where he lived for about twenty-five years. He was in the habit of adding the initials O.T.N. (of Thetford, Norfolk) to the title-page of his published works. In later life he became involved in a law-suit in connexion with a will, and thus exhausted his means. In 1837-1838 he was a prisoner for debt in the king's bench and in the Fleet. He died in London on the 21st of March 1839. Barker was a prolific writer on classical and other subjects. In addition to contributing to the Classical Journal, he edited portions of several classical authors for the use of schools. He was one of the first commentators to write notes in English instead of Latin. In a volume of letters he disputed the claims of Sir Philip Francis to the authorship of the Letters of Junius; his Parrhia (1828) is a vast and ill-digested compilation of literary anecdotes and criticisms. He also saw through the press the English edition of Lemprière's Classical Dictionary (revised by Anthon) and of Webster's English Dictionary. It is as a lexicographer, however, that Barker is chiefly known. While at Hatton, he conceived the design of a new edition of Stephanus's Thesaurus Graecae Linguae. The work was undertaken by A. J. Valpy, and, although not expressly stated, it was understood that Barker was the responsible editor. When a few parts had appeared, it was severely criticized in the Quarterly Review (xxii., 1820) by Blomfield; this was the curtailment of the original plan of the work and the omission of Barker's name in connexion with it. It was completed in twelve volumes (1816-1828). The strictures of the Quarterly were answered by Barker in his Aristarchus Anti-Blomfieldianus, which, although unconvincing, was in turn answered by Bishop Monk. He also published notes on the Elymologicum Gudianum, and collaborated with Professor Dunbar of Edinburgh in a Greek and English Lexicon (1831). The editio princeps (1820) of the treatise attributed to Arcadius, IIopoi tòvnon, was published by him from a Paris MS. Continental scholars entertained a more favourable opinion of him than those of his own country. He expressed contempt for the minute verbal criticism of the Porsonian school, in which he was himself deficient.

An account of his life will be found in the Gentleman's Magazine for May 1839; see also Notes and Queries (6th series, xii. p. 443), where a full list of his works is given.

BARKER'S MILL, a mechanical contrivance invented by Dr Barker about the end of the 17th century. It consisted of a hollow vertical cylinder, provided with a number of horizontal arms fitted with lateral apertures; the contrivance is mounted so as to rotate about the vertical axis. By allowing water to enter the vertical tube, a rotation, due to the discharge through the lateral orifices, is set up.

BARKING, a market-town in the Romford parliamentary division of Essex, England, on the river Roding near its junction with the Thames, 8 miles E. of Fenchurch Street station and Liverpool Street station, London, by the London, Tilbury & Southend and Great Eastern railways. Pop. of urban district of Barking town (1851) 14,501; (1901) 21,547. The church of St Margaret is Norman with perpendicular additions, and contains many monuments of interest. Barking was celebrated for its nunnery, one of the oldest and richest in England, founded about 670 by Erkenwald, bishop of London, and restored in 970 by King Edgar, about a hundred years after its destruction by the Danes. The abbess was a baroness ex officio, and the revenue at the dissolution of the monasteries was £1,084. There remains a perpendicular turned gateway. There is also an ancient market-house, used as a town-hall. Victoria Gardens form a public pleasure-ground, and there are recreation grounds. The Gaslight and Coke Company's works at Beckton are in the parish, and also extensive rubber works. At the mouth of the Roding (Barking Creek) are great sewage works, receiving the Northern Outfall sewer from London. There are also chemical works, and some shipping trade, principally in timber and fish. Barking is a suffragan bishopric in the diocese of St Albans.

BARKLY EAST, a town of Cape province, South Africa, capital of a district of the same name, and 80 m. by rail E.S.E. of Aliew North. The town lies north of the Drakensberg on the Kruger tributary of the Orange river at an elevation of 583 ft. The district has an area of 1,564 sq. m. and a population (1904) of 8400, of whom 50% are whites. The chief occupation followed is sheep-farming, the pasturage being excellent. Like Barkly West, the town and district are named after Sir Henry Barkly, governor of Cape Colony, 1870-1877.

BARKLY WEST, a town of Cape province, South Africa, 21 m. N.W. of Kimberley, capital of a district and of an electoral division of the same name in Griqualand West. It is built on the right bank of the Vaal, here spanned by a bridge. Pop. (1904) 237. Originally called Klipdrift, the town was the first founded by the diggers after the discovery in 1867 of diamonds along the valley of the Vaal, and it had for some years a large floating population. On the discovery of the "dry diggings" at Kimberley, the majority of the diggers removed thither. Barkly West remains, however, the centre of the alluvial diamonds industry. The diamonds of this district are noted for their purity and lustre, and are generally associated with other crystals—garnets, agates, quartz and chalcedonies.

Barkly West electoral division includes the whole of Griqualand West save the Kimberley division. It is divided into the fiscal districts of Barkly West, Hay and Herbert, with a total pop. (1904) of 46,388, of whom 12,170 are whites (see GRIQUALAND).

Balaraa and Josaphat, one of the most popular and widely disseminated of medieval religious romances, which owes its importance and interest to the fact that it is a Christianized version of the story of Gautama Siddharta, the Buddha, with which it agrees not only in broad outline but in essential details. The Christian story first appears in Greek among the works of John (q.v.) of Damascus, who flourished in the early part of the 8th century, and who, before he adopted the monastic life, had
The outline of the Greek story is as follows:—St Thomas had converted the people of India, and after the eremitic life originated in Egypt, many Indians adopted it. But a powerful pagan king arose who hated and persecuted the Christians, especially the ascetics. After this king, Abenner by name, had long been absent, less, a boy greatly desired and matchless in beauty, was born to him and received the name of Josaphat. The king, in his joy, summons astrologers to predict the child’s destiny. They foretell glory and prosperity beyond those of all his predecessors. One sage, most learned of all, assents, but intimates that the scene of this glory will be, not the paternal kingdom, but another infinitely more exalted, and that the child will adopt the faith which his father persecutes.

The boy shows a thoughtful and devout turn. King Abenner, troubled by the remembrance of the prediction, selects a secluded city, in which he causes a splendid palace to be built, where his son should abide, attended only by tutors and servants in the flower of youth and health. No stranger was to have access, and the boy was to be cognizant of none of the sorrows of humanity, such as poverty, disease, old age or death, but only of what was pleasant, so that he should have no inducement to think of the future life; nor was he ever to hear a word of Christ and His religion.

Prince Josaphat grows up in this seclusion, acquires all kinds of knowledge, and in particular, the ascetic singular endowments. At length, on his urgent prayer, the king reluctantly permits him to pass the limits of the palace, after having taken all precautions to keep painful objects out of sight. But through some neglect of orders, the prince one day encounters a leper and a blind man, and asks of his attendants with pain and astonishment what such a spectacle should mean. These, they tell him, are ills to which man is liable. Shall all men have suchills? he asks. And in the end he returns home in deep depression. Another day he falls in with a decrepit old man, and stricken with dismay at the sight, renues his questions and hears for the first time of death. And after many years, continues the prince, does this fate befall man? and must he expect death as inevitable? Is there no way of escape? No means of eschewing this wretched state of decay? The attendants reply as may be imagined; and Josaphat goes home more pensive than ever, dwelling on the certainty of death and on what shall be thereafter.

At this time Barlaam, a eremite of great sanctity and knowledge, dwelling in the wilderness of Sennaritis, diviney warned, travels to India in the disguise of a merchant, and gains access to Prince Josaphat, to whom he imparts the Christian doctrine and commands the monastic life. Barlaam departs. But all attempts to shake the prince’s convictions fail.

As a last resource the king sends for Theudas, a magician, who removes the prince’s attendants and substitutes seductive girls; but all their blandishments are resisted through prayer. The king abandons these efforts and associates his son in the government. The prince uses his power to promote religion, and everything prosperous in his hands. At last Abenner himself yields to the faith, and after some years of penitence dies. Josaphat surrenders the kingdom to a friend called Barachias and departs for the East; for two years his pursuit and much buffeting by demons he finds Barlaam. The latter dies, and Josaphat survives as a hermit many years. King Barachias afterwards arrives, and transfers the bodies of the two saints to India, where they are the source of many miracles.

Now this story is, mutatis mutandis, the story of Buddha. It will suffice to recall the Buddha’s education in a secluded palace, his encounter successively with a decrepit old man, with a man in mortal disease and poverty, with a dead body, and, lastly, with a religious recluse radiant with peace and dignity, and his consequent abandonment of his princely state for the ascetic life in the jungle. Some of the correspondences in the two stories are most minute, and even the phraseology, in which some of the details of Josaphat’s history are described, almost literally renders the Sanskrit of the Lalito Vistara. More than that, the very word Josaphat or Josaphat (Arabic, Yūdāsūf) is a corruption of Bodisattva due to a confusion between the Arabic letters for Y and B, and Bodisattva is a common title for the Buddha in the many birth-stories that clustered round the life of the sage. There are good reasons for thinking that the Christian story did not originate with Josaphat of Damascus, and a strong case has been made by Zettenberg in his Zu Josaphat that it reflects the remarkably similar and disputed stories of the early 7th century in Syria, and that the Greek text was edited by a monk of Saint Saba named John, his version being the source of all later texts and translations. How much older than this the Christian story is, we cannot tell, but it is interesting to remember that it embodies in the form of a speech the “Apology” of the 2nd-century philosopher Aristides. After its appearance among the writings of John of Damascus, it was incorporated with Simeon Metaphrastes’ Lives of the Saints (c. 950), and thence gained great vogue, being translated into almost every European language. A famous Icelandic version was made for Prince Hakon early in the 13th century. In the East, too, it took on new life and Catholic missionaries freely used it in their propaganda. Thus a Tagala (Philippine) translation was brought out at Manila in 1712. Besides furnishing the early playwrights with material for miracle plays, it has supplied episodes and apologies to many a writer, including Boccaccio, John Gower and Shakespeare. Rudolph of Ems about 1220 expanded it into a long poem of 16,000 lines, celebrating the victory of Christian over heathen teaching. The heroes of the romance have even attained saintly rank. Their names were inserted by Petrus de Natalibus in his Catalogus Sanctorum (c. 1350), and Cardinal Baronius included them in the official Martyrologium authorized by Sixtus V. (1585-1590) under the date of the 27th of November. In the Orthodox Eastern Church “the holy Josaph, son of Abenig, king of India” is allotted the 26th of August. Thus unwittingly Gautama the Buddha has come to official recognition as a saint in two great branches of the Catholic Church, and no one will say that he does not deserve the honour. A church dedicated Divo Josaphat in Palemoro is probably not the only one of its kind.

The identity of the stories of Buddha and St Josaphat was recognized by the historian of Portuguese India, Dippo do Couto (1542-1616), as may be seen in his history (Dec. v. liv. vi. cap. 2). In modern times the honour belongs to Laboulaye (1859), Felix Liebrecht in 1868 putting it beyond dispute. Subsequent researches have been carried out by Zettenberg, Max Müller, Rhys Davids, Braenholtz and Joseph Jacobs, who published his Barlaam and Josaphat in 1896.

BAR-LE-DUC, a town of north-eastern France, capital of the department of Meuse, 50 m. E.S.E. of Châlons-sur-Marne, on the main line of the Eastern railway between that town and Brussels, and the line which rises from Tournai on the lower Rhine, and passes by the Meuse and Moselle. The lower or left bank of the Meuse is traversed by two bridges. The town is situated on the south-west by a small arm of the Oise, called the Canal des Usines, on the left bank of which the upper town (Ville Haute) is situated. The Ville Haute, which is reached by staircases and steep narrow thoroughfares, is intersected by a long, quiet street, bordered by houses of the 15th, 16th and 17th centuries. In this quarter are the remains (16th century) of the château of the dukes of Bar, dismantled in 1670, the old clock-tower and the college, built in the latter half of the 16th century. Its church of St Pierre (14th and 15th centuries) contains a skillfully-carved effigy in white stone of a half-decayed corpse, the work of Ligier Richier (1500-1572), a pupil of Michelangelo—erected to the memory of René de Châlons (d. 1554). The lower town contains the official buildings and two or three churches, but these are of little interest. Among the statues of distinguished natives of the town is one to Charles Nicolas Oudinot, whose house serves as the hôtel-de-ville. Bar-le-Duc has tribunals of first instance and of commerce, a board of trade arbitrators, a lycée, a training-college for girls, a chamber of commerce, a branch of the Bank of France and an art museum. The industries of the town include iron-founding and the manufacture of machinery, corsets, hosiery,
flannel goods, jam and wall-paper, and brewing, cotton spinning and weaving, leather-dressing and dyeing. Wine, timber and iron are important articles of commerce.

Bar-le-Duc was at one time the seat of the counts, later duchy, of Bar, the history of which is given below. Though probably of ancient origin, the town was unimportant till the 10th century when it became the residence of the counts.

Counts and Dukes of Bar. In the middle of the 10th century the territory of Bar (Barrois) formed a dependency of the Empire. In the 11th century its lords were only counts by title; they belonged to the house of Mounson (which also produced the counts of Moulins, of Helford and Ferrette), and they finally fought in the French ranks, while their neighbours, the dukes of Lorraine, adhered to the German side. Theobald I., count of Bar, was an ally of Philip Augustus, as was also his son Henry II., who distinguished himself at the battle of Bouvines in 1214. But sometimes the counts of Bar bore arms against France. In 1301 Henry III. having made an alliance with Edward I. of England, whose daughter he had married, was vanquished by Philip the Fair, who forced him to do homage for a part of Barrois, situated west of the Meuse, which was called Barrois mouvain. In 1354 Robert, count of Bar, who had been on a pilgrimage to Jerusalem, was placed on the throne of Pont-à-Mousson by the emperor Charles IV. and took the title of duke of Bar. His successor, Edward III., was killed at Agincourt in 1415. In 1448 Louis of Bar, brother of the last-named, a cardinal and bishop of Châlons, gave the duchy of Bar to René of Anjou, the grandson of his sister Yolande, who married Isabella, duchess of Lorraine. Yolande of Anjou, who in 1444 had married Ferri of Lorraine, count of Vaudémont, became heiress of Nicholas of Anjou, duke of Calabria and of Lorraine, in 1473, and of René of Anjou, duke of Bar, in 1480; thus Lorraine, with Barrois added to it, once more returned to the family of its ancient dukes. United with Lorraine to France in 1634, Barrois remained, except for short intervals, part of the royal domain. It was granted in 1738 to Stanislaus Leszczynski, ex-king of Poland, and on his death in 1766 was once more attached to the crown of France. (M.P.)

Barletta (anc. Barduli), a seaport town and episcopal see of Apulia, Italy, on the E.S.E. coast, in the province of Bari, 34° 11' m. W.N.W. of Bari by rail. Pop. (1901) 42,022. Its importance dates from the time of the Hohenstaufen. The Gothic church of St. Sepolcro was built at the close of the 12th century, and the Romanesque cathedral was built at the same period, but added to later. In front of the former church stands a bronze statue, 14 ft. in height, of the emperor Heraclius. The castle behind the cathedral dates from 1537. The harbour is good. It was cleared by 508 sailing-vessels and 461 steamers, the latter with a total tonnage of 364,904 in 1904; the exports were of the value of £8,069 (principally wine, sulphur, oil, tartar and tartraric acid), and the imports 502,456 (coal, timber and sundries).

In the neighbourhood (between Andria and Corato), during the siege of Barletta by the French in 1503, the town being defended by the Spanish army, a combat took place between thirteen picked knights of Italy and France, which resulted in favour of the former; it has been celebrated by Massimo d'Azeglio in his Disfida di Barletta. Seven miles to the N.W. are the salt-works of Barletta, now known under the name of Margherita di Savoia. (T. As.)

Barley (Hordeum sativum), a member of the grass family, and an important cereal which belongs peculiarly to temperate regions. It originated from a wild species, H. spontaneum, a native of western Asia and has been cultivated from the earliest times. Three subspecies or races are recognized. (I.) H. sativum, subsp. distichum (described by Linnaeus as a distinct species, H. distichum), two-rowed barley. Only the middle spikelet of each tritice is fertile; the ear has therefore only two longitudinal rows of grain, and the spikes are strongly compressed laterally. This approach most nearly to the wild stock, from which it is distinguished by the non-jointed axis and somewhat shorter awns. This is the race most commonly grown in the British Isles and in central Europe, and includes a large number of sub-races and varieties among which are the finest malting-
BARLEY-BREAK—BARLOW

British Pharmacopoeia, which is of value as a demulcent and emollient drug in febrile and inflammatory disorders.

Cultivation.—Apart from the growth-habits of the plant itself, the consideration that chiefly determines the routine of barley cultivation is the demand on the part of the maltster for uniformity of sample. Less care is required in its cultivation when it is intended for feeding live-stock. It is essential that the grains on the maltster’s floor should germinate simultaneously, hence at the time of reaping, the whole crop must be as nearly as possible in the same stage of maturity. On rich soils the crop is liable to grow too rapidly and yield the coarsest, unmarketable sample, because the best barley is grown on light, open and preferably calcareous soils, while if the condition of the soil is too high it is often reduced by growing wheat before the barley.

Barley (see AGRICULTURE, Crops and Cropping) is a rapidly-growing and shallow-rooted plant. The upper layer of the soil must therefore be free from weeds, finely pulverized and stocked with a readily-available supply of nutrient. In most rotations barley is grown after turnips, or some other "cleaning" crop, with or without the interposition of a wheat crop. The roots are fed off by sheep during autumn and early winter, after which the ground is ploughed to a depth of 3 or 4 in. only in order not to put the layer of soil fertilized by the sheep beyond reach of the plant. The ground is then left unworked and open to the crumbling influence of frost till towards the end of winter, when it is stirred with the cultivator followed by the harrows, or in some cases ploughed with a shallow furrow. The seed, which should be plump, light in colour, with a thin skin covered by fine wrinkles, is sown in March and early April 1 at the rate of from 8 to 12 pecks to the acre and lightly harrowed in. As even distribution at a uniform depth is necessary, the drill is preferred to the broadcast-seeder for barley sowing. In early districts seeding may take place as early as February, provided a fine tilth is obtainable, but it rarely extends beyond the end of April. If artificial manures are used, a usual dressing consists of 2 or 3 cwt. of superphosphate to the acre at the time of sowing, followed, if the ground is in poor condition, by 1 cwt. of nitrate of soda when the plant is showing. Nitrogen must, however, be applied with caution as it makes the barley rich in albumen, and highly albuminous barley keeps badly and easily loses its germining capacity. Farm-yard manure should also be avoided. After-cultivation may comprise rolling, harrowing (to preserve the fineness of the tilth) and in some districts hoeing. Barley is cut, either with scythe or machine, when it is quite ripe with the ears bending over. The crop is often allowed to lie loose for a day or two, owing to the belief that sunshine and dews or even showers mellow it and improve its colour. It may even be stacked without tying into sheaves, though this course involves greater expenditure of labour in carrying and afterwards in threshing. There is a prejudice against the use of the binder in reaping barley, as it is impossible to secure uniformity of colour in the grain when the stalks are tightly tied in the sheaf, and the sun has not free access to those on the inside. In any case it must not be stacked while damp, and if cut by machine is therefore sometimes tied in sheaves and set up in stocks as in the case of wheat. The above sketch indicates the general principles of barley-cultivation, but in practice they are often modified by local custom or farming exigencies.

Barley is liable to smut and the other fungus diseases which attack wheat (q.v.), and the insect pests which prey on the two plants are also similar. The larvae of the ribbon-footed corn-fly (Chlorops tenellus) caused great injury to the barley crop in Great Britain in 1853, when the plant was weakened by extreme drought. A fair crop of barley yields about 36 bushels (56 lb to the bushel) per acre, but under the best conditions 40 and 50 bushels may be obtained. The yield of straw is from 13 to 20 cwt. per acre. barley-straw is considered inferior both as fodder and litter.

BARLEY-BREAK, an old English country game frequently mentioned by the poets of the 17th and 18th centuries. It was played by three pairs composed of one of each sex, who were stationed in three bases or plots, contiguous to each other. The couple occupying the middle base, called hell or prison, endeavoured to catch the other two, who, when chased, might break to avoid being caught. If one was overtaken, he and his companion were condemned to hell. From this game was taken the expression "the last couple in hell," often used in old plays.

BARLEY-CORN, a grain of barley, and thus a measure taken from the length of a grain of barley, three of which (sometimes four) were considered to make an inch. The barley-corn has been replaced by the pennyweight and grain or drachm as the standard weight of corn, corresponding to the best barley is grown on light, open and preferably calcareous soils, while if the condition of the soil is too high it is often reduced by growing wheat before the barley.

BARLOW, SIR GEORGE HILARO (1762–1847), Anglo-Indian statesman, was appointed to the Bengal Civil Service in 1778, and in 1788 carried into execution the permanent settlement of Bengal. When the marquis of Cornwallis died in 1805, Sir George Barlow was nominated provisional governor-general, and his passion for economy and retrenchment in that capacity has caused him to be known as the only governor-general who diminished the area of British territory; but his nomination was rejected by the home government, and Lord Minto was appointed. Subsequently Barlow was created governor of Madras, where his want of tact caused a mutiny of officers in 1809, similar to that which had previously occurred under Clive. In 1812 he was recalled, and lived in retirement until his death in February 1847. He was created a baronet in 1803.

BARLOW, JOEL (1754–1812), American poet and politician, born in Redding, Fairfield county, Connecticut, on the 24th of March 1754. He graduated at Yale in 1778, was a post-graduate student there for two years, and from September 1780 until the close of the revolutionary war was chaplain in a Massachusetts brigade. He then, in 1783, removed to Hartford, Connecticut, established there in July 1784 a weekly paper, the American Mercury, with which he was connected for a year, and in 1786 was admitted to the bar. At Hartford he was a member of a group of young writers including Lemuel Hopkins, David Humphreys, and John Trumbull, known in American literary history as the "Hartford Wits." He contributed to the Anarchiad, a series of satirico-political papers, and in 1787 published a long and ambitious poem, The Vision of Columbus, which gave him a considerable literary reputation and was once much read. In 1788 he went to France as the agent of the Scioto Land Company, his object being to sell lands and enlist immigrants. He seems to have been ignorant of the fraudulent character of the company, which failed disastrously in 1790. He had previously, however, induced the company of Frenchmen, who ultimately founded Gallipolis, Ohio, to emigrate to America. In Paris he became a liberal in religion and an advanced republican in politics. He remained abroad for several years, spending much of his time in London; was a member of the obnoxious "London Society for Constitutional Information," published various radical essays, including a volume entitled Advice to the Privileged Orders (1792), which was proscribed by the British government; and was made a citizen of France in 1792. He was American consul at Algiers in 1795–1797, securing the release of American prisoners held for ransom, and negotiating a treaty with Tripoli (1796). He returned to America in 1805, and lived near Washington, D.C., until 1811, when he became American plenipotentiary to France, charged with negotiating a commercial treaty with Napoleon, and with securing the restoration of confiscated American property or indemnity therefor. He was summoned for an interview with Napoleon at Wilna, but failed to see the emperor there; became involved in the retreat of the French army; and, overcome by exposure, died at the Polish village of Zarnowiec on the 24th of December 1812. In 1807 he had published in a sumptuous volume the Columbiad, an enlarged edition of his Vision of Columbus, more pompous even than the original; but, though it added to his reputation in some quarters, on the whole it was not well received, and it has subsequently been much ridiculed. The poem for which he is now best known is his mock heroic Hasty Pudding (1793). Besides the writings mentioned above, he published Conspiracy of Kings, a Poem addressed to

1 Barley is occasionally sown in autumn to provide keep for sheep in the following spring.
BARLOW—BARNABAS

the Inhabitants of Europe from another Quarter of the Globe (1792); View of the Public Debt, Receipts and Expenditure of the United States (1800); and the Political Writings of Joel Barlow (2nd ed., 1796). He also published an edition, "corrected and enlarged," of Isaac Watt's Imitation of the Psalms of David (1786).

BARLOW, PETER (1776–1862), English writer on pure and applied mathematics, was born at Norwich in 1776 and died on the 1st of March 1862. In 1806 he was appointed mathematical master in the Woolwich Academy, and filled that post for forty-one years. In 1823 he was made a fellow of the Royal Society, and two years later received the Copley medal. Steam locomotion received much attention at his hands, and he sat on the railway commissions of 1836, 1839, 1842, 1845. He received many distinctions from British and foreign scientific societies. Barlow's principal works are—Elementary Investigation of the Theory of Numbers (1811); New Mathematical and Philosophical Dictionary (1814); Essay on Magnetic Attractions (1820). The investigations on magnetism led to the important practical discovery of a means of rectifying or compensating compass errors in ships. Besides compiling numerous useful tables, he contributed largely to the Encyclopaedia Metropolitana.

BARM, a word common to Teutonic languages, the scum from the top of the fermenting or fermenting, yeast used to leaven bread, or to set up fermentation in liquor.

BARMECIDES, more accurately Barmakiids, a noble Persian family which attained great power under the Abbasid caliphs. Barmak, the founder of the family, was a Persian fire-worshipper, and is supposed to have been a native of Khorasan. According to tradition, his wife was taken for a time into the harem of Abdallah, brother of Kotaiba the conqueror of Balkh, and became the mother of Khalid b. Barmak the Barmecide. Barmak subsequently (about a.d. 736) rebuilt and adored his native city of Balkh and the rebellion of Harith. The family prospered, and his grandson Yabāy b. Khalid was the viceroy of the caliph Mahdi and tutor of Harūn al-Rashid. His sons Fadl and Ja'far (the Gīfār of the Arabian Nights) both occupied high offices under Harūn. The story of their disgrace, though romantic, is not improbable. Harūn, it is said, found his chief pleasure in the society of his sister 'Abbasā and Ja'far, and in order that these two might be with him continuously without breach of etiquette, persuaded them to contract a purely formal marriage. The conditions were, however, not observed and Harūn, learning that 'Abbasā had borne a son, caused Ja'far suddenly to be arrested, beheaded, and when fermented, yeast used to leaven bread, or to set up fermentation in liquor.

BARMOTÉ COURT (also written BERMHOT, BARMHOT, BARMEMOTE, BARMOUT), a name applied to courts held in the lead-mining districts of Derbyshire, England, for the purpose of determining the customs peculiar to the industry and also for the settlements of any disputes which may arise in connexion therewith. Barmote courts are of very ancient origin, having been in existence in the reign of Edward I. Their jurisdiction extends both to the crown lands in the duchy of Lancaster and to those under individual ownership, comprising seven clearly defined districts. Owing to the progress made in modern mining, many of the customs and much of the procedure had become obsolete, and their powers were regulated by the High Peak Mining Customs and Mineral Courts Act 1851. An appeal from the jurisdiction of the courts lies by way of certiorari.

BARMOUTH (Abermaw, or Mawddach, in Cardigan Bay, the only haven in Merionethshire, North Wales), a small seaport on the north of the estuary. Pop. of urban district (1901), 2214. The ride to Dolgelley (Dolgellau) is fine. The parish church, Llanaber, 1½ m. from Barmouth, is on a cliff overlooking the sea. Barmouth is a favourite bathing place, on the Cambrian railway. It is a centre for coaching in summer, especially to and through the Vale of Llangollen.

BARNABAS, in the New Testament, the surname, according to Acts iv. 36, given by the apostles (possibly in contrast to Joseph Barsabbas, Acts i. 23) to Joseph, "a Levite, a man of Cyprus by birth," who, though like Paul not of the Twelve, came like him to rank as an apostle (Acts xiv. 4, 14, 1 Cor. ix. 6; see Apostle). The Greek rendering of this Semitic name (בָּרָנָבָא) may be translated "son of consolation" (in the A. V.), or "son of exhortation" (as in the R. V.). But there is an initial difficulty about the Greek rendering itself, as no satisfactory etymology of Bar-nabas in this sense has as yet been suggested. The one most generally adopted is a Greek word determined by the phonetic analogy (see Z.N.T.W., 1906, p. 91 for a fresh interpretation), viz. Bar-Nebo, lacks intrinsic fitness for a Jew and a Levite, and of course does not accord with the statement in Acts itself. Hence it still seems best to assume some unknown Aramaic form equivalent to בָּרָנָבָא, and then to take the latter in the sense of comfort or encouragement. This rendering, rather than "exhortation" in the sense of eloquence, best suits the usage of Acts, which suggests such comfort as is given by encouraging rather than rousing words (ix. 31, xi. 23, xii. 15, xv. 31 f.; cf. Luke ii. 25, vi. 24). All we hear of Barnabas points to goodness of heart ("a good man," xi. 24) as his distinctive quality, giving fitness of perception (ix. 27, xi. 25 f.) and large influence into essentials (xi. 23 f.). It was probably the practically helpful and encouraging form that his gift as a "prophet" took (Acts xiii. i,
BARNABAS

with 1 Cor. xiv. 3. It is perhaps significant that his first appearance is of the generously helpful kind described in Acts iv. 36 f. Yet we must beware of regarding Barnabas as merely a fine character; he plays too prominent a part in the New Testament for any such limitation. Thus, he next appears as bringing the suspicions which dogged the ex-protector Saul (Paul)—possibly an old acquaintance in Hellenist circles at Jerusalem (cf. vi. 9, ix. 29)—and introducing him to the older apostles (ix. 27). More suggestive still of his reputation as a man of insight and authority is his mission from the Jerusalem Church to inspect and judge of the new movement in the Gospel at Antioch, in Acts xi. 22. This means very much, though his modesty led him to call in the aid of his friend Saul to cope with the new and expanding situation (xv. 25). After their brief joint visit to Jerusalem (xi. 19, xii. 25) we get a glimpse of Barnabas as still chief among the spiritual leaders of the Antiochen Church, and as called by the Spirit, along with Saul, to initiate the wider mission of the Gospel, outside Syria even, in regions beyond (xiii. 2, 4). He led the way to his native Cyprus; but in the crucial struggle with the magician Bar-Jesus, in the presence of the governor of the island (xiii. 7 ff.), Saul seems to have come so decisively to the front, that henceforth, for the author of Acts he takes the lead, and Barnabas appears as his colleague (see xiii. 15). Paul and his company, the Twelve, are those now referred to as Mark, the kingman of Barnabas. The fact that at Lystra the natives styled Barnabas, Zeus, and Paul, Hermes, while suggesting that Barnabas was the man of nobler mien, proves that Paul was the chief speaker (xiv. 12); and the notices in the Pauline epistles fully bear out the view that "the gospel of the Gentiles" which they preached was in conception Paul's (Gal. ii. 1-9). Indeed, Barnabas's vacillation at Antioch, as recorded in Gal. ii. 11 ff. (whether it preceded or followed their mission in Acts xii.-xiv.), shows that, while gifted with true intuitions, he was not strong in thinking out his position to all its issues on principle, and was easily led by the circumstances (xii. 25). But what Barnabas did see with full reasoned conviction, he was staunch in upholding; thus he upheld the general cause of Gentile freedom from the obligation of circumcision (as distinct from perfect religious equality with Jewish believers) at the Jerusalem conference (Acts xv.). With this stand for principle, however, his main work, as a great link in the transition of the Gospel from its Jewish to its universal mission, reached its climax; and Acts transfers its attention wholly to Paul, after explaining how their roads parted under rather painful circumstances (xv. 25 ff.).

When Barnabas sails away with Mark to resume work in Cyprus, the mists of history hide him from our sight. Only now and again do we catch fugitive and increasingly doubtful glimpses of him and his work. We learn from 1 Cor. ix. 6 that he adhered to Paul's principle of self-support in his mission work, and from Col. iv. 10 that his name was well known and respected at Colosse about a.d. 60. Tradition, which early regards him as one of the seventy (Clem. Alex.), carries him, plausibly enough, to Alexandria (Clem. Hom. ii. ii. 4; cf. the ascription to him of the Alexandrine Epistle of Barnabas). But the evidence for his having visited Rome (later tradition says also Milan) is stronger because more varied (Clem. Recog. ii. 7, cf. Hom. ii. 7; the early Actus Petri Vercellenses; and the late Cypriot Encium), especially if we might trust the Western ascription to him of the epistle to the Hebrews, which begins with Tertullian (De Pud. 20). But this may itself be mere inference from its self-description (xiii. 22), as a "word of exhortation," to the "son of exhortation" (Acts iv. 36) as its author. The legend of his missionary labours in Cyprus, including martyrdom at Salamis, is quite late and untrustworthy. The date of his death is uncertain, but he was probably no longer living when Acts was written (G. A.D. 75-80).

His was essentially a mediating rôle. He filled a position intermediate between Jewish and Pauline Christianity—one characteristic of Christian Hellenists generally. Hence he is spoken of with respect in the Clementines; while Paul, as a radical in relation to the Law, is discom tenced. If we could confidently credit him with the authorship of the epistle to the Hebrews, we could conceive his theological standpoint more exactly. But, in any case, the Barnabas of history was a greater man than the Barnabas of modern tradition.

See W. Cunningham, Epistles of Barnabas, pp. xlvi.-lxi.; O. Brunnesberger, Der Apostel Barnabas, secta Leben . . . (Mainz, 1876); articles s.v. in Ency. Biblica and Hastings's Dictionary of the Bible.

The Epistle of Barnabas is one of the apocryphal books of the New Testament. At the end of the Codex Sinaiticus of the 4th century, as a sort of appendix to the New Testament, there stands an "Epistle of Barnabas." Here it is followed by the Shepherd of Hermas, while in the 11th-century MS., which contains also the Didache, it is followed by two writings which resemble more closely form and content to the New Testament in the Codex Alexandrinus. This means that it once enjoyed quasi-canonical authority, a fact amply borne out by what Eusebius (H. E. iii. 25) says as to its standing in the ancient church. It was at Alexandria that its authority was greatest. Clement comments on it, as on the canonical scriptures, in his Hypotyposes; Origen cites it in the same spirit as scripture (C. Celsum, i. 63, De Princ. iii. 4, 7, 47). Clement, too, ascribes it to "the apostle" or "the prophet" Barnabas (Strom. ii. 6, 33, cf. ii. 20, 116), with explicit reference to Paul's fellow-apostle. Internal evidence makes this ascription likely, nor need it be doubted to such authorship. Lightfoot, indeed, suggests that its author was "some unknown namesake" of the famous Barnabas: but it is simpler to suppose that it was fathered upon the latter by the Alexandrian Church, ready to believe that so favourable a writing was of apostolic origin.

That Alexandria, the place of its earliest reception, was also the place of its birth, is borne out by the internal evidence of style and interpretation, which is Alexandrian throughout (Lightfoot). The picture, too, which it gives of the danger lest the Christianity of its readers should be unduly Judaic in its own decision implies of the writer living in Alexandria, where Judaism was immensely strong. Further, he shows an "astonishing familiarity with the Jewish rites," in the opinion of a modern Jew (Kohler in the Jewish Encyc.); so much so, that the latter agrees with another Jewish scholar in saying that "the writer seems to have been a converted Jew, whose fanatic zeal rendered him a bitter opponent of Judaism within the Christian Church." These opinions must overrule the view of some Christian scholars that the writer often blunders in Jewish matters, the fact being that his knowledge is derived from the Jew of Alexandria rather than Palestine. But we need not therefore regard the author as of Jewish birth. It is enough, and more in keeping with the thought as a whole, to regard him as having been in close contact with Judaism, possibly as a proselyte. He now uses his knowledge to warn his readers, with intense passion, against all compromise between Judaism and the Gospel. In this he goes far as to deny any historical connexion between the two, maintaining with all the devices of an extravagant allegorism, including the Rabbinic Gematria based on the numerical values of letters (ix. 7 f.), that the Law and Prophecy, as meant by God, had never been given to Israel as a people. The Divine oracles had ever pointed to the Christian Covenant, and had been so understood by the men of God in Israel, whereas the apostate people had turned aside to keep the ceremonial letter of the Law at the instigation of an evil angel (ix. 4). In this way he takes in succession the typical Jewish institutions—Circumcision, Foods, Ablutions, Covenant, Sabbath, Temple—showing their spiritual counterpart in the New People and its ordinances, and that the Cross was prefigured from the first. Such insight (gnosis) into the reality of the case as regards the natural issue of Christian faith; and it is his main object to help his readers to attain such spirituality—the more so that, by similar insight applied to the signs of the times, he knows and can show that the end of the present age is imminent (i. 5, 7-iv.). The burden of his epistle, then, is, "Let us become

1 His reference to the wide prevalence of circumcision beyond Israel (ix. 6) is perhaps simply an exaggeration, more or less conscious.
BARNACLE—BARNARD

spiritual, a perfect temple unto God” (iv. 11); and that not only by theoretic insight, but also by practical wisdom of life. In order to enforce this moral, he passes to “another sort of gnosis and instruction” (xviii. 1), viz. the precepts of the “Two Ways,” cited in a slightly different form from that found in the first part of the Teaching of the Apostles. The modifications, however, are all in a more spiritual direction, in keeping with the genuinely evangelic spirit which underlies and pervades even the allegorical ingenuities of the epistle.

Its opening shows it to have been addressed to a Church, or rather a group of Churches, recently visited by the writer, who, while not wishing to write as an authoritative “teacher” so much as one who has come to love them as a friend (i. 8, cf. ix. 9), yet belongs to the class of “teachers” with a recognized spiritual gift (charisma), referred to e.g. in the Didache. He evidently feels in a position to give his gnosis with some claim to a deferential hearing. This being so, the epistle was probably written, not to Alexandria, but rather by a “teacher” of the Alexandrine Church to some body of Christians in Lower Egypt among whom he had recently been visiting. This would explain the absence of specific address, so that it appears as in form a “general epistle” of the Origin; styles it. Its date has been much debated. But Lightfoot’s reading of the apologetic passage in ch. iv.—

with a slight modification suggested by Sir W. M. Ramsay—is really conclusive for the reign of Vespasian (A.D. 70–79). The main counter-view, in favour of a date about A.D. 130, can give no natural account of this passage, while it misconstrues the reference in ch. xvi. to the building of the spiritual temple, the Christian Church. Thus this epistle is the earliest of the Apostolic Fathers, and as such of special interest. Its central problem, the relation of Judaism and Christianity—of the Old and the New forms of a Covenant which, as Divine, must in a sense be the same—was one which gave the early Church much trouble; nor, in absence of a due theory of the education of the race by gradual development, was it able to solve it satisfactorily.

LITERATURE.—Besides collected editions of the Apostolic Fathers, see O. Braunsberger, Der Apostel Barnabas, . . . „a dem beigegleite Brief“ (Mainz, 1876); W. Cunningham, Epistle of Barnabas (1877); sections in J. Donalkson, The Apostolic Fathers; E. Reuss, Théologie chrétienne, vol. ii., and M. von Engelhardt, Das Christenthum Justinus des Martyrers; and Lightfoot’s fragmentary essay in his Clement of Rome, B. 503–512. See also Apocryphal Literature, see, “New Testament.”

Gospel of Barnabas.—We read in antiquity, e.g. in the Decretum Gelasti, of an apocryphal Gospel of Barnabas (see Apocryphal Literature), but we have no knowledge of its contents. There exists, however, in a single MS. in Italian a longish gospel with this title, written from a Mahomedan standpoint, but probably embodying materials partly Gnostic in character and origin. The Italian MS. was found by the Deist, John Toland, in a private collection at Amsterdam (see his Nausenus, 1718); subsequently it came into the possession of Prince Eugene of Savoy, and finally was obtained by Eugene’s library by the imperial library at Vienna. It has been edited, with an English translation (1907) by (Rev.) Lonsdale and Laura Ragg, who hold that it was the work of a Christian renegade to Mahomedanism about the 15th–16th century. See also preliminary notice in the Journal of Theol. Studies, vi. 424 ff. The old view held by Toland and others that the Italian was a translation from the Arabic is demonstrably wrong. The Arabic marginal notes are apparently partly pious ejaculations, partly notes for the aid of Arabic students. The work is highly imaginative and often grotesque, but it is pervaded by an unusually high ethical enthusiasm.

BARNACLE, a name applied to Crustacea of the division Cirripedia or Thyrostraca. Originally, the name was given to the stalked barnacles (Lepadidae of C. Darwin), which attach themselves in great numbers to drift-wood and other objects floating in the sea and are one of the chief agents in the fouling of ships’ bottoms during long voyages. The sessile barnacles (Balanidae of Darwin) or “acorn-shells” are found in myriads, encrusting the rocks between tide-marks on all coasts. One of the most extraordinary and persistent myths of medieval nature history, dating back to the 12th century at least, was the cause of transferring to these organisms the name of the barnack or barnacle goose (Barnaca branta). This bird is a winter visitor to Britain, and its Arctic nesting-places being then unknown, it was fabled to originate within the shell-like fruit of a tree growing by the sea-shore. In some variants of the story this shell is said to grow as a kind of mushroom on rotting timber in the sea, and is obviously one of the barnacles of the genus Lepas. Even after the scientific study of zoology had replaced the fabulous tales of medieval writers, it was a long time before the true affinities of the barnacles were appreciated, and they were at first classed with the mollusca, some of which they closely resemble in external appearance. It was not till Vaughan Thompson demonstrated, in 1830, their development from a free-swimming and typically crustacean larva that it came to be recognized that, in Huxley’s graphic phrase, “a barnacle may be said to be a crustacean fixed by its head and kicking the food into its mouth with its legs.” For a systematic account of the barnacles and their allies, see the article Thyrostraca. (W.T.C.A.)

BARNARD, LADY ANNE (1750–1835), author of the ballad “Auld Robin Gray,” the eldest daughter of James Lindsay, 5th earl of Balcarras, was born at Balcarras House, Fife, on the 12th of December 1750. She was married in 1793 to Andrew Barnard, a son of the bishop of Limerick, for whom she obtained from Henry Dundas (1st Viscount Melville) an appointment as colonial secretary at the Cape of Good Hope. Thither the Barnards went in March 1797, Lady Anne remaining at the Cape until January 1802. A remarkable series of letters written by Lady Anne thence to Dundas, then secretary for war and the colonies, was published in 1801 under the title South Africa a Century Ago. In 1806, on the reconquest of the Cape by the British, Barnard was reappointed colonial secretary, but Lady Anne did not accompany him thither, where he died in 1807. The rest of her life was passed in London, where she died on the 6th of May 1825. “Auld Robin Gray” was written by her in 1772, to music by the Rev. William Leeves (1748–1828), as he admitted in 1812. It was published anonymously in 1783, Lady Anne only acknowledging the authorship of the words two years before her death in a letter to Sir Walter Scott, who subsequently edited it for the Bannatyne Club with two continuations.

See the memoir by W. H. Wilkins, together with the original text of “Auld Robin Gray,” prefixed to South Africa a Century Ago.

BARNARD, FREDERICK AUGUSTUS PORTER (1809–1889), American scientist and educationalist, was born in Sheffield, Massachusetts, on the 5th of May 1809. In 1828 he graduated, second on the honour list, at Yale. He was then in turn a tutor at Yale, a teacher (1831–1832) in the American Asylum for the
Deaf and Dumb at Hartford, Connecticut, and a teacher (1832–1838) in the New York Institute for the Instruction of the Deaf and Dumb. From 1838 to 1848 he was professor of mathematics and natural philosophy, and from 1848 to 1854 was professor of chemistry and natural history in the University of Alabama, for two years, also, filling the chair of English literature. In 1854 he was ordained as deacon in the Protestant Episcopal Church. In the same year he became professor of mathematics and natural philosophy in the University of Mississippi, of which institution he was chancellor from 1856 until the outbreak of the Civil War, when, his sympathies being with the North, he resigned and went to Washington. There for some time he was in charge of the map and chart department of the United States Coast Survey. In 1864 he became the tenth president of Columbia College (now Columbia University) in New York City, which position he held until the year before his death, his service thus being longer than that of any of his predecessors. During this period the growth of the college was rapid; new departments were established; the elective system was greatly extended; much more adequate provision was made for graduate study and original research, and the enrolment was increased from about 150 to more than 1000 students. Barnard strove to have educational privileges extended by the university to women as well as to men, and Barnard College, for women (see COLUMBIA UNIVERSITY), established immediately after his death, was named in his honour. He died in New York City on the 27th of April 1889. Barnard was a versatile man, of catholic training, a classical and English scholar, a mathematician, a physicist, and a chemist, a good public speaker, and a vigorous but somewhat prolix writer on various subjects. His annual reports to the Board of Trustees of Columbia being particularly valuable as discussions of educational problems. Besides being the editor-in-chief, in 1872, of Johnson’s Universal Cyclopaedia, he published a Treatise on Arithmetic (1839); an Analytical Grammar with Symbolic Illustration (1840); Letters on Collegiate Government (1853); and Recent Progress in Science (1860).

See John Fulton’s Memoirs of Frederick A. P. Barnard (New York, 1890).

BARNARD, GEORGE GREY (1863– ), American sculptor, was born at Bellefonte, Pennsylvania, on the 24th of May 1863. He first studied at the Art Institute, Chicago, and in 1883–1887 worked in P. T. Cavelier’s atelier at Paris. He lived in Paris for twelve years, returning to America in 1896; and with his first exhibit at the Salon of 1894 he scored a great success. His principal works include, “The Boy” (1885); “Cain” (1886), later destroyed; “Brotherly Love,” sometimes called “The Two Sisters” (1887); the allegory “The Allegro” (1894), in the Metropolitan Museum, New York City; “The Hermit” (1902, at Cairo, Illinois); “Great God Pan” (in Central Park, New York City); the “Rose Maiden”; the simple and graceful “Maidenhair”; and sculptural decorations for the new Capitol building for the state of Pennsylvania at Harrisburg.

BARNARD, HENRY (1811–1900), American educationalist, was born in Hartford, Connecticut, on the 24th of January 1811. He graduated at Yale in 1830, and in 1833 was admitted to the Connecticut bar. In 1837–1839 he was a member of the Connecticut legislature, effecting in 1838 the passage of a bill, framed and introduced by himself, which provided for “the better supervision of the common schools” and established a board of “commissioners of common schools” in the state. Of this board he was the secretary from 1838 till its abolition in 1842, and during this time worked indefatigably to reorganize and reform the common school system of the state, thus earning a national reputation as an educational reformer. In 1843 he was appointed by the governor of Rhode Island agent to examine the public schools of the state, and recommended improvements; and his work resulted in the reorganization of the school system two years later. From 1845 to 1849 he was the first commissioner of public schools in the state, and his administration was marked by a decided step in educational progress. Returning to Connecticut, he was, from 1851 to 1855, “superintendent of common schools,” and principal of the State Normal School at New Britain, Conn. From 1859 to 1860 he was chancellor of the University of Wisconsin and agent of the board of regents of the normal school fund; in 1866 he was president of St John’s College, Annapolis, Maryland; and from 1867 to 1870 he was the first United States commissioner of education, and in this position he laid the foundation for the subsequent useful work of the Bureau of Education. His chief service to the cause of education, however, was rendered as the editor, from 1855 to 1881, of the American Journal of Education, the thirty-six volumes of which are a veritable encyclopaedia of education, one of the most valuable compendiums of information on the subject ever brought together through the agency of any one man. He also edited from 1838 to 1842, and again from 1851 to 1854, the Connecticut Common School Journal, and from 1846 to 1849 the Journal of the Rhode Island Institute of Instruction. He died at Hartford, Conn., on the 5th of July 1900. Among American educational reformers, Barnard is entitled to rank next to Horace Mann of Massachusetts.

BARNARD, JOHN, English musician, was a minor canon of St Paul’s in the reign of Charles I. He was the first to publish a collection of English cathedral music. It contains some of the finest 16th-century masterpieces, ranging from the “foundations” to the style of Tallis’s Psalms and Responses to the most developed types of full anthem. The text, however, is not trustworthy.

BARNARD CASTLE, a market-town in the Barnard Castle parliamentary division of Durham, England, 17 m. W. of Darlington by a branch of the North Eastern railway. Pop. of urban district (1901) 4421. It is beautifully situated on the steep left bank of the Tees. A noteworthy building in the town is the octagonal town-hall, dating from 1747. There are a few picturesque old houses, and a fragment of an Augustinian convent. St Mary’s church, in a variety of styles from Norman onward, contains some curious tombs; but the building of chief interest is the castle, which gives the town its name, and is the principal scene of Sir Walter Scott’s Rokeby. The remains extend over a space of more than six acres. A remarkable building known as the Bowes’ Mansion and Museum, bequeathed in 1874 to the town by a descendant of Sir George Bowes, contains a valuable collection of works of art. In the vicinity of the town are Egglesstone Abbey, beautifully situated on the Yorkshire bank of the river, Rokeby Park on the same bank, at the confluence of the Greta, and the massive 14th century castle of Raby to the north-east. The principal manufacture is shoe-thread. The castle is impregnable.

As part of the lordship of Gainford, Barnard Castle is said to have been granted by William Rufus to Guy Baliol Bernard, son of Guy Baliol, who built the castle, and called it after himself, Castle Bernard. To the men of the town which grew up outside the castle walls he gave, about the middle of the 12th century, a charter making them burgesses and granting them the same privileges as the town of Richmond in Yorkshire. This charter was confirmed by Bernard Baliol, son of the above Bernard. Other confirmation charters were granted to the town by Hugh, John and Alexander de Baliole. The provost and the eight members of the hands of the Balioles until John Baliol, king of Scotland, forfeited them with his other English estates in 1296. Barnard Castle was then seized by Anthony, bishop of Durham, as being within his patrimony of Durham. Edward I., however, denied the bishop’s rights and granted the castle and town to Guy Beauchamp, earl of Warwick, whose descendants continued to hold them until they passed to the crown by the marriage of Anne Neville with Richard III., then duke of Gloucester. In 1630 Barnard Castle was sold to Sir Henry Vane, and in the same year the castle is said to have been unroofed and dismantled for the sake of the materials of which it was built. Tanning leather was formerly one of the chief industries of the town. In 1614 an act for “knights and burgesses to have place in parliament for the county palatine and city of Durham and borough of Barnard
BARNARDO—BARNAVE

Castle" was brought into the House of Commons, but when the act was finally passed for the county and city of Durham, Barnard Castle was not included.

BARNARDO, THOMAS JOHN (1845–1905), English philanthropist, and founder and director of homes for destitute children, was born at Dublin, Ireland, in 1845. His father was of Spanish origin, his mother being an Englishwoman. With the intention of qualifying for medical missionary work in China, he studied medicine at the London hospital, and later at Paris and Edinburgh, where he became a fellow of the Royal College of Surgeons. His medical work in the east end of London during the epidemic of cholera in 1866 first drew his attention to the great numbers of homeless and destitute children in the cities of England. Encouraged by the support of the seventh earl of Shaftesbury and the first Earl Cairns, he gave up his early ambition of foreign missionary labour, and began what was to prove his life's work.

The first of the "Dr Barnardo's Homes" was opened in 1869 in Stepney Causeway, London, where are still the headquarters of the institution. From that time the work steadily increased until, at the time of the founder's death, in 1905, there were established 112 district "Homes," besides mission branches, throughout the United Kingdom. The object for which these institutions were started was to search for and to receive waifs and strays, to feed, clothe, educate, and, where possible, to give an industrial training suitable to each child. The principle adopted has been that of free and immediate admission; there are no restrictions of age or sex, religion or nationality; the physically robust and the incurably diseased are alike received, the one necessary qualification being the necessity of the child's case. Systems of work have been carried out in broadly as follows:—the infants and younger girls and boys are chiefly "boarded out" in rural districts; girls above fourteen years of age are sent to the industrial training homes, to be taught useful domestic occupations; boys above seventeen years of age are first tested in labour homes and then placed in employment at home, sent to sea or emigrated; boys of between thirteen and seventeen years of age are trained for the various trades for which they may be mentally or physically fitted. Besides the various branches necessary for the foregoing work, there are also, among others, the following institutions:—a rescue home for girls in danger, a cottawseal seaside home, and a hospital for sick waifs. In 1872 was founded the girls' village home at Barkingside, near Ilford, with its own church and sanatorium, and between sixty and seventy cottage homes, forming a real "garden city"; and there Barnardo himself was buried. In 1901, through the generosity of Mr E. H. Watts, a naval school was started at North Elmham, near Norwich, to which boys are drafted from the homes to be trained for the navy and the mercantile marine. Perhaps the most useful of all the varied work instituted by Barnardo is the emigration system, by which means thousands of boys and girls have been sent to British colonies, chiefly to Canada, where there are distributing centres at Toronto and Winnipeg, and an industrial farm of some 800 acres near Russell in Manitoba. The fact that in Canada less than 2% of the children sent out proved failures confirmed Barnardo's conviction that "if the children of the slums can be removed from their surroundings early enough, and can be kept sufficiently long under training, heredity counts for little, environment for almost everything." In 1899 the various institutions and organizations were legally incorporated under the title of "The National Association for the reclamation of Destitute Waif Children," but the institution has always been familiarly known as "Dr Barnardo's Homes." Barnardo laid great stress on the religious teaching of the children under his care. Each child is brought up under the influence and teaching of the denomination of the parents. The homes are divided into two sections for religious teaching, Church of England and Nonconformists; children of Jewish and Roman Catholic parentage are, where possible, handed over to the care of the Jewish Board of Guardians in London, and to Roman Catholic institutions, respectively. From the foundation of the homes in 1867 to the date of Barnardo's death, nearly 60,000 children had been rescued, trained and placed out in life. Barnardo died of angina pectoris in London on the 19th of September 1905. A national memorial was instituted to form a fund of £250,000 to relieve the various institutions of all financial liability and to place the entire work on a permanent basis. Dr William Baker, formerly the chairman of the council, was selected to succeed the founder of the homes as director. Barnardo was the author of many books dealing with the charitable work to which he devoted his life.

His biography (1906) was written by his wife (the daughter of Mr William Elmslie) and J. Marchant.

BARNAU, a town of Asiatic Russia, government of Tomsk, standing in a plain bounded by offshoots of the Altai Mountains, and on the Barnaulka river, at its confluence with the Ob, in lat. 53° 20' N. and long. 83° 46' E., 220 m. S. of Tomsk. It is the capital of the Altai mining districts, and besides smelting furnaces possesses glassworks, a bell-foundry and a mint. It has also a meteorological observatory, established in 1841, a mining school and a museum with a rich collection of mineral and zoological specimens. Barnaul was founded in 1765 by A. Demidov, to whose memory a monument has been erected. Pop. (1897) 20,850.

BARNAVE, ANTOINE PIERRE JOSEPH MARIE (1761–1793), one of the greatest orators of the first French Revolution, was born at Grenoble in Dauphiné, on the 22nd of October 1761. He was of a Protestant family. His father was an advocate at the parlement of Grenoble, and his mother was a woman of high birth, superior ability and noble character. He was educated by his mother because, being a Protestant, he could not attend school, and he grew up at once thoughtful and passionate. He was brought up to the law, and at the age of twenty-two made himself favourably known by a discourse pronounced before the local parlement on the division of political powers. Dauphiné was one of the first of the provinces to feel the excitement of the coming revolution; and Barnave was foremost to give voice to the general feeling, in a pamphlet entitled Espirit des édits enregistrés militairement le 20 mai 1786. He was immediately elected deputy, with his father, to the states of Dauphiné, and took a prominent part in their debates. A few months later he was transferred to the chamber of deputies, and was succeeded by the states-general were convoked at Versailles for the 4th of May 1789, and Barnave was chosen deputy of the tiers état for his native province. He soon made an impression on the Assembly, became the friend of most of the leaders of the popular party, and formed with Adrien Duport and Alexandre Lameth (q.v.) the group known during the Constituent Assembly as "the triumvirate." He took part in the conference on the claims of the three orders, drew up the first address to the king, and supported the proposal of Sisyphus that the Assembly should declare itself National. Until 1791 he was one of the principal members of the club known as the Jacobins, of which he drew up the main rules (see JACOBINS). Though a passionate lover of liberty, he hoped to secure the freedom of France and her monarchy at the same time. But he was almost unwares borne away by the mighty currents of the time, and he took part in the attacks on the monarchy, on the clergy, on church property, and on the provincial parlements. With the one exception of Mirabeau, Barnave was the most powerful orator of the Assembly. On several occasions he stood in opposition to Mirabeau. After the fall of the Bastille he wished to save the throne. He advocated the suspensory veto, and the establishment of trial by jury in civil causes, but voted with the Left against the system of two chambers. His conflict with Mirabeau on the question of assigning to the king the right to make peace or war (from the 16th to the 23rd of May 1791) was one of the most striking scenes in the Assembly. In August 1790, after a vehement debate, he fought a duel with J. A. M. de Cazalès, in which the latter was slightly wounded. About the close of October 1790 Barnave was called to the presidency of the Assembly. On the death of Mirabeau a few months later, Barnave paid a high tribute to his worth and public services, designating him the Shakespeare of oratory. On the arrest of the king and the royal family at Varennes, while attempting to escape from France, Barnave was
one of the three appointed to conduct them back to Paris. On the journey he was deeply affected by the mournful fate of Marie-Antoinette, and resolved to do what he could to alleviate what he regarded as her misery. In one of his most powerful speeches he maintained the inviolability of the king's person. His public career came to an end with the close of the Constituent Assembly, and he returned to Grenoble at the beginning of 1792. His sympathies and relations with the royal family, to whom he had submitted a plan for a counter-revolution, and his desire to check the downward progress of the Revolution, brought on him suspicion of treason. Denounced (15th of August 1792) in the Legislative Assembly, he was arrested and imprisoned for ten months at Grenoble, then transferred to Fort Barraux, and in November 1793 to Paris. The nobility of his character was proof against the assaults of suffering. "Better to suffer and to die," he said, "than lose one shade of my moral and political character." On the 28th of November he appeared before the Revolutionary Tribunal. He was condemned on the evidence of papers found at the Tuileries and executed the next day, with Duport-Dutertre.

Barnave's Œuvres posthumes were published in 1842 by Berenger (de la Bruère) in 4 vols. See A. Aulard, Les Oeuvres de l'Assemblée constituante (Paris, 1882).

BARNBY, SIR JOSEPH (1838-1896), English musical composer and conductor, son of Thomas Barnby, an organist, was born at York on the 21st of August 1838. He was a chorister at York minster from the age of seven, was educated at the Royal Academy of Music under Cipriani Potter and Charles Lucas, and was appointed in 1852 organist of St Andrew's, Wells Street, London, where he raised the services to a high degree of excellence. He was conductor of "Barnby's Choir" from 1864, and in 1872 was appointed, in succession to Gounod, conductor of the Albert Hall Choral Society, a post he held till his death. In 1875 he was precentor and director of music at Eton, and in 1892 became principal of the Guildhall School of Music, receiving the honour of knighthood in July of that year. He conducting an oratorio Reheb, Ps. xxvii., many services and anthems, and two hundred and forty-six hymn-tunes (published in 1897 in one volume), as well as some part-songs (among them the popular "Sweet and Low"), and some pieces for the organ. As a conductor he possessed the qualities as well as the defects of the typical north-countryman; if he was wanting in the higher kind of imagination or ideality, he infused into those who sang under him something of his own rectitude and precision. He was largely instrumental in stimulating the love for Gounod's sacred music among the less educated part of the London public, although he displayed little practical sympathy with opera. On the other hand, he organized a remarkable concert performance of Parsifal at the Albert Hall in London in 1884. He conducted the Cardif Festivals of 1892 and 1895. He died in London on the 28th of January 1896, and after a special service in St Paul's cathedral was buried in Norwood Cemetery.

BARNES, ALBERT (1798-1870), American theologian, was born at Rome, New York, on the 1st of December 1798. He graduated at Hamilton College, Clinton, N.Y., in 1820, and at the Princeton Theological Seminary in 1823, was ordained as a Presbyterian minister by the presbytery of Elizabethtown, New Jersey, in 1825, and was the pastor successively of the Presbyterian Church in Morristown, New Jersey (1825-1830) and of the First Presbyterian Church of Philadelphia (1830-1867). He held a prominent place in the New School branch of the Presbyterians, to which he adhered on the division of the denomination in 1837; he had been tried (but not convicted) for heresy in 1836, the charge being particularly against the views expressed by him in Notes on Romans (1835) of the imputation of the sin of Adam, original sin and the atonement; the bitterness stirred up by this trial contributed towardswidening the breach between the conservative and the progressive elements in the church. He was an eloquent preacher, but his reputation rests chiefly on his expository works, which are said to have had a larger circulation both in Europe and America than any others of their class. Of the well-known Notes on the New Testament it is said that more than a million volumes had been issued by 1870. The Notes on Job, the Psalms, Isaiah and Daniel, found scarcely less acceptance. Displaying no original critical power, their chief merit lies in the fact that they bring in a popular (but not always accurate) form the results of the criticism of others within the reach of general readers. Barnes was the author of several other works of a practical and devotional kind, and a collection of his Theological Works was published in Philadelphia in 1875. He died in Philadelphia on the 24th of December 1870.

BARNES, BARNABE (1560?—1600), English poet, fourth son of Dr Richard Barnes, bishop of Durham, was born in Yorkshire, perhaps at Stonegrave, a living of his father's, in 1568 or 1569. In 1586 he was entered at Brasenose College, Oxford, where Giovanni Florio was his servitor, and in 1591 went to France with the earl of Essex, who was then serving against the prince of Parma. On his return he published Parthenophil and Parthenophila, Sonnettes, Madrigals, Elegies and Odes (ent. on Stationers' Register 1593), dedicated to his "dearest friend," William Percy, who contributed a sonnet to the eulogies prefixed to a later work, Offices. Parthenophil was possibly printed for Dobson in 1591, although often supposed to have been written before the foundation of the Library of St John's. His Library is believed to be unique. Barnes was well acquainted with the work of contemporary French sonnetters, to whom he is largely indebted, and he borrows his title, apparently, from a Neapolitan writer of Latin verse, Hieronymus Angerianus. It is possible to outline a story from this series of love lyrics, but the incidents are slight, and in this case, as in other Elizabethan sonnet-cycles, it is difficult to dogmatize as to what is the expression of a real personal experience, and what is intellectual exercise in imitation of Petrarch. Parthenophil abounds in passages of great freshness and beauty, although elaborate conceits are sometimes over-ingenuous and strained. Barnes took the part of Gabriel Harvey and even experimented in classical metres. This partisanship is sufficient to account for the abuse of Thomas Nashe, who accused him, apparently on no proof at all, of stealing a nobleman's chain at Windsor, and of other things. Barnes's second work, A Divine Centurie of Spirituall Sonnetts, appeared in 1595. He also wrote two plays:—The Devil's Charter (1607), a tragedy dealing with the life of Pope Alexander VI., which was played before the king; and The Battle of Exeom (or Hexam), of which the MS., traced to the hand of Sir Edward Hovenden, is in the duke of Devonshire's collection of papers and letters, and is said to have been written for the special service of all good Princes and Policies, a prose treatise containing, among other things, descriptions of Queen Elizabeth and of the earl of Essex. Barnes was buried at Durham in December 1600. His Parthenophil and Spirituall Sonnetts were edited by Dr A. B. Grosart in a limited issue in 1875; Parthenophil was included by Prof. E. Arber in vol. v. of An English Garner; see also the new edition of An English Garner (Elizabethan Sonnetts, ed. S. Lee, 1904, pp. lxv. et seq.). Professor E. Dowden contributed a sympathetic criticism of Barnes to The Academy of Sept. 2, 1876.

BARNES, SIR EDWARD (1776-1838), British soldier, entered the 47th regiment in 1792, and quickly rose to field rank. He was promoted lieutenant-colonel in 1807, and colonel in 1810, and two years later went to the Peninsula to serve on Wellington's staff. His services in this capacity gained him further promotion, and as a major-general he led a brigade at Vittoria and in the Pyrenean battles. He had the cross and three clasps for his Peninsula service. As adjutant-general he served in the campaign of 1814 and was wounded at Waterloo. Already a K.C.B., he now received the Austrian order of Maria Theresa, and the Russian order of St Anne. In 1819 began his connexion with Ceylon, of which island he was governor from 1824 to 1831. He directed the construction of the great military road between Colombo and Kandy, and of many other lines of communication, made the first census of the population, and introduced coffee cultivation on the West Indian system (1824). In 1831 he received the G.C.B., and from 1831 to 1833 he was commander-in-chief in India, with the local rank of general. On his return home, after two unsuccessful attempts to secure the seat, he became M.P. for Sudbury in 1837, but he died in the following
BARNES, J.—BARNES, W.

413

year. Sir Edward Barnes' portrait was painted, by Celyon, by John Wood, and a memorial statue was erected in Colombo.

BARNES, JOSHUA (1654—1712), English scholar, was born in London on the 10th of January 1654. Educated at Christ's Hospital and at Emmanuel College, Cambridge, he was in 1655 chosen regius professor of Greek, a language which he wrote and spoke with the utmost facility. One of his first publications was entitled Gerania; a New Discovery of a Little Sort of People, anciently discoursed of, called Pygmies (1652), a whimsical sketch to which Swift's Voyage to Lilliput possibly owes something. Among his other works are a History of that Most Victorious Monarch Edward III. (1688), in which he introduces long and elaborate speeches into the narrative; editions of Euripides (1694) and of Homer (1711), also one of Anacreon (1705) which contains titles of Greek verses of his own which he hoped would be published. In the 3rd of August 1712, at Hemingford, near St Ives, Hunts.

BARNES, ROBERT (1405—1550), English reformatory and martyr, born about 1405, was educated at Cambridge, where he was a member, and afterwards prior of the convent at Austin Friars, and graduated D.D. in 1523. He was apparently one of the Cambridge men who were wont to gather at the White Horse Tavern for Bible-reading and theological discussion early in the third decade of the 16th century. In 1526, he was brought before the vice-chancellor for preaching a heterodox sermon, and was subsequently examined by St Paul's four other bishops. He was condemned to abide or be burnt; and preferring the former alternative, was committed to the Fleet prison and afterwards to the Austin Friars in London. He escaped thence to Antwerp in 1528, and also visited Wittenberg, where he made Luther's acquaintance. He also came across Stephen Vaughan, an agent of Thomas Cromwell and an advanced reformer, who recommended him to Cromwell: "Look well," he wrote, " upon Dr Barnes' book. It is such a piece of work as I have not yet seen any like it. I think he shall seal it with his blood." (Letters and Papers... VIII. 1528—1531.) Barnes returned to England, and became one of the chief intermediaries between the English government and Lutheran Germany. In 1533 he was sent to Germany, in the hope of inducing Lutheran divines to approve of Henry's divorce from Catherine of Aragon, and four years later he was employed in negotiations connected with Anne of Cleves' marriage. The policy was Cromwell's, but Henry VIII. had already in 1538 refused to adopt Lutheran theology, and the statute of Six Articles (1539), followed by the king's disgust with Anne of Cleves (1540), brought the agents of that policy to ruin. An attack upon Bishop Gardiner was subsequently examined by St Paul's Council, and the signal for a bitter struggle between the Protestant and reactionary parties in Henry's council, which raged during the spring of 1540. Barnes was forced to apologize and recant; and Gardiner delivered a series of sermons at St Paul's Cross to counteract Barnes' invective. But a month or so later Cromwell was made earl of Essex, Gardiner's friend, Bishop Sampson, was sent to the Tower, and Barnes returned to Lutheranism. It was a delusive victory. In July, Cromwell was attained, Anne of Cleves was divorced and Barnes was burnt (30th July 1540). He also had an act of attainer passed against him, by a somewhat novel distinction in the punishment of heresy, which illustrates the way in which Henry VIII. employed secular machinery for ecclesiastical purposes, and regarded heresy as an offence against the state rather than against the church. Barnes was one of six executed on the same day: two, William Jerome and Thomas Gerrard, were, like himself, burnt for heresy under the Six Articles; three, Thomas Abel, Richard Fetherstone and Edward Powell, were hanged for treason in denying the royal supremacy. Both Lutherans and Catholics on the continent were shocked. Luther published Barnes' confession with a preface of his own as Bekenntnis des Glaubens (1540), which is included in Walch's edition of Luther's Werke xxii. 186.

BARNES, THOMAS (1785—1841), British journalist, was born about 1785. Educated at Christ's Hospital and Pembroke College, Cambridge, he came to London and soon joined the famous literary circle of which Hunt, Lamb and Hazlitt were prominent members. Upon the retirement of Dr Stoddart in 1817 he was appointed editor of The Times, a position which he held until his death, when he was succeeded by Delane. Lord Lyndhurst gave expression to a very widely-held opinion when he described him as "the most powerful man in the country." He died on the 7th of May 1841.

BARNES, WILLIAM (1800—1886), the Dorsetshire poet, was born at Blandford on 12th February 1800, at Rushbury near Pentridge in Dorset, the son of John Barnes and Grace Scott, of the farmer class. He was a delicate child, in direct contrast to a strong race of forebears, and inherited from his mother a refined, retiring disposition and a love for books. He went to school at Sturminster Newton, where he was considered the clever boy of the school; and when a solicitor named Dashwood applied to the master for a quick-witted boy to join him as pupil, Barnes was selected for the post. He worked with the village parson in his spare hours at classics and studied music under the organist. In 1818 he left Sturminster for the office of one Coombe at Dorchester, where he continued his evening education with another kindly clergyman. He also made great progress in the art of wood-engraving, and with the money he received for a series of blocks for a work called Walks about Dorchester, he printed and published his first book, Orra, a Landscape Tale, in 1822. In the same year he became engaged to Julia Miles, the daughter of an excise officer. In 1823 he took a school at Mare in Wiltshire, and for four years later married and settled in Chantry House, a fine old Tudor mansion in that town. The school grew in numbers, and Barnes occupied all his spare time in assiduous study, reading during these years Shakespeare, Johnson, and other classical authors. In 1831 he published An Etymological Glossary of English Words of Foreign Derivation. In 1832 a strolling company of actors visited Mare, and Barnes wrote a farce, The Honest Thief, which they produced, and a comedy which was played at Wincanton. Barnes also wrote a number of educational books, such as Elements of Perspective, Outlines of Geography, and in 1833 first began his poems in the Dorsetshire dialect, among them the two eclogues "The Reader" and "The Drolley," in the pages of the local paper. In 1835 he left Mare, and returned to Dorchester, where he started another school, removing in 1837 into larger quarters. In 1844 he published Poems of Rural Life in the Dorset Dialect. Three years later Barnes took holy orders, and was appointed to the cure of Whitcombe, 3 m. from Dorchester. He had been for some years upon the books of St John's College, Cambridge, and took the degree of B.D. in 1850. He resigned Whitcombe in 1832, finding the work too hard in connexion with his mastership; and in June of that year he sustained a severe bereavement by the death of his wife. Continuing his studies in the science of language, he published his Philological Grammar in 1854, drawing examples from more than sixty languages. For the copyright of this erudite work he received £5. The second series of dialect poems, Hewnely Rhymes, appeared in 1859 (2nd ed. 1863). Hewnely Rhymes contained some of his best-known pieces, and in the year of its publication he first began to give readings from his works. As their reputation grew he travelled all over the country, delighting large audiences with his quaint humour and natural pathos. In 1861 he was awarded a civil list pension of £70 a year, and in the next year published Till, the most striking of his philological studies, in which the Teutonic roots in the English language are discussed. Barnes had a horror of Latin forms in English, and would have substituted English compounds for many Latin forms in common use. In 1862 he broke up his school, and
removed to the rectory of Winterborne Came, to which he was presented by his old friend, Captain Seymour Dawson Damér. Here he worked continuously at verse and prose, contributing largely to the magazine. A new series of Poems of Rural Life in the Dorset Dialect appeared in 1862, and he was persuaded in 1868 to publish a series of Poems of Rural Life in Common English, which was less successful than his dialect poems. These latter were collected into a single volume in 1879, and on the 7th of October 1886 Barnes died at Winterborne Came. His poetry is essentially English in character; no other writer has given quite so simple and sincere a picture of the homely life and labour of rural England. His work is full of humour and the clean, manly joy of life; and its rusticity is singularly allied to a literary sense and to high technical finish. It is indeed the Victorian Thracius; and, as English country life is slowly swept away before the advance of the railway and the telegraph, he will be more and more read for his warm-hearted and fragrant record of rustic love and piety. His original and suggestive books on the English language, which are valuable in spite of their eccentricities, include:—Se Gefysta: an Anglo-Saxon Delectus (1849); A Grammar and Glossary of the Dorset Dialect (1864); An Outline of English Speech-Craft (1878); and A Glossary of the Dorset Dialect (Dorchester, 1886).

BARNET, a residential district in the mid or St Albans parliamentary division of Hertfordshire, England; 10 m. N. of London, served by the main line and branches of the Great Northern railway. The three chief divisions are as follows:—(1) Chipping or High Barnet, a market town and urban district (Barnet), pop. (1901) 7876. The second, epitaph designates its position on a hill, but the first is given it from the market granted to the abbeys of St Albans to be kept there, by Henry II. Near the town, round a point marked by an obelisk, was fought in 1471 the decisive battle between the houses of York and Lancaster, in which the earl of Warwick fell and the Lancastrians were totally defeated. The town is on the Great North Road, on which it was formerly an important coaching station. A large annual horse and cattle fair is held. (2) East Barnet, 2 m. S.E. of Chipping Barnet, has an ancient parish church retaining Norman portions, though enlarged in modern times. Pop. of East Barnet Valley urban district, 19,094. (3) New Barnet lies 1 m. E. by S. from Chipping Barnet.

FRIERN Barnet, in the Enfield parliamentary division of Middlesex, lies 3 m. S. of Chipping Barnet. Pop. of urban district, 11,566. The prefix recalls the former lordship of the manor possessed by the friary of St John of Jerusalem in Clerkenwell, London. Friern Barnet adjoins Finchley on the north and Whetstone on the south, the whole district being residential.

BARNETT, John (1802–1860), English musical composer, son of a Prussian named Bernhard Beer, who changed his name on settling in England as a jeweller, was born at Bedford, and at the age of eleven sang on the Lyceum stage in London. His good voice led to his being given a musical education, and he soon began writing songs and lighter pieces for the stage. In 1834 he published a collection of Lyrical Illustrations of the Modern Poets. His Sylph,—with which his name is chiefly connected,—received a warm welcome when produced at the Lyceum on August 25, 1834, as the first modern English opera: and it was followed by another opera Fair Rosamund in 1837, and by Partinelli in 1851. He had a large connexion as a singing-master at Cheltenham, and published Systems and Steps (Barnet Valley) and School for the Voice (1844). He died on the 16th of April 1850.

His nephew, John Francis Barnett (1837–1919), son of John’s brother, Joseph Alfred, also a professor of music, carried on the traditions of the family as a composer and teacher. He obtained a queen’s scholarship at the Royal Academy of Music, and developed into an accomplished pianist, visiting Germany to study in 1857 and playing at a Gewandhaus concert at Leipzig in 1860. He came into notice as a composer with his symphony in A minor (1864), and followed this with a number of compositions for orchestra, strings or pianoforte. His cantata The Ancient Mariner was brought out at Birmingham in 1867, and another, Paradise and the Peri, in 1870, both with great success. In 1873 his most important work, the oratorio The Raising of Lazarus, was written, and in 1876 produced at Hereford. Many other cantatas, pianoforte pieces, &c. were composed by him, and successfully brought out; and he took an active part as a professor in the work of the Guildhall School of Music and Royal College of Music.

