\(^1\) A complete list, showing all individual contributors, with the articles so signed, appears in the final volume.
A. W. Po. Alfred William Pollard, M.A.

A. W. R. Alexander Wood Renton, M.A., LL.B.

Adviser on Petroleum to the Admiralty, Home Office, India Office, Corporation of London, and Port of London Authority. President of the Society of Chemical Industry. Member of the Council of the Chemical Society. Member of Council of Institute of Chemistry. Author of Cantor Lectures on Petroleum; Petroleum and its Products; Chemical Technology; &c.

See the biographical article: BÉMONT, C.

C. D. Cyril J. H. Davenport, F.S.A.
Assistant to the Keeper of Printed Books, British Museum. Cantor Lecturer on Decorative Bookbindings, Society of Arts. Author of Royal English Bookbindings; Engish Embroidered Bookbindings; History of the Book; &c.

C. D. W. Hon. Carroll Davidon Wright.
See the biographical article: WRIGHT, C. D.

Formerly Scholar of Magdalen College, Oxford.

C. E. A. C. E. Aebers.
Formerly The Times Correspondent in Buenos Aires. Author of A History of South America, 1534-1904.

C. E. S. Hon. Charles Emory Smith.
See the biographical article: SMITH, CHARLES EMORY.

Formerly Divisional Resident and Member of the Supreme Council of Sarawak. Author of A Descriptive Account of the Mammals of Borneo, and numerous papers in scientific journals.

C. K. S. Clement King Shorter.
Editor of the Sphere. Author of Charlotte Brontë and her Circle; The Brontës: Life and Letters; &c.

Assistant Secretary to the Board of Education. Author of Life of Henry V. Editor of Chronicles of London and Stow's Survey of London.

C. Pf. Christian Pfister, D. És. L.
Professor at the Sorbonne, Paris. Chevalier of the Legion of Honour. Author of Élue sur le rège de Robert le Pieux; Le Duché merovingien d'Alsace et la legende de Saint-Odile.

C. S. S. Charles Scott Sherrington, D.Sc., M.D., M.A., LL.D., F.R.S.
Professor of Physiology, University of Liverpool. Foreign Member of Academies of Rome, Vienna, Brussels, Göttingen, &c. Author of The Integrative Action of the Nervous System.

D. B. Ma. Duncan Black Macdonald, M.A., M.D.
Professor of Semitic Languages, Hartford Theological Seminary, U.S.A. Author of Development of Muslim Theology, Jurisprudence and Constitutional Theory; Selections from Ibn Khaldun; Religious Attitude and Life in Islam; &c.

D. C. B. Demetrius Charles Bougler.
Author of History of Belgium; England and Russia in Central Asia; History of China; Life of Gordon; India in the 19th Century; &c.

Formerly Editor of the Art Journal. Author of The Brothers Maris; The Barbizon School of Painters; Life of "Pthé"; Life of Beckett; &c.

D. F. T. Donald Francis Tovey.

D. H. David Hannay.
Formerly British Vice-Consul at Barcelona. Author of Short History of Royal Navy, 1217-1658; Life of Emilio Castelar; &c.
D. Li. T. 
DANIEL LEWIS THOMAS. 
Stipendiary Magistrate for Pontypridd and Rhondda. Formerly Assistant 
Commissioner to the Labour Commission and Secretary to the Welsh Land Commission.

D. Mn. 
REV. DUGALD MACPADDEN, M.A. 
Minister of South Grove Congregational Church, Highgate. Director of the London 
Missionary Society. Author of Constructive Congregational Ideals.

E. Br. 
ERNEST BARKER, M.A. 
Fellow of, and Lecturer in Modern History at, St John's College, Oxford. Formerly 
Fellow and Tutor of Merton College. Craven Scholar, 1895.

E. Ca. 
EGERTON CASTLE, M.A., F.S.A. 
Trinity College, Cambridge. Author of English Book Plates; Bibliotheca Dimicatæ; 
&c.

E. C. B. 
RIGHT REV. EDWARD CUTHBERT BUTLER, O.S.B., D.LITT. 
Abbot of Downside Abbey, Bath.

E. Es. 
EDMUND ESMONN.

E. G. 
EDMUND GOSSE, LL.D. 
See the biographical article: GOSSE, EDMUND W.

E. H. C. 
ERNST HARTLEY COLEIDGE, M.A. 
Balliol College, Oxford. Editor of Byron's Poems; Letters of Samuel Taylor Cole 
idge; &c.

E. H. B. 
M.P. for Bury St Edmunds, 1847-1852. Author of A History of Ancient Geography; 
&c.

E. H. M. 
ELLIS HOWELL MINNS, M.A. 
Lecturer and Assistant Librarian, and formerly Fellow of Pembroke College, 
Cambridge. University Lecturer in Palaeography.

E. K. 
EDMUND KNECHT, Ph.D., F.I.C. 
Professor of Technological Chemistry, Manchester University. Head of Chemical 
Department, Municipal School of Technology, Manchester. Examiner in Dyeing, 
City and Guilds of London Institute. Author of A Manual of Dyeing &c. Editor of 
Journal of the Society of Dyers and Colourists.

E. L. B. 
EDWARD LIVERMORE BURLINGAME, A.M., Ph.D. 
Editor of Scribner's Magazine. Formerly on Staff of New York Tribune.

E. Ma. 
EDWARD MANSON. 
Barrister-at-Law, Middle Temple. Joint-editor with Sir John Macdonnell, C.B., 
of the Journal of Comparative Legislation. Author of Law of Trading Companies; &c.

E. O.* 
Consulting Surgeon to St Mary's Hospital, London, and to the Children's Hospital, 
Great Ormond Street. Late Examiner in Surgery at the Universities of Cambrid 

E. Pr. 
EDGAR PRESTAGE. 
Special Lecturer in Portuguese Literature in the University of Manchester. Com 
mandador, Portuguese Order of St. Thiago. Corresponding Member of Lisbon Royal 
Academy of Sciences, Lisbon Geographical Society, &c. Examiner in Portuguese 
in the University of London, Manchester, &c.

E. Wa. 
College, 1884-1905. Author of Grammar of Rowing; &c.

E. W. B. 
SIR EDWARD WILLIAM BRABBROOK, C.B. 
Barrister-at-Law, Lincoln's Inn. Chief Registrar of Friendly Societies, 1891-1904. 
Author of Building Societies; Provident Societies and Industrial Welfare; Institutions 
for Thrift; &c.

F. By. 
FRANK BRINKLEY. 
Captain R.N. Foreign Adviser to Nippon Yusen Kaisha, Tokyo. Correspondent of 
The Times in Japan. Editor of the Japan Mail. Formerly Professor of Mathe 
matics at Imperial Engineering College, Tokyo. Author of Japan; &c.

F. D. A. 
FRANK DAWSON ADAMS, D.Sc., Ph.D., F.R.S., F.G.S. 
Dean of the Faculty of Applied Science, and Logan Professor of Geology, McGill 
University, Montreal. President of Canadian Mining Institute.

F. G. P. 
FREDERICK GYMNER PARSONS, F.R.C.S., F.Z.S., F.R.ANTHROP.INST. 
Vice-President, Anatomical Society of Great Britain and Ireland. Lecturer on 
Anatomy at St Thomas's Hospital and the London School of Medicine for Women. 
Formerly Examiner in the Universities of Cambridge, Aberdeen, London and Bir 
mingham; and Hunterian Professor at the Royal College of Surgeons.

F. H. 
FRANCIS HUEFFER, PHIL.D. (1845-1890). 
Formerly Musical Critic of The Times. Author of The Troubadours; a History of 
Provençal Life and Literature in the Middle Ages; Richard Wagner and the Music of 
The Future. Editor of Great Musicians.

F. J. C. 
SIR FRANCIS J. CAMPBELL, LL.D., F.R.G.S., F.S.A. 
Principal, Royal Normal College for the Blind, Norwood, London. Author of 
Papers on the Education of the Blind.

</table>
BISHARIN (the anc. Ichthyophagi), a nomad tribe of African "Arabs," of Hamitic origin, dwelling in the eastern part of the Nubian desert. In the middle ages they were known as Beja (q.v.), and they are the most characteristic of the Nubian "Arabs." With the Abhida and Hadendoa they represent the Blemmyes of classical writers. Linguistically and geographically the Bisharín form a connecting link between the Hamitic populations and the Egyptians. Nominally they are Mohammedan; they, however, preserve some non-Islamic religious practices, and exhibit traces of animal-worship in their rule of never killing the serpent or the partridge, which are regarded as sacred.

BISHOP, SIR HENRY ROWLEY (1786-1856), English musical composer, was born in London on the 18th of November 1786. He received his artistic training from Francesco Bianchi, and in 1804 wrote the music to a piece called Angelina, which was performed at Margate. His next composition was the music to the ballet of Tamerlan et Bajazet, produced in 1806 at the King's theatre. This proved successful, and was followed within two years by several others, of which Caracatus, a pantomimic ballet, written for Drury Lane, may be named. In 1809 his first opera, The Cireassian's Bride, was produced at Drury Lane; but unfortunately the theatre was burned down after one performance, and the score of the work perished in the flames. His next work of importance, the opera of The Misan, written for the Lyceum in 1810, established his reputation, and probably secured him an appointment for three years as composer for Covent Garden theatre. The numerous works—operas, burlettas, cantatas, incidental music to Shakespeare's plays, &c.—which he composed while in this position, are in great part forgotten. The most successful were—The Virgin of the Sun (1812), The Miller and his Men (1813), Guy Manering and The Slave (1816), Maid Marian and Clari, introducing the well-known air of "Home, Sweet Home" (1822). In 1825 Bishop was induced by Eltison to transfer his services from Covent Garden to the rival house in Drury Lane, for which he wrote with unusual care the opera of Aladdin, intended to compete with Weber's Oberon, commissioned by the other house. The result was a failure, and with Aladdin Bishop's career as an operatic composer may be said to close. On the formation of the Philharmonic Society (1813) Bishop was appointed one of the directors, and he took his turn as conductor of its concerts during the period when that office was held by different musicians in rotation. In 1830 he was appointed musical director at Vauxhall; and it was in the course of this engagement that he wrote the popular song "My Pretty Jane." His sacred cantata, The Seventh Day, was written for the Philharmonic Society and performed in 1833. In 1839 he was made bachelor in music at Oxford. In 1841 he was appointed to the Reid chair of music in the university of Edinburgh, but he resigned the office in 1843. He was knighted in 1842, being the first musician who ever received that honour. In 1848 he succeeded Dr Crotch in the chair of music at Oxford. The music for the ode on the occasion of the installation of Lord Derby as chancellor of the university (1853) proved to be his last work. He died on the 30th of April 1855 in impoverished circumstances, though few composers ever made more by their labours. Bishop was twice married: to Miss Lyon and Miss Anne Riviére. Both he and his wives were singers. His name lives in connexion with his numerous glee, songs and smaller compositions. His melodies are clear, flowing, appropriate and often charming; and his harmony is always pure, simple and sweet.

BISHOP, ISABELLA (1832—1904), English traveller and author, daughter of the Rev. Edward Bird, rector of Tattenhall, Cheshire, was born in Yorkshire on the 15th of October 1832. Isabella Bird began to travel when she was twenty-two. Her first book, The Englishwoman in America (1856), consisted of her correspondence during a visit to Canada undertaken for her health. She visited the Rocky Mountains, the South Pacific, Australia and New Zealand, producing some highly written books of travel. But her reputation was made by the records of her extensive travels in Asia: Unbeaten Tracks in Japan (2 vols., 1880), Journeys in Persia and Kurdistan (2 vols., 1891), Among the Tibetans (1894), Korea and her Neighbours (2 vols., 1898), The Yangtze Valley and Beyond (1899), Chinese Pictures (1900). She married in 1881 Dr John Bishop, an Edinburgh physician, and was left a widow in 1886. In 1892 she became the first lady fellow of the Royal Geographical Society, and in 1901 she rode a thousand miles in Morocco and the Atlas Mountains. She died in Edinburgh on the 7th of October 1904. See Anna M. Stoddart, The Life of Isabella Bird (1906).
of nomination. The same is true of Austria (except four sees), Bavaria, Spain and Portugal. In some countries the bishop is elected by the cathedral chapter (as in Würtemberg), or by the bishops of the provinces (as in Ireland). In others, as in Great Britain, the United States of America and Belgium, the pope selects one out of a list submitted by the chapter. In all cases the nomination or election is subject to confirmation by the Holy See. Before this is granted the candidate is submitted to a double examination as to his fitness, first by a papal delegate at his place of residence (processus informativus in paribus elect), and afterwards by the Roman Congregation of Cardinals assigned for this purpose (processus electionis definitivos in curia). In the meantime the pope, in consultation with the bishops, reserves the election to some other candidate. If the election is confirmed, preconized, and so far promoted that he is allowed to exercise the rights of jurisdiction in his See. He cannot, however, exercise the functions proper to the episcopal order (potestas ordinis) until his consecration, which ordinarily takes place within three months of his confirmation. The bishop is consecrated, after taking the oath of fidelity to the Holy See, and subscribing the profession of faith, by a bishop appointed by the pope for this purpose, assisted by at least two other bishops or prelates, the main features of the act being the laying on of hands by the bishop, and of the oil of chrism, and the方可 the bishop-elect is confirmed, preconized, and so far promoted that he is allowed to exercise the rights of jurisdiction in his See. He cannot, however, exercise the functions proper to the episcopal order (potestas ordinis) until his consecration, which ordinarily takes place within three months of his confirmation. The bishop is consecrated, after taking the oath of fidelity to the Holy See, and subscribing the profession of faith, by a bishop appointed by the pope for the purpose, assisted by at least two other bishops or prelates, the main features of the act being the laying on of hands by the bishop, and of the oil of chrism, and the confirmation of the bishop-elect. After consecration the new bishop is solemnly enthroned and blessed the assembled congregation. The potestas ordinis of the bishop is not peculiar to the Roman Church, and, in general, is claimed by all bishops, whether Oriental or Anglican, belonging to churches which have retained the Catholic tradition in this respect. Besides the full functions of the presbyterate, or priesthood, bishops have the sole right (1) to confer holy orders, (2) to administer confirmation, (3) to prepare the holy oil, or chrism, (4) to consecrate sacred places or utensils (churches, churchyards, altars, etc.), (5) to give the benediction to abbots and abbesses, (6) to anoint kings. In the matter of their rights of jurisdiction, however, Roman Catholic bishops differ from others in their peculiar responsibility to the Holy See. Some of their powers of legislation and administration they possess motu proprio in virtue of their position as diocesan bishops, others they enjoy under special faculties granted by the Holy See; but all bishops are bound, by an oath taken at the time of their consecration, to go to Rome at fixed intervals (visita sacra limina apostolorum) to report in person, and to write at least thirty years of age born in lawful wedlock, and of good life and behaviour. The mode of appointment is regulated by 25 Henry VIII. c. 20, re-enacted in 1 Elizabeth c. 1 (Act of Supremacy 1558). On a vacancy occurring, the dean and chapter notify the king thereof in chancery, and pray leave to make election. A licence under the Great Seal to proceed to the election of a bishop, known as the congé d'êtable, together with a letter missive containing the name of the king's nominee, is thereupon sent to the dean and chapter, who are bound under the penalties of Praemunire to proceed within twelve days to the election of the person named in it. In the event of their refusing obedience or neglecting to elect, the bishop may be appointed by letters patent under the Great Seal without the form of election. Upon the election being reported to the crown, a mandate issues from the crown to the archbishop and metropolitan, requesting him and commanding him to confirm the election, and to invest and consecrate the bishop-elect. Thereupon the archbishop issues a commission to his vicar-general to examine formally the process of the election of the bishop, and to supply by his authority all defects in matters of form, and to administer to the bishop-elect the oaths of allegiance, of supremacy and of canonical obedience (see CONFESSION OF TRINITY). In the disestablished and daughter Churches the election is by the synod of the Church, as in Ireland, or by a diocesan convention, as in the United States of America.

In the Church of England the potestas ordinis is conferred by consecration. This is usually carried out by an archbishop, who is assisted by two or more bishops. The essential "form" of the consecration is in the simultaneous "laying on of hands" by the consecrating prelates. After this the new bishop, who has so far been vested only in a rochet, rotires and puts on the rest of the episcopal habit, viz. the chimer. After consecration he is sometimes invested with the crozier, the staff, the ring, the mitre, the crozier, the staff, the ring, the mitre, etc. Besides the functions exercised in virtue of their order, bishops are also empowered by law to exercise a certain jurisdiction over all consecrated places and over all ordained persons. This jurisdiction they exercise for the most part through their consistorial courts, or through commissioners appointed under the Church Discipline Act of 1840. By the Clergy Discipline Act of 1892 it was decreed that the trial of clerks accused of unfitness to exercise the cure of souls should be before the consistory court with five assessors. Under the Public Worship Regulation Act of 1871, which gave to churchwardens and aggrieved parties the right to institute proceedings against the clergy for breaches of the law in the conduct of divine service, a discretionary right was reserved to the bishop to stay proceedings.

The bishops also exercise a certain jurisdiction over marriages, inasmuch as they have by the canons of the Church of England power of dispensing with the proclamation of banns before marriage. These dispensations are termed marriage licences, and their legal validity is recognised by the Marriage Act of 1837. The bishops had formerly jurisdiction over all questions touching the validity of marriages and the status of married persons, but this jurisdiction has been transferred from the consistorial courts of the bishops to a court of the crown by the Matrimonial Causes Act of 1857. They have in a similar manner been relieved of their jurisdiction in testamentary matters, and in matters of defamation and of brawling in churches; and the only jurisdiction which they continue to exercise over the general laity is with regard to their use of the churches and churchyards. The churchwardens, who are representative officers of the parishes, are also executive officers of the bishops in matters touching the decency and order of the churches and of the churchyards, and they are responsible to the bishops for the due discharge of their duties; but the abolition of church rates has relieved the churchwardens of the most onerous part of their duties, which was connected with the stewardship of the church funds of their parishes.

The bishops are still authorized by law to dedicate and set apart buildings for the solemnization of divine service, and grants for the performance of burials, according to the rites and ceremonies of the Church of England; and such buildings
and grounds, after they have been duly consecrated according to law, cannot be diverted to any secular purpose except under the authority of an act of parliament.

The bishops of England have also jurisdiction to examine clerks who may be presented to benefices within their respective dioceses, and they are bound in each case by the 95th canon of 1603. The clergy of a deanery, or any church, school, or college, are entitled to the services of such clerks for the time being, to the same extent as to the service of their own chancels. (See Benefice.)

As spiritual peers, bishops of the Church of England have (subject to the limitations stated below) seats in the House of Lords, though whether as barons or in their spiritual character has been a matter of dispute. The latter, however, would seem to be the case, since a bishop was entitled to his writ of summonses after confirmation and before doing homage for his barony. Doubts having been raised whether a bishop of the Church of England, being a lord of parliament, could resign his seat in the Upper House, although several precedents to that effect are on record, a statute of the realm, which was confined to the case of the bishops of London and Durham, was passed in 1856, declaring that on the resignation of their sees being accepted by their respective metropolitans, those bishops should cease to sit as lords of parliament, and their seats should be filled up in the manner provided by law in the case of the avoidance of a bishopric. In 1869 the Bishops' Resignation Act was passed. It provided that, on any bishop desiring to retire on account of age or incapacity, the sovereign should be empowered to declare the see void by an order in council, the retiring bishop or archbishop to be secured the use of the episcopal residence for life and a pension of one-third of the revenues of the see, or £2000, whichever sum should prove the larger. Other sections defined the proceedings for proving, in case of need, the incapacity of a bishop, provided for the appointment of coadjutors and defined their status (Philimore i. 82).

In view of the necessity for increasing the episcopate in the 19th century and the objection to the consequent increase of the spiritual peers in the Upper House, it was finally enacted by the Bishops' Act of 1858 that only the archbishops and the bishops of London, Winchester and Durham should be always entitled to writs summoning them to the House of Lords. The rest of the twenty-five sees are filled up, as a vacancy occurs, according to seniority of consecration.

Bishops of the Church of England rank in order of precedence immediately above barons. They may marry, but their wives as such enjoy no title or precedence. Bishops are addressed as "Right Reverend" and have legally the style of "Lord," which, as in the case of Roman Catholic bishops in England, is extended to all, whether suffragans or holders of colonial bishoprics, by courtesy.

The insignia of the Anglican bishop are the rochet and the chimere, and the episcopal throne on the gospel side of the chancel of the cathedral church. The use of the mitre, pastoral staff and pectoral cross, which had fallen into complete disuse by the end of the 18th century, has been now very commonly, though not universally, revived; and, in some cases, the interpretation put upon the "Ornaments Rubric" by the modern High Church party, has led to a more complete revival of the pre-Reformation vestments.

In the Orthodox Church of the East and the various communions springing from it, the poetes ordinis of the bishop is the same as in the Western Church. Among his qualifications the most peculiar is that he must be unmarried, which, since the secular priests are compelled to marry, entails his belonging to the "black clergy" or monks. The insignia of an oriental bishop, with considerable variation in form, are essentially the same as those of the Catholic West.

Besides bishops presiding over definite sees, there have been from time immemorial in the Christian Church bishops holding their jurisdiction in subordination to the bishop of the see of Rome. (1) The Episcopi regionarii, or general, were the bishops of the cities in the early church to exercise jurisdiction in the remote towns and villages as these were converted from paganism. Their functions varied in different times and places, and by some it has been held that they were originally only presbyters. In any case, this class of bishops, which had been greatly curtailed in the East in A.D. 143 by the council of Laodicea, was practically extinct everywhere by the 10th century. It survived longest in Ireland, where in 1152 a synod, presided over by the papal legate, decreed that, after the death of the existing holders of the office, no more should be consecrated. Their place was taken by arch-presbyters and rural deans. (2) The Episcopi regionarii, or general, were simply missionary bishops without definite sees. Such were, at the outset, Boniface, the apostle of Germany, and Willibrord, the apostle of the Frisians. (3) Bishops in portibus infidelium were originally those who had been expelled from their sees by the pagans, and, while retaining their titles, were appointed to assist diocesan bishops in their work. In later times the custom arose of consecrating bishops for this purpose, or merely as an honorary distinction, with a title derived from some place once included within, but now beyond the bounds of Christendom. (4) Coadjutor bishops are such as are appointed to assist the bishop of the diocese when incapacitated by infirmity or by other causes from fulfilling his functions alone. Coadjutors in the early church were appointed with a view to their succeeding to the see; but this, though common in practice, is no longer the rule. In the Church of England the appointment and rights of coadjutor bishops were regulated by the Bishops' Resignation Act of 1869. Under this act the coadjutor bishop has the right of succession to the see, or in the case of the archiepiscopal sees and those of London, Winchester and Durham, to the see vacated by the bishop, translated from another diocese to fill the vacancy. (5) Suffragan bishops (episcopi suffragani or auxiliari), are those appointed to assist diocesan bishops in their pontifical functions when hindered by infirmity, public affairs or other causes. In the Roman Church the appointment of the suffragan rests with the pope, on the petition of the bishop, who must prove that such is the custom of the see, name a suitable priest and guarantee his maintenance. The suffragan is given a title in portibus, but never that of archbishop, and the same title is never given to two suffragans in succession. In the Church of England the status of suffragan bishops was regulated by the Act 26 Henry VIII. c. 14. Under this statute, which, after long remaining inoperative, was amended and again put into force by the Suffragans' Nomination Act of 1888, every archbishop and bishop, being disposed to have a suffragan to assist him, may name two honest and discreet spiritual persons for the crown to give to one of them the title, name, style and dignity of a bishop of any one of twenty-six sees enumerated in the statute, as the crown may think convenient. The crown, having made choice of one of such persons, is empowered to present him by letters patent under the great seal to the metropolitan, requiring him to consecrate him to the same name, title, style and dignity of a bishop; and the person so consecrated is thereupon entitled to exercise, under a commission from the bishop who has nominated him, such authority and jurisdiction, within the diocese of such bishop, as shall be given to him by the commission, and no other.

The title of bishop survived the Reformation in certain of the Lutheran churches of the continent, in Denmark, Norway, Finland, Sweden and Transylvania; it was temporarily restored in Prussia in 1701, for the coronation of King Frederick I., again between 1816 and 1830 by Frederick William III., and in Nassau in 1818. In these latter
cases, however, the title bishop is equivalent to that of "superintendent," the form most generally employed. The Lutheran bishops, as a rule, do not possess or claim an "apostolic succession"; those of Finland and Sweden are, however, an exception. The Lutheran bishops of Transylvania sit, with the Roman and Orthodox bishops, in the Hungarian University. In itself, however, the secularization of episcopal principalities at the Reformation led to the survival of the title of bishop as a purely secular distinction. Thus the see of Osnabrück (Osnab-urgh) was occupied, from the peace of Westphalia to 1802, alternately by a Catholic and a Protestant prince. From 1762 to 1803 it was held by Frederick, duke of York, the last prince-bishop. Similarly, the bishopric of Schwarzen was survived as a Protestant prince-bishop until 1608, when it was finally secularized and annexed to Mecklenburg, and the see of Lübeck was held by Protestant "bishops" from 1530 till its annexation to Oldenburg in 1803.

In other Protestant communities, e.g., the Moravians, the Methodist Episcopal Church and the Methodists, the office and title of bishop have survived, or been created. Their functions and status will be found described in the accounts of the several communities. See Wetzer and Welte, Kirchenlexikon, s. "Bischof" and "Weißen"; Hinschius, Kirchenrech., vol. ii; Herzog-Hauck, Realencyclopdie, s. v. "Bischof" (though rather arbitrarily, classes Anglican bishops among the Lutheran bishops as not bishops in any proper sense at all); Phillimore, Ecclesiastical Law; the articles ORDER, HOLY; VESTMENTS; ECCLESIASTICAL JURISDICTION; EPISCOPY. (W. A. P.)

BISHOP AUCKLAND, a market town in the Bishop Auckland parliamentary division of Durham, England, 11 m. S.S.W. of the city of Durham, the junction of several branches of the North Eastern railway. Pop. of urban district (1901) 11,969. It is beautifully situated on an eminence near the confluence of the Wear and the Gaunless. The parish church is 1 m. distant, at Auckland St. Andrews, a fine cruciform structure, formerly collegiate, in style mainly Early English, but with earlier portions. The palace of the bishops of Durham, which stands at the north-east end of the town, is a spacious and splendid, though irregular pile. The site of the palace was first chosen by Bishop Anthony Beck, in the time of Edward I. The present building covers about 5 acres, and is surrounded by a park of 800 acres. On the Wear 1 m. above Bishop Auckland there is a small and very ancient church at Escob, massively built and tapering from the bottom upward. It is believed to date from the 7th century, and some of the stones are evidently from a Roman building, one bearing an inscription. These, no doubt, came from Bins-chester, a short distance up stream, where remains of a Roman fort (Vinovia) are traceable. It guarded the great Roman north road from York to Hadrian's wall. The industrial population of Bishop Auckland is principally employed in the neighbouring collieries and iron works.

BISHOP'S CASTLE, a market town and municipal borough in the southern parliamentary division of Shropshire, England; the terminus of the Bishop's Castle light railway from Craven Arms. Pop. (1901) 1378. It is pleasantly situated in a hilly district to the east of Clun Forest, climbing the flank and occupying the summit of an eminence. Of the castle of the bishops of Hereford, which gave the town its name, there are only the slightest fragments remaining. The town has some agricultural trade. It is governed by a mayor, 4 aldermen and 12 councillors. Area, 1867 acres.

Bishop's Castle was included in the manor of Lydbury, which belonged to the marcher lord before the Norman conquest. The castle at first called Lydbury Castle, was built by one of the bishops of Hereford between 1063 and 1115, to protect his manor from the Welsh, and the town which sprang up round the castle walls acquired the name of Bishop's Castle in the 13th century. In 1292 the bishop claimed to have a market every Friday, a fair on the eve, day and morrow of the Decollation of St John, and asse of bread and ale at St Edburth's Church, which no person is permitted to infringe immemorial. Ten years later he received a grant from Richard II. of a market every Wednesday and a fair on the 2nd of November and two days following. Although the town was evidently a borough by the 13th century, since the burgesses are mentioned as early as 1292, it has no charter earlier than the incorporation charter granted by Queen Elizabeth in 1572. This was confirmed by James I. in 1617 and by James II. in 1688. In 1584 Bishop Castle returned two members to parliament, and was represented until 1552, when it was disfranchised.

BISHOP STORTFORD, a market town in the Hertford parliamentary division of Hertfordshire, England; 30 m. N.N.E. from London by the Cambridge line of the Great Eastern railway. Pop. of urban district (1901) 7,143. It lies on the river Stort, close to the county boundary with Essex, and has water-communication with London through the Lea and Stort Navigation. The church of St Michael, standing high above the valley, is a fine embattled Perpendicular building with western tower and spire. The high school, formerly the grammar school, was founded in the time of Elizabeth. Here were educated Sir Henry Chauncey, an early historian of Hertfordshire (d. 1719), and Cecil Rhodes, who was born at Bishop Stortford in 1853. There are a Nonconformist grammar school, a diocesan training college for mistresses, and other educational establishments. The industries include brewing and malting, coach-building, lime-burning and foundry, and there are important horse and cattle markets.

Before the Conquest the manor of Bishop Stortford is said to have belonged to Edveda the Fair, wife of Harold, who sold it to the bishop of London, from whom it was taken by William the Conqueror. William restored it after a few years, and with it gave the bishop a small castle called Waymento, of which there are scanty remains. The dungeon of this castle, called "Bishop's Hole" or "Bishop's Prison," was used as an ecclesiastical prison until the 16th century. The town now possesses no early incorporation charters, and although Bishop Courtenay and Salustione, their histories of Hertfordshire state, that it was created a borough by charter of King John in 1206, the charter cannot now be found. The first mention of Bishop Stortford as a borough occurs in 1311, in which year the mayor and burgesses to parliament. The town was represented from that date until 1332, and again in 1335-1336, but the privilege was then allowed to lapse and has never been revived.

BISKRA, a town of Algeria, in the arrondissement of Batna, department of Constantine, 150 m. S.S.W. of the city of Constantine and connected with it and with Philippeville by rail. It lies in the Sahara 360 ft. above the sea, on the right bank of the Wad Biskra, a river which, often early dry, becomes a mighty torrent after one or two days' rain in winter. The name Biskra applies to a union of five or six villages of the usual Saharan type, scattered through an oasis 3 m. in length by less than 1 m. broad, and separated by huge gardens full of palm and olive trees. The houses are built of hard-packed mud, with doors and roof of palm wood. The foreign settlement is on the north of the oasis; it consists of a broad main street, the rue Berte (from which a few side streets branch at right angles), lined with European houses, the whole in the style of a typical French winter resort, a beautiful public garden, with the church in the centre, an arcade, a pretentious maiére in pseudo-Moorish style with entrance guarded by terra-cotta lions, some good shops, a number of excellent hotels and cafes, a casino, clubs, and, near by, a street of dancing and singing girls of the tribe of Walad-Nail. East of the public garden is Fort St Germain, named after an officer killed in the insurrection of the Zaatcha in 1849; it is capable of resisting any attack of the Arabs, and extensive enough to shelter the whole of the civil population, who took refuge therein during the rebellion of 1871. It contains barracks, hospital, and government offices. From the Carthage road lies the 33rd line of C.-E. Landon with magnificent gardens filled with tropical plants. The population (1896) of the chief settlement was 4,218, of the whole oasis 10,413.

From November to April the climate of Biskra is delightful. Nowhere in Algeria can be found more genial temperature or clearer skies, and while in summer the thermometer often registers 110° F. in the shade, and 90° at night, the pure dryness of the air in this practically rainless region makes the heat
endurable. The only drawback to the climate is the prevalence of high cold winds in winter. These winds cause temperatures as low as 36°, but the mean reading, on an average of ten years, is 75°.

In the oasis are some 200,000 fruit trees, of which about 15,000 are date-palms, the rest being olives, pomegranates and apricots. In the centre of the oasis is the old kasbah or citadel.

In 1844 the duc d’Aumale occupied this fort, and here, on the night of the 12th of May of that year, the 68 men who formed the French garrison were, with one exception, massacred by Arabs. In the fort are a few fragments of Roman work—all that remains of the Roman post Ad Pisicnurn.

Biskra is the capital of the Ziban (plural of Zab), a race of mixed Berber and Arab origin, whose villages extend from the southern slopes of the Aures to the Shut Melir. These villages, built in oases dotted over the desert, nestle in groves of date-palms and fruit trees and waving fields of barley. The most interesting village is that of Sidi Okba, 12 m. south-east of Biskra. It is built of houses of one story made of sun-dried bricks. The mosque is square, with a flat roof supported on clay columns, and crowned by a minaret. In the north-west corner of the mosque is the tomb of Sidi Okba, the leader of the Arabs who in the 1st century of the Hegira conquered Africa for Islam from Egypt to Tangier. Sidi Okba was killed by the Berbers near this place in A.D. 632. His tomb is the inscription in Cufic characters, “This is the tomb of Okba, s.a. of Nafi. May God have mercy upon him.” No other Arabic inscription is known to exist in Africa.

BISLEY, a village of Surrey, England, 34 m. N.W. of Woking. The ranges of the National Rifle Association were transferred from Wimbledon here in 1890. (See RIFLE.)

BISMARCK, OTTO EDUARD LEOPOLD VON, PRINCE, duke of Lauenburg (1815-1898), German statesman, was born on the 1st of April, 1815, at the manor-house of Schönhausen, his father’s seat in the mark of Brandenburg. The family has, since the 14th century, belonged to the landed gentry, and many members had held high office in the kingdom of Prussia. His father (d. 1849), of whom he always spoke with much affection, was a quiet, unassuming man, who retired from the army in early life with the rank of captain of cavalry (Rittmeister). His mother, a daughter of Mencken, cabinet secretary to the king, was a woman of strong character and ability, who had been brought up at Berlin under the “Aufklärung.” Her ambition was centred in her son, but Bismarck in his recollections of his childhood missed the influences of maternal tenderness. There were several children of the marriage, which took place in 1806, but all died in childhood except Bernhard (1810-1893), Otto, and one sister, Malvina (b. 1827), who married in 1845 Oscar von Arnim. Young Bismarck was educated in Berlin, first at a private school, then at the gymnasium of the Graue Kloster (Grey Friars). At the age of seventeen he went to the university of Göttingen, where he spent a little over a year; he joined the corps of the Hannoveran and took a leading part in the social life of the students. He completed his studies at Berlin, and in 1835 passed the examinations which admitted him to the public service. He was intended for the diplomatic service, but spent some months at Aix-la-Chapelle in administrative work, and then was transferred to Potsdam and the judicial side. He soon retired from the public service; he conceived a great distaste for it, and had shown himself defective in discipline and regularity. In 1839, after his mother’s death, he undertook, with his brother, the management of the family estates in Pomeraaria; at the time most of the estate attached to Schönhausen had to be sold. But the management of the rest of his life with his father at Schönhausen. He and his brother took an active part in local affairs, and in 1846 he was appointed Deichhauptsmann, an office in which he was responsible for the care of the dykes by which the country, in the neighbourhood of the Elbe, was preserved from inundation. During these years he travelled in England, France and Switzerland. The influence of his mother, and his own wide reading and critical character, made him at one time inclined to hold liberal opinions on govern- ment and religion, but he was strongly affected by the religious revival of the early years of the reign of Frederick William IV.; his opinions underwent a great change, and under the influence of the neighbouring country gentlemen he acquired those strong principles in favour of monarchical government as the expression of the Christian state, of which he was to become the most celebrated exponent. His religious convictions were strengthened by his marriage to Johanna von Puttkamer, which took place in 1847.

In the same year he entered public life, being chosen as substitute for the representative of the lower nobility of his district in the estates-general, which were in that year summoned to Berlin. He took his seat with the extreme right, and distinguished himself by the vigour and originality with which he defended the rights of the king and the Christian monarchy against the Liberals. When the revolution broke out in the following year he offered to bring the peasants of Schönhausen to Berlin in order to defend the king against the revolutionary party, and in the last meeting of the estates voted in a minority of two against the address thanking the king for granting a constitution. He did not sit in any of the assemblies summoned during the revolutionary year, but took a very active part in the formation of a union of the Conservative party, and was one of the founders of the Kreuzzeitung, which has since then been the organ of the Monarchical party in Prussia. In the new parliament which was elected at the beginning of 1849, he sat for Brandenburg, and was one of the most frequent and most incisive speakers of what was called the Junker party. He took a prominent part in the discussions on the new Prussian constitution, always defending the power of the king. His speeches of this period show great debating skill, combined with strong originality and imagination. His constant theme was, that the party disputes were a struggle for power between the forces of revolution, which derived their strength from the fighters on the barricades, and the Christian monarchy, and that between these opposed principles no compromise was possible. He took also a considerable part in the debates on the foreign policy of the Prussian government; he defended the government for not accepting the Frankfort constitution, and opposed the policy of Radowitz, on the ground that the Prussian king would be subjected to the control of a non-Prussian parliament. The only thing, he said, that had come out of the revolutionary year unharmed, and had saved Prussia from Germany and Germany from anarchy, was the Prussian army and the Prussian civil service; and in the debates on foreign policy he opposed the numerous plans for bringing about the union of Germany, by subjecting the crown and Prussia to a common German parliament. He had a seat in the parliament of Erfurt, but only went there in order to oppose the constitution which the parliament had framed. He foresaw that the policy of the government would lead it into a position when it would have to fight against Austria on behalf of a constitution by which Prussia itself would be dissolved, and he was, therefore, one of the few prominent politicians who defended the complete change of front which followed the surrender of Olmütz.

It was probably his speeches on German policy which induced the king to appoint him Prussian representative at the restored diet of Frankfort in 1851. The appointment was a bold one, as he was entirely without diplomatic experience, but he justified the confidence placed in him. During the eight years he spent at Frankfort he acquired an unrivalled knowledge of German politics. He was often used by the government in each of the missions, as in 1852, when he was sent to Vienna. He was entrusted with the negotiations by which the duke of Augustenburg was persuaded to assent to the arrangements by which he resigned his claims to Schleswig and Holstein. The period he spent at Frankfort, however, was of most importance because of the change it brought about in his own political opinions. When he went to Frankfort he was still under the influence of the extreme Prussian Conservatives, men like the Gerlachs, who regarded the maintenance of the principle of the
BISMARCK

Christian monarchy against the revolution as the chief duty of the Prussian government. He was prepared on this ground for a close alliance with Austria. He found, however, a deliberate intention on the part of Austria to humble Prussia, and to degrade her from the position of an equal power, and also great jealousy of Prussia among the smaller German princes, many of whom owed their thrones to the Prussian soldiers, who, as in Saxony and Baden, had crushed the insurgents. He therefore came to the conclusion that if Prussia was to regain the position she had lost she must be prepared for the opposition of Austria, and must strengthen herself by alliances with other powers. The solidarity of Conservative interests appeared to him now a dangerous fiction. At the time of the Crimean War he advocated alliance with Russia, and it was to a great extent owing to his advice that Prussia did not join the western powers. Afterwards he urged a good understanding with Napoleon, but his advice was met by the insuperable objection of King Frederick William IV. to any alliance with a ruler of revolutionary origin.

The change of ministry which followed the establishment of a regency in 1857 made it desirable to appoint a new envoy at Frankfort, and in 1858 Bismarck was appointed ambassador at St Petersburg, where he remained for four years. During this period he acquired some knowledge of Russian, and gained the warm regard of the tsar, as well as of the dowager-empress, herself a Prussian princess. During the first two years he had little influence on the Prussian government; the Liberal ministers distrusted his known opinions on parliamentary government, and the monarchical feeling of the prince regent was offended by Bismarck's avowed readiness for alliance with the Italians and his disregard of the rights of other princes. The failure of the ministry, and the estrangement between King William and the Liberal party, opened to him the way to power. Roon, who was appointed minister of war in 1861, was an old friend of his, and through him Bismarck was thenceforward kept closely informed of the condition of affairs in Berlin. On several occasions the prospect of entering the ministry was open to him, but nothing came of it, apparently because he required a free hand in foreign affairs, and this the king was not prepared to give him. When an acute crisis arose out of the refusal of parliament, in 1862, to vote the money required for the reorganization of the army, which the king and Roon had carried through, he was summoned to Berlin; but the king was still unable to make up his mind to appoint him, although he felt that Bismarck was the only man who had the courage and capacity for conducting the struggle with patience. He was, therefore, in June, made ambassador at Paris as a temporary measure. There he had the opportunity for renewing the good understanding with Napoleon which had been begun in 1857. He also paid a short visit to England, but it does not appear that this had any political results. In September the parliament, by a large majority, threw out the budget, and the king, having nowhere else to turn for help, at Roon's advice summoned Bismarck to Berlin and appointed him minister-president and foreign minister.

Bismarck's duty as minister was to carry on the government against the wishes of the Lower House, so as to enable the king to complete and maintain the reorganized army. The opposition of the House was supported by the country and by a large party at court, including the queen and crown prince. The indignation which his appointment caused was intense; he was known only by the reputation which in his early years he had won as a violent ultra-Conservative, and the apprehensions were increased by his first speech, in which he said that the German question could not be settled by speeches and parliamentary decrees, but only by blood and iron. His early fall was predicted, and it was feared that he might bring down the monarchy with him. Standing almost alone he succeeded in the task he had undertaken. For four years he ruled without a budget, taking advantage of an omission in the constitution which did not specify what was to happen in case the crown and the two Houses could not agree on a budget. The conflict of the ministers and the House assumed at times the form of bitter personal hostility; in 1863 the ministers refused any longer to attend the sittings, and Bismarck challenged Virchow, one of his strongest opponents, to a duel, which, however, did not take place. In 1853 he had fought a duel with pistols against Georg von Vinder, a political opponent. In June 1853, as soon as parliament had risen, Bismarck published ordinances controlling the liberty of the press, which, though in accordance with the letter, seemed opposed to the intentions of the constitution, and it was on this occasion that the crown prince, hitherto a silent opponent, publicly dissociated himself from the policy of his father's ministers. Bismarck depended for his position solely on the confidence of the king; and the necessity for defending himself against the attempts to destroy this confidence added greatly to the suspiciousness of his nature. He was, however, really indispensable, for his resignation must be followed by a Liberal ministry, parliamentary control over the army, and probably the abdication of the king. Not only, therefore, was he secure in the continuance of the king's support, but he had also the complete control of foreign affairs. Thus he could afford to ignore the criticism of the House, and the king was obliged to acquiesce in the policy of a minister to whom he owed so much.

He soon gave to the policy of the monarchy a resolution which had long been wanting. When the emperor of Austria summoned a meeting of the German princes at Frankfort to discuss a reform of the confederation, Bismarck published a Foreign policy.
events. Watched as he was by countless enemies at home and abroad, a single false step would have brought ruin and disgrace on himself; the growing national excitement would have burst through all restraint, and again, as fifteen years before, Germany divided and unorganized would have had to capitulate to the orders of foreign powers (see SCHLESWIG-HOLSTEIN QUESTION).

The peace of Vienna left him once more free to return to his older policy. For the next eighteen months he was occupied in preparing for war with Austria. For this war he was alone responsible; he undertook it deliberately as the only means of securing Prussian ascendancy in Germany. The actual cause of dispute was the disposition of the conquered duchies, for Austria now wished to put Augustenborg on the throne to which Bismarck would not assent. In 1865 a provisional arrangement was made by the treaty of Gastein, for Bismarck was not yet ready. He would not risk a war unless he was certain of success, and for this he required the alliance of Italy and French support; both he secured during the next year. In October 1865 he visited Napoleon at Biarritz and Paris. No formal treaty was made, but Napoleon promised to regard favourably an extension of Prussian power in Germany; while Bismarck led the emperor to believe that Prussia would help him in extending the frontier of France. A treaty of alliance was signed in Paris in May 1866, and Bismarck then with much difficulty overcame the reluctance of the king to embark in a war with his old ally. The results of the war entirely justified his calculations. Prussia, though opposed by all the German states except a few principalities in the north, completely defeated all her enemies, and at the end of a few weeks the whole of Germany lay at her feet.

The war of 1866 is more than that of 1870 the crisis of modern German history. It finally settled the controversy which had begun more than a hundred years before, Germany or Prussia the dominant power in Germany. It determined that the unity of Germany should be brought about not by revolutionary means as in 1848, not as in 1849 had been attempted by voluntary agreement of the princes, not by Austria, but by the sword of Prussia. This was the great work of Bismarck's life; he had completed the programme foreshadowed in his early speeches, and finished the work of Frederick the Great. It is also the turning-point in Bismarck's own life. Having secured the dominance of the crown in Prussia and of Prussia in Germany, he could afford to make a reconciliation with the parties which had been his chief opponents, and turn to them for help in building up a new Germany. The settlement of 1866 was peculiarly his work. We must notice, first, how in arranging the terms of peace he opposed the king and the military party who wished to advance on Vienna and annex part of Austrian Silesia; with greater foresight he looked to renewing the old friendship with Austria, and insisted (even with the threat of resignation) that no territory should be demanded. The southern states he treated with equal moderation, and thereby was able to arrange an offensive and defensive alliance with them. On the other hand, in order to secure the complete control of North Germany, which was his immediate object, he required that the whole of Hanover, Hesse-Cassel, Hesse-Nassau and the city of Frankfort, as well as the Elbe duchies, should be absorbed in Prussia. He then formed a separate confederation of the North German states, but did not attempt to unite the whole of Germany, partly because of the internal difficulties which would have produced, partly because it would have brought about a war with France. In the new confederation he became sole responsible minister, with the title Bundes-Kanzler; this position he held till 1890, in addition to his former post of premier minister. In 1871 the title was altered to Reichs-Kanzler.

The reconciliation with the Prussian parliament he effected by bringing in a bill of indemnity for the money which had been spent without leave of parliament. The Radicals still continued their opposition, but he thereby made possible the formation of a large party of moderate Liberals, who thenceforward supported him in his new Nationalist policy. He also, in the constitution for the new confederation, introduced a parliament (Bundestag) elected by universal suffrage. This was the chief demand of the revolutionists in 1848; it was one to which in his early life he had been strongly opposed. His experience at Frankfort had diminished his dislike of popular representation, and it was probably to the advice of Lassalle that his adoption of universal suffrage was due. He first publicly proposed it just before the war; by carrying it out, notwithstanding the apprehensions of many Liberal politicians, he placed the new constitution on a firmer base than would otherwise have been possible.

Up to 1866 he had always appeared to be an opponent of the National party in Germany, now he became their leader. His next task was to complete the work which was half-finished, and it was this which brought about the second of the great wars which he undertook.

The relations with Napoleon III. form one of the most interesting but obscurest episodes in Bismarck's career. We have seen that he did not share the common prejudice against co-operation with France. He found Napoleon willing to aid Prussia as he had aided Piedmont, and was ready to accept his assistance. There was this difference, that he asked only for neutrality, not armed assistance, and it is improbable that he ever intended to assume any German territory; he showed himself, however, on more than one occasion, ready to discuss plans for extending French territory, on the side of Belgium and Switzerland. Napoleon, who had not anticipated the rapid success of Prussia, after the battle of Königgrätz at the request of Austria came forward as mediator, and there were a few days during which it was probable that Prussia would have to meet a French attempt to dictate terms of peace. Bismarck in this crisis by deferring to the emperor in appearance avoided the danger, but he knew that he had been deceived, and the cordial understanding was never renewed. Immediately after an armistice had been arranged, Benedetti, at the orders of the French government, demanded as recompense a large tract of German territory on the left bank of the Rhine. This Bismarck peremptorily refused, declaring that he would rather have war. Benedetti then made another proposal, submitting a draft treaty by which France was to support Prussia in adding the South German states to the new confederation, and Germany was to support France in the annexation of Luxemburg and Belgium. Bismarck discussed, but did not conclude the treaty; he kept, however, a copy of the draft in Benedetti's handwriting, and published it in The Times in the summer of 1870 so as to injure the credit of Napoleon in England. The failure of the scheme made a contest with France inevitable, at least unless the Germans were willing to forgo the purpose of completing the work of German unity, and during the next four years the two nations were each preparing for the struggle, and each watching to take the other at a disadvantage.

It is necessary, then, to keep in mind the general situation in considering Bismarck's conduct in the months immediately preceding the war of 1870. In 1867 there was a dispute regarding the right to garrison Luxemburg. Bismarck then produced the secret treaties with the southern states, an act which was, as it were, a challenge to France by the whole of Germany. During the next three years the Ultramontane party hoped to bring about an anti-Prussian revolution, and Napoleon was working for an alliance with Austria, where Beust, an old opponent of Bismarck's, was chancellor. Bismarck was doubtless well informed as to the progress of the negotiations, for he had established intimate relations with the Hungarians. The British government, with an eye on the possibility of completing the work of German unity was so strong that he could with difficulty resist it, and in 1870 he was much embarrassed by a request from Baden to be admitted to the confederation, which he had to refuse. It is therefore not surprising that he eagerly welcomed the opportunity of gaining the goodwill of Spain, and supported by all the means in his power the offer made by Marshal Prim that Prince Leopold of Hohenzollern should be chosen king of that country. It was only by his urgent and repeated representations that the prince was persuaded against his will to accept. The negotiations were
BISMARCK carried out with the greatest secrecy, but as soon as the acceptance was made known the French government intervened and declared that the project was inadmissible. Bismarck was away at Varzin, but on his instructions the Prussian foreign office in answer to inquiries denied all knowledge or responsibility. This was necessary, because it would have caused a bad impression in Germany had he gone to war with France in support of the prince’s candidature. The king, by receiving Benedetti at Ems, departed from the policy of reserve Bismarck himself adopted, and Bismarck (who had now gone to Berlin) found himself in a position of such difficulty that he contemplated resignation. The French, however, by changing and extending their demands enabled him to find a cause of war of such nature that the union of the empire would be united against French aggression. France asked for a letter of apology, and Benedetti personally requested from the king a promise that he would never allow the candidature to be resumed. Bismarck published the telegram in which this information and the refusal of the king were conveyed, but by omitting part of the telegram made it appear that the request and refusal had both been conveyed in a more abrupt form than had really been the case.1 But even apart from this, the publication of the French demand, which could not be complied with, must have brought about a war.

In the campaign of 1870–71 Bismarck accompanied the headquarters of the army, as he had done in 1866. He was present at the battle of Gravelotte and at the surrender of Sedan, and it was on the morning of the 2nd of September that he had his famous meeting with Napoleon after the surrender of the emperor. He accompanied the king to Paris, and spent many months at Versailles. Here he was occupied chiefly with the arrangements for admitting the southern states to the confederation, and the establishment of the empire. He also understood much anxiety lest the efforts of Thiers to bring about an interference by the neutral powers might be successful. He had to carry on the negotiations with the French prior to the surrender of Paris, and to enforce upon them the German terms of peace.

For Bismarck’s political career after 1870 we must refer to the article GERMANY, for he was henceforward entirely absorbed in the affairs of his country. The foreign policy he controlled absolutely. As chancellor he was responsible for the whole imperial policy of the empire, and his influence is likely to be seen in every department of state, especially, however, in the great change of policy after 1878. During the earlier period the estrangement from the Conservatives, which had begun in 1866, became very marked, and brought about a violent quarrel with many of his old friends, which culminated in the celebrated Armin trial. He incurred much criticism during the struggle with the Roman Catholic Church, and in 1873 he was shot at and slightly wounded by a youth called Rullmann, who professed to be an adherent of the Clerical party. Once before, in 1866, just before the outbreak of war, his life had been attempted by a young man called Cohen, a native of Württemberg, who wished to save Germany from a fratricidal war. In 1873 he retired from the presidency of the Prussian ministry, but returned after a few months. On several occasions he offered to retire, but the emperor always refused his consent, on the last time with the word “Never.” In 1877 he took a long leave of absence for ten months. His health at this time was very bad. In 1878 he presided over the congress of Berlin. The following years were chiefly occupied, besides foreign affairs, which were always his first care, with the internal policy of the great reformer. In 1880 he resigned this office and the office of Prussian minister of trade in addition to his other posts. During this period his relations with the Reichstag were often very unsatisfactory, and at no time did he resort so freely to prosecutions in the law-courts in order to injure his opponents, so that the expression Bismarck-Beleidigung was invented. He was engaged at this time in a great struggle with the Social-Democrats, whom he tried to keep in check by legal penal laws. The death of the emperor William in 1888 made a serious difference in his position. He had been bound to him by a long term of loyal service, which had been rewarded with equal loyalty. For his relations to the emperors Frederick and William II., and for the events connected with his dismissal from office in March 1890, we must refer to the articles under those names.

After his retirement he resided at Friedrichsruh, near Hamburg, a house on his Lauenburg estates. His criticisms of the government, given sometimes in conversation, sometimes in the Columns of the Hamburger Nachrichten, caused an open breach between him and the emperor; and the new chancellor, Count Caprivi, in a circular despatch which was afterwards published, warned all German envoys that no real importance must be attached to what he said. When he visited Vienna for his son’s wedding the German ambassador, Prince Reuss, was forbidden to take any notice of him. A reconciliation was effected in 1893.

In 1895 his eightieth birthday was celebrated with great enthusiasm: the Reichstag alone, owing to the opposition of the Clericals and Nationalists, refused to make any public acknowledgment. He had been elected a member of the Reichstag, but he never took his seat. He died at Friedrichsruh on the 31st of July 1898.

Bismarck was made a count in 1865; in 1871 he received the rank of Fürst (prince). On his retirement the emperor created him duke of Lauenburg, but he never used the title, which was not inherited by his son. In 1866 he received 60,000 as his share of the donation voted by the Reichstag for the victorious generals. With this he purchased the estate of Varzin in Pomerania, which henceforth he used as a country residence in preference to Schönhausen. In 1871 the emperor presented him with a large part of the domains of the duchy of Lauenburg. On his seventieth birthday a large sum of money (£70,000) was raised by public subscription, of which half was devoted to repurchasing the estate of Schönhausen for him, and the rest was used by him to establish a fund for the assistance of schoolmasters. As a young man he was an officer in the Landwehr and militia, and in addition to his civil honours he was eventually raised to the rank of general. Among the numerous orders he received we may mention the Crown of Italy and the first class of the German Red Cross, the order of Christ; this was done after the cessation of the Kulturkampf and the reference of the dispute with Spain concerning the Caroline Islands to the arbitration of the pope.

Bismarck’s wife died in 1894. He left one daughter and two sons. Herbert (1849–1904), the elder, was wounded at Mars-la-Tour, afterwards entered the foreign office, and acted as private secretary to his father (1871–1881). In 1882 he became councillor to the embassy at London, in 1884 was transferred to St Petersburg, and in 1885 became under-secretary of state for foreign affairs. In 1884 he had been elected to the Reichstag, but had to resign his seat when, in 1886, he was made secretary of state for foreign affairs and Prussian minister. He conducted many of the negotiations with Great Britain on colonial affairs. He retired in 1890 at the same time as his father, and in 1893 was again elected to the Reichstag. He married Countess Margarete Hoyo in 1892, and died on the 18th of September 1904. He left two daughters and three sons, of whom the eldest, Otto Christian Archibald (b. 1897), succeeded to the princely title. The second son, Wilhelm, who was president of the province of Brunswick, died in 1910. There is a biographical work by K. Kröcher, Die Erinnerungen; the works of Gedanken and Erinnerungen, translated into English as Bismarck’s Memoirs and Reminiscences (London, 1895). They are incomplete, but contain very valuable discussions on particular points. The speeches are the greatest importance both for his character and for political history; of the numerous editions that by Horst Kohl, in

1 It was not till many years later that our knowledge of these events (which is still incomplete) was established; in 1894 the publication of the memoirs of the king of Rumania showed, what had hitherto been denied, that Bismarck had taken a leading part in urging the Triple Alliance on the prince of Hohenzollern. It was in 1891 that the language used by Bismarck himself made it necessary for the German government to publish the original form of the Ems telegram.
BISMARCK—BISMUTH

12 vols. (Stuttgart, 1892-1894), is the best; there is also a cheap edition in Reclain's Universalbichbchen. Bismarck was an admirable letter-writer, and all his private letters have been published in a collected edition which has been brought out by Horst Kohl. His letters to his wife were published by Prince Herbert Bismarck (Stuttgart, 1900). A translation of a small selection of the private letters was published in New York by Horst Kohl (1888). The year 1858 is the correspondence with General L. v. Gerlach, which has been edited by Horst Kohl (3rd ed., Berlin, 1893). A selection of the political letters was published in 1899-1900 (2nd ed., Berlin, 1890). Of far greater importance are the collections of despatches and state papers edited by Herr v. Poschinger. These include four volumes entitled Preussen im Auslande (Berlin, 1872-1882), which were despatched during the time he was at Frankfurt. Next in importance are two works, Bismarck als Vollzahler und Aktenstucke zur Wirtschaftspolitik des Preussen, which are part of the collection of state papers, Aktenstucke zur Geschichte der Wirtschaftspolitik in Preussen. They contain full information on Bismarck's commercial policy, including a number of important state papers. A useful general collection is that by Ludwig Hahn, Bismarck, sein politisches Leben, 5 vols. (Berlin, 1878-1891), which includes a selection from letters, speeches and newspaper articles. These collections have only been possible owing to the extreme generosity with which the archives of relatives and friends have been opened to the public. Bismarck always professed to have no secrets. A full account of the diplomatic history from 1863 to 1870 is given by Sybel in Die Begrundung des deutschen Reichs (Munich, 1879), which were written with the full cooperation of the archivist, H. v. Poschinger.

The last two volumes, covering 1869-1870, are of less value, as he was not able to use the archives for this period. Poschinger has also edited a series of works in which an attempt is made to elucidate the relations and conversations are, however, of very unequal value. They are Bismarck und die Parlamentarier, Fursten Bismarck und der Bundesrat, Die Anspreehe des Fürsten Bismarck, Neue Tischtage, and Briefe und die Diplomaten (Berlin, 1902-1904). These have also been published in English by Charles Lowe, The Tabletalk of Prince Bismarck, and by Sidney Whitman, Conversations with Bismarck. By far the fullest guide to Bismarck's life is Horst Kohl's Fürsten Bismarck, Regesten aus einer wissenschaftlichen Biographie (Leipzig, 1891-1902), which contains a record of Bismarck's actions on each day, with references to extracts from his letters and speeches. For the works of Moritz Wirths, discussed in his Biographie de Bismarck, the German edition of his daily papers, and the article Besen, further materials were published periodically in the Bismarck-Jahrbuch, edited by Horst Kohl (Berlin, 1894-1896; Stuttgart, 1896).m. Poschinger has also brought out a Bismarck Postfussel. Of German biographies may be mentioned Hans Blum, Bismarck und seine Zeit (6 vols., Munich, 1894-1895), with a volume of appendices, 8 vols. (1898); Heyck, Bismarck (Bielefeld, 1896); Kreutzer, Otto von Bismarck (2 vols., Leipzig, 1900); Klein-Hattingen, Bismarck and seine Welt, 1815-1871, 2 vols. (Berlin, 1902); Lenz, Geschichte Bismarcks (Leipzig, 1902); Penzler, Fürsten Bismarck (Berlin, 1894); Schrappe, Bismarck und seine Zeit, 1871-1890 (1905). Poschinger also brought out a Bismarck Postfussel. Of German biographies may be mentioned Hans Blum, Bismarck und seine Zeit (6 vols., Munich, 1894-1895), with a volume of appendices, 8 vols. (1898); Heyck, Bismarck (Bielefeld, 1896); Kreutzer, Otto von Bismarck (2 vols., Leipzig, 1900); Klein-Hattingen, Bismarck and seine Welt, 1815-1871, 2 vols. (Berlin, 1902); Lenz, Geschichte Bismarcks (Leipzig, 1902); Penzler, Fürsten Bismarck (Berlin, 1894); Schrappe, Bismarck and seine Zeit, 1871-1890 (1905). Poschinger also brought out a Bismarck Postfussel.
BISMUTH

the basic tellurate mineral, Bi₂O₅·TeO₂; the silicates
cylitie and agricole, Bi₃(SiO₄)₂; and the uranyl arsenate
colurite, Bi₂(AsO₄)₃; and the uranyl arsenate

Metallurgy.—Bismuth is extracted from its ores by dry, wet,
or electrolysis methods. Each method requires a detailed
composition of the ore and economic conditions. The dry process
is more frequently practised, for the easy reducibility of the oxide and
the corresponding low melting point of the oxide render it sufficient to effect a ready separation of the metal from the
gangue and impurities. The extraction of ores in which the
bismuth is present in the metallic condition may be accomplished by
the action of carbon in a reducing atmosphere, or by melting out the
metallic bismuth, or by a combination of both methods. The wet process
shows a lower percentage of metallic bismuth, or by a complete fusion of the ore.
The first process never extracts all the bismuth, as much as one-third
being retained in the matte or speiss; the second is more suitable
for the extraction of a small amount of metallic bismuth, or by a separate addition of reducing agents to decompose any admixed bismuth oxide or sulphide. In the liqation process the ore is heated in
boiling hydraulic stoves, and the metallic bismuth is allowed to settle to the
lower end; the residues being removed from the upper end. The fusion process is preferably carried out in crucible furnaces; shaft
furnaces are unsatisfactory on account of the disintegrating action of
the molten bismuth on the furnace linings.

Sulphurated ores are smelted, either with or without a preliminary
calcination, with metallic iron; calcined ores may be smelted with carbon
in the presence of a reducing atmosphere to obtain metallic bismuth. The solution
in calcination furnaces and a subsequent smelting in the same type of furnace
with the addition of about 3% of coal, lime, soda and flux, has been adopted for treating
the Bolivian ores, which generally contain the sulphides of bismuth, copper, iron, antimony, lead and a little silver. The metallic bismuth is in the form of a metallic bismuth, the succeeding layers are a bismuth copper, which is subsequently worked up, and a slag. Ores containing the oxide and carbonate are treated either by smelting with carbon or
by a wet process.

In the wet process the ores, in which the bismuth is present as oxide
or carbonate, are dissolved in hydrochloric acid, or, if the bismuth is to be extracted from a matte or alloy, the solvent extraction
is preferred. It is followed by precipitation with hydrogen sulphide, which
occasions the separation of the unreduced bismuth sulphide, or by the addition of metallic chlorides or sulphates so obtained is precipitated by iron,
metallic bismuth filtered, washed with water, pressed on canvas bags, and finally fused in graphite crucibles, the surface being protected
by a layer of charcoal. Another process consists in adding water to
the solution and so precipitating the bismuth as oxalate, which is then converted into the metal.

The bismuth obtained by the precipitation processes is generally
contaminated by arsenic, sulphur, iron, nickel, cobalt and antimony,
and sometimes with silver or gold. A dry method of purification consists in
boiling a heated bismuth nitrate solution, which occasions the separation of the unreduced bismuth sulphate from the bulk of the other impurities.

A better process is to remelt the metal in crucibles with the addition of certain refining agents. The details of this process are at present considerably
confused. One new method of removing impurities is the fusion of the metal with phosphorus, which causes a reduction of impure iron to the
metallic state and the practice of particular works. The wet refining process is more tedious and expensive, and is only exceptionally employed, as in the case of preparing the pure metal of its salts for pharmaceutical or chemical purposes. The basic nitrate is the salt generally prepared, and, in general outline, the process consists in dissolving the metal in nitric acid, adding water to
the solution, boiling the precipitated basic nitrate with an alkali to
remove the arsenic and lead, dissolving the residue in nitric acid, and
reprecipitating as basic nitrate with water. J. F. W. Hampe
prepared chemically pure bismuth by fusing the metal with sodium carbonate, adding water to the dissolved precipitate, dissolving the precipitate in nitric acid, precipitating the bismuth as the basic nitrate, redissolving this salt in nitric acid, and then precipitating with ammonia.

The bismuth hydroxide so obtained is finally reduced by hydrogen.

Properties.—Bismuth is a very brittle metal with a white crystalline
structure and a characteristic reddish-white colour. It is
brittle and effloresces in a long diagonal line at the angles of 87° 40'. According to G. A. Kahlbaum,
Roth and Siedler (Zet. Anorg. Chem., 29, p. 294). its specific gravity is
9.78443; Roberts and Wrighton give the specific gravity of solid
bismuth as 9.76. The specific gravity of molten bismuth varies from 9.14500 to 9.14500 (T. Carnelley and W. C. Williams). Regnault determined its
specific heat between 0° and 100° to be 0.0089; Kahlbaum, Roth and Siedler (loc. cit.), of molten bismuth, as 0.0089
0.100°; and the lowest electrical conductivity of the metal, determined by direct methods, depends on the method employed.
It oxidizes very slowly in dry air at ordinary temperatures,
but somewhat more rapidly in moist air or when heated. In the last
it becomes coated with a greyish-black layer of an oxide
(4T) 1, at a red heat the layer consists of the trioxide (Bi₂O₃),
and a second layer of oxide and a third, consisting of grey, a brown
impure; at a bright red heat it burns with a bluish flame to the
bismuth. Bismuth combines directly with the halogens, and the elements of the sulphur group. It readily dissolves in nitric acid, ether and alcohol without complete decomposition. It is rendered
insoluble in the pure metallic state by adding potassium hydroxide
acid. It is precipitated as the metal from its salts by the metals of the alkaloids and alkaline earths, zinc, iron, copper, &c.
In some cases it is obtained by the decomposition of thermopiles;
it an important distinction is that it forms no hydrogen compound analogous to arsenic and stibine.

Alloys.—Bismuth readily forms alloys with other metals. Treated
with sodium nitrate it yields a yellow-black mass, BIna, which table
in the air and decomposes water. A brittle potassium alloy of silver-white colour and lamellar fracture is obtained by calcining the metal in air, and its solidification; many of them are used in the arts (see FUSIBLE
Metal).

Compounds.—Bismuth forms four oxides, of which bismuth oxide, Bi₂O₃, is the most important. This compound occurs in nature as
bismuth ocher, and may be prepared artificially by oxidizing the metal at a red heat, or by heating the carbonate, nitrate or hydrate.
Bismuth oxide is obtained by precipitating bismuth oxalate with nitric acid to form soluble salts, which are readily precipitated as basic acids when the solution is diluted. It melts to a reddish-brown liquid, which solidifies to a yellow crystalline mass on cooling. The hydrate, Bi₂O₃·H₂O, is obtained by mixing bismuth oxide powder with potash to a solution of a bismuth salt. Bismuth oxide, Bi₂O₃, or Bi₂O₃·H₂O, is said to be formed by the limited oxidation of the metal, and as a brown precipitate by adding mixed solutions of bismuth and stannous chlorides in the presence of water. Bi₂O₃·H₂O, is a powder, which in the presence of water, alternately sending bismuth bismuthate, is obtained by melting bismuth trioxide with potash, or by igniting bismuth trioxide with potash and potassium chloride. It is also formed by oxidizing bismuth trioxide suspended in caustic potash with chloride, the pentoxide being formed simultaneously; oxidation and potassium ferricyanide simply gives the tetroxide (Baum and Vannini, Zet. Anorg. Chem., 1904, 39, p. 381). The hydrate, Bi₂O₃·H₂O, or Bi₂O₃·H₂O, is formed by heating bismuth oxide, Bi₂O₃, to 150°; this acid (in the form of its salts) being the product of the continued oxidation of bismuth chloride or bismuth oxychloride.

Bismuth forms two chlorides : Bic₂Cl₂ and BiCl₃. The dichloride,
BiCl₂, is obtained by fusing the metal with the trichloride, or in a current of chlorine, or by heating the chloride in a current of hydrogen. It is a yellowish-brown, not easily removable, well-formed, bismuth and the oxychloride, BiClO₃. Bismuth trichloride, BiCl₃,
was obtained by Robert Boyle by heating the metal with corrosive sublimate. It is the final product of burning bismuth in an excess of
chlorine. It is a white substance, melting at 225°-230° and boiling at 435°-441°. With excess of water, it gives a white precipitate of the oxychloride, BiClO₃. Bismuth trichloride forms double compounds with hydrochloric acid, the chlorides of the alkaline metals, ammonia, nitric oxide and nitrogen. Bismuth tri-
fluoride, BiF₃, a white powder, bismuth tribromide, BiBr₃, golden yellow crystals, bismuth iodide, BiI₃, greyish-black crystals, are also known. The method of preparation of bismuth and their properties, forming oxyhaloids with water, and double compounds with ammonia, &c.

Carbonates.—The basic carbonate, 2Bi(OH)₃·CO₃, constitutes the mineral bismutite, which is found in large transparent asymmetric prisms by evaporating a solution of
the metal in nitric acid. The action of carbonic acid produces a
precipitate of basic carbonate of bismuth, precipitated as Bi₂CO₃(OH)·H₂O, or
employed. This precipitate constitutes the magnesia of bismuth or the "subnitrate of bismuth of pharmacy", and under the name of pearl white, blanc d'argent, or stibine, is given to the white pigment employed. Sulphides.—Bismuth combines directly with sulphur to form a disulphide, Bi₂S₃, and a trisulphide, Bi₂S₆, the latter compound being formed when the sulphur is in excess. A hydrated disulphide, Bi₂S₃·H₂O, is obtained by passing sulphuric hydrogen into a solution of bismuth nitrate and stannous chloride. Bismuth
BISMUTHITE—BISON

BISMUTHITE is a grey metallic substance, which is decomposed by hydrochloric acid with the separation of metallic bismuth and the formation of bismuth trichloride. Bismuth trisulphide, Bi2S3, constitutes a mineral variety of bismuth, and may be prepared by direct union of its constituents, or as a brown precipitate by dissolving sulphuretted hydrogen into a solution of a bismuth salt. It is easily soluble in nitric acid. When heated to 200°, crystallises in a system of monoclinic, white, translucent crystals. The mineral oxysulphides: Bi2O3S constitutes the mineral karelinite found at the Zavadinski mine in the Altai; Bi2O3S and Bi2O3S have been prepared artificially. Bismuth also forms the sulphohaloids, BISCI, BISiH, BISiI, analogous to the oxysulphaloids.

Bismuth sulphate, Bi(SO4)2, is obtained as a white powder by dissolving the metal or sulphide in concentrated sulphuric acid. Water is added to a hot solution of Bi2SO4•2H2O, which on heating gives (Bi2O3)SO4. Other basic salts are known.

Bismuth forms compounds similar to the trisulphide with the elements selenium and tellurium. The tellurite constitutes the mineral tetrathymite, Bi2Te2.

Analysis.—Traces of bismuth may be detected by treating the solution with excess of tartaric acid, potash and stannous chloride, a precipitate or dark coloration of bismuth oxide being formed even when only one part of bismuth is present in 20,000 of water. The blackish brown sulphide precipitated from bismuth salts by sulphuric acids is insoluble in ammonium sulphide, but is readily dissolved by nitric acid. The metal can be reduced by magnesium, zinc, cadmium, iron, tin, copper and substances like hypophosphorous acid from acid solutions or from alkaline ions by formation of a precipitate. In qualitative estimations it is generally treated as oxide, after precipitation as sulphide or carbonate, or in the metallic form, reduced as above.

Pharmacology.—The salts of bismuth are feeltly antiseptic. The subnitrate of bismuth nitrate, containing in contact with water, tends to decompose, gradually liberating nitric oxide, one of the most powerful antiseptics. The physical properties of the powder also give it a mild astringent action. There are no remote actions.

Therapeutics.—The subnitrate of bismuth is invaluable in certain cases of dyspepsia, and still more notably so in diarrhoea. It owes its value to the decomposition described above, by means of which a powerful antiseptic action is safely and continuously exerted. There is hardly a safer drug. It may be given in drachms doses with impunity. It colours the faeces black owing to the formation of subnitrate of bismuth.

BISMUTHITE, a somewhat rare mineral, consisting of bismuth trisulphide, Bi2S3. It crystallizes in the orthorhombic system and is isomorphous with stibnite (Sb2S3), which closely resembles in appearance. It forms loose interlacing aggregations of acicular crystals without terminal faces (only in a single instance has a terminated crystal been observed), or as masses with a foliated or fibrous structure. An important character is the perfect cleavage in one direction parallel to the length of the needles. The color is lead-grey inclining to tin-white and often with a yellowish or iridescent tarnish. The hardness is 2; specific gravity 6.6. It occurs in several localities in England, in Cornwall and Bolivia, often in association with native bismuth and tin-ores. Other localities are known; for instance, Brandy Gill in Calderbeck Fells, Cumberland, where with molybdenite and apatite it is embedded in white quartz. The mineral was known to A. Cronstedt in 1758, and was named bismuthine by F. S. Beudant in 1832. This name, which is also used in the forms bismuthite and bismuthinite, is rather unfortunate, since it is readily confused with bismite (bismuth oxide) and bismutite (basic bismuth carbonate), especially as the latter has also been used for antimony, and may be used for the mineral bismuthalumite for the species under consideration is free from this objection.

(L. J. S.)

BISMDA, a group of runi mounds, about 1 m. long and ½ m. wide, consisting of a number of low ridges, nowhere exceeding 40 ft. in height, lying in the Jezirich, somewhat nearer to the Tigris than the Euphrates, about a day’s journey to the south-east of Nippur, a little below 32° N. and about 45° 40’ E. Excavations conducted here for six months, from Christmas of 1903 to June 1904, for the university of Chicago, by Dr Edgar J. Banks, proved that these mounds covered the site of an ancient city. Abad (Ud-Nun), hitherto known only from a brief mention of its name in the introduction to the Khammuri code (c. 2250 B.C.). The city was divided into two parts by a canal, on an island in which stood the temple, E-mach, with a zigurat, or stage tower. It was evidently once a city of considerable importance, but deserted at a very early period, since the ruins found close to the surface of the mounds belong to Dungi and Ur Gur, kings of Ur in the earlier part of the third millennium B.C. Immediately below these, as at Nippur, were found the remains of Naram-Sin and Sar-gon, c. 3000 B.C. Below these there were still 35 ft. of stratified remains, constituting seven-eighths of the total depth of the ruins. Besides the remains of buildings, walls, graves, &c., Dr Banks discovered a large number of inscribed tablets, several of a very early period, on the skull, bronze implements and the like. But the two most notable discoveries were a complete statue in white marble, apparently the most ancient yet found in Babylonia (now in the museum in Constantinople), bearing the inscription—E-mach, King Da-udu, King of Ud-Nun; and a temple refuse heap, consisting of great quantities of fragments of vases in marble, alabaster, ooyx, porphyry and granite, some of which were inscribed, and others engraved and inlaid with ivory and precious stones.

BISON, the name of the one existing species of European wild ox, Bos (Bison) bonasus, known in Russian as zubr. Together with the nearly allied New World animal known in Europe as the (North) American bison, but in its own country as "buffalo," and scientifically as Bos (Bison) bison, the bison represents a group of the ox tribe distinguished from other species by the greater breadth and convexity of the forehead, superior length of limb, and the longer spinal processes of the dorsal vertebrae, which, with the powerful muscles attached for the support of the immense hump or protrudece or bump on the shoulders. The bisons have also fourteen pairs of ribs, while the common ox has only thirteen. The forehead and neck of both species are covered with long, shaggy hair of a dark brown colour; and in winter the whole of the neck, shoulders and hump are similarly clothed, so as to form a curty, felted mane. This mane in the European species disappears in summer; but in the American bison it is to a considerable extent persistent.

The bison is now the largest European quadruped, measuring about 10 ft. long, exclusive of the tail, and standing nearly 6 ft. high. Formerly it was abundant throughout Europe, as is proved by the fossil remains of this or a closely allied form found on the continent and in England, associated with those of the extinct mammoth and rhinoceros. Caesar mentions the bison as abounding, along with the extinct aurochs or wild ox, in the forests of Germany and Belgium, where it appears to have been occasionally captured and afterwards exhibited alive in the Roman amphitheatres. At that period, and long after, it seems to have been common throughout central Europe, as we learn from the evidence of Herberstein in the 16th century.

Nowadays the bisons are but few in the forests of the Caucasus, where they are specially protected by the Russian government. There is, however, a herd, somewhat in the condition of park-animals, in the forest of Byelovitza, in Lithuania, where it is protected by the tsar, but nevertheless is gradually dying out. In 1867 the Lithuanian bisons numbered over 1200, but by 1872 they had diminished to 528, and in 1892 there were only 491. The prince of Joess has a small herd at Prommitz, his Silesian estate, founded by the gift of a bull and two females by Alexander II. in 1855, his herd being the source of the menagerie stock.

Bison feed on a coarse aromatic grass, and browse on the leaves, shoots, bark and twigs of trees.

The American bison is distinguished from its European cousin by the following among other features: The hind-quarters are weaker and fall away more suddenly, while the withers are proportionately higher. Especially characteristic is the great mass of brown or blackish brown hair clothing the head, neck and forepart of the body. The shape of the skull also differs; the horns themselves being shorter, thicker, blunter and more sharply curved, while the forehead of the skull is more convex and the sockets of the eyes are more distinctly tubular. This species formerly ranged over a third of North America in countless numbers, but is now practically extinct. The great herd was separated into a northern and...
southern division by the completion of the Union Pacific railway, and the annual rate of destruction from 1870 to 1875 has been estimated at 2,500,000 head. In 1880 the completion of the Northern Pacific railway led to an attack upon the northern herd. The last of the Dakota bison were destroyed by Indians in 1883, leaving then less than 1,000 wild individuals in the United States.

A count which was concluded at the end of February 1903, put the number of captive bison at 1,119, of which 969 were in parks and zoological gardens in the United States, 47 in Canada, and 100 in Europe. At the same time it was estimated that there were 34 wild bison in the United States and 600 in Canada.

In England small herds are kept by the duke of Bedford at Woburn Abbey, Bedfordshire, and by Mr C. J. Leyland at Haggerston Castle, Northumberland.

Two races of the American bison have been distinguished—the typical prairie form, and the woodland race, B. bison athabascae; but the two are very similar.

(R.K.*

**BISQUE** (a French word of unknown origin, formerly spelt in English "bisk"); a term for odds given in the games of tennis, lawn tennis, croquet and golf; in the two former a bisque is one point to be taken at any time during a "set" at the choice of the receiver of the odds, while in croquet and golf it is one extra stroke to be taken similarly during a game. The name is given, in cookery, to a thick soup, made particularly of crayfish or lobsters.

**BISSELL, GEORGE EDWIN** (1839— ), American sculptor, son of a quarryman and marble-cutter, was born at New Preston, Connecticut, on the 16th of February 1839. During the Civil War he served as a private in the 23rd Connecticut volunteers in the Department of the Gulf (1862–1863), and on being mustered out became acting assistant paymaster in the South Atlantic squadron. At the close of the war, he joined his father in business. He studied the art of sculpture abroad in 1875–1876, and lived much in Paris during the years 1883–1896, with occasional visits to America. Among his more important works are the soldiers' and sailors' monument, and a statue of Colonel Chatfield, at Waterbury, Connecticut; and statues of General Gates at Saratoga, New York, of Chancellor John Watts in Trinity churchyard, New York City; of Colonel Abraham de Peyster in Bowling Green, New York City; of Abraham Lincoln at Edinburgh; of Burns and "Highland Mary," in Ayr, Scotland; of Chancellor James Kent, in the Congressional library, Washington; and of President Arthur in Madison Square, New York City.

**BISSEXTE, or BISSEXTUS** (Lat. bis, twice; sextus, sixth), the day intercalated by the Julian calendar in the February of every fourth year to make up the six hours by which the solar year was computed to exceed the year of 365 days. The day was inserted after the 24th of February, i.e. the 6th day before the calends (rat) of March; there was consequently, besides the sextus, or sixth before the calends, the bis-sex-tus or "second sixth," our 25th of February. In modern usage, with the exception of ecclesiastical calendars, the intercalary day is added for convenience at the end of the month, and years in which February has 29 days are called "bissextile," or leap-years.

**BISTRE,** the French name of a brown paint made from the root of wood, now largely superseded by Indian ink.

**BIT** (from the verb "to bite," either in the sense of a piece bitten off, or an act of biting, or a thing that bites or is bitten), generally, a piece of anything; the word is, however, used in various special senses, all derivable from its origin, either literally or metaphorically. The most common of these are (1) its use as the name of various tools, e.g. centre-bit; (2) a horse's "bit," or the metal mouth-piece of the bridle; (3) in money, a small sum of money of varying value (e.g. threepenny-bit), especially in the West Indies and southern United States.

**BITHYNIA** (Bithya), an ancient district in the N.W. of Asia Minor, adjoining the Propontis, the Thracian Bospors and the Euxine. According to Strabo it was bounded on the E. by the river Sangarius; but the more commonly received division extended it to the Parthenius, which separated it from Paphlagonia, thus comprising the district inhabited by the Mariandyni. On the W. and S.W. it was separated from Mysia by the river Rhynoanaxis and on the S. it adjoined Phrygia Epibatis and Galatia. It is in great part occupied by mountains and forests, but has valleys and districts near the sea-coast of great fertility. The most important mountain range is the (so-called) "Mysian" Olympus (7,600 ft.), which towers above Brusa and is clearly visible as far away as Constantinople (70 m.). Its summits are covered with snow for a great part of the year. East of this the range now called Ala-Dagh extends for about 100 m. from the Sangarius to Paphlagonia. Both of these ranges belong to that border of mountains which bounds the great table-land of Asia Minor. The country between them and the coast, covered with forests and traversed by few lines of route, is still imperfectly known. But the broad tract which projects towards the west as far as the shores of the Bospors, though hilly and covered with forests—the Turkish Aghatch Denizî, or "The Ocean of Trees"—is not traversed by any mountain chain. The west coast is indented by two deep inlets, (1) the northermost, the Gulf of Ismid (anc. Gulf of Astacus), penetrating between 40 and 50 m. into the interior as far as Ismid (anc. Nicomedias), separated by an isthmus of only about 25 m. from the Black Sea; (2) the Gulf of Mudania or Gemlik (Gulf of Cius), about 25 m. long. At its extremity is situated the small town of Gemlik (anc. Cius) at the mouth of a valley, communicating with the lake of Isnik, on which was situated Nicaea.

The principal rivers are the Sangarius (mod. Sakaria), which traverses the province from south to north; the Rhynoanes, which separated it from Mysia; and the Billaecus (Filiyas), which rises in the Ala-Dagh, about 50 m. from the sea, and after flowing by Bolî (anc. Claudipolis) falls into the Euxine, close to the ruins of the ancient Thum, about 40 m. north-east of Heraclæa, having a course of more than 100 m. The Parthenius (mod. Bartian), the boundary of the province towards the east, is a much less considerable stream.

The natural resources of Bithynia are still imperfectly developed. Its vast forests would furnish an almost inexhaustible supply of timber, if rendered accessible by roads. Coal also is known to exist near Eregli (Heraclæa). The valleys towards the Black Sea abound in fruit trees of all kinds, while the valley of the Sangarius and the plains near Brusa and Isnik (Nicæa) are fertile and well cultivated. Extensive plantations of mulberry trees supply the silk for which Brusa has long been celebrated, and which is manufactured there on a large scale.

According to ancient authors (Herodotus, Xenophon, Strabo, &c.), the Bithynians were an immigrant Thracian tribe. The existence of a tribe called Thyni in Thrace is well attested, and the two cognate tribes of the Thyni and Bithyni appear to have settled simultaneously in the adjoining parts of Asia, where they expelled or subdued the Mysians, Caucones, and other petty tribes, the Mariandyni alone maintaining themselves in the north-east. Herodotus mentions the Thyni and Bithyni as existing side by side; but ultimately the latter must have become the more important, as they gave their name to the country. They were incorporated by Crossus with the Lydian monarchy, with which they fell under the dominion of Persia (546 B.C.), and were included in the satrapy of Phrygia, which comprised all the countries up to the Hellespont and Bospors. But even before the conquest by Alexander the Bithynians appear to have asserted their independence, and successfully maintained it under two native princes, Bas and Zipoteæ, the last of whom (Ziptæ) bore the title of king. This monarch founded Nicomedias, which soon rose to great prosperity, and during his long reign (278-250 B.C.), as well as those of his successors, Prusias I.,
BITLIS—BITTERLING

The region of Asia Minor is rich in history and culture. The kingdom of Bitihnäa held a considerable place among the minor monarchies of Asia. But the last king, Nicomedes III., was unable to maintain himself against Mithradates of Pontus, and, after being restored to his throne by the Roman senate, he bequeathed his kingdom by will to the Romans (74 B.C.). Bitihnäa was by its limits a large province. Its limits have much varied, and it was commonly used for administrative purposes with the province of Pontus. This was the state of things in the time of Trajan, when the younger Pliny was appointed governor of the combined provinces (103-105 A.D.), a circumstance to which we are indebted for valuable information concerning the Roman provincial administration. Under the Byzantine empire Bitihnäa was again divided into two provinces, separated by the Sangarius, to the west of which the name of Bitihnäa was restricted.

The most important cities were Nicomedia and Nicaea, which disputed with one another the rank of capital. Both of these were founded after Alexander the Great; but at a much earlier period the Greeks had established on the coast the colonies of Clus (afterwards Prusa, mod. Gemlik); Chaledon, at the entrance of the Bosporus, nearly opposite Constantinople; and Heraclea Pontica, on the Euxine, about 120 m. east of the Bosporus. All these rose to be flourishing places of trade, as also Prusa at the foot of M. Olympus (see Brusa). The only other places of importance at the present day are Isnid (Nicomedia) and Scutari.

BITILS, or BERTILS (Arm. Paghesh), the chief town of a vilayet of the same name in Asiatic Turkey, situated at an altitude of 4700 ft., in the deep, narrow valley of the Bitlis Chai, a tributary of the Tigris. The main part of the town and the bazaars are crowded alongside the stream, while the suburbs with scattered houses among orchards and gardens extend up two tributary streams. The houses are massive and well built of a soft volcanic tufa, and with their courtyards and gardens climbing up the hillsides afford a striking picture. At the junction of two streams in the centre of the town is a fine old castle, partly ruined, which, according to local tradition, occupies the site of a fortress built by Alexander the Great. It is apparently an Arab building, as Arabic inscriptions appear on the walls; but as the town stands on the principal highway between the Van plateau and the Mesopotamian plain it must always have been of strategic importance. The bazaars are crowded, covered across with branches in summer, and typical of a Kurdish town. The population numbers 35,000, of whom about 12,000 are Armenians and the remainder are Kurds or of Kurdish descent.

Kurdish boys and shicks have much influence in the town and wild mountain districts adjoining, while the Sasan moun- tains, the scene of successive Armenian revolutions of late years, are not far off to the west. The town was ruled by a semi-independent Kurdish bey as late as 1836. There are some fine old mosques and madressas (colleges), and the Armenians have a large monastery and churches. There are British, French and Russian consuls in the town, and a branch of the American Mission with schools is established also. The climate is healthy and the thermometer rarely falls below 6° Fahr., but there is a heavy snowfall and the narrow streets are blocked for some five months in the year.

A good road runs southward down the pass, passing after a few miles some large chalybeate and sulphur springs. Roads also lead north to the strip of Armenia between the lake and river and Thibis, and a line, which is now a postal communication, is through Erzerum with Trebizond. Tobacco of an inferior quality is largely grown, and the chief industry is the weaving of a coarse red cloth. Manna and gum tragacanth are also collected. Fruit is also plentiful, and there are many vineyards close by.

The Bitlis vilayet comprises a very varied section of Asiatic Turkey, as it includes the Mush plain and the plateau country west of Lake Van, as well as a large extent of wild mountain districts inhabited by turbulent Kurds and Armenians on either side of the central town of Bitlis, also some of the lower country about Sairt along the left bank of the main stream of the Tigris. The mountains have been little explored, but are believed to be rich in minerals, iron, lead, copper, traces of gold and many metal workings are known to exist. (F. R. M.)

BUTONTO (unc. Buto, ancient town and episcopal see of Bitonto, Italy, in the province of Bari, 10 m. west by steam tramway from Bari. Pop. (1901) 36,617. It was a place of no importance in classical times. Its medieval walls are still preserved. Its cathedral is one of the finest examples of the Romanesque architecture of Apulia, and has escaped damage from later restorations. The palace Sylos-Labini has a fine Renaissance court of 1502.

BITSH (Fr. Bitche), a town of Germany, in Alsace-Lorraine, on the Horn, at the foot of the northern slope of the Voges between Hagenau and Sangeumünd. Pop. (1903) 4000. There are a Roman Catholic and a Protestant church, a classical school and an academy of forestry. The industries include shoe-making and watch-making, and there is some trade in grain and timber.

The town of Bitse, which was formed out of the villages of Rohr and Kaltenhausen in the 17th century, derives its name from the old stronghold (mentioned in 1172 as Bytis Castrum) standing on a rock some 250 ft. above the town. This had long given its name to the countship of Bitse, which was originally in the possession of the dukes of Lorraine. In 1197 it passed by marriage to Eberhard I. of Zellbrücken, whose line became extinct in 1569, when the countship reverted to Lorraine. It passed with that duchy to France in 1766. After that date the town rapidly increased in population. The citadel, which had been constructed by Vauban on the site of the old castle after the capture of Bitse by the French in 1624, had been destroyed when it was restored to Lorraine in 1608. This was restored and strengthened in 1740 into a fortress that proved impregnable in all succeeding wars. The attack upon it by the Prussians in 1793 was repulsed; in 1813 they had to be content with driving the French from it; and it was only taken by the Germans after the battle of Wörth, it held out until the end of the war. A large part of the fortification is excavated in the red sandstone rock, and rendered bomb-proof; a supply of water is secured to the garrison by a deep well in the interior.

BITTER, KARL THEODORE FRANCIS (1867- ), American sculptor, was born in Vienna on the 6th of December 1867. After studying art there, in 1880 he removed to the United States, where he became naturalized. In America he gained great popularity as a sculptor, and in 1905-1907 was president of the National Sculpture Society, New York. Among his principal works are: the Astor memorial gates, Trinity church, New York; "Elements Controlled and Uncontrolled," on the Administration Building at the Chicago Exposition; a large relief, "Triumph of Civilization," in the waiting-room of the Broad street station of the Pennsylvania railway in Philadelphia; decorations for the Dewey Naval Arch in New York City; the "Standard Bearers," at the Pan-American Exposition grounds; a sitting statue and a bust of Dr. Pepper, provost of the University of Pennsylvania; and the Villard and Hubbard memorials in the New York chamber of commerce.

BITTERFELD, a town of Germany, in the Prussian province of Saxony, 26 m. N. from Leipzig by rail, on the river Mulde, and an important junction of railways from Leipzig and Halle to Berlin. Pop. (1900) 11,839. It manufactures drain-pipes, paper-roofing and machinery, and has saw-mills. Several coal-mines are in the vicinity. The town was built by a colony of Flemish immigrants in 1153. It was captured by the land- wardens of the Black Forest League, who besieged the town until it was ceded to Prussia in 1815. Owing to its pleasant situation and accessibility, it has become a favourite residence of business men of Leipzig and Halle.

BITTERLING (Rhodeus amarus), a little carp-like fish of central Europe, belonging to the Cyprinid family. In it we have a remarkable instance of symbiosis. The genital papilla of the female acquires a great development during the breeding season and becomes produced into a tube nearly as long as the
fish itself; this acts as an ovipositor by means of which the comparatively few and large eggs (3 millimetres in diameter) are introduced through the gaping valves between the branchiae of pond mussels (Unio and Anodonta), where, after being inseminated, they undergo development, the fry leaving their host about a month later. The molluscs reciprocate by throwing off its embryos on the parent fish, in the skin of which they remain encysted for some time, the period of reproduction of the fish coinciding.

**BITTERN,** a genus of wading birds, belonging to the family Ardeidae, comprising several species closely allied to the herons, from which they differ chiefly in their shorter neck, the back of which is covered with down, and the front with long feathers, which can be raised at pleasure. They are solitary birds, frequenting countries possessing extensive swamps and marshy grounds, remaining at rest by day, concealed among the reeds and bushes of their haunts, and seeking their food, which consists of fish, reptiles, insects and small quadrupeds, in the twilight. The common bittern (Botaurus stellaris) is nearly as large as the heron, and is widely distributed over the eastern hemisphere. Formerly it was common in Britain, but extensive drainage and persecution have greatly diminished its numbers and it is now only an uncertain visitor. Not a winter passes without its appearing in some numbers, when its uncommon aspect, its large size, and beautifully pencilled plumage cause it to be regarded as a great prize by the lucky gun-bearer to whom it falls a victim. Its value as a delicacy for the table, once so highly esteemed, has long vanished. The old fable of this bird inserting its beak into a reed or plunging it into the ground, and so causing the booming sound with which its name will be always associated, is also exploded, and nowadays indeed so few people in Britain have ever heard its loud and awful voice, which seems to be uttered only in the breeding-season, and is therefore unknown in a country where it no longer breeds, that incredulity as to its booming at all has in some quarters succeeded the old belief in this as in other reputed peculiarities of the species. The bittern in the days of falconry was strictly preserved, and afforded excellent sport. It sits crouching on the ground during the day, with its bill pointing in the air, a position from which it is not easily roused, and even when it takes wing, its flight is neither swift, nor long sustained. When wounded it requires to be approached with caution, as it will then attack either man or dog with its long sharp bill and its acute claws. It builds a rude nest among the reeds and flags, out of the materials which surround it, and the female lays four or five eggs of a brownish olive. During the breeding season it utters a booming noise, from which it probably derives its generic name, Botaurus, and which has made it in many places an object of superstitious dread. Its plumage for the most part is of a pale buff colour, rayed and speckled with black and reddish brown. The American bittern (Botaurus lentiginosus) is larger than the European species, and is found throughout the central and southern portions of North America. It also occurs in Britain as an occasional straggler. It is distinguishable by its uniform greyish-brown primaries, which want the tawny bars that characterize B. stellaris. Both species are good eating.

**BITTERN** (from "bitter"), the mother liquor obtained from sea-water or brines after the separation of the sodium chloride (common salt) by crystallization. It contains various magnesium salts (sulphate, chloride, bromide and iodide) and is employed commercially for the manufacture of Epsom salts (magnesium sulphate) and bromine. The same term is applied to a mixture of quassia, iron sulphate, cocculus indicus, liquorice, &c., used in adulterating beer.

**BITTERS,** the name given to aromatized (generally alcoholic) beverages containing a bitter substance or substances, used as tonics, appetizers or digestives. The bitterness is imparted by such substances as bitter orange rind, gentian, rhubarb, quassia, cascara, angostura, quinine and cinchona. Juniper, cinnamon, caraway, camomile, cloves and other flavouring agents are also employed in conjunction with the bitter principles, alcohol and sugar. Some bitters are prepared by simple maceration and subsequent filtration (see LIQUEURS), others by the more complicated distillation process. Those prepared by the latter process are the finer commercial articles. Bitters are usually sold under the name of the substance which has been used to give them the predominant flavour, such as orange, angostura or peach bitters, &c. The alcoholic strength of bitters varies, but generally in the neighbourhood of 40% of alcohol. Some bitters, although possessing tonic properties, may be regarded as beverages pure and simple, notwithstanding the fact that they are seldom consumed in an undiluted state; others again, are obviously medicinal preparations and should be treated as such.

**BITUMEN,** the name applied by the Romans to the various descriptions of natural hydrocarbons, the word *petroleum* not being used in classical Latin. In its widest sense it embraces the whole range of these substances, including natural gas, the more or less liquid descriptions of petroleum, and the solid forms of asphalt, alberite, gilsonite, uintahite, wintahite or wintahite. To distinguish bitumen intermediate in consistency between asphalt and the more liquid kinds of crude petroleum, the term *maltha* (Latin) is frequently employed. The bitumens of chief commercial importance may be grouped under the three headings of (1) natural gas, (2) petroleum, and (3) asphalt, and will be found fully described under these titles. In the scriptures there are numerous references to bitumen, among which the following may be quoted:—In Genesis ix. 3, we are told that in the building of the tower of Babel "slime had they for mortar," and in Genesis xiv. 10, that the vale of Siddim "was full of slime-pits." The word "slime" in the latter quotation from our version appearing as *bitumen* in the Vulgate. Herodotus alludes to the use of the bitumen brought down by the Is, a tributary of the Euphrates, as mortar in building the walls of Babylon. Diodorus, Curtius, Josephus, Bochart and others make similar mention of this use of bitumen, and Vitruvius tells us that it was employed in adixture with clay.

In its various forms, bitumen is one of the most widely distributed of substances. It occurs, though sometimes only in small quantity, in almost every part of the globe, and throughout the whole range of geological strata, from the shaly rocks to the most recent members of the Quaternary period. Although the gaseous and liquid forms of bitumen may be regarded as having been formed in the strata in which they are found or as having been received into such strata shortly after formation, the semi-solid and solid varieties may be considered to have been produced by the oxidation and evaporation of
liquid petroleum escaping from underling or better preserved deposits into other strata, or into fissures where atmospheric action and loss of the more volatile constituents can take place. It should, however, be stated that there is some difference of opinion as to the precise manner of production of some of the solid forms of bitumen, and especially of oozekite. (B. R.)

BITURIGES, a Celtic people, according to Livy (v. 34) the most ancient in Gaul in the time of Tarquinius Priscus. At some period unknown they split up into two branches—Bituriges Cubi and Bituriges Vivisci. The name is supposed to mean either "rulers of the world" or "perpetual kings."

The Bituriges Cubi, called simply Bituriges by Caesar, in whose time they acknowledged the supremacy of the Aedui, inhabited the modern diocese of Bourges, including the departments of Cher and Indre, and partly that of Allier. Their chief towns were Avaricum (Bourges), Argentomagus (Argenton-sur-Creuse), Neroniamagus (Néris-les-Bains), Navidiunum (perhaps Villate). At the time of the rebellion of Vercingetorix (52 B.C.), Avaricum, after a desperate resistance, was taken by assault, and the inhabitants put to the sword. In the following year, the Bituriges submitted to Caesar, and under Augustus they were incorporated (in 28 B.C.) in Aquitania. Pliny (Nat. Hist. iv. 109) speaks of them as liberi, which points to their enjoying a certain amount of independence under Roman government. The district contained a number of iron works, and Caesar says they were skilled in driving galleries and mining operations.

The Bituriges Vivisci occupied the strip of land between the sea and the left bank of the Gartempe, forming part of the modern department of Girond. Their capital was Burdigala (Bordeaux), even then a place of considerable importance and a wine-growing centre. Like the Cubi, they also are called liberi by Pliny.

BITZIUS, ALBRECHT (1797-1854), Swiss novelist, best known by his pen name of "Jeremias Gothelf," was born on the 4th of October 1797 at Morat, where his father was pastor. In 1804 the home was moved to Utzenstorf, a village in the Bernese Emmental. Here young Bitzius grew up, receiving his early education and consorting with the boys of the village, as well as helping his father to cultivate his geie. In 1812 he went to complete his education at Bern, and in 1820 was received as a pastor. In 1821 he visited the university of Göttingen, but returned home in 1822 to act as his father's assistant. On his father's death (1824) he went in the same capacity to Herzogenbuchsee, and later to Bern (1829). Early in 1831 he went as assistant to the aged pastor of the village of Lützelflüh, in the Upper Emmental (between Langnau and Burgdorf), being soon elected his successor (1832) and marrying one of his granddaughters (1833). He spent the rest of his life there, dying on the 3rd of October 1854, and leaving three children (the son was a pastor, the two daughters married pastors). His first work, the "Bauerspügel," appeared in 1833. It purported to be the life of Jeremias Gothelf, narrated by himself, and this name was later adopted by the author as his pen name. It is a living picture of Bernese (or, strictly speaking, Emmental) village life, true to nature, and not attempting to gloss over its defects and failings. It is written (like the rest of his works) in the Bernese dialect of the Emmental, though it must be remembered that Bitzius was not (like Auerbach) a peasant by birth, but belonged to the educated classes, so that he reproduces what he had seen and learnt, and not what he had himself personally experienced. The book was a great success, as it was a picture of real life, and not of fancifully beribboned 18th-century villagers. Among his later tales are the "Leiden und Freuden eines Schulmeisters" (1835-1839), "Uli der Knecht" (1841), with its continuation, "Uli der Pfarrer" (1849), Anne Bötti Jnoüger (1843-1844), "Käthi die Grossmutter" (1847), Die Käseren in der Yehfreude (1850), and the Erlebnisse eines Schuldenbaurers (1854). He published also several volumes of shorter tales. One slight drawback to some of his writings is the echo of local political controversies, for Bitzius was a Whig and strongly opposed to the Radical party in the canton, which carried the day in 1846.

Lives by C. Manuel, in the Berlin edition of Bitzius's works (Berlin, 1861), and by J. Ammann in vol. i. (Bern, 1884) of the "Sammlung Bernischer Biographien. His works were issued in 24 vols. at Berlin, 1856-1861, while 10 vols., giving the original text of each story, were issued at Bern, 1858-1900 (edition not to be completed).

BIVOUAC (a French word generally said to have been introduced during the Thirty Years' War, perhaps derived from Beiuwach, extra guard), originally, a night-watch by a whole army under arms to prevent surprise. In modern military parlance the word is used to mean a temporary encampment in the open field without tents, as opposed to "billets" or "cantonment" on the one hand and "camp" on the other. The use of bivouacs permits an army to remain closely concentrated for all emergencies, and avoids the necessity for numerous wagons carrying tents. Constant bivouacs, however, are trying to the health of men and horses, and this method of quartering is never employed except when the military situation demands concentration and readiness. Thus the outposts would often have to bivouac while the main body of the army lay in billets.

BIWA, a lake in the province of Omi, Japan. It measures 36 m. in length by 12 m. in extreme breadth, has an area of 180 sq. km., is about 350 ft. above sea-level, and has an extreme depth of some 300 ft. There are a few small islands in the lake, the principal being Chikubu-shima at the northern end.

 Tradition alleges that Lake Biwa and the mountain of Fuji were produced simultaneously by an earthquake in 286 B.C. On the west of the lake the mountains Hieizan and Hira-yama slope down almost to its margin, and on the east a wide plain extends towards the boundaries of the province of Mino. It is drained by a river flowing out of its southern end, and taking its course into the sea at Osaka. This river bears in succession the names of Seta-gawa, Yodo-gawa or Yodogawa. It abounds with fish, and the beauty of its scenery is remarkable. Small steamboats ply constantly to the points of chief interest, and around its shores are to be viewed the Omi-no-hakkai, or "eight landscapes of Omi"; namely, the lake silvery under an autumn moon as one looks down from Ishi-yama; the snow at eve on Hira-yama; the glow of sunset at Seta; the groves and classic temple of Miidera as the evening bell sounds; boats sailing home from Yabase; cloudless peaks at Awazu; rain at nightfall over Karasaki; and wild geese sweeping down to Kalata. The lake is connected with Kyoto by a canal constructed in 1890, and is thus brought into water communication with Osaka.

BIXIO, NINO (1821-1873), Italian soldier, was born on the 2nd of October 1821. While still a boy he was compelled by his parents to embrace a maritime career. After numerous adventures he returned to Italy in 1846, joined the Giovine Italia, and, on 4th November 1847, made himself conspicuous at Genoa by seizing the bridle of Charles Albert's horse and crying, "Pass the Ticino, Sire, and we are all with you." He fought through the campaign of 1848, became captain under Garibaldi at Rome in 1849, taking prisoners an entire French battalion, and gaining the gold medal for military valour. In 1859 he commanded a Garibaldi's battalion, and gained the military cross of Savoy. Joining the Marsala expedition in 1860, he turned the day in favour of Garibaldi at Calatafimi, was wounded at Palermo, but recovered in time to besiege Reggio in Calabria (21st of August 1860), and, though again wounded, took part in the battle of Volturno, where his leg was broken. Elected deputy in 1861, he endeavoured to reconcile Cavour and Garibaldi. In 1866, at the head of the seventh division, he covered the Italian retreat from Custozza, ignoring the Austrian summons to surrender. Created senator in February 1870, he was in the following September given command of a division during the movement against Rome, took Civitá Vecchia, and participated in the general attack upon Rome (20th September 1870). He died of cholera at Achin Bay in Sumatra en route for Batavia, whither he
had gone in command of a commercial expedition (16th December 1873).

**BIZERTA** (properly pronounced Ben Zert; Fr. *Bizerie*), a seaport of Tunisia, in 37° 17' N., 9° 50' E. Pop. about 13,000. Next to Toulon, Bizerta is the most important naval port of France in the Mediterranean. It occupies a commanding strategical position in the narrowest part of the sea, being 714 m. E. of the mouth of the W.N.W. of Port Said, 240 m. N.W. of Malta, and 420 m. S. by E. of Toulon. It is 16 m. by rail N.W. of Tunis. The town is built on the shores of the Mediterranean at the point where the Lake of Bizerta enters the sea through a natural channel, the mouth of which has been canalized. The modern town lies almost entirely on the north side of the canal.

A little farther north are the ancient citadel, the walled "Arab" town, and the old harbour (disused). The present outer harbour covers about 300 acres and is formed by two converging jetties and a breakwater. The north jetty is 4000 ft. long, the east jetty 3300 ft., and the breakwater—which protects the port from the prevalent north-east winds—2500 ft. long. The entrance to the canal is in the centre of the outer harbour. The canal is 6000 ft. long and 78 ft. wide on the surface. Its banks are lined with quays, and ships drawing 26 ft. of water can moor alongside. At the end of the canal is a large commercial harbour, beyond which the channel opens into the lake—in reality an arm of the sea—roughly circular in form and covering about 50 sq. m., two-thirds of its waters having a depth of 30 to 40 ft. underneath. The lake, in which merchant vessels are not allowed to enter, contains the naval port and arsenal. There is a torpedo and submarine boat station on the north side of the channel at the entrance to the lake, but the principal naval works are at Sidi Abdullah at the south-west corner of the lake and 10 m. from the open sea. Here is an enclosed basin covering 125 acres with ample quayage, dry docks and everything necessary to the accommodation, repair, revictualling and coaling of a numerous fleet. Barracks, hospitals and water-works have been built, the military town, called Perryville, being self-supporting.

Fortifications have been built for the protection of the port. They comprise (a) the older works surrounding the town; (b) a group of coast batteries on the high ground of Cape Bizerta or Guardia, 4 m. north-north-west of the town; these are grouped round a powerful fort called Jebel Kebir, and have a command of 500 to 800 ft. above sea-level; (c) another group of batteries on the narrow ground between the sea and the lake to the east of the town; the highest of these is the Jebel Tulha battery 265 ft. above sea-level. The Lake of Bizerta, called Tinja by the Arabs, abounds in excellent fish, especially mullets, the dried roe of which, called *botargo*, is largely exported, and the fishing industry employs a large proportion of the inhabitants. The western shore of the lake is low, and in many places is covered with olive trees to the water's edge. The south-eastern shores are hilly and wooded, and behind them rises a range of picturesque hills. A narrow and shallow channel leads from the western side of the lake into another sheet of water, the Lake of Ishkuli, so called from Jebel Ishkuli, a hill on its southern bank 1740 ft. high. The Lake of Ishkuli is nearly as large as the first lake, but is very shallow. Its water is generally brackish.

Bizerta occupies the site of the ancient Tyrian colony, Hippo Zarytus or Darrhytus, the harbour of which, by means of a spacious pier, protecting it from the north-east wind, was rendered one of the safest and finest on this coast. The town became a Roman colony, and was conquered by the Arabs in the 7th century. The place thereafter was subject either to the rulers of Tunis or of Constantine, but the citizens were noted for their frequent revolts. They threw in their lot (c. 1530) with the pirate Khair-ed-Din, and subsequently received a Turkish garrison. Bizerta was captured by the Spaniards in 1535, but not long afterwards came under the Tunisian government. Centuries of neglect followed, and the ancient port was almost choked up, though the value of the fisheries saved the town from utter decay. Its strategical importance was one of the causes which led to the occupation of Tunisia by the French in 1881. In 1890 a concession for a new canal and harbour was granted to a company, and five years later the new port was formally opened. Since then the canal has been widened and deepened, and the naval port at Sidi Abdullah created.

**BIZET** [ALEXANDRE CESAR LEOPOID GEORGES (1838–1875), French musical composer, was born at Bougival, near Paris, on the 25th of October 1838, the son of a singing-master. He displayed musical ability at an early age, and was sent to the Paris Conservatoire, where he studied under Halévy and speedily distinguished himself, carrying off prizes for organ and fugue, and finally in 1857, after an ineffectual attempt in the previous year, the Grand Prix de Rome for a cantata called *Cloris et Clotilde*. A success of a different kind also befell him at this time. Offenbach, then manager of the Théâtre des Bouffes-Parisiens, had organized a competition for an opera, in which young Bizet was awarded the first prize in conjunction with Charles Lecocq, each of them writing an opera called *Docile Miracre*. After the three years spent in Rome, an obligation imposed by the French government on the winners of the first prize at the Conservatoire, Bizet returned to Paris, where he achieved a reputation as a pianist and accompanist. On the 23rd of September 1863 his first opera, *Les Pécheurs de perles*, was brought out at the Théâtre Lyrique, but owing possibly to the somewhat uninteresting nature of the story, the opera did not enjoy a very long run. The qualities displayed by the composer, however, were amply recognized, although the music was stated, by some critics, to exhibit traces of Wagnerian influence. Wagnerism at that period was a sort of spectre that haunted the imagination of many leading members of the musical press. It sufficed for a work to be at all out of the common for the epithet "Wagnerian" to be applied to it. The term, it may be said, was intended to be condemnatory, and it was applied with little understanding as to its real meaning. The score of the *Pécheurs de perles* contains several charming numbers; its dreamy melodies are well adapted to fit a story laid in Eastern climes, and the music reveals a decided dramatic temperament. Some of its dances are now usually introduced into the fourth act of *Carmen*.

On the 3rd of June 1865 Bizet married a daughter of his old master, Halévy. His second opera, *La Jolie Fille de Perth*, produced at the Théâtre Lyrique on 26th December 1867, was scarcely a step in advance. The libretto was founded on Sir Walter Scott's novel, but the opera lacks unity of style, and its pages are marred by concessions to the vocalist. One number has survived, the characteristic Bohemian dance which has been interpolated into the fourth act of *Carmen*. In his third opera, *Boris Godounov* (produced in 1874), Bizet returned to an oriental subject, *Djamileh*, a one-act opera, given at the Opéra Comique on the 22nd of May 1872, is certainly one of his most individual efforts. Again were accusations of Wagnerism hurled at the composer's head, and *Djamileh* did not achieve the success it undoubtedly deserved. The composer was more fortunate with the incidental music he wrote to Alphonse Daudet's drama, *L'Arlesienne*, produced in October 1872. Different numbers from this, arranged in the form of suites, have often been heard in the concert-room. Rarely have poetry and imagination been so well allied as in the exquisite pages, which seem to reflect the sunny skies of Provence.

Bizet's masterpiece, *Carmen*, was brought out at the Opéra Comique on the 3rd of March 1875. It was based on a version by Meilhac and Halévy of a study by Prosper Mérimée—in which the dramatic element was obscured by much descriptive writing. The detection of the drama underlying this psychological narrative was in itself a brilliant discovery, and in reconstructing the story in dramatic form the authors produced one of the most famous libretti in the whole range of opera. Still more striking than the libretto was the music composed by Bizet, in which the peculiar use of the flute and of the lowest notes of the harp deserves particular attention.

On the 3rd of June, three months after the production of *Carmen* in Paris, the genial composer expired after a few hours' illness from a heart affection. Before dying he had the satisfaction
BJÖRNEBORG—BLACHFORD

of knowing that Carmen had been accepted for production at Vienna. After the Austrian capital came Brussels, Berlin and, in 1878, London, when Carmen was brought out at Her Majesty's theatre with immense success. The influence exercised by Bizet on dramatic music has been very great, and may be discerned in the realistic works of the young Italian school, as well as in those of his own countrymen.

BJÖRNEBORG (Finnish Port), a district town of Finland, province of Åbo-Björneborg, on the Eastern coast of the Gulf of Bothnia, at the mouth of the Kustaan. 51° 8' N., long. 46° 6' E. Pop. (1904) 16,053, mostly Swedes. Large vessels cannot enter its roadstead, and stop at Råfåö. The town has shipbuilding wharves, machine works, and several tanneries and brick-works, and has a total trade of over 16,000,000 marks, the chief export being timber.

BJÖRNSON, BJÖRNSJÖERNE (1852-1910), Norwegian poet, novelist and dramatist, was born on the 8th of December 1832 at the farmstead of Bjørgen, in Kvivne, in Östfold, Norway. In 1837 his father, who had been pastor of Kvivne, was transferred to the parish of Neset, in Romsdal; in this romantic district the childhood of Bjørnson was spent. After some teaching at the neighbouring town of Molde, he was sent to a well-known school in Christiania to study for the university; his instinct for poetry was already awakened, and indeed he had written verses from his eleventh year. He matriculated at the university of Christiania in 1852, and soon began to work as a journalist, especially as a dramatic critic. In 1857 appeared Synnøve Solbakken, the first of Bjørnson's peasantravels; in 1858 this was followed by Arne, in 1860 by A Happy Boy, and in 1868 by The Fisher Maidens. These are the most important specimens of his bonde-fortaellinger or peasant-tales—a section of his literary work which has made a profound impression in his own country, and has made him popular throughout the world. Two of the tales, Arne and Synnøve Solbakken, offer perhaps finer examples of the pure peasant-story than are to be found elsewhere in literature.

Bjørnson was anxious "to create a new saga in the light of the peasant, as he put it, and he thought this should be done, not merely in prose fiction, but in national dramas or folke-stykker. The earliest of these was a one-act piece the scene of which is laid in the 12th century, Between the Battles, written in 1855, but not produced until 1857. He was especially influenced at this time by the study of Baggesen and Oehlenschläger, during a visit to Copenhagen 1856-1857. Between the Battles was followed by Lone Hulda in 1858, and King Sterre in 1861. All these efforts, however, were far excelled by the splendid trilogy of Sigurd the Bastard, which Bjørnson issued in 1862. This raised him to the front rank among the younger poets of Europe. His Sigurd the Crusader should be added to the category of these heroic plays, although it was not printed until 1872.

At the close of 1857 Bjørnson had been appointed director of the theatre at Bergen, a post which he held, with much journalistic work, for two years, when he returned to the capital. From 1860 to 1863 he travelled widely throughout Europe. Early in 1865 he undertook the management of the Christiania theatre, and brought out his popular comedy of The Newly Married and his romantic tragedy of Mary Stuart in Scotland. Although Bjørnson had introduced into his novels and plays songs of extraordinary beauty, he was never a very copious writer of verse; in 1870 he published his Poems and Songs and the epic cycle called Arnljot Gelline; the latter volume contains the magnificent ode called "Bergliot," Bjørnson's finest contribution to lyrical poetry. Between 1864 and 1874, in the very prime of life, Bjørnson displayed a slackening of the intellectual forces very remarkable in a man of his energy; he was indeed during these years mainly occupied with politics, and with his business as theatrical manager. This was the period of Bjørnson's most fiery propagandism as a radical agitator. In 1871 he began to supplement his journalistic work in this direction by delivering lectures over the length and breadth of the northern countries. He possessed to a surprising degree the arts of the orator, combined with a magnificent physical prestige. From 1873 to 1876 Bjørnson was absent from Norway, and in the peace of voluntary exile he recovered his imaginative powers. His new departure as a dramatic author began with A Bankruptcy and The Editor in 1874, social dramas of an extremely modern and realistic cast.

The poet now settled on his estate of Aulestad in Gausdal. In 1877 he published another novel, Magnißld—an imperfect production, in which his ideas on social questions were seen to be in a state of fermentation, and gave expression to his republican sentiments in the polemical play called The King, to a later edition of which he prefixed an essay on "Intellectual Freedom," and in further explanation of his position. Captain M. Magnusson, an episode of the war of Italian independence, belongs to 1878.

Extremely anxious to obtain a full success on the stage, Bjørnson concentrated his powers on a drama of social life, Leonardo (1879), which raised a violent controversy. A satirical play, The New System, was produced a few weeks later. Although these plays of Bjørnson's second period were greatly discussed, none of them (except A Bankruptcy) pleased on the boards. When once more he produced a social drama, A Gaunlast, in 1883, he was unable to persuade any manager to stage it, except in a modified form, though this play gives the full measure of his powers as a dramatist. In the autumn of the same year, Bjørnson published a mystical or symbolic drama Beyond our Powers, dealing with the abnormal features of religious excitement with extraordinary force; this was not acted until 1899, when it achieved a great success.

Meanwhile, Bjørnson's political attitude had brought upon him a charge of high treason, and he took refuge for a time in Germany, returning to Norway in 1882. Convinced that the theatre was practically closed to him, he turned back to the novel, and published in 1884, Flags are Flying in Town and Port, embodying his theories on heredity and education. In 1889 he printed another long and still more remarkable novel, In God's Way, which is chiefly concerned with the same problems. The same year saw the publication of a comedy, Geography and Love, which continues to be played with success. A number of short stories, of a more or less didactic character, dealing with startling points of emotional experience, were collected in 1894; among them those which produced the greatest sensation were Dust, Mother's Hands, and Absalom's Hair. Later plays were a political tragedy called Paul Lange and Tor Arbsberg (1898), a second part of Beyond our Powers (1895), Laborwmen (1901), At Storkove (1902), and Daggløtt (1904). In 1899, at the opening of the National theatre, Bjørnson received an ovation, and his saga-drama of Sigurd the Crusader was performed.

A subject which interested him greatly, and on which he occupied his indefatigable pen, was the question of the bonde-maal, the adopting of a national language for Norway distinct from the Danish-Dano-Norwegian), in which his literature has hitherto been written. Bjørnson's strong and sometimes rather narrow patriotism did not blind him to the fatal folly of such a proposal, and his lectures and pamphlets against the maalstrøm in its extreme form did more than anything else to save the language in this dangerous moment. Bjørnson was one of the original members of the Nobel committee, and was re-elected in 1900. In 1903 he was awarded the Nobel prize for literature. Bjørnson had done as much as any other man to raise Norwegian national feeling, but in 1905, on the verge of the rupture between Norway and Sweden, he preached conciliation and moderation to the Norwegians. He was an eloquent advocate of Pan-Germanism, and, writing to the Figaro in 1905, he outlined a Pan-Germanic alliance of northern Europe and North America. He died on the 26th of April 1910.

See Bjørnson's Samlede Vaerker (Copenhagen, 1890-1902, 11 vols.; The Novels of Bjørnstjerne Bjørnson (1863, &c.), edited by Edmund Gosse; Branca, (1883), and The Progress of the Northmen (1893); C. D. af Wirsén, Kritiker (1901); Chr. Collin, Bjørnstjerne Bjørnson (2 vols., German ed., 1903), the most complete biography and criticism at present available; and B. Halvorsen, Norway's Literature (1885).

BLACHFORD, FREDERIC ROGERS, Baron (1811-1899), British civil servant, eldest son of Sir Frederick Leman Rogers, 7th Bart. (whom he succeeded in the baronetcy in 1851), was
BLACK, A.—BLACK, J.

born in London on the 31st of January 1811. He was educated at Eton and Oriel College, Oxford, where he had a brilliant career, winning the Craven University scholarship, and taking a double first-class in classics and mathematics. He became a fellow of Oriel (1833), and won the Vinerian scholarship (1834), and fellowship (1840). He was called to the bar in 1837, but never practised. At school and at Oxford he was a contemporary of W. E. Gladstone, and at Oxford he began a lifelong friendship with J. H. Newman and R. W. Church; his classical and literary tastes, and his combination of liberalism in politics with High Church views in religion, together with his good social position and interesting character, made him an admired member of their circles. For two or three years (1841–1844) he wrote for The Times, and he helped to found The Guardian in 1846; he also did a good deal to assist the Tractarian movement. But he eventually settled down to the life of a government official. He began in 1844 as registrar of joint-stock companies, and in 1846 became commissioner of lands and emigration. Between 1857 and 1859 he was engaged in government missions abroad, connected with colonial questions, and in 1860 he was appointed permanent under-secretary of state for the colonies. Sir Frederic Rogers was the guiding spirit of the colonial office under six successive secretaries of state, and on his retirement in 1871 was raised to the peerage as Baron Blachford of Wisdome, a title taken from his place in Devonshire. He died on the 21st of November 1889.

BLACK, ADAM (1754–1824), Scottish publisher, founder of the firm of A. & C. Black, the son of a builder, was born in Edinburgh on the 20th of February 1784. After serving his apprenticeship to the bookselling trade in Edinburgh and London, he began business for himself in Edinburgh in 1808. By 1826 he was recognized as one of the principal booksellers in the city; and a few years later he was joined in business by his nephew Charles. The two most important events connected with the history of the firm were the publication of the 7th, 8th and 9th editions of the Encyclopaedia Britannica, and the purchase of the stock and copyright of the Waverley Novels. The copyright of the Encyclopaedia passed into the hands of Adam Black and a few friends in 1827. In 1831 the firm bought the copyright of the Waverley Novels for £27,000; and in 1861 they became the proprietors of De Quincey’s works. Adam Black was twice lord provost of Edinburgh, and represented the city in parliament from 1862 to 1865. He retired from business in 1856, and died on the 24th of January 1874. He was succeeded by his sons, who removed their business in 1865 to London. There is a bronze statue of Adam Black in East Princes Street Gardens, Edinburgh.

BLACK, JEREMIAH SULLIVAN (1810–1883), American lawyer and statesman, was born in Stony Creek township, Somerset county, Pennsylvania, on the 10th of January 1810. He was largely self-educated, and before he was of age was admitted to the Pennsylvania bar. He gradually became one of the leading American lawyers, and in 1851–1852 was a member of the supreme court of Pennsylvania (chief-justice 1851–1854). In 1857 he entered President Buchanan's cabinet as attorney-general of the United States. In this capacity he successfully contested the validity of the "California land claims"—claims to about 19,000 sq. m. of land, fraudulently alleged to have been granted to land-grabbers and others by the Mexican government prior to the close of the Mexican War. From the 17th of December 1860 to the 4th of March 1861 he was secretary of state. Perhaps the most influential of President Buchanan's official advisers, he denied the constitutionality of secession, and urged that Fort Sumter be properly reinforced and defended. "For . . . the vigorous assertion at last in word and in deed that the Union is a nation," says James Ford Rhodes, "for pointing out the way in which the authority of the Federal government might be exercised without infringing on the rights of the states, the gratitude of the American people is due to Jeremiah S. Black." He became reporter to the Supreme Court of the United States in 1861, but after publishing the reports for the years 1861 and 1862 he resigned, and devoted himself almost exclusively to his private practice, appearing in such important cases before the Supreme Court as the one known as Ex-Porte Milligan, in which he ably defended the right of trial by jury, the McCord case and the United States v. Blyet et al. After the Civil War he opposed the Congressional plan of reconstructing the late Confederate states, and himself drafted the message of President Johnson, vetoing the Reconstruction Act of the 2nd of March 1867. Black was also for a short time counsel for President Andrew Johnson, in his trial on the article of impeachment, before the United States Senate, and for William W. Belknap (1829–1890), secretary of war from 1869 to 1876, in whose impeachment was impeached on a charge of corruption; and with others he represented Samuel J. Tilden during the contest for the presidency between Tilden and Hayes (see Electoral Commission). He died at Brockie, Pennsylavnia, on the 10th of August 1883.

See Essays and Speeches of Jeremiah S. Black, with a Biographical Sketch (New York, 1885), by his son, C. F. Black.

BLACK, JOSEPH (1728–1799), Scottish chemist and physicist, was born in 1728 at Bordeaux, where his father—a native of Belfast but of Scottish descent—was engaged in the wine trade. At the age of twelve he was sent to a grammar school in Belfast, whence he removed in 1746 to study medicine in Glasgow. There he had William Cullen for his instructor in chemistry, and the relation between the two soon became that of professor and assistant rather than of master and pupil. The action of lithontriptic medicines, especially lime-water, was one of the questions of the day, and through his investigations of this subject Black was led to the chemical discoveries associated with his name. The causticity of alkaline bodies was explained at that time as depending on the presence in them of the principle of fire, "phlogiston"; quicklime, for instance, was chalk which had taken up phlogiston, and when mild alkalis such as sodium or potassium carbonate were causticized by its aid, the phlogiston was supposed to pass from it to them. Black showed that on the contrary causticization meant the loss of something, as proved by loss of weight; and this something he found to be an "air," which, because it was fixed in the substance before it was causticized, he spoke of as "fixed air." Taking magnesia alba, which he distinguished from limestone with which it had previously been confused, he showed that on being heated it lost weight owing to the escape of this fixed air (named carbonic acid by Lavoisier in 1781), and that the weight was regained when the calcined product was made to reabsorb the fixed air with which it had parted. These investigations, by which Black not only gave a great impetus to the chemistry of gases by their indicating the existence of a gas distinct from common air, but also anticipated Lavoisier and modern chemistry by his appeal to the balance, were described in the thesis De humore acido e cibis obtus, et magnesia alba, which he presented for his doctor's degree in 1754; and a fuller account of them was read before the Medical Society of Edinburgh in June 1755, and published in the following year as Experiments upon magnesia, quicklime and some other alkaline substances.

It is curious that Black left to others the detailed study of this "fixed air" he had discovered. Probably the explanation is pressure of other work. In 1756 he succeeded Cullen as lecturer in chemistry at Glasgow, and was also appointed professor of anatomy, though that post he was glad to exchange for the chair of medicine. The preparation of lectures thus took up much of his time, and he was also gaining an extensive practice as a physician. Moreover, his attention was engaged on studies which ultimately led to his doctrine of latent heat. He noticed that when ice melts it takes up a quantity of heat without undergoing any change of temperature, and he argued that this heat, which must have combined with the particles of ice and thus become latent in its substance. This hypothesis he verified qualitatively
BLACK, W.—BLACKBIRD

by experiments, performed at the end of 1761. In 1764, with the aid of his assistant, William Irvine (1743–1787), he further measured the latent heat of steam, though not very accurately. This doctrine of latent heat he taught in his lectures from 1761 onwards, and in April 1762 he described his work to a literary society in Glasgow. But he never published any detailed account of it, so that others, such as J. A. Deluc, were able to claim the credit of his results. In the course of his inquiries he also noticed that different bodies in equal masses require different amounts of heat to raise them to the same temperature, and so founded the doctrine of specific heats; he also showed that equal additions or abstractions of heat produced equal variations of bulk in the liquid of his thermometers. In 1766 he succeeded Cullen in the chair of chemistry in Edinburgh, where he devoted practically all his time to the preparation of his lectures. Never very robust, his health gradually became weaker and ultimately he was reduced to the condition of a valetudinarian. In 1795 he received the aid of a coadjutor in his professorship, and two years later he lectured for the last time. He died in Edinburgh on the 6th of December 1799 (not on the 26th of November as stated in Robison’s life).

As a scientific investigator, Black was conspicuous for the carefulness of his work and his caution in drawing conclusions. Holding that chemistry had not attained the rank of a science—his lectures dealt with the “effects of heat and mixture”—he had an almost morbid horror of hasty generalization or of anything that had the pretensions of a fully fledged system. This modesty and attitude, combined with a certain lack of initial drive and the weakness of his health, probably prevented him from doing full justice to his splendid powers of experimental research. Apart from the work already mentioned he published only two papers during his life-time: “The supposed effect of boiling on water, in disposing it to freeze more readily” (Phil. Trans., 1773), and “An analysis of the waters of the hot springs in Iceland” (Trans. Roy. Soc. Ed., 1794).

After his death his lectures were written out from his own notes, supplemented by those of some of his pupils, and published with a biographical preface by his friend and colleague, Professor John Robison (1739–1805), in 1803, as Lectures on the Elements of Chemistry, delivered in the University of Edinburgh.

BLACK, WILLIAM (1841–1898), British novelist, was born at Glasgow on the 6th of November 1841. His early ambition was to be a painter, but he made no way, and soon had recourse to journalism for a living. He was at first employed in newspaper offices in Glasgow, but obtained a post on the Morning Star in London, and at once proved himself a descriptive writer of exceptional vivacity. During the war between Prussia and Austria in 1866 he represented the Morning Star at the front, and was taken prisoner. This paper shortly afterwards failed, and Black joined the editorial staff of the Daily News. He also edited the Examiner, at a time when that periodical was already moribund. After his first success in fiction, he gave up journalism, and devoted himself entirely to the production of novels. For nearly thirty years he was successful in retaining the popular favour. He died at Brighton on the 10th of December 1888, without having experienced any of that reaction of the public taste to which many novelists are subjected upon conspicuous successes in fiction. Black’s first novel, James Morie, published in 1862, was a complete failure; his second, Love or Marriage (1868), attracted but very slight attention. In Silk attire (1869) and Kilmeny (1870) marked a great advance on his first work, but in 1871 A Daughter of Beth suddenly raised him to the height of popularity, and he followed up this success by a string of favourites. Among the best of his books are The Strange Adventures of a Phaeton (1872); A Princess of Thule (1874); Madcap Violets (1876); Mark’s White Wings (1881); Sunset (1882); Shandon Bells (1883); Judith Shakespeare (1884); White Heather (1885); and Donald Ross of Himera (1891). Black was a thoroughgoing sportsman, particularly fond of fishing and yachting, and his best stories are those which are laid amid the breezy mountains of his native land, or upon the deck of a yacht at sea off its wild coast. His descriptions of such scenery are simple and picturesque. He was a word-painter rather than a student of human nature. His women are stronger than his men, and among them are many wayward and lovable creatures; but sublety of intuition plays no part in his characterization. Black also contributed a life of Oliver Goldsmith to the English Men of Letters series.

BLACK APE, a sooty, black, short-tailed, and long-faced representative of the macaques, inhabiting the island of Celebes, and generally regarded as forming a genus by itself, under the name of Cynopithecus niger, but sometimes relegated to the rank of a subgenus of Macacus. The nostrils open obliquely at some distance from the end of the snout, and the head carries a crest of long hair. There are several local races, one of which was long regarded as a separate species under the name of the Moor macaque, Macacus mauros. (See Primates.)

BLACKBALL, a token used for voting by ballot against the election of a candidate for membership of a club or other association. Formerly white and black balls about the size of pigeons’ eggs were used respectively to represent votes for and against a candidate for such election; and although this method is now generally obsolete, the term “blackball” survives both as noun and verb. The rules of most clubs provide that a stated proportion of “blackballs” shall exclude candidates proposed for election, and the candidates so excluded are said to have been “blackballed”; but the ballot (q.v.) is now usually conducted by a method in which the favourable and adverse votes are not distinguished by different coloured balls at all. Either voting papers are employed, or balls—of which the colour has no significance—are cast into different compartments of a ballot-box according as they are favourable or adverse to the candidate.

BLACKBERRY, or Bramble, known botanically as Rubus fruticosus (natural order Rosaceae), a native of the north temperate region of the Old World, and abundant in the British Isles as a copse and hedge-plant. It is characterized by its prickly stem, leaves with usually three or five ovate, coarsely toothed stalked leaflets, many of which persist through the winter, white or pink flowers in terminal clusters, and black or red-purple fruits, each consisting of numerous succulent drupels crowded on a dry conical receptacle. It is a most variable plant, exhibiting many more or less distinct forms which are regarded by different authorities as sub-species or species. In America several forms of the native blackberry, Rubus nigrobracteatus (formerly known as R. villosus), are widely cultivated; it is described as one of the most important and profitable of bush-fruits. For details see F. W. Card in L. H. Bailey’s Cyclopedia of American Horticulture (1900).

BLACKBIRD (Turdus merula), the name commonly given to a well-known British bird of the Turdidae family, for which the ancient name was ouzel (q.v.), Anglo-Saxon ēsel, equivalent of the German Amsel, a form of the word found in several old English books. The plumage of the male is of a uniform black colour, that of the female various shades of brown, while the bill of the male, especially during the breeding season, is of a bright gamboge yellow. The blackbird is of a shy and restless disposition, and feeds mostly on the ground, rather than singly or in pairs, and taking flight when startled with a sharp shrill cry. It builds its nest in March, or early in April, in thick bushes or in ivy-clad trees, and usually rears at least two broods each season. The nest is a neat structure of coarse grass and moss, mixed with earth, and plastered internally with mud, and here the female lays from four to six eggs of a blue colour speckled with brown. The blackbird feeds chiefly on fruits, worms, the larvae of insects and snails, extracting the last from their shells by dexterously chipping them on stones; and though it is generally regarded as an enemy of the garden, it is probable that the amount of damage by it to the fruit is largely compensated for by its undoubted services as a vermin-killer. The notes of the blackbird are rich and full, but monotonous as compared with those of the song-thrush. Like many other singing birds it is, in the wild state, a
Black Buck (Antilope cervicapra), the Indian Antelope, the sole species of its genus. This antelope, widely distributed in India, with the exception of Ceylon and the region east of the Bay of Bengal, stands about 32 in. high at the shoulder; the general hue is brown deepening with age to black; chest, belly and inner sides of limbs pure white, as are the muzzle and chin, and an area round the eyes. The horns are long, tinged, and form spirals with from three to five turns. The doe is smaller in size, yellowish-fawn above, and this hue obtains also in young males. These antelopes frequent grassy districts and are usually found in herds. Coursing black-buck with the cheeta (q.v.) is a favourite Indian sport.

Blackburn, Colin Blackburn, Baron (1813-1860), British judge, was born in Selkirkshire in 1813, and educated at Eton and at Trinity College, Cambridge, taking high mathematical honours in 1835. He was called to the bar in 1838, and went the northern circuit. His progress was at first slow, and he employed himself in reporting and editing, with T. F. Ellis, eight volumes of the highly-esteemed Ellis and Blackburn reports. His deficiency in all the more brilliant qualities of the advocate almost confined his practice to commercial cases, in which he obtained considerable employment in his circuit; but he continued to belong to the outside bar, and was so little known to the legal world that his promotion to a puisne judgeship in the court of queen's bench in 1859 was at first ascribed to Lord Campbell's partiality for his countrymen, but Lord Lyndhurst, Lord Wensleydale and Lord Cranworth came forward to defend the appointment. Blackburn himself is said to have thought that a county court judgeship was about to be offered him, which he had resolved to decline. He soon proved himself one of the soundest lawyers on the bench, and when he was promoted to a baronetcy in 1850, and in 1856 to a baronetcy, was considered by Westminster the highest authority on common law. In 1876 he was made a lord of appeal and a life peer. Both in this capacity and as judge of the queen's bench he delivered many judgments of the highest importance, and no decisions have been received with greater respect. In 1886 he was appointed a member of the commission charged to prepare a digest of the criminal law, but retired on account of indisposition in the following year. He died at his country residence, Doonholm in Ayrshire, on the 8th of January 1896. He was the author of a valuable work on the Law of Suits.

See The Times, 10th of January 1896; E. Manson, Builders of Our Law (1904).

Blackburn, Jonathan (c. 1700-c. 1765), American portrait painter, was born in Connecticut. He seems to have been the son of a painter, and to have had a studio in Boston in 1750-1765; among his patrons were many important early American families, including the Apthorps, Amorys, Buffinches, Lowells, Ewings, Saltstonstalls, Winthrops, Winslows and Otises of Boston. Some of his portraits are in the possession of the public library of Lexington, Massachusetts, and of the Massachusetts Historical Society, but most of them are privately owned and are scattered over the country, the majority being in Boston. John Singleton Copley was his pupil, and it is said that he finally left his studio in Boston, through jealousy of Copley's superior success. He was a good portrait painter, and some of his pictures were long attributed to Copley.

Blackburn, a municipal, county and parliamentary borough of Lancashire, England, 210 m. N.W. by N. from London, and 243 N.N.W. from Manchester, served by the Lancashire & Yorkshire and the London & North Western railways, with several lines from all parts of the country. Pop. (1891) 120,064; (1901) 127,626. It lies in the valley of a stream called in early times the Blackburn, but now known as the Brook. The hills in the vicinity rise to some 900 ft., and among English manufacturing towns Blackburn ranks high in beauty of situation. Besides numerous churches and chapels the public buildings comprise a large town hall (1856), market house, exchange, county court, municipal offices, chamber of commerce, free library, and, outside the town, an infirmary. There are an Elizabethan grammar school, in modern buildings (1884) and an excellent technical school. The Corporation Park and Queen's Park are well laid out, and contain ornamental waters. There is an efficient tramway service, connecting the town with Darwen, 5 m. south. The cotton industry employs thousands of operatives, the iron trade is also very considerable, and many are engaged in the making of machines; but a former woollen manufacture is almost extinct. Blackburn's speciality in the cotton industry is weaving. Coal, lime and building stone are abundant in the neighbourhood. Blackburn received a charter of incorporation in 1851, and is governed by a mayor, 14 aldermen and 42 councillors. The county borough was created in 1888. The council has a 10-member borough council, one member for each division of the county, the borough council having a seat in the House of Commons. The county council has one representative. In 1890 it was estimated that the population of Blackburn was 82,762.

See W. A. Abram, History of Blackburn (Blackburn, 1897).

Blackburne, Francis (1782-1862), lord chancellor of Ireland, was born at Great Footstown, Co. Meath, Ireland, on the 11th of November 1782. Educated at Trinity College, Dublin, he was called to the English bar in 1805, and practised with great success on the home circuit. Called to the Irish bar in 1822, he vigorously administered the Insurrection Act in Limerick for two years, effectually restoring order in the district. In 1826 he became a serjeant-at-law, and in 1830, again, in the same character; in 1846 he was made chief-justice of the county of Down, in 1850 chief-justice of the county of Meath, and in 1852 lord chancellor of Ireland. In 1856 he was made a lord justice of appeal in Ireland. He is remembered as having prosecuted O'Connell and presided at the trial of Smith O'Brien. He died on the 7th of September 1867.

Blackcock (Tetrao tetrix), the English name given to a bird of the family Tetraonidae or grouse, the female of which is known as the grey hen and the young as pouls. In size and plumage the two sexes offer a striking contrast, the male weighing about 4 lb., its plumage for the most part a rich glossy black shot with blue and purple, the lateral tail feathers curved outwards so as to form, when raised, a fan-like crest, and the eyebrows destitute of feathers and of a bright vermilion red. The female,
on the other hand, weighs only 2 lb, its plumage is of a russet brown colour irregularly barred with black, and its tail feathers are but slightly forked. The males are polygamous, and during autumn and winter associate together, feeding in flocks apart from the females; but with the approach of spring they separate, each selecting a locality for itself, from which it drives off all intruders, and where morning and evening it seeks to attract the other sex by a display of its beautiful plumage, which at this season attains its greatest perfection, and by a peculiar cry, which Selby describes as "a crowing note, and another similar to the noise made by the whetting of a scythe." The nest, composed of a few stalks of grass, is built on the ground, usually beneath the shadow of a low bush or a tuft of tall grass, and here the female lays from six to ten eggs of a dirty-yellow colour speckled with dark brown. The blackcock then rejoins his male associates, and the female is left to perform the labours of hatching and rearing her young brood. The plumage of both sexes is at first like that of the female, but after moulting the young males gradually assume the more brilliant plumage of their sex. There are also many cases on record, and specimens may be seen in the principal museums, of old female birds assuming, to a greater or less extent, the plumage of the male. The blackcock is very generally distributed over the highland districts of northern and central Europe, and in some parts of Asia. It is found on the principal heaths in the south of England, but is specially abundant in the Highlands of Scotland.

BLACK COUNTRY, THE, a name commonly applied to a district lying principally in S. Staffordshire, but extending into Worcestershire and Warwickshire, England. This is one of the chief manufacturing centres in the United Kingdom, and the name arises from the effect of numerous collieries and furnaces, which darken the face of the district, the buildings and the atmosphere. Coal, ironstone and clay are mined in close proximity, and every sort of iron and steel goods is produced. The district extends 15 m. N.W. from Birmingham, and includes Smethwick, West Bromwich, Dudley, Oldbury, Sedgley, Tipton, Bilston, Wednesbury, Wolverhampton and Walsall as its most important centres. The ceaseless activity of the Black Country is most readily realized when it is traversed, or viewed from such an elevation as Dudley Castle Hill, at night, when the glare of furnaces appears in every direction. The district is served by numerous branches of the Great Western, London & North Western, and Midland railways, and is intersected by canals, which carry a heavy traffic, and in some places are made to surmount physical obstacles with remarkable engineering skill, as in the case of the Castle Hill tunnels at Dudley. Among the numerous branches of industry there are several characteristic of certain individual centres. Thus, locks are a specialty at Wolverhampton and Willenhall, and keys at Wednesfield; horses' bits, harness-fittings and saddlery at Walsall and Bloxwich, anchors and cables at Tipton, glass at Smethwick, and nails and chains at Bradley.

BLACK DROP, in astronomy, an apparent distortion of the planet Mercury or Venus at the time of internal contact with the limb of the sun at the beginning or end of a transit. It has been in the past a source of much perplexity to observers of transits, but is now understood to be a result of irradiation, produced by the atmosphere or by the aberration of the telescope.

BLACKFOOT (Siksika), a tribe and confederacy of North American Indians of Algonquian stock. The name is explained as an allusion to their leggings being observed by the whites to have become blackened by marching over the freshly burned prairie. Their range was around the headwaters of the Missouri, from the Yellowstone northward to the North Saskatchewan and westward to the Rockies. The confederacy consisted of three tribes, the Blackfoot or Siksika proper, the Kaina and the Piegan. During the early years of the 19th century the Blackfoots were one of the strongest Indian confederacies of the north-west, numbering some 40,000. At the beginning of the 20th century there were about 5000, some in Montana and some in Canada.

See Jean L'Heureux, Customs and Religious Ideas of Blackfoot Indians in J. A. I., vol. xv. (1886); G. B. Grinnell, Blackfoot Lodge Tales (1892); G. Catlin, North American Indians (1846); Handbook of American Indians (1897), under "Siksika."
Schwarzwaldbahn from Offenburg to Singen, from which various small local lines ramify.

BLACK HAWK [Ma'katawimesheka'ka, "Black Sparrow Hawk"], (1767-1838, American Indian warrior of the Sauk and Fox tribes, was born at the Sauk village on Rock river, near the Mississippi, in 1757. He was a member of the Thunder gens of the Sauk tribe, and, though neither an hereditary nor an elected chief, was for some time the recognized war leader of the Sauk and Foxes. From his youth he was intensely bloodthirsty and hostile to the Americans. Immediately after the acquisition of Louisiana, the Federal government took steps for the removal of the Sauk and Foxes, who had always been a disturbing element among the north-western Indians, to the west bank of the Mississippi river. As early as 1804, by a treaty signed at St. Louis on the 3rd of November, they agreed to the removal in return for an annuity of $1000. British influences were still strong in the upper Mississippi valley and undoubtedly led Black Hawk and the chiefs of the Sauk and Fox confederacy to repudiate this agreement of 1804, and subsequently to enter into the conspiracy of Tecumseh and take part with the British in the war of 1812. The treaties of 1815 at Portage des Sioux (with the Foxes) and of 1816 at St. Louis (with the Sauk) substantially renewed that of 1804. That of 1816 was signed by Black Hawk himself, who declared, however, when in 1823 Chief Keokuk and a majority of the two nations crossed the river, that the consent of the chiefs had been obtained by fraud. In 1830 a final treaty was signed at Prairie du Chien, by which all title to the lands of the Sauk and Foxes east of the Mississippi was ceded to the government, and provision was made for the immediate opening of the tract to settlers. Black Hawk, leading the party in opposition to Keokuk, at once refused to accede to this cession and threatened to retaliate if his lands were invaded. This precipitated what is known as the Black Hawk War. Settlers began pouring into the new region in the early spring of 1831, and Black Hawk in June attacked several villages near the Illinois-Wisconsin line. After massacring several isolated families, he was driven off by a force of Illinois militia. He renewed his attack in the following year (1832), but after several minor engagements, in most of which he was successful, he was defeated (21st of July) at Wisconsin Heights on the Wisconsin river, opposite Prairie du Sac, by Michigan volunteers under Colonels Henry Dodge and James D. Henry, and fleeing westward was again decisively defeated on the Mississippi at the mouth of the Bad Axe river (on the 1st and 2nd of August) by General Henry Atkinson. His band was completely dispersed, and he himself was captured by a party of Winnebagoes. At Fort Armstrong, Rock Island, on the 21st of September, a treaty was signed, by which a large tract of the Sauk and Fox territory was ceded to the United States; and the United States granted to them a reservation of 400 sq. m., the payment of $20,000 a year for thirty years, and the settlement of certain traders' claims against the tribe. With several warriors Black Hawk was sent to Fortress Monroe, Virginia, where he was confined for a few weeks; afterwards he was taken by the government through the principal Eastern cities. On his release he settled in 1837 on the Sauk and Fox reservation on the Des Moines river, in Iowa, where he died on the 3rd of October 1838.

Sir Frank E. Stevens, The Black Hawk War (Chicago, 1903); R. G. Thwaites, "The Story of the Black Hawk War" in vol. xii. of The Collections of the State Historical Society of Wisconsin; J. B. Patterson, Life of Ma-ko-tai-me-the-kia-black or Black Hawk (Boston, 1831); and other works of Black Hawk's story as told by himself; and Benjamin Drake, Life of Black Hawk (Cincinnati, 1846).

BLACKHEATH, an open common in the south-east of London, England, mainly in the metropolitan borough of Lewisham. This high-lying tract was crossed by the Roman Watling Street from Kent, on a line approximating to that of the modern Shooter's Hill; and was a rallying ground of Wat Tyler (1381), who was killed in the battle of Basing. Later it was in the hands of the County of Kent. The opening was attempted but not completed; and in 1477 it was defeated and captured by the troops of Henry VII. in 1477. It also witnessed the acclamations of the citizens of London on the return of Henry V. from the victory of Agincourt, the formal meeting between Henry VIII. and Anne of Cleves, and that between the army of the restoration and Charles II. The introduction into England of the game of golf is traditionally placed here in 1608, and attributed to King James I. and his Scottish followers. The common, the area of which is 267 acres, is still used for this and other pastimes. For the residential district to which Blackheath gives name, see Lewisham.

BLACK HILLS, an isolated group of mountains, covering an area of about 6000 sq. m. in the adjoining corners of South Dakota and Wyoming, U.S.A. They rise on an average some 2000 ft. above their base, the highest peak, Harney, having an altitude above the sea of 7216 ft. They are drained and in large part enclosed by the North (or Belle Fourche) and South forks of the Cheyenne river (at whose junction a fur-trading post was established about 1830); and are surrounded by semi-arid, alkaline plains lying 3000 to 3500 ft. above the sea. The mass has an elliptical shape, its long axis, which extends nearly N.N.W.-S.S.E., being about 120 m. and its shorter axis about 40 m. long. The hills are formed by a short, broad, anticlinal fold, which is flat or nearly so on its summit. From this fold the stratified beds have in large part been removed, the more recent having been almost entirely eroded from the elevated mass. The edges of these are now found encircling the mountains and forming a series of fairly continuous rims of hogbacks. The carboniferous and older stratified beds still cover the west half of the hills, while from the east half they have been removed, exposing the granite. Scientific exploration began in 1849, and systematic geological investigation about 1875. Rich gold placers had already been discovered, and in 1875 the Sioux Indians within whose territory the hills had until then been included, were removed, and the lands were open to white settlers. Subsequently low-grade quartz mines were found and developed, and have furnished a notable part of the gold supply of the country (about $100,000,000 from 1875 to 1901). The output is to-day relatively small in comparison with that of many other fields, but there are one or two permanent gold mines of great value working low-grade ore. The silver product from 1879 to 1901 was about $4,154,000. Deposits of copper, tin, iron and tungsten have been discovered, and a variety of other mineral products (graphite, mica, spodumene, coal, petroleum, &c.). In sharp contrast to the surrounding plains the climate is subhumid, especially in the higher Harney region. There is an abundance of fertile soil and magnificent grazing land. A third of the total area is covered with forests of pine and other trees, which have for the most part been made a forest-reserve by the national government. Jagged crags, sudden abysses, magnificent canyons, forests with open parks, undulating hills, mountain prairies, freaks of weathering and erosion, and the enclosing lines of the successive hog-backs afford scenery of remarkable variety and wild beauty. There are several interesting limestone caverns, and Sylvan Lake, in the high mountain district, is an important resort.

See the publications of the United States Geological Survey (especially Professional Paper No. 26, Economic Resources of the Northern Black Hills, 1904), and of the South Dakota School of Mines Bulletin No. 1, containing a history and bibliography of Black Hills investigations); also R. L. Dodge, The Black Hills: A Minute Description ... (New York, 1876).

BLACKIE, JOHN STUART (1809—1893), Scottish scholar and man of letters, was born in Glasgow on the 28th of June 1809. He was educated at the New Academy and afterwards at the Marischal College, in Aberdeen, where his father was manager of the Commercial Bank. After attending classes at Edinburgh University (1825–1826), Blackie spent three years at Aberdeen as a student of theology. In 1829 he went to Germany, and after studying at Göttingen and Berlin (where he came under the influence of Heeren, Ottfried Müller, Schleiermacher, Neander and Böckh) he accompanied Bunsen to Italy and Rome. The years spent abroad extinguished his former wish to enter the Church, and at his father's desire he gave himself up to study. He had already written books, and was admitted to his father's law office, but only remained there six months. By the time he was admitted a member of the Faculty of Advocates (1834) he had acquired a strong love of the classics and a taste for letters in
general. A translation of *Pausi*, which he published in 1834, met with considerable success. After a year or two of desultory literary work he was (May 1839) appointed to the newly-instituted chair of Humanity (Latin) in the Marischal College. Difficulties arose in the way of his installation, owing to the action of the Presbytery on his refusing to sign unreservedly the Confession of Faith; but these were eventually overcome, and he took up his duties as professor in November 1841. In the following year he married. From the first his professorial lectures were conspicuous for the unconventional enthusiasm with which he endeavoured to revivify the study of the classics; and his growing reputation, added to his untinted reputation by a translation of Aeschylus which he published in 1850, led to his appointment in 1852 to the professorship of Greek at Edinburgh University, in succession to George Dunbar, a post which he continued to hold for thirty years. He was somewhat erratic in his methods, but his lectures were a triumph of influential personality. A journey to Greece in 1853 prompted his essay on *The Living Language of the Greeks*, a favourite theme of his, especially in his later years; he adopted for himself a modern Greek pronunciation, and devoted his days to a stimulating school of indigent able students to learn Greek at Athens. Scottish nationality was another source of enthusiasm with him; and in this connexion he displayed real sympathy with Highland home life and the grievances of the crofters. The foundation of the Celtic chair at Edinburgh University was mainly due to his efforts. In spite of the many calls upon his time he produced a considerable amount of literary work, usually on classical or Scottish subjects, including some poems and songs of no mean order. He died in Edinburgh on the 2nd of March 1895. Blackie was a Radical and Scottish nationalist in politics, but of a fearlessly independent type; he was one of the "characters" of the Edinburgh of the day, and was a well-known figure as he went about in his plaid, worn shepherd-wise, wearing a broad-brimmed hat, and carrying a big stick. His published works include (besides several volumes of verse) *Homer and the Iliad* (1860), maintaining the unity of the poems; *Four Phases of Morals: Socrates, Aristotle, Christianity, Utilitarianism* (1871); *Essay on Self-Culture* (1874); *Herae Helleniacae* (1874); *The Language and Literature of the Scottish Highlanders* (1876); *The Natural History of Albion* (1877); *The Wise Men of Greece* (1877); *Lay Sermons* (1881); *Alzavona* (1882); *The Wisdom of Goethe* (1883); *The Scottish Highlanders and the Land Laws* (1885); *Life of Burns* (1888); *Scottish Song* (1889); *Essays on Subjects of Moral and Social Interest* (1890); *Christianity and the Ideal of Humanity* (1893). Amongst his political writings may be mentioned a pamphlet *On Democracy* (1867), *On Forms of Government* (1867), and *Political Tracts* (1868).

**BLACK ISLE, THE**, a district in the east of the county of Ross and Cromarty, Scotland, bounded N. by Cromarty Firth, E. by Moray Firth, S. by Inner Moray Firth (or Firth of Inverness) and Beauly Firth, and W. by the river Conon and the parish of Urray. It is a diamond-shaped peninsula jutting out from the mainland in a north-easterly direction, the longer axis, from Muir of Ord station to the South Sutor at the entrance to Cromarty Firth, measuring 10 m., and the shorter, from Ferryton Point to Craigton Point, due north and south, 12 m., and it has a coast-line of 53 m. Originally called Ardmbrid, and having Gaelic ad, height, *mainuishe*, monach, monk, "the monk's height," from an old religious house on the finely-wooded ridge of Muilbeie, it derived its customary name from the fact that, since snow does not lie in winter, the promontory looks black while the surrounding country is white. Within its limits are comprised the parishes of Urquhart and Logic Wester, Kilmallan, Knockbain (Gaelic *croc*, hill; *bhein*, white), Avoch (pront. Auch), Rosemarkie, Resolles (Gaelic *rudha* or *ros* stiubnaich, shape of the light " or "Kirkmichael and Cromarty. The Black Isle, Highland, Muir of Ord to Fortrose; steamers connect Cromarty with Invergordon and Inverness, and Fortrose with Inverness; and there are ferries, on the southern coast, at North Kessock (for Inverness) and Chanonry (for Fort George), and, on the northern coast, at Alcaig (for Dingwall), Newballpoint and Cromarty (for Nigg). The principal towns are Cromarty and Fortrose. Rosehaugh, near Avoch, belonged to Sir George Mackenzie, founder of the Advocates' Library in Edinburgh, who earned the sobriquet of "Bloody" from his persecution of the Covenanters. Redcastle, on the shore, near Kilmallan church, dates from 1179 and is said to have been the earliest inhabited house in the north of Scotland. On the forefutile of the earldom of Ross it became a royal castle (being visited by Robert Bruce, 1306), and afterwards held a memorable period for a time in the hands of the Mackenzies of Gairloch. The chief industries are agriculture—high farming flourishes owing to the great fertility of the peninsula—sandstone-quarrying and fisheries (mainly from Avoch). The whole district, though lacking water, is Picturesque and was once forested. The Mulbuie ridge, the highest point of which is 838 ft. above the sea, occupies the centre and is the only elevated ground. Antiquarian remains are somewhat numerous, such as forts and cairns in Cromarty parish, and stone circles in Urquhart and Logic Wester and Knockbain parishes. The latter also contains a hut circle and rock fortress.

**BLACKLOCK, THOMAS** (1721-1791), Scottish poet, the son of a bricklayer, was born at Annan, in Dumfriesshire, in 1721. When not quite six months old he lost his sight by smallpox, and his career is largely interesting as that of one who achieved what he did in spite of blindness. Shortly after his father's death in 1740, some of Blacklock's poems began to be handed about among his acquaintances and friends, who arranged for his education at the grammar-school, and subsequently at the university of Edinburgh, where he was a student of divinity. His first volume of *Poems* was published in 1746. In 1754 he became deputy librarian for the Faculty of Advocates, by the kindness of Hume. He was eventually estranged from Hume, and defended James Beattie's attack on that philosopher. Blacklock was one of the first friends of Burns in Edinburgh, being one of the earliest to recognize his genius. He was in 1762 ordained minister of the church of Kirkcudbright, a position which he soon resigned; in 1767 the degree of doctor in divinity was conferred on him by Marischal College, Aberdeen. He died on the 7th of July 1791.

An edition of his poems in 1793 contains a life by Henry Mackenzie.

**BLACKMAIL**, a term, in English law, used in three special meanings, at different times. The usual derivation of the second half of the word is from Norman Fr. *maille* (medial; cf. "medal"), small copper coin; the *New English Dictionary* derives from "mail" (q.v.), meaning rent or tribute. *(1)* The primary meaning of "blackmail" was rent paid in labour, grain or baser metal (i.e. money other than sterling money), called *reditus niger*, in contradistinction to rent paid in silver or white money (*mailles blanches*). *(2)* In the northern counties of England (Northumberland, Westmorland, and the bishopric of Durham) it signified a tribute in money, corn, cattle or other consideration exacted from farmers and small owners by free-booters in return for immunity from robbers or moss-troopers. By a statute of 1601 it was made a felony without benefit of clergy to receive or pay such tribute, but the practice lingered until the union of England and Scotland in 1707. *(3)* The word now signifies extortion of money or property by threats of libel, prosecution, exposure, &c. See such headings as *Coercion, Conspiracy, Extortion*, and authorities quoted under *Criminal Law*.

**BLACKMORE, SIR RICHARD** (c. 1650-1729), English physician and writer, was born at Corsham, in Wiltshire, about 1650. He was educated at Westminster school and St Edmund Hall, Oxford. He was for some time a schoolmaster, but finally, after graduating in medicine at Padua, he settled in practice as a physician in London. He supported the principles of the Revolution, and was accordingly knighted in 1697. He held the office of physician in ordinary both to William III. and Anne, and died on the 9th of October 1729. Blackmore had a
BLACKMORE, R. D.—BLACK ROD

passion for writing epics. Prince Arthur, an Herioc Poem in X Books appeared in 1695, and was followed by six other long poems between 1715 and 1721. Of these Creation, . . . (1715), a philosophic poem intended to refute the atheism of Vanini, Hobbes and Spinoza, and to unfold the intellectual philosophy of Locke, was the most favourably received. Dr Johnson anticipated that this poem would transmit the author to posterity “among the first favourites of the English muse,” while John Dennis went so far as to describe it as “a philosophic poem, which has equalled that of Lucretius in the beauty of its versification, and infinitely surpassed it in the solidity and strength of its reasoning.” These opinions have not been justified, for the poem, little noticed, and the Blackmore who wrote it is unremembered. His Creations appears in Johnson’s and Anderson’s collections of the British poets. He left also works on medicine and on theological subjects.

BLACKMORE, RICHARD DODDRIDGE (1825–1900), English novelist, was born on the 7th of June 1825 at Longworth, Berkshire, of which village his father was curate in charge. He was educated at Blundell’s school, Tiverton, and Exeter College, Oxford, where he obtained a scholarship. In 1847 he took a second degree in law. Two years later he entered as a student at Lincoln’s Inn, and was called to the bar in 1854. His first publication was a volume of Poems by Melanter (1854), which showed no particular promise, nor did the succeeding volume, Epulla (1855), suggest that Blackmore had the makings of a poet. He was nevertheless enthusiastic in his pursuit of literature; and when, a few years later, the complete breakdown of his health rendered it clear that he must remove from London, he determined to combine a literary life in the country with a business career as a market-gardener. He acquired land at Teddington, and set earnestly to work, the literary fruits of his new surroundings being a translation of the Georgics published in 1862. In 1864 he published his first novel, Clara Vaughan, the merits of which were promptly recognized. Cradock Novell (1866) followed, but it was in 1869 that he suddenly sprang into fame with Lorna Doone. This fine story was a pioneer in the romantic revival; and appearing at a jaded hour, it was presently recognized as a work of singular charm, vigour and imagination. Its success could scarcely be repeated, and though Blackmore wrote many other capital stories, of which the best known are The Maid of Sker (1872), Chriostromell (1882), Periyarrant (1894), Tales from the Telling House (1896) and Derid (1897), he will always be remembered almost exclusively as the author of Lorna Doone. He continued his quiet country life to the last, and died at Teddington on the 20th of January 1900, in his seventy-fifth year. Lorna Doone has the true out-of-door atmosphere, is shot through and through with adventurous spirit, and in its dramatic moments shows both vigour and intensity. The heroine, though she is invested with qualities of faery which are scarcely human, is an idyllic and haunting figure; and John Ridd, the bluff hero, is, both in purpose and achievement, a veritable giant of romance. The story is a classic of the West country, and many pilgrimages are made annually to the Doone Valley (the actual characteristics of which differ materially from the descriptions given in the novel) are entirely inspired by the buoyant imagination of Richard Blackmore. A memorial window and tablet to his memory were erected in Exeter cathedral in 1904.

BLACK MOUNTAIN, a mountain range and district on the Haara border of the North-West Frontier Province of India. It is inhabited by Yusufzai Pathans. The Black Mountain itself has a total length of 25 to 50 m., and an average height of 8000 ft. above the sea. It rises from the Indus basin near the village of Kiara, up to its watershed by Bruddur; thence it runs north-west by north to the point on the crest known as Chittabut. From Chittabut the range runs due north, finally descending by two large spurs to the Indus again. The tribes which inhabit the western face of the Black Mountain are the Hassanzais (2500 fighting men), the Akazais (165 fighting men) and the Chagarzais (480 fighting men), all sub-sections of the Yusufzai Pathans. It was in this district that the Hindostani Fanatics had their stronghold, and they were responsible for much of the unrest on this part of the border.

1. The Black Mountain is chiefly notable for four British expeditions:
   1. Under Lieut.-Colonel F. Mackeson, in 1852–3, against the Hassanzais. The occasion was the murder of two British customs officers. A force of 3000 British troops traversed their country, destroying their villages and grain, &c.
   2. Under Major-General A. T. Wilde, in 1858. The occasion was an attack on a British police post at Oghi in the Agor Valley by all three tribes. A force of 12,500 British troops entered the country and the tribe made submission.
   3. The First Hazara Expedition was undertaken in 1888. The cause was the constant raids made by the tribes on villages in British territory, culminating in an attack on a small British detachment, in which two English officers were killed. A force of 12,500 British troops traversed the country of the tribes, and severely punished them. Punishment was also inflicted on the Hindostani Fanatics of Palosi.
   4. The Second Hazara Expedition of 1891. The Black Mountain tribes fired on a force within British limits. A force of 750 British troops entered the country. The tribesmen made their submission and entered into an agreement with government to preserve the peace of the border.

The Black Mountain tribes took no part in the general frontier rising of 1897, and after the disappearance of the Hindostani Fanatics they sank into comparative inactivity.

BLACKPOOL, a municipal and county borough and seaside resort in the Blackpool parliamentary division of Lancashire, England, 46 m. N. of Liverpool, served by the Lancashire & Yorkshire, and London & North Western railways. Pop. (1891) 23,846; (1901) 47,560. The town, which is quite modern, contains many churches and chapels of all denominations, a town hall, public libraries, the Victoria hospital, three piers, theatres, ball-rooms, and other places of public amusement, including a lofty tower, resembling the Eiffel Tower of Paris. The municipality maintains an electric tram service. There are handsome promenades along the sea front, which command fine views. Extensive works upon these, affording a sea front unsurpassed by that of any English watering-place, were completed in 1905. The beach is sandy and the bathing good. The borough was created in 1876 (county borough, 1904), and is governed by a mayor, 12 aldermen and 36 councillors. Area, exclusive of foreshore, 3406 acres; including foreshore, 4424 acres.

BLACK ROD (more fully, “Gentleman Usher of the Black Rod”), an official of the House of Lords, instituted in 1350. His appointment is by royal letters patent, and his title is due to his staff of office, an ebony stick surmounted with a gold lion. He is a personal attendant of the sovereign in the Upper House, and is also usher of the order of the Garter, being doorkeeper at the meetings of the knights’ chapter. He is responsible for the maintenance of order in the House of Lords, and on him falls the duty of arresting any peer guilty of breach of privilege or other offence of which the House takes cognizance. But the duty which brings him most into prominence is that of summoning the Commons and their speaker to the Upper House to hear a speech from the throne or the royal assent given to bills. If the sovereign is present in parliament, Black Rod commands the attendance of the gentlemen of the Commons, but when lords commissioners represent the king, he only desires such attendance. Black Rod is on such occasions the central figure of a curious ceremony of much historic significance. As soon as the attendants of the House of Commons are aware of his approach, they close the doors in his face. Black Rod then strikes three times with his staff, and on being asked “Who is there?” replies “Black Rod.” Being then admitted he advances to the bar of the House, makes three obeisances and says, “Mr Speaker, the king commands this honourable House to attend his majesty immediately in the House of Lords.” This formality originated in the famous attempt of Charles I. to arrest the five members, Hampden, Pym, Holles, Hesilrige and Strode, in 1642. Indigent
at this breach of privilege, the House of Commons has ever since maintained its right of freedom of speech and uninterrupted debate by the closing of the doors on the king's representative.

BLACK SEA (or EUXINE; anc. Pontus Euxinus) \(^1\) a body of water lying almost entirely between the latitudes 41° and 45° N., but extending to about 47° N. near Odessa. It is bounded N. by the southern coast of Russia; W. by Rumania, Turkey and Bulgaria; S. and E. by Asia Minor. The northern boundary is broken at Kerch by a strait entering into the Sea of Azov, and at the junction of the western and southern boundary is the Bosporus, which unites the Black Sea with the Mediterranean through the Sea of Marmora and the Dardanelles. The 100-fathom line is about 10 to 20 m. from the shore except in the north-west corner between Varna and Sevastopol, where it extends 140 m. seawards. The greatest depth is 1030 fathoms (1227 Russian fathoms) near the centre, there being only one basin. The deepest incline outside 100 fathoms is to the south-east of the Crimea and at Amastra; the incline to the greater depths is also steep off the Caucasus and between Trebizond and Batum. The conditions that prevail in the Black Sea are very different from those of the Mediterranean or any other sea. The existence of sulphuretted hydrogen in great quantities below 100 fathoms, the extensive chemical precipitation of calcium carbonate, the stagnant nature of its deep waters, and the absence of deep-sea life are conditions which make it impossible to discuss it along with the physical and biological conditions of the Mediterranean proper.

The depths of the Black Sea are lifeless, higher organic life not being known to exist below 100 fathoms. Fossiliferous remains of Dreissena, Cardium and other mollusca have, however, been dredged up, which help to show that conditions formerly existed in the Black Sea similar to those that exist at the present day in the Caspian Sea. According to N. Andrusov, when the union of the Black Sea with the Mediterranean through the Bosporus took place, salt water rushed into it along the bottom of the Bosporus and killed the fauna of the less saline waters. This gave rise to a production of sulphuretted hydrogen which is found in the deposits, as well as in the deeper waters.

Observations in temperature and salinity have only been taken during summer. During summer the surface salinity of the Black Sea is from 1.7% to 2.0% down to 50 fathoms, whereas in the greater depths it attains a salinity of 2.25%. The temperature is rather remarkable, there being an intermediate cold layer between 25 and 50 fathoms. This is due to the sinking of the cold surface water (which in winter reaches freezing-point) on to the top of the denser saline water of the greater depths. There is thus an intermingling of oxygen in the greater depths causing there uniformity of temperature, an absence of the circulation of oxygen by other means than diffusion, and a protection of the sulphuretted hydrogen from the oxidation which takes place in homologous situations in the open ocean. The temperature down to 25 fathoms is from 78°-3° to 46°-2° F., and in the cold layer, between 25 and 50 fathoms, is from 46°-2° to 43°-5° F., rising again in greater depths to 48°-2° F.

The Sea of Marmora may be looked upon as an arm of the Aegean Sea and thus part of the Mediterranean proper. Its salinity is comparable to that of the eastern basin of the Mediterranean, which is greater than that of the Black Sea, viz. 4%. Similar currents exist in the Bosporus to those of the Strait of Gibraltar. Water of less salinity flows outwards from the Black Sea as an upper current, and water of greater salinity from the Sea of Marmora flows into the Black Sea as an under-current. This under-current flows towards Cape Tzaranugut, where it divides into a left and right branch. The left branch is appreciably nearer the Black Sea than the north-west corner; the right branch sweeps past the Crimean coast, strikes the Caucasian shore (where it comes to the surface running across, but not into, the south-east corner of the Black Sea), and finally disperses flowing westwards along the northern coast of Asia Minor between Jason and Caphrion.

\(^1\) The early Greek navigators gave it the epithet of eurusin, i.e. unfriendly to strangers, but as Greek colonies sprang up on the shores this was changed to euxinus, friendly to strangers.

Sinope. This current causes a warmer climate where it strikes. So marked is this current that it has to be taken into account in the navigation of the Black Sea.

The Sea of Azov is exceedingly shallow, being only about 6 fathoms in its deepest part, and it is largely influenced by the river Don. Its water is considerably fresher than the Black Sea, varying from 1.53 to 0.68%. It freezes more readily and is not affected by the Mediterranean current.

BLACK SEA (Russ. Chernomorschaya), a military district of the province of Kuban, formerly an independent province of Transcaucasia, Russia; it includes the narrow strip of land along the N.E. coast of the Black Sea from Novorossiysk to the vicinity of Pitsunda, between the sea and the crest of the main range of the Caucasus. Area, 2836 sq. m. Pop. (1897) 54,228; (1906, estimate) 71,000. It is penetrated by numerous spurs of this range, which strike the sea abruptly at right angles to the coast, and in many cases plunge down into it sheer. Owing to its southern exposure, its sheltered position, and a copious rainfall, vegetation, in part of a sub-tropical character, grows in great profusion. In consequence, however, of the mountainous character of the region, it is divided into a large number of more or less isolated districts, and there is little intercourse with the country north of the Caucasus, the passes over the range being few and difficult (see CAUCASUS). But since the Russians became masters of this region, its former inhabitants (Circassian and Georgians) have emigrated in large numbers, and the Black Sea has now only thinly inhabited. It is divided into three districts—Novorossiysk, with the town (pop. in 1897, 16,268) of the same name, which acts as the capital of the Black Sea district; Velyaminovsk; and Sochi. Novorossiysk is connected by rail, at the west end of the Caucasus, with the Rostov-Vladikavkaz line, and a mountain road leads from Velyaminovsk (or Tuapse) to Maikop in the province of Kuban.

BLACKSTONE, SIR WILLIAM (1723-1780), English jurist, was born in London, on the 10th of July 1723. His parents having died when he was young, his early education, under the care of his uncle, Dr Thomas Bigg, was obtained at the Charterhouse, from which, at the age of fifteen, he was sent to Pembroke College, Oxford. He was entered in the Middle Temple in 1741. In 1744 he was elected a fellow of All Souls' College. From this period he divided his time between the university and the Temple, where he took chambers in order to attend the law courts. In 1746 he was called to the bar. Though but little known or distinguished as a pleader, he was actively employed, and his character was that of a man of industry and simplicity in the internal management of his college. In May 1749, as a small reward for his services, and to give him further opportunities of advancing the interests of the college, Blackstone was appointed steward of its manors. In the same year, on the resignation of his uncle, Seymour Richmond, he was elected recorder of the borough of Wallingford in Berkshire. In 1750 he became doctor of civil law. In 1753 he decided to retire from London work to his fellowship and an academical life, still continuing the practice of his profession as a provincial counsel.