BARNETT, Samuel Augustus (1844–1921). English clergyman and social reformer, was born at Bristol on the 8th of February 1844, the son of Francis Augustus Barnett, an iron manufacturer. After leaving Wadham College, Oxford, in 1866, he visited the United States. Next year he was ordained to the curacy of St Mary’s, Blythe, and took priest’s orders in 1868. In 1872 he became vicar of St Jude’s, Commercial Street, Whitechapel, and in the next year married Henrietta Octavia Rowland, who had been a co-worker with Miss Octavia Hill and was no less ardent a philanthropist than her husband. Mr and Mrs Barnett worked hard for the poor of their parish, opening evening schools for adults, providing them with music and home comfort, and sending into the hands of the guardians and on the managing committees of schools. Mr Barnett did much to discourage outdoor relief, as tending to the pauperization of the neighbourhood. At the same time the conditions of indoor relief were improved, and the various charities were co-ordinated, by co-operation with the Charity Organization Society and the parish board of guardians. In 1875 Arnold Toynbee paid a visit, the first of many, to Whitechapel, and Mr Barnett, who kept in constant touch with Oxford, formed in 1877 a small committee, over which he presided himself, to consider the organization of university extension in London. His chief assistants being Leonard Montefiore, a young Oxford man, and Frederick Rogers, a member of the velum binders’ trade union. The committee received influential support, and in October four courses of lectures, one by Dr S. R. Gardiner on English history, were given in Whitechapel. The Barnettts were also associated with the building of model dwellings, with the establishment of the children’s country holiday fund and the annual loan exhibitions of fine art at the Whitechapel gallery. In 1884 an article by Mr Barnett in the Nineteenth Century discussed the question, and the late Dr A. Grosart that the poet was the life of Richard Barnfield (or Barnefield) and Maria Skrymsmer, his wife, who were married in April 1572. They resided in the parish of Norbury, in Staffordshire, on the borders of Solop, where the poet was baptized on the 13th of June 1574. The mother died in giving birth to a daughter early in 1581, and her unmarried sister, Elizabeth Skrymsmer, seems to have devoted herself to the care of the children. In November 1580 Barnfield matriculated at Brasenose College, Oxford, and took his degree in
BARNIM

February 1502. He “performed the exercise for his master’s gown,” but seems to have left the university abruptly, without proceeding to the M.A. It is conjectured that he came up to London in 1503, and became acquainted with Watson, Drayton, and perhaps with Spenser. The death of Sir Philip Sidney had occurred while Barnfield was still a school-boy, but it seems to have strongly affected his imagination and to have inspired some of his earliest verses. In November 1594, in his twenty-first year, Barnfield published anonymously his first work, The Affectacione Shepherd, dedicated to a familiar piece entitled Penelope, Lady Rich. This was a sort of florid romance, in two books of six-line stanza, in the manner of Lodge and Shakespeare, dealing at large with “the complaint of Daphnis for the love of Ganymede.” As the author expressly admitted later, it was an expansion or paraphrase of Virgil’s second eclogue—

“Formosus pastor Corydon ardebat Alexim.”

This poem of Barnfield’s was the most extraordinary specimen hitherto produced in England of the licence introduced from Italy at the Renaissance. Although the poem was successful, it did not pass without censure from the moral point of view. Into the conventional outline of The Affectacione Shepherd the young poet has poured all his fancy, all his epithets, and all his coloured touches of nature. If we are not repelled by the absurd subject, we have to admit that none of the immediate imitators of Venus and Adonis has equalled the juvenile Barnfield in the picturesque-ness of his “fine ruff-footed doves,” his “spackled flower call’d sops-in-wine,” or his desire “by the bright glimmering of the starry light, to catch the long-bill’d woodcock.” Two months later, in January 1595, Barnfield published his second volume, Cynthia, with certain Sonnets, and this time signed the preface, which was dedicated, in terms which imply close personal relations, to William Stanley, 1st Earl of Derby. This is a book of extreme interest; it exemplifies the earliest study both of Spenser and Shakespeare. “Cynthia” itself, a panegyric on Queen Elizabeth, is written in the Spenserian stanza, of which it is probably the earliest example extant outside The Faerie Queene. This is followed by a sequence of twenty sonnets, which have the extraordinary interest that, while preceding the publication of Shakespeare’s sonnets by fourteen years, they are closer to them in manner than are any others of the Elizabethan age. They celebrate, with extravagant ardour, the charms of a young man whose initials seem to have been J. or J. V., and of whom nothing else is known. These sonnets, which preceded even the Amoretti of Spenser, are of unusual merit as poetry, and would rank as high in quality as in date of publication if their subject-matter were not so preposterous. They show the influence of Drayton’s Idea, which had appeared a few months before; in that collection also, it is to be observed, there had appeared amatory sonnets addressed to a young man. If editors would courageously alter the gender of the pronouns, several of Barnfield’s glowing sonnets might take their place at once in our anthologies. Before the publication of his volume, however, he had repented of his heroics, and had become enamoured of a “lass” named Eliza (or Elizabeth), whom he celebrates with effusion in an “Ode.” This is probably the lady whom he presently married, and as we find him a grandfather in 1626 it is unlikely that the wedding was long delayed. In 1598 Barnfield published his third volume, The Encomion of Lady Pocynia, a poem in praise of money, followed by a sort of continuation, in the same six-line stanza, called “The Complaint of Poetry for the Death of Liberality.” In this volume there is already a decline in poetic quality. But an appendix of “Poems in diverse Humours” to this volume of 1598 presents some very interesting features. Here appears what seems to be the absolutely earliest praise of Shakespeare, and of the works of the time, a couplet, which is the unacknowledged author of Venus and Adonis is celebrated by the side of Spenser, Daniel and Drayton. Here also are the sonnet, “If Music and sweet Poetry agree,” and the beautiful ode beginning “As it fell upon a day,” which were until recently attributed to Shakespeare himself. In the next year, 1599, The Passionate Pilgrim was published, with the words “By W. Shakespeare” on the title-page. It was long supposed that this attribution was correct, but Barnfield claimed one of the two pieces just mentioned, not only in 1598, but again in 1605. It is certain that both are his, and possibly other things in The Passionate Pilgrim also; Shakespeare’s share in the twenty poems of that miscellany being doubtless confined to the five short pieces which have been definitely identified as his. In the opinion of the present writer the sonnet beginning “Sweet Cythercia” has unmistakably the stamp of Barnfield, and is probably a gloss on the first rapturous perusal of Venus and Adonis; the same is to be said of “Scarce had I seen,” which is not by Barnfield, but the work of some other contributor to The Passionate Pilgrim may be conjectured, with less confidence, to be Barnfield’s. It has been stated that the poet was now studying the law at Gray’s Inn, but for this the writer is unable to discover the authority, except that several members of that society are mentioned in the course of the volume of 1598. In all probability Barnfield now married and withdrew to his estate of Dorleston (or Darlaston), in the county of Stafford, a house romantically situated on the river Trent, where he henceforth resided as a country gentleman. In 1605 he reprinted his Lady Pocynia, and this was his latest appearance as a man of letters. His son, which Barnfield had published it, might possibly have been his executors when his will was proved at Lichfield; his wife, therefore, doubtless predeceased him. Barnfield died at Dorleston Hall, and was buried in the neighbouring parish church of St Michael’s, Stone, on the 6th of March 1627. The labours of Dr Grosart and of Professor Arber have thrown much light on the circumstances of Barnfield’s career. He has taken of late years a far more prominent place than ever before in the history of English literature. This is due partly to the remarkable merit of his graceful, melodious and highly-coloured verse, which was practically unknown until it was privately printed in 1876 (ed. Grosart, Roxburghe Club), and at length given to the public in 1882 (ed. Arber, English Scholars’ Library). It is also due to the mysterious personal relation of Barnfield to Shakespeare, a relation not easy to prove in detail, as it is built up on a great variety of small indications. It is, however, obvious that Barnfield warmly admired Shakespeare, whose earliest imitator he may be said to have been, and that between 1595 and 1600 the younger poet was so close to the elder that the compositions of the former could be confused with those of the latter. Barnfield died, as a poet, in his twenty-fifth year. Up to that time he had displayed a talent which, if he had published it, might have made him very high among the English poets. As it is, he will always interest a certain number of readers as being, in his languid “Italianate” way, a sort of ineffectual Meleager in the rich Elizabethan anthology.

Besides the editions already cited, The Affectacione Shepherd was edited by Mr J. O. Halliwell-Phillipps for the Percy Society (Early English Texts, vol. xxii: The Encomion of Pocynia and some other poems by J. Boswell (Roxburghe Club, 1816); and by J. P. Collier in Illustrations of Old English Literature (vol. i., 1866). (E. G.)

BARNIM, the name of a district between the Spree, the Oder and the Havel, which was added to the mark of Brandenburg during the 13th century. In the 15th century it was divided into upper and lower Barnim, and these names are now borne by two circles (Kreise) in the kingdom of Prussia.

BARNIM, the name of thirteen dukes who ruled over various divisions of the duchy of Pomerania. The following are the most important:

BARNIM I. (c. 1200-1278), called the Good, was the son of Bogislaus II., duke of Pomerania-Stettin, and succeeded to this duchy on his father’s death in 1220. After he became of age he was engaged in a long struggle with external enemies, and in 1250 was compelled to recognize the supremacy of the margrave of Brandenburg. Having in 1254 united the whole of Pomerania under his rule, Barnim devoted his energies to improving its internal condition. He introduced German settlers and customs into the duchy, founded many towns, and was extremely generous towards ecclesiastical foundations. He died on the 13th or 14th of November 1278.

BARNIM II. (c. 1303-1368), called the Great, was the son of Otto I., duke of Pomerania-Stettin, and took a prominent part in the defence and government of the duchy before his father’s
death in 1534. A long and intermittent struggle with the representatives of the emperor Louis IV., who had invested his own son Louis with the mark of Brandenburg, enabled him to gain military experience and distinction. A victory gained by him in August 1332 was mainly instrumental in freeing Pomerania for a time from the vexatious claim of Brandenburg to supremacy over the duchy, which monuments and wire is carried on. The latter passed to his grandson, Emperor Charles IV., in his struggle with the family of Wittelsbach. He died on the 24th of August 1368.

BARNIM XI. (1501-1573), son of Bogislaus X., duke of Pomerania, became duke on his father's death in 1523. He ruled for a time in common with his elder brother George; and after George's death in 1531 he shared the duchy with his nephew Philip I., retaining for himself the duchy of Pomerania-Stettin.

The earlier years of his rule were troubled by a quarrel with the margrave of Brandenburg, who wished to annex Pomerania. In 1529, however, a treaty was made which cleared Pomerania from the supremacy of Brandenburg on condition that if the ducal family became extinct the duchy should revert to Brandenburg.

Barnim adopted the doctrines of Martin Luther, and joined the league of Schmalkalden, but took no part in the subsequent war. But as this attitude left him without supporters he was obliged to submit to the emperor Charles V., to pay a heavy fine, and to accept the Interim, issued from Augsburg in May 1548. In 1569 Barnim handed over his ducy to his grand-nephew, John Frederic, and died at Stettin on the 2nd of June 1573.

Barnim's property in the market town and municipal borough of Barnsley is very extensive. Barnsley is a market town and borough in the Barnsley parliamentary division of the West Riding of Yorkshire, England, 15 m. N. of Sheffield. Pop. (1891) 35,427; (1901) 41,686. It is served by the Midland, Great Central, Lancashire & Yorkshire, Great Northern, and Hull & Barnsley railways. It is in the parish of Silkstone, which gives name to important collieries. It is situated on rising ground west of the river Dearne, and, though it loses in attraction owing to its numerous factories, its neighbourhood has considerable natural beauty. Among the principal buildings are the collegiate church (which is the oldest, the parish church of St Mary, which was built in 1821 on an early site; court house, public hall, institute and free library. Among several educational institutions, the free grammar school dates from 1665; and a philosophical society was founded in 1828. A monument was erected in 1905 to prominent members of the Yorkshire Miners' Association. The park was presented in 1862 by the widow of Joseph Locke, M.P. The manufacture of iron and steel, and the weaving of linen and other cloth, are the two principal industries; but there is also bleaching, printing, dyeworks, sawmills, cornmills and malt-houses; and the manufacture of glass, needles and clocks, and there are large coalfields in the neighbourhood, which, indeed, extend under the coal. Coal and coke are largely exported to London and Hull. In the vicinity, Monk Bretton Priory, a Cluniac foundation of 1157, retains a Perpendicular gatehouse, some Decorated domestic remains, and fragments of the church. Wentworth Castle, built in 1730 by Thomas, earl of Strafford, stands in a singularly beautiful park, and contains a fine collection of portraits of historical interest. Besides the communications afforded by railway, Barnsley has the advantage of connexion with the Aire and Calder Navigation system of canals. There are manorial arches, of which there are no less than eight, of which there is a mayor, six aldermen and eighteen councillors. Area, 2390 acres. At the time of the Domesday survey, Herbert de Lacy held Barnsley by gift of William the Conqueror as part of the honour of Pontefract, and the overlordship remained in his family until the reign of Stephen, when it was granted by Henry de Lacy to the monks of Pontefract. Henry III. in 1249 granted the prior and convent of Pontefract a market every Wednesday at Barnsley, and a fair on the vigil and feast of St Michael and two following days, and Henry VIII. in 1512 granted them a new fair on the day of the Conversion of St Paul and two following days. The monastery evidently also held another fair there called St Ellen's fair, for in 1583 Queen Elizabeth granted this fair and St Paul's fair and the market "lately belonging to the dissolved monastery of Pontefract" to one Henry Burdett, and Ralph and Henry his sons for their lives. Besides these charters and others granting land in Barnsley to the monks of Pontefract there is very little history of the town, since it was not until after the introduction of the linen manufacture in 1744 that it became really important.

Before that time the chief industry had been wire-drawing, but this trade began to decrease about the end of the 18th century, just as the linen manufacture was becoming important. In 1869 Barnsley was incorporated.

See Rowland Jackson, The History of the Town and Township of Barnsley (1858); Victoria County History—Yorkshire.
and twenty-four chief burgesses. James I., by a charter dated 1610, increased the number of chief burgesses to twenty-five and instituted a recorder, a clerk of the market, justices of the peace and other officers. This charter was confirmed in 1611 and 1659, and held force until the Municipal Corporations Act of 1835, when it was replaced by a body of six aldermen and fourteen councillors. The borough sent two members to parliament in 1625, and so continued to do until the Redistribution of Seats Act of 1885, when the representation was merged in that of the county. Barnstaple was once famous for its woolen trade, now entirely declined, and as early as the reign of Edward III. was an important naval port, with an extensive shipping trade. That this prosperity was not altogether uninterrupted is testified by the fact that, at the time of the Armada, the mayor pleaded inability to contribute three ships, on account of injuries to trade consequent on the war with Spain. The Friday market and the annual four days' fair in September are held by immemorial prescription.

*BARNUM, PHINEAS TAYLOR* (1810–1891), American showman, was born in Bethel, Connecticut, on the 5th of July 1810, his father being an inn- and store-keeper. Barnum first started as a store-keeper, and was also concerned in the lottery mania then prevailing in the United States. After failing in business, he started in 1829 a weekly paper, *The Herald of Freedom*, in Danbury; after several libel suits and a prosecution resulted in imprisonment. This check he moved to New York in 1834, and in 1835 began his career as a showman, with his purchase and exploitation of a coloured woman, Joyce Heth, reputed to have been the nurse of George Washington, and to have been a hundred and sixty years old. With this woman and a small company he made well-advertised and successful tours in America till 1839, though Joyce Heth died in 1836, when her age was proved to be not more than seventy. After a period of failure, he purchased Scudder's American Museum, New York, in 1841; to this he added considerably, and it became one of the most popular in the United States. One of the most remunerative features of this show, incorporated in the name of "General Tom Thumb" (see Dwar); in 1844 Barnum toured with the dwarf in England. A remarkable instance of his enterprise was the engagement of Jenny Lind to sing in America at $1000 a night for one hundred and fifty nights, all expenses being paid by the entrepreneur. The tour began in 1850. Barnum retired from the show business in 1855, but had to settle with his creditors in 1857, and began his old career again as showman and museum proprietor. In 1871 he established the "Greatest Show on Earth," a travelling amalgamation of circus, menagerie and museum, and in 1875 he added in "Frauds," and in 1882, of Charles Stratton, the celebrated "General Tom Thumb," and in 1883, of "Barnum, Bailey & Hutchinson," and later of "Barnum & Bailey's," toured all over the world. In 1907 the business was sold to Ringling Brothers. Barnum wrote several books, such as *The H umbugs of the World* (1865), *Struggles and Triumphs* (1869), and his *Autobiography* (1854, and later editions). He died on the 7th of April 1891.

*BAROCCHIO* (or Barozzi), G IACOMO, called DA VIGNOLA (1557–1573), Italian architect, was born at Vignola in the Modenese territory on the 1st of October 1557. His early work was conducted at Bologna, Placenza, Assisi and Perugia, until he returned to Rome as papal architect under Pope Julius III. In 1564 he succeeded Michelangelo as the architect of St Peter's, and executed various portions of that fabric, besides a variety of works in Rome. The designs for the Escurial were also supplied by him. He is the author of an excellent work on the *Five Orders of Architecture* (Rome, 1563), and another work on *Practical Perspective* (Rome, 1583). To his extensive acquirements and exquisite taste were superadded an amenity of manners and a noble generosity that won the affection and admiration of all who knew him. He died in Rome on the 7th of July 1573. He was an eminent upholder of the classic style at a period when the style known as baroque was corrupting the architecture of Italy. The term baroque owes its origin to the Spanish word *barroco* or *burraco*, an imperfectly round pearl, and is not derived from the architect Barocchio, whose name so much resembles it. Yet it is curious that it was much used to describe a debased form of architecture encouraged by the Jesuits whose church in Rome was built by Barocchio.
became as well governed and prosperous as a British district. He repeatedly visited Europe in company with his wife. In 1887 the queen-empress conferred upon him at Windsor the insignia of G.C.S.I., and in 1892 upon his wife the Imperial order of the crown of India.

The gross revenue of the state is more than a million sterling. In 1907 the state currency of Babashai rupees was withdrawn, and the British rupee was introduced. The regular military force consists of a field battery, with several regiments of cavalry and battalions of infantry. In addition, there is an irregular force of horse and foot. Compulsory education has been carried on experimentally since 1893 in the Amreli division with apparent success, the compulsory age being 7 to 12 for boys and 7 to 10 for girls. Special measures are also adopted for the education of low castes and aboriginal tribes. There is a female training college under a Christian lady superintendent. The Kala Bhavan, or technical school, has departments for drawing, carpentry, dyeing, weaving and agriculture. There is also a state museum under a European director, and a state library. Portions of the state are crossed by the Bombay & Baroda and the Rajputana railways. In addition, the state has constructed three railways of its own, on three different gauges. Other railways are in contemplation. The state possesses a cotton mill.

The city of Baroda is situated on the river Viswamitri, a station on the Bombay & Baroda railway, 245 m. N. of Bombay by rail. "Baroda" (1902) is the Gr. φερων, pressure, and μεχριν, measure), an instrument by which the weight or pressure of the atmosphere is measured. The ordinary or mercurial barometer consists of a tube about 36 in. long, hermetically closed at the upper end and containing mercury. In the "cistern barometer" the tube is placed with its open end in a basin of mercury, and the atmospheric pressure is measured by the difference of the heights of the mercury in the tube and the cistern. In the "siphon barometer" the cistern is dispensed with, the tube being bent round upon itself at its lower end; the reading is taken of the difference in the levels of the mercury in the two limbs. The "aneroid" barometer (from the Gr. ανεριδς, privative, and ρηθες, water) employs no liquid, but depends upon the changes in volume experienced by an exhausted metallic chamber under varying pressures. "Baroscopes" simply indicate variations in the atmospheric pressure, without supplying quantitative data.

"Barographs" are barometers which automatically record any variations in pressure.

Philosophers prior to Galileo had endeavoured to explain the action of a suction pump by postulating a principle that "Nature abhorred a vacuum." When Galileo observed that a suction pump could not raise a column of water more than about 32 ft. he considered that the "abhorrence" was limited to 32 ft., and commended the matter to the attention of his pupil Evangelista Torricelli. Torricelli perceived a ready explanation of the observed phenomenon if only it could be proved that the atmosphere had weight, and the pressure which it exerted was equal to that of a 32-ft. column of water. He proved this to be the correct explanation by reasoning as follows:—If the atmosphere supports 32 feet of water, then it should also support a column of about $\frac{1}{2}$ ft. of mercury, for this liquid is about as heavy as water. This he proved in the following manner. He selected a glass tube and about a quarter of an inch in diameter and 4 ft. long, and hermetically sealed one of its ends; he then filled it with mercury and, applying his finger to the open end, inverted it in a basin containing mercury. The mercury instantly sank to nearly 30 in. above the surface of the mercury in the basin, leaving in the top of the tube an apparent vacuum, which is now called the Torricellian vacuum; this experiment is sometimes known as the Torricellian experiment. Torricelli's views rapidly gained ground, notwithstanding the objections of certain philosophers. Valuable confirmation was afforded by the various devices which have been proposed and elevations. René Descartes and Blaise Pascal predicted a fall in the height when the barometer was carried to the top of a mountain, since, the pressure of the atmosphere being diminished, it necessarily followed that the column of mercury sustained by the atmosphere would be diminished also. This was experimentally observed by Pascal's brother-in-law, Flörn Périer (1605-1672), who measured the height of the mercury column at various altitudes on the Puy de Dôme. Pascal himself tried the experiment at several towers in Paris,—Notre Dame, St Jacques de la Boucherie, &c. The results of these researches were embodied in his treatises De l'équilibre des liqueurs and De la pesanteur de la masse d'air, which were written before 1651, but were not published till 1663 after his death. Corroboration was also afforded by Marin Mersenne and Christian Huygens. It was not long before it was discovered that the height of the column varied at the same place, and that a rise or fall was accompanied by meteorological changes. The instrument thus came to be used as a means of predicting the weather, and it was frequently known as the weather-glass. The relation of the barometric pressure to the weather is mentioned by Robert Boyle, who expressed the opinion that it is exceedingly difficult to draw any correct conclusions. Edmund Halley, Leibnitz, Jean André Deluc (1727-1817) and many others investigated this subject, giving rules for predicting the weather and attempting explanations for the phenomena. Since the height of the barometric column varies with the elevation of the station at which it is observed, it follows that observations of the barometer afford a means for measuring altitudes. The early experiments of Pascal were developed by Edmund Halley, Edmé Deluc, J. Cassini, J. D. Berthollet, and more especially by Deluc in his Recherches sur les modifications de l'atmosphère (1772), which contains a full account of the early history of the barometer and its applications. More highly mathematical investigations have been given by Laplace, and also by Richard Rühlmann (Barometrischen Unternahmeng., Leipzig, 1870). The modern aspects of the relation between atmospheric pressure and the weather and altitudes are treated in the article METEOROLOGY.

Many attempts have been made by which the variation in the height of the mercury column could be magnified, and so more exact measurements taken. It is not possible to enumerate all the various improvements which have been made. The reader is referred to Charles Hutton's Mathematical and Philosophical Dictionary (1815), William Ellis's paper on the history of the barometer in the Quarterly Journal of the Royal Meteorological Society, vol. xii. (1886), and E. Gerland and F. Traumiller's Geschichte der physikalischen Experimenterkunft (1890). Descartes suggested a method which Huygens put into practice. The barometer tube was expanded into a cylindrical vessel at the top, and into this chamber a fine tube partly filled with water was inserted. A slight motion of the mercury in the open tube resulted in a change of the water level, and the changes in the barometric pressure were more readily detected and estimated. But the instrument failed as all water-barometers do, for the gases dissolved in the water coupled with its high vapour tension destroy its efficacy. The substitution of methyl salicylate for the water has been attended with success. Its low vapour tension (Sir-William Ramsay and Sydney Young give no value below 70° C.), its low specific gravity (1.18 at 10° C.), its freedom from viscosity, have contributed to its successful use. In the form patented by C. O. Bartram it is claimed that readings to 0.01 of an inch of mercury can be taken without the use of a vernier.

The diagonal barometer, in which the upper part of the tube is inclined to the lower part, was suggested by Bernardo Ramazzini (1633-1714), and also by Sir Samuel Morland (or Moreland). This form has many defects, and even when the
BAROMETER

...tube is bent through 45° the readings are only increased in the ratio of 7 to 5. The wheel barometer of Dr R. Hooke, and the steel-yard barometer, endeavour to magnify the oscillation of the mercury column by means of a float resting on the surface of the mercury in the cistern; the motion of the float due to any alteration in the level of the mercury being rendered apparent by a change in the position of the wheel or steel-yard. The pendant barometer of G. Amontons, invented in 1695, consists of a funnel-shaped tube, which is hung vertically with the wide end downwards and closed in at the upper end. The tube contains mercury which adjusts itself in the tube so that the length of the column balances the atmospheric pressure. The instability of this instrument is obvious, for any jar would cause the mercury to leave the tube.

The Siphon Barometer (fig. 1) consists of a tube bent in the form of a siphon, and is of the same diameter throughout. A graduated scale passes along the whole length of the tube, and the height of the barometer is ascertained by taking the difference of the readings of the upper and lower limbs respectively. This instrument may also be read by bringing the zero-point of the graduated scale to the level of the surface of the lower limb by means of a screw, and reading off the height at once from the surface of the upper limb. This barometer, therefore, no correction for errors of capillarity or capacity. Since, however, impurities are contracted by the mercury in the lower limb, which is usually in open contact with the air, the satisfactory working of the instrument comes soon to be seriously interfered with. Fig. 2 shows the Cistern Barometer in its essential and simplest form. This barometer is subject to two kinds of error, one arising from capillarity, and the other from changes in the level of the surface of the cistern as the mercury rises and falls in the tube, the latter being technically called the error of capacity. If a glass tube of small bore be plunged into a vessel containing mercury, it will be observed that the level of the mercury in the tube is not in the line of that of the mercury in the vessel, but somewhat below it, and that the surface is convex. The capillary depression is inversely proportional to the diameter of the tube. In standard barometers, the tube is about an inch in diameter, and the error due to capillarity is less than 0.001 of an inch. Since capillarity depresses the height of the column, cistern barometers require an addition to be made to the observed height, in order to give the true pressure, the amount depending, of course, on the diameter of the tube.

The error of capacity arises in this way. The height of the barometer is the perpendicular distance between the surface of the mercury in the cistern and the upper surface of the mercurial column. Now, when the barometer falls from 30 to 29 inches, an inch of mercury must flow out of the tube and pass into the cistern, thus raising the cistern level; and, on the other hand, when the barometer rises, mercury must flow out of the cistern into the tube, thus lowering the level of the mercury in the cistern. Since the scales of barometers are usually engraved on their brass cases, which are fixed (and, consequently, the zero-point from which the scale is graduated is also fixed), it follows that, from the incessant changes in the level of the cistern, the readings would be sometimes too high and sometimes too low, if no provision were made against this source of error.

A simple way of correcting the error of capacity is—to ascertain (1) the neutral point of the instrument, or that height at which the zero of the scale is exactly in the middle of the tube, and (2) the rate of error as the barometer rises or falls above this point, and then apply a correction proportional to this rate. The instrument in which the error of capacity is satisfactorily (indeed, entirely) got rid of is Fortin’s Barometer. Fig. 3 shows how this is effected. The upper part of the cistern is formed of a glass cylinder, through which the level of the mercury may be seen. The bottom is made like a bag, of flexible leather, against which a screw works. At the top of the interior of the cistern is a small piece of ivory, the point of which coincides with the zero of the scale. By means of the screw, which acts on the flexible cistern bottom, the level of the mercury can be raised or depressed so as to bring the ivory point exactly to the surface of the mercury in the cistern. In some barometers the cistern is fixed, and the ivory point is brought to the level of the mercury in the cistern by raising or depressing the scale.

In constructing the best barometers three materials are employed, viz.:(1) brass, for the case, on which the scale is engraved; (2) glass, for the tube containing the mercury; and (3) the mercury itself. It is evident that if the coefficient of expansion of mercury and brass were the same, the height of the mercury as indicated by the brass scale would be the true height of the mercurial column. But this is not the case, the coefficient of expansion of mercury being considerably greater than that for brass. The result is that if a barometer stand at 30 in. when the temperature of the whole instrument, mercury and brass, is 32°, it will no longer stand at 30 in. if the temperature be raised to 60°; in fact, it will then stand at 30.1 in. This increase in the height of the column by the tenth of an inch is due not to any increase of pressure, but altogether to the greater expansion of the mercury at the higher temperature, as compared with the expansion of the brass case with the engraved upper scale by which the height is measured. In order, therefore, to compare with each other with exactness barometric observations made at different temperatures, it is necessary to reduce them to the heights at which they would stand at some uniform temperature. The temperature to which such observations are reduced is 32° Fahr. or 0° cent.

If English units be used (Fahrenheit degrees and inches), this correction is given by the formula \[ x = -H^2 - \frac{2.85}{800} \] in the centigrade-centimetre system the correction is \( \frac{0.0001614}{H} \), (\( H \) being the observed height and \( T \) the observed temperature). Devices have been invented which determine these corrections mechanically, and hence obviate the necessity of applying the above formula, or of referring to tables in which these corrections for any height of the column and any temperature are given.

The standard temperature of the English yard being 62° and not 32°, it will be found in working out the corrections from the above formula that the temperature of no correction is not 32° but 28.5°. If the scale be engraved on the glass tube, or if the instrument be furnished with a glass scale or with a wooden scale, different corrections are required. These may be worked out from the above formula by substituting for the coefficient of the expansion of brass that of glass, which is assumed to be 0.0000408, or that of wood, which is assumed to be 0. Wood, however, should not be used, its expansion with temperature being unstable, as well as uncertain.

If the brass scale be attached to a wooden frame and be free to move up and down the frame, as is the case with many siphon barometers, the corrections for brass scales are to be used, since the zero-point of the scale is brought to the level of the lower limb; but if the brass scale be fixed to a wooden frame, the corrections for brass scales are only applicable provided the zero of the scale be fixed at (or nearly at) the zero line of the column, and be free to expand upwards. In siphon barometers, with which an observation is made from two readings on the scale, the
Barometer scale must be free to expand in one direction. Again, if only the upper part of the scale, say from 27 to 31 in., be screwed to a wooden frame, it is evident that not the corrections for brass scales, but those for wooden scales must be used. No account need be taken of the expansion of the glass tube containing the mercury, it being evident that no correction for this expansion is required in the case of any barometer the height of which is measured from the surface of the mercury in the cistern.

In fixing a barometer for observation, it is indispensable that it be hung in a perpendicular position, seeing that it is the perpendicular distance between the surface of the mercury in the cistern and the top of the column which is the true height of the barometer. The surface of the mercury column is convex, and in noting the height of the barometer, it is not the chord of the curve, but its tangent which is taken. This is done by setting the straight lower edge of the vernier, an appendage with which the barometer is furnished, as a tangent to the curve. The vernier is made to slide up and down the scale, and by it the height of the barometer may be read true to 0.002 or even to 0.001 in.

It is essential that the barometer is at the temperature shown by the attached thermometer. No observation can be regarded as good if the thermometer indicates a temperature differing from that of the whole instrument by more than a degree. For every degree of temperature the attached thermometer differs from the barometer, the observation will be faulty to the extent of about 0.003 in., which in discussions of diurnal range, &c., is a serious anomaly.

Before being used, barometers should be thoroughly examined as to the state of the mercury, the size of cistern (so as to admit of low readings), and their agreement with some known standard instrument at different points of the scale. The pressure of the atmosphere is not expressed by the weight of the mercury sustained in the tube by it, but by the perpendicular height of the column. Thus, when the height of the column is 30 in., it is not said that the atmospheric pressure is 14.7 lb on the square inch, or the weight of the mercury filling a tube at that height whose transverse section equals a square inch, but that it is 30 in., meaning that the pressure will sustain a column of mercury of that height.

It is essential in gasometry to fix upon some standard pressure to which all measurements can be reduced. The height of the standard mercury column commonly used is 76 cms. (29.922 in.) of pure mercury at 0°; this is near the average height of the barometer. Since the actual force exerted by the atmosphere varies with the intensity of gravity, and therefore with the position on the earth's surface, a place must be specified in defining the standard pressure. This may be avoided by expressing the force as the pressure of a column of mercury, one square centimetre in section, which is supported by the atmosphere. If H cms. be the height at 0°, and g the value of gravity, the pressure is 13.596 Hg dynes (13.596 being the density of mercury). At Greenwich, where g = 981.17, the standard pressure at 0° is 1,013,800 dynes. At Paris the pressure is 1,013,600 dynes. The closeness of this unit to a mega-dyne (a million dynes) has led to the suggestion that a mega-dyne per square centimetre should be adopted as the standard pressure, and it has been adopted by some modern writers on account of its convenience of calculation and independence of locality.

The height of the barometer is expressed in English inches in England and America, but the metric system is used in all scientific work excepting in meteorology. In France and most European countries, the height is given in millimetres, a millimetre being the thousandth part of a metre, which equals 39.370979 English inches.

Up to 1860 the barometer was given in half-lines in Russia, which, equalling the twentieth of an English inch, were readily reduced to English inches by dividing by 20. The metric barometric scale is now used in Russia. In a few European countries the French or Paris line, equalling 0.088814 in., is sometimes used. The English measure of length being a standard at 62° Fahr., the old French measure at 61.2°, and the metric scale at 32°, it is necessary, before comparing observations made with the three barometers, to reduce them to the same temperature, so as to neutralize the inequalities arising from the expansion of the scales by heat.

The synopimeter was invented in 1818 by Adie of Edinburgh. It is a revived form of Hooke's marine barometer. It consists of a glass tube, with a small chamber at the top and an open cistern below. The upper part of the tube is filled with air, and the lower part and cistern with glycerin. When atmospheric pressure is increased, the air is compressed by the rising of the fluid; but when it is diminished the fluid falls, and the contained air expands. To correct for the error arising from the increased pressure of the contained air when its temperature varies, a thermometer and sliding-scale are added, so that the instrument may be adjusted to the temperature at each observation. It is a sensitive instrument, and well suited for rough purposes at sea and for travelling, but not for exact observation. It has long been superseded by the Aneroid, which far exceeds it in handiness.

Aneroid Barometer.—Much obscurity surrounds the invention of barometers in which variations in pressure are rendered apparent by the alteration in the volume of an elastic chamber. The credit of the invention is usually given to Lucien Vidie, who patented his instrument in 1845, but similar instruments were in use much earlier. Thus in 1799 Nicolas Jacques Conté (1755-1809), director of the aerostatic school at Meudon, and a man of many parts—a chemist, mechanician and painter,—devised an instrument in which the lid of the metal chamber was supported by internal springs; this instrument was employed during the Egyptian campaign for measuring the altitudes of the war-balloons. Although Vidie patented his device in 1845, the commercial manufacture of aneroids only followed after E. Bourdon's metallic manometer in 1849, when Bourdon and Richard placed about 1,000 aneroids on the market. The production was stopped by an action taken by Vidie against Bourdon for infringing the former's patent, and in 1858 Vidie obtained 25,000 francs (£1000) damages.

Fig. 4 represents the internal construction, as seen when the face is removed, but with the hand still attached, of an aneroid which differs only slightly from Vidie's form. a is a flat circular metallic box, having its upper and under surfaces corrugated in concentric circles. This box or chamber being partially exhausted of air, through the short tube b, which is subsequently made air-tight by soldering, constitutes a spring, which is affected by every variation of pressure in the external atmosphere, the corrugation on its surface increasing its elasticity. At the centre of the upper surface of the exhausted chamber there is a solid cylindrical projection x, to the top of which the principal lever cde is attached. This lever rests partly on a spiral spring at d; it is also supported by two vertical pins, with perfect freedom of motion. The end e of the lever is attached to a second or small lever f, from which a chain g extends to h, where it works on a drum attached to the axis of the hand, connected with a hair spring at h, changing the motion from vertical to horizontal, and regulating the hand, the attachments of which are made to the metallic plate t. The motion originates in the corrugated elastic box a, the surface of which is depressed or elevated as the weight of the atmosphere is increased or diminished, and this motion is communicated through the levers to the axis of Fig. 4.—Aneroid Barometer.
BAROMETRIC LIGHT—BARON 421

the hand at h. The spiral spring on which the lever rests at d is intended to compensate for the effects of alterations of temperature. The actual movement at the centre of the exhausted box, where the indications emanate, is very slight, but by the action of the lever is multiplied 657 times at the point of the hand, so that a movement of the 220th part of an inch in the box carries the point of the hand through three inches on the dial. The effect of this combination is to multiply the smallest degrees of atmospheric pressure, so as to render them sensible on the index. Vidie's instrument has been improved by Vautet and Hulot. Eugène Bourdon's aneroid depends on the same principle.

The aneroid requires, however, to be repeatedly compared with a mercurial barometer, being liable to changes from the elasticity of the metal chamber changing, or from changes in the system of levers which work the pointers, and no mercurial barometers constructed showing great accuracy in their indications, yet none can lay any claim to the exactness of mercurial barometers. The mechanism is liable to get fouled and otherwise go out of order, so that they may change 0-300 in. in a few weeks, or even indicate pressure so inaccurately and so irregularly that no confidence can be placed in them for even a few days, if the means of comparing them with a mercurial barometer be not at hand.

The mercurial barometer can be made self-registering by concentrating the rays from a source of light by a lens, so that they strike the top of the mercurial column, and having in a sheet of sensitized paper attached to a frame which is placed behind a screen, with a narrow vertical slit in the line of the rays. The mercury being opaque throws a part of the paper in the shade, while above the mercury the rays from the lamp pass unobstructed to the paper. The paper being carried steadily round on a drum at a given rate per hour, the height of the column of mercury is photographed continuously on the paper. From the photograph the height of the barometer at any instant may be taken. The principle of the aneroid barometer has been applied to the construction of barographs. The lever attached to the column which terminates in an ink-fed pen is required to register the pressure of the atmosphere on a marking ribbon. In all continuously registering barometers, however, it is necessary, as a check, to make eye-observations with a mercury standard barometer hanging near the registering barometer from four to eight times daily.

See Marvin, Barometers and the Measurement of Atmospheric Pressure (1901); and C. Abbe, Meteorological Apparatus (1888). Reference may also be made to B. Stewart and W. W. H. Gee, Practical Physics (vol. i, 1901), for the construction of standard barometers, their corrections and method of reading.

BAROMETRIC LIGHT, the luminous glow emitted by mercury in a sheet of sensitized paper attached to a frame and exposed to a focus of light, was discovered by John Picard, and formed the subject of many experiments at the hands of Francis Hawksbee. The latter showed that the Torricellian vacuum was not essential to the phenomenon, for the same glow was apparent when mercury was shaken with air only partially rarefied. The glow is an effect of the electricity generated by the friction of the mercury and the air in the barometer tube.

BARON, MICHEL (1653-1729), French actor (whose family name originally was Boyron), was born in Paris, the son of a leading actor (d. 1655) and of a talented actress (d. 1662). At the age of twelve he joined the company of children known as the Petits Comédiens Dauphins, of which he was the brightest star. Molière was delighted with his talent, and with the king's permission secured him for his own company. In consequence of a misunderstanding with Molière's wife, the actor withdrew from the dramatist's company, but rejoined it in 1670, reappearing as Domitian in Corneille's Titre et Bérbice, and in his Psyche. He remained in this company until Molière's death. He then became a member of the company at the Hôtel de Bourgogne, and from this time until his retirement in 1691 was undisputed master of the French stage, creating many of the leading roles in Racine's tragedies, besides those in two of his own comedies, L'Homme égaré (1666) and Le Médecin malgré lui (1658). He also wrote Les Enlèvements (1683), Le Débauché (1680), and translated and acted two plays of Terence. In 1720 Baron reappeared at the Palais Royal, and his activity on the stage was renewed in a multitude of parts. He died on the 22nd of December 1729.

His son ÉTIENNE MICHEL BARON (1676-1711) was also a fine actor, and left a son and two daughters who all played at the Comédie Française.

See George Morin, Un Comédien amateur d'art (1894); also the Abbé d'Almain's Lettres à mylord XXX. sur Baron et la danseuse Lecouvez, in F. G. J. S. Andrieux's Collection des mémoires sur l'art dramatique (1822).

BARON. This word, of uncertain origin, was introduced into England at the Conquest to denote "the man" (i.e. one who had done him "homage") of a great lord, and more especially of the king. All who held in chief (i.e. directly) of the king were alike barones, bound to perform a stipulated service, and members, in theory at least, of his council. Great nobles, whether earls or not, also spoke of their tenants as "barons," where lesser magnates spoke of their "men" (homines). This was especially the case in earldoms of a patrician character, such as Chester, where the earl's barons were a well-recognized body, the Venables family, "barons of Kinderton," existing in existence down to 1679. In the patinate of Durham also, the bishop had his barons, among whom the Hiltons of Hilton Castle were usually styled "Barons of Hilton " till extinct in 1746. Other families to whom the title was accorded, independently of peerage dignity and on somewhat uncertain grounds, were "the barons of Mr. Greystock," "the barons of Stafford," and the Cornwalls, "barons of Burford." Fantoms makes Henry II. speak of "mes barons de Ludres "; John's charter granting permission to elect a mayor speaks of "our barons of our city of London," and a London document even speaks of "the greater barons of the city." The aldermen seem to have been loosely deemed equivalent to barons, and were actually assessed to the poll-tax as such under Richard II. In Ireland the patinate character of the great lordships made the title not uncommon (e.g. the barons of Galtrin, the barons of Slane, the barons of the Naas).

As all those who held direct of the crown by military service (for those who held "by serjeancy" appear to have been classed apart), from earls downwards, were alike "barons," the great difference in their position and importance must have led, from an early date, to their being roughly divided into "greater " and "lesser" barons, and indeed, under Henry II., the Dialogus de Scaccario already distinguishes their holdings as "greater" or "lesser" baronies. Within a century of the Conquest, as we learn from Becket's case (1164), there arose the practice of sending to the greater barons a special summons to the council, while the lesser barons, it is stipulated in Magna Carta (1215), were to be summoned only through the sheriffs. This was the practice of the three great baronies, and the earliest writs accepted as creating hereditary baronies are those issued in his reign. It must not, however, be supposed that those who received such summons were as yet distinguished from commoners by any style or title. The only possible prefix at that time was Dominus (lord), which was regularly used by simple knights, and writs of summons were still issued to the lowest order of peers as knights (chevaliers) only. The style of baron was first introduced by Richard II. in 1387, when he created John de Beauchamp, by patent, Lord de Beauchamp and baron of Kiddlesminster, to make him "unum patrum et baronum regni nostri." But it was not till 1433 that the next "baron" was created, Sir John Cornwall being then made baron of Fanhope. In spite, however, of these innovations, the barons
was only summoned to parliament by the style of “John Beauchamp of Kidderminster,” and the latter by that of “John Cornwall, knight.” Such coronations, in his common under, Henry VI., a transition, with in peerage styles, but “Baron” could not evict “Sir,” “Chevalier” and “Dominus.” Patents of creation contained the formula “Lord A. (and) Baron of B.,” but the grantee still styled himself “Lord” only, and it is an historically interesting fact that to this day a baron is addressed in correspondence, not by that style, but as “the Lord A.,” although all peers under the rank of Duke are spoken of as “lords,” while they are addressed in correspondence by their proper styles. To speak of “Baron A.” or “Baron B.” is an unhistorical and quite recent practice. When a barony, however, is vested in a lady it is in the recognized custom to speak of her as baroness, e.g., Baroness Berkeley.

The solemn investiture of barons created by patent was performed by the king himself, by enrobing the peer in the scarlet “robe of estate” during the reading of the patent, and this form continued till 13 Jac. I., when the lawyers declared that the delivery of the letters patent without ceremony was sufficient. The letters patent express the limits of inheritance of the barony. The usual limit is to the grantee and heirs male of his body, and the issue of his body, with the exception of the male relative (as in the case of Lord Brougham, 1860) or (as in the case of Lord Basset, 1797, and Lord Burton, 1857) to the heiress-male of a daughter, and occasionally (as in the case of Lord Nelson, 1801) to the heiress-male of a sister. Sometimes also (as in the case of the barony of Rayleigh, 1821) the dignity is bestowed upon a lady with remainder to the heirs-male of her body. The coronation robes of a baron are the same as those of an earl, except that he has only two rows of spots on each shoulder; and, in like manner, his parliamentary robes have but two guartered white fur, with rows of gold lace; but in other respects they are the same as those of other peers. King Charles II. granted to the barons a coronet, having six large pearls set at equal distances on the chaplet. A baron’s cap is the same as a viscount’s. His style is “Right Honourable”; and he is addressed by the king or queen, “Right Trusty and Well-beloved.” His children are by courtesy entitled to the prefix “The Honourable.”

Barons of the Exchequer were formerly six judges (a chief baron and five puisne barons) to whom the administration of justice was committed in causes between the king and his subjects relative to matters of revenue. Selden says that when Wm. the Third took the title of king, before he ascended the throne, it was to have come to mean a “strong or powerful man,” and thus generally “a magnate.” Finally, in France in the 17th century the general expression barons was introduced in a restricted sense, as applied properly to all lords possessing an important fief, subject to the rule of primogeniture and thus not liable to be divided up, and held of one overlord alone. Sometimes it included ecclesiastical lordships of the first rank. In the 13th century the Register of King Philip Augustus places the barones regis Francie next to the dukes and counts holding in chief, the title being limited to vassals of the second rank. Towards the end of the 12th century, the title of baron could only be borne by the holder of a territorial barony; and it was Louis XIV. who first Speeded the title in France by creating numerous barons by royal letters. This entire dissociation of the title from the idea of feudal rights and obligations was completed by Napoleon’s decree of March 1, 1808, reviving the ancient titles. This instrument the title of baron was to be borne ex officio by a number of high officials, e.g., ministers, senators, councillors of state, archbishops and bishops. It was given to the 37 mayors who attended the coronation, and could be claimed by any mayor who had served to the emperor’s satisfaction for ten years, and by any member of an electoral college who had attended three sessions. The title was made to descend in order of primogeniture to legitimate or adopted sons and to the nephews of bishops, the sole condition being that proof must be presented of an actual income of 15,000 fr., of which one-third should descend with the title. The creation of barons was continued by Louis XVIII., Charles X. and Louis Philippe, and, suspended at the revolution of 1848, was revived again on a generous scale by Napoleon III. The tolerant attitude of the Second Republic towards titles, which it does not officially recognize, has increased the confusion by facilitating the assumption of the title on very slender grounds of right. The result has been that in France the title of baron, unless borne by the recognized representative of a historic name, not only involves no political status, but confers also but very slight social distinction.

The same is true, mutatis mutandis, of most other European countries, and notably of Italy. In Austria and Germany the

escutcheon, the man’s being always on the dexter side, and the woman’s on the sinister. But in this case the woman is supposed to be borne upon her husband’s name, but not on his die, the husband on an escutcheon of pretence. (See Heraldry.)

The foreign title of baron is occasionally borne by English subjects, but confers no precedence in the United Kingdom. It may be Russian, e.g., Baron Dinsdale (1762); German, e.g., Baron Stockmar, Baron Halkett (Hanoverian); Austrian, e.g., Baron Rothschild (1823), Baron de Worms; Italian, e.g., Baron Heath; French, e.g., Baron de Telszier; French-Canadian, e.g., Baron de Longueil (1700); Dutch, e.g., Baron Mackay (Lord Reay).

(From the Foreign Title—On the continent of Europe there is a barony, though the same in its origin, has come, owing to a variety of causes, to imply a rank and status very different from its conception in the United Kingdom, and again varies considerably in different countries. Originally baro meant no more than “man,” and is so used in the Salic and other “barbarian” laws; e.g., Si quis mortuabiti barum vel feminam, &c. (Lex Alemon. tit. 76). In this way, too, it was long preserved in the sense of “husband,” as in the Assize of Jerusalem (MSS. cap. 98): S’il est appelé assise chose femme qui aura baron, et il la sert defendre, si elle est deveine femme, il est assise chose femme qui aura baron, and must be borne by the husband in his own name, to have come to mean a “strong or powerful man,” and thus generally “a magnate.” Finally, in France in the 17th century the general expression barones was introduced in a restricted sense, as applied properly to all lords possessing an important fief, subject to the rule of primogeniture and thus not liable to be divided up, and held of one overlord alone. Sometimes it included ecclesiastical lordships of the first rank. In the 13th century the Register of King Philip Augustus places the barones regis Francie next to the dukes and counts holding in chief, the title being limited to vassals of the second rank. Towards the end of the 12th century, the title of baron could only be borne by the holder of a territorial barony; and it was Louis XIV. who first Speeded the title in France by creating numerous barons by royal letters. This entire dissociation of the title from the idea of feudal rights and obligations was completed by Napoleon’s decree of March 1, 1808, reviving the ancient titles. This instrument the title of baron was to be borne ex officio by a number of high officials, e.g., ministers, senators, councillors of state, archbishops and bishops. It was given to the 37 mayors who attended the coronation, and could be claimed by any mayor who had served to the emperor’s satisfaction for ten years, and by any member of an electoral college who had attended three sessions. The title was made to descend in order of primogeniture to legitimate or adopted sons and to the nephews of bishops, the sole condition being that proof must be presented of an actual income of 15,000 fr., of which one-third should descend with the title. The creation of barons was continued by Louis XVIII., Charles X. and Louis Philippe, and, suspended at the revolution of 1848, was revived again on a generous scale by Napoleon III. The tolerant attitude of the Second Republic towards titles, which it does not officially recognize, has increased the confusion by facilitating the assumption of the title on very slender grounds of right. The result has been that in France the title of baron, unless borne by the recognized representative of a historic name, not only involves no political status, but confers also but very slight social distinction.

The same is true, mutatis mutandis, of most other European countries, and notably of Italy. In Austria and Germany the
case is somewhat different. Though in Latin documents of the middle ages the term barones for liberis domini was used, it was not until the 17th century that the word Baron, perhaps under the influence of the court of Versailles, began to be used as the equivalent of the old German Freiherr, or free lord of the Empire. The style Freiherr (liber dominus) implied originally a dynastic status, and many Freiherrn held countships without taking the title of count. When the more important of these titles themselves counted, the Freiherrn sank into an inferior class of nobility. The practice of conferring the title Freiherr by imperial letters was begun in the 16th century by Charles V., was assumed on the ground of special imperial concessions by many of the princes of the Empire, and is now exercised by all the German sovereigns. Though the practice of all the children taking the title of their father has tended to make that of Baron comparatively very common, and has dissociated it from all idea of territorial possession, it still implies considerable social status and privilege in countries where a sharp line is drawn between the caste of "noble" and the common herd, whom no wealth or intellectual eminence can place on the same social level with the poorest Adeliger. In Japan the title baron (Dan) is the lowest of the five titles of nobility introduced in 1885, on the European model. It was given to the least important class of territorial nobles, but is also bestowed as a title of honour without reference to territorial possession.

See du Cange, Glossarium, s. "Baro" (ed. Nioit, 1883); John Selden, Titles of Honor, p. 353 (ed. 1672); Achille Luchaire, Manuel des institutions françoises (Paris, 1892); Man F. Luchaire, art. "Baron" in La Grande Encyclopédie. (W. A. P.)

BARONET. Although the origin of this title has been the subject of learned speculation, it is not known for certain why it was selected as that of a new Dignite between Barons and Knights" created by James I. The object of its institution was to raise money for the crown, as was also done by the sale of peerage dignities under this sovereign. But the money was professedly devoted to the support of troops in Ulster, that is, each grantee was to be liable for the pay of thirty men, at 8d. a day for three years. This amounted to £1095, which was the sum paid for the honor. When it was instituted, in May 1614, the king, to keep the baronetage select, counseled that he would not create more than two hundred, and that only those who had £1000 a year in landed estate and whose paternal grandfathers had borne arms should receive the honour. But these qualifications were before long abandoned. As an inducement to apply for it, it was made to confer the prefix of "Sir" and "Lady" (or "Dame"), and was assigned precedence above knights, though below the younger sons of barons. Eight years later (30th of September 1619), the baronetage of Ireland was instituted, the king pledging himself not to create more than a hundred baronets. Meanwhile, questions had arisen as to the exact precedence of the baronets, and James by royal decree (28th of May 1612) had announced that it was his intention to rank them below the younger sons of barons. As this had the effect of stopping applications for the honour, James issued a fresh commission (18th of November 1614) to encourage them, and finally, as "the Kings wants might be much relieved out of the vanities and ambition of the genteel" (in Chamberlain's words), he granted, in 1616, the further privilege that the heirs apparent of baronets should be knighted on coming of age.

The baronetage of Nova Scotia was devised in 1624 as a means of promoting the "plantation" of that province, and James announced his intention of creating a hundred baronets, each of whom was to support six colonists for two years (or pay 2000 marks in lieu thereof) and also to pay 1000 marks to Sir William Alexander (afterwards earl of Stirling), to whom the province had been granted by charter in 1621. For this he was to receive a "free barony" of 16,000 acres in Nova Scotia, and to become a baronet of "his Hienes Kingdom of Scotland." James dying at this point, Charles I. carried out the scheme, creating the first Scottish baronet on the 28th of May 1625, penonating in the creation charter that the baronets "of Scotland or of Nova Scotia" should never exceed a hundred and fifty in number, that their heirs apparent should be knighted on coming of age, and that no one should receive the honour who had not fulfilled the conditions, viz. paid 3000 marks (£166, 13s. 4d.) towards the plantation of the colony. Four years later (17th of November 1629) the king wrote to the contractors for baronets, recognizing that they had advanced large sums to Sir William Alexander for the plantation on the security of the payments to be made by future baronets, and empowering them to offer a further inducement to applicants; and on the same day he granted to all Nova Scotia baronets the right to wear about their necks, suspended by an orange tawny ribbon, a badge bearing an azure saltire with a crowned inescutcheon of the arms of Scotland and the motto "Fax mentis honestae gloria." As the required number, however, could not be completed, Charles announced in 1633 that English and Irish gentlemen might receive the honour, and in 1634 they began to do so. Yet even so, he was only able to create a few more than a hundred and twenty in all. In 1638 the creation ceased to carry with it the grant of lands in Nova Scotia, and on the union with England (1707) the Scottish and ceased, English and Scotsmen alike receiving thenceforth baronetcies of Great Britain.

It is a matter of dispute whether James I. had kept faith with the baronets of England as to limiting their number; but his son soon rejected the restriction freely. Creations became one of his devices for raising money; blank patents were hawked about, and in 1641 Nicholas wrote that baronetcies were to be had for £400 or even for £300; a patent was offered about this time to Mr Wrottesley of Wrottesley for £300. On the other hand, the patent was disliked, and appears to have been nothing on some ardent royalists when the great struggle began.

Cromwell created a few baronets, but at the Restoration the honour was bestowed so lavishly that a letter to Sir Richard Leveson (3rd of June 1660) describes it as "too common," and offers to procure it for any one in return for £300 or £400. Sir William Wiseman, however, is said to have given £500.

The history of the baronetage was uneventful till 1783, when in consequence of the wrongful assumption of baronetcies, an old and then increasing evil, a royal warrant was issued (6th of December) directing that no one should be recognized as a baronet in official documents till he had proved his right to the dignity, and also that those created in future must register their arms and pedigree at the Heralds' College. In consequence of the opposition of the baronets themselves, the first of these two regulations was rescinded and the evil remained unabated. Since the union with Ireland (1800) baronetcies have been created, not as of Great Britain or of Ireland, but as of the United Kingdom.

In 1834 a movement was initiated by Mr Richard Broun (whose father had assumed a Nova Scotia baronetcy some years before), to obtain certain privileges for the order, but on the advice of the Heralds' College, the request was refused. A further petition, for permission to all baronets to wear a badge, as did those of Nova Scotia, met with the same fate in 1836. Meanwhile George IV. had revoked (10th of December 1827), as to all future creations the right of baronets' eldest sons to claim knighthood. Mr Broun claimed it as an heir apparent in 1836, and on finally meeting with refusal, publicly assumed the honour in 1842, a foolish and futile act. In 1854 Sir J. Kingston James was knighted as a baronet's son, and Sir Ludlow Cotter similarly in 1874, on his coming of age; but when Sir Claude de Crespigny's son applied for the honour (17th of May 1899), his application was refused, on the ground that the Lord chancellor did not consider the clause in the patent (1805) valid. The reason for this decision appears to be unknown.

Mr Broun's subsequent connexion with a scheme for reviving the territorial claims of the Nova Scotia baronets as part of a colonizing scheme need not be discussed here. A fresh agitation was aroused in 1897 by an order giving the sons of life peers precedence over baronets, some of whom formed themselves, in 1898, into "the Honourable Society of the Baronetage" for the maintenance of its privileges. But a royal warrant was issued on the 15th of August 1898, confirming the precedence complained of as an infringement of their rights. The above body, however,
BARONIUS has continued in existence as the “Standing Council of the Baronetage,” and succeeded in obtaining invitations for some representatives of the order to the coronation of King Edward VII. It has been sought to obtain badges or other distinctions for baronets and also to purge the order of wrongful assumptions, an error into which the baronetage of Nova Scotia and of Ireland in relation to those of England was left undetermined by the Acts of Union, and appears to be still a moot point with heralds. The premier baronet of England is Sir Hickman Bacon, whose ancestor was the first to receive the honour in 1611.

J. H. K.

BARONIUS, CAESAR (1538–1607), Italian cardinal and ecclesiastical historian, was born at Sora, and was educated at Veroli and Naples. At Rome he joined the Oratory in 1557 under St Philip Neri (q.v.) and succeeded him as superior in 1593. Clement VIII., whose confessor he was, made him cardinal in 1596 and librarian of the Vatican. At subsequent conclaves he was twice nearly elected pope, but on each occasion was opposed by Spain on account of his work *On the Monarchy of Sicily*, in which he supported the papal claims against those of the Spanish government. Baronius is best known by his *Annales Ecclesiastici*, undertaken by the order of St Philip as an answer to the *Magdeburg Centuries*. After nearly thirty years of lecturing on the history of the Church at the Vallicella and being trained by St Philip as a great man for a great work, he began to write, and produced twelve folios (1588–1607). In the *Annales* he treats history in strict chronological order and keeps theology in the background. In spite of many errors, especially in Greek history, in which he had to depend upon second-hand information, the work of Baronius stands as an honest attempt to write history, marked with a sincere love of truth. Sarpé, in urging Cassaboyn to write against Baronius, warns him never to charge or suspect him of bad faith, for no one who knew him could accuse him of disloyalty to truth. Baronius makes use of the words of St Augustine: “I shall love with a special love the man who most rigidly and severely corrects my errors.” He also undertook a new edition to the Roman martyrology (1586), which purified of many inaccuracies.

His *Annales*, which end in 1596, were continued by Rinaldi (q.v., 1676–1677); by Ladernchi (3 vols., 1728–1773); and by Theiner (3 vols., 1856). The most useful edition is that of Mansi (38 vols., Lucca, 1738–1759), giving Pagli’s corrections at the foot of each page.

(E. TW.)

BARONY, the domain of a baron (q.v.). In Ireland counties are divided into counties and baronies, which are equivalent to the civil parishes of England, and are comprised out of the territories of the Irish chiefs, as each submitted to English rule (General Report of the Census of England, iv. 181, 1873). In Scotland the term is applied to any large freehold estate even when held by a commoner. Barony also denotes the rank or dignity of a baron, and the feudal tenure “by barony.”

BAROQUE, a technical term, chiefly applicable to architecture, furniture and household decoration. Apparently of Spanish origin—a *barroco* is a large, irregularly-shaped pearl—the word was for a time confined to the craft of the jeweller. It indicates the more extravagant features of design that were in vogue in the first half of the 18th century, chiefly in Italy and France, in which everything is fantastic, grotesque, florid or incongruous—irregular shapes, meaningless forms, an utter lack of restraint and simplicity. The word suggests much the same order of ideas as rococo.

BARROSS, GABOR (1858–1902), Hungarian statesman, was born at Trenčín on the 6th of July 1858, and educated at Esztergom. He was for a time one of the professors there under Cardinal Kolos Vasary. After acquiring considerable local reputation as chief notary of his county, he entered parliament in 1875. He at once sits with Asellus to the Seat of May. The death of his burial so many of the supporters of the prime minister. It was he who drew up the reply to the malcontents on this occasion, for the first time demonstrating his many-sided ability and his genius for sustained hard work. But it was in the field of economics that he princi-

BAROTSE—BAROTSELAND, a people and country of South Central Africa. The greater part of the country is a British protectorate, forming part of Rhodesia. The Barotse are the paramount tribe in the region of the Upper Zambezi basin, but by popular usage the name is also applied to contiguous subject tribes. Barotseland being the country over which the Barotse paramount chief exercises authority. The present article treats (1) of the people, (2) of the country, (3) of the establishment of the British protectorate and of subsequent developments.

1. The Barotse.—These people, originally known as Ailui, have...
occupied the extensive plain through which the Zambezi passes from 14° 35' S. to 16° 25' S. throughout the reigns of twenty-two successive paramount chiefs and therefore approximately since the commencement of the 17th century. Previously, for an indefinite period, they dwelt on the Kabombo river, 200 m. to the N.E. of their present country, and here the decendants of a sonet chief, whose name still survives, under the name Balokwakwa (men of the ambuscade), formerly known as Allukolouki. That the Barotse at a still more remote period emigrated from the far north-east is indicated by vague tradition as well as by a certain similarity in type and language to some tribes living in that direction, though the fact that natives from Mashonaland can understand those at Lialui (the Barotse capital) has led to the assumption by some writers that the Barotse are an offshoot of the Mashona. The variety in type among the Mashona and the homogeneity of the Barotse would rather point to an opposite conclusion.

Early in the 19th century a section of the Basuto tribe known as Makololo trekked from the south of what is now the Orange River Colony and fought their way through Bechuanaland and the Kalahari to the land of the Barotse, whom they ultimately subdued. Their chief, Sebitutuane, who as an administrator and general was far in advance of his compeers, established the rule of his house for some forty years, until about 1862 an organized rebellion of the Barotse led to the almost complete extinction of this Makololo oligarchy and the reinstatement of the original dynasty. It was the Makololo who gave the name Barotse to their capital, *Borotsi*, which means the plain—*Murotsi*, man of the plain—*Murotsi*, people of the plain, the latter being inaccurately rendered Barotse, *Ba* being the equivalent of *Ma* in certain other languages).

The Barotse proper are comparatively few in number, but as is inferred from the fact that for many generations they have held in sway a country two and a half times the size of Great Britain, they are the intellectual and physical superiors of the vast majority of the negro races of Africa. Very black, tall in stature, deep in chest and comparatively speaking refined in feature, a Barotse is readily distinguishable amidst a mixed group of natives. Being numerically small they form an oligarchy in which, with few exceptions, each man holds rank in a chief-tainship of which there are three grades. Next to the chiefs rank their descendants who have not themselves acquired chief's rank and hold an intermediate position as freeborn; all others, whether members of the subject-tribes or prisoners of war, being, up to 1900, mere slaves. This class was also graded. Slaves might own slaves who in their turn might own slaves, the highest grade always being directly responsible to some Barotse chief. As a reward of gallantry or ability the paramount chief occasionally allows the Barotse their homeland, and these *ipso facto* assumed the name and privileges of the Barotse. It was a counterpart of the feudal system of Europe in which every grade from king to serf found a place. In 1906 the paramount chief, by proclamation, abolished the state of slavery, an act which, however, left untouched the predominant position of the Barotse and their rights to chief-tainship. The paramount chief shares with a queen (Mokwai) his authority and prerogatives. The Mokwai is not the wife but the eldest sister of the ruling chief. With his death her privileges lapse. Theoretically, these co-rulers are equal, neither may promulgate a national decree without the assent of the other, but each has a capital town, councillors and absolute authority in a province, the two having joint authority over all other provinces. In their code of laws the Barotse show an advance on the standard of probably any other African negro state. By right, an accused chief is tried by his peers, each of whom in rotation from junior to senior gives his verdict, after which the president reports the finding of the court to the paramount chief, who passes sentence. As to their religious beliefs the Barotse imagine the sun to be the embodiment of a great god whose sole care is for the amelioration of man. Him they worship, though more pains are taken to appease evil spirits, in whose existence they also believe, to whom every evil to which man is heir is attributed. The spirits of ancestors—especially of deceased chiefs—are also objects of worship. Christianity, of a Protestant evangelical type, was first introduced into the country in 1884 by François Coillard and has made some progress among the people, among the converts being Letia, eldest son and heir of Lewanika, the paramount chief.

2. Barotseland.—This term includes, in the sense of the country in which the authority of the paramount Barotse chief is acknowledged, not only the lands of the Barotse proper, but the territory of fifteen contiguous and subject tribes. This vast territory extends approximately from the Kuito river in the west to the Kafue river in the east, and from the Congo-Zambezi watershed in the north to the Linyante or Kwando river and Zambezi in the south, and may be divided into three groups:

(a) Central provinces directly administered by the paramount chief from the capital Lialui (a town on the Zambezi), by the Mokwai from Nalolo, and by two chiefs of the blood from Sesheke;
(b) Outlying provinces over which, in the absence of a central local system of government, Barotse chiefs administer districts under the direction of the paramount chief; and
(c) Tribes over which the local chiefs are permitted to retain their position subject to the payment of annual tribute and to their doing homage in person at Lialui when called upon to do so.

With the publication of the king of Italy's award in 1905 in the Anglo-Botswanan Barotse Boundary dispute (see below), the term Barotseland may be said to have acquired a second meaning. By this award the western and part of the northern section of Barotseland as described above were declared to be outside the dominion of the paramount chief and therefore not in the British sphere of influence, while tribal boundaries were complicated by the introduction of a longitudinal and latitudinal frontier. Though this award altered the political boundaries, ethnologically Barotseland remains much as above described. The area of the country under British protection is about 182,000 sq. m. Excluding the ridge of high ground running east and west which, culminating at a height of 5000 ft., forms the Congo-Zambezi water-parting, the extreme east (Botoka) and the district in the immediate vicinity of the Victoria Falls (q.v.) throughout which, with local variations, a red laterite clay predominates, the main physical features of Barotseland may be described as a series of heavy white sand undulations covered with subtropical forest vegetation. These are intersected by alluvium-charged valleys through which streams and rivers flow towards the central basin of the Upper Zambezi. There is evidence that this has at one time been the site of a large lake. There is a central area of close-cropped, very heavy grassland, which, though still alluvium, affords rich cattle pasture, the succulence of which prevents cattle losing condition towards the end of the dry season, as is the case in many parts of Africa. There seems to be little or no indication of mineral wealth in the white sand area, but in the north and east there is not only every prospect of a great agricultural and pastoral future but also of considerable mining development. Though basalt predominates in the neighbourhood of the Victoria Falls and large fields of granite crop up on the Botoka plateau and elsewhere, there is every indication of the existence of useful minerals in these districts. Gold, copper, tin, lead, zinc and iron have been discovered.

Much of the area of Barotseland is within the healthy zone, the healthiest districts being the Botoka and Mashikolumbwe plateaus in the east with extreme altitudes of 4400 and 4150 ft. respectively, and the line of the Congo-Zambezi watershed which rises to 5000 ft. in many places. The Zambezi valley from the Victoria Falls (3000 ft.) to the Kabombo confluence (3500 ft.), though involving little or no risk to health to the traveller, cannot be considered suitable for white settlement. Taking into consideration the relative value of altitude to latitude, the plateau land of Barotseland compares very favourably with existing conditions elsewhere, being several degrees more temperate than would be expected. Approximately the mean
maximum and minimum temperatures stand at 86° and 55° F., respectively, with an extreme range of 100° to 35° and a mean annual temperature of 68° to 70°. The rainfall varies according to district from 22 to 32 in. a year and has shown extraordinary stability. In the first year in which a record was taken, François Coillard, Barotseland has known no droughts, though South Africa has suffered periodically in this respect.

The Zambezi, as would be expected, forms a definite boundary line in the distribution of many species of fauna and flora. In these respects, as well as from an ethnological standpoint, Barotseland essentially belongs not to South but to Central Africa. The great river has also served to prevent the spread from South Africa into Barotseland of such disastrous cattle diseases as tick fever and lung sickness.

3. The Establishment of British Suzerainty.—By the charter granted to the British South Africa Company in October 1889, the company was allowed to establish its rule in the regions north of the Middle Zambezi not included in the Portuguese dominions, and by a treaty of the 11th of June 1891 between Great Britain and Portugal it was declared that the Barotse kingdom was within the British sphere of influence. The dispute between the contracting powers as to what were the western limits of Barotseland was eventually referred to the arbitration of the king of Italy, who awarded the 30th of May 1905, fixed the frontier at the Kwanza river, 23° E., a meridian up to the 13° S., which parallel it follows as far east as 24° E., and then that meridian to the Belgian Congo frontier. In the meantime the British South Africa Company had entered into friendly relations with Lewanka (q.e.), the paramount chief of the Barotse, and an administrator was appointed on behalf of the company to reside in the country. A native police force under the command of a British officer was raised and magistrates and district commissioners appointed. In the internal affairs of the Barotse the company did not interfere, and the relations between the people of Barotseland and the British have been uniformly friendly. The pioneers of Western civilization were not, however, the agents of the Chartered Company, but missionaries. F. S. Arnot, an Englishman, spent two years in the country (1882–1884) and in 1884 a mission, fruitful of good results, was established by the Société des Missions Évangéliques de Paris. Its first agent was François Coillard (1834–1904), who had previously been engaged in mission work in Basutoland and who devoted the rest of his life to the Barotse. Though always an admirer of British institutions and anxious that the country should ultimately fall under British jurisdiction, Coillard in the interests of his mission was in the first instance anxious to work for the advancement of the people of Barotseland and to bring them into the European civilization became inevitable, all the influence acquired by Coillard’s exceptional personal magnetism and singleness of purpose was used to prepare the way for the extension of British rule.

Only those few pioneers who knew the Barotse under the old conditions can fully realize what civilization and England have done for the co-operation of which this history must be considered as a part.

Under the Chartered Company’s rule considerable progress has been made in the development of the resources of the country, especially in opening up the mining districts in the north. The seat of the administration, Kalomo, is on the “Cape to Cairo” railway, about midway between the Zambezi and Kafue rivers. The railway reached the Broken Hill copper mines, 110 m. N. of the Kafue in 1906, and the Belgian Congo frontier in 1910. From Lobito Bay in Portuguese West Africa a railway was being built in 1909 which would connect with the main line near the Congo frontier. This would not only supply Barotseland with a route to the sea but also provide a new and more rapid mail route to southern Rhodesia and the Transvaal. The Zambezi also, with Krubabasa as its one bar to navigation between Barotseland and the sea, will supply a cheap line of communication. (See Rhodesia.)

BAROUCHE (Ger. bairische, Span. barrocho, Ital. barocco; from Lat. bi-rotus, double-wheeled), the name of a sort of carriage, with four wheels and a hood, arranged for two couples to sit inside facing one another.

BARQUISIMETO, a city of western Venezuela, capital of the state of Lara, on the Barquisimeto river, 101 m. by rail S.W. of Tucacas, its port on the Caribbean coast. Pop. (est. 1899) 40,000. It is built in a small, fertile valley of the Merida Cordilleras, 195 ft. above sea-level, has a temperate, healthy climate with a mean annual temperature of 78° F., and is surrounded by a highly productive country from which are exported coffee, sugar, cacao and rum. It is also an important distributing centre for the Guayana region. Many miles of narrow-gauge railway are regularly laid out and well built, and is well provided with educational and charitable institutions. Barquisimeto was founded in 1522 by Juan de Villedes, who was exploring the neighbourhood for gold, and it was first called Nueva Segovia after his native city. In 1807 its population had risen to 15,000, principally through its commercial importance, but on the 26th of March 1812 it was totally destroyed by an earthquake, and with it 1500 lives, including a part of the revolutionary forces occupying the town. It was soon rebuilt and is one of the few cities of Venezuela which have recovered from the ravages of the war of independence and subsequent disorders.

BARR, a town of Germany, in the imperial province of Alsace-Lorraine, on the Kirnec, 13 m. N. from Schleitstadt by rail. It has an Evangelical and a Roman Catholic church and considerable tanneries. There is an active trade in wine and timber. Pop. (1900) 5243.

BARR, or Baray (Scand. Barøy, isle of the ocean), an island of the outer Hebrides, Inverness-shire, Scotland. Pop. (1901) 2362. It lies about 5 m. S.W. of South Uist, is 8 m. in length and from 2 to 4 m. in breadth, save at the sandy ismus 2 m. in width, where it is only a few hundred yards wide. The rock formation is gneiss. The highest hill is Heaval (1260 ft.) and there are several small lochs. The chief village is Castlebay, at which the Glasgow steamer calls once a week. This place derives its name from the castle of Kishmuil standing on a rock in the bay, which was once the stronghold of the M’Neills of Barra, one of the oldest of Highland clans. There are remains of ancient chapels, Danish duns and Druidical circles on the island. There is communication by ferry with South Uist. The parish comprises a number of smaller islands and islets—among which the French island of Mingalay (London, 1806) to the N.E., and Vatersay, Pabbay, Mingalay (pop. 135) and Berneray to the S.E.—and contains 4000 acres of arable land and 18,000 acres of meadow and hill pasture. The cod, ling and herring fisheries are important, and the coasts abound with shell-fish, especially cockles, for which it has always been famous. On Barra Head, the highest point of Berneray, and also the most southerly point of the outer Hebrides chain, is a lighthouse 680 ft. above high water.

BARRACKPUR, a town and magistracy subdivision of British India, in the district of West 24 Parganas, Bengal. The town is the largest cantonment in Lower Bengal, having accommodation for two batteries of artillery, the wing of a European regiment and two native battalions. Its name is said to be derived from the fact of troops having been stationed here since 1772. It is a station on the Eastern Bengal railway. Job
BARRACKS

Charnock, the founder of Calcutta, erected a bungalow and established a small bazaar here in 1690. The cantonment is situated on the left bank of the Hugli; it has also a large bazaar and several large tanks, and also a parade ground. To the south of the cantonment is situated the park, created by the taste and public spirit of Lord Wellesley. Within the park is situated the Government House, a noble building begun by Lord Minto, and enlarged into its present state by the marquess of Hastings. The park is beautifully laid out, and contains a small menagerie. Its most interesting feature is now Lady Canning's tomb. Barrackpur played an important part in the two Sepoy mutinies of 1854 and 1857, but the details of these belong to the general history of British rule in India. North Barrackpur had a population in 1901 of 12,600 and south Barrackpur of 19,307.

Barrackpur subdivision was formed in 1804. It contains an area of 190 sq. m., which, at the census of 1901, had a population of 263,311, a large proportion being workers in the mills on the left bank of the Hugli.

BARRACKS (derived through the French from the Late Lat. barro, a bar), the buildings used for the accommodation of military or naval forces, including the quarters for officers, warrant officers, non-commissioned officers and men, with their messes and recreation establishments, regimental offices, shops, stores, stables, vehicle sheds and other accessory buildings for military or domestic purposes. The term is usually applied to permanent structures of brick or stone used for the peace occupation of troops; but many hut barracks of corrugated iron or light wood have been built generally in connexion with a training ground for troops, and in these the accommodation given is somewhat less than in permanent barracks, and conditions more nearly approach those of a military encampment.

British System.—The accommodation to be given in British military barracks is scheduled in the Barrack Synopsis, which contains "statements of particulars, based upon decisions which have, from time to time, been laid down by authority, as regards the military buildings authorized for various units, and the accommodation and fittings to be provided in connexion therewith." Each item of ordinary accommodation is described in the synopsis, and the areas and cubic contents of rooms therein laid down form the basis of the designs for any new barracks. Supplementary to the synopsis is a series of "Standard Plans," which illustrate how the accommodation may be conveniently arranged; the object of the issue of these plans is to put in convenient form the best points of previous designs, and to avoid the necessity of making an entirely fresh design for each building that is to be erected, by using the standard type modified to suit local conditions. External appearance is considered with regard to the materials to be used, and the position the buildings are to occupy; convenience of plan and sound sanitary construction being the principal objects rather than external effect, designs are usually simple, and depend for architectural effect more on the grouping and balance of the parts than on ornamentation such as would add to expense. The synopsis and standard plans are from time to time revised, and brought up to date as improvements suggest themselves, and increases in scale of accommodation are authorized, after due consideration of the financial effect; so that systematic evolution of barrack design is carried on.

Modern British Barracks.—A description of a modern barracks for a battalion of infantry will give an idea of the standard of accommodation which is now authorized, and to which older barracks are gradually remodelled as funds permit. The unmarried soldiers are quartered in barrack-rooms usually planned to contain twelve men in each; this number forms a convenient division to the organization of the company, and is more popular with the men than the larger numbers which were formerly the rule in each barrack-room; there is a greater privacy, whilst the number is not too small to keep up the feeling of barrack-room comradeship which plays an important part in the soldier's training. The rooms give 600 cub. ft. of air per man, and have windows on each side; the beds are spaced between the windows so that only one bed comes in a corner, and not more than two between any two windows: inlet ventilators are fixed high up in the side walls, and an extract shaft warmed by the chimney flue keeps up a circulation of air through the room: the door is usually at one end of the room and the fireplace at the opposite end: over each man's bed is a locker and shelf where he keeps his kit; and his rifle stands near the head of his bed. Convenient access from the door to the barrack-rooms is the ablation-room with basins and foot-bath; also disassociated by a lobby a water-closet and urinal for night use, others for day use being provided in separate external blocks. Baths are usually grouped in a central bath-house adjacent to the cook-house; and have hot water laid on. For every two or four barrack-rooms, a small single room is provided for the occupation of the sergeant in charge, who is responsible for the safety of a small store, where men may leave their rifle and kit when going on furlough. Adjacent to the barrack blocks and next to the cook-house are arranged the dining-rooms where the men assemble for their meals; no food is now served in the barrack-rooms, and the air in them is thus kept much purer and fresher than under the old system. The dining-rooms are lofty and well ventilated, and are warmed by hot water; tables and forms are arranged so as to make the most of the space, and room is provided for all the men to dine simultaneously.

Next to the dining-room is the cook-house where the meals for a half battalion are cooked, and served direct to the dining-rooms on each side. Wash-up rooms are arranged off the serving-lobby with plate-racks and shelves for the storage of the crockery after it has been washed. The cooking apparatus is designed for economical use of coal fuel, and, if carefully used, consumes little more than ½ lb of coal per man per day. The cook-house is well lighted and ventilated by a top lantern; tables, dressers, and pastry slab are provided for preparing and serving the meals, and a sink for washing kitchen utensils. Under the kitchen block is a basement containing the boiler for heating the dining-rooms and another for the supply of hot water to baths and sinks, with in some cases also a hot-air furnace for heating drying-rooms, for drying the men's clothing when they come in wet from a route-march or field day. Not far from the barrack blocks is placed the recreation establishment or soldiers' club, where the rank and file may go for relaxation and amusement when off duty; this establishment has, on the ground floor, a large and lofty room with a stage at one end for lectures or entertainments, and at the other
BARRACKS

end is a supper bar, extending across the room, where mineral waters and other light refreshments are sold; tables are also arranged for suppers. A grocery shop is provided where the men and their families may purchase groceries and dairy produce, with arrangements on a cash basis, with arrangements on a wholesale price, and sold without more profit than is necessary to keep the institution self-supporting. On the first floor are billiard and games rooms, reading-room and library, and writing-room. The manager’s quarter and kitchen premises complete the establishment. Near the recreation establishment is the canteen, devoted solely to the sale of beer, and not permitted to vie in attractiveness with the recreation establishment. A bar is provided for the soldiers, a separate room for corporals, and a jug department for the supply of the families; this building also has a manager’s quarter attached to it, and an office for the checking of accounts.

For the senior non-commissioned officers a sergeants’ mess is provided, containing dining-room, reading-room and billiard-room, with kitchen premises and liquor store, which also has a jug department for the sergeants’ families. The single non-commissioned officers have all their meals in this mess, and the married members also use it as a club. The warrant officers, and the proportion of non-commissioned officers and men who are on the married establishment, are provided with accommodation at some little distance from the main block of buildings. These arrangements, on open sites, self-contained cottages have been built, and these are more popular than the older pattern of tenement buildings approached by common staircases or verandahs. The warrant officers are allowed a living-room, kitchen, and scullery, with three bedrooms and a bathroom. The married soldiers have a living-room, scullery, and one, two, or three bedrooms according to the size of their families. A laundry is provided adjacent to the married quarters, equipped with washing-troughs, wringer, drying-closet, and ironing-room; and the women are encouraged to use this in preference to doing washing in their cottages.

Officers' Quarters.—At a little distance from the men’s barracks, and usually looking over the parade or cricket ground, is the officers’ mess. This building has an entrance-hall with band alcove, where the band plays on guest nights; on one side of the hall is the mess-room (or dining-rooms), and on the other the ante-room (or reading-room), whilst the billiard-room and kitchen are kept to the back so that lantern lights can be arranged for. A mess office is provided, and all the accessories required for the mess waiters’ department, including pantry, plate-closet and cellars, and for the kitchen the necessary stoves and range. There is also a quarter for the mess-man. The officers’ quarters are usually arranged in wings extending the frontage of the mess building, and in a storey over the mess itself. Each officer has a large room, part of which is partitioned off for a bedroom, and the field officers are allowed two rooms. The soldier servant, told off to each officer, has a small room allotted for cleaning purposes, and bathrooms, supplied with hot water from the mess kitchen, are centrally situated. A detached house, containing three sitting-rooms, seven bed- and dressing-rooms, bathroom, kitchen, servants’ hall, and the usual accessories, is provided for the commanding officer: also a smaller house, having two sitting-rooms, four bedrooms, bath, kitchen, &c., for the quartermaster. Other regimental married officers are not provided for, and have to arrange to house themselves, a lodging allowance being usually granted.

Regimental Accessories.—Apart from the buildings providing accommodation, others are required for administrative and military purposes. These are the guard house and regimental offices, the small-arm ammunition store, the fire-engine house, the drill and gymnastic hall, and the medical inspection block with dispensary, where the sick may be seen by a medical officer and either prescribed for or sent into hospital, as may be necessary. Stables are provided for the officers’ and transport horses, and a vehicle shed and storehouse for the mobilization equipment. Stores are required for bread, meat, coal, clothing, and for machinery, signalling, and general small stores under the quartermaster’s charge—also workshops for armourers, carpenters, plumbers, painters and glaziers, shoemakers, and tailors. Mention of the five court, recreation ground and parade ground completes the description of a barrack establishment.

Cavalry Barracks.—The accommodation provided for cavalry is very similar to that already described for infantry. The barrack blocks are arranged to suit the organization of the regiment, and are placed so that the men can turn out readily and get to their horses. Detached buildings are provided for cavalry troop stables, one block for the horses of each troop. Formerly stables were often built for convenience with the barrack-rooms over them; but this system has been abandoned on sanitary grounds, to the benefit of both men and horses. Each horse is given 1500 cub. ft. of air space, the horses’ heads are turned to the outer walls, and provision is made, by traversed air-ducts below the roofs, for fresh air to be supplied to the horses while lying down. Above the horses’ heads are windows which are arranged to open inwards, being hinged at the bottom and fitted with hopper cheeks to avoid direct draught. Ridge ventilation and skylights are given, so that all parts of the stable are well lighted and airy.

Cast-iron mangers and hay- racks are provided, and the horses are separated by rails, with chains to manger brackets and heel posts; saddle brackets are fixed to the heel posts. Each stable has a troop store, where spare saddles and gear are kept; also an addition of vehicle sheds for drums and ammunition wagons. In the blocks from the forage barn, is kept until it is given out in feeds. The stables are paved with blue Staffordshire paving bricks, graded to a collecting channel carrying the drainage well clear of the building, before it is taken into a gully.

The space between the blocks of stables is paved with cement concrete to form a yard, and horse-troughs, litter-sheds and dung-pits are provided. Officers’ stables are built in separate blocks, and usually have only one row of stalls; the stalls are divided by partitions, and separate saddle-rooms are provided. Stalls and loose boxes in infantry stables give 2000 cub. ft. of air space per horse and are placed at some distance from the transport stables in a separate enclosure. A forge and shoeing shed is provided in a detached block near the troop stables. A forage barn and granary is usually built to hold a fortnight’s supply, and a chaff-cutter driven by horse power is fixed close by. Cavalry regiments each have a large covered riding school, and a number of open manèges, for exercise and riding instruction.

Artillery, &c.—The accommodation provided for horses and field artillery is arranged to suit their organization in batteries and brigades, and is generally similar to that already described, with the addition of vehicle sheds for guns and ammunition wagons, and special shops for wheelers and saddlers. Accommodation for other units follows the general lines already laid down, but has to be arranged to suit the particular organization and requirements of each unit.

Garrison Accessories.—In every large military station in addition to the regimental buildings which have been described, a number of buildings and works are required for the service of the garrison generally. Military hospitals are established at home and abroad for the treatment of sick officers and soldiers as well as their wives and families. Military hospitals are classified as follows:—First-grade hospitals are large central hospitals serving important districts. These hospitals are complete in themselves and fully equipped for the carrying out of operations of all kinds; they generally contain wards for officers, and may have attached to them separate isolation hospitals for the treatment of infectious cases, and military families’ hospitals for women and children. Second-grade hospitals are smaller in size and less fully equipped, but are capable of acting independently and have operation rooms. Third-grade hospitals or reception centres are required for small stations principally, to act as feeders to the large hospitals, and to deal with accident and non-transportable cases. The principles of construction of military hospitals do not differ materially from the best modern civil practice; all are now built on the pavilion system with connecting corridors arranged so as to interfere as little as possible with the free circulation of air between the blocks. The site is carefully selected and enclosed with railings. The administration block
BARRACKS

is centrally placed, with ward blocks on each side, and accessory buildings placed where most convenient; the isolation wards are in a retired position and divided off from the hospital enclosure. Ward blocks usually have two storeys, and the ordinary large wards provide 1200 cub. ft. of air space per patient. A due proportion of special case and other special wards is arranged in which the space per patient is greater or less, as necessary.

After schools are built to give slightly more liberal accommodation than is laid down as the minimum by the Board of Education, but the principles of planning are much the same as in civil elementary schools. Schools are usually placed between the married quarters and the barracks, so as to serve both for the instruction of the men, when working for educational certificates, and for the education of the children of the married soldiers. Garrison churches are built when arrangements for the troops to attend divine service at neighbouring places of worship cannot well be made. Only two military prisons now remain, viz. Dover and Curragh, and these are for soldiers discharged from the service with ignominy. For ordinary sentences detention barracks and branch detention barracks are attached to the military commands and districts: these are constructed in accordance with the home office regulations; but crime in the army fortunately continues to decrease, and little accommodation has recently been added. Barrack expense stores for the issue of bedding, utensils and other stores for which the troops depend upon the Army Service Corps, are necessary in all barracks; and in large stations a supply depot for the issue of provisions, with abattoir and bakery attached to it, may be necessary. An engineer office with building yard and yard shops to deal with the ordinary duties in connexion with the upkeep of War Department property is required at every station, and for large stations such as Aldershot, it may be necessary to undertake special water supply schemes, works for disposal of sewage, and for the supply of electricity or gas for lighting the barracks. The system of roads, pipes and mains within the barracks are in all cases maintained by the Royal Engineers, as well as the buildings themselves. District and borough offices are necessary for the administration of large units, and quarters for the general officer commanding and the headquarters staff may sometimes be required.

Location of Barracks.—The selection of a healthy site for a barracks building or new military station is a matter of great importance. In the earlier days of barracks construction, barracks were, for political reasons, usually built in large towns, where troops would be at hand for putting down disturbances, and cramped and inconvenient buildings of many storeys, were erected on a small piece of ground often surrounded by the worst slums of the city; such, for example, were the Ship Street barracks in Dublin, and the cavalry barracks at Hulme, Manchester. Worse still were cases where an existing building, such as the Linen Hall in Dublin, was purchased, and converted into barracks with little regard for the convenience of the occupants, and a total disregard for the need of a free circulation of pure air and about the buildings, which is the first condition of health. In the present day, except in a few cases where strong local influence is allowed to prevail to retain troops in towns, where their presence, and perhaps the money they spend, are appreciated for patriotic or other motives, every opportunity is taken to move troops from the vicinity of crowded towns, and quarter them in barracks or hutsments built in the open country. Due regard can then be given to sanitary location, and military training can more effectively be carried out. With improvements in communication by rail, road and telegraph, support to the civil power in case of disturbance can always be afforded in good time, without permanently stationing troops in the actual locality where their assistance may be needed. It has been recognized ever since the Crimean War, that the leading principle of barrack policy must, in the future, be to facilitate in peace time the training of the army for war, and that this can only be done by quartering troops in large bodies, including all branches of the service, in positions where they have space for practice, gun and rifle practice, and manoeuvring. The camps at Aldershot, Colchester, Shorncliffe and Curragh were accordingly started between 1856 and 1860, and the same policy has since been continued by the acquisition of Strensall Common, near York, Kilworth domain, near Fermoy, the lease of a portion of Dartmoor and a large area at Glen Imaal in Co. Wicklow, and the purchase of the Sitobs estate in Scotland and of a large part of Salisbury Plain.

Barrack Construction.—The history of barracks construction in Great Britain is an interesting study, but can only be touched on briefly. As long as operations in the field were carried on by troops levied especially for the war in hand, no barracks apart from fortifications were required, except those for the royal bodyguard; and even after the standing army exceeded those limits, the necessity for additional barracks was often avoided by having recourse to the device of billeting, i.e. quartering the soldiers on the populations of the towns where they were posted. This, however, was a device burdensome to the people, subversive of discipline, and prejudicial to military efficiency in many ways, while it exposed the scattered soldiers to many temptations to disloyalty. Hence barracks were gradually provided, at first in places where such an arrangement was most necessary owing to the paucity of the population, or where concentration of troops was most important, owing to the disaffection of some of the inhabitants. The earliest barracks of which there is any record as regards England, were those for the foot guards, erected in 1666. Among the earliest of those still existing are the Royal Barracks at Dublin, dating from 1790, and during the 18th century barracks were built in several parts of Ireland, but in England it was not until the end of the 18th century that the most of the earlier barracks were constructed. So long as barracks were mainly in connexion with fortresses their construction naturally fell to the duty of the King's Engineers, afterwards the Corps of Engineers, working under the master-general of the ordnance. About 1796, however, a special civil department was formed under the Commissioners for the affairs of barracks, to deal with barracks apart from fortifications. In 1816 we find a warrant appointing a civilian comptroller of the barracks department to deal with the erection and upkeep of barracks and barracks hospitals not within fortified places. This warrant gives one of the earliest records of the nature of accommodation provided, and a few extracts from it are worth notice. No definite regulations as to cubic or floor space per man are laid down; but in the infantry, twelve men, and in the cavalry, eight men are allotted to one room. "Bedsteads or berths" are allowed, "a single one to each man, or a double one to two men," or "hammocks where necessary." The married soldier's wife is barely recognized, as shown by the following extract:—"The comptroller of the barracks department may, if he sees fit, and when it in no shape interferes with or straitens the accommodation of the men, permit (as an occasional indulgence, and as tending to promote cleanliness, and the convenience of the soldier) four married women per troop or company of sixty men, and six per troop or company of a hundred men, to be resident within the barracks; but no one article shall on this account be furnished by the barracks-masters, upon any consideration whatever. And if the barracks-masters perceive that any mischief, or damage, arises from such indulgence, the commanding officer shall, on their representation, displace such women. Nor shall any dogs be suffered to be kept in the rooms of any barrack or hospital." Another regulation says: "Where barracks are constructed for the soldiers, they shall not be allowed to dress their provisions in any other places." In about 1818 the civil barrack department was abolished on account of abuses which had grown up, and the duke of Wellington as master-general of the ordnance and commander-in-chief transferred to the corps of Royal Engineers the duties of construction and maintenance of barracks. In 1826 a course of practical architecture was started at the school of military engineering at Chatham under Lieutenant-Colonel (afterwards Sir Charles) Pasley, the first commandant of the school, who himself wrote an outline of the course. Wellington interested himself in the
BARRACKS

barrack question, and under his orders single iron bedsteads were substituted for the wooden berths, two tiers high, in which two men slept in the same bed, then a certain cubical space per man was allotted, and cook-houses and ablation-rooms were added. Next, sergeants’ messes were started, and ball courts allowed for the recreation of the men. It was not, however, till after the Crimean War that public attention was directed by the report dated 1857 of the royal commission on the sanitary state of the army, to the high death-rate, and certain sanitary defects in barracks and huts, such as overcrowding, defective ventilation, and insanitary means of cooking and cleanliness, to which this excessive mortality was among other causes assigned.

In 1857 a commission appointed for improving the sanitary condition of barracks and hospitals made an exhaustive inspection of the barracks in the United Kingdom, and reported in 1861. This was followed by similar commissions to examine the barracks in the Mediterranean stations and in India. These commissions, besides making valuable recommendations for the improvement of almost every barrack inspected by them, laid down the general sanitary standard to be aimed at in the reconstruction and construction of military barracks and hospitals; and in spite of the lapse of time, the reports repay close study by any one interested in sanitary science as applied to the construction and improvement of such buildings. The names of Sidney Herbert (afterwards Lord Herbert of Lea), Captain (afterwards Sir Douglas) Galton, R.E., and John Sutherland, M.D., stand out prominently among those who contributed to the work. The commission was constituted a standing body in 1862, and continues its work to the present day, under the name of the Army Sanitary Committee, which advises the secretary of war on war on all sites for new barracks or hospitals, also upon type plans, especially as to sanitary details, and principles of sanitary construction and fittings.

A definite standard of accommodation was laid down, which formed the basis of the first issue of the Barrack Synopsis in 1865. A general order dated 1845 had directed that a space of 450 to 500 cub. ft. per man should be provided in all new barracks at home stations; but this had not been applied in existing barracks or buildings appropriated as such, and when detailed examination was made, it was found that some men had actually less than 250 cub. ft., and out of accommodation for nominally 75,613 soldiers, to the arrange had 600 cub. ft. per man, which was the minimum scale now laid down by the royal commission of 1857. To give every soldier his allotted amount of 600 cub. ft., meant a reduction in accommodation of the barracks by nearly one-third the number. Many buildings were condemned as being entirely unsuitable for use as barracks; in other cases improvements were possible by alterations to buildings and opening-up of sites. Ventilation of the rooms was greatly improved, cook-houses, ablation-rooms and sanitary accessories were carefully examined and a proper scale laid down. Separate quarters for the married soldiers did not exist in many barracks, and in some instances married men’s beds were found in the men’s barrack-rooms without even a screen to separate them; in other cases, married people were accommodated together in a barrack-room, with only a blanket hung on a cord as a screen between the different families. The recommendations of the committee resulted in a single room being allotted to all married soldiers, and this accommodation has gradually improved up to the comfortable cottage now provided.

From the time of this first thorough inquiry into barrack accommodation, steady and systematic progress has been made. Although lack of funds has always hampered rapid progress, and keeps the accommodation actually existing below the standard aimed at, much has been done to improve the soldiers’ condition in this respect. Numerous regimental depots and other barracks were built under the Military Forces Localization Act of 1872. The Barracks Act of 1890 replaced the worn-out huts at Aldershot, Colchester, Shorncliffe and Curragh by convenient and sanitary permanent buildings, and further additions and improvements have been made under the Military Works Acts of 1897, 1899 and 1901. As some evidence of the practical result of the care and money that has been expended on this work, it is interesting to note that while, in 1857, the annual rate of mortality in the army at home per 1000 men was 17·5 (compared with 9·2 for the civil male population of corresponding age), forty years later, in 1897, the rate of mortality in the army was only 3·42 per 1000. No doubt, improved barrack accommodation contributed greatly to this result. Barrack construction work remained in the hands of the Corps of Royal Engineers until 1904, when a civil department was again formed under an architect styled 1 director of barrack construction,” to deal with the construction of barracks at home stations, and the construction and maintenance of military hospitals.

British Colonial.—Barracks at colonial stations are governed by the general scale of accommodation in the Barrack Synopsis, modified according to the climate of the station, in the direction of increase in floor area and height of rooms. In the planning of rooms for occupation in tropical or sub-tropical countries provision has to be made for the freest possible circulation of air through the buildings. The walls have to be thick, and a high vaulted or pointed opening, such as a corbelled arch or pointed window, is required. In the special local domestic arrangements have to be taken into consideration. For example, in hot countries it is usually undesirable to have kitchens directly attached to the dwelling-houses, sanitary arrangements vary according to the methods adopted, and in some cases it is necessary to provide a free circulation of air below the ground floors of all inhabited buildings by raising them off the ground some 4 ft. The aspect of the buildings will usually be arranged so as to catch the prevailing wind, and the mode of construction varies greatly according to the custom and resources of the country.

Indian Barracks.—In India, barracks for the British troops are built by the Royal Engineer officers detailed for military work duties, assisted by military foremen, who pass through the civil engineering colleges, and by a native subordinate staff. The scale of accommodation to be provided is laid down in the Indian army regulations, and is for the private soldier more liberal than is allowed by the home government for any of the colonial stations. The barrack-rooms are lofty and airy, with verandahs all round, and clerestory windows. Roofs are usually of double tiling. The allowance of space is 90 sq. ft. per man in rooms 16 ft. high, with, in addition, a direct or间接 supply of air by a vertical shaft to the men for their meals or as a sitting-room. Recreation establishments are liberally provided for, and other means of recreation, such as bowling and skittle alleys, fives courts, plunge baths and cricket grounds, are given. Separate blocks of married quarters are provided, and schools for the children. Hospital accommodation on a higher scale than at home is necessary; but hill sanatoria have in recent years done much to improve the health of the troops by giving change of air, during the hot weather, to a large proportion of the men and families. Piped water supplies have replaced the old wells at many stations, and attention is being directed to improved cooking and sanitary arrangements.

Naval Barracks.—In recent years, large naval barracks have been built, notably at Portsmouth, Chatham and Devonport. These differ from military barracks principally in that they keep up the system of board-room life to which the men are accustomed. Large barrack-rooms are provided with caulked floors like ships’ decks, and have rows of hammocks slung across them; these are stowed in the day-time, when the rooms are used as mess-rooms. Ablution and sanitary arrangements are grouped together on the basement floors. Fine recreation establishments and canteens are provided, and a separate quarters and recreation halls for the ships’ officers, but the officers’ quarters are not so large as in military barracks, though no doubt spacious to the naval officer, accustomed as he is to a small cabin. Married quarters for the men are not provided except in connexion with coastguard stations.

Other Countries.—A great number of the German and French barracks are erected in the form of a large block of three or four storeys containing all the accommodation and accessories for officers, married and single non-commissioned officers and men, of a complete battalion or regiment in one building. Some of the
BARRANDE—BARRAS

431

modern barracks, however, are arranged more on the pavilion system with separate blocks; but the single block system is well liked on account of its compactness and the facility it gives for supervision; it is also more satisfactory from the architectural point of view. The system of allotment and arrangement of accommodation for these two great armies does not differ much, except in detail, from that adopted by the British army. The floor and cubic space allotted per man is a little less; accommodation for officers is not usually provided, except to a limited extent, unless the barracks are on a country site. The German army, however, now provides every regiment with a fine officers' mess-house furnished at the public expense. Married quarters for some of the non-commissioned officers are provided, but not for privates. American barracks are interesting, as providing for perhaps a higher class of recruit than usual; they are well designed and superior finish internally is given. The barracks are arranged usually on the separate block system, and centre round a post-exchange or soldiers' club, which is a combined recreation establishment, gymnasium and sergeants' mess, with bath-house attached. Canteens for the sale of liquor were abolished in 1901.

See The Barrack Synopsis (1905); The Handbook of Design and Construction of Military Buildings (1905); The Army Regulations, India, vol. xii. (E. N. S.)

BARRANDE, JOACHIM (1799–1883), Austrian geologist and palaeontologist, was born at Saugues, Haute Loire, on the 11th of August 1799, and educated in the Ecole Polytechnique at Paris. Although he had received the training of an engineer, his first appointment was that of tutor to the brother of Baron de Chambord (afterwards known as the comte de Chambord), grandson of Charles X., and when the king abdicated in 1830, Barrande accompanied the royal exiles to England and Scotland, and afterwards to France. Settling in that city in 1831, he became occupied in engineering works, and his attention was then attracted to the fossils from the Lower Palaeozoic rocks of Bohemia. The publication in 1839 of Murchison's Silurian System incited Barrande to carry on systematic researches on the equivalent strata in Bohemia. For ten years (1840–1850) he made a detailed study of these rocks, engaging workmen specially to collect fossils, and in this way he discovered upwards of 700 species of graptolites, brachiopods, mollusca, crustacea (particularly trilobites) and fishes. The first volume of his great work, Système silurien du centre de la Bohême (dealing with trilobites), appeared in 1852; and from that date until 1881, he issued twenty-one quarto volumes of text and plates. Two other volumes were issued after his death in 1883 and 1894. It is estimated that he spent nearly £60,000 on these works. In addition he published a large number of separate papers. In recognition of his important researches the Geological Society of London in 1855 awarded to him the Wollaston medal.

Barrande was employed by Barrande, after Murchison, in a more comprehensive sense than was justified by subsequent knowledge. Thus the Silurian rocks of Bohemia were divided into certain stages (A to H)—the two lowermost, A and B without fossils (Azoic), succeeded by the third stage, C, which included the primordial zone, since recognized as part of the Cambrian of Sedgwick. The fourth stage (Étage D), the true lower Silurian, was described by Barrande as including isolated patches of strata with organic remains like those of the Upper Silurian. These assemblages of fossils were designated "Colonies," and regarded as evidence of the early introduction into the area of species from neighbouring districts, that became locally extinct, and reappeared in later stages. The interpretation of Barrande was questioned in 1854 by Edward Forbes, who pointed to the disturbances, overturns and crumplings in the older rocks as affording a more reasonable explanation of the occurrence of strata with newer fossils amid those containing older ones. Other geologists subsequently questioned the doctrine of "Colonies." In 1880 Dr. J. E. Marr, from a personal study in the field, brought forward evidence to show that the repetitions of the fossiliferous strata on which the "Colonies" were based were due to faults. The later stages of Barrande, F, G and H, have since been shown by Emanuel Friedrich Heinrich Kayser (b. 1845) to be Devonian. Despite these modifications in the original groupings of the strata, it is recognized that Barrande "made Bohemia classic ground for the study of the oldest fossiliferous formations." He died at Frohsdorf on the 4th of October 1883.

BARRANQUILLA, a city and port of Colombia, South America, capital of a province of the same name in the department of Atlantico, on the left bank of the Magdalena river about 7 m. above its mouth and 183 m. by rail from its seaport, Puerto Colombia. Pop. (est. 1902) 31,000. Owing to a dangerous bar at the mouth of the Magdalena the trade of the extensive territory tributary to that river, which is about 60% of that of the entire country, must pass in great part through Barranquilla and its seaport, making it the principal commercial centre of the republic. Savanilla was used as a seaport until about 1850, when shoals caused by drifting sands compelled a removal to Puerto Colombia, a short distance westward, where a steel pier, 4000 ft. in length, has been constructed to facilitate the handling of freight. The navigation of the Magdalena is carried on by means of light-draught steamboats which ascend to Yeguas, 14 m. below Honda, where goods are transhipped by rail to the latter place, and thence by pack animals to Bogotá, or by smaller boats to points farther up the river. Barranquilla was originally founded in 1629, but attracted no attention as a commercial centre until about the middle of the 19th century, when efforts were initiated to secure the trade passing through Cartagena. The city is built on a low plain, is regularly laid out, and has many fine warehouses, public buildings and residences, but its greater part, however, consists of mud-walled cabins supported by bamboo (guadua) framework and thatched with rushes. The water-supply is drawn from the Magdalena, and the city is provided with telephone, electric light and tram services. Owing to periodical inundations, the surrounding country is but little cultivated, and the greater part of the population, which is of the mixed type common to the lowlands of Colombia, is engaged in no settled productive occupation.

BARRAS, PAUL FRANÇOIS NICOLAS, COMTE DE (1755–1829), member of the French Directory of 1795–1799, was descended from a noble family of Provence, and was born at Fox-Amphoux. At the age of sixteen he entered the regiment of Languedoc as "gentleman cadet," but embarked for India in 1776. After an adventurous voyage he reached Pondicherry and shared in the defence of that city, which ended in its capitulation to the British on the 18th of October 1778. The garrison being released, Barras returned to France. After taking part in a second expedition to the East Indies in 1782–1783, he left the army and occupied the following years with the frivollities congenial to his class and to his nature. At the outbreak of the Revolution in 1789, he espoused the democratic cause, and became one of the administrators of the department of the Var. In June 1792 he took his seat in the high national court of Orleans; and later in that year, on the outbreak of war with the kingdom of Sardinia, he became commissioner to the French army of Italy, and entered the Convention (the third of the national assemblies of France) as a deputy for the department of the Var. In January 1793 he voted with the majority for the death of Louis XVI. Much of his time, however, was spent in missions to the districts of the south-east of France; and in this way he made the acquaintance of Bonaparte at the siege of Toulon. As an example of the incorrectness of the Barras Mémoires we may note that the writer assigned 10,000 men to the royalist defending force, whereas it was less than 12,000; he also sought to minimize the share taken by Bonaparte in the capture of that city.

In 1794 Barras sided with the men who sought to overthrow the Robespierre faction, and their success in the coup d'etat of 9 Thermidor (27th of July) brought him almost to the front rank. In the next year, when the Convention was threatened by the malcontent National Guards of Paris, it appointed Barras to command the troops engaged in its defence. His nomination of Bonaparte as one of his subalterns led to the adoption of vigorous measures, which ensured the dispersal of the royalists and
malcontents in the streets near the Tuileries, 13 Vendémiaire (5th of October 1793). Thereupon Barras became one of the five Directors who controlled the executive of the French republic. Owing to his intimate relations with Joséphine de Beauharnais, he helped to facilitate a marriage between her and Napoleon, and many have alleged, though on defective evidence, that Barras procured the appointment of Bonaparte to the command of the army of Italy early in the year 1796. The achievements of Bonaparte gave to the Directory a stability which it would not otherwise have enjoyed; and when in the summer of 1797 the royalist and constitutional opposition again gathered strength, Bonaparte sent General Augereau (q.v.), a headstrong Jacobin, forcibly to repress that movement by what was known as the coup d'état of 18 Fructidor (4th September). Barras and the violent Jacobins now carried matters with so high a hand as to render the government of the Directory odious; and Bonaparte had no difficulty in overthrowing it by the coup d'état of 18–19 Brumaire (9th–10th November). Barrassawtheneedofa change and was to some extent (how far will perhaps never be known) an accomplice in Bonaparte's designs, though he did not suspect the power and ambition of their contriver. He left on one side by the three Consuls who took the place of the five Directors and found his political career at an end. He had amassed a large fortune and spent his later years in voluptuous ease. Among the friends of his youth, however, he was respected, and Barres the see Memoirs of Gohier, Larevellière-Lépée and de Lescure; also Scioit, Le Directoire (4 vols., Paris, 1892–1897), A. Sorel, L'Europe et la Révolution française (exp. vols. v. and vi., Paris, 1903–1904), and A. Vandel, L'âge de Bonaparte (Paris, 1902–1904). (J. L. R.)

BARRATRY (O. Fr. *baréter, barater, to barter or cheat), in English criminal law, the offence (more usually called common barratry) of constantly inciting and stirring up quarrels in disturbance of the peace, either in courts or elsewhere. It is an offence both at common law and by statute, and is punishable by fine and imprisonment. It was a crime in 1761, and an aggravation of their offence, respecting Barras see the Memoirs of Gohier, Larevellière-Lépée and de Lescure; also Scioit, Le Directoire (4 vols., Paris, 1892–1897), A. Sorel, L'Europe et la Révolution française (exp. vols. v. and vi., Paris, 1903–1904), and A. Vandel, L'âge de Bonaparte (Paris, 1902–1904). (J. L. R.)

BARRATRY—BARREL-ORGAN

attack on Pitt, of whom, however, he became ultimately a devoted adherent. A vigorous opponent of the taxation of America, his mastery of invective was powerfully displayed in his championship of the American cause, and the name "Sons of Liberty" which he had applied to the system of crowns, became a common designation of the American organizations directed against the Stamp Act, as well as of later patriotic clubs. His appointment in 1782 to the treasurership of the navy, which carried with it a pension of £3200 a year, at a time when the government was ostensibly advocating economy, caused great discontent; subsequently, however, he received from the younger Pitt the clerkship of the plen in place of the pension, which thus was saved to the public. Becoming blind, he retired from office in 1790 and died on the 20th of July 1802. Barré, a city of Washington county, Vermont, U.S., public installations, and roads. It is in the north central part of the state, about 6 m. S.E. of Montpelier. Pop. (1890) 4146; (1900) 8448, of whom 2831 were foreign-born; (1910, census) 16734. It is served by the Central Vermont and the Montpelier & Wells River Railway, and is connected by electric street railways with Montpelier. Barre is an important seat of the granite industry, and manufactures monuments and tombstones, stone-cutting implements and other machinery. In 1905 the city's factory products were valued at $3,373,046, of which 86-9 % was the value of the monuments and tombstones manufactured. Among its institutions are the Aldrich public library and Goddard Seminary (1870; Universalist). There is a beautiful granite statue of Burns (by J. Massey Rhind), erected in 1899 by the Scotsmen of Barre. The water-works are owned and operated by the municipality. Settled soon after the close of the War of Independence, the township of Barre (pop. in 1910, 4194) was organized in 1793 and named in honour of Isaac Barré (1726–1802), a defender of American rights in the British parliament. The present city, chartered in 1894, was originally a part of the township.

BARREL-ORgan, a small portable organ mechanically played by turning a handle. The barrel-organ owes its name to the cylinder on which the tunes are pricked out with pins and staples of various lengths, set at definite intervals according to the scheme required by the music. The function of these pins and staples is to raise balanced keys connected by simple mechanism with the valves of the pipes, which are thus mechanically opened, admitting the stream of air from the wind-chest. The handle attached to the shaft sets the cylinder in slow rotation by means of a worm working in a fine-toothed gear on the barrel-head; the same motion works the bellows by means of cranks and connecting rods on the shaft. The wind is thereby forced into a reservoir, whence it passes into the wind-chest, on the sides of which are grouped the pipes. The barrel revolves slowly from back to front, each revolution as a rule playing one complete tune. A notch-pin in the barrel-head, furnished with as many notches as there are tunes, enables the performer to shift the barrel and change the tune. The ordinary street barrel-organ had a compass varying from 24 to 34 notes, forming a diatonic scale with a few accidentals, generally F, G, C, E. There were usually two stops, one for the open pipes of metal, the other for the closed wooden pipes. Barrel-organ
have been made with as many as three or four cylinders set in a circular revolving frame, but these more elaborate instruments were mainly used in churches and chapels, a purpose for which they were in great demand in the early date of this invention and voluntary during the 18th and early 19th centuries. A barrel-organ was built for Fulham church by Wright, and a large instrument with four barrels was constructed by Bishop for Northallerton church in 1820.

The origin of the barrel-organ is now clearly established, and many will doubtless be surprised to find that it must be sought in the Netherlands as early as the middle of the 15th century, and that accurate and detailed diagrams of every part of the mechanism for a large stationary barrel-organ worked by hydraulic power were published in 1615. There are letters patent preserved in the archives of Belgium appointing a certain organ-builder, Jehan van Steeken, dii Aren, "Master of organs which play of themselves"; in the original Flemish Meester van orgelen spelende bij hem selve. This organ was not a portable one like English street-organs, but a more imposing instrument, as we learn from other documents giving a detailed account of the moneys paid to Maistre Jehan for conveying the organs to Bruges to Brussels. Steeken was, by virtue of the same letters patent, awarded an annual pension of fifty Rhenish florins in consideration of the services rendered to the duke of Burgundy, and on condition of his submitting to his liege Philip the Good all other instruments he might make in the future. There is nothing singular in the early date of this invention, for the 15th century was distinguished for the extraordinary impulse which the patronage and appreciation of the duke of Burgundy had created for automatic contrivances of all kinds, carillons, clocks, speaking animals and other curiosities due to Flemish genius. No contemporary illustration is forthcoming, but in 1615 Solomon de Caus, who avowedly owed his inspiration to Hero of Alexandria, describes a number of hydraulic machines, amongst which is the barrel-organ, illustrating his description by means of several large drawings and diagrams very carefully carried out. De Caus' organ, entitled "Machine par laquelle l'on fera sonner un jeu d'orgues par le moyen de l'eau," was built up on a wall a foot thick. In the illustrations the barrel is shown to be divided into bars, and each bar into eight beats for the quavers. The whole drum is pierced with holes at the intersecting points, the pins being movable, so that when the performer grew tired of one tune, he could rearrange the pins to form another. The four bellows are set in motion by means of ropes strained over pulleys and attached to four cranks on the rotating shaft. Solomon de Caus lays no claim to the invention of this organ, but only to the adaptation of hydraulic power for revolving the drum; on the contrary, in a dissertation on the invention of hydraulic machines and organs, he states that there was evidently some difference between the organs of the ancients and those of his day, since there is no mention in the classics of any musical wheel by means of which tunes could be played in several parts—the ancients, indeed, seem to have used their fingers on the keyboard to sound their organs. The eighteen keys drawn in one diagram bear names, beginning at the left, D, C, B, A, G, F, F#, E, D, C, B, A, G, F, E, D, C, B; De Caus states that only half the keyboard is given for want of space; the compass, therefore, probably was as shown, with a few accidentals. A barrel-organ, also worked by hydraulic power, is somewhat fantastically drawn by Robert Fludd in a work published two years after that of Solomon de Caus. This diagram is of no value except as a curiosity, for the author betrays a very imperfect knowledge of the mechanical principles involved. The piece of barrel-organ actually set on de Caus' barrel-organ, six bars of which can be made out, consists of a madrigal, "Chi fara fed' al ciel," by Alessandro Striggio, written in organ tablature by Peter Philips, organist of the Chapel Royal, Brussels, at the end of the 16th century. A French barrel-organ in the collection of the Brussels Conservatoire, bearing the date "5 Mars 1792," has the following compass with flats, beginning at the left:

![Fig. 1.—Large stationary barrel-organ worked by hydraulic power, from Solomon de Caus, Les Raisons des forces mouvantes (Frankfort-on-Main, 1615).](image-url)

Otherwise, the details of the origin of the barrel-organ are not wanting. The inventory of the organs and other keyboard instruments belonging to the duke of Modena, drawn up in 1598, contains two entries of an organo Tedesco. In England these organs were also known as "Dutch organs," and the name clung to the instrument even in its diminutive form of hand-organ of the itinerant musician. In Jenediah Morse's description of the

9 V. C. Mahillon, Catalogue descriptif (Brussels, 1896), No. 1137, p. 371.
10 Tedesco was applied by Italians to both German and Dutch Count Valdbrighd, Musurgiana: I. Seravdola, Pianoforte, Salierio (Modena, 1879), pp. 27 and 28; and E. van der Straeten, op. cit. vol. vi. p. 122.
manner and customs of the Netherlands; we find the following allusion:—’The diversions of the Dutch differ not much from those of the English, who seem to have borrowed from them the neatness of their drinking booths, skittle and other grounds... which form the amusements of the middle ranks, not to mention their hand-organisms and other musical inventions.’ An illustration of the hand-organ of that period is given in Knight’s London, being one of a collection of street views published by Dayes in 1789. In a description of Bartholomew Fair, as held at the beginning of the 18th century, there is a further reference to the Dutch origin of the barrel-organ.—’It stands in the centre of the town, well known for playing on winter evenings before Spital Garden Coffee House, opposite Wigley’s great exhibition room, consisted of a double drum, a Dutch organ, the tambourine, violin, pipes and the Turkish jingle used in the army. This band was generally hired at one of the booths of the fair.’

Mr Thomas Brown relates that one Mr Stephens, a Poultry author, proposed to parliament for any one that should presume to keep an organ in a Publick House to be fined £100 and made incapable of being an ale-draper for the future. In 1757 Horace Walpole writes:—’I am now in pursuit of getting the finest pieces of music that ever was heard; it is a thing that will play eight tunes. Handel and all the great musicians say that it is beyond anything they can do, and this may be performed by the most ignorant person, and when you are weary of those eight tunes, you may have them changed for any other that you like.’ The organ was put in a lottery and fetched £1000.

There was a very small barrel-organ in use during the 18th and 19th centuries, known as the bird-organ (Fr. serinette, tutiltouine, merline). One of these now in the collection of the Brussels Conservatoire is described by V.C. Mahillon. The instrument is in the form of a mahogany box, the back of which is the title ‘Le chant des oiseaux, Tome vi.’ There are ten pewter stopped pipes giving the scale of G with the addition of F sharp and A a two octaves higher. The whole instrument measures approximately 8 × 5 × 2.5 inches, and plays eight tunes. Mozart wrote an Andante for a small barrel-organ.

For an illustration of the construction of the barrel-organ during the 18th century, consult P. M. D. J. Engravemle, La tomographie ou l’art de noter les cylindres et tous ce qui est susceptible de notage dans les instruments de concerts mécaniques (Paris, 1775), with engravings (not in the British Museum); and for a clear diagram of the instrument and an explanation on ‘Automatic Instruments connected with Music,’ by Dr E. J. Hopkins, in Grove’s Dictionary of Music and Musicians, vol. i. (1904), p. 134. (K.S.)

BARRÉ ISLAND, a volcanic island in the Bay of Bengal. It has an irregularly circular form of about 2 m. in diameter, composed of an outer rim rising to a height of from 700 to 1000 ft., with a central cone the altitude of which is 1015 ft. This cone rises from a depth of 800 fathoms below the sea. It was active between 1789 and 1832, but has since been dormant.

BARRÉ, MAURICE (1829-1904), French novelist and politician, was born at Charmes (Vosges) on the 22nd of August 1829; he was educated at the lycée of Nancy, and in 1883 went to Paris to continue his legal studies. He was already a contributor to the monthly periodical, Jeune France, and he now issued a periodical of his own, Les Taches d’encre, which survived for a few months only. After four years of journalism he went to Italy, where he wrote Sous l’œil des barbares (1888), the first volume of a trilogie du mois, completed by Un Homme libre (1889), and Le Jardin de Bérénice (1891). He divided the world into moi and the barbarians, the latter including all those asepathetic to the writer’s individuality. These apologies for individualism were supplemented by L’Ennemi des lois (1892), and an admirable volume of impressions of travel, Du sens, de la volonté et de la mort (1893). His early books are written in an elaborate style and are often very obscure. Barrés carried his theory of individualism into politics as an ardent partisan of General Boulanger. He directed a Boulanger paper at Nancy, and was elected deputy in 1889, retaining his seat in the legislature until 1893. His play, Une Journée parlementaire, was produced at the Comédie Française in 1894. In 1897 he began his trilogy, Le Roman de l’énergie nationale, with the publication of Les Déracinés. The series is a plea for local patriotism, and for the preservation of the distinctive qualities of the old French provinces. The first narrates the adventures of seven young Lorrainers, who set out to conquer fortune in Paris. Six of them survive in the second novel of the trilogy, L’Appel au soldat (1900), which gives the history of Boulangerism; the sequel, Leurs figures (1901), deals with the Panama scandals. Later works are:—Scènes et doctrines du nationalisme (1902); Les Amitiés françaises (1903), in which he urges the incitation of patriotism by the early study of national history; Ce que j’ai vu à Rennes (1904); Au service de l’Allemagne (1909), the experiences of an Alsatian conscript in a German regiment; Le Voyage de Saphir (1906). M. Barrès was admitted to the French Academy in 1906.

See also R. Doumic, Les Jeunes (1896); J. Lionnet, L’Évolution des idées (1903); Anatole France, La Vie litéraire (4th series, 1892).

BARRÉT, LAWRENCE (1838-1891), American actor, was born of Irish parents in Paterson, New Jersey, on the 4th of April 1838. His family name was Brannigan. He made his first stage appearance on the American stage in The French Spy in 1853. In December 1856 he made his first New York appearance at the Chambers Street theatre as Sir Thomas Clifford in The Hunchback. In 1858 he was in the stock company at the Boston Museum. He served with distinction in the Civil War as captain in the 28th Massachusetts infantry regiment. From 1867 to 1870, with John McCullough, he managed the California theatre, San Francisco. Among his many and varied parts may be mentioned Hamlet, Lear, Macbeth, Shylock, Richard III., Walscy, Benedict, Richelieu, David Garrick, Herman, Alfred Evelyn, Lanciotto in George Henry Boker’s (1823-1890) Francesca da Rimini, and James Harebell in The Man a’ Airie. He played Othello to Booth’s Iago and Cassius to his Brutus. He acted in London in 1867, 1881, 1883 and 1884, his Richelieu in Bulwer Lytton’s drama being considered his best part. He wrote a life of Edwin Forrest in the American Actors Series (Boston, 1881), and an admirable sketch of Edwin Booth in Edwin Booth and his Contemporaries (Boston, 1886). He died on the 20th of March 1891.

BARRÉT, LUCAS (1837-1862), English naturalist and geologist, was born in London on the 14th of November 1837, and educated at University College school and at Ebersdorf. In 1856 he accompanied R. McAndrew on a dredging excursion from the Shetlands to Norway and beyond the Arctic Circle; and subsequently made other cruises to Greenland and to the coast of Spain. These expeditions laid the foundations of an extensive knowledge of the distribution of marine life. In 1855 he was engaged by Sedgwick to assist in the Woodwardian Museum at Cambridge, and during the following three years he aided the professor by delivering lectures. He discovered bones of birds in the Cambridge Greensand, and he also prepared a geological map of Cambridge on the one-inch Ordnance map. In 1859, after nearly two years of his work, he was appointed director of the Geological Survey of Jamaica. There he determined the Cretaceous age of certain rocks which contained Hippurites, the new genus Barretia being named after him by S. P. Woodward; he also obtained many fossils from the Miocene and newer strata. He was drowned at the early age of twenty-five, on the 18th of December 1862, while investigating the sea-bottom off Kingston, Jamaica.

Obituary by S. P. Woodward in Geologist (Feb. 1863), p. 60.

BARRÉT, WILSON (1846-1904), English actor, manager and playwright, was born in Essex on the 18th of February 1846,
BARRHEAD — BARRIE, J. M.

son of a farmer. He made his first appearance on the stage at Halifax in 1864, and then played in the provinces alone and with his wife, Caroline Heath, in East Lynne. After managerial experiences at Leeds and elsewhere, in 1879 he took the management of the old Court theatre, where he introduced Madame Modjeska to London, in an adaptation of Schiller’s Maria Stuart, Adrienne Lecouvreur, La Dame aux camélias and other plays. It was not till 1881, however, when he took the Princess’s theatre, that he became well known to the public in the emotional drama, The Lights o’ London, by G. R. Sims. The play which made him an established favourite was The Silver King by Henry Arthur Jones, perhaps the most successful melodrama ever staged, produced in 1882 with himself as Wilfred Denver, his brother George (an excellent comedian) in the cast, and E. S. Willard (b. 1853) in the part of Spider — this being before the days of Mr. Willard, afterwards a well-known actor both in America and England, first came to the front. Barrett played this part for three hundred nights without a break, and repeated his London success in W. G. Wills’s Claudian which followed. In 1884 he appeared in Hamlet, but soon returned to melodrama, and though he had occasional seasons in London he acted chiefly in the provinces. In 1886 he made his first visit to America, repeated in later years, and in 1890 he visited Australia. During these years the London stage was coming under new influences, and Wilson Barrett’s vogue in melodrama had waned. But in 1895 he struck a new vein of success with his drama of religious emotion, The Sign of the Cross, which crowded his theatre with audiences largely composed of people outside the ordinary circle of playgoers. He attempted to repeat the success with other plays of a religious type, but without equal attempt, and several of his later plays were failures. He died on the 22nd of July 1904. Wilson Barrett was a sterling actor of a robust type and striking physique, not remarkable for intellectual finesse, but excelling in melodrama, and very successful as the central figure on his own stage.

BARRICADE, a police burgh of Renfrewshire, Scotland, situated on the Lenvon, 7½ m. S.W. of Glasgow by the Glasgow & South-Western railway. Pop. (1901) 9855. Founded in 1773, it has gradually absorbed the villages of Arthurlie, Dovecothall and Grahamston, and become a thriving town. The chief industries include bleaching, calico-printing, cotton-spinning, weaving, iron and brass founding, engineering and the manufacture of sanitary appliances. Neilston (pop. 2668), about 2 m. S.W., has bleachfields and print-works, and 2 m. N. by E. lie Hurlet, where are important manufactures of alum and other chemicals, and Nithmill (pop. 1342) with chemical works, quarries and sawmills.

BARRICADE, or BARRICADO (from the Span. barricado, from barrica, a cask, casks filled with earth having been early used to form barricades), an improvised fortification of earth, paving-stones, trees or any materials ready to hand, thrown up, especially across a street, to hinder the advance of an enemy; in the old wooden warships a fence or wooden rail, supported by stanchions and strengthened by various materials, extending across the quarter-deck as a protection during action.

BARRIE, JAMES MATTHEW (1860— ), British novelist and dramatist, was born at Kirriemuir, a small village in Forfarshire, on the 16th of May 1860. He was educated at the Dumfries academy and Edinburgh University. He has told us in his quasi-autobiographical Margaret Ogilvy that he wrote tales in the garret before he went to school, and at Edinburgh wrote the greater part of his three-volume novel, which a publisher presumed was the work of a clever lady and offered to publish for £100. The offer was not accepted, and it was through journalism that he found his way to literature. After a short period of waiting in Edinburgh, he became leader-writer on the Nottingham Journal in February 1883. To this paper he contributed also special articles and notes, which provided an opening and training for his personal talent. He soon began to submit articles to London editors, and on the 17th of November 1884 Mr Frederick Greenwood printed in the St James’s Gazette his article on “An Auld Licht Community.” With the encouragement of this able editor, more Auld Licht “Idylls” followed; and in 1885 Mr Barrie moved to London. He continued to write for the St James’s Gazette and for Home Chimes (edited by Mr F. W. Robinson). He was soon enlisted by Mr Alexander Riach for the Edinburgh Evening Dispatch, which in turn led to his writing (over the signature of “Ogilvy”) for Dr Robertson Nicoll’s British Weekly. Later he became a contributor to the Scots (afterwards National) Observer, edited by W. E. Henley, and also to the Speaker, upon its foundation in 1890. In 1887 he published his first book, Better Dead. It was a mere jeu d’esprit, a specimen of his humorous journalism, elaborated from the St James’s Gazette. This was followed in 1888 by Auld Licht Idylls, a collection of the Scots village sketches written for the same paper. They portrayed the life and humours of his native village, idealised as “Thurums,” and were the fruits of early observation and of his mother’s. “She told me everything,” Mr Barrie has written, “and so my memories of our little red town were coloured by her memories.” Kirriemuir itself was not wholly satisfied with the portrait, but “Thurums” took its place securely on the literary map of the world. In the same year he published An Edinburgh Eleven, sketches from the British Weekly of eminent Edinburgh students; also his first long story, When a Man’s Single, a humorous transcription of his experiences as journalist, particularly in the Nottingham office. The book was introduced by what was in fact another Thrums “Idyll,” on a higher level than the rest of the book. In 1889 came A Window in Thurums. This brought a national book, and the Idylls gave Mr Barrie’s measure of Mr Barrie’s gifts of humanity, humour and pathos, with abundant evidence of the whimsical turn of his wit, and of his original and vernacular style. In 1891 he made a collection of his lighter papers from the St James’s Gazette and published them as My Lady Nicotine. In 1891 appeared his first long novel, The Little Minister, which had been first published serially in Good Words. It introduced, not with unmixed success, extraneous elements, including the winsome heroine Babbie, into the familiar life of Thurums, but proved the author’s possession of a considerate gift of romance. In 1894 he published Margaret Ogilvy, based on the life of his mother and his own experiences with her, most tenderly conceived and beautifully written, though too intimate for the taste of many. The book is full of revelations of great interest to admirers of Mr Barrie’s genius. The following year came Sentimental Tommy, a story tracing curiously the psychological development of the “artistic temperament” in a Scots lad of the people. R. L. Stevenson supposed himself to be portrayed in the hero, but it may be safely assumed that the author derived his material largely from introspection. The tale was completed by a sequel, Tommy and Grisel, published in 1900. The effect of this story was somewhat marred by the comparative failure of the scenes in society remote from Thurums. In 1902 he published The Little White Bird, a pretty fantasy, wherein he gave full play to his whimsical invention, and his tenderness for child life, which is relieved by the genius of sincerity from a suspicion of mawkishness. This book contained the episode of “Peter Pan,” which afterwards suggested the play of that name. In the meantime Mr Barrie had been developing his talent as a dramatist. In 1892 Mr Toole had made a great success at his own theatre of Barrie’s Walker, London, a farce of his, entitled Vibrations. In 1893 he published A Man’s Own, a short novel, and the Idyll, written with Mr Barrie’s gifts of humanity, humour and pathos, with abundant evidence of the whimsical turn of his wit, and of his original and vernacular style. In 1891 he made a collection of his lighter papers from the St James’s Gazette and published them as My Lady Nicotine. In 1891 appeared his first long novel, The Little Minister, which had been first published serially in Good Words. It introduced, not with unmixed success, extraneous elements, including the winsome heroine Babbie, into the familiar life of Thurums, but proved the author’s possession of a considerate gift of romance. In 1894 he published Margaret Ogilvy, based on the life of his mother and his own experiences with her, most tenderly conceived and beautifully written, though too intimate for the taste of many. The book is full of revelations of great interest to admirers of Mr Barrie’s genius. The following year came Sentimental Tommy, a story tracing curiously the psychological development of the “artistic temperament” in a Scots lad of the people. R. L. Stevenson supposed himself to be portrayed in the hero, but it may be safely assumed that the author derived his material largely from introspection. The tale was completed by a sequel, Tommy and Grisel, published in 1900. The effect of this story was somewhat marred by the comparative failure of the scenes in society remote from Thurums. In 1902 he published The Little White Bird, a pretty fantasy, wherein he gave full play to his whimsical invention, and his tenderness for child life, which is relieved by the genius of sincerity from a suspicion of mawkishness. This book contained the episode of “Peter Pan,” which afterwards suggested the play of that name. In the meantime Mr Barrie had been developing his talent as a dramatist. In 1892 Mr Toole had made a great success at his own theatre of Barrie’s Walker, London, a farce of his, entitled Vibrations. In 1893 he published A Man’s Own, a short novel, and the Idyll, written with
Crichton and Little Mary. The year 1904 produced Peter Pan, a kind of poetical pantomime, in which the author found scope for some of his most characteristic and permanently delightful gifts. In 1905 Alice-Sit-by-the-Fire and in 1906 What Every Woman Knows were added to the list. As dramatist Mr Barrie brought, to a sphere rather ruddy by convention, a method wholly unconventional and a singularly fresh fancy, seasoned by a shrewd touch of satirical humour; and in Peter Pan he proved himself a Hans Andersen of the stage. In literature, the success of "Thrams" produced a crop of imitations, christened in derision by W. E. Henley the "Kailyard School," though the imitations were by no means confined to Scotland. In this school the Auld Licht Idylls and A Window in Thrams remained unsurpassed and unapproached. The Scots village tale was no novelty in literature—witness John Galt, the Chronicles of Carlingford and George MacDonald. Yet Mr Barrie, in spite of a dialect not easy to the Southron, contrived to touch a more intimate and more responsive chord. With the simplest materials he achieved an almost unendurable pathos, which yet is never forced; and the pathos is salted with humour, while about the moving homelessness of his humanity play the gleams of a whimsical wit. Stevenson, in a letter to Mr Henry James, in December 1882, said justly of Barrie that "there was genius in him, but there was a journalist on his elbow." This genius found its most perfect and characteristic expression in the humanity of "Thrams" and the bizarre and tender fantasy of Peter Pan.

BARRIE, the capital of Simcoe county, Ontario, Canada, 56 m. N. of Toronto, on Lake Simcoe, an important centre on the Grand Trunk railway. It contains several breweries, carriage factories, boat-building and railway shops, and manufactories of woollens, stoves and leather. It is also a summer resort and the starting-point for the numerous Lake Simcoe steamers. Pop. (1901) 5049.

BARRIERE, THÉODORE (1823-1877), French dramatist, was born in Paris in 1823. He belonged to a family of map engravers which had long been connected with the war department, and spent nine years in that service himself. The success of a vaudeville he had performed at the Beaumarchais and which was immediately snapped up for the repertory of the Palais Royal, showed him his real vocation. During the next thirty years he signed, alone or in collaboration, for a hundred plays, among the most successful were: La Vie de bohème (1859), adapted from Henri Murger's book with the novelist's help; Moulin Lescoult (1851); Les Filles de marbre (1853); L'Héritage of Monseur Pluamé (1858); Les Faux Bonshommes (1856) with Ernest Capendu; Malheureux vaincus (1865), which was forbidden by the censor; Le Gascón (1878). Barrière died in Paris on the 16th of October 1877.

See also Revue des deux mondes (March 1859).

BARRIER TREATY, the name given first to the treaty signed on 29th of October 1709 between Great Britain and the states-general of the United Netherlands, by which the latter engaged to guarantee the Protestant succession in England in favour of the house of Hanover; while Great Britain undertook to procure for the Dutch an adequate barrier on the side of the Netherlands, consisting of the towns of Funes, Nieuport, Ypres, Menin, Lille, Tournaï, Condé, Valenciennes, Maubeuge, Charleroi, Namur, Halle, Damme, Dendermonde and the citadel of Ghent. The treaty was based on the same principle of securing Holland against French aggression that had inspired that of Ryswick in 1698, by the terms of which the chief frontier fortresses of the Netherlands were to be garrisoned by Dutch troops. A second Barrier Treaty was signed between Great Britain and Holland on 29th of January 1713, by which the strong places designed for the barrier were reduced to Funes, the fort of Knocke, Ypres, Menin, Tournaï, Mons, Charleroi and the citadel of Ghent, and certain fortresses in the neighbourhood of that city and of Bruges; Great Britain undertaking to obtain the right for the Dutch to garrison them from the future sovereign of the Spanish Netherlands. Its terms were included in the treaty of Rastatt, between the emperor and France, signed on the 7th of March 1714. A third Barrier Treaty was signed in November 1715.

BARRINGTON, DAINES (1777-1800), English lawyer, antiquary and naturalist, was born in 1777, fourth son of the first Viscount Barrington. He was educated for the profession of the law, and after filling various posts, was appointed a Welsh judge in 1777 and afterwards second justice of Chester. Though an indifferent judge, his Observations on the Statutes, chiefly the more ancient, from Magna Charta to 21st James I., cap. 27, with an appendix, being a proposal for new-modelling the Statutes (1766), had a high reputation among historians and constitutional antiquaries. In 1773 he published an edition of Orosius, with Alfred's Saxon version, and an English translation, with notes; notably: Tracts on the Probability of reaching the North Pole (1775) were written in consequence of the northern voyage of discovery undertaken by Captain C. J. Phipps, afterwards Lord Mulgrave (1744-1792). Barrington's other writings are chiefly to be found in the publications of the Royal and Antiquarian Societies, of both of which he was a long member, and of the latter vice-president. Many of these were collected by him in a quarto volume entitled Miscellanies on various Subjects (1781). He contributed to the Philosophical Transactions for 1780 an account of Mozart's visit at eight years of age to London. In his Miscellanies on varied subjects he included this with accounts of four other prodigies, namely, Crotch, Charles and Samuel Wesley, and Garrett Wellesley, Lord Mornington. Among the most curious and ingenious of his papers are his Experiments and Observations on the Singing of Birds, and his Essay on the Language of Birds. He died on the 14th of March 1800 and was buried in the Temple church.

BARRINGTON, GEORGE (b. 1755), an Irishman with a curious history, was born at Maynooth on the 14th of May 1755, the son of a working silversmith named Waldron. In 1771 he robbed his schoolmaster at Dublin and ran away from school, becoming a member of a touring theatrical company under the assumed name of Barrington. At Limerick races he joined the manager of the company in pocket-picking. The manager was detected and sentenced to transportation, and Barrington fled to London, where he assumed clerical dress and continued his pocket-picking. At Covent Garden theatre he robbed the Russian prince Orlov of a snuff-box, said to be worth £30,000. He was
detected and arrested, but as Prince Orlov declined to prosecute, was discharged, though subsequently he was sentenced to three years' hard labour for pocket-picking at Drury Lane theatre. On his release he was again caught at his old practices and sentenced to five years' hard labour, but influence secured his release on the condition that he left England. He accordingly went for a short time to Dublin, and then returned to London, where he was once more detected pocket-picking, and, in 1790, sentenced to seven years' transportation. On the voyage out to Botany Bay a conspiracy was hatched by the convicts on board to seize the ship. Barrington disclosed the plot to the captain, and the latter, on reaching New South Wales, reported him favourably to the authorities, with the result that in 1792 Barrington obtained a warrant of emancipation (the first issued), becoming subsequently superintendent of convicts and acting as highest constable of Paramatta. In 1796 a theatre was opened at Sydney, the principal actors being convicts, and Barrington wrote the prologue to the first production. This prologue has obtained a wide publicity. It begins:

"From distant climes, o'er widespread seas we come, Though not with much éclat or beat of drum; True patriots we, for, be it understood, We left our country for our country's good."

Barrington died at a ripe old age at Paramatta, but the exact date is not on record. He was the author of _A Voyage to Botany Bay_ (London. 1801); _The History of New South Wales_ (London. 1802); _The History of New Holland_ (London, 1808).

**BARRINGTON, JOHN SHUTE, 1ST VISCOUNT (1678-1734).** English lawyer and theologian, was the son of Benjamin Shute, merchant, and was born at Theobalds, in Hertfordshire, in 1678. He received part of his education at the university of Utrecht; and, after returning to England in 1685, studied law in the Inner Temple. In 1701 he published several pamphlets in favour of the civil rights of Protestant dissenters, to which class he belonged. On the recommendation of Lord Somers he was employed to induce the Presbyterians in Scotland to favour the union of the two kingdoms, and in 1703 he was rewarded for this service by being appointed to the office of commissioner of the customs. From this, however, he was removed on the change of administration in 1711; but his fortune had, in the meantime, been improved by the bequest of two considerable estates—one of them left him by Francis Barrington of Tofts, whose name he assumed by act of parliament, the other by John Wildman of Beckett. Barrington now stood at the head of the dissenters. On the accession of George I. he was returned to parliament for Berwick-upon-Tweed; and in 1720 the king raised him to the Irish peerage, with the title of Viscount Barrington of Ardglass. But having unfortunately engaged in the Harburg lottery, one of the bubble speculations of the time, he was expelled from the House of Commons in 1723,—a punishment which was considered much too severe, and was thought to be due to personal malice of Walpole. In 1725 he published his principal work, entitled _Miscellanea Sacra or a New Method of considering so much of the History of the Apostles as is contained in Scripture_, 2 vols. 8vo,—afterwards reprinted with additions and corrections, in 3 vols. 8vo. 1770, by his son Shute. In the same year he published _An Essay on the Several Dispensations of God to Mankind_. He died on the 14th of December 1734.

**BARRINGTON, VISCOUNT (1734-1826).** British admiral, was the fourth son of the 1st Viscount Barrington. He entered the navy at an early age and in 1747 had worked his way to a post-captaincy. He was in continuous employment during the peace of 1748-1756, and on the outbreak of the Seven Years' War served with Hawke in the Basque roads in command of the "Achilles" (60). In 1759 the "Achilles" captured a powerful French privateer, after two hours' fighting. In the Havre-de-Grace expedition of the same year Barrington's ship carried the flag of Rear-Admiral Rodney, and in 1760 sailed with John Byron to destroy the Louisbourg fortifications. At the peace in 1763 Barrington had been almost continuously aloft for twenty-two years, and in 1768 to the frigate "Venus" as governor to the duke of Cumberland, who remained with him in all ranks from midshipman to rear-admiral. In 1778 the duke's flag-captain became rear-admiral and went to the West Indies, while in conjunction with the army he took the island of Santa Lucia from the French, and repulsed the attempt of the contre d'Estaing to retake it. Superseded after a time by Byron, he remained as that officer's second-in-command and was present at Grenada and St. Kitts (6th and 22nd of July 1779). On his return home, he was offered, but refused, the command of the Channel fleet. His last active service was the relief of Gibraltar in October 1782. As admiral he flew his flag for a short time in 1790, but was not employed in the French revolutionary wars. He died in 1800.

See _Raffe, Naval Biographies_, i. 120; _Charnock, Biographia Navalis_, vi. 10.

**BARRINGTON, SHUTE (1734-1836), youngest son of the 1st Viscount Barrington, was educated at Eton and Oxford, and after holding some minor dignities was made bishop of Llandaff in 1769. In 1782 he was translated to Salisbury and in 1791 to Durham. He was a vigorous Protestant, though willing to grant Roman Catholics "every degree of toleration short of political power and establishment." He published several volumes of sermons and tracts, and wrote the political life of his brother, Viscount Barrington.

**BARRINGTON, WILLIAM WILDMAN SHUTE, 2ND VISCOUNT (1717-1793), eldest son of the 1st Viscount Barrington, was born on the 7th of January 1717. Succeeding to the title in 1734, he spent some time in travel, and in March 1740 was returned to parliament as member for Berwick-upon-Tweed. Having taken his seat in the Irish House of Lords in 1745, he was appointed one of the lords commissioners of the admiralty in 1746, and was one of the "managers" of the impeachment of Simon, Lord Lovat. In 1754 he became member of parliament for Plymouth, in 1755 was made a privy councillor and secretary at war, and in 1761 was transferred to the office of chancellor of the exchequer. In 1762 he became treasurer of the navy, and in 1765 returned to his former position of secretary at war. He retained this office until December 1778, and during four months in 1782 was joint postmaster-general. He married in 1740 Mary, daughter of Mr. Henry Lovell, but left no children. He died at Becket on the 1st of February 1793, and was buried in Shriverham church.

**BARRISTER, in England and Ireland the term applied to the highest class of lawyers who have exclusive audience in all the superior courts, the word being derived from the "bar" (q.v.) in the law courts. Every barrister in England must be a member of one of the four ancient societies called Inns of Court, viz. Lincoln's Inn, Middle Temple, Inner Temple, and in Ireland, of the King's Inns. The existence of the English societies as schools can be traced back to the 13th century, and their rise is attributed to the clause in Magna Carta, by which the Common Pleas were fixed at Westminster instead of following the king's court, and the professors of law were consequently brought together in London. Associations of lawyers acquired houses of their own in which students were educated in the common law, and the degrees of barrister (corresponding to apprentice or bachelor) and sergeant (corresponding to doctor) were conferred. These schools of law are now represented by the Inns of Court.

Students are admitted as members of the Inns of Court, on paying certain fees and on passing a general (elementary) examination or (alternatively) producing evidence of having passed a public examination at a university; their subsequent call to the bar depends on their keeping twelve terms (of which there are four in each year), and passing certain further examinations. (see _English Law ad fin._). A term is "kept" by dining six times (three for a student whose name is on the books of a university) in hall. This is a relic of the older system in which examinations were not included, the only requisite being a certificate from a barrister that the student had read for twelve weeks in his chambers. Dining in hall then applied a certain social test, which has now become unmeaning. The profession of barrister is open to almost every one; but no person connected
with the law in any inferior capacity or who is a chartered or professional accountant, can enter an Inn of Court as a student until he has entirely and bona fide ceased to act or practise in such capacity. Some of the Inns also make a restriction that their members shall not be engaged in trade. A form of admission has to be filled up, containing a declaration to this effect, and mentioning inter alia the age, nationality, condition in life and occupation of the applicant. Previous to the student's call this declaration must be repeated, and he must further declare that he is not in holy orders, has not held any clerical preference and has not performed any clerical functions during the year preceding. Subject to the above, practising solicitors of not less than five years' standing may be called to the bar without keeping any terms, upon passing the necessary examinations, and, per contra, a barrister of the same standing may, without any period of apprenticeship, become a solicitor upon passing the final examination for solicitors.

Irish barristers of three years' standing may be called to the English bar without passing any examination upon keeping three terms, and so also may barristers of those colonies where the professions of barrister and solicitor are still kept distinct. No one can become a barrister till he is twenty-one years old.

The benchers of the different Inns of Court have the right of rejecting any applicant for membership with or without cause assigned; and for sufficient reasons, subject to an appeal to the common-law judges as visitors of the Inns, they may refuse to call a student to the bar, or may expel from their society or from the Inns-benchers of this bar, "either for immorality, or for the uttering, or giving or causing to be given, of such statements, or for conveying or offering to convey or for such being or returning, as were disapproved of by the benchers. The benchers appear to take cognizance of any kind of misconduct, whether professional or not, which they may deem unworthy of the rank of barrister. The grade of barrister comprehends the attorney-general and solicitor-general (appointed by and holding office solely at the will of the government of the day), who rank as the heads of the profession, king's counsel and ordinary practitioners, sometimes technically known as "utter barristers."

The peculiar business of barristers is the advocacy of causes in open court, but in England a great deal of other business falls into their hands. They are the chief conveyancers, and the pleadings (i.e. the counter statements of parties previous to joining issue) are in all but the simplest cases drafted by them. There was formerly, indeed, a separate class of conveyancers and special pleaders, being persons who kept the necessary number of terms qualifying for a call but who, instead of being called, took out licences, granted for one year only, but renewable, to practise under the bar, but now conveyancing and special pleading form part of the ordinary work of a junior barrister. The higher rank among barristers is that of king's or queen's counsel, or of an English court, and gives opinions on cases submitted to them, but they do not accept conveyancing or pleading, nor do they admit pupils to their chambers. Precedence among king's counsel, as well as among outer barristers, is determined by seniority. The old order of serjeants-at-law (p.s.) who ranked after king's counsel, is now extinct. Although every barrister has a right to practise in any court in England, each

special class of business has its own practitioners, so that the bar may almost be said to be divided into several professions. The most marked distinction is that between barristers practising in chancery and barristers practising in the courts of common law. The fusion of law and equity brought about by the Judicature Acts 1873 and 1875 was expected in course of time to break down this distinction; but to a large extent the separation between these two great branches of the profession remains. There are also subordinate distinctions in each branch. Counsel at common law attach themselves to one or other of the circuits into which England is divided, and may not practise elsewhere unless under special conditions. In chancery the king's counsel for the most part restrict themselves to one or other of the courts of the chancery division. Business before the court of probate, divorce and admiralty, the privy council and parliamentary committees, exhibits, though in a less degree, the same tendency to specialization. In some of the larger provincial towns there are also local bars of considerable strength. The bar of Ireland exhibits in its general arrangements the same features as the bar of England. For the Scottish bar, see under Advocates, FACULTY OF. There is no connexion whatever between the Scottish and English bars. A distinctive dress is worn by barristers when attending the courts, consisting of a stuff gown, exchanged for one of silk (whence the expression "to take silk") when the wearer has attained the rank of king's counsel, both classes also having wigs dating in pattern and material from the 18th century.

Remunerative, not answerable for anything spoken by him relative to the cause in hand and suggested in the client's instructions, even though it should reflect on the character of another and prove absolutely groundless, but if he mention an untruth of his own invention, or even upon instructions if it be impertinent to the matter in hand, he is then liable to an action from the party injured. Counsel may also be punished by the summary power of the court or judge as for a contempt, and by the benchers of the inn to which he may belong on cause shown.

The rank of barrister is a necessary qualification for nearly all offices of a judicial character, and a very usual qualification for other important appointments. Not only the judgeships in the superior courts of law and equity in England and in her colonies, but nearly all the magistracies of minor rank—recorderships, county court judgeships, &c.—are restricted to the bar. The result is a unique feature in the English system of justice, viz. the perfect harmony of opinion and interest between the bar as a profession and all degrees of the judicial bench. Barristers have the rank of esquires, and are privileged from arrest whilst in attendance on the superior courts and on circuit, and also from serving on juries whilst in active practice. Barristers are counsel of not less than seven years' standing appointed to revise the lists of parliamentary voters.

Barristers cannot maintain an action for their fees, which are regarded as gratuities, nor can they, by the usage of the profession, undertake a case without the intervention of a solicitor, except in criminal cases, where a barrister may be engaged directly, by having a fee given him in open court, nor is it competent for them to enter into any contract for payment by their clients with respect to litigation.

BARROIS, CHARLES (1851— ), French geologist, was born at Lille on the 21st of April 1851, and educated at the college in that town, where he studied geology under Prof. Jules Gosselet and qualified as D. ès Sc. To this master he dedicated his first comprehensive work, Recherches sur le terrain crétacé supérieur de l'Angleterre et de l'Irlande, published in the Mémoires de la société géologique du Nord in 1876. In this essay the palaeontological zones in the Chalk and Upper Greensand of Britain were for the first time marked out in detail, and the results of Dr Barrois's original researches have formed the basis of subsequent investigations. Some of his earlier papers have in all leading features been confirmed. In 1876 Dr Barrois was appointed a collaborator to the French Geological Survey, and in 1877 professor of geology in the university
of Lille. In other memoirs, among which may be mentioned those on the Cretaceous rocks of the Ardennes and of the Basin of Oviedo, Spain; on the (Devonian) Calcaire d’Erbray; on the Palaeozoic rocks of Brittany and of northern Spain; and on the granitic and metamorphic rocks of Brittany, Dr Barrois has proved himself an accomplished petrologist as well as palaeontologist and field-geologist. In 1881 he was awarded the Bigsbury medal, and in 1901 the Wollaston medal by the Geological Society of London. He was chosen member of the Institute (Academy of Sciences) in 1904.

BARROS, JOÃO DE (1496–1570), called the Portuguese Livy, may be said to have been the first great historian of his country. Educated in the palace of King Manoel, he early conceived the idea of writing history, and, to prove his powers, composed, at the age of twenty, a romance of chivalry, the Chronicle of the Emperor Clarimundo, in which he is said to have had the assistance of Prince John, afterwards King John III. The latter, on ascending the throne, gave Barrois the capiscany of the fortress of St George of Elmina, whither he proceeded in 1522, and he obtained in 1525 the post of treasurer of the India House, which he held until 1536. He was sent from Lisbon to his country house near Pombal, and there he finished a moral dialogue, Rhopica Pneuma, which was the first of the Décades of his Asia. In his return to Lisbon in 1532 the king appointed Barrois factor of the India and Mina House—positions of great responsibility and importance. It was here that Lisbon was the European emporium for the trade of the East. Barrois proved a good administrator, displaying great industry and a disinterestedness rare in that age, with the result that he made but little money where his predecessors had amassed fortunes. At this time, John III., wishful to attract settlers to Brazil, divided it up into captaincies and gave that of Maranhão to Barrois, who, associating two partners in the enterprise with himself, prepared an armada of ten vessels, carrying nine hundred men, which set sail in 1530. Owing to the ignorance of the pilots, the whole fleet suffered shipwreck, which entailed serious financial loss on Barrois, yet not content with meeting his own obligations, he paid the debts of those who had perished in the expedition. During all these busy years he had continued his studies in his leisure hours, and shortly after the Brazilian disaster he offered to write a history of the Portuguese in India, which the king accepted. He began work forthwith, but, before printing the first part, he again proved his pen by publishing a Portuguese grammar (1540) and some more moral Dialogues. The first of the Décades of his Asia appeared in 1552, and its reception was such that the king straightway charged Barrois to write a chronicle of King Manoel. His many occupations, however, prevented him from undertaking this book, which was finally composed by Damião de Goes (q.v.). The Second Decade came out in 1553 and the Third in 1563, but the Fourth and final one was not published until 1615, long after the author’s death. In January 1568 Barrois retired from his remunerative appointment at the India House, receiving the rank of fidalgos together with a pension and other pecuniary emoluments from King Sebastian, and died on the 20th of October 1570. A man of lofty character, he preferred leaving his children an example of good morals and learning to bequeathing them a large pecuniary inheritance, and, though he received many royal benefactions, they were volunteered, never asked for. As an historian and a stylist Barrois deserves the high fame he has always enjoyed. His Decades contain the early history of the Portuguese in Asia and reveal careful study of Eastern historians and geographers, as well as of the records of his own country. They are distinguished by clearness of exposition and orderly arrangement. His style has all the simplicity and grandeur of the masters of historical writing, and the purity of his diction is incontestable. Though, on the whole, impartial, Barrois is the narrator and apostle of the great deeds of his countrymen, and lacks the critical spirit and intellectual acumen of Damião de Goes. Diogo do Couto continued the Decades, adding nine more, and a modern edition of the whole appeared in Lisbon in 14 vols. in 1778–1788. The title of Barrois’ work is Da Asia de João de Barros, dos feitos que os Portugueses fizeram no descubrimento e

conquista dos mares e terras do Oriente, and the edition is accompanied by a volume containing a life of Barrois by the historian Manoel Severim de Faria and a copious index of all the Decades. An Italian version in 2 vols. appeared in Venice in 1561–1562 and a German in 5 vols. in 1821. Clarimundo has gone through the following editions: 1522, 1555, 1601, 1742, 1791 and 1843, all published in Lisbon. It influenced Francisco de Moraes (q.v.); cf. Purser, Palmerin of England, Dublin, 1904, pp. 440 et seq.