His lectures on the laws of England appear to have been an early and favourite idea; for in the Michæmas term immediately after he abandoned London, he entered on the duty of reading them at Oxford; and we are told by the author of his Life, that even at their commencement, the high expectations formed from the acknowledged abilities of the lecturer attracted to these lectures a very crowded class of young men of the first families, characters and hopes. Bentham, however, declares that he was a "formal, precise and affected lecturer—just what you would expect of such writings—cold, reserved and wary, exhibiting a frigid pride." It was not till the year 1758 that the lectures in the form they now bear were read in the university. Blackstone, having been unanimously elected to the newly-founded Vinerian professorship, on the 25th of October read his first introductory lecture, afterwards prefixed to the first volume of his celebrated Commentaries. It is doubtful
whether the Commentaries were originally intended for the press; but many imperfect and incorrect copies having got into circulation, and a pirated edition of them being either published or preparing for publication in Ireland, the author thought proper to print a correct edition himself, and in November 1765 published the first volume, under the title of Commentaries on the Laws of England. The remaining parts of the work were given to the world in the course of the four succeeding years. It may be remarked that before this period the reputation which his lectures had deservedly acquired for him had induced him to resume practice in London; and, contrary to the general order of the profession, he who had quitted the bar for academic life was sent back from the college to the bar with a considerable increase of business. He was likewise elected to parliament, first for Hindon, and afterwards for Westbury in Wilt; but in neither of these departments did he equal the expectations which his writings had raised. The part he took in the Middlesex election drew upon him many attacks as well as a severe animadversion from the caustic pen of "Junius." This circumstance probably strengthened the aversion he professed to parliamentary ambition. "There," he said, "amidst the rage of contending parties, a man of moderation, if he be really wise, will not quarter from any side." In 1770 he declined the place of solicitor-general; but shortly afterwards, on the promotion of Sir Joseph Yates to a seat in the court of common pleas, he accepted a seat on the bench, and on the death of Sir Joseph succeeded him there also. He died on the 14th of February 1780.

The design of the Commentaries is exhibited in his first Vinerian lecture printed in the introduction to them. The author there dwells on the importance of noblemen, gentlemen and educated persons generally being well acquainted with the laws of the country; and his treatise, accordingly, is as far as possible a popular exposition of the laws of England. Falling into the common error of identifying the various meanings of the word law, he advances from the law of nature (being either the revealed or the inferred will of God) to municipal law, which he defines to be a rule of civil conduct prescribed by the supreme power in a state commanding what is right and prohibiting what is wrong. On this definition he founds the division observed in the Commentaries. The objects of law are rights and wrongs. Rights are either rights of persons or rights of things. Wrongs are either public or private. These four headings form respectively the subjects of the four books of the Commentaries.

Blackstone was by no means what would now be called a scientific jurist. He has only the vaguest possible grasp of the elementary conceptions of law. He evidently regards the law of gravitation, the law of nature, and the law of England, as different examples of the same principle—as rules of action or conduct imposed by a superior power on its subjects. He propounds in terms the doctrine that municipal or positive laws derive their validity from their conformity to the so-called law of nature or law of God. "No human laws," he says, "are of any validity if contrary to this." His distinction between rights of persons and rights of things, implying, as it would appear, that things as well as persons have rights, is attributable to a misunderstanding of the technical terms of the Roman law. In distinguishing between private and public wrongs (civil injuries and crimes) he fails to seize the true principle of the division. Austin, who accused him of following slavishly the method of Halle's Analysis of the Law, declares that he "blindly adopts the mistakes of his rude and condescending model; missing invariably, with a nice and surprising infelicity, the pregnant but obscure suggestions which it proffered to his attention, and which would have guided a discerning and inventive writer to an arrangement comparatively just." By the want of precise and closely-defined terms, and his tendency to substitute loose literary phrases, he falls occasionally into irreconcilable contradictions. Even in discussing a subject of such immense importance as equity as well as law, he hardly takes pains to discriminate between the legal and popular, the technical and the popular, the academic and the popular phase which equity jurisprudence occupies in his arrangement, he would scarcely seem to have realized its true position in the law of England. Subject, however, to these strictures the completeness of the treatise, its serviceable if not scientific order, and the power of lucid exposition possessed by the author demand emphatic recognition. Blackstone's defects as a jurist are more conspicuous in his treatment of the underlying principles and fundamental divisions of the law than in his account of its substantive principles.

Blackstone by no means confines himself to the work of a legal commentator. It is his business, especially when he touches on the framework of society, to find a basis in history and reason for all the most characteristic English institutions. There is not a custom, a ceremony, a order of things, in which it is not his purpose to find or to indicate its source and origin. Whether through the natural conservatism of a lawyer, or through his own timidity and subserviency as a man and a politician, he is always found to be a specious defender of the existing order of things. Bentham accuses him of being the enemy of all reform, and the unscrupulous champion of every form of professional chicanery. Austin says that he truckled to the sinister interests and mischievous prejudices of power, and that he flattered the overweening conceit of the English in their own institutions. He displays much ingenuity in giving a plausible form to common prejudices, but it is not always easy to make it plain whether he takes his prejudices or his principles from the people he is writing to. The best of all professions is not free of its imperfections. It is by no means clear that he was not imposed upon himself. More undeniable than the political fairness of the treatise is its merits as a work of literature. It is written in a most graceful and attractive style, and although no opportunity of embellishment has been lost, the language is always simple and clear. Whether it is owing to its literary graces, or to its success in flattering the prejudices of the public to which it was addressed, the influence of the book in England has been extraordinary. Not lawyers only, and lawyers perhaps even less than others, accepted it as an authoritative revelation of the law. It performed the education of society in England much the same service as was rendered to the people of Rome by the publication of their previously unknown laws. It is more correct to regard it as a handbook of the law for laymen than as a legal treatise; and as the first and only book of the kind in England it has been received with something indeterminate reverence. It is certain that a vast amount of the constitutional sentiment of the country has been inspired by its pages. To this day Blackstone's criticism of the English constitution would probably express the most profound political convictions of the majority of the English people. Long after it has ceased to be of much practical value as an authority in the courts, it remains the arbiter of all public discussions on the law or the constitution. On such occasions the Commentaries are apt to be construed as strictly as if they were a code. It is curious to observe how much importance is attached to the ipsissima verba of a writer who aimed more at presenting a picture intelligible to laymen than at recording the principles of the law with technical accuracy of detail. See also the article English Law.

BLACKWATER, the name of a number of rivers and streams in England, Scotland and Ireland. The Blackwater in Essex, which rises near Saffron Walden, has a course of about 40 m. to the North Sea. The most important river of the name is in southern Ireland, rising in the hills on the borders of the counties Cork and Kerry, and flowing nearly due east for the greater part of its course, as far as Cappoquin, where it turns abruptly southward, and discharges through an estuary into Youghal Bay.
BLACKWATER FEVER—BLADDER DISEASES

The length of its valley (excluding the lesser windings of the river) is about 90 m., and the drainage area about 1300 sq. m. It is navigable only for a few miles above the mouth, but its salmon fisheries are both attractive to sportsmen and of considerable commercial value. The scenery of its banks is at many points very beautiful.

BLACKWATER FEVER, a disease occurring in tropical countries and elsewhere, which is often classed with malaria (q.v.). It is characterized by irregular febrile paroxysms, accompanied by rigors, bilious vomiting, jaundice and haemorrhagicuria (Sambon). It has a wide geographical distribution, including tropical Africa, parts of Asia, the West Indies, the southern United States, and—in Europe—Greece, Sicily and Sardinia; but its range is not coextensive with malaria. Malarial parasites have occasionally been found in the blood. Some authorities believe it to be caused by the excessive use of quinine, taken to combat malaria. This theory has had the support of Koch, but it is not generally accepted. If it were correct, one would expect blackwater fever to be regularly prevalent in malarial countries and to be more or less coextensive with the use of quinine, which is not at all the case. It often resembles yellow fever, but the characteristic black vomit of yellow fever rarely occurs in blackwater fever, while the black urine from which the latter derives its name is equally rare in the former. According to the modern school of tropical parasitology, blackwater fever is neither a form of malaria nor produced by quinine, but a specific disease due to a protozoal parasite akin to that which causes the redwater fever of cattle.

BLACKWELL, THOMAS (1701-1757), Scottish classical scholar, was born at Aberdeen on the 4th of August 1701. He took the degree of M.A. at the Marischal College in 1718. He was appointed professor of Greek in 1725, and was principal of the institution from 1748 until his death on the 8th of March 1757. In 1733 his first work, _An Inquiry into the Life and Writings of Homer_, was published anonymously. It was reprinted in 1736, and followed (in 1747) by _Proofs of the Enquiry into Homer's Life and Writings_, a translation of the copious notes in foreign languages which had previously appeared. This work, intended to explain the causes of the superiority of Homer to all the poets who preceded or followed him, shows considerable research, and contains many curious and interesting details; but its want of method made Bentley say that, when he had gone through half of it, he had forgotten the beginning, and, when he had finished the reading of it, he had forgotten the whole. Blackwell's next work (also published anonymously in 1748) was _Letters Concerning Mythology_. In 1752 he took the degree of doctor of laws, and in the following year published the first volume of _Memoirs of the Court of Augustus_; the second volume appeared in 1755, the third in 1764 (prepared for the press, after Blackwell's death, by John Mills). This work shows considerable originality and erudition, but is even more unmethodical than his earlier writings and full of unnecessary digressions. Blackwell has been called the restorer of Greek literature in the north of Scotland; but his good qualities were somewhat spoiled by pomposity and affectation, which exposed him to ridicule.

BLACKWOOD, WILLIAM (1776-1834), Scottish publisher, founder of Blackwood's Magazine, was born of humble parentage at Edinburgh on the 20th of November 1776. At the age of fourteen he was apprenticed to a firm of booksellers in Edinburgh, and he followed his calling also in Glasgow and London for several years. Returning to Edinburgh in 1804, he opened a shop in South Bridge Street for the sale of old, rare and curious books. He undertook the Scottish agency for John Murray and other London publishers, and gradually drifted into publishing on his own account, removing in 1816 to Princes Street. On the 23rd of April 1817 was issued the first number of the _Edinburgh Magazine_, which only in its number, bore the name of Blackwood's as the leading part of the title. "Mag._

As this magazine soon came to be called, was the organ of the Scottish Tory party, and round it gathered a host of able writers. William Blackwood died on the 16th of September 1834, and was succeeded by his two sons, Alexander and Robert, who added a London branch to the firm. In 1845 Alexander Blackwood died, and shortly afterwards Robert.

A younger brother, John Blackwood (1818-1879), succeeded to the business; four years later he was joined by Major William Blackwood, who continued in the firm until his death in 1861. In 1862 the major's elder son, William Blackwood (b. 1836), was taken into partnership. John Blackwood was a man of strong personality and great business discernment; it was in the pages of his magazine that George Eliot's first stories, _Stops of Clerical Life_, appeared. He also inaugurated the "Ancient Classics for English readers" series. On his death Mr William Blackwood was left in sole control of the business. With him were associated his nephews, George William and J. H. Blackwood, sons of Major George Blackwood, who was killed at Maivan in 1880.

See _Annals of a Publishing House; William Blackwood and his Sons..._ (1897-1898), the first two volumes of which were written by Mrs Oliphant; the third, dealing with John Blackwood, by his daughter, Mrs Gerald Porter.

BLADDER (from A.S. _blæddre_, connected with _blæsan_, to blow, _cf._ Ger. _blase_), the membranous sac in animals which receives the urine secreted from the kidneys. The word is also used for any similar sac, such as the gall-bladder, the swim-bladder in fishes, or the small vesicle in various seaweeds.

BLADDER AND PROSTATE DISEASES. The urinary bladder in man (for the anatomy see _Urinary System_), being the temporary reservoir of the renal secretion, and, as such, containing the urine for longer or shorter periods, is liable to attack for many important affections. These are dealt with in the first part of this article. The diseases of the prostate are so intimately allied that they are best considered, as in the subsequent section, as part of the same subject.

_Diseases of the Bladder._

_Cystitis_, or inflammation of the bladder, which may be acute or chronic, is due to the invasion of the mucous lining by micro-organisms, which gain access either from the urethra, the kidneys or the blood-stream. It is easy to see how the diplococci of gonorrhoea may infect the bladder-membrane by direct extension of the inflammation, and how the bacilli which are swarming in the neighbouring bowels may find access to the urethra or bladder when the intervening tissues have been rendered penetrable by a wound or by inflammation. Sometimes, however, especially in the female, the germs from the large intestine enter the bladder by way of the vulva and the urethra. Any condition leading to disturbance of the function of the bladder, such as enlargement of the prostate, stricture of the urethra, stone, or injury, may cause cystitis by preparing the way for bacillary invasion. The bacilli of tuberculosis and of typhoid fever may set up cystitis by coming down into the bladder from the kidneys with the urine, or they reach it by the blood-stream, or invade it by the uterine. Another way of cystitis being set up is by the introduction of the germs of suppuration by a catheter or bougie sweeping them in from the urethra; or the instrument itself may be unsterilized and dirty and so may introduce them. It used formerly to be thought that wet or cold was enough to cause inflammation of the bladder, but the probability is that this is only by preparing the resistance of the lining membrane of the bladder, and preparing it for the invasion of the germs which were merely waiting for an opportunity. In the same way, gout or injury may lead to the lurking bacilli being enabled to effect their attack. But in every case disease-germs are the cause of the trouble, and they may be found in the urine. The first effect of inflammation is to render the bladder irritable, so that as soon as a few drops of urine have collected, the individual has intense or uncontrollable desire to micturate. The effort may be very painful and may be accompanied by bleeding from the overexpanded blood-vessels of the inflamed membrane. In addition to blood, pus is likely to be found in the urine, which by this time is alkaline and ammoniacal, and teeming with micro-organisms. As regards treatment, the patient should be at once sent to bed in a warm room, and should
sit several times a day in a very hot bath. When he has got back to bed, a fomentation under oil-silk, or some other water-proof material, should be placed over the lower part of the abdomen. The diet should be milk (diluted with hot or cold water), barley-water, and bread and butter; no alcoholic drink should be allowed. If the urine is acid, bicarbonate of soda may be given, or citrate of soda; if alkaline, urotropine—a derivative of formic aldehyde—may prove a useful urinary disinfectant. If the straining and distress are great, a suppository of ½ or 1 grain of morphia may be introduced into the rectum every two or three hours. The bowels must be kept freely open. If the urine is foul, the bladder should be frequently washed out by a soft catheter and two or three feet of india-rubber tubing with a funnel at the other end, weak and abundant hot lotions of Sanitas or Condy's fluid being used.

**Chronic cystitis** is the condition left when the acute symptoms have passed away, but it is liable at any moment to resume the acute condition. If the cystitis is very intractable, refusing to yield to hot irrigations, and to washings with nitrate of silver lotion, it may be advisable to open the bladder from the front, and to explore, treat, drain and rest it.

In **tuberculous cystitis** there is added to the symptoms the discharge of the bacilli of tuberculosis in the urine, and cystoscopic examination may reveal the presence of tubercles of the mucous membrane or even of ulceration. The patient is probably losing weight, and he may present foci of tuberculosis at the back of the testicle, the lung or kidney, or in a joint or bone, or in a lymphatic gland. Treatment is rebellious and unpromising. Washings and lotions give but temporary relief, and if the bladder is opened for rest, and for a more direct treatment, the germs of suppuration may enter, and, working in conjunction with the bacilli, may cause great havoc. Koch's tuberculin treatment should certainly be given a trial. This consists of the injection into the body of an emulsion of dead tubercle bacilli which have been sterilized by heat. As a result of this injection the blood sets to work to form an "opsonia"—a protective material which so modifies the disease-germs as to render them attractive to the white corpuscles of the patient's blood (phagocytes), which then seize upon and destroy them. Sir A. E. Wright has devised a delicate method of examination of the blood (the calculation of the opsonic index) which tells when the tuberculin injections should be resorted to and when withheld (see under "Genitourinary Tuberculosis").

**Calculi and Gravel.**—Uric acid is deposited from the urine either as small crystals resembling cayenne pepper, or else, in combination with soda and ammonia, as an amorphous "brick-dust" deposit, which, on cooling, leaves a red stain on the bottom of the vessel, soluble in hot water. These substances are derived from the disintegration of nitrogenized food taken in excess of demand, and from the breaking down of the human tissues. They occur therefore in fevers, in wasting diseases, and in the normal subject after excessive muscular exercises, especially if these exercises have been accompanied with so much perspiration that the excess of water from the blood has escaped by the skin rather than by the kidneys. The abundance of this deposit is in accordance with the amount of heat developed and work done in the body, and corresponds with the dust and ashes raked out of the fire-box of the locomotive after a long run. But supposing that the uric acid débris continues to be excessive, the risk of the formation of renal or vesical calculi becomes considerable, and it may be advisable to place the patient on a restricted nitrogenized diet, to induce him to drink large quantities of water, and to keep his bowels so loose with watery laxatives, such as Epson salts or sulphate of soda, that the waste products of his body are made to escape by the bowels rather than by the kidneys. In addition to the salts just mentioned, an occasional dose of blue pill will prove helpful. A course of treatment at Contrexéville or Carlsbad may be taken with advantage.

Alkaline urine is unable to hold the phosphates of ammonia and magnesium in solution, so they are deposited in abundance either in the kidney or bladder. If the voided urine is allowed to stand in a tall glass they sink to the bottom with pus and mucus in a cloudy deposit. To remedy this condition it is necessary to treat the cystitis with which the bacterial decomposition of the urine is associated. It may be that a calculus of acid urine, such as one of uric acid or oxalate of lime, has been resting in the bladder and keeping up incessant irritation, and that the repeated attacks of decomposition or suppuration have found their way to the mucous lining of the bladder from either the bowel, the urethra or the blood-stream; undergoing cultivation there they break up the urea into carbonate of ammonia and so render the urine alkaline. This alkaline urine deposits its phosphates, which light upon the calculus and encrust it with a mortuary shell, which may go on increasing in size until it may even fill the bladder. Sometimes the nucleus of a calculus is a chip of bone or a blood-clot, or some foreign substance which has been introduced into the bladder. Sooner or later the urine becomes alkaline and the calculus is encrusted with lime salts.

When urine contains a larger amount of chemical constituents than it can conveniently hold in solution, a certain quantity crystallizes out, and may be deposited in the kidney or in the bladder. If the crystals run together in the kidney the resulting concretion may either remain in that organ or may find its way into the bladder, where it may remain to form the nucleus of a larger body, or, especially in the case of females, it may, while still small, escape from the bladder during micturition.

In children, in whom there is a rapid disintegration of nitrogenized tissues, a uric acid calculus in escaping from the bladder may block the urethra and give rise to sudden retention of urine. On introducing a metal "sound," the surgeon may strike the stone, and if it happens to be near the bladder he may push it back and subsequently remove it by crushing. But if it has made its way some distance along the urethra, so that he can feel it from the outside, he should remove it by a clean incision.

A stone in the bladder worries the nerves of the mucous membrane, and, giving them the impression that the bladder contains much water, causes the desire and need for micturition to be constant. The irritation causes an excessive secretion of mucus, just as a piece of grit under the eyelids causes a constant running from the eye. So the urine, if allowed to stand, gives a copious deposit. During micturition the contracting bladder bruises its congested blood-vessels against the stone, so that towards the end of micturition blood appears in the urine. Lastly, cystitis occurs, and the urine contains fetid pus. A stone in the bladder gives rise to the condition of the penis, and it is apt suddenly to stop the flow of urine during micturition.

The association of any of these symptoms leads the surgeon to suspect the presence of a stone in the bladder, and he confirms his suspicions by introducing a slender steel rod, a "sound," by which he strikes and feels the stone. Further confirmation may be obtained by the help of the X-rays, or, in the adult, by using a cystoscope. In a child the stone may often be felt by a finger in the rectum, the front of the bladder being pressed by a hand on the lower part of the abdomen. The cystoscope is a straight, hollow metal tube about the size of a long cedar pencil, which the surgeon introduces into the adult bladder, which has already been filled with warm boracic lotion. Down the tube run two fine wires which control a minute electric lamp at the bladder end of the instrument. At that end also is a small glass window which prevents the fluid escaping by the tube, and also a prism; at the other end of the tube is an eye-piece. By the use of this slender speculum the practised surgeon can recognize the presence of tuberculous or tuberculous ulceration of the bladder, stone, or other foreign material, and he can introduce a steel probe through the uriniferous urethra entering the bladder by the openings of the ureters, and determine from which kidney blood or pus is coming.

The treatment of stone in the bladder is governed by various conditions. Speaking generally, the surgeon prefers to introduce a lithotrite and crush the stone into small fragments, and then to flush out the fragments by using a full-sized, hollow metal catheter and an india-rubber wash-bottle. Even in children this operation may generally be adopted with success, the stone being crushed to atoms and the fragments being washed out to
the last small chip. But if the stone is a very hard one (as are some of the oxalate of lime calculi), or if it is very large, or if the bladder or the prostate gland is in a state of advanced disease, or if the urethra is not roomy enough to admit instruments of adequate calibre, the crushing operation (lithotomy) must be deemed unsuitable, and the stone must be removed by a cutting operation (lithotomy).

**Lithotomy.**—Cutting for stone has been long practised; but up to the beginning of the 19th century it was performed only by a few men, who, bolder than their contemporaries, had specially worked at that operation and had attained celebrity as skilful lithotomists. Patients went long distances to be operated on by them, and certain of the older surgeons, as William Cheselden, performed a large number of operations with most excellent results. The operation was by an incision from the perineum, and is ordinarily spoken of as **lateral lithotomy.** It was splendidly designed, and gave good results, especially in children. But it is now a thing of the past, having almost entirely given place to the **high or supra-publie operation.**

In the high operation the patient, being duly prepared, is placed upon his back and the bladder is emptied by a small rubber lotson, and when the lotion returns quite clean a final injection is made until the bladder is felt rising above the pubes. Then the india-rubber tube is removed from the silver catheter by which the injection has been made, and the end of the catheter is plugged by a spigot. An incision is then made in the middle line of the abdomen over the bladder region. The incision must be kept as low as possible, so that the bladder may be reached below the peritoneum, which, higher up, gives it an external, serous coat. As the bladder is approached, a good many veins are seen to be in the way, some of which have to be wounded. The bladder-wall is recognized by its coarse network of pale muscular fibres, through which, on each side of the middle line, a strong suture is passed, so that when the bladder is opened and the lotion comes rushing out, the opening which has been made into the bladder may not sink into the depths of the pelvis. A finger introduced into the bladder makes out the exact size and position of the stone, or stones, and the removal is effected by forceps. Bleeding having ceased, the bladder-wound is partly or entirely closed by sutures and allowed to fall into the pelvis, the catheter having been removed. It is advisable to leave a drainage tube in the abdominal wound for a while, so that if urine leaks from the bladder-wound it may find a ready escape to the dressings.

**Litholapaxy.**—Lithotripsy consists of two parts—the crushing of the stone, and the removal of the detritus. The two stages are now carried out at one sitting, without an interval being allowed between them, as was formerly the practice, and the term **litholapaxy** designates this method. The patient, having been anaesthetized, 10 oz. of hot boracic lotion are injected, and the crushing instrument, the lithotrite, is then passed into the bladder. The lithotrite has two blades, a "male" and a "female," the latter fenestrated, the former solid with its surface notched. When the stone is fixed between the blades the screw is used, and great pressure is applied evenly, gradually and continuously to the stone. The lithotrite is made of very tough steel, so that hard stones may be crushed without danger of the instrument breaking or being rent. Care must be taken not to catch the bladder-wall with the lithotrite. This danger is avoided by raising the point of the lithotrite immediately after grasping the stone and before crushing. The stone breaks into two or more pieces, and these fragments must be crushed, one by one, until they are powdered fine enough to escape by the large evacuating catheter. If the stone be large and hard, half an hour or longer may be required to crush it sufficiently fine. When the surgeon fails to catch any more large pieces, the procedure is such that the stone has been thoroughly broken up. The lithotrite is then withdrawn and another piece, cut off by an "aspirator," which consists of a stiff elastic ball which is connected with a trap, into which fragments of stone fall so as not to pass out on the instrument being used at later periods in the operation. A large catheter, with the eye very near the end of the short curve, is passed into the bladder; the aspirator, full of boracic lotion, is attached to the catheter, and a few ounces of the fluid are expressed from the aspirator into the bladder by squeezing the rubber ball. When the pressure is taken off the ball, it dilates and draws the fluid out of the bladder, and with it some of the detritus, which falls into the trap. This is repeated until all the fragments have been removed. After the operation the patient sometimes suffers from discomfort. His urine should be drawn off by a soft catheter at regular intervals for a few days. If the pain be severe, it can generally be relieved by the application of crushing remedies. The patient must be kept in bed after the operation, and in cases where the stone has been large and the bladder irritable, the surgeon should insist on his remaining there for at least a week; in those cases which go on favourably the patients are soon able to perform their ordinary duties. Fatal terminations, however, do now and again occur from suppression of urine, the result of the old-standing kidney disease which so often complicates these cases.

To Brigade-Surgeon Lieutenant-Colonel Dennis Francis Keegan, of the Indian Medical Service, is due the fact that the operation of crushing was the first to remove all fragments of a vesical calculus as is well suited for boys as for men. In entire opposition to long-standing European prejudices, Keegan's operation is now firmly and permanently established. The old operation (Cheselden's) of cutting a stone out through the bottom of a boy's bladder is now seldom resorted to, and if a stone in a boy is found too large or too hard to lend itself to the crushing operation, it is removed by a vertical incision through the lower part of the anterior wall of the abdomen, as in the case of a female. In the case of a stone which is small, the operation in a boy a small lithotrite has, of course, to be used, and it must be of the very best English make. The operation has to be done with the utmost gentleness and thoroughness, not a particle of the crushed stone being left in the bladder, since otherwise the piece left becomes the nucleus of a fresh stone and the trouble recurs.

The treatment of vesical calculi by other means than operative surgery is of little value. Attempts have been made to dissolve them by internal remedies, or by the injection of chemical agents into the bladder; but, although such methods have for a time been apparently successful, they have invariably been found worthless for removing calculi once actually formed. Nevertheless, much can be done towards **preventing** the formation of calculi in those who have a tendency to their formation, by attention to diet, by taking proper exercise, and by the internal administration of drugs.

**Rupture of the bladder** may be caused by a kick or blow over the upper part of the abdomen, by a sudden strain, or it may be a complication of fracture of the pelvis. If the rupture is in that part of the bladder which is uncovered by the peritoneum, the extravasated urine may be cut down upon and let out with good prospect of success; but if the rupture is in the upper or hinder part of the bladder the urine is let loose into the general peritoneal cavity and sets up peritonitis, which is more than likely to prove fatal. If the surgeon knows that the bladder is ruptured he should operate at once in order to provide escape for the urine, and also to sew up the rent. If the possibility of the bladder being ruptured be even suspected, the surgeon should pass a catheter. Perhaps he draws out a few ounces or two of blood-stained urine. This makes him doubly suspicious, so he injects into the bladder five, eight or ten ounces of warm boracic lotion, and, leaving it there for a few minutes, he measures the amount which he is able afterwards to withdraw. If he finds that a certain amount is lost he is assured that a leakage has taken place and he at once proceeds to operate. If only the diagnosis is made promptly, and the operation is at once undertaken, there is not unfrequently an operation or so back nearly all the cases of rupture of bladder ended fatally.

**Villous disease** of the bladder is innocent; that is to say, it does not spread to the neighbouring structures or implicate the lymphatic glands. The villi are slender, long, branched, and with the root springing from the floor of the bladder, float in the urine like seaweed. They are freely supplied with blood-vessels, so that when a piece of the villous tissue is detached in the course of a hemorrhage, it is a painless haemorrhage is one of the characteristic features of the disease, and when fragments of the "seaweed" are found in the urine the diagnosis is correct. If the bladder is opened from the front, as already described, the villi may be nipped off by special forceps and the disease permanently cured.
Malignant disease of the bladder is almost always the way of some form of cancer known as epithelium. It springs, as a general rule, from the mucous membrane of the floor near the opening of one of the ureters, and, worrying the sensory nerves, causes irritation of the bladder and prelude of ureteral colic. When the cancerous germs reach the bladder, either from the urethra, the bowel, the kidney, or the blood-stream, and cystitis sets in. When ulceration has taken place, blood occurs in the urine, and the patient—generally beyond middle life—suffers from frequent and urgent micturition. The bladder becomes greatly enlarged and rigid, and of course unable to retain the urine. It will also be noticed that the indwelling catheter may give great dislike to the patient and the treatment as a whole. When the bladder is distended, it is necessary to evacuate it as soon as possible. If there is no obstruction to the flow of urine, the retention being due to the persistence of the ureteral colic, it may be safely drained off. But when there is an obstruction which cannot be overcome, aspiration has to be resorted to, the needle of the aspirator being pushed through the abdominal wall into the bladder. The point of puncture is the abdominal wall in the middle line a few inches above the symphysis pubis. The bladder may be emptied in this way very many times in the same person with only good result.

Diseases of the Prostate Gland.

The prostate gland may become acutely inflamed as the result of the backward extension of gonorrhoeal inflammation of the urethra; it may also be attacked by the germs of ordinary suppuration as well as by the bacilli of tuberculosis. A sudden enlargement of a large gland lying against the outlets of the bladder and the bowel renders micturition difficult, painful, and impossible, and interferes with defaecation. Pressure of the seat of the chair upon the perineum also causes distress, so that the sufferer is generally forced to adopt the semi-recumbent position. If it is not removed it should be incised from the perineum; if allowed to run its course it may burst into the bladder, the urethra or the rectum, and set up serious complication. The treatment of prostatitis (inflammation of the prostate) consists in rest in bed, sitt-baths and fomentations. If retention of urine takes place a soft catheter must be passed. In the early stage of an acute attack a dozen leeches upon the perineum may do good. The bowels must be kept freely open, and from time to time, as the pain demands, a morphia suppository may be introduced into the bowel.

Chronic prostatitis is a legacy from a recent or long-past attack of gonorrhoea. The enlargement gives rise to a feeling of weight and fulness in the perineum, irritability of the bladder, and a gleet or urethral discharge. Manual examination reveals the presence of a large, hard mass in front of the bladder, and in the mass there can often be felt softish or tender areas which seem to threaten abscesses. On urine being passed into a glass, a cloudiness is seen, and material like pieces of vermicelli or broken threads may be noticed. These are the castings from the long tubular glands, and are characteristic of chronic inflammation of the prostate. The occasional passage of a large metal bougie, the use of weak lotions of nitrate of silver, the administration of quinine and iron, and the application of blisters to the perineum, may be tried as circumstances direct. The patient should lead a quiet life, free from sexual excitement. Horse-exercise, cycle-riding, rough games and alcohol should be avoided.

Enlargement of the prostate exists in a considerable proportion of persons after the age of forty. The prostate may be enlarged and the condition of the bladder is carefully important to prevent over-distension by the urine being retained too long, and at the same time to treat by appropriate means the cause which has produced or is keeping up the condition.

Incontinence of urine may occur in the adult or in the child, but is due to widely different causes in the two cases. In the child it may be simply a bad habit, the child not having been properly trained; and is usually treated by punishment, by means of the micturition-centre, so that the child passes its water unwittingly, especially during the night. In adults it is not so much a condition of incontinence in the sense of water being passed against the will, but a condition of the organ that the bladder is not entirely full, the outflow being from a too full reservoir. It is usually caused by an obstruction external to the bladder, e.g., enlarged prostatic, stricture, calculus, or stone in the urethra; and is known as super-added incontinence. In the child an attempt must be made to improve the tone of the micturition-centre by the use of belladonna or strychnine internally, and of a blister or faradism externally over the lumbar region; whilst in adults it is necessary to avoid any water at stated times and regular intervals. In the adult the cause which produces the over-distension must be removed if possible; but, as a rule, the patient has to be provided with a catheter, which he can pass before the bladder has filled to overflowing. A soft flexible catheter should be given in preference to a rigid or semi-rigid one. The best form is the rubber catheter, and he should be taught not to keep it in if possible. In children incontinence of urine means irritability; in adults it means overflow.

The condition termed by Sir James Paget stammering micturition is analogous to speech stammering, and occurs in those who are nervous and easily put out. It would seem to be due to the spasticity of the bladder not relaxing synchronously with the contraction of the detrusor, and is sometimes caused by external irritation, such as preputial adhesions. Occasionally not a drop of urine can be passed, or a little passes and then a sudden stoppage occurs; or the patient strains the worse he becomes, until at last there is complete retention. The trouble can usually be cured by the removal of irritating causes, and in these cases, as well as in those in which no such cause can be discovered, care should be taken to avoid those articles of diet which have caused the possibility of a patient’s being put in a state of stammering retention.

If at any time he should fail to perform the act of micturition, he ought not to strain, but should quietly wait for a little before making any further effort. Regularity in the times of making water is of much importance.

Retention of urine may occur in paralysis of the bladder, or in conditions where the patient is suffering from an illness which blunts the nervous sensibility, such as apoplexy, concussion of the brain, or exhaustion of the liver. In the first case the effluvium of urine in the bladder continues to pass to the kidneys and out through the ureters; in the second case it passes to the cavity anterior to the bladder, as in stricture of the urethra or enlargement of the prostate. The distended bladder can be felt as a rounded swelling above the pubes, and perhaps reaching to the level of the upper edge of the symphysis pubis. When the bladder is distended, it is necessary to evacuate it as soon as possible. If there is no obstruction to the flow of urine, the retention being due to the persistence of the ureteral colic, it may be safely drained off. But when there is an obstruction which cannot be overcome, aspiration has to be resorted to, the needle of the aspirator being pushed through the abdominal wall into the bladder. The point of puncture is the abdominal wall in the middle line a few inches above the symphysis pubis. The bladder may be emptied in this way very many times in the same person with only good result.
enlarged prostate, when by this method of manual examination the amount of increase appears quite unimportant. The explanation is that the prostate is chiefly composed of a mass of minute cellular tissue which protrudes like a tongue into the water-way. Robert M'Gill of Leeds was the first surgeon to remove by a supra-pubic operation this tongue-like process of new prostatic growth. Attempts had sometimes been made to get rid of this interference with the bladder being emptied. To do this, he asks the patient to pass as much water as he is able, and then with due precautions introduces a soft catheter and measures the amount of urine which he thus draws off—that is, his regular withdrawal serious trouble is almost certain to ensue. The passing of a large catheter may have the effect of so opening up the water-way that, at any rate for a time, the irritability of the bladder may cease, in which case the patient may be instructed in the art of passing a catheter for himself. Or the surgeon may find that in addition to the regular passing of a large catheter an occasional washing-out of the bladder with hot boracic lotion is all that is needed in the way of active treatment. At the same time, however, the patient is placed upon a plain and wholesome diet with little or no alcohol, and he is instructed to lead in every respect a regular and quiet life. To many men with enlarged prostate the passing of an ounce or more of urine morning and night is a great hardship, while to others the idea of leaving what is called a "catheter life" appears intolerable, or, having for a time been patiently carried out, is found not only not severely trying but greatly disappointing.

Lastly, in other persons the passing of the catheter is attended with so much difficulty, distress or bleeding, that something more helpful and effectual is urgently called for.

Operative Treatment.—It has long been known that large tumours of the uterus sometimes dwindle if the ovaries are removed by operation, and Professor William White of Philadelphia thought that prostatic growths might be similarly influenced by the removal of the testicles. Beyond question considerable improvement has followed this operation in cases of enlargement of the prostate, especially where the enlargement seemed to be general, soft and vascular. A similar though perhaps a slower effect is produced when the duct of the testis, the vas deferens, is divided on each side of the body. If there is no great urgency about the case this treatment may well be tried, the bladder being all the while duly emptied by catheter and washed by irrigation. But if the case is urgent, there being danger of an atonic bladder or of bleeding with the passing of the catheter, the bladder being excessively irritable and the urine foul, a more radical measure is needed. The best operation is that upon the lines laid down by Robert M'Gill, who opened the bladder through the anterior abdominal wall and removed that part of the prostate gland which was blocking the water-way. M'Gill's operation was improved upon by Eugene Fuller of New York, who, in 1853, published a full account of his procedure.1 Having opened the bladder from the front (as in supra-pubic lithotomy), he introduced his left index finger into the rectum and thrust the prostate gland forward from its firmly coupled position in front of the bladder. With the nail of that finger, or with the end of a pair of scissors, he made a rent in the mucous membrane of the bladder and the capsule of the gland, and then shelled out the mass of new tissue which had caused the prostatic enlargement. This operation is called "prostatectomy," which means the removal of the prostate gland. The prostate gland, however, is not removed, but only a muscular and glandular mass (adenoma), which, growing within the prostate capsule, encreases the urine-stream and causes the original gland tissue to deteriorate in existence. Following on the lines of M'Gill and Fuller, P. J. Freyer has done excellent work in England towards placing this operation upon a sound basis.

Subsequently to the operation the bladder enjoys complete and needful rest, and the kidneys, which previously were in a condition of perpetual disturbance, improve in working power. The wound in the bladder and in the abdominal wall gradually closes; the function of the bladder returns, and the patient is soon able to go back to his usual occupation in greatly improved health and vigour. The operation is, necessarily, a serious one, and the age of the patient, the condition of his bladder, of his kidneys, and of his blood-vessels, require to be taken into consideration; still, the operation gives an excellent account of itself in statistics, and if a practical surgeon advises a patient to accept its risks his counsel may well be followed.

Malignant disease of the prostate is distinguished from simple glandular enlargement by the rapidity of its growth, by the freeness of the bleeding which is associated with the introduction of a catheter, and by the marked wasting which the individual undergoes. Unfortunately, by the time that the cancerous nature of the disease is definitely recognized, the prospect of relief being afforded by operation is small.

BLADDER-WORT, the name given to a submerged water plant, *Utricularia vulgaris*, with finely divided leaves upon which are borne small bladders provided with trap-door entrances which open only inwards. Small crustaceans and other aquatic animals push their way into the bladders and are unable to escape. The products of the decay of the organisms thus captured are absorbed into the plant by star-shaped hairs which line the interior of the bladder. In this way the plant is supplied with nitrogenous food from the animal kingdom. Bladder-wort bears small, yellow, two-lipped flowers on a stem which rises above the surface of the water. It is found in pools and ditches in the British Isles, and is widely distributed in the north temperate zone. The genus contains about two hundred species in tropical and temperate regions.

BLADES, WILLIAM (1824-1890), English printer and bibliographer, was born at Clapham, London, on the 5th of December 1824. In 1840 he was apprenticed to his father's printing business in London, being subsequently taken into partnership. The firm was afterwards known as Blades, East & Blades. His interest in printing led him to make a study of the volumes produced by Caxton's press, and of the early history of printing in England. His *Life and Typographic of William Caxton, England's First Printer*, was published in 1861-1863, and the conclusions which he set forth were arrived at by a careful examination of types in the early books, each class of type being traced from its first appearance to the time when it was dropped, and when it passed out of Caxton's hands. Some 450 volumes from the Caxton Press were thus carefully compared and classified in chronological order. In 1877 Blades took an active part in organizing the Caxton celebration, and strongly supported the foundation of the Library Association. He was a keen collector of old books, prints and medals. His publications relate chiefly to the early history of printing, the *Enemies of Books*, his most popular work, being produced in 1881. He died at Sutton in Surrey on the 27th of April 1890.

BLAENAVON, or BLAENAFON, an urban district in the northern parliamentary division of Monmouthshire, England, 15 m. N. by W. of Newport, on the Great Western, London & North Western and Rhymney railways. Pop. (1901) 10,869. It lies in the uppermost part of the Afon Lwyd valley, at an elevation exceeding 1000 ft., in a wild and mountainous district, on the eastern
edge of the great coal and iron mining region of Glamorganshire and Monmouthshire. There are very extensive iron and steel works, with blast furnaces and rolling mills in the district, which employ the large industrial population.

BLAGOVYESHCHEANSK, a town of East Siberia, chief town of the Amur government, on the left bank of the Amur, near its confluence with the Zeya in 50° 1' N. lat. and 127° 38' E. long., 610 m. by river above Khabarovsk. Founded in 1836, the town had, in 1900, 37,368 inhabitants, and is the seat of the bishop of Amur and Kamchatka. There are steam flour-mills and iron works. It is a centre for tea exported to Russia, cattle brought from Transbaikalia and Mongolia for the Amur, and for grain.

BLAIKIE, WILLIAM GARDEN (1820-1899), Scottish divine, was born on the 5th of February 1820, at Aberdeen, where his father had been the first provost of the reformed corporation. After studying at the Marischal College, where Alexander Bain and David Masson were among his contemporaries, he went in 1839 to Edinburgh to complete his theological course under Thomas Chalmers. In 1842 he was presented to the living of Drumblay by Lord Kintore, with whose family he was connected. The Disruption controversy reached its climax immediately afterwards, and Blaikie, whose sympathies were entirely with Chalmers, was one of the 474 ministers who signed the deed of demission and gave up their livings. He was Free Church minister at Pilrig, between Edinburgh and Leith, from 1844 to 1868. Keenly interested in questions of social reform, his first publication was a pamphlet, which was afterwards enlarged into a book called Better Days for Working People. It received public commendation from Lord Brougham, and 60,000 copies were sold. He formed an association for providing better homes for working people, and the Pilrig Model Buildings were erected. He also undertook the editorship of the Free Church Magazine, and that of the North British Review, which he carried on until 1863. In 1864 he was asked to undertake the Scottish editorship of the Sunday Magazine, and for this magazine much of his most characteristic literary work was done, especially in the editorial notes, then a new feature in magazine literature.

In 1868 Blaikie was called to the chair of apologetics and pastoral theology at New College, Edinburgh. In dealing with the latter subject he was seen at his very best. He had wide experience, a comprehensive grasp of facts, abundant sympathy, an extensive knowledge of men, and a great capacity for teaching. In 1870 he was one of two representatives chosen from the Free Church of Scotland to attend the united general assembly of the Presbyterian churches of the United States. He prolonged his visit to make a thorough acquaintance with American Presbyterianism, and this, followed by a similar tour in Europe, fitted him to become the real founder of the Presbyterian Alliance. Much of his strength in the later years of life was given to this work. In 1892 he was elected to the chairmanship of the general assembly, the last of the moderators who had entered the church before the disruption. In 1897 he resigned his professorship, and died on the 11th of June 1899.

Blaikie was an ardent philanthropist, and an active and intelligent temperance reformer, in days when this was far from easy. He raised £14,000 for the relief of the Waldensian churches. Although he took an active part in the affairs of his denomination, he was not a mere ecclesiastic. He had a keen eye for the evidences of spiritual growth or decline, and emphasized the need of maintaining a high level of spiritual life. He welcomed Moody to Scotland, and the evangelist made his headquarters with him during his first visit. His best books are The Work of the Ministry—A Manual of Homiletic and Pastoral Theology (1873); The Books of Samuel in the Expositor's Bible Series (2 vols.); The Personal Life of David Livingstone (1880); After Fifty Years (1893), an account of the Disruption Movement in the form of letters of a grandfather; Thomas Chalmers (1896).

BLAINE, JAMES GILLESPIE (1830-1893), American statesman, was born in West Brownsville, Pennsylvania, on the 31st January 1830, of sturdy Scottish-Irish stock on the side of his father. He was the great-grandson of Colonel Ephraim Blaine (1741-1804), who during the War of Independence served in the American army, from 1778 to 1782 as commissary-general of the Northern Department. With many early evidences of literary capacity and political aptitude, J. G. Blaine graduated at Washington College in Washington, Pennsylvania, in 1847, and subsequently taught successively in the Military Institute, Georgetown, Kentucky, and in the Institution for the Blind at Philadelphia. During this period, also, he studied law. Settling in Augusta, Maine, in 1854, he became editor of the Kennebec Journal, and subsequently of the Portland Advertiser. But his editorial work was soon abandoned for a more active public career. He was elected to the lower house of the state legislature in 1858, and served four years, the last two as speaker. He also became chairman of the Republican state committee in 1859, and for more than twenty years personally directed every campaign of his party.

In 1862 he was elected to Congress, serving in the House thirteen years (December 1863 to December 1876), followed by a little over four years in the Senate. He was chosen speaker of the House in 1869 and served three terms. The House was the fit arena for his political and parliamentary ability. He was a ready and powerful debater, full of resource, and dexterous in controversy. The tempestuous politics of the war and reconstruction period suited his aggressive nature and constructive talent. The measures for the rehabilitation of the states that had seceded from the Union occupied the chief attention of Congress for several years, and Blaine bore a leading part in framing and discussing them. The primary question related to the basis of representation upon which they should be restored to their full rank in the political system. A powerful section contended that the basis should be the body of legal voters, on the ground that the South could not then secure an increment of political power on account of the emancipated blacks unless these blacks were admitted to political rights. Blaine, on the other hand, contended that representation should be based on population instead of voters, as being fairer to the North, where the ratio of voters varied widely, and he insisted that it should be safeguarded by security for impartial suffrage. This view prevailed, and the Fourteenth Amendment to the Constitution was substantially Blaine's proposition. In the same spirit he opposed a scheme of military governments for the southern states, unless associated with a plan by which, upon the acceptance of prescribed conditions, they could release themselves from military rule and resume civil government. He was the first in Congress to oppose the claim, which gained momentary and widespread favour in 1867, that the public debt, pledged in coin, should be paid in greenbacks. The protection of naturalized citizens who, on return to their native land, were subject to prosecution on charges of disloyalty, enlisted his active interest and support, and the agitation, in which he was conspicuous, led to the treaty of 1870 between the United States and Great Britain, which placed adopted and native citizens on the same footing. As the presidential election of 1876 approached, Blaine was clearly the popular favourite of his party. His chance for securing the nomination, however, was materially lessened by persistent charges which were brought against him by the Democrats that as a member of Congress he had been guilty of corruption in his relations with the Little Rock & Fort Smith and the Northern Pacific railways.1 By the majority of Republicans, at least, he was considered to have cleared himself completely, and in the Republican national convention he missed by only twenty-eight votes the nomination for president, being finally beaten by a combination of the supporters of all the other candidates. Thereupon he entered the Senate, where his activity was unabated. Currency legislation was especially prominent. Blaine, who had previously opposed greenback inflation now resisted depreciated silver coinage. He was the earnest champion of the advancement of American shipping, and advocated liberal subsidies, insisting that the policy of protection should be applied on sea as well as on land. The Republican national

1 This attack led to a dramatic scene in the House, in which Blaine fervidly asseverated his denial.
convention of 1880, divided between the two nearly equal forces of Blaine and General U. S. Grant—John Sherman of Ohio also having a considerable following—struggled through thirty-six ballots, when the friends of Blaine, combining with those of Sherman, succeeded in nominating General James A. Garfield. In the new administration Blaine became secretary of state, but, owing to the assassination of President Garfield and the reorganization of the cabinet by President Chester A. Arthur, he held the office only until December 1881. His brief service was distinguished by several notable steps. In order to promote the friendly understanding and co-operation of the nations on the American continents he projected a Pan-American congress, which, after being arranged for, was frustrated by his retirement. He also sought to secure a modification of the Clayton-Bulwer treaty, and in an extended correspondence with the British government strongly asserted the policy of an exclusive American control of any isthmian canal which might be built to connect the Atlantic and Pacific oceans.

With undiminished hold on the imagination and devotion of his followers he was nominated for president in 1884. After a heated canvass, in which he made a series of brilliant speeches, he was beaten by a narrow margin in New York. By many, including Blaine himself, the defeat was attributed to the effect of a phrase, "Romu, Romanism and Rebellion," used by a clergyman, Rev. Samuel D. Burchard (1812–1891), on the 29th of October 1884, in Blaine's presence, to characterize what, in his opinion, the Democratic party stood for. The phrase was not Blaine's, but his opponents made use of it to misrepresent his attitude toward the Roman Catholics, large numbers of whom are supposed, in consequence, to have withdrawn their support. Refusing to be a presidential candidate in 1888, he became secretary of state under President Harrison, and resumed his work which had been interrupted nearly eight years before. The Pan-American congress, then projected, now met in Washington, and Blaine, as its master spirit, presided over and guided its deliberation through its session of five months. Its most important conclusions were for reciprocity in trade, a continental railway and compulsory arbitration in international complications. Shaping the tariff legislation for this policy, Blaine negotiated a large number of reciprocity treaties which augmented the commerce of his country. He upheld American rights in Samoa, pursued a vigorous diplomacy with Italy over the lynching of eleven Italians, all except three of them American naturalized citizens, in New Orleans on the 14th of May 1891, held a firm attitude during the strained relations between the United States and Chile (growing largely out of the killing and wounding of American sailors of the U.S. ship "Baltimore" by Chileans in Valparaiso on the 16th of October 1891), and carried on with Great Britain a resolute controversy over the seal fisheries of Bering Sea,—a difference afterwards settled by arbitration. He resigned on the 4th of June 1892, on the eve of the meeting of the Republican national convention, wherein his name was ineffectually used, and he died at Washington, D.C., on the 27th of January 1893.

During his later years of leisure he wrote Twenty Years of Congress (1854–1886), a brilliant historical work in two volumes. Of great value is his "With remarkable knowledge of the men and history of his country, and of the literary memory, his masterful talent for politics and state-craft, together with his captivating manner and engaging personality, gave him, for nearly two decades, an unrivalled hold upon the fealty and affection of his party."

See the Biography of James G. Blaine (Norwich, Conn., 1895) by Mary Abigail Dodge ("Gail Hamilton"), and, in the "American Statesmen," the life of G. Blaine (Nassau, 1905) by C. E. S. Taunton; also Mrs Blaine's Letters (1908).

BLAINVILLE, HENRI MARIE DUCROTAY DE (1777–1859). French naturalist, was born at Arques, near Dieppe, on the 12th of September 1777. About 1796 he went to Paris to study painting, but he ultimately devoted himself to natural history, and attracted the attention of Baron Cuvier, for whom he occasionally lectured at the Collège de France and at the Athenaeum. In 1812 he was aided by Cuvier to obtain the chair of anatomy and zoology in the Faculty of Sciences at Paris, but subsequently an estrangement grew up between the two men and ended in open enmity. In 1825 Blainville was admitted a member of the Academy of Sciences; and in 1830 he was appointed to succeed J. B. Lamarck in the chair of natural history at the museum. Two years later, on the death of Cuvier, he obtained the chair of comparative anatomy, which he continued to occupy for the space of eighteen years, proving himself a worthy successor to his great teacher. He died at Paris on the 1st of May 1850. Besides many separate memoirs, he was the author of Fodromre d'une nouvelle distribution méthodique du règne animal (1810); Ostographie ou description iconographique comparée du squelette, &c. (1839–1864); Faune française (1821–1830); Cours de physiologie générale et comparée (1853); Manuel de malacologie et de conchyliologie (1852–1857); L'histoire des sciences de l'organisme (1845).

BLAIR, FRANCIS PRESTON (1791–1876), American journalist and politician, was born at Abingdon, Virginia, on the 12th of April 1791. He removed to Kentucky, graduated at Transylvania University in 1811, took to journalism, and was a contributor to Amos Kendall's paper, the Argus, at Frankfort. In 1830, having become an ardent follower of Andrew Jackson, he was made editor of the Washington Globe, the recognized organ of the Jackson party. In this capacity, and as a member of Jackson's "Kitchen Cabinet," he long exerted a powerful influence; the Globe was the administration organ until 1841, and the chief Democratic organ until 1845; Blair ceased to be its editor in 1849. In 1848 he actively supported Martin Van Buren, the Free Soil candidate, for the presidency, and in 1852 he supported Franklin Pierce, but soon afterwards helped to organize the new Republican party, and presided at its preliminary convention at Pittsburg, Pennsylvania, in February 1856. He was influential in securing the nomination of John C. Frémont at the June convention (1856), and of Abraham Lincoln in 1860. After Lincoln's re-election in 1864 Blair thought that his former close personal relations with the Confederate leaders might aid in bringing about a cessation of hostilities, and with Lincoln's consent went unofficially to Richmond and induced President Jefferson Davis to appoint commissioners to confer with representatives of the United States. This resulted in the futile "Hampton Roads Conference" of the 3rd of February 1865 (see LINCOLN, ABRAHAM). After the Civil War Blair became a supporter of President Johnson's reconstruction policy, and eventually rejoined the Democratic party. He died at Silver Spring, Maryland, on the 18th of October 1876.

His son, MONTGOMERY BLAIR (1813–1883), politician and lawyer, was born in Franklin County, Kentucky, on the 14th of May 1841. He graduated at West Point in 1861, but after a year's service in the Seminole War, left the army, studied law, and began practice at St Louis, Missouri. After serving as United States district attorney (1839–1843), as mayor of St Louis (1842–1843), and as judge of the court of common pleas (1843–1849), he removed to Maryland (1852), and devoted himself to law practice principally in the Federal supreme court. He was United States solicitor in the court of claims from 1855 until 1858, and was associated with George T. Curtis as counsel in the Dred Scott case in 1857. In 1860 he took an active part in the presidential campaign in behalf of Lincoln, in whose cabinet he was postmaster-general from 1861 until September 1864, when he resigned as a result of the hostility of the Radical Republican faction, who stipulated that Blair's retirement should follow the withdrawal of Frémont's name as a candidate for the presidential nomination in that year. Under his administration such reforms and improvements as the establishment of free city delivery, the adoption of a money order system, and the use of railway mail cars were instituted—the last having been suggested by George B. Armstrong (d. 1871), of Chicago, who from 1869 until his death was general superintendent of the United States railway mail service. Differing from the Republican party on the reconstruction policy, Blair gave his adherence to the Democratic party after the Civil
BLAIR, H.—BLAIR ATHOLL

War. He died at Silver Spring, Maryland, on the 27th of July 1835.

Another son, FRANCIS PRESTON BLAIR, jun. (1821-1879), soldier and political leader, was born at Lexington, Kentucky, on the 10th of February 1821. After graduating at Princeton in 1841 he practised law in St Louis, and later served in the Mexican War. He was ardently opposed to the extension of slavery and supported Martin Van Buren, the Free Soil candidate for the presidency in 1848. He served from 1852 to 1856 in the Missouri legislature as a Free Soil Democrat, in 1856 joined the Republican party, and in 1857-1860 and 1861-1862 was a member of Congress, where he proved an able debater. Immediately after the South Carolina campaign of 1861, Blair thought that the southern leaders were planning to carry Missouri into the movement, began active efforts to prevent it and personally organized and equipped a secret body of 1000 men to be ready for the emergency. When hostilities became inevitable, acting in conjunction with Captain (later General) Nathaniel Lyon, he suddenly transferred the arms in the Federal arsenal at St Louis to Alton, Illinois, and a few days later (May 10, 1861) surrounded and captured a force of state guards which had been stationed at Camp Jackson in the suburbs of St Louis with the intention of seizing the arsenal. The resulting Federal capture of Missouri was a decisive initial advantage in Missouri. Blair was pro- moted brigadier-general of volunteers in August 1862 and a major-general in November 1862. In Congress as chairman of the important military affairs committee his services were of the greatest value. He commanded a division in the Vicksburg campaign and in the fighting about Chattanooga, and was one of Sherman's corps commanders in the final campaigns in Georgia and the Carolinas. In 1866 like his father and brother he opposed the Congressional reconstruction policy, and on that issue left the Republican party. In 1868 he was the Demo- cratic candidate for vice-president on the ticket with Horatio Seymour. In 1871-1873 he was a United States senator from Missouri. He died in St Louis, on the 8th of July 1875.

BLAIR, HUGH (1718-1800), Scottish Presbyterian divine, was born on the 7th of April 1718, at Edinburgh, where his father was a merchant. Entering the university in 1730 he graduated M.A. in 1739; his thesis, De Fundamentis et Obliga- tione Legis Naturae, contains an outline of the moral principles afterwards unfolded in his sermons. He was licensed to preach in 1741, and a few months later the earl of Leven, hearing of his eloquence, presented him to the parish of Collies Fife. In 1743 he was elected to the second charge of the Canongate church, Edinburgh, where he ministered until removed to Lady Yester's, one of the city churches, in 1754. In 1757 the university of St Andrews conferred on him the degree of D.D., and in the following year he was promoted to the High Church, Edinburgh, the most important charge in Scotland. In 1759 he began, under the patronage of Lord Kames, to deliver a course of lectures on composition, the success of which led to the foundation of a chair of rhetoric and belles lettres in the Edinburgh University. To this chair he was appointed in 1765, with a salary of £70 a year. Having long taken interest in the Celtic poetry of the Highlands, he published in 1763 a laudatory Dissertation on Macpherson's Ossian, the authenticity of which he maintained. In 1777 the first volume of his Sermons appeared. It was succeeded by four other volumes, all of which met with the greatest success. Samuel Johnson praised them warmly, and they were translated into almost every language of Europe. In 1780 George III. conferred upon Blair a pension of £200 a year. In 1783 he retired from his professorship and published his Lectures on Rhetoric, which have been frequently reprinted. He died on the 27th of December 1800. Blair belonged to the "moderate" or latitudinarian party, and his Sermons have been criticized as wanting in doctrinal definiteness. His works display little originality, but are written in a flowing and elaborate style. He is remembered chiefly by the place he fills in the literature of his time. Blair's Sermons is a typical religious book of the period that preceded the Anglican revival.

See J. Hall, Account of Life and Writings of Hugh Blair (1807).

BLAIR, JAMES (1656-1743), American divine and educa- tionalist, was born in Scotland, probably at Edinburgh, in 1656. He graduated M.A. at Edinburgh. Unusually beneficed in the Episcopal Church in Scotland, and for a time was rector of Cranston Parish in the diocese of Edinburgh. In 1682 he left Scotland for England, and three years later was sent by the bishop of London, Henry Compton, as a missionary to Virginia. He soon gained great influence over the colonists both in ecclesiastical and in civil affairs, and, according to Prof. Moses Colt Tyler, "probably no other man in the colonial time did so much for the intellectual life of Virginia." He was the minister of Henrico parish from 1685 until 1694, of the Jamestown church from 1695-1702, and of the church in Williamsburg from 1710 until his death. From 1689 until his death he was the commissary of the bishop of London for Virginia, the highest ecclesiastical position in the colony, his duties consisting "in visiting the parishes, correcting the lives of the clergy, and keeping them orderly." In 1693, by the appointment of King William III., he became a member of the council of Virginia, of which he was for many years the president. Largely because of charges brought against them by Blair, Governor Sir Edmond Andros and Lieutenant-Governor Francis Nicholson, and Lieutenant- Governor Alexander Spotswood were removed in 1698, 1703 and 1722 respectively. Blair's greatest service to the colony was rendered as the founder, and the president from 1693 until his death, of the College of William and Mary, for which he himself secured a charter in England. "Thus, James Blair may be called," says Tyler, "the creator of the healthiest and most extensive intellectual influence that was felt in the Southern group of colonies before the Revolution." He died on the 18th of April 1743, and was buried at Jamestown, Va. He published a collection of 117 discourses under the title Our Saviour's Divine Sermon on the Mount (4 vols., 1722; second edition, 1733), and, in collaboration with Henry Hartwell and Edward Chilton, a work entitled The Present State of Virginia and the College (1727; written in 1693), probably the best account of the Virginia of that time.

See Daniel E. Molley's Life of Commissary James Blair (Baltimore, 1901; series xix. No. 15, of the Johns Hopkins University Studies in Historical and Political Science), and, for a short sketch and an estimate, M. C. Tyler's A History of American Literature, 1607-1795 (New York, 1878).

BLAIR, ROBERT (1669-1740), Scottish poet, eldest son of the Rev. Robert Blair, one of the king's chaplains, was born at Edinburgh in 1669. He was educated at the university of Edinburgh and in Holland, and in 1731 was appointed to the living of Athelstaneford in East Lothian. He married in 1738 Isabella, daughter of Professor William Law. The possession of a small fortune gave him leisure for his favourite pursuits, gardening and the study of English poets. He died at Athelstaneford on the 4th of February 1746. His only considerable work, The Grave (1743), is a poem written in blank verse of great vigour and freshness, and is much less conventional than its gloomy subject might lead one to expect. Its religious subject no doubt contributed to its great popularity, especially in Scotland; but the whole it attained was justified by its picturesque imagery and occasional felicity of expression. It inspired William Blake to undertake a series of twelve illustrative designs, which were engraved by Louis Schiaivonetti, and published in 1808.

See the biographical introduction prefixed to his Poetical Works, by Dr Robert Anderson, in his Poets of Great Britain, vol. viii. (1804).

BLAIR ATHOLL (Gaelic Blair, "a plain"), a village and parish of Perthshire, Scotland, 351 m. N.W. of Perth by the Highland railway. Pop. (1901) 367; of parish, 1722. It is situated at the confluence of the Tilt and the Garry. The oldest part of Blair Castle, a seat of the duke of Atholl, dates from 1260; as restored and enlarged in 1869-1872 from the plans of Daniel Bryce, R.S.A., it is a magnificent example of the Scottish baronial style. It was occupied by the marquess of Montrose prior to the battle of Tippermuir in 1644, stormed by the Crom- wellians in 1653, and garrisoned on behalf of James II. in 1689. The Young Pretender stayed in it in 1745, and the duke of
Cumberland in 1746. The body of Viscount Dundee, conveyed hither from the battlefield of Killiecrankie, was buried in the church of Dunkeld, in which a monument was erected to his memory in 1889 by the 7th duke of Atholl. The grounds surrounding the castle are among the most beautiful in the Highlands. A golf course has been laid down south-east of the village, between the railway and the Garry, and every September a great display of Highland games is held. Ben-y-gloc (367 ft. high), the scene of the hunt given in 1329 by the earl of Atholl in honour of James V. and the queen dowager, may be climbed by way of Fender Burn, a left-hand tributary of the Tilt. The falls of Fender, near the old bridge of Tilt, and those of Coire Auch sehr, formed by the left tributary of the Bruar, which, rising in Ben Dearg (3303 ft.), flow into the Garry after an imperious course of 10 m.

BLAIRGOWRIE, a police burgh of Perthshire, Scotland, situated on the Erich. Pop. (1901) 3378. It is the terminus of a branch line of the Caledonian railway from Coupar Angus, from which it is 45 m. distant, and is 16 m. N. by E. of Perth by road. The town is entirely modern, and owes its progress to the water-power supplied by the Erich for linen and jute factories. There are also sawmills, breweries, and a large factory for beer; and there are flour-mills, saw-mills, and flour. Strawberries, raspberries and other fruits are largely grown in the neighbourhood. A park was presented to the town in 1832. On the left bank of the Erich, opposite Blairgowrie, with which it is connected by a four-arched bridge, stands the town and police burgh of Rattray (pop. 2019), where there are flax and jute mills. Donald Cargill the Covenanter, who was executed at Edinburgh, was a native of the parish. Four miles west of Blairgowrie, on the coach road to Dunkeld, lies Loch Clunie, of some interest historically. On a crag in the lake are the ruins of a small castle which belonged to James "the Admirable" Crichton, and the large mound near the loch was the site of the castle in which Edward I. lodged on one of his Scottish expeditions.

BLAKE, EDWARD (1833–1873), Irish-Canadian statesman, eldest son of William Hume Blake of Cashel Grove, Co. Galway, who settled in Canada in 1832, and there became a distinguished lawyer and chancellor of Ontario, was born on the 13th of October 1833 at Adelaide in Middlesex county, Ontario. Educated at Upper Canada College and the university of Toronto, Blake was called to the bar in 1856 and quickly obtained a good practice, becoming Q.C. in 1864. In 1857 he was elected member for West Durham in the Dominion parliament, and for South Bruce in the provincial legislature, in which he became leader of the Liberal opposition two years later. On the defeat of John Sandfield Macdonald's government in 1851 Blake became prime minister of Ontario, but resigned this office the same year in consequence of the abolition of dual representation. He declined the leadership of the Liberal party in the Dominion parliament, but, having taken an active part in bringing about the overthrow of Sir John Macdonald's ministry in 1873, joined the Liberal cabinet of Alexander Mackenzie, though without portfolio or salary. Impaired health soon compelled him to resign, and to take the voyage to Europe; on his return in 1875 he rejoined the cabinet as minister of justice, in which office it fell to him to take the chief part in framing the constitution of the supreme court of Canada. Continued ill-health compelled him in 1877 again to seek rest in Europe, having first exchanged the portfolio of justice for the less exacting office of president of the council. During his absence the Liberal government was driven from power by the elections of 1878; and Blake himself, having failed to secure re-election, was for a short time without a seat in parliament. From 1880 to 1887 he was leader of the opposition, being succeeded on his resignation of the position in the latter year by Mr (afterwards Sir) Wilfrid Laurier. In 1892 he became a member of the British House of Commons as an Irish Nationalist, being elected for South Longford. But he did not fulfil the expectations which were held on the strength of his colonial reputation; he took no very prominent part in debate, and gave little evidence of his undoubted oratorical gifts. In 1907 he retired from public life. In 1858 he had married Margaret, daughter of Benjamin Cronyn, first bishop of Huron.

BLAKE, ROBERT (1599–1677), English parliamentarian and admiral, was born at Bridgewater in Somersetshire. The day of his birth is not known, but he was baptized on the 27th of September 1599. Blake was the eldest son of a well-to-do merchant, and received his early education at the grammar school of Bridgewater. In 1615 he was sent to Oxford, entering first St. Alban's Hall, but afterwards moving to Magdalen College, then recently founded. He remained at the university till 1625, but failed to obtain any college preferment. Nothing is known of his life with certainty for the next fifteen years. An anonymous Dutch writer, in the Hollandische Mercurius (1652), represents him as saying that he had lived in Schiedam "for five or six years" in his youth. He doubtless engaged in trade, and apparently with success. When, after eleven years of kingship without parliaments, a parliament was summoned to meet in April 1640, Blake was elected to represent his native borough. This "Short" was dissolved in three weeks, and the career of Blake as a politician was suspended. Two years later the inevitable conflict began. Blake declared for the Parliament, and served under Sir John Horner. In 1643 he was entrusted with the command of one of the forts of Bristol. This he stoutly held during the siege of the town by Prince Rupert, and earned the approval of parliament by refusing to surrender his post till duly informed of the capitulation. In 1644 he gained high distinction by the resolute defence of Lyme in Dorsetshire. The siege was raised on the 23rd of May, and on the 8th of July Blake took Taunton by surprise, and notwithstanding its imperfect defences and inadequate supplies, held the town for the Parliament against two sieges by the Royalists until July 1645, when it was relieved by Fairfax. In 1645 he re-entered parliament as member for Taunton, when the Royalist Colonel Windham was expelled.

He adhered to the Parliamentary party after the king's death, and within a month (February 1649) was appointed, with Colonels Dean and Popham, to the command of the fleet, under the title of General of the Sea. In April he was sent in pursuit of Prince Rupert, who with the Royalist fleet had entered the harbour of Kinsale in Ireland. There he blockaded the prince for six months; and when the latter, in want of provisions, and hopeless of relief, succeeded in making his escape with the fleet and in reaching the Tagus, Blake followed him thither, and again blockaded him for some months. The king of Portugal refusing permission for Blake to attack his enemy, the latter made reprisals by falling on the Portuguese fleet, richly laden, returning from Brazil. He captured seventeen ships and burnt three, bringing his prizes home without molestation. After revictualing his fleet, he sailed again, captured a French man-of-war, and then pursued Prince Rupert, who had been asked to go away by the Portuguese and had entered the Mediterranean. In November 1650 Blake destroyed the bulk of the Royalist squadron near Cartagena. The thanks of parliament were voted to Blake, and he received a grant of £1000. He was continued in his office of admiral and general of the sea; and in May following he took, in conjunction with Ayscue, the Scilly Islands. For this service the thanks of parliament were again awarded him, and he was soon after made a member of the council of state.

In 1652 war broke out with the Dutch, who had made great preparations for the conflict. In March the command of the fleet was given to Blake for nine months; and in the middle of May the Dutch fleet of forty-five ships, led by their great admiral Tromp, appeared in the Downs. Blake, who had only twenty ships, sailed to meet them, and the battle took place off Dover on the 23rd of May. The Dutch were defeated with an extremity of four or five hours, lost two ships, and withdrew under cover of darkness. Attempts at accommodation were made by the states, but they failed. Early in July war was formally declared,
and in the same month Blake captured a large part of the Dutch fishery-fleet and the twelve men-of-war that formed their convoy. On the 28th of September Blake and Penn again encountered the Dutch fleet, now commanded by De Ruyter and De Witt, off the Kentish Knock, defeated it, and chased it for two days. The Dutch took refuge in Gorce. A third battle was fought near the end of November. By this time the ships under Blake's command had been reduced in number to forty, and nearly the half of these were useless for want of seamen. Tromp, who had been reinstated in command, appeared in the Downs, with a fleet of eighty ships besides ten fireships. Blake, nevertheless, risked a battle off Dungeness, but was defeated, and withdrew into the Thames. The English fleet having been refitted, put to sea again in February 1653; and on the 15th Blake, at the head of eighty ships, encountered Tromp in the Channel. The Dutch force, according to Clarendon, numbered 100 ships of war, but according to the official reports of the Dutch, only seventy. The battle was severe, and continued through three days, the Dutch, however, retreating, and taking refuge in the shallow waters off the French coast. In this action Blake was severely wounded. The three English admirals put to sea again in May; and on the 3rd and 4th of June another battle was fought near the North Foreland. On the first day Dean and Monk were repulsed by Tromp; but on the second day the scales were turned by the arrival of Blake, and the Dutch retreated to the Texel.

Ill-health now compelled Blake to retire from the service for a time, and he did not appear again on the seas for about eighteen months; meanwhile he sat as a member of the Little Parliament (Barbeyn's). In November 1654 he was selected by Cromwell to conduct a fleet to the Mediterranean to exact compensation from the duke of Tuscany, the knights of Malta, and the piratical states of North Africa, for wrongs done to English merchants. This mission he executed with his accustomed spirit and with complete success. Tunis dared not resist his demands, and Tunis paid the penalty of the destruction of its two fortresses by English guns. In the winter of 1655-1656, war being declared against Spain, Blake was sent to cruise off Cadiz and the neighbouring coasts, to intercept the Spanish shipping. One of his captains captured a part of the Plate fleet in September 1656. In April 1657 Blake, then in very ill health, suffering from dropsy and scurvy, and anxious to have assistance in his arduous duties, heard that the Plate fleet lay at anchor in the bay of Santa Cruz, in the island of Teneriffe. The position was a very strong one, defended by a castle and several forts with guns. Under the shelter of these lay a fleet of sixteen ships drawn up in crescent order. Captain Stayner was ordered to enter the bay and fall on the fleet. This he did. Blake followed him. Broad-sides were poured into the castle and the forts at the same time; and soon nothing was left but ruined walls and charred fragments of burnt ships. The wind was blowing hard into the bay; but suddenly, and fortunately for the heroic Blake, it shifted, and carried him safely out to sea. "The whole action," says Clarendon, "was so incredible that all men who know the place wondered that any sober man, with what courage soever endowed, would ever have undertaken it; and they could hardly persuade themselves to believe what they had done; while the Spaniards comforted themselves with the belief that they were devils and not men who had destroyed them in such a manner." The English lost one ship and 200 men killed and wounded. The thanks of parliament were voted to officers and men; and a very costly jewel (diamond ring) was presented to Blake, "as a testimony," says Cromwell in his letter of 10th June, "of the court of Teneriffe's great and solemn acceptance of your carriage in this action." "This was the last mark of the brave Blake."

After again cruising for a time off Cadiz, his health failing more and more, he was compelled to make homewards before the summer was over. He died at sea, but within sight of Plymouth, on the 17th of August 1657. His body was brought to London and embalmed, and after lying in state at Greenwich House was interred with great pomp and solemnity in Westminster Abbey. In 1661 Charles II. ordered the exhumation of Blake's body, with those of the mother and daughter of Cromwell and several others. They were cast out of the abbey, and were reburyed in the churchyard of St. Margaret's. "But that regard," says Johnson, "which was denied his body has been paid to his better remains, his name and his memory. Nor has any writer dared to deny him the praise of intrepidity, honesty, contempt of wealth, and love of his country." Clarendon bears the following testimony to his excellence as a commander:—"He was the first man that declined the old track, and made it apparent that the science might be attained in less time than was imagined. He was the first man that brought ships to contain castles on the shore, which had ever been thought very formidable, but were discovered by him to be made not only, but to fright some who could be rarely hurt by them."

A life of Blake is included in the work entitled Lives, English and Foreign. Dr Johnson wrote a short life of him, and in 1822 appeared Heaworth Dixon's fuller narrative, Robert Blake, Admiral and General of the Dutch, and refitted, and chased it for two days.
talent, he was pledged to the life of a painter, and these Poetical Sketches, though they are often no more than the utterances of a dreamer, are no less decisive in marking Blake as a future poet.

For a while the two gifts are exhibited in association. To the close of his life Blake continued to print and publish, after a manner of his own, the inventions of his verse illustrated by original designs, but there is a certain period in his career when the union of the two gifts is peculiarly close, and when their service to one another is unquestionable. In 1784 Blake, moving from Green Street, set up in company with a fellow-pupil, Parker, as print-seller and engraver next to his father's house in Broad Street, Golden Square, but in 1787 this partnership was severed, and he established an independent business in Poland Street. It was from this house, and in 1787, that the Songs of Innocence were published, a work that must always be remarkable for beauty both of verse and of design, as well as for the singular method by which the two were combined and expressed by the artist. Blake became in fact his own printer and publisher. He engraved upon copper, by a process devised by himself, both his text and his designs. Nor is this all. The very idea of what he was to publish, and to the pages printed from the copper plates an appropriate colouring was afterwards added by hand. The poetic genius already discernible in the first volume of Poetical Sketches is here more decisively expressed, and some of the songs in this volume deserve to take rank with the best things of their kind in our literature. In an age of enfeebled poetic style, when Wordsworth, with more weighty apparatus, had as yet scarcely begun his reform of English versification, Blake, unaided by any contemporary influence, produced a work of fresh and living beauty; and if the Songs of Innocence established Blake's claim to the title of poet, the setting in which they were given to the world proved that he was also something more. For the full development of his artistic powers we have to wait till a later date, but here at least he exhibits a just and original understanding of the sources of decorative beauty. Each page of these poems is a study of design, full of invention, and often wrought with the utmost delicacy of workmanship. The artist retained to the end this feeling for decorative effect; but as time went on, he considerably enlarged the imaginative scope of his work, and decoration then became the condition rather than the aim of his labour.

Notwithstanding the distinct and precious qualities of this volume, it attracted but slight attention, a fact perhaps not very wonderful, when the system of publication is taken into account. Blake, however, proceeded with other work of the same kind. The same year he published The Book of Thel, more decidedly mystic in its poetry, but scarcely less beautiful as a piece of illumination; The Marriage of Heaven and Hell followed in 1790; and in 1793 there are added The Gates of Paradise, The Vision of the Daughters of Albion, and some other "Prophetic Books." It becomes abundantly clear on reaching this point in his career that Blake's utterances cannot be judged by ordinary rules. The Songs of Experience, put forth in 1794 as a companion to the earlier Songs of Innocence, are for the most part intelligible and coherent, but in these intervening works of prophecy, as they were called by the author, we get the first public expression of that phase of his character and of his genius upon which a charge of insanity has been founded. The question whether Blake was or was not mad seems likely to remain in dispute, but there can be no doubt whatever that he was at different periods of his life under the influence of illusions for which there are no outward facts to account, and that much of what he wrote is so far wanting in the quality of sanity as to be without a logical coherence. On the other hand, it is equally clear that no madness imputed to Blake could equal that which would be involved in the rejection of his work on this ground. The greatness of his work is not the more established by its frailty, and in considering the work it must have left, it is not the more overwhelming by that it is by the sublimity of his genius, and not by any mental defect, that he is most clearly distinguished from his fellows. With the publication of the Songs of Experience Blake's poetic career, so far at least as ordinary readers are concerned, may be said to close. A writer of prophecy he continued for many years, but the works by which he is best known in poetry are those earlier and simpler efforts, supplemented by a few pieces taken from various sources, some of which were of later production. But although Blake the poet ceases in a general sense at this date, Blake the artist is only just entering upon his career. In the Songs of Innocence and Experience, and even in some of the earlier Books of Prophecy, the two gifts worked together in perfect balance and harmony; but at this point the supremacy of the artistic faculty asserts itself, and for the remainder of his career Blake was pre-eminent as a designer and engraver. The labour of poetical composition continues, but the product passes beyond the range of general comprehension; while, with apparent inconsistency, the work of the artist gains steadily in strength and coherence, and never to the last loses its hold upon the understanding. It may almost be said without exaggeration that his earliest poetic work, The Songs of Innocence, and nearly his latest effort in design, the illustrations to The Book of Job, take rank among the sanest and most admirable products of his genius. As a designer and engraver, he was at first sight, quite beyond a possible explanation. As Blake advanced in his poetic career, he was gradually hindered and finally overpowered by a tendency that was most serviceable to him in design. His inclination to substitute a symbol for a conception, to make an image do duty for an idea, became an insuperable obstacle to literary success. He endeavoured constantly to treat the intellectual material of verse as if it could be moulded into sensuous form, with the inevitable result that as the ideas to be expressed advanced in complexity and depth of meaning, his poetical gifts became gradually more inadequate to the task of interpretation. The earlier poems dealing with simpler themes, and put forward at a time when the bent of the artist's mind was not strictly determined, do not suffer from this difficulty; the symbolism then only enriches an idea of no intellectual intricacy; but when Blake began to concern himself with profounder problems the want of a more logical understanding of language made itself strikingly apparent. If his ways of thought and modes of workmanship had not been developed with an intensity almost morbid, he would probably have been able to distinguish and keep separate the double functions of art and literature. As it is, however, he remains as an extreme illustration of the ascendancy of the artistic faculty. For this tendency to translate ideas into image, and to find for every thought, however simple or sublime, a precise and sensuous form, is of the essence of pure artistic invention. If this be accepted as the dominant bent of Blake's genius, it is not so wonderful that his work in art should have strengthened in proportion as his poetic powers waned; but whether the explanation satisfies all the requirements of the case or not, the fact remains, and cannot be overlooked by any student of Blake's career.

In 1766 Blake was actively employed in the work of illustration. Edwards, a bookseller of New Bond Street, projected a new edition of Young's Night Thoughts, and Blake was chosen to illustrate the work. It was to have been issued in parts, but for some reason not very clear the enterprise failed, and only a first part, including forty-three designs, was given to the world. These designs were engraved by Blake himself, and they are interesting not only for their own merit but for the peculiar system by which the illustration has been associated with the text. It was afterwards discovered that the artist had executed original designs in water-colour for the whole series, and these drawings, 537 in number, form one of the most interesting records of Blake's genius. Gilchrist, the painter's biographer, in commenting upon the engraved plates, regrets the absence of colour, "the use of which Blake so well understood, to relieve his simple design and give it significance," and an examination of the original water-colour drawings fully supports the justice of this statement. The first of these plates was introduced by Flaxman to the poet Hayley, and in the year 1801 he accepted the suggestion of the latter, that he should take up his residence at Felpham in Sussex. The mild and
amiable poet had planned to write a Life of Cowper, and for the illustration of this and other works he sought Blake's help and companionship. The residence at Felpham continued for three years, partly pleasant and partly sombre to Blake, but apparently not very profitable to the progress of his art. One said that his annoyance of his stay was a malicious prosecution for treason set on foot by a common soldier whom Blake had summarily ejected from his garden; but a more serious drawback was the increasing irritation which the painter seems to have experienced from association with Hayley. In 1804 Blake returned to London, to take up his residence in South Moulton Street, and as the fruit of his residence in Felpham, he published, in the manner already described, the prophetic books called the Jerusalem, The Emancipation of the Giant Albion, and Visions of the Daughters of Albion. The first of these is a very notable performance in regard to artistic invention. Many of the designs stand out from the text in complete independence, and are now and then of the very finest quality.

In the years 1804-1805 Blake executed a series of designs in illustration of Robert Blair's The Grave, of much beauty and grandeur, though showing stronger traces of imitation of Italian art than any earlier production. These designs were purchased from the artist by an adventurous and unscrupulous publisher, Cromek, for the paltry sum of £17, and afterwards published in a series of engravings by Scheffer. The latter's ill treatment Blake received in the matter, and the other evils, including a quarrel with his friend Stothard as to priority of invention of a design illustrating the Canterbury Pilgrims, which his association with Cromek involved, the book gained for him a larger amount of popularity than he at any other time secured. Stothard's picture of the Canterbury Pilgrims was exhibited in 1807, and in 1809 Blake, in emulation of his rival's success, having himself painted in water-colour a picture of the same subject, opened an exhibition, and drew up a Descriptive Catalogue, curious and interesting, and containing a very valuable criticism of Chaucer.

The remainder of the artist's life is not outwardly eventful. In 1813 he formed, through the introduction of George Cumberland of Bristol, a valuable friendship with John Linnell and other rising water-colour painters. Amongst the group Blake seems to have found special sympathy in the society of John Varley, who, himself addicted to astrology, encouraged Blake to cultivate his gift of inspired vision; and it is probably to this influence that we are indebted for several curious drawings made from visions, especially the celebrated "ghost of a flea" and the humorous portrait of the builder of the Pyramids. In 1821 Blake removed to Fountain Court, in the Strand, where he died on the 12th of August 1827. The chief work of these last years was the splendid series of engraved designs in illustration of the book of Job. Here we find the highest imaginative qualities of Blake's art united to the technical means of expression which he best understood. Both the invention and the engraving are in all ways remarkable, and the series may fairly be cited in support of a very high estimate of his genius. None of his works is without the trace of that peculiar artistic instinct and power which seizes the pictorial element of ideas, simple or sublime, and translates them into the appropriate language of sense; but here the double faculty finds the happiest exercise. The grandeur of the theme is duly reflected in the simple and sublime images of the artist's design, and in the presence of these plates we are made to feel the power of the artist over the expressive resources of human form, as well as his sympathy with the imaginative significance of his subject.

Blake's life, both in selection from his works, by Alexander Gilchrist, was published in 1856 (new edition by W. G. Robertson, 1906); in 1868 A. C. Swinburne published a critical essay on his genius, remarkable for a full examination of the Prophetic Books, and in 1874 William Michael Rossetti published a memoir prefixed to an edition of the poems. In 1893 appeared The Works of William Blake, edited by E. J. Ellis and W. B. Yeats. But for a long time all that had been said so little attention to a correct following of Blake's own MSS. The text of these was finally published in exemplary care and thoroughness by John Sampson in his edition of the Poetical Works (1895), which has rescued Blake from the "improvements" of previous editors. See also The Letters of William Blake, together with a Life by Frederick Taltoon; edited by H. B. Russell (1906); and Basil de Selincourt, William Blake (1909) (J. C.).
author of the first English Life of Aristotle (1859), an edition of Herodotus (1852-1854) in the Bibliotheca Classica, and Four Months in Algeria (1859). He died on the 18th of April 1885.

BLAMIRE, SUSANNA (1747-1794), English poet, daughter of a Cumberland yeoman, was born at Cardew Hall, near Dalston, in January 1747. Her mother died while she was a child, and she was brought up by her aunt, a Mrs Simpson of Thackwood, who sent her niece to the village school at Raughton Head. Susanna Blamire's earliest poem is "Written in a Churchyard, on seeing a number of cattle grazing," in imitation of Gray. She lived an uneventful life among the farmers of the neighbourhood, and her gaiety and good-humour made her a favourite in rustic society. In 1767 her elder sister Sarah married Colonel Graham of Gartmore. "An Epistle to her friends at Gartmore" gives a playful description of the monotonous simplicity of her life. To her Perthshire visits her songs in the Scottish vernacular are no doubt partly due. Her chief friend was Catharine Gilpin of Scaleby Castle. The two ladies spent the winters together in Carlisle, and wrote poems in common. Susanna Blamire died in Carlisle on the 5th of April 1794. The poems which were not collected during her lifetime, were first published in 1842 by Henry Lonsdale as The Poetical Works of Miss Susanna Blamire, "the Muse of Cumberland," with a memoir by Mr Patrick Maxwell. Some of her songs rank among the very best of north-country lyrics. "And ye shall walk in silk attire" and "What ails this heart o' mine," are well known, and were included in Johnson's Scots' Musical Museum.

BLANC (Jean Joseph Charles) LOUIS (1811-1883), French politician and historian, was born on the 29th of October 1811 at Madrid, where his father held the post of inspector-general of finance under Joseph Bonaparte. Failing to receive aid from Pozzo di Borgo, his mother's uncle, Louis Blanc studied law in Paris, living in poverty, and became a contributor to various journals. In the Revue du progres, which he founded, he published in 1839 his study on L'Organisation du travail. The principles laid down in this famous essay form the key to Louis Blanc's whole political career. He attributes all the evils that afflict society to the pressure of competition, whereby the weaker are driven to the wall. He demanded the equalization of wages, and the merging of personal interests in the common good—"à chacun selon ses besoins, de chacun selon ses facultés." This was to be effected by the establishment of "social workshops," a sort of combined co-operative society and trade-union, where the workmen in each trade were to unite their efforts for their common benefit. In 1842 he published his Histoire de dix ans 1830-1840, an attack upon the monarchy of July. It ran through four editions in four years.

In 1847 he published the first two volumes of his Histoire de la Révolution Française. Its publication was interrupted by the revolution of 1848, when Louis Blanc became a member of the provisional government. It was on his motion that, on the 25th of February, the government undertook "to guarantee the existence of the workmen by work"; and though his demand for the establishment of a ministry of labour was refused—as beyond the competence of a provisional government—he was appointed to preside over the government labour commission (Commission du Gouvernement pour les travailleurs) established at this time. Louis Blanc, thus, turned to industrial questions. On the 20th of May he, in the National Assembly, his proposal for a ministry of labour, but the temper of the majority was hostile to socialism, and the proposal was again rejected. His responsibility for the disastrous experiment of the national workshops he himself denied in his Appel aux honnêtes gens (Paris, 1840), written in London after his flight; but by the insurgent mob of the 15th of May and by the victorious Moderates alike he was regarded as responsible. Between the rancorous factions he endeavoured to force him to place himself at their head, and the national guard, hearing this, was walled up and Louis Blanc was sentenced to death. Rescued with difficulty, he escaped with a false passport to Belgium, and thence to London; in his absence he was condemned by the special tribunal established at Bourges, in contumaciæ, to deportation. Against trial and sentence he alike protested, developing his protest in a series of articles in the Nouveau Monde, a review published in Paris under his direction. These he afterwards collected and published as Pages de l'histoire de la révolution de 1848 (Brussels, 1850).

During his stay in England he made use of the unique collection of materials for the revolutionary period preserved at the British Museum to complete his Histoire de la Révolution Française in 12 vols. (1847-1862). In 1858 he published a reply to Lord Normanby's A Year of Revolution in Paris (1858), which he developed later into his Histoire de la révolution de 1848 (2 vols., 1879-1880). As far back as 1830 Louis Blanc had vehemently opposed the idea of a Napoleonic restoration, predicting that it would be "despotism without glory," "the Empire without the Emperor." He therefore remained in exile till the fall of the Second Empire in September 1870, after which he returned to Paris and served as a private in the national guard. On the 8th of February 1871 he was elected a member of the National Assembly, in which he maintained that the republic was "the necessary form of national sovereignty," and voted for the continuation of the war; yet, though a member of the extreme Left, he was too clear-minded to sympathize with the Commune, and exerted his influence in vain on the side of moderation. In 1878 he advocated the abolition of the presidency and the senate. In January 1879 he introduced into the chamber a proposal for the amnesty of the Communists, which was carried. This was his last important act. His declining years were darkened by ill-health and by the death, in 1876, of his wife (Christina Groh), an Englishwoman whom he had married in 1865. He died at Cannes on the 6th of December 1882, and on the 12th of December received a state funeral in the cemetery of Père-Lachaise.

Louis Blanc possessed a picturesque and vivid style, and considerable power of research; but the fervour with which he expressed his convictions, while placing him in the first rank of orators, tended to turn his historical writings into political pamphlets. His political and social ideas have had a great influence on the development of socialism in France. His Discours politiques (1847-1851) was published in 1882. His most important works, besides those already mentioned, are Lettres sur l'Angleterre (1866-1867), Discours de l'Angleterre (1879-1884), and Questions d'aujourd'hui et de demain (1873-1884).

See L. Fiaux, Louis Blanc (1883).

BLANC, MONT, the culminating point (15,782 ft.) of the mountain range of the same name, which forms part of the Pennine Alps, and is divided unequally between France, Italy and Switzerland. The actual highest summit is wholly French and is the loftiest peak in the Alps, and in Europe also, if certain peaks in the Caucasus (Aviso, 18,250 ft.) and in North America (Asgard, 18,657 ft.) be included. The peak was in former days named the Montagne Maudite, but the present name seems to have been always used locally. On the north is the valley of Chamonix, and on the east the head of the valley of Aosta. Among the great glaciers which stream from the peak the most noteworthy are those of Bossons and Taconnaz (northern slope) and of Brenva and Miage (southern slope). The first ascent was in 1786 by two Chamonix men, Jacques Balmat and Dr Michel Paccard, and the second in 1787 by Balmat with two local guides, H. B. de Sauvage made the third ascent, memorable in many respects, and was followed a week later by Colonel Beaufoy, the first Englishman to gain the top. These ascents were all made from Chamonix, which is still the usual starting point, though routes have been forced up the peak from nearly every side, those on the Italian side being much steeper than that from Chamonix. The ascent from Chamonix is now frequently made in summer (rarely in winter also), but, owing to the great height of the mountain, the view is unsatisfactory, though very extensive (Lyons is visible). There is an inn at the Grands Mulets (9900 ft.). In 1850 M. Vallot built an observatory and shelter hut (14,312 ft.) on the Bosses du Dromadaire (north-west ridge of the mountain), and in 1893 T. J. C. Janssen constructed an observatory just below the very summit.

BLANCHARD—BLANDRATA

BLANCHARD, SAMUEL LAMAN (1804–1849), British author and journalist, the son of a painter and glazier, was born at Great Yarmouth on the 15th of May 1804. He was educated at St Olave's school, Southwark, and then became clerk to a proctor in Doctors' Commons. At an early age he developed literary taste, and contributed dramatic sketches to a paper called *Drama*. For a short time he was a member of a travelling dramatic company, but subsequently became a proof-reader in London, and wrote for the *Monthly Magazine*. In 1827 he was made secretary of the Zoological Society, a post which he held for three years. In 1828 he published *Lyric Offerings*, dedicated to Charles Lamb. He had a very varied journalistic experience, editing in succession the *Monthly Magazine*, the *True Sun*, the *Constitutional*, the *Court Journal*, the *Courier*, and *George Cruikshank's Omaibus*; and from 1841 till his death he was connected with the *Examiner*. In 1846 Bulwer-Lytton collected a number of his passages under the title *Sketches of a Life of Dr. Thomas,* to which he prefixed the author's prefatory verse. His verse was collected in 1876 by Blanchard Jerrold. Over-work broke down his strength, and, unnerved by the death of his wife, he died by his own hand on the 15th of February 1845.

His eldest son, SIDNEY LAMAN BLANCHARD, who was the author of *Yesterday and To-day in India*, died in 1883.

BLANCHE, JACQUES ÉMILE (1861– ), French painter, was born in Paris. He enjoyed an excellent cosmopolitan education, and was brought up at Passy in a house once belonging to the princesse de Lamballe, which still retained the atmosphere of 18th-century elegance and refinement and influenced his taste and work. Although he received some instruction in painting from Gervex, he may be regarded as self-taught. He acquired a great reputation as a portrait painter; his art is derived from French and English sources, refined, sometimes super-elegant, but full of character. Among his chief works are portraits of his father, of Pierre Louÿs, the Thaulow family, Aubrey Beardsley and Yvette Guilbert.

BLANCHE DE CASTILE (1188–1252), wife of Louis VIII. of France, third daughter of Alphonso VIII., king of Castile, and of Eleanor of England, daughter of Henry II., was born at Valencia. In consequence of a treaty between Philip Augustus and John of England, she was betrothed to the former's son, Louis, and was brought over to France in the spring of 1200, by John's mother, Eleanor. On the 22nd of May 1200 the treaty was finally signed, John ceding with his niece the fiefs of Issoudun and Graçay, together with those that André de Chavigny, lord of Châteauroux, held in Berry, of the English crown. The marriage was celebrated the next day, at Portmort on the right bank of the Seine, in John's domains, as those of Philip lay under an interdict.

Blanche first displayed her great qualities in 1216, when Louis, who on the death of John claimed the English crown in her right, invaded England, only to find a united nation against him. Philip Augustus refused to help his son of Llyw, Blanche was his member. The queen established herself at Calais and organized two fleets, one of which was commanded by Eustace the Monk, and an army under Robert of Courtenay; but all her resolution and energy were in vain. Although it would seem that her masterful temper exercised a sensible influence upon her husband's gentler character, her rôle during his reign (1223–1226) is not well known. Upon his death she left Blanche regent and guardian of his children. Of her twelve or thirteen children, six had died, and Louis, the heir—afterward to succeed Louis IX. —was but twelve years old. The situation was critical, for the hard-won domains of the house of Capet seemed likely to fall to pieces during a minority. Blanche had to bear the whole burden of affairs alone, to break up a league of the barons (1226), and to repel the attack of the king of England (1230). But her energy and firmness overcame all dangers. There was an end to the calumnies circulated against her, based on the poetical homage rendered her by Theobald IV., count of Champagne, and the prolonged stay in Paris of the papal legate, Romano Bonaventura, cardinal of Sant' Angelo. The nobles were awed by her warlike preparations or won over by adroit diplomacy, and their league was broken up. St Louis owed his realm to his mother, but he himself always remained somewhat under the spell of her imperious personality. After he came of age (1236) her influence upon him may still be traced. In 1248 she again became regent, during Louis IX.'s absence on the crusade, a project which she had strongly opposed. In the disasters which followed she maintained peace, while draining the land of men and money to aid her son in the East. At last her strength failed her. She fell ill at Melun in November 1252, and was taken to Paris, but lived only a few days. She was buried at Maubuisson.

BLANCH FEE, or BLANCHE HOLDING (from Fr. blanc, white), an ancient tenure in Scottish land law, the duty payable being in silver or white money in contradistinction to gold. The phrase was afterwards applied to any holding of which the quit-rent was merely nominal, as a penny, a peacock-feather, an egg.

BLANDFORD, or BLANDFORD FORUM, a market town, and municipal borough in the northern parliamentary division of Dorsetshire, England, on the Stour, 19 m. N.W. of Bournemouth by the Somerset & Dorset railway. Pop. (1901) 3649. The town is ancient, but was almost wholly destroyed by fire in the 18th century. The church of St Peter and St Paul, a classical building, was built in 1732. There are a grammar-school (founded in 1521 at Milton Abbas, transferred to Blandford in 1775), a Blue-coat school (1729), and other educational charities.

Remnants of a mansion of the 14th century, Damory Court, are seen in a farm-house, and an adjoining coach-house, which is used as a barn. There are numerous early earthworks on the chalk hills in the neighbourhood. The fine modern mansion of Bryanston, in the park adjoining the town, is the seat of Lord Portman. The municipal borough is under a mayor, 4 aldermen and 12 councillors. Area, 145 acres.

BLANDRATA, or BLANDRATA, GIORGIO (c. 1515–1588), Italian physician and polemic, who came of the De Blandrate family, powerful from the early part of the 15th century, was born at Saluzzo, the youngest son of Bernardino Blandrate. He was educated in a farm-house, and an adjoining clarer cell, which was specialized in the functional and nervous disorders of women. In 1544 he made his first acquaintance with Transylvania; in 1553 he was with Alciati in the Grisons; in 1557 he spent a year at Geneva, in constant intercourse with Calvin, who distrusted him. He attended the English wife (Jane Stafford) of Count Celso Massimiliano Martinengo, preacher of the Italian church at Geneva, and fostered anti-trinitarian opinions in that church. In 1558 he found it expedient to remove to Poland, where he became a leader of the heretical party at the synods of Pinczów (1558) and Ksiaznin (1560 and 1563). His point was the suppression of extremes of opinion, on the basis of a confession literally drawn from Scripture. He obtained the position of court physician to the queen dowager, the Milanese Bona Sforza. She had been instrumental in the burning (1539) of Catharine Weygel, at the age of eighty, for anti-trinitarian opinions; but the writings of Ockhino had altered her views, which were now anti-Catholic. In 1563 Blandrata transferred his services to the Transylvanian court, where the daughters of his patronage were married to ruling princes. He revisited Poland (1576) in the train of Stephen Báthory, whose tolerance permitted the propagation of heresies; and when (1579) Christopher Báthory introduced the Jesuits into Transylvania, Blandrata found means of conciliating them. Throughout his career he was accompanied by his two brothers, Ludovico and Alphonso, the former being canon of Saluzzo. In Transylvania, Blandrata co-operated with Francis Dávid (d. 1579), the anti-trinitarian bishop, but in 1578 two circumstances broke the
BLANE—BLANK VERSE

41

connexion. Blanlara was charged with "Italian vice"; Dávid denounced the worship of Christ. To influence Dávid, Blanlara sent for Faustus Socinius from Basel. Socinius was Dávid's guest, but the discussion between them led to no result. At the instance of Blanlara, Dávid was tried and condemned to prison at Déva (in which he died) on the charge of innovation. Having amassed a fortune, Blanlara returned to the connexion of Rome. His end is obscure. According to the Jesuit, Jacob Wujek, he was strangled by a nephew (Giorgio, son of Alphonso) in May 1588. He published a few polemical writings, some in conjunction with Dávid.

BLANE, SIR GILBERT (1749-1834), Scottish physician, was born at Blanefield, Ayrshire, on the 20th of August 1749. He was educated at Edinburgh university, and shortly after his removal to London became private physician to Lord Rodney, whom he accompanied to the West Indies in 1779. He did much to improve the health of the fleet by attention to the diet of the sailors and by enforcing due sanitary precautions, and it was largely through him that in 1793 the use of lime-juice was made obligatory for the crew. He was a member of the Royal College of Physicians. Enjoying a number of court and hospital appointments he built up a good practice for himself in London, and the government constantly consulted him on questions of public hygiene. He was made a baronet in 1812 in reward for the services he rendered in connexion with the return of the Walcheren expedition. He died in London on the 26th of June 1834. Among his works were Observations on the Diseases of Seamen (1795) and Elements of Medical Logic (1816).

BLanford, William Thomas (1832-1905), English geologist and naturalist, was born in London on the 7th of October 1832. He was educated in private schools in Brighton and Paris, and with a view to the adoption of a mercantile career spent two years in a business house at Civita Vecchia. On returning to England in 1851 he was induced to enter the newly established Royal School of Mines, of which his younger brother Henry F. Blanford (1834-1893), afterwards head of the Indian Meteorological Department, had already joined; he then spent a year in the mining school at Freiburg, and towards the close of 1853 both he and his brother obtained posts on the staff of work in India. In that service he remained for twenty-seven years, retiring in 1882. He was engaged in various parts of India, in the Ranganji coalfield, in Bombay, and in the coalfield near Talchir, where boulders considered to have been ice-borne were found in the Talchir strata—a remarkable discovery confirmed by subsequent observations of other geologists in equivalent strata elsewhere. His attention was given not only to geology but to zoology, and especially to the land-mollusca and to the vertebrates. In 1866 he was attached to the Abyssinian expedition, accompanying the army to Mâgâlala and back; and in 1871-1872 he was appointed a member of the Persian Boundary Commission. The best use was made of the exceptional opportunities of studying the natural history of those countries. For his many contributions to geological science Dr Blanford was in 1853 awarded the Wollaston medal by the Geological Society of London; and for his labours on the zoology and geology of British India he received in 1901 a royal medal from the Royal Society. He had been elected F.R.S. in 1874, and was chosen president of the Geological Society in 1888. He was created C.I.E. in 1902. He died in London on the 27th of June 1905. His principal publications were: Observations on the Geology and Zoology of Abyssinia (1870), and Manual of the Geology of India, with H. B. Medlicott (1870).

Biography, with bibliography and portrait, in Geological Magazine, January 1906.

BLANK (from the Fr. blanc, white), a word used in various senses based on that of "left white," i.e. requiring something to be filled in; thus a "blank cheque" is one which requires the amount to be inserted, an insurance policy in blank, where the name of the beneficiary is lacking, "blank verse" (q.v.) verse without rhyme, "blank cartridge" that contains only powder and no ball or shot. The word is derived, as a substantive, for a ticket in a lottery or sweepstake which does not carry a number or the name of a horse running or for an unstamped metal disc in coining.

BLANKENBERGHE, a seaside watering-place on the North Sea in the province of West Flanders, Belgium, 12 m. N.E. of Ostend, and about 9 m. N.W. of Bruges, with which it is connected by railway. It is more bracing than Ostend, and has a fine parade over a mile in length. During the season, which extends from June to September, it receives 'a large number of visitors, proportionately over 50,000 altogether, from Holland and Germany as well as from Belgium. There is a small fishing port as well as a considerable fishing-fleet. Two miles north of this place along the dunes is Zeebrugge, the point at which the new ship-channel from Bruges enters the North Sea. Fixed population (1904) 5925.

BLANKENBURG. (1) A town and health resort of Germany, in the duchy of Brunswick, at the N. foot of the Harz Mountains, 12 m. by rail S.W. from Halberstadt. Pop. (1901) 10,173. It has been in large part rebuilt since a fire in 1856, and possesses the branches of various collections, a museum of antiquities, an old town hall and churches. There are picturesque views of a hospital for nervous diseases. Gardening is a specialty. In the vicinity is a cliff or ridge of rock called Teufelsmauer (Devil's wall), from which fine views are obtained across the plain and into the deep gorges of the Harz Mountains.

(2) Another Blankenburg, also a health-resort, is situated in Schwarzburg-Rudolstadt, Thuringia, at the confluence of the rivers Rinne and Schwarza, and at the entrance of the Schwarzatal. Its environs are charming, and to the north of it, on an eminence, rise the fine ruins of the castle of Greifenstein, built by the German king Henry L., and from 1275 to 1553 the seat of a cadet branch of the counts of Schwarzburg.

BLANKETERS, the nickname given to some 5000 operatives who on the 10th of March 1817 met in St Peter's Field, near Manchester, to march to London, each carrying blankets or rags. Their object was to see the prince regent and lay their grievances before him. The Habees Corpus Act was suspended, and the leaders were seized and imprisoned. The bulk of the demonstration yielded at once. The few stragglers who persisted in their agitation were intercepted by troops, and treated with considerable severity. Eventually the spokesmen had an interview with the ministers, and some reforms were the result.

BLANK VERSE, the unrhymed measure of iambic deca-syllable in five beats which is usually adopted in English epic and dramatic poetry. The epithet is due to the absence of the rhyme which the ear expects at the end of successive lines. The decasyllabic line occurs for the first time in a Provençal poem of the 10th century, but in the earliest instances preserved it is already constructed with such regularity as to suggest that it was no new invention. It was certainly being used almost simultaneously in the north of France. Chaucer employed it in his Complete to Pute about 1370. In all the literatures of western Europe it became generally used, but always with rhyme. In the beginning of the 16th century, however, certain Italian poets made the experiment of writing decasyllables without rhyme. The tragedy of Sophonisba (1515) of G. G. Trissino (1475-1530) was the earliest work completed in this form; it was followed in 1525 by the didactic poem L'Api (The Bees), of Giovanni Rucellai (1475-1525), who announced his intention of writing "Con serbo Erisco dalle rime sciolto" in consequence of which expression this kind of metre was called versi sciolti or blank verse. In a very short time this form was largely adopted in Italian dramatic poetry, and the comedies of Ariosto, the Aminta of Tasso and the Pastor Fido of Guarini are composed in it. The iambic blank verse of Italy was, however, mainly hendecasyllabic, not decasyllabic, and under French influences the habit of rhyme soon returned.

Before the close of Trissino's life, however, his invention had been introduced into another literature, where it was destined to enjoy a longer and more glorious existence. Towards the
close of the reign of Henry VIII., Henry Howard, earl of Surrey, translated two books of the Aeneid into English rhyme verse, "drawing" them "into a strange metre." Surrey's blank verse is stiff and timid, permitting itself no divergence from the exact iambic movement:

"Who can express the slaughter of that night, 
Or tell the number of the corpses slain, 
Or can in tears bewail them worthy?
The ancient famous city falleth down.
That many years did hold such seigery,"

Surrey soon found an imitator in Nicholas Grimald, and in 1562 blank verse was first applied to English dramatic poetry in the Corboduc of Sackville and Norton. In 1576, in the Steel Glass of Gascoigne, it was first used for satire, and by the year 1585 it had come into almost universal use for theatrical purposes. In Lyly's The Woman in the Moon and Peele's Arrangement of Paris (both of 1584) we find blank verse struggling with rhymed verse and successfully holding its own. The earliest play written entirely in blank verse is supposed to be The Mistrauntes of Arthur (1587) of Thomas Hughes. Marlowe now immediately followed, with the magnificent movement of his Tamburlaine (1589), which was mocked by satirical critics as "the swelling bombast of bragging blank verse" (Nash) and "the spacious volubility of a drumming decasyllable" (Greene), but which introduced a great new music into English poetry, in such "mighty lines" as

"Still climbing after knowledge infinite, 
And always moving as the restless spheres,"

or:

"See where Christ's blood streams in the firmament!"

Except, however, when he is stirred by a particularly vivid emotion, the blank verse of Marlowe continues to be monotonous and uniform. It still depends too exclusively on a counting of syllables. But Shakespeare, after having returned to rhyme in his earliest dramas, particularly in The Two Gentlemen of Verona, adopted blank verse exclusively about the time that the career of Marlowe was closing, and he carried it to the greatest perfection in variety, supplesness and fulness. He released it from the excessive bondage that it had hitherto endured; as Robert Bridges has said, "Shakespeare, whose early verse may be described as syllabic, gradually came to write a verse dependent on stress." In comparison with that of his predecessors and successors, the blank verse of Shakespeare is essentially regular, and his prosody marks the admirable mean between the stiffness of his dramatic forerunners and the laxity of those who followed him. Most of Shakespeare's lines conform to the normal type of the decasyllable, and the rest are accounted for by familiar and rational rules of variation. The ease and fluidity of his prosody were abused by his successors, particularly by Beaumont and Fletcher, who employed the soft feminine ending to excess; in Massinger dramatic blank verse came too near to prose, and in Heywood and Shirley it was relaxed to the point of losing all nervous vigour.

The later dramatists gradually abandoned that rigorous difference which should always be preserved between the cadence of verse and prose, and the example of Ford, who endeavoured to revive the old severity of blank verse, was not followed. But just as the form was sinking into dramatic desuetude, it took new life in the direction of epic, and found its noblest proficient in the person of John Milton. The most intricate and therefore the most interesting blank verse which has been written is that of Milton in the great poems of his later life. He reduced the elisions, which had been frequent in the Elizabethan poets, to law; he admitted an extraordinary variety in the number of stresses; he deliberately inverted the rhythm in order to produce particular effects; and he multiplied at will the caesure or breaks in a line. Such verses as

"A morning with reflected purple and gold—
Shouts invisible virtue even to the deep—
Universal reproach, far worse to bear—
Me, me only, just object of his ire—"

are not mistaken in rhythm, nor to be scanned by forcing them to obey the conventional stress. They are instances, and

Paradise Lost is full of such, of Milton's exquisite art in ringing changes upon the metrical type of ten syllables, five stresses and a rising rhythm, so as to adapt the whole texture of the verse to his poetical thought. Writing many years later in Paradise Regained and in Samson Agonistes, Milton retained his system of blank verse in its general characteristics, but he treated it with increased dryness and with a certain harshness of effect. It is certainly in his biblical drama that blank verse has been pushed to its most artificial and technical perfection, and it is there that Milton's theories are to be studied best; yet it must be confessed that learning excludes beauty in some of the very audacious irregularities which he here permits himself in Samson Agonistes, such as

"Made arms ridiculous, useless the forgery—
My griefs not only pain me as a lingering disease—
Drunk with idolatry, drunk with wine—
Justly, yet despair not of his final pardon "—

are constructed with perfect comprehension of metrical law, yet they differ so much from the normal structure of blank verse that they need to be explained, and to imitate them would be perilous. A persistent weakness in the third foot has ever been the snare of English blank verse, and it is this element of monotony and dulness which Milton is ceaselessly endeavouring to obviate by his wonderful inversions, elisions and breaks.

After the Restoration, and after a brief period of experiment with rhymed plays, the dramatists returned to the use of blank verse, and in the hands of Otway, Lee and Dryden, it recovered much of its magnificence. In the 18th century, Thomson and others made use of a very regular and somewhat monotonous form of blank verse, the heroic and didactic poems, of which the Night Thoughts of Young is, from a metrical point of view, the most interesting. With these poets the form is little open to licence, while inversions and breaks are avoided as much as possible. Since the 18th century, blank verse has been subjected to constant revision in the hands of Wordsworth, Coleridge, Shelley, Keats, Tennyson, the Brownings and Swinburne, but no radical changes, of a nature unknown to Shakespeare and Milton, have been introduced into it.

See J. A. Symonds, Blank Verse (1893); Walter Thomas, Le Décasylabisme romantique et son histoire en Angleterre et en France (1894); Robert Bridges Milton's Proseody (1894); Ed. Guest, A History of English Rhythm (1892); J. Motheré, Les Théories du vers hérodique anglais (1886); M. Schipper, Les Études de vers de la France (1888-1890).

BLANQUI, JÉRÔME ADOLPHE (1798-1854). French economist, was born at Nice on the 21st of November 1798. Beginning life as a schoolmaster in Paris, he was attracted to the study of economics by the lectures of J. B. Say, whose pupil and assistant he became. Upon the recommendation of Say he was in 1825 appointed professor of industrial economy and of history at the Conservatoire des Arts et Métiers. In 1833 he succeeded Say as professor of political economy at the same institution, and in 1838 was elected a member of the Académie des Sciences Morales et Politiques. In 1838 appeared his most important work, Histoire de l'économie politique en Europe, depuis les anciens jusqu'à nos jours. He was indefatigable in research, and for the purposes of his economic inquiries travelled over almost the whole of Europe and visited Algeria and the East. He contributed much to our knowledge of the conditions of the working-classes, especially in France. Other works of Blanqui were De la situation économique et morale de l'Espagne en 1836; Résumé de l'histoire du commerce et de l'industrie (1837); Précis élémentaire d'économie politique (1826); Les Classes ouvrières en France (1848).

BLANQUI, LOUIS AUGUSTE (1805-1881). French publicist, was born on the 8th of February 1805 at Puget-Théniers, where his father, Jean Dominique Blanqui, was at that time prefect. He studied both law and medicine, but found his real vocation in politics, and at once constituted himself a champion of the most advanced opinions. He took an active part in the revolution of July 1830, and continuing to maintain the doctrine of republicanism during the reign of Louis Philippe, was condemned to repeated terms of imprisonment. Implicated in the armed outbreak of the Société des Saisons, of which he was a
leading spirit, he was in the following year, 1840, condemned to death, a sentence that was afterwards commuted to imprisonment for life. He was released by the revolution of 1848, only to resume his attacks on existing institutions. The revolution, he declared, was a mere change of name. The violence of the Société républicaine centrale, which was formed by Blanqui to demand a modification of the government, brought him into conflict with the more moderate Republicans, and in 1849 he was condemned to ten years' imprisonment. In 1865, while serving a further term of imprisonment under the Empire, he contrived to escape, and henceforth continued his propaganda against the government from abroad, until the general amnesty of 1869 enabled him to return to France. Blanqui's leaning towards violent measures was illustrated in 1870 by two unsuccessful armed demonstrations: one on the 12th of January at the funeral of Victor Noir, the journalist shot by Pierre Bonaparte; the other on the 14th of August, when he led an attempt to seize some guns at a barracks. Upon the fall of the Empire, through the revolution of the 4th of September, Blanqui established the club and journal *La patrie en danger*. He was one of the band that for a moment seized the reins of power on the 31st of October, and for his share in that outbreak he was again condemned to death on the 17th of March of the following year. A few days afterwards the insurrection which established the Commune broke out, and Blanqui was elected a member of the insurgent government, but his detention in prison barred him from taking an active part. Nevertheless he was in 1872 condemned along with the other members of the Commune to transportation; but on account of his broken health this sentence was commuted to one of imprisonment. In 1879 he was elected a deputy for Bordeaux; although the election was pronounced invalid, Blanqui was set at liberty, and at once resumed his work of agitation. At the end of 1880, after a speech at a revolutionary meeting in Paris, he was struck down by apoplexy, and expired on the 1st of January 1881. Blanqui's unswerving devotion to the revolutionary cause, and his determination to enforce it by violence, necessarily brought him into conflict with every French government, and half his life was spent in prison. Besides his innumerable contributions to journalism, he published an astronomical work entitled *L'Éternité par les astres* (1872), and after his death his writings on economic and social questions were collected under the title of *Critique sociale* (1885).

A biography by G. Geoffroy, *L'Enferm. éternel* (1897), is highly coloured and deliberately partisan.

**BLANTYRE**, the chief town of the Nyassaland protectorate, British Central Africa. It is situated about 3000 ft. above the sea in the Shire Highlands 300 m. by river and rail N.N.W. of the Chinde mouth of the Zambezi. Pop. about 6000 natives and 100 whites. It is the headquarters of the principal trading firms and missionary societies in the protectorate. It is also a station on the African trans-continental telegraph line. The chief building is the Church of Scotland church, a fine red brick building, a mixture of Norman and Byzantine styles, with lofty turrets and white domes. It stands in a large open space and is approached by an avenue of cypresses and eucalyptus. The church was built entirely by native labour. Blantyre was founded in 1876 by Scottish missionaries, and is named after the birthplace of David Livingstone.

**BLANTYRE** (Gaelic, "the warm retreat"), a parish of Lanarkshire, Scotland. Pop. (1901) 14,145. The parish lies a few miles south-east of Glasgow, and contains High Blantyre (pop. 2521), Blantyre Works (or Low Blantyre), Stonefield and several villages. The whole district is rich in coal, the mines of which is extensively carried on. Blantyre Works (pop. 2683) was the birthplace of David Livingstone (1813-1873) and his brother Charles (1821-1873), who as lads were both employed as piecers in a local cotton-mill. The scanty remains of Blantyre Priory, founded towards the close of the 13th century, stand on the left bank of the Clyde, almost opposite the beautiful ruins of Bothwell Castle. High Blantyre and Blantyre Works are connected with Glasgow by the Caledonian railway. Stonefield (pop. 7288), the most populous place in the parish, entirely occupied with mining, lies between High Blantyre and Blantyre Works. Calderwood Castle on Rotten Calder Water, near High Blantyre, is situated amid picturesque scenery.

**BLARNEY**, a small town of Co. Cork, Ireland, in the mid paroquial division of 5 m. N.W. of the city of Cork on the Cork & Muskeggy light railway. Pop. (1901) 928. There is a large manufacture of tweed. The name "blarney" has passed into the language to denote a peculiar kind of persuasive eloquence, alleged to be characteristic of the natives of Ireland. "The "Blarney Stone," the kissing of which is said to confer this faculty, is pointed out within the castle. The origin of this belief is not known. The castle, built c. 1446 by Cormac McCarthy, was of immense strength, and parts of its walls are as much as 18 ft. thick. To its founder is traced by some the origin of the term "blarney," since he delayed by persuasion and promises the surrender of the castle to the lord president. Richard Millikin's song, "The Groves of Blarney" (c. 1798), contributed to the fame of the castle, which is also bound up with the civil history of the county and the War of the Great Rebellion.

**BLASHFIELD, EDWIN HOWLAND** (1848- ), American artist, was born on the 15th of December 1848 in New York City. He was a pupil of Bonnat in Paris, and became (1888) a member of the National Academy of Design in New York. For some years a genre painter, he later turned to decorative work, marked by a delicacy and beauty of colouring. He painted mural decorations for a dome in the manufacturers' building at the Chicago Exposition of 1893; for the dome of the Congressional library, Washington; for the capitol at St. Paul, Minnesota; for the Baltimore court-house; in New York City for the Appellate court house, the grand ball-room of the Waldorf-Astoria hotel, the Lawyers' club, and the residences of W. K. Vanderbilt and Collis P. Huntington; and in Philadelphia for the residence of George W. Drexel. With his wife he wrote *Italian Cities* (1900) and edited Vaas's *Travels of the Painters* (1896), and was well known as a lecturer and writer on art. He became president of the Society of Mural Painters, and of the Society of American Artists.

**BLASius** (or **BLAISE**), **SAINT**, bishop of Sebaste or Sivas in Asia Minor, martyred under Diocletian on the 3rd of February 316. The Roman Catholic Church holds his festival on the 3rd of February, the Orthodox Eastern Church on the 11th. His flesh is said to have been torn with woolcombers' irons before he was beheaded, and this seems to be the only reason why he has always been regarded as the patron saint of woolcombers. In pre-Reformation England St. Blaise was a very popular saint, and the council of Oxford in 1222 forbade all work on his festival. Owing to a miracle which he is alleged to have worked on a child suffering from a throat affection, who was brought to him on his way to execution, St. Blaise's aid has always been held potent in throat and lung diseases. The woolcombers of England still celebrate St. Blaise's day with a procession and general festivities. He forms one of a group of fourteen (i.e. twice seven) saints, who for their help in time of need have been associated as objects of particularly devoted worship in Roman Catholic Germany since the middle of the 15th century.

**BLASPHEMY** (through the Fr. from Gr. βλασφήμια, profane language, slander, probably derived from root of βλασφήμω, to injure, and φήμη, speech), literally, defamation or evil speaking, but more peculiarly restricted to an indignity offered to the Deity by words or writing. By the Mosaic law death by stoning was the punishment for blasphemy (Lev. xxiv. 16). The 77th Noel of Justinian assigned death as the penalty, as did also the Capitulaires. The common law of England treats blasphemy as an indictable offence. All blasphemies against God, as denying His being, or providence, all contumelious reproaches of Jesus Christ, all profane scoffing at the Holy Scriptures, or exposing any part thereof to contempt or ridicule, are punishable by the temporal courts with fine, imprisonment and also infamous corporal punishment. An act of Edward VI. (1547) repealed
BLASS—BLASTING

1553, and revived 1558) enacts that persons reviling the sacra-
ment of the Lord's Supper, by contemptuous words or otherwise,
shall suffer imprisonment. Persons denying the Trinity were
deprived of the benefit of the Act of Toleration by an act of 1688.
An act of 1697-1698, commonly called the Blasphemy Act, enacts
that if any person, educated in or having made profession of
the Christian religion, should by writing, preaching, teaching or
advocating a justice of the peace, and for all crimes (except
blasphemy), deny any one of the Persons of the Holy Trinity
in the political, or should assert or maintain that there are more
gods than one, or should deny the Christian religion to be true, or
the Holy Scriptures to be of divine authority, he should, upon the
first offence, be rendered incapable of holding any office or place
of trust, and for the second incapable of bringing any action, of
being guardian or executor, or of taking a legacy or deed of gift,
and should suffer three years' imprisonment without bail. It
has been held that a person offending under the statute is also
indictable at common law ('Rex v. Carlisle, 1815, where Mr
Justice Best remarks, "In the age of toleration, when that
statute passed, neither churchmen nor sectarians wished to
protect in their infidelity those who disbelieved the Holy
Scriptures"). An act of 1812-1813 excepts from these enact-
ments "persons denying as therein mentioned respecting the
Holy Trinity," but otherwise the common and the statute law on
the subject remain as stated. In the case of 'Rex v. Woolston
(1728) the court declared that they would not suffer it to be
debated whether to write against Christianity in general was
not an offence punishable in the temporal courts at common law,
but there did not exist disputes between learned men on
particular controverted points.

The law against blasphemy has practically ceased to be put in
active operation. In 1841 Edward Moxon was found guilty of
the publication of a blasphemous libel (Shelley's 'Queen Mab'),
the prosecution having been instituted by Henry Hetherington, who
had previously been condemned to four months' imprisonment
for a similar offence, and wished to test the law under which he
was punished. In the case of Cowan v. Milburn (1867) the
defendant had broken his contract to let a lecture-room to the
plaintiff, on discovering that the intended lectures were to
maintain that "the character of Christ is defective, and his
teaching misleading, and that the Bible is no more inspired than
any other book," and the court of exchequer held that the
publication of such doctrine was blasphemy, and the contract
therefore illegal. On that occasion the court reaffirmed the
dictum of Chief Justice Hale, that Christianity is part of the laws
of England. The commissioners on criminal law (sixth report)
remark that "although the law forbids all denial of the being and
providence of God or the Christian religion, it is only implied
that it means the form of an insult to God and man that the
interference of the criminal law has taken place." In England
the last prominent prosecution for blasphemy was the case of 'R.
v. Ramsey & Foote, 1883, 48 L.T. 739, when the editor,
publisher and printer of the 'Freethinker' were sentenced to
imprisonment; but police court proceedings were taken as late
as 1908 against an obscure Hyde Park orator who had become
a public nuisance.

Proflane cursing and swearing is made punishable by the
Proflane Oaths Act 1745, which affects any offender to be brought
before the magistrates to answer for the words, and fine five shillings,
two shillings or one shilling, according as he is a gentleman, below the rank
of gentleman, or a common labourer, soldier, &c.

By the law of Scotland, as it originally stood, the punishment
of blasphemy was death, but by an act of 1825, amended in
1837, blasphemy was made punishable by fine or imprisonment
or both.

In France, blasphemy (which included, also, speaking against
the Holy Virgin and the saints, denying one's faith, or speaking
with impiety of holy things) was from very early times
given a severity. The punishment was death in various forms,
burning alive, mutilation, torture or corporal punishment.
In the United States the common law of England was largely
followed, and in most of the states, also, statutes were enacted
against the offence, but, as in England, the law is practically
never put in force. In Germany, the punishment for blasphemy
is imprisonment varying from one day to three years, according
to the gravity of the offence. To constitute the offence, the
blasphemy must be uttered in public, be offensive in character,
and have wounded the religious susceptibilities of some other
person. In Austria, whoever commits blasphemy by speech or
writing is liable to imprisonment for any term from six months
up to ten years, and the seriousness of the offence

BLASS, FRIEDRICH (1843-1907), German classical scholar,
was born on the 22nd of January 1843 at Osnabrück. After
studying at Göttingen and Bonn from 1860 to 1863, he lectured at
difficult and profound matters of classical philology at Kiel, and ordinary professor in 1881. In 1892 he accepted a professorship at Halle, where he died on the 9th of March 1907. He frequently visited England, and was intimately acquainted with leading British scholars. He received an honorary degree from Dublin University in 1892, and his readiness to place the results of his labours at the disposal of others, together with the
courtesy and kindness of his disposition, won the respect of all
who knew him. Blass is chiefly known for his works in connexion
with the study of Greek oratory: 'Die griechische Beredsamkeit
von Alexander bis auf Augustus' (1862); 'Die attische Beredsamkeit
(1868-1880; 2nd ed., 1887-1898), his greatest work; editions
for the Teubner series of Andocides (1880), Antiphan (1881),
Hypereides (1881, 1894), Demosthenes (Dindorf's ed., 1885,
Leocrates (1885), Isocrates (1888), Diogenes Laertius (1893),
Aeschines (1896), Lycurgus, Leocrates (1902); 'Die
Rhythmen der attischen Kunstprosa' (1901); 'Die Rhythmen
der ägyptischen Kunstprosa' (1903). Among his other
works are editions of Eudoxus of Cnidus (1887), the 'Abybolos
(4th ed., 1903), a work of great importance, and Bacchylides
(3rd ed., 1904); 'Grammatik des neutestamentlichen Griechisch
(1902); Eng. trans. by H. St John Thackery, 1905; 'Hermeneu-
tik und Kritik und Paläographie, Buchwesen, und Handschriften-
bände' (vol. i. of Müller's Handbuch der klassischen Altertums-
wissenschaft, 1891); 'Über die Aussprache des Griechischen
(1888; Eng. trans. by W. J. Purton, 1890); 'Die Interpolationen in
der Odyssey' (1904); contributions to Collitz's Sammlung der
griechischen Dialektschriften; editions of the texts of certain portions
of the New Testament (Gospels and Acts). His last work was
an edition of the 'Choeponi' (1906).

See notices in the 'Academy', March 16, 1907 (J. P. Mahaffy);
'Classical Review', May 1907 (J. E. Sandys), which contains also a review of 'Die Rhythmen der attischen Kunstprosa' in

BLASTING, the process of rending or breaking apart a solid
body, such as rock, by exploding within it or in contact with it
some explosive substance. The explosion is accompanied by
the sudden development of gas at a high temperature and under
a tension sufficiently great to overcome the resistance of the
enclosing body, which is thus shattered and disintegrated.
Before the introduction of explosives, rock was laboriously
excavated by hammer and chisel, or by the ancient process of
'stre-getting,' i.e. building a fire against the rock, which, on
cooling, splits and flacks off. To hasten disintegration, water
was often applied to the heated rock, the loosened portion being
then quickly removed by hammer. In the latter process, at
some times blasting has become a necessity for the excavation of
rock and other hard material, as in open surface cuts, quarrying,
tunnelling, shaft-sinking and mining operations in general.

For blasting, a hole is generally drilled to receive the charge
of explosive. The depth and diameter of the hole and the quantity
of explosive used are all variable, depending on the character
of the rock and of the explosive, the shape of the mass to be
blasted, the presence or absence of cracks or fissures, and the position
of the hole with respect to the free surface of the rock. The shock of
a blast produces impulsive waves acting radially in all directions,
the force being greatest at the centre of explosion and varying
inversely as the square of the distance from the charge.
This is evidenced by the observed facts. Immediately surrounding
the explosive, the rock is often finely splintered and crushed.
Beyond this is a zone in which it is completely broken and
The drilling holes in the rock to be blasted; the placing of the hole charge of explosive, with its fuse; (3) tamping the charge, i.e., compacting it and filling the remainder of the hole with some suitable material, of cutting away any broken material without breaking the ground; (4) igniting or detonating the charge; (5) clearing away the broken material. The holes for blasting are made either by hand, with hammer and drill or jumper, or by machine drill, the latter being driven by steam, compressed air, or electricity, or, in rare cases, by hydraulic power. Drilling holes ordinarily vary in diameter from 1 to 3 in., and in depth from a few inches up to 15 or 20 ft. or more. The deeper holes are made only in surface excavation of rock, the shallower, to a maximum depth of say 12 ft., being suitable for tunneling and mining operations.

**Hand Drilling.**—The work is either "single-hand" or "double-hand." In single-hand drilling, the miner wields the hammer with one hand, and with the other holds the drill or "bit," rotating it slightly after every blow in order to keep the hole round and prevent the drill from sticking fast; in double-hand work, one man strikes, while the other holds and rotates the drill. For large and deep holes, two hammermen are sometimes employed.

A miner's drill is a steel bar, occasionally round but generally of octagonal cross-section, one end of which is forged out to a cutting edge (fig. 1). The edge of the drill is made either straight, like that of a chisel, or with a convex curve, the latter shape being best for very hard rock. For hard rock the cutting edge should be rather thicker and blunter, and therefore stronger, than for softer rock. Drills are made of high-grade steel, as they must be tempered accurately and uniformly. The diameter of the drill steel for hand work is usually from 1 to 1 in., and the length of cutting edge, or gauge, of the drill is always greater than the diameter of the shank, in the proportion of from 1 to 3:4. Holes over 10 or 12 in. deep generally require the use of a set of drills of different lengths and depending in number on the depth required. The shortest drill, for starting the hole, has the widest cutting edge, the edges of the others being successively narrower and graduated to follow each other properly, as drill after drill is dulled in deepening the hole. Thus the hole decreases in diameter as it is made deeper. The miner's hammer (fig. 2) ranges in weight from 3 to 9 lb. for single-hand drilling, up to 8 or 10 lb. for double-hand. If the hammer is directed downward, a little water is poured into it at intervals, to keep the cutting edge of the drill cool and make a thin mud of the cuttings. From time to time the hole is cleaned out by the "scaper" or "spoon," a long slender iron bar, forged in the shape of a hollow semi-cylinder, with one end flattened and turned over at right angles. If the hole is directed steeply upward and the rock is dry, the cuttings will run out continuously during the drilling; otherwise the scraper is necessary, or a small pipe with a plunger like a syringe is used in pushing out the cuttings. The "jumper" is a long steel bar, with cutting edges on one or both ends, which is alternately raised and dropped in the hole by one or two men. In rock work the jumper is rarely used except for holes directed steeply downward, though for coal or salt slate or slate it may be employed for drilling holes horizontally or upward. Other tools used in connection with rock-drilling are the pick and gad.

Holes drilled by hand usually vary in depth from say 18 to 36 in., according to the nature of the rock and purpose of the work, though deeper holes are often made. For soft rock, single-hand drilling is from 20 to 30% cheaper than double-hand, but this difference does not hold good for the harder rocks. For these double-hand drilling is preferable, and may even be essential, to secure a reasonable speed of work.

**Machine Drills.**—The introduction of machine drills in the latter part of the 19th century exerted an important influence on the work of rock excavation in general, and especially on the art of mining. By their use many great tunnels and other works involving rock excavation under adverse conditions have been rapidly and successfully carried out. Before the invention of machine drills such work progressed slowly and with difficulty. Nearly all machine drills are of the reciprocating or percussive type, in which the drill point is firmly clamped to the piston rod and delivers a rapid succession of strong blows on the bottom of the hole. The ordinary compressed-air drill (which, for surface work, may be operated also by steam) may be taken as an illustration. The piston is carried in a cylinder, provided with a valve motion somewhat similar to that of a steam-engine, together with an automatic device for producing the necessary rotation of the piston and drill bit. While at work the machine is mounted on a heavy tripod (fig. 3); or, if underground, sometimes on an iron column or bar, firmly wedged in position between the roof and floor, or side walls, of the tunnel or mine workings. As the hole is deepened, the entire drill head is generally fed forward by a screw feed, a succession of longer and longer drill bits being used as required.

Among the numerous types and makes of percussion drill may be named the following: Adelaide, Climax, Darlington, Dubois-François, Ferrous, Froelich, Hierman, Ingersoll, Jeffrey, Leyner, McKlerman, Rand, Schram, Sergeant, Sullivan and Wood. One of the simplest of the machine drills is the Darlington (figs. 4 and 5), a is the cylinder; b, piston rod; c, bit; d, air inlets, e, exhaust, f, ratchet works; g, hammer or ratchet, h, holding of piston, i, h, or ratchet displaced or projected, leaving an enveloping mass of more or less ragged fractured rock only partially loosened. Lastly, the diminishing waves produce vibrations which are transmitted to considerable distances. Theoretically, if a charge of explosive be fired in a solid material of perfectly homogeneous texture and at a proper distance from the free surface, a conical mass will be blown out to the full depth of the drill hole, leaving a funnel-shaped cavity. No rock, however, is of uniform mineralogical and physical character, so that in practice there is only a rough approximation to the conical crater, even under the most favourable conditions. Generally, the shape of the mass blasted out is extremely irregular, because of the variable texture of the rock and the presence of cracks, fissures and cleavage planes. The ultimate or resultant useful effect of the explosion of a confined charge is in the direction where the least resistance is presented. In the actual work of rock excavation it is only by trial, or by deductions based on experience, that the behaviour of a given rock can be determined and the quantity of explosive required properly proportioned.
in-stroke until the port is uncovered. This admits the compressed air to the rear end of the cylinder, and as the area of this end of the piston is much greater than that of the shoulder, when the piston is driven forward and strikes its blow. When it has advanced far enough to cover the exhaust port & the air behind the piston is exhausted, and, under the pressure of the compressed air, the head is reversed. The rotation of piston and bit is caused by the rifle-bar j. On the outward stroke, the cylinder is fed forward with respect to the shell r, by rotating the handle j, which works a long screw-bar engaging with a nut on the under side of the cylinder. The shell r is bolted to the clamp s, which in turn is mounted on the hollow column or bar g, or on a tripod, according to the character of the work. By the motion of the adjacent clamp s, the machine can be set for drilling a hole in any desired direction. The drill makes from 400 to 800 strokes per minute.

For the reciprocating movement of the piston a spool valve is used, just as shown in fig. 6. The steam or compressed air is distributed through the ports alternately to the ends of the cylinder, by the reciprocations of a spool-valve working in a chest mounted on the cylinder. The movements of this valve are caused by the strokes of the main piston, which, by means of the wide annular groove around the middle of the piston, alternately open and close the spool-valve exhaust ports. Fig. 7 shows the Ingersoll Light rock-drilling drill, as mounted on a tripod, and in position for drilling a hole vertically downward. In the Leyner drill the drill-bit is not connected to the piston, but is struck a quick succession of blows by the latter. An important feature of this machine is the provision of a stream of water into the hole for clearing out the cuttings. For this purpose the Shank of the drill-bit is perforated longitudinally, the water being supplied under pressure from a small tank, to which compressed air is led.

A rock drill of entirely different design, the Brandt, has been successfully used in Europe for driving railway tunnels. It is operated by hydraulic power, the pressure water being supplied by a pump. The hollow drill-bit, which has a serrated cutting edge, is forced under heavy pressure against the bottom of the hole, and is rotated slowly—at six to eight revolutions per minute—by a pair of small hydraulic cylinders, thus grinding and crushing the rock instead of chipping it. The bottom of the hole is kept clean and the drill-bit cooled by a stream of water passing down through its hollow shank. On account of its size and weight, this machine is not suitable for mine work.

Most of the machine drills are made in a number of sizes, from 2 in. up to 5 in. diameter of cylinder, the larger sizes being capable of drilling holes 5 in. diameter and 30 ft. deep. They range in weight from say 95 to 690 lb. for the drill head (unmounted), the tripods weighing from 40 to 260 lb., exclusive of the weights placed for stability on the tripod legs (fig. 3). The sizes in most common use for cylindrical and conical holes, of the order of 3 in. to 5 in. in diameter, average hardness the best drills make from 4 to 7.5 lineal ft. of hole per hour. For use in narrow veins, or other confined workings underground, several extremely small and light conical and cylindrical air drills have been introduced, as, for example, the Frank and Wodehouse drill, the first of which weighs only 16 lb., and the second 18 lb. These drills are held in the hands of the miner in the required position, and the percussion of the rock is produced by a hand pump. All these mechanical drills operated by hand power have been invented. Some imitate hand-drilling in the mode of delivering the blow; in others the drill-bit is caused to reciprocate by means of combinations of crank and spring. None of these machines is entirely satisfactory, and none is universal.

Among percussion rock-drills operated by electricity are the Bladray, Box, Durkee, Marvin and Siemens-Halske. The Marvin drill works with a solenoid; most of the others have crank and spring movements for producing the reciprocations of the piston. Power is furnished by a small electric motor, either mounted on the machine itself, as with the Box drill, or more often standing on the ground and transmitting its power through a flexible shaft. Although rather freer than the percussion drills cannot yet be considered entirely successful, at least for mine service, in competition with compressed air machines. Another type of electric drill, however, has been successfully used in collieries, viz. rotary auger drills, mounted on light columns and driven through gearing by diminutive motors. These are intended for boring in coal, slate or other similar soft material. Hand augers resembling a carpenter’s brace and bit are also often used in collieries.

Whatever may be the method of drilling, after the hole has been completed to the depth required, it is finally cleaned out by a scraper or swab; or, when compressed air drills are used, by a jet of air directed into the hole by a short piece of pipe connected through a flexible hose with the compressed air supply pipe. The hole is then ready for the charge.

Location and Arrangement of Holes.—For hand drilling in mining the position of the holes is determined largely by the character and shape of the face of rock to be blasted. The miner observes the necessity of placing the holes to take advantage of them and to secure the best result from the blast. In driving a tunnel or drift, as in figs. 7 and 8, the rock joints can be made of material assistance by beginning with hole No. 1 and following round in a sequence corresponding to the figure; 8, 7, 6, 5, 4, 3, 2, 1. Frequently the ore, or vein matter, is separated from the wall-rock by a thin, soft layer of chy (D, fig. 8). This would act almost as a face, and the first holes of the round would be directed at an angle towards it, for blasting out a wedge; after which the positions of the other holes would be chosen. When machine drills are employed, less attention is given to natural rock or joints, chiefly because when the drill is once set up several holes at different angles can be drilled in succession by merely swinging the cylinder of the machine into a new position with respect to its mounting. According to one method, the holes are placed with the axes of symmetry, in roughly concentric rings, as shown by figs. 9 and 10. The centre holes are blasted first, and are followed by the others in one or more volleys as indicated by the dotted lines. Another method is the “centre cut,” in which the holes are drilled in parallel rows on each side of the centre line of the tunnel, drift or shaft. Those in the two rows nearest the middle are directed towards each other, and enclose a prism of rock, which is broken out as one piece. A few additional holes, done after the rows of side holes, will break with relatively light charges.

Explosives.—A great variety of explosives are in use for blasting purposes. Up to 1864, gunpowder was the only available explosive, but in that year Alfred Nobel first applied nitroglycerin for blasting, and in 1867 invented dynamite. This name was originally applied to its mixture of nitroglycerin with kieselguhr, but now includes also other mechanical mixtures or chemical compounds which develop a high explosive force as compared with gunpowder. Besides these there are the so-called flameless or safety explosives, used in collieries where inflammable gases are given off from the coal.

Gunpowder, or black powder, is seldom used for rock-blasting, except in quarrying building-stone, where slow and sustained explosives of relatively low power are desirable to avoid shattering the stone, and in such collieries as do not require the use of safety explosives. Gunpowder is exploded by detonation, through the agency of a fuse and fulminating cap, exerting a quick, shattering, rather than a rending force. Dynamites and other explosives are made in a variety of strengths, and are packed in waterproofed cartridges of different sizes. The grades of dynamite most commonly employed contain from 35 to 60% of nitroglycerin, the stronger are used for rough rock or deep holes, or for holes unfavourably placed in narrow mine workings, as sometimes in shaft-sinking or tunnelling. When of good quality high explosives are safer to handle than gunpowder,
as they cannot be ignited by sparks and are not so easily exploded. The ordinary dynamites used in mining are about four times as powerful as gunpowder.

Nitroglycerin in its liquid form is now rarely used for blasting, partly because it is very dangerous to transport and partly because of the difficulty and danger of transporting, handling and charging it. If employed at all, it is charged in thin tinned plate cases or rubber-cloth cartridges.

There are several accepted modes of thawing dynamite: (1) In a water bath, the cartridges being placed in a vessel surrounded on the sides and bottom by warm water contained in a larger enclosing vessel. The warm water may be renewed from time to time, or may be replaced by a hot water bath. (2) In a stove. (2) In two vessels, similar to the above, with the space between them occupied by air, provided the heat applied can be definitely limited, as by using a candle. (3) When large quantities of dynamite are required, warm the entire mass to the detonating point (say 360° F.) before all is consumed, an explosion will result. Furthermore, dynamite, when even moderately heated, becomes extremely sensitive to shocks.

BLASTING

There are several accepted modes of thawing dynamite: (1) In a water bath, the cartridges being placed in a vessel surrounded on the sides and bottom by warm water contained in a larger enclosing vessel. The warm water may be renewed from time to time, or may be replaced by a hot water bath. (2) In a stove. (2) In two vessels, similar to the above, with the space between them occupied by air, provided the heat applied can be definitely limited, as by using a candle. (3) When large quantities of dynamite are required, warm the entire mass to the detonating point (say 360° F.) before all is consumed, an explosion will result. Furthermore, dynamite, when even moderately heated, becomes extremely sensitive to shocks.
trial shots with different charges and depths of hole, and noting the results; also by letting contracts using the workmen to pay for the loss. In the event of rock excavation the location and determination of the depth of the holes and the quantity of explosive used, are occasionally put in charge of one or more skilled men, who then both plan the blast and are responsible for the results obtained.

Blasting in surface excavations and quarries is sometimes done on an immense scale—called "mammoth blasting." Shafts are sunk, or tunnels driven, in the quarry, and a number of charges are fired at one time to be blown in the mass. The result is that a large number of charges are excavated to receive the charges of explosive. The preparation for such blasts may occupy months, and many tons of gunpowder or dynamite may be exploded simultaneously, breaking against or disagreeing with several thousand, or even hundreds of thousands, of tons of rock. This method is adopted for getting stone cheaply, as for building macadamized roads, dams and breakwaters, obtaining limestone for blast furnace flux, or for rock excavation in subway excavations. It is also applied in submarine blasting for the removal of reefs obstructing navigation, and sometimes for freeing extensive banks of partly cemented gold-bearing gravel, preparatory to washing by hydraulic means.

BLAUBEUREN, a town of Germany, in the kingdom of Württemberg, 12 m. W. of Ulm, with which it is connected by railway. (Pop. 1906) 3114. It is romantically situated in a wild and deep valley of the Swabian Alps at an altitude of 1000 ft. and is the seat of an ancient abbey. At the site of the two ancient churches (two Evangelical and one Roman Catholic) the most remarkable is the abbey church (Klosterkirche), a late Gothic building dating from 1465-1496, the choir of which contains beautiful 15th century carved choir-stalls and a fine high altar with a triptych (1496). The choir only is used for service (Protestant), the nave being used as a gymnasium. The town church (Stadtkirche) also has a fine altar with triptych. The Benedictine abbey, founded in 905, was used after the Reformation as a school, and is now an Evangelical theological seminary. There are two hospitals in the town.

BLAVATSKY, HELENA PETROVNA (1831-1891), Russian theosophist, was born at Ekaterinoslav, on the 31st of July (O.S.) 1831, the daughter of Colonel Peter Hahn, a member of a Mecklenburg family, settled in Russia. She married in her seventeenth year a man very much her senior, Nicephore Blavatsky, a Russian official in Caucasus, from whom she was separated after a few months; in later days, when seeking to invest herself with a halo of virginity, she described the marriage as a nominal one. During the next twenty years Mme Blavatsky appears to have travelled widely in Canada, Texas, Mexico and India, and it is said there is evidence to prove she crossed the frontier alone in disguise, been lost in the desert, and, after many adventures, been conducted back by a party of horsemen. The years from 1848 to 1858 were alluded to subsequently as "the veiled period of her life," and she spoke vaguely of a seven years' sojourn in "Little and Great Tibet," or preferably of a "Himalayan retreat." In 1858 she revisited Russia, where she created a sensation as a spiritualistic medium. About 1870 she acquired prominence among the spiritualists of the United States, where she lived for six years, becoming a naturalized citizen. Her leisure was occupied with the study of occult and kabbalistic literature, to which she soon added that of the sacred writings of India, through the medium of Mr. M. D. (as he styled himself), consequently taking up the plan of combining the spiritualistic "control" with the Buddhaistic legends about Tibetan sages. Henceforth she determined to exclude all control save that of two Tibetan adepts or "mahatmas." The mahatmas exhibited their "astral bodies" to her, "precipitated" messages which reached her from the confines of Tibet in an instant of time, supplied her with sound doctrine, and inclined her to perform tricks for the conversion of sceptics. At New York, on the 17th of November 1875, with the aid of Colonel Henry S. Bulkley, she founded the "Theosophical Society" with the object of forming a brotherhood of man, (2) studying and making known the ancient religions, philosophies and sciences, (3) investigating the laws of nature and developing the divine powers latent in man. The Brahmanic and Buddhaistic literature supplied the society with its terminology, and its doctrines were a curious amalgam of Egyptian, kabbalistic, occultist, Indian and modern spiritualistic ideas and formulas. Mme Blavatsky's principal works were Isis Unveiled (New York, 1877), The Secret Doctrine, the Synthesis of Science, Religion and Philosophy (1888), The Key to Theosophy (1888), Isis Unveiled, Second Volume, or the Synthesis of Science, Religion and Philosophy (1897), and Isis Unveiled, Third Volume, or the Synthesis of Science, Religion and Philosophy (1899), and the mystical quotations from such books as K. R. H. Mackenzie's Royal Masonic Encyclopaedia, C. W. King's Ghosts, Zeller's Plato, the works on magic by Dunlop, E. Salvatore, Joseph Ennenmesser, and Des Mousseaux, and the mystical writings of Eliphas Levi (L. A. Constant). A Glossary of Theosophical Terms (1890-1892) was compiled for the benefit of her disciples. But the appearance of Home's Lights and Shadows of Spiritualism (1877) had a prejudicial effect upon the propaganda, and Heliona P. Blavatsky (as she began to style herself) retired to India. Thence she contributed some clever papers, "From the Caves and Jungles of Himalaya" (published separately in English, London, 1892) to the Rysky Vyestnik. Defeated in her object of obtaining employment in the Russian secret service, she resumed her efforts to gain converts to theosophy. For this purpose the exhibition of "physical phenomena" was found necessary. Her jugglery was cleverly concealed, but on three occasions was exposed in the most conclusive manner. Nevertheless, her cleverness, volubility, energy and will-power enabled her to maintain her ground, and when she died on the 8th of May 1891 (White Lotus Day), in her last collateral descendant, in London, she was the acknowledged head of a community numbering not far short of 100,000, with journalistic organs in London, Paris, New York and Madras.

Much information respecting her will be found in V. S. Soloyev's Modern Priestess of Isis, translated by Walter Leaf (1895), in Arthur Lillie's Madame Blavatsky and Her Theosophy (1895), and in the report made to the Society for Psychical Research by the Cambridge graduate despatched to investigate her doings in India. See also the article THEOSOPHY.

BLAYDES, FREDERICK HENRY MARVELL (1816-1908), English classical scholar, was born at Hampton Court Green, on the 29th of September 1818, being a collateral descendant of Arthur Marvell, he was educated at St Peter's school, York, and Christ Church, Oxford. He was Hertford scholar in 1838, took a second class in literae humaniores in 1840, and was subsequently elected to a studentship at Christ Church. In 1842 he took orders, and from 1843 to 1886 was vicar of Harringworth in Northamptonshire. During a long life he devoted himself almost entirely to the study of the Greek dramatists. His editions and philological papers are remarkable for bold conjectural emendations of corrupt (and other) passages. His distinction was reconocced by his being made an honorary LL.D. of Dublin, Ph.D. of the university of Budapest and a fellow of the royal society of letters at Athens. He died at Southsea on the 7th of September 1908.

His works include:—Aristophanes: Comedies and Fragments, with critical notes and commentary (1880-1893); Clouds, Knights, Frogs, Wasps (1873-1876); Opera Omni, with critical notes (1880);
BLAYDON—BLEACHING

BLAYDON, an urban district in the Chester-le-Street parliamentary division of Durham, England, on the Tyne, 4 m. W. of Newcastle by a branch of the North-Eastern railway. Pop. (1911) 11,617; (1901) 10,687; (1900) 19,617.

The town, Bleachers, had much Manufactures in her old mansion of Stellas, and below St. Stellaheugh, to which the victorious Scottish army crossed from Newburn on the Northumberland bank in 1640, after which they occupied Newcastle.

BLAYE-ET-STE LUCE, A town of south-western France, capital of an arrondissement in the department of Gironde, on the right bank of the Gironde (here over 2 m. wide), 35 m. N. of Bordeaux by rail. Pop. (1906) of the town, 34,235; of the commune, 48,600.

The town has a citadel built by Vauban on a rock beside the river, and embracing in its enceintes ruins of an old Gothic chateau. The latter contains the tomb of Count of Toulouse and son of Cloitre II. Blaye is also defended by the Fort Pâte on an island in the river and the Fort Médoc on its left bank, both of the 17th century. The town is the seat of a sub-prefect, and has tribunals of first instance and of commerce and a communal college. It has a small river-port, and carries on trade in wine, brandy, grain, fruit and timber. The industries include the building of small vessels, distilling, flour-milling, and the manufacture of oil and candles. Fine red wine is produced in the district.

In ancient times Blaye (Blania) was a port of the Santones. Tradition states that the hero Roland was buried in its basilica, which was on the site of the citadel. It was early an important stronghold which played an important part in the wars against the English and the Religious Wars. The duchess of Berry was imprisoned in its fortress in 1832-1833.

BLAZF (A.-S. blæse, a torch), a fire or bright flame; more nearly akin to the Ger. blase, pale or shining white, is the use of the word for the white mark on the face of a horse or cow, and the American use for a mark made on a tree by cutting off a piece of bark from it. The latter maybe a word of the same root, noise abroad, comes from the A.-S. blasan, to blow, cf. the Ger. blasen; in sense, if not in origin, it is confused with "blazon" in heraldry.

BLAZON, a heraldic shield, a coat of arms properly "described" according to the rules of heraldry, hence a proper heraldic description of such a coat. The O. Fr. blason seems originally to have meant simply a shield as a means of defence and not a shield-shaped figure for the display of armorial bearings, but this is difficult to reconcile with the generally accepted derivation from the Ger. blasen, to blow, proclaim, English "blaze," to noise abroad, to declare. In the 16th century the heraldic term, and "blaze" and "blazon" in the sense of proclaim, had much influence on each other.

BLEACHING, the process of whitening or depriving objects of colour, an operation incessantly in activity in nature by the influence of light, air and moisture. The art of bleaching, of which we have here to treat, consists in inducing the rapid operation of whitening agencies, and as an industry it is mostly directed to cotton, linen, silk, wool and other textile fibres, but it is also applied to the whitening of paper, pulp, bees' wax and some oils and other substances. The term bleaching is derived from the A.-S. bleasan, to bleach, or to fade, from which also comes the cognate German word bleichen, to whiten or render pale. Bleachers, down to the end of the 18th century, were known in England as "whistlers," a name obviously derived from the nature of their calling.

The operation of bleaching must from its very nature be of the same antiquity as the work of washing textures of linen, cotton or other vegetable fibres. Clothing repeatedly washed, and exposed in the open air to dry, gradually assumes a whiter and whiter hue, and our ancestors cannot have failed to notice and take advantage of this fact. Scarcely anything is known with certainty of the art of bleaching as practised by the nations of Egypt and Greece, and the manufactures, and her white and coloured linens were in high repute among contemporary nations. As a uniformly well-bleached basis is necessary for the production of a satisfactory dye on cloth, it may be assumed that the Egyptians were fairly proficient in bleaching, and that still more so were the Phoenicians with their brilliant and famous purple dyes. We learn, from Pliny, that different plants, and likewise the ashes of plants, which no doubt contained alkali, were employed as detergents. He mentions particularly the Struthium as much used for bleaching in Greece, a plant which has been identified some with Gypsophila Struthium. But as it does not appear from John Sibthorp's Flora Graeca, edited by Sir James Smith, that this species is a native of Greece, Dr Sibthorp's conjecture that the Struthium of the ancients was the Saponaria officinalis, a plant common in Greece, is certainly more probable.

In modern times, down to the middle of the 18th century, the Dutch possessed almost a monopoly of the bleaching trade although we find mention of bleach-works at Southwark near London as early as the middle of the 17th century. It was customary to send all the brown linen, then largely manufactured in Scotland, to Holland to be bleached. It was sent away in the month of March, and not returned till the end of October, being thus out of the hands of the merchant more than half a year.

The Dutch mode of bleaching, which was mostly conducted in the neighbourhood of Haarlem, was to steep the linen first in a waste lye, and then for about a week in a potash lye poured over it boiling hot. The cloth being taken out of this lye and washed, was next put into wooden vessels containing buttermilk, in which it lay under a pressure for five or six days. After this—"it was spread upon the grass, and kept wet for several months, exposed to the sunshine of summer."

In 1728 James Adair from Belfast proposed to the Scottish Board of Manufactures to establish a bleachfield in Galloway; this proposal the board approved of, and in the same year resolved to devote £2000 as premiums for the establishment of bleachfields throughout the country. In 1732 a method of bleaching with kelp, introduced by R. Holden, also from Ireland, was submitted to the board; and with their assistance Holden established a bleachfield for procuring his process at Pitkerro, near Dundee.

The bleaching process, as at that time performed, was very tedious, occupying a complete summer. It consisted in steeping the cloth in alkaline lyes for several days, washing it clear, and spreading it upon the grass for some weeks. The steeping in alkaline lyes, called bucking, and the bleaching on the grass, called crofting, were repeated alternately for five or six times. The cloth was then steeped for some days in sour milk, washed clean and crofted. These processes were repeated, diminishing every time the strength of the alkaline lye, till the linen had acquired the requisite whiteness.

For the first improvement in this tedious process, which was faithfully copied from the Dutch bleachfields, manufacturers were indebted to Dr Francis Home of Edinburgh, to whom the Board of Trustees paid £100 for his experiments in bleaching. He proposed to substitute water acidulated with sulphuric acid for the sour milk previously employed, a suggestion made in consequence of the new mode of preparing sulphuric acid, completed some time before by Dr John Roebuck, which reduced the price of that acid to less than one-third of what it had formerly been. When this change was first adopted by the bleachers, there was the same outcry against its corrosive effects as arose when chlorine was substituted for crofting. A great advantage was found to result from the use of sulphuric acid, which was that a souring with sulphuric acid required at the longest only twenty-four hours, and often not more than twelve; whereas, when sour milk was employed, six weeks, or even two
months, were requisite, according to the state of the weather. In consequence of this improvement, the process of bleaching was shortened from eight months to four, which enabled the merchant to dispose of his goods so much the sooner, and consequently to trade with less capital.

No further modification of consequence was introduced in the art till the year 1787, when a more important change was introduced by the introduction of chlorine (q.v.) an element which had been discovered by C. W. Scheele in Sweden about thirteen years before. The discovery that this gas possesses the property of destroying vegetable colours, led Berthollet to suspect that it might be introduced with advantage into the art of bleaching, and that it would enable practical bleachers greatly to shorten their processes. In a paper on chlorine or oxygenated muriatic acid, read before the Academy of Sciences at Paris in April 1786, and published in the Journal de Physique for May of the same year (vol. xxxi. p. 325), he mentions that he had tried the effect of the gas in bleaching cloth, and found that it answered perfectly. This idea is still further developed in a paper on the same substance, published in the Journal de Physique for 1786. In 1786 he exhibited the experiment to James Watt, who, immediately upon his return to England, commenced a practical examination of the substance, and was accordingly the person who first introduced the new method of bleaching into Great Britain. We find from Watt's own testimony that chlorine was practically employed in the bleachfield of his father-in-law, Mr. Mackenzie, in the neighbourhood of Glasgow, in March 1787. Shortly thereafter the method was introduced at Aberdeen by Messrs Gordon, Barron & Co., on information received from De Saussure through Professor Patrick Colandon of Aberdeen. Thomas Henry of Manchester was the first to bleach with chlorine in the Lancashire district, and to his independent investigations several of the early improvements in the application of the material were due.

In these early experiments, the bleacher had to make his own chlorine and the goods were bleached either by exposing them in black chambers to the action of the gas or by steeping them in its aqueous solution. If we consider the inconveniences which must have arisen in working with such a pungent substance as free chlorine, with its detrimental effect on the health of the workpeople, it will be readily understood that the process did not at first meet with any great amount of success. The first important improvement was the introduction in 1792 of eau de Javel, which was prepared at the Javel works near Paris by absorbing chlorine in a solution of potash (1 part) in water (3 parts) until effervescence began. This process was, however, given up by the introduction in 1799 of chloride of lime, or bleaching-powder, by Charles Tennant of Glasgow, whereby the bleacher was supplied with a reagent in solid form which contained up to one-third of its weight of available chlorine. Latterly frequent attempts have been made to replace bleaching-powder by hypochlorite of soda, which is prepared by the bleacher as required, by the electrolytic decomposition of a solution of common salt in specially constructed cells, but up to the present this mode of procedure has met with only a limited success (see ALKALI MANUFACTURE).

Bleaching of Cotton. Cotton is bleached in the raw state, as yarn and in the piece. In the raw state, and as yarn, the only impurities present are those which are naturally contained in the fibres and which include cotton wax, fatty acids, pectic substances, colouring matters, albuminoids and mineral matter, amounting in all to some 5% of the weight of the material. Both in the raw state and in the manufactured condition cotton also contains small black particles or specks which are firmly adherent to the material and are technically known as "motes." These consist of fragments of the cotton seed husk, which cannot be completely removed by mechanical means. The bleaching of cotton pieces is more complicated, since the bleacher is called upon to remove the sizing materials with which the manufacturer strengthens the warp before weaving (see below).

In principle, the bleaching of cotton is a comparatively simple process in which three main operations are involved, viz. (1) boiling with an alkali; (2) bleaching the organic colouring matters by means of a hypochlorite or some other oxidizing agent; (3) souring, i.e. treating with weak hydrochloric or sulphuric acid. For loose cotton and yarn these three operations are sufficient, but for piece goods a larger number of operations is usually necessary in order to obtain a satisfactory result.

Loose Cotton.—The bleaching of loose or raw cotton previously to spinning is usually carried out essentially in first steeping the material in a warm solution of soda for some hours, after which it is washed and treated with a solution of bleaching-powder, which is usually provided by washing, soured with weak sulphuric or hydrochloric acid, and ultimately washed free from acid. Careful treatment is necessary in order to avoid any undue matting of the fibres, while any drastic treatment such as boiling with caustic soda and soap, as is done for other cotton materials, cannot be employed, since the natural wax would thereby be removed, and this would detract from the spinning qualities of the fibre. In case the cotton is not intended to be spun, but is to serve for cotton wool or for the manufacture of gun cotton, more drastic treatment can be employed, and is, in fact, desirable. Thus, cotton waste is first extracted with petroleum spirit or some other suitable solvent, and then, after the removal of the grease, which may be present, it is then boiled with dilute caustic soda and resin soap, washed, bleached white with bleaching-powder, washed, soured and finally washed free from acid. In these operations some amount of dirt is removed, but it is of sufficient frequency necessary to open out the material after drying, in order to remove the scatters.

Cotton Yarn.—Cotton yarn is bleached in the form of cops, bunks or warps. In principle the processes employed are the same in each case, but the machinery necessarily differs. Most yarn is bleached in largeekt or "kiers" and it is given to one of these only. The sequence of operations is the same as in the bleaching of cotton waste, and these can be conducted for small lots in an ordinary rectangular wooden vat as used in dyeing, in which the yarn is suspended in the liquor from poles which rest with their ends on the two longer sides of the vat. For bleaching yarn in bulk, however, this mode of procedure would involve so much manual labour that the process would become too expensive. It is, therefore, mainly with the object of expediting the manufacture, that various methods, by means of which large quantities can be dealt with at a time.

The first operation, viz. that of boiling in alkali, is carried out in a "kier," a large, egg-ended, upright cylindrical vessel, constructed of boiler-plate and capable of treating from one to three tons of yarn at a time. In construction, the kiers used for yarn bleaching are similar in construction to those used for pieces (see below). The yarn to be bleached is evenly packed in the kier, and is then boiled by means of steam with the alkaline lye (3-4% of soda ash or 2% caustic soda on the weight of the cotton being usually employed) at various temperatures, varying from 35° to 120°. A thorough circulation of the liquor should be maintained during the boiling, and this is effected by means of a steam injector, or in other ways. As a rule low pressure kiers (working up to 10 lb. pressure) are employed, whereas with some bleachers prefer to use high pressure kiers for the purpose.

When the boiling has continued for the requisite time (6-8 hours), the steam is shut off and the yarn is washed below the floor line. The yarn is then washed in the kier by filling the latter with water and then running off, this operation being repeated two or three times. The yarn is then transferred to a stone cistern provided with a false bottom, beneath which a pipe connects the cistern with a well situated below the floor line. The well contains a solution of bleaching-powder, usually of 2° T. strength, and this is drawn up by means of a centrifugal brass pump and showered over the tops of the goods through a perforated wooden tray, passing then by gravitation through the goods back into the well. The circulation is maintained for one and a half to two hours, when the yarn will be found to be bleached. The bleaching-powder solution is now allowed to drain off, and water is circulated through the cistern to wash out what bleaching powder remains in the goods. The souring is next carried out either in the same or in a separate cistern by circulating a weak, 3% solution of soda, while it is allowed to drain, and the yarn is thoroughly washed to remove all acid, when it is taken out and wrung or hydroextracted. At this stage the yarn may be further treated in the same way or it may be dried, but if it is to be sold as white yarn, it is bleued. The bleuing may either be effected by dyeing or tinting with a colouring matter like Victoria blue 4R or acid violet, or by treating with an acid such as sulphuric acid. The bleuing is continued until the colour is uniformly distributed throughout the material. The yarn is now straightforwardly dried.
The effect of boiling with alkali is to remove the peracetic acid, the fatty acids, part of the cotton wax and the uncombined cot- tonoid, while the albuminoids and the nitrates are oxidised. The solution may be used alone or with soda in the proportion of 1 part to 2, in which case it has a more offensive smell. When the solution is used with the carbonic acid of the atmosphere it suffers decomposition according to the equation, \( \text{Ca} + \text{CO}_2 + \text{H}_2\text{O} \rightarrow \text{CaCO}_3 + \text{H}_2\text{O} \). The solution is injurious to the atmosphere, as the carbonic acid thus liberated destroys living matter still remaining from the first operation, by oxidation. At the same time the nitrates which were sweated up by the alkali are broken up into small fragments and are thus removed. In the operation the soda is sometimes lost, and which has been deposited on the fibres during the treatment with bleaching powder is dissolved, while at the same time any other metallic oxides (iron, copper, etc.) are removed.

**Cotton Pieces.**—By far the largest bulk of cotton is bleached in the piece, as it can be more conveniently and more economically dealt with in this form than in any other. Though similar in principle to yarn bleaching, the process of piece bleaching is more complex because the pieces contain in addition to the natural impurities of the cotton a considerable amount of foreign matter in the form of size which has been incorporated with the warp before weaving, with the object of strengthening it. This size consists essentially of starch (farina), with additions of tallow, zinc chloride, and occasionally other substances such as paraffin wax, magnesium chloride, etc., which must be removed if a perfect bleach is to result. Besides, mineral oil stains from the machinery of the weaving-shed are of common occurrence in piece goods.

Cotton pieces are bleached either by hot water or for dyed goods. The processes employed for these different classes vary but slightly and only in detail. The most drastic bleach that is required for goods which are subsequently to be printed. For dyed goods, the main object is not so much to obtain a perfect white, as to remove any impurities which might interfere with the dyeing, while avoiding the formation of any oxy- cellulose. In bleaching for whites ("market bleach") it is essential that the white should be as perfect as possible, and such goods are consequently invariably bleached after dyeing.

For small lots (1-20 pieces) the bleaching can be conducted on very simple machinery. Thus many small piece dyers combine the whole of their bleaching on the jigger, a simple form of dyeing machine on which most cotton piece goods are dyed (see DYEING).

In muslins, laces and other very light fabrics, which will not stand rough handling, the operations are conducted mainly by hand, washing being effected in the dash-wheel (fig. 1), which consists of a cylindrical box, revolving on its axis. It has four divisions, as shown by the dotted lines, and an opening into each division. A number of pieces are put into each, abundance of water is admitted behind, and the knocking of the pieces as they alternately dash from one side of the wheel to the other during the revolution of the wheel effects the washing. The process lasts from four to six minutes.

For velveteens, corduroys, heavy drills, pocketings and other thick fabrics in which creation is to be avoided as much as possible, the so-called "open bleach" is resorted to, which differs from the ordinary process chiefly in that the goods are treated throughout at full width.

The great bulk of cotton pieces is bleached in rope form, i.e. stitched together end to end and laterally collapsed, so that they will run through a dash-wheel of 4 to 5 in. in diameter.

The first operation which the goods undergo on arriving in the grey-room of the bleachers is that of stamping with tar or some other indigestible material in order that they may be identified after passing through the whole process. Then stitched together end to end by means of special sewing machines, the stitch being of such a nature (chain stitch) that the thread can be ripped out at one place and not at the whole operations.

**Singeing.**—In the condition in which the pieces leave the loom and come into the hands of the bleacher, the surface of the fabric is seen to be covered with a nap of projecting fibres which gives it a deposition of burling. This process which has not a disadvantage, but in the majority of cases, especially for those pieces which require a clean surface is essential, the nap is removed before bleaching.

This is removed by running the pieces at full width over a couple of arched casting plates heated to a full red heat by means of a fire. An arrangement of the kind is shown in fig. 2, in which the singe-plates, a and b, are mounted over the flames of a coal fire. The plate b is most highly heated, a being at the end of the flue farthest removed from the fire. The cloth enters over a rail A, and in passing over the plate a is thoroughly dried and prepared for the singeing, it receives when it comes to the highly-heated plate b. A block c, carrying two rails in the space between the plates, can be raised or lowered so as to increase or lessen the pressure of the cloth against the plates, or if necessary, to lift it quite free of contact with them.

The pieces on leaving the singeing machine are passed either through a water trough or through a steam box with the object of extinguishing sparks, and are then plaited down. The speed at which the pieces travel over the singe plates is necessarily considerable and varies with different classes of material.

In lieu of plates, a cast-iron cylinder is sometimes employed ("roller singeing"), the heating being effected by causing the flame of the fire to be drawn through the roller, which is carried on two small rollers at each end and revolves slowly in the reverse direction to that followed by the piece, thus exposing continuously a freshly heated surface and avoiding uneven cooling. For figured pieces which have an uneven surface, it is obvious that plate or roller singeing would only affect the portions which project most, leaving the rest untouched. For such goods, "gas singeing" is employed, which consists in running the pieces over a non-luminous gas flame, the breadth of which slightly exceeds that of the piece, or in drawing the flame right through the piece. The construction of an ordinary gas singeing apparatus is seen in section in fig. 3. Coal gas mixed with air is sent under pressure through a pipe a into the burners b, where the mixture burns with an intense heat. The cloth travels in the direction of the arrows, and in passing over the small nap rollers c comes into contact with the flame four times in succession before leaving the machine.

Gas singeing is also used for plain goods, and being cleaner and under better control has largely replaced plate singeing. At this stage the goods which have been browning on the water by singeing are ready for the bleaching operations. A number of innovations have been introduced in recent years in the bleaching of calico, but although it is generally admitted that in point of view of time and economy many of these processes offer considerable advantages, the old process, in which a lime boil is employed for the other operations, is still the one which is most largely employed by bleachers in England. In this, the sequence of operations is the following—

**Grey Washing.**—This operation (which is sometimes omitted) simply consists in running the pieces through an ordinary washing machine (as shown in fig. 5) through water in order to wet them out. On leaving the machine they are piled in a heap and left over night, when fermentation sets in, which results in the starch being to a large extent hydrolysed and rendered soluble in water.

**Lime Boil.**—In this operation, which is also known as boulking (Ger. Buechen), the pieces are first run through milk of lime contained in an ordinary washing machine and of such a strength

---

1. Besides being used for cotton goods, plate singeing is also employed for certain classes of worsted goods (alpacas, bunting, etc.), and for most union goods (cotton warp and worsted weft).

A machine working on this principle has been constructed by F. Binder, and the makers of the machine (Messrs Mather & Platt, Ltd.) claim that it does better service than the machines constructed on the older principle.
that they take up about 4% of their weight of lime (CaO). They are then run over winches and guided through smooth porcelain rings ("pot-eyes") into the kier, where they are evenly packed by boys who enter the vessel through the manhole at the top. It is of the greatest importance that the goods should be evenly packed, for, if channels or loosely-packed places are left, the liquor circulating through the kier, when boiling is subsequently in progress, will follow the line of least resistance, and the result is an uneven treatment. Of the numerous forms of kier in use, the injector kier is the one most generally adopted. This consists of an egg-ended cylindrical vessel constructed of stout boiler plate and shown in sectional elevation in fig. 4. The kier is from 10 to 12 ft. in height and from 6 to 7 ft. in diameter, and stands on three iron legs riveted to the sides, but not shown in the figure. The bottom exit pipe E is covered with a shield-shaped false bottom of boiler plate, or (and this is more usual) the whole bottom of the kier is covered with large rounded stones from the river bed, the object in either case being to prevent the accumulation of liquor and to prevent the pipe E being blocked. The cloth is evenly packed up to within about 3 to 4 ft. of the manholes M, when lime water is run in through the liquor pipe until the level of the liquid reaches within about 2 ft. of the top of the goods. The manholes are now closed, and steam is turned on at the injector J by opening the valve v. The effect of this is to suck the liquor through E, and to force it up through pipe P into the top of the kier, where it dashes against the umbrella-shaped shield U and is distributed over the pieces, through which it percolates, until on arriving at G it is again carried to the top of the kier, a continuous circulation being thus effected. As the circulation proceeds, the steam condensing in the liquor rapidly heats the latter to the boiler, and as soon as, in the opinion of the foreman, all air has been expelled, the blow-through tap is closed and the boiling is continued for periods varying from six to twelve hours under 20-60 lb pressure. Steam is now turned off, and by opening the valve V the liquor, which is of a dark-brown colour, is forced out by the pressure of the steam it contains.

The pieces are now run through a continuous washing machine, which is provided with a plentiful supply of water. The machine,

![Fig. 4.—High Pressure Blow-through Kier.](image)

which is shown in fig. 5, consists essentially of a wooden vat, over which there is a pair of heavy wooden (sycamore) bowls or squeezers. The pieces enter the front end, as indicated by the arrows, and pass rapidly through the bowls down to the bottom of the vat over a loose roller, thence between the first pair of guide pegs through the bowls again, and travel thus in a spiral direction until they arrive simply to prove the machine, when they leave at the side opposite to that on which they entered. The same type of machine is used for liming, chemicking, and souring.

The next operation is the "grey sour," in which the goods are run through a washing machine containing hydrochloric acid of 2% Tw. strength, with the object of dissolving out the lime which the goods retain in considerable quantity after the lime boil. The goods are then well washed, and are now boiled again in the ash boiling kier, which is similar in construction to the lime kier, with soda ash (3%) and a solution of rosine (13%) in caustic soda (12%).

![Fig. 5.—Roller Washing Machine.](image)

For white bleaching the rosin soap is omitted, soda ash alone being employed.

The pieces are now washed free from alkali and the bleaching proper or "chemicking" follows. This operation may be effected in various ways, but the most efficient is to run the goods in a washing machine through bleaching powder solution at 3/4-1° Tw., and allow them to lie loosely piled over night, or in some cases for a longer period. They are now washed, run through dilute sulphuric or hydrochloric acid at 2° Tw. ("white sour") and washed again. Should the white not appear satisfactory at this stage (and this is usually the case with very heavy or dense materials), they are boiled again in soda ash, chemicked with bleaching powder at 1/2° Tw. or even weaker, soaked and washed. It is of the utmost importance that the final washing should be as thorough as possible, in order to completely remove the acid, for if only small quantities of the latter are left in the goods, they are liable to become tender in the subsequent drying, through formation of hydrocellulose.