The minor works of Barros are described by Innocencio da Silva: Dicionario Bibliographico Portuguez, vol. iii. pp. 320–323 and vol. x. pp. 197–198, and in Severim de Faria’s Life, cited above. A compilation of Barrois’s Varia was published by the visconde de Azevedo (Porto, 1869).

BARROZ, CAMILLE HYACINTHE ODILON (1791–1873). French politician, was born at Villefort (Lozère) on the 10th of September 1791. He belonged to a legal family, his father, an advocate of Toulouse, having been a member of the Convention who had voted against the death of Louis XVI. Odilon Barrot’s earliest recollections were of the October insurrection of 1795. He was sent to the military school of Saint-Cyr, but presently removed to the Lycée Napoleon to study law and was called to the Parisian bar in 1811. He was placed in the office of the extreme Republicans and was appointed, one of the three deputies who had signed the address of March 1830 to Charles X., and threatened to reply to force by force. After the ordinances of the 26th of July 1830, he joined the National Guard and took an active part in the revolution. As secretary of the municipal commission, which sat at the hôtel-de-ville and formed itself into a provisional government, he was charged to convey to the chamber of deputies a protest embodying the terms which the advanced Liberals wished to impose on the king to be elected. He supported the idea of a constitutional monarchy against the extreme Republicans. But as it was the success of his immediate predecessor that was being expected, the deputies chose commissioners chosen to escort Charles X. out of France. On his return he was nominated prefect of the department of the Seine. His concessions to the Parisian mob and his extreme gentleness towards those who demanded the prosecution of the ministers of Charles X. led to an unflattering comparison with Jérôme Pétion under similar circumstances. Louis Philippe’s government was far from satisfying his desires for reform, and he persistently urged the “broadening of the bases of the monarchy,” while he protested his loyalty to the dynasty. He was returned to the chamber of deputies for the department of Eure in 1831. The day after the demonstration of June 1832 on the occasion of the funeral of General Lamarque, he made himself indirectly the mouthpiece of the Democrats in an interview with Louis Philippe, which is given at length in his Mémoires. Subsequently, in pleading before the court of cassation on behalf of one of the rioters, he secured the annulling of the judgments given by the council of war. The death of the duke of Orleans in 1842 was a blow to Barrot’s party, which sought to substitute the regency of the duchess of Orleans for that of the duke of Nemours in the event of the succession of the court of Paris. In 1846 Barrot made a tour in the Near East, returning in time to take part a second time in the preliminaries of revolution. He organized banquets of the disaffected in the various cities of France, and demanded electoral reform to avoid revolution. He did not foresee the strength of the outbreak for which his eloquence had prepared the way, and clung to the programme of 1830. He tried to support the regency of the duchess in the chamber on the 24th of February, only to find that the time was past for
BARROW, ISAAC (1630–1677), English mathematician and divine, was the son of Thomas Barrow, a linen-draper in London, belonging to a noted Suffolk and Cambridge family. His uncle was Bishop Isaac Barrow of St Asaph (1614–1658). He was first placed for two or three years at the Charterhouse school. There, however, his conduct gave but little hopes of his ever succeeding as a scholar. But after his removal from this establishment to Felsted school in Essex, where Martin Hobbe was master, his disposition took a happier turn; and having soon made considerable progress in learning, he was in 1643 entered at St Peter's College, and afterwards at Trinity College, Cambridge, where he applied himself to the study of literature and science, especially natural philosophy. He at first intended to adopt the medical profession, and made some progress in anatomy, botany and chemistry, after which he studied chronology, geography and astronomy. He then travelled in France and Italy, and in a voyage from Leghorn to Smyrna gave proofs of great personal bravery during an attack made by an Algerine pirate. At Smyrna he met with a kind reception from the English consul, Mr Bretton, upon whose death he afterwards wrote a Latin elegy. From this place he proceeded to Constantinople, where he received similar civilities from Sir Thomas Beldish, the English ambassador, and Sir Jonathan Dawes, with whom he afterwards contracted an intimate friendship. While at Constantinople he read and studied the works of St Chrysostom, whom he preferred to all the other Fathers. He resided in Turkey somewhat more than a year, after which he proceeded to Venice, and thence returned home through Germany and Holland in 1659.

Immediately on his reaching England he received ordination from Bishop Brownrig, and in 1660 he was appointed to the Greek professorship at Cambridge. When he entered upon this office he intended to have preciated upon the tragedies of Sophocles; but he altered his intention and made choice of Aristotle's rhetoric. His lectures on this subject, having been lent to a friend who never returned them, are irrecoverably lost. In July 1662 he was elected professor of geometry in Gresham College, on the recommendation of Dr John Wilkins, master of Trinity College and afterwards bishop of Chester; and in May 1663 he was chosen a fellow of the Royal Society, at the first election made by the council after obtaining their charter. The same year the executors of Henry Lucas, who, according to the terms of his will, had founded a mathematical chair at Cambridge, fixed upon Barrow as the first professor; and although his two professorships were not inconsistent with each other, he chose to resign that of Gresham College, which he did on the 20th of May 1664. In 1669 he resigned his mathematical chair at his pupil, Isaac Newton, having now determined to renounce the study of mathematics for that of divinity. Upon quitting his professorship Barrow was only a fellow of Trinity College; but his uncle gave him a small sinecure in Wales, and Dr Seth Ward, bishop of Salisbury, conferred upon him a prebend in that church. In the year 1670 he was created doctor in divinity by mandate; and, upon the promotion of Dr Pearson to the see of Chester, he was appointed to succeed him as master of Trinity College by the king's commission. He was interred in the college chapel before the date of the order of Knighthood, 1672. In 1675 Dr Barrow was chosen vice-chancellor of the university. He died on the 4th of May 1677, and was interred in Westminster Abbey, where a monument, surmounted by his bust, was soon after erected by the contributions of his friends.

By his English contemporaries Barrow was considered a mathematician second only to Newton. Continental writers do not place him so high, and their judgment is probably the more correct one. He was undoubtedly a clear-sighted and able mathematician, who handled admirably the severe geometrical method, and who was himself the first to enunciate the course of reasoning by which Newton was afterwards led to the doctrine of ultimate ratios; but his substantial contributions to the science are of no great importance, and his lectures upon elementary principles do not throw much light on the difficulties surrounding the border-line between mathematics and philosophy. (See infinitesimal calculus.) His sermons have long enjoyed a high reputation; they are weighty pieces of reasoning, elaborate in construction and ponderous in style.

His scientific works are very numerous. The most important are: Euclid's Elements; Euclid's Data; Optical Lectures, read in the public school of Cambridge; Thirteen Geometrical Lectures; The Works of Archimedes, the four Books of Apollonius's Conic Sections, the Translation of Tacquet's Phaenomena, and an English translation of the Metrical Proof of the Theorems of the Sphere and Cylinder are investigated and briefly demonstrated; Mathematical Lectures, read in the public schools of the university of Cambridge. The above were all written in Latin. His English works have been collected and published in four volumes folio.

BARROW, SIR JOHN (1764–1848), English statesman, was born in the village of Drayley Beck in the parish of Ulverston in Lancashire, on the 10th of June 1764. He started in life as a serving clerk of an iron foundry at Liverpool and afterwards taught mathematics at a school in Greenwich. Through the interest of Sir George Staunton, to whom he taught mathematics, he was attached on the first British embassy to China as comptroller of the household to Lord Macartney. He soon acquired a good knowledge of the Chinese language, on which he subsequently contributed interesting articles to the Quarterly Review; and the account of the embassy published by Sir George Staunton records many of Barrow's valuable contributions to literature and science connected with China. Although Barrow ceased to be officially connected with Chinese affairs after the return of the embassy in 1794, he always took much interest in them, and on critical occasions was frequently consulted by the British government. In 1797 he accompanied Lord Macartney, as private secretary, in his important and delicate mission to settle the government of the newly acquired colony of the Cape of Good Hope. Barrow was entrusted with the charge of numerous secret negotiations on the country in the interior. On his return from his journey, in the course of which he visited all parts of the colony, he was appointed auditor-general of public accounts. He now decided to settle in South Africa, married Anne Maria Trüter, and in 1800 bought a house in Cape Town. But the surrender of the colony at the peace of Amiens (1802) upset this plan. He returned to England in 1804, was appointed by Lord Melville second secretary to the admiralty, a post which he held for...
forty years. He enjoyed the esteem and confidence of all the eleven chief lords who successively presided at the admiral board during that period, and more especially of King William IV, while the lord high admiral, who honoured him with tokens of his personal regard. Barrow was a fellow of the Royal Society, and in 1821 received the degree of L.L.D. from Edinburgh University. A baronetcy was conferred on him by Sir Robert Peel in 1835. He retired from public life in 1845 and devoted himself to writing a history of the modern Arctic voyages of discovery (1846), of which he was a great promoter, as well as his autobiography, published in 1847. He died suddenly on the 23rd of November 1848.

Besides the numerous articles in the Quarterly Review already mentioned, Barrow contributed to other works, among others, Travels in China (1804); Travels into the Interior of South Africa (1806); and lives of Lord Macartney (1807), Lord Anson (1839), Lord Howe (1838). He was also the author of several valuable contributions to the seventh edition of the Encyclopaedia Britannica.

See Memoir of John Barlow, by G. F. Staunton (1852).

BARROW, a river of south-eastern Ireland. It rises in the Slieve Bloom mountains, and flows at first Easterly and then almost due south, until, on joining the Suir, it forms the estuary of the south coast known as Waterford Harbour. Including the sea of the estuary, the length of its valley is rather more than 100 m., without counting the lesser windings of the river. The total area of drainage to Waterford Harbour (including the basin of the Suir) is 3500 sq. m., and covers the whole of the county Kilkenny, with parts of Waterford, Cork and Limerick, Tipperary, Carlow, King's and Queen's counties. The chief towns on the banks of the Barrow are Athy (where it becomes navigable and has a junction with the Grand Canal), Carlow, Bagenalstown and New Ross. The chief affluent is the Nore, which it receives from the north-west a little above New Ross.

The scenery on its banks is in parts very beautiful.

Barrow (from the Irish word 'beard' or 'hilt'), a word found occasionally among place-names in England applied to natural eminences, but generally restricted in its modern application to denote an ancient grave-mound. The custom of constructing barrows or mounds of stone or earth over the remains of the dead was a characteristic feature of the sepulchral systems of primitive times. Originating in the common sentiment of humanity, which desires by some visible memorial to honour and perpetuate the memory of the dead, it was practised alike by peoples of high and of low development, and continued through all ages of the world, as is shown by the immediate influence of the early Christian church. The primary idea of sepulture appears to have been the provision of a habitation for the dead; and thus, in its perfect form, the barrow included a chamber or chambers where the tenant was surrounded with the prized possessions of his previous life. A common feature of the earlier barrows was the enclosing fence, which marked off the site from the surrounding ground. When the barrow was of earth, this was effected by an encircling trench or a low vallum. When the barrow was a stone structure, the enclosure was usually a circle of standing stones. Sometimes, instead of a chamber formed above ground, the barrow covered a pit excavated for the interment under the original surface. In later times the mound itself was frequently dispensed with, and the interments made within the enclosure of a trench, a vallum or a circle of standing stones. Usually the great barrows occupy conspicuous sites; but in general the external form is no index to the internal construction and gives no definite indication of the nature of the sepulchral usages. Thus, while the long barrow is characteristic of the Stone Age, it is impossible to tell without direct examination whether it may be chambered or unchambered, or whether the interments within it may be those of burnt or of unburnt bodies.

In England the long barrow usually contains a single chamber, entering by a passage underneath the higher and wider end of the mound. In Denmark the chambers are at irregular intervals along the body of the mound, and have no passages leading into them. The long barrows of Great Britain are often from 200 to 400 ft. in length by 60 to 80 ft. wide. Their chambers are rude but strongly built, with dome-shaped roofs, formed by overlapping the successive courses of the upper part of the side walls. In Scandinavia, on the other hand, the barrow-roofed chambers are unknown, and the construction of the chambers as a rule is megalithic, five or six monoliths supporting one or more capstones of enormous size. Such chambers, denuded of the covering mound, or over which no covering mound has been raised, are popularly known in England as "cromlechs" and in France as "dolmens" (see Stone Monuments). The prevailing mode of sepulture in all the different varieties of these structures is by the deposition of the body in a contracted position, accompanied by weapons and implements of stone, occasionally by ornaments of gold, jet or bone. Vessels of clay, wood, or leaf-ornate in character, which occur with these early interments of unburnt bodies, have been regarded as food-vessels and drinking-cups, differing in character and purpose from the cinerary urns of larger size in which the ashes of the dead were deposited after cremation.

The custom of burning the body commenced in the Stone Age, before the long barrow or the dolmen had passed out of use. While cremation is rare in the long barrows of the south of England, it is the rule in those of Yorkshire and the north of Scotland. In Ireland, where the long barrow form is all but unknown, the round barrow or cairn was consequently called from the earliest Pagan period till the introduction of Christianity. The round barrow occurs in groups in certain localities, some of which seem to have been the royal cemeteries of the tribal confederacies, whereas eight are enumerated in an ancient Irish manuscript, the Leabhar na h-Ulidhri, compiled c. A.D. 1100. The best-known of these is situated on the banks of the Boyne above Drogheda, and consists of a group of the largest cairns in Ireland. One, at New Grange, is a huge mound of stones and earth, over 300 ft. in diameter and 70 ft. in height. Around its base are the remains of a circle of large standing stones. The chamber, which is 20 ft. high in the centre, is reached by an entrance in the side, and has a ceiling of about 10 ft. thick. At Loughcrew Hills, Co. Meath, there is a group of about thirty stone barrows or cairns, mostly chambered, their bases measuring from 5 or 6 to 60 yds. in diameter. They are unusually interesting from the fact that many of the exposed slabs in the walls of the chambers are ornamented with spirals and other devices, rudely incised. As in the case of the long barrows, the traditional form of the circular, chambered barrow was retained through various changes in the sepulchral customs of the people. It was the natural result of the practice of cremation, however, that it should vary with the condition of the interment. In the case of the chamber, no longer regarded as a habitation to which the deceased, became simply a flat for the reception of the urn which held his ashes. The degradation of the chamber naturally produced a corresponding degradation of the mound which covered it, and the barrows of the Bronze Age, in which cremation was common, are smaller and less imposing than those of the Stone Age, but often surprisingly rich in the relics of the life and of the art workmanship of the time. In addition to the varied and beautiful forms of implements and weapons—frequently ornamented with a high degree of artistic taste—armlets and other personal ornaments in gold, amber, jet and bronze are not uncommon. The barrows of the bronze period, like some of those of the Stone Age, appear to have been used as tribal or family cemeteries. In Denmark as many as seventy deposits of burnt interments have been observed in a single mound, indicating its use as a burying-place throughout a long succession of years.

In the Iron Age there was less uniformity in the burial customs. In some of the barrows in central France, and in the wolds of Yorkshire, the interments include the arms and accoutrements of a charioteer, with his chariot, harness and horses. In Scandinavia a custom, alluded to in the sagas, of burying the viking in his ship, drawn up on land, and raising a barrow over it, is exemplified by the ship-burials discovered in Norway. The ship found in the Gokstad mound was 78 ft. long, and had a mast and sixteen pairs of oars. In a chamber abaft the mast the viking had been laid, with his weapons, and together with him were
BARROWE

buried twelve horses, six dogs and a peacock. An interesting example of the great timber-barred barrow is that at Jelling in Jutland, known as the barrow of Thyrre Danebod, queen of King Gorm the Old, who died about the middle of the 10th century. It is a mound about 200 ft. in diameter, and over 50 ft. in height, containing a chamber 23 ft. long, 8 ft. wide and 5 ft. high, formed of massive slabs of oak. Though it had been entered and plundered in the middle ages, a few relics were found when it was reopened, among which were silver cup, ornamented with the interlacing work characteristic of the time and some personal ornaments. It is highly probable that the chambered tumuli of which the ancient sepulchral usages were retained even after the Introduction of Christianity that King Harold, son and successor of Gorm the Old, who is said to have christianized all Denmark and Norway, followed the pagan custom of erecting a chambered tumulus over the remains of his father, on the summit of which was placed a rude pillar-stone, bearing on one side the memorial inscription in runes, and on the other a representation of the Saviour of mankind distinguished by the crossed nimbus surrounding the head. The so-called Kings' Haws at Upsala in Sweden rival those of Jelling in size and height. In the chamber of the late 25 ft. high there was a long line of stone bones; and along with it were ornaments of gold showing the characteristic workmanship of the 4th and 6th centuries of the Christian era. Along with the calcined human bones were bones of animals, among which those of the horse and the dog were distinguished.

Comparing the results of the researches in European barrows with such notices of barrow-barial as may be gleaned from early writings, we find them mutually illustrative. The Homeric account of the building of the barrow of Hector (II, xxvii) brings vividly before us the scene so often suggested by the re-examination of the tumuli of prehistoric times. During nine days wood was collected and brought, in carts drawn by oxen, to the site of the funeral pyre. Then the pyre was built and the body placed upon it. After burning for twenty-four hours the smouldering embers were extinguished with libations of wine. The white and calcined bones were then picked out of the ashes by the friends and placed in a metallic urn, which was deposited in a hollow grave or cist and covered over with large well-fitting stones. Finally, a barrow of great magnitude was heaped over the remains and the funeral feast was celebrated. The obscurities of Achilles, as described in the Odyssey, were, in the Iliad, replaced by details which are strikingly similar to those observed in tumuli both of the Bronze and Iron Ages. The body was brought to the pile in an embroidered robe and sceptre, and the bones were placed beside it. Sheep and oxen were slaughtered at the pile. The incinerated bones were collected from the ashes and placed in a golden urn along with those of Patroclus, Achilles' dearest friend. Over the remains a great and shapely mound was raised on the high heathland, so that it might be seen from afar by future generations of men.

Herodotus, describing the funeral customs of the Scythisans, states that, on the death of a chief, the body was placed upon a couch in a chamber sunk in the earth and covered with timber, in which were deposited all things needful for the comfort of the deceased in the other world. One of his wives was strangled and laid beside him, his cup-bearer and other attendants, his charioteer and his horses were killed and placed in the tomb, which was then filled up with earth and an enormous mound raised high over all. The barrows which cover the plains of ancient Scythia attest the truth of this description. A Siberian barrow, described by Demidov, contained three contiguous chambers of unhewn stone. In the central chamber lay the skeleton of the ancient chief, with his sword, his spear, his bow and a quiver full of arrows. The skeleton reclined upon a sheet of pure gold, extending the whole length of the body, which had been wrapped in a mantle broderied with gold and studded with precious stones. Over it was extended another sheet of pure gold. In a smaller chamber at the chief's head lay the skeleton of a female, richly attired, extended upon a sheet of pure gold and similarly covered with a sheet of the same metal. A golden chain adorned her neck and her arms were encircled with bracelets of pure gold. In a third chamber, at the chief's feet, lay the skeleton of his favourite horse with saddle, bridle and stirrups.

So curiously alike in their general features were the sepulchral usages connected with barrow-barial over the whole of Europe, that we find the Anglo-Saxon Saga of Beowulf describing the chambered tumulus with its gigantic masonry "held fast on props, with vaults of stone," and the passage under the mound haunted by a dragon, the guardian of the treasures of heathen gold which it contained. Beowulf's own burial is minutely described in terms which occasionally a strong resemblance to the similarity of the Iliad and Odyssey. There is first the preparation of the pile, which is hung round with helms, shields and coats of mail. Then the corpse is brought and laid in the midst; the pile is kindled and the roaring flame rises, mingled with weeping, till all is consumed. Then, for ten long days, the warriors labour at the rearing of his mighty mound on the heathland, high and broad, to be seen afar by the passers-by on land and sea.

The pyramids of Egypt, the mausoleas of the Lydian kings, the circular, chambered sepulchres of Mycenae, and the Etruscan tombs at Caere and Volci, are linedly descended from the chambered barrow. In fact, as such tombs were, according to the advance of architectural art at the period of their erection. There is no country in Europe destitute of more or less abundant proofs of the almost universal prevalence of barrow-barial in early times. It can also be traced on both sides of the basin of the Mediterranean, and from Asia Minor across the continent to India, China and Japan.

In the new world as well as in the old, similar customs prevailed from a very remote period. In the great plains of North America the dead were buried in barrows of enormous magnitude, which was often difficult for the Beres. In fact, the characteristic Christian practice of inhumation in the cemeteries sanctioned by the church, was only enforced in Europe by capilarieties denouncing the punishment of death on those who persisted in burying their dead after the pagan fashion in the pagan mounds. Yet even in the middle ages kings of Christian countries were buried with their swords and spears, and queens with their spindles and ornaments; the bishop was laid in his grave with his crozier and comb; the priest with his chalice and vestments; and clay vessels filled with charcoal (answering to the urns of heathen deities) are found in the churches of France and Denmark.

BARROWE, HENRY (?1550-1593), English Puritan and Separatist, was born about 1550, at Shipdam, Norfolk, of a family related by marriage to the lord keeper Bacon, and
probably to Ayler, bishop of London. He matriculated at Clare Hall, Cambridge, in November 1566, and graduated B.A. in 1569-1570. Afterwards he "followed the court" for some time, leading a frivolous if not licentious life. He was a member of Gray's Inn for a few years from 1570, but was never called to the bar. About 1570 or 1581 he was deeply impressed by a sermon, wherein he retired to the country, and was led by study and meditation to the strictest form of Puritanism. Subsequently, in what manner is not known, he came into intimate relations with John Greenwood, the Separatist leader, whose views (probably due, in part at least, to Browne's influence) he adopted without reserve. Though not strictly resident in London at this time, he was associated with the brethren of the Separation there, in whose secret meetings his natural earnestness and eloquence made him conspicuous. He was having regular correspondence by the post, and Browne came from the country to visit him, and on the 20th of November 1586 was detained by the gaoler and brought before Archbishop Whithgiff. He insisted on the illegality of this arrest, refused either to take the ex officio oath or to give bail for future appearance, and was committed to the Gatehouse. After nearly six months' detention and several irregular examinations before the high commissioners, he and Greenwood were formally indicted (May 1587) for recusancy under an act originally directed against Papists. They were ordered to find heavy bail for conformity, and to remain in the Fleet Prison until it was forthcoming. Browne continued a prisoner, the remainder of his life, nearly six years, sometimes in close confinement, sometimes having "the liberty of the prison." He was subjected to several more examinations, once before the privy council at Whitehall on the 18th of March 1588, as a result of petition to the queen. On these occasions he vigorously maintained the principle of separatism, denouncing the prescribed ritual of the Church as "a false worship," and the bishops as oppressors and persecutors. During his imprisonments he was engaged in written controversy with Robert Browne (down to 1588), who had yielded a partial submission to the established order, and from whom Browne continued a renegade. He also wrote several vigorous treatises in defence of separatism and congregational independency, the most important being:—

A True Description of the Visible Congregation of the Saints, &c. (1580); A Plain Refutation of Mr Gifford's Bookes, intituled A Short Treatise Against the Donatists of England (1590-1591), and A Brief Discovery of the False Church (1591). Others were written in conjunction with his fellow-prisoner, Greenwood. These writings were taken charge of by friends and mostly printed in Holland. By 1590 the bishops thought it advisable to try other means of convincing or silencing these indomitable controversialists, and went several conforming Puritan ministers to Browne to talk with him, but without effect. At length it was resolved to proceed on a capital charge of "devising and circulating seditious books," for which, as the law then stood, it was easy to secure a conviction. They were tried and sentenced to death on the 23rd of March 1593. What followed is, happily, unique in the history of English misrule. The day after sentence they were brought out as if for execution and respite. On the 31st of March they were taken to the gallows, and after the ropes had been placed about their necks were again respite. Finally they were hanged early on the morning of the 6th of April. The evidence of all this is obscure, but there is some evidence that the lord treasurer Burghley endeavoured to save their lives, and was frustrated by Whitgift and other bishops.

The opinions of Browne and Barrowe had much in common, but were not identical. Both maintained the right and duty of the Church to carry out necessary reforms without awaiting the permission of the civil power; and both advocated congregational independency. But the ideal of Browne was a spiritual democracy, towards which separation was only a means. Barrowe, on the other hand, regarded the whole established church order as polluted by the relics of Catholicism, and inveighed in separation as essential to pure worship and discipline (see further CONGREGATIONALISM). Barrowe has been credited by H. M. Dexter and others with being the author of the "Mar prelate Tracts"; but this is improbable.

**BARROW-IN-FURNESS**—BARRY, SIR C.

**Authorities.—H. M. Dexter, The Congregationalism of the Last Twenty Hundred Years** (1795-1895), II. J. Crowe, Henry Barrowe and the Exiled Church. See also B. Brook, Lives of the Puritans; and Cooper, Athenae Cantabrigiensis (1861), vol. ii.

**BARROW-IN-FURNESS**, a seaport and municipal, county and parliamentary borough of Lancashire, England, 2643 m. N.W. by N. from London, on the Furness railway. Pop. (1891) 51,712; (1901) 57,586. It lies on the seaward side of the hammer-shaped peninsula forming part of the district of Furness, between the estuary of the Duddon and Morecambe Bay, where a narrow channel intervenes between the mainland and the long low island of Walney, on which the erection of a strong fort was once intended. The only town is Barrow, a market town, on the Furness road, 7 m. E., where the Furness packet boat debunks. In 1905 the connexion of Walney with the mainland by a bridge was undertaken, and in the channel is Barrow Island (among others) which is connected with the mainland, declaration having been carried on until only a narrow channel was left, which was utilized as docks. Barrow is of modern and remarkably rapid growth. Its rise was dependent primarily on the existence and working of the veins of pure haematite iron ore in the district of Furness (q.v.). At the outset Barrow merely exported the ore to the furnaces of South Wales and the midlands. At the beginning of the 19th century this export amounted at most to a few thousand tons, and though by the middle of the century it had reached some 50,000 in 1847 the population of Barrow was only 325. In 1846 the first section of the Furness railway was opened, connecting Barrow with the mines near Dalton; in the ensuing years a great increase in trade justified the opening of further communications, and in 1859 the iron works of Messrs Schneider & Hannay were instituted. The Barrow Haematite Steel Company (1860) absorbed this company, and a great output of steel produced by the Bessemer process was begun. Other industries followed. Of these the shipbuilding works have surpassed the steel works in importance, the celebrated firm of Vickers, Sons & Maxim having a yard where they construct numerous vessels of war as well as others. There are also a petroleum storage establishment, a paper-pulp factory, jute works, and engineering and wagon works.

The docks in the strait between Barrow Island and the mainland were constructed in 1867, and named the Devonshire and Bucleuch docks. The Ramsden docks are a subsequent extension. These are 24 ft. in depth. There are also a graving dock 500 ft. long, a depositing dock accommodating vessels of 16 ft. draught, and two electric cranes each able to lift 150 tons. The Furness railway company is the dock authority. Passenger steamers run to weekdays to Belfast. The town is laid out in rectangular form, and contains several handsome churches, municipal buildings, exchange and other public buildings. An electric tramway service connects the outskirts and the centre. There are statues of Lord Frederick Cavendish (assassinated at Dublin, 1882), in front of the town hall, and of Sir James Ramsden (d. 1860), managing director of the Furness railway and first mayor of Barrow, to whom, together with the dukes of Devonshire and Buccleuch, the town owed much of its rise in the middle of the 19th century. The cottage inhabited by George Stephenson on which he laboured the invention of the steam locomotive was preserved in 1942 at Barrow and retains it as a memorial. Educational institutions include a school of science and art, a girls' high school and a technical school. Barrow is a suffragan bishopric in the diocese of Carlisle. The parliamentary borough (1885), falling within the North Lonsdale division of the county, returns one member. The town was incorporated in 1867, and became a county borough in 1888. The corporation consists of a mayor, 8 aldermen and 24 councillors. Area, 11,023 acres.

**BARRY, SIR CHARLES** (1705-1806), English architect, was born in London on the 23rd of May 1755, the son of a stationer. He was educated at a firm of architects, with whom he remained till 1817, when he set out on a three years' tour in Greece and Italy, Egypt and Palestine for the purpose of studying
ARCHITECTURE. On his return to England in 1820 he settled in London. One of the first works by which his abilities as an architect became generally known was the church of St Peter at Brighton, completed in 1826. He built many other churches; but the marked preference for Italian architecture, which he acquired during his travels, showed itself in various important undertakings of his earlier years. In 1831 he completed the Travellers' Club in Pall Mall, a splendid work in the Italian style and the first of its kind built in London. In the same style and on a grander scale he built in 1837 the Reform Club. He was then engaged on Fishbourne private mansions in London, the finest being Bridgewater House (1847). Birmingham possesses one of his best works in King Edward's grammar school, built in the Tudor style between 1833 and 1836. For Manchester he designed the Royal Institution of Fine Arts (1824) and the Athenaeum (1836); and for Halifax the town-hall. He was engaged for some years in reconstructing the Treasury buildings, Whitehall. But his masterpiece, notwithstanding all unfavourable criticism, is the Houses of Parliament at Westminster (1840-1860). Barry was elected A.R.A. in 1840 and R.A. in the following year. His genius and acquirements were recognized by various artistic bodies of the principal European nations; and his name was enrolled as a member of the academies of art at Rome, Berlin, St Petersburg, Brussels and Stockholm. He was chosen F.R.S. in 1849 and was knighted by Queen Victoria in 1852. He died suddenly at Clapham near London on the 12th of May 1860, and his remains were interred in Westminster Abbey. As a landscape gardener he was no less brilliant than as an architect, and in connexion with the building of the Houses of Parliament he formed schools of modelling, stone and wood carving, cabinet-making, metal-working, glass and decorative painting, and of encaustic tile-making. In 1867 appeared a life of him by his son, Bishop Alfred Barry. A claim was thereupon set up on behalf of Pugin, the famous architect, who was dead and who had been Barry's assistant, to a much larger share in the work of designing the Houses of Parliament than was admitted in Dr Barry's narrative. The controversy raged for a time, but without substantiating Pugin's claim.

His second son, ALFRED BARRY (1836- ), was educated at King's College, London, and Trinity College, Cambridge, where he was 4th wrangler and gained a first-class in the classical tripos in 1858. He was successively sub-warden of Trinity College, Glenalmond (1849-1854), head-master of Leeds grammar school (1854-1862), principal of Cheltenham College (1862-1868), and principal of King's College, London (1868-1883). He was canon of Worcester from 1871 to 1881, and of Westminster from 1881 to 1884. From 1884 to 1889 he served as bishop of Sydney and primate of Australia, and on his return to England he was assistant bishop in the diocese of Rochester from 1889 to 1891, and rector of St James's, Piccadilly, from 1895 to 1900. He was appointed canon of Windsor in 1891 and assistant bishop in West London in 1897. Besides the life of his father mentioned above, he published numerous theological works.

Another son, EDWARD MIDDLETON BARRY (1830-1880), was also an architect. He acted as assistant to his father during the latter years of Sir Charles's life. On the death of his father, the duty of completing the latter's unfinished work devolved upon him. Amongst other buildings thus completed were the Houses of Parliament at Westminster (see Architecture, fig. 97, and Plate X. fig. 110), and Halifax town-hall (Id. fig. 90). In 1861 he was elected an associate of the Royal Academy; and in 1869 a full academian. From 1873 till his death he held the Academy's professorship of architecture. Among other buildings designed by him were Covent Garden theatre, Charing Cross and Cannon Street hotels, the Birmingham and Midland Institute, new galleries for the National Gallery and new chambers for the Inner Temple. He died on the 27th of January, 1880.

The youngest son, SIR JOHN WOLFE WOLFE-BARRY (1836- ), the eminent engineer, who assumed the additional name of Wolfe in 1858, was educated at Glenalmond, and was articled as engineering pupil to Sir John Hawkshaw, with whom he was associated in the building of the railway bridges across the Thames at Charing Cross and Cannon Street. In 1867 he began to practise on his own account, and soon gained an extensive connexion with railway companies, both in Great Britain and in other countries. Among the works on which he was engaged were extensions of the Metropolitan District railway, the St Paul's station and bridge of the London, Chatham & Dover railway, the Barry Docks of the Barry railway company near Cardiff, and the Tower and new New bridges over the Thames. On the completion of the Tower Bridge in 1894, he was made a C.B., becoming K.C.B. three years later. He served on several commissions, including those on Irish Public Works (1886-1890), Highlands and Islands of Scotland (1889-1890), Accidents to Railway Servants (1869-1900), Port of London (1900-1902), and London Traffic (1903-1905). He was elected president of the Institution of Civil Engineers in 1896, and published books on Railway Appliances (1894), and, with Sir F. J. Bramwell, on Railways and Locomotives (1882).

BARRY, ELIZABETH (1658-1713), English actress, of whose early life the details are meagre. At first she was so unsuccessful on the stage as to be more than once dismissed, but she was conferred by her lover, the first Duke of Bridgewater, who had laid a wager that in a short time he would make a first-rate actress of her, and the results confirmed his judgment. Mrs Barry’s performance as Issabella, queen of Hungary, in the earl of Orrery’s Mustapha, was said to have caused Charles II, and the duke and duchess of York so much delight that the duchess took lessons in English from her, and when she became queen she gave Mrs Barry her coronation robes in which to appear as Elizabeth in Bankes’s Earl of Essex. Mrs Barry is said to have created over 100 parts, and she was particularly successful in the plays of Thomas Otway. Betterton says that her acting gave “success to plays that would disgust the most patient reader.” Dryden pronounced her “always excellent.” Cibber is authority for the statement that it was on her behalf that benefits, which up to that time were reserved for authors, were first established for actors by command of James II. Mrs Barry had a child by Lord Rochester and a second by Sir George Etheredge, both of whom were provided for by their fathers. In 1709 she retired from the stage and died on the 7th of November 1713.

BARRY, JAMES (1741-1806), English painter, was born at Cork on the 11th of October 1741. His father had been a builder, and, at one time of his life, a coating trader between the two countries of England and Ireland. To this business of trader James was destined, and he actually made when a boy several voyages; but he manifested such an aversion to the life and habits of a sailor as to induce his father to suffer him to pursue his own inclinations, which led strongly towards drawing and study. At the schools in Cork to which he was sent he was regarded as a prodigy. About the age of seventeen he first attempted oil-painting, and between that and the age of twenty-two, when he first went to Dublin, he produced several large pictures, which decorated his father’s house, such as “Aeneas escaping with his Family from the Flames of Troy.” “Susanna and the Elders,” “Daniel in the Lion’s Den,” &c. At this period he also produced the painting which first brought him into public notice, and gained him the acquaintance and patronage of Edmund Burke. The picture was founded on an old traditional of the landing of St Patrick on the sea-coast of Cashel, and of the conversion and baptism of the king of that district by the patron saint of Ireland. It was exhibited in London in 1762 or 1763. By the liberality of Burke and his other friends, Barry in the latter part of 1765 was enabled to go abroad. He went first to Paris, then to Rome, where he remained upwards of three years, from Rome to Florence and Bologna, and thence home through Venice. His letters to the Burkes, giving an account of Raphael, Michelangelo, Titian and Leonardo da Vinci, show remarkable insight. Barry painted two pictures while abroad, an Adam and Eve, and a Philoctetes, neither of them of any merit. Soon after his return to England in 1771 he produced his picture of Venus, which was compared, though with little justice, to the Galatea of Raphael, the Venus of Titian and the Venus of Medici. In 1773 he exhibited his “Jupiter and Juno on Mount Ida.” His
"Death of General Wolfe," in which the British and French soldiers are represented in very primitive costumes, was considered as a falling-off from his great style of art. His fondness for Greek costume was assigned by his admirers as the cause of his reluctance to paint portraits. His failure to go on with a portrait of Burke which he had begun caused a misunderstanding with his early patron. The difference between them is said to have been widened by Burke's growing intimacy with Sir Joshua Reynolds, and by Barry's feeling some little jealousy of the fame and fortune of his rival "in a humbler walk of the art." About the same time he painted a pair of classical subjects, Mercury inventing the lyre, and Narcissus looking at himself in the water, the last suggested to him by Burke. He also painted a historical picture of Chiron and Achilles, and another of the story of Stratonice, for which last the duke of Richmond gave him a hundred guineas. In 1773 it was proposed to decorate the interior of St Paul's with historical and sacred subjects; but the plan fell to the ground, from not meeting with the concurrence of the bishop of London and the archbishop of Canterbury. Barry was much mortified at the failure, for he had in anticipation fixed upon the subject he intended to paint—the rejection of Christ by the Jews when Pilate proposes his release. In 1773 he published An Inquiry into the real and imaginary Obstructions to the Acquisition of the Arts in England, vindicating the capacity of the English for the fine arts and tracing their slow progress hitherto to the Reformation, to political and civil dissensions, and lastly to the general direction of the public mind to mechanics, manufactures and commerce. The work was well received, and in Valentine Green to Reynolds, West, Cipriani, Barry, and other artists to ornament the great room of the Society for the Encouragement of Arts, Manufactures and Commerce in the Adelphi with historical and allegorical paintings. This proposal was at the time rejected by the artists themselves; but in 1777 Barry made an offer to paint the whole on condition of being allowed the choice of his subjects, and being paid by the society the expenses of canvas, paints and models. His offer was accepted, and he finished the series of pictures at the end of seven years to the entire satisfaction of the members of the society, who granted him two exhibitions, and at different periods voted him 50 guineas, their gold medal and 200 guineas. Of the six paintings making up the series, only one, that of the Olympic Games, shows any artistic power.

Soon after his return from the continent Barry had been chosen a member of the Royal Academy; and in 1782 he was appointed professor of painting in the room of Mr Penny with a salary of £30 a year. Among other things, he insisted on the necessity of purchasing a collection of pictures by the best masters as models for the students, and proposed several of those in the Orleans collection. The proposal was not accepted, and in 1790 Barry was expelled from the academy, soon after the appearance of his Letter to the Dilettanti Society, a very amusing but eccentric publication, full of enthusiasm for art and at the same time of contempt for the living professors of it. After the loss of his salary, a subscription was set on foot by the earl of Buchan to relieve him from his difficulties, and to settle him in a larger house to finish his picture of Pandora. The subscription amounted to £1500, with which an annuity was bought, but on the 6th of February 1806 he was seized with illness and died on the 22nd of his illness. On the 14th of March his remains were interred at St Paul's.

As an artist, Barry was more distinguished for the strength of his conceptions, and for his resolute and persistent determination to apply himself only to great subjects, than for his skill in designing or for beauty in his colouring. His drawing is rarely good, his colouring frequently wretched. He was extremely impulsive and unequal; sometimes morose, sometimes sociable and urbane; jealous of his contemporaries, and yet capable of pronouncing a splendid eulogy on Reynolds.

BARRY, SIR REDMOND (1813-1886), British colonial judge, son of General H. C. Barry, was educated at a military school in Kent, and at Trinity College, Dublin, and was called to the Irish bar in 1838. He emigrated to Australia, and after a short stay at Sydney went to Melbourne, with which city he was ever afterwards closely identified. After practising his profession for some years, he became commissioner of the court of requests, and after the creation in 1851 of the colony of Victoria, out of the Port Phillip district of New South Wales, was the first solicitor-general with a seat in the legislative and executive councils. Subsequently he held the office of judge of the Supreme Court, acting chief-justice and administrator of the government. He represented Victoria at the London International Exhibition of 1862 and at the Philadelphia Exhibition of 1876. He was knighted in 1866 and was created K.C.M.G. in 1877. Sir Redmond Barry was the first person in Victoria to take an interest in higher education, and induced the local government to expend large sums of money upon that object. He was the founder of the university of Melbourne (1853), of which he was the first chancellor, was president of the Melbourne public library (1854), national gallery and museum, and was one of the first to foster the youth movement in Australia. To his exertions is due the prosperity of the two institutions with which his memory is identified.

BARRY, SPRANGER (1719-1777), British actor, was born in Dublin on the 23rd of November 1719, the son of a silversmith, to whose business he was brought up. His first appearance on the stage was at the Smock Alley theatre on the 5th of February 1744, and his engagement at once increased its prosperity. His first London appearance was made in 1746 as Othello at Drury Lane. Here his talents were speedily recognized, and in Hamlet (1747) he already showed signs of greatness. But his jealousy by his success as Romeo. This resulted in his leaving Drury Lane for Covent Garden in 1750, accompanied by Mrs Cibber, his Juliet. Both houses now at once put on Romeo and Juliet for a series of rival performances, and Barry's impersonation was preferred by the critics to Garrick's. In 1758 Barry built the Crow Street theatre, Dublin, and later a new theatre in Cork, but he was not successful as a manager and returned to London to play at the Haymarket, then under the management of Foote. As his second wife, he married in 1768 the Melbourne-Mrs Dance (1734-1802), and he and Mrs Siddons played under Garrick's management. Barry appearing in 1767, after ten years' absence from the stage, in Othello, his greatest part. In 1774 they both moved to Covent Garden, where Barry remained until his death on the 10th of January 1777. He was a singularly handsome man, with the advantage of height which Garrick lacked.

His second wife, ANN STREET BARRY, was born in Bath in 1734, the daughter of an apothecary. Early in life she married an actor of the name of Dancer, and it was as Mrs Dancer that she made her first recorded appearance in 1758 as Cordelia to Spranger-Skinner's Lear at the Drury Lane theatre, the London and the next nine years she played all the leading tragic parts, but without any great success, and it was not until she came to Drury Lane with Barry that her reputation advanced to the high point at which it afterwards stood. After his death, she remained at Covent Garden and married a man much younger than herself, named Crawford, being first billed as Mrs Crawford in 1778. Her last appearance is said to have been as Lady Randolph in Douglas at Covent Garden in 1798. This part, and that of Desdemona, were among her great impersonations; in both she was considered by some critics superior to Mrs Siddons, who expressed her fear of her in one of her letters. She died on the 29th of November 1801 and was buried in Westminster Abbey.

BARRY, an urban district and seaside of Glamorganshire, Wales, on the Bristol Channel, 153 m. by rail from London and 8 m. S.W. from Cardiff. Its station is a terminus on the Barry railway, which starts at Hafod in the Rhondda Valley, where it joins the Taff Vale railway, having also junctions with the same line for Aberdare and Merthyr at Treforest, and for Cardiff and Penarth at Cogan, and with the Great Western main line at Peterstone and St Fagans. A branch from the main line at Barry Vale station runs by the merthyr Vale and North-Western railway, and the Brecon & Merthyr railway. The Vale of Glamorgan railway (which is worked by
the Barry company and has a junction with the Great Western railway at Bridgend) affords a direct route to Barry from the Llynvi, Ogmore and Garw coalfields. The urban district of Barry, with a population in 1901 of 27,030, comprises the ecclesiastical parishes of Barry, Cadxoton, Merthyr-Dovan, and a portion of Sully in which is included Barry Island (194 acres), now, however, joined to the mainland. The total population of this area in 1881 was only about 500, that of Barry village alone being only 25. A small brook named Barri runs here into the sea, whence the place was formerly known in Welsh as Aber-Barri, but the name of both the river and the island is supposed to be derived from Baruch, a Welsh saint of the 7th century, who had a cell on the island. His chapel (which still existed in Leland's time) was a place of pilgrimage in the middle ages. According to Giraldus, his own family derived its name de Barri from the island which they once owned. One of the followers of Fithamton settled at Barri near the end of the 11th century, building there a castle of which only a gateway remains. Besides the small old parish churches of Merthyr-Dovan and Cadxoton, and the rebuilt parish church of Barry, there are four modern churches (in one of which Welsh services are held). There are about thirty nonconformist chapels, in nearly a third of which the services are Welsh. There are also a Roman Catholic church, and one for German and Scandinavian seamen. The other public buildings are a county intermediate school for 350 boys and girls, built in 1896, a free library (opened in 1892) with 10,000 volumes, a schoolroom for the Barry market, built in 1890 at a cost of £3500 (but now used as a concert-hall), and Romilly hall for public meetings.

Barry owes its seaport to the determination of a number of colliery owners to secure an alternative port to Cardiff, with an independent railway to it from the coalfields. After falling in 1883, they obtained parliamentary powers for this purpose in 1884, and the first sod of the new dock at Barry was cut in November of that year. The docks are 114 acres in extent, and have accommodation for the largest vessels afloat. Dock No. 1, opened on the 18th of July 1889, is 73 acres (with a basin of 7 acres) and occupies the eastern side of the old 'channel between the island and the mainland, having a well-sheltered deep-sea entrance. There is good anchorage between Barry and Sully island. Dock No. 2 (34 acres) was opened on the 10th of October 1898. There are 41 acres of timber-ponds and three large graving-docks. For loading the coal there are thirty fixed and seven movable coal-hoists. The total tonnage of the exports in 1906 was 9,757,380 (all of which, except 26,491 tons, was coal), and of the imports 560,103 tons.

Barry is industrial and concerned with four branches—textile, of which the leading firm is that of Maclou and Sons, which built the great furnishing mills in the town; coalfields, of which the leading firm is Williams, which owns the telephone and telegraph system; iron and steelworking, of which the leading firm is the Principality; and cotton manufacture, of which the leading firm is that of J. A. Saliby and Sons. The textile works were only begun in 1903 with H. Labourot's edition and translation of his Exposition of the Liturgy (Paris). His commentaries on the Gospels have been edited and translated by J. Sedlaczek and J.-B. Chatot (Fasc. L., Paris, 1906), and the Syriac text of the treatise against the Jews has been edited by J. de Zwaan (Leiden, 1906). Barry-Saliby was undoubtedly an able theologian, no vogue by the Eastern railway.

Barry is an agriculturally prosperous district, and has a fine system of farms and a well-developed market garden, which supplies the town with fruit. The principal crops are potatoes, flax, and hops. The town is served by a railway, which is also the terminus of the Barry and Margam Light Railway.

Bar-sur-Seine, a town of eastern France, capital of an arrondissement in the department of Aube, 34 m. E. by S. of Troyes on the main line of the Eastern railway between that town and Belfort. Pop. (1906) 4276. Bar-sur-Seine lies at the foot of hills on the right bank of the Aube at its confluence with the Bresse. A circle of buildings occupies the site of the old fortress, which now generally remains. Of the ecclesiastical buildings, the most worthy are St Pierre and St Maclou, both dating mainly from the end of the 12th century. St Pierre has wooden exterior galleries and two fine Gothic porches. The sacristy of St Maclou is conjectured to have formed the chapel of the castle of the counts of Bar, of which the square tower flanking the north side of the church formed the entrance. The town is a seat of a sub-prefect, and the public institutions include a tribunal of first instance and a communal college. Flour-milling, tanning, and the manufacture of brandy, hosiery and agricultural implements are carried on. The wine of the district is much esteemed.

Traces of a Roman settlement have been found on hills to the south of the town. Under the domination of the counts of Champagne, it became the scene of important fairs which did not cease till 1648. In 1814 several actions between the French and the army of the allies took place at Bar-sur-Seine (see Napoleonic Wars).

Bart, Jean (1651-1702), French naval commander, son of a fisherman, was born in Dunkirk on the 21st of October 1651. He served when young in the Dutch navy, but when war broke out between Louis XIV. and Holland in 1672 he entered the French service. He gained great distinction in the Mediterranean, where he held an irregular sort of commission, not being then able from his low birth to receive a command in the navy. His success was so great, however, that he was made a lieutenant in 1686, and rose rapidly to the rank of captain and then to that of admiral. The peace of Ryswick put a close to his active service. Many anecdotes are narrated of the courage and bluntness of the uncultivated sailor, who became the popular hero
of the French naval service. The town of Dunkirk has honoured his memory by a statue and by naming a public square after him. See Richer, Vie de Jean Bart (1780), and many editions since; Vanderest, Histoire de Jean Bart.

BARTAN, more correctly BARTIN, a town in the vilayet of Kastamuni, Asiatic Turkey, retaining the name of the ancient village Parthenia and situated near the mouth of the Bartan-su (anc. Parthenius), which formed part of the boundary between Bithynia and Phrygia. Various etiological explanations of the name Parthenius were given by the ancients, e.g. that the maiden Artemis hunted on its banks, or that the flow of its waters was gentle and maiden-like. This town, which is the residence of a kaimakam, is built on two low limestone hills and its streets are paved with limestone blocks. It is noted for the fine boxwood grown in the vicinity, is a port of call for Black Sea coasting steamers and carries on a considerable trade with Constantinople which might be increased were it not for the obstruction of the harbour by a bar. Pop. 6077, according to Cuinet, La Turquie d’Asie (1834).

BARTELS, HANS VON (1856– ), German painter, was born in Hamburg, the son of Dr N. F. von Bartels, a Russian government official. He studied first under the marine painter R. Hardorff in Hamburg, then under C. Schweitzer in Düsseldorf and C. Oesterley in Hamburg, and finally at the Berlin School of Art. After travelling extensively, especially in Italy, he settled in Munich in 1885 and was appointed professor of painting in 1891. An oil painter of great power, he is one of the leading German water-colour painters, mainly of marines and scenes of fishing life, painted with rude vigour and a great display of technical skill. He excelled in storm scenes and in depicting the strong, healthy fishing-folk of the northern coasts. He became an honorary member of leading English, German, Dutch, Belgian and Austrian art societies. Among his principal works are:—Sturmflut (Berlin Gallery); “Lonely Beach” (Hungarian National Gallery); “Potato Harvest—Rügen” (Prague); Storm—Bornholm” (German emperor’s collection); and “Moonlight on the Zuyder Zee” (New Pinakothek, Munich).

BARTENSTEIN, a town of Germany, in the kingdom of Prussia, on the Alle, 34 m. S. of Königsberg by rail. Pop. (1900) 6805. It has a considerable trade in corn and live stock, and its industries comprise foundry and carriage-building, tanneries, breweries and potteries. Bartenstein is celebrated for the treaty concluded here on the 26th of April 1807 between Prussia and Russia.

BARTER (from Fr. barater, to truck, to exchange), the exchange of commodities for commodities, in contra-distinction to the exchange of commodities for money. Barter was the simplest form of trading among primitive communities, but its inconveniences led, at an early stage of civilization, to the adoption of metals as mediums of exchange. Barter, however, is still very common in dealings with uncivilized peoples, and traders in many countries find that the most satisfactory method of effecting exchange is to furnish themselves with such commodities as weapons, tools and ornaments, which are more readily taken than money.

For the history of barter and the steps by which a system of currency was gradually evolved, see MONEY. Consult also W. S. Jevons, Money and the Mechanism of Exchange; A. Marshall, Economics; W. Ridgeway, Origin of Currency and Weight Standards.

BARTET (REGNAULT), JEANNE JULIA (1854– ), French actress, was born in Paris and trained at the Conservatoire. In 1873 she began a successful career at the Vaudeville, and in 1879 was engaged at the Comédie Française, of which she became a sotéist in 1880. For many years she played the chief parts in both tragedy and comedy, her grand style and exquisite finesse making her supreme among the younger actresses on the French stage. She had a season in London in 1898, when her consummate art was displayed in a number of parts.

BARTH, HEINRICH (1821–1869), German explorer, was born at Hamburg on the 16th of February 1821, and educated at Berlin University, where he graduated in 1844. He had already visited Italy and Sicily and had formed a plan to journey through the Mediterranean countries. After studying Arabic in London he set out on his travels in 1845. From Tangier he made his way overland throughout the length of North Africa, visiting the sites of the ancient cities of Barbary and Cyrenaica. He also travelled through Egypt, ascending the Nile to Wadi Halfa and crossing the desert to Berenice. While in Egypt he was attacked and wounded by robbers. Crossing the Sinai peninsula he traversed Palestine, Syria, Asia Minor, Turkey and Greece, ending his travels in a search of antiquity; and returned to Berlin in 1847. For a time he was engaged there as Privatdocent, and in preparing for publication the narrative of his Wanderungen durch die Küstentänder des Mittelmeeres, which appeared in 1849.

At the instance of Bunsen and other scientists, Barth and Adolf Overweg, a Prussian astronomer, were appointed colleagues of James Richardson, an explorer of the Sahara who had been selected by the British government to open up commercial relations with the states of the central and western Sudan. The party left Tripoli early in 1850, but the deaths of Richardson (March 1851) and Overweg (in September 1851) left Barth alone on the mission alone. He returned to Europe in September 1855, after one of the most fruitful expeditions ever undertaken in inner Africa. In addition to journeys across the Sahara, Barth traversed the country from Lake Chad and Bagirmi on the east to Timbuktu on the west and Cameroon on the south, making prolonged sojourns in the ancient sultanates or emirates of Bornu, Kano, Nupe, Sokoto and Gando and at Timbuktu. He studied minutely the topography, history, civilizations and resources of the countries he visited. The story of his travels was published simultaneously in English and German, under the title Travels and Discoveries in North and Central Africa (1857–1858, 5 vols.). For accuracy, interest, variety and extent of information Barth’s Travels have few rivals among works of the kind. It is a book that will always rank as a standard authority on the regions in question, of which a great part, under the name of Nigeria, has since come under British rule. Except a C.B., Barth himself received no recognition of his services from the British government. He returned to Germany, where he prepared a collection of Central African vocabularies (Gotha, 1865–1866). In 1853 he undertook another journey in Asia Minor. In 1860 he visited Turkey and in 1862 published a Short Description of his Travels in Asia Minor (Gotha, 1862–1865), which was translated into English and German. In 1863 he was appointed professor of geography at Berlin University and president of the Geographical Society. He died at Berlin on the 25th of November 1865.

See Schubert’s Heinrich Barth, der Bahnbrecher der deutschen Afrikaforschung (Berlin, 1897). An edition of the Travels in two volumes was published in London in 1890 (Minerva Library of Famous Books).

BARTH, KASPAR VON (1587–1653), German philologist, was born at Küssin in the province of Brandenburg on the 21st of June 1587. He was an extremely precocious child, and was looked upon as a marvel of learning. After studying at Gotha, Eisenach, Wittenberg and Jena, he travelled extensively, visiting most of the countries of Europe. Too independent to accept any regular post, he lived alternately at Halle and on his property at Sellerhausen near Leipzig. In 1636, his library and MSS. at Sellerhausen having been destroyed by fire, he removed to the Paulinum at Leipzig, where he died on the 17th of September 1658. Barth was a very voluminous writer; his works, which were the fruits of extensive reading and a retentive memory, are unmethodical and uncritical and marred by want of clarity. He appears to have been excessively vain and of an unnatural disposition. Of his writings the most important are: Adversaria (1634), a storehouse of miscellaneous learning, dealing not only with classical but also with medieval and modern writers; and commentaries on Claudian (1612, 1650) and Statius (1664).

BARTH, a town of Germany, in the kingdom of Prussia, on the Barther Bodden, a lake connecting with the Baltic, 15 m. N.W. from Stralsund by rail. Pop. (1900) 7070. It contains a fine Gothic Protestant church (St Mary’s) dating from the 13th century and has several educational establishments, notably a
school of seamanship. Its industries comprise iron-founding, ship-building, brewing, and the manufacture of cigars, leather and tinned fish. There is an active export trade in grain.

**BARTHÉLEMY, ANATOLE JEAN-BAPTISTE ANTOINE DE (1821-1904).** French archaeologist and numismatist, was born at Reims on the 1st of July 1821, and died at Ville d'Avray on the 27th of June 1904. In collaboration with J. Geolfin de Bourgogne he published *Études sur les monnaies de Bretagne* for 1835, and between 1835 and 1879 an exhaustive work in six volumes on the *Anciens échos de Bretagne; histoire et monuments*. In 1880 appeared the *Choix de documents inédits sur l'histoire de la ligue en Bretagne*, by himself alone. But it was, above all, his numismatic work which established his reputation. This included several popular publications, such as the *Neuveaux manuel complet de numismatique ancienne* (1831; second edition, revised, 1890), and the *Neuveaux manuel complet de numismatique du moyen âge et modernes* (1853; new edition revised by Adrien Planchet), and a large number of monographs and articles in the technical reviews. The following may be specially mentioned: *Numismatique mérovingienne* (1863); *Essai sur les monnaies parisis* (1874); *Note sur l'origine de la monnaie tournoise* (1890); and in the series of instructions issued by the *Comité des travaux historiques et scientifiques* he edited the number on *La Numismatique de la France* (1891). In 1897 he was elected a member of the Académie des Inscriptions et Belles-lettres. His younger brother, Edouard Marie, comte de Barthélemy, who was born in Angers in 1830, has published a number of documents upon the ancient French nobility and upon the history of Champagne.

**BARTHÉLEMY, AUGUSTE MARSEILLE (1796-1867).** French satirical poet, was born at Marseilles in 1796. His name can hardly be separated from that of his friend and countryman, J. P. A. Méry (1798-1860), with whom he carried on so intimate a collaboration that it is not possible to distinguish their personal contributions in their joint works. After having established some local reputation as a poet, Barthélemy went to Paris, where by one of his first efforts, *Le Sacre de Charles X* (1825) he gained the favour of the court. His energies, however, were soon enlisted in the service of the opposition party. In 1825 appeared a clever political satire, *Les Sixièmes*, followed by *La Villégiature ou la prise du château de Rivoli* (1827), *La Corbière* (1827), *La Pescaderie* (1827), the joint productions of Barthélemy and Méry. The success was immediate and pronounced; fifteen editions of the *Villégiature* were called for during the year. A rapid succession of political squibs and satires was now poured forth by the authors, among the most remarkable being *Biographie des quarante de l'académie française* (1826) and *Napoléon en Égypte* (1828), which passed through nearly a dozen editions in a year. In 1831 the *Études historiques sur le règne de Charles X* was published, and in 1832 the publication of their *Fils de l'homme*, a poem on the duke of Reichstadt, Napoleon's son. The Revolution of 1830 liberated him; and in company with Méry, he celebrated the triumph of the people in one of their most brilliant efforts, *L'Insurrection*. From March 1831 to April 1832 they produced a series of verse satires issued weekly, the *Némésis*, attacking the government and ministers of Louis Philippe. The small pension of which Barthélemy was the recipient was stopped. When the publication ceased there was a strong suspicion that Barthélemy had been paid for his silence. In 1832 he published an anonymous poem, supporting some acts of the government which were peculiarly obnoxious to the Liberal party. This change of front destroyed his influence and his later writings passed unnoticed. For the next few years he enjoyed a handsome pension from the government and refrained from all satirical writing. He again resumed his old style in 1844 but without the former success. From that date he contented himself with merely occasional poems. Barthélemy died on the 23rd of August 1867 at Marseilles. Joseph Méry was an ardent romanticist and wrote a great number of stories now forgotten. He produced several pieces at the Paris theatres, and also collaborated with Gérard de Nerval in adaptations from Shakespeare and in other plays. He received a pension from Napoleon III. and died in Paris on the 16th of June 1866.

The *Œuvres* of Barthélemy and Méry were collected, with a notice by L. Reybaud, in 1851 (4 vols.). See also *Barthélemy et Méry Stories* dans leurs rapports avec la légende napoléonienne, by Jules Garsou in vol. viii. of *Mémoires de l'Académie Royale de Belgique*, which contains full information on both authors.

**BARTHÉLEMY, FRANÇOIS, MARQUIS DE (1747 of 1750-1830).** French politician, was educated by his uncle the abbé Jean Jacques Barthélemy for a diplomatic career, and after serving as secretary of legation in Sweden, in Switzerland and as French minister plenipotentiary in Switzerland, in which capacity he negotiated the treaties of Basel with Prussia and Spain (1795). Elected a member of the Directory in May 1797, through royalist influence, he was arrested at the coup d'état of the 18 Fructidor (17th of September 1797) and deported to French Guiana, but escaped and made his way to the United States and then to England. He returned to France after the 18 Brumaire, entered the senate in February 1800 and contributed to the establishment of the consulship for life and the empire. In 1814 he abandoned Napoleon, took part in the drawing up of the constitutional charter and was named peer of France. During the Hundred Days he lived in concealment, and after the second Restoration obtained the title marquis, and in 1819 introduced a motion in the chamber of peers tending to render the electoral law more aristocratic.

**BARTHÉLEMY, JEAN JACQUES (1716-1795).** French writer and numismatist, was born on the 20th of January 1716 at Cassis, in Provence. He was educated first at the college of the Oratory in Marseilles, and afterwards at that of the Jesuits in the same city. While studying for the priesthood, which he intended to join, he devoted much attention to oriental languages, and was introduced by his friend M. Cay of Marseilles to the study of classical antiquities, particularly in the department of numismatics. In 1744 he went to Paris with a letter of introduction to M. Gros de Boze, perpetual secretary of the Academy of Inscriptions and Belles-lettres and keeper of the royal collection. He became assistant to de Boze, on whose death (1753) he became keeper of the medals. In 1755 he accompanied the French ambassador, M. de Stainville, afterwards due de Choiseul, to Italy, where he spent three years in archaeological research. Choiseul had a great regard for Barthélemy, and on his return to France, Barthélemy became an inmate of his house, and received valuable preferments from his patron. In 1759, after the publication of his *Voyage du jeune Anacharsis*, he was elected a member of the French Academy. During the Revolution Barthélemy was arrested as an aristocrat. The Committee of Public Safety, however, were no sooner informed by the duke of Choiseul of the arrest, than they gave orders for his immediate release, and in 1793 he was nominated librarian of the Bibliothèque Nationale. He refused this post but resumed his old functions as keeper of medals, and enriched the national collection by many valuable acquisitions. Barthélemy died on the 30th of April 1795.

Barthélemy was the author of a number of learned works on antiquarian subjects, but the great work on which his fame rests is *Voyage du jeune Anacharsis en Grèce, vers le milieu du quatrième siècle avant l'ére chrétienne* (4 vols. 1782). It had begun in 1757 and had been working on it for thirty years. The hero, a young Scythian descended from the famous philosopher Anacharsis, is supposed to repair to Greece for instruction in his early youth, and after making the tour of her republics, colonies and islands, to return to his native country and write this book in his old age, after the Macedonian hero had overturned the Persian empire. In the manner of modern travellers, he gives an account of the customs, government and antiquities of the country he is supposed to have visited; a copious introduction supplies whatever may be wanting in respect to historical details, whilst the text is copious quotations from the Greek, on the literature of the Athenians, and on the economy, pursuits, ruling passions, manners and customs of the surrounding states supply ample
information on the subjects of which they treat. Modern scholarship has superseded most of the details in the Voyage, but the author himself did not imagine his book to be a register of accurately ascertained facts; he rather intended to afford to his countrymen, in an interesting form, some knowledge of Greek civilization. The Charicles of W. A. Becker is an attempt in a similar direction, but, though superior in scholarship, it wants the charm of style of the Anacharsis.

Barthélemy's correspondence with Paucaud, chiefly on antiquarian subjects, was edited with the Correspondance intitulée du comte de Caylus in 1877 by Ch. Nizard; his letters to the comte de Caylus were published by Antoine Serles in Voyage en Italie (1801); and his letters to Mme du Deffand, with whom he was on intimate terms, were published as Correspondance composée de mes lettres avec la duchesse de Choiseul, l'abbé Barthélemy and M. Cruvrau (3 vols., 1806), edited by the marquis of Sainte-Aulaire. See also Mémoires sur la vie de l'abbé Barthélemy, écrites par lui-même (1824), with a notice by Lalande. Les Oeuvres complètes (4 vols. 1821), contain a notice by Villemav.

BARthéLMÉ SAINT-HILAIRE, JULES (1805-1892), French philosopher and statesman, was born at Paris on the 10th of August 1805. In his early years he was an active political journalist, and from 1826 to 1830 opposed the reactionary policy of the king in La Gloire. At the revolution of 1830 he signed the protestation of the journalists on the 28th of July 1830. After 1830 he contributed to different newspapers—Le Constitutionnel, Le National and the Courrier français—until 1833, when he gave up politics in order to devote himself to the history of ancient philosophy, undertaking a translation of Aristotle, which occupied him the greater part of his life (1837-1892). The reputation which he gained from this work won for him the chair of ancient philosophy at the Collège de France (1838) and a seat at the Academy of Moral and Political Science (1839). After the revolution of 1838 he was elected as a republican deputy; but he was obliged to withdraw after the coup d'état of Louis Napoleon. In 1855 he was elected member of the international commission to Egypt to report on the possibility of the proposed Suez canal, and by the articles which he wrote he contributed largely to making the project popular in France. Elected deputy again in 1860, he joined the opposition to the Empire, and in 1871 bent all his efforts to the election of Thiers as president of the republic, acting afterwards as his secretary. Appointed senator for life in 1875, he took his place among the moderate republicans, and from September 1880 to November 1881 was minister of foreign affairs. In 1840 he married the Countess de la Trémoille. He occupied the second place in the French Senate as an orator and policy maker. He was a member of the French Academy in 1869, and was elected to the chair of ancient philosophy in 1882. His main work was a translation of the works of Aristotle and his disciples, the results of which were published in 1848, 1849, 1853 and 1880. He also published many papers on political and social questions, and was a member of the French Academy.

BARTHÉLEMY, or BARTHÉS, PAUL JOSEPH (1734-1806), French physician, was born on the 11th of December 1734 at Montpellier. He was educated at Narbonne and Toulouse, and began the study of medicine at Montpellier in 1750, taking his doctor's degree in 1753. In 1756 he obtained the appointment of physician to the military hospital in Normandy attached to the army of observation commanded by Marshal d'Estrees, but a severe attack of fever compelled him to leave this post. In 1757 his services were required in the medical staff of the army of Westphalia, where he had the rank of consulting physician, and on his return to Paris he acted as joint editor of the Journal des savants and the Encyclopédie méthodique. In 1759 he obtained a medical professorship at Montpellier, and in 1774 he was created joint chancellor of the university. In 1778 he published his most famous work, Nouveaux éléments de la science des hommes, in which he employs the expression "vital principle" as a convenient term for the cause of the phenomena of life, without committing himself to either a spiritualist or a materialistic view of its nature. Taking the degree of doctor of civil law in 1780, he secured the appointment of counsellor to the Supreme Court of Aids at Montpellier, but he soon took up his residence in Paris in 1781, being nominated consulting physician to the king.

On the outbreak of the French Revolution he lost much of his fortune and retired to Carcassonne, where he devoted himself to the study of theoretical medicine. It was owing to this that he gave to the world his Nouvelle mécanique des mouvements de l'homme et des animaux, which appeared in 1798. In 1802 he published his Traité des maladies goutteuses, and he afterwards occupied himself in preparing for the press a new edition of his Éléments de la science de l'homme, of which he just lived to see the publication. His health had been declining for some years before his death, which took place soon after his removal to Paris, on the 15th of October 1806. He bequeathed his books and manuscripts to J. Lordat, who published two volumes of his works in 1807. His Traité du beau was also published posthumously in 1807.

BARTHOLINUS, GASPAR [CASPAR BARTHELEMY], (1585-1629), physician, was born in 1585 at Malmö, in Sweden. His precocity was extraordinary; at three years of age he was able to read, and in his thirteenth year he composed Greek and Latin orations and delivered them in public. When he was about eighteen he went to the university of Copenhagen and afterwards studied at Rostock and Wittenberg. He then travelled through Germany, the Netherlands, England, France and Italy, and was crowned with many laurels at the different universities he visited. In 1613 he was chosen professor of medicine in the university of Copenhagen, and filled that office for eleven years, when, falling into a dangerous illness, he made a vow that if he should recover he would apply himself solely to the study of divinity. He fulfilled his vow by becoming professor of divinity at Copenhagen and canon of Roskilde. He died on the 13th of July 1629 at Sorø in Zealand.

Of his sons, Thomas (1616-1680) was born at Copenhagen, where, after a long course of study in various universities of Europe, he was appointed successively professor of mathematics (1647) and anatomy (1648). During his tenure of the latter chair he distinguished himself by observations on the lymphatics. In 1660 he retired to Hagested. In 1670 his house and library were burnt, and in consideration of his loss he was appointed physician to the king, with a handsome salary, and librarian to the university of Copenhagen. He died at Hagested in 1680. Another son, Erasmus (1625-1698), born at Roskilde, spent ten years in visiting England, Holland, Germany and Italy, and filled the chairs of mathematics and medicine at Copenhagen. He discovered double refraction in Iceland spar (Experientia philomathia, Copenhagen, 1669). He died at Copenhagen in 1698. In the third generation, Caspar Thomsen (1655-1738), son of Thomas, also taught anatomy at Copenhagen, his name being associated with the description of one of the ducts of the sublingual gland and of the glandulae Bartholini, while his younger brother, Thomas (1659-1690), was a student of northern antiquities who published Antiquitatum Danicarum libri tres in 1680.

BARTHOLOWN, SAINT, one of the twelve apostles, regarding whose early life we know nothing, unless in accordance with a widely-spread belief he is to be identified with Nathanael (q.v.). If so, Bartholomew is probably a patronymic, the apostle's full name being Nathanael Bartholmai, i.e. the son of Tolmai. On the other hand, according to a Syrian tradition, Bartholomew's original name was Jesus, which he dropped owing to its being the name of the Master Himself. In the synoptic gospels Bartholomew is never mentioned except in the lists of the apostles, where his name always appears after Philip's. He is said to have gone, after the ascension of the Lord, on a missionary tour to India (then a very wide geographical designation) where, according to a story in Eusebius (His. E. v. 10), he left behind him a copy of St Matthew's gospel. According to the traditional account he was flayed alive and then crucified with his head downwards, at Albanopolis in Armenia, or, according to Nicephorus, at Urbanopolis in Cilicia. In works of art he is generally represented with a large knife, the instrument of his martyrdom, or, as in Michelangelo's "Last Judgment," with his own skin hanging over his arm. The festival of St Bartholomew is celebrated on the 24th of August.
BARTHOLOMEW

Dr Nestle has drawn attention to the fact that in the Syriac translation of Eusebius' history the name Tolmai, i.e. Bartholomew, takes the place of Matthias, the apostle who was appointed in place of Judas (i. 12, cf. ii. 1, iii. 25 and 29). If this identification can be made out there would, in the list of apostles as finally constituted, be two men who bore the patrimonial Bartholomew. See further Expoxy Times, ix. pp. 566 ff. (1898).

BARTHOLOMEW, JOHN (1831–1893), Scottish cartographer, was born at Edinburgh on the 25th of December 1831. His father had a cartographical establishment there and he was educated in the work. He was subsequently assistant to the German geographer August Petermann, until in 1856 he took up the management of his father's firm. For some years he edited the Geographical Institute, Bartholomew built up a reputation unsurpassed in Great Britain for the production of the finest cartographical work. Among his numerous publications mention may be specially made of the series of maps of Great Britain reduced from the Ordnance Survey 10 miles to scales of 1 in. and 1 in. 10 m., with relief shown by contours and a systematic scale of colours. The 1 in. series, which was extended (and its principles applied to many other works) by Mr J. G. Bartholomew, who succeeded his father in the business, is the finest of its kind ever produced. John Bartholomew died in London on the 29th of March 1893.

BARTHOLOMEW FAIR, a fair held in West Smithfield, London, on St Bartholomew’s Day (24th of August, O.S.) from 1153 to 1855. The charter authorizing its holding was granted by Henry I. to his former minstrel, Rahere, who had taken orders and had founded the priory of St Bartholomew close by. For many centuries the fair lasted a fortnight, but in 1601 it was shortened to four days only. In 1641 it had become so large that it involved no less than four parishes: Christ Church, Great and Little St Bartholomew’s and St Sepulchre’s. It was known to Sir Robert Peterman. Through the Geographical Institute, Bartholomew built up a reputation unsurpassed in Great Britain for the production of the finest cartographical work. Among his numerous publications mention may be specially made of the series of maps of Great Britain reduced from the Ordnance Survey 10 miles to scales of 1 in. and 1 in. 10 m., with relief shown by contours and a systematic scale of colours. The 1 in. series, which was extended (and its principles applied to many other works) by Mr J. G. Bartholomew, who succeeded his father in the business, is the finest of its kind ever produced. John Bartholomew died in London on the 29th of March 1893. For a full account see Prof. H. Morley, Memoirs of Bartholomew Fair (1890).

BARTIZAN (according to the New English Dictionary, from bertisene, a Scottish corruption of "bratticing" or "brattishing," from O. Fr. bretesse, and meaning a battlemented parapet; apparently first used by Sir Walter Scott), a small battlemented turret, corbelled out at the angle of a wall or tower to protect a warden and enable him to see around him. Bartizans generally are furnished with oyles or arrow-slits.

BARTLETT, JOHN (1802–1893), American publisher and compiler, was born in Plymouth, Massachusetts, on the 14th of June 1802. He became a bookseller and publisher in Cambridge, Mass., and from 1865 to 1889, when he retired, was a member of the bookselling and publishing firm of Little, Brown & Co., in Boston. In 1855 he published the first edition of his Familiar Quotations, subsequently greatly expanded and long the best-known collection of the sort, and in 1894 (although it had been copyrighted five years before), after many years' labour, he published his New and Complete Concordance or Verbal Index to Words, Phrases and Passages in the Dramatic Works of Shake- speare; with a Supplementary Concordance to the Poems—surpassing any of its predecessors in the number and fulness of its citations from the poet's writings. In all of his work he was greatly assisted by his wife, a daughter of Sidney Willard (1780– 1866), professor of Hebrew at Harvard from 1807 to 1831. Bartlett died at Cambridge, Mass., on the 3rd of December 1905.

BARTLETT, JOHN RUSSELL (1805–1889), American historical and linguistic student, was born in Providence, Rhode Island, on the 23rd of October 1805. From his first to his eighteenth year he lived in Kingston, Canada; he was then in turn, from 1824 to 1836, a clerk in a dry goods store, a bookkeeper and a bank cashier at Providence, and for more than ten years after 1836 he was a bookseller in New York City, returning to Providence in 1850. In 1850–1853 he was the commissioner on the part of the United States for the survey of the boundary between the United States and Mexico, but owing to the lack of funds did not finish the work. After being superseded by another commissioner upon the accession of President Franklin Pierce, he published A Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora and Chihuahua (2 vols., 1855), another edition of which was published by the establishment, now bearing his name, of numerous publications mention may be specially made of the series of maps of Great Britain reduced from the Ordnance Survey 10 miles to scales of 1 in. and 1 in. 10 m., with relief shown by contours and a systematic scale of colours. The 1 in. series, which was extended (and its principles applied to many other works) by Mr J. G. Bartholomew, who succeeded his father in the business, is the finest of its kind ever produced. John Bartholomew died in London on the 29th of March 1893. For a full account see Prof. H. Morley, Memoirs of Bartholomew Fair (1890).

BARTLETT, PAUL WAYLAND (1835– ), American sculptor, was born in New Haven, Connecticut, the son of Truman H. Bartlett, an art critic and sculptor. When fifteen he began to study at Paris under Frémiet, modelling from animals in the Jardin des Plantes. He won a medal at the Paris Salon of 1857. Among his principal works are: "The Bear Tamer," in the Metropolitan Museum of Art, New York; the equestrian statue of Lafayette, in the Place du Carrousel, Paris, presented to the French Republic by the school children of America; the powerful and virile Columbus and Michelangelo, in the Congressional Library, Washington, D.C.; the "Ghost Dancer," in the Pennsylvania Academy, Philadelphia; the "Dying Lion"; the equestrian statue of McClellan in Philadelphia; and a statue of Joseph Warren in Boston, Massachusetts. His bronze patinas of reptiles, insects and fish are also remarkable.

BARTOLI, DANIELLO (1608–1685), Italian Jesuit priest, was born at Ferrara and entered the Society of Jesus in 1623. Debarred from the foreign mission field, he attained high distinction as a preacher and as a teacher of rhetoric in Genoa, Rome and Venice."The Learned Man", with which he gained the second prize of the Academy in 1803, at once established his fame as a sculptor and gained for him a number of influential patrons. He executed many minor pieces for Denon, besides busts of Mélul and Cherubini. His great patron, however, was Napoleon, for whom he executed a colossal bust, and who sent him to Carrara to found a school of sculpture. Here he remained till after the fall of Napoleon, and then took up his residence in Florence, where he resided till his death. His works are varied and include an immense number of busts. The best are, perhaps, the group of Charity, the "Heracles and Lichas" and the "Faith in God," which exemplify the highest types of Bartolini's style. Popular opinion in Italy associates his qualities as a sculptor with those of Thorwaldsen and Canova.

BARTOLOMMEI, MARQUIS FERDINANDO (1821–1886), Italian revolutionist and statesman, who played an important part in the political events of Tuscany from 1848 to 1860. From the beginning of the revolutionary movement Bartolommei was always an ardent Liberal, and although belonging to an old and
noble Florentine family his sympathies were with the democratic party rather than with the moderately liberal aristocracy. In 1847-1848 his house was a centre of revolutionary committees, and during the brief constitutional régime he was much to the fore. After the return of the grand duke Leopold II. in 1849 under Austrian protection, Bartolommei was present at a requiem service in the church of Santa Croce for those who fell in the late campaign against Austria; on that occasion disorders occurred and he was relegated to his country estate in consequence (1851). Shortly afterwards he was implicated in the distribution of seditious literature and exiled from Tuscany for life. On his return, he took up and established relations with Cavour and the Piedmontese liberals. He subsequently visited France and England, and like many Italian patriots became enamoured of British institutions. He returned to Florence in 1853; from that time onward he devoted himself to the task of promoting the ideas of Italian independence and unity among the people, and although carefully watched by the police, he kept a secret printing-press in his palace in Florence. Finding that the nobility still hesitated at the idea of uncompromising hostility to the house of Lorraine, he allied himself more firmly with that party when Admiral le Grand had seemed likely to carry his plans through. Giuseppe Dolfi (1818-1860) an honest and whole-hearted enthusiast who had great influence with the common people. As soon as war between Piedmont and Austria appeared imminent, Bartolommei organized the expedition of Tuscan volunteers to join the Piedmontese army, spending large sums out of his own pocket for the purpose, and was also president of the Tuscan branch of the Società Nazionale (see under La Parina e Cavour). He worked desperately hard conspiring for the overthrow of the grand duke, assisted by all the liberal elements, and on the 31st of April 1859, Florence rose as one man, the troops refused to fire on the people, and the grand duke departed, never to return. Sapristi pos un carreau cassé! was the comment of the French minister to Tuscany on this bloody revolution. A provisional government was formed and Bartolommei elected gonfaloniere. He had much opposition to encounter from those who still believed that the retention of the grand duke as a constitutional sovereign and member of an Italian confederation was possible. In the summer elections were held, and on the meeting of parliament Bartolommei's unitarian views prevailed, the assembly voting the resolution that the house of Lorraine had forfeited its rights and that Tuscany must be united to Italy under King Victor Emmanuel. Bartolommei was made senator of the Italian kingdom and received various other honours. His last years were spent in educational and philanthropic work. He died on the 15th of June 1869, leaving a widow and two daughters.

The best biography of Bartolommei is contained in Il Rivoluzione Toscano e l'azione popolare, by his daughter Matilde Gioli (Florence, 1905), but the author attributes perhaps an undue preponderance to her father in the Tuscan revolution, and is not quite fair towards Bettino Riccali (q.v.) and other leaders of the aristocratic party. C. Lettere e documenti di B. Riccali (Florence, 1887-1890), and D. Zanichelli, a Lettere scelte di B. Riccali, G. Peruzzi, N. Cornini, e C. Riddoli (Bologna, 1896).

BARTOLOMMEO DI PAGHOLI, Fra (1475-1517), the Italian historical and portrait painter,—known also as Baccio (short for Bartolommeo) DELLA PORTA (because he lived near the Porta Romana), was born at Soffignano, near Florence, in 1475, and died at Florence in 1517. He received the first elements of his artistic education from Cosimo Roselli; and after leaving him, devoted himself to the study of the great works of Leonardo da Vinci. Of his productions, which were not finished for their grace and beauty, the most important is the fresco of the Last Judgment, in which he was assisted by his friend Marrotto Albertini. While he was engaged upon some pieces for the convent of the Dominican friars, he made the acquaintance of Savonarola, who quickly acquired great influence over him, and Bartolommeo was so affected by his cruel death, that he soon after entered the convent, and for some years gave up his art. He had not long resumed it, in obedience to his superior, when Raphael came to Florence and formed a close friendship with him. Bartolommeo learned from the younger artist the rules of perspective, in which he was so skilled, while Raphael owes to the fraile the improvement in his colouring and handling of drapery, which was noticeable in the works he produced after having met with him. Some years afterwards he visited Rome, and was struck with admiration and a feeling of his own inferiority when he contemplated the masterpieces of Michelangelo and Raphael. With the latter, however, he remained on the most friendly terms, and when he departed from Rome, left in his hands two unfinished pictures which Raphael completed. Fra Bartolommeo's figures had generally been small and draped. These qualities were the alleged defects of his style; but the result of want of power, he painted the magnificent figure of St Mark (his masterpiece, at Florence), and the undraped figure of St Sebastian. The latter was so well designed, so naturally and beautifully coloured, and so strongly expressive of suffering and agony, that it was found necessary to remove it from the place where it had been exhibited in the chapel of a convent. The majority of Bartolommeo's compositions are altar-pieces. They are remarkable for skill in the massing of light and shade, richness and delicacy of colouring, and a tone of quiet dignity in which the grandeur of the figures is handled, Bartolommeo having been the last to introduce and use the lay-figure with joints.

BARTOLOZZI, Francesco (1725-1815), Italian engraver, was born at Florence. He was originally destined to follow the profession of his father, who was a gold- and silver-smith; but he manifested so much skill and taste in designing that he was placed under the superintendence of two Florentine artists, who instructed him in painting. After devoting three years to that art, he went to Venice and studied engraving. He made very rapid progress, and executed some works of considerable importance at Venice. He then removed for a short time to Rome, where he completed a set of engravings representing events from the life of St Nilus, and, after returning to Venice, set out for London in 1764. For nearly forty years he resided in London, and produced an enormous number of engravings, the best being those of Clytie, after Annibale Caracci, and of the Virgin and Child, after Carlo Dolce. A great proportion of them are from the works of Cipriani and Angelica Kauffmann. Bartolozzi also contributed a number of plates to Boydell's Shakespeare Gallery. In 1802 he was invited to Lisbon as director of the National Academy. He remained in Portugal till his death. His son Gaetano Stephano (1755-1821), also an engraver, was the father of Madame Vestrin.

BARTOLUS (1314-1357), Italian jurist, professor of the civil law at the university of Perugia, and the most famous master of the dialectical school of jurists, was born in 1314, in Sassoferrato, in the duchy of Urbino, and hence is generally styled Bartolus de Saxoferrato. His father was Francesco Severi, and his mother was of the family of the Alfini. He studied the civil law first of all under Cinus at Perugia, and afterwards under Oldradus and Jacobus de Belvicius at Bologna, where he was promoted to the degree of doctor of civil law in 1334. His great reputation dates from his appointment to a chair of civil law in the university of Perugia, 1345, where he lectured for many years, raising the character of the law school of Perugia to a level with that of Bologna. He died in 1357 at Perugia, where a magnificent monument recorded the interment of his remains in the church of San Francisco, by the simple inscription of "Osta Bartolì." Bartolus left behind him a great reputation, and many writers have sought to explain the fact by attributing to him the introduction of the dialectical method of teaching law; but this is not quite fair towards him. Bartolus, who lived in the previous century, and the successors of Odofredus had abused it to an extent which has rendered their writings in many instances unprofitable to read, the subject matter being overlaid with dialectical forms. It was the merit of Bartolus, on the other hand, that he employed the dialectical method with advantage as a teacher, and disavowed the abuse of it; but his great reputation was more probably owing to the circumstance that he revived the exegetical system of teaching law (which had been
neglected since the ascendency of Accursius) in a spirit which
gave it new life, whilst he imparted to his teaching a practical
interest, from the judicial experience which he had acquired
while acting as assessor to the courts at Todi and at Pisa before
he undertook the duties of a professorial chair. His treatises On
Procedure and On Evidence are amongst his most valuable works,
whilst his Commentary on the Code of Justinian has been in some
countries regarded as of equal authority with the code itself.
BARTON, B. S.—BARTON, ELIZABETH (1756—1854). "The maid of Kent," was, according to her own statement, born in 1506 at Aldingbton, Kent. She appears to have been a neurotic girl, subject to
epilepsy, and an illness in her nineteenth year resulted in hysteria
and religious mania. She was at the time a servant in the house
of a certain Cobb, a Quaker, as he was termed in the papers. William Warham, archbishop of Canterbury. During her convalescence she passed into trances lasting for days at a time,
and in this state her ravings were of such a "marvelous holiness in
rebuke of sin and vice" that the country folk believed her to be
inspired. Cobb reported the matter to Richard Masters, the parish
priest, who in turn acquainted Archbishop Warham. The girl having recovered, and finding herself the object of local
admiration, was cunning enough, as she confessed at her trial,
to feign trances, during which she continued her prophecies. Her
fame steadily growing, the archbishop in 1526 instructed the
prior of Christ Church, Canterbury, to send two of his monks
to hold an inquiry into the case. One of these latter, Edward
Bocking, obtained her admission as a nun to St Sepulchre's
convent, Canterbury. Under Bocking's instruction Barton's
prophecies became still more remarkable, and attracted many
pilgrims, who believed her to be, as she asserted, in direct
communication with the Virgin Mary. Her utterances were cun-
ningly directed towards political matters, and a profound and
widespread sensation was caused by her declaration that should
Henry persist in his intention of divorcing Catherine he "should
no longer be king of this realm, but should die a villain's death."
Even such men as Fisher, bishop of Rochester, and Sir
Thomas More, corresponded with Barton. On his return from
France in 1532 Henry passed through Canterbury and is said
to have allowed the nun to force herself into his presence,
when she made an attempt to terrify him into abandoning
his marriage. After its solemnization in May 1533, her utterances
becoming still more treasonable, she was examined before
Cranmer (who had in March succeeded to the archbishopric on
Warham's death) and confessed. On the 25th of September
mourning and another nun, Warham, were arrested, and to
November, Masters and others were implicated. The maid and
her fellow prisoners were examined before the Star Chamber,
and were by its order publicly exposed at St Paul's Cross, where
they each read a confession. In January 1534 by a bill of
attainder the maid and her chief accomplices were condemned
to death, and were executed at Tyburn on the 20th of April.
It has been held that her confession was extracted by force,
and therefore valueless, but the evidence of her imposture seems
conclusive.

See Froude, History of England; Burnet, History of the Reforma-
tion; Lingard, History of England; F. A. Gasquet, Henry VII.
and the English Monasteries (ch. iii. 1890 ed.); T. E. Bridgett, Life of Blessed John Fisher (1888); vols. vi. and VII. of Letters and Papers of Henry VIII.; James Gairdner, The English Church in the 16th Century (1890); Strype, Memorials, i. l. 274, and Cranmer; a detailed account of the case is contained in the published Act of Attainder 25 Henry VIII. c. 12.

BARTON BEDS, in geology, the name given to a series of softish grey and brown clays, with layers of sand, of Upper Eocene age, which are found in the Hampshire Tertiary basin, where they are particularly well exposed in the cliffs of Barton, Hordwell, and in the Isle of Wight. Above the highly fossiliferous Barton Clay there is a sandy series with few fossils; these are the Headon Hill or Barton Sands. Either of these names is preferable to the term "Upper Bagshot Beds," which has been applied to these sands. The Barton Beds are absent from the London basin, and the Upper Bagshot Sands of that area are probably at a lower horizon than the Barton Sands. The term "Bartonia" was introduced by Mayer-Eymar in 1857 for the continental equivalents of the series.

Hampshire basin and Isle of Wight.

Barton Clay 140-200 ft. Bartonien (sables moyens) Limestone of St Ouen.

Barton Clay 162-255 ft. Bartonien Sands of Beauchamp Fluvialites lucratix, Ostrea gigantica, Pectunculus (Glycimeris) delete are characteristic fossils; fishes (Lamna, Arios, &c.) and a crocodile (Diplonychodon) are also found in the Barton Clay. The sands are very pure and are used in glass making.

BARTON-UPON-HUMBER, a market town in the N. Lindsey or Brigg parliamentary division of Lincolnshire, England, the terminus of a branch of the Great Central railway, 44 m. N. by E. of Lincoln. Pop. of urban district (1901) 5671. It lies beneath low hills, on flat ground bordering the Humber, but the centre of the town is a mile from the river. The church of St Peter has a remarkable west tower of pre-Conquest workmanship, excepting the early Norman top storey. Against the western face is a low building of the date of the lower tower storeys, measuring 15 ft. by 12, with rude, deeply-splayed windows. The tower itself is arced in the two lower storeys, having round arches in the lower and triangular in the upper, and there is a round-headed S. doorway and a triangular-headed N. doorway. The rest of the church is Decorated and Perpendicular. The church of St Mary is fine Early English with Perpendicular clerestory. Industries include brick-making, malting, and rope-making. Barton appears in Domesday, when the ferry over the Humber existed. As a port, moreover, it subsequently rose into some importance, for it was able to supply eight ships and men to the expedition of Edward III. to Brittany.

BARUCH, the name (meaning "Blessed") in Hebrew of a character in the Old Testament (Jer. xxxvi., xxxvii., xxxiii.), associated with the prophet Jeremiah, and described as his secretary and spokesman.

Book of Baruch. This deuterocanonical book of the Old Testament is placed by the LXX. between Jeremiah and Lamentations, and in the Vulgate after Lamentations. It consists of several parts, which cohere so badly that we are obliged to assume plurality of authorship.

Contents.—The book consists of the following parts:—

i. 1-14. The historical preface with a description of the origin and purpose of the book.

i. 15-ii. 5. A confession of sin used by the Palestinian Remnant. This confession was according to i. 14 sent from Babylon (i. 4, 7) to Jerusalem to be read "on the day of the feast and on the days of the solemn assembly." The confession is restricted to the use of the remnant at home (see next paragraph). In this confession there is a national acknowledgment of sin and a recognition of the Exile as a righteous judgment.

ii. 6-iii. 8. A confession of the captives in Babylon and a prayer for restoration. This confession opens as the former (in i. 15) with the words found also in Daniel ix. 7, "To the Lord our God belongeth righteousness, &c." The confession is of the Exiles and not of the remnant in Palestine, as Marshall has pointed out. Thus it is the Exiles clearly who are speaking in i. 13, "We are but a few left among the heathen where thou hast scattered us"; ii. 14, "Give us favour in the sight of them which have led us away captive"; iii. 7, "We will praise thee in our captivity"; iii. 8, "We are yet this day in our captivity where thou hast scattered us." On the other hand the speakers in the confession in i. 15-ii. 5 are clearly the remnant in Jerusalem. i. 15, "To the Lord our God belongeth righteousness, but unto us confusion of face... to the men of Judah and the inhabitants of Jerusalem." The Exiles are mentioned by way of contrast to the speakers; ii. 4, 5, "He hath given them to be in subjection to all the kingdoms that the round about us to be a reproach among all the people round about where the Lord hath scattered them. Thus were they cast down... because we sinned against the Lord our God;" iii. 9-iv. 4. The glorification of wisdom, that is, of the Law.Israel is bidden to walk in the light of it; it is the glory of Israel and is not to be given to another.

iv. 5-9. Consolation of Israel with the promise of deliverance and lasting happiness and blessing to Jerusalem.

Integrity.—From the foregoing description it seems clear that the book is the product of a plurality of authors. Not scholars, such as Frischke, Hitzig, or Gressmann, Hilgenfeld, scissors, agree in assuming that i.-iii. 8 and iii. 9-9 are from distinct writers. But some critics have gone further. Thus Rothstein (Kautzsch, Apok. und Pseud. i. 213-215) holds that there is no unity in iii. 9-9, but that it is composed of two independent writings—iii. 9-iv. 4 and iv. 5-9. Marshall (Hastings' Bible Dictionary, i. 251-254) gives a still more complex analysis. He finds in it the work of four distinct writers: i. 1-14, i. 15-iii. 8, iii. 9-iv. 4, iv. 5-9. The evidence for a fourfold authorship is strong though not convincing. In any case i.-iii. 8 and iii. 9-9 must be ascribed to different authors.

Original Language.—(1) Several scholars, as Ewald, Kneucker, Davidson, Rothstein and König, believe that the whole book was originally written in Hebrew; (2) Frischke, Hilgenfeld, Reuss, Gifford, Schürer, and Toy advocate a Hebrew original of i.-iii. 8 and a Greek original of the rest; (3) Marshall argues that i.-iii. 8 is translated from a Hebrew original, iii. 9-4 from an Aramaic, and the rest from the Greek; (4) and lastly, Berthold, Havernick and Nöldeke regard the Greek as the primitive text. The last view must be put aside as unworkable. For the third no convincing evidence has been adduced, nor does it seem likely that any can be. We have therefore to decide between the two remaining theories. In any case we can hardly err in admitting a Hebrew original of i.-iii. 8. For (1) we have such Hebraisms as "... avv.o 'arkav vev. wv (ii. 26); "ov. ... ekv0 ov. wv (ii. 4, 13, 20; iii. 8); "ov. ... tov wv uav. aev. ovw wv (ii. 7). (2) We have meaningless expressions which are really mistranslations of the Hebrew. It is noteworthy that these mistranslations are for the most part found in Jeremiah—a fact which has rightly drawn scholars to the conclusion that we owe the LXX of Baruch i.-iii. 8, and of Jeremiah to the same translator. Thus in i. 9 " evravōv wv ... avv. apdlwv "prisoner," where the text had "escaped," and the Greek should have been rendered "locksmith." The same mistranslation is found in Jer. xxiv. 1, xxxvi. (xxix.) 2. Next in ii. 4 we have ἄβασαι, "wilderness," where the text had τομ. and the translation should have ἐστασαι. The same misrendering is found several times in Jeremiah. Again ἔγραψαν is used in i. 22, ii. 21, 22, 24 as a translation of τομ. in the sense of "serving," where douléwn ought to have been the rendering. So also in Jer. xxiv. (xxvii.) 11, xxxvi. (xxx.) 8, &c. Again in τόλμωv Ἰωάνα κα ἐμνημ Ἰερονημίv the ἐξοθην is a mistranslation of πανοv as in Jer. xi. 6, xi.

1 Toy (Jewish Enc. ii. 556) thinks that the "thems" in ii. 4-5 may be a scribal slip and that we have here not the confession of the Palestinian remnant and that of the Exiles, but simply a juxtaposition of two forms of confession.
BARUCH

(xxxxii.) 10, &c., where the translator should have given παράστασιν. 1 For ἔβηθεν (ii. 29) τοις we should have ἐπλήθος.
(3) Finally there are passages where by re-translation we discover that the translator either misread his text or had a corrupt text before him. Thus μᾶλλον in i. 10 is a corrupt translation of νῦν—elsewhere in a dozen passages of the LXX. In iii. 4 ἐνθροπισμόν ἔχει—which the translator should have read ἐνθροπίζων. From the above instances, which could be multiplied, we have no hesitation in postulating a Hebrew original of i.—iii. 8.

As regards iii. 9—v. 9 the case is different. This section is free from such notable Hebraisms as we have just dealt with, and no convincing grounds have been advanced to prove that it is a translation from a Semitic original.

Date.—The dates of the various constituents of the book are quite uncertain. Erdwald, followed by Gifford and Marshall, assigns i.—iii. 8 to the period after the conquest of Jerusalem by Tolyemo I. in 320 B.C.; Reuss to some decades later; and Fritzsche, Schrade, Keil and Toy to the time of the Maccabees. Hitzig, Kneucker and Schürer assume that it was written after A.D. 70. Ryle and James (Pss. of Solomon, pp. lxxiii.—lxxvii.) hold that iv. 31—v. 9 is dependent on the Greek version of Ps. xl., and that, accordingly, Baruch was reduced to its present form after A.D. 70. The most probable of the above dates appears to be that maintained by Fritzsche, that is, if we understand by the Maccabean times the early decades of the 2nd cent., which are the days of the Maccabean dynasty the Twelve tribes were supposed to be in Palestine. The idea that the Jewish Kingdom embraced once again the entire nation easily arose when the Maccabeans extended their dominion northwards over Samaria and Galilee and eastwards beyond the Jordan. This belief displaced the older one that the nine and a half tribes were still in captivity. With the downfall of the Maccabean dynasty, however, the older idea revived in the 1st cent. A.D. to the beginnings of the 2nd cent. A.D. the view of the dead given in ii. 17 would point, where it is said that those whose spirits had been taken to Mournings of the future would not give glory unto the Lord. This statement as to the desolate condition of the Temple in ii. 26 is with Kneucker to be rejected as an interpolation.

Canon.—The Book of Baruch was never accepted as canonical by the Palestinian Jews (Baba Bathra 148), though the Apostolic Constitutions, v. 10, state that it was read in public worship on the 10th day of the month Gorpæus, but this statement can hardly be correct. It was in general use in the church till its canonicity was rejected by the Protestant churches and accepted by the Roman church at the council of Trent.

Liturgy and Editions.—The additions of the last book of the Bar. to Syriac, and an Arabic. The Latin one in the Vulgate belongs to a time prior to Jerome, and is tolerably literal. Another, somewhat later, was first published by Jos. Maria Caro in 1688, and was reprinted by Sabatier, side by side with the ante-Hieronymian one, in his Bibliaurum Sacrorum Latinarum Versiones Antiquae. It is founded upon the preceding one, and is less literal. The Syriac and Arabic versions, printed in the London Polyglot, are literal. The Hexaplar-Syriac version made by Paul, bishop of Telæ, in the beginning of the 7th century has been published by Ceriani.

The references to the editions of the Greek text are Tischendorf's in the second volume of his Septuagint, and Swete's in vol. iii.; Fritzsche's in Libri Apocryphi Veteris Testamenti Graece (1871). The best editions of the book are Kneucker's Das Buch Baruch (1870); Gifford's in the Speaker's Apoc. ii. See also the articles in the Encyc. Biblica, Hastings' Bible Dictionary; Schürer, History of Jewish People.

APOCALYPSE OF BARUCH. The discovery of this long lost apocalypse was due to Ceriani. This apocalypse has survived only in the Syriac version of which Ceriani discovered a 6th century MS. in the Milan library. Of this he published a Latin translation in 1873. The Syriac text, as reprinted in 1871 (Libri Apocryphi V. T., pp. 654-690), and the text in 1873 (Mon. Sacra. V. ii. 113-150), and subsequently in photo-lithographic facsimile in 1883. Chaps. lxvi.—lxviii., indeed, of this book have long been known. These constitute Baruch's epistle to the nine and a half tribes in captivity, and have been published in Syriac and Latin in the London and Paris Polyglots, and in Syriac alone from one MS. in Lagarde's Liber V. T. Apocryphi Syr. (1861); and by Charles from ten MSS. (Apocalypse of Baruch, 1896, pp. 124 167). The entire book was translated into English by the last named writer (op. cit. pp. 1-167), and into German by Rysell (Kautzsch's Apok. und Pseud., 1900, ii. pp. 413-464).

The Syriac is translated from the Greek; for Greek words are occasionally transliterated, and passages can be explained only on the hypothesis that the wrong alternative meanings of certain Greek words were followed by the translator. The Greek in turn is derived from the Hebrew for understanding the Syriac can be explained and the text restored by retranslation into Hebrew. Thus in xxi. 9, 11, 12, xxiv. 2, lix. 7 we have an unintelligible antithesis, "those who sin and those who are justified." The source of the error can be discovered by retranslation. The Syriac in these passages is a stock rendering of הườiב and this in turn of מ. But מ means not only הườiב but also ב and is, and this is the very meaning required by the context in the above passages: "those who sin and those who are righteous." Again xlvii. 12 the text reads: the new world which does not turn to corruption those who are separated on the day of the son. Two fables of the days of the Maccabean dynasty the Twelve tribes were supposed to be in Palestine. The idea that the Jewish Kingdom embraced once again the entire nation easily arose when the Maccabeans extended their dominion northwards over Samaria and Galilee and eastwards beyond the Jordan. This belief displaced the older one that the nine and a half tribes were still in captivity. With the downfall of the Maccabean dynasty, however, the older idea revived in the 1st cent. A.D. to the beginnings of the 2nd cent. A.D. the view of the dead given in ii. 17 would point, where it is said that those whose spirits had been taken to Mournings of the future would not give glory unto the Lord. This statement as to the desolate condition of the Temple in ii. 26 is with Kneucker to be rejected as an interpolation.

Canon.—The Book of Baruch was never accepted as canonical by the Palestinian Jews (Baba Bathra 148), though the Apostolic Constitutions, v. 10, state that it was read in public worship on the 10th day of the month Gorpæus, but this statement can hardly be correct. It was in general use in the church till its canonicity was rejected by the Protestant churches and accepted by the Roman church at the council of Trent.

Liturgy and Editions.—The additions of the last book of the Bar. to Syriac, and an Arabic. The Latin one in the Vulgate belongs to a time prior to Jerome, and is tolerably literal. Another, somewhat later, was first published by Jos. Maria Caro in 1688, and was reprinted by Sabatier, side by side with the ante-Hieronymian one, in his Bibliorum Sacrorum Latinarum Versiones Antiquae. It is founded upon the preceding one, and is less literal. The Syriac and Arabic versions, printed in the London Polyglot, are literal. APOCALYPSE OF BARUCH. The discovery of this long lost apocalypse was due to Ceriani. This apocalypse has survived only in the Syriac version of which Ceriani discovered a 6th century MS. in the Milan library. Of this he published a Latin translation in 1873. The Syriac text, as reprinted in 1871 (Libri Apocryphi V. T., pp. 654-690), and the text in 1873 (Mon. Sacra. V. ii. 113-150), and subsequently...
present and future destiny on earth, there is written nothing save "lamentation, and mourning, and woe." The world is a scene of corruption, its evils are irreparable, its end is nigh, and the advent of the new and spiritual world at hand. The first to draw attention to the composite elements in this book was Kabisch (Jahrbiicher f. protest. Theol., 1891, pp. 66-107). This critic regarded xxiv. 3-xxix., xxxvi.-xl. and liii.-lxxv. as independent sources written before the fall of Jerusalem, A.D. 70, and his grows, which consists of a few parts of his book, with the exception of a few verses, as composed after that date. All these elements were put together by a Christian contemporary of Papias. Many of these conclusions were arrived at independently by a French scholar, De Faye (Les Apocalypses juives, 1893, pp. 25-28, 76-103, 192-204). The present writer (Apocalypse of Baruch, 1896, pp. liii.-lxxvii.), after submitting the book to a fresh study, has come to the following conclusions:—The book is of Pharisaic authorship and composed of six independent writings: A₁, A₂, B₁, B₂, B₁, B₄. The first three were composed when Jerusalem was still standing and the Messianic kingdom expected: A₁, a mutilated apocalypse = xxviii.-xxx. i; A₂, the Cedar and Vine Vision = xxxvi.-xl.; B₁, the Cloud Vision = liii.-lxxv. The last three were written after A.D. 70, and probably before 90. Thus B₁ = lxxxv. was written by a Jew in exile, who, despairing of a national restoration, looked only for a spiritual recompense in heaven. The rest of the book is derived from B₂ and B₄, written in Palestine after A.D. 70. These writings belong to very different types of thought. In B₁ the earthly Jerusalem is to be rebuilt, but not so in B₂; in the former the exiles are to be restored, but not in the latter; in the former a Messianic kingdom without a Messiah is expected, but no earthly blessedness of any kind in the latter, &c. B₁ = i-ix., xxii., xxii., xxiii.-lxxv., lxxvi., lxxvii., lxxviii., lxxvii., lxxvii., lxxvii., lxxvii., lxxvi.-lxxvii. The final editor of the work wrote in the name of Baruch the son of Neriah.

The above critical analyses were attacked and rejected by Clemen (Stud. und Krit., 1888, 211 sqq.). He fails, however, in many cases to recognize the difficulties at issue, and those which cannot be ignored he sets down to the conflicting apocalyptic traditions, in which the author was allowed to draw for the subject-matter. Though Ryssel (Kautzsch, Apok. u. Pseud. des A. T. ii. 409) has followed Kautzsch, neither has given any real explanation of the disorder of the book as it stands at present. Beer (op. cit.) agrees that xxxvi.-xl. and liii.-lxxv. are of different authorship from the rest of the book and belong to the earlier date.

**Relation to 4 Ezra.**—The affinities of this book and 4 Ezra are so numerous (see Charles, op. cit. 170-171) that Ewald and Ryle assumed identity of authorship. But their points of divergence are so weighty (see op. cit. pp. lxix.-lxxi.) that this view cannot be sustained. Three courses still remain open. If we assume that both works are composite, we shall perforce admit that some of the constituents of 4 Ezra are older than the latest of Baruch, and that other constituents of Baruch are decidedly older than the remaining ones of 4 Ezra. On the other hand, if we assume unity of authorship, it seems impossible to arrive on the chronological relations of these two works. Langen, Hilgenfeld, Wieseler, Stähelin, Reman, Hausrath, Drummond, Dillmann, Rosenthal, Gunkel, have maintained on various grounds the priority of 4 Ezra; and Schürer, Bisseill, Thomson, Deane, Kabisch, De Faye, Wellhausen, and Ryssel the priority of Baruch on grounds no less convincing.

**Relation to Rabbinical Literature.**—A very close relation subsists between our book and rabbinical literature. Indeed in some instances the parallels are so close that they are almost word for word. The description of the destruction of Jerusalem by angels in vi.-viii. is found also in the Pesikta Rabbati 26 (ed. Friedmann 131a). By means of this passage we are, as Ginsberg has shown, able to correct the corrupt reading, "the holy Ephod" (vi. 7), שֶׁמֶשׁ לָאֵל into "the holy Ark," i.e. שֶׁמֶשׁ כָּלָא. What might be taken as poetic fancies in our text are recounted as historical facts in rabbinical literature. Thus the words (x. 19): "And ye priests, take ye the keys of the sanctuary, And cast them into the height of heaven, And give them to the Lord and say: 'Guard Thine own house; for lo we are found unfaithful stewsards.'" are given in various accounts of the fall of Jerusalem. (See Tannith, 204; Pesik. R., loc. cit.; Yalqut Shim'on; on Isa. xx.; Aloth of Rabbi Nathan vii.). Even the statement that the bodies of Sennacherib's soldiers were burned while their garments and armour remained unconsumed has its parallel in Sank. 94a.

**Integrity of the Book.**—In lxxvii. 19 it is said that Baruch wrote two epistles, one to the nine and a half tribes and the other to the two and a half at Babylon. The former is found in lxxviii.-lxxxi.; the latter is lost, but is probably preserved either wholly or in part in the Book of Baruch, ill. 9-iw. 26 (see Charles, op. cit.); pp. lxxvii.-lxxviii. On the other hand, it is not necessary to infer from lxxv. that an account of Baruch's assumption was to be looked for in the book.

**Authors.**—The literature is fully cited in Schürer, Gesch. iii. 223-232, and R. H. Charles, Apocalypse of Baruch, pps. xxx.-xliii. Ginzberg article in the Jewish Encyclopaedia, i. 551-556, is a fresh and valuable contribution.

**Rest of the Words of Baruch.** This book was undoubtedly written originally by a Jew but was subsequently revised by a Christian, as has been shown by Kohler in the Jewish Quarterly Review (1893), pp. 407-449. It passed under a double name in the Abyssinian Church, where it was known both as "the Rest of the Words of Baruch" and "the Rest of the Words of Jeremiah." Its Greek name is the latter—τά παρακαταγείρα Ιερουσαλήμ προφητεια. It has been preserved in Greek, Ethiopic, Armenian and Slavonic. The Greek was first printed at Venice in 1609, next by Ceriani in 1668 in his Man. Sacra, v. 11-18; by Harris, The Rest of the Words of Baruch, in 1880; and Basilius, Anc. Graco-Byzantina, i. 308 sqq. (1893). The book begins like the Syriac Apocalypse of Baruch with an account of the removal of the sacred vessels of the Temple before its capture by the Chaldees. Baruch remains in Jerusalem and Jeremiah accompanies the Exiles to Babylon. After 66 years' exile Jeremiah brings back the Jews to Jerusalem, but refuses to admit such as had brought with them heathen wives. Then follows a vision of Jeremiah which is Christian.

Harris regards the book in its present form as an eirenicon addressed to the Jews by a Christian after the rebellion of Bar Cochba (Barcochebas) and written about 136. Though the original work was dependent on the Apocalypse of Baruch it cannot have been written much before the close of the 1st cent. A.D. Its terminus ad quem is at present indeterminable.

(R. H. C.)

**BARUGO-BARYATINSKY.**

BARUGO, a town on the north coast of the province of Leyte, island of Leyte, Philippine Islands, on Carigara Bay. Pop. (1901) 12,560. It exports large quantities of hemp and copra, and imports rice, petroleum, and cotton-goods.

BARYATINSKY, ALEXANDER IVANOVICH, Prince (1814-1879). Russian soldier and governor of the Caucasus, was privately educated, entered the school of the ensigns of the Guard in his seventeenth year and, on the 8th of November 1833, received his commission of cornet in the Life Guards of the cæsarovich Alexander. In 1835 he served with great gallantry in the Caucasus, and on his return to St Petersburg was rewarded with a gold sword "for valour." On the first of January 1836 he was attached to the suite of Alexander, and in 1845 was again ordered off to the Caucasus and again most brilliantly distinguished himself, especially in the attack on Shamy's stronghold, for which he received the order of St George. In 1846 he assisted
Fieldmarshal Paskievič to suppress the Cracow rising. From 1848 to 1856 he took a leading part in all the chief imperial events in the Caucasus, his most notable exploits being his victory at Mezeninsk in 1850 and his operations against Shamyl at Chechen. His energetic and at the same time systematic tactics inaugurated a new era of mountain warfare. On the 6th of January 1853 he was appointed adjutant-general and, on July 5th of the same year, chief of the staff. In 1854 he took part in the brilliant Kürük Dere campaign. On the 1st of January 1856 he became commander-in-chief of the Caucasian army, and, subsequently, governor of the Caucasus. As an administrator he showed himself fully worthy of his high reputation. Within three years of his appointment, the whole of the eastern Caucasus was subdued and the long elusive Shamyl was taken captive. Baryatinsky also conquered many of the tribes of the western Caucasus dwelling between the rivers Laba and Byelaya. For these fresh services he was created a fieldmarshal. But his health was now entirely broken by his strenuous labours, and on the 6th of December 1862 he was, at his own request, relieved of his post. He spent the last days of his life abroad and died at Genoa after forty-eight years of active service.

**BARYE, ANTOINE LOUIS** (1796-1857), French sculptor, was born in Paris on the 24th of September 1796. Like many of the sculptors of the Renaissance he began life as a goldsmith. After studying under Bosio, the sculptor, and Gros, the painter, he was in 1818 admitted to the École des Beaux Arts. But it was not till 1823, when he was working for Fauconnier, the goldsmith, that he discovered his real bent from watching the wild beasts in the Jardin des Plantes, making vigorous studies of them in pencil drawings worthy of Delacroix and then modelling them in sculpture on a large or small scale. In 1831 he exhibited his "Tiger devouring a Crocodile," and in 1832 had mastered a style of his own in the "Lion and Snake." Thenceforward Barye, though engaged in a perpetual struggle with want, exhibited year after year these studies of animals—admirable groups which reveal him as inspired by a spirit of true romance and a feeling for the beauty of the antique, as in "Theseus and the Minotaur" (1847), "Lapithaand Centaur" (1848), and numerous minor works now very highly valued. Barye was no less successful in sculpture on a small scale, and excelled in representing animals in their most familiar attitudes. As examples of his larger work we may mention the Lion of the Column of July, of which the plaster model was cast in 1839, various lions and tigers in the gardens of the Tuileries, and the four groups—War, Peace, Strength, and Order. In 1851 he cast his bronze "Jaguar devouring a Hare." The famous "Deer in Love" is dated 1852. He was made professor at the museum in 1854, and was elected to the Academy of Fine Arts in 1868. He died on the 25th of June 1875. The mass of admirable work left to us by Barye entitles him to be regarded as the greatest artist of animal life of the French school, and as the creator of a new class of art which has attracted such men as Frémit, Peter, Cain, and Gardet, who are regarded with justice as his worthiest followers.

**BARYTES,** a widely distributed mineral composed of barium sulphate (BaSO₄). It is a most striking feature and the one fact which it derives its name barytes, barite (from the Greek βαρύς, heavy) or heavy spar, is its weight. Its specific gravity of 4.5 is about twice as great as that of salt and of many other colourless, transparent and glassy minerals not unlike barytes in general appearance. The mineral is usually found in a state of considerable chemical purity, though small amounts of strontium and calcium sulphates may isomorphously replace the barium sulphate: ammonium sulphate is also sometimes present, whilst clay, silica, bituminous matter, &c., may be enclosed as impurities.

Crystals of barytes are orthorhombic and isomorphous with the strontium and lead sulphates (celestite and anglesite); they are usually very perfectly developed and present great variety of form. The simplest are rhomb-shaped tables (fig. 1) bounded by the two faces of the basal pinacoid (c) and the four faces of the prism (m); the angle between the prism-faces (mm) is 78° 23′, whilst that between c and m is 90°. The mineral has a very perfect cleavage parallel to the faces c and m, and the cleavage surfaces are perfectly smooth and bright. The crystals of prismatic habit represented in figs. 2 and 3 are bounded by the planes d and f and the basal pinacoid c; fig. 4 is a plan of a still more complex crystal. Twinning is represented only by twin-lamellae, which are parallel to the planes m and f and are of secondary origin, having been produced by pressure.

Crystals of barytes may be transparent and colourless, or white and opaque, or of a yellow, brown, bluish or greenish colour. Well developed crystals are extremely common, but the mineral occurs also in a granular, earthy, or stalactitic condition. It is known as cawk in the Derbyshire lead mines. The "crested" or "cock's comb" barytes occurs as rounded aggregations of thin lamellar crystals.

Barytes is of common occurrence in metalliferous veins, especially those which yield ores of lead and silver; some of the largest and most perfect crystals of colourless barytes were obtained from the lead mines near Dufon in Westmorland. It is found also in beds of iron ore, and the haematite mines of the Clentor Moor district in west Cumberland have yielded many extremely fine crystals, specimens of which may be seen in all mineral collections. In the neighbourhood of Nottingham, and other places in the Midlands, barytes forms a cementing material in the Triassic sandstones; amber-coloured crystals of the same mineral are found in the fuller's earth at Nuthfield in Surrey; and the sepiotar nodules in London Clay contain crystals of barytes as well as of calcite. Crystals are found as a rarity in the amygdaloidal cavities of igneous rocks.

Artificially prepared crystals of barytes may be obtained by allowing a solution of a soluble barium salt to diffuse slowly into a solution of a soluble sulphate. Barium chloride is present in some natural waters, and when this is the case the interaction of sulphates results in a deposition of barytes, as has occurred in the pipes and water-boxes of the Newcastle-on-Tyne coal mines.

Commercially, barytes is used in the preparation of barium compounds, as a body for certain kinds of paper and cloth, and as a white pigment ("permanent white"). The finely powdered and washed mineral is too crystalline and consequently of insufficient opacity to be used alone as a paint, and is therefore mixed with "white lead," of which material it is also used as an adulterant.

**BARYTOCALCITE,** a rare mineral found only at Alston Moor in Cumberland, where it occurs as diverging groups of white transparent crystals lining cavities in the Mountain Limestone.
The crystals belong to the monoclinic system and are usually prismatic or blade-shaped in habit. The hardness is 4, and the sp. gr. 3.6-5. There are perfect cleavages parallel to the prism faces inclined at an angle of 73° 6′, and a less perfect cleavage parallel to the basal plane, the angle between which and the prism faces is 72° 6′; the angles between these three cleavages thus approximate to the angles (74° 55′) between the three cleavages of calcite, and there are other points of superficial resemblance between these two minerals. Chemically, barytocalcute is a double salt of barium and calcium carbonates, BaCo(CO₃)₂, thus differing from the orthorhombic bromlite (Q.S.) which is an isomorphous mixture of the two carbonates.

L. J. S.

BARYTONE, or BARTONE (Ital. baritone, from Gr. βαρύτων, deep sounding), a musical term for the male voice whose range lies between those of the tenor and of the bass—a high bass rather than a low tenor; also the name of an obsolete stringed instrument like the viola da Gamba, and of the small Bb or C saxhorn.

BASALT, in petrology, one of the oldest rock names, supposed to be derived from an Ethiopian word basal, signifying a stone which yields iron; according to Pliny, the first basalt lake was obtained in Ethiopia. In current usage the term includes a large variety of types of igneous rock belonging to the basic subdivision, dark in colour weathering to brown, and comparatively rich in magnesia and iron. Some basalts are in large measure glassy (tachylites), and many are very fine grained and compact; but it is more usual for them to exhibit porphyritic structure, showing larger crystals of olivine, augite or felspar in a finely crystalline groundmass. Olivine and augite are the commonest porphyritic minerals in basalts, the former green or yellowish (and weathering to green or brown serpentine), the latter pitch-black. Porphyritic plagioclase felspars, however, are also very common, and may be one or two inches in length, though usually not exceeding a quarter of an inch; when fresh they are dark grey with smooth lustreous cleavage surfaces; when decomposed they become turbid, and assume grey or greenish shades. Basaltic lavas are frequently spongy or pumiceous, especially near their surfaces; and, in course of time, the steam cavities become filled with secondary minerals such as calcite, chlorite and zeolites. Another characteristic of this group of rocks is the perfection with which many of them show prismatic or columnar jointing, a structure often called "basaltic jointing."

The minerals of basaltic rocks have a fairly uniform character throughout the whole group. In microscopic section the olivine is pale green or colourless, and is very frequently more or less altered to serpentine. The secondary mineral begins to form upon the surfaces and along the cracks of the olivine, gradually producing a mesh-work in the interstices of which small kernels of olivine remain; and when the process is completed the mesh structure persists in the resulting pseudomorph, giving a clear indication as to its history. The augite is mostly brown, often with a purplish tinge, hardly at all dichroic, but frequently showing green (or greyish) structure, and various types of twinning. Other varieties of augite, pale or greenish, are well known in the Eifel, and other volcanic districts in Germany, also in Bohemia, Italy, Java, Montana, Celebes, &c. The minerals haüyne, nosean, sodalite and melilite tend to occur with some frequency in nepheline and leucite-basalts, though rare in ordinary basalts. Melilite, a lime-alumina-silicate, is characteristic of certain very basic rocks, the melilite-basalts. It is pale yellow or colourless in thin sections, and yields peculiar and characteristic dark blue polarization colours. This rare group of rocks is known to occur in Bohemia, Swabia and South Africa. Perofskite, in small dark brown cubic crystals, is a constant accessory in these rocks. The augite is usually violet coloured, and shows zonal and hour-glass structures. Green augite may occur in the nepheline-basalts, and aegerine (soda-iron-augite) is occasionally found in them.

The distribution of basalts is world-wide; and in some places
they occur in immense masses, and cover great areas. In Washington, Oregon, and Idaho many thousands of square miles are occupied by basaltic-lava fields. In the Sandwich Islands and Iceland they are the prevalent lavas; and the well-known columnar jointed basalts of Skye, Staffa, and Antrim (Giant's Causeway) form a southward extension of the Icelandic volcanic province. All these lavas are connected by the similar rocks of the Faeroe Islands. In the Deccan in India great basaltic lava fields are known; and Etna and Vesuvius emit basaltic rocks. In older geological periods they were not less common; for example, in the Carboniferous in Scotland.

J. S. F.

BASCOM, JOHN (1827– ), American educationalist and philosophical writer, was born at Genoa, New York, on the 1st of May 1827. He graduated at Williams College in 1849 and at the Andover Theological Seminary in 1855, was professor of rhetoric at Williams College from 1855 to 1874, and was president of the University of Wisconsin and professor of mental and moral philosophy there from 1874 to 1887. In 1887–1891 and in 1901–1903 he was lecturer in sociology, and in 1891–1901 professor of economics in Williams College. He retired in 1903. Among his publications may be mentioned: Aesthetics (1862); Philosophy of Rhetoric (1865); Science, Philosophy and Religion (1871); Philosophy of English Literature (1874); Philosophy of Religions (1876); Problems in Philosophy (1885); The New Theology (1891); Social Theory (1893); Evolution and Religion (1896); Growth of Nationality in the United States (1899); and God and His Goodness (1901).

BASE. (1) (Fr. bas, Late Lat. bassus, low; cf. Gr. βάθος) an adjective meaning low or deep, and so mean, worthless, or wicked. This sense of the word has sometimes affected the next, which is really distinct. (2) (Gr. βάσις, strictly 'stepping,' and so a foundation or pedestal) a term for a foundation or starting-point, used in various senses; in sports, e.g. hockey and baseball; in geometry, the line or face on which a figure or solid stands; in crystallography, e.g. "basal plane;" in surveying, in the "base line," an accurately measured distance between the points from which the survey is conducted; in heraldry, in the phrase "in base," applied to any figure or emblem placed in the lowest part of a shield.

In chemistry the term denotes a substance which combines with an acid to form a salt. In inorganic chemistry such compounds are almost invariably oxides or hydroxides, and water is eliminated during the combination; but in organic chemistry many compounds exist, especially ammonia derivatives, which directly combine with acids. Chemical bases are consequently antithetical to acids; and an acid is neutralized by a base with the production of a salt. They reverse certain colur reactions of acids, e.g. turn red litmus blue; this is termed an "alkaline reaction."

In architecture the "base" is the lowest member of a column or shaft. In Egyptian and Greek architecture it is the raised slab in stone or cement on which the primitive timber column was placed, to keep it dry. Afterwards it was always reproduced in Egypt, even although the column, being in stone, no longer required it; a custom probably retained because, being of a much larger circumference than the lower part of the column, it gave increased stability. In Greek architecture it served to carry wooden posts or columns, it took the form of a large torus moulding with enrichments. In Persian architecture the base was much higher than in any other style, and was elaborately carved. In primitive Greek work the base consisted of the stone plinth as found in Crete and Tирy, and of three small steps at Mycenaean. In archaic Greek work it has already disappeared in the Doric order, but in the Ionic and Corinthian orders it is more or less richly moulded, the most elaborative examples being those found in the temple of Apollo at Branchidae in Milesia. For the contour of the mouldings see Orders. The Roman orders all have the favourite design known as the Attic base. Romanesque bases were rude but vigorous copies of the old classic base, and were often decorated with projections or spurs (Fr. griffes) at the angles of the square dies, thus connecting them with the square base. In the Early English style, these spurs followed the conventional design of the period, and about the same time the mouldings were deeply sunk and occasionally cut downwards, so that they would have held water if used externally. Later, the base becomes less bold in treatment, but much more complex in its contours, and in the 15th century is given an unusual height with two stages, the lower one constituting a kind of plinth, which is sometimes known as the ground table, or the base course.

A BASE COURT (Fr. basse cour, i.e. the lower court), is the first open space within the gates of a castle. It was used for exercising cavalry, and keeping live stock during a siege. (See ENCEINTE.)

The BASE of a WALL of GROUND TABLE, in architecture, is the mouldings round a building just above ground; they mostly consist of similar members to those above described and run round the buttresses. The flat band between the plinth and upper mouldings is frequently panelled and carved with shields, as in Henry VII. Chapel at Westminster.

BASE-BALL (so-called from the bases and ball used), the national summer sport of the United States, popular also throughout Canada and in Japan. Its origin is obscure. According to some authorities it is derived from the old English game of rounders (q.v.), several variations of which were played in America during the colonial period; according to other authorities, its resemblance to rounders is merely a coincidence, and it had its origin in the United States, probably at Cooperstown, New York, in 1839, when, it is said, Abner Doubleday (later a general in the U.S. army) devised a scheme for playing it. About the beginning of the 19th century a game generally known as "One Old Cat" became popular with schoolboys in the North Atlantic states; this game was played by three boys, each fielding and batting in turn, a run being scored by the batsman running to a single base and back without being put out. Two Old Cat, Three Old Cat, and Four Old Cat were modifications of this game, having respectively four, six, and eight players. A development of this game bore the name of town-ball, and the Olympic Town-Ball Club of Philadelphia was organized in 1833. Matches between organized base-ball clubs were first played in the neighbourhood of New York, where the Washington Baseball Club was founded in 1843. The first regular code of rules was drawn up in 1845 by the Knickerbocker Baseball Club and used in its matches with the Gotham, Eagle and Empire clubs of New York, and the Excelsior, Putnam, Atlantic and Eckford clubs of Brooklyn. In 1858 the first National Association was organized, and, while its few simple laws were generally similar to the corresponding rules of the present code, the ball was larger and "live," and the pitcher was compelled to deliver it with a foot, no longer with a throw being allowed. The popularity of the game spread rapidly, resulting in the organization of many famous clubs, such as the Beacon and Lowell of Boston, the Red Stockings of Cincinnati, the Forest City of Cleveland and the Maple Leaf of Guelph, but, owing to the sharp rivalry between the foremost teams, semi-professionalism soon crept in, although in those days a man who played for a financial consideration always had some other means of livelihood, as the income to be derived from playing ball in the summer time was not enough to support him throughout the year. The scarcity of great players was made up by undesirable adjuncts. The betting and pool selling evils became prominent, and before long the game was in thorough disrepute. It was not only generally believed that the matches were not played on their merits, but it was known that players themselves were not above selling contests. At that time many of the journals of the day foretold the speedy downfall of the sport. A convention of those interested financially and otherwise in the game, was held in 1867 in Philadelphia, and an effort was made to effect a reformation. That the sport even then was by no means insignificant can be seen from the fact that in that convention some 500 organizations were represented. While the work done at the convention did not accomplish all that was expected, it did produce certain reforms, and the sport grew rapidly thereafter both in the eastern and in the middle western part of the United States. In the next five years the
interest in the game became so great that it was decided to send a representation of American base-ball players to England; and two clubs, the Bostons, who were the champions that year, and the Athletics, former champions, crossed the Atlantic and played several exhibition games with each other. While successful in exciting some interest, the trip did not succeed in popularizing base-ball in Great Britain. Fifteen years later two other nines of representative American base-ball players made a grand tour of Australia and various other countries, completing their trip by a contest in England. This too, however, had little effect, and later attempts to establish base-ball in England have likewise been unsuccessful. But in America the game continued to prosper. The first entirely professional club was the Cincinnati Red Stockings (1860). Two national associations were formed in 1871, one having jurisdiction over professional clubs and the other over amateurs. In 1876 was formed the National League, of eight clubs under the presidency of Nicholas E. Young, which contained the expert ball-players of the country. There were so many people in the United States who wanted to see professional base-ball that this organization proved too small to furnish the desired number of games, and hence in 1882 the American Association was formed. For a time it seemed that there would be room for both organizations; but there was considerable rivalry, and it was not until an agreement was made between the two organizations that they were able to work together in harmony. They practically controlled professional base-ball for many years, although there were occasional attempts to overthrow their authority, the most notable being the formation in 1890 of a brotherhood of players called the Players' League, organized for the purpose of securing better benefits accruing to the managers, as well as for the purpose of abolishing black-listing and other supposed abuses. The Players' League proved not sufficiently strong for the task, and fell to pieces. For some years the National League consisted of twelve clubs organized as stock companies, representing cities as far apart as Boston and St. Louis, but in 1900 the number was reduced to eight, namely, Boston, Brooklyn, Chicago, Cincinnati, New York, Pittsburgh, Philadelphia and St. Louis. Certain aggressive and dissatisfied elements took advantage of this change to organize a second, more professional association under the presidency of B. B. Johnson, the "American League," of eight clubs, six of them in cities where the National League was already represented. Most of the clubs of both leagues flourish financially, as also do the many minor associations which control the clubs of the different sections of the country, among which are the Eastern League, the American Association, Western League, Southern Association, New England League, Pacific League and the different state leagues. Professional base-ball has not been free from certain objectionable elements, of which the unnecessary and rowdyish fault-finding with the umpires has been the most evident, but the authorities of the different leagues have lately succeeded, by strenuous legislation, in abating these. Of authorities on base-ball, Henry Chadwick (d. 1908) is the best known.

Amateur base-ball, in its organized phase, is played mostly by school and university clubs as well as those of athletic associations. The first college league was formed in 1879 and comprised Harvard, Princeton, Amherst, Brown and Dartmouth, Yale joining a year later. The Eastern College League, with Columbia, Harvard, Princeton and Yale, followed in 1887. This was afterwards dissolved and at present the most important universities of the eastern states are members of no league, although such organizations exist in New England and different parts of the west and south. Amateur base-ball has progressed along the same lines as professional, although the college playing rules formerly differed in certain minor points from those of the professional leagues. The following is a general description of the field and of the manner in which the game is played, but as the game has become highly complicated, situations may arise in playing in which general statements do not strictly hold. Any smooth, level field about 150 yds. long and 100 yds. broad will serve for a base-ball ground. Upon this field is marked out with white chalk a square, commonly called the diamond, smooth, like a cricket pitch, the sides of which measure 30 yds. each, and the nearest corner of which is distant about 30 yds. from the limit of the field. This corner is marked with a white plate, called the home-base or plate, five-sided in shape, two of the sides being 1 ft. long and that towards the pitcher 17 in. At the other three corners are attached to pegs are white canvas bags 15 in. square filled with soft material, called bags, long to the right, as one looks towards the field, first-base, second-base and third-base respectively. The lines from home-base to first, and from home to third are indefinitely prolonged and called foul-lines. The game is played by two sides of nine men each, one of these taking its turn at the bat while the other is in the field endeavouring, as provided by certain rules, to put out the side at bat. Each side has nine turns, or innings, at bat, unless the side last at bat does not need its ninth innings in order to win; a tie at the end of the ninth innings makes additional innings necessary. A five-man game usually takes from 1 1/2 to 2 hrs. to play. Three batsmen are put out in each inning, and the side scoring the greatest number of runs (complete encircling of the bases without being put out) wins. A runner who is not put out but fails to reach home-base does not score a run, but is "left on base."

** Implements of the Game.**—The ball, which is 9 1/2 in. in circumference and weighs 5-5 1/2 oz., is made of yarn wound upon a small core of vulcanized rubber and covered with white leather, which may not be intentionally discoloured. The ball must be round, not over 2 1/4 in. in diameter at the thickest part, nor more than 42 in. in length. It is usually made of ash or some other hard wood, and the handle may be wound three times. Three-cornered spikes are usually worn on the players' shoes. The catcher and first-baseman (v. infra) may wear a glove of any size on one hand; the gloves worn by all other players may not measure more than 14 in. round the palm nor weigh more than 10 oz.

**The Players.**—The fielding side consists of (a) the pitcher and catcher, called the battery, (b) the first-baseman, second-baseman, third-baseman and short-stop, called infielders, and (c) the left-fielder, centre-fielder and right-fielder, called outfielders.

The pitcher, who delivers the ball to the batsman, is the most important member of the side. In the art of pitching, which is throwing either over or underhand, he must keep on foot in contact with a white plate, called the pitcher's plate, 24 in. long and 6 in. wide, placed 60-5 ft. from the back of the home-base. Before 1875 the pitcher was obliged to deliver the ball with a full toss only, but about that time a disguised underhand throw, which greatly increased the pace, began to be used so generally that it was soon legalized, and the overhand throw followed as a matter of course. As long as the arm was held stiff no curve could be imparted to the flight of the ball in the air, but with the increase of pace came the possibility of doing this by a movement of the wrist as the ball left the hand, the twist thus given causing the ball, by the pressure on the air, to swerve to one side or the other, or downwards, according to the position of the hand and fingers as the ball is let go. The commonest of these swerving deliveries, and the first one invented, is the out-curve, the ball coming straight towards the batsman until almost within reach of his bat, when it suddenly swerves away from him towards the right, if he be right-handed. The other important curves are the in-curve, shooting sharply to the left, and the drop, with their many variations. Nearly every pitcher using some favourite curve. Change of pace, disguised as well as possible, is also an important part of pitching strategy, as well as variation of the delivery and the play upon the known weaknesses or idiosyncrasies of the batsman. Good control over the ball is a necessity, as four "balls" called by the umpire,—that is, balls not over the base, or over the base and not between the shoulder and knee of the batsman,—entitle the batsman to become a base-runner and take his first base. If the pitcher disregards the restrictions placed upon him by the rules (e.g. he may not, while in position, make a motion to deliver the ball to the batsman without actually
delivering it, or to first-base, while that base is occupied by a runner, without completing the throw), he is said to have made a runner advance a base. In fielding batted balls the pitcher takes all that come directly to him, especially slow ones which the other fielders cannot reach in time. One of his duties is to "back up" the first-baseman in order to stop balls thrown wide, and to cover first-base in place of the baseman whenever that player has to leave his base to field a ground ball. On occasion he also backs up other positions.

The catcher usually stands about 1 yd. behind the home plate, and he must never be more than 10 ft. behind the home plate when the pitcher delivers the ball to the batsman. He generally catches the ball from the pitcher before it strikes the ground, and, when a man of the opposing side has succeeded in getting to a base, must be on the alert to head this opponent off should he endeavour to steal the next base, i.e. run to it while the pitcher is delivering the ball to the batsman. For this reason the catcher must be a quick, strong and accurate thrower. As the catcher alone faces the whole field, he is able to warn the pitcher when to throw to a base in order to catch a runner mapping off the base, and by secretly signalling to the pitcher (usually by means of signs with his fingers) he directs what kind of a ball is to be pitched, so that he may be in the proper position to receive the ball, be it high or low, to left or right. Some pitchers, however, prefer to reserve the choice of balls and therefore do the signalling themselves. The catcher wears a mask, a breast-plate, and a large glove, without which the position would be a very dangerous one.

As every batsman upon hitting the ball must run for the first-base, the first-baseman must be a sure catch of balls thrown to head runners off, even those thrown too low, high or wide. A tall man is usually chosen for this position. The second-baseman usually stands about 30 ft. to the right of second-base and back of the line between the bases, and attends to balls batted to his side of the diamond. He also backs up any exposed position and must be ready to cover second-base whenever a runner tries to steal down from first-base, or whenever there is a runner on second-base, a duty which he shares with the short-stop, whose position corresponds to that of the second-baseman on the left side of the diamond. Short-stop must be a quick and accurate thrower and a lively fielder, as he is required to back up second- and third-base. Both he and the second-baseman must field ground balls cleanly and are often called upon to catch fly balls also. The requirements of third-baseman are very similar, but he must be an exceptionally good thrower, as he has the longest distance to throw to the first-base; and as he plays nearer to the batsman than do the second-baseman and the short-stop, the balls batted in his direction are apt to be faster and more difficult to field. One of the third-baseman's chief duties is to be ready to run in towards the batsman to field "bunts," i.e. balls blocked by allowing them to rebound from a loosely held bat. These commonly roll slowly in the direction of third-baseman, who, in order to get them to first-base in time to put the runner out, must run in, pick them up, usually with one hand, so as to be in position to throw without the loss of an instant, and "snap" them to the first-baseman, i.e. throw them underhand without taking time to raise his body to an erect position. Many of these bunts can be fielded either by the pitcher or, if they drop dead in front of the home-plate, by the catcher. The positions of the three outfielders can be seen on the diagram. Their duties consist of catching all "flies" batted over the heads of the infielders (i.e. high batted balls that have not touched the ground), stopping and returning ground balls that pass the infield, and backing up the basemen. The accompanying diagram indicates the territory roughly allotted to the different fielders. "Back up" is a very prominent feature in fielding. Even the pitcher, for example, should run behind the first-baseman when the ball is thrown to the latter by another, in order to stop a widely thrown or missed ball, which, if allowed to pass, would enable the runner to gain one or more additional bases. Bases vacated by their basemen while fielding balls must often, also, be promptly covered by another player. The general rule of defence strategy is similar to that in cricket, namely, to have as many men as possible at the probable point of attack. There is usually an infield and an outfield captain for the special purpose of calling the name of the player who is to take a certain fly ball, to prevent collisions.

The batsman stands three-quarters facing the pitcher within a parallelogram ("box") 6 ft. long and 4 ft. wide, the lines of which he may not overstep, on penalty of being declared out. His object is to get to first-base without being put out. This he may do in several ways. (1) He may make a "safe-hit," i.e. one that is either to first or second base, when he has either a muffed fly, a failure to stop and field a ground ball, a muffed throw ball or a bad throw. Only balls batted within the foul-lines (see diagram) are fair. All others are "foul," and the batsman cannot run on them. All foul-struck balls are called strikes until two strikes have been called by the umpire, after which fouls are not counted.

Batting, as in cricket, is a science by itself, although comparatively more stress is laid on fielding than in cricket. A good batsman can place the ball in any part of the field he chooses by directing this angle. He may make a safe hit either by hitting the ball on the ground directly through the infield out of reach of the fielders, or so hard that it cannot be
stopped. In the last case a failure to stop and field it does not count as an “error” (misplay) for the fielder, even though it came straight at him, the decision as to errors appearing in the score (infra) depending upon the official scorer of the home club. The batsman may also hit safely by placing the ball over the heads of the infielders, but not far enough to be caught by the outfielders, or over the heads of the outfielders themselves, or he may bunt successfully. A hit by which two bases can be made (without errors by opponents) is a “two-base-hit,” “for three-bases,” “three-base-hit,” “for first-bases,” and on the bases a “home-run.” The batsman may be put out in various ways. For example, he is out (i) if he fails to bat in the order named in the published batting-list; (ii) if he fails to take his position within one minute after the umpire has summoned him; (iii) if he makes a foul which is caught before it strikes the ground (a ball barely ticked by the bat [“foul-tip”] does not count); (iv) if he oversteps the batting-lines; (v) if he intentionally obstructs or interferes with the catcher; (vi) if he unsuccessfully attempts the third strike and the ball hits his person or is caught by the catcher (under certain conditions he is put out whether the ball is so caught or not), or, if not being caught, is thrown to first-base and held there by an opposing player before the batsman can get there; (vii) if a fair ball be caught before striking the ground; (viii) if any fair ball is fielded to first-baseman before he reaches the base. The batsman becomes a base-runner the moment he starts for first-base. He may, when he first reaches first-base, over-run his base (provided he turns to his right in returning to it) without risk of being put out, but thereafter can be put out by being touched with the ball in the hands of a fielder unless some part of the runner’s person is in contact with the base. When a fair or foul ball struck by a batsman on his side is caught on the fly, he must retouch his base, or be put out if the baseman receives the ball before he can do so. A runner on first-base is forced to run to second as soon as a fair ball is batted, or, being on second with another runner on first, he is forced to run to third. This is called being “forced off his base.” In such a situation the forced runner can be put out if the ball is thrown to the baseman at the next base before the runner gets there. He does not require to be touched with the ball. The runner on first is entitled, however, to advance to second without risk of being put out if the batsman becomes similarly entitled to first-base (e.g. on being unavoidably struck by the ball, or on four balls). Frequently, if the ball is batted to the infield while a runner is on first-base, the baseman tosses it to second-baseman, putting out the runner, and the second-baseman has still time to throw the ball to first-base ahead of the batsman, thus completing a “double play.” Triple plays are sometimes made when there are runners on two or on all of the bases. Base-running is one of the important arts of base-ball play. A good base-runner takes as long a lead off the base as he dares, starts to run the moment the pitcher makes the first movement to deliver the ball, and if necessary throws himself with a slide, either feet or head first, on to the objective base, the reason for the slide being to make it more difficult for the baseman to touch the runner, having to stoop in order to do so, thus losing time. A base-runner is out if he interferes with an opponent while the latter is fielding a ball or if he is hit by a batted ball. An example of modern base-running is offered by the “double steal,” carried out, e.g., when there is a runner on first-base and a runner on third-base. The runner on first starts for second leisurely in order to draw a throw to second by the catcher. If the catcher throws, the runner on third runs for the home-plate, the second-baseman returning the ball to the catcher in order to put the runner out. The play often results in a score, but the runner is frequently able to take the throwers and land and safe, or when the catcher decelerates the runner by throwing, not to the player at second-base, but to a man stationed for the purpose much nearer the home-plate, this man intercepting the ball and returning it to the catcher if the runner on third is attempting to score, or letting it pass to the player on second-base, if the runner on third does not make the attempt.

Team batting is the co-operation of batsman and base-runner. The commonest example is the “hit and run” play, e.g., when a runner is on first-base. After the runner has ascertained by a false start which infielder, whether second-baseman or short-stop, will cover second-base, the batsman signals to the runner that he will hit the next ball. As soon as the pitcher delivers the ball the runner starts for second and the batsman hits the ball to that part of the infield vacated by the fielder who has gone to receive the ball at second from the catcher. If successful this play results in a safe hit, while the runner not infrequently makes, not only second, but third-base as well. Another instance of team batting is when runners are on third-base and the batsman signals that he will hit the next ball. This enables the pitcher to get a long start, making his scoring nearly certain if the batsman succeeds in hitting the ball fairly. If the ball is hit without the signal and consequent long start by the runner, the latter is frequently put out at the plate, as the infielder who fields the ball will ignore the batsman and throw the ball to the catcher to head off the runner and prevent a run being scored. In close games the “sacrifice-hit,” a part of team batting, is an important element. It consists, when a runner is on base, of a hit by the batsman resulting in his own retirement but the advancement to the next base of the runner. Another kind of sacrifice-hit is a long fly to the outfield. On such a hit a runner on third-base (as on the other bases) must remain on the base until after the ball is caught, but the distance from the outfield to the home-plate is so great that a fast runner can generally beat the ball and score his run. When men are on bases, coaches are allowed to stand near first and third bases to direct the runners.

One umpire, who has absolute jurisdiction over all points of play, usually officiates in base-ball, but, in important games, two umpires are often employed, one of them standing behind the catcher and calling the good and bad balls pitched, and the other, posted in the infield, giving decisions on plays at the bases.

In cases where the game is tied after nine innings, extra ones are played, the umpire “calling” a game when it becomes too dark to play. In case of rain, play is suspended by the umpire, who calls the game if the rain continues for one half-hour. Should play be permanently interrupted the game counts if five innings have been completed by each side.

Scoring. The scores, in vertical columns, (1) how many times each player has been at bat (bases taken on balls and sacrifice-hits not counted); (2) how many runs he has scored; (3) how many base-hits he has made; (4) how many sacrifice-hits he has hit; (5) how many opponents he has put out; (6) how many “assists,” i.e. times he has assisted in putting out (e.g. stopping a ground ball and throwing it to first-base); (7) the number of errors he has made, wild pitches and “passed balls,” i.e. not held by the catcher, as well as balks and bases on balls, not being counted as errors but set down under the regular columns, together with the record of stolen bases, extra long hits, double and triple plays, basemen struck out by each pitcher, the number of men struck by each pitcher with the ball, the time of the game and the name of the umpire.

Careful record is kept of the batting, fielding, pitching and base-running averages of both professional and amateur players. To find the batting record of a player, divide the number of hits made by the number of times at bat. To find a fielding record, divide the number of accepted chances by the total chances, e.g. A.B. put 1188 men out, and assisted sixty-four times, while making fifteen errors; his fielding average is therefore 1252 divided by 1267, or 988, 1000 being perfect fielding.

BASEDOW, JOHANN BERNHARD (1723-1790), German educational reformer, was born at Hamburg on the 11th of September 1723, the son of a hairdresser. He was educated at the Johanneum in that town, where he came under the influence of the rationalist H. S. Reimarus (1694-1768), author of the
BASEL

Felix entertain limited Modern burg, of the creation of the FEE, which was transferred to Hamburg, and between 1749 and 1753 was private tutor in a nobleman’s family in Holstein. Basedow now began to exhibit his remarkable powers as an educator of the young, and acquired so much distinction that, in 1753, he was chosen professor of moral philosophy and belles-lettres in the academy of Sorø in Denmark. On account of his theological opinions he was in 1751 removed from this post and transferred to Altona, where some of his published works brought him into great disfavour with the orthodox clergy. He was forbidden to give further instruction, but did not lose his salaried, and towards the end of 1765, he abandoned theology to devote himself with the same ardour to education, of which he conceived the project of a general reform in Germany. In 1768 he appeared his Vorstellung an Menschenfreunde für Schulen, nebst dem Plan eines Elementarbuches der menschlichen Erkennnisse, which was strongly influenced by Rousseau’s Émile. He proposed the reform of schools and of the common methods of instruction, and the establishment of an institute for qualifying teachers,—obtaining subscriptions for the printing of his Elementarwerk, where his principles were to be explained at length, and illus- trated by plates. The subscriptions for this object amounted to 15,000 Talers (2150), and in 1774 he was able to publish the work in four volumes. It contains a complete system of primary education, intended to develop the intelligence of the pupils and to bring them, so far as possible, into contact with realities, not with mere words. The work was received with great favour, and Basedow obtained means to establish an institute for education at Dessau, and to apply his principles in training disciples, who might spread them over all Germany. The name of Philanthropin which he gave to the institution appeared to him the most expressive of his views; and he engaged in the new project with all his accustomed ardour. But he had few scholars, and the success by no means answered his hopes. Nevertheless, so well had his ideas been received that similar institutions sprang up all over the land, and the most prominent writers and thinkers openly advocated the plan. Basedow, unfortunately, was little calculated by nature or habit to succeed in an employment which required the greatest regularity, patience and attention; his temper was intractable, and his management was one long quarrel with his colleagues. He resigned his direc- torship of the institution in 1789, and it was finally closed in 1793. Basedow died at Magdeburg on the 23rd of July 1790.

Hahn, Basedow und sein Verhältnis zu Rousseau (Leipzig, 1885); A. Plüsch, Basedow et le philantropinisme (Paris, 1890); C. Gösgen, Rousseau und Basedow (1891).

BASEL, in law, a freehold estate of inheritance which is limited or qualified by the existence of certain conditions. In modern property law the common law notion of a base was an estate created by a tenant in tail, not in possession, who bars the entail without the consent of the protector of the settlement. However he bars his own issue, he cannot bar any remainder or reversion, and the estate (i.e. the base fec) thus created is determinable on the failure of his issue in tail. An example of this kind of estate was introduced by George Elliot into the plot of Feliz Holt. Another example of a base fec is an estate descendable to heirs general, but terminable on an uncertain event; for example, a grant land to A and his heirs, tenants of the manor of Dale. The estate terminates whenever the prescribed qualification ceases. An early meaning of base fec was an estate held not by free or military service, but by base service, i.e. the will of the lord.

BASEL, or Bâle, one of the most northerly of the Swiss cantons, and the only one (save Schaffhausen) that includes any territory north of the Rhine. It is traversed by the chain of the Jura, and is watered by the Birs and the Ergolz, both tributaries (left) of the Rhine. It is traversed by railways from Basel to Olten (25 m.) and to Laufen (142 m.), besides local lines from Basel to Flüelen (8 m.) for the frequented pilgrimage resort of Mariastein, and from Liestal to Waldenburg (68 m.).

1356 - 1519 the canton was one of the six “Directorial” cantons of the Confederation. Since 1833 it has been divided into two half cantons, with independent constitutions.

One is that of Basel Stadt or Bâle Ville, including, besides the city of Basel, the three rural districts (all to the north of the Rhine) of Riehen, Bettingen and Klein Hüningen (the latter now united to the city). The total area of this half canton is 13.7 sq. m. only, of which 11 sq. m. are classed as “productive,” forests occupying 1.5 sq. m., but its total population in 1900 was 112,227 (of whom 3066 inhabited the rural districts), mainly Roman Catholics, and numbering 37,101 Protestants, 37,101 Romanists (including the Old Catholics), and 1897 Jews. The cantonal constitution dates from 1880. The executive of seven members and the legislature (Goldrat) of 135 members, as well as the one member sent to the Federal Ständerat and the six sent to the Federal Nationalrat, are all elected by a direct popular vote for the term of three years. Since 1875, 1000 citizens can claim a popular vote (facultative Referendum) on all bills, or can exercise the right of initiative whether as to laws or the revision of the cantonal constitution.

The other half canton is that of Basel Landschaft or Bâle Campagne, which is divided into four administrative districts and comprises seventy-four communes, its capital being Liestal. Its total area is 165 sq. m., of which all but 5 sq. m. is reckoned “productive” (including 55 sq. m. of forests). In 1900 its total population was 68,497, nearly all German-speaking, while there were 53,763 Protestants, 15,594 Romanists, and 130 Jews.

The cantonal constitution dates from 1862. The executive of 5 members and the legislature or Landrat (one member per 800 inhabitants or fraction over 400), as well as the single member sent to the Federal Ständerat and the three sent to the Federal Nationalrat, are all elected by a direct popular vote for three years. The “obligatory Referendum” obtains in the case of all laws, while 1500 citizens have the right of “initiative” whether as to laws or the revision of the cantonal constitution. Silk ribbon weaving, textile industries and the manufacture of tiles are carried on.

(W. A. B. C.)

BASEL (Fr. Bâle, but Basle is a wholly erroneous form; Ital. Basilea), the capital of the Swiss half canton of Basel Stadt or Bâle Ville. It is now the second most populous (109,161 inhabitants) town (ranked after Zürich) in the Swiss Confederation, as well as the second richest, the number of resident millionaires (in francs) exceeding that of any other Swiss town. Both facts are largely due to the opening (1882) of the St Gotthard railway, as merchandise collected from every part of north and central Europe is stored in Basel previous to being redistributed by means of that line. Hence the city has an extremely large and flourishing transit trade, despite the rather dingy appearance of its older portions. The city is divided by the Rhine into Gross Basel (south) and Klein Basel (north), the former being by far the larger. There are several bridges over the river, the old wooden bridge having been replaced in 1905 by one built of stone. The central or main railway station is principally used by the Federal government, the Baden station is in Klein Basel. The most prominent building in the city is the cathedral or Münster, built of deep red sandstone, on a terrace high above the Rhine. It was consecrated in 1015, but was mainly rebuilt after the disastrous earthquake of 1356 that nearly ruined the city. The public meetings of the great oecumenical council (1431-1449) were held in the choir, while the committees sat in the chapter-house. Erasmus lived in Basel 1521-1526, and on his death there (1536) was buried in the cathedral, attached to which are cloisters, in which various celebrities have been imured (e.g. G. Grisone, Grynaeus (d. 1541), Buxtorf (d. 1573). The 16th-century Bäckerstrasse town hall has recently been restored. In the museum is a fine collection of works of art by Holbein (who lived in Basel from...
BASEL, CONFESSION OF—BASEL, COUNCIL OF

1528 to 1531, while the historical museum (in the old Franciscan church) contains many treasures, and among them the fragments of the famous Dance of Death, wrongly attributed to Holbein. The university (founded by Pius II. in 1460) is the oldest in Switzerland, and of late years has been extended by the construction of detached buildings for the study of the natural sciences, e.g. the Vesalianum and the Bernoullianum. The university library is very rich, and contains the original MSS. of the acts of the great ecclesiastical council. There are a number of modern monuments in the city, the most important being that set up to the memory of the Swiss who fell in the battle of St Jakob (1444), won by the French. Basel is the seat of the chief missionary society in Switzerland, the training school for missionaries being at St Chrischona, 6 m. out of the city.