The modern processes of bleaching cotton pieces differ from the one described above, chiefly in that the lime boil is entirely dispensed with, its place being taken by a treatment in the kier with caustic soda (or a mixture of caustic soda and soda ash) and resin soap. The best known and probably the most widely practiced of these processes is one which was worked out by the late M. Horace Koechlin in conjunction with Sir William Mather, and this differs from the old process notably in the sequence of the operations, but also in the construction of the kier. This consists of a horizontal egg-ended cylinder, and is shown in transverse and longitudinal sections in figs. 6 and 7. One of the ends E constitutes a door which can be raised or lowered by means of the power-driven chain C. The goods to be bleached are packed in wagons W outside the kier, and when filled these are pushed home into the kier, so that the pipes P fit with their flanges on to the fixed pipes at the bottom of the kier. The heating is effected by means of steam pipes at the lowest extremity of the kier, while the circulation of the liquor is brought about by means of the centrifugal pump F, which draws the liquor through the pipes P from beneath the false bottoms of the wagons and showers it over distributors D on to the goods. By this mode of working a considerable economy is effected in point of time, as the kier can be worked almost continuously; for as soon as one lot of goods has been boiled, the wagons are run out and two freshly-packed wagons take their place. The following is the sequence of operations:—The goods are first steeped over night in
dilute sulphuric acid, after which they are washed and run through old kier liquor from a previous operation. They are then packed evenly in the wagons which are pushed into the kier, and, the door having been closed, they are boiled for about eight hours at 7-15 lb pressure with a liquor containing soda ash, caustic soda, resin soap and a small quantity of sulphite of soda. The rest of the operations (chemicking, scouring and washing) are the same as in the old process.

A somewhat different principle is involved in the Thies-Herzig process. In this the kier is vertical, and the circulation of the liquor is effected by means of a centrifugal or other form of pump, while the beating of the liquor is brought about outside the kier in a separate vessel between the pump and the kier by means of indirect steam. The sequence of operations is similar to that adopted in the Mather-Koechlin process, differing chiefly from the latter in the first operation, which consists in running the goods, after singeing, through very dilute boiling sulphuric or hydrochloric acid, containing in either case a small proportion of hydrofluoric acid, and then running them through a steam box, the whole operation lasting from twenty to sixty seconds.

Bleached by any of the above processes, the cloth is next passed over a mechanical contrivance known as a "scratcher," which opens it out from the rope form to its full breadth, and is then dried on a continuous drying machine. Fig. 8 shows the appearance and construction of an improved form of the horizontal drying machine, which is in more common use for piece goods than the vertical form.

The machine consists essentially of a series of copper or tinned iron cylinders, which are geared together so as to run at a uniform speed. Steam at 10-15 lb pressure is admitted to the first cylinder, then in a zigzag direction over all succeeding cylinders, and ultimately leaves the machine dry, being mechanically plaited down at the other end. The pieces pass in the direction of the arrow (fig. 9) over a scryp rail or expanding roller round the first cylinder, then in a zigzag direction over all succeeding cylinders, and ultimately leave the machine dry, being mechanically plaited down at the other end. The process has been improved considerably; these machines should not only show a uniform pure white colour, but their strength should remain unimpaired. Careful experiments conducted by the late Mr. Charles O'Neill showed in fact that carefully bleached cotton may actually be stronger than in the unbleached condition, and this result has since been corroborated by others. Excessive bluing, which is frequently resorted to in order to cover the defects of imperfect bleaching, can readily be obtained by means of a solution of the material in water, or, better still, in water containing a little ammonia, and then comparing with the original. The formation of oxycellulose during the bleaching process may either take place in boiling under pressure with lime or caustic soda in consequence of the presence of air in the kier, or through excessive action of bleaching powder, which may either result from the latter not being properly dissolved or being used too strong.

Its detection may be effected by dyeing a sample of the bleached cotton in a cold, very dilute solution of methylene blue for about ten minutes, when any portions of the fabric in which the cellulose has been converted into oxycellulose will assume a darker colour than the rest. The depth of the colour is at the same time an indication of the extent to which such conversion has taken place. Most bleached cotton contains some oxycellulose, but as long as the formation has not proceeded far enough to cause tendering, its presence is of no importance in white goods. If, on the other hand, the cotton has to be subsequently dyed with direct cotton colours (see Dyeing), the presence of oxycellulose may result in uneven dyeing. Tendering of the pieces, due to insufficient washing after the final scouring operation, is a common defect in bleached goods. As a rule the free acid in detected by extracting the tendered material with distilled water and adding to the extract a drop of methyl orange solution, when the latter will turn pink if free acid be present. Other defects which may occur in bleached goods are iron stains, mineral oil stains, and defects due to the addition of paraffin wax in the size.

Bleaching of Linen.

The bleaching of linen is a much more complicated and tedious process than the bleaching of cotton. This is due in part to the fact that in linen the impurities amount to 20%, or more, of the weight of the fibre, whereas in cotton they do not usually exceed 5%. Furthermore these impurities, which include colouring matter, intracellular substances and a peculiar wax known as "flax wax," are more difficult to attack than those which are present in cotton, and the difficulty is still further enhanced in the case of piece goods owing to their dense or impervious character.

Till towards the end of the 18th century the bleaching of linen both in the north of Ireland and in Scotland was accomplished by bowking in cows' dung and souring with milk, the pieces being exposed to light on the grass between these operations for prolonged periods. Subsequently potash and later on soda...
was substituted for the cows' dung, while sour milk was replaced by sulphuric acid. This "natural bleach" is still in use in Holland, a higher price being paid for linen bleached in this way than for the same material bleached with the aid of bleaching powder. In the year 1744 Dr James Ferguson of Belfast received a premium of £300 from the Irish Linen Board for the application of lime in the bleaching of linen. Notwithstanding this reward, the use of lime in the bleaching of linen was for a long time afterwards forbidden in Ireland under statutory penalties, and so late as 1815 Mr Barklie, a respectable linen bleach of Linen Vale, near Keady, was "prosecuted for using lime in the whitening of linens in his bleachyard."

The methods at present employed for the bleaching of linen are, except in one or two unimportant particulars, the same as were used in the middle of the 19th century. In principle they resemble those used in cotton bleaching, but require to be frequently repeated, while an additional operation, which is a relic of the old-fashioned process, viz. that of "grassing" or "crofting," is still essential for the production of the finest whites. Considerably more care has to be exercised in linen bleaching than is the case with cotton, and the process consequently necessitates a greater amount of manual labour. The practical result of this is that whereas cotton pieces can be bleached and finished in less than a week, linen pieces require at least six weeks. Many attempts have naturally been made to shorten and cheapen the process, but without success. The use of stronger reagents and more drastic treatment, which would at first suggest itself, incurs the risk of injury to the fibre, not so much in respect to actual tendering as to the destruction of its characteristic gloss, while if too drastic a treatment is employed at the beginning the colouring matter is liable to become set in the fibre, and it is then almost impossible to remove it. Among the many modern improvements which have been suggested, mention may be made of the use of hypochlorite of soda in place of bleaching powder, the use of oil in the first treatment in alkali (Cross & Parkes), while de Keukelaere suggests the use of sodium sulphide for this purpose. With the object of dispensing with the operation of grassing, which besides necessitating much manual labour is subject to the influences of the atmospheric conditions, Siemens & Halske of Berlin have suggested exposure of the goods in a chamber to the action of electrolytically prepared ozone. Jardin seeks to achieve the same object by steeping the linen in dilute nitric acid. Since the qualities of linen which are submitted to the bleach vary considerably, and the mode of treatment has to be varied accordingly, it is not possible to give more than a bare outline of linen bleaching.

Linen is bleached in the yarn and in the piece. Whenever one of the operations is repeated, the strength of the reagent is successively diminished. In yarn-bleaching the sequence of the operations is about as follows:—(1) Boil in kier with soda ash. (2) Reel in bleaching powder. This operation, which is peculiar to linen bleaching, consists in suspending the hanks from a square roller into bleaching powder solution contained in a shallow stone trough. The roller revolves slowly, so that the hanks, while passing continuously through the bleaching powder, are for the greater part of the time being exposed to the air. (3) Sour in sulphuric acid. (4) Scald in soda ash. (5) Sour in sulphuric acid. (6) Scald in soda ash. (8) Dip, i.e. steep in bleaching powder. (9) Sour in sulphuric acid. (10) Scald in soda ash. (11) Dip in bleaching powder. (12) Sour in sulphuric acid. For a full white, two more operations are usually required, viz. (13) scald in soda ash, and (14) dip in bleaching powder. Washing intervenes between all these operations.

The pieces are not stapled as in the case of cotton, but thread-marked by hand with cotton dyed Turkey red. They are then sewn together end to end, and subjected to the following operations:

Boil with lime in kier.

The pieces are now separated and made up into bundles (except in the case of very light linens, which may pass through the whole of the operations in rope form) and soared with sulphuric acid.

First lye boil with soda ash and caustic soda.
Second lye boil. For some classes of goods no less than six lye boils may be required.
Grass between lye boils (according to their number).
Rub with rubbing boards. This is also a speciality in linen bleaching, and consists of a mechanical treatment with soft soap, the object of which is to remove black stains in the yarn.
Bleach with hypochlorite of soda.
Scald. The two latter treatments are repeated three to five times, each series constituting a "turn." Grassing intervenes between each turn, and in some instances the pieces are rubbed before the last soda boil.

The pieces are next steeped in large vessels (kiers) in weak hypo-

---

**FIG. 8.—Mather & Platt's Horizontal Drying Machine.**

**FIG. 9.—Diagram showing the Horizontal Drying Machine threaded with Cloth.**

**Bleaching of other Vegetable Textile Fabrics.**

Hemp may be bleached by a process similar to that used for linen, but this is seldom done owing to the expense entailed. China grass is bleached like cotton. Jute contains in its raw state a considerable amount of colouring matter and intracellular substance. Since the individual fibres are very short, the
complete removal of the latter would be attended by a disintegration of the material. Although it is possible to bleach jute white, this is seldom if ever carried out on a large scale owing to the great expense involved. A half-bleach on jute is obtained by steeping the goods alternately in bleaching powder (or hypochlorite of soda) and sulphuric acid, washing intervening. For a cream these treatments are repeated.

**Bleaching of Straw.**

In the Luton district, straw is bleached principally in the form of palt, in which form it is imported. The bleaching is effected by steeping the straw for periods varying from twelve hours to several days in fairly strong alkaline peroxide of hydrogen. The number of baths depends upon the quality of straw and the degree of whiteness required. Good whites are thus obtained, and no further process would be necessary if the hats are not subsequently to be "blocked" or pressed at a high temperature which brings about a deterioration of the colour. After bleaching with peroxide and drying, the straw consequently undergoes a further process of sulphuring, i.e., exposure to gaseous sulphurous acid. Panama hats are bleached after making up, but in this case only peroxide of hydrogen is used and a very lengthy treatment entailing sometimes fourteen days' steeping is required.

**Bleaching of Wool.**

In the condition in which it is delivered to the manufacturers wool is generally a very impure article, even if it has been washed on the sheep's back before shearing. The impurities which it contains consist in the main of the natural grease (in reality a kind of wax) exuded from the skin of the sheep and technically known as the "yolk," the dried-up perspiration from the body of the sheep, technically called "sweat," and dust, dirt, burrs, &c., which mechanically adhere to the sticky surfaces of the fibres. In this condition wool is quite unfit for any manufacturing purposes and must be cleaned before any mechanical operations can be performed. Properly washing was effected in stale urines, which owed its detergent properties mainly to the presence of ammonium carbonate. The stale urine or lant was diluted with four to five times its bulk of water, and in this liquor, heated to 40°–50° C., the washing was effected.

At the present day this method has been entirely abandoned, the washing or "scouring" being effected with soap, assisted by ammonia, potash, soda or silicate of soda. The finest qualities of wool are washed with soft soap and potash, while for inferior qualities, cheaper detergents are employed. The operation is in principle perfectly simple, the wool being submerged in the warm soap solution, where it is moved about with forks and then taken out and allowed to drain. A second treatment in weaker soap serves to complete the process. In dealing with large quantities, wool-washing machines are employed, which consist essentially of long cast-iron troughs which contain the soap solution. The wool to be washed is fed in at one end of the machine and is slowly propelled to the other end by means of a system of mechanically-driven forks or rakes. As it passes from the machine, it is squeezed through a pair of rollers. Three such machines are usually required for efficient washing, the first containing the strongest, and the third the weakest soap.

The washing of wool is in the main a mechanical process, in which the water dissolves out the sweat while the soap emulsifies the yolk and thus removes it from the fibre. The attendant earthy impurities pass mechanically into the surrounding liquid and are swilled away.

In some works the wool is washed first with water alone, the aqueous extract thus obtained being evaporated to dryness and the residue calcined. A very great quantity of potash is thus obtained as a by-product. In many works in Yorkshire and elsewhere, the dirty soap liquors obtained in wool-washing are not allowed to run to waste, but are run into tanks and thereby treated with sulphuric acid. The effect of this treatment is to decompose the soap, and the fatty acids along with the wool-grease rise as a magma to the surface. The purified product is known in the trade as "Yorkshire grease."

Attempts have been made from time to time to extract the natural grease from wool by means of organic solvents, such as carbon bisulphide, carbon tetrachloride, petroleum spirit, &c., but have not met with much success.

Worsted yarn spun on the English system, as well as woollen yarn and fabrics made from them, contain oil which has been incorporated with the wool to facilitate the spinning. This oil must be got rid of previous to bleaching, and this is effected by scouring in warm soap with or without the assistance of alkalis.

The actual bleaching of wool may be effected in two ways, viz., by treating the material with sulphurous acid or with hydrogen peroxide. Sulphurous acid may either be applied in the gaseous form or in solution as bisulphite of soda. In working by the first method, which is technically called "clayning," the scoured yarn is wetted in very weak soap containing a small amount of some colouring matter, wrung or hydro-extracted and then suspended in a chamber or stove. Sulphur contained in a vessel on the floor of the chamber is now lighted, and the door having been closed, is allowed to burn itself out. The goods are thus exposed to the sulphur dioxide overnight, when they are taken out and washed in water. For piece goods a somewhat different arrangement is employed, the pieces passing through a slit into a chamber supplied with sulphur dioxide, then slowly up and down over a large number of rollers and ultimately emerging again at the same slit. Wool bleached by this process is referred to as "bleached in the back." After washing in bisulphite of soda and then washing well in water. Wool bleached with sulphurous acid or bisulphite is readily affected by alkalis. The natural yellow colour is re-established on washing with soap or soda. A more permanent bleach is obtained by bleaching in hydrogen peroxide (of 12 volumes strength), let down with about three times its bulk of water and rendered slightly alkaline with ammonia or silicate of soda. Black or brown-dyed wool bleached white, but when treated with peroxide they assume a golden colour, a change which is frequently desired in human hair.

**Bleaching of Silk.**

In raw silk, the fibre proper is uniformly coated with a proteid substance known as silk-gum, silk-glue or sericine which amounts to 10–12% of the weight of the material, and it is only after the removal of this coating that the characteristic properties of the silk fibre become apparent. This is effected by the process of "discharging" or "boiling-off," which consists in suspending the hanks of raw silk over poles or sticks in a vat containing a strong hot soap solution (30% of soap on the weight of the silk). The liquor is kept just below boiling point for two or three hours, the hanks being turned from time to time. During the process, the sericine at first swells up considerably, the fibres becoming slippery, but as the operation proceeds it passes into solution. It is important that only soft water should be used for boiling-off, as otherwise calcareous impurities are liable to mar the lustre of the silk.

The silk is now rinsed in weak soda solution and wrung. In this condition it is suitable for being dyed, but if it is to be bleached, the hanks are tied up loosely with smooth tape, put into coarse linen bags to prevent the silk becoming entangled, and boiled again in soap solution which is half as strong as that used in the first operation. The hanks are now taken out, rinsed in a weak soda solution, washed in water and wrung.

The actual bleaching of silk is usually effected by stoving as in the case of wool, with this difference, that the operation is repeated several times and blueing or tinting with other colours is effected after bleaching. Silk may also be bleached with peroxide of hydrogen, but this method is only used for certain qualities of spun silk and for tussore.

**Ornamental feathers** are best bleached by steeping in peroxide of hydrogen, rendered slightly alkaline by the addition of ammonia. The treatment is applied to the bleaching of ivory. If peroxide of hydrogen could be prepared at a moderate cost, it would doubtless find a much more extensive application in bleaching, since it combines economy with safety, and gives good results with both vegetable and animal substances.

**BLEAK, or BLICK (Alburnus lucidus),** a small fish of the Cyprinid family, allied to the bream and the minnow, but with a more elongate body, resembling a sardine. It is found in European streams, and is caught by anglers, being also a favourite in aquariums. The well-known and important industry of "Essence Orientale" and artificial pearls, carried on in France and Germany with the crystalline silver covering matter of
the bleek, was introduced from China about the middle of the 17th century.

BLEEK, FRIEDRICH (1793–1859), German Biblical scholar, was born on the 4th of July 1793, at Ahrensbök, in Holstein, a village near Liibeck. His father sent him in his sixteenth year to the gymnasium at Liibeck, where he became so much interested in ancient languages that he abandoned his idea of a legal career and resolved to devote himself to the study of theology.

After spending some time at the university of Kiel, he went to Berlin, where, from 1814 to 1817, he studied under De Wette, Neander and Schleiermacher. So highly were his merits appreciated by his professors that he was appointed an extraordinary professor at the university, and to that post he was also called to the chair of the Sibylline authority, and was induced to write a special Charisma for the science of "Introduction"—that in 1818 after he had passed the examinations for entering the ministry he was recalled to Berlin as Repetent or tutorial fellow in theology, a temporary post which the theological faculty had obtained for him. Besides discharging his duties in the theological seminary, he published two dissertations in Schleiermacher's and G. C. F. Lücke's Journal (1819–1820), one on the origin and composition of the Sibylline Oracles "Uber die Entstehung und Zusammensetzung der Sibyllischen Orakel" and another on the Book of Daniel, "Uber Verfasser und Zweck des Buches Daniel." These articles attracted much attention, and were distinguished by those qualities of solid learning, thorough investigation and candour of judgment which characterized all his writings. Bleek's merits as a rising scholar were recognized by the minister of public instruction, who continued his stipend as Repetent for a third year, and promised further advancement in due time. But the attitude of the political authority underwent a change. De Wette was dismissed from his professorship in 1819, and Bleek, a favourite pupil, incurred the suspicion of the government as an extreme democrat. Not only was his stipend as Repetent discontinued, but his nomination to the office of professor extraordinarius, which had already been signed by the minister Karl Altenstein, was withheld. At length it was found that Bleek had been confused with a certain Bauleven Blech, and in 1823 he received the appointment.

During the six years that Bleek remained at Berlin, he twice declined a call to the office of professor ordinarius of theology, once to the Greifswald chair, and once to Königsberg. In 1829, however, he was induced to accept Lücke's chair in the recently-founded university of Bonn, and entered upon his duties there in the summer of the same year. For thirty years he laboured with ever-increasing success, due not to any attractions of manner or to the enunciation of novel or bizarre opinions, but to the soundness of his investigations, the impartiality of his judgments, and the clearness of his method. In 1843 he was raised to the office of consistorial councillor, and was selected by the university to hold the office of rector, a distinction which has not since been conferred upon any theologian of the Reformed Church. He died suddenly of apoplexy on the 27th of February 1859.

Bleek's works belong entirely to the departments of Biblical criticism and exegesis. His views on questions of Old Testament criticism were "advanced" in his own day; for on all the disputed points concerning the unity and authorship of the books of the Old Covenant he was opposed to received opinion. But with respect to the New Testament his position was conservative. An opponent of the Tübinger school, his defence of the genuineness and authenticity of the gospel of St John is among the ablest that have been written; and although on some minor points his views did not altogether coincide with those of the traditional school, his critical labours on the New Testament must nevertheless be regarded as among the most important contributions to the maintenance of orthodox opinions. His greatest work, his commentary on the epistle to the Hebrews (Brief an die Hebrewer erläuterter durch Einleitung, Übersetzung, und fortlaufenden Kommentar, in three parts, 1838, 1838 and 1840) won the highest praise from men like De Wette and Fr. Delitzsch. This work was abridged by Bleek for his college lectures, and was published in that condensed form in 1868.

In 1846 he published his contributions to the criticism of the gospels (Beiträge zur Evangelien Kritik, pt. i), which contained his defence of St John's gospel, and arose out of a review of J. H. A. Ehrard's Wissenschaftliche Kritik der Evangelischen Geschichte (1842).

After his death were published:—(1) His Introduction to the Old Testament (Einleitung in das Alte Testament), (3rd ed., 1869); Eng. trans. by G. H. Venables (from 2nd ed., 1886); in 1878 a new and enlarged edition was published by E. J. Stukenbrock. (2) His Introduction to the New Testament (3rd ed., W. Mangold, 1875), Eng. trans. (from 4th ed., 1882) by C. B. Pusey. (3) His Exposition of the First Three Gospels (Synoptische Erklärung der drei ersten Evangelien), by H. Holtzmann (1862); (4) his Lectures on the Apocalypse (Verlesungen über die Apokalypse), (Eng. trans. 1875). Besides these there has also appeared a small volume containing his Lectures on Colossians, Philoemen and Ephesians (Berlin, 1865). Bleek also contributed many articles to the Studien und Kritiken. For further information as to Bleek's life and writings, see Kamphausen's article in Herzog-Hauck's Realencyklopädie; Frédéric Lichtenberger's Histoire des idées religieuses en Allemagne, vol. iii.; Diezel's Geschichte des Alten Testamentes (1886); and T. K. Cheyne's Old Testament Criticism (1893).

BLEEK, WILHELM HENRICH IMMANUEL (1827–1875), German philologist, son of Friedrich Bleek, was born in 1827 at Berlin. He studied first at Bonn and afterwards at Berlin, where his attention was directed towards the philological peculiarities of the South African languages. In his doctor's dissertation (Bonn, 1851), De nominum generibus linguarum Africæ Australis, he endeavoured to show that the Hottentot language was of North African descent. In 1854 his health prevented him accompanying Dr W. B. Baikie in the expedition to the Niger; but in the following year he accompanied Bishop Colenso to Natal, and was enabled to prosecute his researches into the language and customs of the Kaafs. Towards the close of 1857 he was appointed interpreter at Cape Town, and in 1857 was appointed interpreter by Sir George Grey. In 1859 he was compelled by ill-health to visit Europe, and on his return in the following year he was made librarian of the valuable collection of books presented to the colony by Sir George Grey. In 1860 he visited England, where the value of his services was recognized by a pension from the civil list. He died at Cape Town on the 17th of August 1875. His works, which are of considerable importance for African and Australian philology, consist of the Vocabulary of the South African Languages (London, 1859); Handbook of African Research in Australia (vol. i., 1860); Comparative Grammar and Language of the South African Languages (vol. i., London, 1860); Reimand the Fox in South Africa, or the Hottentot Fables and Tales (London, 1864); Origin of Language (London, 1865).

BLENDE, or SPHALERITE, a naturally occurring zinc sulphide, ZnS, and an important ore of zinc. The name blende was used by G. Agricola in 1546, and is from the German blenden, to blind, or deceive, because the mineral resembles lead-ore in appearance but contains no lead, and was consequently often rejected as worthless. Spuleralite, introduced by E. F. Glocker in 1847, has the same meaning (Gr. σφαλέρος, deceptive, and so have the miners' terms "mock ore," "false lead," and "black jack.") The term "blende" was at one time used in a generic sense, and as such enters into the construction of several old names of German origin; the species under consideration is therefore sometimes distinguished as zinc-blende.

Crystals of blende belong to that subclass of the cubic system in which there are six faces of symmetry parallel to the faces of the rhombic dodecahedron and none parallel to the cubic faces; in other words, the crystals are cubic with inclined hemihedry, and have no centre of symmetry. The fundamental form is the tetrahedron. Fig. 1 shows a combination of two tetrahedra, in which the four faces of one tetrahedron are larger than the four faces of the other; further, the two sets of faces differ in surface
characters, those of one set being dull and striated, whilst those of the other set are bright and smooth. A common form, shown in fig. 2, is a combination of the rhombic dodecahedron with a three-faced tetrahedron y (311); the six faces meeting in each triad axis are often rounded together into low conical forms. The crystals are frequently twinned, the twin-axis coinciding with a triad axis; a rhombic dodecahedron so twinned (fig. 3) has no re-entrant angles. An important character of blende is the perfect dodecahedral cleavage, there being six directions of cleavage parallel to the faces of the rhombic dodecahedron, and angles between which are 60°.

When chemically pure, which is rarely the case, blende is colourless and transparent; usually, however, the mineral is yellow, brown or black, and often opaque, the depth of colour and degree of transparency depending on the amount of iron present. The streak, or colour of the powder, is brownish or light yellow, rarely white. The lustre is resinous to adamantine, and the index of refraction high (2.356 for sodium light). The substance is usually optically isotropic, though sometimes it exhibits anomalous double refraction; fibrous zinc sulphide which is doubly refracting is to be referred to the hexagonal species wurtzite. The specific gravity is 4.0, and the hardness 4.

Crystals exhibit pyroelectrical characters, since they possess four uniterminal triad axes of symmetry. Crystals of blende are of very common occurrence, but owing to twinning and distortion and curvature of the faces, they are often rather complex and difficult to decipher. For this reason the mineral is not always readily recognized by inspection, though the perfect dodecahedral cleavage, the adamantine lustre, and the brown streak are characters which may be relied upon. The mineral is also frequently found massive, with a coarse or fine granular structure and a crystalline fracture; sometimes it occurs as a soft, white, amorphous deposit resembling artificially precipitated zinc sulphide. A compact variety of a pale liver-brown colour and forming concentric layers with a reniform surface is known in Germany as Schollenblende or Lederblende.

A few varieties of blende are distinguished by special names, these varieties depending on differences in colour and chemical composition. A pure white blende from Franklin in New Jersey is known as cleiophane; snow-white crystals are also found at Nordmark in Vermland, Sweden. Black blende containing ferrous sulphide, in amounts up to 15 or 20% isomorphously replacing zinc sulphide, is known as marmatite (from Marmato near Guayabal in Colombia, South America) and christophite (from St Christophe mine at Breitenbrunn near Elbenstock in Saxony). Transparent blende of a red or reddish-brown colour, such as that found near Holywell in Flintshire, is known as "ruby-blende" or "ruby-zinc." Pifibrine is the name given to a cadmiumiferous blende from Pifiram in Bohemia. Other varieties contain small amounts of mercury, tin, manganese or thallium. The elements gallium and indium were discovered in blende.

Blende occurs in metalliferous veins, often in association with galena, also with chalcopyrite, barytes, fluor spar, &c. In ore-deposits containing both lead and zinc, such as those filling cavities in the limestones of the north of England and of Missouri, the galena is usually found in the upper part of the deposit, the blende not being reached until the deeper parts are worked.

Blende is also found sporadically in sedimentary rocks; for example, in nodules of clay-ironstone in the Coal Measures, in the serpent-doggers of the Liias, and in the casts of fossil shells. It has occasionally been found on the old timbers of mines. In these cases the zinc sulphide has probably arisen from the reduction by sulphate of organic matter.

Localities for fine crystallized specimens are numerous. Marmatite may be made by pressure on blende crystals from Alston Moor in Cumberland, St Agnes in Cornwall and Derbyshire. Yellow crystals are found at Kapnik-Banya, near Nagy-Banya in Hungary. Transparent yellow cleavage masses of large size occur in limestone in the zinc mines at Picos de Europa in the province of Santander, Spain. Beautiful isolated tetrahedra of transparent yellow blende are found in the snow-white crystalline dolomite of the Binnenthal in the Valais, Switzerland.

**BLENHEIM**

(Ger. Blenheim), a village of Bavaria, Germany, in the district of Swabia, on the left bank of the Danube, 50 m. N.E. from Ulm by rail, a few miles below Höchstadt. Pop. 700. It was the scene of the defeat of the French and Bavarians under Marshals Tallard and Marsin, on the 13th of August 1704, by the English and the Austrians under the duke of Marlborough and Prince Eugene. In consideration of his military services and especially his decisive victory, a princely mansion was erected by parliament for the duke of Marlborough near Woodstock in Oxfordshire, England, and was named Blenheim Palace after this place.

The battle of Blenheim is also called Höchstädt, but the title accepted in England has the advantage that it distinguishes this battle from that won on the same ground a year previously, by the elector of Bavaria over the imperial general Styrum (20 September 1703), and from the fighting between the Austrians under Krag and the French under Moreau in June 1800 (see French Revolutionary Wars). The ground between the hills and the marshy valley of the Danube forms a defile through which the main road from Donauwörth led to Ulm; parallel streams divide the narrow plain into strips. One of these streams, the Nebel, the French and Bavarians (somewhat superior in numbers) took up their position facing eastward, their right flank resting on the Danube, their left in the underfeatures of the hilly ground, and their front covered by the Nebel, on which were the villages of Oberglau, Unterglau and Blenheim. The imperial army of Eugene and the allies under Marlborough (52,000 strong) encamped 5 m. to the eastward along another stream, their flanks similarly protected. On the 2nd-13th of August 1704, Eugene and Marlborough set their forces in motion, towards the hostile camps; several streams had to be crossed on the march, and it was seven o'clock (five hours after moving off) when the British of Marlborough's left wing, next the Danube, deployed opposite Blenheim, which Tallard thereupon garrisoned with a large force of his best infantry, aided by a battery of 24-pounder guns. The French and Bavarians were taken somewhat by surprise, and were arrayed in two separate armies, each with its cavalry on the wings and its foot in the centre. Thus the centre of the combined forces consisted of the cavalry of Marsin's right and of Tallard's left.

Here was the only good ground for mounted troops, and Marlborough followed Tallard's example when forming up to attack, but it resulted from the dispositions of the French marshal that this weak point of junction of his two armies was exactly that at which decisive action was to be expected. Tallard therefore had a few horse on his right between the Danube and Blenheim, a mass of infantry in his centre at Blenheim itself, and a long line of cavalry supported by a few battalions marching his left wing and covering blackly with the Zollern army. This array was similarly drawn up. The cavalry right wing was in the open, the French infantry near Oberglau, which was strongly held, the Bavarian infantry next on the left, and finally the Bavarian cavalry with a force of foot on the extreme left in the hills. The elector of Bavaria commanded his own troops in person. Marlborough and Eugene on their part were to attack respectively Tallard and Marsin. The
right wing under Eugene had to make a difficult march over broken ground before it could form up for battle, and Marlborough waited, with his army in order of battle between Unterglau and Blenheim, until his colleague should be ready. At 12.30 the battle opened. Lord Cutts, with a detachment of Marlborough's left wing, attacked Blenheim with the utmost fury. A third of the leading brigade (British) was killed and wounded in the vain attempt to break through the strong defences of the village, and some French squadrons charged upon it as it retired; a colour was captured in the mêlée, but a Hessian brigade in second line drove back the cavalry and retook the colour. After the repulse of these squadrons, in which the British cavalry from the centre took part, Cutts again moved forward. The second attack, though pressed even more fiercely, fared no better than the first, and the losses were heavier than before. The duke then ordered Cutts to observe the enemy in Blenheim, and concentrated all his attention on the centre. Here, between Unterglau and Blenheim, preparations were being made, under cover of artillery, for the crossing of the Nebel, and farther up-stream a corps was sent to attack Oberglau. This attack failed completely, and it was not until Marlborough himself, with a detachment of Tallard's heavy cavalry, had driven back into Oberglau that the allies were free to cross the Nebel.

In the meanwhile the first line of Marlborough's infantry had crossed lower down, and the first line of cavalry, following them across, had been somewhat severely handled by Tallard's cavalry. The squadrons under the Prussian general Bothmer, however, made a dashed charge, and achieved considerable temporary success. Eugene was now closely engaged with the elector of Bavaria, and both sides were losing heavily. But Eugene carried out his holding attack successfully. Marsin dared not reinforce Tallard to any extent, and the duke was preparing for the grand attack. His whole force, except the detachment of Cutts, was now across the Nebel, and he had formed it in several lines with the cavalry in front. Marlborough himself led the cavalry; the French squadrons received the attack at the halt, and were soon broken. Marsin's right swung back towards its own army. Those squadrons of Tallard's left which retained their order fell back towards the Danube, and a great gap was opened in the centre of the defence, through which the victorious squadrons poured. Wheeling to their left the pursuers drove hundreds of fugitives into the Danube, and Eugene was now pressing the army of Marsin towards Marlborough, who re-formed and faced northward to cut off its retreat. Tallard was already a prisoner, but in the dust and confusion Marsin slipped through between the duke and Eugene. General Churchill, Marlborough's brother, had meanwhile surrounded the French garrison of Blenheim; and after one or two attempts to break out, twenty-four battalions of infantry and four regiments of dragoons, many of them the finest of the French army, surrendered.

The losses of the allies are stated at 4,500 killed and 7,500 wounded (British 670 killed and 1,500 wounded). Of the French and Bavarians 11,000 men, 100 guns and 200 colours and standards were taken; besides the killed and wounded, the numbers of which were large but uncertain—many were drowned in the Danube. Marsin's army, though it lost heavily, was drawn off in good order; Tallard's was almost annihilated.

**BLENNERHASSETT, HARMAN** (1765–1831), Irish-American lawyer, son of an Irish country gentleman of English stock settled in Co. Kerry, was born on the 9th of October 1765. He was educated at Trinity College, Dublin, and in 1790 was called to the Irish bar. After living for several years on the continent, he married in 1796 his niece, Margaret Agnew, daughter of Robert Agnew, the lieutenant-governor of the Isle of Man. Ostracised by their families for this step the couple decided to settle in America, where Blennerhassett in 1798 bought an island in the Ohio river about 2 m. below Parkersburg, West Virginia. Here in 1805 he received a visit from Aaron Burr (q.v.), in whose conspiracy he became interested, furnishing liberal funds for its support, and offering the use of his island as a rendezvous for the gathering of arms and supplies and the training of volunteers. When the conspiracy collapsed, the mansion and island were occupied and plundered by the Virginia militia. Blennerhassett fled, was twice arrested and remained a prisoner until after Burr's release. The island was then abandoned, and Blennerhassett was in turn a cotton planter in Mississippi, and a lawyer (1819–1822) in Montreal, Canada. After returning to Ireland, he died in the island of Guernsey on the 2nd of February 1831. His wife, who had considerable literary talent and who published The Deserted Isle (1822) and The Widow of the Rock and Other Poems (1824), returned to the United States in 1840, and died soon afterward in New York City while attempting to obtain through Congress payment for property destroyed on the island.

**BLERA** (mod. Bieda), an ancient Etruscan town on the Via Clodia, about 32 m. N.N.W. of Rome. It was of little importance, and is only mentioned by geographers and in inscriptions. It is situated on a long, narrow tongue of rock at the junction of two deep gorges. Some remains of the town walls still exist, and some ancient buildings, both belonging to the Via Clodia, and many tombs hewn in the rock—small chambers imitating the architectural forms of houses, with beams and rafters represented in relief. See G. Dennis, Cities and Cemeteries of Etruria, i. 207.

**BLESSINGTON, MARGUERITE, COUNTESS OF** (1789–1849), Irish novelist and miscellaneous writer, daughter of Edmund Power, a small landowner, was born near Clonmel, Co. Tipperary, Ireland, on the 1st of September 1789. Her childhood was made unhappy by her father's character and poverty, and her early womanhood wretched by her compulsory marriage at the age of fifteen to a Captain Maurice St Leger Farmer, whose drunken habits brought him at last as a debtor to the king's bench prison, where, in October 1817, he died. His wife had left him some time before, and in February 1818 she married Charles John Gardiner, earl of Blessington. Of rare beauty, charm and wit, she was no less distinguished for her generosity and for the extravagant tastes which she shared with her husband, which resulted in encumbering his estates with a load of debt. In the autumn of 1821 they went abroad, spent four months of the next year at Genoa in close intimacy with Byron, and remained on the continent till Lord Blessington's death in May 1829. Some time before this they had been joined by Count D'Orsay, who in 1827 married Lady Harriet Gardiner, Lord Blessington's only daughter by a former wife. D'Orsay, who had soon separated from his wife, now accompanied Lady Blessington to England and lived with her till her death. Their home, first at Seamount Place, and afterwards Gore House, Kensington, became a centre of attraction for whatever was distinguished in literature, learning, art, science and fashion. After her husband's death she supplemented her diminished income by contributing to various periodicals as well as by writing novels. She was for some years editor of The Book of Beauty and The Keepsake, popular annuals of the day. In 1834 she published her Conversations with Lord Byron. Her Idler in Italy (1839–1840), and Idler in France (1841) were popular for their personal gossip and anecdote, descriptions of nature and sentiment. Early in 1849, Count D'Orsay left Gore House to escape his creditor; the furniture and decorations were sold, and Lady Blessington joined the count in Paris, where she died on the 4th of June 1849.

Her Literary Life and Correspondence (5 vols.), edited by R. R. Madden, appeared in 1855. Her portrait was painted in 1808 by Sir Thomas Lawrence.

**BLIDA,** a town of Algeria, in the department of Algiers, 32 m. by railway S.W. from Algiers, on the line to Oran. Pop. (1906) 16,866. It lies surrounded with orchards and gardens, 630 ft. above the sea, at the base of the Little Atlas, on the southern edge of the fertile plain of the Metijs, and on the right bank of the Wad-el-Kebir affluent of the Chîfâ. The abundant water of this stream provides power for large corn
mills and several factories, and also supplies the town, with its numerous fountains and irrigated gardens. Blida is surrounded by a wall of considerable extent, pierced by six gates, and is further defended by Fort Mimich, crowning a steep hill on the left bank of the river. The present town, French in character, has well-built modern streets with many arcades, and numbers among its buildings several mosques and churches, extensive barracks and a large military hospital. The principal square, the place d'Armes, is surrounded by arcaded houses and shaded by trees. The centre of a fertile district, and a post of one of the main routes in the country, Blida has a flourishing trade, chiefly in oranges and flour. The orange groves contain over 50,000 trees, and in April the air for miles round is laden with the scent of the orange blossoms. In the public gardens is a group of magnificent olive trees. The products of the neighbouring cork trees and cedar groves are a source of revenue to the town. In the vicinity are the villages of Joinville and Montpensier, which owe their origin to military camps established by Marshal Valée in 1838; and on the road to Medea are the tombs of the marabouts Mahomed-el-Kebir, who died in 1805, and his two sons.

Blida, i.e. belaida, diminutive of the Arab word belad, city, occupies the site of a military station in the time of the Romans, but the present town appears to date from the 16th century. A mosque was built by order of Khair-ed-din Barbarossa, and under the Turks the town was of some importance. In 1839 it was nearly destroyed by an earthquake, but was speedily rebuilt on a site about a mile distant from the ruins. It was not till 1838 that it was finally held by the French, though they had been in possession for a short time eight years before. In April 1866 it was chosen as the place of detention of Behanzin, the ex-king of Dahomey, who died in December of that year.

Blida is the chief town of a commune of the same name, having (1906) a population of 33,332.

BLIGH, WILLIAM (1754-1817), English admiral, was born of a good Cornish family in 1754. He accompanied Captain Cook in his second expedition (1772-1774) as sailing-master of the "Resolution." During the voyage, the bread-fruit, already known to Dampier, was found by them at Otaheite; and after seeing service under Lord Howe and elsewhere, "Bread-fruit Bligh," as he was nicknamed, was despatched at the end of 1787 to the Pacific in command of H.M.S. "Bounty," for the purpose of introducing it into the West Indies from the South Sea Islands. Bligh sailed from Otaheite, after remaining there about six months; but, when near the Friendly Islands, a mutiny (April 28, 1788) broke out on board the "Bounty," headed by Fletcher Christian, the master's mate, and Bligh, with eighteen others, was set adrift in the launch. The mutineers themselves settled on Pitcairn Island (q.v.), but some of them were afterwards captured, brought to England and in three cases executed. This mutiny, which forms the subject of Byron's Island, did not arise so much from tyranny on the part of Bligh as from attachments contracted between the seamen and the women of Otaheite. After suffering severely from hunger, thirst and storms, Bligh and his companions landed at Timor in the East Indies, having performed a voyage of about 4000 m. in an open boat. Bligh returned to England in 1790, and he soon afterwards appointed to the "Providencia," in which he effected the purpose of his former appointment by introducing the bread-fruit tree into the West India Islands. He showed great courage at the mutiny of the Nore in 1797, and in the same year took part in the battle of Camperdown, where Admiral Duncan defeated the Dutch under De Winter. In 1801 he commanded the "Glutton" (54) at the battle of Copenhagen, and received the personal commendations of Nelson. In 1805 he was appointed captain general and governor of New South Wales. As he made himself intensely unpopular by hard and arbitrary authority, he was deposed in January 1808 by a mutiny headed by Major George Johnston of the 10th foot, and was imprisoned by the mutineers till 1810. He returned to England in 1811, was promoted to rear-admiral in that year, and to vice-admiral in 1814. Major Johnston was tried by court martial at Chelsea in 1811, and was dismissed the service. Bligh, who was an active, persevering and courageous officer, died in London in 1817.

BLIND, MATHILDE (1841-1896), English author, was born at Mannheim on the 21st of March 1841. Her father was a banker named Cohen, but she took the name of Blind after her step-father, the political writer, Karl Blind (1835-1907), one of the exiled leaders of the Baden insurrection in 1848-1849, and an ardent supporter of the various 19th-century movements for the freedom and autonomy of struggling nationalities. The family was compelled to take refuge in England, where Mathilde devoted herself to literature and to the higher education of women. She produced also three long poems, "The Prophecy of St Oran" (1881), "The Heather on Fire" (1886), an indignant protest against the evictions in the Highlands, and "The Ascent of Man" (1888), which was to be the epic of the theory of evolution. She wrote biographies of George Eliot (1885) and Madame Roland (1886), and translated D.F. Strauss's The Old Faith and the New (1873-1874) and the Memoirs of Marie Bashkirtseff (1890). She died on the 26th of November 1896, bequeathing her property to Newnham College, Cambridge.

A complete edition of her poems was edited by Mr Arthur Symons in 1900, with a biographical introduction by Dr Richard Garnett.

BLIND HOOKEY, a game of chance, played with a full pack of cards. The deal, which is an advantage, is decided as at whist, the cards being shuffled and cut as at whist. The dealer gives a parcel of cards to each player including himself. Each player puts the amount of his stake on his cards, which he must not look at. The dealer has to take all bets. He then turns his parcel, exposing the bottom card. Each player in turn does the same, winning or losing according as his cards are higher or lower than the dealer's. Ties pay the dealer. The cards rank as at whist. The suits are of no importance, the cards taking precedence according to their face-value.

BLINDING, a form of punishment anciently common in many lands, being inflicted on thieves, adulterers, perjurers and other criminals. The inhabitants of Apollonia (Illyria) are said to have inflicted this penalty on their "watch" when found asleep at their posts. It was resorted to by the Roman emperors in their persecutions of the Christians. The method of destroying the sight varied. Sometimes a mixture of lime and vinegar, or barely scalding vinegar alone, was poured into the eyes. Sometimes a rope was twisted round the victim's head till the eyes started out of their sockets. In the middle ages the punishment seems to have been changed from total blindness to a permanent injury to the eyes, amounting, however, almost to blindness, produced by holding a red-hot iron dish or basin before the face. Under the forest laws of the Norman kings of England blinding was a common penalty. Shakespeare makes King John order his nephew Arthur's eyes to be burnt out.

BLINDMAN'S-BUFF (from an O. Fr. word, buffe, a blow, especially a blow on the cheek), a game, in which one player is blindfolded and made to catch and identify one of the others, who in sport push him about and "buffet" him.

BLINDNESS, the condition of being blind (a common Teutonic word), i.e. devoid of sight (see also VISION; and EYE: Diseases). The data furnished in various countries by the census of 1901 showed generally a decrease in blindness, due to the progress in medical science, use of antiseptics, better sanitation, control of infectious diseases, and better protection in shops and factories. Blindness is much more common in hot countries than in temperate and cold regions, but Finland and Iceland are exceptions to the general rule.1 In hot countries the eyes are affected by the glaring sunlight, the dust and the dryness of the air. From statistics in Italy, France and Belgium, localities on the coast seem to have more blind persons than those at a distance from the sea.

1 There are no late returns for Iceland, but the last available statistics gave 3400 per million. A paper written in 1903 on blindness in Egypt stated that 1 in every 50 of the population was blind.
The following table gives the number of blind persons as reported in the census of each country. Unless otherwise stated, it refers to the statistics of 1900.

CAUSES AND PREVENTION

There are many cases of complete or partial blindness which might have been prevented, and a knowledge of the best methods of prevention and cure should be spread as widely as possible. Magnus, Bremer, Steffen and Kössler are of opinion that 40% of the cases of blindness might have been prevented. Hayes gives 33.35% as positively avoidable, 38.75% possibly avoidable, and 46.27% as a conservative estimate. Cohn regards blindness as certainly preventable in 33%, as probably preventable in 43%, and as quite unpreventable in only 24%. If we take the lowest of these figures, and assume that 400 out of every 1000 blind persons might have been saved from such a calamity, we realize the importance of preventative measures. For the physiologist and pathology of the eye generally, see Vision and Eye.

The great majority of these cases are due to infantile purulent ophthalmia. This arises from inculcation of the eyes with hurtful material at time of birth. If the contagious discharge are allowed to remain uncontrolled infection is set up which usually ends in the loss of sight. It depends on the presence of a microbe, and the effective application of a weak solution of nitrate of silver is curative, if made in a proper manner at an early period of the case. In Germany, midwives are expressly prohibited by law from treating any affection of the eyes or eyelids of infants, however slight. On the appearance of the first symptoms, they are required to represent to the parents, or others in charge, that medical assistance is urgently needed, or, if necessary, they are themselves to report to the local authorities and the district doctor. Neglect of these regulations entailing liability to punishment. Eleven of the United States of America have enacted laws requiring that, if one or both eyes of an infant should become inflamed, swollen or reddened at any time during two weeks of its birth, it shall be the duty of the midwife or nurse having charge of such infant to report in writing within six hours, to the health officer or some legally qualified physician, the fact that such inflammation, swelling or redness exists. The penalty for failure to comply is fine or imprisonment.

The following weighty words, from a paper prepared by Dr. Park Lewis, of Buffalo, N.Y., for the American Medical Association, show that laws are not sufficient to prevent evil, unless supported by strong public sentiment:

"When an enlightened, civilized and progressive nation quietly and passively, year after year, permits a multitude of its people unnecessarily to become blind, and more especially when one-quarter of these are infants, the reason for such a startling condition of affairs demands explanation. That such is the fact, practically all reliable ophthalmologists agree.

From a summary of carefully tabulated statistics it has been demonstrated that at least four-tenths of all existing blindness might have been avoided had proper preventative or curative measures been employed, while one-quarter of this, or one-tenth of the whole, was due to ophthalmia neonatorum, a curable and almost absolutely curable disease. Perhaps this statement will take on a new meaning when it is added that there are in the state of New York alone more than 6000, and in the United States more than 50,000 blind persons, of whom 5000 in the country, would have been saved from lives of darkness and unhappiness, in having lost all the joys that come through sight, and of more or less complete independence and individual self-sufficiency without as with eyes—if a simple, safe and easily applied precautionary measure had been taken at the right time and in the right way to prevent this affliction. The following three must not be questioned, but are universally accepted by those qualified to know—

1. The ophthalmia of infancy is an infectious germ disease.
2. By the instillation of a silver salt in the eyes of a new-born infant the disease is prevented from developing in all but an excedingly small number of the cases in which it would otherwise have appeared.
3. In practically all those few exceptional cases the disease is absolutely curable, if life treatment is employed at a sufficiently early period.

Since these facts are not long subject to discussion, but are universally accepted by all educated medical men, the usual inquiry follows: Why, as a common-sense proposition, are not these simple, harmless, preventive measures invariably employed, which, in consequence of this negligence, are allowed to progress with quackery and indifferently by, making no attempt to prevent this enormous and needless waste of human eyes?

The reasons are three-fold, and lie—first, with the medical profession; second, with the lay public; third, with the state.

"For the education of its blind children annually New York alone pays per capita at least $500, and a yearly gross sum amounting to much more than $100,000. If, as sometimes happens, the blind child is for some reason, or on account of its blindness, dependent throughout a long life, the cost of maintenance is not less than $10,000, and the mere cost in money will be multiplied many times in that a productive factor, by reason of blindness, has been removed to the community.

"If, therefore, as an economic proposition, it were realized how vitally it concerns the state that no one child shall needlessly become blind, thereby increasing the public financial burden, there is no doubt that early and effective measures would be instituted to protect the state from this unnecessary and extravagant expenditure of public funds.

Eleven states have passed legislative enactments requiring that the midwife shall report each case to the proper health authority, and affixing a penalty for the failure to do so. As has been intimated, however, it is not by any means always under the ministration of the law, and that these enactments, while they do not a strong and well-informed public sentiment, this law is rarely enforced. A more effective method must be devised. Every physician having to do with the parturient mother and child, and constantly advised of the dangers and possibilities of this disease, the necessity of prevention, and the value of early and correct treatment. They must then have placed in their hands, ready for instant use, a safe and efficient preparation, issued by the health authorities as a guarantee as to its quality and efficiency.

An important step was taken in this direction when a resolution was passed by the House of Delegates at the annual meeting of the New York State Medical Society, requesting the various health officers of the state to include ophthalmia neonatorum among the infectious diseases which must be reported to the local boards of health.

The second, in order, that the cause of infantile ophthalmia be abolished, is that a solution of the necessary silver salt be prepared and kept under the authority of every medical association, inspiring universal confidence, and that it be distributed by the health department of every state gratuitously to every obstetrician, physician, midwife, or nurse for use in cases of the solution, together with the character of the descriptive card which should accompany it, should be determined by a committee, chosen by the president of the American Medical Association, representing the authority of every medical association, the assurance that the solution is entirely safe and necessary, and that its use should invariably be part of the toilet of every new-born child. The solution, probably silver nitrate, should be put up either by the state itself or by some trustworthy pharmacist, at an insignificant cost; its purity and sterility should be vouched for by the board of health of the state. It should be enclosed in specially prepared receptacles,
each containing a special quantity, and so arranged that it may be used drop by drop. These, properly enclosed, accompanied by a brief lucid explanation of the danger of the disease, the necessity of this preliminary step, and the importance of subsequent care of the eyes, should be sent to the obstetrician on the receipt of each birth certificate.

I have said that responsibility for the indifference that is annually resulting in such frequent disaster lies primarily with the state, the public and the medical profession.

"The state is already aroused to the necessity of taking effective means to wipe out this dangerous plague. Bills have been introduced in the legislature of Massachusetts and of New York, providing for the appointment of commissions for the blind, one of whose duties will be to study the causes of unnecessary blindness and to suggest preventive measures.

One of the most common diseases of the eye is trachoma, often called "granular lids," because the inner surface of the lid seems to be covered with little granulations. The disease sometimes lasts for years without causing blindness, though it gives rise to great irritation. It is generally attended by a discharge, which is highly contagious, producing the same disease if it gets into other eyes. Want of cleanliness is one of the most important factors in the propagation of trachoma, hence its great prevalence in Oriental countries.

Trachoma is very prevalent in Egypt, where those suffering from total or partial blindness are said to amount to 10% of the population. During Napoleon's Egyptian campaign, nearly every soldier, out of an army of 32,000 men, was affected. During the following twenty years the disease spread through almost all European armies. In the Belgian army, there was one trachomatous soldier out of every five, and up to 1834 no less than 4000 soldiers had lost both eyes and 10,000 one eye.

It is a disease which is very common in workhouse schools, orphan asylums and similar establishments. Unlike opthalmia of new-born children, it is difficult to cure, and a total separation of the diseased from the healthy children should be effected.

About one-half of those who are blinded by injuries lose the second eye by sympathetic ophthalmia. It is a constant source of danger to those who retain an eye blinded by injury. Blindness from this cause can be prevented by the removal of the injured eye, but unfortunately the proposal often meets with opposition from the patient.

Glaucome is a disease which almost invariably leads to total blindness; but in most cases it can be arrested by a simple operation if the case is seen sufficiently early.

Myopia, or "short-sight," makes itself apparent in children between the ages of seven and nine. Neglect of a year or two may do serious mischief. Short-sight, when not inherited, is produced by excessiveooking into close and complicated objects. Children should be encouraged to describe objects at a distance, with which they are unacquainted, and parents should choose out-door occupations and amusements for children who show a tendency to short-sightedness.

A report was issued in 1906, by the school board of Glasgow, as to an investigation by Dr H. Wright Thomas, ophthalmic surgeon, regarding the eyesight of school children, which includes the following passage. Dr Wright Thomas states that the teachers tested the visual acuteness of 53,493 children, and found 18,565, or 35%, to be below what is regarded as the normal standard. He examined the 18,565 defective by retinoscopy, and found that 11,200, or 21% of the whole, had ocular defects. The proportion of these cases was highest in the poor and closely-built districts and in old schools, and was lowest in the better-class schools and those near the outskirts of the city. Defective vision, apart from ocular defects, seems to be due partly to want of training of the eyes for distant objects and partly to exhaustion of the eyes, which is easily induced when work is carried on in bad light, or the nutrition of the children is defective from bad feeding and unhealthy surroundings. Regarding training of the eyes for distant objects, much might be done in the infant department by the total abolition of sewing, which is definitely hurtful to such young eyes, and the substitution of competitive games involving the recognition of small objects at a distance of 20 ft. or more. An annual testing by the teachers, followed by medical inspection of the children found defective, would soon cause all existing defects to be corrected, and would lead to the detection of those which develop during school life.

HISTORY OF INSTITUTIONS

Although there is a record of a hospital established by St Basil at Caesarea, Cappadocia, in the 4th century, a refuge for the blind, Lymnee (d. c. 455) at Syr, Syria, in the 5th century, and an institution by St Bertrand, bishop of Le Mans, in the 7th century, the first public effort to benefit the blind was the founding of a hospital at Paris, in 1260, by Louis IX, for 300 blind persons. The common legend is that he founded it as an asylum for 300 of his soldiers who had become blinded in the crusade in Egypt, but the statutes of the founder are preserved, and no mention is made of crusaders. This Hospice des Quinze-Vingts, increased by subsequent additions to its funds, still assists the adult blind of France. The pensioners are divided into two classes—those who are inmates of the hospital (300), and those who receive pensions in the form of out-door relief. All appointments to inmates or pensions are vested in the minister of the Interior, and applicants must be of French nationality, totally blind and not less than forty years of age.

From the time of St Louis to the 16th century, there are records of isolated cases of blind persons who were educated, and of efforts to devise tangible apparatus to assist them.

Giorlamo Cardan, the 16th-century Italian physician, conceived the idea that the blind could be taught to read and write by means of touch. About 1517 Francesco Lucas in Spain, and Rampazetto in Italy, made use of large letters cut in wood for instructing the blind. In 1646 a book, on the condition of the blind, was written by an Italian, and published in Italian and French, under the title of L'Avveneatif et consu. In 1676 a book was written on the instruction of the blind by Lan Terzi, the Jesuit. In 1676 Jacques Bernoulli, the Swiss savant, taught a blind girl to read, but the means of her instruction were not made known. In 1749 D. Diderot wrote his Lettre sur les aveugles à l'usage de ceux qui voient, to show how far the intellectual and moral nature of man is modified by blindness. Dr S. G. Howe, who many years after translated and printed the "Letter" in embossed type, characterizes it as abounding with errors of fact and inference, but also with beauties and suggestions. The heterodox speculations contained in his "Letter on the Blind" caused Diderot to be imprisoned three months in the Bastille. He was released because his services were required for producing the Encyclopédie. Rousseau visited Diderot in prison, and is reported to have suggested a system of embossed printing. J. Locke, G. W. Leibnitz, Mollineau and others discussed the effect of blindness on the human mind. In Germany, Weismienburg had used signs in relief and taught Mlle Paradis.

Prior to the 18th century, blind beggars existed in such numbers that they struggled for standing room in positions favourable for asking alms. Their very affliction led to their being used as spectacles to amuse the audience, by the degraded state of the masses of the blind in France attracted the attention of Valentin Haüy. In 1771, at the annual fair of St Ovid, in Paris, an innkeeper had a group of blind men attired in a ridiculous manner, decorated with peacock tails, asses' ears, and pasteboard spectacles without glasses, in which condition they gave a burlesque concert, for the profit of their employer. This sad scene was repeated day after day, and greeted with loud laughter by the gaping crowds. Among those who gazed at this outrage to humanity was the philanthropist Valentin Haüy who left the disgraceful scene full of sorrow. "Yes," he said to himself, "I will substitute truth for this mocking parody. I will make the blind to read, and they shall be enabled to execute harmonious music." Haüy collected all the information he could gain respecting the blind, and began teaching a blind boy who had gained his living by begging at a church
BLINDNESS

Many of the early institutions were asylums, and to the present day schools for the blind are regarded by the public as asylums rather than as educational establishments. With nearly all these schools workshops were connected. In 1856 Miss Gilbert, the blind daughter of the bishop of Chichester, established a workshop in Berners Street, London, and since that date workshops have been started in many of the provincial towns.

After the beginning of the 19th century, institutions for the blind were established in various parts of Europe. The institution at Vienna was founded in 1804 by Dr W. Klein, a blind man, and he remained at its head for fifty years. That of Berlin was established in 1806, Amsterdam, Prague and Dresden in 1808, Copenhagen in 1811. There are more than 150 on the European continent, most of them receiving aid from the government, and being under government supervision.

The first school for the blind in the United States was founded in Boston, Mass., chiefly through the efforts of Dr John D. Fisher, a young physician who visited the French school. It was incorporated in 1829, and in honour of T.H. Perkins (1764-1834) who gave his mansion to the institution was named the Perkins Institution and Massachusetts Asylum (now School) for the Blind. Aid was granted by the state from the beginning. In 1831 Dr Samuel G. Howe (q.v.) was appointed director, and held that position for nearly forty-four years, being succeeded by his son-in-law Michael Anagnos (d. 1906), who established a kindergarten for the blind at Jamaica Plain, in connexion with the Perkins Institution. Dr Howe was interested in many charitable and sociological movements, but his life-work was on behalf of the blind.

One of his most notable achievements was the education of Laura Bridgman (q.v.) who was deaf, dumb and blind, and this has since led to the education of Helen Keller and other blind deaf-mutes. The New York Institution was incorporated in 1831, and the Pennsylvania Institution was founded at Philadelphia by the Society of Friends in 1833. The Ohio was founded at Columbus in 1837, Virginia at Staunton in 1839, Kentucky at Louisville in 1842, Tennessee at Nashville in 1844, and now every state in the Union makes provision for the education of the blind.

**Statistics**

In England and Wales the total number of persons returned in 1901 as afflicted with blindness was 25,317, being in the proportion of 778 per million living, or 1 blind person in every 1285 of the population. The following table shows that the proportion of blind persons to population has diminished at each successive enumeration since 1851, in which year particulars of those afflicted in this manner were ascertained for the first time. It will, however, be noted that, although the degree in the proportion of blind in the latest intercensal period was still considerable, yet the rate of decrease which had obtained between 1871 and 1891 was not maintained.

The following table, which gives the proportions of blind per million living at the earlier age-groups, shows that in the decennium 1851-1901, as also in recent previous intercensal periods, there was a decrease in the proportion of blind children in England and Wales generally; it thus lends support to the contention, in the General Report for 1891, that the decrease was due either to the lesser prevalence, or to the more efficient treatment, of purulent ophthalmia and other infantile maladies which may result in blindness.
BLINDNESS

In 1896 a royal commission on the blind, deaf and dumb was appointed by the government, and, after taking much valuable evidence, issued an exhaustive and instructive report. Following on the practical recommendations submitted by this commission, the Elementary Education (Blind and Deaf Children) Act 1893, was passed, under which the education of the blind became for the first time compulsory. In terms of this statute, the school authorities were made responsible for the provision of suitable elementary education for blind children up to sixteen years of age, and grants of £3, £5 for elementary subjects, and of £2, £3 for industrial training, were contributed by the state towards the cost of educating children in schools certified as efficient within the meaning of the Elementary Education Act 1876. The principal aim of the Education Act of 1893 was to supply education in some useful profession or trade which will enable the blind to earn their livelihood and to become useful citizens, but the weak spot was that no provision was made therein for the completion of their education and industrial training after the age of sixteen.

In England and Wales, in 1907, there were twenty-four resident schools and forty-three workshops for the blind. In many of the large towns, day classes for the education of blind children have been established by local education authorities. There are forty-six home teaching societies, who send teachers to visit the blind in their homes, to teach adults who wish to learn to read, to act as colporteurs, to lend and exchange useful books, and to act as Scripture readers to those who are aged and infirm. All the home teaching societies for the blind and many public libraries lend embossed books. The public library at Oxford has nearly 400 volumes of classical works for the use of university students.

A society was instituted in 1847 by Dr W. Moon for stereotyping and embossing the Scriptures and other books in "Moon" type. The type has been adapted to over 400 languages and dialects. After Dr Moon's death in 1854 the work was carried on by his daughter, Miss Adelaide Moon, and the books are much used by the blind.

By 1868 T. R. Armitage, being aware of the great improvements which had been made in the education of the blind in other countries, founded the British and Foreign Blind Association. This association was formed for the purpose of promoting the education and employment of the blind, by ascertaining what had been done in these respects in various countries, by endeavouring to supply deficiencies where these were found to exist, and by attempting to bring about greater harmony of action between the different existing schools and institutions. It gave a new impetus to the education and training of the blind in the United Kingdom. At that time their education was in a state of chaos. The Bible, or a great part of it, had been printed in five different systems. The founders took as an axiom that the relative merits of the various methods of education through the sense of touch should be decided by those and those only who have to rely on this sense. The council, who were all totally or partially blind, spent two years in comparing the different systems of embossed print. In 1860 and 1870 Dr Armitage corresponded with Dr J. R. Russ in regard to the New York Point. No trouble was spared to arrive at a right conclusion. The Braille system was finally adopted, and the association at once became a centre for supplying frames for writing Braille, printed books, maps, music and other educational apparatus for the blind. All books printed by the association are printed from stereotyped plates embossed by blind copyists. About 3000 separate works, varying in length from 1 to 12 volumes, have been copied by hand to meet the requirements of public libraries and individuals. About 700 ladies, who give their services, make the first Braille copy of these books, and they are recopied by blind scribes, chiefly women and girls, who are paid for their work.

The National Lending library, London, was founded in 1882. It has over 5500 volumes in Braille and other types. Books are forwarded to all parts of the United Kingdom.

There are fourteen magazines published in embossed type in the United Kingdom.

According to the census of 1901, Scotland had 3253 (or 727 per million) blind persons, as against 2793 in 1891, but in a paper read at the conference in Edinburgh in 1909, the superintendent of the Glasgow Mission to the Out-door Blind stated that there were 736 employed or being educated in institutions, and 3276 known as "out-door blind," making a total of 3926. There are in Scotland ten missions, so distributed as to cover the whole country, and regular visits are made as far north as the Orkney and Shetland Islands. In carrying on the work, there are twenty-four paid missionaries or teachers and a large number of voluntary workers. These societies originated in a desire to teach the blind to read in their own homes, and to provide them with the Scriptures and other religious books, but the social, intellectual and temporal needs of the blind also receive a large share of attention. These teachers afford the best means of circulating embossed literature, therefore the library committee of the Glasgow corporation has agreed to purchase books and place them in the mission library instead of in the public library. As the institutions provide for only a small number of the blind, strenuous efforts are made by the committee and teachers of missions to find some employment for the many adults who come under their care.

In Glasgow, a ladies' auxiliary furnishes work for 150 knitters, and takes the responsibility of disposing of their work. In Scotland there is a certificate of competency, and a large number of these institutions are asylums, that system having been largely adopted in Ireland. The scarcity of manufacturing industries, except in a few northern counties, entails a lack of work suited to the blind. The Elementary Education Act (Blind and Deaf) does not extend to Ireland.

The following table gives the number of blind in age-groups in 1901:

In the Dominion of Canada, South Africa, the states of the Australian Commonwealth and New Zealand, provision is made by the government for the education of the young blind, and in some cases for training adults. Embossed literature is carried free of expense, and on the Victorian railways no charge is made for the guide who accompanies a blind person.
BLINDNESS

The enumerators reported a total of 101,123 persons alleged to be blind as defined in the instructions contained in the schedules, but this number was greatly reduced as a result of the correspondence directly with the individuals, 8842 reporting that the alleged defect did not exist, and 6541 that they were blind only in one eye but were able to see with the other, and hence did not come within the scope of the inquiry. No replies were received in 19,884 cases in which personal schedules were sent, although repeated inquiries were made; consequently their elimination was impossible. In cases in which the personal schedules returned were too incomplete for use, and in 75 cases duplication was discovered. The number of cases remaining for statistical treatment, after making the eliminations and corrections, was 64,765, representing 35,645 totally blind, and 29,118 partially blind. This number, however, can be considered only as the minimum, as an unknown proportion of the blind were not located by the enumerators, and hence a considerable proportion of the 19,884 persons who failed to return the personal schedules should be included in the total.

Blindness, either total or partial, is so largely a defect of the ages, and occurs with so much greater frequency as the age advances and the population diminishes, that in any comparison of the proportion of the blind in the general population of different classes, such as native and foreign-born whites, or white and coloured, the age distribution of the population of each class should be consistently borne in mind. The differences in this respect account for many of the differences in the gross ratios, and it is only when ratios are compared for classes of population of identical ages that their relative liability to blindness can be properly inferred. In Table II, the classification, by degree of blindness, of the blind under twenty years of age, twenty years of age and over, and of unknown age, with respect to colour and nativity, with the number at the specified ages per million of population in the same age-group, the relationship or consanguinity of parents of the 64,763 blind was based in 56,367 cases, in 2527 (or 4.5%) of which the parents were related as cousins. In 57,726 cases the inquiry as to the existence of blind relatives was answered; 10,667 (or 19%) of this number reported that they had blind relatives. Of the 2527 blind persons whose parents were cousins, 993 (or 39.3%) had blind relatives,—44 having blind brothers, sisters or ancestors, and 140 having blind collateral relatives or descendants. Of the 5598 blind whose parents were not related, 4900 (or 17.6%) had blind relatives, 7395 having blind brothers, sisters or ancestors, and 2005 had blind collateral relatives or descendants. It was found that, of the 632 whose parents were cousins, 632 (or 25%) were congenitally blind, of whom 350 (or 55.4%) had also blind relatives of the classes specified; while, among the 5598 whose parents were not related, the number of congenitally blind was 3668 (or but 6.8%), of whom only 1023 (or 17.9%) had blind relatives.

In 1863 the number of blind in France was estimated at 32,056, the total population of the country being 38,000,000; 2546 of the

(Taught in 1853), and that of the Frères de Saint Jean de Dieu (founded in 1875).

The number of the blind in Germany was about 35,000, or 870 per million in 1835. The number of institutions was 28, nearly all being educational, with a total of 21,193 pupils. All these institutions, except two which are supported entirely by private munificence, are largely supported by the state, the communes or the provinces. Seventeen of them derive their entire requirements from the state, so that they are quite independent of private charity, while the remainder are only supplemented from public funds so far as the private contributions fall short of the expenses.

The following extracts were made from an official communication from Hereditary Burgher of the institution for the blind in Dresden, to the royal commission, concerning the care and supervision (Pflege) of the blind after their discharge from the institution—

"When twenty years of age, the blind are usually discharged from the institution. Long experience has taught us that the care and supervision of the blind after their discharge from the institution are quite as important as their education and training in the institution. It would, inappropriately, be unjust to remove them from their sad surroundings, educate and accustom them to higher wants, and then allow them to sink backward into their former miserable way of life. After much deliberation it was decided to remain in connexion with the discharged blind, to visit them in their places of abode, to learn their wants, to study the difficulties which they experienced in supporting themselves independently, and, as far as possible, to remove their grievances. Director Georgi began this work in 1834, Director Reinhardt continued it from 1867 to 1879, and the present director has followed the same path. With the knowledge of these difficulties the Pflege (care) for discharged blind steadily advanced and has won the confidence of the Saxony people. It was decided that, on the discharge of the blind person, the director should select a trustworthy assistant, residing in his own place of abode, to give him advice and practical help, to protect him from imposition, and to keep up communication with the director. If this guardian is unable to advise or help, he then writes to the director, who, if necessary, comes to the place, and this is all the easier as he travels free on all railways in Saxony. The result of these visits, as well as all communications from the guardian, the letters from the blind person, and every document relating to him, are entered in a register kept at the institution. These guardians are respectable, benevolent, practical men, capable of procuring custom for their wards. But there was no doubt that, in spite of these arrangements, the discharged blind were unable to support themselves without the assistance of capital, whether in money or outfit. The blind man can do as good work as the man who can see; but as a rule he does not work so quickly, and if the man who is not blind has to use every exertion to support himself and his family, the blind man to do the same requires some special help, and for which he will either not be able to compete, or will have to lead a life of great privation.

The fund for the discharged blind is administered by the director of the institution. The number of those assisted amounted at present to about 400, who live respectably in all parts of Saxony, are almost self-supporting, and feel themselves free men. For, just as a son does not feel galled by a gift from his father, so they are not ashamed to receive assistance from their second paternal home, the institution."

The number of the blind in Holland, according to the census of the 1st December, 1879, was 9,992, or one in every 13,500 of the general population. The Protesants and Roman Catholics were about equally balanced. No cognizance was taken of the blind in the census of 1879. There is only one blind institution, that of Amsterdam, with 60 pupils, a preparatory school at Venchem (with 20 pupils) and an asylum for adults with 52 inmates (unmarried). Besides these, there are workshops at Amsterdam, Rotterdam, the Hague, Utrecht and Middelburg.

According to the census of 1879, there were in Denmark 1,249 blind (577 males and 672 females), or one blind for every 1428 persons. One institution has been established by government, i.e. the Royal Institution for the Blind, at Copenhagen. There are 100 children, aged 10 and upwards, are here educated. There is a preparatory school for blind children under 10 years of age, and an asylum for blind females, most of whom are former pupils of the royal school. An association for promoting the self-dependence of the blind assists not only former pupils of the school but every blind man or woman willing and able to work.

The number of blind persons in Sweden, according to the census

of December 1880, was 5723, being at the rate of one blind person for every 1226 of the entire population. At the beginning of the year 1879, the instruction of the blind in Sweden was completely separated from that of the deaf and dumb, on the grounds that it hindered the intellectual development of the blind—a conclusion which experience shows to be tolerably correct. Since

IV. 3
BLINDNESS

July 1888 the Royal Institution of the Blind has obtained a new building at Tontelba, near Stockholm. The law of the 7th of July, 1881, concerning the instruction of abnormal children, has imposed on the state the duty of establishing for the blind a public asylum, as well as for the other abnormal children. All the blind of the country, from 9 years of age until the age of 21, are compelled to become educated, with a maximum of 8 years of instruction for each pupil.

The census of 1873 showed that in Finland there were 7059 blind in a total population of about 2,000,000 inhabitants, the proportion being 1 in 274. In 1884, the number of these institutions for blind children has been increased to 2000, and the proportion is about 1 in 667 of the total population. Nevertheless there were only 160 of school age. For these there are two institutions, one at Helsingfors, where the instruction is given in the Swedish language, and another at Pori and another at Kuopio, where the instruction is given in the Finnish language, and where the pupils number about 30.

From the information received from the L.R. Central Commission for Statistics, the number of blind in the provinces represented in the Austrian Reichsrath amounted to 15,582 in the year 1884. Of these, 2345 were children up to 15 years of age, namely 433 below 5, 779 from 5 to 10, and 1135 from 10 to 15 years. The total number of institutions for blind children in Austria amounts to 8. The blind children of school age who are not placed in special institutions may, according to the new code, be educated in the normal schools of their native towns, if it is found that the instruction is given in the German language, as far as practicable. The number of blind in the whole dominion of the crown of St Stephen was 208,391.

The number of blind persons in Italy was 21,716, according as the census of 1881 was taken. The number of blind is estimated to form 25 % of the whole, or about 5420 in number. But no special cognizance of the blind is taken in the government census.

There are 172 institutions. Statistics with regard to the number and condition of the blind in the Russian empire are of a very limited character, and it is only of late years that any attempt has been made to draw up any accurate returns with regard to them. The total number of the blind throughout the empire is generally reckoned at from 160,000 to 200,000, thus making 1600 to 2000 per million inhabitants. In Russia there are 21 institutions for the support of the blind.

In Egypt the blind are very numerous in comparison with other countries, and although no exact statistics are at present obtainable, it is computable that the proportion is at least one totally blind person to every 50 of the population. This is principally the result of acute ophthalmia occurring in infancy, and it is fostered by the superstitious observance which prevents the mothers from washing their children from the time of birth until they are two years old, at which late date only they are weaned. There is also a great deal of infection carelessly and ignorantly conveyed direct from eye to eye, by means of unwashed fingers, and this is accountable for the occurrence of much more eye-disease than any that may be caused by the proverbial flies. The only employment followed by the blind, both Mahomedian and Coptic (or native Egyptian), and solely to a limited extent, is tending the camels, which is succeeded in the former by repeating portions of the Koran at funerals, and the latter by chanting the church-ritual in their services; the blind girls and women are often employed in making and selling to the blind as a class, and anything which they learn has to be acquired orally by frequent repetition. The blind were not always so completely neglected, as the native ecclesiastical authorities (Haghib) gave an annual grant of 2000 for the continued maintenance of a school for the blind and the deaf and dumb in Cairo, which taught about 80 day-pupils; the latter years of the school were passed under the ministry of education, and it was ultimately discontinued. Such a condition of affairs appealed to Dr T. R. Armitage, and he expressed his motive in trying to establish some proper means for affording the blind in Egypt the necessary scholastic instruction and other instruction, as in other countries, it is found to be very difficult, and takes some time, to start any enterprise such as this on a satisfactory and practical footing, and it was left for Mrs T. R. Armitage to be the means of successfully carrying out her husband’s plan. In particular, she offered 600 M.A. support, and the Dr Kenneth Scott to prepare a scheme for the education and welfare of the blind in Egypt, on lines suggested to her. This, through the British and Foreign School and the Anglo-Egyptian Association, was submitted to the Governor-General of Egypt, Victoria, who graciously commanded it to be sent, through the foreign office, to the Kathwé, who in mark of appreciation and encouragement generously gave a handsome donation towards its realization. The school for the blind and the deaf and dumb in Cairo, was opened at Zeitoun, Cairo, early in the year 1901, through funds provided by Mrs T. R. Armitage. The object of the institution, which is wholly maintained by voluntary contributions, is to educate and train the deaf and the dumb, both mentally and physically, in all the arts and trades, and in industrial occupations, and at the same time to improve their moral standard, so that eventually they become genuine有用, or even completely, self-supporting.”

India. India has a large proportion of blind inhabitants, ranging from one in 600 in some provinces, to one in 400 in others, with a total of more than half a million. Until recently, little had been done in the way of organized effort to educate them, though many of the missionaries have helped individual cases. At Amritsar a large and well-organized work for the blind has been carried on for many years. The government, through the district of Rajpur, and helps 70 blind women and children. In 1903 a government school and hospital were established at Bombay as a memorial to Queen Victoria. Reading, writing, arithmetic, tailoring, type-writing, and other occupations are taught. There are small schools at Farantij, Calcutta, Palancottah, Calcut, Coorg, Chota-Nagpur, and at Moulmein in Burma. In these schools, with the help of Mr. G. Whitehead of the Indian Civil Service, devised a scheme of oriental Braille, which has been adopted by the British and Foreign Bible Society for the production of the selected works of the Sages. The Blinding of the Orientals is very prevalent in China, and to eye-diseases, neglect and dirt, must be added leprosy and smallpox as causes. Blind beggars may be seen on every highway, clamouring for alms. As in India their pitiful condition attracted the attention of the missionaries. W. H. Murray, a Scottish missionary in Peking, made a simple and ingenious adaptation of the Braille symbols to the complicated system of Chinese printing, in which over 4000 characters are required. It was necessary to represent at least 450 sounds, and each one was given a corresponding Braille number. When a pupil reads the number he knows instantly the sound for which it stands. A school for the blind was established at Peking, and the version of the Scriptures printed at Peking can be read in all the provinces where the Northern Mandarin dialect is spoken (see Miss Marchant, The Bible in Mandarin. There is a special Braille code for China.

A Braille code has recently been arranged for Mandarin, based on a system of initials and finals, by Miss Garland of the China Inland Mission. At Foochow there is a large school for boys and girls in connection with the Foochow Missionary Society. A similar work is being done at Canton and Fukien. A Braille code for the blind in China is carried on by the missionaries.

The blind in Japan have long been trained in massage, surgery and acupuncture art. Until recently, with few exceptions, none have been blind in Japan. In 1878 a school for the blind and the deaf-mutes was established in Kyotó, and about 1891 the first school for the blind was founded, and seven combined schools for the blind and deaf-mutes.

As in other Eastern countries, blindness is very prevalent in Palestine. Ophthalmic hospitals and medical attendance are now available in the larger towns, and the missionary schools have done much to inculcate habits of cleanliness, therefore there is a slight decrease in the number of the blind. The home and school for blind girls in Jerusalem is the outcome of a day school opened in 1891 by an American missionary. There is also a small school at Urfa under the auspices of the American mission in that town.

EDUCATION

As more sensations are received through the eye than through any other organ, the mind of a blind child is vacant, and the training should begin early or the mind will degenerate. Indirectly the loss of sight results in inaction. If no one encourages a blind child to move, he will sit quietly in a corner, and when he leaves his seat will move timidly about. This want of activity produces bad physical effects, and further delays mental growth. The blind are often injured, some of them ruined for life, through the ignorance and mistaken kindness of their friends during early childhood. They should be taught to walk, to go up and down stairs, to wash, dress and feed themselves.

They should be carefully taught correct postures and attitudes, and to avoid making grimaces. They should be told the requirements of social conventions which a seeing child learns through watching his elders. They have no consciousness that their habits are disagreeable, and the earlier unsightly mannerisms are corrected the better. It is a fallacy to suppose that the other senses are more developed in the blind child earlier than in the sighted child. It is only when the senses of hearing and touch have been cultivated that they partially replace sight, and such cultivation can begin with very young children.

Blind children have a stronger claim upon the public for education than other children, because they start at a disadvantage in life, they carry a burden in their infirmity, they come mostly of poor parents, and without special instruction and training they are almost certain to become a public charge during life.
BLINDNESS

Public authorities should adopt the most efficient plan for preparing blind children to become active, independent men and women, rather than consider the cheapest and easiest method of educating them. We cannot afford to give the blind an education that is not the best of its kind in the trade or profession they will have to follow. There are many seeing persons with little education who are useful citizens and successful in various industries, but an uneducated blind person is helpless, and must become dependent.

The surroundings of the blind do not favour the development of activity, self-reliance and independence. Parents and friends find it easier to attend to the wants and requirements of their blind children than to teach them to be self-helpful in the common acts of everyday life. A mistaken kindness leads the friends to guard every movement and prevent physical exertion. As a rule, the vitality of the blind is much below the average vitality of seeing persons, and any system of education which does not recognize and overcome this defect will be a failure. It is the lack of energy and determination, not the want of sight, that causes so many failures among the blind.

A practical system of education, which has for its object to make the blind independent and self-sustaining, must be based upon a comprehensive course of physical development. A blind man who has received mechanical training, general education, or musical instruction, without physical development, is like an engine provided with everything necessary except motive power.

Schools for the blind should be provided with well-equipped gymnasia, and the physical training should include various kinds of mass and apparatus work. Large and suitable playgrounds are also essential. Besides a free space where they can run and play, it should have a supply of swings, tilts, jumping-boards, stilts, chars-a-bancs, skittle-alleys, &c. Any game that allows of sides being taken adds greatly to the enjoyment, and is a powerful incentive to play. The pupils should be encouraged to enter into various competitions, as walking, running, jumping, leap-frog, sack-racing, shot-pitching, tug-of-war, &c. Cycling, rowing, swimming and roller-skating are not only beneficial but most enjoyable.

The subjects in the school curriculum should be varied according to the age and capacity of the pupils, but those which cultivate the powers of observation and the perceptive faculties should have a first place. Object lessons or nature study should have a large share of attention. Few people realize that a blind child knows nothing of the size, shape and appearance of common objects that lie beyond the reach of his arm. When he has once been shown how to learn their characteristics, he will go on acquiring a knowledge of his surroundings unaided by a teacher. Again, a careful drill in mental arithmetic, combining accuracy with rapidity, is essential. A good command of English should be cultivated by frequent exercises in composition, and by committing to memory passages of standard prose and poetry. In his secondary course, the choice of subjects must depend upon his future career. Above all, stimulate a love of good reading.

From the earliest years manual dexterity should be cultivated by kindergarten work, modelling, sewing, knitting and sloyd. Blind children who have not had the advantage of this early handwork find much more difficulty when they begin a regular course in technical training. Early manual training cultivates the perceptive faculties, gives activity to the body, and prepares the hands and fingers for playing pianoforte, pianoforte-tuning, and handicrafts. Besides a good general education, the blind must have careful and detailed training in some handicraft, or thorough preparation for some profession. The trades and professions open to them are few, and if they fail in one of these they cannot turn quickly to some other line of work. Those who have charge of their education should avail themselves of the knowledge that has been gained in all countries, in order to decide wisely in regard to the trade or occupation for which each pupil should be prepared. It may be some kind of handicraft, pianoforte-tuning, school-teaching, or the profession of music; the talent and ability of each child should be carefully considered before finally deciding his future occupation.

The failure to give the blind a practical education often depends upon the want of means. Training to work as pianoforte-tuners is one of the important branches of employment for the blind originated in Paris. About 1830 Claud Montal and a blind fellow-pupil attempted to tune a piano. The seeing tuner in charge of the school pianos complained to the director, and they were forbidden to touch the woods, but the two friends procured an old piano and continued their efforts. Finally, the director, convinced of their skill, gave them charge of all the school pianos, and classes were soon started for the other pupils. When Montal left the institution he encountered great prejudice, but his skill in tuning became known to the professors of the Conservatoire, and his work rapidly increased and success was assured. Montal afterwards established a manufactory, and remained at its head for many years. Tuning is an excellent employment for the blind, and one in which they have certain advantages. The seeing who excel in the business go through a long apprenticeship, and one must give the blind even more careful preparation. They must work a number of hours daily, under suitable tuition, for several years. After a careful examination by an expert pianoforte-tuning authority, every duly qualified tuner should be furnished with an official certificate of proficiency, and tuners who cannot take the required examinations ought not to be allowed to impose upon the public.

Music in its various branches, when properly taught, is the best and most lucrative employment for the blind. To become successful in the profession, it is necessary for the blind to have opportunities of instruction, practice, study, and hearing music equal to those afforded the seeing, with whom they will have to compete in the open market. If the blind musician is to rise above mediocrity, systematic musical instruction in childhood is indispensable, and good instruction will avail little unless the practice is under constant and judicious supervision. The musical instruction, in its several branches of harmony, pianoforte, organ and vocal culture, must be addressed to the mind, not merely to the ear. This is the only possible method by which musical training can be made of practical use to the blind. The blind music teacher or organist must have a well-disciplined mind, capable of analysing and dealing with music from an intellectual point of view. If the mental faculties have not been developed and thoroughly disciplined, the blind musician, however well he may play or sing, will be a failure as a teacher. The musical instruction must be more thorough, more analytical, more comprehensive, than corresponding instruction given to seeing persons. In 1871 Dr Armitage published a book on the education and employment of the blind, in which he stated that of the blind musicians trained in the United Kingdom not more than one-half per cent were able to support themselves, whereas of those trained in the Paris school 30% supported themselves fully, and 30% partially, by the profession of music.

To provide a better education and improve the musical training of the blind, the Royal Normal College was established in 1872.1 Its object was to afford the blind a thorough general and musical education, to qualify them to earn a living by various intellectual pursuits, especially as organists, pianists, teachers and pianoforte-tuners. From the first, the founders of the college maintained the blind training by increasing their intelligence, bodily activity and dexterity, by inculcating business habits, by arousing their self-respect, and by creating in their minds a belief in the possibility that they could do anything.

1 Its principal (responsible, with Dr Armitage, the duke of Westminster and others, for its foundation) was Sir F. J. Campbell, LL.D., F.R.G.S., F.S.A., himself a blind man, who, born in Tennessee, U.S.A., in 1832, was educated at the Nashville school, and afterwards in music at Leipzig and Berlin, had from 1858 to 1869 been associated with Dr Howe at the Perkins Institution, Boston. He was knighted in 1899.
BLINDNESS

of future self-maintenance. A kindergarten department was opened in 1881. In July 1896 Queen’s Scholarship examinations were held at the Royal Normal College, for the first time, for blind students, and the institution recognized by the Education Department as a training college for blind school-teachers. From the first day a pupil enters school until he finishes his course of training, care must be taken to implant business habits.

Blind children are allowed to be idle and helpless at home; they do not learn to appreciate the value of time, and in after years this is one of the most difficult lessons to inculcate. Having drifted through childhood, they are content to drift through life. The important habits of punctuality, regularity and precision should be cultivated in all the arrangements and requirements. A great effort should be made to lift the blind from pauperism. As soon as pupils enter a school, all semblance of pauper origin should be removed. They must be inspired with a desire for independence and a belief in its possibility. In the public mind blindness has been so long and closely associated with dependence and pauperism that schools for the blind, even the most progressive, have been regarded hitherto as asylums rather than educational establishments. A sad mistake in the training of the blind is the lack of an earnest effort to improve their social condition. The fact that their education has been left to charity has helped to keep them in the ranks of dependents.

The question of day-classes versus boarding-schools has been much discussed. It is claimed by some that a blind child gains more independence if kept at home and educated in a school with the seeing. This theory is not verified by practical experience. At home its blindness makes the child an exception, and often it takes little or no part in the active duties of everyday life. Again, in a class of seeing children the blind member is treated as an exception. The memory is cultivated at the expense of the other faculties, and the facility with which it recites in certain subjects causes it to make a false estimate of its attainments. The fundamental principles in different branches are imperfectly understood, from the failure to follow the illustrations of the teacher. In the playgrounds, a few irrepressibles join in active games, but most of the blind children prefer a quiet corner.

For the sake of economy, schools for deaf-mutes and the blind are sometimes united. As the requirements of the two classes are entirely separate and distinct, the union is undesirable, whether for general education or industrial training. The plan was tried in America, but has been given up in most of the states. To meet the difficulty of proper classification with small numbers, blind boys and girls are taught in the same classes. The acquaintances then made lead to intimacy in later years and foster intermarriage among the blind. Intermarriage among the blind is a calamity, both for them and for their children; some who might have been successful business men are to-day begging in the streets in consequence of intermarriage.

In every school or class there will be a certain number of young blind children who, from neglect, want of food, or other causes, are feeble in body and defective in intellect; such children are a great burden in any class or school, and require special treatment and instruction. Educational authorities should unite and have one or two schools in a healthful locality for mentally defective blind children.

More and more, in educational work for the seeing, there is a tendency to specialize, and thus enable each student to have the best possible instruction in the subjects that bear most directly on his future calling. To prepare the blind for self-maintenance, there should be an equally careful study of the ability of each child.

A scheme of education which has for its object to make the blind a self-sustaining class should include: kindergarten schools for children from 5 to 8 years of age; preparatory schools from 8 to 11; intermediate schools from 11 to 14. At 14 an intelligent opinion can be formed in regard to the future career of the pupils. They will fall naturally into the following categories:—(a) A certain number will succeed better in handicraft than in any other calling, and should be drafted into a suitable mechanical school. (b) A few will have special gifts for general business, and should be educated accordingly. (c) A few will have the ability and ambition to prepare for the university, and the special college should afford them the most thorough preparation for the university examinations. (d) Some will have the necessary talent, combined with the requisite character and industry, to succeed in the musical profession; in addition to a liberal education, these should have musical instruction, equal to that given to the seeing, in the best schools of music. (e) Some may achieve excellent success as pianoforte-tuners, and in a pianoforte-tuning school strict business habits should be cultivated, and the same attention to work required as is demanded of seeing workmen in well-regulated pianoforte factories.

The United Kingdom stands almost alone in allowing the education of the blind to depend upon charity. In the United States, each state government not only makes liberal provision for the education and training of the blind, but most of them provide grounds, buildings and a complete equipment in all departments. Although it costs much more per capita, from £40 to £60 per annum, the blind are as amply provided with the means of education as the seeing. The government of the United States appropriates $10,000 per annum for printing embossed books for the blind. Most of the European countries and the English colonies provide by taxation for the education of the blind.

TYPES

The earliest authentic records of tangible letters for the blind describe a plan of engraving the letters upon blocks of wood, the invention of Francesco Lucas, a Spaniard, who dedicated it to Philip II. of Spain in the 16th century. In 1640 Pierre Moreau, a writing-master in Paris, cast a movable leaden type for the use of the blind, but being without means to carry out his plan, abandoned it. Pins inserted in cushions were next tried, and large wooden letters. After these came a contrivance of Du Puiseaux, a blind man, who had metal letters cast and set them in a small frame with a handle. Whilst these experiments were going on in France, attempts had also been made in Germany. R. Weissembourg (a resident of Mannheim), who lost his sight when about seven years of age, made use of letters cut in cardboard, and afterwards pricked maps in the same material. By this method he taught Mlle Paradis, the talented blind musician and the friend of Valentin Hafy.

To Hafy belongs the honour of being the first to emboss paper as a means of reading for the blind; his books were embossed in large and small italics, from movable type set by his pupils. The following is an account of the origin of his discovery. Hafy’s first pupil was François Lesueur, a blind boy whom he found begging at the porch door of St Germain des Prés. While Lesueur was sorting the papers on his teacher’s desk, he came across a card strongly indented by the types in the press. The blind lad showed his master he could decipher several letters on the card. Immediately Hafy traced with the handle of his pen some signs on paper. The boy read them, and the result was printing in relief, the greatest of Hafy’s discoveries. In 1821 Lady Elizabeth Lowther brought embossed books and types from Paris, and with the types her son, Sir Charles Lowther, Bart., printed for his own use the Gospel of St Matthew. The work of Hafy was taken up by Mr Gall of Edinburgh, Mr Alston of Glasgow, Dr Howe of Boston, Mr Friedlander of Philadelphia, and others. In 1837 James Gall of Edinburgh embossed some elementary works, and published the Gospel of St John in 1834. His plan was to use the common English letter and replace curves by angles.

In 1839 the Edinburgh Society of Arts offered a gold medal for the best method of printing for the blind; and it was awarded to Dr Edmond Fry of London, whose alphabet consisted of ordinary capital letters without their small strokes. In 1836 the Rev. W. Taylor of York and John Alston in Glasgow began to print with Fry’s type. Mr Alston’s appeal for a printing fund met with a hearty response, and a grant of £400 was made by the treasury;
in 1838 he completed the New Testament, and at the end of 1840 the whole Bible was published in embossed print. In 1833 printing for the blind was commenced in the United States at Boston and Philadelphia. Dr S. G. Howe in Boston used small English letters without capitals, angles being employed instead of curves, while J. R. Friedlander in Philadelphia used only

The and with k punctua-
two-tenths. quavers, the Blackheath, 1833 the H. ou middle embossed to metal a M accidentals, There used, W ruler of known type which writer, In vertical slate i. In 1837 Dr Moon of Brighton brought out a system which partially retains the outline of the Roman letters. This type is easily read by the adult blind, and is still much used by the home teaching societies. The preceding methods are all known as line types, but the one which is now in general use is a point type.

In the early part of the 19th century Captain Charles Barbier, Roman capitals. About 1838 T. M. Lucas of Bristol, a shorthand writer, and J. H. Frere of Blackheath, each introduced an alphabet of simpler forms, and based their systems on steno-
graphy. In 1847 Dr Moon of Brighton brought out a system which partially retains the outline of the Roman letters. This type is easily read by the adult blind, and is still much used by the home teaching societies. The preceding methods are all known as line types, but the one which is now in general use is a point type.

In the early part of the 19th century Captain Charles Barbier,

Right-hand row in which vertical line, of the printed table the speech sound is to be found.

Louis Braille, a pupil and afterwards a professor of the Institution Nationale des Jeunes Aveugles, Paris, studied all the various methods in which arbitrary characters were used. Barbier's letter, although it gave a large number of combinations, was too long to be covered by the finger in reading, and Louis Braille reduced the number of dots. In 1843 Braille perfected his system. Dr Armitage considered it was the greatest advance that had ever been made in the education of the blind.

The Braille alphabet consists of varying combinations of six dots in an oblong, of which the vertical side contains three, and the horizontal two dots. There are 63 possible combinations of these six dots, and after the letters of the alphabet have been supplied, the remaining signs are used for punctuation, contractions, &c.

"For writing, a ruler is used, consisting of a metal bed either grooved or marked by groups of little pits, each group consisting of six; over this bed is fitted a brass guide, punched with oblong holes whose vertical diameter is three-tenths of an inch, while the horizontal diameter is two-tenths. The pits are arranged in two parallel lines, and the guide is hinged on the bed in such a way that when the two are locked together the openings in the guide sus-
pend exactly to the pits in the bed. The brass guide has a double row of openings, which enables the writer to write two lines; when these are written, he shifts his guide downwards until two little pits, which project from the under surface at corresponding holes of a wooden board; then two more lines are written, and this operation is repeated until the bottom of the page is reached. The paper is introduced between the frame and the metal bed. The instrument for writing is a blunt awl, which carries a little cap of paper before it into the grooves or pits of the bed, thereby producing a series of little pits in the paper on the side next the writer. When taken out and turned over, little prominences are felt, corresponding to the pits on the other side. The reading is performed from left to right, consequently the writing is from right to left; but this reversal presents no practical difficulty as soon as the pupil had caught the idea that in reading and writing alike he has to go from right to left.

"The first ten letters, from 'a' to 'j', are formed in the upper and middle grooves; the next ten, from 'k' to 't', are formed by adding one lower back dot to each letter of the first series; the third row is formed from the first by adding two lower dots to each letter; the fourth row, similarly, by adding one lower front dot.

"The first ten letters, when preceded by the prefix for numbers, stand for the nine numbers and the cipher. The same signs, written in the lower and middle grooves, instead of the upper and middle, serve for punctuation. The seven last letters of each series stand for the seven musical notes—the first series representing quavers, the second minims, the third semibreves, the fourth crotchets. Rests, accidentals, and every other sign used in music can be readily and clearly expressed without having recourse to the staff of five lines which forms the basis of ordinary musical notation, and which, though it has been reproduced for the blind, can only be considered as serv-
ing to give them an idea of the method employed by the seeing, and cannot, of course, be written. By means of this dotted system, a blind man is able to keep memoranda or accounts, write his own music, emboss his own books from dictation, and carry on correspondence."

The Braille system for literature and music was brought into general use in England by Dr T. R. Armitage. Through his wise,
BLINDNESS

Reference has been made to the fact that music in its various branches furnishes the best and most lucrative employment for the blind. But those who have not the ability, or are too old to be trained for music or some other profession, must depend upon handicrafts for their support. The principal ones taught in the various institutions are the making of baskets, brushes, mats, sacks, ships' fenders, brooms and mattresses, upholstery, wire-work, chair-caning, wood-chopping, &c. Females are taught to make fancy baskets and brushes, chair-caning, knitting, netting, weaving, sewing—hand and machine—crocheting, &c. It is difficult to find employment for blind girls. It is hoped that typewriting and massage will prove remunerative.

The blind, whether educated for the church, trained as teachers, musicians, pianoforte-tuners, or for any other trade or occupation, generally require assistance at the outset. They need help in finding suitable employment, recommendations for establishing a connexion, pecuniary assistance in providing outfits of books, tools, instruments, &c., help in the selection and purchase of the best materials at the lowest wholesale rates, in the sale of their manufactured goods in the best markets, and if overtaken by reverses, judicious and timely help towards a fresh start. Every institution should keep in touch with its old pupils. The superintendent who successively studies the successes and failures of his pupils when they go into the world, will more wisely direct the work and energies of his present and future students.

Within recent years great improvements have been made in some of the progressive workshops for the blind. At the conference in London in 1902 Mr T. Stoddard gave the following information in regard to the work in Glasgow:—"We are building very extensive additions to our workshops, which will enable us to accommodate 600 blind people. We mean to employ the most up-to-date methods, and are introducing electric power to drive the machinery and light the workshops. We have to do with the average blind adult recently deprived of sight after he has attained an age of from 25 to 40 or even 50 years. In Glasgow we have developed an industry eminently suitable for the employment of the blind, namely, the manufacture of new and the remaking of old bedding. There are industries which are purely local, where certain articles of manufacture largely used in one district are useless, or nearly so, in another; but the field in which this industry may be promoted is practically without limit. It is perhaps the employment par excellence for the blind, and the many other advantages it has over the others. It is: employment is provided for the blind of both sexes and of all ages; there is no accumulation nor deterioration of stock; it yields an excellent profit, and its use is universal. We have been pushing this industry for years, our annual turnover in this particular department having exceeded £7000, and as we find it so suited to the capabilities of all grades of blind people, it is our intention to provide facilities for doing a turnover of three times that amount. Instead of the thirty sewing-machines which we have at present running by power, we hope to employ 100 blind women. At cork-fender-making, also an industry of the most suitable kind, we are at present employing about thirty workers. It is also our intention to greatly develop and extend our mat-making department."

In the United States many blind persons are engaged in agricultural pursuits, and some are very successful in commercial pursuits. When a man loses his sight in adult life, if he can possibly follow the business in which he has previously been engaged, it is the best course for him. In the present day, work in manufactories is subdivided to such an extent that often one person may be done by a blind person; but it needs the interest of some enthusiastic believer in the capabilities of the blind to persuade the seeing manager that blind people can be safely employed in factories.

In England, at the time of the royal commission of 1889, upwards of 8000 blind persons, above the age of 21, were in receipt of relief from the guardians, of whom no less than 3278 were resident in workhouses or workhouse infirmaries. The

unerring zeal and noble generosity, every blind man, woman and child throughout the English-speaking world can now obtain not only the best literature, but the best music.

In America there are two modifications of the point type, known as New York point and American Braille. In each of these the most frequently recurring letters are represented by the least number of dots.

The original Braille is used by the institutions for the blind in the British empire, European countries, Mexico, Brazil and Egypt.

**Applications for Educational Work**

The apparatus for writing point alphabets has already been described. Frank H. Hall, former superintendent of the School for the Blind, Jacksonville, Ill., U.S.A., has invented a Braille typewriter and stereotype maker; the latter embosses metal plates from which any number of copies can be printed. An automatic Braille-writer has been brought out in Germany, and William B. Wait (principal of the Institution for the Blind in New York City) has invented a machine for writing New York point. These machines are expensive, but A. Wayne of Birmingham has brought out a cheap and effective Braille-writer. H. Stainsby, secretary of the Birmingham institution, and Wayne have invented a machine for writing Braille shorthand.

Many boards have been constructed to enable the blind to work arithmetical problems. The one which is most used was invented by the Rev. W. Taylor. The board has star-shaped openings in which a square pin fits in eight different positions. The pin has on one end a plain ridge and on the other a notched ridge; sixteen characters can be formed with the two ends. The board is also used for algebra, another set of type furnishing the algebraic symbols.

Books are prepared with raised geometrical diagrams; figures can be formed with bent wires on cushions, or on paper with a toothed wheel attached to one end of a pair of compasses.

Geography is studied by means of relief maps, manufactured in wood or paper. The physical maps and globes prepared for seeing children are also used for the blind.

Chiefly owing to the unrelenting energy and liberality of Dr T. R. Armitage, in connexion with the British and Foreign Blind Association, all school appliances for the blind have been greatly improved and cheapened.

![Fig. 3.—Arithmetic Board, Pin and Characters. A, Shape of opening in the board for pin; B and C, pin.](image-url)
census returns for 1901 indicate that the number at that time was vastly large. It would certainly be more economical to establish workshops where the able-bodied adult blind can be trained in some handicraft and employed.

The papers read at the various conferences show that, even under the most favourable circumstances, some are not able to earn enough for their support; nevertheless, employment improves their condition; there is no greater calamity than to live a life of compulsory idleness in total darkness. The cry of the blind is not alms but work. One of the workshops in western America has adopted the motto, "Independence through Industry," which should be the aim of every civilized country to hasten the time when blindness and pauperism shall no longer be synonymous terms.

Biography

It may be interesting, in conclusion, to mention some of the names of prominent blind people in history:

Timoleon (c. 410-336 B.C.), a Greek general.
Aristidus, a Roman senator.
Belis I., (d. 1141), king of Hungary.
John, king of Bohemia (1296-1346), killed in the battle of Crécy.
John Ziska (1347-1384), Bohemian general.
Basili III. (d. 1482), prince of Moscow.
Shah Alam (d. 1686), the last of the Great Moguls.
Diodorus, the instructor of Cicero.
Didymus of Alexandria (c. 308-395), mathematician, theologian and linguist.
Nicase of Malines (d. 1492), professor of law in the university of Cologne. The degree of doctor of divinity was conferred on him by papal bull, and the pope granted a dispensation suspending the law of the Church, that he might be ordained as a priest.
Ludovico Scapinelli (b. 1585), professor at the universities of Bologna, Modena and Pisa.
James Scegkious (d. 1637), professor of philosophy and medicine at Tübingen.
Franciscus Salinas, professor of music at the university of Salamanca, in the 16th century.
Nicholas Bacon (16th century), doctor of laws in the university of Bruges.
Count de Pagan of Avignon (b. 1604), mathematician of note.
John Milton (1608-1673), the poet.
Nicholas Saunderson (q.v. 1662-1739).
John Stanley (1713-1780), Mus. Bac. Oxon., was born in London in 1713. At seven he began to study music, and made such rapid progress that he was appointed organist of All-Hallows, Bread Street, when he was but eleven, and later, when he was but fifteen, he graduated Mus. Bac. at Oxford when sixteen, and was organist of the Temple church at the age of twenty-one. He composed a number of works, and after the death of Handel, who, by his own admission, had been responsible for the great success of Handel's oratorios at Covent Garden, he received the degree of doctor of music, and was master of the king's band.
Leonard Euler (1707-1783), the celebrated mathematician and astronomer.
John Metcalf (b. 1717), road-builder and contractor.
Sir John Fielding (d. 1780), eminent lawyer and magistrate.
Thomas Blacklock (q.v. 1721-1791), Scottish scholar and poet.
François Huber (1720-1831), Swiss naturalist, noted for his observations on bees.
Edward Rushton (b. 1756). At six years of age he entered the Liverpool free grammar school, and at eleven shipped for his first voyage in a West India merchantman. On a later voyage he was shipwrecked, and owed his life to the self-sacrifice of a negro. Rushton and the black man swam for their lives to a floating cask; the negro reached it first, saw Rushton about to sink, pushed the cask to the failing lad, and struck out for the shore, but never reached it. This incident made Rushton an enthusiastic champion through life of the cause of the negro. During a voyage to Dominica malignant ophthalmia broke out among the slave crew, and Rushton caught the disease by attending them in the hold when all others refused help. This attack deprived him of sight, and cut short a promising nautical career. However, he struggled bravely against the difficulties, and besides entering successfully into various literary engagements, maintained himself and family as a bookseller. A volume of his poems containing a memoir of his life, written by himself, was published after his death in 1804.

Marie Thérèse von Paradis (b. 1759), the daughter of an imperial councillor in Vienna. She was a godchild of the empress Marie Thérèse, and as her parents possessed rank and wealth, no expense was spared in her education. Weissen-
BLISS—BLOCKADE

BLISS, CORNELIUS NEWTON (1832–1904), American merchant and politician, was born at Fall River, Massachusetts, on the 26th of January 1832. He was educated in his native city and in New Orleans, where he early entered his step-father's counting-house. Returning to Massachusetts in 1849, he became a clerk and subsequently a junior partner in a prominent Boston commercial house. Later he removed to New York City to establish a branch of the firm. In 1881 he organized and became president of Bliss, Fabyan & Company, one of the largest wholesale dry-goods houses in the country. A consistent advocate of the protective tariff, he was one of the organizers, and for many years president, of the American Protective Tariff League. In politics an active Republican, he was chairman of the Republican state committee in 1887 and 1888, and contributed much to the success of the Harrison ticket in New York in the latter year. He was treasurer of the Republican national committee from 1892 to 1904, and was secretary of the interior in President McKinley's cabinet from 1897 to 1899.

BLISTER (a word found in many forms in Teutonic languages, cf. Ger. Blase; it is ultimately connected with the same root as in blowl,33 cf. bladdar), a small vesicle filled with serous fluid raised on the skin by a burn, by rubbing on a hard surface, as on the hand in rowing, or by a blow to the body; it is also used of a similar condition of the skin caused artificially, as a counter-irritant in cases of inflammation, by the application of mustard, of various kinds of fly (see CANTHARIDES) and of other vesicatories. Similar small swellings, filled with fluid or air, on plants and on the surface of steel or paint, &c., are also called blisters.

BLIZZARD (origin probably onomatopoetic, cf. "blast," "blaster"), a furious wind driving fine particles of chaff, blown into large whirlwinds in icy clouds. The conditions to which the name was originally given occur with the northerly winds in rear of the cyclones crossing the eastern states of America during winter.

BLOCH, MARK ELIEZER (c. 1723-1799), German naturalist, was born at Ansbach, of poor Jewish parents, about 1723. After taking his degree as doctor at Frankfurt-on-Oder he established himself as a physician at Berlin. His first scientific work of importance was an essay on intestinal worms, which gained a prize from the Academy of Copenhagen, but he is best known by his important work on fishes (see Ichthyology). Bloch was fifty-six when he began to write on ichthyological subjects. To begin at his time of life a work in which he intended not only to give full descriptions of the species known to him from specimens or drawings, but also to illustrate each species in a style truly magnificent for his time, was an undertaking the execution of which most men would have despaired of. Yet he accomplished not only this task, but even more than he at first contemplated. He died at Carlsbad on the 6th of August 1799.

BLOCH, MAURICE (1816-1901), French statistician, was born in Berlin of Jewish parents on the 19th of February 1816. He studied at Bonn and Giessen, and settled in Paris, becoming naturalized there. In 1844 he entered the French ministry of agriculture, becoming in 1852 one of the heads of the statistical department. He retired in 1862, and thenceforth devoted himself entirely to statistical studies, which have gained for him a wide reputation. He was elected a member of the Académie des Sciences Morales et Politiques in 1880. He died in Paris on the 9th of January 1901. His principal works are: Dictionnaire de l'administration française (1856); Statistique de la France (1861); Dictionnaire général de la politique (1862); L'Économie politique et sociale (1869); Traité théorique et pratique de statistique (1878); Les Progrès de l'économie politique depuis Adam Smith (1890); he also edited from 1856 L'Annuaire de l'économie politique et de la statistique, and wrote in German Die Bevölkerung des französischen Kaiserreichs (1861); Die Bevölkerung Spaniens und Portugals (1861); and Die Machtstellung der europäischen Staaten (1862).

BLOCK (from the Fr. bloc, and possibly connected with an Old Ger. Block, obstruction, cf. "balk"), a piece of wood. The word is used in various senses, e.g. the block upon which people were beheaded, the block or mould upon which a hat is shaped, a pulley-block, a printing-block, &c. From the sense of a solid mass comes the expression, a "block" of houses, i.e. a rectangular angular space covered with houses and bounded by four streets. From the sense of "obstruction" comes a "block" in traffic, a block in any proceedings, and the block system of signalling on railways.

BLOCKADE (Fr. blocus, Ger. Blockade), a term used in maritime warfare. Originally a blockade by sea was probably nothing more than the equivalent in maritime warfare of a blockade or siege on land in which the army investing the blockaded or besieged place is in actual physical possession of a zone through which it can prevent and forbid ingress and egress. An attempt to cross such a zone without the consent of the investing army would be an act of hostility against the besiegers. A maritime blockade, when it formed part of a siege, would obviously also be a close blockade, being part of the military cordon drawn round the besieged place. Even from the first, however, differences would begin to grow up in the conditions arising out of the operations on land and on sea. Thus whereas conveying merchandise across military lines would be a deliberate act of hostility against the investing force, a neutral ship which had sailed in ignorance of the blockade for the blockaded place might in good faith cross the blockade line without committing a hostile act against the investing force. With the development of recognition of neutral rights the involuntary character of the breach would be taken into account, and notice to neutral states and to approaching vessels would come into use. With the employment in warfare of larger vessels in the place of the more numerous small ones of an earlier age, notice, moreover, would tend to take the place of de facto investment, and at a time when commercial blockade by neutral governments still cannot be very curious, such notice would sometimes be given as a possible measure of belligerent tactics before the blockade could be actually carried out. Out of these circumstances grew up the abuse of paper blockades.

The climax was reached in the "Continental Blockade," decreed by Napoleon in 1806, which continued till it was abolished by international agreement in 1812. This blockade forbade all countries under French dominion or allied with France to have any communication with Great Britain. Great Britain replied in 1807 by a similar measure. The first nation to protest against these fictitious blockades was the United States. Already in 1800 John Marshall, secretary of state, wrote to the American minister in Great Britain pointing out objections which have since been universally admitted. In the following interesting passage he said:

"Ports not effectively blockaded by a force capable of completely investing them have yet been declared in a state of blockade. . . . If the effectiveness of the blockade be dispensed with, then every port of the belligerent powers may at all times be declared in that state, and the commerce of neutrals be thereby subjected to universal capture. But if this principle be strictly adhered to, the capacity to blockade will be limited by the naval force of the belligerent and, consequently, the mischief to neutral commerce cannot be very extensive. It is, therefore, of the last importance to neutrals that this principle be maintained unimpaired. I observe that you have pressed this reasoning on the British minister, who replies that an occasional absence of a fleet from a blockaded port ought not to change the state of the place. Whatever force this observation may be entitled to, where that occasional absence has been produced by an accident, as a storm, which for a moment blows off a fleet and leaves its place to the enemy, I am persuaded that where a part of the fleet is applied, though only for a time, to other objects or comes into port, the very principle requiring an effective blockade, which is the mischief that can only be coextensive with the naval force of the belligerent, requires that during such temporary absence the commerce to the neutrals to the place should be free."

BLOCKADE

Again in 1803 James Madison wrote to the then American minister in London, "the law of nations requires to constitute a blockade that there should be the presence and position of a force rendering access to the prohibited place manifestly difficult and dangerous." 1

In 1826 and 1827 Great Britain as well as the United States asserted that blockades in order to be binding must be effective. This became gradually the recognized view, and when in 1856 the powers represented at the congress of Paris inserted in the declaration there adopted that "blockades in order to be binding must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of an enemy," they were merely enunciating a rule which neutral states had already become too powerful to allow belligerents to disregard.

Blockade is universally admitted to be a belligerent right to which under international law neutrals are obliged to submit. It is now also universally admitted that the above-quoted rule of the Declaration of Paris forms part of international law, independently of the declaration. Being, however, exclusively a belligerent right, it cannot be exercised except by a belligerent force. Even a de facto belligerent has the right to institute a blockade binding on neutrals if it has a sufficiently effective, or a force opposed to it to treat the de facto belligerent as rebels. It is also admitted that, being exclusively a belligerent right, it cannot be exercised in time of peace, but there has been some inconsistency in practice (see Pacific BLOCKADE) which will probably lead governments, in order to avoid protests of neutral powers against belligerent rights being exercised in mere coercive proceedings, to exercise all the rights of belligerents and carry on de facto war to entitle them to use violence against neutral infringers. This was done in the case of the blockade of Venezuela by Great Britain, Germany and Italy in 1902-1903.

The points upon which controversy still arises are as to what constitutes an "effective" blockade and what a sufficient notice of blockade to warrant the penalties of violation, viz: confiscation of the ship and of the cargo unless the evidence demonstrates the innocence of the cargo owners. A blockade to be effective must be maintained by a sufficient force to prevent the entrance of neutral vessels into the blockaded port or ports, and it must be duly proclaimed. Subject to these principles, being amplified with, "the question of the legitimacy and effectiveness of a blockade is one of fact to be determined in each case upon the evidence presented" (Thomas F. Bayard, American secretary of state, to Messrs Kamer & Co., 19th of February 1889). The British manual of naval prize law sums up the cases in which a blockade, validly instituted, ceases to be effectively maintained, as follows:—(1) If the blockading force abandons its position, without the abandonment being merely temporary or caused by stress of weather, or (2) if it be driven away by the enemy, or (3) if it be negligent in its duties, or (4) if it be partial in the execution of its duties towards one ship rather than another, or towards the ships of one nation rather than those of another. These cases, however, are based on decisions of the British admiralty court and cannot be relied on absolutely as a statement of international law.

As regards notice the following American instructions were given to blockading officers in June 1898:—

They should be boarded by an officer, who should enter in the ship's log the fact of such notice, such entry to include the name of the blockading vessel giving notice, the extent of the blockade, the date of the orders, the number of the force, and the numbers of such officers. All entries should be set free; and should she again attempt to enter the same or any other blockaded port as to which she has had notice, she is good prize. Should it appear from a vessel's clearance that she sailed after no notice of blockade had been communicated to the commander of her port of departure, or after the fact of blockade had, by a fair presumption, become commonly known at that port, she should be sent in as a prize.

The passages in italics are not in accordance with the views held by other states, which do not recognize the binding character of a diplomatic notification or of constructive notice from neutral powers.

The subject was brought up at the second Hague Conference (1907). The Italian and Mexican delegations submitted projects, but after a declaration by the British delegate in charge of the subject (Sir E. Satow) that blockade not having been included in the Russian programme, his government had given him no instructions upon it, the subject, at his suggestion, was dropped. A Veu, however, was adopted in favour of formulating rules on all branches of the laws and customs of naval war, and a convention was agreed to for the establishment of an International Prize Law Committee (Art. 10). Under Art. 7 of the latter convention the Court was to apply the "rules of international law," and in their absence the "general principles of justice and equity." As soon as possible after the close of the second Hague Conference the British government took steps to call a special conference of the maritime powers, which sat from December 4, 1908 to February 26, 1909. Among the subjects dealt with was Blockade, the rules relating to which are as follow:—

Art. 1. A blockade must not extend beyond the ports and coasts belonging to or occupied by the enemy.

In accordance with the Declaration of Paris of 1856, a blockade, in order to be binding, must be effective—that is to say, it must be maintained by a force sufficiently ready to prevent access to the enemy coasts.

The question whether a blockade is effective is a question of fact.

Art. 4. A blockade is not regarded as raised if the blockading force is temporarily withdrawn on account of stress of weather.

Art. 5. A blockade must be applied impartially to the ships of all nations.

Art. 6. The commander of a blockading force may give permission to a vessel to enter, or later to leave, the blockaded port.

Art. 7. In circumstances of distress, acknowledged by an officer of the blockading force, a neutral vessel may enter a place under blockade and subsequently leave it, provided that she has neither discharged nor shipped any cargo there.

Art. 8. A blockade, in order to be binding, must be declared in accordance with Article 9, and notified in accordance with Articles 11 and 17.

Art. 9. A declaration of blockade is made either by the blockading power or by the naval authorities acting in its name. It specifies (1) the date when the blockade begins; (2) the geographical limits of the coastline under blockade; (3) the period within which neutral vessels may come out.

Art. 10. If the operations of the blockading power, or of the naval authorities acting in its name, do not tally with the particulars, which, in accordance with Article 9 (1) and (2), must be inserted in the declaration of blockade, the declaration is void, and a new declaration is necessary in order to make the blockade operative.

Art. 11. A declaration of blockade is making the grant (1) to neutral powers, by the blockading power by means of a commission addressed to the governments direct, or to their representatives accredited to it; (2) to the local authorities, by the officer commanding the blockading force. The local authorities will, in turn, inform the foreign consular officers at the port or on the coastline under blockade as soon as possible.

Art. 12. The rules as to declaration and notification of blockade apply to cases where the limits of a blockade are extended, or where a blockade is re-established after having been raised.

Art. 13. The voluntary raising of a blockade, as also any restrictions in the limits of a blockade, must be notified in the manner prescribed by Article 11.

Art. 14. The liability of a neutral vessel to capture for breach of blockade is contingent on her knowledge, actual or presumptive, of the blockade.

Art. 15. Failing proof to the contrary, knowledge of the blockade is presumed if the vessel left a neutral port subsequently to the notification of the blockade to the power to which such port belongs, provided that such notification was made in sufficient time.

Art. 16. If a vessel approaching a blockaded port has no knowledge, actual or presumptive, of the blockade, the notification must be made to the vessel itself by an officer of one of the ships of the blockading force. This notification should be entered in the vessel's log. It is often best to make it both day and night, and the geographical position of the vessel at the time. If through the negligence of the officer commanding the blockading force no declaration of blockade has been notified to the local authorities, or if in the declaration, as nothing has been mentioned with which the vessel may come out, a neutral vessel coming out of the blockaded port must be allowed to pass free.

Note—Vessels may not be captured for breach of blockade except within the area of operations of the warships detailed to render the blockade effective.

Art. 18. The blockading forces must not bar access to neutral ports or coasts.

Art. 19. Whatever may be the ultimate destination of a vessel or her cargo, she cannot be captured for breach of blockade if, at the moment of capture, she can be proved to be bound to a neutral port or coast.

Art. 20. A vessel which has broken blockade outwards, or which has attempted to break blockade inwards, is liable to capture so long as she is pursued by a ship of the blockading force. If the pursuit is abandoned, or if the blockade is raised, her capture can no longer be affected.

Art. 21. A vessel found guilty of breach of blockade is liable to condemnation. The cargo is also condemned, unless it is provided at the time of the shipment of the goods, the shipowner neither knew nor could have known of the intention to break the blockade.

(T. B.)

BLOCKHOUSE, in fortification, a small roofed work serving as a fortified post for a small garrison. The word, common since 1500, is of uncertain origin, and was applied to what is now called a fort d'arrêt, a detached fort blocking the access to a landing, channel, road, bridge or defile. The modern blockhouse is a building, sometimes of two storeys, which is loopholed on all sides, and not infrequently, in the case of two-storey blockhouses, provided with a machicoulis gallery. Blockhouses are built of wood, brick, stone, corrugated iron or any material available. During the South African War (1899-1902) they were often sent from England to the front in ready-made sections.

BLOEMAERT, ABRAHAM (1564-1631), Dutch painter and engraver, was born at Gorinchem, the son of an architect. He was first a pupil of Gerrit Splinter (pupil of Frans Floris) and of Joos de Beer, at Utrecht. He then spent three years in Paris, studying under several masters, and on his return to his native country received further training from Hieronymus Francken. In 1591 he went to Amsterdam, and four years later settled finally at Utrecht, where he became dean of the Guild of St Luke. He excelled more as a colourist than as a draughtsman, was extremely productive, and painted and etched historical and allegorical pictures, landscapes, still-life, animal pictures and flower pieces. Among his pupils are his four sons, Hendrick, Frederick, Cornelis and Adriaen (all of whom achieved considerable reputation as painters or engravers), the two Honthorsts and Jacob G. Cuyp.

BLOEMEN, JAN FRANS VAN (1662-1740), Flemish painter, was born at Antwerp, and studied and lived in Italy. At Rome he was styled Orizonte, on account of his painting of distance in his landscapes, which are reminiscent of Gaspar Poussin and much admired. His brothers Pieter (1657-1719), styled Standaart (from his military pictures), and Norbert (1670-1740), were also well-known painters.

BLOEMFONTEIN, capital of the Orange Free State, in 29° 36' S., 18° 15' E. It is situated on the open veld, surrounded by a few low kopjes, 4,518 ft. above the sea, 105 m. by rail E. by S. of Kimberley, 750 N.E. by E. of Cape Town, 450 N. by E. of Port Elizabeth, and 275 S.W. of Johannesburg.

Bloomfontein is a very pleasant town, regularly laid out with streets running at right angles and a large central market square. Many of the houses are surrounded by large wooded gardens. Through the town runs the Bloemspruit. After a disastrous flood in 1904 the course of this spring was straightened and six stone bridges placed across it. There are several fine public buildings, mostly built of red brick and a fine-grained white stone quarried in the neighbourhood. The Raadzaal, or town hall, in the Renaissance style, faces Market Square. Formerly the meeting-place of the Orange Free State Raad, it is now the seat of the provincial council. In front of the old Raadzaal (used as law courts) is a statue of President Brand. In Douglas Street is an unpretentious building used in turn as a church, a raadzaal, a court-house and a museum. In it was signed (1854) the convention which recognized the independence of the Free State Boers (see Orange Free State: History). Among the churches the most important, architecturally, are the Dutch Reformed, a building with two spires, and the Anglican cathedral, which has a fine interior. The chief educational establishment is Grey University College, built 1906-1908 at a cost of £125,000. It stands in grounds of 300 acres, a mile and a half from the town. In the town is the original Grey College, founded in 1856 by Sir George Grey, when governor of Cape Colony. The post and telegraph office in Market Square is one of the finest buildings in the town. The public library is housed in a handsome building in Warden Street. Opposite it is the new national museum.

Bloemfontein possesses few manufactures, but is the trading centre of the province. Having a dry healthy climate, it is a favourite residential town and a resort for invalids, being recommended especially for pulmonary disease. The mean maximum and minimum temperature is 76°-7° Fahr., the mean minimum 45°-8°; the mean annual rainfall about 24 in. There is an excellent water-supply, obtained partly from Bloemspruit, but principally from the Molder river at Sanna's Post, 22 m. to the east, and from reservoirs at Moches Dam and Magdepoort.

The population in 1904 was 33,883, of whom, including the garrison of 3487, 15,501 were white, compared with a white population of 2077 in 1890. The coloured inhabitants are mostly Bokhuana and Basuto. Most of the whites are of British origin, and English is the common language of all, including the Dutch.

The spruit or spring which gives its name to the town was called after one of the emigrant farmers, Jan Bloem. The town dates from 1846, in which year Major H. D. Warden, then British resident north of the Orange, selected the site as the seat of his administration. When in 1854 independence was conferred on the country the town was chosen by the Boers as the seat of government. It became noted for the intelligence of its citizens, and for the educational advantages it offered at the time when education among the Boers was thought of very little. In 1892 the railway connecting it with Cape Town and Johannesburg was completed. During the Anglo-Boer War of 1899-1902 it was occupied by the British under Lord Roberts without resistance (13th of March 1900), fourteen days after the surrender of General Cronje at Paardeberg. In Market Square on the 28th of the following May the annexation of the Orange Free State to the British dominions was proclaimed. In 1907 the first session of the first parliament elected under the constitution granting the colony self-government was held in Bloemfontein. In 1910 when the colony became a province of the Union of South Africa under its old designation of Orange Free State, Bloemfontein was chosen as the seat of the Supreme Court of South Africa. Its growth as a business centre after the close of the war in 1902 was very marked. The rateable value increased from £790,000 in 1901 to £2,400,000 in 1905.

BLOET, ROBERT (d. 1123), English bishop, was chancellor to William I. and Rufus. From the latter he received the see of Lincoln (1053) in succession to Remigius. His private character was indifferent; but he administered his see with skill and prudence, built largely, and kept a magnificent household, which served as a training-school even for the sons of nobles. Bloet was active in assisting Henry I. during the rebellion of 1102, and became that monarch's justiciar. Latterly, however, he fell out of favour, and, although he had been very rich, was impoverished by the fines which the king extorted from him. Perhaps his wealth was his chief offence in the king's eyes; for he was in attendance on Henry when seized with his last illness. He was the patron of the chronicler Henry of Huntington, whom he advanced to an archdeaconry.

BLOIS, LOUIS DE (1506-1566), Flemish mystical writer, generally known under the name of Blosius, was born in October 1506 at the château of Donstienne, near Liége, of an illustrious family to which several crowned heads were allied. He was educated at the court of the Netherlands with the future emperor Charles V, and was a personal friend of the chief of the household. At the age of fourteen he received the Benedictine habit in the monastery of Liessies in Hainaut, of which he became abbot in 1530. Charles V. pressed in vain upon him the archbishopric of Cambrai, but Blosius studiously exerted himself in the reform of his monastery and in the composition of devotional works. He died at his monastery on the 7th of January 1566.

Blosius's works, which were written in Latin, have been translated into almost every European language, and have appealed not only to Roman Catholics, but to many English laymen of note, such as W. E. Gladstone and Lord Coleridge. The best editions of his collected works are the first edition by J. Frojus (Louvain, 1568), and the Cologne reprints (1572, 1587). His best-known works are:—the *Institutio Spiritualis* (Eng. trans., *A Book of Spiritual Instruction*, London, 1900); *Consolatio Pulsannimium* (Eng. trans., *Comfort for the Faint-Hearted*, London, 1903); *Sacellum Animae Fidelis* (Eng. trans., *The Sanctuary of the Faithful Soul*, London, 1905); all these three works were translated and edited by Father Bertrand Wilberforce, O.P., and have been reprinted several times; and especially *Speculum Monachorum* (French trans. by Félicité de Lennaméris, Paris, 1809; Eng. trans., Paris, 1876; re-edited by Lord Coleridge, London, 1871, 1872, and inserted in "Pater-noster" series, 1901).

BLOIS, a town of central France, capital of the department of Loir-et-Cher, 35 m. S.W. of Orleans, on the Orleans railway between that city and Tours. Pop. (1906) 18,457. Situated in a thickly-wooded district on the right bank of the Loire, it covers the summits and slopes of two eminences between which runs the principal thoroughfare of the town named after the philosopher Denis Papin. A bridge of the 18th century from which it presents the appearance of an amphitheatre, unites Blois with the suburb of Vienne on the left bank of the river. The streets of the higher and older part of the town are narrow and tortuous, and in places so steep that means of ascent is provided by flights of stone steps. One of the famous châteaux of Orleans (see ARCHITECTURE: Renaissance Architecture in France), a fine example of Renaissance architecture, stands on the more westerly of the two hills. It consists of three main wings, and a fourth and smaller wing, and is built round a courtyard. The most interesting portion is the north-west wing, which was erected by Francis I., and contains the room where Henry, duke of Guise, was assassinated by order of Henry III. The striking feature of the interior façade is the celebrated spiral staircase tower, the bays of which, with their beautifully-sculptured balustrades, project into the courtyard (see ARCHITECTURE, Plate VIII. fig. 84). The north-east wing, in which is the entrance to the castle, was built by Louis XII., and is called after him; it contains picture-galleries and a museum. Opposite is the Gaston wing, erected by Gaston, duke of Orleans, brother of Louis XIII., which contains a majestically domed staircase. In the north corner of the courtyard is the Salle des États, which, together with the donjon in the west corner, survives from the 13th century. Of the churches of Blois, the cathedral of St. Louis, a building of the end of the 17th century, but in Gothic style, is surpassed in interest by St. Nicolas, once the church of the abbey of St. Laumer, and dating from the 12th and 13th centuries. The picturesque ness of the town is enhanced by many old mansions, the chief of which is the Renaissance Hôtel d'Alluye, and by numerous fountains, among which that named after Louis XII. is of very graceful design. The prefecture, the law court, the corn-market and the fine stud-buildings are among the chief modern buildings.

Blois is the seat of a bishop, a prefect, and a court of assizes.

It has a tribunal of first instance, a tribunal of commerce, a board of trade arbitration, a branch of the Bank of France, a communal college and training-colleges. The town is a market for the agricultural and pastoral regions of Beauce and Sologne, and has a considerable trade in grain, the wines of the Loire valley, and the manufactures of the region and other live-stock. It manufactures boots and shoes, biscuits, chocolate, upholstering materials, furniture, machinery and earthenware, and has vinegar-works, breweries, leather-works and foundries.

Though of ancient origin, Blois is first distinctly mentioned by Gregory of Tours in the 6th century, and was not of any importance till the 9th century, when it became the seat of a powerful countyship (see below). In 1196 Count Louis granted privileges to the townsman; the commune, which survived throughout the middle ages, probably dated from this time. The count of the Châtillon line resided at Blois more often than their predecessors, and the oldest parts of the château (13th century) were built by them. In 1420 Joan of Arc made Blois her base of operations for the relief of Orleans. After his captivity in England, Charles of Orleans in 1440 took up his residence in the château, where in 1452 his son, afterwards Louis XII., was born. In the 16th century Blois was often the resort of the French court. Its inhabitants included many Calvinists, and it was in 1562 and 1567 the scene of struggles between them and the supporters of the Roman church. In 1576 and 1588 Henry III., king of France, chose Blois as the meeting-place of the states-general, and in the latter year he brought about the murders of Henry, duke of Guise, and his brother, Louis, archbishop of Reims and cardinal, in the château, where their deaths were shortly followed by that of the queen-mother, Catherine de' Medici. From 1617 to 1618 Marie de' Medici, wife of King Henry IV., exiled from the court, lived at the château, which was soon afterwards given by Louis XIII. to his brother Gaston, duke of Orleans, who lived there till his death in 1660. The latter's death was the cause of the disorders of the 17th century. In 1743 Blois was for a short time the seat of the regency of Marie Louise, wife of Napoleon I.

BLOIS, COUNTSHIP OF. From 805 to about 940 the countship of Blois was one of those which were held in fief by the margrave of Neustria, Robert the Strong, and by his successors, the abbots Hugh, Odo (or Eudes), Robert II. and Hugh the Great, who passed, about 940 and for nearly three centuries, to a new family of counts, whose chiefs, at first vassals of the dukes of France, Hugh the Great and Hugh Capet, became in 987, by the accession of the Capetian dynasty to the throne of France, the direct vassals of the crown. These new counts were originally very powerful. With the countship of Blois they united, from 940 to 1044, that of Touraine, and from about 950 to 1218, and afterwards from 1269 to 1286, the countship of Chartres remained in their possession.

The counts of Blois of the house of the Theobalds (Thibauds) began with Theobald I., the Count, who became count about 940. He was succeeded by his son, Odo (Eudes) I., about 975. Theobald II., eldest son of Odo I., became count in 996, and was succeeded by Odo II., younger son of Odo I., about 1005. Odo II. was one of the most warlike barons of his time. With the already considerable domains which he held from his ancestors, he united the heritage of his kinsman, Stephen I., count of Troyes. In 1033 he disputed the crown of Burgundy with the emperor, Conrad the Salic, and perished in 1037 while fighting in Lorraine. He was succeeded in 1037 by his eldest son, Theobald III., who was defeated by the Angevins in 1044, and was forced to give up the town of Tours and its dependencies to the count of Anjou. In 1089 Stephen Henry, eldest son of Theobald III., became count. He took part in the first crusade, fell into the hands of the Saracens, and died in captivity; he married Adela, daughter of William I., king of England. In 1102 Stephen Henry was succeeded by his son, Theobald IV. the Great, who united the countship of Troyes with his domains.
in 1128. In 1135, on the death of his maternal uncle, Henry I, king of England, he was called to Normandy by the barons of the duchy, but soon renounced his claims on learning that his younger brother, Stephen, had just been proclaimed king of England. In 1152 Theobald V. the Good, second son of Theobald IV., became count; he died in 1191 in Syria, at the siege of Acre. His son Louis was succeeded in 1199 by the first de Blouet, and after the taking of Constantinople was rewarded with the duchy of Nicea. He was killed at the battle of Adrianople in 1205, in which year he was succeeded by his son, Theobald VI., the Young, who died childless. In 1218 the countship passed to Margaret, eldest daughter of Theobald V., and to Walter (Gautier) of Avenes, her third husband.

The Châtillon branch of the counts of Blous began in 1230 with Mary of Avenes, daughter of Margaret of Blous and her husband, Hugh of Châtillon, count of St Pol. In 1241 her brother, John of Châtillon, became count of Blous, and was succeeded in 1279 by his daughter, Joan of Châtillon, who married Peter, count of Alençon, fifth son of Louis IX., king of France. In 1286 Joan sold the countship of Chartres to the king of France. Hugh of Châtillon, her first-cousin, became count of Blous in 1293, and was succeeded by his son, Guy I., in 1307. In 1342 Louis II., eldest son of Guy I., died at the battle of Crécy, and his brother, Charles of Blous, disputed the duchy of Brittany with John of Montfort. Louis III., eldest son of Louis II., became count in 1346, and was succeeded by John II., second son of Louis II., in 1372. In 1381 Guy II., brother of Louis III. and John II., succeeded in 1381, but died childless. Overwhelmed with debt, he had sold the countship of Blous to Louis I., duke of Orleans, brother of King Charles VI., who took possession of it in 1397. In 1408 the countship of Blous was united with the crown by the accession of King Louis XII., grandson and second successor of Louis I., duke of Orleans.

See Bertrand, Histoire de Blous (1682); La Saussaye, Histoire de la ville de Blois (1857). (A. L. O.)

BLOMEFIELD, FRANCIS (1705-1752), English topographer of the county of Norfolk, was born at Fersfield, Norfolk, on the 23rd of July 1705. On leaving Cambridge in 1727 he was ordained, becoming in 1729 rector of Hargham, Norfolk, and immediately afterwards rector of Fersfield, his father's family living. In 1733 he mooted the idea of a history of Norfolk, for which he had begun collecting material at the age of fifteen, and shortly afterwards, while, collecting further information for his book, discovered some of the famous Paston Letters. By 1740 he was ready to put some of the results of his research into type. At the end of 1739 the first volume of the History of Norfolk was completed. It was printed at the author's own press, bought specially for the purpose. The second volume was ready in 1745. There is little doubt that in compiling his book Blomefield had frequent recourse to the existing historical collections of Le Neve, Kirkpatrick and Tanner, his own work being to a large extent one of expansion and addition. To Le Neve in particular a large share of the credit is due. When half-way through his third volume, Blomefield, who had come up to London in connexion with a special piece of research, caught small-pox, of which he died on the 16th of January 1752. The remainder of his work was published posthumously, and the whole eleven volumes were republished in London between 1805 and 1810.

BLOMEFIELD, SIR ARTHUR WILLIAM (1829-1899), English architect, son of Bishop C. J. Blomefield, was born on the 6th of March 1829, and educated at Rugby and Trinity, Cambridge. He was then articled as an architect to P. C. Hardwick, and subsequently obtained a large practice on his own account. He became president of the Architectural Association in 1861, and a fellow (1867) and vice-president (1880) of the Royal Institute of British Architects. In 1887 he became architect to the Bank of England, and designed the law courts branch in Fleet Street, and he was associated with A. E. Street in the building of the law courts. In 1889 he was knighted. He died on the 30th of October 1899. He was twice married, and brought up two sons, Charles J. Blomefield and Arthur Conran Blomefield, to his own profession, of which they became distinguished representatives. Among the numerous churches which Sir Arthur Blomefield designed, his work at St Saviour's, Southwark, is a notable example of his use of revived Gothic, and he was highly regarded as a restorer.

BLOMEFIELD, CHARLES JAMES (1796-1857), English divine, was born on the 20th of May 1796 at Bury St Edmunds. He was educated at the local grammar school and at Trinity College, Cambridge, where he gained the Browne medals for Latin and Greek odes, and carried off the Craven scholarship. In 1828 he graduated as third wrangler and first medallist, and in the following year was elected to a fellowship at Trinity College. The first-fruits of his scholarship was an edition of the Prometheus of Aeschylus in 1810; this was followed by editions of the Septem contra Thibus, Persae, Choephorae, and Agamennon, of Callimachus, and of the fragments of Sappho, Sophron and Alcæus. Blomefield, however, soon ceased to devote himself entirely to scholarship. He had been ordained in 1810, and held in quick succession the livings of Chesterton, Quarrington, Dunton, Great and Little Chesterton, and Tuddenham. In 1817 he was appointed private chaplain to Wm. Howley, bishop of London. In 1819 he was nominated to the rich living of St Botolph's, Bishopsgate, and in 1822 he became archdeacon of Colchester. Two years later he was raised to the bishopric of Chester where he carried through many much-needed reforms. In 1828 he was transferred to the bishopric of London, which he held for twenty-eight years. During this period his energy and zeal did much to extend the influence of the church. He was one of the best debaters in the House of Lords, took a leading position in the action for church reform which culminated in the ecclesiastical commission, and did much for the extension of the colonial episcopate; and his genial and kindly nature made him an invaluable mediator in the controversies arising out of the tractarian movement. His health at last gave way, and in 1856 he was permitted to resign his bishopric, retaining Fulham Palace and his residences. He died at his residence there on the 5th of August 1857. His published works, exclusive of those above mentioned, consist of sermons, lectures and pamphlets, and of a Manual of Private and Family Prayers. He was a frequent contributor to the quarterly reviews, chiefly on classical subjects.

See Memoirs of Charles James Blomefield, D. D., Bishop of London, with Selections from his Correspondence, edited by his son, Alfred Blomefield (1863); G. E. Biber, Bishop Blomefield and his Times (1857).

BLOMEFIELD, EDWARD VALENTINE (1788-1816), English classical scholar, brother of Bishop C. J. Blomefield, was born at Bury St Edmunds on the 14th of February 1788. Going to Caius College, Cambridge, he was thirteenth wrangler in 1811, obtained several of the classical prizes of the university, and became a fellow and lecturer at Emmanuel College. In 1813 he travelled in Germany and made the acquaintance of some of the great scholars of Germany. On his return, he published in the Museum Criticum (No. ii.) an interesting paper on "The Present State of Classical Literature in Germany." Blomefield is chiefly known by his translation of Mattheus's Greek Grammar (1819), which was prepared for the press by his brother. He died on the 9th of October 1816, his early death depriving Cambridge of one who seemed destined to take a high place amongst her most brilliant classical scholars.

BLOMDEL, DAVID (1591-1655), French Protestant clergyman, was born at Châlons-sur-Marne in 1591, and died on the 6th of April 1655. In 1630 he succeeded G. J. Vossius in the professorship of history at Amsterdam. His works were very numerous; in some of them he showed a remarkable critical faculty, as in his dissertation on Petrarch (1643, 1657), in which he came to the conclusion, now universally accepted, that the whole story is a mere myth. Considerable Protestant indignation was excited against him on account of this book.

BLOMDEL, JACQUES FRANÇOIS (1705-1774), French architect, began life as an architectural engraver, but developed into an architect of considerable distinction, if of no great
originality. As architect to Louis XV. from 1755 he necessarily did much in the rococo manner, although it would seem that he confined himself more often than not to a more straightforward style. He was among the earliest founders of schools of architecture in France, and for this he was distinguished by the Academy; he is now best remembered by his voluminous work L'Architecture française, in which he was the continuator of Marot. The book is a precious collection of views of famous buildings, many of which have disappeared or been remodelled.

BLONDIN (1824-1897), French tight-rope walker and acrobat, was born at St Omer, France, on the 28th of February 1824. His real name was Jean François Gravelet. When five years old he went to the École de Gymnase at Lyons and, after six months' training as an acrobat, made his first public appearance as "The Little Wonder." His superior skill and grace as well as the originality of the settings of his acts, made him a popular favourite. He especially owed his celebrity and fortune to his idea of crossing Niagara Falls on a tight-rope, 1100 ft. long, 160 ft. above the water. He accomplished, first in 1839, a number of times, always with different theatrical variations: blindfold, in a sack, trundling a wheelbarrow, on stilts, carrying a man on his back, sitting down midway while he made and ate an omelette. In 1861 Blondin first appeared in London, at the Crystal Palace, turning somersaults on stilts on a rope stretched across the central transept, 170 ft. from the ground. In 1862 he again gave a series of performances at the Crystal Palace, and elsewhere in England, and on the continent. After a period of retirement he reappeared in 1880, his final performance being given at Belfast in 1886. He died at Ealing, London, on the 19th of February 1897.

BLOOD, the circulating fluid in the veins and arteries of animals. The word itself is common to Teutonic languages; the O. Eng. is blod, cf. Gothic blot, Dutch bloed, Ger. Blut. It is probably ultimately connected with the root which appears in "blow," "bloom," meaning flourishing or vigorous. The Gr. word for blood, ἄρος, appears as a prefix haemo- in many compound words. As that on which the life depends, as the supposed seat of the passions and emotions, and as that part which a child is believed chiefly to inherit from its parents, the word "blood" is used in many figurative and transferred senses; thus "to have his blood," "to fire the blood," "cold blood," "blood-royal," "half" or "whole blood," &c. The expression "blue blood" is from the Spanish sangre azul. The nobles of Castile claimed to be free from all admixture with the darker blood of Moors or Jews, a proof being supposed to lie in the blue veins that showed in their fairer skins. The common English expijective "bloody," used as an adjective or adverb, has been given many fanciful origins; it has been supposed to be a contraction of "by our Lady," or an adaptation of the oat common during the 16th century, "sahlood," a contraction of "God's blood." The exact origin of the expression is not quite clear, but it is certainly merely an application of the adjective formed from "blood." The New English Dictionary suggests that it refers to the use of "blood" for a young rowdy of aristocratic birth, which was common at the end of the 17th century, and later became synonymous with "dandy," "buck," &c.; "bloody drunk" meant therefore "drunk as a blood," "drunk as a lord." The expression came into common colloquial use as a mere intensifier, and was so used till the middle of the 18th century. There can be little doubt that the use of the word has been considerably affected by the idea of blood as the vital principle, and therefore something strong, vigorous, and parallel as an intensive epithet with such expressions as "thundering," "awfully" and the like.

ANATOMY AND PHYSIOLOGY

In all living organisms, except the most minute, only a minimum number of cells can come into immediate contact with the greatest possible area of tissue surfaces, hence the need for a whole organism. Hence those cells—and they are by far the most numerous—which do not lie on the food-absorbing surface, must gain their nourishment by some indirect means. Further, each living cell produces waste products whose accumulation would speedily prove injurious to the cell, hence they must be removed. The only way this is possible is by the circulation of a fluid, called blood, in the organism and indeed from the organism as a whole. In this instance again, only a few cells can lie on a surface whence such materials can be directly discharged to the exterior. Hence the main number of the cells of the organism must depend upon some mechanism by which the waste products can be carried away from them to that group of cells whose duty it is to modify them, or discharge them from the body. These two ends are attained by the aid of a circulating fluid, a fluid which is constantly flowing past every cell of the body. From it the cells extract the food materials they require for their sustenance, and into it they discharge the waste materials resulting from their activity. This circulating medium is the blood.

Whilst undoubtedly the two functions of this circulating fluid above given are the most prominent, there are yet others of great importance. For instance, it is known that many tissues as a result of their activity produce certain chemical substances which are of essential importance to the life of other tissue cells. These substances—internal secretions as they are termed—are carried to the second tissue by the blood stream. Again, many instances are known in which two distant tissues communicate with one another by means of chemical messengers, bodies termed hormones (k highways, to stir up), which are produced by one group of cells, and sent to the other group to excite them to activity. Here, also, the path by which such messengers travel is the blood stream. A further and most important manner in which the circulating fluid is utilized in the life of an animal is seen in the way in which it is employed in protecting the body should it be invaded by micro-organisms.

Hence it is clear that the blood is of the most vital importance to the healthy life of the body. But the fact that it is present as a circulating medium exposes the animal to a great danger, viz. that it may be lost should any vessel carrying it become ruptured. This is constantly liable to happen, but to minimize as far as possible any such loss, the blood is endowed with the peculiar property of clotting, i.e. of setting to a solid or stiff jelly by means of which the orifices of the torn vessels become plugged and the bleeding stayed.

The performance of these essential functions depends upon the maintenance of a continuous flow past all tissue cells, and this is attained by the circulatory mechanism, consisting of a central pump, the heart, and a system of ramifying tubes, the arteries, through which the blood is forced from the heart to every tissue (see VASCULAR SYSTEM). A second set of tubes, the veins, collects the blood and returns it to the heart. In many invertebrates the circulating fluid is actually poured into the tissue spaces from the open terminals of the arteries. From these spaces it is in turn drained away by the veins. Such a system is termed a haemolymph system and the circulating fluid the haemolymph. Here the essential point gained is that the fluid is brought into direct contact with the tissue cells. In all vertebrates, the ends of the arteries are united to the commencement of the veins by aplexus of extremely minute tubes, the capillaries, consequently the blood is always retained within closed tubes and never comes into contact with the tissue cells. It is while passing through the capillaries that the blood performs its work; here the blood stream is at its slowest and is brought nearest to the tissue cell, only being separated from it by the extremely thin wall of the capillary and by an equally thin layer of fluid. Through this narrow barrier the interchanges between cell and blood take place.

The advantage gained in the vertebrate animal by retaining the blood in a closed system of tubes lies in the great diminution of resistance to the flow of blood, and the consequent great increase in rate of flow past the tissue cells. Hence any food stuffs which can travel quickly through the capillary wall to be absorbed by the cell outside can be supplied in proportionately greater quantity within a given time, without requiring any very great increase in the concentration of that substance in the blood. Conversely, any highly diffusible substance may be withdrawn
from the tissues by the blood at a similarly increased pace. These conditions are more peculiarly of importance for the supply of oxygen and the removal of carbonic acid — especially for the former, because the amount of it which can be carried by the blood is small. But as the rate at which a tissue lives, i.e. its activity, depends upon the rate of its chemical reactions and as these latter are accelerated the more rapidly oxygen is carried to the tissue the more rapidly it can live, and the greater the amount of work it can perform within a given time. The rate of supply is of much less importance in the case of the other food substances because they are far more soluble in water, so that the supply in sufficient quantity can easily be met by a relatively slow blood flow. Hence we find that the gradual evolution of the animal kingdom goes hand in hand with the gradual development of a greater oxygen-carrying capacity of the blood and an increase in the rate of its flow.

In the groundwork of a tissue are a number of spaces — the tissue spaces. They are filled with fluid and intercommunicate freely, finally connecting with a number of fine tubes, the lymphatics, through which excess of fluid or any solid particles present are drained away. The contained fluid acts as an intermediary between the blood and the cell; from it, the cell takes its various food stuffs, these having in the first instance been derived from the blood, and into it the cell discharges its waste products. On the course of the lymphatics a number of typical structures, the lymphatic glands, are placed, and the lymph has opportunities through these structures where any deleterious products are retained, and the fluid thus purified is drained away by further lymphatics and finally returned to the blood. Thus there is a second stream of fluid from the tissues, but one vastly slower than that of the blood. The flow is too slow for it to act as the vehicle for the removal of those waste products (carbonic acid, &c.) which must of necessity be removed quickly. These must be removed by the blood. The same is true for the main number of other waste products, which, however, being of small molecular size are readily absorbed into the blood stream.

But in addition to fluid, the tissue spaces may at times be found to contain solid matter in the form of particles, which may represent the debris of destroyed cells, or which are, as is quite commonly the case, micro-organisms. Apparently such material cannot be removed from a tissue by absorption into the blood stream — indeed in the case of living organisms such an absorption would in many instances rapidly prove fatal, and special provision is made to prevent such an accident. These, therefore, are made to travel along the lymphatic channels, and so, before gaining access to the blood stream and thus to the body generally, have to run the gauntlet of the protective mechanism provided by the lymphatic glands, where in the major number of cases they are readily destroyed.

Hence we see that first and foremost we have to regard the blood as a food-carrier to all the cells of the body; in the second place as the vehicle carrying away most if not all the waste products; in a third direction, it is acting as a means for transmitting chemical substances manufactured in one tissue to distant cells of the body for whose nutrition or excitation they may be essential; and in addition to these important functions there is yet another whose value it is almost impossible to overestimate, for it plays the essential rôle in rendering the animal immune to the attacks of invading organisms. The question of immunity is discussed elsewhere, and it is sufficient merely to indicate the chief means by which the blood subserves this essential protective mechanism. Should living organisms find their way into the surface cells or within the tissue spaces, the body fights them in a number of ways. (1) It may produce one or more chemical substances capable of neutralizing the toxic material produced by the organism. (2) It may produce chemical substances which act as poisons to the micro-organism, either paralysing it or actually killing it. Or (3) the organism may be attacked and taken up into the body of wandering cells, e.g. certain of the leucocytes, and then digested by them. Such cells are therefore called phagocytes (φαγεῖν, to eat). Thus, by its power of reacting in these ways the body has become capable of withstanding the attacks of many different varieties of micro-organisms, of both animal and vegetable origin.

General Properties.—Blood is an opaque, viscid liquid of bright red colour possessing a distinct and characteristic odour, especially when warm. Its opacity is due to the presence of a very large number of solid particles, the blood corpuscles, having a higher refractive index than that of the liquid in which they float. The specific gravity in man averages about 1.055. The specific gravity of the liquid portion, the plasma (Gr. πλάσμα, something formed or moulded, πλασματικά, to mould), is about 1.027, whilst that of the corpuscles amounts to 1.088. To litmus it reacts as a weak alkali.

Blood Plasma.—The plasma is a solution in water of a varied number of substances, and as a solvent it confers on the blood its power of acting as a carrier of food stuffs and waste products. One important food substance, oxygen, is, however, only partly carried in solution, being mainly combined with haemoglobin in the red corpuscles. The food stuffs carried by the plasma are proteins, carbohydrates, salts and water. The main waste products dissolved in it are ammonium carbonate, urea, urates, xanthin bases, creatin and small amounts of other nitrogenous bodies, carbonic acid as carbonates, other carbon compounds such as cholesterin, lecitin and a number of other substances.

Thus, if we take mammalian blood as a type, the plasma would have the following approximate composition:

| Substances not vaporizing at 120° C.— | 8-06 |
| Inorganic substances— | 81-92 |
| Chlorine | 3-536 |
| Sulphuric acid | 0-129 |
| Phosphoric acid | 0-445 |
| Potassium | 0-314 |
| Sodium | 3-410 |
| Calcium | 0-218 |
| Magnesium | 0-455 |
| Oxygen | 8-505 |
| Proteins.—The proteins of the blood plasma belong to the two classes of the albumins and the globulins. The globulins present are named fibrinogen and serum-globulin; as its name implies, the chief physiological property of fibrinogen is that it can give rise to fibrin, the solid substance formed when blood clots. It possesses the typical properties of a globulin, i.e. it coagulates on heating (in this instance at a temperature of 56° C.), and is precipitated by half saturating its solution with ammonium sulphate. It differs from other globulins in that it is less soluble. It is only present in very small quantities, 0-4%. The other globulin, serum-globulin, is not coagulated until 75° C. is reached, and we now know that it is in reality a mixture of several proteins, but so far these have not been completely separated from one another and obtained in a pure form. On dialysing a solution of serum-globulin a part is precipitated, and this portion has been named the co-globulin; the remainder being known, in contradistinction, as the pseudo-globulin. Again, on diluting a solution and adding a small amount of acetic acid a precipitate is formed which in some respects differs from the remainder of the globulin present. Whether in these two instances we are dealing with approximately pure substances is extremely doubtful. A further important point in connexion with the chemistry of the globulins is that dextrose may be found among their decomposition products, i.e. that a part of it, or possibly the whole, possesses a glucoside character.

Serum-albumin gives all the typical colour and precipitation reactions of the albumins. If plasma be weakly acidified with sulphuric acid, then treated with crystals of ammonium sulphate until a slight precipitate forms, filtered and the filtrate allowed to evaporate very slowly, typical crystals of serum-albumin may form. According to many it is a uniform and specific
substance, but others hold the view that it consists of at least three distinct substances, as shown by the fact that if a solution be gradually heated coagulation will occur at three different temperatures, viz. at 73°, 77° and 84° C. On the other hand the close agreement between different analyses of even the amorphous powders, points to there being but one substance.

When blood clots two new proteins make their appearance in the fluid part of the blood, or serum, as it is now called. The first of these is fibrin ferment (for its origin see section on Clotting below). The other, fibrinogen, possesses all the typical characteristics of the globulins and coagulates at 64° C.

Carbohydrates.—Three several carbohydrates are described as occurring in plasma, viz. glycozen, animal gum and dextrose. If glycogen is present in solution in the plasma it is in very small quantities only, and has probably arisen from the destruction of the white blood corpuscles, since some leucocytes undoubtedly contain glycogen. A small amount of carbohydrate having the formula for starch and yielding a reducing sugar on hydrolysis with acid has also been described. The constant carbohydrate constituent of plasma, however, is dextrose. This is present to the approximate amount of 0.15% in arterial blood.

The amount may be much greater in the blood of the portal vein during carbohydrate absorption, and according to some observers there is less in venous than in arterial blood, but the difference is small and falls within the error of observation. The statement that when no absorption is taking place the blood of the hepatic vein is richer in dextrose than that of the portal vein (Bernard) is denied by Pavy.

Fats.—Plasma or serum is as a rule quite clear, but after a meal rich in fats it may become quite milky owing to the presence of neutral fats in a very fine state of subdivision. This suspended fat rapidly disappears from the blood after fat absorption has ceased. To some extent it varies in composition with that of the fat absorbed, but usually consists of the glycerides of the common fatty acids palmitic, stearic and oleic. In addition there is a small amount of fatty acid in solution in the plasma. As to the form in which this occurs there is some uncertainty. It is possibly present as a soap or even as a neutral fat, since a little can be dissolved in plasma, the solvent substance being probably protein or cholesterin. Fatty acids also appear to be present to some extent combined with cholesterin forming cholesterin esters (about 0.06%).

Other Organic Compounds.—In addition to the substances above described, belonging to the three main classes of food stuffs, there are still other organic bodies present in plasma in small amounts, which for convenience we may classify as non-nitrogenous and nitrogenous. Among the former may be mentioned lactic acid, glycserin, a lipochrome, and probably many other substances of a similar type whose separation has not yet been effected.

The non-protein nitrogenous constituents consist of the following: ammonia as carbonate or carbamite (0.2 to 0.6%), urea (0.02 to 0.05%), creatine, creatinine, uric acid, xanthine, hypoxanthine and occasionally hippuric acid. Three ferments are also described as being present: (1) a glycolytic ferment exerting an action upon dextrose; (2) a lipase or fat-splitting ferment; and (3) a diastase capable of converting starch into sugar.

Salts.—The saline constituents of plasma comprise chlorides, phosphates, carbonates and possibly sulphates, of sodium, potassium, calcium and magnesium. The most abundant metal is sodium and the most abundant acid is hydrochloric. These two are present in sufficient amount to form about 0.65% of sodium chloride. The phosphate is present to about 0.01%. Sulphuric acid is always present if the blood has been calcined for the purposes of the analysis, and may then be present to about 0.013%. This is, however, probably produced during the destruction of the protein, since it has been shown that no sulphate can be removed from normal plasma by dialysis. The amount of potassium present (0.03%) is less than one-tenth of that of the sodium, and the quantities of calcium and magnesium are even less.

**BLOOD FORMED ELEMENTS.—** When viewed under the microscope the main number of these are seen to be small yellow bodies of very uniform size, shape and shape varying, however, in different animals. When observed in bulk they have the red colour, their presence in fact giving the typical colour to blood. These are the red blood corpuscles or erythrocytes (Gr. ἔρυθρος, red). Mingled with them in the blood are a smaller number of corpuscles which possess no colour and have therefore been called white blood corpuscles or leucocytes (Gr. λευκός, white). Lastly, there are present a large number of small lens-shaped structures, less in number than the red corpuscles, and much more difficult to distinguish. These are known as blood platelets.

Red Corpuscles.—These are present in very large numbers and, under normal conditions, all possess exactly the same appearance.

With rare exceptions their shape is that of a biconvex disk with bevelled edges, the size varying somewhat in different animals, as is seen in the following table which gives their diameters:

<table>
<thead>
<tr>
<th>Species</th>
<th>Diameter (mm)</th>

</tbody>
</table>

In mammals they are apparently homogeneous in structure, have no nucleus, but possess a thin envelope. Their specific gravity is distinctly higher than that of the plasma (1.088), so that if clotting has been prevented, blood on standing yields a large deposit which may form as much as half the total volume of the blood.

Chemical Composition.—On destruction the red corpuscles yield two principal proteins, haemoglobin and a macroglobulin, and a number of other substances similar to those usually obtained on the break-down of any cellular tissue, such for instance as lecinthin, cholesterin and inorganic salts. The most important protein is the haemoglobin. To it the corpuscle owes its distinctive property of acting as an oxygen carrier, for it possesses the power of combining chemically with oxygen and of yielding up that same oxygen whenever there is a decrease in the concentration of the oxygen in the solvent. Thus in a given solution of haemoglobin the amount of it which is combined with oxygen depends absolutely on the oxygen concentration. The greatest dissociation of oxyhaemoglobin occurs as the oxygen tension falls from about 40 to 20 mm. of mercury. That the oxygen forms a definite compound with the haemoglobin is proved by the fact that haemoglobin thoroughly saturated with oxygen (oxyhaemoglobin) has a definite absorption spectrum showing two bands between the D and E lines, whilst haemoglobin from which the oxygen has been completely removed only gives one band between those lines. In association with this, oxyhaemoglobin has a typical bright red colour, whereas haemoglobin is dark purple. The further striking characteristic of haemoglobin is that it contains iron in its molecule. The amount present, though small bears a perfectly definite quantitative relation to the amount of oxygen with which the haemoglobin is capable of combining (two atoms of oxygen to one of iron). One gram of haemoglobin crystals can combine with 1.34 cc. of oxygen. On destruction with an acid or alkali, haemoglobin yields a pigment portion, haematin, and a protein portion, globin, the latter belonging to the group of the histones (Gr. ἵστος, web, tissue).
In this cleavage the iron is found in the pigment. By the use of a strong acid, it may be made to yield iron-free pigment, the remainder of the molecule being much further decomposed.

**Destruction and Formation.**—In the performance of their work the corpuscles gradually deteriorate. They are then destroyed, chiefly in the liver, but whether the whole of this process is effectuated by the corpuscles or is not involving the plasma is not known. It is probable, however, that the destruction of the haemoglobin is entirely effected there. It was for a long time considered to be one of the functions of the spleen to examine the red corpuscles and to destroy and in some way to mark those no longer fitted for the performance of their work. It is proved that the destruction of the haemoglobin is entirely effected in the liver, since both the main cleavage products may be traced to this organ, which discharges the pigmented portion as the bile, pigment, but retains the iron-protein moiety at any rate at a time. The amount of bile pigment eliminated during the day indicates that the destruction must be considerable, and since the number of corpuscles does not vary there must be an equivalent formation of new ones. This takes place in the red bone-marrow, where special cells are provided for their continuous production. In embryonic life their formation is effected in another way. Certain mesodermic cells, resembling those of the connective tissue, collect masses of haemoglobin, and from these elaborate red blood corpuscles which thus come to lie in the fluid part of the cell. By a canalization of the branches of these cells which unite with branches of other cells the precursors of the blood capillaries are formed.

**White Blood Corpuscles.**—These constitute the second important group of formed elements in the blood, and number about 10,000 to 20,000 per cubic mm. They are typical wandering cells carried to all parts of the body by the blood stream, but often leave that stream and gain the tissue spaces by passing through the capillary wall. They exist in many varieties and were first classified according as, under the microscope, they presented a granular appearance or appeared clear. The cells were also distinguished by one another according as they possessed fine or coarse granules. The granules are confined to the protoplasm of the cell, and it has been shown that they differ chemically, because their staining properties vary. Thus, some granules select an acid stain, and the cells containing them are then designated acidoophile or eosinophile; other granules select a basic stain and are called basophile, while yet others prefer a neutral stain (neutrophile).

In human blood the following varieties of leucocytes may be distinguished:

1. The Polymorphonuclear Cell.—This possesses a nucleus of very complicated outline and a fair amount of protoplasm filled with numbers of fine granules which stain with eosin. They vary in size but are usually about 0.01 mm. in diameter. They are highly amoeboid and phagocytic, and form about 70% of the total number of leucocytes.

2. The Coarsely Granular Eosinophile Cell.—These large cells contain a number of well-defined granules which stain deeply with acid dyes. The nucleus is crescentic. The cells amount to about 2% of the total number of leucocytes, though the proportion varies considerably. They are actively amoeboid.

3. The Lymphocyte.—This is the smallest leucocyte, being only about 0.005 mm. in diameter. It has a large spherical nucleus with a small rim of clear protoplasm surrounding it. It forms from 15 to 40% of the number of leucocytes, and is less markedly amoeboid than the other varieties.

4. The *Hyaline* (Gr. υαλος, glassy, crystalline, *βλέφρο*, glass) cell or macrocyte (Gr. μακροδος, long or large).—This is a cell similar to the last with a spherical, oval or indented nucleus, but it has much more protoplasm. It contains about 10% of all the leucocytes and is highly amoeboid and phagocytic.

5. The Basophile Cell.—This possesses a spherical nucleus and the protoplasm contains a small number of granules staining deeply with basic dyes. It is rarely found in the blood of adults except in certain diseases.

**Functions.**—These cells act as scavengers or as destroyers of living organisms that may have gained access to the tissue spaces. They play an important part in the chemical processes underlying the phenomena of immunity, and some at least are of importance in sorting out the processes of clotting. They are constantly suffering destruction in the performance of their work. Many, too, are lost to the body by their passage through the different mucous surfaces. Their origin is still obscure in many points. The lymphocytes are derived from lymphoid tissue, wherever it exists in the different parts of the body. The polymorphonuclear and eosinophile cells are derived from the bone-marrow, each by division of specific mother cells located in that tissue. The macrocyte is believed by many to represent a further stage in the development of the lymphocyte.

Their rate of formation may be influenced by a variety of conditions—for instance, they are found to vary in number according to the diet and also, to a considerable extent, in disease.

**Platelets.**—The platelets or thrombocytes (Gr. θρόμβος, clot) are the third class of formed elements occurring in mammalian blood. There are still, however, many observers who consider that platelets are not present in the normal circulating blood, but only make their appearance after it has been shed or otherwise injured. They are minute lens-shaped structures, and may amount to as many as 800,000 per cubic mm. Under certain conditions, examination has shown that they are protoplasmic and amoeboid, and that each one contains a central body of different staining properties from the remainder of the structure. This has been regarded by some as a nucleus. On being brought into contact with a foreign surface they adhere to it firmly, very rapidly passing through a number of phases resulting ultimately in the formation of granular débris. In shed blood they tend to collect into groups, and during clotting, fibrin filaments may be observed to spin out from these clumps.

**Variations in the Blood of Different Animals.**—If we contrast the blood of different animals of the vertebrate class we find striking differences both in microscopic appearances and in chemical properties. In the first place, the corpuscles vary in amount and in kind. Thus, whilst in a mammal the corpuscles form 40 to 50% of the total volume of the blood, in the lower vertebrates the volume is much less, e.g. in frogs as low as 25% and in fishes even lower. The deficiency is chiefly in the red corpuscles, the ratio of white to red increasing as we examine the blood from animals lower in the scale. The corpuscles themselves are also found to vary, especially the red ones. In the mammal they are biconcave disks with bevelled edges, they do not contain a nucleus so that they are not cells. In the bird they are larger, ellipsoidal in shape and have a large nucleus in the centre of the cell. In reptiles and amphibia the red corpuscles are also nucleated, but the *stroma* portion containing the haemoglobin is arranged in a thickened annular part encircling the nucleus. When seen from the flat they are oval in section. In fishes the corpuscles show very much the same structure. A further very significant difference to be observed between the bloods of different vertebrates is in the amount of haemoglobin they contain; thus in the lower classes, fishes and amphibia, not only is the number of red corpuscles small but the amount of haemoglobin each corpuscle contains is relatively low. The concentration of the haemoglobin in the corpuscles attains its maximum in the mammal and the bird. Since the haemoglobin is practically the same from whatever animal it is obtained and can only combine with the same amount of oxygen, the oxygen-capacity of the blood from vertebrates decreases as we ascend the scale of animals. 

1 The suffix *-phile*, Greek φιλω, to love, prefer, is in scientific terminology applied to substances that exhibit such preference for particular stains or reagents, the names of which form the first part of the word.
increased activity entails an increased rate of supply of oxygen. This latter has been brought about in the animal kingdom in two ways, first by an increase in the concentration of the haemoglobin of the blood effected by an increase both in the number of corpuscles and in the amount of haemoglobin contained in each, and secondly by an increase in the rate at which the blood has been made to pass through the tissues. In the lower vertebrates the blood pressure is low and the haemoglobin content of the blood is low, consequently both rate of blood-flow and oxygen-content are low. In contrast with this, in higher vertebrates the blood pressure is high and the haemoglobin content of the blood is high, consequently both rate of blood-flow and oxygen-content are high. We must associate with this important step in evolution the means employed for the more rapid absorption of oxygen and for its increased rate of discharge to the tissues, the most important features of which are a diminution in the size of the corpuscle and the attainment of its peculiar shape, both resulting in the production of a relatively enormous corpuscular surface in a unit volume of blood.

Variations are also found in the white corpuscles as well as in the red, but these differences are not so striking and lie chiefly in unimportant details of structure of individual cells. Enormous variations are to be found in different species of mammals, but the cells generally conform to the types of secreting cells or phagocytes.

The platelets also differ in the different species. In the frog, for instance, many are spindle-shaped and contain a nucleus-like structure. Birds' blood is stated to contain no platelets. The variations in number of these bodies have not been satisfactorily ascertained on account of the difficulties involved in any attempt to preserve them and to render them visible under the microscope.

Differences are also found in the chemical composition of the plasma. The chief variation is in the amount of protein present, which attains its maximum concentration in birds and mammals, while in reptiles, amphibia and fishes it is much less. The bloods of the latter two classes are much more watery than that of the mammal. Moreover, it has been proved that there are specific differences in the chemical nature of the various proteins present even between different varieties of mammals. Thus the ratio of the globulin fraction to the albumin fraction may vary considerably, and again, one or other of the proteins may be quite specific for the animal from which it is derived.

Clotting.—If a sample of blood be withdrawn from an animal, within a short time it undergoes a series of changes and becomes converted into a stiff jelly. It is said to clot. If the process is watched it is seen to start first from the surfaces where it is in contact with any foreign body; thence it extends through the blood within the mass solidifying. A short time elapses before this process commences—a time dependent upon two chief conditions, viz. the temperature at which the blood is kept and the extent of foreign surface with which it is brought into contact. Thus in a mammal the blood clots most quickly at a temperature a little above body temperature, while if the blood be cooled quickly the clotting is considerably delayed and in the case of some animals altogether prevented. For example, human blood kept at body temperature clots in three minutes, while if allowed to cool at room temperature it may not make its appearance until eight minutes after its removal from the body. The process of clotting is also considerably accelerated by making the blood flow in a thin stream over a wide surface. The full completion of the process occupies some time if the blood be kept quiet, but ultimately the whole mass of the blood becomes converted into a solid. At this stage the containing vessel may be inverted without any drop of fluid escaping. A short time after this stage has been reached drops of a yellow fluid appear upon the surface and, increasing in size and number, run together to form a layer of fluid separated from the clot. This fluid is termed serum; its appearance is due to the contraction of the clot, which thus squeezes out the fluid from between its solid constituents. Contraction continues for about twenty-four hours, at the end of which time a large quantity (one-third or more of the total volume) of serum may have been separated. The clot contracts uniformly, thus preserving throughout the same general shape as that of the vessel in which the blood has been collected. Finally the clot swims freely in the serum which it has expressed.

The cause of the clot formation has been found to be the precipitation of a solid from the liquid plasma of the blood. This solid is in the form of very minute threads and hence is termed fibrin. The threads traverse the mass of blood in every possible direction, intermingling and confining in their meshes all the solid elements of the blood. Soon after their deposition they begin to contract, and as the meshwork they form is very minute they carry with them all the corpuscles of the blood. These with the fibrin form the shrunken clot.

If the rate at which blood clots be retarded either by cooling or by some other process the corpuscles may have time to settle, partially or completely, in which case distinct layers may form. The lowermost of these contains chiefly the red corpuscles, the second layer may be grey owing to the high percentage of leucocytes present, while a third, marked by opalescence only, may be very rich in platelets. Above these a clear layer of fluid may be found. This is plasma. The formation of these layers depends solely upon the rate of sedimentation of these elements, the rate depending partly upon differences in specific gravity, and partly upon the tendency the corpuscles have to run into clumps. Horse's blood offers one of the best instances of the clumping of red corpuscles, and in this animal sedimentation of the red corpuscles is most rapid.

If horse's blood is sedimented and is allowed to clot the process is found to start in the middle two layers, i.e. in those containing the white corpuscles and platelets. From these layers it spreads through the rest of the liquid, being most retarded, however, in the red corpuscle layer, and particularly so if the sedimentation has been very complete. Not only does the clotting process start from the layers containing the leucocytes and platelets, but in them it also proceeds more quickly. These observations clearly indicate that the clotting process is initiated by some change starting from these elements.

The object of the clotting of the blood is quite clear. It is to prevent, as far as possible, any loss of blood when there is an injury to an animal's vessels. The shed blood becomes converted into a solid, and this, extending into the interior of the ruptured vessel, forms a plug and thus arrests the bleeding. It is found that clotting is especially accelerated whenever the blood touches a foreign tissue, for instance, the outer layers of a torn blood-vessel wall, muscle tissue, &c., i.e. in exactly those conditions in which rapid clotting becomes of the greatest importance. Yet another very pregnant fact in connexion with clotting is that if an animal be bled rapidly and the blood collected in successive samples it is found that those collected last clot most quickly. Hence the more excessive the haemorrhage in any case, the greater becomes the onset of the natural cure for the bleeding, viz. clotting.

When we begin to inquire into the nature of clotting we have to determine in the first place whence the fibrin is derived. It has long been known that two chemical substances at least are requisite for its production. Thus certain fluids are known, e.g., certain samples of horse's blood or mare's milk, which will clot spontaneously, but will clot rapidly when a small quantity of serum or of an old blood-clot is added to it. The constituent substance which is present in the first-named fluids is known as fibrinogen, and that present in the serum or the clot is known as fibrin-ferment or thrombin.

Fibrinogen is present in living blood dissolved in the plasma; it is also present in such fluids as hydrocele or pericardial effusions, which, though capable of clotting, do not clot spontaneously. Thrombin, on the other hand, does not exist in living blood, but only makes its appearance there after blood is shed. It is not yet certain what is the nature of the final reaction between fibrinogen and thrombin. The possibilities are, that thrombin may act—(1) by acting upon fibrinogen, which it in some way converts into fibrin, (2) by uniting with fibrinogen to form fibrin, or (3) by yielding part of itself to the fibrinogen which thus
becomes converted into fibrin. The experimental study of the rate of fibrin formation, when different strengths of thrombin solutions are allowed to act upon a fibrinogen solution, leads us to the probable conclusion that the first of these three possibilities is the correct one, and that thrombin therefore exerts a true ferment action upon fibrinogen. It is known that in the reaction, in addition to the formation of fibrin, yet another protein makes its appearance. This is known as fibrinogulbin, and apparently it arises from the fibrinogen, so that the change would be one of cleavage into fibrin and fibrinogulbin. It is very noteworthy that although the amount of fibrin formed during the clotting appears very bulky, yet the actual weight is extremely small, not more than 0.4 gms. from 100 cc. of blood.

Having ascertained that the clotting is due to the action of thrombin upon fibrinogen, we now see that the next step to be explained is the origin of thrombin. It has been shown that the final step in its formation consists in the combination of another substance, termed thrombogen, with calcium. Any soluble calcium salt is found to be effective in this respect, and conversely the removal of soluble calcium (e.g. by sodium oxalate) will prevent the formation of thrombin and therefore of clotting.

In the next place it can be proved that prothrombin does not exist as such in circulating blood, so that the problem becomes an inquiry as to the origin of thrombin. Experiment has shown that in its turn prothrombin arises from yet another precursor, which is named thrombogen, and that thrombogen also is not to be found in circulating blood but only makes its appearance in the tissue. The conversion of thrombogen into prothrombin has been proved to be due to the action of a second ferment which has been named thombokinase, and this latter is again absent from living blood. Hence the question arises, whence are derived thrombogen and thombokinase?

In the study of this question it has been found that if the blood of birds be collected direct from an artery through a perfectly clean cannula into a clean and dust-free glass vessel, it does not clot spontaneously. The plasma collected from such blood is found to contain thrombogen but no thombokinase. A somewhat similar plasma may be prepared from a mammal's blood by collecting samples of blood from an artery into vessels which have been thoroughly coated with paraffin, though in this instance thrombogen may be absent as well as thombokinase. If plasma containing thrombogen but no thombokinase be treated with a saline extract of any tissues it will soon clot. The saline extract contains thombokinase. This ferment can therefore be derived from most tissues, including also the white blood corpuscles and the platelets. Thrombogen is produced from the leukocytes, but it is not yet certain whether it is also formed from the platelets. The discovery that the blood serum of animals contains thrombin from tissue cells explains a fact that has long been known, namely, that if in collecting blood, it is allowed to flow over cut tissues, clotting is most markedly accelerated. The fact that birds' blood if very carefully collected will not clot spontaneously tends to prove that thombokinase is not derived from the leukocytes, and makes probable its origin from the platelets, for it is known that birds' blood apparently does not contain platelets, at any rate in the form in which they are found in mammalian blood. When examining the general properties of platelets, attention was drawn to the remarkably rapid manner in which they undergo change on coming into contact with a foreign surface. It is apparently the actual contact which initiates these changes, changes which are fundamentally chemical in character, resulting in the production of thombokinase and possibly also of thrombogen.

Thus as our knowledge at present stands the following statement gives a recapitulated account of the changes which constitute the many phases of clotting. When blood escapes from a blood-vessel it comes into contact with a foreign surface, either a tissue or the damaged walls of the cut vessel. Very speedily this contact results in the discharge of thombogen and thombokinase, the former from the white blood corpuscles and also possibly from the platelets, the latter from the platelets or from the tissue with which the blood comes in contact. The interaction of these two bodies next results in the formation of prothrombin, which, combining with the calcium of any soluble lime salt present, forms thrombin or fibrin-ferment. The last step in the change is the action of thrombin upon fibrinogen to form fibrin, and the clot is complete.

The intrinsic value to the animal of these changes is quite plain. The power of clotting and thus stopping haemorrhage is of essential importance, and yet this clotting must not occur within the living blood-vessels, or it would speedily result in death. That the tissues should be able to accelerate the process is of very obvious value. That the inner lining of the blood-vessels does not act as a foreign tissue is possibly due to the extreme smoothness of their surface.

Further, an animal must always be exposed to a possible danger in the absorption of some thrombin from a mass of clotted blood still retained within the body, and we know that if a quantity of active ferment is injected into the blood-stream intravascular clotting does result. Under all usual conditions this is obviated, the protective mechanism being of a twofold character. First, it is found that thrombin becomes converted very quickly into an inactive modification. Serum, for instance, very quickly loses its power of inducing clotting in fibrinogen solutions. Secondly, the body has been found to possess the power of making a substance, antithrombin, which can combine with thrombin forming a substance which is quite inactive as far as clotting is concerned. Finally, there is evidence that normal blood contains a small quantity of this substance, antithrombin, and that under certain conditions the amount present may be enormously increased.

(T. G. BR.)

Pathology of the Blood.

The changes in the blood in disease are probably as numerous and varied as the diseases which attack the body, for the blood is not only the medium of respiration, but also of nutrition, of defence against organisms and of many other functions, none of which can be affected without corresponding alterations occurring in the circulating fluid. The immense majority of these changes are, however, so subtle that they escape detection by our present methods. But in certain directions, notably in regard to the relations with micro-organisms, changes in the blood-plasma can be made out, though they are not associated in all cases with changes in the formed elements which float in it, nor with any obvious microscopical or chemical alterations.

The phenomena of immunity to the attacks of bacteria or their toxins, of agglutinative action, of opsonic action, of the precipitin tests, and of haemolysis, are all largely Immunity, dependent on the inherent or acquired characters of the blood, serum, or any other fluid. The conversion of thrombokinase from tissue cells explains the fact that certain people vary in their susceptibility to the attacks of different organisms, and different species of animals also vary greatly. This "natural immunity" is due partly to the power possessed by the leukocytes or white blood corpuscles of taking into their bodies and digesting or holding in an inert state organisms which reach the blood—phagocytosis,—partly to certain bodies in the blood serum which have a bactericidal action, or whose presence enables the phagocytes to deal more easily with the organisms. This natural immunity can be heightened when it exists, or an artificial immunity can be produced in various ways. Doses of organisms or their toxins can be injected on one or several occasions, and provided that the lethal dose be not reached, in most cases an increased power of resistance is produced. The organisms may be injected alive in a virulent condition, or with their virulence lessened by heat or cold, by antiseptics, by cultivation in the presence of oxygen, or by passage through other animals, or they may first be killed, or their toxins alone injected. The method chosen in each case depends on the organism dealt with. The result of this treatment is that in the animal treated protective substances appear in the serum, and these substances can be transferred to the serum of another animal or of man; in other words the active immunity of the experimental animal can be translated into
the passive immunity of man. According to the nature of the
substances injected into the former, its serum may be antitoxic,
if it has been immunized against any particular toxin, or anti-
bacterial, if against an organism. Familiar examples of these
are, of the former diphtheria antitoxin, of the latter anti-plague
and anti-typhoid. An antitoxin exerts its effects by actual
interaction with the respective toxin, the combination being
inert. It is probable that the ultimate stage of the antitoxin is
to be found in the living cells of the tissues and that it passes
from them into the blood. The action of an antibacterial serum
depends on the presence in it of a substance known as "immune-
body," which has a special affinity and power of combining
with the bacterium used. In order that it may exert this power
it requires the presence of a substance normally present in the
serum known as "complement." The development of these
"anti-bodies," though it has been studied mainly in connection
with bacteria and their toxins, is not confined to their action,
but can be demonstrated in regard to many other substances,
such as ferments, tissue cells, red corpuscles, &c. In some
animals, for example, the blood serum has the power of dissolv-
ing the red corpuscles of an animal of different species; e.g.
the guinea-pig's serum is "haemolytic" to the red corpuscles
of the ox. This haemolytic power (haemolysis) can be increased
by repeated injections of red corpuscles from the other animal,
in this case also, as in the bacterial case, by the production
and action of immune-body and complement. The antiserum pro-
duced in the case of the red corpuscles may sometimes, if injected
into the first animal, whose red corpuscles were used, cause
extensive destruction of its red corpuscles, with haemoglo-
inuria, and sometimes a fatal result.

Opsonic action depends on the presence of a substance, the
"opsonin," in the serum of an immunized animal, which makes
the organism in question more easily taken up by the phagocytes
(leucocytes) of the blood. The opsonin becomes fixed to the
organisms. It is present to a certain extent in normal serum,
but can be greatly increased by the process of immunization;
and the "opsonic index," or relation between the number of
organisms taken up by leucocytes when treated with the serum
of a healthy person or "control," and with the serum of a
person affected with any bacterial disease and under treatment
by immunization, is regarded by some as representing the degree
of immunity produced.

Agglutinative action is evidence of the presence in a serum
of a peculiar sort of substance, known as "agglutinin." When
a portion of an antiserum is added to an emulsion of the
respective organism, the organisms, if they are motile, cease
to move, and in any case become gathered together into clumps.
In all probability several different bodies are concerned in this
process. This reaction, in its practical applications at least,
may be regarded as a reaction of infection rather than of im-
munization as ordinarily understood, for it is found that the
blood serum of patients suffering from typhoid, Malta fever,
cholera, and many other bacterial diseases, agglutinates the
corresponding organisms. This fact has come to be of great
importance in diagnosis.

The precipitin test depends on a somewhat analogous reaction.
If the serum of an animal be injected repeatedly into another
animal of different species, a "precipitin" appears in the serum
of the animal treated, which causes a precipitate when added
to the serum of the first animal. The special importance of this
fact is that it can be utilized as a method of distinguishing
between human blood and that of animals, which is often of
importance in medical jurisprudence.

In this summary the facts adduced are practically all biological,
and are due to the extraordinary activity with which the study
of bacteriology (q.v.) has been pursued in recent years. The
chemistry of the blood has hitherto been found to give
information of clinical or diagnostic importance, and nothing
need here be added to what is said above on the physiology of
the blood. Enough has been said, however, to show the extra-
ordinary complexity of the apparently simple blood serum.

The methods at present employed in examining the blood
clinically are: the enumeration of the red and white corpuscles
per cubic millimetre; the estimation of the percentage of
haemoglobin and of the specific gravity of the blood; the micro-
scopic examination of freshly-drawn blood and of blood films
made upon cover-glasses, fixed and stained. In special cases the
measure of the alkalinity of the blood or the blood may be examined bacteriologically. We have no
universally accepted means of estimating, during life, the total
amount of blood in the body, though the method of J. S. Haldane
and J. Lorrain Smith, in which the total oxygen capacity of the
blood is estimated, and its total volume worked out from that
datum, has seemed to promise important results (Journ. of
Physiol. vol. xxv. p. 331, 1900). After death the amount of
blood sometimes seems to be increased, and sometimes, as in
"pernicous anaemia," it is certainly diminished. But the high
counts of red corpuscles which are occasionally reported as
evidence of plethora or increase of the total blood are really only
indications of concentration of the fluid except in certain rare
cases. It is necessary, therefore, in examining blood diseases,
to confine ourselves to the study of the blood-unit, which is
always taken as the cubic millimetre, without reference to the
number of units in the body.

Anaemia is often used as a generic term for all blood diseases,
for in almost all of them the haemoglobin is diminished, either
as a result of diminution in the number of the red corpuscles
in which it is contained, or because the individual red corpuscles contain a smaller amount of
haemoglobin than the normal. As haemoglobin is the medium
of respiratory interchange, its diminution causes obvious symptoms,
which are much more easily appreciated by the patient than
those caused by alterations in the plasma or the leucocytes. It
is customary to divide anaemias into "primary" and "secondary": the primary are those for which no adequate cause has
as yet been discovered; the secondary, those whose cause is
known. Among the former are usually included chlorosis,
pernicous anaemia, and sometimes the leucocytanaemias; among
the latter, the anaemias due to such agencies as malignant
disease, malaria, chronic metallic poisoning, chronic haemor-
rhage, tubercle, Bright's disease, infective processes, intestinal
parasites, &c. As our knowledge advances, however, this
distinction will probably be given up, for the causes of several
of the primary anaemias have been discovered. For example,
the anaemia due to bulbarechaphalus, an intestinal parasite, is
electronically induced from the influence of pernicous anaemia with which it used to be included, and leucocytanaemia
has been declared by L6wit, though probably erroneously,
to be due to a blood parasite closely related to that of malaria.
In all these conditions there is a considerable similarity in the
symptoms produced and in the pathological anatomy. The
general symptoms are pallor of the skin and mucous membranes,
weakness and lassitude, shortness of breath, palpitation, a
tendency to fainting, and usually also gastro-intestinal distur-
base, headache and neuralgia. The heart is often dilated, and
on auscultation the systolic murmurs associated with that
condition are heard. In fatal cases the internal organs are
found to be pale, and very often their cells contain an excessive
amount of fat. In many anaemias there is a special tendency
to haemorrhage. Most of the above symptoms and organic
changes are directly due to diminished respiratory interchange
from the loss of haemoglobin, and to its effect on the various
organs involved. The diagnosis depends ultimately in all cases
upon the examination of the blood.

Though the relative proportions of the leucocytes are probably
constant under varying change even in health, especially as the
result of taking food, the number of red corpuscles remains much
more constant. Through the agency of some unknown mecha-
nism, the supply of fresh red corpuscles from the bone-marrow
keeps pace with the destruction of effete corpuscles, and in
health each corpuscle contains a definite and constant amount
of haemoglobin. The disturbance of this arrangement in
anaemia may be due to loss or to increased destruction of cor-
puscles, to the supply of a smaller number of new ones, to a
diminution of the amount of haemoglobin in the individual new corpuscles, or to a combination of these causes. It is most easy to illustrate this by describing what happens after a haemorrhage. If this is small, the loss is replaced by loss fully-formed corpuscles held in reserve in the marrow, and there is no disturbance. If it is larger, the amount of fluid lost is first made up by fluid drawn from the tissues, so that the number of corpuscles is apparently diminished by dilution of the blood; the erythroblasts, or formative red corpuscles, of the bone-marrow are stimulated to proliferation, and new corpuscles are quickly thrown into the circulation. These are apt, however, to be small and to contain a subnormal amount of haemoglobin, and it is only after some time that they are destroyed and their place taken by normally formed corpuscles. If the blood-loss has been very great, nucleated red corpuscles may even be carried into the blood-stream. The blood possesses a great power of recovery, if time be given, because the organ (bone-marrow) which forms so many of its elements never, in health, works at high pressure. Only a part of the marrow, the so-called red marrow, is normally occupied by erythroblastic tissue, the rest of the medullary cavity of the bones being taken up by fat. If any long-continued demand for red corpuscles is made, the fat is absorbed, and its place gradually taken by red marrow. This compensatory change is found in all chronic anaemias, not merely those in which their cause may be, except in some rare cases in which the marrow does not react.

It is often very difficult, especially in "secondary" anaemias, to say which of the above processes is mainly at work. In acute anaemias, such as those associated with septicemia, there is no doubt that blood destruction plays the principal part. But if the cause of anaemia is a chronic one, a gastric cancer, for instance, though there may possibly be an increased amount of destruction of corpuscles in some cases, and though there is often loss by haemorrhage, the cancer interferes with nutrition, the blood is impoverished, and does not nourish the erythroblasts in the marrow sufficiently, and the new corpuscles which are turned out are few and poor in haemoglobin. In chronic anaemias, regeneration always goes on side by side with destruction, and it is important to remember that the state of the blood in these conditions gives the measure, not of the amount of destruction which is taking place so much as of the amount of regeneration of which the organism is capable. The evidence of destruction has often to be sought for in other organs, or in secretion or excretion products.

Of the so-called primary anaemias the most common is chlorosis, an anaemia which occurs only in the female sex, between the ages of fifteen and twenty-five as a rule. Its symptoms are those caused by a diminution of haemoglobin, and though it is never directly fatal, and is extremely amenable to treatment with iron preparations, its subjects very frequently suffer from relapses at varying intervals after the first attack. Its causation is probably complex. Bad hygienic conditions, over-fatigue, want of proper food, especially of the iron-containing proteins of meat, the strain put upon the blood and blood-forming organs by the accession of puberty and the occurrence of menstruation, all probably play a part in it. It has also been suggested that internal secretions may be concerned in stimulating the bone-marrow, and that in the female sex in particular the genital organs may act in this way. Imperfect assumption of function by these organs at puberty, caused perhaps by some of the above-mentioned conditions, might lead to sluggishness in the bone-marrow, and to the supply to the blood of the poorly-formed corpuscles deficient in haemoglobin which are characteristic of the disease. Chlorosis is the type of anaemia from imperfect blood-formation. Lorrain Smith has produced evidence to show that the total amount of haemoglobin in the body is not diminished in this disease, but that the blood-plasma is greatly increased in amount, so that the haemoglobin is diluted and the amount in each blood-unit greatly lessened.

Pernicious anaemia is a rarer disease than chlorosis, occurs usually later in life, and is distributed nearly equally between the two sexes. But it is of great importance because of its almost uniformly fatal termination, though its downward course is generally broken by temporary improvement on one or more occasions. The symptoms are those of a progressive anaemia, in which gastro-intestinal disturbance usually plays a large part, and nervous symptoms are common, and they become at last much more severe than those of any secondary anaemia. The patient may die in the first attack, but more usually, when things seem to be at their worst, improvement sets in, either spontaneously or as the result of treatment, and the patient slowly regains apparent health. This remission may be followed by a relapse, that again by a remission, and so on, but as a rule the disease is fatal within, at the outside, two or three years.

The prime cause of the disease is not known. It seems probable indeed that the causal factors are numerous. Severe malarial infection, syphilis, pregnancy, chronic gastro-intestinal disease, chronic gas-poisoning, are all, in different cases, known to have been causally associated with it, and it is probable that a congenital weakness of the bone-marrow has often to do with its production, as in many cases a family or hereditary history of the disease can be obtained. The condition is now regarded as a chronic toxæmia, partly because of the clinical symptoms and pathological appearances, partly because analogous conditions can be produced experimentally by such poisons as saponin and tolyydendiam, and partly because of the facts of borrhicephalus anaemia. The site of production of the toxin, or toxins, for it is possible that several may have the same effect on the blood, is possibly not always the same, but must often be the alimentary canal, as borrhicephalus anaemia proves. Not all persons affected with this intestinal tapeworm contract the disease, but only those in whose intestines the worm is dead and decomposing or sometimes only "sick." The expulsion of the worm puts an end to the absorption of the toxin and the patients recover. No adequate explanation of the formation of the toxin in the immense majority of the cases, in which there is no tapeworm, has yet been given. It is certain that no organism as yet known is concerned.

This toxæmia affects the marrow and through it the blood, the gastro-intestinal apparatus and the nervous system, especially the spinal cord, in different proportions in different cases. The effect upon the marrow is to alter the type of red corpuscle formation, causing a reversion to the embryonic condition, in which the nucleated red corpuscles are large (megablasts), and the corpuscles in the blood formed from them are also large, are apparently ill suited to the needs of the adult, and easily break down and escape the deposition into the liver, spleen, kidneys and marrow prove. Whether this reversion is due to exhaustion of the normal process or to an inhibition of it is not definitely known. The result is that the circulating red corpuscles are enormously diminished; it is usual to find 1,000,000 or less in the cubic millimetre instead of the normal 5,000,000. Though the haemoglobin is of course absolutely diminished, it is always, in severe cases, present in relatively higher percentage than the red corpuscles, because the average red corpuscle is larger and contains more haemoglobin than the normal. The large nucleated red corpuscles (megablasts) with which the marrow is crowded, often appear in the blood.

Other anaemias, such as those known as lymphadenoma, or Hodgkin's disease, splenic anaemia, chloroma, leucanaemia and the anaemia pseudo-leucanaemia of children, need not be described here, as they are either rare or their occurrence or nature is still too much under discussion.

The number and nature of the leucocytes in the blood bears no constant or necessary relation to the number or condition of the red corpuscles, and their variations depend on entirely different conditions. The number in the cubic millimetre is usually about 7000, but may vary in health from 5000 to 10,000. A diminution in their number is known as leucopenia, and is found in starvation, in some infective diseases, as for example in typhoid fever, in malaria and Malta fever, and in pernicious anaemia. An increase is very much more frequent, and is known as leucocytosis, though in this term is usually connoted a relative increase in the proportion of the polymorphonuclear neutrophile leucocytes.
Leucocytosis occurs under a great variety of conditions, normally to a slight extent during digestion, during pregnancy, and after violent exercise, and abnormally after haemorrhage, in the course of inflammations and many infective diseases, in malignant disease, in such toxic states as uraemia, and after the ingestion of nuclein and other substances. It does not follow that any one disease is most important of which are typhoid fever, malaria, influenza, measles and uncomplicated tuberculosis. In all cases where it is sufficiently severe and long continued, the reserve space in the bone-marrow is filled up by the active proliferation of the leucocytes normally found there, and is used as a nursery for the leucocytes required in the blood. In many cases leucocytosis is known to be associated with the defence of the organism from injurious influences, and its amount depends on the relation between the severity of the attack and the power of resistance. There may be an increase in the proportions present in the blood of lymphocytes (lymphocytosis), and of eosinophile cells (eosinophilia). This latter change is associated specially with some forms of asthma, with certain skin diseases, and with the presence of animal parasites in the body, such as ankylostoma and filaria.

The disease in which the number of leucocytes in the blood is greatest is leucocytæmia or leucæmia. There are two main forms of this disease, in both of which there are widespread enlargement of the spleen and lymphatic glands, or of either of them, leucocytic hypertrophy of the bone-marrow, and deposits of leucocytes in the liver, kidney and other organs. The difference lies in the kind of leucocytes present in excess in the blood, blood-forming organs and deposits in the tissues. In the one form these are lymphocytes, which are found in health mainly in the marrow, the blood itself, the lymph glands and in the lymphatic tissue round the alimentary canal; in the other they are the kinds of leucocytes normally found in the bone-marrow—myelocytes, neutrophile, basophile and eosinophile, and polymorphonuclear cells, also neutrophile, basophile and eosinophile. The clinical course of the two forms may differ. The first, known as lymphatic leucæmia or lymphæmia, may be acute, and prove fatal in a few weeks or even days with rapidly advancing anaemia, or may be chronic and last for one or two years or longer. The second, known as spleno-mycelogenous leucæmia or myelæmia, is almost always chronic, and may last for several years. Recovery does not take place, though remissions may occur. The use of the X-rays has been found to influence the course of this disease very favourably. The most recent view of the pathology of the disease is that it is due to an overgrowth of the bone-marrow leucocytes, analogous in some respects to tumour growth and caused by the removal of some controlling mechanism rather than by stimulation. The anaemia accompanying the disease is due partly to the leucocyte overgrowth, which takes up the space in the marrow belonging of right to red corpuscles formation and interferes with it.

BLOOD-LETTING. There are certain morbid conditions when a patient may obtain marked relief from the abstraction of a certain amount of blood, from three or four or ounces up to twenty or even thirty in extreme cases. This may be effected by venesection, or the application of leeches, or more rarely by cupping (g.v.). Unfortunately, in years gone by, blood-letting was used to such excess, as a cure for almost every known disease, that public opinion is now extremely opposed to it. In certain pathological conditions, however, it brings relief and saves life when no other means would act with sufficient promptness to take its place. Venesection, in which the blood is usually withdrawn from the median-basical vein of the arm, has the disadvantage that it can only be performed by the medical man, and that the patient's friends are generally very much opposed to the idea. But the public are not nearly so prejudiced against the use of leeches; and as the nurse in charge can be instructed to use these if occasion arises, this is the form of blood-letting usually practised to-day. From one to twelve leeches are applied at the time, the average leech withdrawing some two dribbles of blood. Should this prove insufficient, as much again can be abstracted by the immediate application of hot fomentations to the wounds. They should always be applied over some bony prominence, that pressure may be effectively used to stop the haemorrhage afterwards. They should never be placed over superficial veins, or where there is much loose subcutaneous tissue. If, as is often the case, the patient is fainting, the leeches should be pricked at the desired spot with the point of a sterilized needle, and the leech will then attach itself without further trouble. Also they must be left to fall off of their own accord, the nurse never dragging them forcibly off. If cold and pressure fail to stop the subsequent haemorrhage, a little powdered alum or other styptic may be inserted in the wound. The following are the main indications for their use, though in some cases they are better replaced by venesection. (1) For stagnation of blood on the right side of the heart with constant dyspnoea, cyanosis, &c. In acute lung disease, the sudden obstruction to the passage of blood through the lungs throws such an increased strain on the right ventricle that it may dilate to the verge of paralysis; but by lessening the total volume of blood, the heart's work is lightened for a time, and the danger at the moment tided over. This is a condition frequently met with in the early stages of acute pneumonia, pleurisy and bronchitis, when the obstruction is in the lungs, the heart being normal. But the same result is also met with as a result of failure of compensation with back pressure in certain forms of heart disease (g.v.). (2) To lower arterial tension. In the early stages of cerebral haemorrhage (before coma has supervened), when the heart is working vigorously and the tension of the pulse is high, a timely venesection may lead to arrest of the haemorrhage by lowering the blood pressure and so giving the blood in the ruptured vessel an opportunity to coagulate. (3) In various convulsive attacks, as in acute uræmia.

BLOOD-MONEY, colloquially, the reward for betraying a criminal to justice. More strictly it is used of the money-penalty paid in old days by a murderer to the kinsfolk of his victim. These fines completely protected the offender from the vengeance of the injured family. The system was common among the Scandinavian and Teutonic races previous to the introduction of Christianity, and a scale of payments, graduated according to the heaviness of the crime, was fixed by laws, which further settled who could exact the blood-money, and who were entitled to share it. Homicide was not the only crime thus expiable: blood-money could be exacted for all crimes of violence. Some acts, such as killing any one in a church, was charged again the precincts of the royal palace, were "hot-less"; and the death penalty was inflicted. Such a criminal was outlawed, and his enemies could kill him wherever they found him.

BLOODSTONE, the popular name of the mineral heliotrope, which is a variety of dark green chalcedony or plasman, with bright red spots, splashes and streaks. The green colour is due to a chloritic mineral; the red to haematite. Some coarse kinds are opaque, resembling in this respect jasper, and some writers have sought to restrict the name "bloodstone" to green jasper, with red markings, thus making heliotrope a translucents and bloodstone an opaque stone, but, though convenient, such a distinction is not generally recognized. A good deal of bloodstone comes from India, where it occurs in the Deccan traps, and is cut and polished at Cambay. The stone is used for seals, knife-handles and various trival ornaments. Bloodstone is not very widely distributed, but is found in the basaltic rocks of the Isle of Rum in the west of Scotland, and in a few other localities. Haematite (Gr. αἷμα, blood), or native perroxide of iron, is also sometimes called "bloodstone."

BLOOM (from A.S. Nûm, a flower), the blossom of flowering plants, or the powdery film on the skin of fresh-picked fruit; hence applied to the surface of newly-minted coins or to a cloudy appearance on the varnish of painting due to moisture; also, in metallurgy, a term used of the rough billets of iron and steel, which have undergone a preliminary hammering or rolling, and are ready for further working.

BLOOMER, AMELIA JENKS (1819-1894), American dress-reformer and women's rights advocate, was born at Homer, New
York, on the 27th of May 1818. After her marriage in 1840 she established a periodical called The Lily, which had some success. In 1849 she took up the idea—previously originated by Mrs Elizabeth Smith Miller—of a reform in woman's dress, and the wearing of a short skirt, with loose trousers, gathered round the ankles. The name of "bloomers" gradually became popularly attached to any divided-skirt or knickerbocker dress for women. Until her death on the 30th of December 1894 Mrs Bloomer took a prominent part in the temperance campaign and in that for woman's suffrage.

BLOOMFIELD, MAURICE (1855— ), American Sanskrit scholar, was born on the 23rd of February 1855, in Bielits, Austrian Silesia. He went to the United States in 1867, and ten years later graduated from Furman University, Greenville, South Carolina. He then studied Sanskrit at Yale, under W. D. Whitney, and at Johns Hopkins, to which university he returned as associate professor in 1881 after a stay of two years in Berlin and Leipzig, and soon afterwards was promoted professor of Sanskrit and comparative philology. His papers in the American Journal of Philology number a few in comparative linguistics, such as those on assimilation and adaptation in congeneric classes of words, and many valuable "Contributions to the Interpretation of the Vedas," and he is best known as a student of the Vedas. He translated, for Max-Miller's Sacred Books of the East, the Hymns of the Atharva-Veda (1897); contributed to the Bühler-Kielhorn Grundriss der indo-arischen Philologie und Altertumskunde the section The Atharva-Veda and the Gopatha Brāhmaṇa (1899); was first editor of the Kāṭhaka-Sūtra (1900), and in 1907 published, in the Harvard Oriental series, A Vedic Concordance. In 1905 he published Cerberus, the Dog of Hades, a study in comparative mythology.

BLOOMFIELD, ROBERT (1766–1823), English poet, was born of humble parents at the village of Honington, Suffolk, on the 3rd of December 1766. He was apprenticed at the age of eleven to a farmer, but he was too small and frail for field labour, and four years later he came to London to work for a shoemaker. The poem that made his reputation, The Farmer's Boy, was written in a garret in Bell Alley. The manuscript, declined by several publishers, fell into the hands of Capell Lofti, who arranged for its publication with woodcuts by Bewick in 1780. The success of the poem was remarkable, over 25,000 copies being sold in the next two years. His reputation was increased by the appearance of his Rural Tales (1802), News from the Farm (1804), Wild Flowers (1806) and The Banks of the Wye (1811). Influential friends attempted to provide for Bloomfield, but ill-health and possibly faults of temperament prevented the success of these efforts, and the poet died in poverty at Sheffield, Bedfordshire, on the 19th of August 1823.

BLOOMFIELD, a town of Essex county, New Jersey, U.S.A. about 12 m. W. of New York, and directly adjoining the city of Newark on the N. Pop. (1900) 6,068, of whom 2,267 were foreign-born; (1905, state census) 11,665; (1910), 15,070. Area, 54.24 sq. m. Bloomfield is served by the Erie, and the Delaware, Lackawanna & Western railways, and by several electric lines connecting with Newark, Montclair, Orange, East Orange and other neighbouring places. It is a residential suburb of New York, New Jersey, and is part of the Bloomfield Memorial school (Presbyterian, 1860) and has the Jarvis Memorial library (1902). There is a Central Green, and in 1908 land was acquired for another park. Among the town's manufactures are silk and woollen goods, paper, electric elevators, electric lamps, rubber goods, safety pins, hats, cream separators, brushes and novelties. The value of the town's factory products increased from $3,370,924 in 1900 to $4,64,548 in 1905, or 37.8%. First settled about 1670–1675 by the Dutch and by New Englanders from the New York colony, Bloomfield was long a part of Newark, the principal settlement at first being known as Wardswell. In 1796 it was named Bloomfield in honour of General Joseph Bloomfield (1753–1853), who served (1775–1783) in the War of American Independence, taking the rank of major, was governor of New Jersey in 1801–1802 and 1803–1812, brigadier-general in the United States army during the War of 1812, and a Democratic representative in Congress from 1817 to 1821. The township of Bloomfield was incorporated in 1822. From it were subsequently set off Belleville (1830), Montclair (1868) and Glen Ridge (1895).

BLOOMINGTON, a city and the county-seat of McLean county, Illinois, U.S.A., in the central part of the state, about 125 m. S.W. of Chicago. Pop. (1850) 20,484; (1900) 23,286, in 1905, 36,161. There were 80 instructors, 2,951 students, and a library of 36,000 volumes; its school of law was established in 1842, suspended in 1877 and re-established in 1880; its school of medicine was established in 1903; but most of the medical course is given in Indianapolis; a graduate school was organized in 1904; and a summer school (or summer term of eleven weeks) was first
BLOOMSBURG—BLount, Sir T. P.

held in 1905. Dr David Starr Jordan was the first president of the university in 1885-1891, when it was thoroughly reorganized and its curriculum put on the basis of major subjects and departments. The university’s biological station is on Winona Lake, Kosciusko county. Among the manufactures of Bloomington are furniture and wooden ware. There are valuable limestone quarries in the vicinity. The city was first settled about 1818.

BLOOMSBURG, a town and the county-seat of Columbia county, Pennsylvania, U.S.A., on Fishing Creek, 2 m. from its confluence with the Susquehanna, and about 40 m. S.W. of Wilkes-Barre. Pop. (1890) 61,355; (1900) 61,370; (213 foreign-born); (1910) 74,143. It is served by the Delaware, Lackawanna & Western, the Philadelphia & Reading, and the Bloomsburg & Sullivan and the Susquehanna, Bloomburg & Berwick railways, (the last two only 30 m. and 30 m. long respectively); and is connected with Berwick, Catawissa and Danville by electric lines. The town is built on a bluff commanding extensive views. Among the manufactures of Bloomsburg are railway cars, carriages, silk and woollen goods, furniture, carpets, wire-drawing machines and gun carriages. Iron ore was formerly obtained from the neighbouring hills. The town is the seat of a state normal school, established as such in 1869. Bloomsburg was laid out as a town in 1802, became the county-seat in 1826, and was incorporated in 1870.

BLOUNT, CHARLES (1654-1693), English author, was born at Upper Holloway on the 27th of April 1654. His father, Sir Henry Blount (1606-1683), was the author of a Voyage to the Levant, describing his own travels. He gave his son a careful education, and is said to have helped him in his Anima Mundi; or An Historical Narrative of the Opinions of the Antients concerning Man's Soul after his Life, according to unenlightened Nature (1670), which gave great offence by the sceptical views expressed in it. It was suppressed by order of the bishop of London, and even burnt by some over-zealous official, but a re-issue was permitted. Blount was an admirer of Hobbes, and published his "Last Sayings" (1679), a pamphlet consisting of extracts from The Leviathan. Great is Diana of the Ephesians, or the Original of Idolatry, together with the Political Institution of the Gentiles' Sacrifices (1680) attracted severe criticism on the ground that in depreciating the evils of priestcraft Blount was attacking Christianity itself. His best-known book, The Two First Books of Philostratus concerning the Life of Apollonius Tyanaeus ... (1680), is said to have been prohibited in 1693, chiefly on account of the notes, which are stated by Bayle (note, e. A. Apollonius) to have been taken mainly from a MS. of Lord Herbert of Cherbury. Blount contributed materially to the removal of the restrictions on the freedom of the press, with two pamphlets (1693) by "Philopatria," mainly derived from Milton's Areopagitica. He also laid a successful trap for the censor, Edmund Bohun. Under the name of "Junius Brutus" he wrote a pamphlet entitled "King William and Queen Mary Conquerors." The title-page set forth the theory of the justice of title by conquest, which Blount knew to be agreeable to Bohun. It was duly licensed, but was ordered by the House of Commons to be burnt by the common hangman, as being diametrically opposed to the attitude of William's government on the subject. These proceedings showed the futility of the censorship, and hastened its downfall.

Blount had fallen in love with his deceased wife's sister, and in despair of overcoming her scruples as to the legality of such a marriage, shot himself in the head. He survived for some time, refusing help except from his sister-in-law. Alexander Pope asserted (Epilogue to the Satires, Note, i. 124) that he wounded himself in the arm, pretending to kill himself, and that the result was fatal contrary to his expectations. He died in August 1693.

Shortly before his death a collection of his pamphlets and private papers was printed with a preface by Charles Gildon, under the title of the Oraclcs of Reason. His Miscellaneous Works (1695) is a fuller edition by the same editor.

BLOUNT (or BLunt), EDWARD (b. 1567?), the printer, in conjunction with Isaac Jaggard, of Mr William Shakespeare's Comedies, Histories and Tragedies. Published according to the true Original Copies (1623), usually known as the first folio of Shakespeare. It was produced under the direction of John Heming (d. 1630) and Henry Condell (d. 1667), both of whom had been Shakespeare's colleagues at the Globe theatre, but as Blount combined the functions of printer and editor on other occasions, it is fair to conjecture that he to some extent edited the first folio. The Stationers' Register states that he was the son of Ralph Blount or Blunt, merchant tailor of London, and apprenticed himself in 1578 for ten years to William Pensonby, a stationer. He became a freeman of the Stationers' Company in 1588. Among the most important of his publications are Giovanni Florio's Italian-English dictionary and his translation of Montaigne, Marlowe's Hero and Leander, and the Sive Court Comedies of John Lyly. He himself translated Ars Aulica, or the Courier's Arte (1607) from the Italian of Lorenzo Ducci, and Christian Policie (1632) from the Spanish of Juan de Santa Maria.

BLUNT, THOMAS (1618-1670), English antiquarian, was the son of one Myles Blount, of Orleton in Herefordshire. He was born at Berdesley, Worcestershire. Few details of his life are known. It appears that he was called to the bar at the Inner Temple, but, being a zealous Roman Catholic, his religion interfered considerably with the practice of his profession. Retiring to his estate at Orleton, he devoted himself to the study of the law as an amateur, and also read widely in other branches of knowledge. He died at Orleton on the 26th of December 1679. His principal works are Glossographeia; or, a dictionary interpreting the hard words of whatsoever language, now used in our refined English tongue (1656, reprinted in 1707), which went through several editions and remains most amusing and instructive reading; Namellexicon: a law dictionary interpreting such difficult and obscure words and terms as are found either in our common or statute, ancient or modern laws (1670; third edition, with additions by W. Nelson, 1717); and Fragmenta Antiquitatis: Ancient Tenures of land, and jocular customs of some manners (1679; enlarged by J. Beckwith and republished, with additions by H. M. Beckwith, in 1815; again revised and enlarged by W. C. Hazlitt, 1874). Blount's Boscobel (1613), giving an account of Charles II's preservation after Worcester, with the addition of the king's own account dictated to Pepys, has been edited with a bibliography by C. G. Thomas (1894).

BLOUNT, Sir Thomas POPE (1649-1697), English author, eldest son of Sir Henry Blount and brother of Charles Blount (q.v.), was born at Upper Holloway on the 12th of September 1649. He succeeded to the estate of Tittenhanger on his mother's death in 1678, and in the following year was created a baronet. He represented the borough of St Albans in the two last parliaments of Charles II, and was knight of the shire from the revolution till his death. He married Jane, daughter of Sir Henry Caesar, by whom he had five sons and nine daughters. He died at Tittenhanger on the 30th of June 1697. His Censura celebrorum authorum sive tractatus in quo varia virorum doctorem de clarissimis cujusque seculi scriptoribus judicium traduntur (1690) was originally compiled for Blount's own use, and is a dictionary in chronological order of what various eminent writers have said about one another. This necessarily involved enormous labour in Blount's time. It was published at Geneva in 1694 with all the quotations from modern languages translated into Latin, and again in 1710. His other works are A Natural History, containing many not common observations extracted out of the best modern writers (1693), De poeetica, or remarks upon Poetry, with Characters and Censures of the most considerable Poets ... (1694), and Essays on Several Occasions (1692). It is on this last work that his claims to be regarded as an original writer rest. The essays deal with the perversion of learning, a comparison between the ancients and the moderns (to the advantage of the latter), the education of children, and kindred topics. In the second edition (1697) he added an eighth essay, on religion, in which he deprecated the multiplication of ceremonies. He displays throughout a hatred of pedantry and convention, which makes his book still interesting.
BLount, W.—BLOW-GUN.

See A. Kippis, Biographia Britannica (1780), vol. ii. For an account of Blount’s family see Robert Clutterbuck, History and Antiquities of the County of Hereford (1815), vol. i. pp. 207-212.

BLount, William (1749-1800), American politician, was born in Bertie county, North Carolina, on the 26th of March 1749. He was a member of the Continental Congress in 1783-1784 and again in 1786-1787, at the constitutional convention at Philadelphia in 1787, and of the state convention which ratified the Federal constitution for North Carolina in 1789. From 1790 until 1796 he was, by President Washington’s appointment, governor of the “Territory South of the Ohio River,” created out of land ceded to the national government by North Carolina in 1784. During this period he was a leading representative of Indian affairs for this part of the country. In 1791 he laid out Knoxville (Tennessee) as the seat of government. He presided over the constitutional convention of Tennessee in 1796, and, on the state being admitted to the Union, became one of its first representatives in the United States Senate. In 1797 his connexion became known with a scheme, since called “Blount’s Conspiracy,” which provided for the co-operation of the American frontiersmen, assisted by Indians, and an English force, in the seizure on behalf of Great Britain of the Floridas and Louisiana, then owned by Spain, with which power England was then at war. As this scheme, if carried out, involved the corrupting of two officials of the United States, an Indian agent and an interpreter, a breach of the neutrality of the United States, and the breach of Article V. of the treaty of San Lorenzo el Real (signed on the 27th of October 1793) between the United States and Spain, by which each power agreed not to incite the Indians to attack the other, Blount was impeached by the House of Representatives on the 7th of July 1797, and on the following day was formally expelled from the Senate for “having got up a plot, high misdemeanor, entirely inconsistent with his public trust and duty as a senator.” On the 29th of January 1798 articles of impeachment were adopted by the House of Representatives. On the 14th of January 1799, however, the Senate, sitting as a court of impeachment, decided that it had no jurisdiction, Blount not then being a member of the Senate, and, in the Senate’s opinion, not having been, even as a member, a civil officer of the United States, within the meaning of the constitution. The case is significant as being the first case of impeachment in the United States Senate. From the legal point of view, all that the case decides is that a senator of the United States who has been expelled from his seat is not after such expulsion subject to impeachment” (Francis Wharton, State Trials). In effect, however, it also decided that a member of Congress was not in the meaning of the constitution a civil officer of the United States and therefore could not be impeached. The “conspiracy” was disavowed by the British government, which, however, seems to have secretly favoured it. Blount was enthusiastically supported by his constituents, and upon his return to Tennessee was made a member and the presiding officer of the state senate. He died at Knoxville on the 21st of March 1800.

For a defence of Blount, see General Marcus J. Wright’s Account of the Life and Services of William Blount (Washington, D. C., 1884).

BLouss, a word (taken from the French) used for any loosely fitting bodice belted at the waist. In France it meant originally the upper garment of linen or cotton, generally blue, worn by French workmen to preserve their clothing, and, by transference, the workman himself.

Blow, John (1668-1708), English musical composer, was born in 1668, probably at North Collingham in Nottinghamshire. He became a chorister of the chapel royal, and distinguished himself by his proficiency in music; he composed several anthems at an unusually early age, including Lord, Thou hast been our refuge; Lord, rebuke me not; and the so-called “churb anthem,” I will always give thanks, the last in collaboration with Pelham Humphrey and William Turner, either in honour of a victory over the Dutch in 1665, or—more probably—simply to commemorate the friendly intercourse of the three choristers. To this time also belongs the composition of a two-part setting of Herrick’s Goë, perjùr’d men, written at the request of Charles II. to imitate Carissimi’s Dile, o cieoli. In 1664 Blow became organist of Westminster Abbey. In 1663 he was made a gentleman of the chapel royal, and in the September of this year he was married to Elizabeth Braddock, who died in childbirth ten years later. Blow, who by the year 1678 was a doctor of music, was named in 1685 one of the private musicians of James II. Between 1680 and 1689 he wrote the only stage composition by him of which any record survives, the Masque for the Entertainment of the King: Venus and Adonis. In this Mary Davies played the part of Venus, and her daughter by Charles II., Lady Mary Tudor, appeared as Cupid. In 1687 he became master of the choristers of St Paul’s, and in 1693 his performance at St Margaret’s, Westminster, and is said to have received his post as organist of Westminster Abbey, from which in 1680 he had retired or been dismissed to make way for Purcell. In 1690 he was appointed to the newly created post of composer to the chapel royal. Fourteen services and more than a hundred anthems by Blow are extant. In addition to his purely ecclesiastical music Blow wrote Great sir, the joy of all our hearts, an ode for New Year’s day 1681-1682; similar compositions for 1683, 1686, 1687, 1688, 1693 (?), 1694 and 1700; odes, &c., for the dedication of St Cecilia’s day for 1684, 1691, 1705 and 1706 for the coronation of James II. two anthems, Behold, O God, our Defender, and God spake sometimes in visions; some harpsichord pieces for the second part of Playford’s Musician’s Handmaid (1680); Epicedium for Queen Mary (1695); Ode on the Death of Purcell (1696). In 1700 he published his Anthimone Anglicus, a collection of pieces of music for one, two, three and four voices, with a figured-bass accompaniment. A famous page in Burney’s History of Music is devoted to illustrations of “Dr Blow’s Crudities,” most of which only show the meritorious if immature efforts in the characteristic of English music at the time, while some of them (where Burney says “Here we are lost”) are really excellent. Blow died on the 1st of October 1708 at his house in Broad Sanctuary, and was buried in the north aisle of Westminster Abbey.

BLOW-GUN, a weapon consisting of a long tube, through which, by blowing with the mouth, arrows or other missiles can be shot accurately to a considerable distance. Blow-guns are used both in warfare and the chase by the South American Indian tribes inhabiting the region between the Amazon and Orinoco rivers, and by the Dyaks of Borneo. In the 18th century they were also known to certain North American Indians, especially the Chocattas and Cherokees of the lower Mississippi. Captain Bossu, in his Travels through Louisiana (1756), says of the Chocattas: “They are very expert in shooting with an instrument made of reeds about 7 ft. long, into which they put a little arrow feathered with the wool of the thistle (wild cotton).” The blow-guns of the South American Indians differ in style and workmanship. That of the Macusi of Guiana, called pucuna, is the most perfect. It is made of two tubes, the inner of which, called oorab, is a light redd 3 in. in diameter which often grows to a length of 15 ft. without a joint. This is enclosed, for protection and solidity, in an outer tube of a variety of palm (Iriartella setigera). The mouth-piece is made of a circle of silk-grass, and the farther end is fluted with a kind of nut, forming a sight. A rear open sight is formed of two teeth of a small rodent. The length of the pucuna is about 11 ft. and its weight 15 lb. The arrows, which are from 12 to 18 in. long and very slender, are made of ribs of the cocote palm-leaf. They are usually feathered with a tuft of wild cotton, but some have in place of the cotton a thin strip of bark curled into a cone, which, when the shooter blows into the pucuna, expands and completely fills the tube, thus avoiding windage. Another kind of arrow is furnished with fibres of bark fixed along the shaft, imparting a rotary motion to the missile, a primitive example of the theory of the rifle. The arrows used in Peru are only a few inches long and as thin as fine knitting-needles. All South American blow-gun arrows are steeled in poison. The natives shoot very accurately with the pucuna at distances up to 30 or 60 yds.

The blow-gun of the Borneo Dyaks, called sumpitan, is from
BLOWITZ—BLOWPIPE

6 to 7 ft. long and made of ironwood. The bore, of \( \frac{3}{4} \) in., is made with a long pointed piece of iron. At the muzzle a small iron hook is affixed, to serve as a sight, as well as a spear-head like a bayonet and for the same purpose. The arrows used with the **sämpian** are about 10 in. long, pointed with fish-teeth, and feathered with pith. They are also envenomed with poison.

Poisoned arrows are also used by the natives of the Philippine Island of Mindanao, whose blow-pipes, from 3 to 4 ft. long and many of them often richly ornamented and even jewelled.

The principle of the blow-gun is, of course, the same as that of the common "pea-shooter."

**BLOWITZ, HENRI GEORGES STEPHAN ADOLPHE DE** (1825-1903), Anglo-French journalist, was born, according to the account given in his memoirs, at his father's château in Bohemia on the 26th of December 1825. At the age of fifteen he left home, and travelled over Europe for some years in company with a young professor of philology, acquiring a thorough knowledge of French, German and Italian and a mixed general education. The finances of his family becoming straitened, young Blowitz was on the point of starting to seek his fortune in America, when he became acquainted in Paris with M. de Falloux, minister of public instruction, who appointed him professor of foreign languages at the Tours Lycée, whence, after some years, he was transferred to the Marseilles Lycée. After marrying in 1850 he resigned his professorship, but remained at Marseilles, devoting himself to literature and politics. In 1869 information which he supplied to a legitimist newspaper at Marseilles with regard to the candidature of M. de Lesseps as deputy for that city led to a demand for his expulsion from France. He was, however, allowed to remain, but had to retire to the country. In 1870 his predictions of the approaching fall of the Empire caused the demand for his expulsion to be renewed. While his case was under discussion the battle of Sedan was fought, and Blowitz effectually ingratiated himself with the authorities by applying for naturalization as a French subject. Once naturalized, he returned to Marseilles, where he was fortunately able to render considerable service to Thiers, who subsequently employed him in collecting information at Versailles, and when this work was finished offered him the French consulsiphip at Riga. Blowitz was on the point of accepting this post when Laurence Oliphant, then Paris correspondent of *The Times*, for which Blowitz had already done some occasional work, asked him to act as his regular assistant for a time, Frederick Hardman, the other Paris correspondent of *The Times*, being absent. Blowitz accepted the offer, and when, later on, Oliphant was succeeded by Hardman he remained as assistant correspondent. In 1873 Oliphant died, and Blowitz became chief Paris correspondent to *The Times*. In this capacity he soon became famous in the world of journalism and diplomacy. In 1875 theduc de Decazes, then French foreign minister, showed Blowitz a confidential despatch from the French ambassador in Berlin (in which the latter warned his government that Germany was contemplating an attack on France), and requested the correspondent to expose the German designs in *The Times*. The publication of the facts effectually aroused European public opinion, and any such intention was immediately thwarted. Blowitz's most sensational journalistic feat was achieved in 1878, when his enterprise enabled *The Times* to publish the whole text of the treaty of Berlin at the actual moment that the treaty was being signed in Germany. In 1877 and again in 1888 Blowitz rendered considerable service to the French government by his exposure of internal designs upon the Republic. He died on the 18th of January 1903.

**BLOWPIPE**, in the arts and chemistry, a tube for directing a jet of air into a fire or into the flame of a lamp or gas jet, for the purpose of producing a high temperature by accelerating the combustion. The blowpipe has been in common use from the earliest times for soldering metals and working glass, but its introduction into systematic chemical analysis is to be ascribed to A. F. Cronstedt, and not to Anton Swab, as has been maintained (see J. Landauer, *Ber.* 36, p. 808). The first work on this application of the blowpipe was by G. v. Engeaström, and was published in 1770 as an appendix to a treatise on mineralogy. Its application has been variously improved at the hands of T. O. Bergman, J. G. Gahn, J. J. Berzelius, C. F. Platner and others, but more especially by the two last-named chemists.

The simplest and oldest form of blowpipe is a conical brass tube about \( \frac{3}{4} \) in. in length, curved at the small end into a right angle, and terminating in a small round orifice, which is applied to the flame, while the larger end is applied to the mouth. Where the blast has to be kept up for only a few seconds, this instrument is quite serviceable, but in longer chemical operations inconvenience arises from the condensation of moisture exhaled by the lungs in the tube. Hence most blowpipes are now made with a cavity for retaining the moisture. Cronstedt placed a bulb in the centre of his blowpipe. Dr Joseph Black's instrument consists of a conical tube of tin plate, with a small brass tube, supporting the nozzle, inserted near the wider end, and a mouth-piece at the narrow end.

The sizes of orifice recommended by Platner are \( 0.4 \) and \( 0.5 \) mm. A trumpet mouth-piece is recommended from the support it gives to the cheeks when inflated. The mode of blowing is peculiar, and requires some practice; an uninterrupted blast is kept up by the muscular action of the cheeks, while the ordinary respiration goes on through the nostrils.

If the flame of a candle or lamp be closely examined, it will be found to consist of four parts—(a) a deep blue ring at the base, (b) a dark cone in the centre, (c) a luminous portion round this and (d) an exterior pale blue envelope (see *Flame*). In blowpipe work only two of these four parts are made use of, viz. the pale envelope, for oxidation, and the luminous portion, for reduction. To obtain a good *oxidizing flame*, the blowpipe is held with its nozzle inserted in the edge of the flame close over the level of the wick, and blown into gently and evenly. A conical jet is thus produced, consisting of an inner cone, with an outer one commencing near its apex—the former, corresponding to (o) in the free flame, blue and well defined; the latter corresponding to (d), pale blue and vague. The heat is greatest just beyond the point of the inner cone, combustion being there most complete. Oxidation is better effected (if a very high temperature be not required) the farther the substance is from the apex of the inner cone, for the air has thus freer access. To obtain a good *reducing flame* (in which the combustible matter, very hot, but not yet burned, is disposed to take oxygen from any compound containing it), the nozzle, with smaller orifice, should just touch the flame at a point higher above the wick, and a still weaker current of air should be blown. The flame then appears as a long, narrow, luminous cone, the end being enveloped by a dimly visible portion of flame corresponding to that which surrounds the free flame, while there is also a dark nucleus about the wick. The substance to be reduced is brought into the luminous portion, where the reducing power is strongest.

Various materials are used as supports for substances in the blowpipe flame; the principal are charcoal, platinum and glass or porcelain. *Charcoal* is valuable for its insusibility and low conductivity for heat (allowing substances to be strongly heated upon it), and for its powerful reducing properties; so that it is chiefly employed in testing the fusibility of minerals and in reduction. The best kind of charcoal is that of close-grained pine or cedar; it is cut in short prisms, having a flat smooth surface at right angles to the rings of growth. In this a shallow hole is made for receiving the substance to be held in the flame. Gas-carbon is sometimes used, since it is more permanent in the flame than wood charcoal. *Platinum* is employed in oxidizing processes, and is the means of substances with fluxes; also in observing the colouring effect of substances on the blowpipe flame (which effect is apt to be somewhat masked by charcoal). Most commonly it is used in the form of wire, with a small bend or loop at the end.
The mouth blowpipe is unsuitable for the production of a large flame, and cannot be used for any lengthy operations; hence recourse must be made to types in which the air-blast is occasioned by mechanical means. The laboratory form in common use consists of a bellows worked by either hand or foot, and a special type of gas burner formed of two concentric tubes, one conveying the blast, the other the gas; the supply of air and gas being regulated by stopcocks. The 

**hosi blast blowpipe** of T. Fletcher, in which the blast is heated by passing through a copper coil heated by a separate burner, is only of service when a prolonged flame of a fairly high temperature is required. Blowpipes in which oxygen is used as the blast have been manufactured by Fletcher, Russell & Co., and have proved of great service in conducting fuses which require a temperature above that yielded by the air-blowpipe.

For the applications of the blowpipe in chemical analysis see CHEMISTRY: Analytical.

**BLÜCHER, GEBHARD LEBEREHT VON** (1742-1819), Prussian general field marshal, prince of Wahlstadt in Silesia, was born at Rostock on the 6th of December 1742. In his fourteenth year he entered the service of Sweden, and in the Pomeranian campaign of 1760 he was taken prisoner by the Prussians. He was persuaded by his captors to enter the Prussian service. He took part in the later battles of the Seven Years' War, and as a hussar officer gained much experience of light cavalry work. In peace, however, his ardent spirit led him into excesses of all kinds, and being passed over for promotion he sent in his resignation, to which Frederick replied, "Captain Blücher can take himself to the devil" (1773). He now settled down to farming, and in fifteen years he had acquired an honourable independence. But he was unable to return to the army until after the death of Frederick the Great. He was then reinstated as major in his old regiment, the Red Hussars. He took part in the expedition to Holland in 1787, and in the following year became lieutenant-colonel. In 1789 he received the order pour le mérite, and in 1794 he became colonel of the Red Hussars. In 1793 and 1794 he distinguished himself in cavalry actions against the French, and for his success at Kirnweiler he was made a major-general. In 1801 he was promoted lieutenant-general.

He was one of the leaders of the war party in Prussia in 1805-1806, and served as a cavalry general in the disastrous campaign of the latter year. At Auerstädt Blücher repeatedly charged at the head of the Prussian cavalry, but without success. In the retreat of the broken armies he commanded the rearguard of Prince Hohenlohe's corps, and upon the capitulation of the main body of Brunswick he carried off a remnant of the Prussian army to the northward, and in the neighbourhood of Lübeck he fought a series of combats, which, however, ended in his being forced to surrender at Ratkau (November 7, 1806). His adversaries testified in his capitulation that it was caused by "want of provisions and ammunition."

He was soon exchanged for General Victor, and was actively employed in Pomerania, at Berlin, and at Königsberg until the conclusion of the war. After the war, Blücher was looked upon as the natural leader of the patriot party, with which he was in close touch during the period of Napoleonic domination. His hopes of an alliance with Austria in the war of 1809 were disappointed. In this year he was made general of cavalry. In 1812 he expressed himself so openly on the alliance of Russia with France that he was recalled from his military governorship of Pomerania and virtually banished from the court.

When at last the Napoleonic domination was ended by the outbreak of the War of Liberation in 1813, Blücher of course was at once placed in high command, and he was present at Lützen and Bautzen. During the armistice he worked at the organization of the Prussian forces, and when the war was resumed Blücher became commander-in-chief of the Army of Silesia, with Gneisenau and Muffling as his principal staff officers, and in 1814 was made field marshal and commander-in-chief of his troops.

The autumn campaign of 1813 will be found described in the article NAPOLÉONIC CAMPAIGNS, and it will here be sufficient to say that the most conspicuous military quality displayed by Blücher was his unrelenting energy. The irresolution and divergence of interests usual in allied armies found in him a restless opponent, and the knowledge that if he could not induce others to co-operate he was prepared to attempt the task in hand by himself often caused other generals to follow his lead.

He defeated Marshal Macdonald at the Katzbach, and by his victory over Marmont at Mőckern led the way to the decisive overthrow of Napoleon at Leipzig, which place was stormed by Blücher's own army on the evening of the last day of the battle. On the day of Möckern (October 16, 1813) Blücher was made a general field marshal, and after which march he pursued the rout of French with his accustomed energy. In the winter of 1813-1814 Blücher, with his chief staff officers, was mainly instrumental in inducing the allied sovereigns to carry the war into France itself.

The combat of Brienne and the battle of La Rothière were the chief incidents of the first stage of the celebrated campaign of 1814, and they were quickly followed by the victories of Napoleon over Blücher at Champaubert, Vauxchamps and Montmirail. But the courage of the Prussian leader was undiminished, and his great victory of Laon (March 9 to 10) practically decided the fate of the campaign. After this Blücher infused some of his own energy into the operations of Prince Schwarzenberg's Army of Bohemia, and at last this army and the Army of Silesia marched in one body direct upon Paris. The victory of Montmartre, the entry of the allies into the French capital, and the overthrow of the First Empire were the direct consequences. Blücher was disposed to make a severe retaliation upon Paris for the calamities that Prussia had suffered from the armies of France had not the allied commanders intervened to prevent it. Blowing up the bridge of Jena was said to be one of his contemplated acts. On the 3rd of June 1814 he was made prince of Wahlstadt (in Silesia on the Katzbach battlefield), and soon afterwards he paid a visit to England, being received everywhere with the greatest enthusiasm.

After the peace he retired to Silesia, but the return of Napoleon soon called him to further service. He was put in command of the Army of the Lower Rhine with General Gneisenau as his chief of staff (see WATERLOO CAMPAIGN). In the campaign of 1815 the Prussians sustained a very severe defeat at the outset at Ligny (June 16), in the course of which the old field marshal was ridden over by cavalry charges, his life being saved only by the devotion of his aide-de-camp, Count Nostitz. He was unable to resume command for some hours, and Gneisenau drew off the defeated army. The relations of the Prussian and the English headquarters were at this time very complicated, and it is uncertain whether Blücher himself was responsible for the daring resolution to march to Wellington's assistance. This was in fact done, and after an incredibly severe march Blücher's army intervened with decisive and crushing effect in the battle of Waterloo. The great victory was converted into a success absolutely decisive of the war by the relentless pursuit of the Prussians, and the allies re-entered Paris on the 7th of July.

Prince Blücher remained in the French capital for some months, but his age and infirmities compelled him to retire to his Silesian residence at Krieblowitz, where he died on the 12th of September 1819, aged seventy-seven. He retained to the end of his life that wildness of character and proneness to excesses which had caused his dismissal from the army in his youth, but however they may be regarded, these faults sprang always from the ardent and vivid temperament which made Blücher a daring leader of horse. The qualities which made him a great general were his patriotism and the hatred of French domination which inspired every success of the War of Liberation. He was twice married, and had, by his first marriage, two sons and a daughter. Statues were erected to his memory at Berlin, Breslau and Rostock.

Of the various lives of Prince Blücher, that by Varnhagen von Ense (1827) is the most important. His war diaries of 1793-1794, together with a memoir (written in 1805) on the subject of a national armament (edited by von Ribbentrop and Kibbeltrup (Campagne Journal 1793-4 v. Gl. Li. v. Blücher).
phrases. From the fact of various parties, political and other, having adopted the colour blue for their banners, various classes of phantom figures were known as "blue" or "blues"; thus "true blue" meant originally a staunch Presbyterian, the Covenanters having adopted blue as their colour as opposed to red, the royal colour; similarly, in the navy, there was in the 18th century a "Blue Squadron," Nelson being at one time "Rear-Admiral of the Blue"; again, in 1690, the Royal Horse Guards were called the "Blues" from their blue uniforms, or, from their leader, the earl of Oxford, the "Oxford Blues"; also, from the blue ribbon worn by the knights of the Garter comes the use of the phrase as the highest mark of distinction that can be worn, especially applied on the turf to the winning of the Derby. The "blue peter" is a rectangular blue flag, with a white square in the centre, hoisted at the top of the foremost as a signal that a vessel is about to leave port. At Oxford and Cambridge a man who represents his university in certain athletic sports is called a "blue" from the "colours" he is then entitled to wear, dark blue for Oxford and light blue for Cambridge.

BLUEBEARD, the monster of Charles Perrault's tale of Barbe Bleue, who murdered his wives and hid their bodies in a locked room. Perrault's tale was first printed in his Histoires et contes du temps passé (1697). The essentials of the story—Bluebeard's prohibition to his wife to open a certain door during his absence, her disobedience, her discovery of a gruesome secret, and her timely rescue from death—are to be found in other folklore stories, none of which, however, has attained the fame of Bluebeard. A close parallel exists in an Estonian legend of a husband who had already killed eleven wives, and was prevented from killing the twelfth, who had opened a secret room, by a gooseherd, the friend of her childhood. In "The Feather Bird" of Grimm's Hausmärchen, three sisters are the victims, the third being rescued by her brothers. Bluebeard, though Perrault does not state the number of his crimes, is generally credited with the murder of seven wives. His history belongs to the common stock of folklore, and has even been ingeniously fitted with a mythical interpretation. In France the Bluebeard legend has its local habitation in Brittany, but whether the existing traditions connecting him with Gilles de Rais (p.v.) or Comorre the Cursed, a Breton chief of the 6th century, were anterior to Perrault's tale, we have no means of determining. The identification of Bluebeard with Gilles de Rais, the bête d'extermination of Michelet's formidable character, persists locally in the neighbourhood of the various castles of the baron, especially at Machecoul and Tiffauges, the chief scenes of his infamous crimes. Gilles de Rais, however, had only one wife, who survived him, and his victims were in the majority of cases young boys. The traditional connexion may arise simply from the not improbable association of two monstrous tales. The less widespread identification of Bluebeard with Comorre is supported by a series of frescoes dating only a few years later than the publication of Perrault's story, in a chapel at St Nicolas de Bieuzy dedicated to St Tryphine, in which the tale of Bluebeard is depicted as the story of the saint, who in history was the wife of Comorre. Comorre or Conomor had his original headquarters at Carhaix, in Finistère. He extended his authority by marriage with the widow of Ions, chief of Domnonia, and attempted the life of his stepson Judwal, who fled to the Frankish court. About 547 or 548 he obtained in marriage, through the intercession of St Gildas, Tryphine, daughter of Weroce, count of Vannes. The pair lived in peace at Castel Finans for some time, but Comorre, disappointed in his ambitions in the Vannetais, presently threatened Tryphine. She took flight, but her husband found her hiding in a wood, when he gave her a wound on the skull and left her for dead. She was tended and restored to health by St Gildas, and after the birth of her son retired to a convent of her own foundation. Eventually Comorre was of distinction slain by Judwal. In legend St Tryphine was decapitated and miraculously restored to life by Gildas. Alain Bouchard (Grandes cromniques, Nantes, 1531) asserts that Comorre had already put several wives to death before he married Tryphine. In the

Légendes bretonnes of the count d'Amezeuil the church legend becomes a charming fairy tale.

See also E. A. Vizetelly, Bluebeard (1902); E. Sidney Hartland, "The Forbidden Chamber," in Folklore, vol. iii. (1885); and the editions of the Contes of Charles Perrault (p.v.). Cf. A. France, Les Sept Femmes de Barbe Bleue (1909).

BLUE-BOOK, the general name given to the reports and other documents printed by order of the parliament of the United Kingdom, so called from their being usually covered with blue paper, though some are bound in drab and others have white covers. The printing of its proceedings was first adopted by the House of Commons in 1681, and in 1862 was commenced the practice of selling parliamentary papers to the public. All notices of questions, resolutions, votes and proceedings in both Houses of Parliament are issued each day during the session; other publications include the various papers issued by the different government departments, the reports of committees and commissions of inquiry, public bills, as well as returns, correspondence, &c., specially ordered to be printed by either house. The papers of each session are so arranged as to admit of being bound up in regular order, and so well indexed. The terms upon which blue-books, single papers, &c., are issued to the general public are one halfpenny per sheet of four pages, but for an annual subscription of £20 all the parliamentary publications of the year may be obtained; but subscriptions can be arranged so that almost any particular class of publication can be obtained—for example, the daily votes and proceedings can be obtained for an annual subscription of £3, the House of Lords papers for £20, or the House of Commons papers for £1. Any publication can also be purchased separately.

Most foreign countries have a distinctive colour for the binding of their official publications. That of the United States varies, but foreign diplomatic correspondence is bound in red. The United States government publications are not only on sale (as a rule) but are widely supplied gratis, with the result that important publications soon get out of print, and it is difficult to obtain access to many valuable reports or other information, except at a public library. German official publications are bound in white; French, in yellow; Austrian, in red; Portuguese, in white; Italian, in green; Spanish, in red; Mexican, in green; Japanese, in grey; Chinese, in yellow.

BLUESTOCKING, a derisive name for a literary woman. The term originated in or about 1750, when Mrs Elizabeth Montagu (p.v.) made a determined effort to introduce into society a healthier and more intellectual tone, by holding assemblies at which literary conversation and discussions were to take the place of cards and gossip. Most of those attending were conspicuous by the plainness of their dress, and a Mr Benjamin Stillingfleet specially caused comment by always wearing blue or worsted stockings instead of the usual black silk. It was in special reference to him that Mrs Montagu's friends were called the Bluestocking Society or Club, and the women frequenting her house in Hill Street came to be known as the "Bluestocking Ladies" or simply "bluestockings." As an alternative explanation, the origin of the name is attributed to Mrs Montagu's deliberate adoption of blue stockings (in which fashion she was followed by all her women friends) as the badge of the society she wished to form. She is said to have obtained the idea from Paris, where in the 17th century there was a revival of a social reunion in 1690 on the lines of that formed in 1400 at Venice, the ladies and men of which wore blue stockings. The term had been applied in England as early as 1653 to the Little Parliament, in allusion to the puritanically plain and coarse dress of the members.

BLUFF (a word of uncertain origin; possibly connected with an obsolete Dutch word, blaf, broad), an adjective used of a ship, meaning broad and nearly vertical in the bows; similarly, a bluff face is one which is presenting a bold and nearly perpendicular front; of a person, good-natured and frank, with a rough or abrupt manner. Another word "bluff," perhaps connected with German verblühen, to blaffle, meant originally a horse's blinker, the corresponding verb meaning to blindfold; it survives
as a term in such games as poker, where "to bluff" means to bet heavily on a hand so as to make an opponent believe it to be stronger than it is; hence such phrases as "the game of bluffs," "politics of bluff."  

BLUM, ROBERT FREDERICK (1857–1903), American artist, was born in Cincinnati, Ohio, on the 9th of July 1857. He was employed for a time in a lithographic shop, and studied at the McMicken Art School of Design in Cincinnati, and at the Pennsylvania Academy of Fine Arts in Philadelphia, but he was practically self-taught, and early showed great and original talent. He settled in New York in 1879, and his first published sketches—of Japanese jugglers—appeared in St Nicholas. His most important work is a large frieze in the Mendelssohn Music Hall, New York, "Music and the Dance" (1893). His pen-and-ink work for the Century magazine attracted wide attention, as did his illustrations for Sir Edwin Arnold's Japonica. In the country and art of Japan he had been interested for many years. "A Daughter of Japan," drawn by Blum and W. J. Baer, was the cover of Scribner's Magazine for May 1893, and was one of the earliest pieces of colour-printing for an American magazine. In Scribner's for 1893 appeared also his "Artist's Letters from Japan." He was an admirer of Fortuny, whose methods somewhat influenced his work. Blum's Venetian pictures, such as "A Night Day at Venice" (1882), had lively charm and beauty. He died on the 8th of June 1903 in New York City. He was a member of the National Academy of Design, being elected after his exhibition in 1892 of "The Ameya"; and was president of the Painters in Pastel. Although an excellent draughtsman and etcher, it was as a colourist that he chiefly excelled.

BLUMENBACH, JOHANN FRIEDRICH (1752–1840), German physiologist and anthropologist, was born at Gottingen on the 11th of May 1752. After studying medicine at Jena, he graduated doctor at Gottingen in 1775, and was appointed extraordinary professor of medicine in 1776 and ordinary professor in 1778. He died at Gottingen on the 22nd of January 1840. He was the author of Institutiones Physiologicae (1787), and of a Handbuch der vergleichenden Anatomie (1804), both of which were very popular and went through many editions, but he is best known for his work in connexion with anthropology, of which science he has been justly called the founder. He was the first to show the value of comparative anatomy in the study of man's history, and his craniometrical researches justified his division of the human race into several great varieties or families, of which he enumerated five—the Caucasian or white race, the Mongolian or yellow, the Malayen or brown race, the Negro or black race, and the American or red race. This classification has been very generally received, and most later schemes have been modifications of it. His most important anthropological work was his description of sixty human crania published originally in fasciculi under the title Collectionis saec craniorum diversarum geniitum illustratae decades (Gottingen, 1790–1828).

BLUMENTHAL, LEONARD, COUNT von (1810–1900), Prussian field marshal, son of Captain Ludwig von Blumenthal (killed in 1813 at the battle of Dennewitz), was born at Schwedt-on-Oder on the 30th of July 1810. Educated at the military schools of Culm and Berlin, he entered the Guards as 2nd lieutenant in 1827. After serving in the Rhine provinces, he joined the topographical division of the general staff in 1846. As lieutenant of the 31st foot he took part in 1848 in the suppression of the Berlin riots, and in 1849 was promoted captain on the general staff. The same year he served on the staff of General von Bonin, the Schleswig-Holstein campaign, and so distinguished himself, particularly at Fredericia, that he was appointed chief of the staff of the Schleswig-Holstein army. In 1850 he was general staff officer of the mobile division under von Tietzen in Hesse-Cassel. He was sent on a mission to England in that year (4th class of Red Eagle), and on several subsequent occasions. Having attained the rank of lieutenant-colonel, he was appointed personal adjutant to Prince Frederick Charles in 1859. In 1860 he became colonel of the 31st, and later of the 71st, regiment. He was chief of the staff of the III. army corps when, on the outbreak of the Danish War of 1864, he was nominated chief of the general staff of the army against Denmark, and displayed so much ability, particularly at Düpplow and the passage of Alsen island, that he was made a knight of the order of le mérite. In the war of 1866 Blumenthal occupied the post of chief of the general staff to the crown prince of Prussia, commanding the 2nd army. It was upon this army that the brunt of the fighting fell, and at Königgrätz it decided the fortunes of the day. Blumenthal's own part in these battles and in the campaign generally was most conspicuous. On the field of Königgrätz the crown prince said to his chief of staff, "I know to whom I owe the conduct of my army," and Blumenthal soon received promotion to lieutenant-general and the oak-leaf of the order for le mérite. He was also made a knight of the Hohenzollerl Order. From 1866 to 1870 he commanded the 14th division at Düsseldorf. In the Franco-German War of 1870–71 he was chief of staff of the 3rd army under the crown prince. Blumenthal's soldierly qualities and talent were never more conspicuous than in the critical days preceding the battle of Sedan, and his services in the war have been considered as scarcely less valuable and important than those of Moltke himself. In 1871 Blumenthal represented Germany at the British manoeuvres at Chobham, and was given the post of chief of the army staff of the 2nd, and of the 1st, Corps. In 1873 he became a general of infantry, and ten years later he was made a count. In 1888 he was made a general field marshal, after which he was in command of the 4th and 3rd army inspections. He retired in 1896, and died at Quellendorf near Köthen on the 21st of December 1900.

Blumenthal's diary of 1866 and 1870–71 has been edited by his son, Count Albrecht von Blumenthal (Tagebuch des G.F. von Blumenthal, 2 vols., 1902 and 1903; an English translation (Journals of Count von Blumenthal) was published in 1903.

BLUNDERBUSS (a corruption of the Dutch donder, thunder, and the Dutch bus; cf. Ger. Büchse, a box or tube, hence a thunder-box or gun), an obsolete muzzle-loading firearm with a bell-shaped muzzle. Its calibre was large so that it could contain many balls or slugs, and it was intended to be fired at a short range, so that some of the charge was sure to take effect. The word is also used by analogy to describe a blundering and random person or talker.

BLUNT, JOHN HENRY (1823–1884), English divine, was born at Chelsea in 1823, and before going to the university of Durham in 1852 was for some years engaged in business as a manufacturing chemist. He was ordained in 1852 and took his M.A. degree in 1855, publishing in the same year a work on The Atomeum. He held in succession several prebendaries, among them the vicarage of Kennington near Oxford (1868), which he vacated in 1873 for the crown living of Beverston in Gloucestershire. He had already gained some reputation as an industrious theologian, and had published among other works an annotated edition of the Prayer Book (1867), a History of the English Reformation (1868), and a Book of Church Law (1872), as well as a Useful Dictionary of Doctrinal and Historical Theology (1870). The continuation of these labours was seen in a Dictionary of Sects and Heresies (1874), an Annotated Bible (2 vols., 1878–1879), and a Cyclopedia of Religion (1884), and received recognition in the shape of the D.D. degree bestowed on him in 1882. He died in London on the 11th of April 1884.

BLUNT, JOHN JAMES (1794–1855), English divine, was born at Newcastle-under-Lyme in Staffordshire, and educated at St John's College, Cambridge, where he took his degree as fifteenth wrangler and obtained a fellowship (1816). He was appointed a Wott's travelling bachelor 1818, and spent some time in Italy and Sicily, afterwards publishing an account of his journey. He proceeded M.A. in 1819, B.D. 1826, and was Hulsean Lecturer in 1831–1832 while holding a curacy in Shropshire. In 1834 he became rector of Great Oakley in Essex, and in 1839 was appointed Lady Margaret professor of divinity at Cambridge. In 1854 he declined the see of Salisbury, and he died on the 18th of June 1855. His chief book was Undesigned Coincidences in the Writings both of the Old and New Testaments.
BLUNT, W. S.—BNAI BRITH

(1823; fuller edition, 1847). Some of his writings, among them the History of the Christian Church during the First Three Centuries and the lectures On the Right Use of the Early Fathers, were published posthumously.

A short memoir of him appeared in 1836 from the hand of William Selwyn, his successor in the divinity professorship.

BLUNT, WILFRID SCAWEN (1830—1885), English poet and publicist, was born on the 17th of August 1850 at Petworth House, Sussex, the son of Francis Scawen Blunt, who served in the Peninsular Wars and was wounded at Corunna. He was educated at Stonyhurst and Oscott, and entered the diplomatic service in 1858, serving successively at Athens, Madrid, Paris and Lisbon. In 1867 he was sent to South America, and on his return to England retired from the service on his marriage with Lady Anne Noel, daughter of the earl of Lovelace and a granddaughter of the poet Byron. In 1872 he succeeded, by the death of his elder brother, to the estate of Crabbed Park, Sussex, where he established a famous stud for the breeding of Arab horses. Mr and Lady Anne Blunt travelled repeatedly in northern Africa, Asia Minor and Arabia, two of their expeditions being described in Lady Anne’s Bedouins of the Eastphrates (2 vols., 1879) and A Pilgrimage to Nejd (2 vols., 1881). Mr Blunt became known as an ardent sympathizer with Mahommedan aspirations, and in his Future of Islam (1888) he directed attention to the forces which afterwards produced the movements of Pan-Islamism and Mahdism. He was a violent opponent of the English policy in the Sudan, and in The Wind and the Whirlwind (in verse, 1883) prophesied its downfall. He supported the national party in Egypt, and took a prominent part in the defence of Arabi Pasha. Ideas about India (1885) was the result of two visits to that country, the second in 1883–1884. In 1885 and 1886 he stood unsuccessfully for parliament as a Home Ruler; and in 1887 he was arrested in Ireland while presiding over a political meeting in connexion with the agitation on Lord Clanricarde’s estate, and was imprisoned for two months in Kilmainham. His best-known volume of verse, Love Sonnets of Proteus (1886), is a revelation of his real merits as an emotional poet. The Poetry of Wilfrid Blunt (1888), selected and edited by W. E. Henley and Mr George Wyndham, includes these sonnets, together with “Worth Forest, a Pastoral,” “Griselda” (described as a “society novel in rhymed verse”), translations from the Arabic, and poems which had appeared in other volumes.

BLUNTSCHLI, JOHANN KASPAR (1808–1881), Swiss jurist and politician, was born at Zürich on the 7th of March 1808, the son of a soap and candle manufacturer. From school he passed into the Politische Institut (a seminary of law and political science) in his native town, and proceeding thence to the universities of Berlin and Bonn, took the degree of doctor juris in the latter in 1830. Returning to Zürich in 1839, he threw himself with ardour into the political strife which was at the time unsettling all the cantons of the Confederation, and in this year published Über die Verfassung der Stadt Zürich (On the Constitution of the City of Zürich). This was followed by Das Volk und der Souverän (1830), a work in which, while pleading for constitutional government, he showed his bitter repugnance of the growing Swiss radicalism. Elected in 1837 a member of the Grosser Rath (Great Council), he became the champion of the national conservative party, and his strong views of the philosopher Friedrich Rohmer (1814–1856), a man who attracted little other attention, he endeavoured in Psychologische Studien über Staat und Kirche (1834) to apply them to political science generally, and in particular as a panacea for the constitutional troubles of Switzerland. Bluntschli, shortly before his death, remarked, “I have gained renown as a jurist, but my greatest desert is to have comprehended Rohmer.” This philosophical essay, however, coupled with his uncompromising attitude towards both radicalism and ultramontanism, brought him into disfavour, and rendered his confession in the council, of which he had been elected president, impossible. He resigned his seat, and on the overthrow of the Sonderbund in 1847, perceiving that all hope of power for his party was lost, took leave of Switzerland with the pamphlet Stimme eines Schweizers über die Bundesreform (1847), and settled at Munich, where he became professor of constitutional law in 1848.

At Munich he devoted himself with energy to the special work of his chair, and, resisting the temptation to identify himself with politics, published Allgemeines Staatsrecht (1851–1852); Lehre vom modernen Staat (1851–1876); and, in conjunction with Karl Ludwig Theodor Bratter (1849–1869), Deutsches Staatswörterbuch (11 vols., 1857–1870; abridged by Edgar Löning in 3 vols., 1869–1875). Meanwhile he had assiduously worked at his constitution of Zürich, Proteschtisches Gesetzbuch für den Kanton Zürich (4 vols., 1854–1856), a work which was much praised at the time, and which, particularly the section devoted to contracts, served as a model for codes both in Switzerland and other countries.

In 1861 Bluntschli received a call to Heidelberg as professor of constitutional law (Staatsrecht), where he again entered the political arena, endeavouring in his Geschichte des allgemeinen Staatsrechts und der Politik (1864) “to stimulate,” as he said, “the political consciousness of the German people, to cleanse it of prejudices and to further it intellectually.” In his new home, Baden, he devoted his energies and political influence, during the Austro-Prussian War of 1866, towards keeping the country neutral. From this time Bluntschli became active in the field of international law, and his fame as a jurist belongs rather to this province than to that of constitutional law. His Das moderne Kriegsrecht (1866); Das moderne Völkerrecht (1868), and Das Beuterecht im Kriege (1878) are likely to remain invaluable text-books in this branch of the science of jurisprudence. He also wrote a pamphlet on the “Alabama” case.

Bluntschli was one of the founders, at Ghent in 1875, of the Institute of International Law, and was the representative of the German emperor at the conference on the international laws of war at Brussels. During the latter years of his life he took a lively interest in the Protestantverein, a society formed to combat reactionary and ultramontane views of theology. He died suddenly at Karlsruhe on the 21st of October 1881. His library was acquired by Johns Hopkins University at Baltimore, U.S.A.

Among his works, other than those before mentioned, may be cited Deutsches Privatrecht (1853–1854); Deutsche Staatslehre für Gehilfe (1874); and Deutsche Staatslehre und die heutige Staatswelt (1886).

For notices of Bluntschli’s life and works see his interesting autobiography, Denkwürdiges aus meinem Leben (1884); von Holtzendorff, Bluntschli und seine Verdienste um die Staatswissenschaften (1882); Brockhaus, Konversations-Lexicon (1901); and a biography by Neynaber, Bluntschli, Abgebildet im Allgemeinen Biographie.

BLYTH, a market town and seaport of Northumberland, England, in the parliamentary borough of Morpeth, 9 m. E.S.E. of that town, at the mouth of the river Blyth, on a branch of the North Eastern railway. Pop. of urban district (1901) 5472. This is the port for a considerable coal-mining district, and its harbour, on the south side of the river, is provided with mechanical appliances for shipping coal. There are five dry docks, and upwards of 1½ m. of quayage. Timber is largely imported. Some shipbuilding and the manufacture of rope, sails and ship-fittings are carried on, and the fisheries are valuable. Blyth is also in considerable favour as a watering-place; there are a pleasant park, a pier, protecting the harbour, about 1 m. in length, and a sandy beach affording sea-bathing. The river Blyth rises near the village of Kirkheaton, and has an easterly course of about 25 m. through a deep, well-wooded and picturesque valley.

B’NAI’ BRITH (or SONS OF THE COVENANT), INDEPENDENT ORDER OF, a Jewish fraternal society. It was founded at New York in 1843 by a number of German Jews, headed by Henry Jones, and is the oldest as well as the largest of the Jewish fraternal organizations. Its membership in 1908 was 55,870, its 451 lodges and 10 grand lodges being distributed over the United States, Germany, Austria-Hungary, Rumania, Egypt and Palestine. Its objects are to promote a high morality among Jews, regardless of differences as to dogma and ceremonial customs, and especially to inculcate the supreme virtues of
charity and brotherly love. Political and religious discussions were from the first excluded from the debates of the order. In 1851 the first grand lodge was established at New York; in 1856, the number of district lodges having increased, the supreme authority was vested in a central body consisting of one member from each lodge; and by the present constitution, adopted in 1868, this authority is vested in a president elected for five years, an executive committee and court of appeals (elected as before).

The first lodge in Germany was instituted at Berlin in 1883. A large number of charitable and other public institutions have been established in the United States and elsewhere by the order, of which may be mentioned the large orphan asylum in Cleveland, the home for the aged and infirm at Yonkers, N.Y., the National Jewish hospital for consumptives at Denver, and the Maimonides library in New York City. The B'nai B'rith society has also co-operated largely with other Jewish philanthropic organizations in succouring distressed Israelites throughout the world.

See the Jewish Encyclopedia (1902), s.v.

**BOA**, a name formerly applied to all large serpents which, devoid of poison fangs, kill their prey by constriction; but now confined to that subfamily of the *Boidae* which are devoid of teeth, have记录s and are the true boa or suprasternal bones. The others are known as pythons (q.v.). The true boa comprises some forty species; most of them are American, but the genus *Eryx* inhabits North Africa, Greece, and south-western Asia; the genus *Eunycteris* ranges from New Guinea to the Fiji; *Casarea dussumieri* is restricted to Round Island, near Mauritius; and two species of *Boa* and one of *Corallus* represent this subfamily in Madagascar, while all the other boas live in America, chiefly in tropical parts. All *Boidae* possess vestiges of pelvis and hind limbs, appearing externally as claw-like spurs on each side of the vent, but they are so small that they are practically without function in climbing. The usually short tail is prehensile.

One of the commonest species of the genus *Boa* is the *Boa constrictor*, which has a wide range from tropical Mexico to Brazil. The head is covered with small scales, only one of the preoculars being enlarged. The general colour is a delicate pale brown, with about a dozen and a half darker cross-bars, which are often connected by a still darker dorso-lateral streak, enclosing large oval spots. On each side is a series of large dark brown spots with light centres. On the tail the markings become bolder, brick red with black and yellow. The under parts are yellowish with black dots. This species rarely reaches a length of more than 10 ft. It climbs well, prefers open forest in the neighbourhood of water, is often found in plantations where it retires into a hole in the ground, and lives chiefly on birds and small mammals. Like most true boas, it is of a very gentle disposition and easily domesticates itself in the palm or reed thatched huts of the natives, where it hunts the rats during the night.

The term "boa" is applied by analogy to a long article of women's dress wound round the neck.

**BOABDIL** (a corruption of the name Abu Abdullah), the last Moorish king of Granada, called el chico, the little, and also el soyobi, the unfortunate. A son of Muley Abul' Hassan, king of Granada, he was proclaimed king in 1482 in place of his father, who was driven from the land. Boabdil soon after sought to gain prestige by invading Castle. He was taken prisoner at Lucena in 1483, and only obtained his freedom by consenting to hold Granada as a tributary kingdom under Ferdinand and Isabella, king and queen of Castile and Aragon. The next few years were consumed in struggles with his father and his uncle Abdullah ez Zagal. In 1491 Boabdil was summoned by Ferdinand and Isabella to surrender the city of Granada, and on his refusal it was besieged by the Castilians. Eventually, in January 1492, Granada was surrendered, and the king spent some time on the lands which he was allowed to hold in Andalusia. Subsequently he crossed to Africa, and is said to have been killed in battle fighting for his kinsman, the ruler of Fez. The spot from which Boabdil looked for the last time on Granada is still shown, and is known as the "last sigh of the Moor" (el ultimo suspiro del Moro).

**BOADICEA**, strictly Boudicca, a British queen in the time of the emperor Nero. Her husband Prasutagus ruled the Icenii (in what is now Norfolk) as an autonomous prince under Roman suzerainty. On his death (A.D. 61) without male heir, his dominions were annexed, and the annexation was carried out brutally. He had by his will divided his private wealth between his two daughters and Nero, trusting thereby to win imperial favour for his family. Instead, Nero, his wife, and his son (who had been encouraged (doubtless for resisting the annexation), his daughters outraged, his chief tribesmen plundered. The proud, fierce queen and her people rose, and not alone. With them rose half Britain, enraged, for other causes, at Roman rule. Roman taxation and conscription lay heavy on the province; in addition, the Roman government had just revoked financial concessions made a few years earlier, and L. Annaeus Seneca, who combined the parts of a moralist and a money-lender, had abruptly recalled large loans made from his private wealth to British chiefs. A favourable chance for revolt was provided by the absence of the governor-general, Suetonius Paulinus, and most of his troops in North Wales and Anglesey. All south-east Britain joined the movement. Paulinus rushed back without waiting for his troops, but he could do nothing alone. The Britons burnt the Roman municipalities of Verulam and Colchester, the mart of London, and several military posts, massacred "over 70,000" Romans and Britons friendly to Rome, and almost annihilated the Ninth Legion marching from Lincoln to the rescue. At last Paulinus, who seems to have rejoined his army, met the Britons in the field. The site of the battle is unknown. One writer has put it at Chester; others at London, where King's Cross had once a narrow escape of being christened Boadicea's Cross, and actually for many years bore the name of Battle Bridge, in supposed reference to this battle. Probably, however, it was on Watling Street, between London and Chester. In a desperate soldiers' battle Rome regained the province. Boadicea took poison; thousands of Britons fell in the fight or were hunted down in the ensuing guerrilla. Finally, Rome adopted a kinder policy, and Britain became quiet. But the savagery of Romano-British remains in Norfolk may be due to the severity with which the Iceni were crushed.

See Tacitus, Annals, xiv.; Agric. xv.; Dio lxii. The name Boudicca seems to mean in Celtic much the same as Victoria. (F. J. H.)

**BOAR** (O. Eng. bär; the word is found only in W. Ger. languages, cf. Dutch beer, Ger. Eber), the name given to the uncastrated male of the domestic pig (q.v.), and to some wild species of the family Susidae (see SWINE). The European wild boar (*Sus scrofa*) is distributed over Europe, northern Africa, and central and northern Asia. It has long been extinct in the British Isles, where it once abounded, but traces have been found of its survival in Charlestown, Staffordshire, in an entry of 1683 in an account-book of the steward of the manor, and it possibly remained till much later in the more remote parts of Scotland and Ireland (J. E. Harting, *Extinct British Animals*, 1880). The wild boar is still found in Europe, in marshy woodland districts where there is plenty of cover, and it is fairly plentiful in Spain, Austria, Russia and Germany, particularly in the Black Forest.

From the earliest times, owing to its great strength, speed, and audacity when at bay, the boar has been one of the favourite beasts of the chase. Under the old forest laws of England it was one of the "beasts of the forest," and, as such, under the Norman kings the unprivileged killing of it was punishable by death or the loss of a member. It was hunted in England and in Europe on foot and on horseback with dogs, while the weapon of attack was always the spear. In Europe the wild boar is still hunted with dogs, but the spear, except when used in emergencies and for giving the coup de grâce, has been given up for the gun. It is also hunted in great forest districts in Austria, Germany and Russia. The Indian wild boar (*Sus cristatus*) is slightly taller than *Sus scrofa*, standing some 30 to 40 in. at the shoulder.
is found throughout India, Ceylon and Burma. Here the horse and spear are still used, and the sport is one of the most popular in India. (See Pig-sticking.)

The boar is one of the four heraldic beasts of venery, and was the cognisance of Richard III., king of England. As an article of diet the boar head was long considered a special delicacy, and its serving was attended with much ceremonial. At Queen's College, Oxford, the dish is still brought on Christmas day in procession to the high-table, accompanied by the singing of a carol.

BOARD (O. Eng. bord), a plank or long narrow piece of timber. The word comes into various compounds to describe boards used for special purposes, or objects like boards (drawing-board, ironing-board, sounding-board, chess-board, card-board, back-board, notice-board, scoring-board). The phrase "to keep one's name on the boards," at Cambridge University, signifies to remain a member of a college; at Oxford it is "on the books." In bookbinding, pasteboard covers are called boards. Board was early used of a table, hence such phrases as "bed and board," "board and lodging;" or of a gaming-table, as in the phrase "to sweep the board," meaning to pocket all the stakes, hence, figuratively, to carry all before one. The same meaning leads to "Board of Trade," "Local Government Board," &c.

From the meaning of border or side, and especially ship's side, comes "sea-board," meaning sea-coast, and the phrases "aboard" (Fr. abord), "over-board," "by the board;" similarly "weather-board," the side of a ship which is to windward; "larboard and starboard" (the former of uncertain origin, Mid. Eng. laddeboard or latheboard; the latter meaning "steering side;" O. Eng. stoeboard, the rudder of early ships working over the steering side), signifying (to one standing at the stern and looking forward) the left and right sides of the ship respectively.

BOARDING-HOUSE, a private house in which the proprietor provides board and lodging for paying guests. The position of a guest in a boarding-house differs in English law, to some extent, on the one hand from that of a lodger in the ordinary sense of the term, and on the other from that of a guest in an inn. Unlike the lodger, he frequently has not the exclusive occupation of particular rooms. Unlike the guest in an inn, his landlord has no lien upon his property for rent or any other debt due in respect of his board (Thompson v. Lacy, 1820, 3 B. & Ald. 282). The landlord is under an obligation to take reasonable care for the safety of property brought by a guest into his house, and is liable for damages in case of breach of this obligation (Scarborough v. Cosgrove, 1905, 2 K.B. 803). Again, unlike the innkeeper, a boarding-house keeper does not hold himself out as ready to receive all travellers for whom he has accommodation, for which they are ready to pay, and of course he is entitled to get rid of any guest on giving reasonable notice (see Lamond v. Richard, 1897, 1 Q.B. 341, 348). What is reasonable notice depends on the terms of the contract; and, subject thereto, the course of payment of rent is a material circumstance (see Landlord and Tenant). Apparently the same implied warranty of fitness for habitation at the commencement of the tenancy which exists in the case of furnished lodgings (see Lodger and Lodgings) exists also in the case of boarding-houses; and the guest in a boarding-house, like a lodger, is entitled to all the usual and necessary conveniences of a dwelling-house.

The law of the United States is similar to English law.

Under the French Code Civil, claims for subsistence furnished to a debtor and his family during the last year of his life by boarding-house keepers (matres de pension) are privileged over the generality of moveables, the privilege being exercisable after legal expenses, funeral expenses, the expenses of the last illness, and the wages of servants for the year elapsed and what is due for the current year (art. 2101 (5)). Keepers of taverns (aubergistes) and hotels (hoteîers) are responsible for the goods of their guests—the committal of which to their custody is regarded as a deposit of necessity (dépôt nécessaire). They are liable for the loss of such goods by theft, whether by servants or strangers, but not where the loss is due to force majeure (arts. 1952-1954). Their liability for money and bearer securities not actually deposited is limited to 1000 francs (law of 15th of April 1886). These provisions are reproduced in substance in the laws of Quebec (1815, 1994, 2006) and of St. Lucia (art. 1889). In Quebec, boarding-house keepers have a lien on the goods of their guests for the value or price of any food or accommodation furnished to them, and have also a right to sell their baggage and other property, if the amount remains unpaid for three months, under conditions similar to those imposed on innkeepers in England (art. 1816 A; and see INNS and INNKEEPERS); also in the Civil Code of St Lucia (arts. 1578, 1714, 1715).

BOARDING-OUT SYSTEM, in the English poor law, the boarding-out of orphan or deserted children with suitable foster-parents. The practice was first authorized in 1866, though for many years previously it had been carried out by some boards of guardians on their own initiative. Boarding-out is governed by two orders of the Local Government Board, issued in 1889. The first permits guardians to board-out children within their own union, except in the metropolis. The second governs the boarding-out of children in localities outside the union. The sum payable to the foster-parents is not to exceed 4s. per week for each child. The system has been much discussed by authorities on the administration of the poor law. It has been objected that few working-men with an average-sized family can afford to devote such an amount for the maintenance of each child, and that, therefore, boarded-out children are better off than the children of the independent (Fawcett, Pauperism). Working-class guardians, also, do not favour the system, being suspicious as to the disinterestedness of the foster-parents. On the other hand, it is argued that from the economic and educational point of view much better results are obtained by boarding-out children; they are given a natural life, and when they grow up they are without effort merged in the general population (Mackay, Hist. Eng. Poor Law). See also Poor Law.

The "boarding-out" of lunatics is, in Scotland, a regular part of the lunacy administration. It has also been successfully adopted in Belgium. (See Insanity.)

BOARDMAN, GEORGE DANA (1801-1831), American Baptist missionary, was born at Livermore, Me., and educated at Waterville College and Andover Theological Seminary. He was in 1825 made a missionary of the American Board and in 1827 went to India as a missionary, and in 1831 to Burma, where his promising work among the Karens was cut short by his early death. His widow married another well-known Burmese missionary, Adoniram Judson.

His son, GEORGE DANA BOARDMAN, the younger (1828-1902), made the voyage from Burma to America alone when six years of age. He graduated in 1852 at Brown University, and from the Newton Theological Institution in 1855. He held Baptist pastorates at Rochester (1856-1864), and at Philadelphia, and was president of the American Baptist Missionary Union, 1880-1884. At Philadelphia he is said to have taken his congregation through every verse of the New Testament in 643 Wednesday evening lectures, which occupied nearly eighteen years, and afterwards to have begun on the Old Testament in similar fashion. Among his published works are Studies in the Model Prayer (1879), and Epiphanes of the Risen Lord (1879).

BOASE, HENRY SAMUEL (1799-1833), English geologist, the eldest son of Henry Boase (1763-1827), banker, of Madron, Cornwall, was born in London on the 2nd of September 1799. Educated partly at Tiverton grammar-school, and partly at Dublin, where he studied chemistry, he afterwards proceeded to Edinburgh and took the degree of M.D. in 1821. He then settled for some years as a medical practitioner at Penzance; there geology engaged his particular attention, and he became secretary of the Royal Geological Society of Cornwall. The results of his observations were embodied in his Treatise on Primary Geology (1834), a work of considerable merit in regard to the older crystalline and igneous rocks and the subject of
mineral veins. In 1837 he removed to London, where he remained for about a year, being elected F.R.S. In 1838 he became partner in a firm of bleachers at Dundee. He retired in 1871, and died on the 4th of May 1883.

**BOAT** (O. Eng. *bd*; the true etymological connexion with Dutch and Ger. *boot*, Fr. *bateau*, Itl. *battello* presents great difficulty; in Latin from O. Eng.), a comparatively small open craft for conveyance on water, usually propelled by some form of oar or sail.

The origin of the word "boat" is probably to be looked for in the A.S. *bd* = a stem, a stick, a piece of wood. If this be so, the term in its inception referred to the material of which the primitive vessel was constructed, and in this respect may well be contrasted with the word "ship," of which the primary idea was the process by which the material was fashioned and adapted for the use of man.

We may assume that primitive man, in his earliest efforts to achieve the feat of conveying himself and his belongings by water, succeeded in doing so—(1) by fastening together a quantity of material of sufficient buoyancy to float and carry him above the level of the water; (2) by scooping out a fallen tree so as to obtain buoyancy enough for the same purpose. In these two processes is to be found the genesis of both boat and ship, of which, though often used as convertible terms, the former is generally restricted to the smaller type of vessel such as is dealt with in this article. For the larger type the reader is referred to Sutro.

Great must have been the triumph of the man who first discovered that the rushes or the trunks he had managed to tie together would, propelled by a stick or a branch (cf. *ramus* and *remus*) used as pole or paddle, convey him safely across the river or lake, which had hitherto been his barrier. But use multiplies wants, discovers deficiencies, suggests improvements. Man soon found out that he wanted to go faster than the raft would move, that the water washed over and up through it, and this need of speed, and of dry carrying power, which we find operative throughout the history of the boat down to the present day, drove him to devise other modes of flotation as well as to try to improve his first invention.

The invention of the hollowed trunk, of the "dug-out" (monoxylon), however it came about, whenever and wherever it came into comparison with the raft, must have superseded the latter for some purposes, though not by any means for all. It was superior to the raft in speed, and was, to a certain extent, water-tight. On the other hand it was inferior in carrying power, and stability. But the two contrivances once conceived had come to stay, and to them several, or to attempts to combine the useful properties of both, may be traced all the varieties of vessel to which the name of boat may be applied.

The development of the raft is admirably illustrated in the description, given us by Homer in the Odyssey, of the construction by the hero Ulysses of a vessel of the kind. Floating timber is cut down and carefully shaped and planed with axe and adze, and the timbers are then exactly fitted face to face and compacted with trenails and dowels, just as the flat floor of a lump or lighter might be fashioned and fitted nowadays. A platform is raised upon the floor and a bulwark of osiers contrived to keep out the wash of the waves (cf. *infra*, Malay boats). It seems as if the poet, who was intimately acquainted with the sea ways of his time, intended to convey the idea of progress in construction, as illustrated by the technical skill of his hero, and the use of the various tools with which he supplies him.

On the other hand the dug-out had its limitations. The largest tree that could be thrown and scooped out afforded but a narrow space for carrying goods, and presented problems as to stability which must have been very difficult to solve. The shaping of bow and stern, the bulging out of the sides, the flattening of the bottom, the invention of a keel piece, the attempt to raise the sides by building up with planks, all led on towards the idea of constructing a boat properly so called, or perhaps to the invention of the canoe, which in some ways may be regarded as the intermediate stage between dug-out and boat.

Meanwhile the raft had undergone improvements such as those which Homer indicates. It had arrived at a floor composed of timbers squared and shaped. It had risen to a platform, the prototype of a deck. It was but a step to build up the sides and turn up the ends, and at this point we reach the genesis of ark and punt, of sanpan and junk, or, in other words, of all the many varieties of flat-bottomed craft.

When once we have reached the point at which the improvements in the construction of the raft and dug-out bring them, as it were, within sight of each other, we can enter upon the history of the development of boats properly so called, which, in accordance with the uses and the circumstances that dictated their build, may be said to be descended from the raft or the dug-out, or from the attempt to combine the respective advantages of the two original types.

Uses and circumstances are infinite, in variety and have produced an infinite variety of boats. But we may safely say that in all cases the need to be satisfied, the nature of the material available, and the character of the difficulties to be overcome have governed the reason and tested the reasonableness of the architecture of the craft in use.

It is not proposed in this article to enter at any length into the details of the construction of boats, but it is desirable, for the sake of clearness, to indicate certain broad distinctions in the method of building, which, though they run back into the far past, in some form or other survive and are in use at the present day.

The tying of trunks together to form a raft is still not unknown in the lumber trade of the Danube or of North America, nor was it in early days confined to the raft. It extended to many boats properly so called, even to many of those built by the Vikings of old. It may still be seen in the Madras surf boats, and in those constructed out of driftwood by the inhabitants of Easter Island in the south Pacific. Virgil, who was an archaeologist, represents Charon's boat on the Styx as of this construction, and notes the defect, which still survives, in the craft of the kind when loaded.

"Gemuit sub pondere cymbali, 
Sutilis, et multam accepit rimoa paludem!"  
_Aen._ vi. 303.

Next to the raft, and to be counted in direct descent from it, comes the whole class of flat-bottomed boats including punts and lighters. As soon as the method of constructing a solid floor, with trenails and dowels, had been discovered, the method of converting it into a water-tight box was pursued, sides were attached plank fashion, with strong knees to stiffen them, and cross pieces to _yoke or key_ (cf. _γύος_, _κληρις_) them together. These thwart once fixed naturally suggested seats for those that plied the paddle or the oar. The ends of the vessel were shaped into bow or stern, either turned up, or with the side planking convergent in stem or stern post, or joined together fore and aft by bulkheads fitted in, while interstices were made water-tight by caulking, and by smearing with bitumen or some resinosous material.

The evolution of the boat as distinct from the punt, or flat-bottomed type, and following the configuration of the dug-out in its length and rounded bottom, must have taxed the inventive art and skill of constructors much more severely than that of the raft. It is possible that the coracle or the canoe may have suggested the construction of a framework of sufficient stiffness to carry a water-tight wooden skin, such as would successfully resist the pressure of wind and water. And in this regard two methods were open to the builder, both of which have survived to the present day: (1) the construction first of the shell of the boat, into which the stiffening ribs and cross ties were subsequently fitted; (2) the construction first of a framework of requisite size and shape, on to which the outer skin of the boat was subsequently attached.

Further, besides the primitive mode of tying the parts together, two main types of build must be noticed, in accordance with which a boat is said to be either carvel-built or
clinker-built. (1) A boat is clinker-built when the planks are laid edge to edge so that they present a smooth surface without.
(2) A boat is clinker-built when each plank is laid on so as to overlap the one below it, thus presenting a series of ledges running longitudinally.

The former method is said to be of Mediterranean, or perhaps of Eastern origin. The latter was probably invented by the old Scandinavian builders, and from them handed down through the fishing boats of the northern nations to our own time.

The accounts of vessels used by the Egyptians and Phoenicians generally refer to larger craft which naturally fall under the head of Sipp (q.v.). The Nile boats, however, described by Herodotus (ii. 60), built of acacia wood, were no doubt of various sizes, some of them quite small, but all following the same type of construction, built up brick fashion, the blocks being fastened internally to long poles secured by cross pieces, and the interstices caulked with papyrus. The ends rose high above the water, and to prevent hogging were often attached by a truss running longitudinally over crutches from stem to stern.

The Assyrian and Babylonian vessels described by Herodotus (i. 194), built up of twigs and boughs, and covered with skins smeared with bitumen, were really more like huge coracles and hardly deserve the name of boats.

The use of boats by the Greeks and Romans is attested by the frequent reference to them in Greek and Latin literature, though, as regards such small craft, the details given are hardly enough to form the basis of an accurate classification.

We hear of small boats attendant on a fleet (κενθητον, Thuc. i. 53), and of similar craft employed in piracy (Thuc. iv. 9), and in one case of a sculling boat, or pair oar (ἀκάτων ἄμφωρον, Thuc. iv. 67), which was carted up and down between the town of Megara and the sea, being used for the purpose of marauding at night. We are also familiar with the passage in the Acts (Acts 27:4) with regard to the storm on the sea, where they had hard work "to come by the boat"; which same boat the sailors afterwards "let down into the sea, under colour as though they would have cast anchors out of the foreship," and would have escaped to land in her themselves, leaving the passengers to drown, if the centurion and soldiers acting upon St Paul's advice had not cut off the ropes of the boat and let her fall off.

There can be little doubt that boat races were in vogue among the Greeks (see Prof. Gardner, Journal of Hellenic Studies, ii. 91 ff.), and probably formed part of the Panathenic and Isthmian festivals. It is, however, difficult to prove that small boats took part in these races, though it is not unlikely that they may have done so. The testimony of the coins, such as it is, points to galleys, and the descriptive term (νεων δυμαλα) leads to the same conclusion.

It is hardly possible now to define the differences which separated ἐκατον, ἄκατον, from κελης, κελητος, or from λιμος, or καρδος. They seem all to have been rowing boats, probably clinker-built, some with keels (acati modo carinata, Plin. ix. 19), and to have varied in size, some being simply sculling boats, and others running up to as many as thirty oars.

Similarly in Latin authors we have frequent mention of boats accompanying ships of war. Of this there is a well-known instance in the account of Caesar's invasion of Britain (B.C. iv. 26), when the boats of the fleet, and the pinnaces, were filled with soldiers and sent to assist the Legionaries who were being fiercely attacked as they waded on to the shore. There is also an instance in the civil war, which is a prototype of a modern attack of torpedoes on boats upon men of war, when Antonius manned the pinnaces of his large ships to the number of sixty, and with them attacked and defeated an impudent squadron of Quadriremeres (B.C. iii. 24). The class of boats so frequently mentioned as actuariae seems to have contained craft of all sizes, and to have been used for all purposes, whether as pleasure boats or as despatch vessels, or for piracy. In fact the term was employed vaguely just as we speak of craft in general.

The lembus, which is often referred to in Livy and Polybius, seems to have been of Illyrian origin, with fine lines and sharp bows. The class contained boats of various sizes and with a variable number of oars (hiremis, Livy xxiv. 40, sexdecim, Livy xxxiv. 35); and it is interesting to note the origin in this case, as the invention of the light Liburnian galleys, which won the battle of Actium, and altered the whole system of naval construction, came from the same seaboard.

Besides these, the piratical myoparones (see Cic. In Verrem), and the poetical phaselus, deserve mention, but here again we are met with the difficulty of distinguishing boats (from ships. There is also an interesting notice in Tacitus (Hist. iii. 47) of boats hastily constructed by the natives of the northern coast of Asia Minor, which he describes as of broad beam with narrow sides (probably meaning that the sides "tumbled home"), joined together without any fastenings of brass or iron. In a sea-way the sides were raised with planks added till they were cased in as with a roof, whence their name camarac, and so they rolled about in the waves, having prow and stern alike and convertible rowslocks, so that it was a matter of indifference and equally safe, or perhaps unsafe, whichever way they rowed.

Similar vessels were constructed by Germanicus in his north German campaign (Ann. ii. 6) and by the Suiones (Ger. 44). These also had stem and stern alike, and remind us of the old Norse construction, being rowed either way, having the oars loose in the rowlock, and not, as was usual in the south, attached by a thong to the thowl pin.

Lastly, as a class of boat directly descended from the raft, we may notice the flat-bottomed boats or punts or lighters which plied on the Tiber as ferry-boats, or carrying goods, which were called codicariae from cudes, the old word for a plank.

It is difficult to trace any order of development in the construction of boats during the Byzantine period, or the middle ages. Sea-going vessels according to their size carried one or more boats, some of them small boats with two or four oars, others boats of a larger size fitted with masts and sail as well as with oars. We find lembus and phaselus as generic names in the earlier period, but the indications as to size and character are vague and variable. The same may be said of the batelli, coquets, chaloupes, chalons, golettes, &c., of which, in almost endless number and variety, the nautical erudition of M. Jal has collected the names in his monumental works, Archéologie navale and the Glossaire nautique.

It is clear, however, that in many instances the names, originally applied to boats properly so called, gradually attached themselves to larger vessels, as in the case of chaloupe and others, a fact which leads to the conclusion that the type of build followed originally in smaller vessels was often developed on a larger scale, according to as it was found useful and convenient, while the name remained the same. Many of these types still survive and may be found in the Eastern seas, or in the Mediterranean or in the northern waters, each of which has its own peculiarities of build and rig.

It would be impossible within our limits to do justice to the number and variety of existing types in sea-going boats, and for more detailed information concerning them the reader would do well to consult Mast and Sail in Europe and Asia, by H. Warington Smyth, an excellent and exhaustive work, from which much of the information which follows regarding them has been derived.

In the Eastern seas the Chinese sampen is ubiquitous. Originally a small raft with sail atop, and end upturned, it grew into a boat in very early times, and has given its name to a very large class of vessels. With flat bottom, and considerable width in proportion to its length, the normal sampen runs out into two tails astern, the timbers rounding up, and the end being built in like a bulkhead, with room for the rudder to work between it and the transom which connects the two projecting upper timbers of the stern. Some of them are as much as 30 ft. in
length and 8 to 10 ft. in beam. They are good carriers and speedy under sail.

The Chinese in all probability were the earliest of all peoples to solve the chief problems of boat building, and after their own fashion to work out the art of navigation, which for them has now been set and unchanged for thousands of years. They appear to have used the lee-board and centre-board in junks and sanpan, and to have extended their trade to India and even beyond, centuries before anything like maritime enterprise is heard of in the north of Europe.

As regards the practice of long boat racing on rivers or tidal waters the Chinese are easily antecedent in time to the rest of the world. On great festivals in certain places the Dragon boat race forms part of the ceremony. The Dragon boats are just over 73 ft. long, with 4 ft. beam, and depth 21 in. The rowing or padding space is about 63 ft. and the number of thwarts 27, thus giving exactly the same number of rowers as that of the Zygiotes in the Greek trireme. The two extremities of the boat are much cambered and rise to about 2 ft. above the water. At about 15 ft. from each end the single plank gives place to three, so as to offer a concave surface to the water. The paddle blade is spade-like in form and about 68 in. broad.

Both in Siam and Burma there is a very large river population, and boat racing is on festival days a common amusement. The typical craft, however, is the Duck-boat, which in the shape of hull is in direct contrast to the dug-out form, and primarily intended for sailing. It is interesting to note that the Siamese method of slinging and using quarter rudders is the oldest used by men in sailing craft, being in fact the earliest development from the simple paddle rudder, which has in all ages been the first method of steering boats. The king of Siam's state barge, we are told, is steered by long paddles, precisely in the same way as is figured in the case of the Egyptian boats of the 3rd dynasty (3000 B.C.). On the other hand the sluug quarter rudders are the same in fashion as those used by Roman and Greek merchants, by Norsemen and Anglo-Saxons, and by medieval seamen down to about the 14th century.

The Malays have generally the credit of being expert boat-builders, but the local conditions are not such as to favour the construction of a good type of boat. "Small displacement, hollow lines, V-shaped sections, shallow draught and lack of beam " result in want of stability and weatherliness. But it is among them that the ancient process of dug-out building still survives and flourishes, preserving all the primitive and ingenious methods of hollowing the tree trunk, of forcing its sides outwards, and in many cases building them up with added planks, so that from the dug-out a regular boat is formed, with increased though limited carrying power, increased though still hardly sufficient stability.

To ensure this last very necessary quality many devices and contrivances are resorted to.

In some cases (just as Ulysses is described as doing by Homer, Od. v. 350) the boatman fastens bundles of reeds or of bamboo all along the sides of his boat. These being very buoyant not only act as a defence against the wash of the waves, but are sufficient to keep the boat afloat in any sea.

But the most characteristic device is the outrigger, a piece of floating wood sharpened at both ends, which is fixed parallel to the longer axis of the boat, at a distance of two or three beams, by two or more poles laid at right angles to it. This, while not interfering materially with the speed of the boat, acts as a counterpoise to any pressure on it which would tend, owing to its lack of stability, to upset it, and makes it possible for the long narrow boats even to carry heavy loads. It is remarkable that this invention, which must have been seen by the Egyptians and Phoenicians in very early times, was not introduced by them into the Mediterranean. Possibly this was owing to the lack of large timber suitable for dug-outs, and the consequent evolution by them of boat from raft, with sufficient beam to rely upon for stability.

On the other hand in the boats of India the influence of Egyptian and Arab types of build is apparent, and the dinghy of

the Hugli is cited as being in form strangely like the ancient Egyptian model still preserved in the Ghizeh museum. Coming westward the dominant type of build is that of the Arab show, the boat class of which has all the characteristics of the larger vessel developed from it, plenty of beam, overhanging stem and transom stern. The planking of the shell over the wooden frame has a double thickness which conduces to dryness and durability in the craft.

On the Nile it is interesting to find the naggar preserving, in its construction out of blocks of acacia wood pinned together, the old-world fashion of building described by Herodotus. The goiasssa and dhababah are too large to be classed as boats, but they and their smaller sisters follow the Arab type in build and rig.

It is noteworthy that nothing apparently of the ancient Egyptian or classical methods of build survives in the Mediterranean, while the records of the development of boat-building in the middle ages are meagre and confusing. The best illustrations of ancient methods of construction, and of ancient seamanship, are to be found, if anywhere, in the East, that conservative storehouse of types and fashions, to which they were either communicated, or from which they were borrowed, by Egyptians or Phoenicians, from whom they were afterwards copied by Greeks and Romans.

In the Mediterranean the chief characteristics of the types belonging to it are "carvel-build, high bow, round stern and deep rudder hung on stern post outside the vessel."

The northward basin the long-bowed wide-sterned caique of the Bosporus is perhaps the type of boat best known, but both Greek and Italian waters abound with an unnumbered variety of boats of "beautiful lines and great carrying power." In the Adriatic, the Venetian gondola, and the light craft generally, are of the type developed from the raft, flat-bottomed, and capable of navigating shallow waters with minimum of draught and maximum of load.

In the western basin the majority of the smaller vessels are of the sharp-sterned build. Upon the boats of the felucca class, long vessels with easy lines and low free-board, suitable for rowing as well as sailing, the influence of the long galley of the middle ages was apparent. In Genoese waters at the beginning of the 19th century there were single-decked rowing vessels, which preserved the name of galley, and were said to be the descendants of the Liburnians that defeated the many-banked vessels of Antonius at Actium. But the introduction of steam vessels has already relegated into obscurity these memorials of the past.

Along the Riviera and the Spanish coast a type of boat is noticeable which is peculiar for the inward curve of both stem and stern from a keel which has considerable camber, enabling them to be beached in a heavy surf.

On the Douro, in Portugal, it is said that the boats which may be seen laden with casks of wine, trailing behind them an enormously long steering paddle, are of Phoenician ancestry, and that the curious signs, which many of them have painted on the cross board over the cabin, are of Semitic origin though now indecipherable.

Coming to the northern waters, as with men, so with boats, we meet with a totally different type. Instead of the smooth exterior of the carvel-build, we have the more rugged form of clinker-built craft with great beam, and raking sterns and stems, and a wide flare forward. In the most northern waters the strokes of the sea-going boats are wide and of considerable thickness, of oak or fir, often compacted with wooden treenails, strong enough to do battle with the rough seas and rough usage of travel which they have to endure.

In most of these the origin of form and character is to be sought for in the old Viking vessels or long keels of the 5th century A.D., with curved and elevated stern and stern posts, and without decks or, at the most, half decked.

In the Baltic and the North Sea most of the fishing boats follow this type, with, however, considerable variety in details. It is noticeable that here also, as in other parts of the world, and at other times, the pressing demand for speed and carrying power
BOAT

has increased the size in almost all classes of boats till they pass into the category of ships. At the same time the carved-build is becoming more common, while, in the struggle for life, steam and motor power are threatening to obliterate the old types of rowing and sailing boats altogether.

Next to the Norse skiff and its descendants, perhaps the oldest type of boat in northern waters is to be found in Holland, where the conditions of navigation have hardly altered for centuries. It is to the Dutch that we chiefly owe the original of our pleasure craft, but, though we have developed these enormously, the Dutch boats have remained pretty much the same. The clinker-build and the wide round bow are very much of the same character as they are represented in the old pictures of the 17th and 18th centuries.

The development of boat-building in the British Isles during the 19th century has been uneasing and would need a treatise to itself to do it justice. The expansion of the fishing industry and the pressure of competition have stimulated constant improvement in the craft engaged, and here also are observable the same tendencies to substitute carveil, though it is more expensive, for clinker, and to increase the length and size of the boats, and the gradual supersession of sail and oar by steam power. Under these influences we hear of the skiff and the skiff-like classes, old favourites in northern waters, being superseded by the more modern Zhuulu, which is supposed to unite the good qualities of both; and these in turn running to such a size as to take them outside the category of boats. But even in the case of smaller boats the Zhuulu model is widely followed, so that they have actually been imported to the Irish coast for the use of the crofter fishermen in the congested districts.

For the Shetland zeevern and the broad boats of the Orkneys, and the nabbies of the west coast of Scotland, the curious will do well to refer to H. Warington Smyth's most excellent account.

On the eastern coast of England the influence of the Dutch type of build is manifest in many of the flat-bottomed and mostly round-ended craft, such as the Yorkshire Billyboy, and partly in the coble, which latter is interesting as built for launching off beaches against heavy seas, and as containing relics of Norse influence, though in the main of Dutch origin.

The life-boats of the eastern coast are in themselves an admirable class of boat, with fine lines, great length, and shallow draught, wonderful in their daring work in foul weather and heavy seas, in which as a rule their services are required. Here, however, as in the fishing boats, the size is increasing, and steam is appropriating to itself the provinces of the sail and the oar.

The wherry of the Norfolk Broads has a type of its own, and is often fitted out as a pleasure boat. It is safe and comfortable for inland waters, but not the sort of boat to live in a sea-way in anything but good weather.

The Thames and its estuary rejoice in a great variety of boats, of which the old Peter boat (so called after the legend of the foundation of the abbey on Thorney Island) preserved a very ancient type of build, shorter and broader than the old Thames pleasure wherry. But these and the old hatch boat have now almost disappeared. Possibly survivors may still be seen on the upper part of the tidal river. Round the English coast from the mouth of the Thames southwards the conditions of landing and of hauling up boats above high-water mark affect the type, demanding strong clinker-build and stout timbers. Hence there is a strong family resemblance in most of the short boats in use from the North Foreland round to Brighton. Among these are the life-boats of Deal and the other Channel ports, which have done and are still doing heroic work in saving life from wrecks upon the Goodwins and the other dangerous shoals that beset the narrowing sleeve of the English Channel.

Farther down, along the southern coast, and to the west, where harbours are more frequent, a finer and deeper class of boats, chiefly of cove-build, is to be found. The Cornish ports are the home of a great boat-building industry, and from them a large number of the finest fishing boats in the world are turned out annually. Most of them are built with stem and stern alike, with full and bold quarters, and ample floor.

It is not possible here to enumerate, much less to describe in detail, the variety of types in sea-going boats which have been elaborated in England and in America. For this purpose reference should be made to the list of works given at the end of the article.

The following is a list of the boats at present used in the royal navy. They have all of them a deep foot fore, and with the exception of the whalers and Berthon boats, upright stems and transom stems. The whalers have a raking stem and a sharp stern, and a certain amount of sheer in the bows.

Feet. Ft. in. Ft. in.

1. Dinghy. Freeboard about 9 in. Weight 3 cwt. 2 qr. Between thwarts 2 ft. 9 in. Elm
2. Skiff dinghy for torpedo boats. Freeboard about 9 in. Carry about ten men in moderate weather. Between thwarts 2 ft. 7¾ in. Weight 3 cwt. 4 lb. Yellow pine
2a. Whaler for destroyers. 5 in. sheer. Yellow pine
2b. Whaler. Between thwarts 2 ft. 10 in. Freeboard above water 8 cwt. Strakes No. 13. Lap 4 in. Elm
3. Gig. Between thwarts 2 ft. 9½ in. Weight 8 cwt. 2 qr. 15 lb. 13 Strakes. Elm
3a. Carvel built. Elm
7. Berthon collapsible boats weighing 7 cwt. for destroyers.

With the exception of the larger classes, viz. cutters, pinnaces and launches, the V-shape of bottom is still preserved, which does not tend to stability, and it is difficult to see why the smaller classes have not followed the improvement made in their larger sisters.

Though the number and variety of sea-going boats is of much greater importance, no account of boats in general would be complete without reference to the development of pleasure craft upon rivers and inland waters, especially in England, during the past century. There is a legend, dating from Saxon times, which tells of King Edgar the Peaceable being rowed on the Dee from his palace in Chester to the church of St John, by eight kings, himself the ninth, steering this ancient 8-oor; but not much is heard of rowing in England until 1453, when John Norman, lord mayor of London, set the example of going by water to Westminster, which, we are told, made him popular with the watermen of his day, as in consequence the use of pleasure boats by the citizens became common. Thus it was that the old Thames pleasure wherry, with its high bows and low sharp stern and V-shaped section, and the old skiff came into vogue, both of which have now given way to boats, mostly of clinker-build, but with rounder bottoms and greater depth, safer and more comfortable to row in.

In 1715 Thomas Doggett (q.v.) founded a race which is still rowed in peculiar sculling boats, straked, and with sides flaring up to the sill of the rowlock. Strutt tells us of a regatta in 1775 in which watermen contended in pair-oared boats or skiffs.

At the beginning of the 19th century numerous rowing clubs flourished on the upper tidal waters of the Thames, and we hear of four-oared races from Westminster to Putney, and from Putney to Kew, in what we should now consider large and heavy boats, clinker-built, with bluff entry.

Longer boats, 8-oars, and 10-oars, seem to have been existent at the end of the 18th century. Eton had one 10-oar, and three 8-oars, and two 6-oars, before 1811. The record of 8-oar races at Oxford begins in 1815, at Cambridge in
BOATSWAIN—BOBER

1847. Pair-oar and sculling races in lighter boats seem to have come in soon after 1820, and the first Oxford and Cambridge eighth, race was rowed in 1830, in which year also Eton and Westminster contested at Putney.

Henley regatta was founded in 1839, and since that date the building of racing boats, eights, fours, pairs, and sculling boats, has made great progress. The products of the present time are such, in lightness of build and swiftness of propulsion, as would have been thought impossible between 1810 and 1830.

In the middle of the 19th century the long boats in use were mostly clinker-built with a keel. At Oxford the torpedos were rowed, as now, in clinker-built craft, but the summer races were won by carvel-built boats, which also had a keel.

In 1855 the first keelless 8-oar made its appearance at Henley, built by Mat. Taylor for the Royal Chester Rowing Club. The new type was constructed on moulds, bottom built in after the boat had been turned over.

In 1857 Oxford rowed in a similar boat at Putney, 55 ft. long, 25 in. beam. From that time the keelless racing boat has held its own, four oars and pairs and sculling boats all following suit. But with the introduction of sliding seats racing eights have developed in length to 63 ft., or 21", with desirable camber, and a beam of 23-24 in. There are, however, still advocates of the shorter type with broader beam, and it is noticeable that the Belgian boat that won the Grand Challenge at Henley in 1906 did not exceed 60 ft. The boat in which Oxford won the University race in 1901 was 56 ft. long with 27 in. beam.

In sculling boats the acceptance of the Australian type of build has led to the construction of a much shorter boat with broader beam than that which was in vogue twenty years ago. The same tendency has not shown itself so prominently in pair oars, but will no doubt be manifest in time as the build improves.

In fact we may expect the controversy between long and short racing boats, and the proper method of propelling them respectively, to be carried a step farther. The tendency, with the long slide, and long type of boat, is to try to avoid “pinch” by adopting the scullers’ method of easy beginning, and strong drive with the legs, and sharp finish to follow, but it remains to be seen whether superior speed is not to be obtained in a shorter boat by sharp beginning at a reasonable angle to the boat’s side, and a continuous drive right out to the finish of the stroke.

Appended is a list of pleasure boats in use (1909) on the Thames, with their measurements (in feet and inches).

Racing eight. 66' to 68' 23' to 25' 9' to 10'.
Clinker eight. 56' to 60' 22' to 24' 9' to 10'.
Clinker four. 38' to 42' 23' to 24' 8' to 9'.
Tub fours. 30' to 32' 3' 8" to 3' 10" 13' from keel to top of stem.
Outrigger pair. 30' to 34' 14' to 16' 7' to 8'.
Outrigger sculls. 25' to 30' 10' to 13' 5' to 6'.
Coaching gigs. 26' to 28' 3' to 3' 4' 10' to 14'.
Skiffs (Thames). 24' to 26' 3' to 3' 4' 12' to 14'.

Gigs (pleasure). 24' to 26' 4' 15' to 16'.
Randalls. 27' to 30' 4' 6" 13' from keel to top of stem.
Whiffs. 20' to 23' 1' 4" to 1' 6" 6' from keel to top of stem.
Whiff Gigs. 19' to 20' 2' 8" to 2' 10" 12' over all.
“ semi racers. 28' to 30' 2' 3' to 6' 6' 10' to 11'.
“ pleasure. 26' to 28' 2' 9" to 3' 12' to 13'.

BOATSWAIN (pronounced “boe'sun”; derived from “boat” and “swain,” a servant), the warrant officer of the navy who in sailing-ships had particular charge of the boats, sails, rigging, colours, anchors and cordage. He superintended the deflagration of the ship in dock, and it was his duty to summon the crew to work by a whistle. The office still remains, though with functions modified by the introduction of steam. In a merchant ship the boatswain is the foreman of the crew and is sometimes also third or fourth mate.

BOBBIL, a town of British India, in the Vizagapatam district of Madras, 70 m. north of Vizagapatam town. Pop. (1901) 17,587. It is the residence of a raja of old family, whose estate is 1,275 sq. m.; estimated income, £4,800; permanent land revenue, £9,000.

The attack on the fort at Bobbil made by General Bussy in 1756 is one of the most memorable episodes in Indian history. There was a constant feud between the chief of Bobbil and the raja of Vizianagram; and when Bussy marched to restore the raja persuaded him that the fault lay with the chief of Bobbil and joined the French with 11,000 men against his rival. In spite of the fact that the French field-pieces at once made practicable breaches in the mud walls of the fort, the defenders held out until the French were repulsed after hours of hand-to-hand fighting; and when, after a fresh bombardment, the garrison saw that their case was hopeless, they killed their women and children, and only succumbed at last to a third assault because every man of them was either killed or mortally wounded. An old man, however, crept out of a hut with a child, whom he presented to Bussy as the son of the dead chief. Three nights later four followers of the chief of Bobbil crept into the tent of the raja of Vizianagram and stabbed him to death. The child, Chinha Ranga Rao, was invested by Bussy with his father’s estate, but during his minority it was seized by his uncle. After a temporary arrangement of terms with the raja of Vizianagram the old feud broke out again, and the Bobbil chief was forced to take refuge in the nizam’s country. In 1794, however, on the break-up of the Vizianagram estate, Chinha Ranga Rao was restored by the British, and in 1801 a permanent settlement was made with his son. The title of raja was recognized as hereditary in the family; that of maharaja was conferred as a personal distinction on Sir Venkatachalapaty Ramas Rao, K.C.I.E., the adopted great-great-grandson of Chinha Ranga Rao.

For the siege see Imp. Gazetteer of India (Oxford, 1908), s. v. “Boobil Estate.”

BOBBIO, a town and episcopal see of Lombardy, Italy, in the province of Pavia, 32½ m. S.W. of Piacenza by road. Pop. (1901) 48,648. Its most important building is the church dedicated to St Columban, who became first abbot of Bobbio in 595 or 612, and died there in 615. It was erected in Lombard style in the 11th or 12th century (to which period the campanile belongs) and restored in the 13th. The cathedral is also interesting. Bobbio was especially famous for the manuscripts which belonged to the monastery of St Columban, and are now dispersed, the greater part being in the Vatican library at Rome, and others at Milan and Turin. The cathedral archives contain documents of the 10th and 11th centuries.

BOBER, a river of Germany, the most considerable of the left bank tributaries of the Oder; it rises at an altitude of 240 m., on the northern (Silesian) side of the Riesengebirge. In its upper course it traverses a higher plateau, whence, after passing the town of Landeshut, it descends through a narrow and fertile valley to Kupferberg. Here its romantic middle course begins, and after draining through a deep ravine between the towns of Hirschberg and Löwenberg, it gains the plains. In its lower course it meanders through pleasant pastures, bogland and pine forests in succession, receives the waters of various mountain streams, passes close by Bunzlau and through Sagan, and finally, after a course of 160 m., joins the Oder at Cossen. Swollen by the melting of the winter snows and by heavy rains in the
mountains, it is frequently a torrent, and it is thus, except in the last few miles, unnavigable for either boats or rafts.

BOBRUISK, a town and formerly a first-class fortress of Russia, in the government of Brest (v.), and county of B., in 53° 15' N. lat. and 28° 55' E. long., on the right bank of the Bereina river, and on the railway from Libau and Vilna to Ekaterinoslav. Pop. (1886) 23,761; (1897) 35,177, of whom one-half were Jews. In the reign of Alexander I. there was erected here, at the confluence of the Bobruiska with the Bereina, nearly a mile from the town, a fort, which successfully withstood a bombardment by Napoleon in 1812, and was made equal to the best in Europe by the emperor Nicholas I. It was demolished in 1867, the defences being antiquated. The town is now a railway station and a market town with ironworks and flour-mills; and corn and timber are shipped to Libau. The town was half burnt down in 1902.

BOCAGE, MANUEL MARIA BARBOSA DE (1765-1805), Portuguese poet, was a native of Setubal. His father had held important judicial and administrative appointments, and his mother, from whom he took his last surname, was the daughter of a Portuguese vice-admiral of French birth who had fought at the battle of Matapan. Bocage began to make verses in infancy, and being somewhat of a prodigy grew up to his self-consciousness at an early age. At nineteen or twenty-four, he suddenly left school and joined the 7th infantry regiment; but tiring of garrison life at Setubal after two years, he decided to enter the navy. He proceeded to the royal marine academy in Lisbon, but instead of studying he pursued love adventures, and for the next five years burnt incense on many altars, while his retentive memory and extraordinary talent for improvisation gained him a host of admirers and turned his head. The Brazilian modinhas, little rhymed poems sung to a guitar at family parties, were then in great vogue, and Bocage added to his fame by writing a number of these, by his skill in extemporizing verses on a given theme, and by allegorical idyllic pieces, the subjects of which are similar to those of Watteau's and Boucher's pictures. In 1786 he was appointed guardamarinha in the Indian navy, and he reached Goa by way of Brazil in October. There he came into an ignorant society full of petty intrigue, where his particular talents found no scope to display themselves; the glamour of the East left him unmoved and the climate brought on a serious illness. In these circumstances he compared the heroic traditions of Portugal in Asia, which had induced him to leave home, with the reality, and wrote his satirical sonnets on "The Decadence of the Portuguese Empire in Asia," and those addressed to Affonso de Albuquerque and D. João de Castro. The irritation caused by these satires, together with rivalries in love affairs, made it advisable for him to leave Goa, and early in 1789 he obtained the post of lieutenant of the infantry company at Damaun; but he promptly deserted and made his way to Macao, where he arrived in July-August. According to a modern tradition much of the Lusiads had been written there, and Bocage probably travelled to China under the influence of Caomens, to whose life and misfortunes he loved to compare his own. Though he escaped the penalty of his desertion, he had no resources and lived on friends, whose help enabled him to return to Lisbon in the middle of the following year.

Once back in Portugal he found his old popularity, and resumed his vagabond existence. The age was one of reaction against the Pombaline reforms, and the famous intendant of police, Manique, in his determination to keep out French revolutionary and atheistic propaganda, forbade the importation of foreign classics and the discussion of all liberal ideas. Hence the only vehicle of expression left was satire, which Bocage employed with an unsparring hand. His poverty compelled him to eat and sleep with friends like the turbulent friar José Agostinho de Macedo (q.v.), and he soon fell under suspicion with Manique. He became a member of the New Arcadia, a literary society founded in 1790, under the name of Elmano Sadino, but left it three years later. Though including in its ranks most of the poets of the time, the New Arcadia produced little of real merit, and before long its adherents became enemies and descended to an angry warfare of words. But Bocage's reputation among the general public and with foreign travellers grew year by year. Beckford, the author of Vathek, for instance, describes him as "one of the most voluptuous young men, the queerest but perhaps the most original of God's practical phantoms." This strange and versatile character may be said to possess the true wand of enchantment which at the will of its master either animates or petrifies. In 1797 enemies of Bocage belonging to the New Arcadia cheated him to Manique, who on the pretext afforded by some anti-religious verses, the Epistola à Marilia, and by his loose life, arrested him when he was about to flee the country and lodged him in the Limoine, where he spent his thirty-second birthday. His sufferings induced him to repent of former cant, and while in prison he composed the following lines to petitioner obtained his transfer in November from the state prison to that of the Inquisition, then a mild tribunal, and shortly afterwards recovered his liberty. He returned to his bohemian life and subsisted by writing empty Elogios Dramáticos for the theatres, printing volumes of verses and translating the didactic poems of Delille, Castel and others, some second-rate French plays and Ovid's Metamorphoses. These resources and the help of brother Freemasons just enabled him to exist, and a purifying and weakening malady came into his life in the shape of a real affection for the two beautiful daughters of D. Manuel de Pires Leite, which drew from him verses of true feeling mixed with regrets for the past. He would have married the younger lady, D. Anna Perpetua (Analia), but excesses had ruined his health. In 1801 his poetical rivalry with Macedo became more acute and personal, and ended by drawing from Bocage a stinging epistreme poem, Pena de Talão, which remains a monument to his powers of invective. In 1804 the malady from which he suffered increased, and the approach of death inspired some beautiful sonnets, including one directed to D. Maria (Marcia), eldest sister of Analia, who visited and consoled him. He became reconciled to his enemies, and breathed his last on the 21st of December 1805. His end recalled that of Camoens, for he expired in poverty on the eve of the French invasion, while the singer of the Lusiads just failed to see the occupation of Portugal by the duke of Alva's army. The gulf that divides the life and achievements of these two poets is accounted for, less by difference of talent and temperament than by their environment, and it gives an accurate measure of the decline of Portugal in the two centuries that separate 1580 from 1800.

To Beckford, Bocage was "a powerful genius," and Link was struck by his nervous expression, harmonious versification and the fire of his poetry. He employed every variety of lyric and made his mark in all. His roundels are good, his epigrams witty, his satires vigorous and searching, his odes often full of nobility, but his fable must rest on his sonnets, which almost rival those of Camoens in power, elevation of thought and tender melancholy, though they lack the latter's scholarly refinement of phrasing. So dazelled were contemporary critics by his brilliant and inspired extemporizations that they ignored Bocage's licentiousness, and overlooked the slightness of his creative output and the artificial character of most of his poetry. In 1871 a monument was erected to the poet in the chief square of Setubal, and the centenary of his death was kept there with much circumstance in 1905.

The best editions of his collected works are those of I. F. da Silva, with a biographical and literary study by Rebello da Silva, in 6 vols. (Lisbon, 1853), and of D. Theophilo Braga, in 8 vols. (Cerigo, 1875-1876). See also I. F. da Silva, Dicionário Bibliográfico Portugues, vol. vi. pp. 45-38, and vol. xvi. pp. 260-263; Dr T. Braga, D. António José Rebello (Lisbon, 1902). A striking illustration of Bocage by H. J. da Silva was engraved by Bartolozzi, who spent his last years in Lisbon.

BOCAGE (from O. Fr. boscage, Late Lat. boscum, a wood), a French topographical term applied to several regions of France, the commonest characteristics of which are a granite formation and an undulating or hilly surface, consisting largely of heath or reclaimed land, and dotted with clumps of trees. The most important districts designated by the word are the Bocage of Normandy, which comprises portions of the
BOCCACCIO

departments of Calvados, Manche and Orne; (2) the Bocage of Vendée, situated in the departments of Vendée, Deux-Sèvres, Maine-et-Loire, and Loire-Inférieure.

Boccaccio, Giovanni (1313-1375), Italian author, whose Decameron is one of the classics of literature, was born in 1313, as we know from a letter of Petrarch, in which that poet, who was born in 1304, calls himself the senior of his friend by nine years. The place of his birth is somewhat doubtful—Florence, Paris and Certaldo being all mentioned by various writers as his native city. Boccaccio undoubtedly calls himself a Florentine, but this may refer merely to the Florentine citizenship acquired by his grandfather. The claim of Paris has been supported by Baldelli and Tiraboschi, mainly on the ground that his mother was a lady of good family in that city, where she met Boccaccio's father. There is a good deal in favour of Certaldo, a small town or castle in the valley of the Elsa, 20 m. from Florence, where the family had some property; and where the poet spent much of the latter part of his life. He always signed his name Boccaccio da Certaldo, and named that town as his birthplace in his own epitaph. Petrarch calls his friend Certaldese; and Filippo Villani, a contemporary, distinctly says that Boccaccio was born in Certaldo.

Boccaccio, an illegitimate son, as is put beyond dispute by the fact that a special licence had to be obtained when he desired to become a priest, was brought up with tender care by his father, who seems to have been a merchant of respectable rank. His elementary education he received from Giovanni da Strada, an esteemed teacher of grammar in Florence. But at an early age he was apprenticed to an eminent merchant, with whom he remained for six years, a time entirely lost to him, if we may believe his own statement. From his tenderest years his soul was attached to that "alma poesis," which, on his tombstone, he names as the task and study of his life. In one of his works he relates that, in his seventh year, before he had ever seen a book of poetry or learned the rules of metrical composition, he began to write verse in his childish fashion, and earned for himself amongst his friends the name of "the poet." It is uncertain where Boccaccio passed these six years of bondage; most likely he followed his master to various centres of commerce in Italy and France. We know at least that he was in Naples and Paris for some time, and the youthful impressions received in the latter city, as well as the knowledge of the French language acquired there, were of considerable influence on his later career. Yielding at last to his son's immutable aversion to commerce, the elder Boccaccio permitted him to adopt a course of study somewhat more congenial to the literary tastes of the young man. He was sent to a celebrated professor of canon law, at that time an important field of action both to the student and the practical jurist. According to some accounts—far from authentic, it is true—this professor was Cino da Pistoia, the friend of Dante, and himself a celebrated poet and scholar. But, whoever he may have been, Boccaccio's master was unable to inspire his pupil with scientific ardour. "Again," Boccaccio says, "I lost nearly six years. And so nauseous was this study to my mind, that neither the teaching of my master, nor the authority and command of my father, nor yet the exertions and reproofs of my friends, could make me take to it, for my love of poetry was invincible."

About 1333 Boccaccio settled for some years at Naples, apparently sent there by his father to resume his mercantile pursuits, the canon law being finally abandoned. The place, it must be confessed, was little adapted to lead to a practical view of life one in whose heart the love of poetry was firmly rooted. The court of King Robert of Anjou at Naples was frequented by many Italian and French men of letters; the great Petrarch amongst the number. At the latter's public examination in the noble science of poetry by the king, previous to his receiving the laurel crown at Rome, Boccaccio was present,—without, however, making his personal acquaintance at this period. In the atmosphere of this gay court, enlivened and adorned by the wit of men and the beauty of women, Boccaccio lived for several years. We can imagine how the tedious duties of the market and the counting-house became more and more distasteful to his aspiring nature. We are told that, finding himself by chance on the supposed grave of Virgil, near Naples, Boccaccio on that sacred spot took the firm resolution of devoting himself for ever to poetry. But perhaps another event, which happened some time after, left quite as much of the mentioned occurrence to this decisive turning-point in his life. On Easter-eve, 1341, in the church of San Lorenzo, Boccaccio saw for the first time the natural daughter of King Robert, Maria, whom he immortalized as Fiammetta in the noblest creations of his muse. Boccaccio's passion on seeing her was instantaneous, and (if we may accept as genuine the confessions contained in one of her lover's works) was returned with equal ardour on the part of the lady. But not till after much delay did she yield to the amorous demands of the poet, in spite of her honour and her duty as the wife of another. All the information we have with regard to Maria or Fiammetta is derived from the works of Boccaccio himself, and owing to several apparently contradictory statements occurring in these works, the very existence of the lady has been doubted by commentators, who seem to forget that, surrounded by the chattering tongues of a court, and watched perhaps by a jealous husband, Boccaccio had all possible reason to give the appearance of fictitious incongruity to the effusions of his real passion. But there seems no more reason to call into question the main features of the story, or even the identity of the person, than there would be in the case of Petrarch's Laura or of Dante's Beatrice. It has been ingeniously pointed out by Baldelli, that the fact of her descent from King Robert being known only to Maria herself, and through her to Boccaccio, the latter was the more at liberty to refer to this circumstance,—the bold expression of the truth serving in this case to increase the mystery with which the poets of the middle ages loved, or were obliged, to surround the objects of their praise. From Boccaccio's Ameto we learn that Maria's mother was, like his own, a French lady, whose husband, according to Baldelli's ingenious conjecture, was of the noble house of Aquino, and therefore of the same family with the celebrated Thomas Aquinas. Maria died, according to his account, long before her lover, who cherished her memory to the end of his life, as we see from a sonnet written shortly before his death.

The first work of Boccaccio, composed by him at Fiammetta's command, was the prose tale, Filocolo, describing the romantic love and adventures of Florio and Biancalfa, a favourite subject with the knightly minstrels of France, Italy and Germany. The treatment of the subject by Boccaccio is not remarkable for originality or beauty, and the narrative is encumbered by classical allusions and allegorical conceits. The style also cannot be held worthy of the future great master of Italian prose. Considering, however, that this prose was in its infancy, and that this was Boccaccio's first attempt at remoulding the unwieldy material at his disposal, it would be unjust to deny that Filocolo is a highly interesting work, full of promise and all but articulate power. Another work, written about the same time by Fiammetta's desire and dedicated to her, is the Teseide, an epic poem, and indeed the first heroic epic in the Italian language. The name is chosen somewhat inappropriately, as King Theseus plays a secondary part, and the interest of the story centres in the two noble knights, Palemon and Arcito, and their wooing of the beautiful Emelia. The Teseide is of particular interest to the student of poetry, because it exhibits the first example of the ottava rima, a metre which was adopted by Tasso and Ariosto, and in English by Byron in Don Juan. Another link between Boccaccio's epic and English literature is formed by the fact of Chaucer having in the Knight's Tale adopted its main features. Boccaccio's poetry has been severely criticized by his countrymen, and most severely by the author himself. On reading Petrarch's sonnets, Boccaccio resolved in a fit of despair to burn his own attempts, and only the kindly encouragement of his great friend prevented the holocaust. Pistority has justly differed from the author's sweeping self-criticism. It is true, that compared with Dante's grandeur and passion, and with Petrarch's absolute mastership of metre and language, Boccaccio's
poetry seems to be somewhat thrown into shade. His verse is occasionally slip-shod, and particularly his epic poetry lacks what in modern parlance is called poetic diction,—the quality, that is, which distinguishes the pathos of heroic deeds from the easy grace of the mere contour. This latter feature, so charmingly displayed in Boccaccio's prose, has to some extent proved fatal to his verse. At the same time, his narrative is always fluent and interesting, and his lyrical pieces, particularly the poetic interludes in the Decameron, abound with charming gallantry, and frequently rise to lyrical pathos.

About the year 1341 Boccaccio returned to Florence by command of his father, who, in his old age desired the assistance and company of his son. Florence, at that time disdaining the civilized and cultivated methods of her foreign kinsmen, was at length to be visited by the presence of a half-king. Boccaccio's hallowed name could not but appear in an unfavourable light to one accustomed to the gay life of the Neapolitan court. But more than all this, Boccaccio regretted the separation from his beloved Fiammetta. The thought of her at once embittered and consoled his loneliness. Three of his works owe their existence to this period. With all of them Fiammetta is connected; of one of them she alone is the subject. The first work, called Ameto, describes the civilizing influence of love, which subdues the ferocious manners of the savage. The second work referred to, Ameto—Although the heroine of the story, is amongst the nymphs who with their tales of true love soften the mind of the huntsman. Ameto is written in prose alternating with verse, specimens of which form occur in old and middle Latin writings. It is more probable, however, that Boccaccio adopted it from that sweetest and purest blossom of medieval French literature, Acassin et Nicolette, which dates from the 13th century, and was undoubtedly known to him. So pleased was Boccaccio with the idea embodied in the character of Ameto that he repeated its essential features in the CIMONE of his Decameron (Day 5th, tale 1.). The second work referred to is a poem in fifty chapters, called L'amorosa Visions. It describes a dream in which the poet, guided by a lady, sees the heroes and lovers of ancient and medieval times. Boccaccio evidently has tried to imitate the celebrated Trionfi of Petrarch, but without much success. There is little organic development in the poem, which reads like the catalogue raisonné of a picture gallery; but it is remarkable from another point of view. It is perhaps the most astounding instance in literature of ingenuity wasted on trifles; even Edgar Poe, had he known Boccaccio's puzzle, must have confessed himself surpassed. For the whole of the Amorosa Visiones is nothing but an acrostic on a gigantic scale. The poem is written, like the Divina Commeda, in tersa rima, and the initial letters of all the triplets throughout the work compose three poems of considerable length, in the first of which the whole is dedicated to Boccaccio's lady-love, this under her real name of Maria. In addition to this, the initial letters of the first, third, fifth, seventh and ninth lines of the dedicatory poem form the name of Maria; so that here we have the acrostic in the second degree. No wonder that thus entommed the poet's thought begins to flag and his language to halt. The third important work written by Boccaccio during his stay at Florence, or soon after his return to Naples, is called L'amorosa Fiammetta; and although written in prose, it contains more real poetry than the elaborate production just referred to. It purports to be Fiammetta's complaint after her lover, following the call of filial duty, had deserted her. Bitterly she deplores his fate, and upbraids her lover with coldness and want of devotion. Jealous fears add to her torture, not altogether unfounded, if we believe the commentators' assertion that the heroine of Ameto is in reality the beautiful Lucia, a Florentine lady loved by Boccaccio. Sadly Fiammetta recalls the moments of former bliss, the first meeting, the stolen embrace. Her narrative is indeed our chief source of information for the incidents of this strange love-story. It has been thought unlikely, and indeed impossible, that Boccaccio should thus have become the mouthpiece of a real lady's real passion for himself; but there seems nothing incongruous in the supposition that after a happy reunion the poet should have heard with satisfaction, and surrounded with the halo of ideal art, the story of his lady's sufferings. Moreover, the language is too full of individual intensity to make the conjecture of an entirely fictitious love affair intrinsically probable. L'amorosa Fiammetta is a melody of passion sustained even to the verge of dulness, but strikingly real, and therefore artistically valuable.

By the intercession of an influential friend, Boccaccio at last obtained (in 1344) his father's permission to return to Naples, where in the meantime Giovanna, grand-daughter of King Robert, had succeeded to the crown. Being young and beautiful, fond of poetry and of the praise of poets, she received Boccaccio with all the distinction due to his literary fame. For many years she remained his faithful friend, and the poet returned her favour with grateful devotion. Even when the charge of having instigated, or at least connived at, the murder of her husband was but too clearly proved against her, Boccaccio was amongst the few who stood by her, and undertook the hopeless task of clearing her name from the dreadful stain. It was by her desire, no less than by that of Fiammetta, that he composed (between 1344 and 1350) most of the stories of his Decameron, which afterwards were collected and placed in the mouths of the Florentine ladies and gentlemen. During this time he also composed the Filostrato, a narrative poem, the chief interest of which consists in its reading in its connection with Chaucer. With a boldness pardonable only in men of genius, Chaucer adopted the main features of the plot, and literally translated parts of Boccaccio's work, without so much as mentioning the name of his Italian source.

In 1350 Boccaccio returned to Florence, owing to the death of his father, who had made him guardian to his younger brother Jacopo. He was received with great distinction, and entered the service of the Republic, being at various times sent on important missions to the margrave of Brandenburg, and to the courts of several popes, both in Avignon and Rome. Boccaccio boasts of the friendly terms on which he had been with the great potentates of Europe, the emperor and pope amongst the number. But he was never a politician in the sense that Dante and Petrarch were. As a man of the world he enjoyed the society of the great, but his interest in the internal commotions of the Florentine state seems to have been very slight. Besides, he never liked Florence, and the expressions used by him regarding his fellow-citizens betray anything but patriotic prejudice. In a Latin eclogue he applies to them the term 'Batroches' (frogs), by which he adds parenthetically—"Hic esties Flumenorum norem; loquacissimi enim sumus, verum in rebus bellica nihil valentum."

The only important result of Boccaccio's diplomatic career was his intimacy with Petrarch. The first acquaintance of these two great men dates from the year 1350, when Boccaccio, then just returned to Florence, did all in his power to make the great poet's short stay in that city agreeable. When in the following year the Florentines were anxious to draw men of great reputation to their newly-founded university, it was again Boccaccio who insisted on the claims of Petrarch to the most distinguished position. He himself accepted the mission of inviting his friend to Florence, and of announcing to Petrarch at the same time that the forfeited estates of his family had been restored to him. In this manner an intimate friendship grew up between them to be parted only by death. Common interests and common literary pursuits were the natural basis of their friendship, and both occupy prominent positions in the early history of that great intellectual revival commonly called the Renaissance.

During the 14th century the study of ancient literature was at a low ebb in Italy. The interest of the lay world was engrossed by political struggles, and the treasures of classical history and poetry were at the mercy of monks, too lazy or too ignorant to use, or even to preserve them. Boccaccio himself told that, on asking to see the library of the celebrated monastery of Monte Cassino, he was shown into a dusty room without a door to it. Many of the valuable manuscripts were mutilated; and his guide told him that the monks were in the habit of tearing leaves from the codices to turn them into psalters for children, or amulets for women at the price of four or five soldi apiece.
Boccaccio did all in his power to remove by word and example this barbarous indifference. He bought or copied with his own hand many valuable MSS. and, an old writer remarks that if Boccaccio had been a professional copyist, the amount of his work might astonish us. His zealous endeavours for the revival of the all but forgotten Greek language in western Europe are well known. The most celebrated Italian scholars about the beginning of the 15th century were unable to read the Greek characters. Boccaccio deplored the ignorance of his age. He took lessons from Leone Pilato, a learned adventurer of the period, who had lived a long time in Thessaly and, although born in Calabria, pretended to be a Greek. By Boccaccio’s advice Leone Pilato was appointed professor of Greek language and literature in the university of Florence, a position which he held for several years, not without great and lasting benefit for the revival of classical learning. Boccaccio was justly proud of having been intimately connected with the foundation of the first chair of Greek in Italy. But he did not forget, in his admiration of classic literature, the great poets of his own country. He never tires in his praise of the sublime Dante, whose works he copied with his own hand. He conjures his friend Petrarach to study the great Florentine, and to defend himself against the charges of wilful ignorance and envy brought against him. A life of Dante, and the commentaries on the first sixteen cantos of the Inferno, bear witness to Boccaccio’s learning and enthusiasm.

In the chronological enumeration of our author’s writings we now come to his most important work, the Decameron, a collection of one hundred stories, published in their combined form in 1353, although mostly written at an earlier date. This work marks in a certain sense the rise of Italian prose. It is true that Dante’s Vita Nuova was written before, but its involved sentences, founded essentially on Latin constructions, cannot be compared with the infinite suppleness and precision of Boccaccio’s prose. The Decameron, in spite of the collection might be raised against Chaucer, Shakespeare, Goethe (in Faust), and indeed most of the master minds of all nations. Power of invention is not the only nor even the chief criterion of a great poet. He takes his subjects indiscriminately from his own fancy, or from the consciousness of his and other nations. Stories float about in the air, known to all yet realized by few; the poet gathers their disjecta membra into an organic whole, and this he inspires and calls into life with the breath of his genius. It is in this sense that Boccaccio is the creator of those innumerable beautiful types and stories, which have since come to us as the household words amongst civilized nations. No author can equal him in these contributions to the store of international literature. There are indeed few great poets who have not in some way become indebted to the inexhaustible treasure of Boccaccio’s creativeness. One of the greatest masterpieces of German literature, Lessing’s Nathan the Wise, contains a story from Boccaccio (Decameron, Day 1st, tale III.), and the list of English poets who have drawn from the same source comprises, among many others, the names of Chaucer, Lydgate, Dryden, Keats and Tennyson.

For ten years Boccaccio continued to reside in Florence, leaving the city only occasionally on diplomatic missions or on visits to his friends. His fame in the meantime began to spread far and wide, and his Decameron, in particular, was devoured by the fashionable ladies and gentlemen of the age. About 1360 he seems to have retired from the turbulent scenes of Florence to his native Certaldo, the secluded charms of which he describes with rapture. In the following year took place that strange turning-point in Boccaccio’s career which is generally described as his conversion to Primo. While at Certaldo charged with a posthumous message from another monk of the same order, to the effect that if Boccaccio did not at once abandon his godless ways in life and literature his death would ensue after a short time. It is also mentioned that the revelation to the friar on his deathbed of a secret known only to Boccaccio gave additional import to this alarming information. Boccaccio’s impressionable nature was deeply moved. His life had been far from virtuous; in his
BOCCALINI—BOCCHERINI

writings he had frequently sinned against the rules of morality, and worse still, he had attacked with bitter satire the institutions and servants of holy mother church. Terrified by the approach of immediate death, he resolved to sell his library, abandon literature, and devote the remainder of his life to a religious exercise. To this effect he wrote to Petrarch. We possess the poet's answer; it is a masterpiece of writing, and what is more, a proof of tenderest friendship. The message of the monk Petrarch is evidently inclined to treat simply as pious fraud, without, however, actually committing himself to that opinion. "No monk is required to tell thee of the shortness and precariousness of human life. Of the advice received accept what is good; abandon worldly cares, conquer thy passions, and reform thy soul and life of degraded habits. But do not give up the studies which are the true food of a healthy mind."

Boccaccio seems to have acted on this valuable advice. His later works, although written in Latin and scientific in character, are by no means of a religious kind. It seems, however, that his entering the church in 1362 is connected with the events just related.

In 1363 Boccaccio went on a visit to Naples to the seneschal Acciaiuoli (the same Florentine who had in 1344 persuaded the elder Boccaccio to permit his son's return to Naples), who commissioned him to write the story of his deeds of valour. On his arrival, however, the poet was treated with shameful neglect, and revenged himself by denying the possibility of relating any valorous deeds for want of their existence. This declaration, it must be confessed, came somewhat late, but it was provoked by a sily attack on the poet himself by one of the seneschal's indirect friends.

During the next ten years Boccaccio led an unsettled life, residing chiefly at Florence or Certaldo, but frequently leaving his home on visits to Petrarch and other friends, and on various diplomatic errands in the service of the Republic. He seems to have been poor, having spent large sums in the purchase of books, but his independent spirit rejected the numerous splendid offers of hospitality made to him by friends and admirers. During this period he wrote four important Latin works—De Genealogia Deorum libri XV., a compendium of mythological knowledge full of deep learning; De Montium, Silvarum, Lacuum, et Mauritum nominibus liber, a treatise on ancient geography; and two historical books—De Casibus Virorum et Feminarum Illustrium (Florence, 1360). The first printing in English was the original of John Lydgate's Fall of Princes; and De Claris Mulieribus. To the list of his works ought to be added Il Ninfale Fiesolano, a beautiful love-story in verse, and II Corbaccio ossia II Laberinto d'Amore, a coarse satire on a Florentine widow who had jilted the poet, written about 1355, not to mention many elegoes in Latin and miscellaneous Rome in Italian (the latter collected by his biographer Count Baldelli in 1802).

In 1373 we find Boccaccio again settled at Certaldo. Here he was attacked by a terrible disease which brought him to the verge of death; and from the consequences of which he never quite recovered. But sickness could not subdue his intellectual vigour. When the Florentines established a chair for the explanation of the Divina Commedia in their university, and offered it to Boccaccio, the senescent poet at once undertook the arduous duty. He delivered his first lecture on the 23rd of October 1373. The commentary on part of the Inferno, already alluded to, bears witness of his unabated power of intellect. In 1374 the news of the loss of his dearest friend Petrarch reached Boccaccio, and from this blow he may be said to have never recovered. Almost his dying efforts were devoted to the memory of his friend; urgently he entreated Petrarch's son-in-law to arrange the publication of the deceased poet's Latin epic Africa, a work of which the author had been far more proud than of his immortal sonnets to Laura.

In his last will Boccaccio left his library to his father confessor, and after his decease to the convent of Santo Spirito in Florence. His small property he bequeathed to his brother Jacopo. His own natural children had died before him. He himself died on the 21st of December 1375 at Certaldo, and was buried in the church of SS. Jacopo e Filippo of that town. On his tombstone was engraved the epitaph composed by himself shortly before his death. It is calm and dignified, worthy indeed of a great life with a great purpose. These are the lines:

"Iac sub molo jacent cineres ac ossa Joannis, Mens segetis ante dies et aegrotalibus Mortalis vitae. Genitor Boccaccius illi; Patria Cerdalum; studium fugit alma poesis."

A complete edition of Boccaccio's Italian writings, in 17 vols., was first published by Moretto (Florence, 1615), but the life of this great writer has been renewed by Tira osoboci, Mazzucchelli, Count Baldelli (Vita di Boccaccio, Florence, 1866), and others. In English the best biography is Edward Hutton (1909). The first printed edition of the Decameron is without a date or place of issue. It is generally believed to belong to the year 1469 or 1470, and to have been printed at Florence. Besides this, Baldelli mentions eleven editions during the 15th century. The entire number of editions by far exceeds a hundred. A curious expurgated edition, authorized by the pope, appeared at Florence, 1573. Here, however, the grossest indecencies remain, the chief alteration being the change of the improper personages from priests and monks into laymen. The best old edition is that of Florence, 1527. Of modern reprints, that by Forfoni (Florence, 1857) deserves mention. Manni has written a Storia del Decamerone (1742), and a German scholar, M. Landau, has published a Valuable edition (Vienna, 1873). The Latin translation of the Decameron subsequently brought out in 1877 a general study of Boccaccio's life and works. An interesting English translation of the Decameron and other works of Boccaccio was published in the hand of the title The Puerile Morals, Wit, Eloquence and Conversation, 1877.
when he returned to Spain. He died at Madrid on the 28th of May 1805.

As an admirer of Haydn, and a voluminous writer of instrumental music, chiefly for the violoncello, Boccherini represents the effect of the rapid progress of a new art on a mind too refined to be led into crudeness, too inventive and receptive to neglect any of the new artistic resources within its cognizance, and too superficial to grasp their real meaning. His mastery of the violoncello, and his advanced sense of beauty in instrumental tone-colour, must have made even his earlier works seem to contemporaries at least as novel and mature as any of those experiments at which Haydn, with eight years more of age and experience, was labouring in the development of the true new forms. Most of Boccherini's technical resources proved useless to Haydn, and resemblances occur only in Haydn's earliest works (e.g. most of the slow movements of the quartets in op. 3 and in some as late as op. 17); whichever derived the characteristics of such movements from the other, the advantage is decidedly with Boccherini. But the progress of music did not lie in the production of novel beauties of instrumental tone in a style in which polyphonic organization was either deliberately abandoned or replaced by a pleasing illusion, while the form in its larger aspects was a mere inorganic amplification of the old suite-forms, which presupposed a genuine polyphonic organization as the vitalizing principle of their otherwise purely decorative nature. In the true tendency of the new sonata forms was to make instrumental music dramatic in its variety and contrasts, instead of merely decorative. Haydn from the outset buried himself with the handling of new rhythmic proportions; and if it is hardly an exaggeration to say that the surprising beauty of colour in such a specimen of Boccherini's 125 string-quintets as that in E major (containing the popular minuet) is perhaps more modern and certainly safer in performance than any special effect Haydn ever achieved, it is nevertheless true that even this beauty fails to justify the length and monotonity of the work. Where Haydn used a smaller fraction of the resources of such a style, the ultimate effect is in proportion to a purpose of which Boccherini, with all his genuine admiration of his elder brother in art, could form no conception. Boccherini's works are, however, still indispensable for violoncellists, both in their education and their concert repertories; and his position in musical history is assured as that of the most original and, next to Tartini, perhaps the greatest writer of music for stringed instruments in the late Italian amplifications of the older quasi-polyphonic sonata or suite-form that survived into the beginning of the 19th century of the 18th. Boccherini may safely be regarded as its last real master. He was wittily characterized by the contemporary violinist Puppo as "the wife of Haydn"; which is very true, if man and woman are two different species; but not as true as e.g. the equally common saying that "Schubert is the wife of Beethoven," and still less true than that "Vittoria is the wife of Palestrina."

His life, with a Catalogue raisonné, was published by L. Picquot (1856).

BOCHSUS, king of Mauretania (about 110 B.C.), and father-in-law of Jughurta. In 108 he vacillated between Jughurta and the Romans, and joined Jughurtha only on his promising him the third part of his kingdom. The two kings were twice defeated. Bocchus again made overtures to the Romans, and after an interview with Sulla, who was Marius's successor at that time, sent ambassadors to Rome. At Rome the hope of an alliance was encouraged, but on condition that Bocchus showed himself deserving of it. After further negotiations with Sulla, he finally agreed to send a message to Jughurta requesting his presence. Jughurtha fell in with the trap and was given up to Sulla. Bocchus concluded a treaty with the Romans, and a portion of Numidia was added to his kingdom. Further to conciliate the Romans and especially Sulla, he sent to the Capitol a group of Victories guarding a device in gold showing Bocchus handing over Jughurta to Sulla.

See Jugurtha; also Sallust, Jugurtha, 80-120; Plutarch, Marius, 8-32, Sulla, 3; A. H. J. Greenidge, History of Rome (London, 1904).

His son, Bocchus, was king of Mauretania, jointly with a younger brother Bogud. As enemies of the senatorial party, their title was recognized by Caesar (49 B.C.). During the African war they invaded Numidia and conquered Cirta, the capital of the kingdom of Juba, who was thus obliged to abandon the idea of joining Metellus Scipio against Caesar. At the end of the war, Caesar bestowed upon Bocchus part of the territory of Massinissa, Juba's ally, which was recovered after Caesar's murder by Massinissa's son Aridion. Dio Cassius says that Bocchus sent his sons to support Sextus Pompeius in Spain, while Bogud fought on the side of Caesar, and there is no doubt that after Caesar's death Bocchus supported Octavian, and Bogud Antony. During Bogud's absence in Spain, his brother seized the whole of Numidia, and was confirmed sole ruler by Octavian. After his death in 33, Numidia was made a Roman province.

BOCHART, SAMUEL (1599-1667), French scholar, was born at Rouen on the 30th of May 1599. He was for many years a pastor of a Protestant church at Caen, and became tutor to Wentworth Dillon, earl of Roscomon. In 1646 he published his Phædhe and Chanaan (Caen, 1646 and 1651), the two parts of his Geographia Sacra. His Hierozoicon, which treats of the animals of Scripture, was printed in London (2 vols., 1685). In 1652 Christian of Sweden, chaplain of the French embassy, sent him to Stockholm, where he studied the Arabian manuscripts in the queen's possession. He was accompanied by Pierre Daniel Huet, afterwards bishop of Avranches. On his return to Caen he was received into the academy of that city. Bochart was a man of profound erudition; he possessed a thorough knowledge of the principal Oriental languages, including Hebrew, Syriac, Chaldaic and Arabic; and at an advanced age he wished to learn Ethiopic. He was so absorbed in his favourite study, that he saw Phenician and nothing but Phenician in everything, even in Celtic words, and hence the number of chimerical etymologies which swam in his works. He died at Caen on the 16th of May 1667.

BOCHOLT, a town of Germany, in the Prussian province of Westphalia, near the frontier of Holland, 12 m. by rail north of Wesel. It is a seat of the cotton industry. Pop. (1900) 21,278.

BOCHUM, a town of Germany, in the Prussian province of Westphalia, 11 m. by rail west from Dortmund. Pop. (1905) 118,000. It is a centre of the iron and steel industries, producing principally cast steel, cast iron, iron pipes, wire and wire ropes, and lamps, with tin and zinc works, coal-mining, factories for carpets, calcium carbide and paper-roofing, brickworks and breweries. The Bochumer Verein für Bergbau (mining) and Gustahl Fabrication (steel manufacture) is one of the principal trusts in this industry, founded in 1854. There are a mining and a metallurgical school.

BOCKH, PHILIPP AUGUST (1783-1867), German classical scholar and antiquarian, was born in Karlsruhe on the 24th of November 1785. He was sent to the gymnasium of his native place, and remained there until he left for the university of Halle (1803), where he devoted himself to the study of theology. F. A. Wolf was then creating there an enthusiasm for classical studies; Böckh fell under the spell, passed from theology to philology, and became the greatest of all Wolf's scholars. In 1807 he established himself as privat-doent in the university of Heidelberg and was shortly afterwards appointed a professor extraordinary, and in 1811, becoming professor two years later. In 1815 he removed to the new Berlin University, having been appointed professor of eloquence and classical literature. He remained there till his death on the 3rd of August 1867. He was elected a member of the Academy of Sciences of Berlin in 1814, and for a long time acted as its secretary. Many of the speeches contained in his Kleine Schriften were delivered in this latter capacity.

Böckh worked out the ideas of Wolf in regard to philology,
and illustrated them by his practice. Discarding the old notion that philology consisted in a minute acquaintance with words and the exercises of the critical art, he regarded it as the entire knowledge of antiquity, historical and philosophical. He divides philology into five parts: first, an inquiry into public acts, with a knowledge of times and places, into civil institutions, and also into law; second, an inquiry into private affairs; third, an exhibition of the religions and arts of the ancient nations; fourth, a history of all their moral and physical speculations and beliefs, and of their literatures; and fifth, a complete explanation of the language. These ideas in regard to philology Böck set forth in a Latin oration delivered in 1828 (Gesammelte kleine Schriften, 1.). In his speech at the opening of the congress of German philologists in 1850, he defined philology as the historical construction of the entire life—therefore, of all forms of culture and all the productions of a people in its practical and spiritual tendencies. He allows that such a work is too great for any one man; but the very infinity of subjects is the stimulus to the pursuit of truth, and men strive because they have not attained (ib. ii.). An account of Böck's division of philology will be found in F. H. W. Kleists Archiv für Philologie, vol. ii. From 1850 to his death Böck's literary activity was unceasing. His principal works were the following:—(1) An edition of Pindar, the first volume of which (1821) contains the text of the Epinician odes; a treatise, De Metris Pindari, in three books; and Notae criticæ: the second (1829) contains the Scholia, and part ii. of volume ii. (1821) contains a Latin translation, a commentary, the fragments and indices. It is still the most complete edition of Pindar that we have. But it was especially the treatise on the metres which placed Böck in the first rank of scholars. This treatise forms an epoch in the treatment of the subject. In it the author threw aside all attempts to determine the Greek metres by mere subjective standards, pointing out at the same time the close connexion between the music and the poetry of the Greeks. He investigated minutely the nature of Greek music as far as it can be ascertained, as well as all the details regarding Greek musical instruments; and he explained the statements of the ancient Greek writers on rhythm. In this manner he laid the foundation for a scientific treatment of Greek metres. (2) Die Staatszustandsbewertung der Athener, 1837 (and ed. 1859), with a supplementary volume Urkunden über das Seewesen des attischen Staats; 3rd ed. by Franckel, 1886), translated into English by Sir George Cornewall Lewis (1828) under the title of The Public Economy of Athens. In it he investigated a subject of peculiar difficulty with profound learning. He amassed information from the whole range of Greek literature carefully appraised the value of the information given, and shows throughout every portion of it rare critical ability and insight. A work of a similar kind was his Metrologische Untersuchungen über Griechische, Mäusifuss, and Masse des Alterthums (1838). (3) Böck's third great work arose out of his second. In regard to the taxes and revenue of the Athenian state he derived a great deal of his most trustworthy information from inscriptions, many of which are given in his book. It was natural, therefore, that when the Berlin Academy of Sciences projected the plan of a Corpus Inscriptionum Graecarum, Böck should be chosen as the principal editor. This great work (1838-1877) is in four volumes, the third and fourth volumes being edited by J. Franz, E. Curtius, A. Kirchhoff and H. Rhul. Böck's activity was continually digressing into widely different fields. He gained for himself a foremost position amongst the investigators of ancient chronology, and his name occupies a place by the side of those of Ideler and Mommsen. His principal works on this subject were: Zur Geschichte der Mondzyklen der Hellener (1853); Epigraphisch-chronologische Studien (1856); Über die vierjährigen Sonnenkreise der Alten (1862), and several papers which he published in the Transactions of the German academy. Böck's interest in the history of the philosophy of one of his earliest papers was on the Platonic doctrine of the world, De Platonico corporis mundi fabrica (1809), followed by De Platonico Systemate Celestium globorum et de vera Indole Astronomiae Philosophiae (1812), to which may be added Monetho und die Hunderstterperiode (1845). In opposition to Otto Gruppe (1804-1876), he denied that Plato affirmed the diurnal rotation of the earth (Untersuchungen über das kosmische System des Platon, 1852), and when in opposition to him Grote published his opinions on the subject (Plato and the Rotation of the Earth) Böck was ready with his reply. Another of his earlier papers, and one frequently referred to, was Commentatio Academica de simulato quae Platonis cum Xenophonte intercessit furtur (1811). Other philosophical writings were Commentatio in Platonis quis velo furtur Mineem (1806), and Philologiae des Psychogeneis Lehrnen nebst einigen Bruchstücken (1819) in which he endeavoured to show the genuineness of the fragments.

Besides his edition of Pindar, Böck published an edition of the Antigone of Sophocles (1843) with a poetical translation and essays. An early and important work on the Greek tragedians is his Graecae Tragediae Principum . . . num ea quae supersunt et genuina omnia sert et primitiva seruuta (1808). The smaller writings of Böck began to be collected in his lifetime. They are published before his death, and (Gesammelte kleinse Schriften, 1858-1874). The first two consist of orations delivered in the university or academy of Berlin, or on public occasions. The third, fourth, fifth and sixth contain his contributions to the Transactions of the Berlin Academy, and the seventh contains his critiques. Böck's lectures, delivered from 1809-1865, were published by Bratuschek under the title of Encyclopädische Methodologie der Erdkunde (2 vols., Elze, 1865). His philosophical and scientific theories are set forth in Elze, Über Philosophie als System (1845), and Reichardt, Die Gliederung der Philologie entwickelt (1846). His correspondence with Otto von Böck's father appeared in the Transactions of the Berlin Academy, and the correspondence with August Böck is referred to August Böck's father, and Max Hoffmann, August Böck (1901); and S. Reiter, in Neue Jahrbücher für das klassische Altertum (1902), p. 436.