The town was founded in A.D. 374 by the emperor Valentinian, from whose residence there it takes its name. In the 17th century the bishop of Augusta Rauricorum (now called Kaiser August), 73 m. to the east, moved his see thither. Henceforth the history of the city is that of the growing power, spiritual and temporal, of the bishops, whose secular influence was gradually supplanted in the 14th century by the advance of the rival power of the burgurers. In 1356 the city was nearly destroyed by a great earthquake. After long swaying between the neighbouring Rhine cities and the Swiss Confederation, it was admitted into the latter in 1501. It later became one of the chief centres of the Reform movement in Switzerland, so that the bishopric could not retain its old sway. Finally settling at Soleure in 1828, the bishopric having been wholly reorganized since 1814. As in other Swiss towns the trade gilds got all political power into their hands, especially by the 18th century. They naturally favoured the city at the expense of the rural districts, so that in 1832 the latter proclaimed their independence, and in 1833 were organized into the half canton of Basel Landschaft, the city forming that of Basel Stadt.

BASEL, CONFESSION OF, one of the many statements of faith produced by the Reformation. It was put out in 1534 and must be distinguished from the First and Second Helvetic Confessions, its author being Oswald Myconius, who based it on a shorter confession promulgated by Oecolampadius, his predecessor in the church at Basel. Though it was an attempt to bring into line with the reforming party both those who still inclined to the old faith and the anabaptist section, its publication provoked a good deal of controversy, especially on its statements concerning the Eucharist, and the people of Strassburg even reproached those of Basel with celebrating a Christless supper. Up to the year 1826 the Confession (sometimes also known as the Confession of Mühlhausen from its adoption by that town) was publicly read from the pulpits of Basel on the Wednesday of Passion week in each year. In 1872 a resolution of the great council of the city practically annulled it.

BASEL, COUNCIL OF. A decree of the council of Constance (9th of October 1417) sanctioned by Martin V. had obliged the papacy periodically to summon general councils. At the expiry of the first term fixed by this decree, Martin V. did, in fact, call together at Pavia a council, which it was necessary to transfer almost immediately from one part of the empire to another on account of the subsequent events. It had to be dissolved owing to circumstances still imperfectly known, just as it was beginning to discuss the subject of reform (1424). The next council was due to assemble at the expiry of seven years, i.e. in 1431; with his usual punctuality, Martin V. dully convoked it for this date to the town of Basel, and selected to preside over it the cardinal Julian Cesarini, a man of the greatest worth, both intellectually and morably. Martin himself, however, died before the opening of his dominions by condottieri. From Italy, France and Germany the fathers were slow in appearing at Basel. Cesarini devoted all his energies to the war against the Hussites, until the disaster of Taus forced him hastily to evacuate Bohemia. The progress of heresy, the reported troubles in Germany, the war which had lately broken out between the dukes of Austria and Burgundy, and finally, the small number of fathers who had responded to the summons of Martin V., caused that pontiff's successor, Eugenius IV., to think that the synod of Basel was doomed to certain failure. This opinion, added to the desire which he felt of himself to presiding over the council, induced him to recall the fathers from Germany, whither his health, impaired of late, probably owing to a cerebral congestion, rendered it all the more difficult for him to go. He commanded the fathers to disperse, and appointed Bologna as their meeting-place in eighteen months' time, his intention being to make the session of the council coincide with some conferences with representatives of the Greek church, which were to be held there with a view to union (18th December 1431).

This order led to an outcry among the fathers of Basel and incurred the deep disapproval of the legate Cesarini. The Hussites too were so incensed that the Church afraid to face them; the laity would accuse the clergy of shirking reform; in short, this failure of the council would produce disastrous effects. In vain did the pope explain his reasons and yield certain points; the fathers would listen to nothing, and, relying on the decrees of the council of Constance, which amid the troubles of the schism had proclaimed the superiority, in certain cases, of the council over the pope, they insisted upon their right of remaining assembled, hastily beat up the laggards, held sessions, promulgated decrees, interfered in the government of the papal states, and declined to treat with the emperor. With this he interfered, and, as representatives of the universal Church, presumed to impose laws upon the sovereign pontiff himself. Eugenius IV. resolved to resist this supremacy, though he did not dare openly to repudiate a very widespread doctrine considered by many to be the actual foundation of the authority of the popes before the schism. However, he soon realized the impossibility of treating the fathers of Basel as ordinary rebels, and tried a compromise; but as time went on, the fathers became more and more intractable, and between him and them gradually arose an impassable barrier.

Abandoned by a number of his cardinals, condemned by most of the emperors, despised by the princes, and shamefully invoked the authority of the council, the pope made concession after concession, and ended on the 15th of December 1433 by a pitiable surrender of all the points at issue in a bull, the terms of which were dictated by the fathers of Basel, that is, by declaring his bull of dissolution null and void, and recognizing that the synod had not ceased to be legitimately assembled. It would be wrong, however, to believe that Eugenius IV. ratified all the decrees coming from Basel, or that he made a definite submission to the supremacy of the council. No express pronouncement on this subject could be wrung from him, and his enforced silence concealed the secret design of safeguarding the principle of sovereignty.

The fathers, who were filled with suspicion, would only allow the legates of the pope to preside over them on condition of their recognizing the superiority of the council; the legates ended by submitting to this humiliating formality, but in their own name only, thus reserving the judgment of the Holy See. Nay more, the difficulties of all kinds against which Eugenius had to contend, the insurrection at Rome, which forced him to escape by the Tiber, lying in the bottom of a boat, left him at first little chance of resisting the enterprises of the council. But the time of reform, deplored by the pope, was abandoned. His successor, who made a last effort to suppress the works of reform, their principal object being to curtail the power and resources of the papacy. This is why, besides the disciplinary
measures which regulated the elections, the celebration of divine service, the periodic holding of diocesan synods and provincial councils, are found also, and aimed at some of the “righter” by which the powers had extended their power, and helped out their finances at the expense of the local churches. Thus annates (q.v.) were abolished, the abuse of “reservation” of the patron-age of benefices by the pope was much limited, and the right claimed by the pope of “next presentation” to benefices not yet vacant (known as gratiae expectatrices) was done away with altogether. By other decrees the jurisdiction of the court of Rome was much limited, and rules were even made for the election of popes and the constitution of the Sacred College. The fathers continued to devote three of these “deputations” — and in the Hussites; they also intervened, in rivalry with the pope, in the negotiations between France and England which led only to the treaty of Arras, concluded by Charles VII. with the duke of Burgundy; finally, they investigated and judged numbers of private cases, lawsuits between prelates, members of religious orders and holders of benefices, thus themselves falling into one of the serious abuses for which they had most blamed the court of Rome.

The democratic character of the assembly of Basel was the result both of its composition and of its organization; not only was the number of votes it always small in comparison with that of the doctors, masters, representatives of chapters, monks or clerks of inferior orders, but the influence of the superior clergy had all the less weight because, instead of being separated into “nations,” as at Constance, the fathers divided themselves according to their tastes or aptitudes into four large committees or “deputations” (deputationes), one concerned with questions of faith (fidelis), another with negotiations for peace (pacis), the third with reform (reformatorii), the fourth with what they called “common concerns” (pro communibus). Every decision made by three of these “deputations” — and in each of them the lower clergy formed the majority — was ratified for the sake of form in general congregation, and if necessary led to decrees promulgated in session. It was on this account that the council could sometimes be called, not without exaggeration, “an assembly of copyists” or even “a set of grooms and scrullions.”

Eugenius IV., however much he may have wished to keep on good terms with the fathers of Basel, was neither able nor willing to accept or overlook all their decrees. The question of the union with the Greek church, especially, gave rise to a long dispute, the result of which was a rupture. The emperor John Palaeologus, pressed hard by the Turks, showed a great desire to unite himself with the Catholicks; he consented to come with the principal representatives of the Greek church to some place in the west where the union could be concluded in the presence of the pope and of the Latin council. Hence arose a double negotiation between him and Eugenius IV. on the one hand and the fathers of Basel on the other. The chief object of the latter was to fix the meeting-place at a place remote from the influence of the pope, and they persisted in suggesting Basel or Avignon or Savoy, which neither Eugenius nor the Greeks would on any account accept. The result was that Palaeologus accepted the offers of the pope, who, by a bull dated the 18th of September 1437, again pronounced the dissolution of the council of Basel, and summoned the fathers to Ferrara, where on the 8th of January 1438 he opened a new synod which he later transferred to Florence. In this latter town took place the momentary union, which was more apparent than real, between the Latin and the Greek church (6th July 1439). During this time the council of Basel, though abandoned by Cesarini and most of its members, persisted under the influence of Cardinal Aleman, in affirming its oecumenical character. On the 24th of January 1438 it suspended Eugenius IV., and went on in spite of the intervention of most of the powers to pronounce his deposition (25th June 1439), finally giving rise to a new schism by electing on the 4th of November Amadeus VIII., duke of Savoy, as pope, who took the name of Felix V.

This schism lasted fully ten years, although the antipope found hardly any adherents outside of his own hereditary states, those of Alphonsus of Aragon, of the Swiss confederation and certain intellect and with a great number of the cardinals. Eugenius IV., having confined himself to securing to his kingdom by the Pragmatic Sanction of Bourges, which became law on the 13th of July 1438, the benefit of a great number of the reforms decreed at Basel; England and Italy remained faithful to Eugenius IV. Finally, in 1447 Frederick III., king of the Romans, after negotiations with Eugenius, commanded the burgomaster of Basel not to allow the presence of the council any longer in the imperial city. In June 1448 the rump of the council migrated to Lausanne. The antipope, at the instance of France, ended by abdicating (7th May 1449). On the 29th of February 1447, and the fathers of Lausanne, to save appearances, gave their support to his successor, Nicholas V., who had already been governing the Church for two years. Trustworthy evidence, they said, proved to them that this pontiff accepted the dogmas of the superiority of the council as it had been defined at Con stance and at Basel. In reality, the struggle which they had carried on in defence of this principle for seventeen years, with a good faith which it is impossible to ignore, ended in a defeat. The papacy, which had been so fundamentally shaken by the great schism of the West, came through this trial victorious. The great Council, which divided the Church, was closed; the constitution of the Church remained monarchial.

BASEMENT, the term applied to the lowest storey of any building placed wholly or partly below the level of the ground. It is incorrectly applied to the ground storey of any building, even when, as for instance in the case of Somerset House, London, the ground floor is of plain or rusticated masonry, and the upper storey which it supports is divided up and decorated with columns or pilasters.

BASHAHR, or BISHAIH, a Rajput hill state, within the Punjab, amid the Himalayan mountains, with an area of 3,380 sq. m. and a population in 1901 of 80,584. In 1858, the raja being of weak intellect and unable to hold his own within the boundaries of his state, entered into alliance with France, and a British official. In 1906 there were some local troubles owing to the refusal of the people to pay taxes. The revenue is obtained chiefly from land and forests, the latter being leased to the British government.

BASHAN, a region lying E. of the Jordan, and towards its source. Its boundaries are not very well defined, but it may be said in general to have been north of the territory of Gilead. The name first appears in Hebrew history in connexion with the wanderings of the Israelites. According to Numbers xxx. 33, the tribes after the rout of Sihon, king of the Amorites, turned to go by the land of Bashan; and its king, Og, met them at Edrei, and was there defeated and slain. The value of this narrative is a matter of much dispute. The gigantic stature of the king, and the curious details about his “bedstead” (Deut. iii. 11) are regarded as suggestive of legend; to say nothing of the lateness of all the documents relating to the wars of Og, and the remoteness of Bashan from the regions of the Israelites’ wandering. The story, however, had so firm a hold on Hebrew tradition that it can hardly fail to have some basis in fact; and an invasion by Israel of Bashan before coming to Jordan is by measure improbable.

The great stature of Og is explained in the passage of Deuteronomy mentioned by the statement that he was the remnant of the aboriginal Rephaim. This was a race distinguished by lofty stature; and in Genesis xiv. 5 we find them established in Asheroth-Karnaim (probably the same as Ashhtaroth, which, as we shall see, was an important city of Bashan). The territory
was allotted on the partition of the conquered land to the eastern division of the tribe of Manasseh (Numbers xxxiii. 33; Josh. xiii. 29). One of the cities of refuge, Golan, was in Bashan (Deut. iv. 43). By Solomon, Bashan, or rather "the region of Argob in Bashan," containing "threesome great cities with walls and brazen bars," was assigned to the administrative district of Ben-Geber, one of his lieutenants (1 Kings iv. 13, compare ver. 19). In the days of Jehu the country was taken from Israel by Hazael, king of Syria (2 Kings x. 33). This is the last historical event related in the Old Testament of Bashan. In the poetical and prophetic books it is mentioned in connexion with the products for which it was noted. From a passage in the "Blessing of Moses" (Deut. xxxiii. 22) it seems to have been inhabited by lions. Elsewhere it is referred to in connexion with its cattle (Deut. xxxiii. 14; Ezek. xxxix. 18), which seem to have been proverbial for ferocity (Ps. xxii. 12); Amos (iv. 1) calls the wealthy women of Samaria, who oppressed the poor, "the kine of Bashan." It is also noted for its mountain (Ps. lxviii. 15), and especially for oak, which are coupled with the cedars of Lebanon (Isa. ii. 13; compare xxxiii. 9; Zechariah xi. 2). Oaks were made from them (Ezek. xxvii. 6). Bashan mentioned in this extent be deduced from the indications afforded in the earlier historical books. Og dwelt at Ashteroth, and did battle with the Israelites at Edrei (Deut. i. 4). In Deut. iii. 4, "the region of Argob" with its threesome cities is mentioned; Mt. Hermon is referred to as a northern limit, and Salekah is alluded to in addition to the other cities already mentioned. Josh. xiv. 2 and Josh. xiii. 29 confirm this. Josephus (Ant. iv. 5. 3; Wars, ii. 6. 3) enumerates four provinces of Bashan, Gaulanitis, Trachonitis, Auranitis and Batanaea. Gaulanitis (which probably derived its name from the city of refuge, Golan, the site of which has not yet been discovered) is represented by the modern Jaulan, a plain extending from the Jordan lakes to the Hāj Road. Josephus (Wars, iv. r. 1) speaks of it as divided into two sections, Gamalitis and Sogana. Trachonitis (mentioned in Luke iii. 1 as in the territory of Philip the tetrarch) adjoined the territory of Damascus, Auranitis and Batanaea. This corresponds to the Trachônes of Strabo (xvi. 20), and the modern district of the Lejā; inscriptions have been found in the Lejā giving Trachôn as its former name. Auranitis is the Hauran of Ezekiel xvii. 16, and of the modern Arabs. It is south of the Jaulān and north of Gilead. According to Porter (Journal Soc. Lib. 1854, p. 903) the name is locally restricted to the plain south of the Lejā and the narrow strip on the west; although it is loosely applied by strangers to the whole country east of the Jaulān. The fourth province, Batanaea, which still is remembered in the name 'Ardr el-Bathānīyeh, lies east of the Lejā and the Hauran plain, and includes the Jebel ed-Druż or Hauran mountain.

The identification of Argob, a region of the kingdom of Og, is a matter of much difficulty. It has been equated on philological grounds to the Lejā. But these arguments have been shown to be shaky if not baseless, and the identification is now generally abandoned. The confidence with which the great cities of Og were identified with the extensive remains of ancient sites in the Lejā and Hauran has also been shown to be without justification. All the so-called "giant cities of Bashan" without exception are now known to be Greco-Roman, not earlier than the time of Herod, and, though in themselves of very high architectural and historical interest, have no connexion whatever with the more ancient periods. No tangible traces of Og and his people, or even of their Israelite supplacers, have yet been found.

The fact somewhat weakens the various identifications that have been proposed for the cities of Bashan enumerated by name. Edrei for example is identified with Ed-Dera'a. This is perhaps the most satisfactory comparison, for besides the Greco-Roman remains there is an extensive subterranian city of unknown date, which may be of great antiquity, though even this is still sub judice. The other identifications that have commanded most acceptance are as follows:—Ashteroth Karnaim, also called Asharoth and (Josh. xxi. 27) Be-esherah, has been identified with Busrah (Bostra), where are very important Herodian ruins, but there is no tangible evidence yet adduced that the history of this site is of so remote antiquity. From the similarity of the names, it has also been sought at Tell Ashari and Tell 'Ashera. The true site can be determined, if at all, by excavation only; identifications based on mere outward similarity of names have always been fruitful sources of error. Salekah is perhaps less doubtful; it is a remarkable name, and a ruin similarly styled, Sukbat, is to be seen in the Hauran. It is inhabited by Druses. Another town in eastern Manasseh, namely Kenath, has been identified by Porter with Kanawāt, which may be correct.

In the later history Bashan became remarkable as a refuge for outlaws and robbers, a character it still retains. The great subterranian "city" at Ed-Dera'a has been partially destroyed by the local sub-governor, in order to prevent it becoming a refuge of fugitives from justice or from government requirements (conscript, taxation, &c.). Strabo refers to a great cave in Trachonitis capable of holding 4000 robbers. Arab tradition regards it as the home of Jōh; and it is famous as being the centre of the Druze and the Auranitian dynasty. The Hauran is one of the principal habitations of the sect of the Druzes (n.).

The physical characteristics of Bashan are noteworthy. Volcanic in origin—the Jebel ed-Druż is a group of extinct volcanoes—the friable volcanic soil is extraordinarily fertile. It is said to yield wheat eighty-fold and barley a hundred. The oaks for which the country was once famous still distinguish it in places.

BIBLIOGRAPHY.—In addition to books mentioned under PALESTINE see the following:—U. J. Seatzn, Reisen durch Syrien, Palästina, Phönizien, etc. (4 vols., 1854); Rev. J. L. Porter, Five Years in Damascus (2 vols., 1853); The Giant Cities of Bashan (out of date, but some of the descriptions good, 1865); J. G. Wetzstein, Reisebericht über Hauran und die Trachonen (Berlin, 1866); Sir R. F. Burton and C. F. T. Drake, Unexplored Syria (1872); G. Schumacher, The Jaulān (1888); Abila, Pella and Northern Ajarun (1890); Across the Jordan (1886), (Palestine Exploration Fund); Rev. W. Ewing, A Journey in the Hauran (with a large collection of inscriptions); Palestine Exploration Fund Quarterly Statement, 1895; W. H. Waddington's Inscriptions of Syria may also be consulted; Dussaud (René) and Frédéric Macler, Voyage archéologique au Sod et dans le Djabel ed-Drus (1901). In 1900 an important survey of the Hauran and neighbouring regions was made under American auspices, directed by Dr Enno Littmann; the publication of the great harvest of results was completed in 1906.

BASHI-BAZOUK—BASHKALA, the name given to a species of irregular mounted troops employed by the Turks. They are armed and maintained by the government but do not receive pay. They do not wear uniform or distinctive badges. They fight either mounted or dismounted, chiefly the latter, but are incapable of undertaking serious work, because of their lack of discipline. Their uncertain temper has sometimes made it necessary for the Turkish regular troops to disarm them by force, but they are often useful in the work of reconnaissance and in outpost duty. They are accused, and generally with justice, of robbery and maltreatment of the civil population, resembling in those things, as in their fighting methods and value, the Arabs, Circassians, and Cordobes and Tolpitches of 18th-century European armies. The term is also used of a mounted force, existing in peace time in various provinces of the Turkish empire, which performs the duties of gendarmerie.

BASHKALA, the chief town of a sanjak of the vilayet of Van in Asiatic Turkey. It is a military station, situated at an elevation of 7500 ft. above sea-level in the valley of the Great Zab river. It stands on the east slope of lofty bare mountains, overlooking a wide valley on the farther side of which flows the Zab. The most knoll of them is now occupied by a Russian garrison, defended from the north by a Russian fort. The population numbers some 10,000, principally Kurds, but including 1500 Armenians and 1000 Jews. The place is important as the centre of the Hakkari sanjak, a very difficult mountain district to the south-west containing numerous tribes of Kurds and Nestorian Christians, and also many of the Turkish tribes along the Persian frontier. The houses are well built of sun-dried brick, and the streets are wide and fairly clean. Good smiths' and carpenters' work is
done. The bazaar is small, although a thriving trade is done with the mountain districts. Owing to the great elevation the winter is extremely severe, and the summer of short duration. Wheat, barley, millet and sesame are cultivated on the plain, but fruit and vegetables have mostly be imported from Persia. Roads lead to Van, Urmia in Persia and Mosul through the Nestorian country. The Kord and Nestorian tribes in the wilder parts of the Hakkari Mountains are under slight government control, and are permitted to pay tribute and given self-government in a large degree. (F. R. M.)

BASHKIRS, a people inhabiting the Russian governments of Ufa, Orenburg, Perm and Samara, and parts of Vyatka, especially on the slopes and confines of the Urals, and in the neighboring plains. They speak a Tatar language, but some authorities think that they are ethnically a Finnish tribe transformed by Tatar influence. The name Bashkir or Bash-kirt appears for the first time in the beginning of the 10th century in the writings of Ibn-Foslan, who, describing his travels among the Volga Bulgarians, mentions the Bashkirs as a warlike and idolatrous race. The name was not used by the people themselves in the 10th century, but is a mere nickname.

Of European writers, the first to mention the Bashkirs are Joannes de plano Carpin (c. 1200-1260) and William of Rubruquis (1220-1293). These travellers, who fell in with them in the upper parts of the river Urals, call them Pascatir, and assert that they spoke at that time the same language as the Hungarians. Till the arrival of the Mongolians, about the middle of the 13th century, the Bashkirs were a strong and independent people and troublesome to their neighbours, the Bulgarians and Petchenegs. At the time of the downfall of the Kazan kingdom they were in a weak state. In 1536 they voluntarily recognized the supremacy of Russia, and, in consequence, the city of Ufa was founded to defend them from the Kirghiz, and they were subjected to a fur-tax. In 1676 they rebelled under a leader named Seiit, and were with difficulty reduced; and again in 1707, under Aldar and Kusyom, on account of ill-treatment by the Russian officials. Their last and third insurrection was in 1755, at the time of the foundation of Orenburg, and it lasted for six years. In 1786 they were freed from among them, and in 1795 an irregular army was formed from among them. They are now divided into cantons and give little trouble, though some differences have arisen between them and the government about land questions. By mode of life the Bashkirs are divided into settled and nomadic. The former are engaged in agriculture, cattle-rearing and bee-keeping, and live without want. The nomadic portion is subdivided, according to the districts in which they wander, into those of the mountains and those of the steppes. Almost their sole occupation is the rearing of cattle; and they are extremely negligent in the care of them, not allowing a sufficient store of winter fodder for all their herds, but allowing part of them to perish. The Bashkirs are usually very poor, and in winter live partly on a kind of gruel called yeryu, and badly prepared cheese named skort. They are hospitable but suspicious, apt to plunder and to the last degree lazy. They have large heads, black hair, eyes narrow and flat, small foreheads, ears always sticking out and a swarthy skin. In general, they are strong and muscular, and able to endure all kinds of labour and privation. They profess Mahomedanism, but know little of its doctrines. Their intellectual development is low.

BASHKIRSEFF, MARIA CONSTANTINOVA [MARI] (1860-1884), Russian artist and writer, was born at Gawronsk in province of Pultowa in Russia on the 23rd of November 1860. When Marie was seven years old, as her father (one of the nobility of Pultowa) and her mother were unable through incompatibility to live together, Madame Bashkirsseff with her little daughter left Russia to spend the winters at Nice or in Italy, and the summers at German watering-places. Marie acquired an education superior to that given to most girls of her rank. She could read Plato and Virgil in the original, and write four languages with almost equal facility. A gifted musician, she at first hoped to be a singer, and studied seriously in Italy to that end; her voice, however, was not strong enough to enable her to work in that line. More than once she was invited to draw. When she lost her voice she devoted herself to painting, and in 1877 settled in Paris, where she worked steadily in Tony Robert-Fleury's studio. In 1880 she exhibited in the salon a portrait of a woman; in 1881 she exhibited the "Atelier Julian"; in 1882 "Jean et Jacques"; in 1884 the "Meeting," and a portrait in pastel of a lady—her cousin—now in the Luxembourg gallery, for which she was awarded a mention honorable. Her health, always delicate, could not endure the labour she imposed on herself in addition to the life of fashion in which she became involved as a result of her success as an artist, and she died of consumption on the 31st of October 1884, leaving a small series of works of remarkable promise. From her childhood Marie Bashkirtseff kept an autobiographical journal; but the editors of these brilliant confessions (Journal de Marie Bashkirtseff, 1890), aiming apparently at captivating the reader's interest by the girl's precocious gifts and by the names of the various distinguished persons with whom she came in contact, so treated certain portions as to draw down vehement protest. This, to some extent, has brought into question the stamp of truthfulness which constitutes the chief merit of this memoirs; and the English translation of Marie Bashkirtseff literature was published in the shape of letters between her and Guy de Maupassant, with whom she started a correspondence under a feigned name and without revealing her identity.

See Mathilde Blind, A Study of Marie Bashkirtseff (T. Fisher Unwin, 1892); The Journal of Marie Bashkirtseff, an Exposure and a Defense, by "S." (showing that there is throughout a mistake in the dates in the diary); The Testament of Marie Bashkirtseff, translated, with an Introduction, by Mathilde Blind (2 vols., London, 1890); The Letters of Marie Bashkirtseff (1 vol.).

BASIL, known as BASIL THE GREAT (c. 329-379), bishop of Caesarea, a leading churchman in the 4th century, came of a famous family, which gave a number of distinguished supporters to the Church. His father, Macrinus, was a man of aristocratic descent; his brother, the saintly life; his second brother was the famous Gregory of Nyssa; his youngest was Peter, bishop of Sebaste; and his eldest brother was the famous Christian jurist Nauraciius. There was in the whole family a tendency to ecstatic emotion and enthusiastic piety, and it is worth noting that Cappadocia had already given to the Church men like Firmilian and Gregory Thaumaturgus. Basil was born about 330 at Caesarea in Cappadocia. While he was still a child, the family removed to Pontus; but he soon returned to Cappadocia to live with his mother's relations, and seems to have been brought up by his grandmother Macrina. Eager to learn, he went to Constantinople and spent four or five years there and at Athens, where he had Gregory (q.v.) of Nazianzus for a fellow-student. Both men were deeply influenced by Origen, and compiled the well-known anthology of his writings, known as Philologia (edited by J. A. Robinson, Cambridge, 1893). It was at Athens that he seriously began to think of religion, and resolved to seek out the most famous hermit saints in Syria and Arabia, in order to learn from them how to attain to that enthusiastic piety in

1 The name Basil also belongs to several other distinguished churchmen. (1) Basil, bishop of Anency from 336 to 360, a semi-Arian, but afterwards (favoured by Constantine) an orthodox writer; none of his works are extant. (2) Basil of Seleucia (fl. 448-458), a bishop who shifted sides continually in the Eutychian controversy, and who wrote extensively; his works were published (1837-1842). (3) Basil of Anency, fl. 787; he opposed imperial worship at the second council of Nicaea, but afterwards retracted. (4) Basil of Acriboc, archbishop of Thessalonica about 1155; he was a staunch upholder of the claims of the Eastern Church against the widening supremacy of the papacy.
which he delighted, and how to keep his body under by maceration and other ascetic devices. After this we find him at the head of a convent near Arnesi in Pontus, in which his mother Emilia, now a widow, his sister Macrina and several other ladies, gave themselves to a pious life of prayer for the charitable work. He was not ordained presbyter until 356, and his ordination was probably the result of the entreaties of his ecclesiastical superiors, who wished to use his talents against the Arians, who were numerous in that part of the country and were favoured by the Arian emperor, Valens, who then reigned in Constantinople. In 370 Eusebius, bishop of Caesarea, died, and Basil was chosen to succeed him. It was then that his great powers were called into action. Caesarea was an important diocese, and its bishop was, ex officio, exarch of the great diocese of Pontus. Hot-blooded and somewhat imperious, Basil was also generous and sympathetic. “His zeal for orthodoxy did not blind him to what was good in an opponent; and for the sake of peace and charity he was content to waive the use of orthodox terminology when it could be surrendered without a sacrifice of truth.” He died in 379.

The principal theological writings of Basil are his De Spiritu Sancto, a lucid and elevating appeal to Scripture and early Christian tradition, and his three books against Eunomius, the chief exponent of Anomoean Arianism. He was a famous preacher, and many of his homilies, including a series of ten letters on the Hexaemeron, the exposition of the psalter, have been preserved. His ascetic tendencies are exhibited in the Moralia and Regulae, ethical manuals for use in the world and the cloister respectively. His three hundred letters reveal a rich and observant nature, which, despite the troubles of ill-health and ecclesiastical unrest, remained optimistic, tender and even playful. His principal efforts as a reformer were directed towards the improvement of the liturgy, and the reformation of the monastic orders of the East. (See Basilian Monks.)

Bibliography.—Editions of his works appeared at Basel (1532); Paris, in Codex Parisiensis (Marksbury, 1775), and in the Sinner (1839). Migne’s Patrologia, ser. graec. 29-32; De Spiritu Sancto, ed. C. F. Johnston (Oxford, 1892); Liturgia, ed. A. Robertson (London, 1894). See also the patrologies, e.g. that of O. Bardenhewer, and the histories of dogma, e.g. those of A. Harnack and F. Loofs.

BASIL I. (d. 886), known as the “Macedonian”, Roman emperor in the East, was born of a family of Arabian (not Slavonic) descent, settled in Macedonia. He spent a part of his boyhood in captivity in Bulgaria, whither his family was carried by the Bulgarian prince Krum in 813. He succeeded his father in 829, when his brother, Leo, and the emperor Basil I. sharing the service of Thrace, a relative of the Caesar Bardas (uncle of Michael III.), as groome. It seems that while serving in this capacity he visited Patrae with his master, and gained the favour of Daniellis, a very wealthy lady of that place, who received him into her household, and endowed him with a fortune. He earned the notice of Michael III. by winning a victory in a wrestling match, and soon became the emperor’s boon companion and was appointed chamberlain (parakoimomenos). A man of his stamp, advancing unscrupulously on the road of fortune, had no hesitation in divorcing his wife and marrying a mistress of Michael, Eudocia Ingerina, his eunuch master. It was commonly believed that Leo VI., Basil’s successor and reputed son, was really the son of Michael. The next step was to murder the powerful Caesar Bardas, who, as the emperor was devoted to amusement, virtually ruled the empire; this was done with the emperor’s consent by Basil’s own hand (April 866), and a few weeks later Basil was raised to the imperial dignity. Hitherto few perhaps had divined in the unprincipled adventurer, who shared in the debauches of the imperial drunkard, the talents of a born ruler. On the throne he soon displayed the serious side of his nature and his exceptional capacities for administration. In September 867 he caused his worthless benefactor to be assassinated, and reigned alone. He inaugurated a new age in the history of the empire, associated with the dynasty which he founded,—“the Macedonian dynasty” it is usually called; it would be more instructive to call it “Armenian.” It was a period of territorial expansion, during which the empire was the strongest power in Europe. The great legislative work which Basil undertook and his successor completed, and which may be described as a revival of Justinianic law, entitles him to the designation of a second Justinian (the Basileus, a collection of laws in sixty books; and the manuals known as the Precon and Epistolographia of legislation see Basilica and Roman Empire, Later). His financial administration was prudent. His ecclesiastical policy was marked by a wish to keep on good terms with Rome. One of his first acts was to exile the patriarch Photius and restore his rival Ignatius, whose claims were supported by the popes. Yet he had no intention of yielding to Rome’s pretensions beyond a certain point. The decision of the Bulgarian tsar Michael to submit the new Bulgarian Church to the jurisdiction of Constantinople was a great blow to Rome, who had hoped to secure it for herself. In 877 Photius the patriarch again and again was a virtual though not a formal breach with Rome. Thus the independence of the Greek Church may be said to date from the time of Basil. His reign was marked by a troublesome war with the Paulician heretics, an inheritance from his predecessor; the death of their able chief Chrysocoir led to the definite subjection of this little state, of which the chief stronghold was Tephrike on the upper Euphrates, and which the Saracens had helped to bid a long defiance to the government of Constantinople. There was the usual frontier warfare with the Saracens in Asia Minor; Cyprus was lost to them, but only retained for seven years. Syracuse was lost, but Barla was won back, and the part of Calabria which had been occupied by the Saracens. The last successes opened a new period of Byzantine domination in southern Italy. Above all, New Rome was again mistress of the sea, and especially of the gates of the Adriatic. Basil reigned nineteen years as sole sovereign. His death (20th of August 886) was due to a fever contracted in consequence of a serious accident in hunting. A stag dragged him from his horse by fixing its antlers in his belt. He was saved by an attendant who cut him loose with a knife. His last act was to cause his saviour to be beheaded, suspecting him of the intention to kill and not to rescue. Basil is one of the most remarkable examples of a man, without education and exposed to the most demoralizing influences, manifesting extraordinary talents in the government of a great state, when he had climbed to the throne by acts of unscrupulous bloodshed.

Sources.—Vita Basilii, by his grandson Constantine VII. (bk. v. of the Continuation of Theophanes, ed. Bonn); Genesios (ed. Baur, 1888); Histories of Euthymius (ed. Migne, 1868); the memoirs of Boor (Regensburg, 1867).

BASIL II. (c. 958-1025), known as Bulgarkotinos (slayer of Bulgarians), Roman emperor in the East, son of Romanus II. and Theophano, great-great-grandson of Basil I., was born about 958 and crowned on the 22nd of April 966. After their father’s death (963) he and his younger brother Constantine were nominal emperors during the actual reigns of Nicephorus Phocas, their stepfather, and John Tzimisces. On the death of the latter (18th of January 976) they assumed the sovereignty without a colleague, but throughout their joint reign Constantine exercised no power and devoted himself chiefly to pleasure. This was in accordance with the Byzantine principle that in the case of two or more co-regnant basileis only one governed. Basil was a brave soldier and a superb horseman; he was to approve himself a strong ruler and an able general. He did not at first display the full extent of his energy. The administration remained in the hands of the empress Basilieos (an illegitimate son of Romanus I.), president of the senate, a wit and gifted man, who hoped that the young emperors would be his puppets. Basil waited and watched without interfering, and devoted himself to learning the details of administrative business and instructing himself in military science. During this time the throne was seriously endangered by the rebellion of an ambitious general who aspired to play the part of Nicephorus Phocas or Tzimisces. This was Bardas
Sclerus, whom the eunuch deposed from his post of general in the East. He belonged to the powerful landed aristocracy of Asia Minor, whose pretensions were a perpetual menace to the throne. He made himself master of the Asiatic provinces and threatened Constantinople. To oppose him, Bardas Phocas, another general who had revolted in the previous reign and been interned in a monastery, was recalled. Defeated in two battles, he was victorious in a third and the revolt was suppressed (970). Phocas remained general in the East till 987, when he rebelled and was proclaimed emperor by his troops. It seems that the minister Basilios was privy to this act, and the cause was dissatisfaction at the energy which was displayed by the emperor, who showed that he was determined to take the administration into his own hands and to control the army. Phocas retired to the Hellespont and besieged Abydos. Basil obtained timely aid, in the shape of Varangian mercenaries, from his brother-in-law Vladimir, the Russian prince of Kiev, and marched to Abydos. The two armies were facing each other, when Basil galloped forward, seeking a personal combat with the usurper who was riding in front of his lines. Phocas, just as he prepared to face him, fell from his horse and was found to be dead. This ended the rebellion.

The fall of Basilios followed; he was punished with exile and the disavowal of his enormous property. Basil made ruthless war upon the system of immense estates which had grown up in Asia Minor and which his predecessor, Romanus I., had endeavoured to check. (For this evil and the legislation which was aimed at it see Roman Empire, Later.) He sought to protect the lower and middle classes.

Basil gained some successes against the Saracens (995); but his most important work in the East was the annexation of the principalities of Armenia. He created in those highlands a strongly fortified frontier, which, if his successors had been capable, should have proved an effective barrier against the invasions of the Seljuk Turks. The greatest achievement of the reign was the subjugation of Bulgaria. After the death of Tzâmisces (who had reduced only the eastern part of the Bulgarian kingdom), the power of Bulgaria was restored by the Tsar Samuel, in whom Basil found a worthy foe. The emperor's first efforts against him were unsuccessful (981), and the war was not resumed till 996, Samuel in the meantime extending his rule along the Adriatic coast and imposing his lordship on Servia. Eastern Bulgaria was finally recovered in 1000; but the war continued with varying fortunes till 1014, when the Bulgarian army suffered an overwhelming defeat. Basil blinded 13,000 prisoners, leaving a one-eyed man to every hundred to lead them to their tsar, who fainted at the sight and died two days later. The last sparks of resistance were extinguished in 1018, and the great Slavonic realm lay in the dust. The power of Byzantium controlled once more the Illyrian peninsula. Basil died in December 925 in the midst of preparations to send a naval expedition to recover Sicily from the Saracens.

Basil's reign marks the highest point of the power of the Eastern empire since Justinian I. Part of the credit is due to his predecessors Nicephorus and Tzâmisces, but the greater part belongs to him. He dedicated himself unsurprisingly to the laborious duties of ruling, and he had to reckon throughout with the ill-will of a rich and powerful section of his subjects. He was hard and cruel, without any refinement or interest in culture. In a contemporary psalter (preserved in the library of St Mark at Venice) there is a portrait of him, with a grey beard, crowned and robed in imperial costume.

BASIL (Russ. VASILY), the name of four grand-dukes of Moscow and tsars of Muscovy.

BASIL I. DMITREVICH (1371-1422), son of Dmitrii (Demetrius) Donchik, whom he succeeded in 1389, married Sophia, the daughter of Vitovt, grand-duke of Lithuania. In his reign the grand-duchy of Muscovy became practically hereditary, and asserted its supremacy over all the surrounding principalities. Nevertheless Basil received his yarlîk or investiture, from the Golden Horde and was compelled to pay tribute to the grand khan, Tokhtamish. He annexed the principality of Suzdal to Moscow, together with Murom, Kozelsk Peremysl, and other places; reduced the grand-duchy of罗斯托夫 to a state of vassalage; and acquired territory from the republic of Tver and the Tsar of Novgorod to Kirov. In his reign occurred the invasion of Timur (1395), who ruined the Volgan regions, but did not penetrate so far as Moscow. Indeed Timur's raid was of service to the Russian prince as it all but wiped out the Golden Horde, which for the next twelve years was in a state of anarchy. During the whole of this time no tribute was paid to the khan, though vast sums of money were collected in the Moscow treasury for military purposes. In 1406 the Mirza Edigiel ravaged Muscovite territory, but was unable to take Moscow. In 1412, however, a vast army penetrated by the long-deferred visit of submission to the Horde. The most important event of the reign was the elevation of the Bulgarian, Gregory Tzamblik, to the metropolitan see of Kiev (1415) by Vitovt, grand-duke of Lithuania; the immediate political consequence of which was the weakening of the hold of Muscovy on the south-western Russian states. During Basil's reign a terrible visitation of the "Black Death" decimated the population.

See T. Schiemann, Russland bis ins 17. Jahrhundert (Gotha, 1885-1887).

BASIL II., called Talevni ("the Blind") (1415-1462), son of Ivan III., succeeded his father as grand-duke of Moscow in 1425. He was a man of small ability and unusual timidity, though not without tenacity of purpose. Nevertheless, during his reign Moscow steadily increased in power, as if to show that the personality of the grand-dukes had become quite a subordinate factor in its development. In 1430 Basil was seized by his uncle, George of Halicz, and sent a prisoner to Kostroma; but the nation, dissatisfied with George, released Basil and in 1433 he returned in triumph to Moscow. George, however, took the field against him and Basil fled to Novgorod. On the death of George, Basil was in constant variance with his brother-in-law, one of whom, Basil, he had blinded; but in 1445 the grand-duke fell into the hands of blind Basil's brother, Shemjak, and was himself deprived of his sight and banished to Uglich (1445). The clergy and people, however, being devoted to the grand-duke, assisted him not only to recover his throne a second time, but to put Shemjak to flight, and to seize Halicz, his patrimony. During the remainder of Basil II.'s reign he slowly and unobtrusively added district after district to the grand-duchy of Muscovy, so that, in fine, only the republics of Novgorod and Pskov and the principalities of Tver and Vereya remained independent of Moscow. Yet all this time the realm was overrun continually by the Tatars and Lithuanians, and suffered severely from their depredations. Basil's reign saw the foundation of the Solovetsky monastery and the rise of the Khanate of the Crimea. In 1448 the north Russian Church became virtually independent of the patriarchal see of Constantinople by adopting the practice of selecting its metropolitan from among native priests and prelates exclusively. See S. M. Solovye, History of Russia (Russ.), (Peterburg, 1895).

BASIL III., Ivanovitch (1479-1533), tsar of Muscovy, son of Ivan III., and his Palaeologus, succeeded his father in 1492. A crafty prince, with all the tenacity of his race, Basil succeeded in incorporating with Muscovy the last remnants of the ancient independent principalities, by accusing the princes of Ryazan and Syeyerov of conspiracy against him, seizing their persons, and annexing their domains (1517-1523). Seven years earlier (24th of January 1510) the last free republic of old Russia, Pskov, was deprived of its charter and assembly-bell, which were sent from Constantinople.
to Moscow, and tsarist governors were appointed to rule it. Basil also took advantage of the difficult position of Sigismund of Poland to capture Smolensk, the great eastern fortress of Poland (1512), chiefly through the aid of the rebel Lithuanian, Prince Michael Glinky, who provided him with artillery and engineers from western Europe. The loss of Smolensk was the first serious injury inflicted by Muscovy on Poland and only the exigencies of Sigismund compelled him to acquiesce in its surrender (1522). Equally successful, on the whole, was Basil against the Tatars. Although in 1519 he was obliged to buy off the khan of the Crimea, Mahomed Giri, under the very walls of Moscow, towards the end of his reign he established the Russian frontier at Mogila, and his son Ivan the Terrible was to extend it as far as the Volga.

Basil was the first grand-ducj of Moscow who adopted the title of tsar and the double-headed eagle of the East Roman empire. By his second wife, Helena Glinka, whom he married in 1526, Basil had a son Ivan, who succeeded him as Ivan IV.

See Sigismund Herberstain, Rerum Moscovitcarum Commentarii (Vienna, 1549); P. A. Byelor, Russian History Previous to the Reforms of Peter the Great (Russ.), (Petersburg, 1895); E. I. Kasha-provsky, The War of Basil III. with Sigismund I. (Russ.), (Nyezhin, 1899).

BASIL IV., SHUISKY (d. 1612), tsar of Muscovy, was during the reigns of Theodore I. and Boris Godunov, one of the leading boyars of Muscovy.

It was he, who, in obedience to the secret orders of Tsar Boris, went to Uglich to inquire into the cause of the death of Demetrius, the infant son of Ivan the Terrible, who had been murdered there by the agents of Boris. Shuisky obsequiously reported that it was a case of suicide; yet, on the death of Boris and the accession of his son Theodore II., the false boyar, in order to gain favour with the first false Demetrius, went back upon his own words and recognized the pretender as the real Demetrius, thus bringing about the assassination of the young prince and reviving the hatred of the people against Shuisky. He fled to Moscow, and Demetrius and procured his death (May 1600) also by publicly confessing that the real Demetrius had been indeed slain and that the reigning tsar was an impostor. This was the viler in him as the pseudo-Demetrius had already forgiven him one conspiracy. Shuisky's adherents thereupon proclaimed him tsar (10th of May 1600). He reigned till the 19th of July 1610, but was never generally recognized. Even in Moscow itself he had little or no authority, and was only not deposed by the dominant boyars because they had none to put in his place. Only the popularity of his heroic cousin, Prince Michael Skopin-Shuisky, who led his people to victory over the Tzb, temporarily atoned for the crime. Shuisky thereupon fled to Sweden, whose assistance he purchased by a disgraceful cession of Russian territory, kept him for a time on his unstable throne.

In 1610 he was deposed, made a monk, and finally carried off as a trophy by the Polish grand hetman, Stanislas Zolkiewski. He died at Warsaw in 1612.

BASILIAN MONKS, those who followed the rule of Basil the Great.

The chief importance of the monastic rule and institute of St Basil lies in the fact that to this day his reconstruction of the monastic life is the basis of the monasticism of the Greek and Slavonic Churches, though the monks do not call themselves Basilians. St Basil's claim to the authorship of the Rules and other ascetical writings that go under his name, has been questioned; but the tendency now is to recognize as his at any rate the two sets of Rules. Probably the truest idea of his monastic system may be derived from a correspondence between him and St Gregory Nazianzen at the beginning of his monastic life, the chief portions whereof are translated by Newman in the Church of the Fathers, "Basil and Gregory," §§4, 5. On leaving Athens Basil visited the monasteries of Egypt and Palestine; in the latter country and in Syria the monastic life tended to become more and more eremitical and to run to great extravagances in the matter of bodily austerities (see MONASTICISM). When (c. 360) Basil formed his monastery in the neighbourhood of Neoesarea in Pontus, he deliberately set himself against these tendencies. He declared that the cenobitical life is superior to the eremitical; that fasting and austerities should not interfere with prayer or work; that work should form an integral part of the monastic life, not merely as an occupation, but for its own sake and in order to do good to others; and therefore that monasteries should be near towns. All this was a new departure in monachism. The life St Basil established was strictly cenobitical, with common prayer seven times a day, common work, common meals. It was, in spite of the new ideas, an austere life, of the kind called contemplative, given up to prayer, the reading of the Scriptures and heavy field-work. The so-called Rules (the London Rules of the Shorter, or cathecisms of the spiritual life rather than a body of regulations for the corporate working of a community, such as is now understood by a monastic rule. Apparently no vows were taken, but obedience, personal poverty, chastity, self-denial, and the other monastic virtues were strongly enforced, and a monk was not free to abandon the monastic life. A novitiate had to be passed, and young boys were to be educated in the monastery, but were not expected to become monks.

St Basil's influence, and the greater suitability of his institute to European ideas, ensured the propagation of Basilian monachism. Sozomen says that in Cappadocia and the neighbouring provinces, especially in Thrace, there were no bishops or monasteries. However, the eastern hankering after the eremitical life long survived, and it was only by dint of legislation, both ecclesiastical (council of Chalcedon) and civil (Justinian Code), that the Basilian cenobitic form of monasticism came to prevail throughout the Greek-speaking lands, though the eremitical forms have always maintained themselves.

Greek monachism underwent no development or change for four centuries, except the vicissitudes inevitable in all things human, which in monachism assume the form of alternations of relaxation and revival. The second half of the 5th century seems to have been a time of very general decadence; but about the year 800 Theodore, destined to be the only other creative name in Greek monachism, became abbot of the monastery of the Studium in Constantinople. He set himself to reform his monastery and restore St Basil's spirit in its primitive vigour. But to effect this, and to give permanence to the reformation, he saw that there was need of a more practical code of laws to regulate the details of the daily life, as a supplement to St Basil's Rules. He therefore drew up constitutions, afterwards codified (see Migne, Patro. Graec., xc., 1754-1757), which became the norm of the life at the Studium in Constantinople, and gradually tended thence to the rest of the Greek empire. Thus to this day the Rules of Basil and the Constitutions of Theodore the Studite, along with the canons of the Councils, constitute the chief part of Greek and Roman monastic law.

The spirit of Greek monachism, as regenerated by Theodore, may best be gathered from his Letters, Discourses and Testaments. Under the abbot were several officials to superintend the various departments; the liturgical services in the church took up a considerable portion of the day, but Theodore seems to have made no attempt to revive the early practice of the Studium in this matter (see ACOEMET); the rest of the time was divided between reading and work; the latter included the chief handicrafts for the monks, only ten in number, when Theodore became abbot, increased under his rule to over a thousand. One kind of work practised with great zeal and success by the Studite monks, was the copying of manuscripts, so that to them and to the schools that went forth from them we owe a great number of existing Greek MSS. and the preservation of many works of classical and ecclesiastical antiquity. In addition to this, literary and theological studies were pursued, and the mysticism of pseudo-Dionysius was cultivated. The life, though simple and self-denying and hard, was not of extreme austerity. There was a division of the monks into two classes, similar to the division in vogue in later time in the West into choir-mons and lay-brothers. The life of the choir-mons was predominantly contemplative,

1 Specimen passages, and also a general picture of the life, will be found in Miss Alice Gardner's The Theodore of Studium, ch. v.
being taken up with the church services and private prayer and study; the lay-brothers carried on the various trades and external works. There is little or no evidence of works of charity outside the monastery being undertaken by Studite monks. Strict personal poverty was enforced, and all were encouraged to approach confession and communion frequently. Vows had been imposed on monks by the council of Chalcedon (451). The picture of Studite life is the picture of normal Greek and Slavonic monachism to the early day.

During the middle ages the centre of Greek monachism shifted from Constantinople to Mount Athos. The first monastery to be founded here was that of St Athanasius (c. 900), and in the course of the next three or four centuries monasteries in great numbers—Greek, Slavonic and one Latin—were established on Mount Athos, some twenty of which still survive. Basilian monachism spread from Greece to Italy and Russia. Rufinus had translated St Basil's Rules into Latin (c. 400) and they became the rule of life in certain Italian monasteries. They were known to St Benedict, who refers his monks to "the Rule of our holy Father Basil."—indeed St Benedict owed more of the ground-ideas of his Rule to St Basil than to any other monastic legislator. In the 6th and 7th centuries there appear to have been Greek monasteries in Rome and south Italy and especially in Sicily. But during the course of the 8th, 9th and 10th centuries crowds of fugitives poured into southern Italy from Greece and Sicily, under stress of the Saracenic, Arab and other invasions; and from the middle of the 9th century Slavonic perpendiculars of Greek-styled monasteries, were established in great numbers in Calabria and spread northwards as far as Rome. Some of them existed on into the 12th century, and the only survivor now is the monastery founded by St Nifius (c. 1000) at Grottaferrata in the Alban Hills. Professor Kirssopp Lake has (1903) written four valuable articles (Journal of Theological Studies, iv., v.) on "The Greek monasteries of South Italy"; he deals in detail with their scriptoria and the dispersal of their libraries, a matter of much interest, in that some of the chief collections of Greek MSS. in western Europe—as the Bessarion at Venice and a great number at the Vatican—come from the spoils of these Italian basilicas.

Of much greater importance was the importation of Basilian monachism into Russia, for it thereby became the norm of monachism for all the Slavonic lands. Greek monks played a considerable part in the evangelization of the Slavs, and the first Russian monastery was founded at Kiev (c. 910) by a monk from Mount Athos. The monastic institute had a great development in Russia, and at the present day there are in the Russian empire some 400 monasteries of men and 100 of women, many of which supported hospitals, almshouses and schools. In the other Slavonic principalities of the Slavonic-speaking peoples, monasteries were established in great numbers in Calabria and spread northwards as far as Rome. Some of them existed on into the 15th century, and the only survivor now is the monastery founded by St Nifius (c. 1000) at Grottaferrata in the Alban Hills. Professor Kirssopp Lake has (1903) written four valuable articles (Journal of Theological Studies, iv., v.) on "The Greek monasteries of South Italy"; he deals in detail with their scriptoria and the dispersal of their libraries, a matter of much interest, in that some of the chief collections of Greek MSS. in western Europe—as the Bessarion at Venice and a great number at the Vatican—come from the spoils of these Italian basilicas.

The question whether this word conveyed to the ancients any special architectural significance is a difficult one, and some writers hold that the name betokened only the site of the building, others that it suggested also a certain form. Our knowledge of the subject—excepting the North Italian a basilica—has been derived primarily from Vitruvius, and we learn about it also from existing remains and from incidental notices in classical writers and in inscriptions. If we review all the evidence we are led to the conclusion that there did exist a normal form of the building, though many examples deviated therefrom. This normal form we shall understand if we consider the essential character of the building in the light of what Vitruvius tells us of it.

Vitruvius treats the basilica in close connexion with the forum, to which in his view it is an adjunct. In the earlier classical times, both in Greece and Italy, business of every kind, political, commercial and legal, was transacted in the open forum, and there also were presented shows and pageants. When business increased and the numbers of the population were multiplied, it was found convenient to provide additional accommodation for these purposes. Theatres and amphitheatres took the performances and games. Markets provided for those that bought and sold, while for business of more important kinds accommodation could be secured by laying out new agorae or fora in the immediate vicinity of the old. At Rome this was done by means of the so-called imperial fora. The latest and most splendid of these fora corresponded to the later Greek or Hellenistic agora, which, as Vitruvius tells us, was of regular form and surrounded by colonnades in two stories, and they had the practical use of relieving the pressure on the
The basilica was a structure intended for the same purposes. It was to all intents and purposes a covered forum, and in its normal form was constituted by an arrangement of colonnades in two stories round a rectangular space, that was not, like the Greek agora, open, but covered with a roof. Vitruvius writes of it as frequented by merchants, who would find in it shelter and quiet for the transaction of their business. Legal tribunals were also set up in it, though it is a mistake to suppose the basilica a mere law court. The magistrates who presided over these tribunals had sometimes platforms, curved or rectangular in plan, provided as part of the permanent fittings of the edifice.

According to Vitruvius (v. 1. 4, cf. also vi. 3. 9) the building is to be in plan a rectangle, not more than three times nor less than twice as long as it is broad. If the site oblige the length to be greater, the surplus is to be cut off to form what he calls *calcidica*, by which must be meant open vestibules. The interior is divided into a central space and side aisles one-third the width of this. The ground plan of the basilica at Pompeii (fig. 1) illustrates this description, though the superstructure did not correspond to the Vitruvian scheme. The columns between nave and aisles, Vitruvius proceeds, are the same height as the width of the latter, and the aisle is covered with a flat roof forming a terrace (*contignatio*) on which people can walk. Surrounding this on the inner side is a breastwork or parapet (*pluteum*), which would conceal these promenaders from the view of the merchants in the basilica below. On the top of this parapet stood the upper row of columns, three-quarters as high as the lower ones. The spaces between these columns, above the

**Fig. 1.—Basilica at Pompeii. 1, Portico (Chalcidicium); 2, hall of basilica; 3, aisles; 4, altar; 5, tribunal; 6, offices.**

The word "basilica" is a Latinized form of the Greek adjective βασιλική, "royal," and some feminine substantive, such as *domus* or *stauro* must be understood with it. A certain building at Athens, wherein the βασιλικεία was transacted business and the court of the Areopagus sometimes assembled, was called βασιλική σταυρός, and it is an accredited theory, though it is by no means proved, that we have here the origin of the later basilica. It is difficult to see why this was called "royal" except for some special but accidental reason such as can in this case be divined. There are other instances in which a term that becomes specific has been derived from some one specimen accidentally named. "Labyrinth" is one case in point, and "basilica" may be another. It is time that we do not know what was the shape of the King Archon's portico, but the same name (βασιλική σταυρός) was given to the grand structure erected by Herod the Great along the southern edge of the Temple platform at Jerusalem, and this corresponded to the Vitruvian scheme of a columned fabric, with nave and aisles and clerestory lighting.

Whether the Roman basilicas, with which we are chiefly concerned, were derived directly from the Athenian example, or mediately from this through structures of the same kind erected in the later Greek cities, is hard to say. We should naturally look in that direction for the prototypes of the Roman basilicas, but as a fact we are not informed of any very early basilicas in these cities. The earliest we know of is the existing basilica at Pompeii, that may date back into the 2nd century B.C., whereas basilicas made their appearance at Rome nearly at the beginning of that century. The first was erected by M. Porcius Cato, the censor, in 184 B.C., and was called after his name Basilica Porcia. Cato had recently visited Athens and had been struck by the beauty of the city, so that it is quite possible that the importation was direct.

Rome soon obtained other basilicas, of which the important Basilica Fulvia-Aemilia came next in point of time, till by the age of Augustus there were at least five in the immediate neighbourhood of the forum, the latest and most extensive being the Basilica Julia, which ran parallel to its southern side, and is shown in plan in fig. 2. The great Basilica Ulpia was built by Trajan in connexion with his forum about A.D. 112, and a fragment of the Capitoline plan of Rome gives the scheme of it (fig. 3), while an attempted restoration of the interior by Canina is shown in fig. 4. The vaulted basilica of Maximus or Constantine on the Via Sacra dates from the beginning of the 4th century, and fig. 5 gives the section of it. The number of public basilicas we read of at Rome alone amounts to about a score, while many private basilicas, for business or recreation, must also have existed, that in the palace of Domitian on the Palatine being the best known. In provincial cities in Italy, and indeed all over the empire, basilicas were almost universal, and in the case of Italy we have proof of this as early as the date of the death of Augustus, for Suetonius (Aug. 100) tells us that the body of that emperor, when it was brought from Nola in Campania to Rome, rested "in basilica cujusque oppidis."

As regards existing examples, neither in the peninsula nor the provinces can it be said that these give any adequate idea of

**Fig. 2.—Plan of Basilica Julia, Rome. (From Baedeker's Central Italy, by permission of Karl Baedeker.)**

**Fig. 3.—Plan of Basilica Ulpia, from Capitoline plan of Rome.**

the former abundance and wide distribution of basilicas. Northern Africa contributes one or two examples, and a plan is given of that at Timgad (fig. 6). The Gallic basilicas, which must have been very numerous, are represented only by the noble structure at Trier (Trèves), which is now a single vast hall 180 ft. long, 90 ft. wide and 100 ft. high, commanded at one end by a spacious apse. There is reason to conjecture that this is the basilica erected by Constantine, and some authorities believe that originally it had internal colonnades. In England basilicas remain in part at Silchester (fig. 7), Uriconium (Wroxeter),
Chester (?) and Lincoln, while three others are mentioned in inscriptions (C.I.L. vii. 287, 445, 965).

A comparison of the plans of existing basilicas shows considerable variety in form. Some basilicas (Julia, Ulpia, Pompeii) have the central space surrounded by galleries supported on columns or piers, according to the normal scheme, and the newly excavated Basilia Aemilia, north of the Roman forum, agrees with these. In some North African examples, in the palace basilica of Domitian, and at Silchester, there are colonnades down the long sides but not across the ends. Others (Trier (?), Timagd) have no interior divisions. One (Maxentius) is entirely a vaulted structure and in form resembles the great halls of the Roman Thermae. At Pompeii, Timagd and Silchester, there are fixed tribunals, while vaulted apses that may have contained tribunals occur in the basilica of Maxentius. In the Basilica Julia there was no tribunal at all, though we know that the building was regularly used for the centumviral court (Quint. xii. 5. 6), and the same was the case in the Ulpia, for the semicircular projection at the end shown on the Capitolina-plan, was not a vaulted apse and was evidently distinct from the basilica.

In view of the above it might be questioned whether it is safe to speak of a normal form of the basilica, but when we consider the vast number of basilicas that have perished compared to the few that have survived, and the fact that the origins and traditions of the building show it to have been, as Vitruvius describes it, essentially a colonnated structure, there is ample justification for the view expressed earlier in this article. There can be little doubt that the earlier basilicas, and the majority of basilicas taken as a whole, had a central space with galleries, generally in two stories, round it, and some arrangement for clerestory lighting. Later basilicas might vary in architectural scheme, while affording the same sort of accommodation as the older ones.

The relation of the civil basilica of the Romans to the Christian church has been extensively discussed, and the reader will find the controversy ably summarized in Kraus' Geschicte der christlichen Kunst, bk. 5. There is nothing remarkable in the fact that a large church was called a basilica, for the term was applied, as we have seen, to structures of many kinds, and we even find 'basilica' used for the meeting-place of a pagan religious association (Rom. Mitt. 1891, p. 109). The similarity in some respects of the early Christian churches to the normal form of the columned basilica is so striking, that we can understand how the theory was once held that Christian churches were the actual civil basilicas turned over from secular to religious uses. There is no evidence for this in the case of public basilicas, and it stands to reason that the demands on these for secular purposes would remain the same whether Christianity were the religion of the empire or not. Moreover, though there are one or two civil basilicas that resemble churches, the latter differ in some most important respects from the form of the basilica that we have recognized as normal. The early Christian basilicas, at any rate in the west, had very seldom, if ever, galleries over the side aisles, and their interior is always dominated by the semidome of an apse that terminates the central nave, whereas, with the doubtful exception of Silchester (Archaeologia, lili. 499), there is no instance known of a vaulted apse in a columned civil basilica of the normal kind.

When buildings were first expressly erected for Christian worship, in the 3rd or perhaps already in the 2nd century a.d. (Leclercq, Manuel, ch. iii. "Les edifices chretiens avant la paix de l'eacute;glise"), they probably took the form of an oblong interior

terminated by an apse. After the time of Constantine, when the numbers of the faithful were enormously increased, side aisles were added, and in this way the structure came to assume an appearance similar to that of the civil basilica. A striking confirmation of this view has recently come to light at S. Saba on the Aventine at Rome, where a small and very early church, without aisles, has been discovered beneath the floor of the present basilica. 

There are, on the other hand, instances in which private basilicas in palaces and mansions were handed over to the Christians for sacred uses. We know that to have been the case with the basilicas of S. Croce in Gerusalemme and S. Maria Maggiore at Rome, which originated in the halls of the Sessorian and Liberian palaces respectively, granted by Constantine to the Christians. We may adduce also as a subject of the same practice a passage in bk. x. ch. 77 of the theological romance known as The Recognitions of Clement, probably dating from the early half of the 3rd century, in which we are told that Theophilus of Antioch, on his conversion by St Peter, made over "the basilica of his house" for a church. But however this may have been, with, perhaps, the single exception of S. Croce, the existing Christian basilicas were erected from the ground for their sacred purpose. At Rome the columns, friezes and other materials of the desecrated temples and public buildings furnished abundant materials for their construction. The decadence of art is plainly shown by the absence of rudimentary architectural knowledge in these reconstructions. Not only are columns of various heights and diameters made to do duty in the same colonnade, but even different orders stand side by side (e.g. Ionic, Corinthian and Composite at S. Maria in Trastevere); while pilasters assume a horizontal position and serve as entablatures, as at S. Lorenzo fuori le Mura. There being no such quarry of ready-worked materials at Ravenna, the noble basilicas of that city are free from these defects, and exhibit greater unity of design and harmony of proportions.

An early Christian basilica may be thus described in its main features:—A porch supported on pillars (as at S. Clemente) gave admission into an open court or atrium, surrounded by a colonnaded cloister (S. Clemente, Old St Peter's, S. Ambrogio at Milan, Parenzo). In the centre of the court stood a cistern or fountain (cantharos, phiale), for drinking and ablutions. In close contiguity to the atrium, often to the west, was the baptistery, usually octagonal (Parenzo). The church was entered through a long narrow porch (narthex), beyond which penitents, or those under ecclesiastical censure, were forbidden to pass. Three or more lofty doorways, according to the number of the aisles, set in marble cases, gave admission to the church. The doors themselves were of rich wood, elaborately carved with scriptural subjects (S. Sabina on the Aventino), or of bronze similarly adorned and often gilt. Magnificent curtains, frequently embroidered with sacred figures or scenes, closed the entrance, keeping out the heat of summer and the cold of winter.

The interior consisted of a long and wide nave, sometimes as much as 80 ft. across, terminating in a semicircular apse, with one or sometimes (St Paul's, Old St Peter's, St John Lateran) two aisles on each side, separated by colonnades of marble pillars supporting horizontal entablatures (Old St Peter's, S. Maria Maggiore, S. Lorenzo) or arches (St Paul's, S. Agnese, S. Clemente, the two basilicas of S. Apollinare at Ravenna). Above the pillars the clerestory wall rose to a great height, pierced in its upper part by a range of plain round-headed windows. The space between the windows and the colonnade (the later triforium-space) was usually decorated with a series of mosaic pictures in panels. The colonnades sometimes extended quite to the end of the church (the Ravenna basilicas), sometimes ceased some little distance from the end, thus admitting the formation of a transverse aisle or transept (St Paul's, Old St Peter's, St John Lateran). Where this transept occurred it was divided from the nave by a wide arch, the face and soft of which were richly decorated with mosaics. Over the crown of the arch we often find a bust of Christ or the holy lamb lying upon the altar, and, on either side, the evangelistic symbols, the seven candlesticks and the twenty-four elders. Another arch spanned the semicircular apse, in which the church always terminated. From Carlington times this was designated the arch of triumph, because a cross was suspended from it.

The coenaculum-lacuna which covered the apse was always covered with mosaic pictures, usually paintings of our Lord, either seated or standing, with St Peter and St Paul, and other apostles and saints, on either hand. The beams of the roof were sometimes concealed by a flat ceiling, richly carved and gilded. The altar, standing in the centre of the chord of the apse on a raised platform reached by flights of steps, was rendered conspicuous by a lofty canopy supported by marble pillars (ciborium, baldacchino), from which depended curtains of the richest materials. Beneath the altar was the confessio, a subterranean chapel, containing the body of the patron saint, and relics of other holy persons. This was approached by descending flights of steps from the nave or aisles. The confessio in some cases reproduced the original place of interment of the patron saint, either in a catacomb-chapel or in an ordinary grave, and thus formed the sacred nucleus round which the church arose. We have good examples of this arrangement at St Peter's and St Paul's at Rome, and S. Apollinare in Classe, Ravenna. It was copied in the original cathedral of Canterbury. The bishop or officiating presbyter advanced from his seat in the centre of the semicircle of the apse to the altar, and celebrated the Eucharist with his face to the congregation below. At the foot of the altar steps a raised platform, occupying the upper portion of the nave, formed a choir for the singers, readers and other inferior clergy. This oblong space was separated from the aisles and from the western portion of the nave by low marble walls or railings (cancelli). From these walls projected ambones or pulpits with desks, also of marble, ascended by steps.

The exterior of the basilicas was usually of an extreme plainness. The vast brick walls were unrelieved by ornament, save occasionally by arcading as at S. Apollinare in Classe, Ravenna, and had no compensating grace of outline or beauty of proportion. An exception was made for the entrance-front, which was sometimes covered with plates of marble mosaics or painted stucco (Old St Peter's, S. Lorenzo). But in spite of any decorations the external effect of a basilica must always have been heavy and unattractive. S. Apollinare in Classe at Ravenna (fig. 8) affords a typical
Example. The campanile is a later addition. Within, apart from the beautiful mosaic decoration, a fine effect was produced by the arch of triumph and the apse, which terminated the nave and dominated the whole vast space of the interior.

To pass from general description to individual churches, the first place must be given, as the earliest and grandest examples of the type, to the world-famous Roman basilicas; those of St Peter, St Paul and St John Lateran, "omnia urbis et orbis ecclesiæ præstent ædificiæ quæ Stæ Peteræ, Stæ Paulæ, et Stæ Johnis Lateranæ. It is true that no one of these exists in its original form, Old St Peter's having been entirely removed in the 16th century to make room for its magnificent successor; and both St Paul's and St John Lateran having been greatly injured by fire, and the last named being so completely modernized as to have lost all interest. Of the two former, however, we possess drawings and plans and minute descriptions, which give an accurate conception of the original buildings. To commence with St Peter's, from the illustrations annexed (figs. 9, 10, 11) it will be seen that the church was entered through a vast colonnaded atrium, 212 ft. by 235 ft., with a fountain in the centre, the atrium being preceded by a porch mounted by a noble flight of steps. The church was 212 ft. wide by 380 ft. long; the nave, 80 ft. in width, was six steps lower than the side aisles, of which there were two on each side. The four dividing colonnades were each of twenty Corinthian columns. Those next the nave supported horizontal entablatures. The inner colonnades bore arches, with a second clerestory. The main clerestory walls were divided into two rows of square panels containing mosaics, and had windows above. The transept projected beyond the body of the church,—a very unusual arrangement. The apse, of remarkably small dimensions, was screened off by a double row of twelve wreathed columns of Parian marble. The pontifical chair was placed in the centre of the curve of the apse, on a platform raised several steps above the presbytery. To the right and left the seats of the cardinals followed the line of the apse. At the

![Fig. 13.—Section of the Basilica of St Paul, Rome.](image)

centres of the chord stood the high altar beneath a ciborium, resting on four pillars of porphyry. Beneath the altar was the subterranean chapel, the centre of the devotion of so large a portion of the Christian world, believed to contain the remains of St Peter; a vaulted crypt ran round the foundation wall of the apse in which many of the popes were buried. The roof showed its naked beams and rafters.

The basilica of St Paul without the walls, dedicated 324 A.D., rebuilt 388-423, remained in a sadly neglected state, but substantially unaltered, till the disastrous fire of 1823, which reduced the nave to a calcined ruin. Its plan and dimensions (figs. 12, 13) were almost identical with those of St Peter's.

The only parts of the modernized five-aisled basilica of St John Lateran (of which we have a plan in its original state, Agincourt, pl. lxxiii. No. 22) which retain any interest, are the double-vaulted aisle which runs round the apse, a most unusual arrangement, and the baptistry. The latter is an octagonal building standing some little distance from the basilica to the south. Its roof is supported by a double range of columns, one above the other, encircling the baptismal basin sunk below the floor.

Of the three-aisled basilicas the best example is the Liberian or S. Maria Maggiore dedicated 355, and reconstructed 432 A.D. Its internal length to the chord of the apse is 290 ft. by 100 ft. in breadth. The Ionic pillars of grey granite, uniform in style, twenty on each side, form a colonnade of great dignity and beauty, unfortunately broken towards the east by intrusive arches opening into chapels. The clerestory, though modern, is excellent in style and arrangement. Corinthian pilasters divide the windows, beneath which are very remarkable mosaic pictures of subjects from Old Testament history, generally supposed to
BASILICA

475

date from the pontificate of Sixtus III., 432-440. The face of
the arch of triumph presents also a series of mosaics illustrative
of the infancy of our Lord, of great value in the history of art.
The apse is of later date, reconstructed by Paschal I. in 818.
Of the remaining Roman basilicas that of S. Sabina on the
Aventine is of special interest as its interior, dating from about
A.D. 430, has preserved more of the primitive aspect than any
other. Its carved wooden doors of early Christian date are of
unique value, and in the spandrels of its inner arcades, upheld
by splendid antique Corinthian columns, are some good specimens
of opus sectile or mosaic of cut marble. The ancient roof is an
open one. The basilicas of S. Lorenzo fuori le Mura and S.
Agneze deserve particular notice, as exhibiting galleries corres-
ponding to those of the civil basilicas and to the later triclinium,
carried above the aisles and returned across the entrance end.
It is doubtful, however, whether these galleries are part of the
original schemes. The architectural history of S. Lorenzo's is
curious. When originally constructed in A.D. 429, it consisted
of a short nave of six bays, with an internal narthex the whole
height of the building. In the 13th century Honorius III.
dis-orientated the church by pulling down the apse and erecting
a nave of twelve bays on its site and beyond it, thus converting
the original nave into a square-ended choir, the level being much
raised, and the magnificent Corinthian columns half buried. As
a consequence of the church being thus shifted completely round,
the face of the arch of triumph, turned away from the present
entrance, but towards the original one, is invested with the usual
mosaics (Agincourt, pl. xxviii. Nos. 29, 30, 31). The basilica of
S. Agneze, of which we give a section (fig. 14), is a small but
Paschal candlestick, with a spiral shaft, decorated with mosaic.
Opposite, to the south, is the epistle-ambo, square in plan, with
two marble reading-desks facing east and west, for the reading
of the epistle and the gradual respectively. The sanctuary is
raised two steps above the choir, from which it is divided by
another portion of the same marble screen. The altar stands
beneath a lofty ciborium, supported by marble columns, with a

![Fig. 14.—Section of Basilica of S. Agneze at Rome.](image1)

interior, much like what S. Lorenzo must have been
before it was altered.

Though inferior in size, and later in date than most of the
basilicas already mentioned, that of S. Clemente is not surpassed
in interest by any one of them. This is due to its having retained
its original ritual arrangements and church-fittings more per-
fectly than any other. These fittings have been removed from
the earlier church, lying below the existing building, which at
some unknown date and for some unrecorded reason was
abandoned and filled up with earth, while a new building was
erected upon it as a foundation. The most probable account is
that the earlier church was so completely overwhelmed in the
ruin of the city in 1084, when Robert Guiscard burnt all the
public buildings from the Lateran to the Capitol, that it was
found simpler and more convenient to build a new edifice at a
higher level than to repair the old one. The annexed plan
(fig. 15) and view (fig. 16) show the peculiarities of the existing
building. The church is preceded by an atrium, the only perfect
example remaining in Rome, in the centre of which is the can-
thurus or fountain for ablutions. The atrium is entered by a
portico made up of earlier fragments very carelessly put together.
The chorum cantorum, which occupies about one-third of the nave,
is enclosed by a low marble screen, about 3 ft. high, a work of
the 9th century, preserved from the old church but newly
arranged. The white marble slabs are covered with patterns
in low relief, and are decorated with ribbons of glass mosaic of
the 13th century. These screen-walls stand quite free of the
pillars, leaving a passage between. On the ritual north stands
the gospel-ambo, of octagonal form, with a double flight of steps
westwards and eastwards. To the west of it stands the great

canopy on smaller shafts above. It retains the rods and rings
for the curtains to run on. Behind the altar, in the centre of the
curved line of the apse, is a marble episcopal throne, bearing
the monogram of Anastasius who was titular cardinal of this
church in 1108. The conch of the apse is inlaid with mosaics of
quite the end of the 13th century. The subterranean church,
disinterred by the zeal of Father Mullooly, the prior of the
adjacent Irish Dominican convent, is supported by columns of
very rich marble of various kinds. The aisle walls, as well as
those of the narthex, are covered with fresco-paintings of various
dates from the 7th to the 11th century, in a marvellous state of
preservation. (See St Clement, Pope and Martyr, and his Basilica
in Rome, by Joseph Mullooly, O.P., Rome, 1873.)

The fullest lists of early Christian basilicas outside Rome are
given in Kraus's Realeencyklopädie der christlichen Alterthümer,
Freiburg i. B., 1882, art. "Basilica," and more recently in
App. 1, "Essai de Classement des Principaux Monuments." Only
a few characteristic specimens in different regions can here
be noticed. In Italy, apart from Rome, the most remarkable
basilican churches are the two dedicated to S. Apollinare at
Ravenna. They are of smaller dimensions than those of Rome,
but the design and proportions are better. The cathedral of
this city, a noble basilica with double aisles, erected by Arch-
bishop Ursus, A.D. 400 (Agincourt, pl. xxiii. No. 21), was un-
fortunately destroyed on the erection of the present tasteless
building. Of the two basilicas of S. Apollinare, the earlier,
S. Apollinare Nuovo, originally an Arian church erected by
Theodoric, 493-525, measuring 315 ft. in length by 115 ft. in
breadth, has a nave 51 ft. wide, separated from the single aisles
by colonnades of twenty-two pillars, supporting arches, a small

![Fig. 16.—Interior of S. Clemente in Rome.](image3)

prismatic block bearing a sculptured cross intervening with
very happy effect between the capital and the arch. Below the
windows a continuous band of saintly figures, male on one side
and female on the other, advancing in stately procession towards
Our Lord and the Virgin Mother respectively, affords one of the
most beautiful examples of mosaic ornamentation to be found.
in any church (fig. 17). The design of the somewhat later and smaller church of S. Apollinare in Classe, A.D. 538-540, measuring 216 ft. by 104 ft., is so similar that they must have proceeded from the same architect (Agincourt, pl. lxxii. No. 35).