BÖCKLIN, ARNOLD (1827-1901), Swiss painter, was born at Basel on the 16th of October 1827. His father, Christian Frederick Böcklin (b. 1802), was descended from an old family of Schaffhausen, and engaged in the silk trade. His mother, Ursula Lippe, was a native of the same city. In 1846 he began his studies at the Düsseldorf academy under Schirmer, who recognized in him a student of exceptional promise, and sent him to Antwerp and Brussels, where he copied the works of Flemish and Dutch masters. Böcklin then went to Paris, worked at the Louvre, and painted several landscapes; his "Landscape and Ruin" reveals at the same time a strong feeling for nature and a dramatic conception of scenery. After serving his time in the army he set out for Rome in March 1850, and the sights of the Eternal City was a fresh stimulus to his mind. So, too, was the influence of Italian nature and that of the dead pagan world. At Rome he married (June 20, 1853) Angela Rosa Lorenza Pascucci. In 1856 he returned to Munich, and remained there four years. He then exhibited the "Great Park," one of his earliest works, in which he treated ancient mythology with the stamp of individuality, which was the basis of his reputation. Of this period, too, are his "Nymph and Satyr," "Heroic Landscape" (Diana Hunting), both of 1858, and "Sappho" (1859). These works, which were much discussed, together with Lenbach's recommendation, gained him his appointment as professor at the Weimar academy. He held the office for two years, painting the "Venus and Love," the "Portrait of Lenbach," and the "Saint Catherine." He was again at Rome from 1862 to 1866, and there gave his fancy and his taste for violent colour free play in his "Portrait of Mme Böcklin," now in the Basel gallery, in "An Anchorite in the Wilderness" (1861); a "Roman Tavern," and "Villa on the Sea-shore" (1864); this last, one of his best pictures. He returned to Basel in 1866 to finish his frescoes in the gallery, and to paint, besides several portraits, "The Magdalen with Christ" (1868); "Anacreon's Muse" (1869); and "A Castle and Warriors" (1871). His "Portrait of Myself," with Death playing a violin (1873), was painted after his return from America; he treated his life of "Pegasus," a "Centaur" (in the Basel gallery); "Landscape with Moritz Horsemens" (in the Lucerne gallery); and "A Farm" (1872). From 1876 to 1885 Böcklin was working at Florence, and painted
BOCLAND—BODEL

a "Pietà," "Ulysses and Calypso," "Prometheus," and the "Sacred Grove." From 1886 to 1892 he settled at Zürich. Of this period are the "Näalden at Play," "A Sea Idyll," and "War." After 1892 hespeedily returned to San Dorand, near Florence. An exhibition of his collected works was held at Basel from the 20th of September to the 24th of October 1897. He died on the 16th of January 1901.

His life has been written by Henri Mendelssohn. See also F. Hermann, Gazette des Beaux Arts (Paris, 1893); Max Lehr, Arnold Böcklin, Ein Leitfaden zum Verständnis seiner Kunst (Munich, 1895); "Arnold Böcklin" (Basel, 1895); Die Böcklin Jubiläums Ausstellung (Basel, 1897).

BOCLAND, Bockland or BOOKLAND (from A.S. buc, book), an original mode of tenure of land, also called charter-land or deed-land. Bockland was folk-land granted to individuals in private ownership by a document (charter or book) in writing, with the signatures of the king and witenagemot; at first it was rarely, if ever, held by laymen, except for religious purposes. Boclond to a certain extent resembled full ownership in the modern sense, in that the owner could grant it in his lifetime, in the same manner as he had received it, by boc or book, and also dispose of it by will. See also BOCKLAND.

BOCKLAY, Stephen [Irúván] (1557-1606), prince of Transylvania, the most eminent member of the ancient Bocskay family, son of György Bocskay and Krisztina Sulyok, was born at Kolozsvar, Hungary. As the chief councillor of Prince Zsigmond Báthory, he advised his sovereign to contract an alliance with the emperor instead of holding to the Turk, and rendered important diplomatic services on frequent missions to Prague and Vienna. The enmity towards him of the later Báthory princes of Transylvania, who confiscated his estates, drove him to seek protection at the imperial court (1590); but the attempts of the emperor Rudolph II. to deprive Hungary of her constitution and the Protestats of their religious liberties speedily alienated Bocskay, especially after the terrible outrages inflicted on the Transylvanians by the imperial general Sta Basta and Belgioso from 1602 to 1604. Bocskay, to save the independence of Transylvania, assisted the Turks; and in 1605, as a reward for his part in driving Basta out of Transylvania, the Hungarian diet, assembled at Modgys, elected him prince (1605), on which occasion the Ottoman sultan sent a special embassy to congratulate him and a splendid jewelled crown made in Persia. Bocskay refused the royal dignity, but made skilful use of the Turkish alliance. To save the Austrian provinces of Hungary, the archduke Matthias, setting aside his semi-lunatic imperial brother Rudolph, thereupon entered into negotiations with Bocskay, and ultimately the peace of Vienna was concluded (June 23, 1606), which guaranteed all the constitutional and religious rights and privileges of the Hungarians both in Transylvania and imperial Hungary. Bocskay, at the same time, was acknowledged as prince of Transylvania by the Austrian court, and the right of the Transylvanians to elect their own independent princes in future was officially recognized. The fortress of Tokaj and the counties of Bereg, Szatmár and Ugozas were at the same time ceded to Bocskay, with reversion to Austria if he should die childless. Simultaneously, at Szitvatorok, a peace, confirmatory of the peace of Vienna, was concluded with the Turks. Bocskay survived this signal and unprecedented triumph only a few months. He is said to have been poisoned (December 29, 1606) by his chancellor, Mihály Kátya, who was hanged to bits by Bocskay's adherents in the market-place of Kassa. See Political Correspondence of Stephen Bocskay (Hung.), edited by Károly Jenö Thury, Stephen Bocskay's Rebellion (Hung.), Budapest, 1899. (R. N. B.)

BODE, Johann Elert (1747-1826), German astronomer, was born at Hamburg on the 16th of January 1747. Devoted to astronomy from his earliest years, he eagerly observed the heavens at a garret window with a telescope made by himself, and at nineteen began his career with the publication of a short work on the solar eclipse of the 5th of August 1766. This was followed by an elementary treatise on astronomy entitled Anleitung zur Kenntniss des gestirnten Himmels (1768, 10th ed. 1744), the success of which led to his being summoned to Berlin in 1772 for the purpose of computing ephemerides on an improved plan. There resulted the foundation laid by him, in 1774, of the well-known Astronomisches Jahrbuch, 51 yearly volumes of which he compiled and issued. He became director of the Berlin observatory in 1786, withdrew from official life in 1825, and died at Berlin on the 23rd of November 1826. His works were highly effective in diffusing throughout Germany a taste for astronomy. Besides those already mentioned he wrote:--Sammlung astronomischer Tafeln (3 vols., 1776); Erläuterung der Sternkunde (1776, 3rd ed. 1808); Uranographia (1801), a collection of 20 star-maps accompanied by a catalogue of 17,240 stars in the southern hemisphare. In this work Bode propounded, in 1776, a theory of the solar constitution similar to that developed in 1795 by Sir William Herschel. He gave currency, moreover, to the empirical rule known as "Bode's Law," which was actually announced by Johann Daniel Titius of Wittenberg in 1772. It is expressed by the statement that the proportionate distances of the several planets from the sun may be represented by adding 4 to each term of the series; 0, 3, 6, 12, 24, &c. The irregularity will be noticed of the first term, which should be 1/2 instead of 0. (See SOLAR SYSTEM.) See also BOEDDEKER, Berlin Abhandlungen (1786), iii. 1605, edited by Arnold Schumacher, Astr. Nach. v. 255, 367 (1827): Poggendorf, Biogr. historisches Handwörterbuch; Allgemeine deutsche Biographie, iii. 1.

BODEL, Jehan (died c. 1210), French trouvère, was born at Arras in the second half of the 12th century. Very little is known of his life, but in 1205 he was about to start for the crusade when he was attacked by leprosy. In a touching poem called Le Congé (pt. by Mœm in Recueil de fabliaux et contes, vol. i.), he bade farewell to his friends and patrons, and begged for a nomination to a leper hospital. He wrote Le Jeu de Saint Nicolas, one of the earliest miracle plays preserved in French (printed in Monnerqué and Michel's Théâtre français du moyen âge, 1839, and for the Soc. des bibliophiles français, 1831); the Chanson des Saintes (ed. F. Michel 1839), four pastourelles (printed in K. Bartsch's Altfrans. Romanzen und Pastourellen, Leipzig, 1870); and probably, the eight fabliaux attributed to an unknown Jean Bedel. The legend of Saint Nicholas had already formed the subject of the Latin Ludus Sancti Nicholai of Hilarius. Bodel placed the scene partly on a field of battle in Africa, where the crusaders perish in a hopeless struggle, and partly in a tavern on the road to Jerusalem. It was commonly supposed that the miracle of Saint Nicholas narrated in the prologue, ends with a wholesale conversion of the African king and his subjects. The dialogue in the tavern scenes is written in thieves' slang, and is very obscure. The Chanson des Saintes, Bodel's authorship of which has been called in question, is a chanson de geste belonging to the period of decadence, and is really a roman d’aventures based on earlier legends belonging to the Charlemagne cycle. It relates the wars of Charlemagne against the Saxons under Guiteclin de Sassoigne (Witkind or Widukind), with the second revolt of the Saxons and their final submission and conversion. Jehan Bodel makes no allusion to Ogier the Dane and many other personages of the Charlemagne cycle, but he mentions the defeat of Roland at Roncevaux. The romance is based on historical fact, but is overlaid with romantic detail. It really embraces three distinct legends—those of the wars against the Saxons, of Charlemagne's rebellious barons, and of Baudouin and Sebille. The earlier French poems on the subject are lost, but the substance of them is preserved in the Scandinavian versions of the Charlemagne cycle (supposed to have been derived from English sources) known as the Karlstorp, or the Dailyg, the Sagan (German Christiania, 1860) and Keiser Karl Magnus Krönikhe (Råstamst Digtnung, ed. C. J. Brandt, Copenhagen, 1877).

Meyer, in Ausgaben und Abhandlungen aus der romanischen Philologie (Marburg, 1885), pp. 1-76, where its relation to the rest of the Charlemagne cycle is discussed.
BODENBACH—BODIN

BODENBACH (Czech Podomohy), a town of Bohemia, Austria, 83 m. N.N.E. of Prague by rail. Top. (1900) 10,782, almost exclusively German. It is situated on the left bank of the Elbe opposite Tetschen, and is an important railway junction, containing also an Austrian and a Saxon custom-house. Bodenbach, which in the middle of the 11th century had only a few hundred inhabitants, has become a very important industrial centre. Its principal manufactures include cotton and woollen goods, earthenware, furniture, paper, photography, chemical products, foodstuffs, meats and preserves, and beer. It has also a very active transit trade.

BODENSTEDT, FRIEDRICH MARTIN VON (1819-1892), German author, was born at Peine, in Hanover, on the 22nd of April 1819. He studied in Göttingen, Munich and Berlin. His career was determined by his engagement in 1844 as tutor in the family of Prince Galitzin at Moscow, where he gained a thorough knowledge of Russian. This led to his appointment in 1844 as the head of a public school at Tiflis, in Transcaucasia. He took the opportunity of his proximity to Persia to study Persian literature, and in 1851 published a volume of original poetry in oriental guise under the fanciful title, Die Liefer des Mirza Schaffy (English trans. by E. d'Esterre, 1850). The success of this work can only be compared with that of Edward FitzGerald's Omar Khayyam, produced in somewhat similar circumstances, but differed from it in being immediate. It has gone through 100 editions in Germany, and has been translated into almost all literary languages. Nor is this celebrity undeserved, for although Bodenstedt does not attain the poetical elevation of FitzGerald, his view of life is wider, more cheerful and more sane, while the execution is a model of grace. On his return from the East, Bodenstedt engaged for a while in journalism, married the daughter of a Hussian officer (Matilde, the Editorium of his poems), and was in 1854 appointed professor of Slavonic at Munich. The rich stores of knowledge which Bodenstedt brought back from the East were turned to account in two important books, Die Völker des Kaukasus und ihre Freiheits-Kämpfe gegen die Russen (1848), and Toussend und ein Tag im Orient (1850). For some time Bodenstedt continued to devote himself to Slavonic subjects, producing translations of Pushkin, Lermontov, Turgeniev, and of the poets of the Ukraines, and writing a tragedy on the false Demetrius, and an epic, Ada die Lesghierin, on a Circassian theme. Finding, probably, this vein exhausted, he exchanged his professorship in 1858 for one of Early English literature, and published (1853-1860) a valuable work on the English dramatists contemporary with Shakespeare, with copious translations. In 1862 he produced a standard translation of Shakespeare's sonnets, and between 1866 and 1872 published a complete version of the plays, with the help of many condottieri. In 1867 he undertook the direction of the court theatre at Meiningen, and was ennobled by the duke. After 1873 he lived successively at Altona, Berlin and Wiesbaden, where he died on the 19th of April 1892. His later works consist of an autobiography (1888), successful translations from Hafiz and Omar Khayyam, and lyrics and dramas which added little to his reputation.

An edition of his collected works in 12 vols. was published at Berlin (1866-1889), and his Erzählungen und Romane at Jena (1871-1881) are illustrated by biographical details, see Bodenstedt's Erinnerungen aus meinem Leben (2 vols. Berlin, 1888-1899), and G. Schenck, Friedrich von Bodenstedt. Ein Dichterleben in seinen Briefen (Berlin, 1893).

BODHI VAMSA, a prose poem in elaborate Sanskritized Pali, composed by Upatissa in the reign of Mahinda IV. of Ceylon about A.D. 950. It is an adaptation of a previously existing work in Sinhalese on the same subject, and describes the bringing of a branch of the celebrated Bo or Bodhi tree (i.e. Wisdom Tree, under which the Buddha had attained wisdom) to Ceylon in the 3rd century B.C. The Bodhi Vamsa quotes verses from the Mahàvamsa, but draws a great deal of its material from other sources; and it has occasionally preserved details of the older tradition not found in any other sources known to us.

BODICHON, BARBARA LEIGH SMITH (1827-1891), English educationalist, was born at Watlington, Norfolk, on the 8th of April 1827, the daughter of Benjamin Smith (1783-1860), long M.P. for Norwich. She early showed a force of character and Catholicity of sympathy that later won her a prominent place among philanthropists and social workers. In 1857 she married an eminent French physician, Dr Eugène Bodichon, and, although winning many years in Algiers, continued to lead the movements she had initiated in behalf of Englishwomen. In 1869 she published her Brief Summary of the Laws of England concerning Women, which had a useful effect in helping forward the passage of the Married Women's Property Act. In 1866, co-operating with Miss Emily Davies, she matured a scheme for the extension of university education to women, and the first small experiment at Hitchin developed into Girton College, to which Mme Bodichon gave liberally of her time and money. With all her public interests she found time for society and her favourite art of painting. She studied under William H. Hunt, and her water-colours, exhibited at the Salon, the Academy and elsewhere, showed great originality and talent, and were admired by Corot and Daubigny. Her London salon included many of the literary and artistic celebrities of her day; she was George Eliot's most intimate friend, and, according to her, the first to recognize the authorship of Adam Bede. Her personal appearance is said to be described in that of Romola. Mme Bodichon died at Robertsbridge, Sussex, on the 11th of June 1891.

BODIN, JEAN (1530-1596). French political philosopher, was born at Angers in 1530. Having studied law at Toulouse and lectured there on jurisprudence, he settled in Paris as an advocate, but soon applied himself to literature. In 1555 he published his first work, a translation of Oppian's Cynegeticon into Latin verse, with a commentary. The celebrated scholar, Tenehrs, complained that some of his emendations had been appropriated without acknowledgment. In 1558, in refutation of the views of the seigneur de Malestroit, comptroller of the mint, who maintained that there had been no rise of prices in France during the three preceding centuries, he published his Responso ad Paradoxa de Malestreto (Réponse aux paradoxes de M. Malestroit), which the first time explained in a nearly satisfactory manner the revolution of prices which took place in the 16th century. Bodin showed a more rational appreciation than many of his contemporaries of the causes of this revolution, and the relation of the variations in money to the market values of wares in general as well as to the wages of labour. He saw that the amount of money in circulation did not constitute the wealth of the community, and that the prohibition of the export of the precious metals was rendered imperative by the necessities of trade. This tract, the Discours sur les causes de l'extrême cherté qui est aujourd'hui en France (1574), and the disquisition on public revenues in the sixth book of the République, entitle Bodin to a distinguished position among the earlier economists.

His learning, genial disposition, and conversational powers won him the favor of Henry III. and of his brother, the duc d'Alençon; and he was appointed king's attorney at Laon in 1563. For this performance, Bodin was authorized to send to his country, and completed his greatest literary work. Elected by the tiers état of Vermandois to represent it in the states-general of Blois, he contended with skill and boldness in extremely difficult circumstances for freedom of conscience, justice and peace. The nobility and clergy favoured the League, and urged the king to force his subjects to profess the Catholic religion. When Bodin found he could not prevent this resolution being carried, he contrived to get inserted in the petition drawn up by the states the clause "without which practically rendered nugatory all its other clauses." While he thus resisted the clergy and nobility he successfully opposed the demand of the king to be allowed to alienate the public lands and royal demesnes, although the chief deputies had been won over to assent. This lost him the favour of the king, who wanted money on any terms. In 1581 he acted as secretary to the duc d'Alençon
when that prince came over to England to seek the hand of Queen Elizabeth. Here he had the pleasure of finding that the République was studied at London and Cambridge, although in a barbarous Latin translation. This determined him to translate his work into Latin himself (1586). The latter part of Bodin's life was spent at Laon, where he is said to have persuaded to declare for the League in 1589, and for Henry IV, five years afterwards. He died of the plague in 1596, and was buried in the church of the Carmelites.

With all his breadth and liberality of mind Bodin was a controversialist and a craftsman of the first order. He could not abide the power of the stars, and in 1580 he published the De Diurnis motibus et des sorciers, a work which shows that he was not exempt from the prejudices of the age. Himself regarded by most of his contemporaries as a sceptic, and by some as an atheist, he denounced all who dared to disbelieve in sorcery, and urged the burning of witches and wizards. It might, perhaps, have gone hard with him if his counsel had been strictly followed, as he confessed to have had from his thirty-seventh year a friendly demon, who, if properly invoked, touched his right ear when he purposed doing what was wrong, and his left when he meditated doing good.

His chief work, the Six livres de la République (Paris, 1576), which passed through several editions in his lifetime, that of 1583 having as an appendix L'Apologie de René Harding (Bodin himself), was the first modern attempt to construct an elaborate system of political science. It is perhaps the most important work of its kind between Aristotle and modern writers. Though he was much indebted to Aristotle he used the material to advantage, adding much from his own experience and historical knowledge. In harmony with the conditions of his age, he approved of absolute governments, though at the same time they must, he thought, be controlled by constitutional laws. He entered into an elaborate defence of individual property against Plato and More, rather perhaps because the scheme of his work required the treatment of that theme than because it was practically urgent in his day, when the excesses of the Anabaptists had produced a strong feeling against communistic doctrines. He was under the general influence of the mercantilist views, and approved of energetic governmental interference in industrial matters, of high taxes on foreign manufactures and low duties on raw materials and articles of food, and attached great importance to a dense population. But he was not a blind follower of the system; he wished for unlimited freedom of trade in many cases; and he was in advance of his more eminent contemporary Montaigne in perceiving that the gain of one nation is not necessarily the loss of another. To the public finances, which he called "the sinews of the state," he devoted much attention, and insisted on the duties of the government in respect to the right adjustment of taxation. In general he respects the praise of steadily keeping in view the higher aims and interests of society in connexion with the regulation and development of its material life.

Among his other works are Oratio de instituendo in republica juventute (1550); Methodus ad faciendum historiarum cognitum (1566); Universale Natureae Theatrum (1566, French trans. by Fougerolles, 1597), and the Colloquium Heptaplomeres de abditis rerum sublimium arcana, written in 1588, published first by Guhrauer (1841), and in a complete form by L. Noack (1857). The last is a philosophy of naturalism in the form of a conversation between several learned men—a Jew, a Muhammadan, a Lutheran, a Zwinglian, a Roman Catholic, an Englishman and a Theist. The conclusion to which they are represented as coming is that they will live together in charity and toleration, and cease from further disputation as to religion. It is curious that Leibnitz, who originally regarded the Colloquium as the work of a professed enemy of Christianity, subsequently described it as a most valuable production (cf. M. Carrière, Weltanschauung, p. 317). See H. Baudrillart, J. Bodin et son temps (Paris, 1853); Ad. Franck, Réformateurs et publicistes de l'Europe (Paris, 1864); N. Flanchenault, Études sur Jean Bodin (Angers, 1838); E. de Barthélémy, Études sur J. Bodin (Paris, 1876); for the political philosophy of Bodin, see P. Janet, Hist. de la science polit. (3rd ed., Paris, 1887); Hancke, B. Studien über d. Begriff d. Souveränität (Breslau, 1894), A. Bardoux, Les Lettrae et leur influence sur la francçaise; Fournil, Baudrillart, Geschichte de Montesquieu (1866) on his political economy, J. K. Ingram, Hist. of Pol. Econ. (London, 1888); for his ethical teaching, A. Desjardins, Les Moralistes du français du环境中le siècle, ch. iv; and for his historical views, K. Flint's History of the Philosophy of History in Europe (ed. 1895, London, 1821).

BODKIN—(Early Eng. boydekin, a dagger, a word of unknown origin, possibly connected with the Greek biaidgos, a short sword), a small, needle-like instrument of steel or bone with a flattened knob at one end, used in needlework. It has one or more slits or eyes, through which cord, tape or ribbon can be passed, for threading through a hem or series of loops. The word is also used of a small piercing instrument for making holes in cloth, &c.

BODLE or BODDE (said to be from Bothwell, the name of a mint-master), a Scottish copper coin worth about one-sixth of an English penny, first issued under Charles II. It survives in the phrase "not to care a bodle.

BODLEY, GEORGE FREDERICK (1827–1907), English architect, was the youngest son of a physician at Brighton, his elder brother, the Rev. W. H. Bodley, becoming a well-known Roman Catholic preacher and a professor at Oscott. He was articled to the famous architect Sir Gilbert Scott, under whose influence he became imbued with the spirit of the Gothic revival, and he gradually became known as the chief exponent of 14th-century English Gothic, and the leading ecclesiastical architect in England. One of his first churches was St Michael and All Angels, Brighton (1859), and among his principal erections may be mentioned All Saints, Cambridge; Eton Mission Church, Hackney Wick; Clumber church; Eccleston church; Hoar Cross church; St Augustine's, Pendlebury; Holy Trinity, Kensington; Chapel Allerton, Leeds; St Faith's, Brentford; Queen's College chapel, Cambridge; Marlborough College chapel; and Burton church. His domestic work included the London School Board offices, the new buildings at Magdalen, Oxford, and Hewell Grange (for Lord Windsor). From 1872 he had for twenty years the partnership of Mr T. Garner, who worked with him. He also designed (with his pupil James Vaughan) the cathedral at Washington, D.C., U.S.A., and cathedrals at San Francisco and in Tasmania; and when Mr Gilbert Scott's design for his new Liverpool cathedral was successful in the competition he collaborated with the young architect in preparing for its erection. Bodley began contributing to the Royal Academy in 1854, and in 1881 was elected A.R.A., becoming R.A. in 1902. In addition to being a most learned master of architecture, he was a beautiful draughtsman, and a connoisseur in art; he published a volume of poems in 1899; and he was a designer of wall-papers and chintzes for Watts & Co., of Baker Street, London; in early life he had been in close alliance with the Pre-Raphaelites, and he did a great deal, like William Morris, to improve public taste in domestic decoration and furniture. He died on the 21st of October 1907, at Water Eaton, Oxford.

BODLEY, SIR THOMAS (1545–1613), English diplomatist and scholar, founder of the Bodleian library, Oxford, was born at Exeter on the 2nd of March 1545. During the reign of Queen Mary, his father, John Bodley, being obliged to leave the kingdom on account of his Protestant principles, went to live at Geneva. In that university, in which Calvin and Beza were then teaching divinity, young Bodley studied for a short time. On the accession of Queen Elizabeth he returned with his father to England, and soon after entered Magdalen College, Oxford. In 1563 he took his B.A. degree, and was admitted a fellow of Merton College. In 1565 he read a Greek lecture in hall, took his M.A. degree the year after, and read natural philosophy in the public schools. In 1569 he was proctor, and for some time after was deputy public orator. Quitting Oxford in 1576, he made the tour of Europe; shortly after his return he became gentleman usher to Queen Elizabeth; and in 1587, apparently, he married Arabella, a widow lady of considerable fortune, a daughter of Mr Carey of Bristol. In 1584 he entered parliament as member for Portsmouth, and represented St German's in 1586. In 1587 Bodley was entrusted
with a mission to form a league between Frederick II. of Denmark and certain German princes to assist Henry of Navarre. He was next despatched on a secret mission to France; and in 1588 he was sent to the Hague as minister, a post which demanded great diplomatic skill, for it was in the Netherlands that the power of Spain had to be fought. The essential difficulties of his mission were complicated by his being the queen's minster at home, and Bodley repeatedly begged that he might be recalled. He was finally permitted to return to England in 1596, but finding his preferment obstructed by the jarring interests of Burleigh and Essex, he retired from public life. He was knighted on the 18th of April 1604. He is, however, remembered specially as the founder of the Bodleian at Oxford, practically the earliest public library in Europe (see Libraries). He determined, he said, "to take his farewell of state employments and to set up his staff at the library door in Oxford." In 1598 his offer to restore the old library was accepted by the university. Bodley not only used his private fortune in his undertaking, but induced many of his friends to make valuable gifts of books. In 1611 he began its permanent endowment, and at his death in London on the 28th of January 1613, the greater part of his fortune was left to it. He was buried in the choir of Merton College chapel where a monument of black and white marble was erected to him.

Sir Thomas wrote his own life to the year 1609, which, with the final draft of the statue drawn up for then trying a commercial career, he finally found his vocation in letters. In 1725 he was appointed professor of Helvetic history in Zürich, a chair which he held for half a century, and in 1735 became a member of the "Groser Rat." He published (1721-1723), in conjunction with J. J. Breitinger (1701-1774) and several others, Die Discourse der Mahnervn, a weekly journal after the model of the Spectator. Through his prose translation of Milton's Paradise Lost (1732) and his successful endeavours to make a knowledge of English literature accessible to Germany, he aroused the hostile criticism of Gottsched (g.n.) and his school, a struggle which ended in the complete discomfiture of the latter. His most important writings are the treatises Von dem Wunderbaren in der Poesie (1740) and Kritische Betrachtungen über die poetischen Gemälde der Dichter (1741), in which he pleaded for the freedom of the imagination from the restriction imposed upon it by French pseudo-classicism. Bodmer's epics Die Sindfluth (1753) and Noah (1751) are weak imitations of Klopstock's Messias, and his plays are entirely deficient in dramatic qualities. He did value the work of German literature by his editions of the Minnesingers and part of the Nikolengesang. He died at Zürich on the 2nd of January 1783.

BODMIN, a market town and municipal borough in the Bodmin parliamentary division of Cornwall, England, the county town, 30½ m. W.N.W. of Plymouth, on branches of the Great Western and London & South-Western railways. Pop. (1901) 5533. It lies between two hills in a short valley opening westward upon that of the Camel, at the southern extremity of the high open Bodmin Moor. The large church of St. Petrock, mainly Perpendicular, has earlier portions, and a late Norman font. East of it there is a ruined Decorated chapel of St Thomas of Canterbury, with a crypt. A tower of Tudor date, in the cemetery, marks the site of a chapel of the gild of the Holy Rood. Part of the buildings of a Franciscan friary, founded c. 1240, are incorporated in the market-house, and the gateway remains in an altered form. At Bodmin are a prison, with civil and naval departments, the county gaol and asylum, the headquarters of the constabulary, and those of the duke of Cornwall's

Light Infantry. Cattle, sheep and horse fairs are held, and there is a considerable agricultural trade. The borough is under a mayor, four aldermen and twelve councillors. Area, 7707 acres.

Traces of Roman occupation have been found in the western part of the parish, belonging to the first century a.d. Possibly tin-mining was carried on here at that period. The grant of a charter by King Edred to the prior and canons of Bodmin (Bomine, Bodman, Bodmyn) in respect of lands in Devonshire appears in an insignium of 1252. To its ecclesiastical associations it owed its importance at the time of the Domesday survey, when St Petrock held the manor of Bodmin, wherein were sixty-eight houses and one market. To successive priors, as mesne lords, it also owed its earliest municipal privileges. King John's charter to the prior and convent, dated the 11th of July 1209, contains a clause (subsequently cancelled by Richard II.) by which burgesses were exempt from being impelled, touching any tenements in their demesne, except before the king and his chief justice. Richard of Cornwall, king of the Romans, confirmed to the burgesses their guild merchant, Edward I. the pessage of tin, and Edward II. a market for tin and wool. Queen Elizabeth in 1563 constituted the town a free borough and the burgesses a body corporate, granting at the same time two fairs and a Saturday market. There are still held also three other fairs whose origin is uncertain. An amended charter granted in 1594 remained in force until 1789, when the corporation became extinct owing to the diminution of the burgesses. By virtue of a new charter of incorporation granted in 1798 and remodelled by the act of 1835, the corporation now consists of a mayor, four aldermen and twelve councillors. The first members for Bodmin were summoned in 1295. Retaining both its members in 1832, losing one in 1866 and the other in 1885, it has now become merged in the south-eastern division of the county. From 1715 to 1837 the assizes were generally held alternately at Launceston and Bodmin; since 1837 they have been held at Bodmin only. A court of probate has also been held at Bodmin since 1773. A festival known as "Bodmin Riding" was formerly celebrated here on the Sunday and Monday following St Thomas's day (July 7). It is thought by some to have been instituted in 1177 to celebrate the recovery of the bones of St Petrock.

See Victoria County History, Cornwall; Sir John Maclean, Parochial and Family History of the Deanery of Trigg Minor, Cornwall (3 vols., 1873-1879).

BODÖ, a seaport on the north-western coast of Norway, in Nordland amt (county), lat. 67° 17' N. Pop. (1900) 4827. The rock-bound harbour admits large vessels, and there is a brisk trade in fish and eider-down. The neighbouring country has many scenic attractions. Sixty miles inland (E.) rises the great massif of Sutelma on the Swedish frontier, with its copper mines, broad snow-fields and glaciers. The fjords of the district include the imposing Beiernfjord, the Saltenfjord, and the Skjerstafjord, at the narrow mouths of which, between islands, a remarkable cataract (Salström) is formed at the turn of the tide. On this fjord is Skjerstad, a large scattered village.

BODONI, GIAMBATTISTA (1700-1813), Italian printer, was born in 1740 at Saluzzo in Piedmont, where his father owned a printing establishment. While yet a boy he began to engrave on wood. He at length went to Rome, and there became a compositor for the press of the Propaganda. He made himself acquainted with the Oriental languages, and thus was enabled to render essential service to the Propaganda press, by restoring and accurately distributing the types of several Oriental alphabets which, by the fall of the Roman empire had fallen into disuse. The infante Don Ferdinand, afterwards duke of Parma, having established, about 1760, a printing-house on the model of those in Paris, Madrid and Turin, Bodoni was placed at the head of this establishment, which he soon rendered the first of the kind in Europe. The beauty of his typography, &c., leaves nothing further to be desired; but the intrinsic value of his editions is seldom equal to their outward splendour. His Homer, however, is a truly magnificent work; and, indeed, his Greek letters are faultless imitations of the best
Greek manuscript. His editions of the Greek, Latin, Italian and French classics are all highly prized for their typographical elegance, and some of them are not less remarkable for their accuracy. Bodoni died at Padua in 1813. In 1818 a magnificent work appeared in two volumes quarto, entitled Manuale Tipografico, containing specimens of the vast collection of types which had belonged to him.

Serena De Lamà, in Conteschi Giambattista Bodoni (1816).

**BODY-SNATCHING**, the secret disintering of dead bodies in churchyards in order to sell them for the purpose of dissection. Those who practised body-snatching were frequently called resurrectionists or resurrection-men. Previous to the passing of the Anatomy Act 1832 (see *Anatomy: History*), no licence was required in Great Britain for opening an anatomical school, and there was no provision for supplying subjects to students for anatomical purposes. Therefore, though body-snatching was a misdemeanour at common law, punishable with fine and imprisonment, it was a sufficiently lucrative business to lessen the risk of detection. Body-snatching became so prevalent that it was not unusual for the relatives and friends of a deceased person to watch the grave for some time after burial, lest it should be violated. Iron coffins, too, were frequently used for burial, or the graves were protected by a framework of iron bars called mortisafes, well-preserved examples of which may still be seen in Greyfriars' churchyard, Edinburgh.

A detailed history of body-snatching see The Diary of a Resurrectionist, edited by J. B. Bailey (London, 1896), which also contains a full bibliography and the regulations in force in foreign countries for the supply of bodies for anatomical purposes.

**BOEHM** (or - c. 1530), Scottish historian, was born at Dundee about the year 1465, being descended of a family which for several generations had possessed the barony of Panbride in Fife. He received his early education at Dundee, and completed his course of study in the university of Paris, where he took the degree of B.D. He was appointed regent, or professor, of philosophy in the college of Montaigu; and there he was a contemporary of Erasmus, who in two epistles has spoken of him in the highest terms. When William Elphinstone, bishop of Aberdeen, was laying plans for the foundation of the university of Aberdeen (King's College) he made Bœce his chief adviser; and the latter was persuaded, after receipt of the papal bull erecting the university (1494), to be the first principal. He was in Aberdeen about 1500 when lectures began in the new buildings, and he appears to have been well received by the canons of the cathedral, several of whom he has commemorated as men of learning. It was a part of his duty as principal to read lectures on divinity.

The emoluments of his office were poor, but he also enjoyed the income of a canonry at Aberdeen and of the vicarage of Tullynessle. Under the date of 14th July 1527, we find a "grant to Maister Hector" of an annual pension of £50, to be paid by the sheriff of Aberdeen out of the king's casualties; and on the 26th of July 1529 was issued a "precept for a letter to Mr Hector Boys, professor of theology, of a pension of £50 Scots yearly, until the king promote him to a benefice of 100 marks Scots of yearly value; the said pension to be paid him by the customars of Aberdeen." In 1533 and 1534, one-half of his pension was, however, paid by the king's treasurer, and the other half by the comptroller; and an extra payment subseuent to that of 1529, 1534 having been traced in the treasurer's accounts, he is supposed to have obtained the benefice soon after that period. This benefice was the rectorship of Tyrie.

In 1538, soon after the publication of his history, Bœce received the degree of D.D. at Aberdeen; and on this occasion the magistrates voted him a present of a tun of wine when the new wines should arrive, or, according to his option, the sum of £20 to purchase bonnets. He appears to have survived till the year 1536; for on the 22nd of November in that year, the king presented John Gordon to the rectory of Tyrie, vacant by the death of "Mr Hector Boys." He died at Aberdeen, and was buried before the high altar at King's College, beside the tomb of his patron Bishop Elphinstone.

His earliest publication, Episcoporum Mutilationum et Aderdonensis per Hectorem Boetium Vita, was printed at the press of Jodocus Badius (Paris, 1522). The notices of the early prelates are of little value, but the portion of the book in which he speaks of Bishop Elphinstone is of enduring merit. Here we likewise find an account of the foundation and constitution of the college, together with some notices of its earliest members. His fame rests chiefly on his *History of Scotland*, published in 1577 under the title *Scolorum Historiae a prima genesis origne usque ad hanc presentem Septemnatione non sulfari*. This edition contains seventeen books. Another edition, containing the eighteenth book and a fragment of the nineteenth, was published by Ferrerius, who has added an appendix of thirty-five pages (Paris, 1574).

The composition of the history displays much ability; but Bœce's imagination was, however, stronger than his judgment: of the extent of the historian's credibility, his narrative exhibits many unequal proofs; and of deliberate invention or distortion of facts not a few, though the latter are less flagrant and intentional than early 19th-century criticism has assumed. He professed to have obtained from the monastery of Inchmarnock, through the good offices of the earl of Argyll, and his brother, John Campbell of Lundy, the treasurer, certain original historians of Scotland, and among the rest Veremundus, of whose writings not a single vestige is now to be found. In his dedication to the king he is pleased to state that Veremundus, a Spaniard by birth, was archdeacon of St Andrews, and that he wrote in Latin a history of Scotland from the origin of the nation to the reign of Malcolm III., to whom he inscribed his work. His promise that his purpose and the marvelous was at an early period exposed in the following verses by Leland:

> "Hectoris historici tot quot mendacia scripta
Si vis ut numerem, lector amice, tibi,
Me jubes etiam fluctus numerarum marimos
Et qut quis ut numenare poli."

Bœce's *History of Scotland* was translated into Scottish prose by John Bellenden, and into verse by William Stewart. *The Lives of the Bishops* was reprinted for the Bannatyne Club, Edin., 1855, in a limited edition of sixty copies. A commonplace verse-rendering of the *Life of Bishop Elphinstone*, which was written by Alexander Gardyne in 1619, remains in MS. There is no modern edition of the history, though the versions of Bellenden and Stewart have been improved.

**BOEHM, SIR JOSEPH EDGAR**, Bart. (1834–1890), British sculptor, was born of Hungarian parentage on the 4th of July 1834 at Vienna, where his father was director of the imperial mint. After studying the plastic art in Italy and at Paris, he worked for a few years as a medallist in his native city. After a further period of study in England, he was so successful as an exhibitor at the Exhibition of 1862 that he determined to abandon the execution of coins and medals, and to give his mind to portrait busts and statuettes, chiefly equestrian. The colossal statue of Queen Victoria, executed in marble (1869) for Windsor Castle, and the monument of the duke of Kent in St George's chapel, were his earliest great works, and so entirely to the taste of his royal patrons that he rose rapidly in favour with the court. He was made A.R.A. in 1878, and produced soon afterwards the statue of Carlyle on the Thames embankment at Chelsea. In 1881 he was appointed sculptor in ordinary to the queen, and in the ensuing year became full Academician. On the death of Dean Stanley, Boehm was commissioned to execute his sarcophagus in Westminster Abbey, and his achievement, a recumbent statue, has been pronounced to be one of the best portraits in modern sculpture. Less successful was his monument to General Gordon in St Paul's cathedral. He executed the equestrian statue of the duke of Wellington at Hyde Park Corner, and designed the coinage for the Jubilee of Queen Victoria in 1887. Among his ideal subjects should be noted the "Herdsmen and Bull." He died suddenly in his studio at South Kensington on the 12th of December 1890.

**BOEHM VON BAWERK, EUGEN (1835–1915)**, Austrian economist and statesman, was born at Brunn on the 12th of February 1857. Entering the Austrian department of finance in 1872, he held various posts until 1880, when he became
qualified as a teacher of political economy in the university of Vienna. The following year, however, he transferred his services to the university of Innsbruck, where he became professor in 1834. In 1880 he became councillor in the ministry of finance, and represented the government in the Lower House on all questions of finance. In 1893 he was appointed by the government of Lower Austria, and in 1895 was made a member of the Upper House, and in 1900 again became minister of finance. One of the leaders of the Austrian school of economists, he has made notable criticisms on the theory of value in relation to cost as laid down by the "classical school." His more important works are Kapital und Kapitalstruktur (Innsbruck, 1884–1895), in two parts, translated by W. Smart, viz. Capital and Interest (part i., 1890), and The Positive Theory of Capital (part ii., 1891); Karl Marx and the Close of his System (trans. A. M. Macdonald, 1898); Recent Literature on Interest (trans. W. A. Scott and S. Feilbogen, 1901).

BOEHME [or BEHME], JAKOB (1575–1624), German mystical writer, whose surname (of which Foehner gives eight German varieties) appears in English literature as Beem, Böm, Böhm, etc., and notably Behmen, was born at Altsedcnberg, in Upper Lusatia, a straggling hamlet among the hills, some 10 m. S.E. of Görlitz. His father was a well-to-do peasant, and his first employment was that of herd boy on the Landskrone, a hill in the neighborhood of Görlitz; the only education he received was at the town-school of Seidenberg, a mile from his home. Seidenberg, to this day, is filled with shoemakers, and to a shoemaker Jakob was apprenticed in his fourteenth year (1589), being judged not robust enough for candidacy. Ten years later (1599) we find him settled at Görlitz as master-shoemaker, and married to Katharina, daughter of Hans Kuntzschmann, a thriving butcher in the town. After industriously pursuing his vocation for ten years, he bought (1610) the substantial house, which still preserves his name, close by the bridge, in the Neisse-Vorstadt. Two or three years later he gave up business, and did not resume it as a shoemaker; but for some years before his death he made and sold woollen gloves, regularly visiting Prague fair for this purpose.

Boehme's authorship began in his 37th year (1612) with a treatise, Aurora, oder die Morgenröte im Aufgang, which though unfinished was surreptitiously copied, and eagerly circulated in MS. by Karl von Endor. This raised him at once out of his homely sphere, and made him the centre of a local circle of liberal thinkers, considerably above him in station and culture. The charge of heresy was, however, soon directed against him by Gregorius Richter, then pastor primarius of Görlitz. Feeling ran so high after Richter's pulpit denunciations, that, in July 1613, the municipal council, fearing a disturbance of the peace, made a show of examining Boehme, took possession of his fragmentary quarto, and dismissed the writer with an admonition to meddle no more with such matters. For five years he obeyed this injunction. But in 1618 began a second period of authorship; he poured forth, but did not publish, treatise after treatise, expository and polemical, in the next and the two following years. In 1622 he composed nothing but a few short pieces on true repentance, resignation, etc., which, however, devotionally speaking, are the most precious of all his writings. They were the only pieces offered to the public in his lifetime and with his permission, a fact which is evidence of the essentially religious and practical character of his mind. Their publication at Görlitz, on New Year's day 1624, under the title of Der Weg zu Christo, was the signal for renewed clerical hostility. Boehme had by this time entered on the third and most prolific though the shortest period (1623–1624) of his speculations. His labours at the desk were interrupted in May 1624 by a summons to Dresden, where his famous "colloquy" with the Upper Consistorial court was made the occasion of a flattering but transient ovation on the part of a new circle of admirers. Richter died in August 1624, and Boehme did not long survive his pertinacious foe. Seized with a fever when away from home, he was with difficulty conveyed to Görlitz. His wife was at Dresden on business; and during the first week of his malady he was nursed by a literary friend. He died, after receiving the rites of the church, grudgingly administered by the authorities, on Sunday, the 17th of November.

Boehme always professed that a direct inward opening or illumination was the only source of his speculative power. He saw no change in the order of nature; inorganic matter did not expect, for he was essentially a Protestant mystic. No "thus saith the Lord" was claimed as his warrant, after the manner of Antoinette Bourignon, or Ludowig Muggleton; no spirits or angels held converse with him as with Swedenborg. It is needless to dwell, in the way either of acceptance or rejection, on the very few occasions in which his outward life seemed to him to come into contact with the invisible world. The apparition of the pillar of gold to the herd boy on the Landskrone, the visit of the mysterious stranger to the young apprentice, the fascination of the luminous sheen, reflected from a common pewter dish, which first, in 1600, gave an intuitive turn to his meditations, the heavenly music which filled his ears as he lay dying—none of these matters is connected organically with the secret of his special power. The mysteries of which he disclosed were not reported to him: he "beheld" them. He saw the root of all mysteries, the Ungrund or Urgrund, whence issue all contrasts and discordant principles, hardness and softness, severity and mildness, sweet and bitter, love and sorrow, heaven and hell. These he judged to "in their origin: these he attempted to describe in their issue, and to reconcile in their eternal result. He saw into the being of God; whence the birth or going forth of the divine manifestation. Nature lay unvelled to him, he was at home in the heart of things. "His own book, which he himself was," the microcosm of man, with his threefold life, was patent to his vision. Such was his own account of his qualification. If he failed it was in expression; he confessed himself a poor mouthpiece, though he saw with a sure spiritual eye. It must not be supposed that the facts in which Boehme's pneumatic realism worked itself out in detail was shaped entirely from within. In his writings we trace the influence of Theophrastus Bombast von Hohenheim, known as Paracelsus (1493–1541), of Kaspar Schwenkfeld (1490–1561), the first Protestant mystic, and of Valentin Weigel (1533–1588). From the school of Paracelsus came much of his puzzling phraseology,—his Turba and Tinctura, and so forth,—a phraseology embarrassing to himself as well as to his readers. His friends plied him with foreign terms, which he was delighted to receive, interpreting them by an intuition assimilated and used in a calculation and reasoning power in a sense of his own. Thus the word Idea called up before him the image of "a very fair, heavenly, and chaste virgin." The title Aurora, by which his earliest treatise is best known, was furnished by Dr Balthasar Walther. These, however, were false helps; which only serve to obscure a difficult study, like the Pfragat and Lubei, with which his English translator veiled Boehme's own honest Schreck and Lust. There is danger lest his crude science and his crude philosophical vocabulary conceal the fertility of Boehme's ideas and the transcendent greatness of his religious insight. Few will take the pains to follow him through the interminable account of his seven Quellegzeister, which remind us of Gnosticism; or even of his three first properties of eternal nature, in which his disciples find Newton's formulae anticipated, and which certainly bear a marvellous resemblance to the three apxai of Schelling's Thseosmische Natur. Boehme is always greatest when he breaks away from his fancies and his trammels, and allows speech to the voice of his heart. Then he is artless, clear and strong; and no man can help listening to him, whether he dive deep down with the conviction "ohne Gift und Grimm kein Leben," or rise with the belief that "the being of all beings is a wrestling power," or soar with the persuasion that Love "in its height is as high as God." The mystical poet of Silesia, Angelus Silesius, discerned where Boehme's truest power lay when he sang—

"Im Wasser lebt der Fisch, die Pflanze in der Erden, Der Vogel in der Luft, die Sonn' am Firmament, Der Salamander muss im Feur' erhalten werden, Und Gottes Herz ist Jakob Böhme's Element."
The three periods of Boehme's authorship constitute three distinct stages in the development of his philosophy. He himself marks a threefold division of his subject-matter:—1. PHILOSOPHIA, i.e. the pursuit of the divine Sophia, a study of God in himself; this was attempted in the Ungrund. 2. ASTROLOGIA, i.e., in the largest sense, cosmology, the manifestation of the divine in the structure of the world and man; hereunto belong, with others, Die drei Principien göttlichen Wesens; Von dreifachen Leben der Menschen; Von der Menschwerdung Christi; Von der Geburt und Bezeichnung aller Wesen (known as Signatura Rerum). 3. THEOLOGIA, i.e., in Scougal's phrase, "the life of God in the soul of man." Of the speculative writings under this head the most important are Von der Gnadezwohl; Mysterium Magnum (a spiritual commentary on Genesis); Von Christi Testamenten (the Sacraments).

Although Boehme's philosophy is essentially theological, and his theology essentially philosophical, one would hardly describe him as a philosophical theologian; and, indeed, his position is not one in which either the philosopher or the theologian finds it easy to make himself completely at home. The philosopher finds no trace in Boehme of a conception of God which rests its own validity on an accord with the highest canons of reason or of morals; it is in the actual not in the ideal that Boehme seeks God, whom he discovers as the spring of natural powers and forces, rather than as the goal of advancing thought. The theologian is staggered by a language which breaks the fixed associations of the purely revealed, and the usual point of view, characteristically pictures God as underneath rather than above. Nature rises out of Him; we sink into Him. The Ungrund of the unmanifested Godhead is boldly represented in the English translations of Boehme by the word Abyss, in a sense altogether unexplained by its Biblical use. In the Theologia Germanica this tendency to regard God as the substantia, the underlying ground of all things, is accepted as a foundation for piety; the same view, when offered in the colder logic of Spinoza, is sometimes set aside as atheistical. The procession of spiritual forces and natural phenomena out of the Ungrund is described by Boehme in terms of a threefold manifestation, commended no doubt by the constitution of the Christian Trinity, but exhibited in a form derived from the school of Paracelsus. From Weigl he learned a purely idealistic explanation of the universe, according to which it is not the resultant of material forces, but the expression of spiritual principles. These two explanations were fused in his mind till they issued forth as equivalent forms of one and the same thought. Further, Schwenkfeld supplied him with the germs of a transcendental exegesis, whereby the Christian Scriptures and the dogmata of Lutheranism were opened up in harmony with his new-found views. Thus equipped, Boehme's own genius did the rest. A primary effort of Boehme's philosophy is to show how material powers are substantially one with moral forces. This is the object with which he draws out the dogmatic scheme which dictates the arrangement of his seven Quelgeschütz. Translating Boehme's thought out of the uncouth dialect of material symbols (as to which one doubts sometimes whether he means them as concrete instances, or as pictorial illustrations, or as a mere memoria techo), the English translators were compelled to transform triads of forces. Each triad consists of a thesis, an antithesis and a synthesis; and the two are connected by an important link. In the hidden life of the Godhead, which is at once Nichts and Alle, exists the original triad, viz. Attraction, Diffusion, and their resultant, the Agony of the unmanifested Godhead. The transition is made; by an act of will the divine Spirit comes to Light; and immediately the manifested life appears in the triad of Love, Expression, and their resultant, Visible Variety. As the action of contraries and their resultant are explained in the relations of soul, body and spirit; of good, evil and free will; of the spheres of the angels, of Lucifer, and of this world. It is a more difficult problem to account on this philosophy for the introduction of evil. Boehme does not resort to dualism, nor has he the smallest sympathy with a pantheistic repudiation of the fact of sin. That the difficulty presses him is clear from the progressive changes in his attempted solution of the problem. In the Ungrund nothing save good proceeds from the Ungrund, though there is good that abides and good that falls—Christ and Lucifer. In the second stage of his writing the antithesis is directly generated as such; good and its contrary are coincidently given from the one creative source, as factors of life and death, the former being the primary principle of divine manifestation—it is the wrath side of God. Corresponding to this change we trace a significant variation in the moral end contemplated by Boehme as the object of this world's life and history. In the first stage the world is created in remedy of a decline; in the second, for the adjustment of a balance of forces; in the third, to exhibit the eternal victory of good over evil, of love over wrath.

Editions of Boehme's works were published by H. Berke (Amsterdam, 1675); by J. G. Gichtel (Amsterdam, 1662–1683, 10 vols.); by K. W. Schiebler (Leipzig, 1831–1847, 7 vols.). Translations of his works have been made into Latin by J. A. Werenfagen (1632), Dutch (complete, by W. v. Bayerland, 1634–1641), and French (by Etienne Micel, c. 1650, and L. C. de Saint-Martin, 1800–1809. The works translated by John Ellistone (d. 1649) and John Sparrow, assisted by Durand Rothum and Humphrey Blunden, who paid for the undertaking, were much more regular than those of Boehmene himself. The cultivated but the vulgar, existed in England and in Holland. They were widely known as "Quaker" books. From the first, Quakers, that salvation is nothing short of the very presence of God in the soul of man, the most keenly felt and the most unselfish doctrine of the sacraments which exposed them to the polemics of Quakers (e.g., J. Anderson). Muggleton led an anthropomorphic asceticism against them, and so, as the sect was swept away. The Philadelphia Society at the beginning of the 18th century consisted of cultured mystics, Jane Lead, Pordage, Francis Lee, Bromley, &c., who fed upon Boehme. William Law (1666–1761) somewhat later recur ed to the same spring. His result, however, in those dry times of bringing his own good sense into question rather than of reviving the credit of his author. After Law's death the old English translation was in great part re-edited (4 vols., 1762–1784) as a tribute to his memory, by George Ward and Thomas Langcake, with plates from the designs of D. A. Freher (Brit. Mus. Add. MSS. 5767–5794). This form is what commonly called Law's translation; to complete it a 5th vol. (12mo., Dublin, 1820) is needed.

caused the lake to encroach, being among the most fertile in Greece. The central position of Boeotia between two seas, the strategic strength of its frontiers and the ease of communication within its extensive area were calculated to enhance its political importance. On the other hand the lack of good harbours hindered its maritime development; and the Boeotian nation, although it produced great men like Findar, Epaminondas, Pelopidas and Plutarch, was proverbially as dull as its neighbours. A more cunning spirit should have been found in the people for their splendid military qualities: both their cavalry and heavy infantry achieved a glorious record.

In the mythical days Boeotia played a prominent part. Of the two great centres of legends, Thebes with its Cadmean population figures as a military stronghold, and Orchomenus, the home of the Minyae, as an enterprising commercial city. The latter's prosperity is still attested by its archaeological remains (notably the "Treasury of Minyas") and the traces of artificial conduits by which its engineers supplemented the natural outlets. The "Boeotian" population seems to have entered the land from the north at a date probably anterior to the Dorian invasion. With the exception of the Minyae, the original peoples were soon absorbed by these immigrants, and the Boeotians henceforth appear as a homogeneous nation.

In historical times the leading city of Boeotia was Thebes, whose central position and military strength made it a suitable capital. It was the constant ambition of the Thebans to absorb the other townships into a single state, just as Athens had annexed the Attic communities. For a time Athens hardly figures in history before the late 6th century. Previous to this its people is chiefly known as the producer of a type of geometric pottery similar to the Dipylon ware of Athens. About 510 the resistance of Plataea to the federating policy of Thebes led to the interference of Athens on behalf of the former; on this occasion, and again in 507, the Athenians defeated the Boeotian levy. During the Persian invasion of 480, while some of the cities fought whole-heartedly in the ranks of the patriots, Thebes assisted the invaders. For a time the presidency of the Boeotian League was taken away from Thebes, but in 457 the Spartans reinstated that city as a bulwark against Athenian aggression. Athens retaliated by a sudden advance upon Boeotia, and after the victory of Oenophyta brought under its power the whole country excepting the capital. For ten years the land remained under Athenian control, which was exercised through the newly installed democracies; but in 447 the oligarchic majority raised an insurrection, and after a victory at Corona regained their freedom and restored the old constitutions. In the Peloponnesian War the Boeotians, embittered by the early conflicts round Plataea, fought zealously against Athens. Though slightly estranged from Sparta after the battle of Leuctra, they never showed their enmity against their neighbours. They rendered good service at Syraeum; but their greatest achievement was the decisive victory at Delium over the flower of the Athenian army (424), in which both their heavy infantry and their cavalry displayed unusual efficiency.

About this time the Boeotian League comprised eleven groups of sovereign cities and associated townships, each of which elected one Boeotarch or minister of war and foreign affairs, contributed sixty delegates to the federal council at Thebes, and supplied a contingent of about a thousand men and four hundred horse to the federal army. A safeguard against undue encroachment on the part of the central government was provided in the councils of the individual cities, to which all important questions of policy had to be submitted for ratification. These local councils, to which the proportioned classes alone were eligible, were subdivided into four sections, resembling the ptyanes of the Athenian council, which took it in turns to take previous cognizance of all new measures.1

Boeotia took a prominent part in the war of the Corinthian League against Sparta, especially at Haliartus and Coronea (395-394). This change of policy seems due mainly to the national resentment against foreign interference. Yet dissatisfaction against Thebes was now growing rife, and Sparta fostered the insurrection for the complete independence of all the cities in the peace of Antalcidas (387). In 374 Pelopidas restored the Theban dominion. Boeotian contingents fought in all the campaigns of Epaminondas, and in the later wars against Phocis (356-346); while in the dealings with Philip of Macedon the federal cities appear merely as the tools of Thebes. The federal constitution was also brought into accord with the democratic governments now prevalent throughout the land. The sovereign power was vested in the popular assembly, which elected the Boeotarcha (between seven and twelve in number), and sanctioned all laws. After the battle of Chaeronea, in which the Boeotian heavy infantry once again distinguished itself, the land never rose again to prosperity.

The destruction of Thebes by Alexander (335) seems to have paralysed the political energy of the Boeotians, though it led to an improvement in the federal constitution, by which each city received an equal vote. Henceforth they never pursued an independent policy, but followed the lead of protecting powers. Though the old military training and organization continued, the people proved unfit to defend the country, and the land became more than ever the "dancing-ground of Ares." Though enrolled for a short time in the Aetolian League (about 245 B.C.) Boeotia was generally loyal to Macedonia, and supported its later kings against Rome. In return for the excesses of the democracies Rome dissolved the league, which, however, was allowed to revive under Augustus, and merged with the other central Greek federations in the Achaean synod.

The death-blow to the country's prosperity was given by the devastations during the first Mithradatic War. Save for a short period of prosperity under the Frankish rulers of Athens (1205-1310), who repaired the katavthesis and fostered agriculture, Boeotia long continued in a state of decay, aggravated by occasional barbarian incursions. The first step towards the country's recovery was not until 1895, when the ousts of Copals were again put into working order. Since then the northern plain has been largely reclaimed for agriculture, and the natural riches of the whole land are likely to develop under the influence of the railway to Athens. Boeotia is at present a Nomos with Livadia (the old Turkish capital) for its centre; the other principal urban centres have drifted back to the villages.

The population (65,816 in 1907) is largely Albanian.

BOER, the Dutch form of the Eng. "boor," in its original signification of husbandman (Ger. Bauer), a name given to the Dutch farmers of South Africa, and especially to the Dutch population of the Transvaal and Orange River States. (See South Africa and Transvaal.)

BOERHAAVE, HERMANN (1668-1738), Dutch physician and man of science, was born at Voorhout near Leiden on the 31st of December 1668. Entering the university of Leiden he took his degree in philosophy in 1689, and in his dissertation De electromagnetisque motu, in which he attacked the doctrines of Epicurus, Hobbes and Spinoza. He then turned to the study of medicine, in which he graduated in 1693 at Harderwijk in Guelderland. In 1701 he was appointed lecturer on the institutes 1 Thucylides (v. 38), in speaking of the "four councils of the Boeotians," is referring to the plenary bodies in the various states.
BOETHUS—BOETIUS

of medicine at Leiden; in his inaugural discourse, De commen-
dando Hippocratis studio, he recommended to his pupils that
great physician as their model. In 1709 he became professor of
botany and medicine, and in that capacity he did good service,
not only to his own university, but also to botanical science, by
his improvements and additions to the botanical garden of Leiden,
and by the publication of numerous works descriptive of new
species of plants. In 1714, when he was appointed rector of the
university, he succeeded Godert Bidloo (1649-1713) in the chair
of practical medicine, and in this capacity he had the merit of
introducing the modern system of clinical instruction. Four
years later he was appointed also to the chair of chemistry. In
1728 he was elected into the French Academy of Sciences, and
two years later into the Royal Society of London. In 1729
declining health obliged him to resign the chairs of chemistry
and botany; and he died, after a lingering and painful illness,
on the 23rd of September 1738 at Leiden. His genius so raised
the fame of the university of Leiden, especially as a school of
medicine, that it became a resort of strangers from every part of
Europe. All the princes of Europe sent him disciples, who found
in this skilful professor not only an indefatigable teacher, but an
affectionate guardian. When Peter the Great went to Holland
in 1715, to instruct himself in maritime affairs, he also took
lessons from Boerhaave. His reputation was not confined to
Europe; a Chinese mandarin wrote him a letter directed "To
the illustrious Boerhaave, physician in Europe," and it reached
him in due course.

His principal works are—Institutiones medicæ (Leiden, 1708);
Aphorismi de cognoscendis et curandis morbis (Leiden, 1709),
on which his pupil and assistant, Gerard van Swieten (1700-1772)
published a commentary in 5 vols.; and Elementa chemiae (Paris,
1724).

BOETHUS, a sculptor of the Hellenistic age, a native of
Carthage (or possibly Chalcedon). His date cannot be accurately
fixed, but was probably the 2nd century b.c. He was noted for
his representations of children, in dealing with whom earlier
Greek art had not been very successful; and especially for a
group representing a boy struggling with a goose, of which several
copies survive in museums.

BOETIUS (or BOETHIUS), ANICIUS MANLIUS SEVERINUS
(c. A.D. 450-524), Roman philosopher and statesman, described
by Gibbon as the "last of the Romans whom Cato or Tully could
have acknowledged for their countryman." The historians of
the day give us but imperfect records or make unsatisfactory
allusions. Later chroniclers indulged in the fictitious and
the marvellous, and it is almost exclusively from his own books that
true trustworthy information can be obtained. There is considerable
diversity among authorities as to his name. One editor of his
De Consolatione, Bertius, thinks that he bore the praenomen
of Flavius, but there is no authority for this supposition. His
father was Flavius Manlius Boetius, and it is probable that the
Flavius Boetius, the praetorian prefect who was put to death in
A.D. 455 by order of Valentinian III., was his grandfather, but
these facts do not prove that he also had the praenomen of
Flavius. Many of the earlier editors inserted the name of
Tortulanus, but it is not found in any of the best manuscripts.
The name Boetius seems to have been invented for the sake of
being connected with the Greek Βοήθως; but the best manuscripts
agree in reading Boetius.

His boyhood was spent in Rome during the reign of Odoacer.
We know nothing of his early years. A passage in a treatise
falsely ascribed to him (De Disciplina Scholarium) and a mis-
interpretation of a passage in Cassiodorus led early scholars to
suppose that he spent some eighteen years in Athens pursuing
his studies, but there is no foundation for this opinion.
His father, consul in 457, seems to have died soon after; for Boetius
states that, when he was bereaved of his parents, then of the
highest rank took him under their charge (De Cons. lib. ii. c. 3.),
some of his friends. Boetius was consul in 458, and his sons,
while still young, held the same honour together (222). Boetius
regarded it as the height of his good fortune when he witnessed
his two sons, consuls at the same time, conveyed from their home
to the senate-house amid the enthusiasm of the masses. On that
day, he tells us, while his sons occupied the curule chairs in the
senate-house, he himself held the honour of pronouncing a
panegyric on the monarch. But his good fortune did not last,
and he attributes the calamities that came upon him to the
ill-will which his bold maintenance of justice had caused, and to
his opposition to every oppressive measure. Of this he mentions
particular cases. A famine had begun to rage. The prefect
of the praetorium was determined to satisfy the soldiers, regardless
of altogether of the feelings of the provincials. He accordingly
issued an edict for a coempsio, that is, an order compelling the
provincials to sell their corn to the government, whether they
would or not. This edict would have utterly ruined Campania.
Boetius interfered. The case was brought before the king, and
Boetius succeeded in averting the coempsio from the Campanians.
And he gives as a crowning instance that he exposed himself to
the hatred of the informer Cyprianus by preventing the punish-
ment of Albinus, a man of consular rank. He mentions in
another place that when at Verona the king was anxious to
transfer the accusation of treason brought against Albinus to
the whole senate, he defended the senate at great risk. In
consequence of the ill-will that Boetius had thus roused, he was
accused of treason towards the end of the reign of Theodoric.
The charges were that he had conspired against the king, that
he was anxious to maintain the integrity of the senate, and to
restore Rome to liberty, and that for this purpose he had written
to the emperor Justin. Justin had, no doubt, special reasons
for wishing to see an end to the reign of Theodoric. Justin was
orthodox, Theodoric was an Arian. The orthodox subjects of
Theodoric were suspicious of their ruler; and many would gladly
have joined in a plot to displace him. The knowledge of this
fact may have rendered Theodoric suspicious. But Boetius denied
the accusation in unequivocal terms. He did indeed wish with
the integrity of the senate. He would fain have desired liberty,
but all hope of it was gone. The letters addressed by him to Justin
were forgeries, and he had not been guilty of any conspiracy.
Notwithstanding his innocence he was condemned and sent to
Ticinum (Pavia) where he was thrown into prison. It was during
his confinement in this prison that he wrote his famous work De
Consolatione Philosophiae. His goods were confiscated, and after
an imprisonment of considerable duration he was put to death in
524. Procopius relates that Theodoric soon repenting of his cruel
deed, and that his death, which took place a few days after, was
hastened by remorse for the crime he had committed against his
great counsellor.

Two or three centuries after the death of Boetius writers began
to view his death as a martyrdom. Several Christian books were
ascribed to him, and there was one especially on the Trinity (see
below) which was regarded as proof that he had taken an active
part against the heresy of Theodoric. It was therefore for his
orthodoxy that Boetius was put to death. And these writers
joined in the current legend that after his death, his body was
hung out by the hands on the housetops, so that he was exposed to
the marvellous actions which the saint performed at his death.
He was locally regarded as a saint, but he was not canonized.
The brick tower in Pavia in which he was confined was, and still is,
an object of reverence to the country people. Finally, in the year 996, Otho III. ordered the
bones of Boetius to be taken out of the place in which they lay,
and to be placed in the church of S. Pietro in Ciel d'Orò
within a splendid tomb, for which Gerbert, afterwards Pope
Hildebrand, wrote an inscription. Thence they were subsequently
removed to a tomb beneath the high altar of the cathedral.
It should be mentioned also that some have given him a decidedly
Christian name, of the name of Elpis, who wrote hymns, two of
which are still extant (Daniel, Thes. Hymn. i. p. 150). This is a
pure supposition inconsistent with chronology, and based only
on a misinterpretation of a passage in the De Consolatione.
The contemporaries of Boetius regarded him as a man of profound learning. Priscian the grammarian speaks of him as having attained the summit of honesty and of all sciences. Cassiodorus, magister officiorum under Theodoric and the intimate acquaintance of the philosopher, employs language equally strong, and Ennodius, the bishop of Pavia, knows no bounds for his admiration. Theodoric had a profound respect for his scientific abilities. He employed him in writing right the coinage. When he visited Rome with Gunibald, king of the Burgundians, he took him to Boetius, who showed them, amongst other mechanical contrivances, a sun-dial and a water-clock. The foreign monarch was astonished, and, at the request of Theodoric, Boetius had to prepare others of a similar nature, which were sent as presents to Gunibald.

The fame of Boetius increased after his death, and his influence during the middle ages was exceedingly powerful. His circumstances particularly favoured this influence. He appeared at a time when contempt for intellectual pursuits had begun to pervade society. In his early years he was seized with a passionate enthusiasm for Greek literature, and this continued through life. Even amidst the cares of the consulsiphe he found time for commenting on the Categories of Aristotle. The idea laid hold of him of reviving the spirit of his countrymen by imbuing them with the thoughts of the great Greek writers. He formed the resolution to translate all the works of Aristotle and all the dialogues of Plato, and to reconcile the philosophy of Plato with that of Aristotle. He did not succeed in all that he designed; but he did a great part of his work. He translated into Lat in Aristotle's Analytica Priora et Posteriora, the Topica, and Enchelii Sophistici; and he wrote commentaries on Aristotle's Categories, on his book ἀριθμός ἐγγενείας, also a commentary on the Isagoge of Porphyrius. These works formed to a large extent the source from which the middle ages derived their knowledge of Aristotle. (See Stahh, Aristoteles bei den Römern, pp. 196-334.)

Boetius wrote also a commentary on the Topica of Cicero; and he was also the author of independent works on logic.—Introductio ad Categoricas Syllogismos, in one book; De Syllogismis Categoriciis, in two books; De Dialectica, in one book; De Definitione, in one book; De Differentia Topica, in four books.

We see from a statement of Cassiodorus that he furnished manuals for the quadrivium of the schools of the middle ages (the "quattuor matheseos disciplinae," as Boetius calls them) on arithmetic, music, geometry and astronomy. The statement of Cassiodorus that he translated Nicomachus is rhetorical. Boetius himself tells us in his preface addressed to his father-in-law Symmachus that he had taken liberties with the text of Nicomachus, that he had abridged the work when necessary, and that he had introduced formulae and diagrams of his own where he thought them useful for bringing out the meaning. His work on music also is not a translation from Pythagoras, who left no writing behind him. But Boetius belonged to the school of musical writers who based their science on the method of Pythagoras. They thought that it was not sufficient to trust to the ear alone, to determine the principles of music, as did practical musicians like Aristoxenus, but that along with the ear, knowledge of arithmetical proportions should be employed. The work of Boetius is in five books and is a very complete exposition of the subject. It long remained a text-book of music in the universities of Oxford and Cambridge. It is still very valuable as a help in ascertaining the principles of ancient music, and gives us the opinions of some of the best ancient writers on the art. The manuscripts of the geometry of Boetius differ widely from each other. One editor, Godofreduis Friedlein, thinks that there are only two manuscripts which can at all lay claim to contain the work of Boetius. He published the Ars Geometrica, in two books, as given in these manuscripts; but critics are generally inclined to doubt the genuineness even of these. Professor Rand of Georgius Ernst and A. P. McKinlay regard the Ars as certainly inauthentic, while they accept the Interpretatio Euclidis (see works quoted in bibliography).

By far the most important and most famous of the works of Boetius is his book De Consolatione Philosophiae. Gibbon justly describes it as "a golden volume, not unworthy of the leisure of Plato or Tully, but which claims incomparable merit from the barbarism of the times and the situation of the author."

The high reputation it had in medieval times is attested by the numerous translations, commentaries and imitations of it which were made. Among these we may mention Alcuin's translation, and the commentaries of the Great, and Robert Grosseteste, bishop of Lincoln, commented on it. Alfred translated it into Anglo-Saxon. Versions of it appeared in German, French, Italian, Spanish and Greek before the end of the 15th century. Chaucer translated it into English before the year 1382; and this translation was published by Caxton at Westminster, 1480. Lydgate followed in the wake of Chaucer. It is said that, after the invention of printing, amongst others Queen Elizabeth translated it; and that the work was well known to Shakespeare. It was the basis of the earliest specimen of Provençal Literature.

This famous work consists of five books. Its form is peculiar, and Boetius intentionally imitated it from Marcus Cæpella, De Nuptiis Philholiæ et Mercurii. It is alternately prose and verse. The verse shows great facility of metrical composition, but a considerable portion of it is transferred from the tragedies of Seneca. The book opens with a eulogy on the uses of liberal arts, how his sorrows had brought him to a premature old age. As he is thus lamenting, a woman appears to him of dignified mien, whom he recognizes as his guardian, Philosophy. She, resolving to apply the remedy, proceeds to state the case. She says that Boetius believes that God rules the world, but does not know what he himself is; and this absence of self-knowledge is the cause of his distress. In the course of her discourse she lays before him Fortune, who is made to state to him the blessings he has enjoyed, and after that proceeds to discuss with him the kind of blessings that fortune can bestow, which are shown to be unsatisfactory and uncertain. In the third book Philosophy promises to lead him to true happiness, which is to be found in God alone, for since God is the highest good, and the highest good is true happiness, God is true happiness. Nor can real evil exist, for since God is powerful and since he does not wish evil, evil must be non-existent. In the fourth book Boetius raises the question, Why, if the governor of the universe is good, do evils exist, and why is virtue often punished and vice rewarded? Philosophy, who has not promised him anything, is never punished or vice unrewarded. From this Philosophy passes into a discussion in regard to the nature of providence and fate, and shows that every fortune is good. The fifth and last book, which contains the theological work, has been ascribed to Boetius, as has been already mentioned. The Consolation affords conclusive proof that the author was not a practical believer in Christianity. The Christian elements are only quoted as a proof that the purgatoria clementia, which have been thought to be derived from the Christian faith; but they are used in a heathen sense, and are explained sufficiently by the circumstance that Boetius was on intimate terms with Christians. The writer nowhere finds consolation in any Christian belief, and Christ is never named in the work. It is not impossible, however, that Boetius may have been brought up in a Christian household, and that in his early years he may have written some Christian books. Peiper thinks that the first three treaties are the productions of the early years of Boetius. The first, De Sancta Trinitate, is addressed to Symmachus (Domino Patri Symmacho), is a treatise on the Trinity and is a work of the greatest value. The second treatise is addressed to the Deacon Constantius, and is a work of the utmost value. The second treatise is addressed to the Deacon ("Ad Joannis Diaconum"), and its subject is "Utrum Pater et Filius et Spiritus Sanctus de divinitate substantiæ circa praedentem prædictæ." This treatise is shorter than the first, occupying only two or three pages, and the argument is the same. The third treatise bears the title, Quæmost substantiæ in suo quod sint bona sint cum non sint substantiæ bona. It contains nothing distinctly Christian, and it contains nothing of the nature of the Trinity; therefore it is a work of the first years of Boetius. Peiper thinks that, as the best MSS. uniformly assign these treatises to Boetius, they are to be regarded as his; that it is probable that the third is a work of his later years. The third book contains the highest distinction which took charge of him when he lost his father: and that these treatises are the first-fruits of his studies, which he dedicates to his guardians and benefactors. He thinks that the variations in the inscriptions of the fifth treatise, which is not found in the best manuscript, are so great that the name of Boetius could
not have originally been in the title. The fourth book is also not found in the best manuscript, and two manuscripts have no inscription. He infers, from these facts, that there is no sure evidence for the authorship of these books. The last book, however, is entitled De Contr. Eutychen et Nestoriurn. Both Eutyches and Nestorius are spoken of as living. A council is mentioned, in which a letter was read, expounding the opinion of the Eutychians for the first time. This letter also alludes to a letter addressed to Counterparts to the council of Chaledon (451). The treatise was therefore written before the birth of Boetius, if it be not a forgery; but there is no reason to suppose that the treatise was not a genuine production of Boetius, of this period. The foot-note, De Fide Catholicae, does not contain any distinct chronological data; but the tone and opinions of the treatise produce the impression that it was written not long after the zeal shown, as the treatise, by Eutyches and Nestorius. Several inscriptions abjure both these treatises to Boetius. It will be seen from this statement that Peiper bases his conclusions on grounds far too narrow; and on the whole it is not justifiable to say that he wrote non-Greek, or that his Christian treatises, particularly as they are not ascribed to him by any of his contemporaries. Three of them express in the strongest language the orthodox faith of the church in opposition to the Arian heresy, and these three put in unanswerable language the procession of the Holy Spirit from both Father and Son. The fourth argues for the orthodox belief of the two natures and one person in the Son. The desire which it should be to suppose that Boetius perished from his opposition to the heresy of Theodoric, it was natural to ascribe to him works which were in harmony with this supposed fact. The works may really have been written by another Boetius, or Africa, as it is supposed, for the saint Severinus, as Nitzsch conjectures, and the similarity of name may have assisted the delineation of the the theatre or neutral Boetius.

Important and, if genuine, decisive evidence upon this point is afforded by a passage in the Aenectolon Holderi, a fragment contained in a 10th-century MS. (ed. H. Usener, Leipzig, 1877). The fragment gives an extract from a previously unknown letter of Cassiodorus, the important words being "Scriptum (i.e. Boetius) librum de sancta trinitate, et capita quaedam dogmatica, et librum contra Nestorium." Nitzsch, however, held that this was a copyist's gloss, harmonizing with the received Boetius legend, which had been transferred from the text, and did not consider that it outweighed the opposing internal evidence from De Cons. Phil. The first collected edition of the works of Boetius was published at Venice in 1492 (Basil, 1570); the last in J. P. Migne's Patrologia, lxiii., lxiv. (Paris, 1847). Of the numerous editions of the De Consolatione the best are those of Theodorns Obhariaus (Jena, 1843), and R. Peiper (Leipzig, 1871). The first contains prefaces by the life and writings of Boetius, on his religion and philosophy, and on the manuscripts and editions, a critical apparatus, and notes. The text of the second was based on the fullest collection of MSS. used by M. de Saülard, a considerable number of MSS. not used by him, were, however, considered to be collated. In addition to an account of the MSS. used, it gives the Book of Lupus, "De Metris Boetii," the "Vita Boetii" contained in the Cappelen MSS., and a few other treatises and imitators of the Consolation. It contains also an account of the metres used by Boetius in the Consolation, and a list of the passages which he has borrowed from the tragedies of Seneca. The third edition contains the five chief works of Boetius, of which mention has been made above. King Alfred's Anglo-Saxon version of the De Consolatione, with literal English translation, numerous notes, and glosses (1858) is also known. "Boetius" was printed in 1699; on the style, see A. Engelbrecht in Sitzungsber. der Wiener Akad. der Wissenschaften (1902), pp. 15-36. The De Institutions Arithmeticae, De Institutione Musica, and the doubt concerning the Erne, De Institutione Geometrica, De Institutione Mathematica, Boetii nomini tradita sunt quaedam questiones, 1903; A. F. McKinlay in Harvard Classical Studies, 1907; M. Cantor, Geschichte der Mathematik, 1, Leipzig, 1894; G. Friedlein, Gericht der Mathematik, II, Leipzig, 1879; and die Neuen Orphische, English translations are edited by G. Friedlein (Leipzig, 1867). German translation of the De Musica, with explanatory notes, by O. Paul (Leipzig, 1872), and on the sources W. Mücke, Boetius libri de musica primi filiatur (Jena, 1896). Further Commentary on Aristoteles's De Interpretatione, in Boethii, ed. C. Meiser (Leipzig, 1877), and on Porphyry's Isagoge, ed. S. Brandt (Vienna, 1996).

Boethius is generally, see J. G. Sutterer, Die letzte Römer (Eichstätt, 1825); H. Usener, Aenectolon Holderi (Leipzig, 1877); H. F. Stwart, Boethius: an Essay (Edinburgh, 1891); T. Hodgkin, Italy and her Invaders, ii. bk. iv. ch. xii. (1898); A. H. Hodge, Geschichte der Mathematik, des Mittelalters, A. (1899); A. Teuffel-Schwabe, Hist. of Roman Literature (Eng. trans., 1900), p. 478: on the date and order of his works, S. Brandt in Philologus, xxxii. pp. 134, 34, 239, 579, and A. F. McKinlay, as above, with refs.; on his "Songs," A. H. Hodge, Studia in Boetii carmina collata (Regensburg, 1900); on his style, G. Bednarz, De unverso oratioem colore Boethii (Breslau, 1883); on his theological attitude and works, F. A. B. Nitzsch, Das System des Boethius und die ihm zugeschriebenen theologischen Schriften (Berlin, 1860), and art. in Herzog-Hauck's Realencyclopaedie (1897); C. Journaud, De l’origine des traditions sur le "De Consolatione." "Le Christianisme de Boèce," in Journal des Savants (1886), pp. 449-462; A. Hildebrand, Boethius und seine Stellung zum Christentumme (Regensburg, 1863); G. Scheppe, Zu Ps.-Boethiios de fide catholica, in Zeitschrift für kaischriftliche Denkmäler (Berlin, 1865).

Bog (from Ir. and Gael, bogue, bag, soft), a tract of soft, spongy, water-logged ground, composed of vegetation, chiefly mosses, in various stages of decomposition. This vegetable matter when partially decomposed forms the substance known as "peat" (q.v.). When the accumulation of water is rapidly increased by excessive rainfall, there is a danger of a "bog-slide," or "bog-burst," which may obliterate the neighbouring cultivated land with a deposit of the contents of the bog. Destructive bog-slides have occurred in Ireland, such as that of the Knocknagheagh Bog, Rathmore, Kerry, in 1866, at Castlerhea, Roscommon, in 1907, and at Kilmore, Galway, 1909.

There is a French game of cards called "bob," said to be of Italian origin, played with a piquet pack on a table with six divisions, one of which is known by the name of the game and forms the pool. It was fashionable during the Second Empire.

Bogatzky, Karl Heinrich von (1690-1774), German hymn-writer, was born at Jankowce in Lower Silesia on the 7th of September 1690. At first a page at the ducal court of Saxe-Weissenfels, he next studied law and theology at Jena and Hal; but ill-health preventing his further progress, he settled at Czel, Lower Silesia, where he published his first book. After living for a time at Köstritz, and from 1470 to 1475 at the court of Christian Ernst, duke of Saxe-Coburg, at Saalfeld, he made his home at the Waisenhau (orphanage) at Hall., where he engaged in spiritual work and in composing hymns and sacred songs, until his death on the 15th of June 1774. Bogatzky's chief works are Guldénnes Schatskästlein der Kinder Gottes (1718), which has reached more than sixty editions; and Überg der Geistigkeit in allerlei gesellschaftlichen Liedern (1750).

See Bogatzky's autobiography—Lebenslauf von ihrem selben geschrieben (Halle, 1801; new ed., Berlin, 1872); and Leidderose, Das Leben Bogatzky's (Heidelberg, 1846); also Kelly, C. H. von Bogatzky's Life and Work (London, 1889).

Boghaz Keui, a small village in Asia Minor, north-west of Yuzgat in the Angora vilayet, remarkable for the ruins and rock-sculptures in its vicinity. The ruins are those of a ruling city of the oriental type which flourished in the pre-Greek period. They are generally identified with Pertia (q.v.), a place taken by Cæsar after he had crossed the Halys (Herodotus i. 76).

Bogie, a northern English dialect word of unknown origin, applied to a kind of low truck or "trolley." In railway engineering it is applied to an under-truck, most frequently with four wheels, which is often provided at one end of a locomotive or both ends of a carriage. It is pivoted or swiveled on the main frames, so that it can turn relatively to the body of the vehicle or engine, and thus it enables the wheels readily to follow the curves of the line. It has no connexion with the series of words, such as "bogey" or "bogy," "boggle," "boggle," "bogart" (in Shakespeare "bug," "bugs. and goblins"), which are probably connected with the Welsh "bug," a spectre; hence the verb to "boggle," properly applied to a horse which shies at supposed spectres, and so meaning to hesitate, bungle.

Bogno, a seaside resort in the Chichester parliamentary division of Sussex, England, 66 m. S.S.W. from London by the London, Brighton & South Coast railway. Pop. of urban district (1901) 6180. Besides the parish church there is a Roman Catholic priory belonging to the religious of the Benedictine order, a town council, and magistrates, a theatre, assembly rooms, and numerous convalescent homes, including an establishment belonging to the Merchant Taylors' Company. The church of the mother parish of South Bersted is Norman and Early English, and retains a fresco of the 12th century.

Bogo, a town of the province of Celú, island of Cebú, Philippine Islands, on Bogó Bay at the mouth of the Buluic river, in the north-east part of the island. Pop. (1903) 14,915. The
climate is hot but healthy. The surrounding country is fertile, producing sugar, Indian corn, and maguey in abundance; rice, cashew and fruits are also produced. Hats, baskets, clothes and rope are woven and are exported to a limited extent; small quantities of copra are also exported. The fisheries are of considerable local importance. The language is Cebu-Visayan.

**BOGDUKHOV,** a town in Russia, in the government of Kharkov, 45 m. by rail N.W. of the city of that name, in 49° 58’ N. lat. and 36° 9’ E. long. was founded in 1856. (1861) 10,522; (1897) 11,928. There seems to have been a settlement on this site as early as 1571. In 1700, at the time of the Russo-Swedish War, Bogodukhov was taken by Menshikov and the emperor Alexius. It contains a cathedral, built in 1703. Boots, caps and furred gowns are manufactured, and gardening and tanning are carried on. The trade is principally in grain, cattle and fish.

**BOGOMILS,** the name of an ancient religious community which had its origin in Bulgaria. It is difficult to ascertain whether the name was taken from the reputed founder of that sect, a certain pope Bogumil or Bogomil, or whether he assumed that name after it had been given to the whole sect. The word is a direct translation into Slavonic of Massaliati, the Syrian name of the sect corresponding to the Greek Euchites. The Bogomils are identified with the Massaliati in Slavonic documents of the 13th century. They are also known as Pavškeni, i.e. Paulicians. It is a complicated task to determine the true character and the tenets of any ancient sect, considering that almost all the information that has reached us has come from the later compilers. The heretical literature has to a great extent either perished or been completely changed; but much has also survived in a modified written form or through oral tradition. Concerning the Bogomils something can be gathered from the information collected by Euthymius Zygadenus in the 12th century, and from the polemic Against the Heretics written in Slavonic by St Kozma during the 16th century. The old Slavonic lists of forbidden books of the 15th and 16th centuries also give us a clue to the discovery of this heretical literature and of the means the Bogomils employed to carry on their propaganda. Much may also be learnt from the doctrines of the numerous heretical sects which arose in Russia after the 11th century.

The Bogomils were without doubt the connecting link between the so-called heretical sects of the East and those of the West. They were, moreover, the most active agents in disseminating such teachings in Russia and among all the nations of Europe. They may have found in some places a soil already prepared by more ancient tenets which had been preserved in spite of the persecution of the official Church, and handed down from the people in secret Christianity. In the 11th and 12th centuries the Bogomils were already known in the West as "Bulgari." In 1207 the Bulgarorum heresis is mentioned. In 1223 the Albigenes are declared to be the local Bougres, and at the same period mention is made of the "Pope of the Albigenes who resided within the confines of Bulgaria." The Cathars and Patarenes, the Waldenses, the Anabaptists, and in Russia the Strigilni, Molokani and Duobhorita, have all at different times been either identified with the Bogomils or closely connected with them.

**Doctrine.**—From the imperfect and conflicting data which are alone available on the respective religious systems of the Bogomils were both Adoptionists and Manichaens. They had accepted the teaching of Paul of Samosata, though at a later period the name of Paul was believed to be that of the Apostle; and they were not quite free from the Dualistic principle of the Gnostics, at a later period too much identified with the teaching of Mani. They rejected the pneumatic Christianity of the orthodox churches and did not accept the docetic teaching of some of the other sects. Taking as our starting-point the teachings of the heretical sects in Russia, notably those of the 14th century, which are a direct continuation of the doctrines held by the Bogomils, we find that they denied the divine birth of Christ, the personal coexistence of the Son with the Father and Holy Ghost, and the validity of sacraments and ceremonies. The miracles performed by Jesus were interpreted in a spiritual sense, not as real material occurrences; the Church was the inferior spiritual church in which all held equal share. Baptism was only to be practised on grown men and women. The Bogomils repudiated infant baptism, and considered the baptismal rite to be of a spiritual character neither by water nor by oil but by self-abnegation, prayers and chanting of hymns. Carp Strigilni, who in the 14th century preached this doctrine in Novgorod, explained that St Paul had taught that simple-minded men should instruct one another; therefore they elected their preachers from simple-minded people, and they and guides, and had no special priests. Prayers were to be said in private houses, not in separate buildings such as churches. Ordination was conferred by the congregation and not by any specially appointed minister. The congregation were the "elect," and each member could obtain the perfection of Christ and become a Christ or " Chlist." Marriage was not a sacrament. The Bogomils refused to fast on Mondays and Fridays. They rejected monachism. They declared Christ to be the Son of God only through grace like other prophets, and that the bread and wine of the eucharist were not transformed into flesh and blood; that the last judgment would be executed by God and not by Jesus; that the images and the cross were idols and the worship of saints and relics idolatry.

These Paulician doctrines have survived in the great Russian sects, and can be traced back to the teachings and practice of the Bogomils. But in addition to these doctrines of an adoptionist origin, they held the Manichaean dualistic conception of the origin of the world. This has been partly preserved in some of their literary remains, and has taken deep root in the beliefs and traditions of the Bulgarians and other nations with whom they had come into close contact. The chief literature of all the heretical sects throughout the ages has been that of apocryphal Biblical narratives, and the popes Jeremiah or Bogumil are directly mentioned as authors of such forbidden books "which no orthodox dare read." Though these writings are mostly the same in origin as are known from the older lists of apocryphal books, they underwent in this case a certain modification at the hands of their Bogomil editors, so as to be used for the propagation of their own specific doctrines. In its most simple and attractive form—one at the same time invested with the authority of the reputed holy author—their account of the creation of the world and of man; the origin of sin and redemption, the history of the Cross, and the disputes between body and soul, right and wrong, heaven and hell, were embodied either in "Historiated Bibles" (Paleya1) or in special dialogues held between Christ and his disciples, or between renowned Fathers of the Church who expounded these views in a simple manner adapted to the understanding of the people (Lucidaria). The Bogomils taught that God had two sons, the elder Satanail and the younger Michael. The elder son rebelled against the father and became the evil spirit. After his fall he created the lower heavens and the earth and tried in vain to create man; in the end he had to appeal to God for the Spirit. After creation Adam was allowed to till the ground on condition that he sold himself and his posterity to the owner of the earth. Then Michael was sent in the form of a man; he became identified with Jesus, and was "elected" by God after the baptism in the Jordan. When the "Michael" (Michael) appeared in the shape of a dove, Jesus received power to break the covenant, and to form the clay tablet (hierographon) held by Satanail from Adam. He had now become the angel Michael in a human form; as such he vanquished Satanail, and depriving him of the termination "iL = God," in which his power resided. Satanail was thus transformed into Satan. Through his machinations the crucifixion took place, and Satan was the originator of the whole Orthodox community with its churches, vestments, ceremonies, sacraments and fasts, with its monks and priests. This world being the work of Satan, the perfect must eschew any and every excess of its pleasures. But the Bogomils did not go as far as to recommend asceticism. They held the "Lord’s Prayer" in high respect as the most

1 These betray their Gnostic (Marcionite) spirit by the anti-Jewish tone of the oldest MSS. extant, though this prejudice tends to decrease in later MSS.
potent weapon against Satan, and had a number of conjurations against "evil spirits." Each community had its own twelve "apostles," and women could be raised to the rank of "elect." The Bogomils wore garments like mendicant friars and were known as keen missionaries, travelling far and wide to propagate their doctrines. Healing the sick and conjuring the evil spirit, they traversed different countries and spread their apocryphal literature along with some of the books of the Old Testament, deeply influencing the religious spirit of the nations, and preparing them for the Reformation. They sowed the seeds of a rich religious popular literature in the East as well as in the West. The Bogomils, influenced by the Donatists, the Wurmser Heretics, the Waldensians, and the Hussite movement, obtained through Heaven and Hell, the numerous Adam and Martin legends, the religious poems of the "Kaléki perehozhie" and other similar productions owe their dissemination to a large extent to the activity of the Bogomils of Bulgaria, and their successors in other lands.

History.—The Bogomil propaganda follows the mountain chains of central Europe, starting from the Balkans and continuing along the Carpathian Mountains, the Alps and the Pyrenees, with ramifications north and south (Germany, England and Russia, especially). The latter part of the 12th century, to transplanted in Thracia. These were noted heretics and were persecuted by the Greek Church with fire and sword. The empress Theodora killed, drowned or hanged no fewer than 100,000. In the 10th century the emperor John Zimisces, himself of Armenian origin, transplanted less than 200,000 Armenians to Europe and settled them in the neighbourhood of Philippopolis, which henceforth became the centre of a far-reaching propaganda. Settled along the Balkans as a kind of bulwark against the invading Bulgars, the Armenians on the contrary soon fraternized with the newcomers, whom they converted to their own views; even a prince of the Bulgarians adopted their teaching. According to Slavonic documents the founder of this sect was a certain priest Bogumil, who "imibbed the Manichaean teaching and flourished at the time of the Bulgarian emperor Peter" (927-968). According to another source the founder was called Jeremiah (or there was another priest associated with him by the name of Jeremiah). The Slavonic sources are unanimous on the point that his teaching was Manichaean. A Synodikon from the year 1217 affirms that the names of his "apostles" are: Migon, Todor, Dobri, Stefan, Vasile and Peter, all thoroughly Slavonic names. Zealous missionaries carried their doctrines far and wide. In 1004, scarcely 15 years after the introduction of Christianity into Russia, we hear of a priest Adrian teaching the same doctrines as the Bogomils. He was imprisoned by Leontie, bishop of Kiev. In 1125 the Church in the south of Russia had to combat another heresiarch named Dmitri. The Church in Bulgaria also tried to extirpate Bogomilism. The pope in Rome whilst leading the Crusade against the Albigenses did not forget their counterpart in the Balkans and recommended the annihilation of the heretics.

The Bogomils spread westwards, and settled first in Servia; but at the end of the 12th century Stephen Nemanja, king of Servia, persecuted them and expelled them from the country. Large numbers took refuge in Bosnia, where they were known under the name of Patarens (q.v.) or Patareni. From Bosnia their influence extended into Italy (Piedmont). The Hungarian undertook many crusades against the heretics in Bosnia, but towards the close of the 15th century the conquest of that country by the Turks put an end to their persecution. It is alleged that a large number of the Bosnian Paterenies, and especially the nobles, embraced Islam (see BOSNIA AND HERZEGOVINA: History). Few or no remnants of Bogomilism have survived in Bosnia.

The Ritual in Slavonic written by the Bosnian Radoslav, and published in vol. xv. of the Starine of the South Slavonic Academy at Agram, shows great resemblance to the Cathar ritual published by Cunzit, 1853. See F. Racić, "Bogomili i Paterenji", in Novi, vols. vi., viii. and x. (Agram, 1859); Döllinger, Beiträge zur Ketzergeschichte d. Mittelalters, 2 vols. (Munich, 1890).

Under Turkish rule the Bogomils lived un molested as Polatkeni in their ancient stronghold near Philippopolis, and farther northwards. In 1650 they were gathered them into their fold. No less than fourteen villages near Nicopole embrac Catholicism, and a colony of Polatkeni in the village of Cioplea near Bucharest followed the example of their brethren throughout the Danube.

BOGORODSK, a town of central Russia, in the government of Moscow, and 30 m. by rail E.N.E. of the city of Moscow, on the Klyazma, which flows into the Oka. It is built of white stone, and has strong ramparts, central barracks, and numerous different churches. The population was 200,000 (or 202,000, according to another authority) in 1853. The city is 15 m. north of Moscow, and 60 m. north of Zim. The Bogomils were here first introduced. In 1849, the process of the emperor Nicholas, against the Bogomils, was begun. See F. Döllinger, Beiträge zur Ketzergeschichte d. Mittelalters, 2 vols. (Munich, 1890).
white-washed. But few of the public buildings are imposing in appearance, though good taste in style and decoration are often shown.

The city occupies an area of about 24 × 14 m. It has street cars, electric light and telephones. Short lines of railway connect it with Facatativá (24 m.) on the road to Honda, and with Zipaquirá, where extensive salt mines are worked. A line of railway was also under construction in 1906 to Jirardot, at the head of navigation on the upper Magdalena. Bogotá is an archiepiscopal see, founded in 1561, and is one of the centres of medieval clericalism in South America. It has a cathedral, rebuilt in 1814, and some 30 other churches, together with many old conventual buildings now used for secular purposes, their religious communities having been dissolved by Mosquera and their revenues devoted in great measure to education. The capitol, which is occupied by the executive and legislative departments, is an elegant and spacious building, erected since 1875. The interest which Bogotá has always taken in education, and because of which she has been called the "Athens of South America," is shown in the number and character of her institutions of learning—a university, three endowed colleges, a school of chemistry and mineralogy, a national academy, a military school, a public library with some 50,000 volumes, a national observatory, a natural history museum and a botanic garden. The city also possesses a well-equipped mint, little used in recent years. The plain surrounding the city is very fertile, and pastures cattle and produces cereals, vegetables and fruit in abundance. It was the centre of Chibcha civilization before the Spanish conquest and sustained a large population. The climate is mild and temperate, the average annual temperature being about 58° and the rainfall about 43 inches. The geographical location of the city is unfavourable to any great development in commerce and manufactures beyond local needs.

Bogotá was founded in 1538 by Gonzalo Jiménez de Quesada and was named Santa Fé de Bogotá after his birthplace Santa Fé, and after the southern capital of the Chibchás, Bacatá (or Funza). It was the capital of the viceroyalty of Nueva Granada, and soon became one of the centres of Spanish colonial power and civilization on the South American continent. In 1811 its citizens revolted against Spanish rule and set up a government of their own, but in 1816 the city was occupied by Pablo Morillo (1777-1838), the Spanish general, who subjected it to a ruthless military government until 1819, when Bolívar's victory at Boyacá compelled its evacuation. On the creation of the republic of Colombia, Bogotá became its capital, and when that republic was dissolved into its three constituent parts it remained the capital of Nueva Granada. It has been the scene of many important events in the chequered history of Colombia.

BOGRA, or BAGURA, a town and district of British India, in the Rajshahi division of eastern Bengal and Assam. The town is situated on the right bank of the river Karatoya. Pop. (1901) 7094. The District of Bogra, which was first formed in 1821, lies west of the main channel of the Brahmaputra. It contains an area of 1359 sq. m. In 1901 the population (on a reduced area) was 85,433, showing an increase of 11.7% in the decade. The district stretches out in a level plain, intersected by numerous streams and dotted with patches of jungle. The Karatoya river flows from north to south, dividing it into two portions, possessing very distinct characteristics. The eastern tract consists of rich alluvial soil, well watered, and subject to fertilizing inundations, yielding heavy crops of coarse rice, oil-seeds and jute. The western portion of the district is high-lying and produces the finer qualities of rice. The principal rivers are formed by the different channels of the Brahmaputra, which river here bears the local names of the Konai, the Daokoba and the Jamuna, the last forming a portion of the eastern boundary of the district. Its bed is studded with alluvial islands. The Brahmaputra and its branches are joined by streams from the river Atrai, Karatoya and Atrai, afford admirable facilities for commerce, and render every part of the district accessible to native cargo boats of large burden. The rivers swarm with fish. The former production of indigo is extinct, and the industry of silk-spinning is decaying. There is no town with as many as 10,000 inhabitants, trade being conducted at riverside marts. Nor are there any metalled roads. Several lines of railway (the Eastern Bengal, &c.), however, serve the district.

BOGUE, DAVID (1750-1825), British nonconformist divine, was born in the parish of Coldingham, Berwickshire. After a course of study in Edinburgh, he was licensed to preach by the Church of Scotland, but made his way to London (1771), where he taught in schools at Edmonton, Hampstead and Cumberwell. He then settled as minister of the Congregational church at Gosport in Hampshire (1777), and to his pastoral duties added the charge of an institution for preparing men for the ministry. It was the age of the new-born missionary enterprise, and Bogue's academy was in a very large measure the seed from which the London Missionary Society took its growth. Bogue himself would have gone to India in 1796 but for the opposition of the East India Company. He also had much to do with founding the British and Foreign Bible Society and the Religious Tract Society, and in conjunction with James Bennet, minister at Romsey, wrote a well-known History of Dissenters (1 vols., 1809). Another of his writings was an Essay on the Divine Authority of the New Testament. He died at Brighton on the 25th of October 1825.

BOGUS (of uncertain origin, possibly connected with the Fr. bagasse, sugar-cane refuse), a slang word, originally used in America of the apparatus employed in counterfeiting coins, and now generally of any sham or spurious transaction.

BOHÉA (a word derived from the Wu-i hills in the Fukien province of China, h being substituted for W or V), a kind of black tea (p. q.), or, in the 18th and early 19th centuries, tea generally, as in Pope's line, "So past her time 'twixt reading and bohea." Later the name "bohea" has been applied to an inferior quality of tea grown late in the season.

BOHÉMIA1 (Ger. Böhmen, Czech Čechy, Lat. Bohemia), a kingdom and crownland of Austria, bounded N.E. by Prussian Silesia, S.E. by Moravia and Lower Austria, S. by Upper Austria, S.W. by Bavaria and N.W. by Saxony. It has an area of 20,600 sq. m., or about two-thirds the size of Scotland, and forms the principal province of the Austrian empire. Situated in the geographical centre of the European continent, at about equal distance from all the European seas, enclosed by high mountains, and nevertheless easily accessible through Moravia from the Danubian plain and opened by the valley of the Elbe to the German plain, Bohemia was bound to play a leading part in the cultural development of Europe. It became early the scene of important historical events, the avenue and junction of the migrations of peoples, and it forms the borderland between the German and Slavonic races.

1 As a guide to the English-speaking reader, the following notes on the pronunciation of Bohemian names are appended. The Czech (Coch) alphabet is the same as the English, with the omission of the letters c, x. The vowel sounds (a, e, i, o, u) are the same as Italian; but è = Eng. ë in "yet," and â = Eng. oo. The consonants b, d, f, k, l, m, n, r, v, z are as in English; = Eng. g in "gone"; = Eng. initial s. But h = Span. f (in cacoon); = r as chip; = sh; = z (as the French j); k before d, f, s = v before p, t, s = ñ before e, a; l before e, a = English; č-ch; ě-ge. If this pronunciation is adopted, the Bohemian names are: A. J. L. Godl-ýn = Bohlen; Bohmen-phil = Bohemia; Dr. Zedl-ýn = Zedlitz; K. Ch. Katrik = Katrink.
Sudetes, has a general direction from S.E. to N.W., is divided by the pass of Neumark into two parts. The northern part (Czech Český Les) attains in the massif of Czervok an altitude of 3300 ft., but the southern part (Czech Šumava) is at the same time the highest and the most picturesque part of the range, including on the Bohemian side the Ósser (4053 ft.) and the Příčekstein (4515 ft.), although the highest peak, the Arber (4872), is in Bavaria. The beauty of this range of mountains consists in its pure crystalline torrents, in the numerous blue lakes of its valleys, and above all in the magnificent forests of oak and pine with which its sides are covered. The pass of Neumark, called also the Gate of Little Poland, lies along the frontier, forming an unoccupied approach to Bohemia from Germany. It stretches towards the east, above the small town of Taus (Czech Domažlice, once called Taubalt, i.e. the Fortress), and is the place where some of the bloodiest battles in the history of Bohemia were fought. Here in the first half of the 17th century Samo repulsed the invading hordes of the Avars, which threatened the independence of the newly-settled Slavonic inhabitants; here also Wratiales II. defeated the German emperor Henry III. in a two-days' battle (August 22 and 23, 1040). It was in the same place that the Hussites gained their most famous victory against a German army of crusaders, and another similar German army was vanquished here by George of Poděbrad.

The Erzgebirge (Czech Rudo Hory), which form the north-west frontier, have an average altitude of 2600 ft., and at their highest point, the Keilberg (4080 ft.). The numerous mining villages, the great number of cultivated areas and the easy passes, traversed by good roads, give those mountains in many places the aspect of a hilly undulating plain. Several of the villages are built very near the summit of the mountains, and one of them, Gottesgab (pop. about 1500), lies at an altitude of 3345 ft., the highest place in Bohemia and central Germany. To the west the Erzgebirge combine through the Erzgebirge with the Fichtelgebirge, which in their turn are united with the Böhmerwald through the plateau of Waldsassen. To the east the Erzgebirge are separated from the Elbsandsteingebirge by the Nolfendorf pass, traversed by the ancient military route to Saxony; it was the route followed by Napoleon I after the battle of Dresden (1813). To the south stretches the "Thermopylae of Bohemia," the scene of the battle of Kullo and Arnošt, but not so magnificent; and to the east the Erzgebirge come to an end in Saxony at the lowest point in Bohemia (alt. 357 ft.). The north-east frontier is formed by the Sudetes, which comprise the Lusatiergebirge (2950 ft.), the Iseregebirge (with the highest peak, the Tafelfichte, 3683 ft.), the Jeschkengebirge (332 ft. ft.), and the Riesengebirge. The Riesengebirge (Czech Krkonoš) are, after the Alps, among the highest mountains of central Europe, and attain in the Schneeckoppe an altitude of 5264 ft. The last groups of the Sudetes in Bohemia are the Huessengebirge (2353 ft.) and the Adlergebirge (364 ft.). The fourth side of the rhomb is formed by the so-called Bohemian-Moravian Hills, a plateau or broad series of low hills, composed of primitive rocks, and attaining in some places an altitude of 2500 ft.

The interior of Bohemia has sometimes been compared to a deep basin; but for the most part it is an undulating plateau, over 1000 ft. high, formed by a succession of terraces, which gradually slope down from south to north. Its lowest-lying points are not in the middle but in the north, in the valley of the Elbe, and the country can be divided into two parts by a line passing through Hohenau-Prague-Komotau. The part lying to the south of this line is described as highland, and only the part north of it as lowland. The mountain-ranges of the interior of Bohemia are the Budyjov (2794 ft.) in the middle; the Tepler Gebirge (2016 ft.), the Karlbad-Geberge (3037 ft.) and the Kaiserwald (3428 ft.), in the north-west part; while the northern corner is occupied by the Mittelgebirge (2750 ft.), a volcanic massif, stretching on both sides of the Elbe.

Bohemia belongs to the watershed of the Elbe, which rises within the territory and receives on the right the Isar and the Polen, and on the left the Adler; the Eger with its affluent the Teptl; the Biela and the Moldau. But the principal river of Bohemia, from every point of view, is the Moldau (Czech Vltava), not the Elbe. A glance at the hydrographic structure of Bohemia, which is of such a striking regularity, shows us that the Moldau is the main stem, while the Elbe and the other rivers are only lateral branches; moreover, the Elbe below Melnik, the point of its confluence with the Moldau, follows the general direction of the Moldau. Besides, the Moldau is the principal commercial artery of the country, being navigable below Budweis, while the Upper-Elbe is not navigable; its basin (17,800 sq. m.) is twice as great as that of the Elbe, and its width and depth are also greater. It has a length of 279 m., 47 m. longer than the Upper-Elbe, but it flows through a narrow valley, in which there is neither road nor railway, extending from the Budweis to about 15 m. south of Prague. The Moldau receives on the right the Lüzná and the Szazawa and on the left the Wottawa and the Beraun. The Beraun is formed by the union of the Mies with the Radbuss, Angel and Uslava, and is the third most important river of the country. There are only a few lakes, which are mostly found at high altitudes.

Climate.—Bohemia has a continental, generally healthy climate, which varies much in different parts of the country. In the central district, where, e.g. at Prague, the mean annual temperature is 48°F. The rainfall varies also according to the districts, the rainy season being the summer. Thus the mean annual rainfall in the interior of Bohemia is 18 in., in the Riesengebirge 40 in., while in the Böhmerwald it reaches 60 to 70 in.

Agriculture.—Favoured with a suitable climate and inhabited by a thriving rural population, Bohemia is very highly developed in the matter of agriculture. Over 50% of the whole area is under cultivation and the soil is in many parts very fertile, the best-known regions being the "Golden Road" round Königgrätz, the "Paradise" round Teplice, and the "Garden of Bohemia" round Lettermütz. The principal products are oats, rye, barley and wheat, but since the competition of Hungarian wheat large tracts of land have been converted to the cultivation of beetroot. The potato crop, which forms the staple food of the people, is great; the Sazau district is celebrated for hops, and the flax is also of a good quality. Fruit, especially plums, is very abundant and constitutes a great article of export. The forests cover 90-91% of the total area; meadows, 10-05, pastures 5-05, and gardens 1-35%. Cattle-rearing is not so well developed as in previous centuries, but great efforts are being made to improve the breed, and bee-cultivation constitutes another important industry. Pisciculture has been for centuries successfully pursued by the Bohemian peasants, and the attempts recently made for the rearing of silkworms have met with fair success.

Minerals.—Except salt, which is entirely absent, almost every useful metal and mineral is to be found. First in importance, both in quantity and in value, come lignite and coal. Some of the richest lignite fields in Europe are found in the north-east corner of Bohemia round Briix, Dux, Falkenau, Osegra and Teplicit. Coal is mined round Klado, Bruchthrad, Pilsen, Schlan, Rakonitz, Nürsdorf and Radlitz, the last-named place containing the oldest coal mines of Bohemia (17th century). Iron ores are found at Krušina and Nučic, and the principal foundries are round Klado and Königshof. Owing to the improvements in refining, Bohemia has become an important centre of the iron industry. Silver is extracted at Přibram and Joachimsthul, but the silver mines near Kuttenberg, famous in the middle ages, are now abandoned. Lead is extracted at Přibram, tin at Graupen in the Erzgebirge, the only place in Austria where this metal is found. Antimony is especially mined at Milschau near Tabor; uranium and radium near Joachimsthal; graphite near Krumau and Budweis; porcelain-earth near Carlsbad. Other minerals found in various places of Bohemia are copper, sulphur, cobalt, alum, nickel, arsenic and various sorts of precious stone, like the Bohemian garnet (pyrope), and building stone. A large amount of peat is collected, especially in the south-west of Bohemia, as well as a great quantity of asphalt.

Bohemia possesses over two hundred mineral springs, but only a few are used for medicinal purposes. Among them are...
some of the most celebrated mineral springs in the world, such as Carlsbad, Marienbad, Franzenbad, Teplick-Schönau and Bilin. Other springs of importance are Püllna, Sédlice and Seidschitz near Brüx; Giesshübel near Carlsbad; Lieberwerda, Königswart, Sangerberg, Neudorf, Tetschen, Johannabrad, situated at the foot of the Schneeckoppe, &c.

Manufactures and Commerce.—From an industrial point of view, Bohemia takes the first rank amongst the Austrian provinces, and at the same time is one of the greatest manufacturing centres of Europe. Rich as the country is in coal and iron, and in water supplies which can be transformed into motive power, the inhabitants were not slow to utilize these advantages, so that the industry of Bohemia made enormous strides during the last half of the 19th century. The glass industry was introduced from Venice in the 13th century and soon attained a vast importance; the factories are in the neighbourhood of the mountains, where minerals, and especially silica and fuel, are plentiful. The finest product, the crystal-glass, is made round Haida and Steinschöna. The very extensive porcelain industry is concentrated in and around Carlsbad. The textile industry stands in the front rank and is mostly concentrated in the north-east corner of Bohemia, round Reichenberg, and in the valley of the Lower Elbe. The cloth manufacture is located at Reichenberg; Rumburg and Trautenau are the centre of the linen industry; woollen yarns are made at Aussig and Asch. Lace, which is pursued as a home-industry in the Erzgebirge region, has its principal centre at Weipert, while Strakonitz has the speciality of the manufacture of red fesze (Turkish caps). The metallurgical industries, favoured by the abundance of coal and iron, are concentrated round the mines. Industrial and agricultural machinery are manufactured at Reichenberg, Pilsen and Prague, and at the last-named place is also to be found a great establishment for the production of railway rolling-stock. Sugar refining is another industry, which, although of recent date, has had a very great development, and the breweries produce a beer which is appreciated all over the world. Other important branches of industry are—the manufacture of chemicals at Prague and Aussig; pencils at Budweis; musical instruments at Grasitz and Schönau; paper, leather, dyeing and calico-printing. Hand-in-hand with the industrial activity of the country goes its commercial development, which is stimulated by an extensive railway system, good roads and navigable rivers. The centre of the railway system, which had in 1868 a length of some 3,500 m., or 30% of the total length of the Austrian railways, is Prague; and through the Elbe Bohemia has easy access to the sea for its export trade.

Population and Administration.—Bohemia had in 1900 a population of 6,318,450, which corresponds to 315 inhabitants per square mile. As regards numbers, it occupies the second place amongst the Austrian provinces, coming after Galicia, and as regards density of population it stands third, Silesia and Lower Austria, which contains Vienna, standing higher. In 1800 the population was a little over 3,000,000. According to nationality, about 35% are Germans and 65% Czechs. The Czechs occupy the middle of the country, as well as its south and south-east region, while the Germans are concentrated near its borders, especially in the north and west, and are also found all over the country in the large towns. Bohemia is divided into three archbishoprics, German-speaking enclaves situated in purely Czech districts; on the other hand, the Czechs have shown a tendency to invade the purely German mining and manufacturing districts. Notwithstanding its rich natural resources and its great industrial development, Bohemia sends out a steady flow of emigrants, who either settle in the other provinces of the monarchy, in Germany and in Russia, or cross the Atlantic to America. To the Roman Catholic Church belong 66% of the total population; Bohemia is divided into the archbishopric of Prague, and the three bishoprics of Budweis, Königgrätz and Leitmeritz.

Education is well advanced, and Bohemia has the lowest proportion of illiterates amongst the Austrian provinces. At the head of the educational establishments stand the two universities at Prague, one German and the other Czech.

Bohemia sends 130 deputies to the Reichsrat at Vienna; the local diet, to which belong ex officio the archbishop, the three bishops, and the two rectors of the universities, consists of 242 members. For administrative purposes Bohemia is divided into ninety-four districts and two autonomous municipalities, Prague (pop. 204,478), the capital, and Reichenberg (34,204). Other important towns are Pilsen (68,292), Budweis (39,360), Aussig (37,255), Schönau (24,110), Eger (23,663), Warnsdorf (21,150), Brüx (21,523), Gablonz (21,086), Asch (18,675), Kladno (17,808), Pardubitz (17,029), Saaz (16,188), Komotau (15,052), Kolin (14,925), Kuttenberg (14,790), Trautenau (14,477), Carlsbad (14,040), Příbram (13,570), Jungbunzlau (13,470), Leitměřice (13,075), Chrudim (13,017), Dux (11,921), Bodenbach (10,783), Tabor (10,692), Böhmisch-Leipa (10,674), Rumburg (10,382), Weipert (10,037).

See F. Umlauf, Die Länder Österreich-Ungarns in Wort und Bild, (15 vols., Vienna, 1881-1885), vol. vii.; Milkoweit. Altehümer und die Reichenbäder (2 vols., Prague, 1876-1878); F. Ravná, Reichshandbuch für das Königreich Böhmen (Prague, 1882), very useful for its numerous and detailed historical notes.

(° B.)

History

The country derives its name from the Boii, a Celtic tribe which in the earliest historical period inhabited part of the land. According to very ancient traditions accepted by the modern historians of Bohemia, the Boii, whose capital was called Boiohenum, were weakened by continued warfare with neighbouring tribes, and finally subdued by the Teutonic tribe of the Marcomanni (about 12 B.C.). The Marcomanni were afterwards expelled by other Teutonic tribes, and eventually Bohemia was conquered by Slavic tribes, of whom the Czechs (see Czeci) were the most important. The date of the arrival of the Czechs in Bohemia is very uncertain, and the scanty references to the country in classical and Byzantine writers are rather misleading than otherwise. Recent archaeological research has proved the existence of Slavic inhabitants in Bohemia as far back as the beginning of the Christian era. The Czechs appear to have become the masters of the country in the 5th century. The first of their rulers mentioned in history is Samo, who is stated to have defeated the Avars, a Turanian tribe which had for a time obtained the overlordship over Bohemia. Samo also defeated the Franks in a great battle that took place at Wogatschburg (630), probably near the site of the present town of Eger. After the death of Samo the history of Bohemia again becomes absolutely obscure for about 150 years. The next events that are recorded by the oldest chroniclers, such as Cosmas, refer to the foundation of a Bohemian principality by Krok (or Crocus) and his daughter Libussa. The latter is said to have married Tyrnavus, a peasant who was found ploughing his field—a legend that is common in most Slavic countries. Beginning with this semi-mythical ruler, the ancient chroniclers have constructed a continuous list of Přemyslid princes. Neither the deeds attributed to these princes nor the dates of their reigns can be considered as historical.

From the time of the introduction of Christianity into Bohemia the history of the country becomes less obscure. The first attempts to introduce Christianity undoubtedly came from the East. There were the greatest difficulties, as the innate distrust of the Germans naturally rendered the Bohemians unfavourable to a creed which reached them from the realm of their western neighbours. Matters were different when Christianity approached them from Moravia, where its doctrine had been taught by Cyrilus and Methodius—Greek monks from Thessalonica. About the year 873 the Bohemian prince Bořivoj was baptized by Methodius, and the Bohemians now rapidly adopted the Christian faith. Of the rulers of Bohemia the most famous at this period was Wenceslas, surnamed the Holy, who in 925 was murdered by his brother Boleslav, and who was afterwards canonized by the Church of Rome. As Wenceslas had been an ally of Germany, his murder resulted in a war with that country, in which, as far as we can judge by the scanty records of the time,

Christianity. 

Wenceslas.
Boleslav, the brother and successor of Wenceslas, was on the whole successful. During the reigns of Boleslav and his son, Boleslav II., Bohemia extended its frontiers in several directions. Boleslav II. indemnified the Gymnaster, not only over Bohemia and Moravia, but also over a large part of Silesia, and over that part of Poland which is now the Austrian province of Galicia. Like most Slavic states at this and even a later period, the great Bohemian empire of Boleslav II. did not endure long. Boleslav III., son of Boleslav II., lost all his foreign possessions to Boleslav the Great, king of Poland. During his reign Bohemia was involved in constant civil war, caused by the dissensions between Boleslav III. and his brothers Jaromír and Ulrick. Though the prince succeeded in expelling his brothers from the country, his cruelty induced the Bohemians to dethrone him and to choose as their ruler the Polish prince Vladivoj. Vladivoj, brother of Boleslav the Great, and son of the Bohemian princess Dubravks (Dohrava). Vladivoj attempted to strengthen his hold over Bohemia by securing the aid of Germany. He consented not only to continue to pay the tribute which the Germans had already obtained from several previous rulers of Bohemia, but also to become a vassal of the German empire and to receive the German title of duke. This state continued when after the death of Vladivoj the Přemyšlid dynasty was restored. Vladislav I. (1037–1055) restored the former power of Bohemia, and again added Moravia, Silesia and a considerable part of Poland to the Bohemian dominions. To obviate the incessant struggles which had endangered the land at every vacancy of the throne, Břetislav, with the consent of the nobles, decreed that the eldest member of the house of Přemyšl should be the ruler of Bohemia. Břetislav was therefore succeeded first by his eldest son Spítalhův, and then by his second son Vratislav.

In 1053 Vratislav obtained the title of king from the emperor Henry IV., whom he had assisted in the struggle with the papal see, which is known as the contest about investitures.

Though the title of king was only conferred on Vratislav personally, the German king, Conrad III., conferred on the Bohemian prince Sobeslav (1125–1149) the title of hereditary cupbearer of the Empire, thus granting a certain influence on the election of the emperors to Bohemia, which hitherto had only obligations towards the Empire but no right to its government. In 1162 after the death of his father, Jaroslav II. Barbarossa ceded Upper Lusatia to the Bohemian prince Vladislav II., and conferred on him the title of king on condition of his taking part in Frederick's Italian campaigns. It was intended that that title should henceforth be hereditary, but it again fell into abeyance during the struggles between the Přemyšíslde princes which followed the abdication of Vladislav in 1173.

The consequences of these constant internal struggles were twofold: the German influence became stronger, and the power of the sovereign declined, as the nobility on whose support the competitors for the crown were obliged to rely constantly obtained new privileges. In 1197 Přemyšl Ottakar became undisputed ruler of Bohemia, and he was crowned as king in the following year. The royal title of the Bohemian sovereigns was continued uninterrupted from that date. Wenceslas I. (1230–1253) succeeded his father as king of Bohemia without opposition. The last years of his reign were troubled by internal discord. Wenceslas's son, Přemyšl Ottakar II., who under the sovereignty of his father ruled Moravia, became in a tribe the chief leader of the magnates. A reconciliation between son and father, however, took place before the latter's death. Přemyšl Ottakar II. was one of the greatest of Bohemia's kings. He had during the lifetime of his father obtained possession of the archduchies of Austria, and, about the time of his accession to the Bohemian throne, the nobility of Styria also recognized him as their ruler. These extensions of his dominions involved Přemyšl Ottakar II. in repeated wars with Hungary. In 1260 he decisively defeated Bela, king of Hungary, in the great battle of Kressenbrunn. After this victory Ottakar's power rose to its greatest height. He now obtained possession of Carinthia, Istria and parts of northern Italy. His possessions extended from the Giant Mountains in Bohemia to the Adriatic, and included almost all the parts of the present Habsburg empire west of the Leitha. His contemporaries called Ottakar "the man of gold" because of his great wealth, or "the man of iron" because of his military power. From political rather than racial causes Ottakar favoured the immigration of Germans into his dominions. He hoped to find in the German townsman a counterpoise to the overwhelming power of the Bohemian nobility. In 1237 Rudolph, count of Habsburg, was elected king of the Romans. It is very probable that the German crown had previously been offered to Ottakar, but that he had refused it. Several causes, among others his Slavic nationality, which was likely to render him obnoxious to the Germans, contributed to his decision. As Rudolph immediately claimed as vacant fiefs of the Empire most of the lands held by Ottakar, war was inevitable. Ottakar was deserted by many of his new subjects, and even by part of the Bohemian nobility. He was therefore unable to resist the German king, and was obliged to surrender to him all his lands except Bohemia and Moravia, and to recognize Rudolph as his overlord. New dissensions between the two sovereigns broke out immediately. In 1258 Ottakar invaded the Austrian dukies, now under the rule of Rudolph, but was defeated and killed at the battle of Durnkrut on the Marchfeld.

Ottakar's son, Wenceslas II., was only seven years of age at the death of his father, and Otto of Brandenburg, a nephew of Ottakar, for a time governed Bohemia as guardian of the young sovereign. Otto's rule was very unpopular, an insurrection broke out against him, and Bohemia was for a time in a state of complete anarchy. The country, at last pacified through the intervention of Rudolph of Habsburg, and at the age of twelve Wenceslas became nominal ruler of the country. All power was, however, in the hands of Zavis of Falkenstein, one of the great Bohemian nobles, who had married the king's mother, Kunequina. The power of Zavis at last became invidious to the king, by whose order he was beheaded in 1296. Wenceslas, though only nineteen years of age, henceforth governed Bohemia himself, and his short reign was a period of great happiness for the country. Poland also accepted the rule of Wenceslas and the Hungarian crown passed to him. Towards the end of his reign Wenceslas became involved in war with Albert, archduke of Austria, afterwards king of the Romans. While preparing to invade Austria Wenceslas died suddenly (1305). His son and successor, Wenceslas III., was then only sixteen years of age, and he only ruled over Bohemia for one year. While planning a warlike expedition against Poland, on which country the Bohemian sovereigns now again maintained their claim, he was murdered by unknown assassins (1360). With him ended the rule of the Přemyšíslde dynasty over Bohemia.

Albert, king of the Romans, declared that Bohemia was a vacant fief of the Empire, and, mainly by intimidation, induced the Bohemians to elect his son Rudolph as their sovereign; but Rudolph died after a reign of only one year. Though the Habsburg princes at this period already claimed a hereditary right to the Bohemian throne, the Bohemians determined to maintain their right of electing their sovereign, and they chose Henry, duke of Carinthia, who had married a daughter of King Wenceslas II. Henry soon became unpopular, as he was accused of unduly favouring the German settlers in Bohemia. It was decided to depose him, and the choice of the Bohemians now fell on John of Luxemburg, son of Henry, king of the Romans. The Luxemburg dynasty henceforth ruled over Bohemia up to the time of its extinction at the death of Sigismund (1437). Though King John, by his marriage to the princess Elizabeth, a daughter of Wenceslas II., became more closely connected with Bohemia, he does not appear to have felt much interest in that country. Most of his life was spent in other lands, his campaigns ranging from Italy in the south to Lithuania in the north. It became
Bohemia

HISTORY

proverbial "that nothing could be done in the world without the help of God and of the king of Bohemia." The policy of John was founded on a close alliance with France, the country for which he felt most sympathy. Fighting as an ally of France he fell at the battle of Crécy (1346).

He was succeeded as king of Bohemia by his son Charles, whom the German electors had previously aspired to. Some time in 1346 Charles proved one of the greatest rulers of Bohemia, where his memory is still revered. Prague was his favourite residence, and by the foundation of the nové mésto (new town) he greatly enlarged the city, which now had three times its former extent, and soon also trebled its population. He also added greatly to the importance of the city by founding the famous university of Prague. Charles succeeded in re-establishing order in Bohemia. The country had been in a very disturbed state in consequence of feuds that were incessant during the reign of John, who had almost always been absent from Bohemia. Charles also attempted to codify the obscure and contradictory laws of Bohemia; but this attempt failed through the resistance of the powerful nobility of the country. During the reign of Charles, the first symptoms of that movement in favour of church reform that afterwards acquired a world-wide importance, appeared in Bohemia. As Charles has often been accused of undue subserviency to the Church of Rome, it should be mentioned that he granted his protection to several priests who favoured the cause of church reform. In his foreign policy Charles differed from his father. The relations with France gradually became colder, and at the end of his reign Charles favoured an alliance with England; he died in 1378 at the age of sixty-two, prematurely exhausted by arduous work.

Charles was succeeded by his son Wenceslas, who was then seventeen years of age. His reign marks the decline of the rule of the house of Luxemburg over Bohemia. He was a weak and incapable sovereign, but the very exaggerated accusations against him, which are found principally in the works of older historians, are mainly due to the fact that the king and to a larger extent his queen, Sophia, for a time furthered the cause of church reform, thus incurring the displeasure of Romanist writers. During the earlier part of the reign of Wenceslas a continual struggle took place between the king and the powerful Bohemian nobles, who indeed twice imprisoned their sovereign. Wenceslas also became involved in a dispute with the archbishop, which resulted in the death of the famous John of Nepomuk.

The latter part of the reign of Wenceslas is a record of incipient religious conflict. The hold of the Church of Rome on Bohemia had already been weakened during the reign of King Charles by attacks on the immorality of the clergy, which proceeded from pious priests such as Milčík and Waldhauser. The church seism, during which the rival pontiffs assailed each other with all the wild threats and obscurations of medieval theological strife, necessarily alienated the Bohemians to a yet greater extent. Almost the whole Bohemian nation therefore espoused the cause of Huss (q.v.). Wenceslas on the occasion of these disputes displayed the weakness and irresolution that always characterized him, but Queen Sophia openly favoured the cause of Huss, who for some time was her confessor. Huss was tried before the council of Constance (q.v.), to which he had proceeded with a letter of safe conduct given by Wenceslas's brother Sigismund, king of the Romans. He was declared a heretic and burnt on the 6th of July 1415. The inevitable and immediate result of this event was the outbreak of civil war in Bohemia, where Huss was greatly revered by large masses of the people. The nobles of Bohemia and Moravia met at Prague on the 2nd of September 1415, and sent to the council the famed Protestatio Bohemorum, in which they strongly protested against the execution of Huss, "a good, just and catholic man who had for many years been favourably known in the Kingdom by his life, conduct and fame, and who had been convicted of no offence."

They further declared that all who affirmed that heresy existed in Bohemia were "liars, vile traitors and calumniators of Bohemia and Moravia, the worst of all heretics, full of all evil, sons of the devil." They finally stated "that they would defend the law of our Lord Jesus Christ and its plious, humble and steadfast preachers at the cost of their blood, scorning all fear and all human decrees that might be contrary to them."

This protest was declared the beginning of war against the Roman church, and marked the beginning of the Hussite movement. The council, indeed, summoned the nobles before its tribunal, but they refused to appear. A large number of the nobles and knights who had met at Prague formed a confederacy and declared that they consented to freedom of preaching the word of God on their estates, that they declined to recognize the authority of the council of Constance, but would obey the Bohemian bishops and a future pope lawfully elected. Meanwhile they declared the university of Prague the supreme authority in all matters of religion. The members of the confederacy attempted, though unsuccessfully, to induce King Wenceslas to become their leader. The Romanist nobles, who were not numerous, but some of whom owned vast estates, now also formed a confederacy, pledging themselves to support the pope and the council. After the closing of the council in 1418, Sigismund, who—Wenceslas being childless—was heir to the Bohemian throne, sent a letter to his brother, which was practically a manifesto addressed to the Bohemian people. He threatened with the severest penalties all who should continue to resist the authority of Rome. Wenceslas maintained the vacillating attitude that was characteristic of his whole reign, though Queen Sophia still extended her protection to the reformers. By doing this, indeed, she incurred the wrath of the Church to so great an extent that an act of accusation against her was drawn up at the council of Constance. Intimidated by his brother, Wenceslas now attempted to stem the current of religious enthusiasm. Immediately after the death of Huss many priests who refused to administer communion in the two kinds—now the principal tenet of the adherents of Huss—had been expelled from their parishes. Wenceslas decreed that they should be reinstated, and it was only after some hesitation that he even permitted that religious services according to the Utraquist doctrine should be held in three of the churches of Prague. Some of the more advanced reformers left Prague and formed the party known as the Taborites, from the town of Tabor which became their centre. Troubles soon broke out at Prague. When on the 30th of July 1419, the Hussite priest, John of Zelivo, was leading a procession through the streets of Prague, stones were thrown at him and his followers from the town hall of the "new Bohemia." The Hussites, led by John Žižka (q.v.), stormed the town-hall and threw the magistrates from its windows. On receiving the news of these riots King Wenceslas was immediately seized by an attack of apoplexy; a second fit on the 16th of August ended his life.

The news of the death of the king caused renewed rioting in Prague and many other Bohemian cities, from which many Germans, mostly adherents of the Church of Rome were expelled. Finally a temporary truce was concluded, and, early in the following year, Sigismund, who now claimed the Bohemian crown as successor of his brother, arrived at Kutna Hora (Kuttenberg). Pope Martin V. on the 1st of March 1419 proclaimed a crusade against Bohemia, and crusaders from all parts of Europe joined Sigismund's army.

On the 30th day of June the Hungarian king, Sigismund, with a large army consisting of men of various countries, as well as of Bohemians, occupied the castle of Prague, determined to conquer the city, which they considered a heretical community andHelvetia. It was a large fortress, but in the presence of the population and of the Helvetic tract, it was an in- gelsical truths." But the attempt of the crusaders to conquer Prague failed, and after an attack by them on the Vitkov (now Žižkov) hill had been repulsed by the desperate bravery of the Taborites, led by Žižka, Sigismund determined to abandon

1 Protestantatio Bohemorum, frequently printed in English and German, as well as in the Latin original.

2 Laurence of Březova's (contemporary) Kronika Husitská.
the siege of Prague. An attempt of Sigismund to relieve the besieged garrison of the Vyšehrad fortress on the outskirts of Prague also failed, as he was again entirely defeated at the battle of the Vyšehrad (November 1, 1420).

Royal authority now ceased in Bohemia. At a meeting of the diet at Časlav (June 1, 1421) Sigismund was deposed. It was decided that a Polish prince should be chosen as sovereign, and that meanwhile a provisional government, composed of twentysix representatives from the various parties, should be established. In 1422 Sigismund again invaded Bohemia, but was decisively defeated by Žižka at Nemecký Brod (Deutschbord). The Polish prince, Sigismund Korybutovič, now arrived in Bohemia, and was recognized as regent by the large majority of the inhabitants; but through the influence of the papal see he was recalled by the rulers of Poland after a stay of only a few months. After his departure, civil war between the moderate Hussites (Calixtines or Utraquists) and the advanced Taborite party broke out for the first time, though there had previously been isolated disturbances between them. The return of Prince Korybutovič and the menace of a German invasion soon reunited the Bohemians, who gained a decisive victory over the Germans at Aussig in 1426. Shortly afterwards Korybutovič, who had taken part in this great victory, incurred the dislike of the extreme Hussites, and was obliged to leave Bohemia. All hope of establishing an independent Slav dynasty in Bohemia thus came to an end. In 1427 several German princes undertook a new crusade against the Hussites. With the German and other invaders were 1000 English archers, binders of which the bishop of Winchester, who took part in the crusade as papal legate. The crusaders were seized by a sudden panic, both at Měl (Štýbro) and at Tachau, as soon as they approached the Hussites, and they fled hurriedly across the mountains into Bavaria. Though internal disturbances again broke out, the Bohemians after this success assumed the offensive, and repeatedly invaded Hungary and the German states.

The impossibility of conquering Bohemia had now become obvious, and it was resolved that a council should meet at Basel (q.v.) to examine the demands of the Hussites. The Germans, however, influenced by Sigismund, determined to make a last attempt to subdue Bohemia by armed force. The Bohemians, as usual united in the moment of peril, defeated the Germans at Domažlice (Taus) on the 1st of August 1431, after a very short fight. In the course of the same year negotiations began at Basel, the Hussites being represented by a numerous embassy under the leadership of Prokop the Great. The negotiations proceeded very slowly, and in 1433 the Bohemians returned to their own country, accompanied, however, by envoy's of the council. Dissensions had meanwhile again broken out between the Hussites, and they were now of a political rather than a religious nature. The more aristocratic Hussites raised an armed force which was known as "the army of the nobles." The Taborites also collected their men, who formed "the army of the towns." The two armies met at Lipan, near Kolín, on the 30th of May 1434. The Taborites were defeated, and the two Prokops and most of their other leaders perished on the battlefield. The victory of the moderate party paved the way to a reconciliation with Sigismund and the Church of Rome. The Bohemians recognized Sigismund as their sovereign, but obtained considerable concessions with regard to religious matters. These concessions, which were formulated in the so-called Compacts, granted to the Bohemians the right of communion in both kinds, and of preaching the gospel freely, and also to a certain extent limited the power of the clergy to acquire worldly goods.

After the Compacts had been formally recognized at Iglaun in Moravia, Sigismund proceeded to Prague and was accepted as king. He died in the following year (1437) and was succeeded by his son-in-law, Albert of Austria, whom the estates chose as their king after he had reigned over Bohemia less than two years. Though it was known that Albert's widow Elizabeth would shortly give birth to a child, the question as to the succession to the throne again arose; for it was only in 1427 that the question whether the Bohemian crown was elective or hereditary was decided for ever. The nobles formed two parties, one of which, the national one, had George of Poděbrad (q.v.) as its leader. Ulrich of Rosenberg was the leader of the Roman or Austrian division of the nobility. The two parties finally came to an agreement known as the "Letter of Peace" (List mírů). Those who signed it pledged themselves to recognise the Compacts, and to support as archbishop of Prague, John of Rokycan, who had been chosen by the estates in accordance with an agreement made simultaneously with the Compacts, but whom the Church of Rome refused to recognize. On the other hand, the national party abandoned the candidature to the throne of Prince Casimir of Poland, thus paving the way to the eventual succession of Albert's heir. On the 22nd of February 1440 Queen Elizabeth gave birth to a son, who received the name of Ladislas. The Bohemians formally acknowledged him as their king, though after their crown had been declined by Albert, duke of Bavaria. Ladislas remained in Austria under the guardianship of his uncle Frederick, duke of Styria, afterwards the emperor Frederick III., and Bohemia, still without regular government, continued to be the scene of constant conflicts between the rival parties of the nobility. In 1446 a general meeting of the estates of Bohemia together with those of Moravia, Silesia and Lusatia—and so-called "lands of the Bohemian crown"—took place. This meeting has exceptional importance for the constitutional history of Bohemia. It was decreed that at the meeting of the estates their members should be divided into three bodies known as curiae—representing the nobles, the knights and the towns. These curiae were to deliberate separately and only to meet for a final decision. An attempt made at this meeting to appoint a regent was unsuccessful. The negotiations with the papal see continued meanwhile, but led to no result, as the members of the Roman party used their influence at the papal court for the purpose of dissuading it from granting any concessions to their countrymen. Shortly after the termination of the diet of 1446 George of Poděbrad therefore determined to appeal to the fortune of war. He assembled a considerable army at Kutná Hora and marched on Prague (1448). He occupied the town almost without resistance and assumed the regency over the kingdom. The diet in 1451 recognized his title, which was also sanctioned by the emperor Frederick III., guardian of the young king. Poděbrad was none the less opposed, almost from the first, by the Romanists, who even concluded an alliance against him with their extreme opponents, Kolda of Žampach and the other remaining Taborites. In October 1453 Ladislas arrived in Bohemia and was crowned king at Prague; but he died soon after, and was succeeded by George III. (1457). George of Poděbrad has from the first frequently been accused of having poisoned him, but historical research has proved that this accusation is entirely unfounded. The Bohemian throne was now again vacant, for, when electing Ladislas the estates had reaffirmed the elective character of the monarchy. Though there were several foreign candidates, the estates unanimously elected George of Poděbrad, who had now for some time administered the country. Though the Romanist lords, whom Poděbrad had for a time won over, also voted for him, the election was considered a great victory of the national party and was welcomed with enthusiasm by the citizens of Prague.

During the earlier and more prosperous part of his reign the policy of King George was founded on a firm alliance with Matthias Corvinus, king of Hungary, through whose influence he was crowned by the Romanist bishop of Witten. The reign of King George, whose principal supporters were the men of the smaller nobility and of the towns, was at first very prosperous. After a certain time, however, some of the Romanist nobles became hostile to the king, and, partly through their influence, he became involved in a protracted struggle with the papal see. It was in consequence of this struggle that some of George's far-reaching plans—he endeavoured for a time to obtain the supremacy over Germany—failed. After the negotiations
with Rome had proved unsuccessful. George assembled the 
estates at Prague in 1452 and declared that he would to his 
death remain true to the communion in both kinds, and that 
he was ready to risk his life and his crown in the defence of his 
faith. The Romanist party in Bohemia became yet more 
embittered against the king, and at a meeting at Zelena Hora 
(Grünberg) in 1465 many nobles of the Roman religion joined in 
a confederacy against him. In the following year Pope Paul II. 
granted his moral support to the confederacy by issuing a 
sentence of excommunication against George of Poděbrad and by 
releasing all Bohemians from their oath of allegiance to him. 
It was also through papal influence that King Matthias of Hungary, 
desiring his former ally, supported the lords of the league of 
Zelena Hora. Desultory warfare broke out between the two 
parties, in which George was at first successful; but fortune 
changed when the king of Hungary invaded Moravia and 
obtained possession of Brünn, the capital of the country. At 
a meeting of the Catholic nobles of Bohemia and Moravia at 
Olmutz in Moravia, Matthias was proclaimed king of Bohemia 
(May 3, 1469). In the following year George obtained some 
successes over his rival, but his death in 1471 for a time put 
a stop to the war. George of Poděbrad, the only Hussite king of 
Bohemia, has always, with Charles IV., been the ruler of Bohemia 
whose memory has most endeared itself to his countrymen. 
George of Poděbrad had undoubtedly during the more 
prosperous part of his reign intended to found a national dynasty. 
In later years, however, hope of obtaining aid from Poland in his 
struggle against King Matthias induced him to offer the succession 
to the Bohemian throne to Vladislaus (Wladislaus, Ladislaus), 
son of Casimir, king of Poland. No formal agreement was 
made, and at the death of George many Bohemian nobles supported 
the claim of Matthias of Hungary, who had already been proclaimed 
king of Bohemia. Protracted negotiations ensued, but 
they ended by the election of Prince Vladisлав of 
Poland at Kutna Hora, the 27th of May 1471. This 
election was a victory of the national party, and 
may be considered as evidence of the strong anti-clerical 
feeling which then prevailed in Bohemia; for Matthias was an 
unconditional adherent of Rome, while the Polish envoys who 
represented Vladisлав promised that he would maintain the 
Compacts. At the beginning of his reign the new king was 
involved in a struggle with Matthias of Hungary, who maintained 
his claim to the Bohemian throne. Prolonged desultory warfare 
continued up to 1478, when a treaty concluded at Olmutz 
secured Bohemia to Vladisлав; Matthias was to retain the 
so-called “lands of the Bohemian crown”—Moravia, Silesia, 
and Lusatia—during his lifetime, and they were to be restored 
to Matthias in his male or female issue on his death. Though Vladisлав was faithful to 
his promise of maintaining the Compacts, and did not attempt 
to prevent the Bohemians from receiving the communion in 
both kinds, yet his policy was on the whole a reactionary one, 
both as regards matters of state and the religious controversies. 
The king appointed as government officials at Prague men of 
that section of the Utraquist party that was nearest to Rome, 
while a severe persecution of the extreme Hussites known as 
the Bohemian Brethren took place (see Hussites). Serious riots 
took place at Prague, and the townsmen expelled Hussites 
from the three town halls of the city. The nobles of the same faith 
also formed a league to guard themselves against the menaced 
reaction. A meeting of all the estates at Kutna Hora in 1485, 
however, for a time restored peace. Both parties agreed to 
respect the religious views of their opponents and to abstain from 
all violence, and the Compacts were again confirmed. 
As regards matters of state the reign of Vladisлав is marked 
by a decrease of the royal prerogative, while the power of the 
nobility attained an unprecedented height, at the expense, not 
only of the royal power, but also of the rights of the townsfolk 
and peasants. A decree of 1487 practically established serfdom 
in Bohemia, where it had hitherto been almost unknown. It is 
impossible to exaggerate the importance of this measure for the 
future of Bohemia. The rulers of the country were henceforth 
unable to rely on that numerous sturdy and independent 
peasantry of which the armies of Žižka and the Prokops had 
mainly consisted. Various enactments belonging to this reign 
also curtailed the rights of the Bohemian townsmen. A decree 
known as the “regulations of King Vladislav” codified these 
changes. It enumerated all the rights of the nobles and knights, 
but entirely ignored those of the towns. It was tacitly assumed 
that the townsmen had no inherent rights, but only such 
privileges as might be granted them by their sovereign with 
the consent of the nobles and knights. Civil discord was 
the inevitable consequence of these enactments. Several meetings 
of the diet took place at which the towns were not represented. 
The latter in 1513 formed a confederacy to defend their rights, 
and chose Prince Bartholomew of Münsterberg—a grandson of 
King George—as their leader.

Vladisлав was elected king of Hungary in 1490 and many of 
the events of his later life belong to the history of Hungary. He 
married in 1502 Anna de Candale, who was connected 
with the royal family of France. He had two children 
by her, Anna, who afterwards married the archduke Ferdinand 
of Austria, and Louis. Vladisлав died in Hungary in 1516. His 
successor was his son Louis, who had already been crowned 
as king of Bohemia at the age of three. According to the 
informations of Vladisлав, Sigismund, king of Poland, and the emperor 
Maximilian I. were to act as guardians of the young king. The 
Bohemian estates recognized this decision, but they refused to 
allow the guardians any right of interference in the affairs of 
Bohemia. The great Bohemian nobles, and in particular the 
supreme burggrave, Ždeněk Leo, lord of Rožmitál, ruled the 
country almost without control. The beginning of the reign of 
King Louis is marked by an event which had great 
importance for the constitutional development of Bohemia. At 
a meeting of the estates in 1517 known as the diet of St Wenceslas 
—as the members first assembled on the 28th of September, the 
anniversary of that saint—they came to terms and settled the 
questions which had been the causes of discord. The citizens 
renounced certain privileges which they had hitherto claimed, 
while the two other estates recognized their municipal autonomy 
and tacitly sanctioned their presence at the meetings of the 
diet, to which they had already been informally readmitted since 1508. 
At the first sitting of this diet, on the 24th of October, it was 
declared that the three estates had agreed henceforth “to live 
together in friendly intercourse, as became men belonging to the 
same country and race.” In 1522 Louis arrived in Bohemia from 
Hungary, of which country he had also been elected king. On 
his arrival at Prague he dismissed all the Bohemian state officials, 
including the powerful Leo of Rožmitál. He appointed Charles 
of Münsterberg, a cousin of Prince Bartholomew and also a 
grandson of King George, as regent of Bohemia during his 
absences, and John of Wartenberg as burggrave. The new 
officials appear to have supported the more advanced Hussite 
party, while Rožmitál and the members of the town council of 
Prague who had acted in concert with him had been the allies of 
the Romanists and those Utraquists who were nearest to the 
Church of Rome. The new officials thus incurred the displeasure of 
King Louis, who was at that moment seeking the aid of the 
pope in his warfare with Turkey. The king therefore reinstated 
Leo of Rožmitál in his offices in 1525. Shortly afterwards 
Rožmitál became involved in a feud with the mayor of Prague, 
and the feud became a civil war, in which most of the nobles and 
cities of Bohemia took sides. Meanwhile Louis, who had 
returned to Hungary, opened his campaign against the Turks. He 
requested aid from his Bohemian subjects, and this was 
granted by the Rosenberg faction, while Rožmitál and his party 
purposefully delayed sending any forces to Hungary. There were, 
therefore, but few Bohemian troops at the battle of Mohács 
(August 29, 1526) at which Louis was decisively defeated and 
perished.

The death of Louis found Bohemia in a state of great disorder, 
almost of anarchy. The two last kings had mainly resided in 
Hungary, and in spite of the temporary agreement obtained at 
the diet of St Wenceslas, the Bohemians had not succeeded in 
establishing a strong indigenous government which might have
taken the place of the absentee monarchs. Archduke Ferdinand of Austria—afterwards the emperor Ferdinand I.—laid claim to the Bohemian throne as husband of Anna, daughter of King Vladislaus. King Sigismund of Poland, the dukes Louis and William of Bavaria, several other German princes, as well as several Bohemian noblemen, of whom Leo of Rožmitál was the most important, were also candidates. The diet resolved to entrust the election to twenty-four of their members, chosen in equal number from the three estates. These electors, on the 23rd of October (1526), chose Ferdinand of Habsburg as their king. This date is memorable, as it marks the permanent accession of the Habsburg dynasty to the Bohemian throne, though the Austrian archdukes Rudolph and Albert had previously been rulers of Bohemia for short periods. Though Ferdinand fully shared that devotion to Rome which is traditional in the Habsburg dynasty, he showed great moderation in religious matters, particularly at the beginning of his reign. His principal object was to establish the hereditary right of his dynasty to the Bohemian throne, and this object he pursued with characteristic obstinacy. When a great fire broke out at Prague in 1545, which destroyed all the state documents, Ferdinand obtained the consent of the estates to the substitution of a charter stating that he had been recognized as king in consequence of the hereditary rights of his wife Anna, in the place of the former one, which had stated that he had become king by election. This caused great dissatisfaction and was one of the principal causes of the troubles that broke out shortly afterwards. Ferdinand had obtained the throne from his predecessor, the former emperor Charles V., been elected king of the Romans and heir to the Empire. He henceforth took a large part in the politics of Germany, particularly after he had in 1547 concluded a treaty of peace with Turkey, which assured the safety of the eastern frontiers of his dominions. Charles V. about the same time concluded his war with France, and the brothers determined to adopt a firmer policy towards the Protestants of Germany, whose power had recently greatly increased. The latter had, about the time of the recognition of Ferdinand as king of the Romans, and partly in consequence of that event, formed at Schmalkalden a league, of which John Frederick, elector of Saxony, and Philip, landgrave of Hesse, were the leaders. War broke out in Germany in the summer of 1546, and Charles relied on the aid of his brother, while the German Protestants on the other hand appealed to their Bohemian co-religionists for aid.

Since the beginning of the Reformation in Germany the views of the Bohemian reformers had undergone a considerable change. Some of the more advanced Ultraquists differed but little from the German Lutherans, while the Bohemian Brethren, who at this moment greatly increased in influence through the accession of several powerful nobles, strongly sympathized with the Protestants of Germany. Ferdinand’s task of raising a Bohemian army in support of his brother was therefore a difficult one. He again employed his usual tortuous policy. He persuaded the estates to vote a general levy of the forces of the country under the somewhat disingenuous pretext that Bohemia was menaced by the Turks; for at that period no armed force could be raised in Bohemia without the consent of the estates of the realm. Ferdinand fixed the town of Kaaden on the Saxon frontier as the spot where the troops were to meet, but on his arrival there he found that many cities and nobles—particularly those who belonged to the community of the Bohemian Brethren—had sent no men. Of the soldiers who arrived many were Protestants who sympathized with their German co-religionists. The Bohemian army refused to cross the Saxon frontier, and towards the end of the year 1546 Ferdinand was obliged to disband his Bohemian forces. Early in the following year he again called on his Bohemian subjects to furnish an army in aid of his brother. Only a few of the Romanists and more retrograde Ultraquists obeyed his order. The large majority of the Bohemians, as on the other hand, considered the moment opportune for recovering the ancient liberties of Bohemia, on which Ferdinand hadencroached in various ways by claiming hereditary right to the crown and by curtailing the old privileges of the land. The estates met at Prague in March 1547, without awaiting a royal summons,—undoubtedly an unconstitutional proceeding. The assembly, in which the influence of the representatives of the town of Prague and of the knights and nobles who belonged to the Bohemian Brotherhood was predominant, had a very revolutionary character. This became yet more marked when the news of the election of Saxony’s victory at Rochlitz reached Prague. The estates demanded the re-establishment of the elective character of the Bohemian kingdom, the recognition of religious liberty for all, and various enactments limiting the royal prerogatives. It was decided to entrust the management of state affairs to a committee of twelve members chosen in equal number from the three estates. Of the members of the committee chosen by the knights and nobles four belonged to the Bohemian Brotherhood. The committee decided to equip an armed force, the command of which was conferred on Kaspar Pflug of Rabenstein (d. 1576).

According to his instructions he was merely to march to the Saxon frontier, and there await further orders from the estates; there seems, however, little doubt that he was secretly instructed to afford aid to the German Protestants. Pflug marched to Joachimsthal on the frontier, but refused to enter Saxon territory without a special command of the estates.

Meanwhile the great victory of the imperialists at Mühlberg had for a time crushed German Protestantism. The Bohemians were in a very difficult position. They had seriously offended their sovereign and yet afforded no aid to the German Protestants. The arts of Pflug hastily dispersed, and the estates still assembled at Prague endeavoured to propitiate Ferdinand. They sent envoys to the camp of the king, who, with his brother Charles, was then besieging Wittenberg. Ferdinand received the envoys better than they had perhaps expected. He indeed always maintained his plan of making Bohemia a hereditary kingdom under Habsburg rule, and of curtailing as far as possible its ancient constitution, but he did not wish to drive to despair a still warlike people. Ferdinand demanded that the Bohemians should renounce all alliances with the German Protestants, and declared that he would make his will known after his arrival in Prague. He arrived there on the 20th of July, with a large force of Spanish and Walloon mercenaries, and occupied the city almost without resistance. Ferdinand treated the nobles and knights with great forbearance, and contented himself with the confiscation of the estates of some of those who had been most compromised. On the other hand he dealt very severely with the towns—Prague in particular. He declared that their ancient privileges should be revived—a measure that practically signified a broad confiscation of lands that belonged to the municipalities. Ferdinand also forced the Germans to accept the control of state officials who were to be called town-judges and in Prague town-captains. These royal representatives were given almost unlimited control over municipal affairs. The Bohemian Brethren were also severely persecuted, and their bishop Augusta was imprisoned for many years.

Ferdinand’s policy here was as able as it always was. The peasantry had ceased to be dangerous since the establishment of serfdom; the power of the cities was now thoroughly undermined. Ferdinand had only to deal with the nobles and knights, still he hoped that the influence of his court, and yet more that of the Jesuits, with whom he established in Bohemia about this time, would gradually render them amenable to the royal will. If we consider the customs of his time Ferdinand cannot be considered as having acted with cruelty in the moment of his success. Only four of the principal leaders of the revolt—two knights, and two citizens of Prague—were sentenced to death. They were decapitated on the square outside the Hradčany palace where the estates met on that day (August 22). This diet therefore became known as the "Kravý sněm" (bloody diet). When the last remnants of the Bohemian forces were defeated in obtaining the coronation of his eldest son Maximilian as king of Bohemia, thus ensuring to him the succession to the Bohemian throne. As Ferdinand I. acceded to the Hungarian throne at
the same time as to that of Bohemia, and as he also became king of the Romans and after the death of Charles V, emperor, many events of his life do not belong to the history of Bohemia. He died in 1554.

Maximilian succeeded his father as king of Bohemia without any opposition. Circumstances were greatly in his favor; he had in his youth been educated by Protestant tutors in the Netherlands, and had, his whole life, been greatly beloved of the party of church reform. This fact, which became known in Bohemia, secured for him the support of the Bohemian church reformers, while the Romanists and retrograde Utraquists were traditionally on the side of the house of Habsburg. The reign of Maximilian did not fulfill the hopes that met it. Though he published new decrees against the Bohemian Brethren, he generally refused to sanction any measures against the Protestants, in spite of the advice of the Jesuits, who were gradually obtaining great influence in Bohemia. He did nothing, however, to satisfy the expectations of the partisans of church reform, and indeed after a time began again to assist at the functions of the Roman church, from which he had long absent himself. Indifference, perhaps founded on religious scepticism, characterized the king during the many ecclesiastical disputes that played so large a part in his reign. In 1567 Maximilian, who had also succeeded his father as king of Hungary and emperor, visited the Bohemians for the first time since his accession to the throne. Like most princes of the Habsburg dynasty, he was constantly confronted at this period by the difficulties of raising funds for the defense of the kingdom against the Turks. When he asked the Bohemians to grant him supplies for this purpose, they immediately retorted by bringing forward their demands with regard to matters of religion. Their principal demand appears somewhat strange in the light of the events of the past. The estates expressed the wish that the celebrated Compacts should cease to form part of the laws of the country. These enactments had indeed granted freedom of worship to the most moderate Utraquists—men who, except that they claimed the right to receive the communion in both kinds, hardly differed in their faith from the Roman church. On the other hand Ferdinand I. had used the Compacts as an instrument which justified him in oppressing the Bohemian Brethren, and the advanced Utraquists, whose teaching now differed but little from that of Luther. He had argued that all those who professed doctrines differing from the Church of Rome more widely than did the retrograde Utraquists, were outside the pale of religious toleration. Maximilian, indifferent as usual to matters of religious controversy, consented to the abolition of the Compacts, and these enactments, which had once been sacred to the Bohemian people, perished unregretted by all parties. The Romanists had always hated them, believing them not to be in accord with the general custom of the papal church, while the Lutherans and Bohemian Brethren considered their suppression a guarantee of their own liberty of worship.

In 1575 Maximilian, who had long been absent from Bohemia, returned there, as the estates refused to grant subsidies to an absentee monarch. The siting of the diet that met in 1575 were very prolonged. The king maintained a vacillating attitude, influenced now by the threats of the Bohemians, now by the advice of the papal nuncio, who had followed him to Prague. The latter strongly represented to him how great would be the difficulties that he would encounter in his other dominions, should he make concessions to the Protestants of Bohemia. The principal demand of the Bohemians was that the "Confession of Augsburg"—a summary of Luther's teaching 

Confession of Augsburg.—should be recognized in Bohemia. They further renewed the demand, which they had already expressed at the diet of 1572, that the king should have the right of appointing the members of the consistory—the ecclesiastical body which ruled the Utraquist church; for since the death of John of Rokycan that church had had no archbishop. After long deliberations and the king's final refusal to recognize the confession of Augsburg, the majority of the diet, consisting of members of the Bohemian brotherhood and advanced Utraquisits, drew up a profession of faith that became known as the Confessio Bohemica. It was in most points identical with the Augsburg confession, but differed from it with regard to the doctrine of the sacrament of the Lord's Supper. Here the Bohemian profession agreed with the views of Calvin rather than with those of Luther. This is undoubtedly due to the influence of the Bohemian Brethren. The Confessio Bohemica was presented to Maximilian, who verbally expressed his approval, but would not consent to this being made public, and also refused his consent to the inclusion of the Confessio among the charters of the kingdom. Maximilian rejected the demand of the Bohemian estates, that they and not the king should in future appoint the members of the consistory. He finally, however, consented to exempt the Lutherans and advanced Utraquists from the jurisdiction of the consistory, and allowed them to choose fifteen defenders—five of whom were to belong to each of the estates—who were to have supreme control over the Lutheran church. These defenders were to appoint for each district a superintendent (moderator), who was to maintain order and discipline among the clergy. As the Bohemian Brotherhood had never recognized the consistory, that body now lost whatever influence it had still possessed. It became, indeed, subservient to the Romanist archbishop of Prague, which had been re-established by Ferdinand I. Its members henceforth were men who on almost all points agreed with Rome, and sometimes even men who had joined the Roman church, but continued by order of their superiors to remain members of the consistory, where they thought that their influence might be useful to their new creed.

The results of the diet of 1575 were on the whole favourable to the estates, and they seem to have taken this view, for almost immediately afterwards they recognized Maximilian's eldest son Rudolph as his successor and consented to his being crowned king of Bohemia. Maximilian died in the following year, and Rudolph succeeded him without any opposition. The events of the last years of the reign of Rudolph have the greatest importance for Bohemian history, but they are part of the history of the Holy Roman Empire. In 1600 the financial condition of Rudolph became so seriously impaired that the princes of the house of Habsburg thought it necessary to consider the future of the state, particularly as Rudolph had no legitimate descendants. Matthias, the eldest of his brothers, came to Prague and pointed out to Rudolph the necessity of appointing a coadjutor, should he be incapacitated from fulfilling his royal duties, and also of making arrangements concerning the succession to the throne. These suggestions were indignantly repelled by Rudolph, whose anger was further increased by the ill-received manner in which the pope in a forcible though formally courteous manner pointed out to him the evil results which his neglect of his royal duties would entail on his subjects, and called on him to appoint one of the Habsburg princes his successor both to the imperial crown and to the thrones of Bohemia and Hungary. It is probable that the fear that the pope might make good the threats contained in this letter induced Rudolph, who had hitherto been indifferent to matters of religion, to become more subservient to the Romanists. In particular, he very imprudently had the marriage of the young archbishop of Prague, a cousin of the pope, arranged; but it was thought that their influence might be useful to their new creed.
been abolished, and was liable to an interpretation excluding from tolerance all but the Romanists and the retrograde Utraquists. It appeared therefore as a menace to the Lutherans—and all the more advanced Utraquists had now embraced that creed—as well as to the Bohemian Brethren. The estates of Bohemia met at Prague in January 1603. The discussions were very stormy. Budovec of Budova, a nobleman belonging to the community of the Bohemian Brethren, became the leader of all those who were opposed to the Church of Rome. He vigorously attacked the royal decree, which he declared to be contrary to the promises made by King Maximilian. He, however, advised the estates to vote the supplies that King Rudolph had demanded. Immediately after this vote had been passed, the diet was closed by order of the king. Though the royal power was at that period very weak in Bohemia, the open partisanship of the king encouraged the Romanist nobles, who were not numerous, but among whom were some owners of large estates, to attempt to re-establish the Roman creed on their territories. Some of these nobles committed great cruelties while attempting to obtain these forcible conversions.

Strife again broke out between Rudolph and his treacherous younger brother Matthias, who used the religious and political controversies of the time for the purpose of supplanting his brother. The formal cause of the rupture between the two princes was Rudolph's refusal to sanction a treaty of peace with Turkey, which Matthias had concluded as his brother's representative in Hungary. The Hungarians accepted Matthias as their ruler, and when his forces entered Moravia the estates of that country had, by Charles, lord of Zerotin, also renounced the allegiance of Rudolph. Matthias then invaded Bohemia, and invited the estates of the kingdom to meet him at Časlav (Ceslau). In consequence of a sudden revolution of feeling for which it is difficult to account, the Bohemians declared the ouvertures of Matthias. The estates met at Prague in March 1608, and, though again submitting their demands concerning ecclesiastical matters to Rudolph, authorized him to levy troops for the defence of Bohemia. The forces of Matthias had meanwhile entered Bohemia and had arrived at Libeň, a small town near Prague now incorporated with that city. Here Matthias, probably disappointed by the refusal of the Bohemians to join his standard, came to an understanding with his brother (June 25, 1608). Rudolph formally ceded to Matthias the government of Hungary, Moravia, and Upper and Lower Austria, but retained his rights as king of Bohemia.

Soon after the conclusion of this temporary settlement, the estates of Bohemia again brought their demands before their king. Rudolph had declined to discuss all religious matters during the time that the troops of his brother occupied part of Bohemia. The diet that met on the 20th of January 1609 is one of the most important in the history of Bohemia. Here, as so frequently in the 17th century, the religious controversies were largely influenced by personal enmities. Rudolph never forgave the treachery of his brother, and was secretly negotiating (at the time when he again appeared as champion of Catholicism) with Christian of Anhalt, the leader of the German Protestants. This was known to the court of Spain, and the Bohemians also knew that the king could therefore rely on no aid from that quarter. They were therefore not intimidated when Rudolph, vacillating as ever, suddenly assumed a most turbulent attitude. The estates had at their meeting in March of the previous year drawn up a document consisting of twenty-five so-called Articles, which formulated their demands with regard to matters of religion. The king now demanded that this document, which he considered illegal, should be delivered up to him for destruction. The "articles" expressed the wish that the Confessio Bohemica should be recognized as one of the fundamental laws of the kingdom, and that complete religious-liberty should be granted to all classes. They further demanded that the Prague University should again be opened as a seminary to call jointly the Utraquists, Lutherans and Bohemian Brethren—and the Roman Catholics should have an equal right to hold all the offices of state, and that the power of the Jesuits to acquire land should be limited. They finally asked for redress of several grievances caused by the misuse of Rudolph. This document had remained in the hands of Budova, who refused to deliver it to the king. The estates then chose twelve of their number—among whom was Count Henry Matthias Thurn—who were to negotiate with the king and his councilors. Protracted discussions ensued, and the king finally stated, on the 31st of March, that he could grant no concessions in matters of religion. On the following day the estates met under the leadership of Budova. They decided to arm for the defence of their rights, and when the king immediately afterwards dissolved the diet, it was resolved to meet again after a month, even without a royal summons. When they returned to Prague, Adam of Sternberg, the burgrave, again informed Budova that the king would grant no concessions in ecclesiastical matters. Bohemia appeared to be on the verge of a revolution. It is unnecessary to record the frequent and contradictory resolutions of the king, influenced now by the extreme Romanists, now by those of his councilors who favoured a peaceful solution. Finally—on the 9th of July 1609—Rudolph signed the famed "Letter of Majesty" which gave satisfaction to all the legitimate demands of the Bohemian Protestants. In the "Letter of Majesty" Rudolph recognized the Confessio Bohemica. He further granted to the Protestant estates the control over the university of Prague, and authorized them to elect the members of the Utraquist consistory. They were further empowered to elect "defenders" chosen in equal number from the estates of the nobles, knights and citizens, who were to administer the execution of the Confessio Bohemica and generally to uphold the rights of the Protestants. On the same day the Romanist and the Protestant members of the diet also signed an agreement by which they guaranteed to each other full liberty of religious worship and declared that this liberty should be extended to all classes of the population.

In 1611 the peace of Bohemia was again disturbed by the invasion of the archduke Leopold of Austria, bishop of Passau, who probably acted in connivance with his cousin King Rudolph. Leopold succeeded in obtaining possession of part of the town of Prague, but his army was defeated by the troops which the Bohemian estates had hurridly raised, and he was obliged to leave Bohemia. Matthias considered his hereditary rights menaced by the raid of Leopold and again occupied Bohemia. Mainly at his instigation the estates now formally deposed Rudolph, who survived his de-thronement only a few months, and died on the 20th of January 1612. Though Matthias had allied himself with the Bohemian Protestants during his prolonged struggle against his brother, he now adopted the execution of the Confessio Bohemica, which is traditional of the Habsburg dynasty. His relations with the Bohemian Protestants, therefore, soon became strained. In 1615 Matthias convoqued a general diet, i.e. one that besides the Bohemian representatives included also the representatives of the "lands of the Bohemian crown." At the meeting of this diet the question of nationality, which through the constant religious controversies had receded to the background, again became predominant. Former enactments enforcing the use of the national language were reconfirmed, and it was decreed that Bohemian should be the "authorized" (i.e. official) language of the country.

As Matthias was childless, the question as to the succession to the Bohemian throne again arose. The king wished to secure the succession to his cousin Ferdinand, duke of Styria. Ferdinand was known as a fanatical adherent of the Church of Rome and as a cruel persecutor of the Protestants of Styria. None of the less the state officials of Bohemia, by not very scrupulous means, succeeded in persuading the estates to accept Ferdinand as heir to the throne and to consent to his coronation, which was to take place at Prague on the 17th of June 1617. No doubt through the influence of Ferdinand, the policy of Matthias henceforth assumed a yet more pronounced ultramontane character. The king's councillors, all adherents of the Church of Rome,
opened their hope that the Catholic Church would soon recover its ancient hold over Bohemia. On the other hand the Bohemian Protestants, led by Count Thurn, one of the few nobles who had returned to vote for the recognition of Ferdinand as king to the throne, did not wish to defer what they considered an inevitable conflict. It appeared to them more advantageous to encounter the weak Matthias than his younger and more fanatical successor. A comparatively unimportant incident precipitated matters. In December 1617, the archbishop of Prague and the abbot of Břevnov (Braunau) ordered the suppression of the Protestant religious services in churches that had been built on their domains. This was a direct infringement of the agreement concluded by the Romanist and Utraquist estates on the day on which Matthias signed the so-called Letter of Majesty. The defenders took immediate action, by inviting all Protestant members of the diet to meet at Prague. They assembled there on 21st of May 1618, and decided to proceed in full armour to the Hradčany palace to bring their complaints to the knowledge of the councillors of Matthias. On the following day, Thurn, Wenceslas of Ruppa, Ulrich of Kinsky, and other members of the more advanced party held a secret meeting, at which it was decided to put to death the most influential of Matthias's councillors. On the 23rd the representatives came to the Hradčany. Violent accusations were brought forward, particularly against Martinic and Slavata, the king's most trusted councillors, who were accused of having advised him to oppose the wishes of the Bohemians. Finally these two councillors, together with Fabricius, secretary of the royal council, were thrown from the windows of the Hradčany into the moat below—an event known in history as the Defenestration of Prague. Both Martinic and Slavata were but little injured, and succeeded in escaping from Prague. The Bohemians immediately established a provisional government consisting of thirty "directors," ten of whom were chosen by each of the estates. They also proceeded to raise an armed force, the command of which was given to Count Thurn. Hostilities with Austria began in July, when an imperial force entered Bohemia. The troops of Matthias were, however, soon repulsed by the Bohemians, and in November Thurn's army entered Austria, but was soon obliged to retire to Bohemia because of the lateness of the season.

In the following March the Bohemian crown became vacant by the death of Matthias. On the 31st of July the Bohemian estates pronounced the formal deposition of Ferdinand, and on the 26th of August they elected as their king Frederick, elector palatine. The new king and his queen, Elizabeth of England, arrived in Bohemia in October, and were crowned somewhat later at St Vitus's cathedral in Prague. Warfare with Austria continued during this year—1619. Thurn occupied Moravia, which now threw in its lot with Bohemia, and he even advanced on Vienna, but was soon obliged to retreat. In the following year events took a fatal turn for Bohemia. The powerful duke Maximilian of Bavaria joined his forces to those of Ferdinand, who had become Matthias's successor as emperor, and who was determined to reconquer Bohemia. Ferdinand also received aid from Spain, Poland and several Italian states. Even the Lutheran elector of Saxony espoused his cause. A large imperial army, under the command of the duke of Bavaria, Tilly and Bouquoy, entered Bohemia in September 1620. After several skirmishes, in all of which the Bohemians were defeated, the imperial forces arrived at the outskirts of Prague on the evening of the 7th of November. On the following morning they attacked the Bohemian army, which occupied a slightly fortified position on the plateau known as the "Bila Hora" (White Hill). The Bohemians were defeated after a struggle of only a few hours, and on the evening of battle the imperialists already occupied the port of Prague, situated on the left bank of the Vltava (Moldau). King Frederick, who had lost all courage, hurriedly left Prague on the following morning.

Bohemia itself, as well as the lands of the Bohemian crown, now submitted to Ferdinand almost without resistance. The battle of the White Hill marks an epoch in the history of Bohemia. The execution of the principal leaders of the national movement (June 21, 1621) was followed by a system of wholesale confiscations of the lands of all who had in any way participated in the national movement. Almost the entire ancient nobility of Bohemia was driven into exile, and adventurers from all countries, mostly men who had served in the imperial army, shared the spoils. Gradually all those who refused to recognize the creed of the Roman Church were expelled from Bohemia, and by the use of terrible cruelty Catholicism was entirely re-established in the country. In 1627 Ferdinand published a decree, which formally suppressed the ancient free constitution of Bohemia, though a slight indication of representative government was left to the country. The new constitution proclaimed the hereditary of the Bohemian crown in the house of Habsburg. It added a new "estate," that of the clergy, to the three already existing. This estate, which was to take precedence of all the others, consisted of the Roman archbishop of Prague and of all the ecclesiastics who were endowed with landed estates. The diet was deprived of all legislative power, which was exclusively vested in the sovereign. At its meetings the diet was to discuss such matters only as were laid before it by the sovereign. The Bohemians continued to have the right of voting taxes, but they were specially forbidden to attach any conditions to the grants of money which they made to their sovereign. It was finally decreed that the German language should have equal right with the Bohemian one in all the government offices and law-courts of the kingdom. This had indeed become a necessity, since, in consequence of the vast confiscations, the greatest part of the land was in the hands of foreigners to whom the national language was unknown. Though these enactments still left some autonomy to Bohemia, the country gradually lost all individuality. Its history from this moment to the beginning of the 17th century is but a part of the history of Austria (q.v.).

Bohemia was the theatre of hostilities during a large part of the Thirty Years' War, which had begun in its capital. In 1631 the Saxons for a time occupied a large part of Bohemia, and even attempted to re-establish Protestantism. During the later period of the Thirty Years' War Bohemia was frequently pillaged by Swedish troops, and the taking of Prague by the Swedish general Königsmark in 1648 was the last event of the great war. The attempts of the Swedish envoys to obtain a certain amount of toleration for the Bohemian Protestants proved fruitless, as the imperial representatives were inflexible on this point. At the beginning of the 18th century the possibility of the extinction of the male line of the house of Habsburg arose. The estates of Bohemia, at a meeting that took place at Prague on the 16th of October 1720, sanctioned the female succession to the Bohemian throne and recognized the so-called Pragmatic Sanction which proclaimed the indivisibility of the Habsburg realm. The archduchess Maria Theresa, in whose favour these enactments were made, none the less met with great opposition on the death of her father the emperor Charles VI. Charles, elector of Bavaria, raised claims to the Bohemian throne and invaded the country with a large army of Bavarian, French and Saxon troops. He occupied Prague, and a large part of the nobles and knights of Bohemia took the oath of allegiance to him (December 19, 1741). The fortune of war, however, changed shortly afterwards. Maria Theresa recovered Bohemia and the other lands that had been under the rule of the house of Habsburg. During the reign of Maria Theresa, and to a greater extent during that of her son Joseph II., many changes in the internal administration of the Habsburg realm took place which all tended to limit yet further the autonomy of Bohemia. A decree of 1749 abolished the separate law-courts that still existed in Bohemia, and a few years later an Austro-Bohemian chancellor was appointed who was to have the control of the administration of Bohemia, as well as of the German domains of the house of Habsburg. The power of the royal officials who constituted the executive government of
Bohemia was greatly curtailed, and though the chief representative of the sovereign in Prague continued to bear the ancient title of supreme burggrave, he was instructed to conform in all matters to the orders of the central government of Vienna. Yet more extreme measures tending to centralization were introduced by the emperor Joseph, who refused to be crowned at Prague as Langhov, the powers of the Bohemian diet and of the royal officials at Prague were yet further limited, and the German language was introduced into all the upper schools of Bohemia. Some of the reforms introduced by Joseph were, incidentally and contrary to the wishes of their originator, favourable to the Bohemian nationality. Thus the greater liberty which he granted to the press enabled the Bohemians to publish a newspaper in the national language. After the death of Joseph in 1790 the Bohemian estates, whose meetings had been suspended during his reign, again assembled, but they at first made but scanty attempts to reassert their former rights. During the long Napoleonic wars, in which the house of Habsburg was almost continuously engaged, Bohemia continued in its previous lethargic state. In 1804 a merely formal change in the constitutional position of Bohemia took place when Francis I. assumed the hereditary title of emperor of Austria. It was stated in an imperial decree that the new title of the sovereign should in no way prejudice the ancient rights of Bohemia and that the sovereigns would continue to be crowned as kings of Bohemia.

After the re-establishment of European peace in 1815 the long-suppressed national sentiment in Bohemia began to revive. The national movement, however, at first only found expression in the revival of Bohemian literature. The arbitrary and absolutist government of Prince Metternich rendered all political action impossible in the lands ruled by the house of Habsburg. In spite of this pressure the estates of Bohemia began in 1845 to assume an attitude of opposition to the government of Vienna. They affirmed their right of voting the taxes of the country—a right that was due to them according to the constitution of 1817. To obtain the support of the wider classes of the population, they determined in 1847 to propose at their session of the following year that the towns should have a more extensive representation at the diet, that the control of the estates over the finances of the country should be made more stringent, and that the Bohemian language should be introduced into all the higher schools of the country. The revolutionary outbreak of 1848 prevented this meeting of the estates. When the news of the February revolution in Paris reached Prague the excitement there was very great. On the 11th of March a vast public meeting voted a petition to the government of Vienna which demanded that the Bohemian language should be taught in the national higher and lower schools of the country, that a general diet comprising all the Bohemian lands, but elected on an extensive suffrage, should be convoked, and that numerous liberal reforms should be introduced. The deputation which presented these demands in Vienna received a somewhat equivocal answer. In reply, however, to a second deputation, the emperor Ferdinand declared on the 8th of April that equality of rights would be secured to both nationalities in Bohemia, that the question of the reunion of Moravia and Silesia to Bohemia should be left to the representatives of the several districts and parts of Austria, and that a new meeting of the estates of Bohemia, which would include representatives of the principal towns, would shortly be convoked. This assembly, which was to have had full powers to create a new constitution, and which would have established complete autonomy, never met, though the election of its members took place on the 17th of May. In consequence of the general national movement which is so characteristic of the year 1848, it was decided to hold at Prague a "Slavic congress" to which Slavs of all parts of the Austrian empire, as well as Slavs belonging to other countries, were invited. The deliberations were interrupted by the serious riots that broke out in the streets of Prague on the 22nd of June. They were suppressed after prolonged fighting and considerable bloodshed. The Austrian commander, Prince Windischgrätz,
caused the failure of this attempt to reconcile Bohemia with Austria. In 1872 a government with a pronounced German tendency took office in Vienna, and the Bohemians for a time again refused to attend the parliamentary assemblies of Vienna and Prague. In 1870 Count Eduard Taaffe became Austrian prime minister, and he succeeded in persuading the representatives of Bohemia to take part in the deliberations of the parliament of Vienna. They did so, after stating that they took this step without prejudice to their view that Bohemia with Moravia and Silesia constituted a separate state under the rule of the Habsburgs as Austria and Hungary. The government of Count Taaffe, in recognition of this concession by the Bohemians, consented to remove some of the grossest anomalies connected with the electoral system of Bohemia, which had hitherto been grossly partial to the German minority of the population. The government of Count Taaffe also consented to the foundation of a Bohemian university at Prague, which greatly contributed to the intellectual development of the country. On the fall of the government of Count Taaffe, Prince Alfred Windischgrätz became prime minister. The policy of his short-lived government was hostile to Bohemia and he was soon replaced by Count Badeni.

Badeni again attempted to conciliate Bohemia. He did not indeed consider it feasible to reopen the question of its autonomy, but he endeavoured to remedy some of the most serious grievances of the country. In the beginning of 1897 Count Badeni issued a decree which stated that after a certain date all government officials who wished to be employed in Bohemia would have to prove a certain knowledge of the Bohemian as well as of the German languages. This decree met with violent opposition on the part of the German inhabitants of Austria, and caused the fall of Count Badeni's cabinet at the end of the year 1897. After a brief interval he was succeeded by Count Thun and then by Count Clary, whose government repealed the decrees that had to a certain extent granted equal rights to the Bohemian language. In consequence troubles broke out in Prague, and were severely repressed by the Austrian authorities. During the subsequent ministries of Körber and Gautsch the Bohemians continued to oppose the central government of Vienna, and to assert their national rights.

See generally Count Lützow, Bohemia, a Historical Sketch (London, 1896). The valuable collection of historical documents entitled Pontes Rerum Bohemicarum, published at Prague in the latter part of the 19th century, has superseded earlier ones such as Frerichs (Wien), Geschichte der Bohemen, and Frederichs (Prague), Geschichte der Bohemer Rik (vol. i, 1889; vol. ii, 1905). Among the other earlier historical works of Publitschka, Pelzl and De Flory are superseded by František Palacký's Geschichte von Böhmen (Prague, 1874), which, however, when translated into English, by Boweker, Cidley and others have dealt with the history of Bohemia posterior to the year 1526. Professor Adolf Bachmann published (vol. i, 1893; vol. ii, 1905) Geschichte Böhmens up to 1526, which has a strongly marked German tendency. Of French works Professeur Ernest Denis's Jean Hus, et la guerre des Hussites (Paris, 1878), Fin de l'indépendance bohème (2 vols., 1890), and La Bôhême depuis la Montagne Blanche (2 vols., 1903), give a continuous account of Bohemian history from the beginning of the 15th century. (L.)

Literature

The earliest records of the Bohemian or Czech language are very ancient, though the so-called MSS. of Zelena Hora (Grüneberg) and Kraladvůr (Königshof) are almost certainly forgeries of the early part of the 19th century. The earliest genuine documents of the Bohemian language comprise several hymns and legends; of the latter the legend of St Catherine and that of St Dorothy have the greatest value. Several ancient epic fragments have also been preserved, such as the Alexandreis and Tandarios a Floribella. These and other early Bohemian writings have been printed since the revival of Bohemian literature in the 19th century. Of considerable historical value is the rhymed chronicle generally though wrongly known as the chronicle of Dalimil, which the author probably wrote during the reign of King John (1310-1346), records the events of Bohemian history from the earliest period to the reign of King Henry of Carinthia, the immediate predecessor of John. A strong feeling of racial antipathy to the Germans pervades the chronicle.

It is undoubtedly to be attributed to the high intellectual level which Bohemia attained in the 14th century that at that period we already find writers on religious and philosophical subjects who used the national language. Of these the most important is Thomas of Strýčný (c. 1331-1401). Of his works, which contain many ideas similar to those of his contemporary Wycliffe, those entitled O abchynych veczech Krestianskych (on general Christian matters) and Besední réči (in a rough translation "learned entertainments") have most value. Strýčný and some of his contemporaries whose Bohemian writings have perished are known as the forerunners of Huss. Huss, like many of his contemporaries in Bohemia, wrote both in Bohemian and in Latin. Of the Bohemian writings of Huss, who contributed greatly to the development of his native language, the most important is his Vyklad verty, desatera Besiko prikazani, a potere (exposition of the creed, the ten commandments and the Lord's Prayer) written in 1412. Of his numerous other Bohemian works we may mention the Postilla (collection of sermons), the treatises O ponzani cesty prave k spasení (the true road to salvation) and O svatkomupestvi (on simony), and a large collection of letters; those written in prison are very touching.

The years that followed the death of Huss formed in Bohemia a period of incessant theological strife. The anti-Roman or Hussite movement was largely a democratic one, and it is therefore natural that the national language rather than Latin should have been used in the writings that belong to this period. Unfortunately in consequence of the systematic destruction of all Bohemian writings which took place through the agency of the Jesuits, after the battle of the White Hill (1620), a large part of this controversial literature has perished. Thus the writings of the members of the extreme Hussite party, the so-called Taborites, have been entirely destroyed. Of the writings of the more moderate Hussites, known as the Calixtines or Utraquists, some have been preserved. Such are the books entitled Of the Great Torment of the Holy Church and the Lives of the Priests of Tabor, written in a sense violently hostile to that community. A Bohemian work by Archbishop John of Rokycan has also been preserved; it is entitled Postilla and is similar though inferior to the work of Huss that bears the same name.

A quite independent religious writer who belongs to the period of the Hussite wars is Peter Chelčický (born in the last years of the 14th century, died 1450), who may be called the Tolstoy of the 15th. His dominant ideas were horror of bloodshed and the determination to accept unresistingly all, even unjust, decrees of the worldly authorities. Though a strenuous enemy of the Church of Rome, Chelčický joined none of the Hussite parties. His masterpiece is the Štěrky (the net of faith). Among his other works his Postilla and polemical writings in the form of letters to Archbishop John of Rokycan and Bishop Nicolas of Pelníhov deserve mention.

The Hussite period is rather poor in historical works written in the language of the country. We should, however, mention some chronicles who were contemporaries and sometimes eye-witnesses of the events of the Hussite wars. Their writings have been collected and published by František Palacký under the title of Střetové latiny.

In the 16th century when Bohemia was in a state of comparative tranquillity, the native literature was largely developed. Besides the writers of the community of the Bohemian Brethren, we meet at this period with three historians of merit. Of these the best-known is Wenceslas Hajek of Libočan. The year of his birth is uncertain, but we read of him as a priest in 1524; he died in 1553. His great work Kronika česka was dedicated to the emperor Ferdinand I., king of Bohemia, and appeared under the auspices of government officials. It has therefore a strong dynastic and Roman tendency, and its circulation was large even at the time when most Bohemian books were prohibited and many totally destroyed. Hajek's book was translated into several languages and frequently quoted. We
find such second-hand quotations even in the works of many writers who had probably never heard of Hajek. His book is, however, inaccurate and grossly partial. Very little known on the other hand are the works of Bartoš, surnamed “pisák” (the writer), as he was for many years employed as secretary by the city of Prague, and those of Sixt of Ottersdorf. The work of Bartoš (or Bartholomev) entitled the *Chronicle of Prague* has great historical value. He describes the troubles that befell Prague and Bohemia generally during the reign of the weak and absentee sovereign King Louis. The year of the birth of Bartoš is uncertain, but it is known that he died in 1539. The somewhat later work of Sixt of Ottersdorf (1500–1583) deals with a short but very important episode in the history of Bohemia. It is entitled *Memorials of the Troubled Years 1546 and 1547*. The book describes the unsuccessful rising of the Bohemians against Ferdinand I. of Austria. Sixt took a considerable part in this movement, a fact that greatly enhances the value of his book.

Though the life of Chelicky, who has already been mentioned, was an isolated one, he is undoubtedly the indirect founder of the community of the “Bohemian Brethren,” who greatly influenced Bohemian literature. Almost all their historical and theological works were written in the national language, through which influence became far more refined and polished. Before referring to some of the writings of members of the community we should mention the famed translation of the Scriptures known as the *Bible of Kralice*. It was the joint work of several divines of the brotherhood, and was first printed at Kralice in Moravia in 1593. Brother Gregory, surnamed the patriarch of the brotherhood, has left other numerous works. He was well versed in the writings dealing mainly with theological matters. Most important are his *Letters to Archbishop Rokyca*, and the book *On Good and Evil Priests*. After the death of Brother Gregory in 1490 discord broke out in the community, and it resulted in very great literary activity. Brothers Lucas, Blahoslav and Jaffet, as well as August, a bishop of the community, have left us numerous controversial works. Very interesting is the account of the captivity of Bishop August, written by his companion the young priest Jan Bilek. We have evidence that numerous historical works written by members of the brotherhood existed, but most of them perished in the 17th century when nearly all anti-Roman books written in Bohemia were destroyed. Thus only fragments of Blahoslav’s *History of the Unity* (i.e. the brotherhood) have been preserved. One of the historians of the brotherhood, Wenceslas Brezan, wrote a *History of the House of Rosenber*, of which only the biographies of William and Peter of Rosenberg have been preserved. The greatest writer of the brotherhood is John Amos Komensky or Comenius (1592–1670). Of his many works written in his native language the most important is his *Labyrinth of the World*, an allegorical tale which is perhaps the most famous work written in Bohemian. Many of the numerous devotional and educational writings of Comenius,—his works number 142,—are also written in his native tongue.

The year 1620, which witnessed the downfall of Bohemian independence, also marks the beginning of a period of decline of the national tongue, which indeed later, in the 18th century, was almost extinct as a written language. Yet we must notice besides Comenius two other writers, both historians, whose works belong to a date later than 1620. Of these one was an adherent of the nationalistic, the other of the imperialistic party. Paul Škala ze Zhoře (1582–1649) was an official in the service of the “winter king” Frederick of the Palatinate. He for a time followed his sovereign into exile, and spent the last years of his life at Freiberg in Saxon. It was at this period of his life, after his political activity had ceased, that he wrote his historical works. His first work was a short book which is a mere series of chronological tables. Somewhat later he undertook a vast work entitled *Histories cirkveni* (history of the church). In spite of its title the book, which consists of ten enormous MS. volumes, deals as much with political as with ecclesiastical matters. The most valuable part, that dealing with events of 1602 to 1623, of which Škala writes as a contemporary and often as an eye-witness, has been edited and published by Prof. Tietztrunk. A contemporary and a political opponent of Škala was William Count Slavata (1572–1592). He was a faithful servant of the house of Habsburg, and one of the government officials who were thrown from the windows of the Hradcany palace in 1618, at the beginning of the Bohemian uprising. In 1637 Slavata published his *Pamět* (memoirs) which deal exclusively with the events of the 1580s and 1610s, in which he had played a great part. During the leisure of the last years of his long life Slavata composed a vast work entitled *Historicki Spisovani* (historical works). It consists of fourteen large MS. volumes, two of which contain the previously-written memoirs. These two volumes have recently been edited and published by Dr. Jos. Jireček.

After the deaths of Škala, Slavata and Comenius, no works of any importance were written in the Bohemian language for a considerable period, and the new Austrian government endeavoured in every way to discourage the use of the national tongue. The romantic movement started at the beginning of the 19th century. The early revival of the Bohemian language was very modest, and at first almost exclusively translations from foreign languages were published. The first writer who again drew attention to the then almost forgotten Bohemian language was Joseph Dobrovsky (1753–1820). His works, which include a grammar of the Bohemian language and a history of Bohemian literature, were mostly written in German or Latin, and his only Bohemian works are some essays which he contributed to the *Casopis Museu Královstvi Českho* (Journal of the Bohemian Museum) and a collection of letters. It is, however, to four men belonging to a time somewhat subsequent to that of Dobrovsky’s that the revival of the language and literature of Bohemia is mainly due. They are Jungmann, Kolar, Šafařík and Palacký. Joseph Jungmann (1773–1847) published early in life numerous Bohemian translations of German and English writers. His most important works are his *Dejepes literature česka* (history of Bohemian literature), and his monumental German and Bohemian dictionary, which largely contributed to the development of the Bohemian language. John Kolar (1793–1852) was the greatest poet of the Bohemian revival, and it is only in quite recent days that Bohemian poetry has risen to a higher level. Kolar’s principal poem is the *Slovy decesa* (daughter of Slavia), a personification of the Slavic race. Its principal importance at the present time consists rather in the part it played in the revival of Bohemian literature than in its artistic value. Kolar’s other works are mostly philological studies. Paul Joseph Šafařík (1795–1861) was a very fruitful writer. His *Starostinnosti Slovanske* (Slavic antiquities), an attempt to record the then almost unknown history and literature of the early Slavs, has still considerable value. Francis Palacký (1798–1876) is undoubtedly the greatest of Bohemian historians. Among his many works his history of Bohemia from the earliest period to the year 1526 is the most important.

Other Bohemian writers whose work belongs mainly to the earlier part of the 19th century are the poets Francis Ladislav Čelakovský, author of the *Růžičko stolitena* (the hundred-leaved rose), Erben, Macha, Tyl, to mention but a few of the most famous writers. The talented writer Karel Havlíček, the founder of Bohemian journalism, deserves special notice. During the latter part of the 19th century, and particularly after the foundation of the national university in 1882, Bohemian literature has developed to an extent that few perhaps foresaw. Of older writers Božena Němcová, whose *Babička* has been translated into many languages, and Benes Třebizky, author of many historical novels, should be named. John Neruda (1834–1891) was a very fruitful and talented writer both of poetry and of prose. Perhaps the most valuable of his many works is his philosophical novel *Zwicky’s House* (novels). Julius Zeyer (1841–1901) also wrote much both in prose and in verse. His epic poem entitled *Věžbrad*, which
celebrates the ancient glory of the acropolis of Prague, has great
value, and of his many novels Jan Maria Plchov has had the
greatest success. Of later Bohemian poets the best are Adolf
Heyduk, Svatopluk Čech and Jaroslav Vrchlický (b. 1853).
Of Svatopluk Čech's many poems, which are all inspired by
national enthusiasm, Václav z Michnovic, Lesky Bushy Konar
(the smith of Lesen) and Buzze oteoka (the songs of a slave)
are the most notable. While Vrchlický (pseudoem of Emil
Frida] has no less strong patriotic feelings, he has been more
catholic in the choice of the subjects of his many works, both in
poetry and in prose. Of his many collections of lyric poems
Rok na jihu (a year in the south), Poule k Eldorado (pilgrimages
to Eldorado) and Sonety Samotore (sonnets of a recluse) have
particular value. Vrchlický is also a very brilliant dramatist.
Bohemian novelists have become very numerous. Mention
should be made of Alois Jirásek, also a distinguished dramatic
author; Jacob Arbes, whose Romaneta have great merit; and
Václav Iladík, whose Evzen Voldan is a very striking representa-
tion of the life of modern Prague. Like so many Bohemian
authors, Iladík also is a copious dramatic author.

Bohemian has been very fruitful in historic writers. Wenceslas
Tomek (1818-1905) left many historical works, of which his
Dějiny města Prahy (history of the town of Prague) is the
most important. Jaroslav Goll (b. 1846) is the author of many
historical works, especially on the community of the Bohemian
Brethren. Professor Joseph Kalousek has written much on the
early history of Bohemia, and is also the author of a very valuable
study of the ancient constitution (Statní pravo) of Bohemia.
Dr Anton Rezek is the author of important historical studies,
many of which appeared in the Journal of the Bohemian Museum
and in the Český Casopis Historický (Bohemian Historical
Review), which he founded in 1895 jointly with Professor Jaroslav
Goll. More recently Dr Václav Flášhans has published some
excellent studies on the life and writings of John Huss,
and Professors Fic and Niederle have published learned archaeo-
logical studies on the earliest period of Bohemian history.

See Count Lützow, A History of Bohemian Literature (London,
1899); W. R. Morfill, Slavonic Literature (1883); A. N. Pypin
and V. D. Spasović, History of Slavonic Literature (written in Russian,
translated into German by Trangott Pech, Gesch. der slaw. Literaturen,
2 vols., Leipzig, 1880-1884). There are modern histories of Bohemian
literature written in the national language by Dr Karel Tieftrunk,
Dr Václav Flášhans and Mr Jaroslav Vlack.

BOHEMUND, the name of a series of princes of Antioch,
afterwards counts of Tripoli. Their connexion is shown in the
following table:—

| Robert Guiscard | (1) Albereda | (2) Sicelgaeta |
| Bohemund I. = Constance, daughter of Philip I. of France. |
| Bohemund II. = Alice, daughter of Baldwin II. of Jerusalem. |
| (1) Raymund = Constance = (2) Raynald of Châtillon. |
| Bohemund III. = (2) Orguilieuse. |
| Bohemund IV. = (1) Piaissance. |
| (2) Melinda, daughter of Amalric II. |
| Bohemund V. = (1) Alice, widow of Hugh of Cyprus. |
| = (2) Luciana, daughter of count of Segni. |
| Henry I. = Piaissance of Cyprus |
| Bohemund VI. = Sibylla, sister of Leo 111. of Antioch. |
| Bohemund VII. = a s.p. |

BOHEMUND I. (c. A.D. 1058-1111), prince of Otranto and
and afterwards of Antioch, whose first name was Marc, was the
eldest son of Robert Guiscard, dux Apulie et Calabriae, by an
early marriage contracted before 1059. He served under his
father in the great attack on the East Roman empire (1080–
1085), and commanded the Normans during Guiscard's absence
(1082-1084), penetrating into Thessaly as far as Larissa, but
being repulsed by Alexius Comnenus. This early hostility to
Alexius had a great influence in determining the course of his
future career, and thereby helped to determine the history of
the First Crusade, of which Bohemund may be regarded as the
leader. On the death of Guiscard in 1085, his younger son
Roger, born "in the purple" of a Lombard princess Scolgesa,
succeeded to the duchy of Apulia and Calabria, and a war arose
between Bohemund (whose father had destined him for
the throne of Constantinople) and Duke Roger. The war was
finally composed by the mediation of Urban II, and the award
of Otranto and other possessions to Bohemund. In 1096 Bohemund,
along with his uncle the great count of Sicily, was attacking
Amalfi, which had revolted against Duke Roger, when bands of
crusaders began to pass, on their way through Italy to Constanti-
nople. The zeal of the crusader came upon Bohemund: it is
possible, too, that he saw in the First Crusade a chance of
realizing his father's policy (which was also an old Norse instinct)
of the Drang nach Osten, and hoped from the first to carve for
himself an eastern principality. He gathered a fine Norman
army (perhaps the finest division in the crusading host), at
the head of which he crossed the Adriatic, and penetrated to Con-
stantinople along the route he had tried to follow in 1082–
1084. He was careful to observe a "correct" attitude towards
Alexius, and when he arrived at Constantinople in April 1097
he did homage to the emperor. He may have negotiated with
Alexius about a principality at Antioch; if he did so, he
had little encouragement. From Constantinople to Antioch
Bohemund was the real leader of the First Crusade; and it says
much for his leading that the First Crusade succeeded in
conquering Asia Minor, which the Crusades of 1101, 1147 and
1189 failed to accomplish. A politique, Bohemund was resolved to
engineer the enthusiasm of the crusaders to his own ends; and when his
nephew Tancred left the main army at Heraclea, and attempted
to establish a footing in Cilicia, the movement may have been
already intended as a preparation for Bohemund's eastern
principality. Bohemund was the first to get into position
before Antioch (October 1097), and he took a great part in the
siege,besieging off the Mahommedan attempts at a retreat from
the east, and connecting the besiegers on the west with the port
of St Simeon and the Italian ships which lay there. The capture
of Antioch was due to his connexion with Fıruz, one of the
commanders in the city; but he would not bring matters to an
issue until the possession of the city was assured to him (May 1098),
under the terror of the approach of Kerboga with a great army
of relief, and with a reservation in favour of Alexius, if Alexius
should fulfil his promise to aid the crusaders. But Bohemund
was not secure in the possession of Antioch, even after its
surrender and the defeat of Ker-
boh; he had to make good his
claims against Raymund of Tou-
house, who championed the rights of
Alexius. He obtained full possession
in January 1099, and stayed in the
neighbourhood of Antioch to secure
his position, while the other crusaders
moved southward to the capture of
Jerusalem. He came to Jerusalem
at Christmas 1099, and had Dago-
bert of Pisa elected as patriarch,
perhaps in order to check the growth
of a strong Lotharingian power
in the city. It might seem in 1100
that Bohemund was destined to
found a great principality in Antioch,
which would dwarf Jerusalem; he
had a fine territory, a good strategical position and a strong
army. But he had to face two great forces—the East Roman
empire, which claimed the whole of his territories and was
supported in its claim by Raymund of Toulouse, and the strong
Mahommedan principalities in the north-east of Syria. Against
these two forces he failed. In 1100 he was captured by Danis-
mend of Sivas, and he languished in prison till 1103. Tancred
took his place; but meanwhile Raymund established himself
with the aid of Alexius in Tripoli, and was able to check the
expansion of Antioch to the south. Ransomed in 1103 by the generosity of an Armenian prince, Bohemund made it his first object to attack the neighbouring Mahommedan powers in order to gain supplies. But in heading an attack on Harran, in 1104, he was severely defeated at Balich, near Rakka on the Euphrates. The defeat was decisive; it made impossible the great eastern principality which Bohemund had contemplated. It was followed by a Greek attack on Cilicia; and despairing of his own resources, Bohemund returned to Europe for reinforcements in order to defend his position. His attractive personality won him the hand of Constance, the daughter of the French king, Philip I., and he collected a large army. Dazzled by his success, he resolved to use his army not to defend Antioch against the Greeks, but to attack Alexius. He did so; but Alexius, aided by the Venetians, proved too strong, and Bohemund had to submit to a humiliating peace (1108), by which he became the vassal of Alexius, consented to receive his pay, with the title of Sebastos, and promised to cede disputed territories and to admit a Greek patriarch into Antioch. Henceforth Bohemund was a broken man. He died without returning to the East, and was buried at Canossa in Apulia, in 1111.

LITERATURE.—The anonymous Gesa Francorum (edited by H. Harmsen), written by one of Bohemund's followers; and the Alexiad of J. is a partial history for the year 1118 of his life. His career is discussed by B. von Kügel, Bohemund und Tancred (Tübingen, 1862); while L. von Heinemann, Geschichte der Normannen in Sizilien und Unteritalien (Leipzig, 1894), and R. Röhrich, Geschichte des ersten Kreuzzuges (Innsbruck, 1901), and Geschichte des Königreichs Jerusalem (Innsbruck, 1898), may also be consulted for his history.

Bohemund II. (1107-1131), son of the great Bohemund by his marriage with Constance of France, was born in 1108, the year of his father's defeat at Durazzo. In 1126 he came from Apulia to Antioch (which, since the fall of Roger, the successor of Tancred, in 1119, had been under the regency of Baldwin II.); and in 1127 he married Alice, the younger daughter of Baldwin. After some trouble with Joscelin of Edessa, and after joining with Baldwin II. in an attack on Damascus (1127), he was defeated and slain on his northern frontier by a Mahommedan army from Aleppo (1131). He had shown that he had his father's courage: if time had sufficed, he might have shown that he had the other qualities of the first Bohemund.

Bohemund III. was the son of Constance, daughter of Bohemund II., by her first husband, Raymond of Antioch. He succeeded his mother in the principality of Antioch in 1163, and first appears prominently in 1164, as regent of the kingdom of Jerusalem during the expedition of Amalric I. to Egypt. During the absence of Amalric, he was defeated and captured by Nureddin (August 1164) at Harenc, to the east of Antioch. He was at once ransomed by his brother-in-law, the emperor Manuel, and returned to Syria, whence he returned with a Greek patriarch. In 1180 he deserted his second wife, the princess Orguilleuse, for a certain Sibylla, and he was in consequence excommunicated. By Orguilleuse he had had two sons, Raymond and Bohemund (the future Bohemund IV.), whose relations and actions determined the rest of his life. Raymond married Alice, a daughter of the Armenian prince Ruphen (Rupin), brother of Leo of Armenia, and died in 1197, leaving behind him a son, Raymond Ruphen. Bohemund, the younger brother of Raymond, had succeeded the last count of Tripoli in the possession of the principality; but the problem which occupied the last years of Bohemund III. was to determine whether his grandson, Raymond Ruphen, or his younger son, Bohemund, should succeed him in Antioch. Leo of Armenia was naturally the champion of his great-nephew, Raymond Ruphen; indeed he had already claimed Antioch in his own right, before the marriage of his niece to Raymond, in 1194, when he had captured Bohemund III. at Gastroin, and attempted without success to force him to cede Antioch.1 Bohemund the younger, however, prosecuted his claim with vigour, and even evicted his father from Antioch (between 1191 and 1193). Thus the second king of Antioch, Bohemund III., was practically all that is known about the history of Antioch and Tripoli. (E. Br.)

BÖHMER, JOHANN FRIEDRICH (1795-1863), German historian, son of Karl Ludwig Bömer (d. 1837), was born at Frankfurt-on-Main on the 22nd of April 1805. Educated at the universities of Heidelberg and Göttingen, he showed an interest in art and visited Italy; but returning to Frankfurt he turned his attention to the study of history, and became

1 During the captivity of Bohemund III., the patriarch of Antioch helped to found a commune, which persisted, with its mayor and jurats, during the 13th century.

the grace of the emperor, Henry VI.), and Bohemund III. died in possession of his principality (1201).

Bohemund IV., younger son of Bohemund III., by his second wife Orguilleuse, became count of Tripoli in 1187, and succeeded his father in the principality of Antioch, to the exclusion of Raymond Ruphen, in 1201. But the dispute lasted for many years (Leo of Armenia continuing to champion the cause of his great-nephew), and long occupied the attention of Innocent III. Bohemund IV. enjoyed the support of the Templars (who, like the Knights of St John, had estates in Tripoli) and of the Greek inhabitants of Antioch, to whom he granted their own patriarchy in 1207, while Leo appealed (1210-1211) both to Innocent III. and the emperor Otto IV., and was supported by the Hospitaliters. In 1216 Leo captured Antioch, and established Raymond Ruphen as its prince; but he lost it again in less than four years, and it was once more in the possession of Bohemund IV. when Leo died in 1220. Raymond Ruphen died in 1221; and after the event Bohemund reigned in Antioch and Tripoli till his death, proving himself a determined enemy of the Hospitaliters, and thereby incurring excommunication in 1230. He first joined, and then deserted, the emperor Frederick II., during the crusade of 1228-29; and he was excluded from the operation of the treaty of 1229. When he died in 1233, he had just concluded peace with the Hospitaliters, and Gregory IX. had released him from the excommunication of 1230.

Bohemund V., son of Bohemund IV. by his wife Plaisance (daughter of Hugh of Gibelet), succeeded his father in 1233. He was prince of Antioch and count of Tripoli, like his father, and like him he enjoyed the alliance of the Templars and experienced the hostility of Armenia, which was not appeased till 1251, when the mediation of St Louis, and the marriage of the future Bohemund VI. to the sister of the Armenian king, finally brought peace. By his first marriage in 1225 with Alice, the widow of Hugh I. of Cyprus, Bohemund V. connected the history of Antioch for a time with that of Cyprus. He died in 1251. He had resided chiefly at Tripoli, and under him Antioch was left to be governed by its bailiff and commune.

Bohemund VI. was the son of Bohemund V. by Luciana, a daughter of the count of Segni, nephew of Innocent III. Born in 1237, Bohemund VI. succeeded his father in 1251, and was knighted by St Louis in 1252. His sister Plaisance had married in 1250 Henry I. of Cyprus, the son of Hugh I.; and the Cypriot connexion of Antioch, originally formed by the marriage of Bohemund V. and Alice, the widow of Hugh I., was thus maintained. In 1252 Bohemund VI. established himself in Antioch, leaving Tripoli to itself, and in 1257 he procured the recognition of his nephew, Hugh II., the son of Henry I. by Plaisance, as king of Cyprus. He allied himself to the Mongols against the advance of the Egyptian sultan; but in 1268 he lost Antioch to Bihars, and when he died in 1275 he was only count of Tripoli.

Bohemund VII., son of Bohemund VI. by Sibylla, sister of Leo III. of Armenia, succeeded to the county of Tripoli in 1275, with his mother as regent. In his short and troubled reign he had trouble with the Templars who were established in Tripoli; and in the very year of his death (1287) he lost Laodicea to the sultan of Egypt. He died without issue; and as, within two years of his death, Tripoli was captured, the county of Tripoli may be said to have come to an end.

LITERATURE.—The history of the Bohemunds is the history of the principality of Antioch, and, after Bohemund IV., of the county of Tripoli also. For Antioch, we possess its Assises (Venice, 1870); and two articles on its history have appeared in the Revue de l'Orient et de Latin (Paris, 1893, fol.), both by E. Rey ("Resumé chronologique de l'histoire des princes d'Antioche," vol. iv., and "Les dignitaires de la principauté d'Antioche," vol. vili.). R. Röhrich, Geschichte des Königreichs Jerusalem (Innsbruck, 1901), and the work of G. Friedrich, both give practically all that is known about the history of Antioch and Tripoli. (E. Br.)
secretary of the Gesellschaft für ältere deutsche Geschichtskunde. He was also archivist and then librarian of the city of Frankfurt. Böhmer had a great dislike of Prussia and the Protestant faith, and a corresponding affection for Austria and the Roman Catholic Church, to which, however, he did not belong. His critical sense was, perhaps, somewhat warped; but his researches are of great value to students. He died unmarried, at Frankfurt, on the 22nd of October 1863. Böhmer's historical work was chiefly concerned with collecting and tabulating charters and other imperial documents of the middle ages. First appeared an abstract, the Regesta chronologico-diplomatica regum et imperatorum Romanorum 911–1313 (Frankfort, 1831), which was followed by the Regesta chronologico-diplomatica Karolorum. Die Urkunden sämtlicher Karolinger in kurzen Auszügen (Frankfort, 1833), and a series of Regesta imperii. For the period 1314–1347 (Frankfort, 1839) the Regesta was followed by three, and for the period 1246–1313 (Frankfort, 1842) by two supplementary volumes. The remaining period of the Regesta, as edited by Böhmer, is 1168–1254 (Stuttgart, 1840). These collections contain introductions and explanatory passages by the author. Very valuable also is the Fontes rerum Germanicarum (Stuttgart, 1843–1868), a collection of original authorities for German history during the 13th and 14th centuries. The fourth and last volume of this work was edited by A. Huber after the author's death. Other collections edited by Böhmer are: Die Reichsgezeiten 900–1400 (Frankfort, 1835); Wittelsbachische Regesten von der Erwerbung des Herzogtums Bayern bis zu 1320 (Stuttgart, 1854); and Codex diplomaticus Moeno-Francicorum. Urkundenbuch der Reichsstadt Frankfurt (Frankfort, 1836; new edition by F. Law, 1901). Other volumes and editions of the Regesta imperii, edited by J. Ficker, E. Mühlbacher, E. Winkelmann and others, are largely based on Böhmer's work. Böhmer left a great amount of unpublished material, and after his death two other works were published from his papers: Acta imperii selecta, edited by J. Ficker (Innsbruck, 1870); and Regesta archiepiscoporum Maguntinensium, edited by C. Will (Innsbruck, 1877–1880).

See J. Janssen, J. F. Böhmer's Leben, Briefe und kleinere Schriften (Freiburg, 1868).

BOHN, HENRY GEORGE (1796–1884), British publisher, son of a German bookbinder settled in England, was born in London on the 4th of January 1796. In 1831 he started as a dealer in rare books and "reminders." In 1841 he issued his "Guineas" Catalogue of books, a monumental work containing 23,208 items. Bohn was noted for his book auction sales: one held in 1843 lasted four days, the catalogue comprising twenty-folio pages. Printed on this catalogue was the information: "Dinner at 2 o'clock, dessert at 4, tea at 5, and supper at ro."

The name of Bohn is principally remembered by the important Libraries which he inaugurated: these were begun in 1846 and comprised editions of standard works and translations, dealing with history, science, classics, theology and archaeology, consisting in all of 766 volumes. One of Bohn's most useful and laborious undertakings was his revision (6 vols. 1846) of The Bibliographer's Manual of English Literature (1834) of W. T. Lowndes. The plan includes bibliographical and critical notices, particular of prices, &c., and a considerable addition to the original work. It had been one of Bohn's ambitions to found a great publishing house, but, finding that his sons had no taste for the trade, he sold the Libraries in 1864 to Messrs. Bell and Daldy, afterwards G. Bell & Sons. Bohn was a man of wide culture and many interests. He himself made considerable contributions to his Libraries: he collected pictures, china and ivory, and was a famous rose-grower. He died at Twickenham on the 22nd of August 1884.

BÖHTLINGK, OTTO VON (1815–1904) German Sanskrit scholar, was born on the 30th of May (11th of June O.S.) 1815 at St Petersburg. Having studied (1833–1835) Oriental languages, particularly Arabic, Persian and Sanskrit, at the university of St Petersburg, he continued his studies in Berlin and then (1839–1842) in Bonn. Returning to St Petersburg in 1842, he was attached to the Royal Academy of Sciences, and was elected an ordinary member of that society in 1855. In 1860 he was made "Russian state councillor," and later "privy councillor" with a title of nobility. In 1868 he settled at Jena, and in 1885 removed to Leipzig, where he resided until his death there on the 1st of April 1904. Böhtlingk was one of the most distinguished scholars of the 19th century, and his works are of pre-eminent value in the field of Indian and comparative philology. His first great work was an edition of Panini's Aṣṭi Bāńča gramaṃśāmatī Rāgaṃ (Bonn, 1839–1840), which was in reality a criticism of Franz Bopp's philological methods. This book Böhtlingk again took up forty-seven years later, when he published it with a complete translation under the title Paninis Grammatik mit Übersetzung (Leipzig, 1887). The earlier edition was followed by Vopadesva Grammatik (St Petersburg, 1847); Über die Sprache der Jakuten (St Petersburg, 1851); Indische Sprache (2nd ed. in 3 parts, St Petersburg, 1870–1873, to which an index was published by Blau, Leipzig, 1893); a critical examination and translation of Chhandogya-Upaniśad (St Petersburg, 1889) and a translation of Bhāradavāyaka-upaniśad (St Petersburg, 1889). In addition to these he published several smaller works, notably one on the Sanskrit accents, Über den Accents im Sanskrit (1845). But his magnum opus is his great Sanskrit dictionary, Sanskrit-Wörterbuch (7 vols., St Petersburg, 1833–1857; new ed. 7 vols., St Petersburg, 1870–1896), with which the assistance of his two friends, Rudolf Roth (1821–1895) and Albrecht Weber (b. 1825), was completed in twenty-three years.

BOHUN, the name of a family which plays an important part in English history during the 13th and 14th centuries; it was taken from a village situated in the Cotentin between Coutances and the estuary of the Vire. The Bohuns came into England at, or shortly after, the Norman Conquest; but their early history there is obscure. The founder of their greatness was Humphrey III., who, in the latter years of Henry I., makes his appearance as a dafier, or steward, in the royal household. He married the daughter of Milo of Gloucester, and played an ambiguous part in Stephen's reign, siding at first with the king and afterwards with the empress. Humphrey III. lived until 1187, but his history is uneventful. He remained loyal to Henry II. through all changes, and fought in 1137 at Farnham against the rebels of East Anglia. Outliving his eldest son, Humphrey IV., he was succeeded in the family estates by his grandson Henry. Henry was connected with the royal house of Scotland through his mother Margaret, a sister of William the Lion; an alliance which no doubt assisted him to obtain the earldom of Hereford from John (1199). The lands of the family lay chiefly on the Welsh Marches, and from this date the Bohuns take a foremost place among the Marcher barons. Henry de Bohun figures with the earls of Clare and Gloucester among the twenty-five barons who were elected by their fellows to enforce the terms of the Great Charter. In the subsequent civil war he fought on the side of Louis, and was captured at the battle of Lincoln (1217). He took the cross in the same year and died on his pilgrimage (June 1, 1220). Humphrey V., his son and heir, returned to the path of loyalty, and was permitted, some time before 1239, to inherit the earldom of Essex from his maternal uncle, William de Mandeville. But in 1238 this Humphrey fell away, like his father, from the royal to the baronial cause. He served as a nominee of the opposition on the committee of twenty-four which was appointed, in the Oxford parliament of that year, to reform the administration. It was only the alliance of Montfort with Llewelyn of North Wales that brought the earl of Hereford back to his allegiance. Humphrey V. headed the first secession of the Welsh Marchers from the party of the opposition (1263), and was amongst the captives whom the Montfortians took at Lewes. The earl's son and namesake was on the victorious side, and shared in the defeat of Evesham, which he did not long survive. Humphrey V. was, therefore, naturally selected as one of the twelve arbitrators to draw up the ban of Kenilworth (1266), by which the disaffected rebels were made liable to be outlawed in the same manner as the barons. In 1275, he was succeeded by his grandson Humphrey VII. This Bohun lives in history as one of the recalcitrant barons of the year 1297, who extorted from Edward I. the Conformatio Cartorum...
The motives of the earl’s defiance were not altogether disinterested. He had suffered twice from the chicanery of Edward’s lawyers; in 1284 when, as a himself bound for Flanders. Their attitude brought to a head the general discontent which Edward had excited by his arbitrary taxation, and Edward was obliged to do in order on all the subjects of complaint. At Falkirk (1298) Humphrey VII. redeemed his character for loyalty. His son, Humphrey VIII., who succeeded him in the same year, was allowed to marry one of the king’s daughters, Eleanor, the widowed countess of Holland (1302). This close connexion with the royal house did not prevent him, as it did not prevent Earl Thomas of Lancaster, from joining the opposition to the feeble Edward II. In 1310 Humphrey VII. figured among the Lords Ordainers; though, with more patriotism than some of his fellow-commissioners, he was afterwards won over by the promise of the earldom of Derby, son of John of Gaunt and afterwards Henry IV., in 1380 or 1381. From these two marriages sprang the houses of Lancaster and Stafford. 

BOIARDO, MATTEO MARIA, COUNT (1434–1494). Italian poet, who came of a noble and illustrious house established at Ferrara, but originally from Reggio. He was born at Scandiano, one of the seignorial estates of his family, near Reggio di Modena, about the year 1434, according to Tiraibochi, or 1420 according to Mazzuchelli. At an early age he entered the university of Ferrara, where he acquired a good knowledge of Greek and Latin, and even of the Oriental languages, and was in due time admitted doctor in philosophy and in law. At the court of Ferrara, where he enjoyed the favour of Duke Borso d’Este and his successor Hercules, he was entrusted with several honourable employments, and in particular was named governor of Reggio, an appointment which he held in the year 1451. After the death of the latter, the young Duke, thus left in possession of Modena, reappointed governor of the town and citadel of Reggio, where he died in the year 1494, though in what month is uncertain.

Almost all Boiardo’s works, and especially his great poem of the Orlando Inamorato, were composed for the amusements of Duke Hercules and his court, though not written within its precincts. His practice, it is said, was to retire to Scandiano or some other of his estates, and there to devote himself to composition; and Castelvetro, Vallisneri, Mazzuchelli and Tiraibochi all unite in stating that he took care to insert in the descriptions of his poem those of the agreeable environs of his château, and that the greater part of the names of his heroes, as Mandricardo, Gradasse, Sacripant, Agramant and others, were merely the names of some of his peasants, which, from their uncouthness, appeared to him proper to be given to Saracen warriors. Be this as it may, the Orlando Inamorato deserves to be considered as one of the most important poems in Italian literature, since it forms the first example of the romantic epic worthy to serve as a model, and, as such, undoubtedly produced Arloto’s Orlando Furioso. Gravina and Mazzuchelli have said, and succeeding writers have repeated of their authority, that Boiardo proposed to himself to model his work after that Paris is besieged like the city of Troy; that Angelica holds the place of Helen; and that, in short, the one poem is a sort of reflex image of the other. In point of fact, however, the subject-matter of the poem is derived from the Fabulous Chronicle of the pseudo-Turpin; though, with the exception of the names of Charlemagne, Roland, Oliver, and some other principal warriors, who necessarily figure as important characters in the various scenes, there is little resemblance between the detailed plot of the one and that of the other poem, which Boiardo did not live to finish, was cut off at Scandiano the year after his death, under the superintendence of his son Count Camillo. The title of the book is without date; but a Latin letter from Antonio Caraffa di Reggio, prefixed to the poem, is dated the kalends of June 1495. A second edition, also without date, but which must have been printed before the year 1500, appeared at Venice; and the poem was twice reprinted there during the first twenty years of the 16th century. These editions are the more curious and valuable since they contain nothing but the text of the author, which is comprised in three books, divided into canto and let, and a few prologues added by the printer. But Niccolo degli Agostini, an indifferent poet, had the courage to continue the work commenced by Boiardo, adding to it three books, which were printed at Venice in 1526–1531, in 4to; and since that time no edition of the Orlando has been printed without the continuance of Agostini, wretched as it unquestionably is. Boiardo’s poem suffers from the incurable defect of a laboured and heavy style. His story is skillfully constructed, the characters are well drawn and sustained throughout; many of the incidents show a power and fertility of imagination not inferior to that of Ariosto, but the perfect workmanship indispensable for a great work of art is wanting. The poem in its original shape was not popular, and has been completely superseded by the Rifacimento of Francesco Berni (q.v.).

The other works of Boiardo are,—(1) Il Timone, a comedy, Scandiano, 1500, 4to; (2) Sonnetti e Canzoni, Reggio, 1490, 4to; (3) Carmen Bucolicum, Reggio, 1500, 4to; (4) Cinque Capirol in terza rima, Venice, 1528 or 1531 (5) Apuleio dell’ Asino d’Oro, Venice, 1516, 1518; (6) Asino d’Oro di Luciano tradotto in volgare, Venice, 1523, 8vo; (7) Erodoto d’Oro tradotto in lingua italiana, Venice, 1533 and 1538, 8vo; (8) Rerum Italicorum Scriptores. See Panizzi’s Boiardo (9 vols., 1830–1831).

BOIE, HEINRICH CHRISTIAN (1744–1806). German author, was born at Meldorf in the then Danish province of Schleswig-Holstein on the 10th of July 1744. After studying law at Jena, he went in 1769 to Göttinngen, where he became one of the leading spirits in the Göttinngen “Dichterbund” or “Hain.” Boie’s poetical talent was not great, but his thorough knowledge of literature, his excellent taste and sound judgment, made him a true critical guide to his less skilled contemporaries. Together with F. W. Götter (p. 2) he founded in 1770 the Göttinngen Musenalmanach, which he directed and edited until 1775, when, in conjunction with C. W. von Dohn (1751–1820), he brought out Das deutsche Museum, which became one of the best literary periodicals of the day. In 1776 Boie became secretary to the commander-in-chief at Hanover, and in 1781 was appointed administrator of the province of Süderdithmarschen in Holstein. He died at Meldorf on the 3rd of March 1806.

See K. Weinhold, Heinrich Christian Boie (Halle, 1868).
BOIELDIEU—BOII

BOIELDIEU, FRANÇOIS ADRIEN (1775-1834), French composer of comic opera, was born at Rouen on the 15th of December 1775. He received his first musical education from M. Broche, the cathedral organist, who appears to have treated him very harshly. He began composing songs and chamber music at a very early age—his first opera, La Fille coupable (the libretto by his father), and his second opera, Rosalie et Myrrha, being produced on the stage of Rouen in 1795. Not satisfied with his local success he went to Paris in 1795. His scores were submitted to Cherubini, Méhul and others, but met with little approbation. Grand opera was the order of the day. Boieldieu had to fall back on his talent as a pianoforte-player for a livelihood. Success came at last from an unexpected source. P. J. Garat, a fashionable singer of the period, admired Boieldieu's touch on the piano, and made him his accompanist. In the drawing-rooms of the Directoire Garat sang the charming songs and ballads with which the young composer supplied him. Thus Boieldieu's reputation gradually extended to wider circles. In 1796 Les Deux lettres was produced, and in 1797 La Famille suisse appeared for the first time on a Paris stage, and was well received. Several other operas followed in rapid succession, of which only Le Calife de Bagdad (1800) has escaped oblivion. After the enormous success of this work, Boieldieu felt the want of a thorough musical training and took lessons from Cherubini, the influence of that great master being clearly discernible in the more artistic finish of his later compositions. In 1802 Boieldieu, to escape the domestic troubles caused by his marriage with Clotilde Aug. Maufreux, a celebrated ballad-dancer of the Paris opera, took flight and went to Russia, where he was received with open arms by the emperor Alexander. During his prolonged stay at St Petersburg he composed a number of operas. He also set to music the choruses of Racine's Athalie, one of his few attempts at the tragic style of dramatic writing. In 1811 he returned to his own country, where the following year witnessed the production of one of his finest works, Jean de Paris, in which he depicted with much felicity the charming coquetry of the queen of Navarre, the chivalrous virtue of the king, the officious pedantry of the seneschal, and the amorous tenderness of the page. He succeeded Méhul as professor of composition at the Conservatoire in 1817, Le Chapeau rouge was produced with great success in 1818. Boieldieu's second and greatest masterpiece was his Dôme blanche (1823). The libretto, written by Scribe, was partly suggested by Walter Scott's Monastery, and several original Scottish tunes cleverly introduced by the composer add to the melodious charm and local colour of the work. On the death of his wife in 1825, Boieldieu married a singer. His own death was due to a violent attack of pulmonary disease. He vainly tried to escape the rapid progress of the illness by travel in Italy and the south of France, but returned to Paris only to die on the 8th of October 1834.

Lives of Boieldieu have been written by Pougin (Paris, 1875), J. A. Refeuville (Rouen, 1856), Hecquet (Paris, 1864), Emile Duval (Geneva, 1883). See also Adolphe Charles Adam, Derniers souvenirs d'un musicien.

BOIGNE, BENOIT DE, COUNT (1751-1830), the first of the French military adventurers in India, was born at Chambéry in Savoy on the 8th of March 1751, being the son of a fur merchant. He joined the Irish Brigade in France in 1768, and subsequently he entered the Russian service and was captured by the Turks. Hearing of the wealth of India, he made his way to that country, and after serving for a short time in the East India Company, he resigned and joined Mahadji Sindhia in 1779. He was placed in command of troops trained in the European methods of war. In the battles of Lalsot and Chaksan Boigne and his two battalions proved their worth by holding the field when the rest of the Mahatta army was defeated by the Rajputs. In the battle of Agra (1788) he restored the Mahatta fortunes, and made Mahadji Sindhia undisputed master of Hindostan. This success led to his being given the command of a brigade of ten battalions of infantry, with which he won the victories of Patan and Merta in 1790. In consequence Boigne was allowed to raise further two brigades of disciplined infantry, and made commander-in-chief of Sindhiya's army. In the battle of Lakhair (1793) he defeated Holkar's army. On the death of Mahadji Sindhia in 1794, Boigne could have made himself master of Hindostan but he wished it not, but he remained loyal to Daulat Rao Sindhia. In 1795 his health began to fail, and he resigned his command, and in the following year returned to Europe with a fortune of £400,000. He lived in retirement during the lifetime of Napoleon, but was greatly honoured by Louis XVIII. He died on the 21st of June 1830.

See H. Compton, European Military Adventures of Hindustan (1892).

BOII (perhaps = "the terrible"), a Celtic people, whose original home was Gallia Transalpina. They were known to the Romans, at least by an inscription (cf. Plautus, Plaut. modest. 21). But the first records of them are contained in Pliny's Naturalis historia, in which they are represented as the most civilized of the Gallic tribes. The Roman colonies of Cremona and Placentia, they rendered valuable assistance to Hannibal. They continued the struggle against Rome from 201 to 192, when they were finally subdued by P. Cornelius Scipio Nasica, and deprived of nearly half their territory. According to Strabo (v. p. 213) the Boii were driven back across the Alps and settled on the land of their kinsmen, the Taurisci, on the Danube, adjoining Vindelicia and Raetia. Most authorities, however, assume that there had been a settlement of the Boii on the Danube from very early times, in part of the modern Bohemia (anc. Bohemum, "land of the Boii") (cf. Plautus, Plaut. modest. 21). About 150 B.C. some of the Boii migrated to Noricum and Pannonia, when 32,000 of them joined the expedition of the Helvetians into Gaul, and shared their defeat near Bibracte (58). They were subsequently allowed by Caesar to settle in the territory of the Aedui between the Loire and the Allier. Their chief town was Gorgobina (site uncertain). Those who remained on the Danube were exterminated by the Dacian king, Boebedista, and the district they had occupied was afterwards called the "desert of the Boii" (Strabo vii. p. 292). In A.D. 69 a Boian named Mariccus stirred up a fanatical revolt, but was soon defeated and put to death. Some remnants of the Boii are mentioned as dwelling near Bordeaux; but Mommens inclines to the opinion that the three groups (in Bordeaux, Bohemia and the Po districts) were not really scattered branches of one and the same stock, but that they are instances of a mere similarity of name. The Boii, as we know them, belonged almost certainly to the Early Iron age. They probably used long iron swords for dealing cutting blows, and from the size of the handles they must have wielded a variety of long swords (cf. Pliny ii. 30). For their ethnological affinities and especially for their possible connexion with the Homeric Achaeans see W. Ridgeway's Early Age of Greece (vol. i, 1901).

BOIL, in medicine, a progressive local inflammation of the skin, taking the form of a hard suppurating tumour, with a core of dead tissue, resulting from infection by a microbe, Staphylococcus pyogenes, and commonly occurring in young persons whose blood is disordered, or as a complication of rheumatism. Treatment proceeds on the lines of bringing the mischief out, assisting the evacuation of the boil by the lancet, and clearing the system. In the English Bible, and also in popular medical terminology, "boil" is used of various forms of ulcerous affection. The boils which were one of the plagues in Egypt were apparently the bubonic plague. The terms Aleppo boil (or bull), Delhi boil, Oriental boil, Biskra burn, &c., have been given to a tropical epidemic, characterized by ulcers on the face, due to a diplococcus parasite.

BOILEAU-DESPRÉAUX, NICOLAS (1636-1711), French poet and critic, was born on the Ist of November 1636 in the rue de Jérusalem, Paris. The same Despréaux was derived from a small property at Crosne near Villeneuve-Saint-Georges. He was the fifteenth child of Gilles Boileau, a clerk in the parlement. Two of his brothers attained some distinction: Gilles Boileau (1631-1686), the author of a translation of Epictetus; and Jacques Boileau, who became a canon of the Sainte-Chapelle, and made valuable contributions to church history. His mother died when he was two years old; and Nicolas Boileau, who had a delicate constitution, seems to have suffered something from want of care. Sainte-Beuve puts down his somewhat hard and unsympathetic outlook quite as much to the uninspiring circumstances of these days as to the general character of his time. He cannot be said to have been early disinherited, for he never seems to have had any illusions; he grew up with a single passion, "the hatred of stupid books." He was educated at the Collège de Beauvais, and was then sent to study theology at the Sorbonne. He exchanged theology for law, however, and was called to the bar on the 4th of December 1656. From the profession of arms, after a trial, he receded in disgust, complaining bitterly of the amount of chicanery which passed under the name of law and justice. His father died in 1657, leaving him a small fortune, and thenceforward he devoted himself to letters.

Such of his early poems as have been preserved hardly contain the promise of what he ultimately became. The first piece in which his peculiar powers were displayed was the first satire (1666), in imitation of the third satire of Juvenal; it embodied the farewell of a poet to the city of Paris. This was quickly followed by eight others, and the number was at a later time increased to twelve. A twofold interest attaches to the satires. In the first place the author skillfully parodies and attacks writers who at the time were placed in the very first rank, such as Jean Chapelain, the abbé Charles Cotin, Philippe Quinault and Georges de Scudéry; he openly raised the standard of revolt against the older poets. But in the second place he showed both by precept and practice what were the poetical capabilities of the French language. Prose in the hands of such writers as Descartes and Pascal had proved itself a flexible and powerful instrument of expression, with a distinct mechanism and form. But except with Malherbe, there had been no attempt to fashion French versification according to rule or method. In Boileau for the first time appeared terseness and vigour of expression, with perfect regularity of verse structure. His admiration for Molière found expression in the stanzas addressed to him (1663), and in the second satire (1664). In 1664 he composed his prose Dialogue des héros de roman, a satire on the elaborate romances of the time, which may be said to have once for all abolished the lucubrations of La Calprenède, Mlle de Scudéry and their fellows. Though fairly widely read in manuscript, the book was not published till 1713, out of regard, it is said, for Mlle de Scudéry. To these early days belong the reunions at the Mouton Blanc and the Pomme de Pin, where Boileau, Molière, Racine, Chapelle and Antoine Furetière met to discuss literary questions. To Molière and Racine he proved a constant friend, and supported their interests on many occasions.

In 1666, prompted by the publication of two unauthorized editions, he published Satires du Sieur D. . . . , containing seven satires and the Discours au roi. From 1669 onwards appeared his epistles, graver in tone than the satires, mature in thought, more exquisite and polished in style. The Epîtres gained for him the favour of Louis XIV., who desired his presence at court. "The king seems to have thought his best verses. Whereupon Boileau diplomatically selected only some still unprinted lines in honour of the grand monarch and proceeded to recite them. He received forthwith a pension of 2000 livres. In 1674 his two masterpieces, L'Art poétique and Le Lutrin, were published with some earlier works as the Œuvres diverses du sieur D. . . . The first, in imitation of the Ars Poetica of Horace, lays down the code for all future French verse, and may be said to fill in French literature a parallel place to that held by its prototype in Latin. On English literature the maxims of Boileau, through the translation revised by Dryden, and through the magnificent imitation of them in Pope's Essay on Criticism, have exercised no slight influence. Boileau does not merely lay down rules for the language of poetry, but analyses carefully the various kinds of verse composition, and enunciates the principles peculiar to each. Of the four books of L'Art poétique, the first and last consist of general precepts, inculcating mainly the great rule of bon sens; the second treats of the pastoral, the elegy, the ode, the epigram and satire; and the third of tragic and epic poetry. Though the rules laid down are of value, their tendency is rather to hamper and render too mechanical the efforts of poetry. Boileau himself, a great, though by no means infallible critic in verse, cannot be considered a great poet. He rendered the utmost service in destroying the exaggerated reputations of the mediocrities of his time, but his judgment was sometimes at fault. The Lutrin, a mock heroic poem, of which four cantos appeared in 1674, furnished Alexander Pope with a model for the Rape of the Lock, but the English poem is superior in richness of imagination and subtlety of invention. The fifth and sixth cantos, afterwards added by Boileau, rather detract from the beauty of the poem; the last canto in particular is quite unworthy of his genius. In 1674 appeared also his translation of Longinus On the Sublime, to which were added in 1693 certain critical reflections, chiefly directed against the theory of the superiority of the moderns over the ancients as advanced by Charles Perrault.

Boileau was made historiographer to the king in 1677. From this time the amount of his production diminished. To this period of his life belong the satire, Sur les femmes, the ode, Sur la prétendue Nausicaa, the epistles, A mon vers and Sur l'amour de Dieu, and the satire Sur l'homme. The satires had raised up a crowd of enemies against Boileau. The 10th satire, on women, provoked an Apologie des femmes from Charles Perrault. Antoine Arnauld in the year of his death wrote a letter in defence of Boileau, but when at the desire of his friends he submitted his reply to Bossuet, the bishop pronounced all satire to be incompatible with the spirit of Christianity, and the 11th satire to be subversive of morality. The friends of Arnauld had declared that it was inconsistent with the dignity of a churchman to write on any subject so trivial as poetry. The epistle, Sur l'amour de Dieu, was a triumphant vindication on the part of Boileau of the dignity of his art. It was not until the 15th of April 1684 that he was admitted to the Academy, and then only by the king's wish. In 1687 he retired to a country-house he had bought at Auteuil, which Racine, because of the numerous guests, calls his hôtel d' Auteuil. In 1705 he sold his house and returned to Paris, where he lived with his confessor in the cloisters of Notre Dame. In the 12th satire, Sur l'équivoque, he attacked the Jesuits in verses which Samuel de Champlain had written in the manner of Pascal. This was written about 1705. He then gave his attention to the arrangement of a complete and definitive edition of his works. But the Jesuit fathers obtained from Louis XIV. the withdrawal of the privilege already granted for the publication, and demanded the suppression of the 12th satire. These annoyances are said to have hastened his death, which took place on the 13th of March 1711.

Boileau was a man of warm and kindly feelings, honest,
outspoken and benevolent. Many anecdotes are told of his frankness of speech at court, and of his generous actions. He holds a well-defined place in French literature, as the first who reduced its versification to rule, and taught the value of workmanship for its own sake. His influence on English literature, through Pope and his contemporaries, was not less strong, though less durable. After much undue depreciation from Boileau's critical works, has been rehabilitated by recent writers, perhaps to the extent of some exaggeration in the other direction. It has been shown that in spite of undue harshness in individual cases most of his criticisms have been substantially adopted by his successors.

Numerous editions of Boileau's works were published during his lifetime. The first of these, Oeuvres diverses (1701), known as the first edition, was reprinted in 1707, 1711, and 1714. An edition of the poet, with notes by Alphonse Pauly (2 vols., 1894), The critical text of his works was established by Berriat Saint-Prix, Oeuvres de Boileau (4 vols., 1830–1837), who made use of some 350 editions. This text, edited with notes by Paul Chéron, with the Balaousa of 1740, and an essay by Sainte-Beuve, was reprinted by Garnier frères (1880).

See also Sainte-Beuve, Contes du monde, vol. vi., F. Brunetière, "L'Esthétique de Boileau" (Revue des Deux Mondes, June 1889), and an exhaustive article by the same critic in La Grande encyclopédie; G. Lanson, Boileau (1892), in the series of Grands écrivains français.

BOILER, a vessel in which water or other liquid is heated to the boiling point; specifically, the apparatus by which steam is produced from water, as one step in the process whereby the potential energy of coal or other fuel is converted into mechanical work by means of the steam-engine. Boilers of the larger kind must all possess certain essential features, whilst of other qualities that are desirable some may not be altogether compatible with the special conditions under which the boilers are to be worked.

Amongst the essentials is the receptacle capable of containing the water and the steam produced by its evaporation, and strong enough continuously to withstand with safety the highest pressure of steam for which the boiler is intended. Another essential is a furnace for burning the fuel, and a further one is the provision of a sufficient surface of heating for the transmission of the heat produced by the combustion of the fuel to the walls of the boiler which is required to be evaporated. Desirable qualities are that the arrangements of the furnaces should be such that a reasonably perfect combustion of the fuel should be possible, and that the heating surfaces should be capable of transmitting a large proportion of the heat produced to the water so as to obtain a high evaporative efficiency. Further, the design generally should be compact, not too heavy or costly, and such that the cleaning necessary to maintain the evaporative efficiency can be easily effected. It should also be such that the cost of upkeep will be small, and that only an average amount of skill and attention will be required under working conditions. It is for providing these qualities in different degrees according to the special requirements of various circumstances that the very different designs of the various types of boilers have been evolved.

Classes of Boilers.—Boilers generally may be divided into two distinct classes, one comprising those which are generally called "tank" boilers, containing relatively large quantities of water, and the other those which are generally called water-tube boilers, in which the water is mainly contained in numerous comparatively small tubes. There are, however, some types of boiler which combine to some extent the properties of both these classes. Each class has its representatives amongst both land and marine boilers. In "tank" boilers the outer shell is wholly or partially cylindrical, this form being one in which the necessary strength can be obtained without the use of a large number of stays. The boilers are generally internally fired, the furnace plates being surrounded with water and forming the most efficient portion of the heating surfaces. On leaving the furnace the products of combustion are led into a chamber, and thence through flues or through numerous small tubes which serve to transmit some of the heat of combustion to the water contained in the boiler. In "water-tube" boilers the fire is usually placed under a collection of tubes containing water and forming the major portion of the heating surface of the boiler. Both the fire and the tubes are enclosed in an outer casing of brickwork or other fire-resisting substance. In some forms of water-tube boiler the fire is entirely surrounded by water-tubes and the casing is in no part exposed to the direct action of the fire. In "tank" boilers generally no difficulty is experienced in keeping all the heating surfaces in close contact with water, but in "water-tube" boilers special provision has to be made in the design for maintaining the circulation of water through the whole apparatus.

For "flash" boilers see Motor Vehicles, and for domestic hot-water boilers Heating.

Tank Boilers.—Of large stationary boilers the forms most commonly used are those known as the "Lancashire" boiler, and its derivative the "Galloway" boiler. These boilers are made from 26 to 30 ft. long, with diameters from 6 ft. to 8 ft., and have two cylindrical furnace tubes in which the "Lancashire" boiler extends for its whole length (see fig. 3). The working pressure of these boilers has been increased by fitting in the furnace tubes a number of "Galloway" tubes. These are conical tubes, made with a flange at each end, by means of which they are connected to the boiler. The diameter of the large end of the tube is slightly greater than that of the flange of the small end; this enables them to be inserted into the tubes and replaced if necessary. These tubes not only add to the heating surface, but they stiffen the flue, promote circulation of the water in the boiler, and by mixing up the flue gases improve the evaporative efficiency. In the "Galloway" boiler the two furnaces extend only for about 9 or 10 ft. into the boiler, and lead into a large chamber or flue in which a number of "Galloway" tubes are fitted, and which extends from the furnace end to the end of the boiler. A cross section of this flue showing the distribution of the Galloway tubes is shown in fig. 2. When boilers less than about 6 ft. in diameter are needed, a somewhat similar type to the Lancashire boiler is used containing only one furnace. This is called a "Cornish" boiler.

In all three types of boiler the brickwork is constructed to form one central flue passing along the bottom of the boiler and two side flues extending up the sides of the boiler to the water level. A cross section of the brickwork of a Galloway boiler is shown in fig. 2. The usual arrangement is for the flue gases to be divided as they leave the central flue; half returns along each side flue to the front of the boiler, and the whole then passes down the central flue, travelling under the bottom of the boiler until the gases again reach the back end, where they pass up the chimney. In a few cases the arrangement is reversed, the gases passing along the bottom flue and returning along the side flues.

This latter arrangement, whilst promoting a more rapid circulation of water, has the disadvantage of requiring two dampers, and it is not suitable for those cases in which heavy deposits form on the bottoms of the boilers. In such cases the floor space is divided into four or more small compartments, other types of cylindrical boilers are used, most of them being of the vertical type. Most commonly used is the simple vertical boiler, with a plain vertical fire-box, and an internal smoke stack traversing the steam space. The fire-box is made slightly tapering in diameter, the space between it and the shell being filled with water. In all but the small sizes cross tubes are generally fitted. Cross tubes, fitted as they are made about halfway in, in diameter of 1 in, plate flanged at each end to enable them to be riveted to the fire-box plates. They are usually fitted with a slight inclination to facilitate water circulation.

Vertical.
and a hand-hole closed by a suitable door is provided in the outer shell opposite to each tube for cleaning purposes. A boiler of this kind is illustrated in fig. 4; the furnaces of combustion are led into an upper combustion chamber traversed by four or more inclined water-tubes of about 9 in. diameter and by several vertical water-tubes of less diameter. In the "Victoria" boiler made by Messrs Clarke, Chapman & Co., and illustrated in fig. 6, the furnace is hemispherical; the furnace gases are led to an internal combustion chamber, and thence through numerous horizontal smoke-tubes to a smoke-box placed on the side of the boiler. In the somewhat similar boiler known as the " Coochan," the combustion chamber is made with a " dry " back. Instead of a water space at the back of the chamber, doors lined with firebrick are fitted. These give easy access to the tube ends.

The cylindrical multitubular return-tube boiler is in almost universal use in merchant steamers. It is made in various sizes ranging up to 17 ft. in diameter, the usual working pressure being from 160 to 200 lb. per sq. in., although in some few cases pressures of 265 lb. per sq. in. are in use. These boilers are of two types, double- and single-ended. In single-ended boilers, which are those most generally used, the furnaces are fitted at one end only and vary in number from one in the smallest boiler to four in the largest. Three furnaces are the most usual practice. Each furnace generally has its own separate combustion chamber. In four furnace boilers, however, one chamber sometimes is made common to the two middle furnaces, and sometimes one chamber is fitted to each pair of side furnaces. In double-ended boilers furnaces are fitted at each end. In some cases each furnace has a separate combustion chamber, but more usually one furnace is made to serve for two furnaces, one at each end of the boiler. The two types of boilers are shown in figs. 7 and 8, which illustrate boilers made by Messrs D. Rowan & Co. of Glasgow, and which may be taken as representing good modern practice. The furnaces used in the smaller sizes are often of the plain cylindrical type, the thickness of plate varying from \( \frac{1}{2} \) in. to \( \frac{7}{8} \) in. according to the diameter of the furnace and the working pressure. Occasionally furnaces with " Adamson " joints similar to those used in Lancashire boilers are employed, but for large furnaces and for high pressures corrugated or ribbed furnaces are usually adopted. Sketches of the sections of these are shown in fig. 9. The sections of the Morison, Fox and Deighton types are made from plates originally rolled of a uniform thickness, made into a cylindrical form with a welded longitudinal joint and then corrugated, the only difference between them being in the shapes of the corrugations. In the other three types the plates from which the furnaces are made are rolled with ribs or thickened portions at distances of 9 in. These furnaces are stronger to resist collapse than plain furnaces of the same size and are more readily to changes of temperature.

There are two distinct types of connexion between the furnaces and the combustion chambers. In one, shown in fig. 8, the furnace is flanged at the crown portion for riveting to the tube plate, and the lower part of the furnace is riveted to the " wrapper " or side plate of the combustion chamber. In the other type, shown in fig. 7, and known generally as the " Gourlay back end," the end of the furnace is contracted into an oval conical form, and is then flanged outwards round the whole of its circumference. The tube plate is made to extend to the bottom of the combustion chamber, and the
The Gourlay back end, however, is not so stiff as the other, and more longitudinal stays are required in the boiler.

The flat sides and backs of the combustion chambers are stayed either to one another or to the shell of the boiler by numerous screw stays which are screwed through the two plates they connect, and which are nearly always fitted with nuts inside the combustion chambers. The tops of the chambers are usually stayed by strong girders resting upon the tube plates and chamber back plates. In a few cases, however, they are stayed by vertical stays attached to T bars riveted to the boiler shell. A few boilers are made in which the chamber tops are strengthened by heavy transverse girder and are expanded into the fire-box side plates. In way of these tubes the outer shell side plates are supported by stay bars passing right through the water-tubes. The usual

Where natural or chimney draught is used the tubes are generally made 3 or 3\frac{1}{4} in. outside diameter and are rarely more than 7 ft. long, but where "forced" draught is employed they are usually made 2\frac{1}{4} in. diameter and 8 to 8\frac{1}{2} ft. long. A clear space of 1\frac{1}{2} in. between the tubes is almost always arranged for, irrespective of size of tubes.

Stay tubes are screwed at both ends, the threads of the two ends being continuous so that they can be screwed into both tube plates;

The locomotive boiler consists of a vertical barrel attached to a portio containing the fire-box, which is nearly rectangular both in horizontal and vertical section. The fire-box sides are stayed to the fire-box shell by numerous stays about 1 in. in diameter, usually pitched 4 in. apart both vertically and horizontally. The top of the fire-box in small boilers is stayed by means of girder stays running longitudinally and supported at the ends upon the tube plate and the opposite fire-box plate. In some boilers the girders are partly supported by slings from the crown of the boiler. In larger boilers the crown of the boiler above the fire-box is made flat and the fire-box crown is supported by vertical stays connecting it with the shell crown. Provision is generally made for the expansion of the tube plate, which is of copper, by allowing the two or three cross rows of stays nearest the tube plate to have freedom of motion upwards but not downwards. The ordinary tubes are usually 1\frac{1}{2} in. diameter. The fire-bars are generally, though not always, made to slope downwards away from the fire door, and just below the lowest tubes a fire-bridge or baffle is fitted, extending about half-way from the tube plate to the fire-door side of the fire-box. In some cases water-tubes are fitted, extending right across the fire-box. In a boiler for the London & South-Western Railway Co., having a grate area of 31\frac{1}{2} sq. ft. and a total heating surface of 2777 sq. ft., there are 112 water-tubes each 2\frac{1}{4} in. diameter. These are arranged in two clusters, each containing 56, one set being placed above the fire-bridge, and the other set nearer the fire-door end of the boiler. The water-tubes are of seamless steel, occasionally nuts are fitted to the front ends. The stay tubes are expanded into the plates and then beaded over.
pressure of locomotive boilers is about 175 lb to 200 lb per sq. in.
A good example of an express locomotive boiler is shown in fig. 10.
In this case the grate area is 30.9 sq. ft. and the heating surface

2500 sq. ft. The barrel is 5 ft. 6 in. diameter, 16 ft. long between tube plates. The fire-box crown is stayed by vertical stays extending to the shell crown, except for the three rows of stays nearest the tube plates. These are supported by cross girders resting upon brackets secured to the outer shell.

**FIG. 10.**—Express Locomotive Boiler, with widened fire-box (Great Northern Railway, England).

*Water-Tube Boilers.*—The "Babcock & Wilcox" boiler, as fitted for land purposes, and illustrated in fig. 11, consists of a horizontal cylinder forming a steam chest, having dished ends and two specially constructed cross-boxes riveted to the bottom. Under the cylinder is placed a sloping nest of tubes, under the upper end of which is the fire. The sides and back of the boiler are enclosed in brickwork up to the height of the centre of the horizontal cylinder and the front is fitted with an iron casing lined with brick at the lower part. Suitable brickwork baffles are arranged between the tubes themselves, and between the nests of tubes and the cylinder, to ensure a proper circulation of the products of combustion, which are made to pass between the three times. The nest of tubes consists of several separate elements, each formed by a front and back header made of wrought steel of sinuous form connected by a number of tubes. The upper ends of the front headers are connected by short tubes to the front cross-box of the horizontal cylinder, the lower ends being closed. The upper ends of the back headers are connected by longer pipes to the back cross-box, and their lower ends by short pipes to a horizontal mud drum to which a blow-off cock and pipe are attached. The headers are furnished with holes on two opposite sides; those on one side form the means of connection between the headers and tubes, and the others allow access for fixing the tubes in position and cleaning. The outer holes are oval, and closed by special fittings shown in fig. 18, the watertightness of the joints being secured by the outer cover plates. The holes being oval, the inside fitting can be placed in position from outside, and it is so made as to cover the opening and prevent any great outbreak of steam or water should the bolt break. Any desired working pressure can be provided for in these boilers; in some special cases it rises as high as 500 lb per sq. in., but a more usual pressure is 180 lb. Like all water-tube boilers, they require to be frequently cleaned if impure feed-water is used, but the straightness of their tubes enables their condition to be ascertained at any time when the boiler is out of use, and any accumulation of scale to be removed. The superheaters, which are frequently fitted, consist of two cross-boxes or headers placed transversely under the cylindrical drum and connected by numerous C-shaped tubes. They are situated between the tubes and the steam-chest, and are exposed to the heat of the furnace gases after their first passage across the tubes. The steam is taken by an internal pipe passing through the bottom of the drum into the upper cross-box, then through the C-sections into the lower box, and thence to the steam pipe. When steam is being raised, the superheater is flooded with water, which is drained out through a blow-off pipe before communication is opened with the steam-pipe. In large boilers of this type, two steam-chests are placed side by side connected together by two cross steam pipes and by the mud drum. Each, however, has its own separate feed supply. The largest boiler made has two steam chests 43 ft. diameter by 251 ft. length, a grate surface of 83 sq. ft., and a total heating surface of 6182 sq. ft.

Another type of water-tube boiler in use for stationary purposes is the "Stirling" (fig. 12). This boiler consists of four or five horizontal drums, of which the three upper form the steam-space, and the one or two lower contain water. The lower drums, where two are fitted, are connected to each other at about the middle of their height by horizontal tubes, and to the upper drums by numerous nearly vertical tubes which form the major portion of the heating surfaces. The central upper drum is slightly higher level than the others, and communicates with that nearest the back of the boiler by a set of curved tubes entirely above the water-level, and with the front drum by two sets—the upper one being above and the lower below the water-level. The whole boiler is enclosed in brickwork, into which the supporting columns and girders are built. Brickwork baffles compel the furnace gases to take specified courses among the tubes. It will be seen that the space between the boiler front and the tubes form a large combustion chamber into which all the furnace gases must pass before they enter the spaces between the tubes; in this chamber a baffle-bridge is sometimes built. Another chamber is formed between the first and second sets of tubes. The feed-water enters the back upper drum, and must pass down the third set of tubes into the lower drum before it reaches the other parts of the boiler. Thus the coldest water is always where the temperature of the furnace gases is lowest; and as the current through the lower drum is slight, the solid matters separated from the feed-water while its temperature is being raised have an opportunity of settling to the bottom of this drum, where the heating is not great and where therefore their presence will not be injurious. When superheaters are required, they are made of two drums connected by numerous small tubes, and are somewhat similar in construction to the boiler proper. The superheater is placed between the first and second sets of tubes, where it is exposed to the furnace gases before too much heat has been taken from them. Arrangements are provided for flooding the superheater while steam is being raised, and for draining it before the steam is passed through it.
A somewhat similar boiler is made by Messrs. Clarke, Chapman & Co., and is known as the "Woodeson" boiler (fig. 11). It consists of three upper drums placed side by side connected together by numerous short tubes, some above and some below the water-level, and of three smaller lower drums also connected by short cross tubes. The upper and lower drums are connected by numerous nearly vertical straight tubes. The whole is enclosed in firebrick casing. The design permits of the insides of all the tubes being readily inspected, and also of any tube being taken out and renewed without displacing any other part of the boiler.

The earliest form of water-tube boiler which came into general use in the British navy is the Belleville. Two views of this boiler are shown in fig. 14. It is composed of two parts, the boiler proper and the economizer. Each of these consists of several sets of elements placed side by side; those of the boiler proper are situated immediately over the fire, and those of the economizer in the uptake above the boiler, the intervening space being designed to act as a combustion chamber. Each element is constructed of a number of straight tubes connected at their ends by means of screwed joints to junction-boxes which are made of malleable cast iron. These are arranged vertically over one another, and except in the case of the upper and lower ones at the front of the boiler, each connects the upper end of one tube with the lower end of the next tube of the element. The boxes at the back of the boiler are all close-ended, but those at the front are provided with a small oval hole, opposite to each tube end, closed by an internal door with bolt and cross-bar; the purpose of these openings is to permit the inside of the tubes to be examined and cleaned. The lower front box of each element of the boiler proper is connected to a horizontal cross-tube of square section, called a "feed-collector," which extends the whole width of the boiler. When the boiler is not in use, any element can be readily disconnected and a spare one inserted. The lower part of the steam-chest is connected to the feed-collector by vertical pipes at each end of the boiler, and prolongations of these pipes below the level of the feed-collector form closed pockets for the collection of sediment. The tubes are made of seamless steel. They are generally about 1/4 in. in external diameter; the two lower rows are 1/2 in. thick, the next two rows 1 in., and the remainder about 1 1/2 in. The construction of the economizer is similar to that of the boiler proper, but the tubes are shorter and smaller, being generally about 2 1/2 in. in diameter. The lower boxes of the economizer elements are connected to a horizontal feed pipe which is kept supplied with water by a feed-pumping engine, and the upper boxes are connected to another horizontal pipe from which the heated feed-water is taken into the steam-chest. Both the boiler proper and the economizer are enclosed in a casing which is formed of two thicknesses of thin iron separated by non-conducting material and lined with firebrick at the part between the fire-bar level and the lower rows of tubes. Along the front of the boiler, above the level of the firing-doors, there is a small tube having several nozzles directed across the fire-grate, and supplied with compressed air at a pressure of about 10 lb. per sq. in. In this way not only is additional air supplied, but the gases issuing from

FIG. 11.—Babcock & Wilcox Water-tube Boiler fitted with Superheaters.

FIG. 12.—Stirling Water-tube Boiler.
boiler proper and the economizer. Any water suspended in the steam is separated in a special separator fitted in the main steam-pipe, and the steam is further dried by passing through a reducing-valve, which ensures a steady pressure on the engine side of the valve, notwithstanding fluctuations of pressure in the boiler. The boiler pressure is usually maintained at about 50 lb per sq. in. In excess of that at which engines are working, the excess forming a reservoir of energy to provide for irregular firing or feeding.

Another type of long-tube boiler which has been used in the British and in other navies is the "Niclausse," shown in fig. 15. It is also in use on land in several electric-light installations. It consists of a horizontal steam-chest under which is placed a number of elements arranged side by side over the fire, the whole being enclosed in an iron casing lined with firebrick where it is exposed to the direct action of the fire. Each element consists of a header of rectangular section, fitted with two rows of inclined close-ended tubes, each slope downwards towards the back of the boiler with an inclination of 6° to the horizontal. The headers are usually of malleable cast iron with diaphragms cast in them, but sometimes steel has been employed, the bottoms being closed by a riveted steel plate, and the diaphragms being made of the same material. The headers are front wall, and each serving to fix two tubes. The products of combustion ascend directly from the fire amongst the tubes, and the combustion is rendered more complete by the introduction of jets of high-pressure air immediately over the fire, as in the "Belleville" boiler.

The "Dürr" boiler, in use in several vessels in the German navy, and in a few vessels in the British navy, in some respects resembles the "Niclausse." The separator, however, in the latter, however, are replaced by one large water-chamber formed of steel plates with welded joints, and instead of the tubes being secured to the inner plate only by conical joints, the holes in the outer plate being closed by small round doors fitted from the inside. In fixing the tubes each is separately forced into its position by means of a small bored-out stake. These caps are closed by cap-nuts made of a special heat-resisting alloy of copper and manganese. Circulation is provided for by a diaphragm in the water-chamber and by inner tubes as in the Niclausse boiler. Baffle plates are fitted amongst the tubes to ensure a circulation of the furnace gases amongst them. Above the main set of tubes is a smaller set arranged horizontally, and connected directly to the steam receiver. These are fitted with internal tubes, and an internal diaphragm is provided so that steam from the chest circulates through these tubes on its way to the stop-valves. This supplementary set of tubes is intended to serve as a superheater, but the amount of surface is not sufficient to obtain more than a very small amount of superheat.

The Yarrow boiler (fig. 16) is largely in use in the British and also in several other navies. It consists of a large cylindrical steam-chest and two lower water-chambers, connected by numerous straight tubes. In the boilers for large vessels all the tubes are of 1½ in. external diameter, but in the large express boilers the two rows nearest to the fire on each boiler are of 1½ in. and the remainder of 1 in. diameter. They are arranged with their centres forming equilateral triangles, and are spaced so that they can be flanged externally both from the front of the boiler and also cross-ways in two directions. In some boilers the lower part of the steam-chest is connected with the water-chambers by large pipes outside the casings with the view of improving the circulation.

The largest size of single-ended large tube boiler in use has a steel drum 4 ft. 2 in. diameter, a grate area of 73·5 sq. ft. and 3750 sq. ft. of heating surface, but much larger double-ended boilers have been made, these being fired from both ends.

In most of the boilers made, access to the inside is obtained by manholes in the steam-chest and in the water-chambers. The smaller sizes fitted in torpedo boats the water-chambers are too small for this, and they are each arranged in two parts connected by a bolted joint, the two parts making all the water-chamber.

The Babcock & Wilcox marine boiler (fig. 17) is much used in the American and British navies, and is one of the best used in steamers. It consists of a horizontal cylindrical steam-chest placed transversely over a group of elements, beneath which is the fire, the whole being enclosed in an iron casing lined with firebrick. Each element consists of a front and back header connected by numerous water-tubes which have a considerable inclination to facilitate the circulation. The upper ends of the front headers are situated immediately under the steam-chest and are connected to it by short nipples; by a similar means they are connected at the bottom to a pipe of square section which extends across the width of the boiler. Additional connexions are made by nearly vertical tubes which cross-ways in the fire or steam-chest. The back headers are each connected at their upper ends by means of two long horizontal tubes with the steam-chest, the bottom ends of the headers being closed by doors of wrought steel, and except the outer pairs, which are flat on the outer portions, they are sinuous on both sides, the sinuosities fitting into one another. The tubes are of two sizes, the two lower rows and the return tubes being spaced by 2½ in. outside diameter, and the remaining tubes 1½ in. The small tubes are arranged in groups of two or four to nearly all of the sinuosities of the headers, the purpose of this arrangement being to give opportunity for the formation of a number of small tubes mixed together, and to ensure their contact with the heating surfaces. Access for securing the tubes in the headers is provided by a hole formed on the other header, through which they are grouped in fours, and by one larger hole opposite each group of two tubes. The larger holes are oval, and are closed by fittings similar to those used in the land boiler (fig. 18). The smaller holes are conical, with the larger diameter on the inside,
and are closed by special conical fittings: the conical portion and belt are one forging, and the nut is close-ended. In case of the breakage of the bolt, the fitting would be retained in place by the steam-pressure. A set of firebrick baffles is placed so as to cover rather more than half of the spaces between the upper of the two bottom rows of large tubes, and another set of baffles covers about two-thirds of the spaces between the upper small tubes. Vertical baffles are also built between the smaller tubes, as shown in the longitudinal section. These baffles compel the products of combustion to circulate among the tubes in the direction shown by the arrows. Experience has shown that this arrangement gives a better evaporative efficiency than where the furnace gases are allowed to pass unaltered straight up between the tubes. The boilers are usually fitted in pairs placed back to back, and one side of each is always made accessible. On this side the casing is provided with the water-level. The two inner rows of tubes, which are bent to the form shown in the figure, also form a water-wall for the larger portion of the length of the boiler, and thus compel the products of combustion to pass in a definite course amongst all the tubes. In the Blechynsden and White-Foster boilers the lower sections connected by bent tubes, the curvature being so arranged that in the former boiler any of the tubes can be taken out of the boiler through small doors provided in the upper part of the steam-chest, and in the White-Foster boiler they can be taken out through the manhole in the end of the steam-chest.

In the Reed boiler the tubes are longer and more curved than in the Normand boiler, and there are no "water-walls," the products of combustion passing from the fire-bars into the tubes direct to the chimney. The special feature of the boiler is that each tube, instead of being expanded into the tube plate, is fitted at each end with specially designed screw and nut connections to enable them to be quickly taken out and replaced if necessary. At their lower ends the tubes are reduced in diameter to enable smaller chambers to be used than would otherwise be necessary. Provision is made for access to the lower tube ends by means of numerous doors in the water-chambers. Access to the top ends is obtained in the steam-chest.

Messrs John I. Thornycroft & Co. make two forms of express boiler. One called the Thornycroft boiler consists of three chambers connected by tubes which are straight for the major portion of their length but bent at each end to enable them to enter the steam- and water-chambers normally. The outer rows of tubes form "water-walls" at their lower parts, but permit the passage of the gases between them at their upper ends. Similarly the inner rows form "water-walls" at their upper parts, but are open at the lower ends. The products of combustion are thus compelled to pass over the whole of the heating surfaces. The fire-rows of tubes in this boiler are made 13 in. in outside diameter and the remainder are made 1 1/8 in. diameter. Large outside circulating pipes are provided at the front end of the boiler. The other type of boiler is known as the Thornycroft-Schulz boiler (fig. 20), there are four chambers, and the fire-grate is arranged in two separate portions. The two outermost rows of tubes on each side are arranged to form water-walls at their lower part, and permit the gases to pass between them at the upper part. The rows nearest the fires are arranged similarly to those in the Thornycroft boiler. Circulation in the outer sets of tubes is arranged for by or sets of circulating pipes of large diameter connecting the steam- and water-chambers. For the middle water-chamber several nearly vertical downcomers are provided in the centre of the boiler. Boilers of this type are extensively used in the British and German navies.

Material of Boilers.—In ordinary land boilers and in marine boilers of all types the plates and stays are almost invariably made of mild steel. For the shell plates and for long stays, a quality having a tensile strength ranging from 28 to 32 tons per sq. in. is usually employed, and for furnaces and flues, for plates which have to be flanged, and for short-screwed stays, a somewhat softer steel with a strength ranging from 26 to 30 tons per sq. in. is used. The tubes of ordinary land and marine boilers are usually made of lap-welded wrought iron. In water-tube boilers for naval purposes seamless steel tubes are invariably used. In locomotive boilers the shells are generally of mild steel, the fire-box plates of copper (in America of steel), the fire-box side stays of copper or special bronze, and other stays of steel. The tubes are usually of brass with a composition either of two parts by weight of copper to one of zinc or 70% copper, 30% zinc; sometimes, however, copper tubes and occasionally steel tubes are used. Where water tubes are used they are made of seamless steel.

Boiler Accessories.—All boilers must be provided with certain mountings and accessories. The water-level in them must be kept above the highest part of the heating surfaces. In some
land boilers, and in some of the water-tube boilers used on shipboard, the feeding is automatically regulated by mechanism actuated by a float, but in these cases means of regulating the feed-supply by hand are also provided. In most boilers hand regulation only is relied upon. The actual level of water in the boiler is ascertained by a glass water-gauge, which consists of a glass tube and three cocks, two communicating directly with the boiler, one above and one below the desired water-level, and the third acting as a blow-out for cleaning the gauge and for testing its working. Three small try-cocks are also fitted, one just at, one above, and one below the proper water-level. The feeding of the boiler is sometimes performed by a pump driven from the main engine, sometimes by an independent steam-pump, and sometimes by means of an injector. The feed-water is admitted by a "check-valve," the lift of which is regulated by a screw and hand-wheel, and which when the feed-pump is not working is kept on its seating by the boiler pressure.

Every boiler is in addition supplied with a steam-gauge to indicate the steam-pressure, with a stop-valve for regulating the admission of steam to the steam-pipes, and with one or two safety-valves. These last in stationary boilers usually consist of valves kept in their seats against the steam-pressure in the boiler by levers carrying weights, but in marine and locomotive boilers the valves are kept closed by means of steel springs. One at least of the safety-valves is fitted with easing gear by which it can be lifted at any time for blowing off the steam. Blow-out cocks are fitted for emptying the boiler.

Openings must always be made in boilers for access for cleaning and examination. When these are large enough to allow a man to enter the boiler they are termed man-holes. They are usually made oval, as this shape permits the doors by which they are closed to be placed on the inside so that the pressure upon them tends to keep them shut. The doors are held in place by one or two bolts, secured to cross-bars or "dogs" outside the boiler.

It is important in making these doors that they should fit the holes so accurately that the jointing material cannot be forced out of its proper position. In the few cases where doors are fitted outside a boiler, so that the steam-pressure tends to open them, they are always secured by several bolts so that the breakage of one bolt will not allow the door to be forced off.

Water-softening.—Seeing that the impurities contained in the feed-water are not evaporated in the steam they become concentrated in the boiler water. Most of them become precipitated in the boiler either in the form of mud or else as scale which forms on the heating surfaces. Some of the mud and such of the impurities as remain soluble may be removed by means of the blow-off cocks, but the scale can only be removed by periodical cleaning. Incrustations on the heating surface not only lessen the efficiency of the boiler by obstructing the transmission of heat through the plates and tubes, but if excessive they become a source of considerable danger by permitting the plates to become overheated and thereby weakened. When the feed-water is very impure, therefore, the boilers used are those which permit of very easy cleaning, such as the Lancashire, Galloway and Cornish types, to the exclusion of multitubular or water-tube boilers in which thorough cleaning is more difficult. In other cases, however, the feed-water is purified by passing it through some type of "softener" before pumping it into the boiler. Most of the impurities in ordinary feed-water are either lime or magnesia salts, which although soluble in cold water are much less so in hot water. In the "softener" measured quantities of feed-water and of some chemical reagents are thoroughly mixed and at the same time the temperature is raised either by exhaust steam or by other means. Most of the impurity is thus precipitated, and some of the remainder is converted into more soluble salts which remain in solution in the boiler until blown out. The water is filtered before being pumped into the boiler. The quantity and kind of chemical employed is determined according to the nature and amount of the impurity in the "hard" feed-water.

**Thermal Storage.**—In some cases where the work required is very intermittent, "thermal storage" is employed. Above the boiler a large cylindrical storage vessel is placed, having sufficient capacity to contain enough feed-water to supply the boiler throughout the periods when the maximum output is required. The upper part of this storage vessel is always in free communication with the steam space of the boiler, and from the lower part of it the feed-water may be run into the boiler when required. The feed-water is delivered into the upper part of the vessel, and arrangements are made by which before it falls to the bottom of the chamber it runs over very extended surfaces exposed to the steam, its temperature being thus raised to that of the steam. At times when less than the normal supply of steam is required for the engine more than the average quantity of feed-water is pumped into the chamber, and the excess accumulates with its temperature raised to the evaporation point. When an extra supply of steam is required, the feed-pump is stopped and the boiler is fed with the hot water stored in the chamber. Besides the "storage" effect, it is found that many

---

**Fig. 16.—Yarrow Water-tube Boiler.**

---
of the impurities of the feed become deposited in the chamber, where they are comparatively harmless and from which they are readily removable.

Oil Separators.—When the steam from the engines is condensed and used as feed-water, as is the case with marine boilers, much difficulty is often experienced with the oil which passes over with the steam. Feed-filters are employed to stop the coarser particles of the oil, but some of the oil becomes “emulsified” or suspended in the water in such extremely minute particles that they pass through the finest filtering materials. On the evaporation of the water in the boiler, this oil is left as a thin film upon the heating surfaces, and by preventing the actual contact of water with the plates has been the cause of serious trouble. An attempt has been made to overcome the emulsion difficulty by uniformly mixing with the water a small quantity of solution of lime. On the water being raised in temperature the lime is precipitated, and the minute particles separated apparently attract the small globules of oil and become aggregated in sufficient size to deposit themselves in quiet parts of the boiler, whence they can be occasionally removed either by blowing out or by cleaning. Much, however, still remains to be done before the oil difficulty will be thoroughly removed.

Corrosion.—When chemicals of any kind are used to soften or purify feed-water it is essential that neither they nor the products they form should have a corrosive effect upon the boiler-plates, &c. Much of the corrosion which occasionally occurs has been traced to the action of the oxygen of the air which enters the boiler in solution in the feed-water, and the best practice now provides for the delivery of the feed into the boiler at such positions that the air evolved from it as it becomes heated passes direct to the steam space without having an opportunity of becoming disengaged upon the under-water surfaces of the boiler.

Where corrosion is feared it is usual to fit zinc slabs in the water spaces of the boiler. Experience shows that it is better to make them of rolled rather than of cast zinc, and to secure them on studs which can be kept bright, so as to ensure a direct metallic contact between the zinc and the boiler-plate. The function of the zinc is to set up galvanic action; it plays the part of the negative metal, and is dissolved while the metal of the shell is kept electro-positive. Care must always be taken that the fragments which break off the zinc as it wastes away cannot fall upon the heating surfaces of the boiler.

Evaporators.—In marine boilers the waste of water which occurs from leakages in the cycle of the evaporation in the boiler, use in the engine, condensation in the condenser and return to the boiler as feed-water, is made up by fresh water distilled from sea-water in “evaporators.” Of these there are many forms with different provisions for cleaning the coils, but they are all identical in principle. They are fed with sea-water, and means are provided for blowing out the brine produced in them when some of the water is evaporated. The heat required for the evaporation is obtained from live steam from the boilers, which is admitted into coils of copper pipe. The water condensed in these coils is returned direct to the feed-water, and the steam evaporated from the sea-water is led either into the low-pressure receiver of the steam-engine or into the condenser.

Efficiency of Boilers.—The useful work obtained from any boiler depends upon many considerations. For a high efficiency, that is, a large amount of steam produced in proportion to the amount of fuel consumed, different conditions have to be fulfilled from those required where a large output of steam from a given plant is of more importance than economy of fuel. For a high efficiency, completeness of combustion of fuel must be combined with sufficient heating surface to absorb so much of the heat
BOILER

produced as will reduce the temperature of the funnel gases to nearly that of steam. Completeness of combustion can only be obtained by admitting considerably more air to the fire than is theoretically necessary fully to oxidize the combustible portions of the fuel, and by providing sufficient time and opportunity for a thorough mixture of the air and furnace gases to take place before the temperature is lowered to that critical point below which combustion will not take place. It is generally considered that the amount of excess air required is nearly equal to that theoretically necessary; experience, however, tends to show that much less than this is really required. If proper means are provided for ensuring an early complete mixture of the gases. Different means are needed to effect this with different kinds of coal, those necessary for properly burning Welsh coal being altogether unsuitable for use with North Country or Scottish coal. As all the excess air has to be raised to the same temperature as that of the really burnt gases, it follows that an excess of air passing through the fire lowers the temperature in the fire and flues, and therefore lessens the heat transmission; and as it leaves the boiler at a high temperature it carries off some of the heat produced. A reduction of the amount of air, therefore, may, by increasing the fire temperature and lessening the chimney waste, actually increase the efficiency even if at the same time it is accompanied by a slight incompleteness of combustion.

Mechanical Stoking.—Most boilers are hand-fired, a system involving much labour and frequent openings of the furnace doors, whereby large quantities of cold air are admitted above the fires. Many systems of mechanical stoking have been tried, but none has been found free from objections. That most usually employed is known as the "chain-grate" stoker. In this system, which is illustrated in fig. 13 (Woodson boiler), the grate consists of a wide endless chain formed of short cast-iron bars; this passes over suitable drums at the front and back of the boiler, by the slow rotation of which the grate travels very slowly from front to back. The coal, which is broken small, is fed from a hopper over the whole width of the grate, the thickness of the fire being regulated by a door which can be raised or lowered as desired. Thus the volatile portions of the coal are distilled at the front of the fire, and pass over the incandescent fuel at the back end. The speed of travel is so regulated that by the time the remaining parts of the fuel reach the back end the combustion is nearly complete. It will be seen that the fire becomes thinner towards the back, and too much air is prevented from entering the thin portion by means of vanes actuated from the front of the boiler.

Draught.—In most boilers the draught necessary for combustion is "natural," i.e. produced by a chimney. For marine purposes, although "natural" draught is the more common, many boiler installations are fitted with "forced" draught arrangements. Two distinct systems are used. In that known as the "closed stokehold" the stokehold compartment of the vessel is so closed that the only exit for air from it is through the fires. Air is driven into the stokehold by means of fans which are made so that they can maintain an air pressure in the stokehold above that of the outside atmosphere. This is the system almost universally adopted in war vessels, and it is used also in some fast passenger ships. The air pressure usually adopted in large vessels is that corresponding to a height of from 1 to 1½ in. of water, whilst so much as 4 in. is sometimes used in torpedo-boats and similar craft. This is, of course, in addition to the chimney-draught due to the height of the funnel. In the closed ashpit or Howden system, the stokehold is open, and fans drive the air round a number of tubes, situated in the uptake, through which the products of combustion pass on their way to the chimney. The air thus becomes heated, and part of it is then delivered into the ashpit below the fire and part into a casing round the furnace front from which it enters the furnace above the fire. In locomotive boilers the draught is produced by the blast or the exhaust steam. With natural draught a

FIG. 19.—Normand Boiler.

and lessening the chimney waste, actually increase the efficiency even if at the same time it is accompanied by a slight incompleteness of combustion.

 Mechanical Stoking.—Most boilers are hand-fired, a system involving much labour and frequent openings of the furnace doors, whereby large quantities of cold air are admitted above the fires. Many systems of mechanical stoking have been tried, but none has been found free from objections. That most usually employed is known as the "chain-grate" stoker. In this system, which is illustrated in fig. 13 (Woodson boiler), the grate consists of a wide endless chain formed of short cast-iron bars; this passes over suitable drums at the front and back of the boiler, by the slow rotation of which the grate travels very slowly from front to back. The coal, which is broken small, is fed from a hopper over the whole width of the grate, the thickness of the fire being regulated by a door which can be raised or lowered as desired. Thus the volatile portions of the coal are distilled at the front of the fire, and pass over the incandescent fuel at the back end. The speed of travel is so regulated that by the time the remaining parts of the fuel reach the back end the combustion is nearly complete. It will be seen that the fire becomes thinner towards the back, and too much air is prevented from entering the thin portion by means of vanes actuated from the front of the boiler.

Draught.—In most boilers the draught necessary for combustion is "natural," i.e. produced by a chimney. For marine
in the estimation of these particulars. Further, in order properly to represent working conditions, the rate of combustion of the fuel throughout the trial must be the same as that intended to be used in ordinary working, and the duration of the test must be sufficient to include proportionately as much cleaning of fires as would occur under the normal working conditions. The tests should always be made with the kind of coal intended to be generally used, and the records should include a test of the calorific value of a sample of the fuel carefully selected so as fairly be conveniently treated together, because similar materials and methods are employed in each, notwithstanding that many points of divergence in practice generally relegate them to separate departments. The materials used are chiefly iron and steel. The methods mostly adopted are those involved in the working of plates and rolled sections, which vastly predominate over the bars and rods used chiefly in the smithy. But there are numerous differences in methods of construction. Flanging occupies a large place in boilermaking, for end-plates, tube-plates, furnace

1 In the first three trials no retarders were used. In the last trial retarders were used.
2 In this trial retarders were used in the tubes.
3 In this trial retarders were used in the tubes.

In bridge work plate or bar is usually drilled or punched apart from its fellows. Boilers, again, being subject to high temperatures and pressures, must be constructed with provisions to ensure some elasticity and freedom of movement under varying temperatures to prevent fractures or grooving, and must be made of materials that combine high ductility with strength when heated to furnace temperatures. Flanging of certain parts, judicious staying, limitation of the length of the tubes,}

**BOILER MAKING**

The practice of the boiler, bridge and girder shops may be fluences, &c., but is scarcely represented in bridge and girder work. Plates are bent to cylindrical shapes in boilermaking, for shells and furnaces, but not in girder work. Welding is much more common in the first than in the second, furnace flues being always welded and stand pipes frequently. In boiler work holes are generally drilled through the seams of adjacent plates. In bridge work each plate or bar is usually drilled or punched apart from its fellows. Boilers, again, being subject to high temperatures and pressures, must be constructed with provisions to ensure some elasticity and freedom of movement under varying temperatures to prevent fractures or grooving, and must be made of materials that combine high ductility with strength when heated to furnace temperatures. Flanging of certain parts, judicious staying, limitation of the length of the tubes,
the forms of which are inherently weak, provide for the first; the selection of steel or iron of high percentage elongation, and the imposition of temper, or bending tests, both hot and cold, provide for the second.

The following are the leading features of present-day methods.

It might be hastily supposed that, because plates, angles, tees, channels and joint sections are rolled ready for use, little work could be left for the plater and boilermaker. But actually so much is involved that subdivisions of tasks are numerous; the operations of templet-making, rolling, planing, punching and shearing, bending, welding and forging, flanging, drilling, riveting, caulking, and tubing require the labours of several groups of machine attendants, and of gangs of unskilled labourers or helpers. Some operations also have to be done at a red or white heat, others cold. To the first belong flanging and welding, to the latter generally all the other operations. Heating is necessary for the rolling of tubes of small diameter; bending is done cold or hot according to circumstances.

The fact that some kinds of treatment, as shearing and punching, flanging and bending, are of a very violent character explains why practice has changed radically in regard to the method of performing these operations in cases where safety is a cardinal matter. Shearing and punching are both severely detruive operations performed on cold metal; both leave jagged edges and, as experience has proved, very minute cracks, the tendency of which is to extend under subsequent stress, with liability to produce fracture. But it has been found that, when a shorn edge is planed and a punched hole enlarged by reaming, no harm results, provided not less than about \( \frac{1}{3} \) in. is removed. A great advance was therefore made when specifications first insisted on the removal of the rough edges before the parts were united.

In the work of riveting another evil long existed. When holes are punched it is practically impossible to ensure the exact coincidence of holes in different plates which have to be brought together for the purpose of riveting. From this followed the use of the drift,—a tapered rod driven forcibly by hammer blows through correspond-

Fig. 20.—Thornycroft-Schulz Water-tube Boiler.
BOILING TO DEATH—BOISGOBEY

BOILING TO DEATH, a punishment once common both in England and on the continent. The only extant legislative notice of it in England occurs in an act passed in 1531 during the reign of Henry VIII., providing that convicted poachers should be boiled to death; it is, however, frequently mentioned in examples as a punishment for coining. The Chronicles of the Grey Friars (published by the Camden Society, 1852) have an account of boiling for poisoning at Smithfield in the year 1522, the man being fastened to a chain and lowered into boiling water several times until he died. The preamble of the statute of Henry VIII. (which made poisoning treason) in 1531 rectifies that one Richard Roose (or Coke), a cook, by putting poison in some food intended for the household of the bishop of Rochester and for the poor of the parish of Lambeth, killed a man and woman. He was found guilty of treason and sentenced to be boiled to death without benefit of clergy. He was publicly boiled at Smithfield. In the same year a maid-servant for poisoning her mistress was boiled at King's Lynn. In 1542 Margaret Davy, a servant, for poisoning her employer, was boiled at Smithfield. In the reign of Edward VI., in 1547 the act was repealed.

BOIS BRULÉS, or BRULES (a French translation of their Indian name SICCHANG), a sub-tribe of North American Dakota Indians (Teton river division). The name is most frequently associated with the half-breeds in Manitoba, who in 1869 came into temporary prominence in connexion with Riel's Rebellion (see RED RIVER); at that time they had lost all tribal purity, and were alternatively called Metis (half-castes), the majority being descendants of French-Canadians.

BOISE, a city and the county-seat of Ada county, Idaho, U.S.A., and the capital of the state, situated on the N. side of the Boise river, in the S.W. part of the state, at an altitude of about 2700 ft. Pop. (1880) 1899; (1900) 5957; (1910) 17358. It is served by the Oregon Short Line railway, being the terminus of a branch connecting with the main line at Nampa, about 20 m. W.; and by electric lines connecting with Caldwell and Nampa. The principal buildings are the state capital, the United States assay office, a Carnegie library, a natatorium, and the Federal building, containing the post office, the United States circuit and district court rooms, and a U.S. land office. Boise is the state seat of the deaf and blind (1906), and just outside the city limits are the state soldiers' home and the state penitentiary. About 2 m. from the city are Federal barracks. Hot water (175° F.) from artesian wells near the city is utilized for the natatorium and to heat many residences and public buildings. The Boise valley is an excellent country for raising apples, prunes and other fruits. The manufactured products of the city are such as are demanded by a mining country, principally lumber, flour and machine-shop products. Boise is the trade centre of the surrounding fruit-growing, agricultural and mining districts. The oldest settlement in the vicinity was made by the Hudson's Bay Fur Company on the west side of the Boise river, before 1860; the present city, chartered in 1864, dates from 1863. After 1900 the city grew very rapidly, principally owing to the great irrigation schemes in southern Idaho; the water for the immense Boise-Payette irrigation system is taken from the Boise, 8 m. above the city. (See IDAHO.)

BOISGEB, FORTUNÉ DU (1824-1861), French writer of fiction, whose real surname was Castille, was born at Granville (Manche) on the 11th of September 1824. He served in the army pay department in Algeria from 1844 to 1848, and extended his travels to the East. He made his literary début in the Petit journal avec a story entitled Deux commédiens (1858). With Le Forçat colonel (1872) he became one of the most popular feuilleton writers. His police stories, though not so convincing
as those of Émile Gaboriau, with whom his name is generally associated, had a great circulation, and many of them have been translated into English. Among his stories may be mentioned: *Les Mystères du nouveau Paris* (1876), *Le Démi-Monde sous la Terreur* (1877), *Les Nuits de Constantinople* (1882), *Le Cri du sang* (1885), *La Main froide* (1886). Boisgobey died on the 26th of February, 1893.

**Boisguilbert, Pierre de Pesant, Seigneur de (1576–1714), French economist, was born at Rouen of an ancient noble family of that city, and was educated to the law. Before he gave up his classical education in Rouen, entered the magistracy and became judge at Montvilliers, near Havre. In 1690 he became president of the *bailliage* of Rouen, a post which he retained almost until his death, leaving it to his son. In these two situations he made a close study of local economic conditions, personally supervising the cultivation of his lands, and entering into relations with the principal merchants of Rouen. He was thus led to consider the misery of the people under the burden of taxation. In 1695 he published his principal work, *Le Détail de la France, la cause de la diminution de ses richesses*, in which he drew a more concise résumé of the general ruin of all classes of Frenchmen, caused by the bad economic régime. In opposition to Colbert’s views he held that the wealth of a country consists, not in the abundance of money which it possesses but in what it produces and exchanges. The remedy for the evils of the time was not so much the reduction as the equalization of the imposts, which would allow the poor to consume more, raise the production and add to the general wealth. He demanded the reform of the taille, the suppression of internal customs duties and greater freedom of trade. In his *Facsimile de la France* (1702) he declared that he gave up the post of controller-general, of the general ruin of the French crown, caused by the bad economic régime.

In his day a mind for antiquities, and he soon formed a collection of the most curious monuments from Rome and its vicinity. He then visited the islands of the Archipelago, with the intention of travelling through Greece, but a severe illness obliged him to return to Rome. Here he resumed his favourite pursuits with great ardour, and having completed his collection, returned to his native country; but not being permitted to profess publicly the Protestant religion, which he had embraced some time before, he withdrew to Metz, where he died on the 30th of October 1702. His most important works were: *Pompei* (1754); *Échanges de la France* (1758); *Icones Vitrum Illustribus* (1797); *Ville et Icones Sultani Turcorum, &c.* (1797); *Theatro Vitea Humanae* (1796); *Romanae Urbis Topographia* (1796–1702), now very rare; *De Divinatione et Magicis Præstigiosis* (1603); *Habitus Variarum Orbis Gentium* (1751), ornamented with seventy illuminated figures.

**Boisguilbert, Marie Louis Antoine Gaston** (1823–1908), French classical scholar, and secretary of the French Academy, was born at Nîmes on the 15th of August 1823. The Roman monuments of his native town very early attracted Gaston Boisguilbert to the study of ancient history. He made epigraphy his particular theme, and at the age of twenty-three became a professor of rhetoric at Angoulême, where he lived and worked for ten years without further ambition. A travelling inspector of the university, however, happened to hear him lecture, and Boisguilbert was called to Paris to be professor at the Lycée Charlemagne. He began his literary career by a thesis on the poet Attius (1857) and a study on the life and work of M. Terentius Varro (1861). In 1861 he was made professor of Latin oratory at the Collège de France, and he became an active contributor to the *Revue des deux mondes*. In 1865 he published *Citoyen et ses amis* (Eng. trans. by A. D. Jones, 1897), which has enjoyed a success such as rarely falls to the lot of a work of erudition. In studying the manners of ancient Rome, Boisguilbert had learned to re-create its society and to reproduce its characteristics with exquisite vivacity. In 1874 he published *La Religion romaine d’Auguste aux Antonins* (2 vols.), in which he analysed the great religious movement of antiquity that preceded the acceptance of Christianity. In *L’Opposition sous les Césars* (1875) he drew a remarkable picture of the political decadence of Rome under the early successors of Augustus. By this time Boisguilbert had drawn to himself the universal respect of scholars and men of letters, and on the death of H. J. G. Patin, the author of *Études sur les tragiques grecs*, in 1876, he was elected a member of the French Academy, of which he was appointed perpetual secretary in 1895.

His later works include *Promenades archéologiques: Rome et Pompéi* (1880; second series, 1886); *L’Afrique romaine, promenades archéologiques* (1901); *La Fin du paganisme* (2 vols., 1891); *Le Conjugation de Catilina* (1903); *Tactile* (1903, Eng. trans. by W. G. Hutchison, 1906). He was a representative example of the French talent for lucidity and elegance applied
with entire seriousness to weighty matters of literature. Though he devoted himself mainly to his great theme, the reconstruction of the elements of Roman society, he also wrote monographs on Madame de Sévigné (1887) and Saint-Simon (1892). He died in June 1908.

BOISSONADE DE FONTARABIE, JEAN FRANÇOIS (1774–1857), French classical scholar, was born at Paris on the 12th of August 1774. In 1792 he entered the public service during the administration of General Dumouriez. In 1793, when he was restored by Lucien Bonaparte, during whose time of office he served as secretary to the prefecture of the Upper Marne. He then definitely resigned public employment and devoted himself to the study of Greek. In 1809 he was appointed deputy professor of Greek at the faculty of letters at Paris, and titular professor in 1813 on the death of P. H. Larcher. In 1828 he succeeded J. B. Gail in the chair of Greek at the Collège de France. He also held the offices of librarian of the Bibliothèque du Roi, and of perpetual secretary of the Académie des Inscriptions. He died on the 8th of September 1857. Boissonade chiefly devoted his attention to later Greek literature: Philostratus, Heroïca (1806) and Epictetae (1842); Marinus, Vitalis procli (1814); Tiberius Rhetor, De Figuris (1815); Nicetas Eugenianus, Drosilia et Charicles (1816); Herodiot, Partiotionis (1819); Aristaeus, Epictetae (1822); Eunapius, Vitae Sophistorum (1822); Babrius, Fables (1844); Tzetzes, Allograea Iliaos (1851); and a Collection of Greek Poets in 24 vols. The Anecdotae Graecae (1829–1833) and Anecdotae Nova (1844) are important for Byzantine history and the Greek grammarians.

A selection of his papers was published by F. Colincauc, Critique litteraire sur le premier Empereur (1802), which contains a complete list of his works, and a "Notice Historique sur Monsieur B.,” by Naudet.

BOISSONADE-D'ANGLAS, FRANÇOIS ANTOINE DE (1756–1828), French statesman, received a careful education and busied himself at first with literature. He had been a member of several provincial academies before coming to Paris, where he purchased a position as advocate to the parlement. In 1786 he was elected by the third estate of the États-Unis de Lannoy as deputy to the states-general. He was one of those who induced the states-general to proclaim itself a National Assembly on the 17th of June 1789; approved, in several speeches, of the capture of the Bastille and of the taking of the royal family to Paris (October 1789); demanded that strict measures be taken against the royalists who were intriguing in the south of France, and published some pamphlets on finance. During the Legislative Assembly he was procureur-syndic for the directory of the department of Ardeche. Elected to the Convention, he sat in the centre, "le Marais.” He voted in the trial of Louis XVI. for his detention until deportation should be judged expedient for the state. He was then sent on a mission to Lyons to investigate the frauds in connexion with the supplies of the army of the Alps. During the Terror he was one of those deputies of the centre who supported Robespierre; but he was gained over by the members of the Mountain hostile to Robespierre, and his support, along with that of some other leaders of the Marais, made possible the 9th Thermidor. He was then elected a member of the Committee of Public Safety and charged with the superintendence of the provisional government. He represented the Montgommery department and voted in the sentence of the 3rd Vendôme of the year III. which established liberty of worship. In the critical days of Germinal and of Prairial of the year III. he showed great courage. On the 12th Germinal he was in the tribune, reading a report on the food supplies, when the hall of the Convention was invaded by the rioters, and when they withdrew he quietly continued where he had been interrupted. On the 1st Prairial he presided over the Convention, and remained unmoved by the insults and menaces of the rioters. When the head of the deputy, Jean Féraud, was presented to him on the end of a pike, he saluted it impassively. He was reporter of the committee which drew up the constitution of the year III., and his report shows keen apprehension of a return of the Reign of Terror, and presents reactionary measures as precautions against the re-establishment of "tyranny and anarchy." This report, the proposal that he made (August 27, 1795) to lessen the severity of the revolutionary laws, and the eulogies he received from several Paris sections suspected of disloyalty to the republic, resulted in his being obliged to justify himself (October 15, 1795). As a member of the Council of the Five Hundred he became more and more suspected of royalism. He presented a measure in favour of full liberty for the press, that at this time was almost unanswerable, because it protested against the outlawry of returned émigrés, spoke in favour of the deported priests and attacked the Directory. Accordingly he was proscribed on the 18th Fructidor, and lived in England until the Consulate. In 1801 he was made a member of the Tribunate, and in 1805 a senator. In 1814 he voted for Napoleon's abdication, which won for him a seat in the chamber of peers; but during the Hundred Days he served Napoleon, and in consequence, on the second Restoration, was for a short while excluded. In the chamber he still sought to obtain liberty for the press—a theme upon which he published a volume of his speeches (Paris, 1817). He was a member of the Institute from its foundation, and in 1816, at the reorganization, became a member of the Académie des Inscriptions et Belles-Lettres. He published in 1819–1821 a two-volume Essai sur la vie et les opinions de M. de Malesherbes.

BOITO, ARRIGO (1842–), Italian poet and operatic composer, was born at Padua on the 24th of February 1842. He studied music at the Milan Conservatoire, but even in those early days he devoted as much of his time to literature as to music, forecasting the divided allegiance which was to be the chief characteristic of his life's history. While at the Conservatoire he wrote and composed, in collaboration with Franco Faccio, a cantata, Le Sordi d'Italia, which was performed with success. On completing his studies Boito travelled for some years, and after his return to Italy settled down in Milan, dividing his time between journalism and music. In 1866 he fought under Garibaldi, and in 1868 conducted the first performance of his opera Mefistofele at the Scala theatre, Milan. The work failed completely, and was withdrawn after a second performance. It was revived in 1875 at Bologna in a much altered and abbreviated form, when its success was beyond question. It was performed in London in 1880 with success, but in spite of frequent revivals has never succeeded in firmly establishing itself in popular favour. Boito treated the Faust legend in a spirit far more nearly akin to the conception of Goethe than is found in Gounod's Faust, but, in spite of many isolated beauties, his opera lacks cohesion and dramatic interest. His energies were afterwards chiefly devoted to the composition of libretti, of which the principal are Otello and Falstaff, set to music by Verdi; La Gioconda, set by Ponchelli; Amleto, set by Faccio; and Ero e Leandro, set by Bottesini and Mancinelli. These works display a rare knowledge of the requirements of dramatic poetry, together with uncommon literary value. Boito also published a book of poems and a novel, L'Alfer Meno. The degree of doctor of music was conferred upon him in 1893 by the university of Bologna.

BOVIN, FRANÇOIS DE, Baron de Villars (d. 1618), French chronicler, entered the service of Charles, Marshal Brissac, as secretary, and accompanied him to Piedmont in 1550 when the marshal went to take command of the French troops in the war with Spain. Remaining in this service he was sent after the defeat of the French at St Quentin in 1557 to assure the French king Henry II. of the support of Brissac. He took part in the negotiations which led to the treaty of Cateau-Cambrésis in April 1559, but was unable to prevent Henry II. from ceding the conquests made by Brissac. Bovin wrote Mémoires sur les guerres démêlées tant dans le Piémont qu'au Monferrat et duché de Milan par Charles de Costé, comte de Brissac (Paris, 1607), which, in spite of some drawbacks, is valuable as the testimony of an eye-witness of the war. An edition, carefully revised,
appears in the Mémoires relatifs à l'histoire de France, tome x., edited by J. F. Michaud and J. F. Poupart (Paris, 1850). He also wrote Instruction sur les affaires d'Etat (Lyons, 1860).

BOKENAM, OSBERN (1397?–1447?), English author, was born, by his own account, on the 6th of October 1393. Dr Horstmann suggests that he may have been a native of Bokham, now Bookham, in Surrey, and derived his name from the place. In a concluding note to his Lives of the Saints he is described as "a Suffolk man, frere Austyn of Stoke Clare." He travelled in Italy on at least two occasions, and in 1445 was a pilgrim to Santiago de Compostela. He also says that he was among the last of holy maidens and women. These are written chiefly in seven- and eight-lined stanzas, and nine of them are preceded by prologues. Bokenam was a follower of Chaucer and Lydgate, and doubtless had in mind Chaucer's Legend of Good Women. His chief, but by no means his only, source was the Legenda Aurea of Jacobus de Voragine, archbishop of Genoa, whom he cites as "Januence." The first of the legends, Vita Scae Margaretae, virgins et maritis, was written for his friend, Thomas Burgh, a Cambridge monk; others are dedicated to pious ladies who desired them. His chief book is his Monastericon (British Museum) is a unique copy of Bokenam's work; it was finished, according to the concluding note, in 1447, and presented by the scribe, Thomas Burgh, to a convent unnamed "that the nuns may remember him and his sister, Dame Betrice Burgh." The poems were edited (1835) for the Roxburgh Club with the title Lyneys of Seyntys ..., and by Dr Carl Horstmann as Osbern Bokenams Legenden (Heilbronn, 1883) E. Köhling's Allengi. Bibliothek, vol. i. Both editions include a dialogue written in Latin and English taken from Dugdale's Monasticon Anglicanum (ed. 1616, vol. vi. p. 1600); "this dialogue is a Secular asking and a Frere answeerynge at the grave of Dame Johan of Acres shewith the lynenal descent of the lordis of the honour of Clare fro ... MCCCLXVIII to ... MCCCLXI" Bokenam wrote, as he tells us, plainly, in the Suffolk speech. He explains his lack of decoration on the plea that the finest flowers had been already plucked by Chaucer, Gower and Lydgate.

BOKHARA, or BUKHARA (the common central Asian pronunciation is Bukhara), a state of central Asia, under the protection of Russia. It lies on the lower bank of the middle Oxus, between 37° and 41° N., and between 62° and 72° E., and is bounded by the Russian governments of Syr-darya, Samarkand and Ferghana on the N., the Pamirs on the E., Afghanistan on the S., and the Transcaspian territory and Khiva on the W. Its south-eastern frontier on the Pamirs is undetermined except where it touches the Russian dominions. Including the khanates of Karataghin and Darvaz the area is about 85,000 sq. m. The western portion of the state is a plain watered by the Zarafshan and by countless irrigation canals drawn from it. It has in the east the Karnap-chul steppe, covered with grass in summer, and in the north an intrusion of the Kara-kum sand desert. Land suitable for cultivation is found only in oases, where it is watered by irrigation canals, but these oases are very fertile. The middle portion of the state is occupied by high plateaus, about 4000 ft. in altitude, sloping from the Tien-shan, and intersected by numerous rivers, flowing towards the Oxus. This region, very fertile in the valleys and enjoying a cooler and damper climate than the lower plains, is densely populated, and agriculture and cattle-breeding are carried on extensively. Heathland, the steppe and the Kafiristan, Chirakchi and Guzar or Huzar. The Hissar range, a westward continuation of the Alai Mountains, separates the Zarafshan from the tributaries of the Oxus—the Surkhan, Kafirnihan and Vakhsh. Its length is about 200 m., and its passes, 1000 to 3000 ft. below the surrounding peaks, reach altitudes of 12,000 to 14,000 ft. and are extremely difficult. Numbers of rivers pierce or flow in wild gorges between its spurs. Its southern foot-hills, covered with loess, make the fertile valleys of Hissar and the Vakhsh. The climate is so dry, and the rains are so scarce, that an absence of forests and Alpine meadows is characteristic of the ridge; but when heavy rain falls simultaneously with the melting of the snows in the mountains, the watercourses become filled with furious torrents, which create great havoc. The main glaciers (12) are on the north slope, but none creeps below 10,000 to 12,000 ft. The Peter the Great range, or Periokh-tau, in Karatechin, south of the valley of the Vakhsh, runs west-south-west to east-north-east for about 130 m., and is higher than the Hissar range. For the meridian of Garm or Harm it rises above the snowline, attaining at least 18,000 ft. in the Sary-kaudal peak, and 20,000 ft. farther east where it joins the snow-clad Darvaz range, and where the group Sandal, adorned with several glaciers, rises to 24,000 or 25,000 ft. Only two mountain peaks, very scarce, are known across the Oxus.

Darvaz, a small vassal state of Bokhara, is situated on the Panj, where it makes its sharp bend westwards, and is emphatically a mountainous region, agriculture being possible only in the lower parts of the valleys. The population, about 35,000, consists chiefly of Moslem Tajiks, and the closely-related Galchas, and its chief town is Kala-i-khun on the Panj, at an altitude of 4370 ft.

The chief river of Bokhara is the Oxus or Amu-darya, which separates it from Afghanistan on the south, and then flows along the northern foot of the Arghun mountains to the Arin-Kau and Sary-Kau basins, through the valleys of Surkhan, and steamboats ply on it up to Karki near the Afghan frontier. The next largest river, the Zarafshan, 660 m. long, the water of which is largely utilized for irrigation, is lost in the sands 20 m. before reaching the Oxus. The Kashka-darya, which flows westwards out of the glaciers of Hazret-sultan (west of the Hissar range), supplies the Shahri-sabs (properly Shahrabzeh) oasis with water, but is lost in the desert to the west of Karsh.

The climate of Bokhara is extreme. In the lowlands a very hot summer is followed by a short but cold winter, during which a frost of -20° Fahr. may set in, and the Oxus may freeze for a fortnight. In the highlands this hot and dry summer is followed by four months of winter; and, finally, in the regions above 8000 ft. there is a great development of snowfields and glaciers, the passes are buried under snow, and the short summer is rainy. The lowlands are sometimes visited by terrible sand-storms from the west, which exhaust men and kill the cotton trees. Malaria is widely prevalent, and in some years, after a wet spring, assumes a malignant character.

The population of the area is estimated at 1,250,000. The dominant race is the Usbes, who are fanatical Moslem Sunnites, scorn work, despise their Iranian subjects, and maintain their old division into tribes or clans. The nomad Turkomans and the nomad Kirghiz are also of Turkish origin; while the Sarts, who constitute the bulk of the population in the towns, are a mixture of Turks with Iranians. The great bulk of the population in the country is composed of Iranian Tajiks, who differ but very little from Sarts. Besides these there are Afghans, Persians, Jews, Arabs and Armenians. Much of the trade is in the hands of a colony of Hindus from Shakhpur. Nearly 20% of the population are nomads and about 15% semi-nomads.

On the irrigated lowlands rice, wheat and other cereals are cultivated, and exported to the highlands. Cotton is widely grown and exported. Silk is largely produced, and tobacco, wine, flax, hemp and fruits are cultivated. Cattle-breeding is vigorously prosecuted in Hissar and the highlands generally. Cotton, silks, woolen cloth, and felt are manufactured, also boots, saddles, cutlery and weapons, pottery and various oils. Salt is also some iron and copper, and small quantities of gold are extracted. Trade has been greatly promoted by the building of the Transcaspian railway across the country (from Charjui on the Oxus to Kati-kurghan) in 1886-1888. The exports to Russia consist of raw cotton and silk, lamb-skins, fruits and carpets, and the imports of manufactured goods and sugar. The imports from India are cottons, tea, shawls and indigo. There are very few roads; goods are transported on camels, or on horses and donkeys in the hilly tracts.

Bokhara has for ages been looked upon as the centre of Mussulman erudition in central Asia. About one-fourth of the
population is said to be able to read and write. The primary schools are numerous in the capital, as well as in the other cities, and even exist in villages, and madrasas or theological seminaries for higher courses of study are comparatively plentiful. The mullahs or priests enjoy very great influence, but the people are very superstitious, believing in witchcraft, omens, spirits and the evil eye. Women occupy a low position in the social scale, though slavery has been abolished at the instance of Russia. The emir of Bokhara is an autocratic ruler, his power being limited only by the traditional custom (shari'a) of the Musulmans. He maintains an army of some 17,000 men, but is subject to Russian control, being in fact a vassal of that empire.

History.—Bokhara was known to the ancients under the name of Sokhiana. It was too far removed to the east ever to be brought under the dominion of Rome, but it has shared deeply in all the various and bloody revolutions of Asia. The foundation of the capital is ascribed to Efrasiab, the great Persian hero. After the conquests of Alexander the Great Sokhiana formed part of the empire of the Seleucidae, and shared the fortunes of the other better-known Bactria. Somewhat later the nomad Yue-chi began to move into the valley of the Oxus from the east, and gradually became a settled territorial power in Bactria and Sokhiana, and the dominions of their king, Kadphises I. (who is believed to have come to the throne about A.D. 45), extended from Bokhara to the Indus. The district, however, was reconquered by Persia under the Sassanian dynasty, and we hear of Nestorian Christians at Samarkand, at any rate in the 6th century. Islam was introduced shortly after the Arab conquest of Persia (642-645) and speedily became the dominant faith. In the early centuries of Mahomedan rule Sokhiana was one of the most celebrated and flourishing districts of central Asia. It was called Sughd, and contained the two great cities of Samarkand and Bokhara, of which the former was generally the seat of government, while the latter had a high reputation as a seat of religion and learning. During the early middle ages this region was also known as Ma war'i Nahar or Ma-vera-un-nahr, the meaning of which is given in the alternative classical title of Transoxiana. Malik Shah, third of the Seljuk dynasty of Persia, passed the Oxus about the end of the 11th century, and subdued the whole country watered by that river and the Jaxartes. In 1216 Bokhara was again subdued by Mahommed Shah Khwarizm, but his conquest was wrested from him by Jenghiz Khan in 1220. The country was wasted by the fury of this savage conqueror, but recovered something of its former prosperity under Ogcai Khan, his son, whose disposition was humane and benevolent. His posterity kept possession till 1360, when Timur or Tamerlane bore down everything before him, and enslaved the whole country. After Samarkand, which Timur degenerated for a time its former splendour. Babar, the fifth in descent from Timur, was originally prince of Ferghana, but conquered Samarkand and northern India, where he founded the Mogul (Mughal) empire. His descendants ruled in the country until about 1500, when it was overrun by the Uzbek Tatars, under Abulkhair or Ebubkheir Khan, the founder of the Shaiban dynasty, with which the history of Bokhara properly commences. The most remarkable representative of this Shaiban dynasty was Shah Abbas (1556-1598), who greatly extended the limits of his kingdom by the conquest of Badakhshan, Herat and Meshed, and increased its prosperity by the public works which he authorized. Before the close of the century, however, the dynasty was extinct, and Bokhara was at once desolated by a Kirghiz invasion and distracted by a disputed succession. At length, in 1598, Baki Mehemet Khan, of the Astrakhan branch of the Timur family, mounted the throne, and thus introduced the dynasty of the Ashtrakhanides. The principal event of his reign was the defeat he inflicted on Shah Abbas of Persia in the neighborhood of Bokhara. His brother, Veli Mehemet, who succeeded in 1605, soon alienated all his subjects, and was supplanted by his nephew Imamakuli. After a highly prosperous reign this prince resigned in favour of his brother, Nazr Mehemet, under whom the country was greatly troubled by the rebellion of his sons, who continued to quarrel with each other after their father's death. Meanwhile the district of Khiva, previously subject to Bokhara, was made an independent khaneate by Abdul-Gazi Bahadur Khan; and in the reign of Subbunkuli, who ascended the throne in 1686, the political power of Bokhara was still further lessened, though it continued to enjoy the unbounded respect of the Sunnite Mahomedans. Subbunkuli died in 1702, and a war of succession broke out between his two sons, who were supported by the rivalry of two Uzbek tribes. After five years the contest terminated in favour of Obukh Khan, who was little better than a puppet in the hands of Rehim Bi Atalik, his vizier. The invasion of Nadir Shah of Persia came to complete the degradation of the land; and in 1740 the feeble king, Abu 'l- Faiz, paid homage to the conqueror, and was soon after murdered and supplanted by his vizier. The time of the Ashtrakhanides had been for the most part a time of dissolution and decay; fanaticism and imbecility went hand in hand. On its fall (1785) the throne was seized by the Manghit family in the person of Mir Ma'sum, who pretended to the most extravagant sanctity, and proved by his military career that he had no small amount of ability. He turned his attention to the encroachments of the Afghans, and in 1787 reconquered the greater part of what had been lost to the south of the Oxus. Dying in 1802 he was succeeded by Sald, who in bigotry and fanaticism was a true son of his father. In 1826 Nasullah mounted the throne, and began with the murder of his brother a reign of continued oppression and cruelty. Meanwhile Bokhara became an object of rivalry to Russia and England, and envoys were sent by both nations to cultivate the favour of the emir, while the Russians treated the Riyadh Khan in the English with contempt. Two emissaries of the British government, Colonel Stoddart and Captain A. Conolly, were thrown by Nasullah into prison, where they were put to death in 1842. In 1862-1864 Arminius Vambery made in the disguise of a dervish a memorable journey through this fanatical state. At this time the Russian armies were gradually advancing, and at last they appeared to the north of Khoakond; but the new emir, Mozaffar- eddin, instead of attempting to expiate the insults of his predecessor, sent a letter to General M. G. Chernayev summoning him to evacuate the country, and threatening to raise all the faithful against him. In 1866 the Russians invaded the territory of Bokhara proper, and a decisive battle was fought on the 20th of May at Irdjar on the left bank of the Jaxartes. The Bokharians were defeated; but after a period of reluctant peace they forced the emir to renew the war. In 1868 the Russians entered Samarkand (May 14), and the emir was constrained to submit to the terms of the conqueror, becoming henceforward only a Russian puppet.

R. Geog. Soc. (1870): Hellwald, Die Russen in Central Asien (1875); Linsly, Upper Bokhara, in Russian (1902); Skrine and Ross, The Heart of Asia (1896); Lord Ronaldshay, Outside of Empire in Asia (1904); and Le Strange, The Lands of the Eastern Caliphate (1905).

BOKHARA (Bokhara-i-Sherif), capital of the state of Bokhara, on the left bank of the Zarafshan, and on the irrigation canal of Shahi-rud, situated in a fertile plain. It is 8 m. from the Bokhara station of the Transcaspian railway, 126 m. by rail W. of Samarkand, in 39° 47' N. lat. and 64° 35' long. The city is surrounded by a stone wall 28 ft. high and 8 m. long, with semicircular towers and eleven gates of little value as a defence. The present city was begun in A.D. 830 on the site of an older city, was destroyed by Jenghiz Khan in 1220, and rebuilt subsequently. The water-supply is very unhealthy. The city has no less than 360 mosques. Nearly 10,000 pupils are said to receive their education in its 140 madrasas or theological colleges; primary schools are kept at most mosques. Some of these buildings exhibit very fine architecture. The most notable of the mosques is the Mir-Arab, built in the 16th century, with its beautiful lecture halls; the chief mosque of the emir is the Mejid-kalyan, or Kok-humbe, close by which stands a brick minaret, 203 ft. high, from the top of which state criminals used to be thrown until 1871. Of the numerous squares the Raghistan
is the principal. It has on one side the citadel, erected on an artificially made eminence 45 ft. high, surrounded by a wall 1 m. long, and containing the palace of the emir, the houses of the chief functionaries, the prison and the water-cisterns. The houses are mostly one-storied, built of unburnt bricks, and have flat roofs.

Bokhara has for ages been a centre of learning and religious life. The mysticism which took hold on Persia in the middle ages spread also to Bokhara, and later, when the Mongol invasions of the 13th century laid waste Samarkand and other Moslem cities, Bokhara, remaining independent, continued to be a chief seat of Islamic learning. The madrasa libraries, some of which were very rich, have been scattered and lost, or confiscated by the emirs, or have perished in conflagrations. But there are still treasures of literature concealed in private libraries, and Afghan, Persian, Armenian and Turkish bibliophiles still repair to Bokhara to buy rare books. Bokhara is, in fact, the principal book-market of central Asia. The population is supposed by Russian travellers not to exceed 50,000 or 60,000, but is otherwise estimated at 75,000 to 100,000. Amongst them is a large mixed race of colonists of Jewish and Bokhara origin, the most important trading town in central Asia. In the city bazaars are made or sold silk stuffs, metal (especially copper) wares, Kara-kul (i.e. astrakhan) lamb-skins and carpets.

New Bokhara, or Kagan, a Russian town near the railway station, 8 m. from Bokhara itself, is rapidly growing, on a territory ceded by the emir. Pop. 2000. (P. A. K.)

BOKBURG, a town of the Transvaal, 14 m. E. of Johannesburg by rail. Pop. of the municipality (1904) 14, 757, of whom 4175 were whites. It is the headquarters of the Witwatersrand coal mining industry. The collieries extend from Boksburg eastward to Springs, 11 m. distant. Brakpan, the largest colliery in South Africa, lies midway between the places named.

BOLAN PASS, an important pass on the Baluch frontier, connecting Jacobabad and Sibi with Quetta, which has always occupied an important place in the history of British campaigns in Afghanistan. Since the treaty of Gandamak, which was signed at the close of the first phase of the Afghan War in 1879, the Bolan route has been brought directly under British control, and it was selected for the first alignment of the Sind-Pishan railway from the plains of Bokhara to a junction with the Bolan at Mach. An alternative route from Sibi to Quetta was found in the Haruai valley to the N.E. of Sibi, the line starting in exactly the opposite direction to that of the Bolan and entering the hills at Nari. The Haruai route, although longer, is the one adopted for all ordinary traffic, the Bolan loop being reserved for emergencies. At the Khudilani gorge of the Bolan route conglomerate cliffs enclose the valley rising to a height of 800 ft., and at Sibi-Bolan the passage between the limestone rocks hardly admits of three persons riding abreast. The temperature of the pass in summer is very high, whereas in winter, near its head, the cold is extreme, and the ice-cold wind rushing down the narrow outlet becomes destructive to life. Since 1879, when the Quetta agency was founded, the freedom of the pass from plundering bands of Baluch marauders (chiefly Marris) has been secured, and it is now as safe as any pass in Scotland. (T. H. E.)

BOLAS (plural of Span. bola, ball), a South American Indian weapon of war and the chase, consisting of balls of stone attached to the ends of a rope of twisted or braided hide or hemp. Charles Darwin thus describes them in his Voyage of the Beagle: "The bolas, or balls, are of two kinds: the simplest, which is used chiefly for catching ostriches, consists of two round stones, covered with leather, and united by a thin, plaited thong about 8 ft. long. The other kind differs only in having three balls united by thongs to a common centre. The Gaucho (native of Spanish descent) holds the smallest of the three in his hand, and whirls the other two round around his head; then, taking aim, sends them like chain shot revolving through the air. The balls no sooner strike any object, than, winding round it, they cross each other and become firmly hitched." Bolas have been used for centuries in the South American pampas and even the forest regions of the Rio Grande. F. Ratzel (History of Mankind) supposes them to be a form of lasso. The Eskimos use a somewhat similar weapon to kill birds. Bolas perdidas (i.e. lost) are stones attached to a very short thong, or, in some cases, having no thong at all.

BOLEG, a town of northern France, in the department of Seine-Inferieure, on the Bolbec, 19 m. E.N.E. of Havre by rail. Pop. (1900) 10,939. Bolbec is important for its cotton spinning and weaving, and carries on the dyeing and printing of the fabric, and the manufacture of sugar. There is a chamber of commerce and a board of trade-arbitration. The town was enthusiastic in the cause of the Reformed Religion in the 16th century, and still contains many Protestants. It was burned almost to the ground in 1665.

BOLE (Gr. βόλος, "a clood of earth"), a clay-like substance of red, brown or yellow colour, consisting essentially of hydrous aluminium silicate, with more or less iron. Most bole differs from ordinary clay in not being plastic, but in dropping to pieces when placed in water, thus behaving rather like fuller's earth. Bole was formerly in great repute medicinally, the most famous kind being the Lemnian Earth (γη Λημνικα), from the Isle of Lemnos in the Greek Archipelago. The earth was dug with much ceremony only once a year, and having been mixed with goats' blood was made into little cakes or balls, which were stamped by the priests, whom they became known as Terra sigillata ("sealed earth"). Large quantities of bole occur as red partings between the successive lava flows of the Tertiary volcanic series in the north of Ireland and the west of Scotland. Here it seems to have resulted from the decomposition of the basalt and kindred rocks by meteoric agencies, during periods of volcanic repose. In Antrim the bole is associated with lithomargite, bauxite and pisolithic iron-ore. Bole occurs in like manner between the great sheets of the Deccan traps in India; and a similar substance is also found interbedded with some of the dolerite lavas of Etna.

In the sense of stem or trunk of a tree, "bole" is from the O. Norwegian bolr, cf. Ger. Bohle, plank. It is probably connected with the large number of words, such as "boll," "ball," "bowl," &c., which stand for a round object.

BOLESLAUS I., called "The Great," king of Poland (d. 1023), was the son of Mieszko, first Christian prince of Poland, and the Bohemian princess Dobrawa, or Bona, whose chaplain, Jordan, converted the court from paganism to Catholicism. He succeeded his father in 997. A born warrior, he speedily raised the little struggling Polish principality on the Vistula to the rank of a great power. In 996 he gained a seaborne by seizing Pommerania, and subsequently took advantage of the troubles in Bohemia to occupy Cracow, previously a Czech city. Like his contemporaries, Stephen of Hungary and Canute of Denmark, Boleslaus recognized from the first the essential superiority of Christianity over every other form of religion, and he deserves with them the name of "Great" because he deliberately associated himself with the new faith. Thus despite an inordinate love of adventure, which makes him appear rather a wandering chieftain than an established ruler, he was essentially a man of insight and progress. He showed great sagacity in receiving the fugitive Adalbert, bishop of Prague, and when the saint suffered martyrdom at the hands of the pagan Slavs (April 23, 997), Boleslaus purchased his relics and solemnly laid them in the church of Gnesen, founded by his father, which now became the metropolitan see of Poland. It was at Gnesen that Boleslaus in the year 1000 entertained Otto III. so magnificently that the emperor, declaring such a man worthy to be merely princes, conferred upon him the royal crown, though twenty-five years later, in the last years of his life, he received the crown only a second time. On the death of Otto, Boleslaus invaded Germany, penetrated to the Elbe, occupying Stralsund and
Meissen on his way, and extended his dominions to the Elster and the Saale. He also occupied Bohemia, till driven out by the emperor Henry IV. in 1054. The German war was terminated in 1058 by the peace of Bautzen, greatly to the advantage of Boleslaus, who retained Lusatia. He then turned his arms against Jaroslav, grand duke of Kiev, whom he defeated and beheaded in the battle of the Bug, thus reducing both Lusatia and Russia and Poland. Nevertheless, Boleslaus remained at Kiev, whence he addressed triumphant letters to the emperors of the East and West. At his death in 1025 he left Poland one of the mightiest states of Europe, extending from the Bug to the Elbe, and from the Baltic to the Danube, and possessing besides the overlordship of Russia. But his greatest achievement was the establishment in Poland of a native church, the first step towards political independence.

See J. N. Pawlowski, St Adalbert (Danzig, 1860); Chronica Neuritii (Vienna, 1860); Heinrich R. von Zeitelsberg, Die Kriege Kaiser Heinrichs II. mit Herzog Boleslaw I. (Vienna, 1868).

BOLESLAUS II., called "The Bold," king of Poland (1030–1081), eldest son of Casimir I, succeeded his father in 1058. The domestic order and tranquillity of the kingdom had been restored by his painingstaker father, but Poland had shrunk territorially since the age of his grandfather, Boleslaus I, and it was the task of Boleslaus II. to assert her dignity and importance. The nearest enemy was Bohemia, to whom Poland had lately been compelled to pay tribute for her oldest possession, Silesia. But Boleslaus's first Bohemian war proved unsuccessful, and was terminated by the marriage of his sister Swatawa with the Czech king Wratyslaus II. On the other hand Boleslaus's ally, the fugitive Magyar prince Bela, succeeded with Polish assistance in winning the crown of Hungary. In the East Boleslaus was more successful. In 1069 he succeeded in placing Izaakas on the throne of Kiev, thereby confirming Poland's overlordship over Russia and enabling Boleslaus to chastise his other enemies, Bohemia among them, with the co-operation of his Russian auxiliaries. But Wratyslaus of Bohemia speedily appealed to the emperor for help, and a war between Poland and the Empire was only prevented by the sudden rupture of Henry IV. with the Holy See and the momentous events which led to the humiliating surrender of the emperor at Canossa. There is nothing to show that Boleslaus took any part in this struggle, though at this time he was on the best of terms with Gregory VII. and there was some talk of sending papal legates to restore order in the Polish Church. On the 26th of December 1076 Boleslaus encircled his own brows with the royal diadem, a striking proof that the Polish kings did not even yet consider their title quite secure. A second successful expedition to Kiev to reinstate his protegé Izaakas, is Boleslaus's last recorded exploit. Almost immediately afterwards (1079) we find him an exile in Hungary, where he died about 1081. The cause of this sudden eclipse was the cruel vengeance he took on the milites, or noble order, who, emulating the example of their brethren in Bohemia, were already attempting to curb the royal power. The churchmen headed by Stanislaus Szczepanowski, bishop of Cracow, took the side of the nobles, whose grievances seem to have been real. Boleslaus in his fury slew the saintly bishop, but so general was the popular indignation that he had to fly his kingdom.

See M. Makeyimian Gumplowicz, Zur Geschichte Polens im Mittelalter (Innsbruck, 1895).

BOLESLAUS III., king of Poland (1086–1139), the son of Wladislaus I. and Judith of Bohemia, was born on the second of December 1077, and was crowned king at Gniezno. His earlier years were troubled continually by the intrigues of his natural half-brother Zbigniew, who till he was imprisoned and blinded involved Boleslaus in frequent contests with Bohemia and the emperor Henry V. The first of the German war began in 1100, when Henry, materially assisted by the Bohemians, invaded Silesia. It was mainly a war of sieges, Henry sitting down before Lubusz, Glogau and Breslau, all of which he failed to take. The Poles avoided an encounter in the open field, but harried the Germans so successfully around Breslau that the plain was covered with corpses, which Henry had to leave to the dogs on his disastrous retreat; hence the scene of the action was known as "the field of dogs." The chief political result of this disaster was the complete independence of Poland for the next quarter of a century. It was during this respite that Boleslaus noted the main burden of his life—the subjugation of Pomerania (i.e. the maritime province) with the view of gaining access to the sea. Pomerania, protected on the south by virgin forests and almost impenetrable morasses, was in those days inhabited by a valiant and savage Slavonic race akin to the Wends, who clung to paganism with unconquerable obstinacy. The possession of a seaboat enabled them to maintain fleets and build relatively large towns such as Stettin and Kolberg, whilst they ravaged at will the territories of their southern neighbours the Poles. In self-defence Boleslaus was obliged to subdue them. The struggle began in 1109, when Boleslaus inflicted a terrible defeat on the Pomeranians at Nackel which compelled their temporary submission. In 1120–1124 the rebellion of the vassal Prince Warczeslaus of Stettin again brought Boleslaus into the country, but the resistance was as stout as ever, and only after 18,000 of his followers had fallen and 8000 more had been ex-patriated did Warczeslaus submit to his conqueror. The obstinacy of the resistance convinced Boleslaus that Pomerania must be christianized before it could be completely subdued; and this important work was partially accomplished by St Otto, bishop of Bamberg, an old friend of Boleslaus's father, who knew the Slavonic languages. In 1124 the southern portions of the land were converted by St Otto, but it was only under the threat of extermination if they persisted in their evil ways that the people of Stettin accepted the faith in the following year. In 1128, at the council of Usedom, St Otto appointed his disciple Boniface bishop of Julin, the first Pomeranian diocese, and the foundation of a better order of things was laid. In his later years Boleslaus waged an unsuccessful war with Hungary and Bohemia, and was forced to come to the mediation of the emperor Lothair, to whom he did homage for Pomerania and Rügen at the diet of Merseburg in 1135. He died in 1139.

See Gallus, Chronicon, ed. Finkal (Cracow, 1899); Makeyimian Gumplowicz, Zur Geschichte Polens im Mittelalter (Innsbruck, 1895).

BOLEUS, a well-marked genus of fungi (order Polyporaceae), characterized by the central stem, the cap or pileus, the soft, fleshy tissue, and the vertical, closely-packed tubes or pores which cover the under surface of the pileus and are easily detached. They are generally of the order Meruliaceae, and were first described by V/uratyslaus I. in the early autumn. They are brown, red or yellow in colour; the pores also vary in colour from pure white to brown, red, yellow or green, and are from one or two lines to nearly an inch long. A few are poisonous; several are good for eating. One of the greatest favourites for the table is Boletus edulis, recognized by its brown cap and white pores which become green when old. It is the cepes of the continental European markets. There are forty-nine British species of Boletus.

BOLEYN (or BULLEN), ANNE (c. 1507–1536), queen of Henry VIII., was the eldest daughter of Sir Thomas Boleyn, afterwards earl of Wiltshire and Ormonde, and of Elizabeth, daughter of Thomas Howard, earl of Surrey, afterwards duke of Norfolk, was born, according to Camden, in 1507, but her birth has been ascribed, though not conclusively, to an earlier date (to 1502 or 1501) by some later writers. In 1544 she accompanied Mary Tudor to France on the marriage of the princess to Louis XII., remained there after the king's death, and became one of the women in waiting to Queen Claude, wife of Francis I. She returned in 1521 or 1522 to England, where she had many admirers, both courtiers and suitors. Among the former was the poet Sir Thomas Wyatt, and among the latter, Henry Percy, heir of the earl of Northumberland, a marriage with whom, however, was stopped by the king and another match provided for her in the

2 According to the Chronicle of King Henry VIII., tr. by M. A. S. Hume, p. 68, she was his mistress.
person of Sir James Butler. Anne Boleyn, however, remained unmarried, and a series of grants and favours bestowed by Henry on her father between 1522 and 1525 have been taken, though very doubtfully, as a symptom of the king's affections. Unlike her sister Mary, who had fallen a victim to Henry's solicitations,\(^1\) Anne had no intention of being the king's mistress; she meant to be his queen, and her conduct seems to have been governed entirely by motives of ambition. The exact period of the beginning of Anne's relations with Henry is not known. They have been surmised as originating as early as 1523; but there is nothing to prove that Henry's passion was anterior to the proceedings taken for the divorce in May 1527, the celebrated love letters being undated. Her name is first openly connected with the king's as a possible wife in the event of Catherine's divorce, in a letter of Mendoza, the imperial ambassador, to Charles V. of the 16th of August 1527,\(^5\) during the absence in France of Wolsey, who, not blinded by passion like Henry, naturally opposed the undesirable alliance, and was negotiating a marriage with Renée, daughter of Louis XII. Henry meanwhile, however, had sent William Knight, his secretary, on a separate mission to Rome to obtain facilities for his marriage with Anne; and on the cardinal's return in August he found her installed as the king's companion and proposed successor to Catherine of Aragon. After the king's final separation from his wife in July 1531, Anne's position was still more marked, and in 1532 she accompanied Henry on the visit to Francis I, while Catherine was left at home neglected and practically a prisoner. Soon after their return Anne was found to be pregnant, and in consequence Henry married her about the 25th of January 1533\(^6\) (the exact date is unknown), their union not being made public till the following Easter. Subsequently, on the 23rd of May, their marriage was declared valid and that with Catherine null, and in June Anne was crowned with great state in Westminster Abbey. Anne Boleyn had now reached the zenith of her hopes. A weak, giddy woman of no stability of character, her success turned her head and caused her to behave with insolence and impropriety, in strong contrast with Catherine's quiet dignity under her misfortunes. She, and not the king, probably was the author of the petty persecutions inflicted upon Catherine and upon the princess Mary, and her jealousy of the latter showed itself in spiteful malice. Mary was to be forced into the position of a humble attendant upon Anne's infant, and her ears were to be boxed if she proved recalcitrant. She urged that both should be brought to trial under the new statute of succession passed in 1534, which declared her own children the lawful heirs to the throne. She was reported as saying that when the king gave opportunity by leaving England, she would put Mary to death even if she were burnt or flayed alive for it.\(^8\) She incurred the remonstrances of the privy council and alienated her own friends and relations. Her uncle, the duke of Norfolk, whom she was reported to have treated “worse than a dog,” reviled her, calling her a “grande putain.” But her day of triumph was destined to be even shorter than that of her predecessor. There were soon signs that Henry's affection, which had before been a genuine passion, had cooled or ceased. He resented her arrogance, and a few months after the marriage he gave her cause for jealousy, and at length a change of heart and a change of plans for Anne the same domestic griefs that had vexed and ruined Catherine and caused her abandonment. In September 1533 the birth of a daughter, afterwards Queen Elizabeth, instead of the long-hoped-for son, was a heavy disappointment; next year there was a miscarriage, and on the 29th of January 1536, the day of Catherine's funeral, she gave birth to a dead male child.

On the 1st of May following the king suddenly broke up a tournament at Greenwich, leaving the company in bewilderment and consternation. The cause was soon known. Inquiries had been made on reports of the queen's ill-conduct, and several of her reputed lovers had been arrested. On the 9th Anne herself was committed to the Tower on a charge of adultery with various persons, including her own brother, Lord Rochford. On the 12th Sir Francis Weston, Henry Norris, William Brereton and Mark Smeaton were declared guilty of high treason, while Anne herself and Lord Rochford were condemned unanimously by an assembly of twenty-six peers on the 15th. Her uncle, the duke of Norfolk, presided as lord steward, and gave sentence, weeping, that his niece was to be burned or beheaded as pleased the king. Her former lover, the earl of Northumberland, left the court seized with sudden illness. Her father, who was excused attendance, had, however, been present at the trial of the other offenders, and had there declared his conviction of his daughter's guilt. On the 16th, hoping probably to save herself by these means, she informed Cranmer of a certain supposed impediment to her marriage with the king—according to some accounts a previous marriage with Northumberland, though the latter solemnly and positively denied it—which was never disclosed, but which, having been considered by the archbishop and a committee of ecclesiastical lawyers, was pronounced, on the 17th, sufficient to invalidate her marriage. The same day all her reputed lovers were executed; and on the 19th she suffered death on Tower Green, her head being struck off with a sword by the executioner of Calais brought to England for the purpose.\(^6\) She had regarded the prospect of death with courage and almost with levity, laughing heartily as she put her hands about her “little neck” and recalled the skill of the executioner. “I have seen many men” (wrote Sir William Kingston, governor of the Tower) “and also women executed, and all they have been in great sorrow, and to my knowledge this lady has much joy and pleasure in death.” On the following day Henry was betrothed to Jane Seymour.

Amidst the vituperations of the adherents of the papacy and the later Elizabethan eulogies, and in the absence of the records on which her sentence was pronounced, Anne Boleyn's guilt remains unproved. To Sir William Kingston she protested her entire innocence, and on the scaffold while expressing her submission she made no confession.\(^5\) Smeaton alone of her supposed lovers made a full confession, and it is possible that his statement was drawn from him by threats of torture or hopes of pardon. Norris, according to one account,\(^7\) also confessed, but subsequently declared that he had been betrayed into making his statement. The others were all said to have “confessed in a manner” on the scaffold, but much weight cannot be placed on these general confessions, which were, according to the custom of the time, a declaration of submission to the king's will and of general repentance rather than acknowledgment of the special crime. “I pray God save the king,” Anne herself is reported to have said on the scaffold, “and send him long to reign over you, for a sinner nor a more merciful prince was there never; and to me he was ever a good, a gentle and sovereign lord.” A principal witness for the charge of incest was Rochester's own wife, a woman of infamour character, afterwards executed for complicity in the intrigues of Catherine Howard. The discovery of Anne's misdeeds coincided in an extraordinary manner with Henry's disappointment in not obtaining by her a male heir, while the king's despotic power and the universal unpopularity of Anne both tended to hinder the administration of pure justice. Nevertheless, though unproved, Anne's guilt is more than probable. It is almost incredible that two grand

1. Of this there is no direct proof, but the statement rests upon contemporary belief and chiefly upon the extraordinary terms of the dispensation granted to Henry to marry Anne Boleyn, which included dispensations from canons relating to impotency by “affinity rising ex illicito coitu in any degree even in the first.” Froude rejects the whole story. Discourse of Catherine of Aragon, p. 54; and see Froden, Poems of Anne Boleyn, 322.

3. According to Cranmer, Letters and Papers of Henry VIII. vi. p. 300, the only authority; and Cranmer himself only knew of it a few years before Anne's marriage was commonly ascribed to the 14th of November 1532.

6. According to the most trustworthy accounts, but see Letters and Papers of Henry VIII. x. p. 386, for a story that a known letter to Henry VIII. attributed to her is now recognized as an Elizabethan forgery.

7. Archaeologia, xxixi. 64.
juries, a petty jury, and a tribunal consisting of nearly all the lay peers of England, with the evidence before them which we do not now possess, should have all unanimously passed a sentence of guilt. I think the law and justice are so perfect, and such a sentence should have been supported by Anne's own father and uncle. Every year since her marriage Anne had given birth to a child, and Henry had no reason to despair of more; while, if Henry's state of health was such as was reported, the desire for children, which Anne shared with him, may be urged as an argument for her guilt. Sir Francis Weston in a letter to his family almost acknowledges his guilt in praying for pardon, especially for offences against his wife; Anne's own conduct and character also prepare us to some extent for her fate. But of her guilt, however, her face caused no regrets and her misfortunes did not raise a single champion or defender. The sordid incidents of her rise, and the insolence with which she used her triumph, had alienated all hearts from the unhappy woman. Among the people she had always been intensely disliked; the love of justice, and the fear of trade losses imminent upon a breach with Charles V., combined to render her unpopular. She appealed to the king's less refined instincts, and Henry's deterioration of character may be dated from his connexion with her. Sept. 26, 1524, "not only tricked, but traversed, in the world; she is of a middling stature, swarthy complexion, long neck, wide mouth, bosom not much raised, and in fact, but the English king's great appetite, and her eyes which are black and beautiful, and take great effect."

1 Cramer admired her--" sitting in her hair " (i.e. with her hair falling over her shoulders, which seems to have been her custom on great occasions), " upon a horse litter, richly apparelled," at her coronation.3

BOLGARI, or BOLGARY, a ruined town of Russia, in the government of Kazan, 4 m. from the left bank of the Volga, in 55° N. lat. It is generally considered to have been the capital of the Bulgarians when they were established in that part of Europe (5th to 15th century). Ruins of the old walls and towers still survive, as well as numerous kurgans or burial-mounds, with inscriptions, some in Arabic (1222-1341), others in Armenian (878 and 886), and yet others in Turkish. Upon being opened these tombs were found to contain weapons, implements, utensils, and silver and copper coins, bearing inscriptions.

1 Letters and Papets, x. 358.

BOLINGBROKE, HENRY ST JOHN, VISOUNT (1678-1751), English statesman and writer, son of Sir Henry St John, Bart. (afterwards 1st Viscount St John, a member of a younger branch of the family of the earls of Bolingbroke and barons St John of Bletso), and of Lady Mary Rich, daughter of the 2nd earl of Warwick, was baptized on the 10th of October 1678, and was educated at Eton. He travelled abroad during 1698 and 1699 and acquired an exceptional knowledge of French. The dissipation and extravagance of his youth exceeded all limits and surprised his contemporaries. He spent weeks in riotous orgies and outdrank the most experienced drunkards. An informant of Goolsdine saw him once "run naked through the park in a state of intoxication." Throughout his career he desired, says he, his intimate friend, to be thought the Alcibiades or Petrenius of his age, and to mix licentious orgies with the highest political responsibilities.4 In 1700 he married Frances, daughter of Sir Henry Winchcombe, Bart., of Buckingham, Berkshire, but matrimony while improving his fortune did not redeem his morals.

He was returned to parliament in 1701 for the family borough of Wootton Bassett in Wiltshire. He declared himself a Tory, attached himself to Harley (afterwards Lord Oxford), then speaker, whom he now addressed as "dear master," and distin-
guished himself by his eloquence in debate, eclipsing his school-

Brothers’ Club, a society of Tory politicians and men of letters, and the same year witnessed the failure of the two expeditions to the West Indies and to Canada promoted by him. In 1712 he was the author of the bill taxing newspapers. But the great business of the new government was the making of the peace with France. The refusal of the Whigs to grant terms in 1706, and again in 1709 when Louis XIV. offered to yield every point for which the allies professed to be fighting, showed that the war was not being continued for English national interests, and the ministry were supported by the queen, the parliament and the people in their design to terminate hostilities. But various obstacles arose from the diversity of aims among the allies; and St John was induced, contrary to the most solemn obligations, to enter into separate and secret negotiations with France for the security of English interests. In May 1712 St John ordered the duke of Ormonde, who had succeeded Marlborough in the command, to refrain from any further engagement. These instructions were communicated to the French, though not to the allies, Louis putting Dunkirk as security into possession of England, and the shameful spectacle was witnessed of the desertion by the English troops of their allies almost on the battlefield. Subsequently St John received the congratulations of the French minister, Tory, on the occasion of the French victory over Prince Eugene at Denain.

In August St John, who had on the 7th of July been created Viscount Bolingbroke and Baron St John of Lydiard Tregoze, went to France to conduct negotiations, and signed an armistice between England and France for four months on the 19th. Finally the treaty of Utrecht was signed on the 11th of March 1713 by all the allies except the emperor. The first production of Addison’s Cato was made by the Whigs the occasion of a great demonstration of indignation against the peace, and by Bolingbroke for presenting the actor Booth with a purse of fifty guineas for “defending the cause of liberty against a perpetual dictator” (Marlborough). In the terms granted to England there was perhaps little to criticize. But the manner of the peace-making, which had been carried on by a series of underhand conspiracies with the enemy instead of by open conferences with the allies, and was characterized throughout by a violation of the most solemn international assurances, left a deep and lasting stain upon the national honour and credit; and not less dishonourable was the abandonment of the Catalans by the treaty. For all this Bolingbroke must be held primarily responsible. In June his commercial treaty with France, establishing free trade with that country, was rejected. Meanwhile the friendship between Bolingbroke and Harley, which formed the basis of the whole Tory administration, had been gradually dissolved. In March 1711, by Guiscard’s attempt on his life, Harley got the wound which had been intended for St John, with all the credit. In May Harley obtained the earldom of Oxford and was made lord treasurer, while in July St John was greatly disappointed at receiving only his viscountcy instead of the earldom lately extinct in his family, and at being passed over for the Garter. In September 1713 Swift came to London, and made a last but vain attempt to reconcile his two friends. But now a further cause of difference had arisen. The queen’s health was visibly breaking, and the Tory ministers could only look forward to their own downfall on the accession of the elector of Hanover. Both Oxford and Bolingbroke had maintained for some time secret communications with James, and promised their help in restoring him at the queen’s death. The aims of the former, prudent, prudocating and vacillating by nature, never extended to the overthrow of the Whigs; and it is difficult to imagine that Bolingbroke could have really advocated the Pretender’s recall, whose divine right he repudiated and whose religion and principles he despised. Nevertheless, whatever his chief motive may have been, whether to dispose Oxford as leader of the party, to strengthen his position and that of the faction in order to dictate terms to the future king, or to reinstate James, Bolingbroke, yielding to his more impetuous and adventurous disposition, went much further than Oxford. It is possible to suppose a connexion between his zeal for making peace with France and a desire to forward the Pretender’s interests or win support from the Jacobites. During his diplomatic mission to France he had incurred blame for remaining at the opera while the Pretender was present, and according to the Mackintosh transcripts he had several secret interviews with him. Regular communications were kept up subsequently. In March 1714 Hervière, the French envoy in London, sent to Tory, the French foreign minister in Paris, the substance of two long conversations with Bolingbroke in which the latter advised patience till after the accession of George, when a great reaction was to be expected in favour of the Pretender. At the same time he spoke of the treachery of Marlborough and Berwick, and of one other, presumably Oxford, whom he refused to name, all of whom were in communication with Hanover. Both Oxford and Bolingbroke warned James that he could have little chance of success unless he changed his religion, but the latter’s refusal (March 13) does not appear to have stopped the communications. Bolingbroke gradually superseded Oxford in the leadership. Lady Masham, the queen’s favourite, quarrelled with Oxford and identified herself with Bolingbroke’s interests. The harsh treatment of the Hanoverian demands was ill borne by him, and won favour with the queen, while Oxford’s influence declined; and by his support of the Schism Bill in May 1714, a violent Tory measure forbidding all education by dissenters by making an episcopal licence obligatory for schoolmasters, he probably intended to compel Oxford to give up the game. Finally, a charge of corruption brought by Oxford in July against Bolingbroke and Lady Masham, in connexion with the commercial treaty with Spain, failed, and the lord treasurer was dismissed or retired on the 27th of July.

Bolingbroke was now supreme, and everything appeared tending inevitably to a Jacobite restoration. The Jacobite Sir William Windham had been made chancellor of the exchequer, important military posts were placed in the hands of the faction, and a new ministry of Jacobites was projected. But now the queen’s sudden death on the 1st of August, and the appointment of Shrewsbury to the lord treasurership, instantly changed the whole scene and ruined Bolingbroke. “The earl of Oxford was removed on Tuesday,” he wrote to Swift on the 3rd of August, “the queen died on Sunday! What a world is this and how does fortune banter us!” According to Hervière, the French envoy, Bolingbroke declared to him that in six weeks he could have secured everything. Nevertheless the exact nature of his projects remains obscure. It is probable that his statement in his letter to Windham that “none of us had any very settled resolution” is true, though his declaration in the Patriotic King that “there were no designs on foot… to place the crown on the head of the Pretender” is a palpable falsehood. His great object was doubtless to gain supreme power and to keep it by any means, and by any betrayal that the circumstances demanded; and it is not without significance perhaps that on the very day of Oxford’s dismissal he gave a dinner to the Whig leaders, and on the day preceding the queen’s death ordered ortures to be made to the elector.

On the accession of George I. the illuminations and bonfire at Lord Bolingbroke’s house in Golden Square were “particularly fine and remarkable,” but he was immediately dismissed from office. He retired to Bucklebury and is said to have now written the answer to the Secret History of the White Staff accusing him of Jacobitism. In March 1715 he in vain attempted to defend the late ministry in the new parliament, and on the composition of his memoir was pronounced to be the authors of the treaty of Utrecht he fled in disguise (March 28, 1715) to Paris, where he was well received, after having addressed a letter to Lord Landsdowne from Dover protesting his innocence.

and challenging, the most inveterate of his enemies to produce any instance of his criminal correspondence. Bolingbroke in July entirely identified himself with the interests of the Pretender. He supported the Craftsmen Bill in 1733, and the Septennial Bill in the following September was he was attainted. But his counsel was neglected for that of ignorant refugees and Irish priests. The expedition of 1715 was resolved upon against his advice. He drew up James's declaration, but the assurances he had inserted concerning the security of the Church of England were cancelled by the priests. He remained at Paris, and endeavoured to establish relations with the regent. On the return of James, as the result of petty intrigues and jealousies, Bolingbroke was dismissed from his office. He now renounced all further efforts on the Pretender's behalf. Replying to Mary of Modena, who had sent him a message deploring his ill-will, he wished his arm might rot off if he ever used pen or sword in their service again.

He now turned to the English government in hopes of pardon. In March 1716 he declared his final abandonment of the Pretender and promised to use his influence to secure the withdrawal of his friends; but he refused to betray any secrets or any individuals. He wrote his Reflections upon Exile, and in 1717 he wrote a letter to Sir W. Windham in explanation of his position, generally considered one of his finest compositions, but not published till after his death. The same year he formed a liaison with Marie Claire Deschamps de Marcellly, widow of the marquis de Villette, whom he married in 1720 after the death in 1718 of Lady Bolingbroke, whom he had treated with cruel neglect. He bought and resided at the estate of La Source near Orleans, studied philosophy, criticized the chronology of the Bible, and was visited amongst others by Voltaire, who expressed unbounded admiration for his learning and politeness. In 1723, through the medium of the king's mistress, the duchess of Kendal, he at last received his pardon, returned to London in June or July, and placed his services at the disposal of Walpole, by whom, however, he offers to procure the accession of several Tories to the administration were received very coldly. During the following winter he made himself useful in France in gaining information for the government. In 1725 an act was passed enabling him to hold real estate but without power of alienating it. But this had been effected in consequence of a peremptory order of the king, against Walpole's wishes, who succeeded in maintaining his exclusion from the House of Lords. He now bought an estate at Dawley, near Uxbridge, where he renewed his intimacy with Pope, Swift and Voltaire, took part in Pope's literary squabbles, and wrote the philosophy for the Essay on Man. On the first occasion which offered itself, that of Putteney's rupture with Walpole in 1726, he endeavoured to organize an opposition in conjunction with the former and Windham; and in 1727 began his celebrated series of letters to the Craftsman, attacking the Walpoles, signed an "Occasional Writer." He gained over the duchess of Kendal with a bribe of £11,000 from his wife's estates, and with Walpole's approval obtained an audience with George. His success was imminent, and it was thought his appointment as chief minister was assured. In Walpole's own words, "as St John had the duchess entirely on his side I need not add what must or might in time have been the consequence," and he prepared for his dismissal. But once more Bolingbroke's "fortune turned rotten at the very moment it grew ripe," and his projects and hopes were crushed by the king's death in June. Further papers from his pen signed "John Trot," appeared in the Craftsman in 1728, and in 1730 followed Remarks on the History of England by Humphrey Oldcastle, attacking the Walpoles' policy. The assault on the government prompted by Bolingbroke was continued in the House of Commons by Windham, and great efforts were made to establish the alliance between the Tories and the Opposition Whigs. The "broad bottom" administration, which in 1732 offered opportunities for further attacks on the government, which Bolingbroke supported by a new series of papers in the Craftsman styled "A Dissertation on Parties"; but the whole movement collapsed after the new elections, which returned Walpole to power in 1735 with a large majority.

Bolingbroke retired baffled and disappointed from the fray to France in June, residing principally at the château of Argeville near Fontainebleau. He now wrote his Letters on the Study of History (printed privately before his death and published in 1749), and the Treatise of Retirement. In 1738 he visited England, became one of the leading friends and advisers of Frederick, prince of Wales, who now headed the opposition, and wrote for the occasion The Patriot King, which together with a previous essay, The Spirit of Patriotism, and The State of Parties at the Accession of George I., were entrusted to Pope and not published. Having failed, however, to obtain any share in politics, he returned to France in 1739, and subsequently sold Dawley. In 1742 and 1743 he again visited England and in 1744, 1745 and 1746 he lived again at Battersea with his friend Hugh Hume, third earl of Marchmont, and was present at Pope's death in May. The discovery that the poet had printed secretly 1500 copies of The Patriot King caused him to publish a correct version in 1749, and stirred up a further altercation with Warburton, who defended his friend against Bolingbroke's bitter aspersions, the latter, whose conduct was generally reprehended, publishing a Familiar Epistle to the Most Impudent Man Living. In 1744 he had been very busy assisting in the negotiations for the establishment of the new "broad bottom" administration, and showed no sympathy for the Jacobite expedition in 1745. He recommended the tutor for Prince George, afterwards George III. About 1749 he wrote the Present State of the Nation, an unfinished pamphlet. Lord Chesterfield records the last words heard from him: "God who placed me here will do what He pleases with me hereafter and He knows best what to do." He died on the 12th of December 1751, his wife having predeceased him in 1750. They were both buried in the parish church at Battersea, where a monument with medallions and inscriptions composed by Bolingbroke was erected to their memory.

The writings and career of Bolingbroke make a far weaker impression upon posterity than they made on contemporaries. His genius and character were superficial; his abilities were exercised upon ephemeral objects, and not inspired by lasting or universal ideas. Bute and George III. indeed derived their political ideas from The Patriot King, but the influence which he is said to have exercised upon Voltaire, Gibbon and Burke is very problematical. Burke wrote his Vindication of Natural Society in imitation of Bolingbroke's style, but in refutation of his principles; and in the Reflections on the French Revolution he exclaims, "Who now reads Bolingbroke, who ever read him through?" Burke denies that Bolingbroke's words left "any permanent impression on his mind." Bolingbroke's conversation, described by Lord Chesterfield as "such a flowing happiness of expression that even his most familiar conversations if taken down in writing would have borne the press without the least correction," his delightful companionship, his wit, good looks, and social qualities which charmed during his lifetime and made firm friendships with men of the most opposite character, can now only be faintly imagined. His most brilliant gift was his eloquence, which according to Swift was acknowledged by men of all factions to be unrivalled. None of his great orations has survived, a loss regretted by Pitt more than that of the missing books of Livy and Tacitus, and no art perishes more completely with its possessor than that of oratory. His political works, in which the expression is often splendidly eloquent, spirited and dignified, are for the most part exceedingly rhetorical in style, while his philosophical essays were undertaken with the chief object of displaying his eloquence, and no characteristic renders
BOLIVAR

writings less readable for posterity. They are both deficient in solidity and in permanent interest. The first deals with mere personal history, or sentiment, and the second, composed as an amusement in retirement without any serious preparation, in their attacks on metaphysics and theology and in their feeble delirium present no originality and carry no conviction. Both kinds reflect in their Voltairian superficiality Bolingbroke's manner of life, which was throughout uninspired by any great ideas or principles and thoroughly false and superficial. Though a libertine and a free-thinker, he had championed the most bigoted and tyrannical high-church measures. His diplomacy had been subordinated to party necessities. He had subscribed his name to a pamphlet containing a libel against an Englishman of interests. He had only conceived the idea of The Patriot King in the person of the worthless Frederick in order to stir up sedition, while his eulogies on retirement and study were pronounced from an enforced exile. He only attacked party government because he was excluded from it, and only railed at corruption because it was the corruption of his antagonists and not his own. His public life presents none of those acts of devotion and self-sacrifice which often redeem a career characterized by errors, follies and even crimes. His writings, though unfortunate and wasted genius, but it is impossible to regret his exclusion from the government of England. He was succeeded in the title as 2nd Viscount Bolingbroke, according to the special remainder, by his nephew Frederick, 3rd Viscount St John (a title granted to Bolingbroke's father in 1716), from whom the title has descended.