The cathedral on the island of Torcello near Venice, originally built in the 7th century, but largely repaired c. A.D. 1000, deserves special attention from the fact that it preserves, in a more perfect state than can be seen elsewhere, the arrangements of the seats in the apse (fig. 18). The bishop’s throne occupies the centre of the arc, approached by a steep flight of steps. Six rows of stone benches for the presbyters, rising one above another like the seats in a theatre, follow the curve on either side—the whole being singularly plain and almost rude. The altar stands on a platform; the sanctuary is divided from the nave by a screen of six pillars. The walls of the apse are inlaid with plates of marble. The church is 125 ft. by 75 ft. The narrow aisles are only 7 ft. in width.

Another very remarkable basilica, less known than it deserves to be, is that of Parenzo in Istria, c. A.D. 542. Few basilicas have sustained so little alteration. From the annexed ground-plan (fig. 19) it will be seen that it retains its atrium and a baptistery, square without, octagonal within, to the west of it. Nine pillars divide each aisle from the nave, some of them borrowed from earlier buildings. The capitals are Byzantine. The choir occupies the three easternmost bays. The apse, as at Torcello, retains the bishop’s throne and the bench for the presbyters apparently unaltered. The mosaics are singularly gorgeous, and the apse walls, as at Torcello, are inlaid with rich marble and mother-of-pearl. The dimensions are small—121 ft. by 32 ft. (See Künstlerdenkmale des österreichischen Kaiserreichs, by Dr G. Heider and others.)

In the Eastern church, though the erection of St Sophia at Constantinople introduced a new type which almost entirely superseded the old one, the basilican form, or as it was then termed dromical, from its shape being that of a race-course (dromos), was originally as much the rule as in the West. The earliest church of which we have any clear account, that of Basilica and had an atrium in front. That erected by Constantine at Jerusalem, on the side of the Holy Sepulchre, 335, followed the same plan (Euseb., Vit. Const. iii. c. 29), as did the original churches of St Sophia and of the Apostles at Constantinople. Both these buildings have entirely passed away, but we have an excellent example of an oriental basilica of the same date still standing in the church of the Nativity at Bethlehem, rebuilt by Justinian in the 6th century (fig. 20). Here we find an oblong atrium, a vestibule or narthex, double aisles with Corinthian columns, and a transept, each end of which terminates in an apse, in addition to that in the usual position. Beneath the centre of the transept is the subterranean church of the Nativity (Vogué, Les Églises de la Terre Sainte, p. 46).

Constantinople preserved till recently a basilican church of the 5th century, that of St John Studios, 463, now a ruin. It had a nave and side aisles divided by columns supporting a horizontal entablature, with another order supporting arches forming a gallery above. There was the usual apsidal termination. The chief difference between the Eastern and Roman basilicas is in the galleries. This feature is very rare in the West, and only occurs in some few examples, the antiquity of which is questioned at Rome but never at Ravenna. It is, on the other hand, a characteristic feature of Eastern churches, the galleries being intended for women, for whom privacy was more studied than in the West (Salzenberg, Altchrist. Baudenkmale von Constantinople).

Other basilican churches in the East which deserve notice are those of the monastery of St Catherine on Mt. Sinai built by Justinian, that of Diana between Antioch and Bir of the same date, St Philip at Athens, Bosra in Arabia, Xanthis in Lycia, and the very noble church of St Demetrius at Thessalonica. Views and descriptions of most of these may be found in Texier and Pullan’s Byzantine Architecture, Couchaud’s Choix d’églises byzantins, and the works of the count de Vogué. In the Roman province of North Africa there are abundant remains of early Christian churches, and S. Gsell, Les Monuments antiques de l’Algérie, has noticed more than 130 examples. Basilicas of strictly early Christian date are not now to be met with in France, Spain or Germany, but the interesting though very plain “Basse Œuvre” at Beauvais may date from Carolingian times, while Germany can show at Michelstadt in the Odenwald an unaltered basilica of the time of Charles the Great. The five-columned basilica of St Mauritius, near Hildesheim, dates from the 11th century, and the basilican form has been revived in the noble modern basilica at Munich.

England can show more early of the Nativity, Bethle-

Christian survivals than France or hem. 1, Narthex; 2, nave; Germany. In the course of the ex- 3, 3, aisles.

cavation of the Roman city of Sil-

chester, there was brought to light in 1892 the remains of a small early Christian basilica dating from the 4th century of which fig. 21 gives the plan (Archeologia, vol. liii.). It will be

Paulinus at Tyre, A.D. 313-322, described by Eusebius (Hist. Eccl. x. 4 § 37), was evidently basilican, with galleries over the aisles,

![Fig. 20.—Plan of church](image4)
BASILICA, a code of law, drawn up in the Greek language, with a view to putting an end to the uncertainty which prevailed throughout the East Roman empire in the 9th century as to the authorized sources of law. This uncertainty had been brought about by the conflicting opinions of the jurists. The 6th century saw the first attempt to give to the legislation of the emperor Justinian, from which had resulted a system of teaching which had deprived that legislation of all authority, and the imperial judges at last were at a loss to know by what rules of law they were to regulate their decisions. An endeavour had been made by the emperor Leo the Isaurian to remedy this evil, but his attempted reform of the law had been rather calculated to increase its uncertainty; and it was reserved for Basil the Macedonian to show himself worthy of the throne, which he had usurped, by purifying the administration of justice and once more giving it the pure light of the law code. The emperor had been attacked by considerable controversy as to the part which the emperor Basil took in framing the new code. There is, however, no doubt that he abrogated in a formal manner the ancient laws, which had fallen into desuetude, and the more probable opinion would seem to be, that he caused a revision to be made of the ancient laws which were to continue in force, and divided them into forty books, and that this code of laws was subsequently enlarged and distributed into sixty books by his son Leo the Philosopher. A further revision of this code is stated to have been made by Constantine Porphyrogenitus, the son and successor of Leo, but this statement rests only on the authority of Theodorus Balsamon, a very learned canonist of the 12th century, who, in his preface to the Nomocanion of Patriarch Photius, cites passages from the Basilica which differ from the text of the code as revised by the emperor Leo. The weight of authority, however, is against any further revision of the code having been made after the formal revision which it underwent in the reign of the emperor Leo, who appointed a commission of jurists under the presidency of Symphilus, the captain of the body-guard, to revise the work of his father, to which he makes allusion in the first of his novellae. This latter conclusion is the more probable from the circumstance, that the text of the code, as revised by the emperor Leo, agrees with the citations from the Basilica which occur in the works of Michael Psellus and Michael Attaliates, both of them high dignitaries of the court of Constantine, who lived a century before Balsamon, and who are silent as to any second revision of the code having taken place in the reign of Constantine Porphyrogenitus, as well as with other citations from the Basilica, which are found in the writings of Mathaeus Blastares and of Constantine Harmenopolitanus, both of whom wrote shortly after Balsamon, and the latter of whom was far too learned a jurist and too accurate a lawyer to cite any but the official text of the code.

Authors are not agreed as to the origin of the term Basilica, by which the code of the emperor Leo is now distinguished. The code itself appears to have been originally entitled The Revision of the Ancient Laws (ἡ ἀναθέσεως τῶν παλαιῶν νόμων); next there came into use the title ἡ ἐπιστροφή νόμων, derived from the division of the work into sixty books; and finally, before the conclusion of the 10th century, the code came to be designated ὁ βασιλικὸς, ὁ τά βασιλικά, being elliptical forms of ὁ βασιλικός νόμος and τὰ βασιλικά νόμους. More probably the Imperial Law or the Imperial Constitution.

The explanation of the term "Basilica" is more probable than the derivation of it from the name of the father of the emperor Leo, inasmuch as the Byzantine jurists of the 11th and 12th centuries ignored altogether the part which the emperor Basil had taken in initiating the legal reforms, which were completed by his son; besides the name of the father of the emperor Leo was written βασιλικὸς, from which substantive, according to the genius of

---

Fig. 22.—Ground-Plan of the original Cathedral at Canterbury, as restored by Willis.

was the original altar end, the eastern apse being a subsequent addition of Archbishop Odo, c. 950, the church having been thus turned from west to east, as at the already-described basilica of S. Lorenzo at Rome. The choir, as at S. Clemente's, occupied the eastern part of the nave, and like it was probably enclosed by breast-high partitions. There were attached porches to the north and south of the nave. The main entrance of the church was through that to the south. At this extilcure, according to Eadmer, "all disputes from the whole kingdom, which could not legally be referred to the king's court, or to the hundreds and counties, received judgment." The northern porch contained a school for the younger clergy.

noted that the apse is flanked by two chambers, of the nature of sacristies, cut off from the rest of the church, and known in ecclesiastical terminology as prothesis and diaconicon. These features are rare in Italy, are almost universal in the churches of North Africa and Syria. Another existing English basilica of early date is that of Brixworth in Northamptonshire, probably erected by Saxulphus, abbot of Peterborough, c. A.D. 660. It consisted of a nave divided from its aisles by quadrangular piers supporting arches carved in Roman brick, with clerestory windows above, and a short chancel terminating in an apse, outside which, as at St Peter's at Rome, ran a circumscribing crypt entered by steps from the chancel. At the west end was a square porch, the walls of which were carried up later in the form of a tower. The first church built in England under Roman influence was the original Saxon cathedral of Canterbury. From the annexed ground-plan (fig. 22), which was conjecturally restored from Eadmer's description, we see that it was an aisled basilica, with an apse at either end, containing altars standing on raised platforms approached by steps. Beneath the eastern platform was a crypt, or confessio, containing relics, "fabricated in the likeness of the confessionary of St Peter at Rome" (Eadmer). The western apse, dedicated to the Blessed Virgin, contained the bishop's throne. From this and other indications Willis thinks that this
the ancient Greek language, the adjective basilides could not well be derived.

No perfect MS. has been preserved of the text of the Basilica, and the existence of any portion of the code seems to have been ignored by the jurists of western Europe, until the important bearing of it upon the study of the Roman law was brought to their attention by Vigilius Zuchemus, in his preface to his edition of the Greek Paraphrase of Theophylactus, published in 1533. A century, however, elapsd before an edition of the sixty books of the Basilica, as far as the surviving ancient copies of its content is concerned, was published in seven volumes, by Charles Anniil Fabrot, under the patronage of Louis XIII. of France, who assigned an annual stipend of two thousand crowns to its editor during its publication, and placed his disposal the royal printing-press. This edition, though it was a great undertaking and a work of considerable merit, was a very imperfect representation of the original code. A newly-restored and far more complete text of the sixty books of the Basilica, published at Leipzig in six volumes (1833-1870), edited by K. W. E. Heimbach and G. E. Heimbach. It may seem strange that so important a body of law as the Basilica should not have come down to us in its integrity, but a jetter has been preserved, which was addressed by Mark the patriarch of Alexandria to Theodorus Bal-sumon, from which it appears that copies of the Basilica were in the 12th century very scarce, as the patriarch was unable to procure a copy of the work. The great bulk of the code was an obstacle to the multiplication of copies of it, whilst the necessity for them was in a great degree superseded by the publication from time to time of summaries of its contents, compiled by the most eminent jurists, of which a very full account will be found in the Histoire au droit bysavtin, by the advocate Moretreul, published in Paris in 1846.

BASILICA, a territorial division of Italy, now known as the province of Potenza, which formed a part of the ancient, Lucania (p. 98.). It is bounded N. by the province of Foggia, N. E. by those of Bari and Lecce, E. by the Gulf of Taranto (for a distance of 24 m.), S. by the province of Cosenza, and W. by the Mediterranean (for a distance of 10 m. only), and by the provinces of Salerno and Avellino. It has an area of 3845 sq. m. The province is as a whole mountainous, the highest point being the Monte Pollino (7325 ft.) on the boundary of the province of Cosenza, while the Monte Vulture, at the N. W. extremity, is an extinct volcano (4365 ft.). It is traversed by five rivers, the Benevento, Basento, Cavone or Salandrelle, Agri and Sinni. The longest, the Bradano, is 104 m. in length; all run S.E. or E. in the Gulf of Taranto. The province is traversed from W. to E. by the railway from Naples to Taranto and Brindisi, which passes through Potenza and reaches at Metaponto the line along the east coast from Taranto to Reggio di Calabria. A branch line runs N. from Potenza via Melfi to Rocchetta S. Antonio, a junction for Foggia, Gioia del Colle and Avellino (the second of these lines runs through the province of Potenza as far as Palazzo S. Gervasio), while a branch S. from the Naples and Taranto line at S. Giovanni terminates at Lagonegro, on the W. edge of the province, which in its central portion forms a high and very mountainous character of the interior. The mountains are still to some extent clothed with forests; in places the soil is fertile, especially along the Gulf of Taranto, though here malaria is the cause of insufficient cultivation. Olive-oil is the most important product. The total population of the province was 490,705 in 1901. The chief towns are Potenza (pop. 1901, 16,180), Avigliana (18,313), Matera (17,737), Melfi (14,649), Rionero in Vulture (11,806), Lauria (10,093). Basilides, one of the most conspicuous exponents of Gnosticism who lived at Alexandria probably as early as the first decades of the 2nd century, that is to say that Eusebius, in his Chronicon, dates his first appearance from A.D. 133, according to Eusebius, Hist. Eccles. iv. 7 §§ 6-8, Agrippa, Castor, who lived under Hadrian (117-138), already wrote a polemic against him, so that his activity may perhaps be set back to a date earlier than 138. Basilides wrote an exegetical work in twenty-four books on "his gospel," but which this was not known. In addition to this there are certain writings by his son Isidorus, a list of these is given by the Eusebius, Hist. Eccles. iv. 7 § 8. These works are collected and commented upon in Hilgenfeld's Ketzer- geschichten, 207-218. The most important fragment published by Hilgenfeld (p. 207), part of the 13th book of the Exegetica, in the Acta Archelai et Maneset c. 55, only became known in its complete form later, and was published by L. Traube in the Sitzungsbericht der Münchener Akad., phil. hist. Kl. (1903), pp. 533-549. Irenaeus (Adv. Haer. i. 24 §§ 3-7) gives a sketch of Basilides' school of thought, perhaps derived from Justin's Syntagma. Closely related to this is the account in the Syntagma of Hippolytus, which is preserved in Epiphanius, Haer. 24, Philastri, Haer. xiii. 10, and Cod. Butt. Biblioth. Hebr. 4. These are completed and confirmed by a number of scattered notices in the Syriac translation of Papias. There are numerous different accounts of Basilides, with a pronounced monistic tendency, is presented by the so-called Philosophomena of Hippolytus (vii. 20-27; x. 14). Whether this last account, or that given by Irenaeus and in the Syntagma of Hippolytus, represents the original system of Basilides, has been the subject of a long controversy. (See Hilgenfeld p. 205, note 337.) The most recent opinion tends to decide against the Philosophomena; for, it is argued, Basilides appears to have used his principal source the compendium of a Gnostic author who has introduced into most of the systems treated by him, in addition to the employment of older sources, his own opinions or those of his sect. The Philosophomena, therefore, cannot be taken into account in describing the teaching of Basilides (see also H. Stachelin, "Die gnostischen Quellen Hippolytos" in Texte und Untersuchungen, vi. 3; and the article Gnosticism). A comparison of the surviving fragments of Basilides, moreover, with the outline of his system in Irenaeus-Hippolytus (Synt.) shows that at least the Fathers of the Church is also in the highest degree unsuited to form the basis of a reliable account of the Basilides. This, in view of the diversity in opinion, is a very important document. Thus Basilides is used as the foundation of the work of the church fathers, who have developed his ideas further, to the extent of oriental dualism. Entirely consistent with this is the information given by the Acta Archelai that Basilides, before he came to Alexandria, had developed public opinion among the Persians (fuli protractor opud Persas) and the assumption that he had appealed to prophets with oriental names, Barkabas and Barkoph (Agrippa in Eusebius Hist. Eccles. iv. 7 § 7). So too his son Isidorus explained the prophecies of a certain Parchos (= Barkoph) and appealed to the prophecies of Cham (Clemens Alexandrinus, Stromat. vi. 6 § 53). Thus Basilides assumed the existence of two principles, not derivable from each other: Light and Darkness. These had existed for a long time side by side, without knowing anything of each other, but when they perceived each other, the Light had only looked and then turned away; but the Darkness, beset with desire for the Light, had not only taken notes, not indeed of the Light itself, but only of its reflection (sparsit, color). Thus they had been in a position to form this world: unde nec perfectum bonum est in hoc mundo, et quod est, valde est exiguum. This speculation is clearly a development of that which the Iranian cosmology has to tell about the battles between Ahura-Mazda and Angro-Mainyu (Ormuzd and Ahriman). The Iranian optimism has been replaced here by a strong pessimism. This material world is no longer, as in Zoroastranism, essentially a creation of the good God, but the powers of evil have crept in with some stolen portions of Light. This is practically the transference of Iranian dualism from the more Greek antithesis of soul and body, spirit and matter (cf. Iren. i. 24 § 5: animae autem eorum solam esse salutem, corpus enim natura corruptibile existit). The fundamental dualism of Basilides is confirmed also by one or two other passages. In the parable of the rich man and Lazarus, Basilides saw the proof of naturam sine radicet et sine loco rebus super- venientem (Acta Archelai). According to Clemens, Strom. iv. 12 § 83, &c., Basilides taught that even those who have not sinned in act, even Jesus himself, possess a sinful nature. It is thus seen in connection with the dualism of his fundamental

1 = Nimrod = Zoroaster, cf. Pseudo-Clement, Homil. iv. i. Recogn. iv. 27.
views that he taught the transmigration of souls (Origen in Ep. ad Rom. lib. v.; Opp. de la Rœuv iv. 549; cf. Clemens, Excerpta ex Theodoto, § 28). Isidorus set up celibacy, though in a modified form, as the ideal of the perfect (Clemens, Strom. ii. 1 § 1, &c.). Clemens accuses Basilides of a defamation of the Devil (θελων των διαβόλων), and regards as his two dogmas that of the Devil and that of the transmigration of souls (Strom. iv. 12 § 85; cf. v. i. § 75). It is remarkable too that Isidorus held the existence of two souls in man, a good and a bad (Clemens, Strom. ii. 20 113); with which may be compared the teaching of Mani about the two souls, which it is impossible to follow F. Ch. Baur in excluding,2 and also the teaching of the Pistis Sophia (translated by C. Schmidt, p. 182, &c.). According to Clemens (Strom. ii. 20 113), a second or second-rate personage was associated with the one already mentioned by name, but without the influence and pre-eminence to which he is credited by Isidorus. This is that to say, here also is assumed an original confusion and intermingling. Epiphanius too tells us that the teaching of Basilides had its beginning in the question as to the origin of evil (Haer. xxiv. 6).

Now, of this sharply-defined dualism there is scarcely a trace in the system described by the Fathers of the Church. It is therefore only with caution that we can use them to supplement our knowledge of the true Basilides. The doctrine described by them that from the supreme God (the innaus pater) had emanated 365 heavens with their spiritual, and answers originally to the astronomical conception of the heavens with their 360 daily aspects (Irenaeus i. 24. 7; Trecentorum autem sexaginta quinque caelorum locales positiones distribuunt simulut mathematici). When, therefore, the supreme God is called by the name ἀβρααξ or ἀβρααξας, which contains the numerical value 365, it is worthy of remark that the name of the Persian god Mithras (Mēllēpā) also was known in antiquity to contain this numerical value (Jerome in Amos 3; Opp. Vallarsi VI. i. 257). Speculations about the Perso-Hellenistic Mithras appear to have been transferred to the Gnostic Abraxas. Further, if the Peter innatus becomes a source of by a numerical series of (from five to seven) Hypostases (according to Irenaeus i. 24. 3; Nos, ἄνωτα, φήνωτα, σοφία, δύναμις; according to Clemens, Strom. iv. 25 § 164, Διακοσιών and Εἰρήνη may perhaps be added), we are reminded of the Amešās-paents which surround Ahura-Mazda. Finally, in the system of Basilides, the (seven) powers from whom this world originates are accepted as the lowest emanations of the supreme God. This conception which is repeated in nearly every Gnostic system, of (seven) world-creating angels, is a specifically oriental speculation. The seven powers which create and rule the world are the seven main heavens, their seven seraphs, and answers originally to the astronomical Babylonian religion. If, in the Gnostic systems, these become daemonic or semi-daemonic forces, this points to the fact that a stronger monotheistic religion (the Iranian) had gained the upper hand over the Babylonian, and had degraded its gods to daemons. The syncretism of the Babylonian and the Persian religion was also the nursing-ground of Gnosticism. Then, when, Basilides identified the highest angel of the seven, the creator of the worlds, with the God of the Jews, this is a development of the idea which did not occur until late, possibly first in the specifically Christian circles of the Gnostics. We may note in this connexion that the system of Basilides assimilates the many battles and quarrels in the world to the privileged position given to his people by the God of the Jews.3

It is at this point that the idea of salvation is introduced into the system. The confusion in the world has meanwhile risen to such a pitch that the supreme God sends his Νοῦς, who is also called Christ, into the world (Irenaeus i. 24. 4). According to Clemens, the Saviour is termed πνεύμα διακοσιον (Strom. ii. 8 § 36) or διάκων (Excerpta ex Theodoto, § 10). It is im-

1 The materials are in Baur, Das manichäische Religionssystem (1857), p. 162, &c.

2 Whether the myth of the creation of the first man by the angels, which recurs in many Gnostic systems, found a place also in the system of Basilides, cannot be determined with any certainty. Philastrius, however, says: hominem autem ab angelis factum assumit, while according to Epiphanius xxxiv. 2, men are created by the God of the Jews.

3 It is possible certainly to determine how Basilides conceived the relation of this Saviour to Jesus of Nazareth. Basilides himself (Strom. iv. 12 § 83) knows of an earthly Jesus and denies the principle of his sinlessness (see above). According to the account given by Irenaeus, the Saviour is said to have appeared only as a phantasm; according to the Excerpta ex Theodoto, 17, the Diakonos descended upon Jesus at His baptism in the form of a dove, for which reason the followers of Basilides celebrated the day of the baptism of Jesus, the day of the ἡμεραὶ πάσης as a high festival (Clemens, Strom. i. 21 § 18). The various attempts at combination probably point to the fact that the purely mythical figure of a god-saviour (Heros) was connected first by Basilides with Jesus of Nazareth. As to what the conception of Basilides was of the confession of the process of redemption, the available sources tell us next to nothing. According to an allusion by Clemens, Strom. ii. 8 § 36, with the mission of the Saviour begins the great separation of the sexes, the fulfilment and the restoration of all things. This agrees with the beginning of the speculation of Basilides. Salvation consists in this, that that which was combined for evil is once more separated.

Among the later followers of Basilides, actual magic played a determining part. They hand down the names of the rulers of the several heavens as a weighty secret. This was a result of the belief, that whoever knew the names of these rulers would after death be passed through all the heavens to the supreme God. In accordance with this, Christ also, in the opinion of these followers of Basilides, was in the possession of a mystic name (Caulacau = υψηλός Jes. xxviii. 10) by the power of which he had descended through all the heavens to earth, and had then again ascended to the Father. Redemption, accordingly, could be conceived as simply the revelation of mystic names. In this connexion the name Abraxas and the Abraxas gems must be remembered. Whether Basilides himself had already given this magic tendency to Gnosticism cannot be decided.

Basilides, then, represents that form of Gnosticism that is closest to Persian dualism. His is the final form. His doctrine is most closely related to that of Sattornil (Saturninus). From most of the other Gnostic sects, with the exception perhaps of the Jewish-Christian Gnosticism, he is distinguished by the fact that with him the figure of the fallen female god (Sophia Achaëmathe), and, in general, the idea of a fall within the godhead is entirely wanting. So far as we can see, on the other hand, Basilides appears actually to represent a further development of Iranian dualism, which last produced the religious system of Mani.

Accounts of the teaching of Basilides are to be found in all the major works which works on Gnosticism (see bibliography to the article Gnosticism). The original sources are best reproduced in Hilgenfeld, Ketzergeschichte des Urchristentums (1884), pp. 195-230. See also Kruger, article "Basilides," in Herzog-Hauck, Realencyklopädie für die Kunde des Christentums, ed. (W. Bo.)

BASILISK (the basilikos of the Greeks, and Tsepha (cockatrice) of the Hebrews), a name given by the ancients to a horrid monster of their own imagination, to which they attributed the most malignant powers and an equally fiendish appearance. The term is now applied, owing to a certain fanciful resemblance, to a genus of lizards belonging to the family Iguanidae, the species of which are characterized by the possession, in the males, of an erectile crest, or 'horn,' on the head, a double crest—ahorn with scales—on the back, and another on the long tail. Basiliscus americanus reaches the length of one yard; its colour is green and brown, with dark crossbars, while the crest is reddish. This beautiful, strictly herbivorous creature is rather common amidst the luxuriant vegetation on the banks of rivers and streams of the Atlantic hot lands of Mexico and Guatemala. The lizards lie upon the branches of trees overhanging the water, into which they plunge at the slightest alarm. Then they propel themselves by rapid strokes of the hind limbs, beating the water in a semi-erect position and letting the long rudder-like tail drag behind. They are universally known as pasa-rios, i.e. ferrymen.

BASIM, a town of India, in the Akola district, Berar, 52 m. S.S.E. from Akola station of the Great Indian Peninsula railway. Pop. (1901) 13,823. Until 1905 it was the headquarters of the district of Basim, which had an area of 9249 sq. m.; but in that
year the district was abolished, its component taluks being divided between the districts of Akola and Yeotmal. Its western portion, the Basin taluk, consists of a fertile tableland, about 1000 ft. above sea-level, sloping down westward and southward to the rich valley of the Penga; its eastern portion, the taluks of Mangrol and Paud, mainly of a succession of low hills covered with poor grass. In the Paud taluk, however, there are wide stretches of woodland, while some of the peaks rise to a height of 2000 ft., the scenery (especially during the rains) being very beautiful. The climate of the locality is better than that of the other districts of Bander; the hot wind which blows during the day in the summer months being succeeded at night by a cool breeze. The principal crops are millet, wheat, other food grains, pulse, oilseeds and cotton; there is some manufacture of cotton-cloth and blankets, and there are ginning factories in the town. In 1901 the population was 353,410, showing a decrease of 11% in the decade, due to the famine of 1899-1900, which was severely felt in the district.

BASIN, THOMAS (1412-1491), bishop of Lisieux and historian, was born probably at Caudebec in Normandy, but owing to the deviation of his principal work, his childhood was mainly spent in moving from one place to another. In 1424 he went to the university of Paris, where he became a master of arts in 1429, and afterwards studied law at Louvain and Pavia. He attended the council of Ferrara, and was soon made canon of the church at Rouen, professor of canon law in the new university of Caen and vicar-general for the bishop of Bayeux. In 1447 he became bishop of Lisieux. He was much involved in the wars between the English and French and was employed by Charles VII of France, and by his successor Louis XI., at whose request Basin drew up a memorandum setting forth the misery of the people and suggesting measures for alleviating their condition. In 1464 the bishop joined the league of the Public and, having retired to the monastery of the Holy Ghost at Poissy, he was elected prior of the monks. At this time (1474) Pope Sixtus IV. bestowed upon him the title of archbishop of Caesarea. Occupied with his writings Basin then passed some years at Trier, and afterwards transferred his residence to Utrecht, where he died on the 3rd of December 1491. He was buried in the church of St John, Utrecht.

Basingstoke, a market-town and municipal borough of Hampshire, England, 48 m. W.S.W. from London by the South-Western railway, and also by a branch of the Great Western railway. Pop. (1901) 9792. The church of St Michael and All Angels is a fine specimen of a late Perpendicular building (principally of the time of Henry VIII.). The chapel of the Holy Ghost is a picturesque ruin, standing in an ancient cemetery, built for the use of the local gild of the Holy Ghost which was founded in 1525, but flourished for less than a century. Close to the neighbouring village of Old Basing are remains of Basing House, remarkable as the scene of the stubborn opposition of John, fifth marquess of Winchester, to Cromwell, by whom it was taken after a protracted siege in 1645. It was occupied by the government troops, and various prehistoric relics have been discovered in the district, and a large circular encampment is seen at Winklebury Hill. Basingstoke has considerable agricultural trade, and brewing, and the manufacture of agricultural implements, and of clothing, are carried on. The Basingstoke canal, which connects the town with the river Wey and so with the Thames, was opened about 1794, but lost its trade owing to railway competition. It was offered for sale by auction unsuccessfully in 1904, but was bought in 1905. The municipal borough is under a mayor, four aldermen and twelve councillors. Area, 4195 acres.
changed. Henry VI. granted a fair at Whitsun to be held near the
chapel of the Holy Ghost. The charter from James I. confirmed another fair at the feast of St. Michael the Archangel,
and that of Charles I. granted two fairs on Basingstoke Down
at Easter and on the 10th and 11th of September. The wool
trade flourished in Basingstoke at an early date, but later appears to
have declined. In 1673 the clothiers of Basingstoke were
complaining of the loss of trade and consequent distress.

See Victoria County History—Hants; F. G. Baligent and J. E.
Millard, History of Basingstoke (Basingstoke, 1898).

BASIN-STAND, a piece of furniture consisting of a small
stand, usually supported on three legs, and most commonly
made of mahogany or rosewood, for holding a wash-hand basin.
The smaller varieties were used for rose-water ablutions, or
for the operation of hair-powering. The larger ones, which
possessed sockets for soap-dishes, were the predecessors of the
ample modern wash-hand stand. Both varieties, often of very
elegant form, were in extensive use throughout a large part of
the 18th century.

BASKERVILLE, JOHN (1706–1775), English printer, was born
at Wotton-under-Edge, Gloucestershire on the 28th of January 1706.
About 1726 he became a writer in Birmingham, and he
seems to have had a great talent for calligraphy and for cutting
inscriptions in stone. While at Birmingham he made some
important improvements in the process of japanning, and gained
a considerable fortune. About the year 1750 he began to make
experiments in type-founding, producing types much superior
in distinctness and elegance to any that had hitherto been
employed. He set up a printing-house, and in 1757 published
his first work, a Virgil in royal quarto, followed, in 1758, by
his famous edition of Milton. In that year he was appointed
printer to the university of Cambridge, and undertook editions
of the Bible and the Book of Common Prayer. The Horace,
published in 1762, is distinguished even among the productions
of the Baskerville press for its correctness and for the beauty
of the paper and type. A second Horace appeared in 1770 in quarto,
and its success encouraged Baskerville to publish a series of
quarto editions of Latin authors, which included Catullus,
Tibullus, Propertius, Lucretius, Terence, Sallust and Florus.
This list of books issued by Baskerville from his press lends some
irony to the allegation that he was a person of no education.
These books are admirable specimens of typography; and
Baskerville’s work is placed among the foremost of those
who have advanced the art of printing. His contemporaries
asserted that his books owed more to the quality of the paper
and ink than to the type itself, but the difficulty in obtaining
specimens from the Baskerville press shows the estimation in
which they are now held. His wife, Sarah Baskerville, carried
on the business for some time after his death, which took place
on the 8th of January 1775.

BASKET, a vessel made of twigs, cane or rushes, as well as of
a variety of other materials, interwoven together, and used for
holding, protecting or carrying any commodity. The process
of interweaving twigs, rushes or leaves, is practised among the
rudest nations of the world; and as it is one of the most universal
arts, so also does it rank among the most ancient industries,
being probably the origin of all the textile arts of the world.
Decorative designs in old ceramic ware are derived from the marks left by the basket mould used before the invention of the
potter’s wheel, and in the willow pattern on old china, and
the basket capitals or mouldings of Byzantine architecture, the
influence of the basketmaker’s art is clearly traceable. Essenti-
ally a primitive craft, its relative importance is in inverse ratio
to the industrial development of a people.

The word ‘basket’ has been generally identified with the
Latin bascauda, as in Martial (xiv. 90):—

“Barbara de pictis veni bascauda Britannias:
Sed me iam mavult dicere Roma sum.”

But its etymology is unknown, and the New English Dictionary
states that there is no evidence to connect basket with bascauda,
which denotes rather a tub, tray or brazen vessel.

Among many uncivilized tribes, baskets of a superior order
are made and applied to various useful purposes. The North
American Indians prepare strong water-tight Waitage baskets
from the roots of a species of abies, and these they frequently
adorn with very pretty patterns made from the dyed quills of their
native porcupine, Erithonion dorsatum. Wealthy Americans
have formed collections of the beautiful ware treasured as heir-
looms in Indian families, and large prices have been paid for
baskets made by the few squaws who have inherited the tradi-
tions and practice of the art, as much as £5oo having been given
for one specimen. It has been computed that baskets to the
value of £1,000,000 were recently drawn from California and
Arizona within two years. The Indians of South America weave
baskets equally useful from the fronds of the Carnahuba and
other palms. The Kaffirs and Hottentots of South Africa are
similarly skillful in using the Iala reed and the roots of plants;
while the Abyssinians and the tribes of Central Africa display
great dexterity in the art of basket-weaving.

Basket-making, however, has by no means been confined to
the fabrication of those simple and useful utensils from which
its name is derived. Of old, the shields of soldiers were fashioned
of wicker-work, either plain or covered with wicker coverings.
Sophon, in his story of the Thirty Tyrants at Athens, relates that
the exiled Greeks who had seized on the Peiraeus made themselves
shields of whitened osiers; and similar weapons of defence are
still constructed by modern savages. The huts of the earliest
settlers in Rome and in western Europe generally were made
of osier work plaited with clay. Some interesting remains of
British dwellings of this nature found near Lewes in 1877
were described by Major-General H. L. F. Pitt-Rivers in Archaeo-
with the skins of animals, attracted the notice of the Romans
in Britain; they seem to have been of the ordinary boat-shape.

The basketwork boats mentioned by Herodotus as being used
on the Tigris and Euphrates were round and covered with bitumen.
Boats of this shape are still used on these rivers, and
boats of analogous construction are employed in crossing the
rivers of India, in which the current is not rapid. Nor have methods
of making much changed. The strokes employed in the construc-
tion of basket-work found in Etruscan tombs
and now exhibited in the Museo Etrusco at Florence, and in
similar articles discovered in Egyptian tombs, are the same as
those used by the English basket-maker to-day. General
Pitt-Rivers, on comparing the remains excavated near Lewes
with a modern hamper in his possession, found the method
to be identical.

Since about the middle of the 19th century the character
of basket-work in England has been greatly modified. The old
English cradle, reticule, and other small domestic wares, have
been driven out of the market by cheap goods made on the
continent of Europe, and the coarse brown osier packing
and hampers have been largely superseded by rough cassks and cases
made from cheap imported timber. This loss has, however, been
more than counterbalanced by the production of work of a
higher class, such as finely made chairs, tables, lounges and
other articles of furniture; luncheon and tea-baskets and
similar requisites of travel. In addition to the foregoing
the chief categories of English manufacture are: vegetable and
fruit baskets, transit and travelling hampers, laundry and linen
baskets, partition baskets for wine, and protective wicker cases
for fragile ware such as glass carboys, stone and other bottles.
With hampers or cases made from cane pith, for the protec-
tion of shells, have been introduced by the English military
authorities. Some evidence of the above developments is afforded by a comparison of the wages lists of the
London Union of Journeymen Basketmakers issued in 1865
and in 1896. The former consists of 87 printed pages; the
latter of 144 pages, and these more closely set.

No machinery is used in basket-making. A considerable
training and natural aptitude go to form the expert workman,
for the ultimate perfection of shape and beauty of texture de-
pend upon the more or less perfect conception of form in the

III. 16
BASKET

craftsmen's mind and on his power to impress it on a recalcitrant material. In England at least, he rarely uses a moud; every stroke made has a permanent effect on the symmetry of the whole work and no subsequent pressure will alter it. Wages in London vary from 2s. to 5os. per week according to aptitude. The Basketmaker's Coop, however, is one of the oldest craft guilds of the city of London and still exists.

Employment is given by the London Association for the Welfare of the Blind to a number of partially or wholly blind workpeople, who are engaged in the making of some of the coarser kinds of baskets; but the work, which bears obvious traces of its origin, is not commercially remunerative, and the association depends for partial support on the contributions of the charitable, and on supplementary sales of fine or fancy work produced under ordinary conditions and largely imported. Similar associations exist in some English provincial towns, in Edinburgh, in Dublin and Belfast, and in certain European cities.

The materials which are actually employed in the construction of basket-work are numerous and varied, but it is from certain species of willow that the largest supply of basket-making materials is produced. Willows for basket-work are extensively grown on the continent of Europe, whence large quantities are exported to Great Britain and the United States; but no rods surpass those of English growth for their tough and leathery texture, and the finest of basket-making willows are now cultivated in England—in Leicester, Nottinghamshire and the valleys of the Thames and the Trent. In the early part of the 19th century, considerable attention was given in Britain to the cultivation of willows suitable for basket-making, and the industry was first stimulated by premiums offered by the Society of Arts. Mr. William Scaling of Basford, Notts, was a most successful grower and published some admirable pamphlets on the cultivation of willows. The most extensive English willow plantation or salicetum (Lat. salix, willow) of the present day is that planted by Mr. W. F. Ellmore at Thurcaston near Leicester, and consists of about 100 acres of the finest qualities. Mr. Ellmore, a practical basket-maker, successfully introduced some valuable continental varieties (see Osier).

Willows are roughly classed by the basket-maker into "osier" and "fine." The former consists of varieties of the true osier, Salix viminalis; the latter of varieties of Salix triandra, S. purpurea and some other species and hybrids of tougher texture. For the coarsest work, dried unpeeled osiers, known as "brown stuff," are used; for finer work, "white (peeled) stuff" and "buff" (willows stained a tawny hue by boiling them previous to peeling) are used. The rod is the chief ingredient, being drawn to lengths varying from 3 ft. to 8 ft., the smallest being known in London and the home counties as "lute," the largest as "great," and the intermediate sizes as "long small," "threepenny" and "middlebore." White and buff rods are more carefully sorted, the smallest, about 2 ft. or less, being known as "small tack," and rising sizes as "tack," "short small," "small," "long small," "threepenny," "middlebore" and "great." Rods of two to three years' growth, known as "sticks," are used to form the rigid framework of the bottoms and lids of square work. In every case, except the last, the stuff is seen to render it pliable before use—brown from three to seven days, white and buff from half-an-hour to half a day. The rods are used whole for ordinary work, but for basketwork of slight and finer texture each is divided into "skains" of different degrees of size. "Skains" are osiers cleft into three or four parts, by means of an implement called a "cleaver," which is a wedge-shaped tool of boxwood inserted at the point or top end of the rod and run down through its entire length. They are next drawn through an implement resembling the common spokeshave, keeping the grain of the split next the iron or stock of the shave, while the pit is presented to the steel edge of the instrument, and in order to bring the split into a shape still more regular, it is passed through another implement called an upright, consisting of a flat piece of steel, each end of which is fashioned into a cutting edge, like that of an ordinary chisel and adjusted to the required width by means of a thumb-screw.

The tools required by a basket-maker are few and simple. They consist, besides the foregoing, of a shop-knife for cutting out material; a picking knife for cutting off the protruding butts and tops of the rods after the work is completed; two or three bodkins of varying sizes; a flat piece of iron somewhat narrowly triangular in shape for driving the work closely together; a stout pair of shears and a "dog" or "commander" for straightening sticks. The employer supplies a screw block or vice for gripping the bottom and cover sticks of square work, and a lapboard on which the workman fixes the upsetted bottom while sitting up the basket. This is the full kit. A common round or oval basket may, however, be made with no other tools than a shop-knife and a bodkin. On the continent of Europe shapes or blocks are in use on which the fabric is in some cases woven.

The technicalities of basket-making may be easily followed by a glance at the illustration here reproduced by the courtesy of the Society of Arts. It will be seen that the "bye-stakes" are merely inserted in the "upset," whereas the stakes are driven in at each side of the "bottom sticks" and picked up to form the rigid framework of the side. When the "bottom-stick" and "stake" are formed of one and the same continuous rod, it is termed a "league." If the bottom is made on a hoop, the butts of the stakes are "slipped," i.e. cut away with a long cut of the shop-knife, and turned tightly round the hoop; they are then said to be "scalloped" on. The chief strokes used in constructing an ordinary basket are; (1) "sew" or "slew"—two or more rods woven together; the "rand," rods woven in singly; the "fitch," two rods tightly worked alternately one under the other, employed for skeleton work such as cages and waste-paper baskets; the "pair," two rods worked alternately one over the other, used for filling up bottoms and covers of round and oval baskets; and the "wale," three or more rods worked alternately, forming a string or binding course. Various forms of plaiting, roping and braiding are used for bordering off or finishing.

An ordinary oval basket is made by preparing the requisite number of bottom sticks, preserving their length greater than the required width of the bottom. They are ranged in pairs on the floor parallel to each other at small intervals, in the direction of the longer diameter of the basket, thus forming what may be called the "woof," for basket-work is literally a web. These parallel rods are then crossed at right angles by two pairs of the largest osiers, on the butt ends of which the workman places his feet; and they are confined in their places by being each woven alternately over and under the parallel pieces first laid down. The whole now forms what is technically called the "slath," which is the foundation of the basket. Next other rods are taken and

---

1 See the report of a paper by T. Okey, published in the Journal of the Society of Arts, January 11th, 1907.
woven under and over the sticks all round the bottom until it be of sufficient size, and the woof be occupied by them. Thus the bottom or foundation on which the superstructure is to be raised is finished. This latter part is accomplished by sharpening the large ends of as many long and stout osiers as may be necessary to form the staves or skeleton. These are forced between the bottom sticks from the edge towards the centre, and are turned up or "upset" in the direction of the sides; then other rods are woven in and out between each of them, until the basket is raised to the intended height, or, more correctly speaking, the depth it is to receive. The edge or border is finished by turning down the ends of the stakes, now standing up, behind and in front of each other, when the whole is firmly and compactly united, and it is technically known as the "belly." A lid is constructed on the same plan as that of the bottom, and tied on with hinges formed of twisted rods; simple handles may be made by inserting similar rods by the sides of two opposite stakes and looping them under the border to form rope-like handles of three strands. This is the most simple kind of basket, from which others differ only in being made with finer materials and in being more nicely executed; but in these there is considerable scope for taste and fancy, and articles are produced of extreme neatness and ingenuity in construction.

Basket-ware and willows many other materials are employed in the fabrication of wicker-work. Among the more important of these is the stem of Calamus viminalis or other allied species—the cane or ratten of commerce—which is used whole or made into skains. Since 1850 the central pith of this material, known as "cane-pulp" or "cane-pith," has been largely used in Great Britain and on the continent of Europe in the manufacture of furniture and other finer classes of work. About the same period plaited rush and straw, often coloured, came into use together with enamelled skains of cane. It must be admitted, however, that the new materials have encroached somewhat on the domain of cabinet-making; for wood and nails are now much used in constructing basket-work chairs, tables and other furniture.

With splits of various species of bamboo the Japanese and Chinese manufacture baskets of unequalled beauty and finish. The bamboo wicker-work with which the Japanese sometimes encase their delicate egg-shell porcelain is a marvellous example of manipulation, and they and the Chinese excel in the application of bamboo wicker-work to furniture. In India Cajan" baskets are extensively made from the fronds of the Palm tree, Borassus flabelliferiformis, and this manufacture has been established in the Black Forest of Germany, where it is now an important and characteristic staple. Among the other materials may be enumerated the odorous roots of the khus-khus grass, Anthericum muricatum, and the leaves of various species of screw pine, used in India and the East generally. The fronds of the palm of the Seychelles, Lodoicea sechellarum, are used for very delicate basket-work in those islands. Strips of the New Zealand flax plant, Phormium tenax, are made into baskets in New Zealand. Esparto fibre is used in Spain and Algeria for rude fruit baskets. Various species of Maranta yam and of the West Indies and South America; and the Tiri, a species of Calathe, a member of the order Zingiberaceae, is also employed similarly in Trinidad. Baskets are also frequently made from straw, from various sedges (Cyperus), and from shavings and splints of many kinds of wood.

The chief centres of English basket manufacture outside London are Thurham in Near Leicester, Basford near Nottingham, and Grantham. Large but decreasing quantities of light basket-work are made for the English market in Verdan, in the department of the Aisne, and in other parts of France; and great quantities of fancy and other work are produced in Belgium, in the Netherlands and in Germany, notably at Lichtenfels in Bavaria, at Sonnefeld in Saxony and in the Black Forest.

The import and export values of baskets and basket-ware, and of willows and rods for basket-making, have been enumerated in the Board of Trade returns for the United Kingdom since 1900, in which year basket-ware from foreign countries was imported to the value of £239,402. In 1901 the imports increased to £264,153; then they declined to £279,070 in 1905. The main sources of supply are shown in this comparison of 1900 and 1905:

</table>

The increase from Japan (for 1904 the value was £2.377) and the decrease from France are remarkable.

The import values of foreign willows increased from £321,219 in 1900 to £325,286 in 1905, the most important exporting countries being:

Small British re-exports of willows (£1808 in 1900 and £321 in 1905) and of baskets (£3785 in 1900 and £663 in 1905) to foreign parts and British possessions are tabulated. No particulars of exports of British produce and manufacture are specified in the returns.

**BASKET-BALL**

A game adapted to the open air, but usually played upon the floor of a gymnasiaum and in the cold season. It was the invention, in 1891, of James Naismith, an instructor in the gymnasium of the Young Men's Christian Association training-school at Springfield, Massachusetts. A demand had arisen for a game for the gymnasium class, which would break the monotony and take the place, during the winter months, of football and baseball, and which was not too rough to be played indoors. The idea of the game was first published in the Triangle, the school paper. It soon became one of the most popular indoor games of America, for girls as well as for men, and spread to England and elsewhere.

Basket-ball is played on a marked-off space 60 ft. by 40 ft. in extent, though in the open air the dimensions may be greater. In the middle of each short side and 10 ft. above the floor or ground, is placed a basket consisting of a net suspended from a metal ring 18 in. in diameter, backed, at a distance of 6 in., by a back-board 6 ft. long and 4 ft. high. The object of the game is to propel an inflated, leather-covered ball, 30 in. in circumference, into the opponents' basket, which is the goal, by striking it with the open hand. The side which scores most goals during two periods of play divided by an interval of rest. Although there is practically no limit to the number of players on each side, all indoor matches are played by teams of five, in positions opposing one another as in lacrosse, centre, right and left forwards and right and left guards (or backs). A referee has the general supervision of the game and decides when goals have been properly scored, and an umpire watches for infringements of the rules, which constitute fouls.

There are also a scorer and timekeeper.

The game is played between two opposing centres standing within a 4-foot ring in the middle of the floor. The referee puts the ball in play by tossing it into the air over the heads of the centres, who jump into the air for its possession or endeavour to bat it towards the opposing goal. From this moment the ball is in play until it falls into a basket, or passes the boundary-lines, or a foul is made. After a goal has been scored, the ball is again put in play by the referee in the centre. Should it be thrown across the boundary, a player of the opposing side, standing on the line at the point where the ball went over, puts it in play by passing or throwing it to one of his own side in any direction, there being no off-side rule—another point of similarity to lacrosse. His opponents, of course, try to prevent the pass or intercept the throw, thus securing the ball themselves. When a foul has been called, a player of the opposing side is allowed a "free throw" for his opponents' basket from a mark 15 ft. distant from it and without interference. A goal scored from a
BASNAGÉ—BASNOCHE

free throw counts one point; one scored while the ball is in play counts two. Hacking, striking, holding and kicking are foul, but a player may interfere with an opponent who has the ball so long as he uses one arm only and does not hold. A player must throw the ball across the free throw line, no running with it being allowed excepting when continuously bounding it on the floor. Basket-ball is an extremely fast game and admits of a high degree of combination or team-play. The principal qualifications of a good player are quickness of movement and of judgment, coolness, endurance, accuracy and self-control. Good dodging, throwing, passing and team-play are the important requisites of the game, which is looked upon as excellent winter training for outdoor games. Basket-ball, with somewhat modified rules, is extremely popular with young women.

See Spalding's Basketball Guide; and George T. Heaphen, How to Play Basket-Ball; and Spalding's Basketball Guide for Women.

BASNAGÉ, JACQUES (1653-1723), French Protestant divine, was the eldest son of the eminent lawyer Henri Basnage, sieur de Franquenay (1615-1695), and was born at Rouen in Normandy in 1653. He studied classical languages at Saumur and afterwards theology at Geneva. He was pastor at Rouen (his native place) from 1676 till 1685, when, on the revocation of the edict of Nantes, he obtained leave of the king to retire to Holland. He settled at Rotterdam as a minister pensionary till 1693, when he was chosen pastor of the Walloon church. In 1704, a grand pensionary A. Heinins (1641-1720) secured his election as one of the pastors of the Walloon church at the Hague, intending to employ him mainly in civil affairs. Accordingly he was engaged in a secret negotiation with Marshal d'Uxelles, plenipotentiary of France at the congress of Utrecht—a service which he executed with so much success that he was entrusted with several important commissions, all of which he discharged with great ability. In 1716 Dubois, who was at the Hague at the instance of the regent Orleans, for the purpose of negotiation, was placed between France and Great Britain and Holland, sought the advice of Basnage, who, in spite of the fact that he had failed to receive permission to return to France on a short visit the year before, did his best to further the negotiations. The French government also turned to him for help in view of the threatened rising in the Cevennes. Basnage had welcomed the revival of the Protestant church due to the zeal of Antoine Court; but he assured the regent that no danger of active resistance was to be feared from it, and, true to the principles of Calvin, he denounced the rebellion of the Camisards (q.v.) in his Instructions pastorales aux Réformés de France sur l'abolition due aux anciens procureurs (Paris, 1720) which was printed by order of the court and scattered broadcast in the south of France. Basnage died on the 22nd of September 1723.

Basnage was a good preacher and a prolific writer. His works include several dogmatic and polemical treatises, but the most important are the historical. Of these may be mentioned Histoire de la religion des églises réformées (Rotterdam, 1690), the Histoire de l'église depuis Jésus-Christ jusqu'à présent (ib. 1699)—both of them written from the point of view of Protestant polemics—and, of greater scientific value, the Histoire des Juifs (Rotterdam, 1706, Eng. trans. 1708) and the Antiquités judaïques ou remarques critiques sur la république des Hébreux (1713). He also wrote short explanatory introductions and notes to a collection of copper-plate engravings, much valued by connoisseurs, called Histoires du Vieux et du Nouveau Testament, représentées par des figures gravées en taille-douce par R. de Hooge (Amsterdam, 1704).

BASNOCHE, or BASNOCHÉ, with the analogical forms BASOUCÉ, BASOGUE and BAZOUGES; from the Lat. basilica, in the sense of large halls or courts, a French gild of clerks, from among whom legal representatives (procureurs) were elected. This gild was very ancient, even older than the gild of the procureurs, with which it was often at variance. It dated, no doubt, from the time when the profession of procureur (procurator, advocate or legal representative) was still free in the sense that persons rendering that service to others when so permitted by the law were not yet public and ministerial officers. For this purpose there was established near each important juridical centre a group of clerks, that is to say, of men skilled in law (or reputed to be so), who at first would probably fill indifferently the rôle of representative or advocate. Such was the origin of the Bascosche of the 16th century to Paris, which naturally formed itself into a guild, like other professions and trades in the middle ages. But this organization eventually became disintegrated, dividing up into more specialized bodies: that of the advocates, whose history then begins; and that of legal representatives, whose profession was regularized in 1344, and speedily became a saleable charge. The remnant of the original clerks constituted the new Basocene, which thenceforward consisted only of those who worked as clerks for the procurers, the richer ones among them aspiring themselves to attain the position of procurer. They all, however, retained some traces of their original condition. "They are admitted," writes an 18th-century author, "to plead before M. le lieutenant civil sur les référés 1 and before M. le juge auditeur; so that the procurers of these days are but the former clerks of the Basoche, admitted to officiate in important cases in preference to other clerks and to their exclusion." From its ancient past the Basoche had also preserved certain picturesque forms and names. It was called the "kingdom of the Basoche," and for a long time its chief, elected each year in general assembly, bore the title of "king." This he had to give up towards the end of the 16th century and, by order, it is said, of Henry III., and was thenceforth called the "chancellor." The Basoche had besides its maîtres des requêtes, a grand court-crier, a referendary, an advocate-general, a procureur-général, a chaplain, &c. In early days, and until the first half of the 16th century, it was organized in companies in a military manner and held periodic reviews or parades (montres), sometimes taking up arms in the king's service in time of war. Of this there survived later only an annual catalade, when the members of the Basoche went to the royal forest of Bondy to cut the maypole, which they afterwards set up in the Palais. We hear also of satirical and literary entertainments given by clerks of the Palais de justice and of the morals played by them in public, which form an important element in the history of the national theatre; but at the end of the 16th century these performances were restricted to the great hall of the Palais.

To the last the Bascosche retained two principal prerogatives. (1) In order to be recognized as a qualified procurer it was necessary to have gone through one's "stage" in the Bascosche, to have been entered by name for ten years on its register. It was not sufficient to have been merely clerk to a procurer during that time but to have been registered at his office. This was the occasion of frequent conflicts during the 17th and 18th centuries between the members of the Bascosche and the procurers, and on the whole, despite certain decisions favouring the latter, the parlement maintained the rights of the Bascosche. Opinion was favourable to it because the certificats de compeissance issued by the procurers were dreaded. These certificats held good, moreover, in places where there was no Bascosche. (2) The Bascosche had judiciary powers recognized by the law. It had disciplinary jurisdiction over its members and decided personal actions in civil law brought by one clerk against another or by an outsider against a clerk. The judgment of the Bascosche, which was only confirmed by a maître des requêtes, was authoritative, and could only be contested by a civil petition before the ancient council of the Bascosche. The Châtelet of Paris had its special basoche, which claimed to be older even than that of the Palais de Justice, and there was contention between them as to certain rights. The clerks of the procurers at the cour des comptes of Paris had their own Bascosche of great antiquity, called the "empire de Gallilée." The Bascosche of the Palais de Justice had in its ancient days the right to create provostships in localities within the jurisdiction of the parlement of Paris, and thus there sprang up a certain number of local basoches. Others were independent in origin; among such being the "regency" of Rouen and the Bascosche of the parlement of Toulouse.

1 A procedure for obtaining a provisional judgment on urgent cases.

**BASQUE PROVINCES (Provincias Vascongadas)**, a division of north-eastern Spain, comprising the three provinces of Alava, Biscay or Vizcaya and Guipúzcoa. Pop. (1900) 605,506; area 27,399 sq. m., the third in density in Spain. The territory occupied by the Basque Provinces forms a triangle bounded on the west and south by the provinces of Santander, Burgos and Logroño, on the east by Navarre, on the north by France and the Bay of Biscay. The French Pays Basque forms part of the arrondissements of Bayonne and Mauléon. For an account of the people, their origin, customs and language, see Basques. Of the Provinces of the Vascongadas, Guipúzcoa is the only one which is essentially Basque; Alava is the least so. Its capital, Vitoria, is said to have been founded by the Gothic king Leovigildo (581). Older than these divisions, the date of which is uncertain, the ancient limits of the dioceses of Pamplona, Bayonne and Calahorra, probably correspond more nearly to the boundaries of the ancient tribes, the Autrigones, the Caristí, the Varduli and the Vascones, with their still differing dialects, than do these civil provinces.

Leaving aside the legendary and uncertain portion of their history, we find the Provinces in some districts dependent auxilies of Navarre, in others of Castile. In Biscay the counts of Haro were lords of Biscay from 1093 to 1350. There was a short union with Castile under Pedro the Cruel, but the definitive union did not take place till 1370. In Alava the ruling power was the con-federation of Arriaga (so called after its meeting place), which united the province to the crown of Castile in 1332. Guipúzcoa, which had been dependent sometimes on Navarre, sometimes on Castile, was definitively united to Castile in 1200. From the year 1425 the provinces were desolated by party wars among the lesser nobles (varíenyes mayores) but these came to an end in 1460–1498, when Henry IV. and Ferdinand the Catholic strengthened their position and formed and erected any fortified house in the country. Though the three Basque Provinces were thus united to the crown of Spain, they still remained a land apart (tierra apartada). Their juntas acted to some extent in common; and although no written federal pact is known to have existed, they employed, as the symbol of their unity, a seal with the word Irurutx, "The Three One," engraved upon it. They preserved their own laws, customs, fueros (see Basques), which the Spanish kings swore to observe and maintain. Unless countersigned by the juntas the decrees of Cortes and Spanish legislation or royal orders had no force in the Provinces. In the junta of 1481 Guipúzcoa alone proposed a treaty of friendship, peace, and commerce for ten years with England, and this was signed in Westminster, on the 9th of March 1482 (see Rymer, Foedera). The Basques still made their own treaties with England and France and are mentioned apart from Spain in the treaty of Utrecht (1713). They still preserved in their municipal institutions the old style of republicas derived from the civitates and respublícàe of ancient Rome. This kind of independence and autonomy lasted unchallenged until the death of Ferdinand VII. in 1833. When, in default of male heirs, his brother Don Carlos claimed the throne, confirmed the Basque fueros, and raised the standard of revolt against his niece, Isabel II. A seven years' war followed, in which an English legion under Sir George de Lacy Evans and a naval force under Lord John Hay took part. It was ended by the Convenio de Vergara (August 31st, 1839) in which the concession and modification of the fueros was demanded. The troubled period which followed the expulsion of Isabel II. in 1868 gave opportunity for a second Carlist war from 1872 to 1876. This ended, unlike the former one, in the utter defeat of the Carlist forces, and left the Provinces at the mercy of the government, without terms or agreement. In general government and legislation the Provinces were then assimilated to the rest of the nation. After 1876, the Provincial parliaments (diputaciones) were elected like the other provincial councils of Spain, deprived of many privileges and subjected to the ordinary interference of the civil governors. But their representatives, assisted by the senators and deputies of the Basque Provinces in the Cortes, negotiated successive pacts, each lasting several years, securing for the Provinces their municipal and provincial self-government, and the assessment, distribution and collection of their principal taxes and octrois duties, on the understanding that an agreed sum should be paid annually to the state, subject to an increase whenever the national taxation of other provinces was augmented. In December 1866, after long discussion, the contribution of the Basque Provinces to the state, according to the law of the 21st of July 1876, was fixed for the next twenty years; for the first ten years at 8,500,000 pesetas, for the next ten an additional 500,000 pesetas, from 1901 to 1905 at 9,395,314 pesetas, and from 1906 to 1912 at 10,281,549 pesetas. These pacts have hitherto been scrupulously observed, and as the local authorities levy the contribution after their own local customs, landed property and the industrial and commercial classes are less heavily taxed in these territories than in the rest of Spain. Enough is raised, however, besides the amount handed over to the government, to enable the schools, roads, harbours and public works of every kind to be maintained at a standard which compares very favourably with other parts of Spain. When the three provinces sent in their first contingent of con-script to the third war, 1877, it was found that all but about sixty knew how to read and write, and succeeding contingents have kept up this high standard.

In agriculture the Basque Provinces and the Pays Basque were great cider countries, but during the 19th century this was gradually replaced by wine-growing. The chief industries of the Basque Provinces are the sea fisheries and iron mining. Some of the mines round Bilbao have been worked from pre-historic times. In 1905 the Basque Provinces produced 5,302,344 tons of iron, over five millions of which came from Biscay, out of a total of 6,395,314 tons for the whole of Spain. More than half of this total was sold to England.

The swords of Mondragon in Guipuzcoa were renowned before those of Toledo. Elbar in the same province has long been a small-arms factory. There in the 19th century Señor Zuloaga successfully revived the artistic alloying of iron and silver in steel and iron.

**BIBLIOGRAPHY.—Of older works, though often uncriticical, R. P. Henao’s Averiguaciones de las Antigüedades de Cantabria (Salamanca, 1688), and valuable editions, 1837, 1844. For all that relates to the manners and customs of the people, Carlist propaganda by R. P. M. de Larramendi, S.J., is indispensable. Written about 1750, it was first printed in Barcelona in 1882 (later edition, San Sebastian, 1898). There are excellent works on the history of the Provinces, Introducción a la Historia Natural, y a la Geografía Física de España, by D. Guillermo Bowles (Madrid, 1775). El Guipuzcuano instruido (San Sebastian, 1780), in the form of a dictionary, gives full details of the life, the rights, duties and obligations of a Basque citizen at that date. El Diccionario Geográfico-Histórico de España, tomes i., ii. El Reyno de Navarra Senorio de Vizcaya y Provincias de Alava y Guipúzcoa (Madrid, 1802), is full of local information, but with a strong bias in favour of the central government. The best works on the various editions of the fueros are Historia de la Legislación . . . civil de España, by A. Marchilar, Marques de Monteia, and Cayetano Fuentes de Navarra Vizcaya, Guipúzcoa y Álava (Madrid, 2nd ed., 1868); and the Noticias de las cosas memorables de Guipúzcoa, by D. Pablo de Gorosabel (Tolosa, 1899–1901), the last volume of which by C. de Echeagaray, gives the legislative acts down to May 1906. Los Provenientes Vascongiàes a Finas de la Edad Media, by D. Carmelo de Echeagaray (San Sebastian, 1895), is excellent. There is a Historia de Bizcaya, by Dr E. de Labayru, and a Compendio of the same by Fermín Herrán (Bilbao, 1903). D. Carmelo de Echeagaray, Cronista de las Provincias Vascongadas, with his colleagues D. Serapio Mugica, F. Soraluce, and other historians, has examined, catalogued and indexed the municipal archives of all the towns. Without which is published by the Basque Branch of the British Archaeological Association, the discoveries of important missing documents and MSS, were thus made. The development of the Basque mining industry is fully described in Las Minas de hierro de la provincia de Vizcaya, proyectos realizados en esta región desde 1850 hasta 1906 (Bilbao, 1900).

**BASQUES**, a people inhabiting the three Basque Provinces—Biscay, Alava and Guipúzcoa—and Navarre in Spain, and the arrondissement of Bayonne and Mauléon in France. The number of those who can be considered in any sense pure Basques is
probably about 600,000 in Europe, with perhaps 100,000 emigrants in the Americas, chiefly in the region of La Plata in South America. The word Basques is historically derived from Vascones, which, written Wascones, has also given the name Gascon to a very different race. The Basques call themselves Eskualdunak, i.e. "those who possess the Eskua", and their country Euskal-Herria.

Language.—The original and proper name of the language is Eskua (euskara, uskara), a word the exact meaning of which has not yet been ascertained, but which probably corresponds with the idea clearly speaking." The language is highly interesting and stands as yet absolutely isolated from the other tongues of Europe, though from the purely grammatical point of view it recalls the Magyar and Finnic languages. It is an agglutinative, incorporating and polysynthetic system of speech; in the general series of organized linguistic families it would take an intermediate place between the American on the one side and the Ugro-Altaic or Ugrian on the other.

Basque has no graphic system of its own and uses the Roman character, either Spanish or French; a few particular sounds are indicated in modern writings by dotted or accented letters. The preservation of a correspondency in the names of dialects of Bonaparte counts, on the whole, thirteen simple vowels, thirty-eight simple consonants. Nasal vowels are found in some dialects as well as "wet" consonants—ty, dy, ny, &c. The doubling of consonants is not allowed and in actual current speech most of the soft consonants are dropped. The letter c cannot begin a word, so that rationem is written in Basque arrazoin.

Declension is raised by a highly developed postpositional system; first, the definite article itself a (plural aki) is a post-position—saldi, "the horse," saldiak, "the horses," or saldi, "the horse," saldiz, "the horse's" declensional suffixes or positionals, which, just like our prepositions, may be added to one another, are postponed to the article when the noun is definite. The principal suffixes are k, the mark of the plural, and of the singular nominative agent; n, "of" and "in"; i, "to"; z, "by"; ik, "some"; ko, "from"; of, (Lat. ò); ika, "from" (Lat. ex); zat, kolat, tsako, "for"; kin, gas, "with"; gaz, "for the sake of"; gana, "towards"; ra, rat, "to," into," at," &c. Of these suffixes some are joined to the definite, others to the indefinite noun, or even to both.

The personal pronouns, which to a superficial observer appear closely related to those of the Semitic or Hamitic languages are nei, "I," hi, "thou"; gu, "we"; zu, "you" in modern times, zu has become a polite form of "thou," and a true plural "you" (i.e. more than one) has been formed by suffixing the pluralizing sign k—silk. The pronouns of the third person are mere demonstratives. There are three: hura or kurua, "that"; hau or kan, "this"; orri or kori, "this" or "that." Other unexplained forms are found in the verbal inflexions, e.g. d, it, and t, "I" or "me"; d-akas-t, "it see I"—I see it; d-arrat-t, "it follows me." The demonstratives are used as articles: gast-en-or, "this younger one"; andre-or, "this lady at some distance." The reflexive "self" is expressed by buru, "head." The relative does not exist, and in its place is used as a kind of verbal participle with the ending ni: doa, "he goes"; doana, "he who is going"; in the modern Basque, however, by imitation of French or Spanish, the interrogative zein, soin, is used as a relative. Other interrogatives are nor, "who"; zer, "what"; zemboi, "how much," &c. Bat, "one"; batu, "several"; bakioi, "each"; norbi, "some one"; haitu or haitinos, "much"; eliar, "both"; are the most common indefinite pronouns. The numeral system is vicesimal; e.g. 34 is hogo i hanmalaur, "twenty and fourteen." The numbers from one to ten are: 1, bat; 2, bi; 3, hiru; 4, lau; 5, bortz or lust; 6, sei; 7, azpiti; 8, sortzi; 9, bederatzi; 10, hamar; 20, hogo or horgol; 40, berrogi (i.e. twice twenty); 100, ehun. There is no genuine word for a thousand.

The genders in Basque grammar are distinguished only in the verbal forms, in which the sex of the person addressed is indicated by a special suffix; so that estakit means, "I do not know it"; but to a woman one says also: estakina, "I do not know it, oh woman!" To a man one says: estakibat (or estakibat), "I do not know it, oh man!" moreover, certain dialectic varieties have a respectful form: estakibat, "I do not know it, you respectable one," from which also a childish form is derived, estakibut, "I do not know it, oh child!"

The Basque conjugation appears most complicated, since it incorporates not only the subject pronouns, but, at the same time, the indirect and direct complement. Each transitive form may thus offer twenty-four variations—"he gives it," "he gives it to you," "he gives them to us," &c., &c. Primitively there were two tenses only, an imperfect and a present, which are preserved in the conjugation with the place of the personal subject element: daki,gu, "we are knowing," i.e. we), and ginaik, "we were knowing it"; in the intransitive by a nasalization of the radical: nis, "I am;" ninate, "I was." In modern times a conjunctual future has been derived by adding the suffix ke, doki, "I will, shall or probably can know it." No proper moods are known, but subjunctive or conjunctive forms are formed by adding a final n, as dukusat, "I am looking at it"; dukusaden, "if I see it." No voices appear to have been used in the same radical, so that there are separate transitive and intransitive verbs.

In its present state Basque only employs its regular conjugation exceptionally; but it has developed, probably under the influence of neo-Latin, a most extensive conjugation by combining a few auxiliary verbs and what may be called participles, in fact declined nouns: ikusten dut, "I have it in seeing," "I see it," ikusiko dut, "I have it to be seen," "I will see it," &c. The principal auxiliaries are: izan, "to be;" and ekon, "to have;" but edin, "to can;" eza, "to be able;" egin, "to make;" joan, "to go;" eron, "to draw," "to move," are also much used in this manner.

The syntax is simple, the phrases are short and generally the order of words is subject, complement, verb. The determining element follows the determined: gizon homdia, "man great the"—the great man; the genitive, however, precedes the nominative—gizmaren etxea, "the man's house." Composition is common and it has caused several juxtaposed words to be combined and contracted, so that they are partially fused with one another—a process called polysyntheticism; odi, "cloud," and ots, "noise," form odos, "thunder;" belar, "forehead," and oin, "foot," give belaoan, "to kneel," front of the foot. The assimilation in words of general and synthetic words is often wanted; but particular terms abound. There is no proper term for "sister," but arreba, a man's sister, is distinguished from ahera, a woman's sister. We find no original words for abstract ideas, and God is simply the "Lord of the high."

The vocabulary, however, varies extremely from place to place and the dialectic varieties are very numerous. They have been summed up by Prince L. L. Bonaparte as eight; these may be reduced to three principal groups: the eastern, comprising the Soulietine and the two lower Navarrese; the central formed by the two upper Navarrese, the Gipuzcoan and the Labordine; and the western, formed by the Biscayan, spoken too in Álava. These names are drawn from the territorial subdivisions, although the dialects do not exactly correspond with them.

Ethnology and Anthropology.—The earliest notices of the geography of Spain, from the 5th century n.c., represent Spain as occupied by a congeries of tribes distinguished mainly as Iberi, Celtiberi and Celts. These had no cohesion together, and unless temporarily united against some foreign foe, were at war with one another and were in constant movement; the ruder tribes being driven northwards by the advancing tide of Mediterranean civilization. The tribes in the south in Baetica had, according to Trogus and Strabo, written laws, poems of ancient date and a literature. Of this nothing has reached us. We have only some inscriptions, legends on coins, marks on pottery and on megalithic monuments, in alphabets slightly differing, and belonging to six geographical districts. These still await an interpreter; but they shew that a like general language was once spoken through the whole of Spain, and for a short distance on
The northern slope of the Pyrenees. The character of the letters is clearly of Levant origin, but the particular alphabets, to which each may be referred, and their connection, if any, with the Basque, are still undetermined. It was early remarked by the classical scholars among the Basques after the Renaissance that certain names in the ancient toponomy of Spain, though transcribed by Greek and Latin writers, i.e. by foreigners, ignorant of the language, yet bear a strong resemblance to actual place-names in Basque (e.g. Iberis, Iriberry); and in a few cases (Mondiculea, Mendigorry; Iruo, Oloron) the site itself shows the reason of the name. Andres de Poza (1587), Larramendi (1760), Juan B. Erro (1806) and others had noted some of these facts, but it was W. von Humboldt (1821) who first aroused the attention of the race to them. This greater extension of a people speaking a language akin to the Basque throughout Spain, and perhaps in Sicily and Sardinia, has been accepted by the majority of students, though some competent Basque scholars deny it; and the certain connexion of the Basques, either with the Iberians or Celthiberians, whether in race or language, cannot be said to be conclusively proved as long as the so-called Celtiberian inscriptions remain uninterpreted. (See also IBERIANS.)

After so many centuries of close contact and interpenetration with other peoples, we can hardly expect to find a pure physical type among the Basques. All that we can expect is to be able to differentiate them from their neighbours. The earliest notice we have of the Basques, by Einhard (778), speaks of their wonderful agility. The next, the pilgrim of the Codex Calixtinus (12th century), says the Basques are fairer in face (facie condidiores) than the Navarrese.

Anthropologists no longer rely solely on craniology, and the measurement of the skull, to distinguish race. The researches of Aranzadi (1880 and 1903) and of Collignon (1889) show them as less fair than northern Europeans, but fairer than any of the southern races; not so tall as the Scandinavians, Teutons or British, but taller than their neighbours of southern races. There is no tendency to prognathism, as in some of the Celts. The profile is often very fine; the carriage is remarkably upright. Neither markedly brachycephalous nor dolichocephalous, the skull has yet certain peculiarities. In the conjunction of the whole physical qualities, says Collignon, there is a Basque type, differing from all those he has studied in Europe and northern Africa. There are differences of type among themselves, yet, when they emigrate to South America, French and Spanish Basques are known simply as Basques, distinct from all other races.

On the origin of the Basques, the chief theories are:—(1) that they are descended from the tribes whom the Greeks and Latins called Iberi; (2) that they belong to some of the fairer Berber tribes ("Iberafrican," Herve) and through the ancient Libyans, a people depicted on the Egyptian monuments; (3) the Atlantic theory, that they belong to a lost Atlantic continent, whose inhabitants were represented by the Guanches of the Canary Islands, and by a fair race on the western coast of Africa; (4) that they are an indigenous race, who have never had any greater extension than their present quarters.

The remains of prehistoric races hitherto discovered in Spain throw little light on the subject, but some skulls found in south-eastern Spain in the age of metal resemble the Basque skulls of Zarautz.

The megalithic remains, the dolmens, menhirs, cromlechs and stone circles are said to resemble more closely those of northern Africa than the larger remains of Brittany and of the British Isles. Aristotle tells us that the Iberi fixed obelisks round the tomb of each warrior in number equal to the enemies he had slain (Polit. vii. c. 2. 6), but proof is wanting that these Iberi were Basques.

Iberian inscriptions have been found on the so-called toras de guisande, rude stone balls or boars, on other monuments of northern Spain and in ancient sepulchres; some of these figures, e.g. at the Cerro de los Santos in Murcia, recall the physical type of the modern Basques, but they are associated with others of very varied types.

Of the religion of the Basques anterior to Christianity, little is certainly known. The few notices we have point to a worship of the elements, the sun, the moon and the morning star, and to a belief in the immortality of the unburied and unburied body. The custom of the cowade, attributed by Strabo to the Cantabr., is unknown among the modern Basques. As elsewhere, the Romans assimilated Basque local deities to their own pantheon, thus we find Deo Baiorizzo (Baigorry) and Herauscorrische in Latin inscriptions. But the name which the Basques themselves give to the Deity is Jaionka, Jaungoikoa, which may mean lord or master, Lord of the high; but in the dialect of Roncal, Goikoa means "the moon," and Jaungoikokoa would mean "Lord of the moon." The term Taum, lord or master, Etcheke Jovana, the lord or master of the house, is applied to every householder.

There is no aid to be got from folk-tales; none can be considered exclusively Basque and the literature is altogether too modern. The first book printed in Basque, the Lingua Vasconum Primitiae, the poems of Bernard d'Echepare, is dated 1545. The work which is considered the standard of the language is the Protestant translation of the New Testament made by Jean de Liçarrague, under the auspices of Jeanne d'Albret, and printed at La Rochelle in 1571. The pastoralés are open-air dramas, like the moralities and mysteries of the middle ages. They are derived from French materials; but a dancing-chorus, strongly introduced, and other parts of the mixture, point to possibly earlier traditions. No MS. hitherto discovered is earlier than the 18th century. The greater part of the other literature is religious and translated. It is only recently that a real literature has been attempted in Basque with any success.

In spite of this modernity in literature there are other matters which show how strong the conservatism of the Basques really is. Thus, in dealing with the language, the only true measure of the antiquity of the race, we find that all cutting instruments are of stone; that the week has only three days. There are also other survivals now fast disappearing. Instead of the plough, the Basques used the laxy, a two-pronged short-handled steel digging fork, admirably adapted to small properties, where labour is abundant. They alone of the peoples of western Europe have preserved specimens of almost every class of dance known to primitive races. These are (1) animal (or possibly totem) dances, in which men personate animals, the bear, the fox, the horse, &c.; (2) dances to represent agriculture and the vintage performed with wine-skins; (3) the simple arts, such as weaving, where the dancers, each holding a long coloured ribbon, dance round a pole on which is gradually formed a pattern like a tree; (4) war-dances, as the sword-dance and others; (5) religious dances in procession before the Host and before the altar; (6) ceremonial dances in which both sexes take part at the beginning and end of a festival, and to welcome distinguished people. How large a part these played in the life of the people, and the value attached to them, may be seen in the vehement defence of the religious dances by Father Larramendi, S.J., in his Corografia de Guipuzcoa, and by the large sums paid for the privilege of dancing the first Saul Basque on the stage at the close of a Pastoralé.

The old Basque house is the product of a land where stone and timber are almost equally abundant. The front-work is of wood with carved beams; the balconies and huge over-hanging roof recall the Swiss chalet, but the side and back walls are of stone often heavily buttressed. The cattle occupy the ground-floor, and the first storey is reached often by an outside staircase. The carved tombstones with their ornaments resemble those of Celtic countries, and are found also at Bologna in Italy.