BIBLIOGRAPHY.—Bolingbroke's collected works, including his chief publications, with biographical and philosophical excursuses, are Concerning the Nature, Extent and Reality of Human Knowledge, On the Posity and Preservation of Philosophers, Of the Rise and Progress of Monothesism, and Of Authority in Matters of Religion, were first published in Mallet's faculty edition in 1754,—according to Johnson's well-known denunciation, "the blunderbus charged against religion and morality," and subsequently in 1776, 1806 and 1841. A Collection of Letters of the 2nd Viscount Bolingbroke was published in 1797. His Letters were published by G. Parke in 1798, and by Grimaud, Lettres historiques, politiques, philosophiques, &c., in 1808; for others see Pope's and Swift's Correspondence; W. Coxe's Walpole; Phillimore's Life of Lyttelton; Harbach State Papers, vol. ii.; Marchmont Papers, ed. by Sir G. H. Rose (1831); Letters to Lord Chancellor Hardwicke in Add. MSS. Brit. Museum. (see Index, 1894-1899), mostly transcribed by W. Sichel; Hist. MSS. Comm., MSS. of Marcus of Bath, Duke of Portland at Welbeck; while a further collection of his letters relating to the treaty of Utrecht is in the British Museum. For his attempts at verse see Walpole's Royal and Noble Minstrel, p. 209 et seq. See also bibliography of his works in Sichel, ii. 456, 249.

A life of Bolingbroke appeared in his lifetime about 1740, entitled Authentic Memoirs (in the Grenville Library, Brit. Mus.), which refuted the other contemporary accounts. There were accounts published in 1752 and 1754, and a life by Goldsmith in 1770. Of the more modern biographies may be noted that in the Diet. of Nat. Biog, by Sir Leslie Stephen, 1897; by C. de Remusat in L'Angleterre au 18me siecle (1866), vol. 1.; by T. Macknight (1863); by J. Churton Collins (1886); by A. Hassall (1889); and by Walter Sichel (1901-1902), elaborate and brilliant, but unduly eulogistic. (P. C. Y.)

BOLIVAR, SIMON (1783-1830), the hero of South American independence, was born in the city of Caracas, Venezuela, on the 24th of July 1783. His father was Juan Vicente Bolivar y Ponte, and his mother Maria Concepcion Palacios y Sojo, both descended from noble families in Venezuela. Bolivar was sent to Europe to prosecute his studies, and resided at Madrid for several years. Having completed his education, he spent some time in travelling, chiefly in the south of Europe, and visited Paris, where he was an eye-witness of some of the last scenes of the Revolution. Returning to Madrid, he married, in 1801, the daughter of Don N. Toro, uncle of the marquis of Toro in Caracas, and was soon after appointed for Venezuela, and there devoted himself to the improvement of his large estate. But the premature death of his young wife, who fell a victim to yellow fever, drove him again to Europe. Returning home in 1809 he passed through the United States, where, for the first time, he had an opportunity of observing the working of free institutions; and soon after his arrival in Venezuela he appears to have identified himself with the cause of independence which had already agitated the Spanish colonies for some years. Being one of the promoters of the insurrection at Caracas in April 1810, he received a colonel's commission from the revolutionary junta, and was associated with Louis Lopez in a mission to the court of Great Britain. Venezuela declared its independence on the 5th of July 1811, and in the following year the war commenced in earnest by the advance of Montevede with the Spanish troops. Bolivar was entrusted with the command of the important post of Puerto Cabello, but not being supported he had to evacuate the place; and owing to the inaction of Miranda the Spaniards recovered their hold over the country.

Like others of the revolutionists Bolivar took to flight, and succeeded in reaching Curacao in safety. He did not, however, remain long in retirement, but in September 1812, hearing of important movements in New Granada, repaired to Cartagena, where he received a commission to operate against the Spanish troops on the Magdalena river. In this expedition he proved eminently successful, driving the Spaniards from post to post, until arriving at the confines of Venezuela, he boldly determined to enter that province and try conclusions with General Montevede himself. His troops did not number more than 500 men; but, in spite of many discouragements, he forced his way to Merida and Trujillo, towns of some importance in the west of Venezuela, and succeeded in raising the population to his support. Forming his army into two divisions, he committed the charge of one to his colleague Rivas, and pushing on for Caracas the capital, issued his decree of "war to the death." A decisive battle ensued at Lastoguanea, where the Spanish troops under Montevede sustained a crushing defeat. Caracas was entered in triumph on the 4th of August 1813, and Montevede took refuge in Puerto Cabello. General Mariano effected the liberation of the eastern district of Venezuela, and the patriots obtained entire possession of the country in January 1814. This success was, however, of very brief duration. The royalists, effectively roused by the reverses they had sustained, concentrated all their means, and a number of sanguinary encounters ensued. Bolivar was eventually defeated by Boves near Cura, in the plains of La Puerta, and compelled to embark for Cumana with the shattered remains of his forces. Caracas was retaken by the Spaniards in July; and before the end of the year 1814 the royalists were again the undisputed masters of Venezuela. From Cumaná Bolivar repaired to Cartagena, and thence to Tunja, where the revolutionary congress of New Granada was sitting. Here, notwithstanding his misfortunes and the efforts of the royalist enemies, he was received and treated with great consideration. The congress appointed him to conduct an expedition against Santa Fé de Bogota, where Don Cundinamarca had refused to acknowledge the new coalition of the provinces. In December 1814 he appeared before Bogota with a force of 2000 men, and obliged the recalcitrant leaders to capitulate,—a service for which he received the thanks of congress. In the meanwhile Santa Martha had fallen into the hands of the royalists, and Bolivar was ordered to the relief of the place. In this, however, he was not successful, General Morillo having landed an overwhelming Spanish force. Hopeless of the attempt he resigned his commission and embarked for Kingston, Jamaica, in May 1815. While residing there an attempt was made upon his life by a hired assassin, who, in mistake, murdered his secretary.

From Kingston Bolivar went to Aux Cayes in Haiti, where he was furnished with a small force by President Petion. An expedition was organized, and landed on the mainland in May 1816, but proved a failure. Nothing daunted, however, he obtained reinforcements at Aux Cayes, and in December landed at La Place, where, in alliance with Barthelemy, by the falling of the government was formed, and troops were assembled to resist Morillo, who was then advancing at the head of a strong division. The hostile forces encountered each other on the 16th of February 1817, when a desperate conflict ensued, which lasted during that and the following days, and ended in the defeat of the royalists. Morillo retired in disorder, and being met on his retreat by J. A. Paez with his llaneros, suffered an additional and more complete overthrow. Being now recognized as commander-in-chief, Bolivar
proceeded in his career of victory, and before the close of the year had fixed his headquarters at Angostura on the Orinoco. At the opening of the congress which assembled in that city on the 15th February 1819 he submitted an elaborate exposition of his views on government, and concluded by surrendering his authority into the hands of congress. Being, however, required to resume his power, and retain it until the independence of the country had been completely established, he reconvened his troops, and set out from Angostura, in order to cross the Cordilleras, effect a junction with General Santander, who commanded the republican force in New Granada, and bring their united forces into action against the common enemy. This bold and original design was crowned with complete success. In July 1819 he entered Tunja, after a sharp action on the adjoining heights; and on the 7th of August he gained the victory of Boyaca, which gave him immediate possession of Bogota and all New Granada.

His return to Angostura was a sort of national festival. He was hailed as the deliverer and father of his country, and all manner of distinctions and congratulations were heaped upon him. Availing himself of the favourable moment, he obtained the enactment of the fundamental law of the 17th of December 1819, by which the republics of Venezuela and New Granada were henceforth to be united in a single state, under his presidency, by the title of the Republic of Colombia. The seat of government was also transferred provisionally to Rosario de Cucuta, on the frontier of the two provinces, and Bolivar again took the field. Being now at the head of the most numerous and best appointed army the republicans had yet assembled, he gained important advantages over the Spaniards under Morillo, and on the 25th of November 1820 concluded at Truxillo an armistice of six months, probably in the hope that the Spaniards would come to terms, and that the further effusion of blood might be spared. If such were his views, however, they were disappointed. Morillo was recalled, and General Torre assumed the command. The armistice was allowed to expire, and a renewal of the contest became inevitable. Bolivar therefore resolved, if possible, to strike a decisive blow; and this accordingly he did at Carabobo, where, encountering Torre, he so completely routed the Spaniards that the shattered remains of their army were forced to take refuge in Puerto Cabello, where two years after they surrendered to Paez. The battle of Carabobo may be considered as having put an end to the war in Venezuela. On the 26th of June 1821 Bolivar entered Caracas, and by the close of the year the Spaniards were driven from every part of the province except Puerto Cabello. The next step was to secure, by permanent political institutions, the independence which had been so dearly purchased; and, accordingly, on the 30th of August 1821 the constitution of Colombia was adopted with general approbation, Bolivar himself being president, and Santander vice-president.

There was, however, more work for him to do. The Spaniards, though expelled from Colombia, still held possession of the neighbouring provinces of Ecuador and Peru; and Bolivar determined to complete the liberation of the whole country. Placing himself at the head of the army, he marched on Quito in Ecuador. At the meeting with the Spaniards, which took place at Pichincha, Bolivar, in accordance with the design of his colleague Sucre, the Spaniards were routed, and Quito was entered by the republicans in June 1822. Bolivar then marched upon Lima, which the royalists evacuated at his approach; and entering the capital in triumph, he was invested with absolute power as dictator, and authorized to call into action all the resources of the country. Owing, however, to the intrigues of the republican factions in Peru he was forced to withdraw to Truxillo, leaving the capital to the mercy of the Spaniards under Canterac, by whom it was immediately occupied. But this misfortune proved only temporary. By June 1824 the liberating army was completely organized; and taking the field soon after, it routed the vanguard of the enemy. Improving his advantage, Bolivar pressed forward, and on the 6th of August defeated Canterac on the plains of Junin, after which he returned to Lima, leaving Sucre to follow the royalists in their retreat to Upper Peru—an exploit which the latter executed with equal ability and success, gaining a decisive victory at Ayacucho, and thus completing the dispersion of the Spanish force. The possessions of the Spaniards in Peru were now confined to the castles of Callao, which Rodill maintained for upwards of a year, in spite of all the means that could be employed for their reduction. In June 1825 Bolivar visited Upper Peru, which, having detached itself from the government of Buenos Aires, was formed into a separate state, called Bolivia, in honour of the liberator. The first congress of the new republic assembled in August 1825, when Bolivar was declared perpetual protector, and requested to prepare for it a constitution of government.

His care was now directed to the administration of the affairs of the freed provinces. His endeavours to satisfy his countrymen in this respect did not always meet with encouragement, and sometimes exposed him to slander. In December 1824 Bolivar convoked a constituent congress for the February following; but this body, taking into consideration the unsettled state of the country, thought it proper to invest him with dictatorial power for another year. His project of a constitution for Bolivia was presented to the congress of that state on the 25th of May 1826, accompanied with an address, in which he embodied his opinions respecting the form of government which he conceived most expedient for the newly established republics. This code, however, did not give satisfaction. Its most extraordinary feature consisted in the provision for lodging the executive authority in the hands of a president for life, without responsibility and with power to nominate his successor, a proposal which alarmed the friends of liberty, and excited lively apprehensions amongst the republicans of Buenos Aires and Chile; whilst in Peru, Bolivar was accused of a design to unite into one state Colombia, Peru and Bolivia, and to render himself perpetual dictator of the confederacy.

In the meanwhile the affairs of Colombia had taken a turn which demanded the presence of Bolivar in his own country. During his absence Santander had administered the government of the state ably and uprightly, and its independence had been recognized by other countries. But Paez, who commanded in Venezuela, having been accused of arbitrary conduct in the enrolment of the citizens of Caracas in the militia, refused obedience to the summons of the senate, and placed himself in a state of open rebellion against the government, being encouraged by a disaffected party in the northern departments who desired separation from the rest of the republic. Accordingly, having entrusted the government to a council nominated by himself, with Santa Cruz at its head, Bolivar set out from Lima in September 1826, and hastening to Bogota, arrived there on the 14th of November. He immediately assumed the extraordinary powers which by the constitution the president was authorized to exercise in case of rebellion. After a short stay in the capital he pressed forward to stop the effusion of blood in Venezuela, where matters had gone much farther than he could have contemplated. On the 31st of December he reached Puerto Cabello, and the following day he issued a decree offering a general amnesty. He had then a more serious task to perform, soon after, when, having fixed his headquarters, in order to check the northern departments, which had been the principal theatre of the disturbances. In the meanwhile Bolivar and Santander were re-elected to the respective offices of president and vice-president, and by law they should have qualified as such in January 1827. In February, however, Bolivar formally resigned the presidency of the republic, at the same time expressing a determination to refuse the imputations of ambition which had been so freely cast upon him, by retiring into private life, and spending the remainder of his days on his patrimonial estate. Santander contested this proposal, urging him to resume his station as constitutional president, and declaring his own conviction that the troubles and agitations of the country could only be appeased by the authority and personal influence of the liberator himself. This view being confirmed by a resolution of congress, although it was not a unanimous
one, Bolivar decided to resume his functions, and he repaired to Bogota to take the oaths. Before his arrival, however, he issued simultaneously three separate decrees—one granting a general amnesty, another convoking a national convention at Ocaña, and a third for establishing constitutional order throughout Colombia. His arrival was accelerated by the occurrence of events in Peru in the southern department which struck at the very foundation of his power. Not long after his departure from Lima, the Bolivian code had been adopted as the constitution of Peru, and Bolivar had been declared president for life on the 9th of December 1826, the anniversary of the battle of Ayacucho. At this time the Colombian auxiliary army was cantoned in Peru, and the third division, stationed at Lima, consisting of veteran troops under Lara and Sands, became distrustful of Bolivar's designs on the freedom of the republic. Accordingly, in about six weeks after the adoption of Bolivar's new constitution, a counter-revolution in the government of Peru was effected by this body of dissatisfied veterans, and the Peruvians, availing themselves of the opportunity, abjured the Bolivian code, deposed the council appointed by the liberator, and proceeded to organize a provisional government for themselves. After this bloodless revolution the third division embarked at Callao on the 17th of March 1827, and landed in the southern department of Colombia in the following month. Intelligence of these events reached Bolivar while in the north of Colombia, and he lost no time in preparing to march against the refractory troops, who formerly had placed such implicit confidence in him. But he was spared the necessity of coming to blows, for the leaders, finding the government in the hands of the national executive, had peaceably submitted to General Ovando. In the meanwhile Bolivar had accepted the presidency, and resumed the functions belonging to his official position. But although Colombia was, to all external appearance, restored to tranquillity, the nation was divided into two parties. Bolivar had, no doubt, regained the personal confidence of the officers and soldiers of the third division; but the republican party, with Santander at their head, continued to regard with undisguised apprehension his ascendency over the army, suspecting him of a desire to imitate the career of Napoleon. In the meanwhile all parties looked anxiously to the convention of Ocaña, which was to assemble in March 1828, for a decided expression of the national will. The republicans hoped that the issue of its deliberations would be favourable to their views; whilst the military, on the other hand, did not conceal their conviction that a stronger and more permanent form of government was essential to the public welfare. The latter view seems to have prevailed. In virtue of a decree, dated Bogota, the 4th of August 1828, Bolivar assumed the government of Colombia, and continued to exercise it until his death, which took place at San Pedro, near Santa Marta, on the 17th of December 1830.

Bolivar spent nine-tenths of a splendid patrimony in the service of his country; and although he had for a considerable period unlimited control over the revenues of three countries—Colombia, Peru and Bolivia—he died without a shilling of public money in his possession. He achieved the independence of three states, and called forth a new spirit in the southern portion of the New World. He fortified the independence of the Peruvians by he created the arts and sciences; he fostered national interests, and he induced other countries to recognize that independence which was in a great measure the fruit of his own exertions. His remains were removed in 1842 to Caracas, where a monument was erected to his memory; a statue was put up in Bogota in 1846; in 1858 the Peruvians followed the example by erecting an equestrian statue of the liberator in Lima; and in 1884 a statue was erected in Central Park, New York.

Twenty-two volumes of official documents bearing on Bolivar's career were officially published at Caracas in 1826-1833. There are lives by Larrazabal (New York, 1866); Rojas (Madrid, 1883); and Ducoudray-Holstein (Paris, 1851). Two volumes of his correspondence were published in New York in 1886.

**Bolivar**, till 1908 a department of Colombia, bounded N. and W. by the Caribbean Sea, E. by the departments of Magdalena and Santander, S. by Antioquia and S.W. by Cauc. It has an area of 27,028 sq. m., composed in great part of low, alluvial plains, densely wooded, but slightly cultivated and unsuited for north European labour. The population, estimated at 323,097 in 1890, is composed largely of mixed races; in some localities the inhabitants of mixed race are estimated to constitute four-fifths of the population. The capital, Cartagena on the Caribbean coast, was chosen the principal city, and various forest products of Colombia. Other important towns are Barranquilla and Mompox (8000), on the Magdalena river, and Corozal (9000) and Loricá (10,596 in 1902), near the western coast.

**Bolívar**, an inland state of Venezuela, lying S. of the Orinoco and Apure, with the Yuruari territory on the E., the Caroni river forming the boundary, and the Amazonas territory and Brazil on the S. Frequent political changes in Venezuela have led to various modifications in the size and outlines of this state, which comprises large areas of uninhabited territory. It is a country of extensive plains (*llanos*) covered in the rainy season with nutritious grass which disappears completely in the dry season, and of great forests and numerous rivers. Its population was given in 1894 as 135,252, but its area has been largely reduced since then. The capital is Ciudad Bolivar, formerly called Angostura, which is situated on the right bank of the Orinoco about 240 m. above its mouth; pop. 11,686. Vessels of light draught easily ascend the Orinoco to this point, and a considerable trade is carried on, the exports being cacao, sugar, cotton, hides, jungle-guar and various forest products.

**Bolivia**, an inland republic of South America, once a part of the Spanish vice-royalty of Peru and known as the province of Charcas, or Upper Peru. It is the third largest political division of the continent, and extends, approximately, from 6° 44' to 25° 50' S. lat., and from 58° to 70° W. long. It is bounded N. and E. by Brazil, S. by Paraguay and Argentina, and W. by Chile and Peru. Estimates of area vary widely and have been considerably confused by repeated losses of territory in boundary disputes with neighbouring states, and no figures can be given which may not be challenged to some extent by further revisions. Official estimates are 640,526 and 703,613 sq. m., but Supan (Die Bevölkerung der Erde, 1904) places it at 516,156 sq. m.

**Boundaries.**—The boundary line between Bolivia and Brazil has its origin in the limits between the Spanish and Portuguese colonies determined by the treaties of Madrid and San Ildefonso (1750 and 1777), which were modified by the treaties of 1867 and 1903. Beginning at the outlet of Bahia Negra into the Paraguay river, lat. 28° 08' 35" S., the line descends to a point on the west bank of a river 9 to 10 kilometres below Fort Colimbra. The line follows the Verde, Guaporé, Mamoré and Madeira rivers down to the mouth of the Abuna, in about lat. 6° 44' S., as determined by the treaty of 1903. This is a part of the original colonial frontier, which extended down the Madeira to a point midway between the Beni and the Amazon, and then ran due W. to the Javary. The treaty of 1867 changed this starting-point to the mouth of the Beni, in lat. 10° 20' S., and designated a straight line to the source of the Javary as the frontier, which gave to Brazil a large area of territory; but when the southern tributaries of the upper Paraguay became known the Brazilians invaded them and demanded another modification of the boundary line. This was finally settled in 1903 by the treaty of Petropolis, which provided that the line should ascend the Abuna river to lat. 10° 20' S., thence along that parallel W. to the Rapirran river, which is followed to its principal source, thence due W. to the Ituxy river which is followed W. to its source, thence to the
source of Bahia Creek which is followed to the Acre or Aquiri river, thence up the latter to its source, whence if east of the 60th meridian it runs direct to the 11th parallel which will form the boundary line to the Peruvian frontier. This frontier gave about 60,000 sq. m. of territory to Brazil, for which the latter gave an indemnity of £3,000,000 and about 1158 sq. m. of territory on the Matto Grosso frontier. The boundary with Paraguay is unsettled, but an unratified treaty of the 23rd of November 1894 provides that the line shall start from a point on the Paraguay river 3 m. north of Fort Olimpo and run south-west in a straight line to an intersection with the Pilcomayo in long. 63° 28' W., where it unites with the Argentine boundary. The boundary with Chile was greatly modified by the results of the war of 1879–83, as determined by the treaties of 1884, 1886 and 1895. Bolivia losing her department of the littoral on the Pacific and all access to the coast except by the grace of the conqueror. Provisions were made in 1895 for the cession of the port of Mejillones del Norte and a right of way across the province of Tarapaca, but Peru protested, and negotiations followed for the cession of Cobija, in the province of Antofagasta. These negotiations proved fruitless, and in 1904 Bolivia accepted a pecuniary indemnity in lieu of territory. The new boundary line starts from the summit of the Sapaleri (or Zapalegui), where the Argentine, Bolivian and Chilean boundaries converge, and runs west to Licancaur, thence north to the most southern source of Lake Ascotán which it follows to and across this lake in the direction of the Oyahuja volcano, and thence in a straight line to the Tua volcano, on the frontier of the province of Tarapaca. From this point the line follows the summits of the Cordillera Silillica north to the Cerro Paquiza, on the Tacna frontier, and to the Nevado Pomarape, near the frontier of Peru. Thence it continues north to an intersection with the Desaguadero, in about 16° 45' S. lat., follows that river to the Winamaca lagoon and Lake Titicaca, and crosses the latter diagonally to Huaichico on the north shore. From this point the line crosses the Cordillera Real through the valley of the San Juan del Oro to Suches Lake, follows the Cololo and Apolobamba ranges to the headwaters of the Sina river, and thence down that stream to the Inambari. Thence the line either follows the latter to its confluence with the Madre de Dios, or the water-parting between that river and the Tambopata or Pando, to the valley of the Madre de Dios, from which point it runs due north to 13° 40' S. lat., and north-west to the new Brazilian frontier. The N.W. angle on the map represents the Bolivian claim until the settlement of 1909, which gave the territory to Peru.

Physiography.—Roughly calculated, two-fifths of the total area
of Bolivia is comprised within the Andean cordilleras which cross its south-west corner and project east toward the Brazilian highlands in the form of a great obtuse angle. The cordilleras, divided into two great parallel chains, with flanking ranges and spurs to the east, reach their greatest breadth at this point and form the massif of the Andean system. It is made up of a number of parallel ranges enclosing great, elevated plateaus, broken by transverse ranges and deep ravines. North-east of Lake Titicaca there is a confused mass or knot (the Nudo de Apolobamba) of lofty intersecting ridges which include some of the highest peaks in South America. Below this mountainous area the ranges open out and enclose extensive plateaus. The western part, the Cordillera Occidental, a part of the boundary between Bolivia and the northern provinces of Chile, closely follows the coast outline and forms the western rampart of the great Bolivian tableland or alto-plantície, which extends from the Vilcanota knot in Peru, south to the Serrania de Lípez on the Argentine frontier, is 500 m. long, and about 80 m. broad, and contains about 40,000 sq. m. The northern part of this plateau is commonly called the puna; the southern part, the "desert of Lípez," in character and appearance is part of the great Puna de Atacama. This plateau has an average elevation of about 12,650 ft. near Lake Titicaca, but descends about 1000 ft. toward its southern extremity. It is a great lacustrine basin where once existed an inland sea having an outlet to the east through the La Paz gorge. The plateau is bleak and inhospitable in the north, barren and arid toward the south, containing great salar depressions covered with water in the rainy season, and broken by ridges and peaks, the highest being the Cerro de Tahuac, 17,454 ft. Overlooking the plateau from the west are the snowclad peaks of Pomerape (20,505 ft.), Parinacota (20,918 ft.), Sajama (21,047), Huallaltiri (21,654), Lirima (19,128), and the three volcanic peaks, Oyahuas (19,226), San Pedro y Pablo (19,423) and Licancabur (19,683). The eastern rampart of this great plateau is formed by the Cordillera Oriental, which extends northward in Peru under the name of Cuzccaya, and south to the frontier in broken ranges, one of which trends south-east in the vicinity of Suecú. The main part of this great range, known as the Cordillera Real, and one of the most imposing mountain masses of the world, extends from the Peruvian frontier south-east to the 18th parallel and exhibits a series of snow-crowned peaks, notably the triple-crested Illampu or Sorata (21,400 ft.), Illimani (Conway, 21,304), Casaca (20,571) and Chachacomani (21,434). Of the ranges extending south from the Cordillera Real and branching out between the 18th and 19th parallels, the more prominent are the Chichis and Tarija, the eastern rampart of the great central plateau and which is celebrated for its mineral deposits, the Chicas which runs south from the vicinity of Potosí to the Argentine frontier, and the Livichuco which turns south-east and forms the watershed between the Cachimayo and Pilcomayo. The more prominent peaks in and between these ranges are the Asanaque (16,857), Michaga (17,865), Cuzco (17,920), Potosí (15,351), Chiriqui (18,480) and Tulumana (15,584). At the southern extremity of the great plateau is the transverse Serrania de Lípez, the culminating crest of which stands 16,424 ft. above sea-level. The eastern rampart of the Bolivian highlands comprises two distinct chains—the Sierra de Cochabamba on the north-east and the Sierra de Misiones on the east. Between these and the Cordillera Oriental is an apparently confused mass of broken, intersecting ranges, which on closer examination are found to conform more or less closely to the two outside ranges. These have been deeply cut by rivers, especially on the north-east, where the rainfall is heavier. The region enclosed by these ranges is extremely rugged in character, but it is esteemed highly for its fertile valleys and its fine climate, and is called the "Bolivian barrens." Lying wholly within the tropics, these mountain masses form one of the most interesting as well as one of the most imposing and difficult regions of the world. At their feet and in their lower valleys the heat is intense and the vegetation is tropical. Above these are cool, temperate slopes and valleys, and high above these, bleak, wind-swept passes and snowclad peaks. West of the Cordillera Oriental, where special conditions prevail, a great desert plateau stretches entirely across one corner of the republic. Apart from the Andean system there is a group of low, broken, gneiss ranges stretching along the east side of Bolivia among the upper affluents of the Mamoré and Guaporé, which appear to belong to the older Brazilian orographic system, and which present a curious feature of action of water. They are known as the Sierras de Chiquitos, and are geologically interesting because of their proximity to the eastern projection of the Andes. Their culminating point is Cerro Cochí, 3804 ft. above sea-level, but for the most part they are but little more than ranges of low wooded hills, having in general a north-west and south-east direction between the 16th and 17th parallels.

The popular conception of Bolivia is that of an extremely rugged mountainous country, although fully three-fifths of it, including the Chiquitos region, is composed of low alluvial plains, great swamps and flooded bottomlands, and gently undulating forest regions. In the extreme south are the Bolivian Chaco and the llanos (open grassy plains) of Manzo, while above these in eastern Chuquisaca and southern Santa Cruz are extensive swamps and low-lying plains, subject to periodical inundations and of little value for agricultural and pastoral purposes. There are considerable areas in this part of Bolivia, however, which lie above the floods and afford rich grazing lands. The great drawback to this region is deficient drainage; the streams have too sluggish a current to carry off the water in the rainy season. Between the Chiquitos sierra and the Andes are the Llanos de Chiquitos, which have a higher general elevation and a more diversified surface. North of this elevation, which formed the southern shore of the ancient Mojos Lake, are the llanos of Guayos and Mojos, occupying an extensive region traversed by the Guaporé, San Miguel, Guapay, Mamoré, Yacuma, Beni and Madre de Dios rivers and their numerous tributaries. It was once covered by the great Mojos Lake, and still contains large uninhabited areas like that of Lake Rojas, the (or Roguagua). It contains rich agricultural districts and extensive open plains where cattle-raising has been successfully followed since the days of the Jesuit missions in that region. The lower slopes of the Andes, especially toward the north-west, where the country is traversed by the Beni and Madre de Dios, are covered with heavy forests. This is one of the richest districts of Bolivia and is capable of sustaining a large population.

The river-systems of Bolivia fall naturally into three distinct regions—the Amazon, La Plata and Central Plateau. The first includes the rivers flowing directly and indirectly into the Madeira, one of the great tributaries of the Amazon, together with some small tributaries of the Acará and Purus in the north, all of which form a drainage basin covering more than one-half of the republic. The two principal rivers of this system are the Mamoré and Beni, which unite in lat. 10° 20' S. to form the Madeira. The Mamoré, the upper part of which is called the Chimore, rises on the north-east slopes of the Sierra de Cocha-bamba a little south of the 17th parallel, and follows a northerly serpentine course to its confluence with the Beni, the greater part of which course is between the 6th and 6th meridians. The river has a length of about 600 m., fully three-fourths of which, from Chimoré (925 ft. above sea level) to the rapids near its mouth, passes across a level plain and is navigable. The principal Bolivian tributary of the Mamoré, the Guaporé or Grande, which is larger and longer than the former above its confluence and should be considered in the main stream, rises in the Cordillera Oriental east of Lake Pampa Auilaguas, and flows east to the north extremity of the Sierra de Minions, where it emerges upon the Bolivian lowlands. Taking the Guaporé above this line, the river, as it runs south-east, is crossed by the Loja River, which, meeting the Guaporé near the eastern extremity of the Sierra de Cochabamba, skirts the Llanos de Chiquitos, and, turning to the north-west, unites with the Mamoré at Junta de los Ríos in about 15° 20' S. lat. and 64° 40' W. long. It has a tortuous course of about 700 m., which is described as not navigable. The principal tributaries of the Guaporé are the Mizque, Piray or Sará and Yapacani, the last rising on the east slopes of the
Cordillera Real, flowing east by Cochabamba to the sierras of that name where it breaks through with a great bend to the north. The other large Bolivian tributaries of the Mamoré, all rising on the north-east flanks of the Andes, are the Chaparé, Sérave, Mandio, Manco, and the Pucuacu, the last draining a region of lakes and swamps north of the Sierra Chayma. The Bení and its great affluent, the Madre de Dios, though of smaller volume and extent than the Mamoré, are of much greater economic importance, owing to their navigability, the fertility of the region they drain, and the great forests along their banks. North of the Bení, the Abuna flows into the Madeira. Several of its south tributaries belong to Bolivia. The Guaporé, or Iteme, an affluent of the Mamoré, is the third large river of this Bolivian drainage basin, but it rises in Brazil, on the south slopes of the Sierra dos Parecis, where it flows in a great bend to the south and then west of north to the Bolivian frontier in 14° S. lat. From this point to its junction with the Mamoré, a little north of the 12th parallel, it flows in a north-westerly direction and forms the boundary line between the two republics. Its Brazilian tributaries are comparatively unimportant, but from Bolivia it receives the Baures and the San Miguel, both rising in the Sierras de Chiquitos and flowing north-west across the llanos to the Guaporé. The Baures has one large tributary, the Blanco, and the Itomama (San Miguel) has its origin in Lake Concepción, lying among the west ranges of the Chiquitos mountains 952 ft. above sea-level.

The south east drainage basin, which is smaller and economically less important than that of the Madeira, discharges into the Paraguay and extends from the Sierras de Chiquitos south to the Argentine frontier, and from the Cordillera Oriental east to the Paraguay. It possesses only one large river in Bolivia, the Pilcomayo, which rises on the east slopes of the Cordillera Oriental opposite the south end of Lake Pampa Aullagas and flows east and south-east through the region south of the Bolivian Chaco. It flows through a nearly level country with so sluggish a current that its channels are greatly obstructed. Nothing definite is known of its tributaries in the Chaco, but in the sierra region it possesses a number of small tributaries, the largest of which are the Cachimayo, Mataca and Pilaya or Camblaya, the latter formed by the Cotaguita and San Juan. The Bermejo, which is an Argentine river, receives one large tributary from the Bolivian uplands, the Tarija or Rio Grande, which drains a south-eastern part of the Cordillera Oriental. The Bolivian tributaries of the upper Paraguay are small and unimportant. The Otuquis, the most southern of the group, is formed by the San Rafael and Tucabaca, which drain both slopes of the Cerro Chochí range; but is lost in some great marshes 50 m. from the Paraguay. Another considerable stream of this region, which is lost in the great marshy districts of the Bolivian plain, is the Parapití, which rises on the eastern slopes of the Sierra de Misiones and flows north-east through a low plain for about 150 m. until lost.

The third drainage basin is that of the great central plateau, or alta-planicie. This is one of the most elevated lacustrine basins in the world, and though it once drained eastward, now has no surface outlet. Lake Titicaca receives the waters of several short streams from the neighbouring heights and discharges through the Desaguadero, a sluggish river flowing south for 184 m. with a gradually diminishing depth to Lake Pampa Aullaguas or Poopo. The Desaguadero is navigable for small craft, and has two or three small tributaries from the west. Two small streams empty into Lake Pampa Aullaguas, which has a small outlet in the Lacañahuira flowing west for 60 m. to the Cienegas de (salt-swamps of) Colpasa. The drainage of this extensive district seems to be wholly absorbed by the dry soil of the desert and by evaporation. In the extreme south the Rio Grande de Lípez is absorbed in the same way.

Few of the Bolivian lakes are at all well known. The great lacustrine basin between the Bení and the Mamoré contains several lakes and lagoons, two of them of large size. These are Lake Rogagua whose waters find their way into the Bení through Rio Negro, and the Roguagudo lagoon and marshes which cover a large area of territory near the Mamoré. The latter has an elevation little, if any, above the level of the Mamoré, which apparently drains this region, and its area has been estimated in 180 sq. m. Lake, by the map of its immediate vicinity, it is 982 ft. above M.S., when extensive areas of level country are flooded and traffic is possible only by the use of boats. The two principal lakes of the plateau region are Titicaca and Pampa Aullaguas or Poopo. The former lies near the north end of the great Bolivian alta-planicie, 12,644 ft. above sea-level, being one of the most elevated lakes of the world. It is indented with numerous bays and coves; its greatest length is 138 m., and its greatest breadth 60 m. According to a survey made by Dr M. Neveu-Lemaire (La Geographie, ix. p. 490, Paris, 1904), its water surface, excluding the islets, is 80,952 sq. m., and its mean depth is 982 ft. The level of the lake rises about 5 in. in summer; the loss in winter is even greater. The lake belongs to both Bolivia and Peru, and is navigated by steamers running between Bolivia ports and the Peruvian railway port of Puno. The outlet of the lake is through the Desaguadero river. It has several islands, the largest of which bears the same name and contains highly interesting archaeological monuments of a prehistoric civilization usually attributed to the Incas. Lake Pampa Aullaguas or Poopo is about 70 m. south-east of Titicaca, and is fed principally by its outflow. It lies 595 ft. below the level of Titicaca, which gives an average fall for the Desaguadero of very nearly 23 ft. per mile. The Pampa Aullaguas has an estimated area of 136 sq. m., and has one large inhabited island. The lake is shallow and the district about it is sparsely populated. Its outlet is through the Lacañahuira river into the Coipasa swamp, and it is estimated that the outflow is much less than the inflow, showing a considerable loss by evaporation and earth absorption. Having no sea-coast, Bolivia has no seaport except what may be gained in usufruct by the coastal islands of the San Juan de Chimoré, seen from the Desaguadero.

**Geology.**—The eastern ranges of the Bolivian Andes are terraces of Palaeozoic rocks with granitic and other intrusions; the Western Cordillera consists chiefly of Jurassic and Cretaceous beds, together with granite and marble. The great valley of Lake Titicaca, which is drained westwards by the Desaguadero, is from 120 to 180 m. wide. The mountain ranges to the south of the lake are sunk below the level of the sea, and the evening plateau is covered by freshwater and terrestrial deposits through which rise ridges of Palaeozoic rock and of a series of red sandstones and gypseous marls of somewhat uncertain age (probably, in part at least, Cretaceous). The Palaeozoic beds have yielded fossils of Cambrian, Ordovician, Devonian and Carboniferous age. In southern Bolivia Cambrian and Ordovician beds form the greater part of the eastern Andes, but farther north the Devonian and Carboniferous are extensively developed, especially in the north-eastern ranges. The hills, known as the Chiquitos, which rise from the plains of eastern Bolivia, are composed of ancient sedimentary rocks of unknown age. The Palaeozoic beds are directly overlaid by a series of red sandstones and gypseous marls, similar to the foraminifera petroliferà of Argentina and Brazil. At the base there is a conglomerate of tuff and sandstone. The most recent fossils found by Louny Steinmann in the middle of the series are said to indicate an age not earlier than the Jurassic, and Steinmann refers them to the Lower Cretaceous. It is, however, not improbable that the series may represent more than one geological system. No later marine deposits have been found either in the eastern Andes or in the plains of Bolivia, but freshwater beds of Tertiary and later date occupy a wide area. The recent deposits, which cover so large a part of the depressions of the Eastern and the Western Cordillera, appear to be partly of terrigenous, like the talus-fans at the foot of mountain ranges in other dry regions; but Lakes Titicaca and Pampa Aullaguas (Poopo) were long in former times, and now are more extensive than they are to-day. The volcanoes of Bolivia lie almost entirely in the Western Cordillera—the great summits of the eastern range, such as Illimani and Sorata, being composed of Palaeozoic sandstones and granite without any volcanic rocks. The gold, silver, and tin of Bolivia occur chiefly in the Palaeozoic rocks of the eastern ranges. The copper belongs mostly to the red sandstone series.
Climate.—Bolivia lies wholly within the tropical zone, and variations in temperature are therefore due to elevation, mountain barriers, and prevailing winds. The country experiences every gradation of temperature, from that of the tropical lowlands to the Arctic cold of the snow-capped peaks directly above. This vertical arrangement of climatic zones is modified to some extent (less than in Argentina) by varying rainfall conditions, which are governed by the high mountain ranges crossing one corner of the republic, and also by the prevailing winds. The trade winds give to S. Bolivia a wet and dry season similar to that of N. Argentina. Farther north, and east of the Cordilleras Oriental, rainfall amounts to the unexpected 200 cm. The warmest months (November–March) are usually described as very hot and rainy. On the west side of the Cordillera, which extracts the moisture from the prevailing easterly winds, the elevated plateaus have a limited rainfall in the north, which diminishes toward the south until the surface becomes absolutely barren. Brief and furious rain-storms sometimes sweep the northern plateau, but these are not frequent and occur during a short season only. Electrical wind storms are frequent in these high altitudes.

Bolivia has a wide range of temperature between places of the same latitude but differing widely in altitude, thus the staple expressions of the climate are yungas, valle or medio yungas, cabecera de valle, puna and puna brava. The yungas comprises all the lowlands and the mountain valleys up to 3,000 ft. above the sea. The climate is warm and the atmosphere is extremely humid. The mean temperature, according to official estimates, is 70 °F., but this probably represents the average between the higher elevations and the lowlands. However, it is the climate of the valleys from 1,500 to 9,500 ft., has a warm climate with moderate variations in temperature and no cold weather, is sub-tropical in character and productions, and is sometimes described as a region of perpetual summer. The cabecera de valle, as the name indicates, includes the heads of the deep valleys above the valle zone, with elevations ranging from 9500 to 11,000 ft.; its climate is temperate, is divided into regular seasons, and is the scene of the introduction of cereals and vegetables in the habitable. The puna, which lies between 11,000 and 12,500 ft., includes the great central plateau of Bolivia. It has but two seasons, a cold summer or autumn and winter. The air is cold and dry, and the warmer season is too short for the production of anything but potatoes and barley. The mean temperature is officially estimated as 54 °F. The puna brava extends from 12,500 ft. up to the snow line (about 17,500 ft.), and covers a bleak, inhospitable territory, inhabited only by shepherds and miners. Above this is the region of eternal snow, an Arctic zone within the tropics. In general, the sub-tropical (valle) and temperate (cabecera de valle) regions of Bolivia are crossed by a mountain range called puna, which is the scene of the introduction of cereals and vegetables in the habitable. There is a high rate of mortality among the natives, due to unsanitary habits and diet, and to the climate. In the tropical valleys, growth is with abundant vegetation, and bats, lizards and fevers are common. There are localities in the open country and on exposed elevations where healthy conditions prevail, but the greater part of Bolivia is considered unhealthy. The prevailing winds are easterly, bringing moisture across Brazil from the Atlantic. But eastern Bolivia is also exposed to hot, oppressive winds from the north, and to violent cold winds (surazos) from the Argentine plains, which have been known to cause a fall of temperature of 36 °F. within a few hours. According to the Simposio Estadistico y Geografico de la Republica de Bolivia (La Paz, 1903), the average mean temperature and the annual rainfall in eastern Bolivia are as follows: 10 °S. lat., 90° W. and 51.5 in. rainfall; 15° S. lat., 86° W. and 30.7 in. rainfall; 20° S. lat., 81° F. and 30 in. rainfall; and 25° S. lat., 76-8° F. and 29.3 in. rainfall.

Fauna.—The indigenous fauna of Bolivia corresponds closely to that of the neighbouring districts of Argentina, Brazil and Peru. Numerous species of monkeys inhabit the forests of the tropical region, together with the puma, jaguar, wildcat, ocelot, ocelute, tapir or ana, sloth, ant-bear, paca (Coelopomys paca) and capybara. A rare species of bear, the Ursus ornatus (spectacled bear) is found among the wooded Andean foothills. The chinchilla (C. laniger), also found in northern Argentina and Chile, inhabits the colder plateau regions and is prized for its fur. The plateau species of the viscacha (Lagidium cuvieri) and the widely distributed South American otter (Lutra paranensis) are also hunted for their skins. The peccary, which prefers a partially open country, ranges from the Chaco to the densely wooded districts of the south and south east. It is a very common being the large marsh deer of the Chaco; but the deer are not numerous. The armadillo, opossum, ferret and skunk are widely distributed. The amphibians are well represented throughout the lower tropical regions. Alligators are found in the tributaries of the Paraguay and their lagoons, lizards and turtles are numerous, and the batrachians are represented by several species. Snakes are also numerous, including rattlesnakes and the great boa-constrictors of the Amazon region.

The most interesting of all the Bolivian animals, however, are the guanaco (Auchenia haasac) and its congeners, the llama (L. camel), alpaca (L. pacos) and vicuna (L. vicugna), belonging to the Camelidae, with the structure and habits of the African camel, but smaller; having no hump, and inhabiting a mountainous, not a level sandy region. They are able to go without food and drink for long periods, and inhabit the arid and barren plateaus of the Andes and the steppes of Patagonia. The guanaco is supposed to be the original type, is the largest of the four, and has the greatest range from Peru to Tierra del Fuego. The llama and alpaca were domesticated long before the discovery of America, but the guanaco and vicuna are found in a wild state only. The llama is used as a pack animal in Bolivia and Peru, and its coarse wool is used in the making of garments for the natives. The alpaca is highly prized for its fine wool, which is a soft, close and silky, and is known in Bolivia as vicuna, and is the animal is reared with difficulty and the product cannot be largely increased. The vicuna also is celebrated for its wool, which the natives weave into beautiful and costly ponchos (blanket cloaks) and other wearing apparel. The guanaco is hunted for its skin, which, when dressed, makes an attractive rug or robe. The slaughter of the guanaco and vicuna is rapidly diminishing their number. The rearing of llamas and alpacas is a recognized industry in the Bolivian highlands and is wholly in the hands of the Indians, who alone seem to understand the habits and peculiarities of these interesting animals.

Of birds and insects the genera and species are very numerous and interesting. The high sierras are frequented by condors and eagles of the largest size, and the whole country by the common vulture, while the American ostrich (Rhea americana) and a species of large stork (the bata or jabara, Mysteria americana) occurs in the highest mountains. They are frequently found even far up in the mountains. The great number of birds, both parrots, aras, toucans, beautiful of feather but harsh of voice, enliven the forests of the lowlands.

Like other South American states, Bolivia benefited greatly from the introduction of European animals. Horses, cattle, sheep, goats, swine and poultry were introduced, and are now sources of food and wealth to a large part of the population. Mules are used to a large extent as pack animals, but they are imported from Argentina. Silkworms have been bred with success in some departments, and the cochineal insect is found wherever the conditions are favourable for the cactus.

Flora.—Owing to the diversities in altitude the flora of Bolivia represents every climatic zone, from the scanty Arctic vegetation of the lofty Cordilleras to the luxuriant tropical forests of the Amazon basin. Between these extremes the diversity in vegetable life is as great as that of climate and soil. The flora of Bolivia has been studied less than the flora of the neighbouring republics, however, because of the inaccessibility of these inland regions. Among the more important productions, the potato, oca (Oxalis tuberosa), quinoa (Chenopodium quinoa) and some coarse grasses characterize the puna region, while barley, an exotic, is widely grown for fodder. Indian corn was cultivated in the temperate and warm regions long before the advent of Europeans, who introduced wheat, rye, oats, beans, pease and the fruits and vegetables of the Old World, for each of which a favourable soil and climate was easily found. In the sub-tropical and tropical zones the indigenous plants are the sweet potato, cassava (Manihot utilissima and M. aipis), peanuts, pineapple, guava, chirrimoya (Annona corinimal), pawpaw (Carica papaya), ipecacuanha (Cephalis), sarsaparilla, vanilla, false jalap (Mirabilis jalapa), copaiba, tol (Myroxylon toluferum),
rubber-producing trees, dyewoods, cotton and a great number of beautiful hardwoods, such as jacaranda, mahogany, rosewood, ceboutcho, colot, pepper, walnut, &c. Among the fruits many of the most common are exotics, as the orange, lemon, lime, fig, date, grape, &c., while others, as the banana, cajú or cashew (Anacardium occidentale) and aguacate avocado or alligator pear, have a disputed origin. Coca, one of the most important plants of the country, is cultivated on the eastern slopes of the Andes at an altitude of 5000 to 6000 ft., where the temperature is uniform and frosts are unknown. Quina or calisaya is a natural product of the eastern Andes, and is found at an altitude of 9000 ft. above sea-level. The calisaya trees of Bolivia rank among the most valuable bark trees in commerce, and their hides are in great demand for vegetable tanning. From the destructive methods of collecting the bark are steadily diminishing the natural sources of supply, and experiments in cinchona cultivation were undertaken during the last quarter of the 19th century, with fair prospects of success. The most important of the indigenous forest products, however, is rubber, derived principally from the Hevea guayanesis (var. brasiliensis), growing along the river courses in the yungas regions of the north, though moniquobo rubber is also obtained from Manihot Glaziovii on the drier uplands. Among the exotics, sugar-cane, rice and tobacco are cultivated in the warm districts.

Population.—The population of Bolivia is composed of Indians, Caucasians of European origin, and a mixture of the two races, generally described as mestizos. There is also a very small percentage of Africans, descendants of the negro slaves introduced in colonial times. A roughly-taken census of 1900 gives the total population as 1,816,271, including the Litoral department, now belonging to Chile (49,020), and estimates the number of wild Indians of the forest regions at 91,000. Of this total, 97-9% were classed as Indians, 12-8% as whites, 26-5% as mestizos, 0-3% as negroes, and 0-4% as unknown. In 1904 an official estimate made the population 2,181,415, also including the Litoral (59,784), but of course all census returns and estimates in such a country are subject to many allowances. The Indian population (926,880) is largely composed of the so-called civilized tribes of the Andes, which once formed part of the nationality ruled by the Incas, and of those of the Mojos and Chiquitos regions, which were organized into industrial communities by the Jesuits in the 17th century. The former, which are chiefly Aymaras south of the latitude of Lake Titicaca, attained a considerable degree of civilization before the discovery of America and have been in closer contact with Europeans than the other tribes of Bolivia. It is doubtful, however, whether their condition has been improved under these influences. The Mojos and Chiquitos tribes, also, have been less prosperous since the expulsion of the Jesuits, but they have remained together in organized communities, and have followed the industries and preserved the religion taught them as well as circumstances permitted. Both these groups of Indians are peaceful and industrious, and form an important labouring element. They are addicted to the excessive use of chicha (a native beer made from Indian corn), and have little or no ambition to improve their condition, but this may be attributed in part to their profound ignorance and to the state of peonage in which they are held. Inhabiting the southern part of the Bolivian plain are the Chiripotes, a detached tribe of the Guarani race which drifted westward to the vicinity of the Andes long ago. They are of a superior physical and mental type, and have made noteworthy progress toward civilization. They are agriculturists and stock-raisers and have the reputation of being peaceable and industrious. The remaining native tribes under the supervision of the state have made little progress, and their number is said to be decreasing (notwithstanding the favourable climatic conditions under which most of them live) because of unsanitary and intemperate habits, and for other causes not well understood, one being the custom noticed by early travellers among some of the tribes of the La Plata region of avoiding the rearing of children. (See Southey's History of Brazil, ii. pp. 402, 673.) Of the wild Indians very little is known in regard to either numbers or customs.

The white population (313,088) is descended in great part from the early Spanish adventurers who entered the country in search of mineral wealth. To this have been added a small number of Spanish Americans from neighbouring republics and some Portuguese Americans from Brazil. There has been no direct immigration from Europe, though Europeans of various nationalities have found their way into the country and settled there as miners or traders. The percentage of whites therefore does not increase as in Argentina and Brazil, and cannot until means are found to promote European immigration. The mestizos (486,018) are less numerous than the Indians, but outnumber the whites by more than two to one. It has been said of the mestizos elsewhere that they inherit the vices of both races and the virtues of neither. Yet, with a decreasing Indian population, and with a white population wanting in energy, barely able to hold its own and comprising only one-eighth of the total, the future of Bolivia mainly depends on them. As a rule they are ignorant, unprogressive and apathetic; intensely superstitious, cruel and inhuman; though individual strong characters have been produced. It may be that education and experience will develop the mestizos into a vigorous progressive nationality, but the first century of self-government can hardly be said to have given much promise of such a result.

Divisions and Towns.—The republic is divided into eight departments and one territory, and these are subdivided into 54 provinces, 415 cantons, 232 vice-cantons, 18 missions and one colony. The names, areas, and populations of the departments, with their capitals, according to the census of 1900, to which correction must be made on account of the loss of territory to Brazil in 1903, are as follows:

The total area according to Gotha computations, with corrections for loss of territory to Brazil in 1903, is 515,156 sq. m. There are no populous towns other than the provincial capitals above enumerated. Four of these capitals—Sucre or Chuquisaca, La Paz, Cochabamba and Oruro—have served as the national capital, and Sucre was chosen, but after the revolution of 1888 the capital was at La Paz, which is the commercial metropolis and is more accessible than Sucre. Among the smaller towns prominent because of an industry or commercial position, may be mentioned the Huanchaca mining centre of Pulacayo (pop. 6,512), where 3,200 men are employed in the mines and surface works of this great silver mining company; Uyuni (pop. 18,376), the junction of the Pulacayo branch with the Antofagasta and Oruro railway, and also the converging point for several important highways and projected railways; and Tupiza (pop. 16,44), a commercial and mining centre near the Argentine frontier, and the terminus of the Argentine railway extension into Bolivia. All these towns are in the department of Potosí. Viacha (pop. 16,70), a small station on the railway from Guauqui to Alto de La Paz, 14 m. from the latter, is the starting point of an important projected railway to Oruro. In the department of Cochabamba, 1 The figures for population include a 5% addition for omissions, sundry corrections and the estimated number of wild Indians.

1
Tarata (4,981) and Totora (2,403) are two important trading centres, and in the department of Santa Cruz, Ascensión (pop. 4784) is a large mission station in the Chiquitos hills.

**Communications.**—Under a treaty with Brazil in 1903 and with Chile in 1904 (ratified 1905) provisions were made for railway construction in Bolivia to bring this isolated region into more effective communication with the outside world. Brazil agreed to construct a railway around the falls of the Madeira (about 180 m. long) to give north-eastern Bolivia access to the Amazon, and paid down £2,000,000 in cash which Bolivia was to expend on railway construction within her own territory. Chile also agreed to extend her railway from the Pacific port of Arica to La Paz, the Bolivian section becoming the property of Bolivia fifteen years after completion, and to pay the interest (not over 5%) which Bolivia might guarantee on the capital invested in certain interior railways if constructed within thirty years, providing these interest payments should not exceed £100,000 a year, nor exceed £1,600,000 in the aggregate. Argentina had already undertaken to extend her northern railway from Jujuy to the Bolivian frontier town of Tupiaia, and the Peruvian Corporation had constructed for the Bolivian government a short line (54 m. long) from the Titicaca railway to the port of Tiquipaya, which was connected with the city of La Paz, 1403 ft. below, by an electric line 5 m. long. This line gives La Paz access to the Peruvian port of Mollendo, 406 m. distant, and promises in time to give it railway communication with Cusco. Rivalry for the control of her trade, therefore, promises to give Bolivia the railways needed for the development of her resources. Up to 1903 the only railways in Bolivia were the Antofagasta and Oruro line, with a total length of 574 m., of which 350 m. are within Bolivian territory, a private branch of that line (26 m. long) running to the Pucayaco mines, and the line (54 m. long) from Guayqui to Alto de la Paz—a total of only 430 m. As a result of her war with Chile in 1878–81, the railways (382 m. long) of her Litoral department passed under Chilean control. Lines were in 1907 projected from La Paz to the navigable waters of the Beni, from La Paz to Cochabamba, from Viacha to Oruro, from Uyuni to Potosí and Sucre, from Uyuni to Tupiza, and from Arica to La Paz via Corocoro. The central northern line of the Argentine government was completed to the Bolivian frontier in 1908, and this line was designed to extend to Tupiza. The undertaking of the Arica-La Paz line by the British Stock Syndicate was an important step towards the improvement of the economic situation in Bolivia. Both these lines offer the country new outlets for its products.

Public highways have been constructed between the large cities and to some points on the frontiers, and subsidized stage coaches are run on some of them. The roads are rough and at times almost impassable, however, and the river crossings difficult and dangerous. The large cities are connected with one another by telegraph lines and are in communication with the outside world through Argentina, Chile and Peru. Telegraph services dates from 1880, and in 1904 there were 3715 in operation, of which 1936 belonged to the state and 1779 to private corporations. The latter includes the lines belonging to the Antofagasta and Oruro railway, which are partly within Chilean territory. Bolivia is a member of the International Postal Union, and has parcel and money order conventions with some foreign countries. Special agreements have been made, also, with Argentina, Chile and Peru for the transmission of the Bolivian foreign mails.

The loss of her maritime department has left Bolivia with no other ports than those of Lake Titicaca (especially Guayqui, or Huaiquí, which trades with the Peruvian port of Puno), and those of the Madeira and Paraguay rivers and their affluents. As none of these can be reached without transhipment in foreign territory, the cost of transport is increased, and her neighbours are enabled to exclude Bolivia from direct commercial intercourse with other nations. An exception formerly existed at Puerto Acre, on the Acre river, to which ocean-going steamers could ascend from Pará, but Brazil first closed the Purús and Acre rivers to foreign vessels seeking this port, and then under a treaty of 1903 acquired possession of the port and adjacent territory. Since then Bolivia's outlet to the Amazon is restricted to the Madeira river, the navigation of which is interrupted by a series of falls before Bolivian territory is reached. The Bolivian port of entry for this trade, Villa Bella, is situated above the falls of the Madeira at the confluence of the Bení and Mamoré, and is reached from the lower river by a long and costly portage. It is also shut off from the navigable rivers above by the falls of the Bení and Mamoré. The railway to be built by Brazil will remedy this unfavourable situation, will afford a better outlet for north-eastern Bolivia, and should promote a more rapid development of that region, which is covered with an admirable system of navigable rivers above the falls of the Bení and Mamoré. The connection between the upper and lower Paraguay at Pacheco on Bahia Negra, Puerto Suárez (about 1700 m. from Buenos Aires by river), on Lake Cáceres, through which passes the bulk of Bolivian trade in that direction, and Puerto Quijaro, on Lake Gaiba, a projected port said to be more accessible than any other in this region. Whenever the trade of southern Bolivia becomes important enough to warrant the expense of opening a navigable channel in the Pilcomayo, direct river communication with Buenos Aires and Montevideo will be possible.

Coca—Stock raising, and one drying beef for the home industries of the country after that of mining. Horses, formerly successfully raised in certain parts of the north, have not flourished there since the introduction of a petae from Brazil, but some are now raised in La Paz and other departments of the temperate region. The Jesuit founders of the Mojos missions took cattle with them when they entered that region to labour among the Indians, with the result that the Mojos and Chiquitos llanos were soon well stocked, and have since afforded an unfailing supply of beef for the neighbouring inland markets. Their accessibility and the costs of transportation have prevented a development of the industry and a consequent improvement in stock, but the persistency of the industry under conditions so unfavourable is evidence that the soil and climate are suited to its requirements. Further south the llanos of Chiquissaca and Tarija also sustain large herds of cattle on the more elevated districts, and on the well-watered plains of the Chaco. There are small districts in La Paz, Potosí and Cochabamba, also, where cattle are raised. Apart from the cattle driven into the mining districts for consumption, a number of saladeros are employed in preparing (usually salting) and one drying beef for the home markets. The hides are exported. Goats are raised in the warm and temperate regions, and sheep for their wool in the latter. On the higher and colder plateaus much attention is given to the breeding of llamas and alpacas. Another industry of a different character is that of breeding the fur-bearing chinchilla (C. laniger), which is a native of the higher plateaus. The Bolivian government has prohibited the exportation of the live animals and is encouraging their production.

The agricultural resources of the republic are varied and of great value, but their development has been slow and hesitating. The cultivation of cereals, fruits and vegetables in the temperate and warm valleys of the Andes followed closely the mining settlements. Sugar-cane also was introduced at an early date, but as the demand for sugar was limited the product was devoted chiefly to the manufacture of rum, which is the principal object of cane cultivation in Bolivia to-day. The climatic conditions are highly favourable for this product in eastern Bolivia, but it is heavily taxed and is restricted to a small home market. Rice is another exotic grown in the tropical districts of eastern Bolivia, but the quantity produced is far from sufficient to meet local requirements. Tobacco of a fair quality is produced in the warm regions of the east, including the yungas valleys of La Paz and Cochabamba; cacáo of a superior grade is grown in the department of Bení, where large orchards were planted at the missions, and also in the warm Andean valleys of La Paz and Cochabamba; and coffee of the best flavour is grown in some of the warmer districts of the eastern Andes. The two indigenous products which receive most attention, perhaps, are those of quinoa and coca. Quinoa is grown in large quantities, and is a staple article of food among the natives. Coca is highly
esteemed by the natives, who masticate the leaf, and is also an article of export for medicinal purposes. It is extensively cultivated in the valleys of Cochabamba and La Paz, especially in the province of Yungas.

In the exploitation of her forest products, however, are to be found the industries that yield the greatest immediate profit to Bolivia. The most prominent and profitable of these is that of rubber-collecting, which was begun in Bolivia between 1880 and 1890, and which reached a registered annual output of nearly 3,500 metric tons just before Bolivia's best rubber forests were transferred to Brazil in 1903. There still remain extensive areas of forests in the Madre de Dios region which are rubber-producing Henea to be found. Although representing less value in the aggregate, the collecting of cinchona bark is one of the oldest forest industries of Bolivia, which is said still to have large areas of virgin forest to draw upon. The Bolivian product is of the best because of the high percentage of quinine sulphate which it yields. The industry is destructive in method, and the area of cinchona forests is steadily diminishing. Many other Bolivian plants are commercially valuable, and organized industry and trade in them will certainly be profitable.

The industrial activities of the Bolivians, people are still of a very primitive character. An act was passed in 1854 authorizing the government to offer premiums and grant advantageous concessions for the development of manufacturing industries, especially in sugar production, but conditions have not been favourable and the results have been disappointing. Spinning and weaving are carried on among the people as a household occupation, and fabrics are made of an exceptionally substantial character. It is not uncommon to see the natives busily twirling their rude spindles as they follow their troops of pack animals over rough mountain roads, and the yarn produced is woven into cloth in their own houses on rough Spanish looms of colonial patterns. Not only is coarse cloth for their own garments made in this manner from the fleece of the llama, but cotton and woolen goods of a serviceable character are manufactured, and still finer fabrics are woven from the wool of the alpaca and vicuña, sometimes mixed with silk or lamb's wool. The Indian women are expert weavers, and their handwork often commands high prices. In the Mojos and Chiquitós districts the natives were taught by the Jesuit missionaries to weave an excellent cotton cloth, and the industry still exists. Cashmere, baize, waterproof ponchos of fine wool and silk, and many other fabrics are made by the Indians of the Andean departments. They are skilled in the use of dyes, and the Indian women pride themselves on a large number of finely-woven, brilliantly-coloured petticoats. Tanning and saddlery are carried on by the natives with primitive methods, but with excellent results. They are skilful in the preparation of tap robes and rags from the skins of the alpaca and vicuña. The home markets are supplied, by native industry, with cigars and cigarettes, soap, candles, hats, gloves, starch, cheese and pottery. Sugar is still made in the old way, and there is a small production of wine and silk in certain districts. No country is better supplied with water power, and electric lighting and electric power plants have been established at La Paz.

Commerce.—The foreign trade of Bolivia is comparatively unimportant, but the statistical returns are incomplete and unsatisfactory; the imports of 1904 aggregated only £1,734,551 in value, and the exports only £1,851,758. The imports consisted of cottons, woolens, live-stock, provisions, hardware and machinery, wines, spirits and clothing. The principal exports were (in 1903) silver and its ores (£36,743), tin and its ores (£1,039,298), copper ores (£1,579,600), bismuth (£16,354), other minerals (£20,931), rubber (£260,559), coca (£28,907), and cinchona (£5197) —total exports, £2,453,638. These figures, however, do not correctly represent the aggregates of Bolivian trade, as her imports and exports passing through Antofagasta, Arica and Mollendo are to a large extent credited to Chile and Peru. Trade in Bolivia is handled by the people. The geographical position limits the exports to mineral forest and some pastoral products, owing to cost of transportation and the tariffs of neighbouring countries.

Government.—The government of Bolivia is a "unitarian" or centralist republic, representative in form, but subject in some important particulars. The constitution in force (1908) was adopted on the 28th of October 1890, and is a model in form and profession. The executive branch of the government is presided over by a president and two vice-presidents, who are elected by direct popular vote for a period of four years, and are not eligible for re-election for the next succeeding term. The president is assisted by a cabinet of five ministers of state,viz.: foreign relations and worship; finance and industry; interior and fomento; justice and public instruction; war and colonization. Every executive act must be countersigned by a minister of state, who is held responsible for its character and enforcement, and may be prosecuted before the supreme court for its illegality and effects. The legislative branch is represented by a national congress of two houses—a Senate and Chamber of Deputies. The Senate is composed of 16 members, two from each department, who are elected by direct popular vote for a period of six years, one-third retiring every two years. The Chamber of Deputies is composed of 72 members, who are elected for a period of four years, one-half retiring every two years. In impeachment cases, the Senate holds the trial, and the Senate sits as a court, as in the United States. One of the duties of the Chamber is to elect the justices of the supreme court. Congress meets annually and its sessions are for sixty days, which may be extended to ninety days. The chambers have separate and concurrent powers defined by the constitution. The right of suffrage is exercised by all male citizens, twenty-one years of age, or over, ill single, and eighteen years, or over, if married, who can read and write, and own real estate or have an income of 200 bolivianos a year, said income not to be compensation for services as a servant. The electoral body is therefore small, and is under the control of a political oligarchy which practically rules the country, no matter which party is in power.

The Bolivian judiciary consists of a national supreme court, eight superior district courts, lower district courts, and jueces de instrucción for the investigation and preparation of cases. The corregidores and alcaldes also exercise the functions of a justice of the peace in the cantons and rural districts. The supreme court is composed of seven justices elected by the Chamber of Deputies from lists of three names for each seat sent in by the Senate. A justice can be removed only by impeachment proceedings before the Senate.

The supreme administration in each department is vested in a prefect appointed by and responsible solely to the president. As the prefect has the appointment of subordinate department officials, including the alcaldes, the authority of the national executive reaches every hamlet in the republic, and may easily become autocratic. There are no legislative assemblies in the departments, and their government rests with the national executive and congress. Subordinate to the prefects are the sub-prefects in the provinces, the corregidores in the cantons and the alcaldes in the rural districts—all appointed officials. The national territory adjacent to Brazil and Peru is governed by two delegados nacionales, appointees of the president. The department capitals are provided with municipal councils which have jurisdiction over certain local affairs, and over the construction and maintenance of some of the highways.

Army.—The military forces of the republic in 1905 included 28,900 regulars and an enrolled force of 80,000 men, divided into a first reserve of 30,000, a second reserve of 40,000, and 10,000 territorial guards. The enrolled force is, however, both unorganized and unarmed. The strength of the army is fixed in each year's budget. That for 1903 consisted of 793 officers and men, of which 275 were commissioned and 518 non-commissioned officers, 181 musicians, and only 1006 rank and file. A conscription law of 1894 provides for a compulsory military service between the ages of twenty-one and fifty years, with two years' actual service in the regular army. The strength is about twenty-five, but the law is practically a dead letter. There is a military school with 60 cadets, and an arsenal at La Paz.
BOLIVIA

Education.—Although Bolivia has a free and compulsory school system, education and the provision for education have made little progress. Only a small percentage of the people can read and write. Although Spanish is the language of the dominant minority, Quichua, Aymarà and Guarani are the languages of the natives, who form a majority of the population. A considerable percentage of the Indians do not understand Spanish at all, and they even resist every effort to force it upon them. Even the cholas (mestizos) are more familiar with the native idioms than with Spanish, as is the case in some parts of Argentina and Paraguay. According to official estimates for 1901, the total number of primary school children in the republic was 733, with an estimated attendance of 147,587 pupils—ten times the number of the population, maintenance being estimated at 585,365 bolivianos, or only 14.97 bolivianos per pupil (about $1.45). The school enrolment was only one in 43.7 of the population, compared with one in 10 for Argentina. The schools are largely under the control of the municipalities, though nearly half of them are maintained by the national government, by the Church and by private means. There were in the same year 13 institutions of secondary and 14 of superior instruction. The latter include so-called universities—such as La Paz, Cochabamba, Tarjia, Potosi, Santa Cruz and Oruro—all of which give instruction in law, the first three in medicine and the first four in theology. The university at Sucre, which dates from colonial times, and that at La Paz, are the only ones on the list sufficiently well equipped to merit the title. Secondary instruction is under the control of the universities, and public instruction in general is under the direction of a cabinet minister. All educational matters, however, are practically under the supervision of the Church. The total appropriation for educational purposes in 1901 was 756,943 bolivianos, or $66,232.66. There are a military academy at La Paz, an agricultural school at Uamala in the department of La Paz, a mining and civil engineering school at Oruro, commercial schools at Sucre and Trinidad, and several mission schools under the direction of religious orders.

Religion.—The constitution of Bolivia, art. 2, defines the attitude of the republic toward the Church in the following words:—“The state recognizes and supports the Roman Apostolic Catholic religion, the public exercise of any other worship being prohibited, except in the colonies where it is tolerated.” This tolleration is tacitly extended to resident foreigners belonging to other religious sects. The census of 1900 enumerated the Roman Catholic population at 1,609,985, and that of other creeds at 24,245, which gives the former 98.5 and the latter 1.5 in every thousand. The domesticated Indians profess the Roman Catholic faith, but it is tinged with the superstitions of their ancestors. They hold the clergy in great fear and reverence, however, and are deeply influenced by the forms and ceremonies of the church, which have changed little since the first Spanish settlements. Bolivia is divided into an archbishopric and three bishoprics. The first includes the departments of Chuquisaca, Oruro, Potosi, Tarjia and the Chilean province of Antofagasta, with its seat at Sucre, and is known as the archbishopric of La Plata. The sees of the three bishoprics are La Paz, Cochabamba and Santa Cruz. Mission work among the Indians is entrusted to the Propaganda Fide, which has five colleges and a large number of missions, and receives a small subvention from the state. It is estimated that these missions have charge of fully 20,000 Indians. The annual appropriation for the Church is about £17,150. The religious orders, which have never been suppressed in Bolivia, maintain several convents.

Finance.—No itemized returns of receipts and expenditures are ever published, and the estimates presented to congress by the cabinet ministers furnish the only source from which information can be drawn. The expenditures are not large, and taxation is not considered heavy. The estimated revenues and expenditures for 1904 and 1905 at 21 cents per boliviano, were as follows: 1904, revenue $543,773; 158, expenditure $498,571: 18; 1905, revenue $563,763; 17: 6, expenditure $583,937: 79: 9. The revenues are derived principally from duties and fees on imports, excise taxes on spirits, wines, tobacco and sugar, general, mining taxes and export duties on minerals (except silver), export duties on rubber and coca, taxes on the profits of stock companies, fees for licenses and patents, stamp taxes, and postal and telegraph revenues. Namely, the import duties are moderate, so much so that Bolivia is sometimes called a “free-trade country,” but this is a misnomer, for in addition to the schedule rates of 10 to 40% ad valorem on imports, there are a consular fee of 1% for the registration of invoices exceeding 200 bolivianos, a consumption tax of 10 centavos per quintal (46 kilograms), fees for visiting certificates to accompany merchandise in transit, special “octroi” taxes on certain kinds of merchandise controlled by monopolies (such as tobacco, sugar, and rice), a total of customs and local taxes levied by the departments and municipalities. The expenditures are chiefly for official salaries, subsidies, public works, church and mission support, justice, public instruction, military expenses, and interest on the public debt. The appropriations for 1905 were as follows: war, 2,081,119 bolivianos; finance and industry, 1,462,259; government and fomento, 2,021,428; justice and public instruction, 1,858,941.

The acknowledged public debt of the country is comparatively small. Bolivia is heavily involved in debt with Chile, there being an indemnity debt due to citizens of that country, estimated at 10,788,293, which had been nearly liquidated in 1904 when Chile took over the unpaid balance. This was Bolivia’s only foreign debt. In 1905 her internal debt, including 1,908,500 bolivianos of treasury bills, amounted to 6,243,279 bolivianos ($546,386). The government in 1903 authorized the issue of treasury notes for the department of Beni and the National Territory to the amount of one million bolivianos ($87,500), for the redemption of which 75% of the customs receipts of the two districts is set apart. The paper currency of the republic consists of bank-notes issued by four private banks, and is therefore no part of the public debt. The amount in circulation on the 30th of June 1903 was officially estimated at 6,144,254 bolivianos ($600,122), issued on a par with silver. The coinage of the country is of silver, nickel and copper. The silver coins are of the denominations of 1 boliviano, or 100 centavos, 20, 20, 10 and 5 centavos, and the issue of these coins from the Potosi mint is said to be about 1,500,000 bolivianos a year. The silver mining companies are required by law to send to the mint 20% of their product, the silver boliviano, but is rarely seen in circulation because of the cheaper paper currency. To check the exportation of silver coin, the fractional denominations have been slightly debased. The nickel coins are of 5 and 10 centavos, and the copper 1 and 2 centavos. The departmental revenues, which are derived from excise and land taxes, mining grants, tithes, inheritance taxes, tolls, stamp taxes, subsidies from the national treasury and other small taxes, were estimated at 2,266,172 bolivianos in 1903, and the expenditures at 2,295,791 bolivianos. The expenditures were chiefly for justice, police, public works, public instruction and the Church. The municipal revenues aggregated 2,317,579 bolivianos in 1902, and the expenditures 61,510 bolivianos in excess of that sum. These revenues are derived from a lighting tax, leases and ground rents, cemetery fees, consumption and market taxes, licences, tolls, taxes on hides and skins, personal and various minor taxes. There is a multiplication of taxes in trade which recalls the old colonial alcabala tax, and it serves to restrict commerce and augment the cost of goods in much the same way, if not to the same degree.

BOLIVIA

HISTORY

The country now forming the republic of Bolivia, named after the great liberator Simon Bolivar (q.v.), was in early days simply a portion of the empire of the Incas of Peru (q.v.). After the conquest of Peru by the Spaniards in the 16th century the natives were subjected to much tyranny and oppression, though it most in fairness be said that much of it was carried out in defiance of the efforts and the wishes of the Spanish home government, whose legislative efforts to protect the Indians from serfdom and ill-use met with scant respect at the hands of the distant settlers and mine-owners, who bid defiance to the humane and protective regulations of the council of the Indies, and treated the unhappy natives little better than beasts of burden. The statement, moreover, that some eight millions of Indians perished through forced labour in the mines is a gross exaggeration. The annual diminution in the number of the Indian population was undoubtedly very great, but it was due far more to the result of European epidemics and to indigence in alcohol than to hard work. The abortive insurrection of 1780-82, led by the Inca Tupac Amaru II, the general rising, and the disturbed war against Creole tyranny rather than against Spanish rule. The heavy losses sustained by the Indians during that outbreak, and their dislike and distrust of the colonial Spaniard, account for the comparative indifference with which they viewed the rise and progress of the 1814 colonial revolt against Spain, which gave the South American states their independence.

We are only concerned here with the War of Independence so far as it affected Upper Peru, the Bolivia of later days. When the patriots of Buenos Aires, in 1810, proceeded in liberating the dominion of Spain the insurrection started in the Rio de la Plata, they turned their arms against their enemies who held Upper Peru. An almost uninterrupted warfare followed, from July 1809 till August 1825, with alternate successes on the side of the Spanish or royalist and the South American or patriot forces,—the scene of action lying chiefly between the Argentine provinces of Salta and Jujuy and the shores of Lake Titicaca. The first movement of the war was an invasion of Upper Peru by the army of Buenos Aires, under General Belgrano, in 1811. After two defeats, the Spanish troops, was able to celebrate the first anniversary of independence near Lake Titicaca, in May 1811. Soon, however, but the patriot army, owing to the dissolute conduct and negligence of its leaders, became disorganized, and was attacked and defeated, in June 1811, by the Spanish army under General Goyeneche, and driven back into Jujuy. Four years of warfare, in which victory was alternately with the Spaniards and the patriots, was terminated in 1815 by the total rout of the latter in a battle which took place between Potosi and Oruro. To this succeeded a revolt of the Indians of the southern provinces of Peru, and the object being the independence of the whole country, it was joined by numerous Creoles. This insurrection was, however, speedily put down by the royalists. In 1816 the Spanish general Laserna, having been appointed commander-in- chief of Upper Peru, made an attempt to invade the Andes provinces, intending to march on Buenos Aires, but he was completely foiled in this by the activity of the irregular guacho troops of Salta and Jujuy, and was forced to retire. During this time and in the six succeeding years a guerrilla warfare was maintained by the patriots of Upper Peru, who had taken refuge in the mountains, chiefly of the province of Yungas, and who frequently harassed the royalist troops. In June 1823 the expedition of General Santa Cruz, prepared with great zeal and activity at Lima, marched in two divisions upon Upper Peru, and in the following months of July and August the whole country between La Paz and Oruro was occupied by his forces; but later, the indecision and want of judgment displayed by Santa Cruz allowed a retreat to be made before a smaller royalist army, and a severe storm converted their retreat into a precipitate flight, only a remnant of the expedition again reaching Lima.

In 1824, after the great battle of Ayacucho in Lower Peru, General Sucre, whose valor had contributed so much to the patriot success of that day, marched with a part of the victorious army to Upper Peru. On the news of the victory a universal rising of the patriots took place, and before Sucre had reached Oruro and Puno, in February 1825, La Paz was already in their possession, and the royalist garrisons of several towns had gone over to their side. The Spanish general Olazeta, with a diminished army of 2000 men, was confined to the province of Potosi, where he held out till March 1825, when he was mortally wounded in an action with some of his own revolted troops.

General Sucre was now invested with the supreme command in Upper Peru, until the requisite measures could be taken to establish in that country a regular and constitutional government. Deputies from the various provinces to the number of fifty-four were assembled at Chuquisaca, the capital, to decide upon the question proposed to them on the part of the government of the Argentine provinces, whether they would or would not remain separate from that country. In August 1825 they decided this question, declaring it to be the national will that Upper Peru should in future constitute a distinct and independent nation. This assembly continued their session for the purpose of the government of that country thus being accomplished, and afterwards gave the name of Bolivia to the country,—issuing at the same time a formal declaration of independence.

The first general assembly of deputies of Bolivia dissolved itself on the 6th of October 1825, and a new congress was summoned and formally installed at Chuquisaca on the 25th of May 1826, to take into consideration the constitution prepared by Bolivar for the new republic. A favourable report was made to that body by a committee appointed to examine it, on which it was finally confirmed and established as the constitution of the republic; and as such, it was sworn to by the people. General Sucre was chosen president for life, according to the constitution, but only accepted the appointment for the space of two years, and on the express condition that 2000 Colombian troops should be permitted to remain with him.

The independence of the country, so dearly bought, did not, however, secure for it a peaceful future. Repeated risings occurred, till in the end of 1827 General Sucre and his Colombian troops were driven from La Paz. A new congress was formed at Chuquisaca in April 1828, which modified the constitution given by Bolivar, and chose Marshal Santa Cruz for president; but only a year later a revolution, led by General Blanco, threw the country into disorder and for a time overturned the government. Quiet being again restored in 1831, Santa Cruz promulgated the code of laws which bore his name, and brought the
financial affairs of the country into some order; he also concluded a treaty of commerce with Peru, and for several years Bolivia remained in peace. In 1835, when a struggle for the chief power had made two factions in the neighbouring republic of Peru, Santa Cruz was induced to take a part in the contest; he marched into that country, and after defeating General Gamarra, the leader of one of the opposing parties, completed the partition of Peru in the Treaty of 1836, naming himself its protector, and had in view a confederation of the two countries. At this juncture the government of Chile interfered actively, and espousing the cause of Gamarra, sent troops into Peru. Three years of fighting ensued till in a battle at Junagay in June 1839 Santa Cruz was defeated and exiled, Gamarra became president of Peru, and General Velasco provisional chief in Bolivia. The Santa Cruz party, however, remained strong in Bolivia, and soon revolted successfully against the new head of the government, ultimately installing General Ballivian in the chief power. Taking advantage of the disturbed conditions of Bolivia, Gamarra made an attempt to annex the rich province of La Paz, invading it in August 1841 and besieging the capital; but in a battle with Ballivian his army was totally routed, and Gamarra himself was killed. The Bolivian general was now in turn to invade Peru, when Chile again interfered to prevent him. Ballivian remained in the presidency till 1842, when he retired to Valparaiso, and in the end of that year General Belzu, after leading a successful military revolution, took the chief power, and during his presidency endeavoured to promote agriculture, industry and trade. General Jose Cornejo, who was Ballivian's successor, but had not been long in office when a new revolt in September 1857, originating with the garrison of Oruro, spread over the land, and compelled him to quit the country. His place was taken by Dr Jose Maria Linares, the originator of the revolution, who, taking into his own hands all the powers of government, and acting with the greatest severity, caused himself to be proclaimed dictator in March 1858. Fresh disturbances led to the deposition of Linares in 1861, when Dr Maria de Acha was chosen president. In 1862 a treaty of peace and commerce with the United States was ratified, and in the following year a similar treaty was concluded with Belgium; but new causes of disagreement with Chile had arisen in the discovery of rich beds of guano on the eastern coast-land of the desert of Atacama, which threatened warfare, and were only set at rest by the treaty of August 1866, in which the 24th parallel of latitude was adopted as the boundary between the two republics. A new military revolution, led by Maria Melgarejo, broke out in 1865, and in February of that year the troops of President Acha were defeated in a battle near Potosi, when Melgarejo took the dominion of the country. After defeating two revolts, in 1865-66, President Acha declared a political amnesty, and in 1866, after imposing a revised constitution on the country, he became its dictator.

In January 1871 President Melgarejo was in his turn deposed and driven from the country by a revolution headed by Colonel Augustin Morales. The latter, becoming president, was himself murdered in November 1872 and was succeeded by Colonel Adolfo Ballivian, who died in 1874. Under this president Bolivia entered upon a secret agreement with Peru which was destined to have grave consequences for both countries. To understand the reasons that urged Bolivia to take this step it is necessary to go back to the above-mentioned treaty of 1866 between Chile and Bolivia. By this instrument Bolivia, besides ceding the 24th parallel as the boundary of Chilean territory, agreed that Chile should have a half share of the customs and full facilities for trading on the coast that lay between the 23rd and 24th parallels, Chile at that time being largely interested in the trade of that region. It was also agreed that Chile should be allowed to mine and export the products of this district without tax or hindrance on the part of Bolivia. In 1875, in further consideration of the sum of $10,000, Bolivia granted to an Anglo-Chilean company the right of working certain nitrate deposits north of the 24th parallel. The great wealth which was passing into Chilean hands owing to these compacts created no little discontent in Bolivia, nor was Peru any better pleased with the hold that Chilean capital was establishing in the rich district of Tarapaca. On 6th February 1873 Bolivia entered upon a secret agreement with Peru, the ostensible object of which was the preservation of their territorial integrity and their mutual defence against external aggression. There can be no doubt that the aggression contemplated as possible by both countries was a further encroachment on the part of Chile upon the territory of Bolivia, immediately after the conclusion of this treaty with Peru, Dr Tomas Frias succeeded to the presidency. He signed yet another treaty with Chile, by which the latter agreed to withdraw her claim to half the duties levied in Bolivian ports on condition that all Chilean industries established in Bolivian territory should be free from duty for twenty-five years. This treaty was never ratified, and four years later General Hilarion Daza, who had succeeded Dr Frias as president in 1876, demanded as the price of Bolivia's consent that a tax of 10 cents per quintal should be paid on all nitrates exported from the country, further declaring that, unless this levy was paid, nitrates in the hands of the exporters would be seized by the Bolivian government. As an answer to these demands, and in order to protect the property of Chilean subjects, the Chilean fleet was sent to blockade the ports of Antofagasta, Cobija and Tocapilla. On the 14th February 1879 the Chilean colonel Sotomayor occupied Antofagasta, and on 1st March, a fortnight later, the Bolivian government declared war.

An offer on the part of Peru to act as mediator met with no favour from Chile. The existence of the secret treaty, well known to the Chilean government, rendered the intervention of Peru more than questionable, and the law passed by the latter in 1875, which practically created a monopoly of the Tarapaca nitrate beds to the serious prejudice of Chilean enterprise, offered no guarantee of her good faith. Chile replied by curtly demanding the annulment of the secret treaty and an assurance of Peruvian neutrality. Both demands being refused, she declared war upon Peru.

The superiority of the Chilenos at sea, though checked for some time by the heroic gallantry of the Peruvians, soon enabled them to land a sufficient number of troops to meet the allied forces which had concentrated at Arica and other points in the south. The Bolivian ports were already in Chilean hands, and a sea attack upon Pisagua surprised and routed the troops under the Peruvian general Buendia and opened the way into the southern territory of Peru. General Daza, who should have cooperated with Buendia, turned back, on receiving news of the Peruvian defeat, and led the Bolivian troops to Tacna in a hasty and somewhat disorderly retreat. The fall of San Francisco followed, and Iquique, which was evacuated by the allies without a struggle, was next occupied. Fighting took possession of Tarapaca surrendered, but the end of 1879 saw the Chilenos in complete possession of the province.

Meanwhile a double revolution took place in Peru and Bolivia. In the former country General Prado was deposed and Colonel Pierola proclaimed dictator. The Bolivians followed the example of their allies. The troops at Tacna, indignant at the inglorious part they had been condemned to play by the incompetence or cowardice of their president, deposed him of his command and elected Colonel Camacho to lead them. At the same time a revolution in La Paz proclaimed General Narciso Campero president, and he was elected to that post in the following June by the ordinary procedure of the constitution. During 1880 the war was chiefly maintained at sea between Chile and Peru, Bolivia taking little or no part in the struggle. In January of 1881 were fought the battles of Chorillos and Miraflores, attended by heavy slaughter and savage excesses on the part of the Chilenan troops. They were followed almost immediately by the surrender of Lima and Callao, which left the Chilenans practically masters of Peru. In the interior, however, where the Peruvian admiral Montero had formed a provisional government, the war still lingered, and in September 1882 a conference took place between the latter and President Campero, at which it was decided that they should hold out for better terms. But the Peruvians
weary of the useless struggle. On the 20th of October 1883 they concluded a treaty of peace with Chile; the troops at Arequipa, under Admiral Montero, surrendered that town, and Montero himself, coldly received in Bolivia, whither he had fled for refuge, withdrew from the country to Europe. On the 9th of November the Chilean army of occupation was concentrated at Arequipa, while what remained of the Bolivian army lay at Oruro. Negotiations were opened, and on 11th December a peace was signed between Chile and Bolivia. By this treaty Bolivia ceded to Chile the whole of its sea-coast, including the port of Calluja.

On the 18th of May 1895 a treaty was signed at Santiago between Chile and Bolivia, "with a view to strengthening the bonds of friendship which unite the two countries," and, "in accord with the higher necessity that the future development and commercial prosperity of Bolivia require her free access to the sea." By this treaty Chile declared that if, in consequence of the plebiscite (to take place under the treaty of Ancon with Peru), or by virtue of direct arrangement, she should "acquire dominion and permanent sovereignty over the territories of Tacna and Arica, she undertakes to transfer them to Bolivia in the same form and to the same extent as she may acquire them"; the republic of Bolivia paying as an indemnity for that transfer $5,000,000 silver. If this cession should be effected, Chile should advance her own frontier north of Camerones to Vitor, from the sea up to the frontier which actually separates that district from Bolivia. Chile also pledged herself to use her utmost endeavour, either separately or jointly with Bolivia, to obtain possession of Tacna and Arica. If she failed, she bound herself to cede to Bolivia the roadstead (caleta) of Vitor, or another analogous one, and $5,000,000 silver. Supplementary protocols to this treaty stipulated that the port to be ceded must "fully satisfy the present and future requirements" of the commerce of Bolivia.

On the 23rd of May 1895 further treaties of peace and commerce were signed with Chile, but the provisions with regard to the cession of a seaport to Bolivia still remained unfulfilled. During those ten years of recovery on the part of Bolivia from the effects of the war, the presidency was held by Dr Pacheco, who succeeded Campero, and held office for the full term; by Dr Aniceto Arce, who held it until 1892, and by Dr Mariano Baptista, his successor. In 1896 Dr Severo Alonso became president, and during his tenure of office diplomatic relations were resumed with Great Britain, German Araymo being sent to London as minister plenipotentiary in July 1897. As an outcome of his mission an extradition treaty was concluded with Great Britain in March 1898.

In December an attempt was made to pass a law creating Sucre the perpetual capital of the republic. Until this Sucre had taken its turn with La Paz, Cochabamba and Oruro. La Paz rose in open revolt. On the 17th of January of the following year a battle was fought some 40 m. from La Paz between the insurgents and the government forces, in which the latter were defeated with the loss of a colonel and forty-three men. Colonel Pando, the insurgent leader, having gained a strong following, marched upon Oruro, and entered that town on 11th April 1899, after completely defeating the government troops. Dr Severo Alonso took refuge in Chilean territory; Colonel Pando formed a provisional government. He had no difficulty in obtaining his election to the presidency without opposition. He entered upon office on the 26th of October, and proved himself to be a strong and capable chief magistrate. He had to deal with two difficult settlements as to boundaries with Chile and Brazil, and to take steps for improving the means of communication in the country, by this means reviving its mining and other industries. The dispute with Brazil over the rich Acër rubber-plantation territory was accentuated by the majority of those engaged in the rubber industry being Brazilians, who resented the attempts of Bolivian officials to exercise authority in the district. This led to a declaration of independence on the part of the state of Acër, and the despatch of a body of Bolivian troops in 1900 to restore order. There was no desire, however, on the part of President Pando to involve himself in hostilities with Brazil, and in a spirit of concession the dispute was settled amicably by diplomatic means, and a treaty signed in November 1903. A new boundary line was drawn, and a portion of the Acër province ceded to Brazil in consideration of a cash indemnity of $10,000,000.

The long-standing dispute with Chile with regard to its occupation of the former Bolivian provinces of Tacna and Arica under the Parto de Tregna of the 4th of April 1884 was more difficult to arrange satisfactorily. In 1895 there had been some prospect of Chile concealing an outlet on the sea in exchange for a recognition of the Chilean ownership of Tacna and Arica. The discovery, however, of secret negotiations between Bolivia and Argentina caused Chile to change its conciliatory attitude. Bolivia was in no position to venture upon hostilities or to compel the Chileans to make concessions, and the final settlement of the boundary dispute between Argentina and Chile deprived the Bolivians of the hope of obtaining the support of the Argentines. President Pando and his successor, Ismail Montes, who became president in 1904, saw that it was necessary to yield, and to make the best terms they could. A treaty was accordingly ratified in 1905, which was in many ways advantageous to Bolivia, though the republic was compelled to cede to Chile the maritime provinces occupied by the latter power since the war of 1881, and to do without a seaport. The government of Chile undertook to construct a railway at its own cost from Arica to the Bolivian capital, La Paz, and to give the Bolivians free transit through Chilean territory to certain towns on the coast. Chile further agreed to pay Bolivia a cash indemnity and lend certain pecuniary assistance to the construction of other railways necessary for the opening out of the country.

See C. Wiener, Bolivia et Pérou (Paris, 1880); E. Mosbach, Bolivia (Leipzig, 1875); Theodore Child, The South American Republics (New York, 1891); Vicente de Ballivian y Rizas, Archivo Boliviano, 1918. In the same year, the Government of Bolivia published a work by General José María Achú under the title La Guerra de la independencia de los gobiernos de dicha República hasta 1893 (Santiago de Chile, 1894).

BOLKHOV, a town of Russia, in the government of Orel, and 35 m. N. of the city of Orel. Pop. (1897) 20,703. It is prettily situated amongst orchards and possesses a cathedral. There is a lively trade in hemp, hemp-seed oil, hemp goods and cattle, and there are hemp-mills, soap-works and tanneries. The much-vedicated monastery, Optina Pustyn, is close by.

BOLL, a botanical term for a fruit-pod, particularly of the cotton plant. The word is in O. Eng. "boll," which is also represented in "bowl," a round vessel for liquids, a variant due to "bowl" ball, which is from the Fr. boule. "Boll" is also used chiefly in Scotland and the north of England, as a measure of weight for flour=140 lb, and of capacity for grain: 16 pecks =1 boll.

BOLLANDISTS, the Belgian Jesuits who publish the Acta Sanctorum, the great collection of biographies and legends of the saints, arranged by days, in the order of the calendar. The original idea was conceived by a Jesuit father, Herbert Rosweyde (see Hagiography), and was explained by him in a sort of prospectus which he issued in 1607 under the title of Fasciculus sanctorum sive in Belgicis Bibliothecis manuscripta. His intention was to publish in eighteen volumes the lives of the saints compiled from the MSS., at the same time adding sober notes. At the time of his death (1629) he had collected a large amount of material, but had not been able actually to begin the work. A Jesuit father, John Bolland, was appointed to carry on the project, and was sent to Antwerp. He continued to amass material, and extended the scope of the work. In 1643 the two volumes for January appeared. The three volumes for February appeared in 1658, the three for March in 1668, the three for April in 1675, and so on. In 1635 Henschensius (Godfried Henschen) was associated with Bolland, and collaborated in the work until 1683. From 1650 to 1714 Papenbroch (Daniel van Papenbrock) collaborated. This was the most brilliant period in the history of the
Acta Sanctorum. The freedom of Papebroch's criticism made him many enemies, and he had often to defend himself against their attacks. The work was continued—with some inequalities, but always in the same spirit—until the suppression of the Society of Jesus in 1773. The last volume published was vol. iii. of October, which appeared in 1775.

On the dispersion of the Jesuits the Bollandists were authorized to continue their work, and remained at Antwerp until 1778, when they were transferred to Brussels, to the monastery of canons regular of Coudenberg. Here they published vol. iv. of October in 1780, and vol. v. of October in 1786, when the monastery of Coudenberg was suppressed. In 1788 the work of the Bollandists ceased. The remains of their library were acquired by the Premonstratensians of Tongerlo, who endeavoured to continue the work, and in their abbey vol. vi. of October appeared in 1794.

After the re-establishment of the Society of Jesus in Belgium the work was again taken up in 1837, at the suggestion of the Académie Royale de Belgique and with the support of the Belgian government, and the Bollandists were installed at the college of St Michael in Brussels. In 1845 appeared vol. vii. of October, the first of the new series, which reached vol. xiii. of October in 1853. In this series the Jesuit fathers Joseph van der Moere, Joseph van Hecke, Benjamin Bossu, Victor and Remi de Bueck, Ant. Timmebroeck, Edu. Carpentier and Henri. Matagne collaborated. Father John Marie de Thezana was entrusted with the editing of the Annuus Graeco-Slavonicus, which appeared in the beginning of vol. xi. of October in 1864.

In 1882 the activities of the Bollandists were exerted in a new direction, with a view to bringing the work more into line with the progress of historical methods. A quarterly review was established under the title of Analecta Bollandiana by the Jesuit fathers C. de Smedt, G. van Hooff and J. de Backer. This reached its 25th volume in 1906, and was edited by the Bollandists de Smedt, F. van Ontroy, H. Delelave, A. Percelet and W. Delanghe. This review contains studies in preparation for the continuation and remoulding of the Acta Sanctorum, inedited texts, dissertations, and, since 1892, a Bulletin des publications hagiographiques, containing criticisms of recent works on hagiographic questions. In addition to this review, the Bollandists undertook the analysis of the hagiographic MSS. in the principal libraries. Besides numerous library catalogues published in the Analecta (e.g. those of Chartres, Namur, Ghent, Messina, Venice, etc.), separate volumes were devoted to the Latin MSS. in the Bibliothèque Royale at Brussels (2 vols., 1886–1889), to the Latin and Greek MSS. in the Bibliothèque Nationale at Paris (5 vols., 1889–1890), to the Greek MSS. in the Vatican (1890), and to the Latin MSS. in the libraries of Rome (1905 seq.). They also prepared inventories of the hagiographic texts hitherto published, and of these there have appeared the Bibliotheca hagiographica graeca (1895), the Bibliotheca hagiographica latina (1899) and the Bibliotheca hagiographica Orientalis. These indispensable works delayed the publication of the principal collection, but tended to give it a more solid basis and a strictly scientific stamp. In 1887 appeared vol. i. for November; in 1894, vol. ii., preceded by the Martyrologium Hieronymianum by J. B. de Rossi and the abbé Louis Duchesne; in 1902, the Propylaeum ad Acta Sanctorum Novembre, comprising the Synaxarium ecclesiae Constantiopolitanae.

There are three editions of the Acta Sanctorum: the original edition (Antwerp, Tongerloo and Brussels, 63 vols., 1643–1902); the Venice edition, stopping at vol. v. of September (1734–1770); and the Paris edition, stopping at vol. xiii. of October (61 vols., 1863–1883). In addition to these, there is a volume of tables, edited by the abbé Rigolot.

See Acta Sanctorum polonicæ libris ... vindictæ (Antwerp, 1755); L. P. Gachard, Mémoire historique sur les Bollandistes (Brussels, 1833); van Hecke, De ratione operum Bollandianorum (Acta Sanctorum 1937, vii.) and Carello, B. Pitra et ses ouvrages sur la collection des Actes des Saints (Paris, 1880). (H. DES.)

BOLOGNA, GIOVANNI DA (1524–1668) [Ital. for his real name, JEAN BOLOGNE or BOULONGNE], French sculptor, was born at Douai in 1524. His early training as a sculptor was conducted at Antwerp, but at the age of twenty-five he went to Italy and he settled in 1553 in Florence, where his best works still remain. His two most celebrated productions are the single bronze figure of Mercury, poised on one foot, resting on the head of a zephyr, as if in the act of springing into the air (in the Bargello gallery), and the marble group known as the Rape of the Sabines, which was executed for Francesco de’ Medici and received this name, Lanzi informs us, after it was finished. It is now in the Loggia de Lanzi of the ducal piazza. Giovanni was also employed at Genoa, where he executed various excellent works, chiefly in bronze. Most of his pieces are characterized by great spirit and elegance. His great fountain at Bologna (1563–1567) is remarkable for beauty of proportion. Noteworthy also are his two fountains in the Boboli gardens, one completed in 1576 and the other in 1585. He also cast the fine bronze equestrian statue of Cosimo de’ Medici at Florence and the very richly decorated west door of Pisa cathedral. One of Bologna’s best works, a group of two nude figures fighting, is now lost. A fine copy in lead was at one time in the front quadrandrel of Brazenose College, Oxford. In 1881 it was sold for old lead by the principal and fellows of the college, and was melted down by the plumber who bought it.

See La Vie et l’oeuvre de Jean Bologne, par Abel Desjardins, d’après les manuscrits—re cueillis par Fouques de Vagnonville (1883, numerous illustrations; list of works).

BOLOGNA, a city and archiepiscopal see of Emilia, Italy, the capital of the province of Bologna, and headquarters of the VI. arrondissement. It is situated on the east bank of the river Reno, 134 ft. above sea-level at the base of the Apennines, 82 m. due N. of Florence by rail, 63 m. by road and 50 m. direct, and 134 m. S.E. of Milan by rail. Pop. (1901) town, 102,122; commune 153,501. The more or less rectangular Roman city, oriented on the points of the compass, with its streets arranged at right angles, can be easily distinguished from the outer city, which received its fortifications in 1206 (see G. Gozzadini, Studi archeologico-topografici sulla città di Bologna, Bologna, 1869). The streets leading to the gates of the latter radiate from the outskirt, and not from the centre, of the former. Some of the oldest churches, however, lie outside the limits of the Roman city (of which no buildings remain above ground) such as S. Stefano, S. Giovanni in Monte and SS. Vitale ed Agricola. The first consists of a group of no less than seven different buildings, of different dates; the earliest of which, the former cathedral of SS. Pietro e Paolo, was constructed about the middle of the 4th century, in part with the débris of Roman buildings; while S. Sepolcro, a circular church with ornamentation in brick and an imitation of opus reticulatum, should probably be attributed to the 6th or 7th centuries. The present cathedral (S. Pietro), erected in 1100, is now almost entirely in the baroque style. The largest church in the town, however, is that of S. Petronio, the patron saint of Bologna, which was begun in 1399; only the nave and aisles as far as the transepts were, however, completed, but even this is a fine fragment, in the Gothic style, measuring 384 ft. long, and 157 wide, whereas the projected length of the whole (a cruciform basilica) was over 500 ft., with a breadth across the transepts of 460 ft., and a dome 300 ft. high over the crossing (see Fig. Cavazzza in Rassegna d’Arte, 1905, 161). The church of S. Francesco, now called the church of the holy body of the saint, who died here in 1221, is unfinished externally, while the interior was remodelled in the 18th century. There are many other churches of interest, among them S. Francesco, perhaps the finest medieval building in Bologna, begun in 1246 and finished in 1260; it has a fine brick campanile of the end of the 14th century. It was restored to sacred uses in 1887, and has been carefully liberated from later alterations (U. Berti in the Rassegna d’Arte, 1905, 15). The church of Corpus Domini has fine 11th-century terra cotta on the façade (F. Malaguzi Valeri in Archivio Storico dell’Arte, ser. ii. vol. ii. (Rome, 1896), 75). The centre of the town is formed by the Piazza Vittorio Emanuele (formerly Piazza Maggiore), and the Piazza del Nettuno, which lie at right angles to one another. Here are the church of S. Petronio, the massive Palazzo Comunale, dating from 1245, the Palazzo del Podesta, completed in the same year, and the
BOLSENA—BOLSOVER

fine bronze statue of Neptune by Giovanni da Bologna (Jean Bologne de Douai).

The famous university of Bologna was founded in the 11th century (its foundation by Theodoric the Great in A.D. 492 is legendary), and acquired a European reputation as a school of jurisprudence under Pepo, the first known teacher at Bologna of Roman law (about 1076), and his successor Inerius and their followers the glossators. The students numbered between three and five thousand in the 12th and the 15th century, and in 1262, it is said, nearly ten thousand (among them were both Dante and Petrarch). Anatomy was taught there in the 14th century. But despite its fame, the university, though an autonomous corporation, does not seem to have had any fixed place where the professors lectured in their own houses, or later in rooms hired or lent by the civic authorities. It was only in 1520 that the professors of law were given apartments in a building belonging to the church of S. Petronio; and in 1562, by order of Pius IV., the university itself was constructed close by, by Carlo Borromeeo, then cardinal legate. The reason of this measure was no doubt partly disciplinary, Bologna itself having in 1506 passed under the dominion of the papacy. Shortly after this, in 1564, Tasso was a student there, and was tried for writing a satirical poem. One of the most famous professors was Marcello Malpighi, a great anatomist of the 17th century. The building has served as the communal library since 1838. Its courtyard contains the arms of those students who were elected as representatives of their respective nations or faculties. The university has since 1803 been established in the (16th century) Palazzo Poggi. Between 1815 and 1848 the number of students sank to about a hundred in some years, chiefly owing to the political persecutions of the government: in 1859 the number had risen to 355. It now possesses four faculties and is attended by some 1700 students. Among its professors women have more than once been numbered.

The Museo Civico is one of the most important museums in Italy, containing especially fine collections of antiquities from Bologna and its neighbourhood. The picture gallery is equally important in its way, affording a survey both of the earlier Bolognese paintings and of the works of the Bolognese eclecticists of the 16th and 17th centuries, the Caracci, Guido Reni, Domenichino, Guercino, &c. The primitive masters are not of great excellence, but the works of the masters of the 16th century, especially those of Jacopo Robusti (1466-1537) and Lorenzo Costa of Ferrara (1460-1535), are of considerable merit. The great treasure of the collection is, however, Raphael's S. Cecilia, painted for the church of S. Giovanni in Monte, about 1515.

The two leaning towers, the Torre Asinelli and the Torre Garisenda, dating from 1109 and 1110 respectively, are among the most remarkable structures in Bologna: they are square brick towers, the former being 320 ft. in height and 4 ft. out of the perpendicular, the latter (unfinished) 163 ft. high and 10 ft. out of the perpendicular. The town contains many fine private palaces, dating from the 15th century onwards. The streets are as a rule arcaded, and this characteristic has been preserved in modern additions, which have on the whole been made with considerable taste, as have also the numerous restorations of medieval buildings. A fine view may be had from the Madonna di S. Luca, on the south-west of the town (938 ft.).

Among the specialties of Bologna may be noted the salami or mortadella (Bologna sausage), tortellini (a kind of macaroni) and liqueurs.

Bologna was for a short while subject to the Lombards, remaining generally under the rule of the exarchate of Ravenna, until this in 756 was given by Pippin the Elder to the papacy. It was sacked by the Hungarians in 902, but otherwise its history is little known, and it is uncertain when it acquired its freedom and its motto Libertas. But the first "constitution" of the commune of Bologna dates from about 1123, and at that time we find it a free and independent city. From the 12th to the 14th century it was very frequently at war, and strongly supported the Guelph cause against Frederick II. and against the neighbouring cities of Romagna and Emilia; indeed, in 1240 the Bolognese took Enzo, the emperor's son, prisoner, and kept him in confinement for the rest of his life. But the struggles between Guelphs and Ghibellines in Bologna itself soon followed, and the commune was so weakened that in 1337 Taddeo de' Pepoli made himself master of the town, and in 1350 his son sold it to Giovanni Visconti of Milan. Ten years later it was given to the papacy, but soon revolted and recovered its liberty. In 1401 Giovanni Bentivoglio made himself lord of Bologna, but was killed in a rebellion of 1402. It then returned to the Visconti, and after various struggles with the papacy was again secured in 1438 by the Bentivoglio, who held it till 1506. It then passed into the hands of the Gonzagas. Bologna was annexed to the papal dominion in 1717 and finally acquired its present constitution in 1797, and in 1815 and during the revolutions of 1821 and 1831 until in 1860 it became part of the kingdom of Italy.

Among the most illustrious natives of Bologna may be noted Luigi Galvani (1737-1798), the discoverer of galvanism, and Prospero Lambertini (Pope Benedict XIV.).

BOLSENA (anc. Volsciini), a town of the province of Rome, Italy, 12 m. W.S.W. of Orvieto by road, situated on the north-east bank of the lake of Bolsena. The town is dominated by a picturesque medieval castle, and contains the church of S. Christina (martyred by drowning in the lake, according to the legend, in 278) which dates from the 10th century and contains some frescoes, perhaps of the school of Giotto. It has a fine Renaissance façade, constructed about 1500 by Cardinal Giovanni de'Medici (afterwards Pope Leo X.), and some good terra cottas by della Robbia. Beneath the church are catacombs, with the tomb of the saint, discovered in 1850 (E. Stevenson in Notizie degli Scavi, 1848, 262; G. B. de Rossi in Bulletino d'Istituto di Studi Romani, 1849, 242). Two sides of the altars in this crypt occurred the miracle of Bolsena in 1263. A Bohemian priest, sceptical of the doctrine of transubstantiation, was convinced of its truth by the appearance of drops of blood on the host he was consecrating. In commemoration of this Pope Urban IV. instituted the festival of Corpus Christi, and ordered the erection of the cathedral of Orvieto. The miracle forms the subject of a celebrated fresco by Raphael in the Vatican.

The Lake of Bolsena (anc. Lacus Volsciensis), 1000 ft. above sea-level, 71 sq. m. in area, and 480 ft. deep, is almost circular, and was the central point of a large volcanic district, though it is probably not itself an extinct crater. Its sides show fine basaltic formation in places. It abounds in fish, but its banks are somewhat deserted and not free from malaria. It contains two islands, Bisentina and Martana, the former containing a church constructed by Vignola, the latter remains of the castle where Alamansutha, the daughter of Theodoric, was imprisoned and strangled.

BOLSOVER, an urban district in the north-eastern parliamentary division of Derbyshire, England, 53 m. E. of Chesterfield, on branch lines of the Midland and the Great Central railways. Pop. (1901) 6844. It lies at a considerable height on a sharp slope above a stream tributary to the river Rother. The castle round which the town grew up was founded

1 According to the theory now generally adopted, the Etruscan Volsci occupied the site of Orvieto, which was hence called Urbis rusto in late classical and medieval times, while the Roman Volsci was transferred to Bolsena (see Volsciini).
shortly after the Conquest by William Peveril, but the existing building, a fine castellated residence, was erected on its site in 1613. The town itself was fortified, and traces of early works remain. The church of St Mary is of Norman and later date; it contains some interesting early stone-carving, and monuments to the Bowsers. It is now the church to which the castle was adapted in the 16th century. Coal-mining and quarrying are carried on in the neighbourhood of Bolsover.

BOLSWARD, a town in the province of Friesland, Holland, 64 m. W.N.W. of Sneek. A steam-tramway connects it with Sneek, Makkum, Harlingen and Franeker. Pop. (1800) 6537.

The Great church, or St Martin's (1446-1460) is a large building containing some good carving, a fine organ and the tombs of many Frisian nobles. The so-called Small church, dating from about 1280, also contains fine carving and tombstones; and is the remnant of a Franciscan convent which once existed here. Bolsward also possesses a beautiful renaissance town-hall (1614-1618) and various educational and charitable institutions, including a music and a drawing school. It has an active trade in agricultural produce, and some spinning-mills and tile and pottery works. The town is mentioned in 725, when it was situated on the Middle Sea. When this receded, a canal was cut to the Zuider Zee, and in 1422 it was made a Hansa town.

The medieval constitution of Bolsward, though in its government by eight scabini, with judicial, and four councillors with administrative functions, it followed the ordinary type of Dutch cities, was in some ways peculiar. The family of Jongema had certain hereditary rights in the administration, which, though not mentioned in the town charter of 1455, were defined in that of 1464. According to this the head of the family sat for two years with the scabini and the third year with the councillors, and had the right to administer an oath to one of each body. More singular was the influential position assigned, in civil legislation and administration, to the clergy, to whom in conjunction with the councillors, there was, even in certain cases, an appeal made from the judgment of the scabini.

See C. Hegel, Studie u. Gülden der germanischen Völker im Mutter aller (Leipzig, 1894).

BOLT, an O. Eng. word (compare Ger. Bole, an arrow), for a "quarrel" or cross-bow shaft, or the pin which fastened a door. From the swift flight of an arrow comes the verb "to bolt," as applied to a horse, &c., and such expressions as "bolt upright," meaning straight upright; also the American use of "bolt" for refusing to support a candidate nominated by one's own party. In the sense of a straight pin for a fastening, the word has come to mean various sorts of appliances. From the sense of "fastening" have also derived the use of a bolt as a definite length (in a roll) of a fabric (40 ft. of canvas, &c.). From another "bolt" or "boul" to sift (through O. Fr. bulot, from the Med. Lat. buretale or butelare), come such expressions as in Shakespeare's Winter's Tale, "The fann'd snow, That's bolted by the northern blasts twice o'er," or such a figurative use as in Burke's "The report of the committee was examined and sifted and bolted to the bran." From this sense comes that of 'to moot, or discuss, as in Milton's Comus, "I hate when vice can bolt her arguments."

BOLTON, DUKES OF. The title of duke of Bolton was held in the family of Powlett or Paulet from 1659 to 1754. Charles Powlett, the 1st duke (c. 1625-1690), who became 6th marquess of Winchester on his father's death in 1675, had been member of parliament for Winchester and then for Hampshire from 1660 to 1675. Having supported the claim of William and Mary to the English throne in 1688, he was restored to the privy council and to the office of lord-lieutenant of Hampshire, and was created duke of Bolton in April 1689. An eccentric man, hostile to the Hanoverians and afterwards to Marlborough, he is said to have travelled during 1687 with four horses and 100 servants, sleeping during the day and giving entertainments at night. He died in February 1690, and was succeeded by his elder son, Charles, 2nd duke of Bolton (1661-1722), who had also been a member of parliament for Hampshire and a supporter of William of Orange. He was lord-lieutenant of Hampshire and of Dorset, a commissioner to arrange the union of England and Scotland; and was twice a lord justice of the kingdom. He was also lord chamberlain of the royal household; governor of the Isle of Wight; and for two short periods was lord-lieutenant of Ireland. His third wife was Henrietta (d. 1730), a natural daughter of James, duke of Monmouth. According to Swift this duke was "a great booby." His eldest son, Charles, 3rd duke of Bolton (1685-1754), was a member of parliament for Winchester 1705-1717, when he was made a peer as Baron Pawlet of Basing. He filled many of the public offices which had been held by his father, and also attained high rank in the British army. Having displeased Sir Robert Walpole he was deprived of several of his offices in 1733 but some of them were afterwards restored to him, and he raised a regiment for service against the Jacobites in 1745. He was a famous gallant, and married for his second wife the singer, Lavinia Fenton (d. 1760), a lady who had previously been his mistress. He died in August 1754, and was succeeded as 4th duke by his brother Harry (c. 1660-1750), who had been a member of parliament for forty years, and who followed the late duke as lord-lieutenant of Hampshire. The 4th duke's son, Charles (c. 1718-1769), who became 5th duke in October 1750, committed suicide in London in July 1755, and was succeeded by his brother Harry (c. 1719-1794), an admiral in the navy, on whose death without sons, in December 1794, the dukedom became extinct. The other family titles descended to a kinsman, George Paulet (1722-1800), who thus became 12th Duke of Winchester. In 1778 Thomas Orde (1746-1807) married Jean Mary (d. 1814), a natural daughter of the 5th duke of Bolton, and this lady inherited Bolton Castle and other properties on the death of the 6th duke. Having taken the additional name of Powlett, Orde was created Baron Bolton in 1797, and the barony has descended to his heirs.

BOLTON (or BOULTON), EDMUND (1572-1633), English historian and poet, was born by his own account in 1575. He was brought up a Roman Catholic, and was educated at Trinity Hall, Cambridge, afterwards residing in London at the Inner Temple. In 1600 he contributed to England's Helicon. He was a retainer of the duke of Buckingham, and through his influence he secured a small place at the court of James I. Bolton formulated a scheme for the establishment of an English academy, but the project fell through after the death of the king, who had regarded it favourably. He wrote a Life of King Henry II. for Speed's Chronicle, but his Catholic sympathies betrayed themselves in his treatment of Thomas Becket, and a life by Dr John Barcham was substituted (Wood, Ath. Oxon. ed. Bliss, iii. 36). The most important of his numerous works are Hypercritica (1618), a book which has not been valued for its notices of contemporary authors, reprinted in Joseph Haslewood's Ancient Critical Essays (vol. ii., 1815); Nero Caesar, or Monarchie Deprased (1624), with special note of British affairs. Bolton was still living in 1633, but the date of his death is unknown.

BOLTON (BOLTON-LE-MOORS), a municipal, county and parliamentary borough of Lancashire, England, 160 m. N.W. by N. from London and 11 m. N.W. from Manchester. Pop. (1891) 146,687; (1901) 168,315. Area, 15,275 acres. It has stations on the London & North-Western and the Lancashire & Yorkshire railways. The town is divided by the Croal, a small tributary of the Irwell, into Great and Little Bolton, and as the full name implies, is surrounded by high moorland. Although of early origin, its appearance, like that of other great manufacturing towns of the vicinity, is wholly modern. It owes not a little to the attractions of its site. The only remains of antiquity are two houses of the 16th century in Little Bolton, of which one is a specially good example of Tudor work. The site of the church of St Peter has long been occupied by a parish church (there was one in the 16th century, if not earlier), but the existing building dates only from 1870. There may also be mentioned a large number of other places of worship, a town hall with fine classical façade and tower, market hall, museums of natural history and of art and industry, an exchange, assembly rooms, and various benevolent institutions. Several free libraries are maintained. Lever's grammar school,
BOLTON ABBEY—BOMB

found in 1641, had Robert Ainsworth, the Latin lexicographer, and John Lemprière, author of the classical dictionary, among its masters. There are municipal technical schools. A large public park, opened in 1856, was laid out as a relief work for unemployed operatives during the cotton famine of the earlier part of the decade. On the moors to the north-west, and including Rivington Pike (1192 ft.), is another public park, and there are various smaller pleasure grounds. A large number of cotton mills furnish the chief source of industry; printing, dyeing and bleaching of cotton and calico, spinning and weaving machine making, iron and steel works, and collieries in the neighbourhood, are also important. The specialty, however, is fine spinning, a process assisted by the damp air of the Midland basin. The town is a parliamentary borough, created in 1832 and returning two members, falls within the Westhoughton division of the county. Before 1838, when Bolton was incorporated, the town was governed by a borough-revee and two constables appointed at the annual court-leet. The county borough was created in 1888. The corporation consists of a mayor, 24 aldermen and 72 councillors.

The earliest form of the name is Bodleton or Bothelton, and the most important of the later forms are Bodelton, Bothelton-le-Moors, Bothelton-le-Furne, Bolton-super-Moors, Bolton-in-y- Moors, Bolton-le-Moors. The manorial borough, created by John de Poicou, and passed through the families of Fergus and Pilkington to the Harringtons of Hornby Castle, who lost it with their other estates for their adherence to Richard III. In 1485 Henry VII. granted it to the first earl of Derby. The manor is now held by different lords, but the earls of Derby still have a fourth part. The manor of Little Bolton seems to have been, at least from Henry III.'s reign, distinct from that of Great Bolton, and was held till the 17th century by the Botheltons or Boltons.

From early days Bolton was famous for its woolen manufactures. In Richard I.'s reign an alneger, whose duty it was to measure and stamp all bundles of woolen goods, was appointed, and it is clear, therefore, that the place was already a centre of the woolen cloth trade. In 1337 the industry received an impulse from the settlement of a party of Flemish clothiers, and extended so greatly that when it was found necessary in 1566 to appoint by act of parliament deputies to assist the alnegers, Bolton is named as one of the places where these deputies were to be employed. In his Itinerary (1568) recorded the fact that Bolton made cottons, which were in reality woolen goods. Real cotton goods were not made in Lancashire till 1641, when Bolton is named as the chief seat of the manufacture of fustians, vermillions and dimities. After the revocation of the edict of Nantes the settlement of some French refugees further stimulated this industry. It was here that velvets were first made about 1750, by Jeremiah Clarke, and muslins and cotton quiltings in 1763. The cotton trade received an astonishing impetus from the inventions of Sir Richard Arkwright (1770), and Samuel Crompton (1780), both of whom were born in the parish. Soon after the introduction of machinery, spinning factories were erected, and the first built in Bolton is said to have been set up in 1780. The number rapidly increased, and in 1851 there were 66 cotton mills with 860,000 throttle spindles at work. The cognate industry of bleaching has been carried on since early in the 18th century, and large ironworks grew up in the latter half of the 19th century. In 1791 a canal was constructed from Manchester to Bolton, and by an act of parliament (1792) Bolton Moor was enclosed.

During the Civil War Bolton sided with the parliament, and in February 1643 and March 1644 the royalist forces assaulted the town, but were on both occasions repulsed. On the 28th of May 1644, however, it was attacked by Prince Rupert and Lord Derby, and stormed with great slaughter. On the 15th of October 1651 Lord Derby, who had been taken prisoner after the battle of Worcester, was brought here and executed the same day.

Up to the beginning of the 19th century the market day was Monday, but the customary Saturday market gradually superseded this old chartered market. In 1251 William de Ferrers obtained from the crown a charter for a weekly market and a yearly fair, but gradually this annual fair was replaced by four of the chief horse fairs, New Year and Whit-sunrise Show fairs only arose during the 19th century.

BOLTON ABBEY, a village in the West Riding of Yorkshire, England, 22 m. N.W. from Leeds and 53 from Ilkley by the Midland railway. It takes its name, inaccurately, from the great foundation of Bolton Priory, the ruins of which are among the most exquisitely situated in England. They stand near the right bank of the upper Wharfe, the valley of which is beautifully wooded and closely enclosed by hills. The earliest part of the church is of transitional Norman date; the nave, which is plane, is Early English Decorated. The transepts and choir are ruined, and the remains of domestic buildings are slight. The manor of Bolton Abbey with the rest of the district of Craven was granted by William the Conqueror to Robert de Romilli, who evidently held it in 1086, although there is no mention made of it in the Domesday survey. William de Meschines and Cicely de Romilli, his wife, heirs of Robert, founded and endowed a priory at Embry or Emmesay, near Skipton, in 1126, but it was moved here in 1151 by their daughter, Alice de Romilli, wife of William FitzDuncan, who gave the site for the new abbey to the earl of Chester. After the dissolution of the monasteries the manor was sold in 1554 to Henry Clifford, 2nd earl of Cumberland, whose descendants, the dukes of Devonshire, now hold it.

BOLZANO, BERNHARD (1751–1848), Austrian priest and philosopher, was born at Prague on the 5th of October 1781. He distinguished himself at an early age, and on his ordination to the priesthood (1805) was appointed professor of the philosophy of religion in Prague University. His lectures, in which he endeavoured to show that Catholic theology is in complete harmony with reason, were received with eager interest by the younger generation of thinkers. But his views met with much opposition; and it was only through the protection of the archbishop, Prince Salm-Salm, that he was enabled to retain his chair. In 1850 he was accused of being connected with some of the students' revolutionary societies, and was compelled to resign. Several doctrines extracted from his works were condemned at Rome, and he was suspended from his priestly functions, spending the rest of his life in literary work. He died at Prague on the 18th of December 1848. The most important of his numerous works are the Wissenschaftslehre, oder Versuch einer neuen Darstellung der Logik, advocating a scientific method in the study of logic (4 vols., Sulzbach, 1837); the Lehrbuch der Religionswissenschaft (4 vols., Sulzbach, 1834), a philosophic representation of all the dogmas of Roman Catholic theology; and Alhazendi, oder Gründe für die Unsterblichkeit der Seele (2nd ed., Mainz, 1838). In philosophy he followed Reinhard in ethics and the monodology of Leibnitz, though he was also influenced by Kant.

See Lebensbeschreibung des Dr Bolzana (an autobiography, 1836); Wiss. Haupt, Sitten aus dem Leben Dr Bolzana (1850); Falcky, Kant und Bolzana (Halle, 1902).

BOMA (properly Momba), a port on the north bank of the river Congo about 60 m. from its mouth, the administrative capital of Belgian Congo. Pop. about 5000. It was one of the places at which the European traders on the west coast of Africa established stations in the 16th and 17th centuries. It became the entrepot for the commerce of the lower Congo and a well-known mart for slaves. The trade was chiefly in the hands of Dutch merchants, but British, French and Portuguese firms soon came across the river. They were all fiercely fought by the natives, though the names of the places were all made up. The smoke of the slave fires at night could be seen from a great distance, though the huts themselves were not more than eight or ten feet in height. The coast was not reconnoitred before the 16th century, and was explored by the Portuguese in 1553. The fort of Bengo, the first built, was taken by the British in 1836, and in 1843 the Portuguese made it a free port. The English settlement was made not far from the mouth of the river, where some of the Portuguese and Spanish founded their first villages the same year. The port is now a considerable town with a busy trade. It is connected by a railway with the interior.
Gr. ὄβος, a hammering, buzzing noise, cf. “bombard” (q.v.). At the present day it is most frequently used of a shattering or incendiary grenade, or of an explosive vessel actuated by clockwork or trip mechanism, employed to destroy life or property. In naval warfare, before the introduction of the shell gun, explosive projectiles were carried principally by special vessels known as bomb-vessels, bombardos or, colloquially, bombs.

The name “bombard” is given to certain masses of lava which have been hurled forth from a volcanic vent by explosive action. In shape they are spheroidal, ellipsoidal or discoidal; in structure they may be solid, hollow or more or less cavernous; whilst in size they vary from that of a walnut to masses weighing several tons. It is generally held that the form is partly due to rotation of the mass during its aerial flight, and in some cases the bomb becomes twisted by a gyrotary movement. According, however, to Dr H. J. Johnston-Lavis, many of the so-called bombs of Vesuvius are not projectiles, but merely globular masses formed in a stream of lava; and in like manner Professor J. D. Dana showed that what were regarded as bombs in Hawaii are in many cases merely lava-balls that have not been hurled through the air. Certain masses of pumice ejected from Vulcano have been called by Johnston-Lavis “bread-crust bombs,” since they present a coating of obsidian which has been bent and cracked in a way suggestive of the crust of a roll. It is probable that here the acid magma was expelled in a very viscous condition, and the crust which formed on cooling was burst by the steam from the occluded water. Some of the bombs thrown out during eruption of Etna consist of white granular quartz, encased in a black scoriaceous crust, the quartz representing an altered sandstone. The bombs of granular olivine, found in some of the tuffs in the Eifel, are represented in most geological collections (see Volcano).

**BOMBARD** (derived through Med. Lat. and Fr. forms from Gr. ὄβος, to make a humming noise), a term applied in the middle ages to a sort of cannon, used chiefly in sieges, and throwing heavy stone balls; hence the later use as a verb (see BOMBARDMENT). The term, in various forms, was also given to a medieval musical instrument (“bombard,” “bumbart,” “pomhar,” “pommer”), the forerunner of the bass oboe or schalmein. At the present day a small primitive oboe called bombarde, with eight holes but no keys, is used among the Breton peasants.

**BOMBARDIER**, originally an artilleryman in charge of a bombard; now a non-commissioned officer in the artillery of the British army, ranking below a corporal.

**BOMBARDMENT**, an attack by artillery fire directed against fortifications, troops in position or town or building. In its strict meaning the term is only applied to the bombardment of defenceless or undefended objects, houses, public buildings, &c., the object of the assailant being to dishearten his opponent, and specially to force the civil population and authorities of a besieged place to persuade the military commandant to capitulate before the actual defences of the place have been reduced to impotence. It is, therefore, obvious that mere bombardment can only achieve its object when the amount of suffering inflicted upon non-combatants is sufficient to break down their resolution, and when the commandant permits himself to be influenced or coerced by the sufferings of his people. A large scale of bombardment will sometimes induce a place to surrender, but instances of its fulfilment being followed by success are rare; and, in general, with a determined commandant, bombardments fail of their object. Further, an intentionally terrific fire at a large target, unlike the slow, steady and minutely accurate “artillery attacks” directed upon the fortifications, requires the expenditure of large quantities of ammunition, and wears out the guns of the attack. Bombardments are, however, frequently resorted to in order to test the temper of the garrison and the civil population, a notable instance being that of Strasbourg in 1870. The latter is often loosely employed to describe artillery attacks upon forts or fortified positions in preparation for assaults by infantry.

**BOMBARDON, or BASS TUBA**, the name given to the bass and contrabass of the brass wind in military bands, called in the orchestra bass tuba.

The name of bombardon is unquestionably derived from bombardone, the Italian for contrabass pommer (bombard), which, before the invention of the fagotto, formed the bass of medieval orchestras; it is also used for a bass reed stop of 16 ft. tone on the organ. The bombardon was the very first bass wind instrument fitted with valves, and it was at first known as the corona basso, clarior or bass horn (not to be confounded with the bass horn with keys, which on being perfected became the ophicleide). The name was attached more to the position of the wind instruments as bass than to the individual instrument. The original corona basso was a brass instrument of narrow bore with the pistons set horizontally. The valve-ophicleide in F of German make had a wider bore and three vertical pistons, but it was only a “half instrument,” measuring about 12 ft. A. Kalbfrenner, in his life of W. Wieprecht (1882), states that in the Jäger military bands of Prussia the corona basso (keyed bass horn) was introduced as bass in 1829, and the bombardon (or valve-ophicleide) in 1831; in the Guards these instruments were superseded in 1835 by the bass tuba invented by Wieprecht and J. G. Moritz.

The modern bombardon is made in two forms: the upright model, used in stationary band music; and the circular model, known as the helicron, worn round the body with the large bell resting on the left shoulder, after the style of the Roman corona (see Horn), which is a more convenient way of carrying this heavy instrument when marching. The bombardon, and the euphonium, of which it is the bass, are the outcome of the application of valves to the bugle family whereby the saxhorns were also produced. The radical difference between the saxhorns and the tubas (including the bombardon) is that the latter have a sufficiently wide conical bore to allow of the production of fundamental sounds in a rich, full quality of immense power. This difference, first recognized in Germany and Austria, has given rise in those countries to the classification of the brass wind as “half” and “whole” instruments (Halbe und Grosse Instrumente). When the brass wind instruments with conical bore and cup-shaped mouthpiece first came into use, it was a well-understood principle that the tube of each instrument must theoretically be made twice as long as an organ pipe giving the same note; for example, the French horn sounding the 8ft. C of an 8ft. organ pipe, must have a tube 16ft. long; C then becomes the second harmonic of the series for the 16ft. tube, the first or fundamental being unobtainable. After the introduction of pistons, instrument-makers experimenting with the bugle, which has a conical bore of very wide diameter in proportion to its length, found that by means of valves constructed on the same principle gave out the fundamental full and clear. A new era in the construction of brass wind instruments was thus inaugurated, and now that the proportions of the bugle have been adopted, the tubes of the tubas are made just half the length of those of the older instruments, corresponding to the length of the organ pipe of the same pitch, so that a euphonium sounding 8 ft. C no longer needs to be 16 ft. but only 8 ft. The older instruments, such as the saxhorns, with narrow bore, have therefore been denominated “half instruments,” because only half the length of the instrument is of practical utility, while the tubas with wide bore are styled “whole instruments.” Bombardons are made in F and G of the 16ft. octave, corresponding to the orchestral bass tuba, double bass in strings, and pedal clarinet and contrabassoon in the wood wind. The bombardon in B flat or C, an octave lower than the euphonium, corresponds to the contrabass tuba in the orchestra.

1 See Dr F. Schaftädt’s article on Musical Instruments, section 4 of Bericht der Beurtheilungskommission bei der allg. deutschen Industrie-Ausstellung, 1854 (Munich, 1856), pp. 169-170; also Friedr. Ziemer, Die Musik und die Musikinstrumente in ihrer Beziehung zu den Geistes der Akustik (Glesien, 1855), p. 313.
The bombardons possess a chromatic compass of 3 to 4 octaves. The harmonic series consists of the harmonics from the 1st to the 8th.

**Bombardon in F flat.**

Harmonic Series of the Contrabass Bombardon in C.

For the bombardon in F, one tone higher.

For the Bb bombardon, one tone lower.

For the F# bombardon, one tone lower.

For the Bb bombardon, one tone lower.

The lowest notes produced by the valves are very difficult to obtain, for the lips seldom have sufficient power to set in vibration a column of air of such immense length, at a rate of vibration slow enough to synchronize with that of notes of such deep pitch. 1 Even when they are played, the lowest valve notes can hardly be heard unless doubled an octave higher by another bombardon.

Bombardons are generally treated as non-transposing instruments, the music being written as sounded, except in France and Belgium, where transposition is usual. The intervening notes are obtained by means of pistons in the valves, which by being depressed, either admit the wind into additional lengths of tubing to lower the pitch, or cut off a length in order to raise it. Bombardons usually have three or four pistons, each the pitch of the instrument respectively 1, 1, 2 and 3 1⁄2 tones (in Belgium, 1, 3, 2 and 3 3⁄4 tones). The valve system, disposal of the tubing and shape and position of the bell differ considerably in the various models of well-known makers.

In Germany and Austria, what is known as the cylinder action is largely used; for the piston or pump is substituted a four-way brass cock operated by means of a key and a series of cranks.

In order to obtain a complete chromatic scale throughout the compass, there must be, as on the slide-trombone, seven different positions or lengths of tubing available, each having its harmonic series. These different lengths are obtained on the bombardon by means of a combination of pistons, and instantaneous use of Nos. 2 and 3 lowers the pitch two tones; of Nos. 1, 2 and 3; three tones; of Nos. 1, 2, 3, 4, five and a half tones; &c. A combination of pistons, however, fails to give the interval with an absolutely correct intonation, since the length of tubing thrown open is not of the theoretical length required to produce it. Many ingenious conventions have been invented from time to time to remedy this inherent defect of the valve system, such as the six-valve independent system of Adolphe Sax; the Besson Regular, giving eight independent positions; the Besson compensating system Transposition; the Boosey automatic compensating piston invented by D. J. Besson; Boosey’s automatic compensating stopped bellows; and the most recently the Besson enharmonic valve system, with six independent tuning slides and three pistons, and Rudall, Carte & Company’s new (Knussmann’s patent) lore, conical through the open tube and additional lengths, have produced instruments which leave nothing to be desired as to intonation. (See VALVES AND TUBA.) (K. S.)

**BOMBAY CITY.**

The capital of Bombay Presidency, and the chief seaport of western India, situated in 18° 55’ N. and 72° 54’ E. The city stands on an island of the same name, which forms one of a group now connected by causeways with the mainland. The area is 22 sq. mi. and the population of the town and island (1901) 776,006 (estimate in 1906 977,822). Bombay is the second most populous city in the Indian empire, having fallen behind Calcutta at the census of 1901. Its position on the side of India nearest to Europe, its advantages as a port and a railway centre, and its monopoly of the cotton industry, are counteracted by the fact that the region which it serves cannot vie with the valley of the Ganges in point of fertility and has no great waterway like the Ganges or Brahmaputra. Nevertheless Bombay pushes Calcutta hard for supremacy in point of population and commercial prosperity.

The Bombay Island, or, as it ought to be more correctly called, the Bombay Peninsula, stands out from a coast embossed by lofty hills, and its harbour is studded by rocky islands and precipices, whose peaks rise to a great height. The approach from the sea discloses one of the finest panoramas in the world,—the only European analogy being the Bay of Naples. The island consists of a plain about 11 m. long by 3 broad, flanked by two parallel lines of low hills. A neck of land stretching towards the south-west forms the harbour on its eastern side, sheltering it from the force of the open sea, and enclosing an expanse of water from 5 to 7 m. wide. At the south-west of the island, Back Bay, a shallow basin rather more than 2 m. in breadth, runs inland for about 3 m. between the extreme points of the two ranges of hills. On a slightly raised strip of land between the head of Back Bay and the harbour is situated the fort, the nucleus of the city of Bombay. Protruding from the land slopes westward towards the central plain, a low-lying tract, which before the construction of the embankment known as the Hornby Vellard, used at high tide to be submerged by the sea. The town itself consists of well-built and unusually handsome native bazaars, and of spacious streets devoted to European commerce. In the native bazaar the houses rise three or four storeys in height, with elaborately carved pillars and front work. Some of the European hotels and commercial buildings are on the American scale, and are the most ornate in the city of India. The Taj Mahal hotel, which was built by the Taj Mahal family in 1904, is the most palatial and modern hotel in India. The private houses of the European residents lie apart alike from the native and from the mercantile quarters of the town. As a rule, each is built in a large garden or compound; and although the style of architecture is less imposing than that of the stately residences in Calcutta, it is well suited to the climate, and has a beauty and comfort of its own. The favourite suburb is Malabar hill, a high ridge running out into the sea, and terraced to the top by handsome houses, which command one of the finest views, of its kind, in the world. Of recent years wealthy natives have been competing with Europeans for the possession of this desirable quarter. To the right of this ridge, looking towards the sea, runs another suburb known as Breach Candy, built close upon the beach and within the refreshing sound of the waves. To the left of Malabar hill lies Back Bay, with a promontory on its farther shore, which marks the site of the old Bombay Fort; its walls are demolished, and the area is chiefly devoted to mercantile buildings. Further round the island, beyond the fort, is Mazagong Bay, commanding the harbour, and the centre of maritime activity. The defences of the port remodelled and armed with the latest guns, consist of batteries on the islands in the harbour, in addition to which there are three large batteries on the mainland. There is also a torpedoboat detachment stationed in the harbour.

No city in the world has a finer water-front than Bombay. The great line of public offices along the esplanade and facing Back Bay, which are in the Gothic style mixed with Saracenic, are not individually distinguished for architectural merit, but they have a cumulative effect of great dignity. The other most notable buildings in the city are the Victoria terminus of the Great Indian Peninsula railway and the Taj Mahal hotel. Towards the northern end of Malabar hill lie the Parsee Towers of Silence, where the Parsees expose their dead till the flesh is devoured by vultures, and then cast the bones into a well where they crumble into dust. The foundation-stone of a museum was laid by the prince of Wales in 1905.

**Local Government.**—The port of Bombay (including docks and warehouses) is managed by a port trust, the members of which are nominated by the government from among the commercial community. The municipal government of the city was framed by an act of the Bombay legislative council passed in 1888. The governing body consists of a municipal corporation and a town council. The corporation is composed of 72 members, of whom 18 are nominated by the government. Of the remainder, 30 are elected by the ratepayers, 16 by the justices of the peace, 2 by the senate of the university, and 2 by the chamber of commerce. The council, which forms the standing committee of the corporation, consists of 12 members, of whom 4 are nominated by the government and the rest elected by the corporation. The members of the corporation include Europeans.
Hindus, Mahomedans and Parsees. The Bombay University was constituted in 1857 as an examining body, on the model of the university of London. The chief educational institutions in Bombay City are the government Elphinstone College, two missionary colleges (Womers and St. Xavier's), the Grant medical college, the government law school, the Sir JamsheDarji Science school of art, and the Victoria Jubilee technical institute.

Docks.—The dockyard, originally built in 1736, has a sea-face of nearly 700 yds. and an area of about 300 acres. There are five graving docks, three of which together make one large dock 646 ft. long, while the other two make a single dock 582 ft. long. There are also four building slips opposite the Apollo Bandar (landing-place) on the south-east side of the enclosure. The dock-yard is lighted by electricity, so that work can be carried on by night as well as day. Bombay is the only important place near the sea in India where the rise of the tide is sufficient to permit docks on the largest scale. The highest spring tides here reach 17 ft., but the average is 14 ft. Prince's dock, of which the foundation-stone was laid by the prince of Wales in 1875, was opened in 1879, and is 1460 ft. long by 1000 ft. broad, with a water area of 30 acres; while the Victoria dock, which was completed and opened in 1887-1888, has a water area of 25 acres. South of the Victoria dock, the foundation-stone of the Alexandra dock, the largest in India, was laid by the prince of Wales in 1905.

Colony—Mills.—The milling industry is next to the docks, the chief feature of Bombay's commerce and success. The staple manufacture is cotton-spinning, but in addition to this there are flour mills and workshops to supply local needs. The number of factories increased from fifty-three in 1881 to eighty-three in 1890, and that decade saw the influx of a great industrial population from the surrounding districts; but the decade 1891-1901 witnessed at least a temporary set-back owing to the ravages caused by plague and the effects of over-production. In addition to the actual mortality it inflicted, the plague caused an exodus of the population from the island, disorganized the labour at the dockyards, and swelled the demand for the manufacture of goods which were spent by the municipality on plague operations and sanitary improvements. After 1901, however, both population and trade began to revive again. In 1901 there were 131,796 persons employed in the cotton industry.

Population.—Owing to its central position between East and West and to the diversity of races in India, no city in the world can show a greater variety of type than Bombay. The Maharrattas is the dominant race among the native races, but in addition to them are a great and influential section of Parsee merchants, Arab traders from the Gulf, Afghans and Sikhs from northern India, Bengalis, Rajputs, Chinese, Japanese, Malays, negroes, Tibetans, Sinhaleses and Siamese. Bombay is the great port and meeting-place of the Eastern world. Out of the large sections of its population, Hindu, Mahomedan, Parsee, Jain and Christian, the Parsees are one of the smallest and yet the most influential. They number only some 46,000 all told, but most of the great business houses are owned by Parsee millionaires and most of the large charities are founded by them.

History.—The name of the island and city of Bombay is derived from Mumba (a form of Parvati), the goddess of the Kolis, a race of bush-bearers and fishermen, who were the earliest known inhabitants, having occupied the island probably about the beginning of the Christian era. Bombay originally consisted of seven islands (the Heptanesia of Potlomy) and formed an outlying portion of the dominions of successive dynasties dominant in western India: Satavahanas, Mauryas, Chaulyaks and Rashtarakas. In the Maurya and Chaulya period (450-750) the city of Puri on Elephanta Island was the principal place in Bombay harbour. The first town built on Bombay Island was Mahakavati (Mahim), founded by Hydas, probably a member of the house of the Yadavas of Deogarh, as a result of Aa-ud-din Khilji's raid into the Deccan in 1294. It remained under Hindu rule until 1348, when it was captured by a Mahomedan force from Gujarat; and the islands remained part of the province (later kingdom) of Gujarat till 1534, when they were ceded by Sultan Bahadur to the Portuguese.

The island did not prosper under Portuguese rule. By the system known as aforamento the lands were gradually parcelled out into a number of fiefs granted, under the crown of Portugal, to individuals or to religious corporations in return for military service or equivalent quit-rents. The northern districts were divided among the Franciscans and Jesuits, who built a number of churches, some of which still survive. The intolerance of their rule did not favour the growth of the settlement, which in 1661, when it was transferred to the British, had a population of only 10,000. The English had, however, long recognized its value as a naval base, and it was for this reason that they fought the battle of Swally (1644-1653), attempted to capture the place in 1666, and that the Surat Council urged the purchase of Bombay from the Portuguese. In 1664 the directors of the Company drew Cromwell's attention to this suggestion, laying stress on the excellence of its harbour and its safety from attack by land. It finally became the property of the British in 1661 as part of the dowry of the infant lady Catherine of Portugal on her marriage to Charles II, but was not actually occupied by the British until 1665, when they experienced much difficulty in overcoming the opposition of the Portuguese, and especially of the religious orders, to the cession. In 1668 it was transferred by the crown to the East India Company, who placed it under the factory of Surat.

The real foundation of the modern city dates from this time, and was the work of Gerald Angier (or Angier), brother of Francis Angier, 3rd Lord Angier of Longford and 1st Earl of Longford in Ireland (d. 1700), who succeeded Sir George Oxenden as president of Surat in 1669 and died in 1677. At this time Bombay was threatened by the Maharrattas from inland, by the Malabar pirates and the Dutch from the sea, and was cut off from the mainland by the Portuguese, who still occupied the island of Salsette and had established a customs-barrier in the channel between Bombay and the shore. In spite of the niggardly policy of the court of directors, who refused to incur the expense of reinforcing Angier and the other English settlements on the town and shore; he also raised a force of militiamen and regulars, the latter mainly Germans (as more trustworthy than the riff-raff collected in London by the Company's crimps). In 1672 Angier transferred his headquarters to Bombay, and after frightening off an imposing Dutch fleet, which in 1670 attempted to surprise the island, set to work to organize the settlement anew. To this task he brought a mind singularly enlightened and a sincere belief in the best traditions of English liberty. In its fiscal policy, in its religious intolerance, and in its cruel and contemptuous treatment of the natives, Portuguese rule had been alike oppressive. Angier altered all this. With the consent of "a general assembly of the chief representatives of the people" he commuting the burdensome land tax for a fixed money payment; he protected all castes in the celebration of their religious ceremonies; and he forbade any compulsion of natives to carry burdens against their will. The result was that the population of Bombay increased rapidly; a special quarter was set apart for the banyas, or capitalist, class of Hindus; while Parsees and Armenians flocked to a city where they were secure of freedom alike for their trade and their religion. Within eight years the population had grown from 10,000 to 60,000. The immediate result of this concentration of people in a spot so unhealthy was the prevalence of disease, produced by the appalling sanitary conditions. This, too, Angier set himself to remedy. In 1675 he initiated the works for draining the foul tidal swamps; and, failing the consent of the Company to the erection of a regular hospital, he turned the law court into an infirmary. He also set up three courts of justice: a tribunal for petty causes under a factor with native assessors, a court of appeal under the deputy governor and members of council, and a court-martial. A regular police force was also established and a gaol built in the Bazaar.1

During this period, however, the position of Bombay was sufficiently precarious. The Malabar pirates, though the city itself was too strong for them, were a constant menace to its

1 Hunter, Hist. of British India, ii. pp. 212, 8Cc.
trade; and it required all the genius of Aungier to maintain the settlement, isolated as it was between the rival powers of the Mahatta and the Mogul empire. After his death, on the 2nd of June 1660, his spirit was not precocious. Even under Aungier the Siddi admirals of the Moguls had asserted their right to use Bombay harbour as winter quarters for their fleet, though they had failed to secure it as a base against the Mahatta. Under his weak successor (Rolt, 1667-1682), the English waters, the value of which had now been proved, became the battle-ground between the rival navies, and for some years Bombay lay at the mercy of both. The Company’s rule, moreover, was exposed to another danger. The niggardly policy of the board, to save the cautious cotation of profits, was so evident that other European states, who were not restrained by rule, could not but be galling to soldiers of fortune. A mutiny at Bombay in 1674 had only been suppressed by the execution of the ringleader; and in 1683 a more formidable movement took place under Richard Keigwin, a naval officer who had been appointed governor of St Helena in reward for the part played by him in the capture of the island from the Dutch in 1673. Keigwin, elected governor of Bombay by popular vote, issued a proclamation in the king’s name, citing the “intolerable exactions, oppressions and executions of William’s policy,” declared this opposition to be in immediate authority of the crown. He ruled with moderation, reformed the system of taxation, obtained notable concessions from the Mahatta, and increased the trade of the port by the admission of “interlopers.” But he failed to extend the rebellion beyond Bombay; and when a letter arrived, under the royal sign manual, ordering him to surrender the fort to Sir John Child, appointed admiral and captain-general of the Company’s forces, he obeyed. Meanwhile the Company had decided to consider Bombay as “an independent settlement, and the seat of the power and trade of the English in the East Indies.” But a variety of causes set back the development of the city, notably the prevalence of plague and cholera due to the sitting up of the creeks that divided its component islands; and it was not till after the amalgamation of the old and new companies in 1768 that the governor’s seat was transferred from Surat to Bombay. In 1718 the city wall was completed; settlers began to stream in, especially from distracted Gujarat; and a series of wise administrative reforms increased this tendency until in 1744 the population, which in 1718 had sunk to 16,000, had risen to 70,000. Meanwhile the Mahatta conquest of Bassein and Sabette (1737-1739) had put a stop to the hostility of the Portuguese, and a treaty of alliance with the Siddis (1733) had secured a base of supplies on the mainland. The French wars of 1744-1748 and 1756-1763 led to a further strengthening of the fortifications; and the influx of settlers from the mainland made the questions of supplies and of the protection of trade from piracy more pressing. The former was in part settled by the acquisition of Bankot (1752) as a result of an alliance with the peshwa, the latter by the successful expedition under Watson and Clive against Vijayadurg (1759). During this period, too, the importance of Bombay as a naval base, long since recognized, was increased by the building of a dock (1750), a second being added in 1762. The year 1770 saw the beginning of the cotton trade with China, the result of a famine in that country, the Chinese government having issued an edict commanding more land to be used for growing grain. This, too, was a period of searching reforms in the administration and the planning and building of the city; the result being a further immense growth of its population, which in 1780 was 113,000. This was still further increased by the famine of 1803, which drove large numbers of people from Konkan and the Deccan to seek employment in Bombay. A great fire broke out in the fort in the same year and caused enormous loss; but it enabled the government to open wider thoroughfares in the more congested parts, and greatly stimulated the tendency of the natives to build their houses and shops outside the walls of the fort in what are now some of the busiest parts of the city.

1 See Hunter, op. cit. ii. 205, &c. He received a full pardon, was appointed later to the command of a frigate in the royal navy, and fell while leading the assault on St Christopher’s (June 21, 1690).

BOBMBAY FURNITURE—BOMBAY PRESIDENCY

The British victories over the Mahatta and the annexation of the Deccan opened a new period of unrestricted development for Bombay. At this time, too (1816), its fortunes were vigorously fostered by Mountstuart Elphinstone, and in 1838 the population had risen to 236,000. But in the next fifty years it more than doubled itself, the figures for 1891 being 831,000. This great leap was due to the influence of railways, of which the first line was completed in 1853, the opening of the Suez Canal, and the foundation of cotton factories. In 1866-1867 the tide of prosperity was interrupted by a financial crisis, due to the fall in the prices of Indian raw materials, and the rise of the English Liverpool wool and cotton. Bombay, however, soon recovered herself, and in 1891 was more prosperous than ever before; but during the ensuing decade great havoc was played by plague (q.v.) with both her population and her trade. In addition to a decline of 6% in the population, the exports also declined by 7%, whereas Calcutta’s exports rose during the same period by 38%.

See S. M. Edwedes, The Rise of Bombay (1902); James Douglas, Bombay and Western India (1883); G. W. Forrest, Cities of India (London, 1900); Imp. Gazetteer of India (Oxford, 1908), s. r. "Bombay City.

BOMBAY FURNITURE. "Bombay blackwood furniture" is a term applied to a rather extensive class of articles manufactured in the city of Bombay and in the towns of Surat and Ahmedabad in India. The wood used is Shisham or blackwood (Dalbergia), a hard-grained dark-coloured timber which with proper treatment assumes a beautiful natural polish. Much of the so-called Bombay furniture is clumsy and inelegant in form, defects which it is suggested by experts, like Sir George Birdwood, it owes to the circumstance that the original models were Dutch. Some of the smaller articles, such as flower-stands, small tables, and ornamental stands, are, however, of exceedingly graceful contour, and good examples are highly prized by dealers. The carving at its best is lace-like in character, and apart from its inherent beauty is attractive on account of the ingenuity shown by the worker in adapting his design in detail to the purpose of the article he is fashioning. The workmen who manufacture the most artistic Bombay furniture are a special class with inherited traditions. Often a man knows only one design, which has been transmitted to him by his father, who in his turn had it from his father before him. In recent years under European auspices efforts have been made with a certain measure of success to modernize the industry by introducing portions of the native work into furniture of Western design. In the main, however, the conventional patterns are still adhered to. "Bombay boxes" are inlaid in geometrical patterns on wood. The inlaying materials consist of the wire, sandal wood, sapan wood, ebony, ivory and stags’ horns, and the effect produced by the combination of minute pieces of these various substances is altogether peculiar and distinctive.

BOMBAY PRESIDENCY. A province or presidency of British India, consisting partly of British districts, and partly of native states under the administration of a governor. This territory extends from 13° 33’ to 28° 45’ N., and from 66° 40’ to 76° 30’ E., and is bounded on the N. by Baluchistan, the Punjab and Rajputana; on the E. by Indore, the Central Provinces and Hyderabad; on the S. by Madras and Mysore; and on the W. by the Arabian Sea. Within these limits lie the Portuguese settlements of Diu, Damman and Goa, and the native state of Baroda which has direct relations with the government of India; while politically Bombay includes the settlement of Aden. The total area, including Sind but excluding Aden, is 188,745 sq. m., of which 122,984 sq. m. are under British and 65,761 under native rule. The total population (1901) is 25,468,200, of which 18,515,587 are resident in British territory and 6,952,618 in native states. The province is divided into four commissionerships and twenty-six districts. The four divisions are the northern or Gujarati, the central or Deccani, the north-western or Camat, and Sind. The twenty-six districts are: Bombay City, Ahmedabad, Broach, Kaira, Panch Mahals, Surat, Thana,
Ahmednagar, Khandesh (partitioned into two districts in 1906), Nasik, Poona, Satara, Sholapur, Belgaum, Bijapur, Dharwar, Kanara, Kolaba, Ratnagiri, Karachi, Hyderabad, Shikarpur, Thar and Parkar, and Upper Sind Frontier. The native states comprise in all 333 separate units, which are administered either by political agents or by the collectors of the districts in which the smaller states are situated. The chief groups of states are: (1) Gujar, comprising Cutch, Kathiawar agency, Palanpur agency, Mahi Kantha agency, Rewa Kantha agency, and Cambay; South Gujarat, comprising Dharapuram, Bandas and Sachin; North Konkan, Nasik and Khandesh, comprising Khandesh political agency, Surgana and Jawhar; South Konkan and Dharwar, comprising Janjira, Sawantwadi and Savanur; the Deccan Satara Jagiris, comprising Akalkot, Bhor, Aundh, Phaltan, Jath and Dhaplapur; the southern Maharratas states, comprising Kolhapur and other states, and Khairpur in Sind. The native states under the supervision of the government of Bombay are divided, historically and geographically, into two main groups. The northern or Gujar group includes the territories of the gaekwar of Baroda, with the smaller states which form the administrative divisions of Cutch, Palanpur, Rewa Kantha, and Mahi Kantha. These territories, with the exception of Cutch, have an historical connexion, as being the allies or tributaries of the gaekwar in 1805, when final engagements were included between that prince and the British government. The southern or Maharratas group includes Kolhapur, Akalkot, Sawantwadi and the southern Maharratas Jagiris, and has an historical bond of union in the friendship they showed to the British in their final struggle with the power of the peshwa in 1818. The remaining territories may conveniently be divided into a small cluster of independent zamin-daris, situated in the wild and hilly tracts at the northern extremity of the Sahyadri range, and certain principalities which, from their history or geographical position, are to some extent isolated from the rest of the presidency.

Physical Aspects.—The Bombay Presidency consists of a long strip of land along the Indian Ocean from the south of the Punjab to the north of Mysore. The coast is rock-bound and difficult of access; and though it contains several bays forming fair-weather ports for vessels engaged in the coasting trade, Bombay, Karachi-in-Sind, Marmagao and Karwar alone have harbours sufficiently land-locked to protect shipping during the prevalence of the south-west monsoon. The coast-line is regular and little broken, save by the Gulfs of Cambay and Cutch, between which lies the peninsula of Kathiawar.

Speaking generally, a range of hills, known as the Western Ghats, runs down the coast, and rises rising in splendid bluffs and precipices from the water's edge, at others retaining inland, and leaving a flat fertile strip of 5 to 50 m. between their base and the sea. In the north of the presidency on the right bank of the Indus, the Hala mountains, a continuation of the great Suleimian range, separate British India from the dominions of the khan of Kalat. Leaving Sind, and passing by the ridges of low sandhills,—the leading feature of the desert east of the Indus,—and the isolated hills of Cutch and Kathiawar, which form geologically the western extremities of the alluvial plains, the principal range is that separating Cutch from the states of central India. The rugged and mountains country south of the Tapti forms the northern extremity of the Sahyadri or Western Ghats. This great range of hills, sometimes overhanging the ocean, and generally running parallel to it at a distance nowhere exceeding 50 m., with an average elevation of about 1500 ft., contains individual peaks rising to more than double that height. They stretch southwards for upwards of 500 m., with a breadth of 10 to 20 m. The western declivity is abrupt, the land at the base of the hills being but slightly raised above the level of the sea. As is usually the case with the trap formation, they descend to the plains in terraces with abrupt fronts. The landward slope is in many places very gentle, the crest of the range being sometimes but slightly raised above the level of the plateau of the Deccan. Their best-known elevation is Mahabalishwar, 4500 ft. high, a fine plateau, 37 m. from Poona, covered with rich vegetation, and used by the Bombay government as its summer retreat and sanitarium. In the neighbourhood of the Sahyadri hills, particularly towards the northern extremity of the range, the country is rugged and broken, containing isolated peaks, masses of rock and spurs, which, running eastward, form watersheds for the great rivers of the Deccan. The Satpura hills separate the Deccan plains from the valley of the Tapti, and the district of Khandesh from the territories of Indore. The Satmala or Ajanta hills, which are rather the northern slope of the plateau than a distinct range of hills, separate Khandesh from the Nizam's Dominions.

The more level parts of Bombay consist of five well-demarcated tracts—Sind, Gujarat, the Konkan, the Deccan, and the Carnatic. Sind, or the lower valley of the Indus, is very flat, with but scanty vegetation, and depending for productive-ness entirely on irrigation. Gujarat, except on its northern parts, consists of rich, highly cultivated alluvial plains, watered by the Tapti and Nerbudda, but not much subject to inundation. The Konkan lies between the Western Ghats and the sea. It is a rugged and difficult country, intersected by creeks, and abounding in isolated peaks and detached ranges of hills. The plains of the Deccan and Khandesh are watered by large rivers, but as the rainfall is uncertain, they are generally, during the greater part of the year, bleak and devoid of vegetation. The Carnatic plain, or the country south of the river Kistna, consists of extensive tracts of black or cotton soil in a high state of cultivation.

The chief river of western India is the Indus, which enters the presidency from the north of Sind and flowing south in a tortuous course, falls into the Arabian Sea by several mouths, such as the Ghiziri creek, Khudhi creek, Pitiani creek, Sira creek, Hajamroo creek, Vathio creek, Mall creek, Wari creek, Bhutia creek, Sir creek and Khor creek. In the dry season the bed varies at different places from 450 to 1600 yds. The flood season begins in March and continues till September, the average depth of the river rising from 9 to 15 ft., and the velocity of the current increasing from 3 to 7 m. an hour. Next to the Indus comes the Nerbudda. Rising in the Central Provinces, and traversing the dominions of Holkar, the Nerbudda enters the presidency at the north-western extremity of the Khandesh district, flows eastward, and after a course of 700 m. from its source, falls into the Gulf of Cambay, forming near its mouth the alluvial plain of Broach, one of the richest districts of Bombay. For about 100 m. from the sea the Nerbudda is at all seasons navigable by small boats, and during the rains by vessels from 60 to 70 tons burden. The Tapti enters the presidency a few miles south of the town of Burhanpur, a station on the Great Indian Peninsula railway, flows eastward through the district of Khandesh, the native state of Rewa Kantha and the district of Surat, and falls into the Gulf of Cambay, a few miles west of the town of Surat. The Tapti drains about 250 m. of country, and is, in a commercial point of view, the most useful of the Gujarat rivers. Besides these there are many minor streams. The Banas and the Saraswati take their rise, in the Aravalli hills, and flowing eastward through the native state of Bans, its course is lost in the Tapti. The Chitravati river rises in the Mahi hills in the Mahi Kantha hills, and flowing southwards, drain the districts of Northern Gujarat, and fall into the sea near the head of the Gulf of Cambay. The streams which, rising in the Sahyadri range, or Western Ghats, flow westward into the Arabian Sea, are of little importance. During the rains they are formidable torrents, but with the return of the fair weather they dwindle away, and during the hot season, with a few exceptions, they almost dry up. Clear and rapid as they descend the hills, on reaching the lowlands of the Konkan they become muddy and brackish creeks. The Konar rivers have a larger body of water and a more regular flow than the streams of the Konkan. One of them, the Sharawati, forcing its way through the western ridge of the Ghats, plunges from the high to the low country by a succession of falls, the principal of which is 890 ft. in height. The Sahyadri, or Western Ghats, also throw off to the eastward
the two principal rivers of the Madras Presidency, the Godavari and the Kistna. These rivers collect countless tributary streams, some of them of considerable size, and drain the entire plain of the Deccan as they pass eastward towards the Bay of Bengal.

The Manchar Lake is situated on the right bank of the Indus. During inundations it attains a length of 20 m., and a breadth of 10, covering a total area estimated at 180 sq. m. But the most peculiar lacustrine feature of the presidency is the Rann or Lake of Cutch, which, according to the season of the year, is a salt marsh, an inland lake, or an arm of the sea with an area of 8000 sq. m. It forms the western boundary of the province of Gujarat, and when flooded during the rains unites the Gulfs of Cutch and Cambay, and converts the territory of Cutch into an island.

Geology.—South of Gujarat nearly the whole of Bombay is covered by the horizontal lava flows of the Deccan Trap series, and these flows spread over the greater part of the Kathiawar peninsula and extend into Cutch. In Cutch and Kathiawar they are underlaid by Jurassic and Neocomian beds. The Jurassic beds are marine and contain numerous Ammonites, but the beds which are referred to the Neocomian include a series of sandstones and shales with remains of plants. Several of the plants are identical with forms which occur in the upper portion of the Gondwana system. Tertiary limestones, sandstones and shales overlie the Deccan Trap in Cutch, but the greatest development of deposits of this age is to be met with on the western side of the Indus (see Siho). The plain of Sindh and of eastern Gujarat is covered by alluvium and wind-blown sand.

Climate.—Great varieties of climate are met with in the presidency. In its extreme dryness and heat, combined with the aridity of a sandy soil, Upper Sindh resembles the salt deserts of Africa. The mean maximum temperature at Hyderabad, in Lower Sindh, during the six hottest months of the year, is 98°F. in the shade, and the water of the Indus reaches blood heat; in Upper Sindh it is even hotter, and the thermometer has been known to register 130°F. in the shade. In Cutch and in Gujarat the heat, though less, is still very great. The Konkan is hot and moist, the fall of rain during the monsoon sometimes approaching 300 in. The table-land of the Deccan above the Ghats, on the contrary, has an agreeable climate except in the hot months, as has also the southern Mahratta country; and in the hills of Mahabaleshwar, Sinigar, and other detached heights, Europeans may go out at all hours with impunity. Bombay Island itself, though in general cooled by the sea breeze, is oppressively hot during May and October. The south-west monsoon generally sets in about the first week in June, and pours down volumes of rain along the coast. From June to October travelling is difficult and unpleasant, except in Sindh, where the monsoon rains exert little influence.

Forests.—Bombay Presidency possesses two great classes of forests—those of the hills and those of the alluvial plains. The hill forests are scattered over a wide area, extending from 23° to 14° N. lat. Most of them lie among the Sahyadri hills or Western Ghats. The alluvial forests lie in Sindh, on or close to the banks of the Indus, and extend over an area of 550 sq. m. The principal timber trees in the forests are—teak; blackwood of two varieties (Dalbergia Sissoo and Dalbergia latifolia), Dalbergia uijoinensis, Pterocarpus Marsupium, Terminalia gabra, Acacia arabica, Acacia Catechu, Nauclea corticifolia, Nauclea parvifolia, Bidelia spinosa, Hardwickia binata, Juga xylocarpa, Populus euphratica, and Tamarindus indica. The forests contain many trees which, on account of their fruits, nuts or berries, are valuable, irrespective of the quality of their timber. Among these are the mango (Mangifera indica); the jack (Artocarpus integrifolia), Ziziphus Jujuba, Agee, Terminalia chebula, Calophyllum inophyllum, Boscia latifolia and Pongamia glabra. The jungle tribes collect gum from several varieties of trees, and in Sindh the Forest Department derives a small revenue from lac. The palms of the presidency consist of cocoa-nut, date, palmyra and areca catechu.

Population.—The census of 1901 gave a total of 25,468,200, out of which the chief religions furnished the following numbers:

<table>
<thead>
<tr>
<th>Religion</th>
<th>Population</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hindu</td>
<td>10,916,438</td>
</tr>
<tr>
<td>Mahomedan</td>
<td>4,507,295</td>
</tr>
<tr>
<td>Jain</td>
<td>535,050</td>
</tr>
<tr>
<td>Zanaduarian</td>
<td>71,186</td>
</tr>
<tr>
<td>Christian</td>
<td>216,118</td>
</tr>
</tbody>
</table>

In Sind Islam has been the predominant religion from the earliest Arab conquest in the 8th century. In Gujarat the predominant religion is Hinduism, though petty Mahomedan kingdoms have left their influence in many parts of the province. The Deccan is the home of the Mahrattas, who constitute 30% of the population. The Konkan is notable for various Christian castes, owing their origin to Portuguese rule; while in the Carnatic, Lingayatism, a Hindu reformation movement of the 12th century, has been embraced by 45% of the population. The Mahrattas are the dominating race next to the Europeans and number (1901) 3,650,000, composed of 1,000,000 Kumbhis, 350,000 Konkanis, and 1,400,000 Mahrattas not otherwise specified.

Languages.—The chief languages of the presidency are Sindhi, Cutchi in Cutch, Gujarati and Hindustani in Gujarat, Mahratti in Thana and the central division, Gujarati and Mahratti in Khandesh, and Mahratta and Konarese in the southern division. There are also Bihli (120,000) and Gipsy (30,000) dialects.

Agriculture.—The staple crops are as follows:—Jowar (Sorghum vulgare) and bajra (Holcus spicatus) are the staple food grains. The Deccan and Khandesh rice is the chief product of the Konkan. Wheat, generally grown in the northern part of the Presidency, but specially in Sindh and Gujarat, is exported to Europe in large quantities from Karachi, and on a smaller scale from Bombay. Barley is principally grown in the northern parts of the presidency. Nachani (Eleusine coracana) and kodra (Paspalum scrobiculatum), inferior grains grown on the hill-sides, furnish food to the Kolis, Bihis, Waralis, and other aboriginal tribes. Of the pulses the most important are gram (Cicer arietinum), tur (Cajanus indicus), kulti (Dolichos biflorus), and mug (Phaseolus Mungo). Principal oil-seeds: til (Sesamum orientale), mustard, castor-oil, safflower and linseed. Of fibres the most important are cotton, Deccan hemp (Hibiscus cannabinus), and sunn or tag (Crotalaria juncus). Much has been done to improve the cotton of the presidency. American varieties have been introduced with much advantage in the Dhawar collectorate and other parts of the southern Mahratta country. In Khandesh the indigenous plant from which one of the lowest classes of cotton in the Bombay market takes its name has been almost entirely superseded by the superior Hinganghat variety. Mutton, beef and mutton crops: sugar-cane, requiring a rich land and a perennial water-supply, and only grown in favoured localities, red pepper, potatoes, turmeric and tobacco.

Manufactures.—The chief feature of the modern industrial life of Bombay is the great development in the growth and manufacture of cotton. Large steam mills have rapidly sprung up in Bombay City, Ahmedabad and Khandesh. In 1905 there were 432 factories in the presidency, of which by far the greater number were engaged in the preparation and manufacture of cotton. The industry is centred in Bombay City and Island, which contains nearly two-thirds of the mills. During the decade 1891-1901 the mill industry passed through a period of depression due to widespread plague and famine, but on the whole there has been a marked expansion of the trade as well as a great improvement in the class of goods produced. In addition to the mills there are (1901) 178,000 hand-loom weavers in the province, who still have a position of their own in the manipulation of designs woven into the cloth. Silk goods are manufactured in Ahmedabad, Surat, Yeola, Nasik, Thana and Bombay, the material being often decorated with printed or woven designs; but owing to the competition of European goods most branches of the industry are declining. The custom of investing savings in gold and silver ornaments gives employment to many goldsmiths; the metal is usually supplied by the customer, and
the goldsmith charges for his labour. Ahmedabad and Surat are famous for their carved wood-work. Many of the houses in Ahmedabad are covered with elaborate wood-carving, and excellent examples exist in Broach, Baroda, Surat, Nasik and Yeola. Salt is made in large quantities in the government works at Kharghoda and Udud in Ahmedabad, whence it is exported by railway to the Gulf and central India. There is one brewery at Dapuri near Poona.

Railways and Irrigation.—The province is well supplied with railways, all of which, with one exception, concentrate at Bombay City. The exception is the North-Western line, which enters Sind from the Punjab and finds its natural terminus at Karachi. The other chief lines are the Great Indian Peninsula, Indian Midland, Bombay, Baroda & Central India, Rajputana-Malwa & Southern Mahratta systems. In 1905 the total length of railway under the Bombay government open for traffic was 7980 m. These figures do not include the railway system in Sind. With the exception of Sind, the water-supply of the Bombay Presidency does not lend itself to the construction of large irrigation works.

Army.—Under Lord Kitchener's re-arrangement of the Indian army in 1904 the old Bombay command was abolished and its place was taken by the Western army corps under a lieutenant-general. The army corps was divided into three divisions under major-generals. The 4th division, with headquarters at Poona, consists of three brigades, located at Nasirabad, Jabulpore and Jhansi, and includes the previous Mhow, Deesa, Nagpur, Nerbudda and Bundelkhand districts, with the Bombay district north of the Tapti. The 6th division, with headquarters at Poona, consists of three brigades, located at Bombay, Ahmednagar and Aden. It comprises the previous Poona district, Bombay district south of the Tapti, Belguam district north of the Tungabhadra, and Dhawar and Aurungabad districts.

Education.—The University of Bombay, established in 1857, is a body corporate, consisting of a chancellor, vice-chancellor and fellows. The governor of Bombay is ex officio chancellor. The education department is under a director of public instruction, who is responsible for the administration of the department in accordance with the general educational policy of the state. The native states have generally adopted the government system. Baroda and the Kathiawar states employ their own inspectors. In 1905 the total number of educational institutions was 10,194 with 593,431 pupils. There are ten art colleges, of which two are managed by government, three by native states, and five are under private management. According to the census of 1901, out of a population of 235 millions nearly 24 millions were illiterate.

Administration.—The government of Bombay is administered by a governor in council consisting of the governor as president and two ordinary members. The governor is appointed from England; the council is appointed by the crown, and selected from the Indian civil service. These are the executive members of government. For making laws there is a legislative council, consisting of the governor and his executive council, with certain other persons, not fewer than eight or more than twenty, at least half of them being non-officials. Each of the members of the executive council has in his charge one or two departments of the government; and each department has a secretary, an under-secretary, and an assistant secretary, with a numerous staff of clerks. The political administration of the native states is under the superintendence of British agents placed at the principal native courts; their position varies in different states according to the relations of the paramount power and the dependencies stand with the paramount power. The administration of justice throughout the presidency is conducted by a high court at Bombay, consisting of a chief justice and seven puisne judges, along with district and assistant judges throughout the districts of the presidency. The administration of the districts is carried on by collectors, assistant collectors, and a varying number of supernumerary assistants.

History.—In the earliest times of which any record remains the greater part of the west coast of India was occupied by Dravidian tribes, living under their kings in fortified villages, carrying on the simpler arts of life, and holding a faith in which the propitiation of spirits and demons played the chief part. There is evidence, however, that so early as 1000 B.C. an export trade was carried on to the north coast of Africa, and that by 750 B.C. a similar trade had sprung up with Babylon by way of the Persian Gulf. It was by this latter route that the traders brought back to India the Brahmi alphabet, the art of brick-making and the legend of the Flood. Later still the settlement of Brahmins along the west coast had already Aryanized the country in religion, and to some extent in language, before the Persian conquest of the Indus valley at the close of the 6th century B.C. The Persian dominion did not long survive; and the march of Alexander the Great down the Indus paved the way for Chandragupta and the Maurya empire. Under this empire Ujain was the seat of a viceroy, a prince of the imperial house, who ruled over Kathiawar, Malwa and Gujaratt. On the death of Asoka in 235 B.C. the empire of the Mauryas broke up, and their heritage in the west fell to the Andhra dynasty of the Satavahanas of Paithan on the Godavari, a Dravidian family whose dominion by 200 B.C. stretched across the peninsula from the deltas of the Godavari and Kistna to Nasik and the Western Ghats. About A.D. 210, however, their power in the west seems to have died out, and their place was taken by the foreign dynasty of the Kshaharatas, the Saka satraps of Surashtra (Kathiawar), who in 170 had mastered Ujain and Gujaratt and had built up a rival kingdom to the north. Since about A.D. 40 the coast cities had been much enriched by trade with the Roman empire, which both the Satavahanas and the satraps did much to encourage; but after the fall of Palmyra (273) and the extinction of the main Kshaharata dynasty (c. 300) this commerce fell into decay. The history of the century and a half that follows is very obscure; short-lived Saka dynasties succeeded one another until, about 888, the country was conquered by the Gupat, of Magadh, who kept a precarious tenure of it till about 470, when their empire was destroyed by the White Huns, or Ephthalites (g.r.), who, after breaking the power of Persia and assailing the Kusn kingdom of Kabul, poured into India, conquered Sind, and established their dominion as far south as the Nerbudda.

Under the Hun tyranny, which lasted till the overthrow of the White Huns on the Oxus by the Turks (c. 565), native dynasties had survived, or new ones had established themselves. In Kathiawar a chief named Bhutarka, probably of foreign origin, had established himself at Valahhi (Wala) on the ruins of the Gupta power (c. 500), and founded a dynasty which lasted until it was overthrown by Arab invaders from Sind in 770. The northern Konkan was held by the Mauryas of Purī near Bombay; the southerly coast by the Kadambas of Vanavasi, while in the southern Deccan Chakryaks and Rashtrakutas struggled for the mastery. A new power, too, appeared from the north: the Gurjars (ancestors, it is supposed, of the Gujar caste), who had probably entered India with the White Huns, established their power over Gujaratt and (c. 600) over all northern India, but were overthrown by the central Huns, who established a branch at Broach (585-740). During the short-lived empire of Harsha (d. 647 or 648), Malwa, Gujaratt and Kathiawar were subject to his sway; but the southern boundary of his kingdom was the Nerbudda, south of which the Chakryaks in the 7th century, having overcome the Rashtrakutas and other rivals, had absorbed the smaller kingdoms into their empire. In 710-711 (92 A.H.) the Arabs invaded India, and in 712 conquered and established themselves in Sind; they did not, however, attempt to conquer any of the northwestern peninsula, which had been divided into a number of small petty kingdoms, confining themselves to more or less serious raids. In 770 they destroyed the city of Valahhi and, as already mentioned, brought its dynasty to an end. Meanwhile the Chakryaks, after successfully struggling with the Pallavas (whose capital was taken by Vikramaditya II., c. 749), had in their turn succumbed to their ancient rivals the Rashtrakutas, who succeeded...
to the bulk of their dominions, including Gujarat, where they had set up a branch line. For some two centuries (c. 750–950) there was a balance of power between the Gujurars and Rashtrakutas, neither kingdom being strong enough to encroach on the other to any extent. The Rashtrakutas were, moreover, debarred from large schemes of conquest by disensions with the branch dynasty which they had set up in Gujarat, and by the constant threat of attack by the Chalukyas from Mysores. Nevertheless their power and magnificence (they were notable builders and patrons of literature) greatly impressed the Arabs, by whom the king was known as Bahkala (i.e. Vahkala, "well-beloved "), a title borrowed from the preceding dynasty. Under them the Konkan and the coast farther south were governed by chiefs of the Silhara family, whose rule is mainly notable for the revival of trade with the Persian Gulf and, doubtless as a result of this, the arrival in 775 on the west coast of a number of Parsee refugees, who found, in a country where three religions were already equally honoured, the toleration denied to them in Musulman Persia. But in the 10th century the Rashtrakuta power began to break up; in 961 Mularaja Solanki (Chalukya) conquered the kingdom of Anhilvad (Anhilvara) in Gujarat, where his dynasty reigned till 1247; and twelve years later the Chalukyas once more overthrew the Rashtrakutas in the Deccan, establishing their capital at Kalyani, while a branch line was set up in southern Gujarat. Farther south the Silharas, however, continued to rule the coast, and succeeded in maintaining their independence until after the final fall of the Chalukyas in 1192. The cause of the downfall of the dynasty, splendid and enlightened as any of its predecessors, was the system of governing by means of great feudatories, which also proved fatal to the Solanki rajas of Anhilvada. From 1143 onward the power of the latter had been overshadowed by that of the Vaghela chiefs of Dholka, and during the same period the Deccan had been rapidly lapsing into absolute anarchy, amid which rival chiefs struggled for the supreme power. In the end the Yadavas of Devagiri (Dauhatabad) prevailed, and in 1192 established a short-lived empire to which the Dholka princes were ultimately forced to become tributary.