In customs, in institutions, in administration, in civil and political life there is no one thing that we can say is peculiarly and exclusively Basque; but their whole system taken together marks them off from other people and especially from their neighbours.

Character.—The most marked features in the Basque character are an intense self-respect, a pride of race and an obstinate conservatism. Much has been written in ridicule of the claim of all Basques to be noble, but it was a fact both in the laws of
Spain, in the *fueros* and in practice. Every Basque freeholder (*tecido*) could prove himself noble and thus eligible to any office. They are not a town race; a Basque village consists of a few houses; the population lives in scattered habitations. They do not fear solitude, and this makes them excellent emigrants and missionaries. They are splendid seamen, and were early renowned as whale fishermen in the Bay of Biscay. They were the first to establish the cod-fishery off the coast of Newfoundland. They took their full part in the colonization of America. Basque names abound in the older colonial families, and Basque newspapers have been published in Buenos-Aires and in Los Angeles, California. As soldiers they are splendid marchers; they retain the tenacity and power of endurance which the Romans remarked in the Iberians and Celtics. They are better in defense than attack. The failure to take Bilbao was the turning-point in both Carlist wars. In civil institutions and in the tenures of property the legal position of women was very high. The eldest born, whether boy or girl, inherited the ancestral property, and this not only among the higher classes but among the peasantry also. In the *fueros* an insult done to a woman, or in the presence of a woman, is punished more severely than a similar offence among men. This did not prevent women from working as hard as, or even harder than, the men. All authors speak of the robust appearance of the women-power on the Basque lands, and of those who loaded and unloaded the ships in Bilbao.

**Institutions.**—In their municipal institutions they kept the old Roman term *respublica* for the civitas and the territory belonging to it. All municipal officers were elective in some form or other, and there is hardly any mode of election, from universal suffrage to nomination by a single person chosen by lot, that the Basques have not tried. The municipalities sent deputies to the juntas or parliaments of each province. These assemblies took place originally in the open air, as in other parts of the Pyrenees, under trees, the most celebrated of which is the oak of Guernica in Biscay, or under copses, as the Bizar in the French Pays Basque.

The cortes of Navarre met at Pamplona. Delegates from the juntas met annually to consider the common interests of the three provinces. Besides the separate municipalities and the juntas, there were often associations and assemblies of three or five towns, or of three or four valleys, to preserve the special privilege or for the special needs of each. Hence was formed a habit of self-government, the practice of legislative, judicial and administrative functions, which resulted gradually in a code of written or unwritten laws embodied in the *fueros* or *fors* of each province, and the *cortes* (or juntas) of the three provinces. These charters are often grants from the lord or sovereign; in reality they are only a confirmation or codification of unwritten customary laws in practice among the people, the origin of which is lost in antiquity. The kings of Castile, of Spain and of Navarre were obliged at their accession, either in person, or by deputy, to swear to observe these *fueros*; and this oath was really kept. While the cortes were tramelled upon and absolutism reigned both in Spain and in France, the Basque *fueros* were respected; in Spain to the middle of the 19th century and in France down to the Revolution. The *fueros* thus observed made the Basque provinces a land of liberty (*una tierra libre*), or self-governing republic (*una verdadera autonomia*), under an absolute monarchy, to which, however, they were always loyal. And this independence was acknowledged, not only in local, but also in international and European treaties, as in art. 15 of the treaty of Utrecht 1713.

So the act of the 3rd of June 1786, which assimilated the Basque Provinces to the rest of Spain, acknowledged the true self-government which they had enjoyed for centuries.

The circumstances and methods which enabled the Basques to preserve this independence were, first, the isolation caused by their peculiar language; next, the mountainous and easily defended nature of the country, its comparative poverty and the possession of a sea-board. Then there were the rights and the safeguards which the *fueros* themselves gave against encroachments. The rights were:—freedom of election to all offices and to the juntas; exemption from all forced military service except for the defence of the country and under their own officers; and payment beforehand exacted for all service beyond their own frontiers (this did not of course exclude voluntary service of individuals in the Spanish or French armies). There was free trade with foreign nations, and especially between the Basques of both nations. The customs’ frontier of Spain really began on the Ebro. Then no decree or sentence of the royal authorities could have effect in the provinces except countersigned by the junta. Otherwise the resisting and even the killing of a royal officer was no murder. But clearest of all the safeguards was the provision that no tax or contribution should be levied or paid to the crown till all petitions had been heard and wrongs redressed; that such a vote should be the last act of the junta or cortes, and the money should be paid not as a demand of right or tax, but as a free gift, and as all the previous payments were paid in a lump sum, and the repartition and levy were left entirely in the hands of the junta and the municipalities.

As a further precaution against the inroads of absolutism, no lawyer was allowed to be a deputy to the junta and all clergy were likewise excluded. The Basques considered that men of these professions would be always on the side of tyranny. One lawyer (*letrado*) was present at the juntas for consultation on the points of law, but he was not allowed to vote. So strictly was this observed that after the battle of Vitoria in 1813, when it was found that several deputies had set together in the design of the country, the *letrado*, though one of the most active and influential members in consultation, was not allowed to vote.

The relations between Church and State among the Basques have been very remarkable. They are a highly religious people, eminently conservative in their religious practices. In religion alone, through Ignatius de Loyola of Guipúzcoa and Francis Xavier of Navarre, they have left their mark upon Europe. They have kept the earliest form of Christian marriage and of the primitive order of deaconesses, forgotten elsewhere in the West. The see of Compostela, instituted by Pope Urban IV. (1263) still appears in Basque literature as *Aquitania*. The earliest notice that we have of them speaks of their liberality to the clergy; yet with all this religious conservatism they have never allowed themselves to be priest-ridden. They constantly resisted the attempts of the crown to force upon them the authority of the Spanish bishops. When Ferdinand the Catholic came to Biscay in 1477 to swear to the *fueros*, he was compelled to send back the bishop of Pamplona whom he had brought with him. No strange priest could enter the town when the junta was sitting, and in some places if a deputy was seen speaking to a priest before the session he lost his vote for that day. The bishops had no share in ecclesiastical patronage in Guipúzcoa; all was in the hands of the king, of the nobles or of the municipalities, or else the priests were chosen by competitive examination or elected by the people. They would not allow the priest to interfere with the games or dances, and when the drama was forbidden in all Spain in 1757 by the authority of the Spanish bishops, the cortes of Navarre compelled the king to withdraw the order.

For a stranger coming from lands of larger farms and apparently higher cultivation, the agriculture of the Basques seems poor, but the old scattered homesteads show a sense of security that has been lacking in many parts of Spain; and the Basques (the *normes*), a thin-skinned but great adaptable to suit their agriculture to new conditions, helped by the presence of the courts at San Sebastian and Bayard. When the old self-sufficient village industries declined, in consequence of the invention of machinery and manufacture elsewhere, the Basques entered at once upon emigration to the agricultural parts of the Americas, and the result has been that the Basque Provinces and the Pays Basque probably have never been more prosperous than they are now, and perhaps a new Eskul-herrera and a new Eskura are being built up in the distant lands to which they are such well-adapted immigrants.

**Bibliography.**—For so restricted a literature see *Essai d’une bibliographie de la langue basque*, by Julien Vinson (Paris, 1891), with the volume of additions and corrections, 1898, is practically exhaustive, and is a mine of information on the principal works. See also for the language, A. Ollenhart, *Notices utraque Basconica* (Paris, 1638 and 1650), 4to., ch. xiv.; Fl. Lecluse, *Manuel de la*
**BASRA—BASS**

489

**BASRA** (written also BUSRA, BASSORA and BUSSORA), the name of a vilayet of Asiatlck Turkey, and of its capital. The vilayet has an area of 16,470 sq. m., formed in 1884 by detaching the southern districts of the Bagdad vilayet. It includes the great marshy districts of the lower Euphrates and Tigris, and of their joint stream, the Shatt el-Arab, and a sanjak on the western shore of the Persian Gulf. A settled population found in the vicinity is composed of Jowhar or Arab, along the river banks. Except the capital, Basra, there are no towns of importance. Korna, at the junction of the two great rivers; Amara on the Tigris; Shatrah on the Shatt el-Hai canal, connecting the Tigris and Euphrates; Nasriah, at the junction of that canal with the Euphrates and Suk esh-Shiekh, on the lower reaches of the Euphrates, are the principal settlements, with a population varying from 3000 to 10,000 or somewhat less. Along the Shatt el-Arab and the lower reaches of the Tigris and Euphrates there are vast plantations of date-palms, which produce the finest dates known. Here and there are found extensive groves of mulberry and date, which are also cultivated in places. But in general the ancient canals on which the fertility of the country depends have been allowed to go to ruin. The whole land is subject to inundations which render settled agriculture impracticable, and the population consists chiefly of nomadic and semi-nomadic tribes whose wealth consists in herds of buffaloes, horses, sheep and goats. The principal exports are wool, dates, cereals, gum, liquorice-root and horses. The climate is humid and unhealthy. The population is estimated at about 200,000 almost exclusively Moslems, of whom three-quarters are Shi'ites. There are about 40,000 Moslem Christian Maronites and 10,000 or more reckoned the remains of the curious sect of Sabaeans or Mandaeans, whose headquarters are in the neighbourhood of Suk esh-Shiekh.

The capital of the vilayet, also called Basra, is situated in 47° 34' E. long. and 33° N. lat., near the western bank of the Shatt el-Arab, about 55 m. from the Persian Gulf. The town proper lies on the canal el-'Assar about 1½ to 2 m. W. of the Shatt el-Arab. There are no public buildings of importance. The houses are mainly built, partly of sun-dried and partly of burnt bricks, with flat roofs surrounded by parapets. The bazaars are narrow and miserable, there are no streets, and the dwellings are of the date trees. The streets are irregular, narrow and unpaved. The greater part of the area of the town is occupied by gardens and plantations of palm-trees, intersected by a number of little canals, cleansed twice daily with the ebb and flow of the tide, which rises here about 9 ft. These canals are navigated by small boats, called bellem (plur. abram), resembling dug-outs in form, but light and graceful. At high-tide, accordingly, the town presents a very attractive appearance, but at low-tide, when the mud banks are exposed, it seems dirty and repulsive, and the noxious exhalations are extremely trying. The whole region is subject to inundations. The town itself is unhealthy and strangers especially are apt to be attacked by fever. Basra is the port of Bagdad, with which it has steam communication by an English line of river steamers weekly and also by a Turkish line. The Shatt el-Arab is deep and broad, easily navigable for ocean steamers, and there is weekly communication by passenger steamer between Basra and Shatt el-Arab, while two or more freight lines, which also take passengers, connect Basra directly with the Persian Gulf, and with European and British ports. It is the great date port of the world, and the dates of Basra are regarded as the finest in the market. Besides dates the principal articles of export are wool, horses, liquorice, gum and attar of roses. The annual value of the exports is approximately £1,000,000, and of the imports a little more. The foreign trade is almost exclusively in the hands of the English, but of late the Germans have begun to enter the market, and the Hamburg-American line of steamers has established direct communication. Since 1858 there has been a British Consul at Basra, before that time he was a representative of the Indian government. France and Russia also maintain consular establishments at Basra. The settled population of Basra is probably under 50,000, but how much it is impossible to estimate. It is a heterogeneous mixture of all the nations and religions of the East—Turks, Arabs, Persians, Indians, Armenians, Chaldaens and Jews. Of the latter there are about 1900, engaged in trade and commerce. Fewest in number are the Turks, comprising only the officials. Most numerous are the Arabs, chiefly Shi'ites. The wealthiest and most influential personage in the capital and the vilayet is the nakhb, or marshall of the nobility (i.e., descendants of the family of the prophet, who are entitled to wear the green turban). Basra is a station of the Arabian mission of the Dutch Reformed Church of America. History.—The original city of Basra was founded by the caliph Omar in A.D. 636 about 8 m. S.W. of its present site, on the edge of the stony and pebbly Arabian plateau, on an ancient canal now dry. The modern town of Zobeir, a sort of health suburb, occupied by the villas of well-to-do inhabitants of Basra, lies near the ruin mounds which mark the situation of the ancient city. In the days of its prosperity it rivalled Kufa and Wasit in wealth and size, and its fame is in the tales of the Arabian Nights. With the decay of the power of the Abashe caliphate its importance declined. The canals were neglected, communication with the Persian Gulf was cut off and finally the place was abandoned altogether. The present city was conquered by the Turks in 1668, and since that period has been the scene of many revolutions. It was taken in 1777 after a siege of eight months by the Persians under Sadik Khan. In about a year it fell again into the hands of the Turks, who were again deprived of it by the sheikh of the Montefik (Montafia) Arabs. The town was in the October following recovered by Suleiman Pasha, who encountered the sheikh on the banks of the Shatt el-Arab, and put him to flight; it has since been in the hands of the Turks. (J. F. E.)

**BASS,** the name of a family of English brewers. The founder of the firm, William Bass (b. 1726), was originally a carrier, one of his chief clients being Benjamin Pintorn, a Burton-on-Trent brewer. By 1777 Bass had saved a little money, and seeing the growing demand for Burton beer he started as a brewer himself. The principal market for Burton beer at that time was in St. Petersburg, whither the beer could be sent by water direct from Burton via the Trent and Hull, and William Bass managed to secure a tolerable share of the large Russian orders. But in 1822 the Russian government placed a prohibitory duty on Burton ales, and the Burton brewers were forced into cultivating the home market. William Bass opened up a connexion with London, and established a fairly profitable home trade. A misunderstanding between the East India Company and the London brewers who were the proprietors of Hodgson's India...
Bass

Pale Ale, at that time the standard drink of Englishmen in the East, resulted in Bass being asked to supply a beer which would withstand the Indian climate and be generally suitable to the Indian palate. After a series of experiments he produced what is still known as Bass's pale ale. This new and lighter beer at once became popular all over India, and Bass's firm became the largest in Burton. After William Bass's death the business was carried on by his son, M. T. Bass, and then by his grandson, Michael Thomas Bass (1799–1884). In 1827 a vessel laden with Bass's beer was wrecked in the Irish Channel. A large proportion of the cargo was however salvaged and sold at Liverpool, where it met with great approval in the local market, and through this chance circumstance the firm opened up a regular trade in the north-west of England and Ireland. "Bass" was, however, little drunk in London till 1851, when it was supplied on draught at the Exhibition of that year, since which time its reputation has been world-wide. In 1880 the business was turned into a limited liability company. Michael Thomas Bass, besides actively conducting and extending the firm's operations, was a man of great public spirit and philanthropy, and the towns of Burton and Derby are largely indebted to his munificence. He took a keen interest in all questions affecting the welfare of the working classes, and was largely instrumental in securing the abolition of imprisonment for debt. On his death, prior to which he had taken into partnership Messrs Ratcliff and Gretton, two of the leading officials of the brewery, converting the business into a limited company known as Messrs Bass, Ratcliff & Gretton, Ltd., the control of the firm passed to his sons, Michael Arthur Bass and Hamar Bass (d. 1898). Michael Arthur Bass (1837–1909), after twenty-one years in parliament as member first for Stafford, then for two divisions of Staffordshire, was in 1886 raised to the peerage as Baron Burton; by a special patent of 1897 the peerage descended to his daughter, Nellie, the wife of Mr J. E. Baillie of Dochfour, the baronetcy descending to his son, T. E. B. A. (Hamar Bass, 1909).—

Bass (the same word as "base," and so pronounced, but influenced in spelling by the Ital. basso), deep, low; especially in music, the lower part in the harmony of a composition, the lowest male voice, or the lowest-pitched of a class of instruments, as the bass-clarinet.

Bass or bastard (a word of doubtful origin, pronounced bást) is the fibrous bark of the lime tree, used in gardening for tying up plants, or to make mats, soft plaited baskets, &c. Basswood is the American lime-tree, Tilia americana; white basswood is T. heterophylla.

The name bass is also given to a fish closely resembling the perch.

Bassa, a province of the British protectorate of Northern Nigeria, occupying the angle made by the meeting of the Benue river with the Niger. It has an area of 7000 sq. m., with a population estimated at about one and a half millions. It is bounded N. by the Benue, W. by the Niger, S. by the frontier of Southern Nigeria, and E. by the province of Muri. The province is heavily forested, and is estimated to be one of the richest of the protectorate in natural products. It has never been penetrated by Moslem influence, and is inhabited in the greater part by warlike and unruly pagans. Early in the 16th century the Igibra (Okpoto or Ibo) were one of the most powerful pagan peoples of Nigeria and had their capital at Iddah. At a later period the Bassas conquered the western portion of the state and the Munshis the eastern, while the Okpoto still held the south and a wedge-shaped district partially dividing the Munshis and Bassas. The Bassas are a very remarkable pagan race who permeate the entire protectorate of Northern Nigeria, and are to be found in small colonies in almost every province. They are clever agriculturists, naturally peaceful and industrious. The Munshis, though also good agriculturists, are a warlike and most unruly race, as are also the Okpoto.

The districts which now comprise the province of Bassa came nominally under British control in 1900, but up to the year 1903 administrative authority was confined to the western half with Dekina (in 7° 3' E., 7° 41' N.) for its capital. In December of 1903 a disturbance resulting in the murder of the British resident led to the despatch of a military expedition, and as a result of the operations the frontiers of the districts under control were extended to the borders of the Munshi country in about 8° E. The western portion of the province, occupied by the friendly and peaceful tribes upon the Niger, has been organized for administration on the same system as the rest of the protectorate. Courts of justice are operative and taxes are peacefully collected. The Okpoto, however, remain turbulent, as do their neighbours the Munshis. Spirits, of which the importation is forbidden in Northern Nigeria, are freely smuggled over the border from Southern Nigeria. Arms and powder are also imported. The slave-trade is still alive in this district, and an overland route for slaves is believed to have been established through eastern Bassa to the Benue. In consequence of the natural wealth of the people, there are trading establishments of the Niger Company and of Messrs Holt on the Niger and Benue, and colonies of native traders have penetrated the country from the north. Roman Catholic and Protestant missions are established at Dekina and Gobece.

Bassano, Jacopo da Ponte (1510–1592), Venetian painter, was born at Bassano. He was educated by his father, who was himself an artist, and then completed his studies at Venice. On the death of his father he returned to Bassano and settled there. His subjects were generally peasants and villagers, both as landscapes and portraits and historical designs. His figures are well designed, and his fine views. The scenes have an agreeable air of simplicity. His compositions, though they have not much eloquence or grandeur, have abundance of force and truth; the local colours are well observed, the flesh-tints are fresh and brilliant, and his chiaroscuro and perspective are unexceptionable. He is said to have finished a great number of pictures; but his genuine works are somewhat rare and valuable—many of those which are called originals being copies either by the sons of Bassano or by others. Bassano's style varied considerably during his lifetime. He naturally was at first under the influence of his father, but the discipline of the Northern schools, of which he had a thorough acquaintance, had a certain influence on him. He was then strongly attracted by the lightness and beautiful colouring of Titian, and finally adopted the style which is recognized as his own. Although he painted few great pictures, and preferred humble subjects, yet his altar-piece of the Nativity at Bassano is estimated highly by the best judges, and in Lanzi's opinion is the finest work of its class.

Bassano, a city of Venetia, Italy, in the province of Vicenza, 24 m. N.E. of Vicenza and 30 m. N. of Padua by rail, at the foot of the Venetian Alps. Pop. (1901) town, 7553; commune, 15,907. The latter is situated upon the Brenta, which is here spanned by a covered wooden bridge, and commands views of the castles, erected by the Ezzelini in the 13th century, lies in the upper portion of the town, above the river; a tower, erected by a member of the same family, is a conspicuous feature. The museum and cathedral and some of the other churches contain pictures by the da Ponte family (16th and early 17th century), surnamed Bassano from their birth-place; Jacopo is the most eminent of them. The museum also contains drawings and letters of the sculptor Antonio Canova. The church of S. Francesco, begun in the 12th century in the Lombard Romanesque style, was continued in the 15th in the Gothic style. Some of the houses have traces of paintings on their façades. In the 11th century Eccelin, a German, obtained sittings in this district from Conrad II. and founded the family of the Ezzelini, who were prominent in the history of North Italy in the 13th and 14th centuries. Bassano apparently came into existence about A.D. 1000. Its possession was disputed between Padua and Vicenza; it passed for a moment under the power of Gian Galeazzo Visconti of Milan, who fortified it. At the beginning of the 13th century it went over to Venice; its industries flourished under Venetian government, especially its manufacture of woolen cloth. Bassano was taken by the Austrian army in 1797; a year later it was again taken by the Austrians, who found 8000 dead in the churchyard.

Bassarab or Bassarabia, the name of a dynasty in Rumania, which ruled Walachia from the dawn of its history until 1668.
The origin of the name and family has not yet been explained. It undoubtedly stands in close connexion with the name of the province of Bassarabia, which oriental chroniclers gave in olden times to the whole of Walachia. The heraldic sign, three heads of negroes in the Bassarab shield, seems to be of late western origin and to rest on a popular etymology connecting the second half of the word with Arabs, who were taken to signify Moors (blacks). The other heraldic signs, the crescent and the star, have evidently been added on the same supposition of an oriental origin of the family. The Servian chroniclers connect its origin with their own nationality, basing this view upon the identification of Sarah with Sorb or Serbs. All this is mere conjecture. It is, however, a fact that the first appearance of the Bassarabs as rulers (beyaz, bow or mirz) is in the western part of Rumania (originally called Little Walachia), and also in the southern parts of Transylvania—the old dukedoms of Fogaras and Al마sh, which are situated on the right bank of the Olt (Aluta) and extend south to Severin and Craiova. Whatever the origin of the Bassarabs may be, the foundation of the Walachian principality is undoubtedly connected with a member of that family, who, according to tradition, came from Transylvania and settled first in Campbellung and Tirgovishten. It is equally certain that almost every one of the long line of princes and voivodes bore a Slavonic surname, perhaps due to the influence of the Slavonic Church, to which the Rumanians belonged. Starting from the 13th century the Bassarabs soon split into two rival factions, known in history as the descendants of the two brothers Dan and Dragul. The form Drakul—devil—by which this line is known in history is no doubt a nickname given by the rival line. It has fastened on the family on account of the cruelties perpetrated by Vlad Drakul (1433-1446) and Vlad Tsepes (1456-1476), who figure in popular legend as representatives of the most frightful cruelty. The feud between the rival dynasties lasted from the beginning of the 15th century to the beginning of the 17th.

The most prominent members of the family were Mircea (1386-1418), who accepted Turkish suzerainty; Neagoe, the founder of the famous cathedral at Curtea de Arges (q.v.); Michael, nicknamed the Brave (1502-1601); and Petru Cercel, famous for his profound learning, who spoke twelve languages and carried on friendly correspondence with the greater scholars and poets of Italy. He was drowned by the Turks in Constantinople in 1590 through the intrigues of Mihnea, who succeeded him on the throne of Walachia. The British Museum possesses the oldest MSS. of the Rumanian Gospels, one owned by Petru Cercel, and containing his autograph signature. The text was published by Dr M. Gaster at the expense of the Rumanian government. Mateiu Bassarab (1633-1654) established the first printing-press in Rumania, and under his influence the first code of laws was compiled and published in Bucharest in 1654. The Bassarab dynasty became extinct with Constantin Sherban in 1658. See Rumania: Language and Literature. (M. G.)

BASS CLARINET (Fr. clarinette basse; Ger. Bass-Klarinette; It. clarinetto basso or clarone; practically the A, Bb or C clarinet speaking an octave lower; what therefore has been said concerning the fingering, transposition, acoustic properties and general history of the clarinet (q.v.) also applies to the bass clarinet. Owing to its greater length the form of the bass clarinet differs from that of the clarinets in that the bell joint is bent up in front of the instrument, terminating in a large gloxinia-shaped bell, and that the mouthpiece is attached by means of a strong ligature and screws to a serpent-shaped crook of brass or silver. The compass of the modern orchestral bass clarinet is in the main the same as that of the higher clarinets in C, Bb and A, but an octave lower, and therefore for the bass clarinet in C is C1-3C1-3; for the bass clarinet in Bb the real sounds are one tone, and for the bass clarinet in A 1½ tone lower, although the notation is the same for all three.

Sometimes the treble clef is used in notation for the bass clarinet. It must then be understood that the instrument in C speaks an octave lower, the bass clarinet in Bb a major ninth and the bass clarinet in A a minor tenth lower. The tenor clef is also frequently used in orchestral works.

The quality of tone is less reedy in the bass clarinet than in the higher instruments. It resembles the bourdon stop on the organ, and in the lowest register, more especially, the tone is somewhat hollow and wanting in power although mellower than that of the bassoon. In the lowest octave the instrument speaks slowly and is chiefly used for sustained bass or melody notes; rapid passages are impossible.

The modern orchestral model may be fitted with almost every kind of key-mechanism, including the Boehm, and the degree of perfection and ingenuity attained has removed the all but insurmountable difficulties which stood in the way of the original inventors who, not understanding key-work, made many futile attempts to bridge the necessarily great distance between the finger-holes by making the bore serpentine, boring the holes obliquely, &c.

The low pitch of the bass clarinet (8 ft. tone) contrasted with the moderate length of the instrument—whose bore measures only some 42 to 43 inches from mouthpiece to bell, whereas that of the bassoon, an instrument of the same pitch, is twice that length—is a puzzle to many. An explanation of the fact is to be found in the peculiar acoustic properties of the cylindrical tube played by means of a reed mouthpiece characteristic of the clarinet family, which acts as a closed pipe speaking an octave lower than an open pipe of the same length, and overblowing a twelfth instead of an octave. This is more fully explained in the articles CLARINET AND AULOS.

The construction of the bass clarinet demands the greatest care. The bore should theoretically be strictly cylindrical throughout its length from mouthpiece to bell joint; the slightest deviation from mathematical accuracy, such as an undue widening of the bell from the point where it joins the body to the mouthpiece, gives rise to serious overblowing of the lower notes of the instrument and to destroy correct intonation.

The origin of the bass clarinet must be sought in Germany, where Heinrich Grenser of Dresden, one of the most famous instrument-makers of his day, made the first bass clarinet in 1793. The bassett horn (q.v.) or tenor clarinet, which had reached the height of its popularity, no doubt suggested to Grenser, who was more especially renowned for his excellent fagottos, the possibility of providing for the clarinet a bass of its own. One of these earliest attempts in the form of a fagotto, stamped on Grenser, Dresden, "with nine square-flapped brass keys working on knobs, is in the Groszherzogliches Museum at Darmstadt and was sent to the Royal Military Exhibition, London 1850. Two other early specimens, belonging originally to Adolphe Sax and to M. de Cousseman, are now respectively preserved in the museums of the Brussels Conservatoire and of the Berlin Hochschule (Snoeck Collection). The tubes are of great thickness and the holes are bored obliquely through the walls. Both instruments are in A.

Attempts were made in Italy to overcome the mechanical difficulties by making the bore of the bass clarinet serpentine. A specimen by Nicolaus Papulini of Pavia in the museum of the Brussels Conservatoire has the serpentine bore pierced through two slabs of pear-wood; the two halves, each forming a vertical section of the instrument, are fitted together with wooden pins. The outside length is only 2 ft. 3 in. and there are nineteen finger-holes.

Joseph Uhmann of Vienna constructed a bass clarinet, also termed " bass basset horn," with twenty-three keys and a compass from Bb through four complete octaves with all chromatic

BASSEIN—BASSES-PYRÉNÉES

semitones. These instruments resemble the saxophones (q.v.), having the bell joint bent up in front and the crook almost at right angles backwards, but the bore of the saxophone is conical.

Georg Streitwolf (1779–1837), an ingenious musical instrument-maker of Göttingen, produced in 1828 a bass clarinet with a compass extending from Ab to F, and this instrument was used in the same manner as that of the clarinet but with few exceptions. In form it resembled the fagotto and had a crook terminating in a beak mouthpiece. The Streitwolf bass clarinet was adopted in 1834 by the Prussian infantry as bass to the wood-wind.1 Streitwolf's first bass clarinet were in C, but later he constructed instruments in B♭ as well. Like the basset horn, Streitwolf's instruments had the four chromatic open keys extending the compass downwards to B♭. The tone was of very fine quality. One of these instruments is in the possession of Herr C. Krispe of Erfurt,2 and another is preserved in the Berlin collection at the Hochschule.

It was, however, the successive improvements of Adolphe Sax (Paris, 1814–1894), working probably from Grenser's and later from Streitwolf's models, which produced the modern bass clarinet, and following up the work of Halary and Buffet in the same field, he secured its introduction into the orchestras at the opera. The bass clarinet in C made its first appearance in opera in 1836 in Meyerbeer's Huguenots, Act V, where in a postlude the lower register of the instrument is displayed to advantage, and later in Dinorah (Le pardon de Ploermel). Two years later (1858) at the theatre of Modena a bass clarinet by F. Malino of Milan, differing in construction from the Sax model, was independently introduced into the orchestra.3 Wagner employed the base clarinet in B♭ and C in Tristan und Isolde,4 where at the end of Act II it is used with great effect to characterize the reproachful utterance of King Mark, thus:

BASSEIN, a district and town in the Irrawaddy division of Lower Burma, in the delta of the Irrawaddy. The district has been reduced to 4127 sq. m., from 8054 sq. m. in 1871, having given up a large tract to the district of Myuangmya formed in 1896.

A mountain range called the Anauk-pet Taungmyin stretches through the district from N. to S. along the coast. The principal river of the district is the Irrawaddy, which debouches on to the Gulf of Martaban its eastern extremity through a delta intersected with salt water creeks, among which the Pyamalaw, Pyinlau, Kyunton, and Ngawn Shaggyi or Bassein river rank as important arms of the sea. Irrawaddy and Inyegyi are the only two lakes in the district. The delta of the Irrawaddy forms, wherever cultivable, a vast sheet of rice, with cotton, sesame, and tobacco as subsidiary crops. In 1901 the population was 301,427.

Bassein, the chief town and port, is the capital of the district and division, and is situated on the eastern border of the Bassein river, one of the main arteries by which the waters of the Irrawaddy discharge themselves into the sea. It forms an important seat of the rice trade with several steam rice mills, and has great capabilities both from a mercantile and a military point of view, as it commands the great outlet of the Irrawaddy. It fell before the British arms, in May 1852, during the second Burmese war. In 1901 it had a population of 31,864. The vessels of the Irrawaddy Flotilla Company ply between Rangoon and Bassein, &c., by inland waters, and a railway opened in 1903 runs north-eastward through the centre of the district, to Henzada and Letpadan.

BASSELIN, OLIVIER (c. 1400–c. 1450), French poet, was born in Val-de-Vire in Normandy about the end of the 14th century. He was by occupation a fuller, and tradition still points out the site of his mill. His singing songs became famous under the name of Vaux-de-Vire, corrupted in modern times into "vaudeville." From various traditions it may be gathered that Bassei was killed in the English wars about the middle of the century, possibly at the battle of Formigny (1450). At the beginning of the 17th century a collection of songs was published by a Norman lawyer, Jean Le Houx, purporting to be the work of Olivier Bassei. There seems to be very little doubt that Le Houx was himself the author of the songs attributed to Bassei, as well as of those he acknowledged as his own.

It has been suggested that Bassei's name may be safely connected with some songs preserved in the Bibliothèque Nationale at Paris, and published at Caen in 1866 by M. Armand Gasté. The question is discussed in M. V. Patard's La Verité dans la question Olivier Bassei et Jean le Houx à propos du Vau-de-Vire (1897). A. Gasté's edition (1875) of the Vaux-de-Vire was translated (1885) by J. P. Muirhead.

BASSES-ALPES, a department of south-eastern France, formed in 1790 out of the northern portion of Provence. It is bounded N. by the department of the Hautes Alpes, E. by Italy and the department of the Alpes Maritimes, S. by that of the Var, and W. by those of Vaucluse and the Drôme. Its area is about 2698 sq. m., while its greatest length is 80¾ m. and its greatest breadth 56 m. Pop. (1906) 115,126. The river Durance passes through the western part of this department, receiving (left), as affluents, the Ubaye, the Bléone and the Asse (the entire course of each of these rivers is included within the department) as well as the Verdon, the upper course of which is within the department, while the lower course forms its southern limit. It is a poor and hilly district, the highest summits (the loftiest is the Aiguille de Chambevrey, 11,155 ft.) rising round the head of the Ubaye. The department is divided into five arrondissements (Digne, Barcelonnette, Castellane, Forcalquier, and Sisteron), 30 cantons and 250 communes. It forms the bishopric of Digne, formerly in the ecclesiastical province of Embrun, but since 1802 in that of Aix-en-Provence. Its chief towns are Digne, Barcelonnette, Castellane, Forcalquier, and Sisteron. It is poorly supplied with railways (total length 1004 m.), the main line from Grenoble to Avignon running through it from Sisteron to Manosque, and sending off two short branch lines to Digne (14 m.) and to Forcalquier (9 m.). It is a poor department from the material point of view, being very mountainous and having few navigable mountain pastures. But these pastures have been much damaged by the Provençal shepherds to whom they are let out, while the forests have been very much thinned (though extensive reafforestments are now being carried out) so that the soil is very dry and made drier by exposure to the southern sun. From near the head of the Ubaye valley the pass of the Col de l'Argentière (5645 ft.) leads over from Barcelonnette to Cuneo, in Italy: it was perhaps traversed by Hannibal, and certainly in 1515 by Francis I.

BASSES-PYRÉNÉES, a department of south-western France, at the angle of the Bay of Biscay, formed in 1790, two-thirds of it from Béarn and the rest from three districts of Gascony—Basse-Navarre, Soule and Labourd. The latter constitute the Basque region of France (see BASQUES) and cover the west of the department. Basses-Pyrénées is bounded N. by Landes and Gers, E. by Hautes-Pyrénées (which has two enclaves forming five communes within this department), S. by Spain, and W. by the Atlantic Ocean. Pop. (1906) 426,871. Area, 2977 sq. m. The whole of the south of the department is occupied by the western and lower summits of the Pyrenees. The remainder consists of a region of heaths and plateaux to the north-east of the Gave de Pau, and of hills divided by numberless fertile valleys to the west of that river. The height of the mountains of the southern frontier increases gradually from west to east. The peak of the Rhune, to the south of St Jean de Luz, rises only to 2590 ft.; and on the border of the Basque country the mean height of the summits is not more than 1000 ft. The peak of Orhy alone, in the south of the valley of Mauléon, reaches 6618 ft. But beyond that of Anie (8125 ft.), on the meridian of Orthez, which marks the boundary of Béarn, much loftier elevations appear,—Mourous (9760 ft.), on the border of Hautes-Pyrénées, and the southern peak of Ossau (9465 ft.). The border between France and Spain, for the most part,
follows the crest-line of the main range. Forts guard the upper valleys of the Nive and the Aspe, along which run important passes into Spain. The general direction of the rivers of the department is towards the north-west. The streams almost all meet in the Adour through the Gave de Pau, the Bidouze, and the Nive. In the north-east the two Luys flow directly to the Adour, which they join in Landes. In the south-west the Nivelle and the Bidassoa flow directly into the sea. The lower course of the Adour forms the boundary between Basses-Pyrénées and Landes; it enters the sea a short distance below Bayonne over a shifting bar, which has often altered the position of its mouth. The Gave de Pau, a larger stream than the Adour, passes Pau and Orthez, but its current is so swift that it is only navigable for a few miles above its junction with the Adour. On the left it receives the Gave d'Oloron, formed by the Gave d'Ossau, descending from the Pic du Midi, and the Gave d'Aspe, which rises in Spain. An important affluent of the Gave d'Oloron, the Saison or Gave de Mauléon, descends from the Pic d'Orhy. From the Pic des Escaliers, which rises above the forest of Iraty, the Bidouze descends northwards; while the forest, though situated on the southern slope of the chain, forms a part of French territory. The Nive, a beautiful river of the Basque country, takes its rise in Spain; after flowing past St Jean-Pied-de-Port, formerly capital of French Navarre and fortified by Vauban to guard the pass of Roncavaux, it joins the Adour at Bayonne. The Nivelle also belongs only partly to France and ends its course at St Jean-de-Luz. The Bidassoa, which is only important as forming part of the frontier, contains the Ile des Faisans, where the treaty of the Pyrenees was concluded (1659), and debouches between Hendaye (France) and Fuenterrabia (Spain).

The climate of the department is mild and it has an abundant rainfall, partly due to the west wind which drives the clouds from the gulf of Gascogne. The spring is rainy; the best seasons are summer and autumn, the heat of summer being moderated by the sea. The winters are mild. The air of Pau agrees with invalids and delicate constitutions, and St Jean-de-Luz and Biarritz are much frequented by winter visitors.

Despite extensive tracts of uncultivated land, the department is mainly agricultural. Maize and wheat are the chief cereals; potatoes, flax and vegetables are also produced. Pasture is abundant, and horses, cattle, sheep and pigs are largely reared. The vine is grown on the lower slopes sheltered from the north wind, the wines of Jurançon, near Pau, being the most renowned. Of the fruits grown, chestnuts, cider-apples, and pears are most important. About one-thirteenth of the department consists of woods, a very small proportion of which belong to the government, the rest to the communes and private individuals.

The department furnishes salt, building-stone, and other quarry products. There are mineral springs at Eaux-Bonnes, Eaux-Chaudes, Cambo-les-Bains (resorted to by the Basques on St John's Eve), St Christau, and Salies. At Le Boucau, 3 m. from Bayonne, there are large metallurgical works, the Forges de l'Adour, and chemical works. The manufactures of the department include wooden caps and sashes, cord slippers, chocolate, and paper, and there are also tanneries, saw- and flour-mills. "Bayonne hams" and other table delicacies are prepared at Orthez. There is a considerable fishing population at Bayonne and St Jean-de-Luz. Bayonne is the principal port. Exports consist chiefly of timber, mine-pros, minerals, wine, salt and resinous products. Coal, minerals, phosphates, grain and wool are leading imports. The interior commerce of the department is, however, of greater importance to its inhabitants; it takes the form of exchange of products between the regions of mountain and plain. The railway lines of Basses-Pyrénées, the chief of which is that from Bayonne to Toulouse via Orthez and Pau, belong to the Southern Company. The Adour, the Nive and the Bidouze are navigable on their lower courses. The department has five arrondissements—Pau, Bayonne, Oloron, Orthez and Mauléon, divided into 47 cantons and 559 communes. It constitutes the diocese of Bayonne, comes within the educational circumscription (académie) of Bordeaux and belongs to the district of the XVIII. army corps. Pau, the capital and seat of a court of appeal, Bayonne, Oloron, Biarritz, Orthez, Eaux-Bonnes, and St Jean-de-Luz are the principal towns. The following places are also of interest—Lescar, which has a church of the 12th and 16th century, once a cathedral; Montaner, with a stronghold built in 1380 by Gaston Phoebus, count of Foix and viscount of Béarn; and Sauveterre, a town finely situated on the Gave d'Oloron, with an old bridge, remains of a feudal castle, and a church in the Romanesque and Gothic styles.

BASSET, or BASSETTE, a French game of cards played by five persons with a pack of fifty-two cards. Once very popular, it is now practically obsolete. It is said to be of Venetian origin and to have been introduced into France by Justiniani, the ambassador of Venice in the second half of the 17th century. It resembles lansquenet (q.v.) in a general way, in that it is played between a banker and several punters, the players winning or losing according as cards turned up match those already exposed or not.

BASSET HORN (Fr. Cor de Basset, or Cor de Bassette; Ger. Bassethorn, Basshorn; Ital. Corno di Bassetto), a wood-wind instrument, not a "horn," member of the clarinet family, of which it is the tenor. The basset horn consists of a nearly cylindrical tube of wood (generally cocus or box-wood), having a cylindrical bore and terminating in a metal bell wider than that of the clarinet. For convenience in reaching the keys and blowing at modern instrument is usually bent or curved either near the mouthpiece or at the bell, which is turned upwards. The older models were bent in the middle at an obtuse angle, and had at the bottom of the lower joint, near the bell, a wooden block, inside which the bore was reflexed, and bent down upon itself. The basset horn has the same fingering as the clarinet, and corresponds to the tenor of that instrument, being pitched a fifth below the clarinet in C. The alto clarinet in E♭ is often substituted for the basset horn, especially in military bands, but the instruments differ in three particulars:—(1) The basset horn has a metal bell instead of the pear-shaped contracted bell of the alto clarinet. (2) The bore of the basset horn is wider than that of the alto clarinet in E♭, or of the tenor clarinet in F. (3) The tube of the basset horn is longer than that of the clarinet, and contains four additional long keys, worked by the thumb of the right hand, which in the clarinet is only used to steady the instrument. These keys give the basset horn an extended compass of two tones downwards to F ♭ whereas the E♭ clarinet only extends to G ♭ and the F clarinet to A ♭ (actual sounds). This brings the compass of the basset horn to a range of four octaves from ♭

![Bassett Horn](https://via.placeholder.com/150)

An instrument of this type, stamped "H. Grenser, S. Wiesner, Dresden," is in the collection of the Rev. F. W. Galpin, of Hatfield, Broad Oak.
Like the clarinet, the basson is a transposing instrument, its music being written a fifth higher than the actual sounds. The treble clef is used in notation for all but the lowest register. The technical capabilities of the basson are the same as for the clarinet, except that the notes are written lower, and are more easily produced slowly and staccato; the notes of the upper register being better represented in the clarinet are seldom used in orchestral music.

The tone of the bass horn is extremely reedy and rich, especially in the medium and low registers; the tone colour is similar to that of the clarinet without its brilliancy; it is mellow and sensuous, but slightly sombre, and therefore well adapted for music of an elegiac funereal character.

The bass horn flourished mainly in Germany, where at the end of the 18th century it was the favourite solo instrument of many celebrated instrumentists, and especially modernists. Beethoven employed it in his Prometheus overture. Mendelssohn used it in military music, and in two concert pieces for clarinet and bass horn with pianoforte accompaniment, in F and D minor, op. 113 and 114, dedicated to Heinrich and Carl Bärmann.

The archetypes of the bass horn are the same as those of the clarinet (q.v.). The bass horn was the outcome of the desire, prevailing during the 16th and 17th centuries, to obtain complete families of instruments to play in concert. The invention of the bass horn in 1770 is attributed to a clarinet maker of Passau, named Horn, whose name was given to the instrument; by a misnomer, the bass horn became known in Italy as cornet da basso, and in France as cor de basset. In 1782, Theodore Lotz of Pressburg made some modifications in the instrument, which was further improved by two instrumentalists of Vienna, Anton and Johann Stadler, and finally in 1812 by Iwan Mueller, a famous clarinetist, who invented the alto clarinet in E♭ from the bass horn, by giving the latter a construction and fingering analogous to those of the clarinet in B♭, which he took as his model, instead of the clarinet in C.

BASSI, LAURA MARIA CATERINA (1711-1728), an Italian lady eminently distinguished for her learning, was born at Bologna in 1711. On account of her extraordinary attainments she received a doctor's degree, and was appointed professor in the philosophical school, where she delivered public lectures on experimental philosophy till the time of her death. She was elected member of many literary societies and carried on an extensive correspondence with the most eminent European men of letters. She was well acquainted with classical literature, as well as with that of France and Italy. In 1738 she married Giuseppe Verrati, a physician, and left several children. She died in 1778.

BASSI, UGO (1800-1849), Italian patriot, was born at Cento, and received his early education at Bologna. An unhappy love affair induced him to become a novice in the Barnabite order when eighteen years old. He repaired to Rome, where he led a life of study and devotion, and entered on his ministry in 1833. It was as a preacher that he became famous, his sermons attracting large crowds owing to their eloquence and genuine enthusiasm. He lived chiefly at Bologna, but travelled all over Italy preaching and tending the poor, so poor himself as to be sometimes almost starving. On the outbreak of the revolutionary movements in 1848, when Pope Pius IX. still appeared to be a Liberal and an Italian patriot, Bassì, filled with national enthusiasm, joined General Durando's papal force to protect the frontiers as army chaplain. His eloquence drew fresh recruits to the ranks, and he exercised great influence over the soldiers and people. When the court discarded all connexion with foreign national revolutions, it was only Bassì who could restrain the Bolognese in their indignation. At Treviso, where he had followed Guidotti's volunteers against the Austrians, he received three wounds, delighted to shed his blood for Italy (17th of May, 1848). He was taken to Venice, and on his recovery he marched unarmed at the head of the volunteers in the fight at Mestre. After the pope's flight from Rome and the proclamation of the Roman republic, Bassì took part with Garibaldi's forces against the French troops sent to re-establish the temporal power. He exposed his life many times while leading the wounded under fire, and when Garibaldi was forced to leave Rome with his volunteers the faithful monk followed him in his wanderings to San Marino. When the legion broke up Garibaldi escaped, but Bassì and a fellow-Garibaldian, Count Livraghi, after endless hardships, were captured near Comacchio. On being brought before the papal governor, Bassì said: "I am guilty of no crime save that of being an Italian like yourself. I have risked my life for Italy, and your duty is to do good to those who have suffered for her." The governor would have freed the prisoners; but he did not dare, and gave them over to an Austrian officer. They were sent to Bologna, falsely charged before a military court with having been armed with arms in their hands (Bassi had never borne arms at all), and shot on the 8th of August, 1849. Bassì is one of the most beautiful figures of the Italian revolution, a gentle unselsh fish, who, although unusually gifted and accomplished, had an almost childlike nature. His execution excited a feeling of horror all over Italy.

Countess Martinengo gives a charming sketch of his life in her Italian Characters (2nd ed., London, 1901); see also Zironi, Vita del condottiero Ugo Bassì (Bologna, 1859); F. Ventosa, Bassì, Maríer de Bologna, in the Pantheon dei Martiri Italiani (Milan, 1863). (L. V.)

BASSIANUS, JOANNEs, Italian jurist of the 12th century. Little is known of his origin, but he is said by Corolus de Tocco to have been a native of Cremona. He was a professor in the law school of Bologna, the pupil of Bulgarus (q.v.), and the master of Azo (q.v.). The most important of his writings which have been preserved in his Summary on the Authentica, which Savigny regarded as one of the most precious works of the school of the Gloss-writers. Joannes, as he is generally termed, was remarkable for his talent in inventing ingenious forms for explaining his ideas with greater precision, and perhaps he most celebrated work is his De Lex Cer dew. Arbores, of which has been the subject of numerous commentaries. The work presents a tree, upon the branches of which the various kinds of actions are arranged after the manner of fruit. The civil actions, or actions stricti juris, being forty-eight in number, are arranged on one side, whilst the equitable or praetorian actions, in number one hundred and twenty-one, are arranged on the other side. A further scientific division of actions was made by him under twelve heads, and by an ingenious system of notation the student was enabled to class at once each of the civil or praetorian actions, as the case might be, under its proper head in the scientific division. By the side of the tree a few glosses were added by Joannes to explain and justify his classification. His Lectures on the Pandects and the Code, which were collected by his pupil Nicolaus Furius, have unfortunately perished.
BASSOMPIERRE—BASSOON

François de Bassompierre (1539–1646), French courtier, son of Christophe de Bassompierre (1547–1596), was born at the castle of Harrouel in Lorraine. He was descended from an old family which had for generations served the dukes of Burgundy and Lorraine, and after being educated with his brothers in Bavaria and Italy, was introduced to the court of Henry IV. in 1598. He became a great favourite of the king and shared to the full in the dissipations of court life. In 1600 he took part in the brief campaign in Savoy, and in 1603 fought in Hungary for the emperor against the Turks. In 1614 he assisted Marie de' Medici in her struggle against the nobles, but upon her failure in 1617 remained loyal to the King Louis XIII. and assisted the royalists when they routed Marie's supporters at Ponts-de-Cé in 1626. His services during the Huguenot rising of 1621–22 won for him the dignity of marshal of France. He was with the army of the king during the siege of La Rochelle in 1628, and in 1629 distinguished himself in the campaign against the rebels of Languedoc. In 1633 Bassompierre had purchased from Henri, duc de Rohan (1579–1638), the coveted position of colonel-general of the Swiss and Grisons; on this account he was sent to raise troops in Switzerland when Louis XIII. marched against Savoy in 1630, and after a short campaign in Italy his military career ended. As a diplomatist his career was a failure. In 1632 he went to Madrid as envoy extraordinary to arrange the dispute concerning the seizure of the Valteline forts by Spain, and signed the fruitless treaty of Madrid. In 1625 he was sent into Switzerland on an equally futile mission, and in 1626 to London to secure the retention of the Catholic ecclesiastics and attendants of Henrietta Maria, wife of Charles I. The personal influence of Henry IV. had deterred Bassompierre from a marriage with Charlotte de Montmorency, daughter of the constable Montmorency, afterwards princesse de Condé; and between 1614 and 1630 he was secretly married to Louise Marguerite, widow of François, prince de Conti, and through her became implicated in the plot to overthrow Richelieu on the "Day of Dupes" 1630. His share was only a slight one, but his wife was an intimate friend of Marie de' Medici, and her hostility to the cardinal aroused his suspicions. By Richelieu's orders, Bassompierre was arrested at Senlis on the 29th of February 1631, and put into the Bastille, where he remained until Richelieu's death in 1643. On his release his offices were restored to him, and he passed most of his time at the castle of Tillières in Normandy, until his death on the 26th of January 1645. He left a son, François de la Tour, by the princesse de Conti, and an illegitimate son, Louis de Bassompierre, afterwards bishop of Saintes. His Mémoires, which are an important source for the history of his time, were first published at Cologne in 1665. He also left an incomplete account of his embassies to Spain, Switzerland and England (Cologne, 1668) and a number of discourses upon various subjects.

BASSOON (Fr. basson; Ger. Fagott; Ital. fogotto), a woodwind instrument with double reed mouthpiece, a member of the oboe (q.v.) family, of which it is the bass. The German and Italian names of the instrument were bestowed from a fancied resemblance to a bundle of sticks, the bassoon being the first instrument of the kind to be doubled back upon itself; its direct ancestor, the bass pommer, 6 ft. in length, was quite straight. The English and French names refer to the pitch of the instrument as the bass of the wood-wind.

The bassoon is composed of five pieces, which, when fitted together, form a wooden tube about 8 ft. long (93 in.) with a conical bore tapering from a diameter of 1 in. at the bell, to 1⁄4 in. at the reed. The tube is doubled back upon itself, the shorter joint extending to about two-thirds of the length of the longer, whereby the height of the instrument is reduced to about 4 ft. The holes are brought into a convenient position for the fingers by the device of boring them obliquely through the thickness of the wood. The five pieces are:—(1) the bell; (2) the long joint, forming the upper part of the instrument when played, although its notes are the lowest in pitch; (3) the wing overlapping the long joint and having a projecting flap through which are bored three holes; (4) the butt or lower end of the instrument (when played) containing the double bore necessitated by the abrupt bend of the tube upon itself. Both bores are pierced in one block of wood, the prolongation of the double tube being usually stopped by a flat oval pad of cork in the older models, whereas the modern instruments have instead a U-shaped tube; (5) the crook, a narrow curved metal tube about 12 in. long, to which is attached the double reed forming the mouthpiece.

The performer holds the instrument in a diagonal position; the lower part of the tube (the butt joint) played by the right hand resting against his right thigh, and the little bell, turned upwards, pointing over his left shoulder; a strap round the neck affords additional support. The notes are produced by means of seven holes and 16, 17, or 19 keys. The mechanism and finger- ing are very intricate. Theoretically the whole construction of the bassoon is imperfect and arbitrary, important acoustic principles being disregarded, but these mechanical defects only enhance its value as an artistic musical instrument. The player is obliged to rely very much on his ear in order to obtain a correct intonation, and next to the strings no instrument gives greater scope to the artist.

The bassoon has an eight foot tone, the compass extending from B♭ to Ab treble

\[

\text{Savary Model.} & \quad \text{(Rudall, Carte & Co.)}
\end{align*}
\]

\[\text{B♭} \quad \text{are extra notes obtained by means of interlocking keys on the long joint, worked by the left thumb; they have no counterpart on the oboe and do not belong to the fundamental scale of the bassoon. The fundamental scale of the oboe is that of C, although the compass has been extended a tone to B♭.} \]

\[\text{Therefore the difference in pitch between the bassoon and the oboe is a twelfth. In the first} \]

1 At Wagner's instigation, the wind-instrument maker, W. Heckel of Biebrich-am-Rhein, made bassoons with an extra key, extending the compass downwards to A.
register of the bassoon, seven semitones  \( \frac{1}{4} \) to \( \frac{1}{4} \) which forms the normal compass. From A to E there are produced by the help of small harmonic holes opened by means of keys at the top of the wind joint; exceptional players obtain, without additional keys, two or more higher harmonic notes, which, however, are only used by virtuosi. This then forms the principle scheme of fingering for the bassoon, and in order to appreciate the efforts of such instrument makers as Carl Almenrädter in Germany, Triebert and Jannecourt in France, Sax in Belgium, Cornelius Ward and Morton in England, to introduce improvements based upon acoustic principles, it is necessary to understand what these general principles are, and why they have been disregarded in the bassoon. In all tubes the note given by the vibrating air column is influenced directly by the length of the tube, but very little, if at all, by the diameter of the bore. The pitch, however, is greatly affected by the diameter of the opening, whether lateral or at the bell, through which the vibrating column of air is again brought into communication with the outer air. The tube only sounds the normal note in proportion to its length, when the diameter of the lateral opening is equal to the inner diameter of the tube at the opening. As in most of our early woodwind instruments the holes would in that case have been too large to be stopped by the fingers, and key-mechanism was still primitive, instrument-makers resorted to the expedient of substituting a hole of smaller diameter nearer the mouthpiece for one of greater diameter in the position the hole should theoretically occupy. This ant principle was well understood by the Romans, and perhaps even by the ancient Greeks, as is proved by existing specimens of the aulos (q.v.) and by certain passages from the classics.

Another curious acoustic phenomenon bears upon the construction of wind instruments, and especially upon the bassoon. When the diameter of the lateral opening or bell is smaller than that of the bore, the portion of the tube below the hole, which should theoretically be as though non-existent, asserts itself, lowering the pitch of the note produced at the hole and damping the tone; this is peculiarly noticeable in the A of the bassoon whose hole is much too high and too small in diameter. To cite an example of the scope of Carl Almenrädter’s improvements in the bassoon, he readjusted the position of the A hole, stopped by the third finger of the right hand, boring lower down the tube, not one large hole, but two of medium diameter, covered by an open key to be closed by the same finger from the accustomed position; one of these A holes communicates with the narrower bore in the butt joint, and the other with the wider bore. The effect is a perfectly clear, full and accurate tone. Almenrädter’s other alterations were made on the same principle, and produced an instrument more perfect mechanically and theoretically than Savary’s, but lacking some of the characteristics of the bassoon. In Germany Almenrädter’s improvements have been generally adopted and his model with 16 keys is followed by most makers, and notably by Heckel of Biebrich.

The unwieldy bass pommers of the 15th and 16th centuries led to many attempts to produce a more practical bass for the orchestra by doubling back the long tube of the instrument. Thus transformed, the pomer became a fagotto. The invention of the bassoon or fagotto is ascribed to A. Mersenne, a pupil of a work by his nephew, Theseus Ambrosius Albonius, entitled Introductio in Chaldaisam Lingvam... et descriptio ac Simulacrum Phagoti Afrani (Pavia, 1539). The illustration of the instrument, showing front and back views, taken in conjunction with the detailed description (pp. 33-38), at once disposes of the suggestion that the phagotus of Afranio and the fagotto or bassoon were in any way related; the author himself is greatly puzzled as to the etymology of the word. The fagotto in fact, resembles nothing so much as the musical curiosity known as flûte à bec à colonne,\(^*\) but double and played by bellows, assigned by G. Chouquet to the 16th century. This flute consisted of a column, with base and capital, both stopped, and the wind and the whistle being concealed within perforated brass boxes, in the upper and lower parts of the column. Afranio’s phagotus consisted of two similar twin columns with base and capital containing finger-holes and keys; between the columns in front was a shorter column for ornament, and at the back of it another still shorter whose capital could be lifted, and a sort of bellows or bag-pipe inserted by means of which the instrument was sounded. The first instrument was made, we are told, by Ravillas of Ferrara, A. Mersenne’s contemporary, as a means of helping the instrument to have any difficulty in understanding the construction of Afranio’s phagotus, does not consider him the inventor of the fagotto or bassoon, but of another kind of fagotto which he classes with the Neapolitan sourdeline, a complicated kind of musette (\textit{see Bag-pipe}). Afranio’s instrument consists, he states, of two bassons as it were interconnected by tubes and blown by bellows. As in the sourdeline, these only speak when the springs (keys) are open. He disposes of Theseus Albonius’s fanciful etymology of the name by showing it to be nothing but the French word fagot, and that it was adopted by the instrument to harmonize with the name of the wood with which it is made from which it is derived. There is no evidence that the phagotus contained areed, which would account for Mersenne calling the pipes flutes. Mersenne’s statement thus seems to uphold the theory that Afranio’s phagotus was only a double flûte à colonne with bellows. Evidence is at hand that in 1555 a contrabass wind instrument was well known as fagotto. In the catalogue of the musical instruments belonging to the Flemish band of Marie de Hongrie in Spain, we find the following: "Ala dicha princesa y al dicho matoto dos instrumentos de musica contrabassos, que llevan fagotes, metidos en dos caos redondas como parece por el perique."\(^{19}\)

Sigmund Schnitzer\(^{10}\) of Nuremberg (d. 1578), a maker of wind instruments who attained considerable notoriety, has been

\(^{10}\) J. J. Quantz, Frederick the Great’s flute-master, gives France the credit of transforming the bombard (pommer) into a more legible form he called the Flöte traversière, enrichissant die Flöte traversière zu spielen (Berlin, 1752), p. 24 and again p. 241. § 6.
BASSO-RELIEVO—BASS ROCK

named as the probable author of the transformation of pommer into bassoon.

We learn from an historical work of the 18th century, that he was renowned "almost everywhere" as a maker of fagotto of extraordinary size, of skilful workmanship and pure intonation, speaking easily. Schnitzer's instruments were so highly appreciated not only all over Germany, but also in France and Italy, that he was kept continually at work producing fagotto for lovers of music.

An earlier chronicler of the artistic celebrities and craftsmen of Nuremberg, Johann Neudorfer, writing in 1549, names Sigmund Schnitzer merely as Pfeifenmacher und Stadtpfeifer. He had been also noted as an inventor of a new form of instrument, the forerunner and collector of which would not have been able to name, if Schnitzer had been the first to reduce the great length of the bass pommer by doubling the tube back upon itself, he would hardly have been handed down to posterity as the clever craftsman who made fagottos of extraordinary size. Doppelmaier, who chronicles in these eulogistic terms, wrote nearly two centuries after the supposed invention of the fagotto, the value of which was realized later by retrospection.

An explanation may perhaps be found in Eisiel's statement about the Deutscher Basson, which he distinguishes from the Basson (our bassoon). The fagotto of the lower instrument, for he had heard that the German ancestors termed them, before music was clothed in Italian and French style, are no longer in use. (Eisiel wrote in 1738) and therefore it is unnecessary to waste paper on them. This refers, of course, to the bombard or bass pommer, the extraordinarily long instruments which Schnitzer made so successfully. From this it would seem that our bassoon was not of German origin. In the meantime we get a clue to the early history of the pommer in transition, but we find it under a different name in no way connected with fagotto. In order to shorten the unwieldy proportions of the tenor pommer in C, and to increase its portability, it was constructed out of a bunch of reeds, and this double the diameter of the pommer, in which two bores were cut, communicating at the bottom of the instrument which was flat. The bell and the crook containing the double reed mouthpiece were side by side at the top. This instrument, which had six holes in front and one at the back as well as two keys, was known as the dulcian, dolcian, dougaine, and also in France as corsaut and in England as the curtall, curtall, &c., being mentioned in 1582—"the common bletting music of ye Drone, Hobius (Hautboy) and Curtoll." The next step in the evolution produced the double curtall, a converted bass pommer an octave below the single curtall. The instrument is identical as in construction with the early fagotto in C. The instrument is shown in fig. 2, the reproduction of a drawing in the MS. of The Academy of Armoury by Randle Holme, written some time before 1688. At the side of the drawing is the following description: A double curtall.

3 See J. Eisel, Musikus autodidactus oder der sich selbst informirende Musicus (Erfurt, 1738), pp. 104 and 100, and also J. Mattheson, Das neu-eröffnete Orchester (Hamburg, 1713). Basson, from whom Eisiel borrowed.
4 See New English Dictionary, and Bateman upon Bartholinus, 423, 1st, margin.
5 British Museum, Harl. MS. 2034, fol. 207b, a reference communicated by Augustus Hughes-Hughes from his valuable appendix to The Dictionary of Musical and Works on Music) of a Catalogue of MS. Music in the British Museum (London, 1908–1999). The Appendix contains a list of typical musical instruments represented in illuminated MSS, or described in MSS in the British Museum, with brief description and full references.
6 Compare Randle Holme's double curtall with the dolcian in C, pl. vi. H. of Capt. C. R. Day's catalogue, and with a dolcian or single curtall by J. C. Denner in Paul de Wit's Catalogue des Musiciens de l'Académie Royale de Musique. (Leipzig, 1736), p. 277, No. 380, and illustr. p. 121 (Collection now transferred to Colog. Consult also

This is double the bigness of the single, mentioned ch. xvi. n. 6 "(the MS. begins at ch. xvii. of bk. 3) and is played 8 notes deeper. It is as it were 2 pipes fixed in one (thick bass pipe, one much longer than the other, from the top of the lower comes a crooked pipe of brass in which is fixed a reed, through it the wind passeth to make the instrument make a sound. It hath 6 holes on the outside and one on that side next the man or back part and 2 brass keys, the highest called double Lo sol re, and the other double B mi."

We may therefore conclude that the satirical name fagotto, presumably bestowed in Italy, since the French equivalent fagot was never used for the basson, was not necessarily applied to the new form of instrument at the outset, but in any case before 1555; that the very term Phagoto d'Afranio, by which the instrument was known during its short fabulous existence, with its pretended Greek etymology, presupposes the pre-existence in Italy of another fagotto with which Afranio was acquainted, perhaps imperfectly. Afranio's was the age of ingenious mechanical devices applied to musical instruments, many of which, like Afranio's, being mere freaks, did not survive the inventor. A document selected from the valuable archives published by Edm. van der Straeten suggests a satisfactory clue. In 1545 Louis Willay, a musical instrument maker of Bruges, sold to Philippe le Verne a triple set of wood-wind instruments, i.e. "4 bombardes, 4 doucaines and 4 flutes," to be sent as a gift to Nicolas III., marquis of Ferrara. The instrument, the doucaine, we may imagine, by its unusual appearance provoked the satirical wit of some courtier, and was henceforth known as fagotto. Just a century later Ravilius of Ferrara made Afranio's first phagotos from the inventor's design.

The bassoon has been a favourite with all the great masters, excepting Handel. Beethoven uses the bassoon largely in his symphonies, writing everywhere for it independent parts of great beauty and originality. Bach, in his mass in B min., has parts for two bassoons. Mozart wrote a concerto in Bb for bassoon, with orchestra (Kochel, No. 191). Weber has also written a concerto for bassoon in F (op. 75), scored for full orchestra.

See also Etienne Ozi, Nouvelle Methode du Basson (Paris, 1788 and 1800); J. B. J. Willent-Borgogny, Gran Metodo completo per il Fagotto (Milan, 1844), with illustrations of early bassoons (English edition, London, J. R. Lalev & Son); Joseph Fröhlich, Vollständige Musikschule für alle beym Orchester gebrauchliche wichtigere Instrumente (many practical illustrations) (Cologne, Bonn, 1811); article "Bassoon," by W. H. Stone and D. J. Blakley in Grove's Dictionary of Music and Musicians (2nd ed.); article "Fagott" in Mendel's Musikalisches Conversations-Lexikon; for the history of the instrument, and of its prototypes, see OBOE and BOMBARD.

BASSO-RELIEVO (Ital. for "low relief"), the term applied to sculpture in which the design projects but slightly from the plane of the background. The relief may not project at all from the original surface of the material, as in the sunken reliefs of the Egyptians, and may be nearly flat, as in the Panathenaic procession of the Parthenon. In the early 19th century the term basse-relieve, or "low relief," came to be employed loosely for all forms of relief, the term méto-relieve having already dropped out of general use owing to the difficulty of accurate application.

BASS ROCK, THE, a small island in the Firth of Forth, about 2 m. from Cantly Bay, Haddingtonshire, Scotland. It is circular in shape, measuring a mile in circumference, and is 350 ft. high. For description, see O. cit. and Michael Praetorius, Syntagma Musicum (Wolfenbüttel, 1616), both of whom describe and figure these forms of early bassoons.

Fig. 2.—Old English double curtall (before 1688).

(Front Harl. MS. 2034 in Brit. Mus.)
BASSUS—BASTAR

On three sides the cliffs are precipitous, but they slope towards the S.W., where landing is effected. The Bass Rock is an instructive mass of phonolitic trachyte or orthophyre. No nepheline has been detected in the rock, and it is possible that its small quantity together with that of the abundant orthoclase and green soda-augite, which bears a close resemblance to the eruptive masses of North Bervick Law and Traprain Law, but is non-porphyrithic. It is regarded by Sir A. Gellie as a plug filling an old volcanic vent, from which lava emanated during the Calceificer Sandstone period. It used to be grazed by sheep, of which the mutton was thought to be unusually good, but its principal denizens are sea-birds, chiefly solan geese, which haunt the rock in vast numbers. A lighthouse with a six-flash lantern of 39,000 candle power was opened in 1902. For a considerable distance to W. there runs through the rock a tunnel, about 15 ft. high, accessible at low water. St Baldred, whose name has been given to several of the cliffs on the shore of the mainland, occupied a hermitage on the Bass, where he died in 756. In the 14th century the island became the property of the Lauders, called afterwards Lauders of the Bass, from whom it was purchased in 1671 by government, and a castle with dungeons was erected on it, in which many Covenanters were imprisoned. Among them were Alexander Peden (1626–1686), for four years, and John Blackadder (1615–1658), who died there after five years' detention at the Revoire. He wrote the young Jacobite capital the Rock, and having been reinforced by a few others, held it for King James from June 1691 to April 1694, only surrendering when threatened by starvation. Thus the island was the last place in Great Britain to submit to William III. Dismantled of its fortifications in 1701, the Bass passed into the ownership of Sir Hew Dalrymple, to whose family it belongs. It is let on annual rental for the feathers, eggs, oil and young of the sea-birds and for the fees of visitors, which reach it usually from Canty Bay and North Bervick.

BASSUS, Roman historian, who lived in the reign of Tiberius. His work, which probably began with the civil wars or the death of Caesar, was continued by the elder Pliny, who, as he himself tells us, carried it down at least as far as the end of Nero's reign. The Bellum Germanicum of Bassus, which is commended, may have been either a separate work or a section of his general history. The elder Seneca speaks highly of him as an historian, but the fragments preserved in that writer's Sasanorae (vi. 23) relating to the death of Cicero, are characterized by an affected style.

Pliny. Nat. Hist., x. 103.

BASSUS, Caesius, a Roman lyric poet, who lived in the reign of Nero. He was the intimate friend of Persius, who dedicated his sixth satire to him, and whose works he edited (Schol. on Persius, vi. 1). He is said to have lost his life in the eruption of Vesuvius (79). He had a great reputation as a poet; Quintilian (Instit. x. 1. 96) goes so far as to say that, with the exception of Horace, he was the only lyric poet worth reading. He is also identified with the author of a treatise De Metris, of which considerable fragments, probably of an abbreviated edition, are extant (ed. Keil, 1885). The work was probably originally in verse, and afterwards recast or epitomized in prose form to be used as an instruction book. A worthless and scanty account of some of the metres of Horace (in Keil, Grammatici Latini, vi. 305), bearing the title Ars Caesae Bassi de Metris is not by him, but chiefly borrowed by its unknown author from the treatise mentioned above.

BASSUS, Cassianus, called Stolaecius (lawyer), one of the geonomici or writers on agricultural subjects. He lived at the end of the 6th or the beginning of the 7th century A.D. He compiled from earlier writers a collection of agricultural treatises (Geonomica) which was afterwards revised by an unknown editor and published about the year 950, in the reign of Constantine Porphyrogenitus, to whom the work itself has been ascribed. It contains a full list of the authorities drawn upon, and the subjects treated include agriculture, birds, bees, horses, cattle, dogs, sheep, fishes and the like.

Complete edition—Needham (1704), Nieckes (1753). Bechtel (1863): see also Gemell in Berliner Studien, i. (1884); Oeder in Rheinisches Museum, xlv. (1890), xcviii. (1893), and De Raynal in Annaire de l’Assoc. pour l’Encouragement des Etudes Grecques, viii. (1874).

BASSUS, Saleius, Roman epic poet, a contemporary of Vespasian Flavius, in the reign of Vespasian. Quintilian calls him a vigorous and poetical genius (Instit. x. 1. 90) and Julius Secundus, one of the speakers in Tacitus Dialogus de Arboribus (5; see also 9) styles him a perfect poet and most illustrious bard. He was apparently overtaken by poverty, but was generously treated by Vespasian, who made him a present of 500,000 sesterces. Nothing from his works has been preserved; the Laus Pisonis, which has been attributed to him, is probably by Titus Calpurnius Siculus (I. Held, De Saleo Basso, 1834).

BASSVILLE, or Bassville, Nicolas Jean Hugo De (d. 1793). French journalist and diplomatist, was born at Abbeville on the 7th of February 1753. He was trained for the priesthood, taught theology in a provincial seminary and then went to Paris. Here in 1784 he published Elements de mythologie and some poems, which brought him into notice. On the recommendation of the prince of Condé he became tutor to two young Americans travelling in Europe. With them he visited Berlin, made the acquaintance there of Mirabeau, and became a member of the Berlin Academy Royal. At the outbreak of the Revolution he turned to journalism, becoming editor of the Mercure International. Then, through the Grand Dictator, Napoleon, he entered the diplomatic service, went in May, 1792, as secretary of legation to Naples and was shortly afterwards sent, without official status, to Rome. Here his conduct was anything but diplomatic. He at once announced himself as the protector of the extreme Jacobins in Rome, demanded the expulsion of the French émigrés who had taken refuge there, including the “demoiselles Capet,” and ordered the fleur-de-lys on the escutcheon of the French embassy to be replaced by a picture of Liberty painted by a French art student. He talked at large of the “purple geese of the Capitol” and met the remonstrances of Cardinal Zelada, the papal secretary of state, with insults. This enraged the Roman populace; a riot broke out on the 13th of January 1793, and Bassville, who was driving with his family to the Corso, was dragged from his carriage and so roughly handled that he died. The affair was magnified in the Convention into a deliberate murder of the “representative of the Republic” by the pope’s orders. In 1797 by an article of the treaty of Tolentino the papal government agreed to pay compensation to Bassville’s family. Among his writings we may also mention Memorial historiques, critiques et politiques sur la Révolution de France (Paris 1790; 8vo, 2 vols.), and Les Diplomates de la Révolution (Paris, 1882).

See F. Masson, Les Diplomates de la Révolution (Paris, 1882); Silvagni, La Corte e la Società romana nei secoli XVIII. e XIX. (Florence, 1881).

Bastar, a feudatory state of British India, in the Chhattisgarh division of the Central Provinces; area, 13,662 sq. m. In 1901 the population was 306,501, showing a decrease of 1% compared with an apparent increase of 58% in the preceding decade. Estimated revenue Rs. 2,000,000; tribute Rs. 300. The eastern part of Bastar is a flat elevated plateau, from 1800 to 2000 ft. above the level of the sea, the centre and N.W. portions are very mountainous, and the southern parts consist of hills and plains. On the plateau there are but few hills; the streams run slowly and the country is a mixture of plain and undulating ground covered by dense sal forests. Principal mountains of the district: (1) a lofty range which separates it from the Sironcha district; (2) a range of equal height called the Bela Dila lying in the centre of the district; (3) a range running N. and S. near Narayanpur; (4) Tangdi Dongri range, running E. and W.; (5) Talu Dongri, bordering on the Sabari river and the Jaintiapur state. There is also a small range running from the river Indravati to the Godavari. The Indravati, the Sabari and the Tal or Taiper, are the chief rivers of the district; all of them affluents of the Godavari. The soil throughout the greater portion of Bastar consists of light clay, with an admixture of sand, suited
for raising rice and wet crops. In the jungles the Marias, who are among the aboriginal tribes of Gond origin, raise kosra (Panicum italicum) and other inferior grains. Aboriginal races generally follow the migratory system of tillage, clearing the jungle on selected patches, and after taking crops for two or three years abandoning them for new ground. They do not use the plough; nor do they possess buffalo, bullocks or cows; their farming methods are sometimes ftilus forpus; they are long-handed iron hoes. They are a timid, quiet, docile race, and although addicted to drinking not quarrelsome. They inhabit the densest jungles and are very shy, avoiding contact with strangers, and flying to the hills on the least alarm; but they bear a good character for honesty and truthfulness. They are very scantily dressed, wear a variety of trinkets, with a knife, hatchet, spear, bow and arrows, the only weapons they use. Their hair is generally shaved, excepting a topknot; and when not shaved it gets into a matted, tangled mass, gathered into a knot behind or on the crown. The Marias and the Jhurias are supposed to be a subdivision of the true Gond family. All the aboriginal tribes of Bastar worship the deities of the Hindu pantheon along with their own national goddess Dantewari.

Bastar is divided into two portions—that held by the Raja or chief himself, and that possessed by feudatory chiefs under him. The climate is unhealthy—fever, smallpox, dysentery and rheumatism being the prevailing diseases. Jagdalpur, Bijapur, Maddar and Bhupalpatnam are the only places of any note in the dependency, the first (on the Indravati river) being the residence of the raja and the chief people of the state. The principal products are rice, oil-seeds, lac, tussur silk, horns, hides, wax and a little iron. Teak timber is floated down the rivers to the Madras coast. A good road has brought Jagdalpur into connexion with the railway at Raipur.

BASTARD (O. Fr. bastard, mod. bâtard = fils de bast, “pack-saddle child,” from bast, saddle), a person born out of legal wedlock. Amongst the Romans, bastards were classified as nolhi, children born in concubinage, and spuri, those not so born. Both classes had a right of succession to their mother, and the nolhi were entitled to support from their father, but had no rights of inheritance from him. Both, however, had in other respects most of the rights of citizenship. The Germanic law was based upon an entirely different principle. It recognized as legitimate only those whose parents were of the same social rank. All others were regarded as bastards, and took the status of the parent of inferior rank. The aim of all the Germanic codes was to preserve purity of race, not to improve morals, for inestimable unions are not censured. The influence of the Germanic law lasted throughout the early feudal period, and bastards were debaraed rights of inheritance. In the 15th century the influence of Roman law tended again to modify this severity. An exception was probably made in the case of those whose fathers were of royal blood, in which case it even seems that no stigma was attached to the accident of their birth, nor did they suffer from the usual disabilities as to inheritance which attended those of illegitimate birth (Gregory of Tours, v. 25). Among the Franks we find Theodoric I., a natural son of Clovis, sharing the kingdom with the legitimate sons; Zentibold, natural son of Arnulf, was, created king of Lorraine by his father in 895; and even William the Conqueror actually assumed the appellation of bastard.

In English law a bastard still retains certain disabilities. His rights are only such as he can acquire; for civilly he can inherit nothing, being looked upon as the son of nobody, and sometimes called filius nolius, sometimes filius populi. This, however, does not hold as to moral purposes, e.g. he cannot marry his mother or bastard sister. Yet he may gain a surname by reputation though he has none by inheritance, and may even be made legitimate and capable of inheriting by the transcendent power of an act of parliament.