But meanwhile a new power had appeared, which was destined to establish the Mussulman domination in western and southern India. In 1023 Mahmud of Ghazni had already invaded Gujurat with a large army, destroyed the national Hindu idol of Somnath, and carried away an immense booty. Mahmmed Ghori also invaded Gujurat, and left a garrison in its capital. But it was not till after the Mussulman power was firmly established in northern India that the Mahomedan sovereigns of Delhi attempted the conquest of the south. In 1294 the emperor Ala-Ad-Din invaded the Deccan, and in 1299 he conquered Gujurat. In 1312 the Mahomedan arms were triumphant through the Mahatta country; and seven years later the whole of Malabar fell a prey to the invaders. In the middle of the 14th century the weakness of the Delhi sovereigns tempted the governors of provinces to revolt against their distant master, and to form independent kingdoms. In this way the Bahmani kingdom was established in the Deccan, and embraced a part of the Bombay presidency. Ahmednagar and Gujurat also became independent, and were joined by Nizam Shahi of Ahmadnagar and reannexed it to the empire; in 1550 he effected the reconquest of Khandesh, and in 1600 that of Ahmednagar. From this time the country was never tranquil, and Ahmednagar became the focus of constant rebellions. During the latter part of the 17th century the Maharratras rose into power, and almost every part of the country now comprising the presidency of Bombay fell under their sway. In 1468 the Portuguese came first to Calicut, their earliest possession in the presidency being the island of Anjediva. After their victory at Diu over the Egyptian fleet their mastery of the Indian Ocean was undisputed, and they proceeded to establish themselves on the coast. They captured Goa in 1510, Malacca in 1512, and Ormuz in 1555. They next took advantage of the decay of the kingdom of Gujurat to occupy Chaul (1531), Basselin with its dependencies, including Bombay (1534), Diu (1535) and Daman (1559). But the inherent vices of their intolerant system undermined their power, even before their Dutch and English rivals appeared on the scene.

The first English settlement in the Bombay presidency was in 1618, when the East India Company established a factory at Surat, protected by a charter obtained from the emperor Jahangir. In 1662 the Dutch and English made an unsuccessful attempt to gain possession of the island of Bombay, and in 1663 proposals were suggested for its purchase from the Portuguese. In 1661 it was ceded to the English crown, as part of the dowry of the infanta Catherine of Portugal on her marriage with Charles II. So lightly was the acquisition esteemed in England, and so unsuccessful was the administration of the crown officers, that in 1668 Bombay was transferred to the East India Company for an annual payment of £10. At the time of the transfer, powers for its defence and for the administration of justice were also conferred; a European regiment was enrolled; and the fortifications erected proved sufficient to deter the Dutch from their intended attack in 1673 (see Bombay City: History). In 1685 Bombay was placed at the head of all the Company's possessions in India; but in 1753 the government of Bombay became subordinate to that of Calcutta. The first collision of the English with the Mahratta power was in 1774 and resulted in 1782 in the treaty of Salbai, by which Saisette was ceded to the British, while Broach was handed over to Sindia. More important were the results of the second Mahratta war, which ended in 1803. Surat had already been annexed in 1800; the East India Company now received the districts of Broach, Kaira, &c.

In 1833 the Bombay presidency included only Saisette, the islands of the harbour (since 1774), Surat and Bankot (since 1750); but between this date and 1827 the framework of the presidency took its present shape. The Gujarat districts were taken over by the Bombay government in 1805 and enlarged in 1818; and the first measures for the settlement of Kathiawar and Mahi Kantha were taken between 1807 and 1820. Baji Rao, the last of the peshwas, who had attempted to shake off the British yoke, was defeated, captured and pensioned (1817–1818), and large portions of his dominions (Poona, Ahmednagar, Nasik, Sholapur, Belgaum, Kadilgi, Dhawar, &c.) were included in the presidency, the settlement of which was completed by Mountstuart Elphinstone, governor from 1819 to 1827. His policy was to rule as far as possible on native lines, avoiding all changes for which the population was not yet ripe; but the grosser abuses of the old régime were stopped, the country was pacified, the laws were codified, and courts and schools were established. The period that followed is notable mainly for the enlargement of the presidency through the lapse of certain native states by the addition of Aden (1839), Sind (1843), and the lease of the Panch Mahals from Sindia (1853). The establishment of an orderly administration, one outcome of which was a general fall of prices that made the unwonted regularity of the collection of taxes doubly unwelcome, naturally excited a certain amount of misgiving and resentment; but on the whole the population was prosperous and contented, and under Lord Elphinstone (1853–1860) the presidency passed through the crisis of the Mutiny without any general rising. Outbreaks among the troops at Karachi, Ahmedabad and Surat were quickly put down, two regiments being disbanded, and the rebellions in Gujarat, among the Bhils, and in the southern Mahatta country were local and isolated. Under Sir Bartle Frere (1862–1867) agricultural prosperity reached its highest point, as a result of the American Civil War and the consequent enormous demand for Indian cotton in Europe. The money thus poured into the country produced an epidemic of speculation known as the "Share Mania" (1864–1865), which ended in a commercial crisis and the failure of the bank of Bombay (1866). But the society was encouraged in a way far more than they lost, and the trade of Bombay was not permanently injured. Sir Bartle Frere encouraged the completion of the great trunk lines of railways, and with the funds obtained by the demolition of the town walls (1862) he began the magnificent series of public buildings that now adorn Bombay.
During recent times the entire history of Bombay has been sadly afflicted by plague and famine. Bubonic plague, of a fatal and contagious nature, first broke out in Bombay City in September 1866, and, despite all the efforts of the government, quickly spread to the surrounding country. Down to the end of October 1902 over 531,000 deaths had taken place due to plague. In 1903-1904 there were 426,387 cases with 316,523 deaths, and 1904-1905 there were 285,897 cases with 212,948 deaths. The great cities of Bombay, Karachi and Poona suffered most severely. A few districts in Gujarat almost entirely escaped; but the mortality was very heavy in Satara, Thana, Surat, Poona, Kolhapur, and in the native states of Cutch, Baroda, and the Trunk states of the Punjab. Sanitary measures that can be said to have been successful was complete migration, which could only be adopted in villages and smaller towns. Inoculation was extensively tried in some cases. Segregation was the one general method of fighting the disease; but, unfortunately, it was misunderstood by the people and led to some deplorable outbreaks. In Poona, during 1897, two European officials were assassinated; the editor of a prominent native paper was sentenced to imprisonment for sedition; and two leaders of the Brahman community were placed in confinement. At Surat, in 1898, a mob of 24,500 people was suppressed. Weaving was not suppressed until several Europeans had been fatally injured. In Nasik district, in January 1898, the native chairman of the plague committee was brutally murdered by a mob. But on the whole the people submitted with characteristic docility to the sanitary regulations of the government. Bombay, like the Central Provinces, suffered from famine twice within three years. The failure of the monsoon of 1896 caused widespread distress throughout the Deccan, over an area of 46,000 sq. m., with a population of 7 millions. The largest number of persons on relief was 301,676 in September 1897; and the total expenditure on famine relief was Rs.1,28,000,000. The measures adopted were signaly successful, both in saving life and in mitigating distress. In 1899 the monsoon again failed in Gujarat, where famine hitherto had been almost unknown; and the winter rains failed in the Deccan, so that distress gradually spread over almost the entire presidency. The worst feature was a virulent outbreak of cholera in Gujarat, especially in the native states. In April 1900 the total number of persons in receipt of relief was 1,281,150 in British districts, 566,571 in native states, and 76,734 in the Trunk states. The total expenditure on famine relief was nearly 3 crores (say, Rs.2,000,000,000) and a continuance of drought necessitated an estimate of 1 crore in the budget of the following year. The Bombay government exhausted its balances in 1897, and was subsequently dependent on grants from the government of India.

Edwardes, The Rise of Bombay (1902); James Douglas, Bombay and Western India (1893); and Sir William Lee-Warner, The Presidency of Bombay (Society of Arts, 1904); the Imperial Gazetteer of India (Oxford, 1908); and for the early history, V. A. Smith, The Early History of India (2nd ed., Oxford, 1908).

BOMBAZINE, or Bombazine, a stuff originally made of silk or silk and wool, and now also made of cotton and wool or of wool alone. Good bombazine is made with a silk warp and a worsted weft. It is twilled or corded and used for dress-material. Black bombazine has been largely used merely for mourning, but the material has gone out of fashion. The word is derived from the obsolete French bombasin, applied originally to silk but afterwards to "tree-silk" or cotton. Bombazine is said to have been made in England in Queen Elizabeth's reign, and early in the 15th century it was largely made at Norwich.

BOMBELLES, MARIE MARC, MARQUIS DE (1744-1822), French diplomatist and ecclesiastic, was the son of the comte de Bombelles, tutor and guardian of the duke of Orleans. He was born at Bitsch in Lorraine, and served in the army through the Seven Years' War. In 1765 he entered the diplomatic service, and after several diplomatic missions became ambassador of France to Portugal in 1786, being charged to win over that country to the Family Compact; but the madness of the queen and then the death of the king prevented his success. He was transferred to Vienna early in 1786, but the Revolution cut short his diplomatic career, and he was deprived of his post in September 1790. He remained attached to Louis XVI., and was employed on secret missions to other sovereigns, to gain their aid for Louis. In 1792 he emigrated, and after Valmy lived in retirement in Switzerland. In 1804, after the death of his wife, he withdrew to the monastery of Brünn in Austria, and became bishop of Obergoagau in Prussia. In 1813 he returned to France, and became bishop of Amiens (1819). He died in Paris in 1822.

His son, Louis Philippe, comte de Bombelles (1780-1843), brother of that of Clencean, passed his life in the diplomatic service of Austria. In 1814 he became Austrian ambassador to Denmark, and in 1816 filled a similar position at Dresden. (E. ES.)

BOMBERG, DANIEL, a famous Christian printer of Hebrew books. His chief activity was in Venice between 1516 and 1549 (the year of his death). Bomberg introduced a new era in Hebrew typography. Among other great enterprises, he published the edict princes (1516-1517) of the rabbinical Bible (Hebrew text with rabbinical commentaries, &c.). He also produced the first complete edition of the Talmud (1520-1523).

BONAPARTE, JOSEPH, a general and author, was born at Mondovi in Piedmont, on the 10th of October 1769. In 1784 he joined the Congregation of Feuillants andwas successively elected prior of Asti, abbot of Mondovi and general of his order. He was created cardinal in 1699 by Clement IX., and during the conclave, which followed that pope's death, was regarded as a possible candidate for the papacy. He died on the 17th of October 1674. Bona's writings are mainly concerned with liturgical and devotional subjects. Of the numerous editions of his works, the best are those of Paris (1677), Turin (1747) and Antwerp (1777). Stores of interesting rabbinical information, interspersed with verses and prayers, are to be found in the De Libris Liturgicis and the Divina Providencia; recent advances in liturgical studies, however, have somewhat lessened their value. The De Discretione Spirituum treats of certain higher phases of mysticism; the Via Compendii ad Deum was well translated in 1876 by Henry Collins, O. Cist., under the title of An Easy Way to God. Sir Roger L'Estrange's translation (The Guide to Heaven, 1688) of the Manuductio ad Coelum was reprinted in 1808, and a new edition of the Prinicipia Vitae Christianae, ed. by D. O'Conor, appeared in 1806. The devotional treatise De Sacrisio Missae is the classical work in its field (new edition by Idefohonous Cummings, 1903).

The chief source for the life of Bona is the biography by the Cistercian abbot Bertolotti (Asti, 1677); the best modern study is by A. Ighina (Mondovi, 1874).

BONA (BÔN), a seaport of Algeria, in 36° 53' N., 7° 46' E., on a bay of the Mediterranean, chief town of an arrondissement in the department of Constantine, 220 m. by mil W. of Tunis, and 136 m. N. E. of Constantine. The town, which is situated at the foot of the wooded heights of Edugh, is surrounded with a modern rampart erected outside the old Arab wall, the compass of which was found too small for its growth. Much of the old town has been demolished, and its general character now is that of a flourishing French city. The streets are wide and well laid out, but are some very steep. Through the centre of the town runs a broad tree-lined promenade, the Cours Jérôme-Bertagna, formerly the Cours National, in which are the principal buildings—théatre, banks, hotels. At its southern end, by the quay, is a bronze statue of Thiers, and at the northern end, the cathedral of St Augustine, a large church built in quasi-Byantine style. In it is preserved a relic supposed to be the right arm of St Augustine, brought from Pavia in 1842. The Grand Mosque, built out of ruins of the ancient Hippo, occupies one side of the chief square, the Place d'Armes. There are barracks with accommodation for 3000 men, and civil and military hospitals. The Kasbah (citadel) stands on a hill at the north-east of the town. The inner harbour, covering 25 acres, is surrounded by fine quays at which vessels drawing 22 ft. can be moored. Beyond is a spacious outer harbour, built 1857-1868 and enlarged in
BONA DEA—BONALD

191

1905—1907. Bona is in direct steamship communication with Marseilles, and is the centre of a large commerce, ranking after Algiers and Oran alone in Algeria. It imports general merchandise, tapestry and leather. The marshes at the mouths of the Seybouse and Bujema rivers, which enter the sea to the south of Bona, have been drained by a system of canals, to the improvement of the sanitary condition of the town, which has the fittest setting of an abundant water supply obtained from the Elagh hills. There are cork woods and marble quarries in the vicinity, and the valley of the Seybouse and the neighbouring plains are rich in agricultural produce. The population of the town of Bona in 1906 was 36,004, of the commune 42,934, of the arrondissement, which includes La Calle (g.9) and 11 other communes, 77,803.

Bona is identified with the ancient *Aphrodisium*, the seaport of *Hippo Regius* or *Ubbio*, but it derives its name from the latter city, the ruins of which, consisting of large cisterns, now restored, and fragments of walls, are about a mile to the south of the town. In the first three centuries of the Christian era Hippo was one of the richest cities in Roman Africa; but its chief title to fame is derived from its connexion with St Augustine, who lived here as priest and bishop for thirty-five years. Hippo was captured by the Vandals under Genseric in 431, after a siege of fourteen months, during which Augustine died. Only the cathedral, together with Augustine's library and MSS., escaped the general destruction. The town was partially restored by Belisarius, and again sacked by the Arabs in the 7th century. On the top of the hill on which Hippo stood, a large basilica, with chancel towards the west, dedicated to St Augustine, was opened in 1900. An altar surmounted by a bronze statue of the saint has also been erected among the ruins. The place was named Hippo Regius (Royal) by the Romans because it was a favourite residence of the Numidian kings. Bona (Arabic *annaba*, "the city of jujube trees"), which has passed through many vicissitudes, was built by the Arabs, and was for centuries a possession of the rulers of Tunis, who built the Kasbah in 1300. From the beginning of the 14th to the middle of the 15th century it was frequented by Italians and Spaniards, and in the 16th it was held for some time by Charles V., who strengthened its citadel. Thereafter it was held in turn by Genoese, Tunisians and Algerines. From the time of Louis XIV. to the Revolution, the French Compagnie d'Afrique maintained a very active trade with the port. The town was occupied by the French for a few months in 1830 and reoccupied in 1832, when Captains Armand and Yusuf with a small force of marines seized the Kasbah and held it for some months until help arrived. From that time the history of Bona is one of industrial development, greatly stimulated since 1853 by the discovery of the phosphate beds at Tebessa.

BONA DEA, the "good goddess," an old Roman deity of fruitfulness, both in the earth and in women. She was identified with Fauna, and by later syncretism also with Ops and Maia—the latter no doubt because the dedication-day of her temple on the Aventine was 1st May (Ovid, *Fasti*, v. 149 foll.). This temple was cared for, and the cult attended, by women only, and the same was the case at a second celebration at the beginning of December in the house of a magistrate with *imperium*, which became famous owing to the profession of these mysteries by P. Clodius in 62 B.C., and the political consequences of his act. Wine and myrtle were tabooed in the cult of this deity, and myth grew up to explain these features of the cult, of which an account may be read in W. W. Fowler's *Roman Festivals*, pp. 103 foll. Herbs with healing properties were kept in her temple, and also snakes, the usual symbol of the medicinal art. Her victim was a *poreia*, as in the cults of other deities of fertility, and was called *damium*; and we are told that the goddess herself was known as Damia and her priestess as *damisatrix*. These names signify that the early Greeks worshipped at several places in Greece, and also at Tarentum, where there was a festival called *Damaia*. It is thus highly probable that on the cult of the original Roman goddess was engraven the Greek one of Damia, perhaps after the conquest of Tarentum (272 B.C.). It is no longer possible to distinguish clearly the Greek and Roman elements in this curious cult, though it is itself quite intelligible as that of an Earth-goddess with mysteries attached. See also Pauly-Wissowa, *Realencyclopadie*. (W. W. F.)

BONA PIDE (Lat. "in good faith"), in law, a term implying the absence of all fraud or unfair dealing or acting. It is usually employed in conjunction with a noun, e.g. "bona fide purchaser," one who has purchased property from its legal owner, to whom he was paying the consideration, and from whom he has taken a legal conveyance, without having any notice of any trust affecting the property; "bona fide holder" of a bill of exchange, one who has taken a bill complete and regular on the face of it, before it was overdue, and in good faith and for value, and without notice of any defect in the title of the person who negotiated it to him; "bona fide traveller" under the licensing acts, one whose lodging-place during the preceding night is at least 3 m. distant from the place where he demands to be supplied with liquor, such distance being calculated by the nearest public thoroughfare.

BONALD, LOUIS GABRIEL AMBROISE, VICOMTE DE (1754—1840), French philosopher and politician, was born at Le Monna, near Millau in Aveyron, on the 2nd of October 1754. Disliking the principles of the Revolution, he emigrated in 1791, joined the army of the prince of Condé, and soon afterwards settled at Heidelberg. There he wrote his first important work, the highly conservative *Théorie du pouvoir politique et religieux* (3 vols., 1796; new ed., Paris, 1854, 2 vols.), which was condemned by the Directory. Returning to France he found himself an object of suspicion, and was obliged to live in retirement. In 1806 he was associated with Chateaubriand and Fétis in the conduct of the *Mercure de France*, and two years later he was appointed councillor of the Imperial University which he had often attacked. After the restoration he was a member of the council of public instruction, and from 1815 to 1824 sat in the chamber as deputy. His speeches were on the extreme conservative side; he even advocated a literary censorship. In 1822 he was made minister of state, and presided over the censorship commission. In the following year he was made a peer, a dignity which he lost through refusing to take the oath in 1830. From 1816 he had been a member of the Academy. He took no part in public affairs after 1830, but retired to his seat at Le Monna, where he died on the 23rd of November 1840.

Bonald was one of the leading writers of the theocratic or traditionalist school, which included de Maistre, Lamennais, Ballanche and d'Ecstein. His writings are mainly on social and political philosophy, and are based ultimately on one great principle, the divine origin of language. In his own words, "L'homme pense sa parole avant de parler sa pensée;" the first language contained the essence of all truth. From this he deduces the existence of God, the divine origin and consequent supreme authority of the Holy Scriptures, and the infallibility of the church. While this thought lies at the root of all his speculations there is a formula of constant application. All relations may be stated as the triad of cause, means and effect, which he sees repeated throughout nature. Thus, in the universe, he finds the first cause as mover, movement as the means, and bodies as the result; in the state, power as the cause, ministers as the means, and subjects as the effects; in the family, the same relation is exemplified by father, mother and children; these three terms bear specific relations to one another; the first is to the second as the second to the third. Thus, in the great triad of the religious world—God, the Mediator, and Man—God is to the God-Man as the God-Man is to Man. On this basis he constructed a system of political absolutism which lacks two things only—well-grounded premises instead of baseless hypotheses, and the acquiescence of those who were to be subjected to it.

Bonald's style is remarkably fine; ornate, but pure and vivacious. Many fruitful thoughts are scattered among his works, but his system scarcely deserves the name of a philosophy. In abstract thought he was a mere dilettante, and his strength
lay in the vigour and sincerity of its statements rather than in cogency of reasoning.

He had four sons. Of these, Victor de Bonald (1760–1871) followed his father in his exile, was rector of the academy of Montpellier. After the fortune of his family, he lost his post during the Hundred Days. Regaining it at the second restoration, he resigned finally in 1830. He wrote *Deux principes opposés aux erreurs du XIXe siècle* (1833), *Moïse et les géologues modernes* (1833), and a life of his father. Louis Jacques Maurice (1787–1870), cardinal (1841), was condemned by the council of state for a pastoral letter attacking Dupin the elder’s *Manuel de droit ecclésiastique*. In 1846 he held a memoria service “for those who fell gloriously in defence of civil and religious liberty.” In 1851 he nevertheless advocated in the senate the evacuation of the temporal power of Rome by force of arms. Henri (d. 1846) was a contributor to legitimist journals; and René was interim prefect of Aveyron in 1817.

Besides the *Théorie* above mentioned, the vicomte de Bonald published *Essai analytique sur les lois naturelles de l’ordre social* (1800); *Législation primitive* (1802); *Du divorce considéré au XIXe siècle* (1801); *Recherches philosophiques sur les premiers objets de connaissances morales* (2 vols., 1818); *Mélanges littéraires et politiques, démonstration philosophique du principe constitutif de la société* (1819, 1852). The first collected edition appeared in 12 vols., 1817–1819; the second and latest in 9 vols., 1858–1860.

**BONAPARTE**

The name of a family made famous by Napoleon I. (q.v.), emperor of France. The French form Bonaparte was not commonly used, even by Napoleon, until after the year 1799. The original name was Buonaparte, which was borne in the early middle ages by several distinct families in Italy. One of these, which settled at Florence before the year 1000, divided in the 15th century into the two branches of San Miniato and Sarzana. A member of this latter, Francesco Buonaparte, emigrated in the middle of the 16th century to Corsica, where his descendants continued to occupy themselves with the affairs of law and the magistracy.

**CARLO BUONAPARTE** [Charles Marie de Bonaparte] (1746–1785), the father of Napoleon I., took his degree in law at the University of Pisa, and after the conquest of Corsica by the French became assessor to the royal court of Ajaccio and the neighbouring districts. His restless and dissatisfied nature led him to press or intrigue for other posts, and to embark in risky business enterprises which contributed to the fortune which was fast coming to him. In 1764 he married Letizia Ramolino, a beautiful and high-spirited girl, aged fourteen, descended from a well-connected family domiciled in Corsica since the middle of the 15th century. The first two children, born in 1765 and 1767, died in infancy; Joseph (see below), the first son who survived, was born in 1768, and Napoleon in 1769. The latter was born in the midst of the troubles consequent on the French conquest, Letizia having recently accompanied her husband in several journeys and escapes. She firm and courageous disposition showed itself to be of the trying time, and she conducted the affairs of her singularly varied career. Simple and frugal in her tastes, and devout in thought and manner of life, she helped to bind her children to the life of Corsica, while her husband, a schemer by nature and a Voltairean by conviction, pointed the way to careers in France, the opening up of which moulded the fortunes of the family and the destinies of Europe. He died of cancer in the stomach at Montpellier in 1785.

Letizia lived to witness the glory and the downfall of her great son, surviving Napoleon I. by sixteen years. She never accommodated herself to the part she was called on to play during the Empire, and, though endowed with immense wealth and distinguished by the title of Madame Mère, lived mainly in retirement, and in the exercise of a strict domestic economy which her early privations had made a second nature to her, but which rendered her very unpopular in France and was displeasing to Napoleon. After the events of 1814 she joined the emperor in the island of Elba and was privy to his plans of escape, returning to Paris during the Hundred Days. After the final downfall of Waterloo, she took up her residence at Rome, where Pope Pius VII. treated her with great kindness and consideration, and protected her from the suspicious attentions of the powers of the Grand Alliance. In 1816 she addressed a pathetic letter to the powers assembled at the congress of Aix, petitioning for Napoleon’s release, on the ground that his mortal illness had removed any possibility of his ever again becoming a menace to the world’s peace. The letter remained unanswered, the powers having reason to believe that it was a mere political move, and that its terms had been previously consulted with Napoleon. Henceforth, saddened by the death of Napoleon, of her daughters Pauline and Elisa, and of several grandchildren, she lived a life of mournful seclusion. In 1829 she was crippled by a serious fall, and was all but blind before her death in 1837.

For the Bonaparte family in general, and Carlo and Letizia, see *Storia onomastica della famiglia Bonaparte, della sua origine fino all’estinzione del ramo già esistente nella città di S. Miniato, scritta da un Somministriese* (D. Morral) (Florence, 1856); F. de Stefani, *Le antichità dei Bonaparte: precede per una introduzione* (L. Beretta) (Venice, 1857); L. Ambrosini and A. Huard, *La Famille impériale*. *Histoire de la famille Bonaparte depuis son origine jusqu’en 1850* (Paris, 1860);

**BONAPARTE**

**Napoleon’s brothers and sisters:**

I. Joseph (1768–1844), was born at Corte in Corsica on the 7th of January 1768. He was educated at the college at Autun, and in 1788 returned to his native island, to begin the defense of his father, and thereafter studied law at the university of Pisa. He became a barrister at Bastia in June 1788, and was soon elected a councillor of the municipality of Ajaccio. Like his brothers, Napoleon and Lucien, he embraced the French or democratic side, and on the victory of the Paoliist party fled with his family from Corsica and sought refuge in France. After spending a short time in Paris, where he was disgusted with the excesses of the Jacobins, he settled at Marseilles and married Mlle Julie Clary, daughter of a merchant of that town. The Bonapartes moved from place to place, mainly with the view of conciliating measures for the recovery of Corsica. Joseph took part in these efforts and went on a mission to Genoa in 1795. In 1796 he accompanied his brother Napoleon in the early part of the Italian campaign, and had some part in the negotiations with Sardinia which led to the armistice of Cherasco (April 28), the news of which he bore to the French government. Later he proceeded to Léhogn, took part in the French expedition for the recovery of Corsica, and, along with the commissioner of the French Republic, Miot de Mazaclub, went in March 1797 to Milan to negotiate with the French, and then went to Paris where he entered on parliamentary life, becoming one of the members for Corsica in the Council of Five Hundred. He made no mark in the chamber and retired in 1799.

Before the coup d’État of Brumaire he helped Napoleon in making overtures to Sieyès and Moreau, but otherwise did little. Thereafter he refused to enter the ministry, but became a member
of the council of state and of the Corps Législatif, where his advice on the state of public opinion was frequently useful. He had a hand in the negotiations for the Concordat, but, according to Lucien Bonaparte, looked on that measure as "ill-advised and retrograde." His services in the diplomatic sphere were more meritorious. In 1807 he accompanied the minister of foreign affairs, de Talleyrand, to the United States, and was successively minister to England, to the United States, and minister plenipotentiary to Congress.

On the 23d of June 1806, Napoleon, who had been engaged in a treaty of commerce with Great Britain, seized the occasion to expel from France all British subjects. The measure was received with the utmost reprobation by the French. It was more than ever necessary for Napoleon to rely on foreign powerful friends. As the minister of foreign affairs, he had acquired a great influence with the British government. He was now to receive the title of chief of the diplomatic service of the French republic. His influence was strongly felt in Spain, where Joseph, the brother of Napoleon, was consul. The Spanish power, at the head of the insubordinate Spanish colonies, was distrustful of Napoleon and his influence. He was in the position of a diplomatist; and he had to act with the greatest delicacy to secure the friendship of the Spanish power. He was also minister plenipotentiary to the Spanish court of Madrid.

The British government had offered to Napoleon the acquisition of the Spanish colonies in the West Indies. He accepted the offer, and, in return, promised to expel the British from the Spanish colonies in the West Indies. This was a violation of the treaty of commerce, which had been concluded with the British government. The British government was determined to resist the invasion of their colonies in the West Indies. They had already a strong fleet in the Mediterranean, and Napoleon could not have succeeded in his attempt. He was now to act with great caution, and to avoid any violation of the treaty of commerce.

Napoleon was now to act as minister plenipotentiary to the Spanish court of Madrid. He was to be the agent of the Spanish government in all its negotiations with the British government. He was to act with great delicacy, and to avoid any violation of the treaty of commerce. He was now to act with great caution, and to avoid any violation of the treaty of commerce.

discipline of the place, and on the outbreak of the Revolution in 1789 he eagerly espoused the democratic and anti-clerical movement then sweeping over France. On returning to Corsica he became the leading speaker in the Jacobin club at Ajaccio. Pushing even Napoleon to more decided action, Lucien urged his brothers to break with Paoli, the leader of the more conservative party, which sought to ally itself with England as against the regicide republic of France. He headed a Corsican deputation which went to France in order to denounce Paoli and to solicit aid for the democrats; but, on the Paolists gaining the upper hand, the Bonapartes left the island and joined Lucien at Toulon. In the south of France he worked hard for the Jacobins and the brothers, abetted by Napoleon, turned the inhabitants of the small town of St Maximin (then renamed Marathon). There on the 4th of May 1794 he married Mlle Catherine Boyer, though he was a minor and had not the consent of his family—an act which brought him into a state almost approaching disgrace and penury. The coup d'etat of Thermidor (July 28, 1794) compelled the young disciple of Robespierre hurriedly to leave St Maximin, and to accept a small post at St Chamans. There he was arrested and imprisoned for a time until Napoleon's influence procured his release, and further gained for him a post as a special envoy of the French Republic to Germany. Lucien soon conceived a dislike for a duty which opened up no vista for his powers of oratory and political intrigue, and repaired to Corsica. In the hope of being elected a deputy of the island, he refused an appointment offered by Napoleon in the army of Egypt in 1798. His hopes were fulfilled, and in 1798 he entered the Council of Five Hundred at Paris. There his vivacious eloquence brought him into prominence, and he was president of that body on the eventful day of the 19th of Brumaire (November 10) 1799, when Napoleon overthrew the national councils of France at the palace of St Cloud. The refusal of Lucien to put the vote of outlawry, for which the majority of the council clamoured, his opportune closing of the sitting, and his appeal to the soldiers outside to disperse les représentants du peuple, turned the scale in favour of his brother.

By a strange irony this event, the chief event of Lucien's life, was fatal to the cause of democracy of which he had been the most eager exponent. In one of his earlier letters to his brother Joseph, Lucien stated that he had detected in Napoleon "an ambition not altogether egotistic but which surpassed his love for himself" and predicted that in forty years Napoleon would "try to ride on the crest of events." Napoleon having by his help triumphed over parliamentary institutions in France, Lucien's suspicion of his brother became a dominant feeling; and the relations between them became strained during the period of the consulate (1799-1804). He accepted office as minister of the interior, but was soon deprived of it owing to political and personal differences with the First Consul. In order to soften the blow, Napoleon appointed him ambassador to the court of Madrid (November 1800). There again Lucien displeased his brother. France and Spain were then about to partition Portugal, and the Spanish forces were beginning to invade that land, when the court of Lisbon succeeded, owing (it is said) to the free use of bribes, in inducing Godoy, the Spanish minister, and Lucien Bonaparte to sign the preliminaries of peace on the 6th of June 1801 at Badajoz. The First Consul, finding his plans of seizing Lisbon frustrated, renounced with his brother, who thereupon resigned his post, and returned to Paris, there taking part in the opposition which the Tribunate offered to some of Napoleon's schemes. Lucien's next proceeding consisted in a breach between the brothers. His wife had died in 1800; he became enamoured of a Mme Joubertthou in the early summer of 1802, made her his mistress, and finally, despite the express prohibition of the First Consul, secretly married her at his residence of Plessis (on October 23, 1803).

At that time Napoleon was pressing Lucien for important reasons of state to marry the widow of the king of Etruria, and on hearing of his brother's action he ordered him to leave French territory. Lucien departed for Italy with his wife and infant son, after annoying Napoleon by bestowing on her publicly the name of Bonaparte. He also charged Joseph never to try to reconcile Napoleon to his brother. For some years he lived in Italy, chiefly at Rome, showing marked hostility to the emperor. In December 1807; the latter sought to come to an arrangement by which Lucien would take his place as a French prince, provided that he would annul his marriage. This step Lucien refused to take; and after residing for some time at his estate of Canino, from which he took the papal title of prince of Canino, he left for America. Captured by a British ship, he was taken to Malta and thence to England, where he resided under some measure of surveillance up to the peace of 1814. Returning to Rome, he offered Napoleon his help in forwarding the Hundred Days (1815), stood by his side at the "Champ de Mai" at Paris, and was the last to defend his prerogatives at the time of his second abdication. He spent the rest of his life in Italy, and died at Rome on the 29th of June 1840. His family comprised four sons and six daughters. He wrote an epic, Charlemagne, ou l'Eglise détruite (2 vols., 1814), also La Vérité sur les Cent Jours et Mémoires, which were not completed.

III. MARIANNE ELISA (1777–1820) was born at Ajaccio on the 1st of January 1777. Owing to the efforts of her brothers she entered the establishment of St Cyr near Paris as a "king's scholar." On its disruption by the revolutionists in 1792 Napoleon took charge of her and brought her back to Ajaccio. She shared the fortunes of the family in the south of France, and on the 5th of May 1797 married Felix Bacciochi, a well-connected Corsican. In 1805, after the foundation of the French empire, Napoleon bestowed upon her the principality of Piombino and shortly afterwards Lucca; in 1808 her importunities gained for her the grand duchy of Tuscany. Bacciochi being almost a nobody, her personal and ability had a great influence on the administration and on Italian affairs in general. Her relations with Napoleon were frequently strained; and in 1813–1814 she abetted Murat in his enterprises (see Murat). After her brother's fall she retired, with the title of countess of Compigiano, first to Bologna and afterwards to Santo Andrea near Trieste, where she died on the 6th of August 1820.

IV. LOUIS (1775–1846) was born at Ajaccio on the 2nd of September 1778. His elder brother Napoleon supervised his education with much care, gaining for him scholarships to the royal military schools of France, and during the time when the elder brother was a lieutenant in garrison at Aixonne Louis shared his scanty fare. In 1795 Napoleon procured for him admission to the military school at Châlons, and wrote thus of the boy:—"I am very pleased with Louis; he fulfils my hopes; intelligence, warmth, good health, talent, good address, kindness—he possesses all these qualities." Louis went through the Italian campaign of 1796–97 with Napoleon and acted as his aide-de-camp in Egypt in 1798–99. In 1802 the First Consul married him to Hortense Beauharnais, a forced union which led to most deplorable results. In 1804 of state in order to perfect his knowledge of administrative affairs. In the next year he became governor of Paris and undertook various military and administrative duties.

After the victory of Austerlitz (December 2, 1805) Napoleon began to plan the formation of a ring of states surrounding, and in close alliance with, the French empire. He destined Louis for the throne of Holland, and proclaimed him king of that country on the 6th of June 1806. From the first the emperor reproached him with being too easy with his subjects and with courting popularity too much. The increasing rigour of the continental
system brought the two brothers to an open rupture. Their relations were embittered by a violent jealousy which Louis conceived against his wife. In 1808 the emperor offered Louis the throne of Spain then vacant; but on Louis refusing to accept it he went to Joseph. The dispute between Louis and the emperor continued. In the latter part of 1809 Napoleon virtually resolved to annex Holland, in order to stop the trade which the Dutch secretly carried on with England. At the close of the year Louis went to Paris, partly in order to procure a divorce from Hortense and partly to gain better terms for Holland. He failed in both respects. In January 1810 Napoleon annexed the island of Walcheren, alleging that Louis had endeavored to divert the interests of France at the time of the British Walcheren expedition (1809). The French troops also occupied Breda and Bergen-op-Zoom. Louis gave way on all the points in dispute; but his acquiescence only postponed the crisis. After the collapse of negotiations with Great Britain in the spring of 1810, the emperor again pressed Louis hard, and finally sent French troops against the Dutch capital. Thereupon Louis, despairing of offering resistance, fled from his kingdom and finally settled at Töplitz in Bohemia. On the 9th of July 1810 Napoleon annexed Holland to the French empire and spent the rest of his life separate from his wife, and in 1815 gained the custody of his elder son. He lived chiefly at Rome, concerning himself with literary and philosophic studies and with the fortunes of his sons. Their devotion to the national and democratic cause in Italy in 1829-31 gave him much pleasure, which was overclouded by the death of the elder, Napoleon Louis, in the spring campaign of 1831 in the Romagna. The failure of his other son, Charles Louis Napoleon (afterwards Napoleon III.), to wrest the French crown from Louis Philippe by the attempts at Strasbourg and Boulogne also caused him much disappointment. He died on the 25th of July 1846 and was buried at St. Leu. Under more favourable conditions Louis would have gained a name for kindness and philanthropy, proofs of which did indeed appear during his reign in Holland and gained him the esteem of his subjects; but his morbid sensitiveness served to embitter his relations both of a domestic and of a political nature and to sour his own disposition. His literary works are unimportant. His sons were Napoleon Charles (1802-1807), Napoleon Louis (1804-1831), and Charles Louis Napoleon (1805-1873), afterwards emperor of the French as Napoleon III. (q.v.).

The chief works on the life and reign of Louis are le comte de Saint-Leu, Documents historiques et réflexions sur le gouvernement de la Hollande 3 vols., 2nd ed., Paris, 1820); F. Rocquain, Napoleon 1er et le Roi Louis, d’après les documents conservés aux archives nationales (Paris, 1849); C. de Casadesus, La Reine de France (Paris, 1883); A. Garnier, La Cour de Hollande sous le règne de Louis Bonaparte, par un auditeur (Paris and Amsterdam, 1824); T. Javouhey and Napoleon, Le roi de Hollande (1806-1812), d’après les documents authentiques et inédits (Paris and The Hague, 1868); V. Loosjes, Louis Bonaparte, Koning van Holland (Amsterdam, 1888); L. Wichers, De Regering van Koning Lodewijk Napoleon (1800-1810) (Utrecht, 1892); F. Masson, Napoleon et sa famille (4 vols., Paris, 1897-1900).

VI. MARIA ANNUNCIATA CAROLINE (1782-1839) was born at Ajaccio on the 25th of March 1782. Early in 1800 she married Joachim Murat, whose interests she afterwards advanced with all the power of her ambitious and intriguing nature. He became governor of Paris, marshal of France (1804), grand duke of Berg and of Cleves (1806), lieutenant of the emperor in Spain (1806), and early in the summer of that year king of Naples. The distance of this capital from Paris displeased Caroline; her relations with Napoleon became strained, and she associated herself with the equivocal movements of her husband in 1814-1815. Before his tragic end at Pizzo on the 13th of October 1815, she had retired to Austrian territory and was placed under some measure of surveillance at Trieste with her sister Elisa. She died on the 18th of May 1839.

See J. Turquet, Caroline Murat, reine de Naples (Paris, 1889); F. Masson, Napoleon et sa famille (Paris, 1892-1900). See also under Murat, Joachim.

VII. JEROME (1784-1860) was born at Ajaccio on the 15th of November 1784; he shared the fortunes of the family in the early years of the French Revolution, was then sent (1799) to Julluy and joined to the side of his elder brother, then First Consul of France, in 1805. Jerome brought his wife to Europe, the emperor ordered her to be excluded from his states. Jerome vainly sought to bend his brother’s will in an interview at Alexandria. In May 1805 he received command of a small squadron in the Mediterranean, while his wife proceeded to Camberwell, where she gave birth to a son. In November Jerome sailed in a squadron commanded by Admiral Willaumez, which was to ravage the West Indies; but it was scattered by a storm. After damaging British commerce in the North Atlantic, Jerome reached France with his ship in safety in August 1806. Napoleone made him a prince of France, and gave him command of a division of South Germans in the campaign of 1806. After Jena, Jerome received the surrender of several Prussian towns. An imperial decree having annulled the Patterson marriage, the emperor united Jerome to the princess Catherine of Württemberg; and in pursuance of the terms of the treaty of Tilsit (July 7, 1807) raised him to the throne of the new kingdom of Westphalia. There Jerome, though frequently rebuked by the emperor, displayed his fondness for luxury, indulged in numerous amours and ran deeply into debt. In some respects his kingdom benefited by the connexion with France. Feudalism was abolished; the Code Napoléon was introduced; the Jews were freed from repressive laws; and education received some impulse in its higher departments. But the unpopularity of Jerome’s rule was shown by the part taken by the peasants in the abortive rising headed by Baron Wilhelm von Dönberg and other Westphalian officers in April 1809. Despite heavy taxation, the state debt increased greatly; and the sending of a contingent to Russia in 1812 brought the state to the verge of bankruptcy. In the early part of that campaign Jerome was entrusted with an important movement which might have brought the southern Russian army into grave danger; on his failure (which was probably due to his lack of energy) the emperor promptly subjected him to the control of Marshal Davout, and Jerome returned to Cassel. In 1813, on the fall of the Napoleonic régime in Germany, Jerome retired to France, and in 1814 spent some time in Switzerland and at Trieste. Returning to France in 1815, he commanded a division on the French left wing at Waterloo and attacked Hougomont with great peritanity. On Napoleon’s second abdication Jerome proceeded to Württemberg, was threatened with arrest.
unless he gave up his wife and child, and was kept under surveillence at Goppingen; finally he was allowed to proceed to Augsburg, and thereafter resided at Trieste, or in Italy or Switzerland. His consort died in 1835. He returned to France in 1847, and after the rise of Louis Napoleon to power, became successively governor of the Invalides, marshal of France and president of the senate. He died on the 24th of June 1860. His children were Jerome Napoleon (see XIV), Mathilde (see XII) and Napoleon Joseph Charles Paul (born in 1822); the last was afterwards known as Prince Napoleon (see XI below) and finally became the heir to the fortunes of the Napoleon family. His daughter Mathilde married the Count of Balmes. His eldest daughter was married to Jerome Napoleon, son of Napoleon, in 1847, followed: 10. Pierre X. Pierre Napoleon (1815-1881), son of Lucien Bonaparte, was born at Rome on the 12th of September 1815. He began his life of adventure at the age of fifteen, joining the insurrectionary bands in the Romagna (1830). After the death of his father, Jerome returned to France and was elected deputy for Corsica to the Constituent Assembly. He declared himself an out-and-out republican and voted even with the socialists. He pronounced himself in favour of the national workshops and against the loi Paflois. His attitude contributed greatly to give popular confidence to his cousin Louis Napoleon (Napoleon III.), of whose coup d'etat on the 2d of December 1851 he disapproved; but he was soon reconciled to the emperor, and accepted the title of prince. The republicans at once abandoned him. From that time on he led a debauched life, and lost all political importance. He turned to literature and published some mediocre poems. In January 1870 a violent incident brought him again into prominence. As the result of a controversy with Paschal Grousset, the latter sent him two journalists to provoke him to a duel. Pierre Bonaparte took them personally to account, and during a violent discussion he drew his revolver and killed one of them, Victor Noir. This crime greatly excited the republican press, which demanded his trial. The High Court acquitted him, and criticism then fell upon the government. Pierre Bonaparte died in obscurity at Versailles on the 7th of April 1881. He had married the daughter of a Paris working-man, Justine Eleanore Russin, by whom he had, before his marriage, two children: (1) Roland Napoleon, born on the 19th of May 1858, who entered the army, was excluded from it in 1886, and then devoted himself to geography and scientific explorations; (2) Jeanne, wife of the marquis de Vencelle. XI. Napoleon Joseph Charles Paul, commonly known as Prince Napoleon, or by the sobriquet of "Plon-Plon," (1822-1891), was the second son of Jerome Bonaparte, king of Westphalia, by his wife Catherine, princess of Württemberg, and was born at Trieste on the 9th of September 1822. He soon rendered himself popular by his advanced democratic ideas, which he expressed on all possible occasions. After the French revolution of 1848 he was elected to the National Assembly as a representative of Corsica, and (his elder brother, Jerome Napoleon Charles, dying in 1847) assumed the name of Jerome. Notwithstanding his ostensible opposition upon the coup d'etat of 1851, he was designated, upon the establishment of the Empire, as successor to the throne if Napoleon III. should die childless, and received a liberal donation, but was allowed no share in public affairs. Privately he professed himself the representative of the Napoleonic tradition in its democratic aspect, and associated mainly with men of advanced political opinions. At court he represented the Liberal party against the empress Eugénie. In 1854 he took part in the Crimean campaign as general of division. His conduct at the battle of the Alma occasioned imputations upon his personal courage, but they seem to have been entirely groundless. Returning to France he undertook the chief direction of the National Exhibition of 1855, in which he manifested great capacity. In 1858 he was appointed minister for the Colonies and Algeria, and his administration aroused great hopes, but his activity was diverted into a different channel by his sudden marriage to a basque daughter named BONAPARTE
in January 1839 with the princess Marie Clotilde of Savoy, daughter of Victor Emmanuel, a prelude to the war for the liberation of Italy. In this war, Napoleon commanded the French corps that occupied Tuscany, and it was expected that he would become ruler of the principality, but he refused to exert any pressure upon the inhabitants, who preferred union with the Italian kingdom. The next few years were chiefly distinguished by remarkable speeches which displayed the prince in the unexpected character of a great orator. Unfortunately his indiscretion equalled his eloquence: one speech (1861) sent him to America to avoid a duel with the duke d'Aumale; another (1865), in which he justly but temperately protested against the Mexican expedition, cost him all his official dignities. Nevertheless he was influential in effecting the reform by which in 1869 it was sought to reconcile the Empire with Liberal principles. The fatal war of 1870 was resolved upon during his absence in Norway, and was strongly condemned by him. After the first disasters he undertook an ineffectual mission to Italy to implore the aid of his father-in-law; and after the fall of the Empire lived in comparative retirement until in 1879 the death of Napoleon III.'s son, the Prince Imperial (see XIII. below), made him desire his return. The Napoleon pretended was unfortunate and inglorious: his democratic opinions were unacceptable to the imperial party, and before his death he was virtually deposed in favour of his son Prince Napoleon Victor, who, supported by Paul de Casagnac and others, openly declared himself a candidate for the throne in 1884. He died at Rome on the 17th of March 1891. In the character of his intellect, as in personal appearance, he bore an extraordinary resemblance to the first Napoleon, possessing the same marvellous lucidity, and the same gift of infallibly distinguishing the essential from the non-essential. He was a warm friend of literature and art, and in a private station would have achieved high distinction as a man of letters. His eldest son, Prince Napoleon Victor Jérôme Frédéric (b. 1862), became at his death the recognized head of the French Bonapartist party. The second son, Prince Louis Napoleon, an officer in the Russian army, showed a steadier disposition, and was more favourably in some monarchist quarters; in 1906 he was made governor of the Caucasus.

XII. Matilde Letitia Wilhelmine (1820-1904), daughter of Jérôme, and sister of Prince Napoleon (XI.), was born at Trieste on the 20th of May 1839; after being almost betrothed to her cousin Louis Napoleon, in 1840 she was married to Prince Anatole Demidov. His conduct, however, led to a separation within five years, and the tsar Nicholas compelled him to make Princess Matilde a handsome allowance. After the election of Louis Napoleon to the presidency of the republic she took up her residence in Paris, and did the honours of the Élysée till his marriage. She continued to live in Paris, having great influence as a friend and patron of men of art and letters, till her death on the 2nd of January 1904.

XIII. Napoleon Eugène Louis Jean Joseph (1866-1879), Prince Imperial, only son of the emperor Napoleon III. and the empress Eugénie, was born at Paris on the 16th of March 1866. He was a delicate boy, but when the war of 1870 broke out his mother sent him to the army, to win popularity for him, and the government journals vaunted his bravery. After the first defeats he had to flee from France with the empress, and settled in England at Chislehurst, completing his military education at Woolwich. On the death of his father on the 9th of January 1873 the Imperialists proclaimed him Napoleon IV., and he became the official Pretender. He was naturally inactive, but he was influenced by his mother on the one hand, and by the Bonapartist leaders in France on the other. They thought that he should win his crown by military prestige, and he was persuaded to end his course as a volunteer to the English expedition to Zululand in February 1879. It was a blunder to have persuaded him to go, and the blunder ended in a tragedy, for while out on a reconnaissance with a few troopers they were surprised by Zulus, and the Prince Imperial was killed (June 1, 1879). His body was brought back to England, and buried at Chislehurst.

XIV. The Bonaventures of Baltimore are a branch of the family settled in America, descended from Jerome Bonaparte (VII.) by his union with Elizabeth (b. 1782), daughter of William Patterson, a Baltimore merchant, probably descended from the Robert Paterson who was the original of Sir Walter Scott's "Old Mortality." The marriage took place at Baltimore on the 24th of December 1803, but it was greatly disliked by Napoleon, who refused to recognize its legality. However, it was valid according to American law, and Pope Pius VII. refused to declare it void. Nevertheless Jerome was forced by his brother to separate himself from his wife, whom he had brought to Europe, and after a stay in England Madame Patterson, or Madame Bonaparte, as she was usually called, returned to Baltimore. She died in 1870. Jerome's only child by this marriage was Jerome Napoleon Bonaparte (1865-1870), who was born in England, but resided chiefly in Baltimore, and is said to have shown a marked resemblance to his uncle, the great emperor. He was on good terms with Jerome, who for some time made him a large allowance, and father and son occasionally met. His elder son, also named Jerome Napoleon Bonaparte (1820-1893), was a popular French writer, and edited several journals, including the Christian Treasury, the Presbyterian Review and the Quarterly Journal of Prophecy; but his best work was done in hynmology, and he published three series of Hymns of Faith and Hope between 1857 and 1866 (new ed., 1886). Nearly every modern hymn contains perhaps a score of his hymns, including "Go, labour on," "I heard the voice of Jesus say," "Here, O my Lord, I see Thee face to face," "When the weary, seeking rest." See Heratius Bonar, D.D., a Memorial (1889).

Bonaventura, Saint (John of Fidanza), Franciscan theologian, was born in 1221 at Bagnarea in Tuscany. He was destined by his mother for the church, and is said to have received his cognomen of Bonaventura from St Francis of Assisi, who performed on him a miraculous cure. He entered the Franciscan order in 1243, and studied at Paris possibly under Alexander of Hales, and certainly under Alexander's successor, John of Rochelle, to whose chair he succeeded in 1253. Three years earlier his fame had gained for him permission to read upon the Sentences, and in 1255 he received the degree of doctor. So high was his reputation that in the following year he was elected general of his order. It was by his orders that Roger Bacon was interdicted from lecturing at Oxford, and compelled to put himself under the surveillance of the order at Paris. He was instrumental in procuring the election of Gregory X., who rewarded him with the titles of cardinal and bishop of Albano, and insisted on his presence at the great council of Lyons in the year 1274. At this meeting he died.

Bonaventura's character seems not unworthy of the eulogistic title, "Doctor Seraphicus," bestowed on him by his
contemporaries, and of the place assigned to him by Dante in his
*Paradiso*. He was formally canonized in 1482 by Sixtus IV.,
and ranked as sixth among the great doctors of the church by
Sixtus V. in 1587. His works, as arranged in the Lyons edition
(7 vols., folio), consist of expositions and sermons, filling the
first three volumes; of a commentary on the *Sentences* of
Lombardus, in two volumes, celebrated among medieval theo-
logians as incomparably the best exposition of the third part,
and of minor treatises filling the remaining two volumes, and
including a life of St Francis. The smaller works are the most
important, and of them the best are the famous *Itinerarium
Mentis ad Deum*, Brevisloquium, De Reductione Artium ad The-
ologia, Soliloquium, and *De septem iernoribus aeternitatis*, in
which most of what is individual in his teaching is contained.

In philosophy Bonaventura presents a marked contrast to
his great contemporaries, Thomas Aquinas and Roger Bacon.
While these may be taken as representing respectively physical
science yet in its infancy, and Aristotelian scholasticism in its
most perfect form, he brings before us the mystical and Platoniz-
ing mode of speculation which had already to some extent found
expression in Hugo and Richard of St Victor, and in Bernard of
Clairvaux. To him, the purely intellectual element, though
never absent, is of inferior interest when compared with the
living power of the affections or the heart. He rejects the
authority of Aristotle, to whose influence he ascribes much of
the heretical tendency of the age, and some of whose cardinal
doctrines—such as eternal life of the world—he contemptuously
vigorously but the Platonism he received was Plato as under-
stood by St Augustine, and as he had been handed down by the
Alexandrian school and the author of the mystical works passing
under the name of Dionysius the Areopagite. Bonaventura
accepts as Platonic the theory that ideas do not exist in rerum
natura, but as thoughts of the divine mind, according to which
actual things were formed; and this conception has no slight
influence upon his philosophy. Like all the great scholastic
doctors he starts with the discussion of the relations between
reason and faith. All the sciences are but the handmaids of
theology; reason can discover some of the moral truths which
form the groundwork of the Christian system, but others it can
only receive and apprehend through divine illumination. In
order to obtain this illumination the soul must employ the
proper means, which are prayer, the exercise of the virtues,
whereby it is rendered fit to accept the divine light, and medita-
tion which may rise even to ecstatic union with God. The
supreme end of life is such union, union in contemplation or
intellect and in intense absorbing love; but it cannot be entirely
reached in this life, and remains as a hope for the virtuous
mind contemplating God has three distinct aspects, stages or
grades—the senses, giving empirical knowledge of what is
without and discerning the traces (*vestigia*) of the divine in
the world; the reason, which examines the soul itself, the image
of the divine Being; and lastly, pure intellect (*intelligentia*),
which, in a transcendent act, grasps the Being of the divine
cause.

To these three correspond the three kinds of theology—*theologia
symbolica*, *theologia propria* and *theologia mystica*. Each
stage is subdivided, for in contemplating the outer world we may use
the imagination; in contemplating the church, knowledge of
*God per vestigia* or *in vestigia*. In the first case the three great
properties of physical bodies—weight, number, measure,—in
the second the division of created things into the classes of
those that have merely physical existence, those that have life,
and those that have thought, irresistibly lead us to conclude the
power, wisdom and goodness of the Triune God. So in the
second stage we may ascend to the knowledge of God, *per
imaginem*, by reason, or *in imagine*, by the pure understanding
(*intelligentia*); in the one case the triple division—memory,
understanding and will—remaining, the second case, faith,
hope and charity,—leading again to the conception of a
Trinity of divine qualities—eternity, truth and goodness.

In the last stage we have first *intelligentia*, pure intellect, contem-
plating the essential being of God, and finding itself compelled
by necessity of thought to hold absolute being as the first notion,
for non-being cannot be conceived apart from being, of which it
is but the privation. To this notion of absolute being, which is
perfect and the greatest of all, objective existence must be
ascribed. In its last and highest form of activity the mind rests
in the contemplation of the infinite goodness of God, which is
apprehended by means of the highest faculty, the *apoxy menis* or
*syndetesis*. This spark of the divine illumination is common
to many forms of mysticism, but Bonaventura adds to it peculiarly
Christian elements. The complete yielding up of mind and heart
to God is unattainable without divine grace, and nothing renders
us so fit to receive this gift as the meditative and ascetic life of
the cloister. The monastic life is the best means of grace.

Bonaventura, however, is not merely a meditative thinker,
whose works may form good manuals of devotion; he is a
dogmatic theologian of high rank, and on all the disputed
questions of scholastic thought, such as universals, matter,
the principle of individualism, or the *intellectus agens*, he
gives weighty and well-reasoned decisions. He agrees with Albertus
Magnus in regarding theology as a practical science; its truths,
according to his view, are peculiarly adapted to influence the
affections. He discusses very carefully the nature and meaning
of the divine attributes; considers universals to be the ideal
forms pre-existing in the divine mind according to which things
were shaped; holds matter to be pure potentiality which
receives individual being and determinateness from the formative
power of God, acting according to the ideas; and finally maintains
that the *intellectus agens* had a separate existence. On these
and many other points of scholastic philosophy the Semitic
Doctor exhibits a combination of subtlety and moderation which
makes his works peculiarly valuable.

Editions.—7 vols., Rome, 1588-1596; 7 vols., Lyons, 1668;
10 vols., Rome, 1882-1892. K. J. Heele edited the Brevisloquium
and the *Itin. Mentis* (3rd ed., Tübingen, 1862); two volumes
of selections were issued by Altx in 1853-1856.

Literature.—W. A. Hollenberg, *Studien zu Bonaventura* (1862);
F. Nitsch, art. in Herzog-Hauck, *Realencycl. f. prot. Theol.,* where
a list of monographs is given, to which add one of De Châvez (1899).

BONCHAMPS, CHARLES MELCHIOR ARTUS, MARQUIS DE (c.
1760-1793), Vendéan leader, was born at Jouverteil, Anjou.
He gained his first military experience in the American War of
Independence, and on his return to France was made a captain
of grenadiers in the French army. He was a staunch upholder
of the monarchy, and at the outbreak of the French Revolution
resigned his command and retired to his château at St Florent.
In the spring of 1793 he was chosen leader by the insurgents of
the Vendéens as a protest against their leaders交给
the royalist leaders; but they had weakened the insurgents, and at the bloody battle of Cholet (October 1793) the Vendéens sustained a severe defeat and
Bonchamps was mortally wounded. He died the next day.
It is said that his last act was the pardoning of five thousand
Republic prisoners, whom his troops had sworn to kill in
revenge for his death. A statue of him by David d'Angers
stands to this day in the town of Cholet, the chief town of the
Vendéens.

BOND, SIR EDWARD AUGUSTUS (1815-1898), English
librarian, was born at Hanwell on the 31st of December 1815,
the son of a schoolmaster. He was educated at Merchant
Taylors' school, and in 1832 obtained a post in the public record
office. In 1838 he became an assistant in the manuscript
department of the British Museum, where he attracted the
notice of his chief, Sir Frederick Madden, the most eminent
palaeographer of his day, and in 1852 he was made Egerton
librarian. In 1856 he became assistant keeper of MSS., and
in 1874 was promoted to the post of keeper. His work in
re-organizing the manuscript department was of lasting value,
and to him is due the classified catalogue of MSS., and
the improved efficiency and punctuality of publication of
the department. In 1878 he was appointed principal librarian.
Under his supervision were erected the new buildings of the

"White Wing," which provide accommodation for prints, drawings, manuscripts and newspapers, and the purchase of the Stowe MSS. was concluded while he remained in office. He founded, in conjunction with Sir E. Maunde Thompson, the Palaeographical Society, and first made classical palaeography an exact science. He was made LL.D. of Cambridge in 1879, created C.B. in 1885, and K.C.B. the day before his death on the 2nd of January 1882. He was the editor of four volumes of facsimiles of Anglo-Saxon charters from 679 to the Conquest, The Speeches in the Trial of Warren Hastings (1859-1861), and a number of other interesting historic documents.

BOND, an obligation by deed. Its design is to secure that the obligor, i.e. the person giving the bond, will either pay a sum of money, or do or refrain from doing some act; and for this purpose the obligor binds himself in a penalty to the obligee, with a condition added that, if the obligor pays the sum secured—which is usually half the penalty—or does or refrains from doing the specified act, the bond shall be void: otherwise it shall remain in full force. This condition is known as the defeasance because it defeats or undoes the bond. The form of condition by which bond runs as follows:—

Know All Men by these presents that I, A. B. (name, address and description of obligor), am bound to C. D. (name, address and description of obligee) in the sum of £1000 to be paid to the said (obligee), his executors, administrators or assigns or to his or their attorney, or his executors, administrators or assigns, to the use of the said (obligee).

Sealed with my seal. Dated this day of

The condition of the above-written bond is such that if the above A, B. (name, address and description of obligor) shall on the day of

pay to the above-named C. D., his executors, administrators, or assigns the sum of £1000, with interest for the same from the date of the above-written bond at the rate of per cent per annum without any deduction, then the above-written bond shall be void: otherwise the bond shall remain in full force.

Signed, sealed and delivered

BOND, A. B. (name, address and description of obligor), in the presence of (witness)

Recitals are frequently added to explain the circumstances under which the bond is given.

If the condition is not performed, i.e. if the obligor does not pay the money by the day stipulated, or do or refrain from doing the act provided for, the bond becomes forfeit or absolute at law, and charges the obligor and his estate (see Conveyancing Act 1851, s. 59). In old days, when a bond was forfeit, the whole penalty was recoverable at law and payment post dictum could not be pleaded to an action on it, but the court of chanery early interposed to prevent oppression. It held the penalty of a bond to be equitable, and therefore did not interfere to secure the repayment of the sum bona fide advanced, and would not permit a man to take more than in conscience he ought, i.e. in case of a common money bond, his principal, interest and expenses. This equitable relief received statutory recognition by an act of 1705, which provided that, in case of a common money bond, payment of the lesser sum with interest and costs shall be taken in full satisfaction of the bond. An obligee of a common money bond can, since the date of the Judicature Act, obtain summary judgment under O. xiv. (R.S.C. 1883) by specially endorsing his writ under O. iii. R. 6.

Bonds were, however, and still are given to secure performance of a variety of matters other than the payment of a sum of money at a fixed date. They may be given and are given, for instance, to guarantee the fidelity of a clerk, of a rent collector, or of a person in an office of public trust, or to secure that an intended husband will settle a sum on his wife in the event of her surviving him, or that a building contract shall be carried out, or that a rival business shall not be carried on by the obligor except within certain limits of time and space. The same object can often be attained—and more conveniently attained—by a covenant than by bond, and covenants have in the practice of conveyancers largely superseded bonds, but there are cases where security by bond is still preferable to security by covenant.

Thus, under a bond a final payment is not due until the default, judgment may be entered for the penalty and stand as security for the future payments without the necessity of bringing a fresh action for each payment. In cases of bonds with special conditions, such as those instances above, the remedy of the obligee for breach of the condition is prescribed by an act of 1606, the procedure under which is preserved by the Judicature Act (O. xii. R. 1, O. xiii. R. 14). The obligee assigns the particular breaches of which he complains, damages in respect of such breaches are assessed, and, on payment into court of the obligor of the amount of such damages, the court enters a stay of execution. A difficulty which has much exercised and still exercises the courts is to determine, in these cases of special conditions, whether the sum for which the bond is given is a true penalty or only liquidated damages. There is nothing to prevent the parties to a bond from agreeing the damages for a breach, and if they have done so, the court will not interfere, as it will in the case of a penalty. The leading case on the subject is Kempie v. Farren (1859; 6 Bing. 148).

Bonds given to secure the doing of anything which is contrary to the policy of the law are void. Such, for instance, is a bond given to a woman for future cohabitation (as distinguished from past cohabitation), or a marriage broage bond, that is, a bond given to procure a marriage between parties. (See the matrimonial agency case, Hermann v. Charlesworth, 1905, 2 K.B. 123.) It was not without design that Shakespeare laid the scene of Shylock's suit on Antonio's bond in a Venetian court; the bond would have had short shrift in an English court.

Post Oblit. Bonds.—A post obit bond is one given by an executrix or legatee, payable on or after the death of the person from whom the obligor has expectations. Such a bond, if the obligee has exacted unconscionable terms, may be set aside.

Bottomy Bonds.—A bottomy bond is a contract of hypothecation by which the owner of the mortgage for the mortgage money for the ship to meet some emergency, e.g., necessary repairs, and pledges the ship (or keel or bottom of the ship, partem for partem, or in part). If the ship fails to safely accomplish her voyage, the obligee gets his money back with the agreed interest if the ship is totally lost, he loses it altogether.

Lloyd's Bonds.—Lloyd's bonds are instruments under the seal of a railway company, admitting the indebtedness of the company to the obligee to a specified amount for work done or goods supplied, with a covenant to pay him such amount with interest on a future day. They are a device by which railway companies were enabled to increase their indebtedness without technically violating their charter. The name is derived from the counsel who settled the form of the bond.

Debenture Bonds.—Debenture bonds are bonds secured only by the covenant of the company without any floating or fixed charge on the assets. (See Debentures and Debenture Stock.)

Equitable.—A recognizance differs from a bond in being entered into before a court of record and thereby becoming an obligation of record.

Heritable bond is a Scots law term, meaning a bond for money, joint with a conveyance of land, and held by a creditor as security for his debt.

For goods "in bond" see Bonded Warehouse. (E. M.A.)

BONDAGE, a word meaning generally a servant, but specially used in the south of Scotland and Northumberland as the term for a female outworker whom a married farm-labourer, living in a cottage attached to the farm, undertakes as a condition of his tenancy to supply for field work. For times also to a hired man. The origin of the system was a dearth of field-labour.

BONDE, GUSTAF, COUNT (1620–1667), Swedish statesman. He is remarkable for being the persistent advocate of a pacific policy at a time when war on the slightest provocation was the watchword of every Swedish politician. Even the popular
Polish adventure of Charles X. was strenuously opposed by Bonde, though when once it was decided upon he materially assisted the king to find the means for carrying it on. He was also in favour of strict economy coupled with the recovery of the royal domains which had fallen into the hands of the nobles, though he advocated partiality for his own authority for scarcity may enough. When in 1655 he was appointed a member of Charles X.'s land-recovery commission. In 1659 he succeeded Herman Fleming as lord high treasurer, and was one of the council of regency appointed to govern Sweden during the minority of Charles XI. In 1661 he presented to the senate a plan which aimed at rendering Sweden altogether independent of foreign subsidies, by a policy of peace, economy and trade-development, and by further recovery of alienated estates. His budget in the following year, framed on the same principles, subsequently served as an invaluable guide to Charles XI. Bonde's extraordinary tenacity of purpose enabled him for some years to carry out his programme, despite the opposition of the majority of the senate and his co-regents, who preferred the more adventurist methods of the chancellor Magnus de la Gardie, ultimately so ruinous to Sweden. But the ambition of the oligarchs, and the fear and jealousy of innumerable monopolists who rose in arms against his policy of economy, proved at last too strong for Bonde, while the costly and useless expedition against Bremen in 1665, undertaken contrary to his advice, completed the ruin of the finances. In his later years Bonde's powers of resistance were weakened by sickness, and mortality, and the triumph of reckless extravagance, and he practically retired from the government some time before his death.

See Martin Velboll, Soeriges Storhetstid (Stockholm, 1881).

**BONDED WAREHOUSE**, a warehouse established by the state, or by private enterprise, in which goods liable to duty are lodged until the duty upon them has been paid. Previous to the establishment of bonded warehouses in England the payment of duties on imported goods had to be made at the time of importation, or a bond with security for future payment given to the revenue authorities. The inconveniences of this system were many; it was not always possible for the importer to find sureties, and he had often to make an immediate sale of the goods, in order to raise the duty, frequently selling when the market was depressed and prices low; the duty, having to be paid in a lump sum, raised the price of the goods by the amount of the interest on the capital required to pay the duty; competition was stifled from the fact that large capital was required for the importation of the more heavily taxed articles; there was also the difficulty of granting an exact equivalent drawback to the exporter, on goods on which duties were paid, or could be paid, at the time of importation or subsequent recovery, as the case might be. These difficulties and to put a check upon frauds on the revenue, Sir Robert Walpole proposed in his "excise scheme" of 1733, the system of warehouse, so far as concerned tobacco and wine. The proposal, however, was very unpopular, and it was not till 1803 that the system was actually adopted. By an act of that year imported goods were to be placed in warehouses approved by the customs authorities, and importers were to give "bonds" for payment of duties when the goods were removed. It was from this that the warehouses derived the name of bonded warehouses. The Customs Consolidation Act 1853 dispensed with the giving of bonds, and laid down various provisions for securing the payment of customs duties on goods warehoused. These provisions are contained in the Customs Consolidation Act 1876, and the amending statutes, the Customs and Inland Revenue Act 1880, and the Revenue Act 1883. The warehouses are known as "king's warehouses," and by s. 284 of the act of 1876 are defined as "any place provided by the crown or approved by the commissioners of customs, for the deposit of goods for security thereof, and the duties due thereon." By s. 12 of the same act the treasurer may appoint warehousing by counties, and the commissioners of customs may from time to time approve and appoint warehouses in such ports or places where goods may be warehoused or kept, and fix the amount of rent payable in respect of the goods. The proprietor or occupier of every warehouse so approved (except existing warehouses of special security in respect of which security by bond has hitherto been dispensed with), or some one on his behalf, must, before any goods be warehoused therein, give security by bond, or such other security as the commissioners may approve of, for the payment of the full duties chargeable on any goods warehoused therein, or for the due exportation thereof (s. 13). All goods deposited in a warehouse, without payment of duty on the first importation, are being entered for home consumption, are chargeable with existing duties on like goods under any customs acts in force at the time of passing such entry (s. 16). The act also prescribes various rules for the unshipping, landing, examination, warehousing and custody of goods, and the penalties on breach. The system of warehousing has proved of great advantage both to importers and purchasers, as the payment of duty is deferred until the goods are required, while the title-deeds, or warrants, are transferable by endorsement.

While the goods are in the warehouse ("in bond") the owner may subject them to various processes necessary to fit them for the market, such as the repacking and mixing of tea, the racking, vatting, mixing and bottling of wines and spirits, the roasting of coffee, the manufacture of certain kinds of tobacco, &c., and certain specific allowances are made in respect of waste arising from such processes or from leakage, evaporation and the like.

**BONDU**, a French protectorate in West Africa, dependent on the colony of Senegal. Bondu lies between the Falémé river and the upper course of the Gambia, that is between 12° S. and 15° N., and 12° and 13° W. The country is an elevated plateau, with hills in the southern and central parts. These are generally unproductive, and covered with stunted wood; but the lower country is fertile, and finely clothed with the baobab, the tamarind and various valuable fruit-trees. Bondu is traversed by torrents, which flow rapidly during the rains but are empty in the dry season, such streams being known in this part of West Africa as marigots. The inhabitants are mostly Fula, though the trade is largely in the hands of Mandingos. The religion and laws of the country are Mahomedan, though the precepts of that faith are not very rigorously observed. Mungo Park, the first European traveller to visit the country, passed through Bondu in 1795, and had to submit to many exactions from the reigning prince. The royal residence was then at Patteconda; but when Major W. Gray, a British officer who attempted to solve the Niger problem, visited Bondu in 1818 it had been removed to Boublali, a small town, with about 3000 population, surrounded by a strong clay wall. In August 1845 the king of Bondu signed a treaty recognizing French sovereignty over his country. The treaty was disregarded by the natives, but in 1858 Bondu came definitely under French control. The country has since enjoyed considerable prosperity (see SENEGAL).

See A. Rançon, Le Bondeau: étude de géographie et d'histoire soudanennes de 1681 à nos jours (Bordeaux, 1894).

**BONE, HENRY** (1755-1834), English enamel painter, was born at Truro. He was much employed by London jewellers for small designs in enamel, before his merits as an artist were well known to the public. In 1800 the beauty of his pieces attracted the notice of the Royal Academy, of which he was then admitted as an associate; in 1811 he was made an academician. Up to 1831 he executed many beautiful miniature pieces of much larger size than had been attempted before in England; among these his eighty-five portraits of the time of Queen Elizabeth, of different sizes, from 5 by 4 to 12 by 8 in. are most admired. They were disposed of by public sale after his death. His Bacchus and Ariadne, after Titian, painted on a plate, brought the great price of 200 guineas.

**BONE** (a word common in various forms to Teutonic languages, in many of which it is confined to the Shank of the leg, as in the German Bein), the hard tissue constituting the framework of the animal skeleton. For anatomy see Skeleton and Connective Tissues.

**Bone Diseases and Injuries.**—The more specific diseases affecting the bones of the human body are treated under separate
headings; in this article inflammation of bone and fractures are dealt with.

Ostitis (barrier, bone), or inflammation of bone, may be acute or chronic. Acute ostitis is one of the most serious diseases which can be met with in young people. It is due to the cultivation of virulent germs in the delicate growing tissue of the bone and in the marrow. Another name for it is septic ostitis, which has the same stage in expressing the cause as well as the exact seat (μυελός, marrow) of the inflammation. The name of the micro-organism causing the inflammation is Staphylococcus pyogenes aureus, which means that the germs collect in clusters like grapes, that they are of the virulent pus-producing kind, and that they have a yellow tinge. As a rule, the germs find their way to the bone by the blood-stream, which they have entered through the membrane lining the mouth or gullet, or some other part of the alimentary canal. In the pre-antiseptic days they often entered the sawn bone during the amputation of a limb, and were not infrequently the cause of blood-poisoning and death. When the individual is well and strong, and there has been no hurt, strain or accident to lower the power of resistance of the bone, the staphylococci may circulate harmlessly in the blood, until they are gradually eaten up by the white corpuscles; but if a bone has been injured it offers a likely and attractive focus to the wandering germs.

The disease is infective. That is to say, the micro-organisms having begun to germinate in the damaged bone find their way by the blood-stream into other tissues, and developing after their kind, are apt to cause blood-poisoning. Should a surgeon prick his finger whilst operating on a case of septic osteomyelitis his blood also might be poisoned, and he would run the risk of losing his finger, his hand, or even his life. The starting-point of the disease is the delicate growing tissue recently deposited between the main part of the shaft of the bone (diaphysis) and the cartilaginous end. And it often happens that the earliest complaint of pain is just above or below the knee; just above the ankle, the elbow or the wrist. It the surgeon is prompt in operating he may find the disease limited to that spot. In the case of infants, the germs are very apt to make their way into the neighbouring joint, giving rise to the very serious disease known as acute arthritis of infants.

Probably the first sign of there being anything amiss with the limb will be a complaint of aches or pains near a joint; and these pains are apt to be miscalled rheumatic. Perhaps they occur during convalescence from scarlet or typhoid fever, or after exposure to injury, or to wet or cold, or after unusual fatigue. The part becomes swollen, hot, red and excessively tender; the tenderness, however, is not in the skin but in the bone, and in the engorged membrane around it, the periosteum. The temperature may run up to 104°, and may be associated with convulsions or shiverings. The patient's nights are disturbed, and very likely he has violent delirium. If the case is allowed to drift on, abscess forms, and death may ensue from septic pneumonia, or pericarditis, or from some other form of blood-poisoning.

As soon as the disease is recognized an incision should be made down to the bone, and the affected area should be scraped out, and disinfected with a solution of corrosive sublimate. A considerable area of the bone may be found stripped bare by sub-periosteal abscess, and necrosis is likely to ensue. Perhaps the shaft of the bone will have to be opened up in the chief part of its length in order that it may be cleared of germs and pus. The surgeon is more apt to err on the side of doing too little in these serious cases than too much. It may be that the whole of that piece of bone (diaphysis) which lies between the joint-ends is found loose in a large abscess cavity, and in some cases immediate amputation may be found necessary in order to save life; in other cases, amputation may be called for later because of long continued suppuration and grave constitutional disturbance. Several bones may be affected at the same time, and large pieces of them may be killed outright (multiple necrosis) by inflammatory engorgement and devastating abscess.

Septic ostitis may be confounded with erysipelas and rheuma-
fix with the splint the joint above or below the fracture. In cases in which a splintering of the bone into a joint has taken place, more especially in those cases in which tendons have been injured, there may be a good deal of effusion into the joint and the tendon sheaths, and this may be organized into fibrous tissue leading to permanent stiffness. This is particularly apt to occur in old people. Care must be taken in such instances by gentle exercises, and by passive movement during the process of cure, to keep the joint and tendons free. To take a common example,—in fracture close to the wrist joint, it is necessary to arrange the splint so that the patient can move his fingers and thumb, and the splint must be taken off every day, in order that the wrist and fingers may be gently bent, straightened and exercised.

The treatment of fractures has undergone considerable improvement of late years. Simple fractures are not kept so long at rest in splints, but are constantly "taken down" in order that massage and movements of the limb may be resorted to. This, of course, is done with the utmost gentleness, and with the result that swelling, pain and other evidences of the serious injury quickly disappear, whilst a more rapid and complete recovery is ensured. Stiff hands and feet after fracture are much less frequently met with. By the aid of the X-rays it is now easy for the surgeon to assure himself that fractured surfaces have been well adjusted and are in close apposition. But if they are not in a satisfactory position, and it be found impracticable to assure their close contact by ordinary means, nothing without undue loss of time, cuts down upon the broken ends and fixes them together by a strong wire suture, which remains permanently in the tissues. If the fracture be associated with an open wound of the part (compound fracture), and the broken ends are found incapable of easy adjustment, immediate wire together of the fragments is now considered to be a necessary part of the primary treatment. The French surgeon, Just Lucas-Championnière, has done more than any one else to show the advantage of discreet movements, of massage and of exercises in the treatment of fractures.

**Special Fracture in Young People.**—The long bones of children and growing persons consist of a shaft with cartilaginous ends in which bone is developed. As the result of injury, the end of the bone may become detached, a variety of fracture known as *diastasis*. Such a fracture,—however well treated,—may be followed by arrest of growth of the bone or by stiffness of the neighbouring joint.

**Delayed union** means that consolidation is taking place very slowly, if at all. This may be due to local or constitutional causes, but provided the bones are in good position, with massage, and with due attention to general health-measures, is necessary.

**An ununited fracture** is one in which after many weeks or months no attempt has been made by nature to consolidate the parts. This may be due to the ends not having been brought close enough together; to the sear of fracture having been constantly disturbed; to muscle or tendon being interposed between the broken ends, or to the existence of some constitutional defect in the patient. Except in the last-named condition, the treatment consists in cutting down to the broken ends, freshening up by sawing off a thin slice, and by adjusting and fixing them by a wire or screw. Ununited fracture of the leg-bones in children is a most unsatisfactory and rebellious condition to deal with. There is still a difference of opinion as to the best way of treating a recent fracture of the patella (knee-cap). Many surgeons are still content to follow the old plan of fixing the limb on a back-splint, or in plaster of Paris splints, and awaiting the result. It is beyond question that a large percentage of those cases recover with a perfectly useful limb,—especially if the fibrous bond of union between the pieces of the broken knee-cap is adequately protected against being stretched by bending the leg at too early a date. But in some cases the fragments have been eventually found wide apart, the patient being left with an enfeebled limb. Still, at any rate, this line of treatment was unassociated with risk. But after Lister showed (1838) that with due care and cleanliness the knee-joint could be opened, and the fragments of the broken patella secured in close apposition by a stout wire suture, the treatment of the injury underwent a remarkable change. The great advantage of Lister's treatment was that the fragments, being fixed close together with a good clean suture, the knee-joint became as sound as it was before. Some surgeons, however, objected to the operation—in spite of the excellence of the results obtainable by it—because of the undue risk which it entailed of the joint becoming invaded by septic microorganisms. As a sort of compromise, Professor A. E. J. Barker introduced the method, which he deemed to be less hazardous, of holding the fragments close together by means of a strong silver wire passed round them vertically by a large needle without actually laying open the joint. But experience has shown that in the hands of careful and skillful surgeons Lister's operation of openly wiring the fragments gives a perfect result with a comparatively small risk. Other surgeons secure the fragments in close contact for bony union by passing a silk or metal suture around them circumferentially. Many years ago Lister remarked that the careful selection of one's patients is an antiseptic measure,—by which he meant that if a surgeon intended to get the most perfect results for his operative work, he must carefully consider whether any individual patient is physically adapted for the performance upon him of any particular operation. This applies equally to the objects of the surgeon's operation, for the fixing of the broken knee-cap is suited for the opening of his knee-joint, or even for the subcutaneous adjustment of the broken fragments. An operative procedure which is admirably suited for one patient might result in disaster when adopted for another, and it is an important part of the surgeon's business to know what to advise in each individual case.

—(E. O.)

**Industrial Applications of Bones.**—By the increasing inventiveness of man, the industrial utilization of animal bone has been so developed that the use of bone as a raw material is now a hundred times more widespread than heretofore. Composed of mineral matters—phosphates, &c.—and gelatinous substances, the phosphates are used as artificial manures, the fat is worked up by the soap-makers and chandlers, and the gelatin matter forms the basis of the gelatin and glue of commerce; while by the dry distillation of bones from which the gelatin has been but partially removed, there are obtained a carbonaceous residue—gelatinous bone—of great value in the medical profession, and bone pitch is obtained. To these by-products there must be added the direct uses of bone—for making buttons, knife-handles, &c.—and an estimate is desired of the commercial importance of these components of the animal frame.

While most of the world's supply of bones goes to the glue and gelatin works, the leg and thigh bones, termed "marrows" and "banging," are used for the manufacture of china, articles of which treatment they receive is very different from that practised in the glue-works. The ends are removed by a saw, and the bones are steeped in a 3% brine solution for three to four days, in order to separate the fibrous matter. The bones are now heated with water, and allowed to simmer for about six hours. This removes a part of the fat and gelatinous matter; the former rises as a scum, the latter passes into solution, and the bones remain sufficiently firm to be worked up by the lathe, &c. The fat is skimmed off, and, after bleaching, reappears as a component of fine soaps, or, if unbleached, the oil is expressed and is used as an adulterant of other animal oils, and for the manufacture of "bone oil," from which the gelatinous water is used (after filtration) for making size for cardboard boxes; while the bones are scrubbled, dried, and then treated to the last named end.

The glue-worker first removes the fat, which is supplied to the soap and candle trades; the bones are now treated for glue (g.v.); and the residue is worked up for manures, &c. These residues are used to a fine or coarse meal, and supplied either directly as a fertilizer or treated with sulphuric acid to form the more soluble superphosphates, which are more readily assimilated by growing plants. In some places, especially South America, the residues are burned, and the ash, which contains some 70-80% of tricalcium phosphate, and is much used as a manure, and in the manufacture of high-grade superphosphates. In the gelatin industry (see GELATIN) the gelatin matter has to be recovered from its solution in hydrochloric acid. To effect this, the Liquors are freed from suspended matter by filtration, and then run into vats where they are mixed with milk of lime, or some similar neutralizer. The slightly soluble bicalcium phosphate, CaHPO₄, is first precipitated, which, with more lime, gives ordinary tricalcium phosphate, Ca₃(PO₄)₂. The contents of
the vats are filter-pressed, and the cakes dried on plates supported on racks in heated chambers. This product is a very valuable manure, and is also used in the manufacture of phosphorus.

Instead of extracting all the gelatinous matter from degreased bone, the practice has long been in vogue to take half and sometimes three-quarters of the residue is frequently adopted. The bones are heated in horizontal cast-iron retorts, holding about 5 cwt., and the operation occupies about twelve to thirteen hours. The residue in the retorts is reduced to a style to which it is subsequently riddled by revolving cylindrical sieves. The yield is from 55 to 60 per cent. of bone, or bone powder, which contains 85 per cent. of carbon and about 75 per cent. of calcium phosphate, the remainder being various inorganic salts and moisture (6-7%). Animal charcoal has a deep black colour, and is much used as a filtering and clarifying material. The vapours evolved during carbonization are condensed in vertical air condensers. The liquid separates into two layers: the upper tarry layer is floated off and redistilled; the distillate is termed bone oil, and is principally used for manufacturing bone powder. Both during the carbonization of the bone and the subsequent distillation of the tar inflammable gases are evolved: these are generally used, after purification, for motive or illuminating purposes.

**BONE BED**—**BONFIRE**

**BONE BED**, a term loosely used by geologists when speaking generally of any stratum or deposit which contains bones of whatever kind. It is also applied to those brecciated and slag-mitic deposits on the floor of caves, which frequently contain ossaceous remains, and was, and is, vastly used in the sense it is used, and to describe thin layers of bony fragments, which occur upon well-defined geological horizons. One of the best-known of these is the Ludlow Bone Bed, which is found at the base of the Downton Sandstone in the Upper Ludlow series. At Ludlow itself, two such beds are actually known, separated by about 14 ft. of strata. Although quite thin, the Ludlow Bone Bed can be followed from that town into Gloucestershire for a distance of 45 m. It is almost made up of fragments of spines, teeth and scales of ganoid fish. Another well-known bed, formerly known as the "Bristol" or "Lias" Bone Bed, exists in the form of several thin layers of micaceous sandstone, with the remains of fish and saurians, which occur in the Raetic Black Paper Shales that lie above the Keuper marls in the south-west of England. It is noteworthy that a similar bone bed has been traced on the same geological horizon in Brunswick, Hanover and Franconia.

A bone bed has also been observed at the base of the Carboniferous limestone series in certain parts of the south-west of England.

**BONE-LACE**, a kind of lace made upon a cushion from linen thread; the pattern is marked out with pins, round which are twisted the different threads, each wound on its own bobbin. The lace was so called from the fact that bobbins were formerly made of bone.

**BONER** (or **BONERIUS**), **ULRICH** (fl. 14th century), German-Swiss writer of fables, was born in Bern. He was descended of an old Bernese family, and, as far as can be ascertained, took clerical orders and became a monk; yet as it appears that he subsequently married, it is certain that he received the "benefit of the clergy," so he might be admitted to the benefit of the **clerici usoris**, who, on divesting themselves of the clerical garb, could return to secular life. He is mentioned in records between 1324 and 1349, but neither before nor after these dates. He wrote, in Middle High German, a collection of fables entitled **Der Edelstein** (c. 1340), one hundred in number, which were based principally on those of Avianus (4th century) and the **Anonymus** (edited by L. Nevelet, 1610). This work he dedicated to the Bernese patrician and poet, Johann von Rinnenberg, adviser (Vogt) of the city of Bern (d. 1350). It was printed in 1463 at Bamberg; and it is claimed for it that it was the first book

1 Bone oil, also known as **Dippel's oil**, was originally produced by the distillation of stag's horns; it is of interest in the history of chemistry, since it was isolated in 1846 by J. Anderson pyridine and some of its homologues.

**BO'NESS**, or **Borrowstounness**, a municipal and police burgh and seaport of Linlithgowshire, Scotland. Pop. (1801) 6095; (1801) 9306. It lies on the southern shore of the Firth of Forth, 17 m. W. of Edinburgh, and 24 m. by rail, being the terminus of the North British railway's branch line from Edinburgh. In the 18th century it ranked next to Leith as a port, but the growth of Grangemouth, higher up the firth, seriously affected its shipping trade, which, however, yet considerable, coal and pig-iron forming the principal exports, and pit props from the Baltic the leading import. It has an extensive harbour (the area of the dock being 7½ acres). The great industries are coal-mining—some of the pits extending for a long distance beneath the firth—iron-founding (with several blast furnaces) and engineering, but it has also important manufactures of salt, soap, vitriol and other chemicals. Shipbuilding and whaling are extinct. Traces of the wall of Antoninus which ran through the parish may still be made out, especially near Inveravan. Blackness, on the coast farther east, was the seaport of Linlithgow till the rise of Bo'ness, but its small port trade now mainly consists of coal, bricks, tiles and lime. Its castle, standing on a promontory, is of unknown age. James III. of Scotland is stated to have consigned certain of the insurgent nobles to its cells, and later it was used as a prison in which many of the Covenanters were immured. It was one of the four castles that had to be maintained by the Articles of Union, but when its uselessness for defensive purposes became apparent, it was converted into an ammunition depot. Kinneil House, 1 m. south of Bo'ness, a seat of the duke of Hamilton, formerly a keep, was fortified by the regent Arran, plundered by the rebels in Queen Mary's reign, and reconstructed in the time of Charles II. Dr John Roebuck (1718-1794), founder of the Carron Iron Works, occupied it for several years after 1764. It was here that, on his invitation, James Watt constructed a model of his steam-engine, which was tested in a now disused colliery. Though Roebuck lost all his money in the coal-mines and salt works which he established at Bo'ness, the development of the mineral resources of the district may be regarded as due to him.

**BONIFACIUS, BENEDETTO**, 15th century Italian painter, was born in Perugia. Until near the middle of the 15th century the Umbrian school was far behind those of Florence and the North, but in the person of Perugino and some of his followers it suddenly advanced into the very first rank. Among the latter none holds a more distinguished place than Benedetto Bonfigli. The most important of his extant works are a series, in fresco, of the life of St Louis of Toulouse, in the communal palace of Perugia.

**BONFIRE** (in Early English "bone-fire," "Scottish" "bane-fire"), originally a fire of bones, now any large fire lit in the open air on an occasion of rejoicing. Though the spelling "bone-fire" was used in the 16th century, the earlier "bone-fir" was common till 1760. The earliest known instance of the derivation of the word occurred as *bone frye ignis ossium* in the *Catholic Anglicum*, A.D. 1453. Other derivations, now rejected, have been sought for the word. Thus some have thought it *Bauel-fyre*, passing through *Boel, Bane to Bane*. Others have declared it to be *boon-fyre* by analogy with *boon-harow*, i.e. "harrowing by gift," the suggestion being that these fires were "contribution" fires, every one in the neighborhood contributing a portion of the material, just as in Northumberland the "contributed Floughing Days" are known as *Bone-daggs*.

Whatever the origin of the word, it has long had several meanings—(a) a fire of bones, (b) a fire for corpses, a funeral pile, (c) a fire for immolation, such as that in which heretics and
proscribed books were burnt, (d) a large fire lit in the open air, on occasions of national rejoicing, or as a signal of alarm such as the bonfires which warned England of the approach of the Armada. Throughout Europe the peasants from the Bordello had lighted bonfires on certain days of the year, and danced around or leapt over them. This custom can be traced back to the middle ages, and certain usages in antiquity so nearly resemble it as to suggest that the bonfire has its origin in the early days of heathen Europe. Indeed the earliest proof of the observance of these bonfire ceremonies in Europe is afforded by the attempts made by Christian synods in the 7th and 8th centuries to suppress them as pagan. Thus the third council of Constantinople (A.D. 680), by its 6th canon, orders: "Those fires that are kindled by certain people on new moons before their shops and houses, over which also they use ridiculously and foolishly to leape, by a certaine antient custome, we command them from henceforth to cease." And the Syndos Francica under Pope Zachary, A.D. 742, forbids "those sacrilegious fires which they call Nederi (or bonfires), and all other observations of the Pagans whatsoever." Leaping over the fires is mentioned among the superstitious rites used at the Pilia (the feast of Pales, the shepherds' goddess) in Ovid's Fasti, when the shepherds lit heaps of straw and jumped over them as they burned. The lighting of the bonfires in Christian festivities was significant of the compromise made with the heathen by the early Church. In Cornwall bonfires are lighted on the eve of St John the Baptist and St Peter's day, and midsummer is thence called in Cornish Golvan, which means both "light" and "festival." Sometimes effigies are burned in these fires, or a pretense is made of burning a living person in them, and there are grounds for believing that anciently human sacrifices were actually made in the bonfires. Spring and midsummer are the usual times at which these bonfires are lighted, but in some countries they are made at Harvest time (October 31) and at Christmas. In spring the first Sunday in Lent, Easter eve and the 1st of May are the commonest dates.

See J. G. Frazer, Golden Bough, vol. iii., for a very full account of the bonfire customs of Europe, &c.

BONGARs, JACQUES (1554-1612), French scholar and diplomatist, was born at Orleans, and was brought up in the reformed faith. He obtained his early education at Marburg and Jena, and returning to France continued his studies at Orleans and Bourges. After spending some time in Rome he visited eastern Europe and made the acquaintance of Segur Pardaillan, a representative of Henry, king of Navarre, afterwards Henry IV. of France. He entered the service of Pardaillan, and in 1587 was sent on a mission to many of the princes of northern Europe, after which he visited England to obtain help from Queen Elizabeth for Henry of Navarre. He continued to serve Henry as a diplomatist, and in 1593 became the representative of the French king at the courts of the imperial princes. Vigorously seconding the efforts of Henry to curtail the power of the house of Habsburg, he spent health and money ungrudgingly in this service, and continued his labours until the king's murder in 1610. He then returned to France, and died at Paris on the 29th of July 1612. Bongars wrote an abridgment of Justin's abridgment of the history of Trogus Pompeius under the title Justinus, Trogi Pompeii Historiarum Philippiacarum epitoma de manuscriptis codicibus emendator et prolegois actorum (Paris, 1581). He collected the works of several French writers who as contemporaries described the crusades, and published them under the title Gesta Del per Francos (Hanover, 1611). Another collection made by Bongars is the Rerum Hungaricarum seribus in annis (Franct., regum, sive regum Epistolae were published at Leiden in 1632), and a French translation at Paris in 1668-1670. Many of his papers are preserved in the library at Bern, to which they were presented in 1632, and a list of them was made in 1634. Other papers and copies of instructions are now in several libraries in Paris; and copies of other instructions are in the British Museum.

See H. Hagen, Jacobus Bongarsius (Bern, 1874); L. Anezque, Henri IV et l'Allemagne (Paris, 1887).

BONGHI, RUGGERO (1828-1895), Italian scholar, writer and politician, was born at Naples on the 20th of March 1828. Exiled from Naples in consequence of the movement of 1848, he took refuge in Tuscan, where he was compelled to flee to Turin on account of a pungent article against the Bourbons. At Turin he resumed his philosophic studies and his translation of Plato, but in 1858 refused a professorship of Greek at Pavia, under the Austrian government, only to accept it in 1859 from the Italian government after the liberation of Lombardy.

In 1860, with the Cavour party, he opposed the work of Garibaldi, Crispi and Bentani at Naples, and became secretary of Luigi Carlo Farini during the latter's lieutenant, but in 1865 assumed contemporaneously the editorship of the Perseveranza of Milan and the chair of Latin literature at Florence. Elected deputy in 1860 he became compelled by the biting wit of his speeches, while, as journalist, the acrimony of his polemical writings made him a redoubtable adversary. Though an ardent supporter of the historic Right, and, as such, entrusted by the Lanza cabinet with the defence of the law of garantances in 1870, he was no respecter of persons, his caustic tongue sparing neither friend nor foe. Appointed minister for public instruction in 1873, he, with feverish activity, reformed the Italian educational system, suppressed the privileges of the university of Naples, founded the Vittorio Emanuele library in Rome, which was provided with the establishment of a Catholic university in the capital. Upon the fall of the Right from power in 1876 he joined the opposition, and, with characteristic vivacity, protracted during two months the debate on Baccelli's University Reform Bill, securing, single-handed, its rejection. A bitter critic of King Humbert, both in the Perseveranza and in the Nuova Antologia, he was, in 1893, excluded from court, only securing readmission shortly before his death on the 22nd of October 1895. In foreign policy a Francophile, he combated the Triple Alliance, and took considerable part in the organization of the inter-parliamentary peace conference.

BONGO (Dor of Deran), a tribe of Nilotic negroes, probably related to the Zande tribes of the Welle district, inhabiting the south-west portion of the Bahar-el-Ghazal province, Anglo-Egyptian Sudan. G. A. Schweinfurth, who lived two years among them, declares that before the advent of the slave-raiders, c. 1850, they numbered at least 300,000. Slave-raiders, and later the dervishes, greatly reduced their numbers, and it was not until the establishment of effective control by the Sudan government (1890-1900) that recuperation was possible. The Bongo formerly lived in countless little independent and peaceful communities, and under the Sudan government they again manage their own affairs. Their huts are well built, and sometimes 24 ft. high. The Bongo are a race of medium height, inclined to be thick-set, with a red-brown complexion, "like the soil upon which they reside"—and black hair. Schweinfurth declares their heads to be nearly round, no other African race, to his knowledge, possessing a higher cephalic index. The women incline to steatopygia in later life, and this deposit of fat, together with the tail of beast which they wore, gave them, as they walked, Schweinfurth says, the appearance of "dancing baboons." The Bongo men formerly wore only a loin-cloth, and many dozen iron rings on the arms (arranged to form a sort of armour), while the women had simply a girdle, to which was attached a tuft of grass. Both sexes now largely use cotton cloth as dresses. The tribal ornaments consist of nails or plugs which are passed through the lower lip. The women often wear a disk several inches in diameter in this fashion, together with a ring or a bit of straw in the upper lip, suggestive of the "c,assigns of a baboon." The Bongo, unlike other of the upper Nile Negroes, are not great cattle-breeders, but employ their time in agriculture. The crops mostly cultivated are sorghum, tobacco, sesame and durra. The Bongo eat the fruits, tubers and fungi in which the country is rich. They also eat almost every creature—bird, beast, insect and reptile, with the exception of the dog. They despise no flesh, fresh or putrid. They drive the vulture from carrion, and eat with relish the intestinal worms of the ox. Earth-eating, too, is
common among them. They are particularly skilled in the
smelting and working of iron. Iron forms the currency of the
country, and is extensively employed for all kinds of useful and
ornamental purposes. Bongo uses, knives, rings, and other
articles are frequently fashioned with great artistry.
They have a variety of musical instruments—drums, stringed
instruments, and horns—in the practice of which they take
great delight; and they indulge in a vocal recitative which
seems intended to imitate a succession of natural sounds.
Schweinfurth says that Bongo music is like the raging of the
elements. Marriage is by purchase; and a man is allowed to
acquire three wives, but not more. Tattooing is partially
practised. As regards burial, the corpse is bound in a sheet
pension with the knees drawn up to the chin; men are placed
in the grave with the face to the north, and women with the
face to the south. The form of the grave is peculiar, consisting
of a niche in a vertical shaft, recalling the mastaba graves of
the ancient Egyptians. The tombs are frequently ornamented
with rough wooden figures intended to represent the deceased.
Of the immortality of the soul they have no defined notion;
and their only approach to a knowledge of a beneficent deity
consists in a vague idea of luck. They have, however, a most intense
belief in the efficacy of petty spells and witchcraft, especially
malignant. Arrows, spears and clubs form their weapons,
the first two distinguished by a multiplicity of barbs.
Euphorbia juice is used as a poison for the arrows. Shields are
rare. Their language is musical, and abounds in the vowels
\( \sigma \) and \( \alpha \); its vocabulary of concrete terms is very rich, but
the same word has often a great variety of meanings.
The grammatical structure is simple. As a race the Bongo are gentle
and industrious, and exhibit strong family affection.

**BONGO** (*Bolecercus eurycerus*), a West African bushbuck, the
largest of the group. The male is deep chestnut, marked on the
body with narrow white stripes, on the chest with a white
crescent, and on the face by two white spots below the eye.
In the East African bongo (*B. e. Isaacii*) the body hue is stronger
and richer. There is, as yet, no evidence as to whether the
females of the true bongo bear horns, though it is probable they
do; but as the horns are present in both sexes of the East African form, Mr Oldfield Thomas has made that the type of the
*genus.*

**BONHAM,** a town and the county-seat of Fannin county,
Texas, U.S.A., about 14 m. S. of the Red river, in the north-east
part of the state, and 70 m. N. of Dallas. Pop. (1890) 3361;
(1900) 5042 (1723 being negroes); (1910), 8444. It is served by the
Missouri, Kansas & Texas, and the Texas & Pacific railways.
Bonham is the seat of Carlton College (Christian), a woman's
college founded in 1867; and its high school is one of the best
in the state. It is a trading and shipping centre of an extensive
farming territory devoted to the raising of live-stock and to the
growing of cotton, Indian corn, fruit, &c. It has large cotton
fins and compresses, a large cotton mill, flour mills, canning
and ice factories, railway repair shops, planing mills and carriage
works. The town was named in honour of J. B. Bonham, a native
of South Carolina, who was killed in the Alamo. The first settle-
ment here was made in 1836. The town was incorporated in
1838, and was reincorporated in 1886.

**BONHEUR** [Marie Rosalie], ROSA (1822-1890), French
painter, was born at Bordeaux on the 22nd of March 1822.
She was of Jewish origin. Jacques Wicher, the Belgian medallist,
a native of Venloo, says that he and Raymond Bonheur, Rosa's
father, used to attend synagoge in that town; while another
authority asserts that Rosa used to be known in common parlance
by the name of Rosa Mazelov (a Hebrew term for "good luck," "
Galitche Bonheur"). She was the eldest of four children, all of
whom were artists—Auguste (1824-1884) painted animals and
landscape; Juliette (1820-1891) was "honourably mentioned"
at the exhibition of 1853; Isidore, born in 1827, was a sculptor
of animals. Rosa at an early age was taught to draw by her

father (who died in 1849), and he, perceiving her very remarkable
qualities, permitted her to abandon the business of dressmaking,
to which she much preferred, and she had been put, in order to
devote herself wholly to art. From 1840 to 1845 she exhibited
at the salon, and five times received a prize; in 1846 a medal
was awarded to her. Her fame dates more especially from the
exhibition of 1855; from that time Rosa Bonheur's works were
much sought after in England, where collectors and public
galleries competed eagerly for them. What is chiefly remark-
able and admirable in her work is that, like her contemporary,
Jacques Raymond Brascassat (1804-1867), she represents
animals as they really are, as she saw them in the country. Her
painting is based on the observation of nature, but she is less
stressed by the mannerism of academic art, and her strokes are
admirable in the work of 1873; one of the two replicas of which
is in the National Gallery, London, the original being in the United
States; and "Hay Harvest in Auvergne" ([1855]. She was
dedicated to the genre of pastoral scenes, which she began as a
child and was subsequently promoted to the rank of "officer" of the
order. After 1859 Rosa Bonheur exhibited but once in the salon,
in 1899, a few weeks before her death. She lived quietly at her
country house at By, near Fontainebleau, where for some years
she had held gratuitous classes for drawing. She left at her
death a considerable number of pictures, studies, drawings
and etchings, which were sold by auction in Paris in the spring of
1900.

**BONHEUR DU JOUR,** the name for a lady's writing-desk,
so called because, when it was introduced in France about 1760,
it speedily became intensely fashionable. The bonheur du jour
is always very light and graceful; its special characteristic is
a raised back, which may form a little cabinet or a nest of
drawers, or may simply be fitted with a mirror. The top, often
surrounded with a chased and gilded bronze gallery, serves for
placing small ornaments. Beneath the writing surface there is
usually a single drawer. The details vary greatly, but the
general characteristics are always traceable. The bonheur
du jour has never been so delicate, so charming, so coquetish
as in the quarter of a century which followed its introduction.
The choicer examples of the time are inlaid with marqueterie,
edged with exotic woods, set in gilded bronze, or enriched
with panels of Oriental lacquer.

**BONI** (*Boni*), a vassal state of the government of Celebes,
Dutch East Indies, in the south-west peninsula of Celebes, on
the Gulf of Boni. Area, 2600 sq. m. It produces rice, tobacco,
coffee, cotton and sugar-cane, none of them important as ex-
ports. The breeds of buffaloes and horses in this state are highly
esteemed. The chief town, Boni, lies 50 m. N.E. of Macassar,
and 24 m. from the east coast of the peninsula. The native race
of Bugis (g.), whose number within this area is about 70,000,
is one of the most interesting in the whole archipelago.

Boni was once the most powerful state of Celebes, all the
other princes being regarded as vassals of its ruler, but its history
is not known in detail. In 1666 the rajah Palakkab, whose
father and grandfather had been murdered by the family of
Hassan, the tyrant of Sumatra, made common cause with the
Dutch against that despot. From that date till the beginning
of the 19th century Dutch influence in the state remained un-
disputed. In 1814, however, Boni fell into the hands of
the British, who retained it for two years; but by the European
treaties concluded on the downfall of Napoleon it reverted
to its original colonizers. Their influence, however, was resisted
more than once by the natives. An expedition in 1825, under
General van Geen, was not fully successful in enforcing it;
and in 1828 and the following year two expeditions were
necessary to oppose an attempt by the princess regent towards
independence. In 1860 a new prince, having allegiance to the
Dutch, was set up. As in other native states in Celebes,
succession to the throne in the female line has precedence over the male line.

For the wars in Boni, see Perelaer, De Bonifacii expeditiis, 1859–1860 (Leiden, 1872); and Meyers, In the Militaire Spectator (1880).

**BONIFACE, SAINT** (680–754), the apostle of Germany, whose real name was Wynfrith, was born of a good Saxon family at Credington or Kirton in Devonshire. While still young he became a monk, and studied grammar and theology first at Exeter, then at Nutwell near Winchester, under the abbot Winberht. He soon distinguished himself both as scholar and preacher, and had every inducement to remain in his monastery, but in 716 he followed the example of other Saxon monks and set out as missionary to Frisia. He was soon obliged to return, however, probably owing to the hostility of Radbod, king of the Frisians, then at war with Charles Martel. At the end of 717 he went to Rome, where in 719 Pope Gregory II. commissioned him to evangelize Germany and to counteract the influence of the Irish monks there. Crossing the Alps, Boniface visited Bavaria and Thuringia, but upon hearing of the death of Radbod he hurried again to Frisia, where, under the direction of his countryman Willibrord (d. 738), the first bishop of Utrecht, he preached successfully for three years. About 722 he visited Hesse and Thuringia, won over some chieftains, and converted and baptized great numbers of the heathen. Having sent special word to Gregory of his success, he was summoned to Rome and consecrated bishop on the 30th of November 722, after taking an oath of obedience to the Roman church; and his mission was continued, and he returned with letters of recommendation to Charles Martel, charged not only to convert the heathen but to suppress heresy as well.

Charles's protection, as he himself confessed, made possible his great career. Armed with it he passed safely into heathen Germany and began a systematic crusade, baptizing, overturning idols, founding churches and monasteries, and calling from England a band of missionary helpers, monks and nuns, some of whom have become famous: St Lull, his successor in the see at Mainz; St Burchard, bishop of Würzburg; St Gregory, abbot at Utrecht; Willibald, his biographer; St Lioba, St Walburge, St Thecla. In 732 Boniface was created archbishop. In 738 for the third time he went to Rome. On his return he organized the church in Bavaria into the four bishoprics of Regensburg, Freising, Salzburg and Passau. Then his power was extended still further. In 741 Pope Zacharias made him legate, and charged him with the reformation of the whole Frankish church. With the support of Carloman and Pippin, who had just succeeded Charles Martel as mayors of the palace, Boniface set to work. As he had done in Bavaria, he organized the east Frankish church into four bishoprics, Erfurt, Würzburg, Bamburg and Eichstadt, and reorganized over them his own monks. In 747 he presided at what is generally counted as the first German council. At the same period he founded the abbey of Fulda, as a centre for German monastic culture, placing it under the Bavarian Sturm, whose biography gives us so many picturesque glimpses of the time, and making its rule stricter than the Benedictine. Then came a theological and disciplinary controversy with Virgil, the Irish bishop of Salzburg, who held, among other heresies, that there were other worlds than ours. Virgil must have been a most remarkable man. He was a disciple of his sheeetoward science he held his own against Boniface, and was canonicized after his death. Boniface was more successful in France. There a certain Adalbert or Aldebert, a Frankish bishop of Neustria, had caused great disturbance. He had been performing miracles, and claimed to have received his relics, not from Rome like those of Boniface, but directly from the angels. Planting crosses in the open fields he drew the people to desert the churches, and had won a great following throughout all Neustria. Opinions are divided as to whether he was a Culdee, a representative of a national Frankish movement, or simply the charlatan that Boniface paints him. At the instance of Pippin, Boniface secured Adalbert's condemnation at the synod of Soissons in 744; but he, and Clement, a Scottish missionary and a heretic on predestination, continued to find followers in spite of legate, council and pope, for three or four years more.

Between 746 and 748 Boniface was made bishop of Mainz, and became metropolitan over the Rhine bishoprics and Utrecht, as well as over those he had established in Germany—thus founding the pre-eminence of the see of Mainz. In 747 a synod of the Frankish bishops sent to Rome a formal statement of their submission to the papal authority. The significance of this act can only be realized when one recalls the tendencies toward the formation of national churches, which had been so powerful under the Merovingians. Boniface does not seem to have taken part in the anointing of Pippin as king of the Franks in 752. In 754 he resigned his archbishopric in favour of Lull, and took up again his earliest plan of a mission to Frisia; but on the 5th of June 754 he and his companions were massacred by the heathen near Dockum. His remains were afterwards taken to Fulda.

St Boniface has well been called the proconsul of the papacy. His organizing genius, even more than his missionary zeal, left its mark upon the German church throughout all the middle ages. The missionary movement which until his day had been almost independent of control, largely carried on by schismatic Irish monks, was brought under the direction of Rome. But in so welding together the scattered centres and binding them to the papacy, Boniface seems to have been actuated by simple zeal for unity of the faith, and not by a conscious political motive.

Though pre-eminently a man of action, Boniface has left several literary remains. We have above all his Letters (Epistolae), difficult to date, but extremely important from the standpoint of the history of the church. Among his other works see Tümler's edition in the Monumenta Germaniae historica, 1892. Besides these there are a grammar (De octo partibus orationisomaticum, ed. Mai, in Classici Auctores, t. vii.), some sermons of contested authenticity, some poems (Amignata, ed. Dümler, Poetae latini aevi Carolini, i. 1881), a penitential, and some Dicta Bonifacii (ed. Rüttner in Theologische Quartalschrift, Tübingen, vol. 70, 1888), the authenticity of which it is hard to prove or to refute. Migne in his Patrologia Latina (vol. 89) has reproduced the edition of Boniface's works by Giles (London, 1844).

There are very many monographs on Boniface and on different phases of his life (see Potthast, Bibliotheca medii aevi, and Ulysses Chevalier's Bibliographie, 2nd ed. for indications), but none that is completely satisfactory. Among recent studies are those of B. Kuhlmann, Der heilige Bonifatius, Abbot der Deutschen (Paderborn, 1895), and of G. Kurth, Saint Boniface (2nd ed., 1902). W. Levison has edited the Viae sancti Bonifatii (Hanover, 1905). (J. T. S.)*

**BONIFACE (Bonifacius),** the name of nine of the popes.

**BONIFACE I.,** bishop of Rome from 418 to 422. At the death of Pope Zosimus, the Roman clergy were divided into two factions, one of which elected the deacon Eulalius, and the other the priest Albinus. The imperial government, in the interests of public order, commanded the two competitors to leave the town, reserving the decision of the case to a council. Eulalius having broken his ban, the emperor Honorius decided to recognize Boniface, and the council was countermanded. But the fact of Eulalius long continued to foment disorders, and the secular authority was compelled to intervene.

**BONIFACE II.,** pope from 530 to 532, was by birth a Goth, and owed his election to the nomination of his predecessor, Felix IV., and to the influence of the Gothic king. The Roman clergy, having elected a priest of Alexandria called Dioscorus, who died a month after his election, and thus left the position open for him. Boniface endeavored to nominate his own successor, thus transforming into law, or at least into custom, the proceeding by which he had benefited; but the clergy and the senate of Rome forced him to cancel this arrangement.

**BONIFACE II.,** pope from the 17th of February to the 12th of November 606. He obtained from Phocas recognition of the “headship of the church at Rome,” which signifies, no doubt, that Phocas compelled the patriarch Constantine to abandon (momentarily) his claim to the title of oecumenical patriarch.

**BONIFACE IV.,** pope from 608 to 615. He received from the emperor Phocas the Pantheon at Rome, which was converted into a Christian church.
BONIFACE OF SAVOY—BONIFACIO

BONIFACE V., pope from 619 to 625, did much for the christianizing of England. Bede mentions (Hist. Eccl.) that he wrote encouraging letters to Mellitus, archbishop of Canterbury, and Justus, bishop of Rochester, and quotes three letters— to Justus, to Eadwin, king of Northumbria, and to his wife Æthelthryth. William of Malmsbury gives a letter to Justus of the year 625, in which Canterbury is constituted the metropolitan see of Britain in the west.

BONIFACE VI. was elected pope in April 806, and died fifteen days afterwards.

BONIFACE VII. was pope from August 984 to July 985. His family name was Franco. In 974 he was substituted by Crescentius and the Roman barons for Benedict VI., who had been assassinated. He was ejected by Count Siculo, the representative of the emperor Otto II., and fled to Constantinople. On the death of Otto (983) he returned, seized Pope John XIV., threw him into prison, and installed himself in his place. (L. D.)

BONIFACE VIII. (Benedetto Gaetano), pope from 1294 to 1303, was born of noble family at Anagni, studied canon and civil law in Italy and possibly at Paris. After being appointed to canonicate at Todi (June 1260) and in France, he became an advocate and then a notary at the papal court. With Cardinal Ottoboni, who was to aid the English king, Henry III., against the bishops of the baronial party, he was besieged in the Tower of London by the rebellious earl of Gloucester, but was rescued by the future Edward I., on the 27th of April 1267.

Created cardinal deacon in 1261, and in 1261 cardinal priest (SS. Sylvester et Martin.), he was entrusted with many diplomatic missions and became very influential in the Sacred College. He helped the ineffective Celestine V. to abdicate, and was himself chosen pope at Naples on the 24th of December 1294. Contrary to custom, the election was not made unanimous, probably because of the hostility of certain French cardinals. Celestine attempted to rule in extreme monastic poverty and humility; not so Boniface, who ardently asserted the lordship of the papacy over all the kingdoms of the world. He was crowned at Rome in January 1295 with great pomp. He planned to pacify the West and then recover the Holy Land from the infidel; but during his nine years' reign, so far from being a peacemaker, he involved the papacy itself in a series of controversies with leading European powers. Avarice, lofty claims and frequent exhibitions of arrogance made him many foes. The policy of supporting the interests of the house of Anjou in Sicily proved a grand failure. The attempt to build up great estates for his family made for the downfall of the Colonna its enemies. Until 1305 he refused to recognize Albert of Austria as the rightful German king. It being declared that he was overlord of Hungary, he declared that its crown should fall to the house of Anjou. He humbled Eric VI. of Denmark, but was unsuccessful in the attempt to try Edward I., the conqueror of Scotland, on the charge of interfering with a papal see; for parliament declared in 1301 that Scotland had never been a fief of Rome. The most noted conflict of Boniface was that with Philip IV. of France. In 1296, by the bull Clerici laicos, the pope forbade the levying of taxes, however disguised, on the clergy without his consent. Forced to recede from this position, Boniface canceled Louis IX. (1297). The hostilities were later renewed, in 1302 Boniface himself drafted and published the indefensible, genuine bull Unam sanctam, one of the strongest official statements of the papal prerogative ever made. The weight of opinion now tends to deny that any part of this much-discussed document save the last sentence bears the marks of an infallible utterance. The French vice-chancellor Guillaume de Nogaret was sent to arrest the pope, against whom grave charges had been brought, and bring him to France to be deposed by an occupational council. The accusation of heresy has usually been dismissed as a slander; but recent investigations make it probable, though not quite certain, that Boniface privately held certain Averroistic tenets, such as the denial of the immortality of the soul. With Sciarra Colonna, Nogaret surprised Boniface at Anagni, on the 7th of September 1303, as the latter was about to pronounce the sentence of excommunication against the king. After a nine-hours' truce the palace was stormed, and Boniface was found lying in his bed, a cross claspèd to his breast; that he was sitting in full regalia on the papal throne is a legend. Nogaret claimed that he saved the pope's life from the vengeful Colonna. Threatened, but not maltreated, the pope had remained three days under arrest when the citizens of Anagni freed him. He was conducted to Rome, only to be confined in the Vatican by the Orsini. He died on the 11th of October 1303, at a great age, perhaps sixty years old, as has commonly been believed, but perhaps under seventy, at all events not over seventy-five. "He shall come in like a fox, reign like a lion, die like a dog," is a phrase wrongly held to be a prophecy of his unfortunate predecessor. Dante, who had become embittered against Boniface while on a political mission in Rome, calls him the "Prince of the new Pharisees" (Inferno, 27, 85), but laments that "in his Vicar Christ was made a captive," and was "mocked a second time" (Purgatorio, 20, 87 f.).

BONIFACE IX. (Piero Tomacelli), pope from 1389 to 1404, was born at Naples of a poor but ancient family. Created cardinal by Urban VI., he was elected successor to the latter on the 2nd of November 1389. In 1391 he canonized Birgitta of Sweden, though the Pope of Avignon had doubts about the canonization of a woman. The election was made at Anagni, opposed to Urban's candidate. In 1398 he was exiled to Avignon, but returned in 1400. In 1403 he ventured at last to confirm the deposition of the emperor Wenceslaus and the election of Rupert. Negotiations for the healing of the Great Schism were without result. In spite of his inferior education, the contemporaries of Boniface trusted his prudence and moral character; yet when in financial straits he found himself in power, he was not always able to resist the pressure of barons' demands and, like his predecessors, he imposed the regal tax. In 1390 he celebrated the regular jubilee, but a rather informal one held in 1400 proved more profitable. Though probably not personally avaricious, he was justly accused of nepotism. He died on the 1st of October 1404, being still under sixty years of age. (W. W. R.)

BONIFACE OF SAVOY (d. 1270), archbishop of Canterbury, became primate in 1243, through the favour of Henry III., of whose queen, Eleanor of Provence, he was an uncle. Boniface, though a man of violent temper and too often absent from his see, was the first primate whose name is connected with the development of the English church. Though in 1250 he provoked the English bishops by claiming the right of visitation in their dioceses, he took the lead at the council of Merton (1258) in vindicating the privileges of his order. In the barons' war he took the royal side, but did not distinguish himself by great activity.

See Matthew Paris, Chronica Majora; François Mugnier, Les Sanoirds en Angleterre (Chambéry, 1890).

BONIFACIO, a maritime town at the southern extremity of Corsica, in the arrondissement of Sartène, 87 m. S.S.E. of Ajaccio (Alt. 1387 ft.); pop. (1901) 5,940. Bonifacio, which overlooks the straits of that name separating Corsica from Sardinia, occupies a remarkable situation on the summit of a peninsula of white calcareous rock, extending parallel to the coast and enclosing a narrow and secure harbour. Below the town and in the cliffs facing it the rock is hollowed into coves accessible only by boat.
BONIFACIUS-BONITZ

St Dominic, a church built in the 13th century by the Templars, and the cathedral of Santa Maria Maggiore which belongs mainly to the 12th century, are the chief buildings. The fortifications and citadel date from the 16th and 17th centuries. A massive medieval tower serves as a powder-magazine. The trade of Bono-
facius, which is carried on chiefly with Sardinia, is in cereals, wine, cork and olive-oil of fine quality. Cork-cutting, tobacco-manu-
facture and coral-fishing are carried on. The olive is largely culti-
vated in the neighbourhood and there are oil-works in the town.

Bonifacio was founded about 828 by the Tuscan marquis whose name it bears, as a defence against the Saracen pirates. At the end of the 11th century it became subject to Genoa, and at the end of the 12th was taken and colonized by the Genoese, whose influence may be traced in the character of the population.

In 1420 it heroically withstood a protracted siege by Alphonso V. of Aragon. In 1554 it fell into the hands of the Franco-Turkish army.

BONIFACIUS (d. 432), the Roman governor of the province of Africa who is generally believed to have invited the Vandals into that province in revenge for the hostile action of Placidia, ruling in behalf of her son the emperor Valentinian III. (425–449).

This is the heroic act attributed to this rival for the earliest authorities speak of a certain Felix, chief minister of Placidia, as the calumniator of Bonifacius. Whether he really invited the Vandals or not, there is no doubt that he soon turned against them and bravely defended the city of Hippo from their attacks.

In 433 he returned to Italy, was received into favour by Placidia, and appointed master of the soldiery. Aetius, how-
ever, resented his promotion, the two rivals met, perhaps in single combat, and Bonifacius, though victorious, received a wound from the effects of which he died three months later.

The authorities for the extremely obscure and difficult history of these transactions are well discussed by E. A. Freeman in an article in the English Historical Review, July 1897, to which the reader is referred.

BONIS ISLANDS, called by the Japanese Ogasawara-jima, a chain of small islands belonging to Japan, stretching nearly due north and south, a little east of 142° E., and from 26° 35' to 27° 45' N., about 500 m. from the mainland of Japan. They number twenty, according to Japanese investigations, and have a coast-line of 174.65 m. and a superificies of 28.82 sq. m. Only ten of them have any appreciable size, and these are named—
commencing from the north—Muku-shima (Bridegroom Island), Nakadachi-shima (Go-between Island?), Yome-shima (Bride Island), Ototo-jima (Younger-brother Island), Ani-shima (Elder-
brother Island), Kita-jima (Northern Island), Haha-jima (Island Mej-i-nee Island), Ani-jima (Elder-sister Island) and Imoto-jima (Younger-sister Island). European geographers have been accustomed to divide the islands into three groups for purposes of nomenclature, calling the northern group the Parry Islands, the central the Beechey Islands and the southern the Coffin or Bailey Islands. The second largest of all, Chichi-jima, in Japanese cartography was called Peel Island in 1827 by Captain Beechey, and the same officer gave the name of Stapleton Island to the Ototo-jima of the Japanese, and that of Becher Island to the Ani-jima. To counteract this account of Captain Beechey's nomenclature, it may be added that he called a large bay on the south of Peel Island Fitton Bay, and a bay on the south-west of Buckland Island Walker Bay. Port Lloyd, the chief anchorage (situated on Peel Island), is considered by Commodore Perry—who visited the islands in 1853 and strongly urged the establishment of a United States coaling station there-to have been formerly the crater of a volcano from which the surrounding hills were thrown up, the entrance to the harbour being a fissure through which lava used to pour into the sea. The islands are largely volcanic, and their nature suggests that the ownership of the islands was for some time doubtful. According to Japanese annals they were discovered towards the close of the 16th century, and added to the fief of a Daimyo, Ogasawara Syadori, whom the name Ogasawara-
jima. They were also called Bonin-jima (corrupted by foreigners into Bonin) because of their being without (bu) inhabitants (niin).

Effective occupation did not take place, however, and commu-
nications with the islands ceased altogether in 1635, as was a natural consequence of the Japanese government's veto against the construction of sea-going vessels. In 1758 fitful communications was restored to the then representative of the Ogasawara family, only to be again interrupted until 1801, when a successful attempt was made to establish a Japanese colony at Port Lloyd. Meanwhile, Captain Beechey visited the islands in the "Blossom," assigned names to some of them, and published a description of their features. Next a small party consisting of two British subjects, two American citizens, and a Dane, sailed from the Sandwich Islands for Port Lloyd in 1839, taking with them some Hawaiian natives. These colonists hoisted the British flag on Peel Island (Chichi-jima), and settled there. When Commodore Perry arrived in 1853, there were on Peel Island thirty-one inhabitants, four being English, four American, one Portuguese and the rest natives of the Sandwich Islands, the Ladrones, &c.; and when Mr Russell Robertson visited the place in 1875, the colony had grown to sixty-nine, of whom only five were pure whites. Mr Robertson found them without education, without religion, without laws and without any system of govern-
ment, but living comfortably on clearings of cultivated land.

English was the language of the settlers, and they regarded themselves as a British colony. But in 1861 the British govern-
ment renounced all claim to the islands in recognition of Japan's right of possession. There is now regular steam communication; the affairs of the islands are duly administered, and the popula-

tion has grown to about 4500. There are no mountains of any considerable height in the Ogasawara Islands, but the scenery is hilly with occasional bold crags. The vegetation is almost tropical luxuriant—palms, wild pineapples, ferns growing profusely, and the valleys being filled with wild heans and patches of taro.

Mr Robertson catalogues a number of valuable timbers that are obtained there, among them being Tremena, cedar, rose-wood, iron-wood (red and white), box-wood, sandal and white oak. The kekope tree, the orange, the laurel, the juniper, the wild cactus, the curry plant, wild sage and celery flourish. No minerals have been discovered. The shores are covered with coral; earthquakes and tidal waves are frequent, the latter not taking the form of bores, but of a sudden steady rise and equally sudden fall in the level of the sea; the climate is rather tropical than temperate, but sickness is almost unknown among the residents.

BONITZ, HERMANN (1814–1888), German scholar, was born at Langensalza in Saxony on the 20th of July 1814. Having studied at Leipzig under G. Hermann and at Berlin under Böck and Lachmann, he became successively teacher at the Blochmann Institute in Dresden (1836), Oberlehrer at the Friedrich- Wilhelms Gymnasium (1838) and the Graues Kloster (1840) in Berlin, professor at the gymnasium at Stettin (1842), professor at the university of Vienna (1849), member of the imperial academy (1854), member of the council of education (1864), and director of the Graues Kloster gymnasium (1867).

He retired in 1888, and died on the 25th of July in that year at Berlin. He took great interest in higher education, and was chiefly responsible for the system of teaching and examination in use in the high schools of Prussia after 1822. But it is as a commentator on Plato and Aristotle that he is best known outside Germany. His most important works in this connection are: Disputationes Platonicae Duae (1837); Platonische Studien (3rd ed., 1886); Observations Criticâes in Aristotelis Libros Metaphysicos (1842); Observations Criticâes in Aristotelis quae feruntur Magna Moralia et Ethica Eudemio (1844); Alexandri Aphroditensis Commentarius in Libros Metaphysicós Aristotelis (1847); Aristotelis Metaphysica (1858–1867); Über die Kategorien A. (1853); Aristotelische Studien (1862–1867); Index

1 Referring to the Japanese custom of employing a go-between to arrange a marriage.
2 These details are taken from The Bonin Islands by Russell Robertson, formerly H.B.M. consul in Yokohama, who visited the islands in 1875.
BONIVARD—BONN

209

Aristotelicus (1870). Other works: Über den Ursprung der homerischen Gedichte (3rd ed., 1881); Beiträge zur Erklärung des Thukydides (1854), of the Sophokles (1856-1857). He also wrote largely on classical and educational subjects, mainly for the Zeitschrift für die österreichischen Gymnasien.

A full list of his writings is given in the obituary notice by T. Gompertz in the Biographisches Jahrbuch für Altertumskunde (1890).

BONIVARD, FRANÇOIS (1490-1570), the hero of Byron's poem, The Prisoner of Chillon, was born at Seyssel of an old Savoyard family. Bonivard has been described as "a man of the dissolved bosom who had strength of mind and age of the Reformation." His real character and history are, however, widely different from the legendary account which was popularized by Byron. In 1550 he succeeded his uncle, who had educated him, as prior of the Cluniac priory of St Victor, close to Geneva. He naturally, therefore, opposed the attempts of the duke of Savoy, aided by his relative, the bishop of the city, to maintain his rights as lord of Geneva. He was imprisoned by the duke at Genx from 1519 to 1521, lost his priory, and became more and more anti-Savoyard. In 1530 he was again seized by the duke and imprisoned for four years underground, in the castle of Chillon, till he was released in 1536 by the Bernese, who then wrested Vaud from the duke. He had been imprisoned for political reasons, for he did not become a Protestant till after his release, and then found that his priory had been destroyed in 1534. He obtained a pension from Geneva, and was four times married, but owing to his extravagances was always in debt. He was officially entrusted in 1542 with the task of compiling a history of Geneva from the earliest times. In 1551 his MS. of the Chroniques de Genève (ending in 1550) was submitted to Calvin for correction, but it was not published till 1831. The best edition of that is that of 1867. The work is uncritical and partial, but is his best title to fame.

BONN, a town of Germany, in the Prussian Rhine province, on the left bank of the Rhine, 15 m. S. by E. from Cologne, on the main line of railway to Mainz, and at the junction of the lines to the Eifel and (by ferry) to the right bank of the Rhine. Pop. (1885) 35,660; (1905) 51,997. The river is here crossed by a fine bridge (1869-1868), 1417 ft. in length, flanked by an embankment 2 m. long, above and parallel with which is the Coblenzer-strasse, with beautiful villas and pretty gardens reaching down to the Rhine. The central part of the town is composed of narrow streets, but the outskirts contain numerous fine buildings, and the appearance of the town from the river is attractive. There are six Roman Catholic and two Protestant churches, the most important of which is the Münster (minster), an imposing edifice of grey stone, in the Romanesque and Transition styles, surmounted by five towers, of which the central, rising to a height of 315 ft., is a landmark in the Rhine valley. The church dates from the 11th, 12th and 13th centuries, was restored in 1757 and following years and in 1890-1894 was adorned with paintings. Among other churches are the Stiftskirche (monastery church), rebuilt 1879-1884; the Jesuitenkirche (1693); the Minoritenkirche (1278-1318), the Herz Jesu-kirche (1862) and the Marienkirche (1802). There is also a synagogue, and the university chapel serves as an English church. The town also possesses a town hall situated on the market square and dating from 1737, a fine block of law-court buildings, several high-grade schools and a theatre.

By far the finest of the buildings, however, is the famous university, which occupies the larger part of the southern frontage of the town. The present establishment only dates from 1818, and owes its existence to King Frederick William III. of Prussia; but as early as 1786 the academy which had been founded about nine years before was raised by Archbishop Maximilian Frederick of Cologne to the rank of a university, and continued to exercise its functions till 1794, when it was dissolved by the last elector. The building now occupied by the university was originally the electoral palace, constructed about 1717 out of the materials of the old fortifications. It was remodelled after the town came into Prussian possession. There are five faculties in the university—a legal, a medical, and a philosophic, and one of Roman Catholic and another Protestant theology. The library numbers upwards of 230,000 volumes; and the antiquarian museum contains a valuable collection of Roman relics discovered in the neighbourhood. Connected with the university are also physiological, pathological and chemical institutes, five clinical departments and a laboratory. An academy of agriculture, with a natural history museum and botanical garden attached, is established in the palace of Clemensruhe at Poppelsdorf, which is reached by a fine avenue about a mile long, bordered on both sides by a double row of chestnut trees. A splendid observatory, built under the charge of Friedrich Wilhelm Argelander, stands on the south side of the road. The Roman Catholic archiepiscopal theological college, beautifully situated on an eminence overlooking the Rhine, dates from 1892.

Beethoven was born in Bonn, and a statue was erected to him in the Münster-platz in 1845. B. G. Niebuhr is buried in the cemetery outside of the Sterntor, where a monument was placed to his memory by Frederick William IV. Here are also the tombs of A. W. von Schlegel, the diplomatist Christian Karl von Bunsen, Robert Schumann, Karl Simrock, E. M. Arndt and Schiller's wife. The town is adorned with a marble monument commemorating the war of 1870-71, a handsome fountain, and a statue of the Old Catholic bishop Reinkens. In 1884 a museum of Beethoven relics was opened in the house in which the composer was born. There are further a municipal museum, arranged in a private house since 1882, an academic art museum (1884), with some classic originals, a creation of F. G. Welcker, and the provincial museum, standing near the railway station, which contains a collection of medieval stone monuments and works of art, besides a small picture gallery.

One of the most conspicuous features of Bonn, viewed from the river, is the pilgrimage (monastic) church of Kreuzberg (1672), behind and above Poppelsdorf; it has a flight of 28 steps, which pilgrims used to ascend on their knees. "Der alte Zoll," commanding a magnificent view of the Siebengebirge, is the only remaining bulwark of the old fortifications, the Sterntor having been removed in order to open up better communication with the rapidly increasing western suburbs and the terminus of the light railway to Cologne.

But for its university Bonn would be a place of comparatively little importance, its trade and commerce being of moderate dimensions. Its principal industries are jute spinning and weaving, and the manufacture of porcelain, flags, machinery and beer, and it has some trade in wine. There are considerable numbers of foreign residents, notably English, attracted by the natural beauty of the place and by the educational facilities it affords.

Bonn (Bonno or Castro Bonnensia), originally a town of the Ubii, became at an early period the site of a Roman military settlement, and as such is frequently mentioned by Tacitus. It was the scene, in A.D. 70, of a battle in which the Romans were defeated by Claudius Civilis, the valiant leader of the Batavians. Greatly reduced by successive barbarian invasions, it was restored about 350 by the emperor Julian. In the centuries that followed the break-up of the Roman empire it again suffered much from barbarian attacks, and was finally devastated in 880 by bands of Norse raiders who had sailed up the Rhine.

It was again fortified by Konrad von Hochstaden, archbishop of Cologne (1236), and in 1310 by Engelbert von Falkenburg (d. 1274), driven out of his cathedral city by the townspeople, established himself here (1265); from which time until 1794 it remained the residence of the electors of Cologne. During the various wars that devastated Germany in the 16th, 17th and 18th centuries, the town was frequently besieged and occupied by the several belligerents, but continued to belong to the electors till 1794, when the French took possession of it. At the peace of Lunéville they were formally recognized in their occupation; but in 1815 the town was made over by the congress of Vienna to Prussia. The fortifications had been dismantled in 1717.

See F. Ritter, Entstehung der drei ältesten Städte am Rhein: Köln, Bonn und Mainz (Bonn, 1853); H. von Sybel, Die Gründung der Universität Bonn (1868); and Führer von Hesse (10th ed., 1901).
BONNAT—BONNER

BONNAT, LÉON JOSEPH FLORENTIN (1853— ), French painter, was born at Bayonne on the 20th of June 1853. He was educated in Spain, under Madrazo at Madrid, and his long series of portraits shows the influence of Velasques and the Spanish realists. In 1886 he won a medal of honour at Paris, where he became one of the leading artists of his day, and in 1888 he became professor of painting at the École des Beaux Arts. In May 1905 he succeeded Paul Dubois as director. His vivid portrait-painting is his most characteristic work, but his subject pictures, such as the " Martyrdom of St Denis " in the Panthéon, are also famous.

BONNE-CARRÈRE, GUILLAUME DE (1754-1829), French diplomatist, was born at Muret in Languedoc on the 13th of February 1754. Than his career in the army, but soon entered the diplomatic service under Vergennes. A friend of Mirabeau and of Dumouriez, he became very active at the Revolution, and Dumouriez re-established for him the title of director-general of the department of foreign affairs (March 1792). He remained at the ministry, preserving the habits of the diplomacy of the old régime, until December 1792, when he was sent to Belgium as agent of the republic, but he was involved in the treason of Dumouriez and was arrested on the 2nd of April 1793. To justify himself, he published an account of his conduct from the beginning of the Revolution. He was freed from prison in July 1794. Napoleon did not trust him, and gave him only some unimportant missions. After 1815 Bonne-Carrère retired into private life, directing a profitable business in public carriages between Paris and Versailles.

BONNER, EDMUND (1500?-1560), bishop of London, was perhaps the natural son of George Savage, rector of Davenham, Cheshire, by Elizabeth Frodsham, who was afterwards married to Edmund Bonner, a sawyer of Hanley in Worcestershire. This account, which was printed with many circumstantial details by Strype (Eccles. Mem. III. i. 172-173), was disputed by Strype's contemporary, Sir Edmund Lechmere, who asserted on not very satisfactory evidence (ib. Annals, I. i. 300) that Bonner was of legitimate birth. He was educated at Broadgates Hall, now Pembroke College, Oxford, graduating bachelor of civil and canon law in June 1549. He was ordained about the same time, and admitted D.C.L. in 1552. In 1559 he was Wolsey's chaplain, and he was with the cardinal at Cawood at the time of his arrest. Subsequently he was transferred, perhaps through Cromwell's influence, to the service of the king; and in January 1553 he was sent to Rome to obstruct the judicial proceedings against Henry in the papal curia. In October 1533 he was entrusted with the unmanly task of intimate Clement VII., while he was the guest of Francis I. at Marseilles, Henry's appeal from the pope to a general council; but there seems to be no good authority for Burnet's story that Clement threatened to have him burnt alive. For these and other services Bonner had been rewarded by the grant of several livings, and in 1535 he was made archdeacon of Leicester.

Towards the end of that year he was sent to further what he called " the cause of the Gospel " (Letters and Papers, 1536, No. 469) in North Germany; and in 1536 he wrote a preface to Gardiner's De vera Obediencia, which asserted the royal, denied the papal, supremacy, and was received with delight by the Lutherans. After a brief embassy to the emperor in the spring of 1538, Bonner superseded Gardiner at Paris, and began his mission by sending Cromwell a long list of accusations against his predecessor (ib. 1538, ii. 144). He was almost as bitter against Wyatt and Mason, whom he denounced as a " papist," and the violence of his conduct led Francis I. to threaten him with a bribe. He succeeded, however, to have pleased his patron, Cromwell, and perhaps Henry, by his energy in seeing the king's " Great " Bible in English through the press in Paris. He was already king's chaplain; his appointment at Hereford had been accompanied by the promotion to the see of Hereford, and before he returned to take possession he was translated to the bishopric of London (October 1539).

Hitherto Bonner had been known as a somewhat coarse and unscrupulous tool of Cromwell, a sort of ecclesiastical Wriothesley. He is not known to have protested against any of the changes effected by his masters; he professed to be no theologian, and was wont, when asked theological questions, to refer his interlocutors to the divines. He had graduated in law, and not in theology. There was nothing in the Reformation to appeal to him, except the repudiation of papal control; and he was one of those numerous Englishmen whose views were faithfully reflected in the Six Articles. He became a staunch Conservative, and, apart from his embassy to the emperor in 1534-1535, was mainly occupied during the last years of Henry's reign in brandishing the " whip with six strings."

The accession of Edward VI. opened a fresh and more creditable chapter in Bonner's career. Like Gardiner, he could not tolerate that royal supremacy, in the establishment of which he had been so active an agent; but he began to doubt that supremacy when he saw to what uses it could be put by a Protestant council, and either he or Gardiner evolved the theory that the royal supremacy was in abeyance during a royal minority. The ground was skilfully chosen, but it was not legally nor constitutionally tenable. Both he and Gardiner had in fact sought fresh licences to exercise their ecclesiastical jurisdiction from the young king; and, if he were supreme enough to confer jurisdiction, he was supreme enough to issue the injunctions and orders the visitation to which Bonner objected. Moreover, if a minority involved an abeyance of the royal supremacy in the ecclesiastical sphere, it must do the same in the temporal sphere, and there could be nothing but anarchy. It was on this question that Bonner came into conflict with Edward's government. He resisted the visitation of August 1547, and was committed to the Fleet; but he withdrew his opposition, and was released in time to take an active part against the government in the parliament of November 1547. In the next session, November 1548-March 1549, he was a leading opponent of the first Act of Uniformity and Book of Common Prayer. When these became law, he neglected to enforce them, and on the 1st of September 1549 he was required by the council to maintain at St Paul's Cross that the royal authority was as great as if the king were forty years of age. He failed to comply, and after a seven days' trial he was deprived of his bishopric by an ecclesiastical court over which Cramner presided, and was sent to the Marshalsea. The fall of Somerset in the following month raised Bonner's hopes, and he appealed from Cramner to the council. After a struggle the Protestant faction gained the upper hand, and the privileges of the deprived were confirmed by the council sitting in the Star Chamber, and he was further condemned to perpetual imprisonment.

He was released by Mary's accession, and was at once restored to his see, his deprivation being regarded as invalid and Ridley as an intruder. He vigorously restored Roman Catholicism in his diocese, made no difficulty about submitting to the papal jurisdiction which he had forswn, and in 1555 began the persecution to which he owes his fame. His apologists explain that his action was merely " official," but Bonner was one of those who brought it to pass that the condemnation of heretics to the fire should be part of his ordinary official duties. The enforcement of the first Book of Common Prayer had also been part of his official duties; and the fact that Bonner made no such protest against the burning of heretics as he had done in the former case shows that he found it the more congenial duty. Tunstal was as good a Catholic as Bonner; he left a different repute behind him, a clear enough indication of a difference in their tempers.

On the other hand, Bonner did not go out of his way to persecute; many of his victims were forced upon him by the council, sometimes thought that he had not been severe enough (see Acts of the P.C. 1554-1556, pp. 115, 130; 1556-1558, pp. 18, 19, 216, 276). So completely had the state dominated the church that religious persecutions had become state persecutions, and Bonner was acting as an ecclesiastical sheriff in the most refractory district of the realm. Even Foxe records instances in which Bonner failed to persecute. But he had
no mercy for a fallen foe; and he is seen at his worst in his brutal jeers at Cranmer, when he was entrusted with the duty of degrading his former chief. It is a more remarkable fact that, in spite of his prominence, neither Henry VIII. nor Mary should ever have been the object of Bonnet's charge. He seems to have regarded by his own party as a useful instrument, especially in disagreeable work, rather than as a desirable colleague.

On her accession Elizabeth refused to allow him to kiss her hand; but he sat and voted in the parliament and convocation of 1559. In May he refused to take the oath of supremacy, acquiring like his colleagues consistency with old age. He was sent to the Marshalsea, and a few years later was indicted on a charge of prevarication on refusing the oath when tendered him by his diocesan, Bishop Horne of Winchester. He challenged the legality of Horne's consecration, and a special act of parliament was passed to meet the point, while the charge against Bonner was withdrawn. He died in the Marshalsea on the 5th of September 1569, and was buried in St George's, Southwark, at midnight to avoid the risk of a hostile demonstration.

**BONNET, CHARLES** (1720-1793), Swiss naturalist and philosophical writer, was born at Geneva on the 13th of March 1720, of a French family driven into Switzerland by the religious persecution in the 16th century. He made law his profession, but his favourite pursuit was the study of natural science. The account of the ant-lion in N. A. Pluche's Spectacle de la nature, which he read in his sixteenth year, turned his attention to insect life. He procured R. A. F. de Réaumur's work on insects, and with the help of live specimens succeeded in adding many observations to those of Réaumur and Pluche. In 1740 Bonnet communicated to the academy of sciences a paper containing a series of experiments establishing what is now termed parthenogenesis in aphides or tree-lice, which obtained for him the honour of being admitted a corresponding member of the academy. In 1741 he began to study reproduction by fusion and the regeneration of lost parts in the freshwater hydra and other animals; and in the following year he discovered that the respiration of caterpillars and butterflies is performed by pores, to which the name of stigmata has since been given. In 1743 he was admitted a fellow of the Royal Society; and in the same year he became a doctor of laws—his last act in connexion with a profession which had ever been distasteful to him.

His first published work appeared in 1745, entitled Traité d'inséciologie, in which were collected his various discoveries regarding insects, along with a preface on the development of germs and the scale of organized beings. Botany, particularly the leaves of plants, next attracted his attention; and after several years of diligent study, rendered irksome by the increasing weakness of his eyesight, he published in 1754 one of the most original and interesting of his works, Recherches sur l'usage des feuilles dans les plantes; in which among other things he advances many considerations tending to show (as has quite recently been done by Francis Darwin) that plants are endowed with powers of sensation and discernment. But Bonnet's eye-sight, which threatened to fail altogether, caused him to turn to philosophy. In 1754 his Essai de psychologie was published anonymously in London. This was followed by the Essai analytique sur les facultés de l'âme (Copenhagen, 1760), in which he develops his views regarding the physiological conditions of mental activity. He returned to physical science, but to the speculative side of it, in his Considérations sur les corps organisés (Amsterdam, 1761), designed to refute the theory of epigenesis, and to explain and defend the doctrine of pre-existing germs. In his Contemplation de la nature (Amsterdam, 1764-1765; translated into Italian, German, English and Dutch), one of his most popular and delightful works, he sets forth, in eloquent language, the theory that all the beings in nature form a gradual scale rising from lowest to highest, without any break in its continuity. His Essai de psychologie philosophique (Geneva, 1769-1770); in it he treats of the present and future of living beings, and supports the idea of the survival of all animals, and the perfecting of their faculties in a future state.

Bonnet's life was uneventful. He seems never to have left Switzerland, nor does he appear to have taken any part in public affairs except for the period between 1752 and 1768, during which he was a member of the council of the republic. The last twenty five years of his life he spent quietly in the country, at Genthod, near Neuchâtel, where he died after a long and painful illness on the 26th of May 1793. His wife was a lady of the family of De la Rive.

They had no children, but Madame Bonnet's nephew, the celebrated J. B. de Saussure, was brought up as their son.

Bonnet's philosophical system may be outlined as follows. Man is a compound of two distinct substances, mind and body, the one immaterial and the other material. All knowledge originates in sensations; sensations follow (whether as physical effects or merely as sequents Bonnet will not say) vibrations in the body, and are appropriate in number to the number and degree to which a particular object tends to reproduce that motion; so that when it a second time receives an impression from the same object it vibrates with less resistance. The sensation accompanying this increased flexibility in the nerve is, according to Bonnet, the condition of memory. When reflection—that is, the active element in mind—is applied to the acquisition and combination of sensations, those abstract ideas are formed which, though generally distinguished from, are thus merely sensations in combination only. That which puts the mind into activity is pleasure or pain; happiness is the end of human existence. Bonnet's metaphysical theory is based on two principles borrowed from Leibnitz—first, that there are not successive acts of creation, but that the universe is completed by the single original act of the divine will, and thereafter moves on by its own inherent force; and secondly, that there is no break in the continuity of existence. The divine Being originally created a multitude of germs in a graduated scale, each with an inherent power of self-development. At every successive step in the progress of the universe, these germs, as progressively modified, advance nearer to perfection; if some advanced and others did not there would be a gap in the continuity of the chain. Thus not man only but all other forms of existence are immortal. Nor is man's mind alone immortal; his body also will pass into the higher stage, not, indeed, the body he now possesses, but a finer one of which the germ at present exists within him. It is impossible, however, to reach absolute perfection, because the distance is infinite. In this final proposition Bonnet violates his own principle of continuity, by postulating an interval between the highest created being and the Divine. It is also difficult to understand whether the constant advance to perfection is performed by each individual, or only by each race of beings as a whole. There seems, in fact, to be an oscillation between two distinct but analogous doctrines—that of the constantly increasing advancement of the individual in future stages of existence, and that of the constantly increasing advancement of the race as a whole according to the successive evolutions of the globe.

**BONNET** (from Lat. bonum, a kind of stuff, then the cap made of this stuff), originally a soft cap or covering for the head,
the common term in English till the end of the 17th century; this sense survives in Scotland, especially as applied to the cap known as a "glaingary." The "bonnet" of a ship's sail now means an additional piece laced on to the bottom, but it seems to have formerly meant a piece laced to the top, the term "to vail the bonnet" being the French verb "avaler" (from the Fr. *analer*), to let down. In modern times "bonnet" has come to be used of a type of head-covering for women, differentiated from "hat" by fitting closely to the head and often having no brim, but varying considerably in shape according to the period and fashion.

The term, by a natural extension, is also applied to certain protective devices, as in a steam-engine or safety-lamp, or in slang use to a gambler's accomplice, a decoy.

**BONNEVAL, CLAUDE ALEXANDRE, COMTE DE (1675-1747).** French adventurer, known also as AIDED PASHA, was the descendant of an old family of Limousin. He was born on the 14th of July 1675, and at the age of thirteen joined the Royal Marine Corps. After three years he entered the army, in which he rose to the command of a regiment. He served in the Italian campaigns under Catatin, Villeroi and Vendôme, and in the Netherlands under Luxemburg, giving proofs of indomitable courage and great military ability. His insolent bearing towards the minister of war was made matter for a court-martial (1704). He was condemned to death, but saved himself by flight to Germany. Through the influence of Prince Eugène, who was then a general in the Austrian army, and with the famous de Vienne, he was allowed to return to France, and fought with great bravery and distinction against France, and afterwards against Turkey. He was present at Malplaquet, and was severely wounded at Peterwardein. The proceedings against him in France were then allowed to drop, and he visited Paris, and married a daughter of Marshal de Biron. He returned, however, after a short time to the Austrian army, and fought with distinction at Belgrade. He might now have risen to the highest rank, had he not made himself disagreeable to Prince Eugene, who sent him as master of the ordnance to the Low Countries. His ungovernable temper led him into a quarrel with the marquis de Prié, Eugene's deputy governor in the Netherlands, who answered his challenge by placing him in confinement. A court-martial was again held upon him, and he was condemned to death; but the emperor commuted the sentence to one year's imprisonment and banishment. Bonneval, soon after his release, offered his services to the Turkish government, professed the Mahometan faith, and took the name of Ahmed. He was made a pasha, and appointed to organize and command the artillery. He rendered valuable services to the sultan in his war with Russia, and with the famous de Vienne, he was allowed to return to France, and fought with the governor of Chios, but he soon fell under the suspicion of the Porte, and was banished for a time to the shores of the Black Sea. He was meditating a return to Europe and Christianity when he died at Constantinople on the 23rd of March 1747.

The Memoirs published under his name are spurious. See Prince de Ligne, Mémoire sur le comte de Bonneval (Paris, 1817); and A. Vandal, Le Pacha Bonnivet (Paris, 1885).

**BONNEVILLE, BENJAMIN L. E.** (1795-1878), American military engineer and explorer, was born in France about 1795. He emigrated to the United States in early youth, and graduated at the United States Military Academy at West Point in 1815. He was engaged in the construction of military roads in the south-west, and became a captain of infantry in 1825. In 1831-1836, having obtained leave of absence from the army, he conducted, largely on his own responsibility, an exploring expedition to the Rocky Mountains, proceeding up the Platte river through parts of the later states of Colorado and Wyoming into the Great Salt Lake basin and thence to California. After being absolutely cut off from civilization for several years, and having his name struck from the army list, he returned with an interesting and valuable account of his adventures, which was edited and amplified by Washington Irving and published under the title *The Rocky Mountains: or Scenes, Incidents, and Adventures in the Far West;* from the Journal of Captain Benjamin L. E. Bonneville of the Army of the United States (2 vols., 1837), subsequent editions bearing the title *The Adventures of Captain Bonneville, U.S.A., in the Rocky Mountains and the Far West.* Bonneville became a major in 1845, and was brevetted lieutenant-colonel for gallantry in the battles of Contreras and Churubusco during the Mexican War. He became a colonel in 1855, commanded the Gila river expedition against the Apaches in 1857, and from 1858 to 1861 commanded the department of New Mexico. He was retired in 1861, but served during the Civil War as recruiting officer and commandant of barracks at St Louis, Missouri, receiving the brevet rank of brigadier-general in 1865. He died at Fort Smith, Arkansas, on the 12th of June 1878. The extinct glacial lake which once covered what is now north-western Utah has been named in his honour.

**BONNEY, THOMAS GEORGE (1833-1913),** English geologist, eldest son of the Rev. Thomas Bonney, master of the grammar school at Rugeley, was born in that town on the 27th of July 1833. Educated at Uppingham and St John's College, Cambridge, he graduated as a 1st wrangler in 1856, and was ordained in the following year. From 1856 to 1861 he was mathematical master at Westminster school, and geology was pursued by him only as a recreation, mainly in Alpine regions. In 1865 he was appointed tutor at St John's College and lecturer in geology. His attention was specially directed to the study of the igneous and metamorphic rocks in Alpine regions and in various parts of England. In 1872 he was appointed to the Chair in the Geological Society and Geological Magazine, he wrote several popular works on Alpine Regions, on English and Welsh scenery, as well as on theoretical subjects. See *Geological Magazine* for September 1901 (with bibliography).

**BONNIER, ANGE ELISABETH LOUIS ANTOINE (1749-1799),** French diplomatist, was a member of the Legislative Assembly and of the Convention, where he voted with the majority. During the Directory he was charged with diplomatic missions, first to Lille and then to the congress of Rastadt (October, 1797), where he negotiated the short peace concluded there without signing the papers. On the 28th of April 1799 the plenipotentiaries on leaving Rastadt were assailed at the gates of the town by Hungarian husars, probably charged to secure their papers. Bonnier and one of his colleagues, Claude Roberjot, were killed. The other, Jean Debry, was wounded. See Hueber, *Der Rastadtergesindenmord* (Bonn, 1896).

**BONNIVET, GUILLAUME GOUFFIER, SEIGNEUR DE (c. 1485-1529),** French soldier, was the younger brother of Artus Gouffier, seigneur de Boisy, tutor of Francis I. of France. Bonnivet was brought up with Francis, and after the young king's accession he was one of the most powerful of the royal favourites. In 1515 he was made admiral of France. In the imperial election of 1519 he superintended the candidature of Francis, and spent vast sums of money in his efforts to secure the votes of the electors, but without success. He was the implacable enemy of the constable de Bourbon and contributed to his downfall. In command of the army of Navarre in 1521, he occupied Fuenterrabia and was probably responsible for its non-restoration and for the consequent renewal of hostilities. He succeeded Malesherbes in 1525 in the command of the army of Italy and entered the Millesimo, but was defeated and forced to effect a disastrous retreat, in which the chevalier Bayard perished. He was one of the principal commanders of the army which Francis led into Italy at the end of 1524, and died at the battle of Pavia on the 24th of February 1525. Brantôme says that it was at Bonnivet's suggestion that the battle
of Pavia was fought, and that, seeing the disaster he had caused, he courted and found death heroically in the fight. In spite of his failures as a general and diplomatist, his handsome face and brilliant wit enabled him to retain throughout his life the influence and affection of his contemporaries.

According to Brantôme he was the successful rival of the king for the favours of Madame de Châteaubriand, and if we may believe him to have been—as is very probable—the hero of the fourth story of the *Histoire de la Couronne Marguerite d’Angoulême* had occasion to resist his importunities.

**BONOMI, GIUSEPPE** (1739-1808), English architect, was born at Rome on the 19th of January 1739. After attaining a considerable reputation in it, he came in 1767 to England, and finally settled in practice there. He was the innocent cause of the retirement of Sir Joshua Reynolds from the presidency of the Royal Academy. Sir Joshua wished him to become a full Academician, regarding him as a fitting occupant of the then vacant chair of professor. But the majority of the Academicians were opposed to this suggestion, and Bonomi was elected an associate only, and that merely by the president’s casting vote.

Bonomi was largely responsible for the revival of classical architecture in England. His most famous work was the Italian villa at Rosenoath, Dumbartonshire, designed for the duke of Argyll. In 1804 he was appointed honorary architect to St Peter’s at Rome. He died in London on the 9th of March 1808.

His son, GIUSEPPE BONOMI (1795-1848), studied art in London at the Royal Academy, and became a sculptor, but is best known as an illustrator of the leading Egyptianological publications of his day. From 1824 to 1832 he was in Egypt, making drawings of the monuments in the company of Burton, Lane and Wilkinson.

In 1833 he visited the mosque of Omar, returning with detailed drawings, and from 1842 to 1844 was again in Egypt, attached to the Prussian government exploration expedition under Lepsius. He assisted in the arrangement of the Egyptian court at the Crystal Palace in 1853, and in 1861 was appointed curator of the Soane Museum. He died on the 3rd of March 1878.

**BONONCI (or BUONONCI), GIOVANNI BATTISTA** (1672-1750?), Italian musical composer, was the son of the composer Giovanni Maria Bononcini, best known as the author of a treatise entitled *Il Musico Pratico* (Bologna, 1673), and brother of the composer Marc’ Antonio Bononcini, with whom he has often been confused. He is said to have been born at Modena in 1672, but the date of his birth must probably be placed some ten years earlier. He was a pupil of his father and of Colonna, and produced his first operas, *Tullo Ostilio* and *Serse*, at Rome in 1693. In 1696 he was at the court of Berlin, and between 1700 and 1720 divided his time between Vienna and Italy. In 1720 he was summoned to London by the Royal Academy of Music, and produced several operas, enjoying the protection of the Marlborough family. About 1731 it was discovered that he had a few years previously palmed off a madrigal by Lotti as his own work, and after a long correspondence he was obliged to leave the country. He remained for several years in France, and in 1748 was summoned to Vienna to compose music in honour of the peace of Aix-la-Chapelle. He then went to Venice as a composer of operas, and nothing more is known of his life.

Bononcini’s rivalry with Handel will always ensure him immortality, but he was in himself a musician of considerable merit, and seems to have influenced the style, not only of Handel but even of Alessandro Scarlatti. Either he or his brother (our knowledge of the two composers’ lives is at present not sufficient to distinguish their works clearly) was the inventor of that sharp rhythmical style conspicuous in *Il Triunfo di Camillo* (1697), the success of which at Naples probably induced Scarlatti to adopt a similar type of melody. It is noticeable in the once popular air of Bononcini, *L’esperto nozziere*, and in the air

*Vado ben spesso*, long attributed to Salvatore Rosa, but really by Bononcini.

**BONONIA** (mod. Bologna), the chief town of ancient Aemilia (see Aemilia, Vis.), in Italy. It was said by classical writers to be a Etruscan foundation, but have been founded, under the name Felsina, from Persia by Aucanucus about the year 1525 B.C. of recent years have, however, led to the discovery of some 600 ancient Etruscan (Ligurian?) huts, and of cemeteries of the same and the succeeding (Umbrian) periods (600-500 B.C.), of which the latter immediately preceded the Etruscan civilization (c. 600-400 B.C.). An extensive Etruscan necropolis, too, was discovered on the site of the modern cemetery (A. Zannoni, *Studi della Città*, Bologna, 1876), and others in the public garden and on the Arnolfo Velii property (*Notizie degli Scavi*, indice 1876-1901, t. i. *Bologna*). In 156 B.C., when the town first appears in history, it was already in the possession of the Boii, and had probably by this time changed its name, and in 180 B.C. it became a Roman colony.

After the conquest of the mountain tribes, its importance was assured by its position on the Via Aemilia, by which it was connected in 187 B.C. with Ariminum and Placentia, and on the road, constructed in the same year, to Arretium; while another road was made, perhaps, in 175 B.C., to Aquileia. It thus became the centre of the road system of north Italy. In 90 B.C. it acquired Roman citizenship. In 43 B.C. it was used as his base of operations against Decimus Brutus by Mark Antony, who settled colonists here; Augustus added others later, constructing a new aqueduct from the Letta, a tributary of the Rhenus, which was restored to use in 1881 (G. Gazzadini in *Notizie degli Scavi*, 1881, 162). After a fire in A.D. 53 the emperor Claudius made a subvention of 10 million sesterces (1,085,500). Bononia seems, in fact, to have been one of the most important cities of ancient Italy, as Bologna is of modern Italy. It was able to resist Araric in 410 and to preserve its existence during the general ruin. It afterwards belonged to the Greek exarchate of Ravenna. Of remains of the Roman period, however, there are none above ground. Though various discoveries have been made from time to time within the city walls, the modern streets corresponding more or less, as it seems, with the ancient lines. Remains of the bridge of the Via Aemilia over the Rhenus have also been found—consisting of parts of the parapets on each side, in brick-faced concrete which belong to a restoration, the original construction (probably by Augustus in 2 B.C.) having been in blocks of Veronez, and the parapets and also of a massive protecting wall slightly above it, of late date, in the construction of which a large number of Roman tombstones were used. The bed of the river was found to have risen to at least 20 ft.; since the collapse of this bridge (about A.D. 1000), the total length of which must have been about 650 ft. and the width between the parapets 383 ft. See E. Brizio in *Notizie degli Scavi* (1890), 125, 450; (1897) 330; (1898) 465; (1902) 537.

**BONPLAND, Aimé Jacques Alexandre** (1773-1858), French traveller and botanist, whose real name was GOUJAND, was born at La Rochelle on the 22nd of August 1773. After serving as a surgeon in the French army and studying under J. N. Corvisart at Paris, he accompanied A. von Humboldt during five years of travel in Mexico, Colombia and the districts bordering on the Orinoco and Amazon. In these explorations he collected and classified about 6000 plants till then mostly unknown in Europe, which he afterwards described in *Plantes équinoxiales*, &c. (Paris, 1808-1816). On returning to Paris he received a pension and the superintendence of the gardens at Malmaison, and published *Monographie des Milieux montagnards* (1806), and *Description des plantes rares de l’Amerique* (1813). From 1816 he set out, taking with him various European plants, for Buenos Aires, where he was elected professor of natural history, an office which he soon quitted in order to explore central South America. While journeying to Bolivia he was arrested in 1832, by command of Dr Francia, the dictator of Paraguay, who detained him until 1831. On regaining liberty he resided at San Burga in the province of Corrientes, until his removal in 1853 to Santa Anna, where he died on the 4th of May 1858.
BONSTETTEN—BOOK

BONSTETTEN, CHARLES VICTOR DE (1745-1832), Swiss writer, an excellent type of a liberal patron, more French than Swiss, and a good representative of the Gallicized Bern of the 18th century. By birth a member of one of the great patrician families of Bern, he was educated in his native town, at Yverdon, and (1763-1766) at Geneva, where he came under the influence of Rousseau and of Charles Bonnet, and imbited liberal sentiments. Recalled to Bern by his father, he was soon sent to Leiden, and the "world" (1790) England, where he became a friend of the poet Gray. After his father's death (1790) he made a long journey in Italy, and on his return to Bern (1794) entered political life, for which he was unfitted by reason of his liberal ideas, which led him to patronize and encourage Johannes Müller, the future Swiss historian. In 1779 he was named the Bernese bailiff of Saanen or Gessenay (here he wrote his Lettres pastorales sur une contrée de la Suisse, published in German in 1781), and in 1787 was transferred in a similar capacity to Nyon, from which post he had to retire after taking part (1791) in a festival to celebrate the destruction of the Bastille. From 1795 to 1797 he governed (for the Swiss Confederation) the Italian-speaking districts of Lugano, Locarno, Mendrisio and Val Maggia, of which he published (1797) a pleasing description, and into which he is said to have introduced the cultivation of the potato. The French revolution of 1798 in Switzerland drove him again into private life. He spent the years 1798 to 1801 in Denmark, with his friend Fredrika Brun, and then settled down in 1803 in Geneva for the rest of his life. There he enjoyed the society of many distinguished persons, among whom was (1809-1817) Madame de Staël. It was during this period that he published his most celebrated work, L'Homme du milieu et l'homme du monde (1824), a study of the influence of climate on different nations, the north being exalted at the expense of the south. Among his other works are the Recherches sur la nature et les lois de l'imagination (1807), and the Études de l'homme, ou Recherches sur les facultés de penser et de sentir (1821), but he was better as an observer than as a philosopher.

Lives by A. Steinlen (Lausanne, 1860), by C. Morell (Winterthur, 1861), and by W. Wille (Bern, 1868). See also vol. xiv. of Sainte-Beuve's Causeries du Lundi.

BONUS (a jocular application of the Lat. bonus, for bonum, "a good thing"), a sum paid to shareholders in a joint-stock company, as an addition to the ordinary dividend, and generally given out of accumulated profits, or out of profits gained from exceptional transactions. As used by insurance companies, the word denotes the addition made to the amount of a policy by a distribution pro rata of accumulated profits or surplus. In a more general sense, bonus is any payment or remuneration over and above what is due and promised.

BONZE (from Japanese bonzo, probably a mispronunciation of Chinese fan san, "religious person"), the European name for the members of the Buddhist religious orders of Japan and China. The word is loosely used of all the Buddhist priests in those and the neighbouring countries.

BOOK, the common name for any literary production of some bulk, now applied particularly to a printed composition forming a volume, or, if in more than one volume, a single organic literary work. The word is also used descriptively for the internal divisions or sections of a comprehensive work. The word "book" is found with variations of form and gender in all the Teutonic languages, the original form postulated for it being a strong feminine Bökis, which must have been used in the sense of a writing-tablet. The most obvious connexion of this is with the old English bec, a beech tree, and though this is not free from philological difficulties, no probable alternative has been suggested. As early as 2400 B.C., in Babylonia, legal decisions, revenue accounts, &c. were inscribed in cuneiform characters on clay tablets and placed in jars, arranged on shelves and labelled by clay tablets attached by straw. In the 7th century, the library of literary works written on such tablets existed at Nineveh, founded by Sargan (721-709 B.C.). As in the case of the "Creation" series at the British Museum the narrative was sometimes continued from one tablet to another, and some of the tablets are inscribed with entries forming a catalogue of the library. These clay tablets are perhaps entitled to be called books, but they are out of the direct ancestry of the modern printed book with which we are here chiefly concerned. One of the earliest direct ancestors of this extant is a roll of eighteen columns in Egyptian hieratic writing of about the 25th century B.C. in the Musée de Louvre at Paris, preserving the maxims of Pothḥepet, a papyrus, the material on which the manuscript (known as the Papyrus Prisse) is written, was made from the pith of a reed chiefly found in Egypt, and is believed to have been in use as a writing material as early as about 4000 B.C. It continued to be the usual vehicle of writing until the early centuries of the Christian era, was used for pontifical bulls until a.d. 1022, and occasionally even later; while in Coptic manuscripts, for which its use had been revived in the 7th century, it was employed as late as about a.d. 1250. It was from the name by which they called the papyrus, βιβλιον or βιβλας, that the Greeks formed βιβλιας, their word for a book, the plural of which (misspelled for a feminine singular) has given us our own word Bible. In the 2nd century B.C. Eumenes II., king of Pergamus, finding papyrus hard to procure, introduced improvements into the preparations of the skins of sheep and calves for writing purposes, and was rewarded by the name of his kingdom being preserved in the word pergamentum, whence our "parchment," by which the dressed material is known. In the 10th century the supremacy which parchment had gradually established was attacked by the introduction from the East of a new writing material made from a pulp of linen rags, and the name of the vanquished papyrus was transferred to this new rival. Paper-mills were set up in Europe in the 12th century, and the use of paper gained ground, though not very rapidly, until on the invention of printing, the demand for a cheap material for books, and the ease with which paper could be worked on a press, gave it a practical monopoly. This it preserved until nearly the end of the 19th century, when substances mainly composed of wood-pulp, esparto grass and clay largely took its place, while continuing, as in the transition from papyrus to linen-pulp, to pass under the same name (see PAPER).

So long as the use of papyrus was predominant the usual form of a book was that of the volumen or roll, wound round a stick, or sticks. The modern form of book, called by the Latins codex (a word originally used for the stump of a tree, or block of wood, and thence for the three-leaved tablets into which the block was sawn) was coming into fashion in Martian's time at Rome, and gained ground in proportion as parchment superseded papyrus. The volumen as it was unrolled revealed a series of narrow columns of writing, and the influence of this arrangement is still apparent in the way the leaves of a book in the Codex Sinaiticus and Codex Vaticanus of the Bible, both of the 4th century, there are respectively four and three columns to a page; in the Codex Alexandrinus (5th century) only two; in the Codex Bezae (6th century) only one, and from this date to the invention of printing, while there were great changes in handwriting, the arrangement of books changed very little, single or double columns being used as was found convenient. In the external form of books there was much the same conserva-
tion. In the Codex Amiatinus written in England in the 8th century one of the miniatures shows a book in a red leather cover, and the arrangement of the pattern on this curiously resembles that of the 17th-century red leather bindings predominant in the Biblioteca Laurenziana at Florence, in which the codex itself is preserved. In the same way some of the small stamps used in Oxford bindings in the 15th century are nearly indisting-
uishable from those used in England three centuries earlier. Much fuller details as to the history of written books in these as well as other respects will be found in the article Manuscript, to which the following account of the fortunes of books after the 15th century is supplementary.

Between a manuscript written in a formal book-hand and an early printed copy of the same work, printed in the same district as the manuscript had been written, the difference in general
appearance was very slight. The printer's type (see Typography) would as a rule be based on a handwriting considered by the scribes appropriate to works of the same class; the chapter headings, headlines, initial-letters, paragraph marks, and in some cases illustrations, would be added by hand in a style closely resembling the like decorations in the manuscript from which the text was being printed; there would be no title-page, and very probably no statement of any kind that the book was printed, or as to where, when or by whom it was produced. Information as to these points, if given at all, was reserved for a paragraph at the end of the book, called by bibliographers a colophon (q.v.), to which the printer often attached a device consisting of his arms, or those of the town in which he worked, or a picturesque design. These devices are sometimes beautiful and often take the place of a statement of the printer's name. Many facsimiles or copies of them have been published. The first dated title-page known is a nine-line paragraph on an otherwise blank page giving the title of the book, *Sermo ad populum predicabilis in festo presentationis Beatissimae Marie Semper Virginis*, with some words in its praise, the date 1470 in roman numerals, and a reference to further information on the next page. The book in which this title-page occurs was printed by Arnold her Hoerener at Cologne. Six years later Erhard Rat- doner, a partner at Venetia printers, printed the same book together with some verses describing the book, on the title-page of a Latin calendar, and surrounded the whole with a border in four pieces. For another twenty years, however, when title-pages were used at all, they usually consisted merely of the short title of the book, with sometimes a woodcut or the printer's (subsequently the publisher's) device beneath it, decoration being more often bestowed on the first page of text, which was sometimes surrounded by an ornamental border. Title-pages completed by the addition of the name and address of printer or publisher, and also by the date, did not become common till about 1520.

While the development of the title-page was thus slow the completion of the book, independently of handwork, in other respects was fairly rapid. Printed illustrations appear first in the form of rude woodcuts in some small books produced at Bamberg by Albrecht Pfister about 1461. Pagination and headings were first used by her Hoerener at Cologne in 1470 and 1471; printed signatures to guide binders in arranging the quires correctly (see Bibliography and Bibliology) by Johann Koelhoff, also at Cologne, about 1473. Illustrations were first printed at Augsburg in the early 'seventies, and in the 'eighties are common in Germany, France and the Low Countries, while in Italy their full development dated from about 1490. Experiments were made in both Italy and France with illustrations engraved on copper, but in the 15th century these met with no success.

Bound with wooden boards covered with stamped leather, or with half of the boards left uncovered, many of the earliest printed books are immensely large and heavy, especially the great choir-books, the Bibles and the Biblical and legal commentaries, in which a great mass of notes surrounds the text. The paper on which these large books were printed was also extraordinarily thick and strong. For more popular books small folio was at first a favourite size, but towards the end of the century small thin quartos were much in vogue. Psalters, books of hours, and other prayer-books were practically the only very small books in use. Owing to changes, not only in the value of money but in the coinage, the cost of books in the 15th century is extremely difficult to ascertain. A vellum copy of the first printed Bible, now in the British Museum, is one of the largest folio volumes, when rubricated and illuminated, is said to have been worth 100 florins. In 1467 the bishop of Aleria writing to Pope Paul II. speaks of the introduction of printing having reduced prices to one-fifth of what they had previously been. Fifteen "Legends" bequeathed by Caxton to St Margaret's, Westminster, were sold at prices varying from 6s. 8d. to 5s. This would be cheap for a large work like the *Golden Legend*, but the bequest was more probably of copies of the *Seram Legenda*, or Lectionary, a much smaller book.

*14th Century.*—The popularization of the small octavo by Aldus at Venice in 1501 and the introduction in these handy books of a new type, the italic, had far-reaching consequences. Italics grew steadily in favour during the greater part of the century, and about 1570 had almost become the standard vernacular type of Italy. In France also they were very popular, the attempt to introduce a rival French cursive type (lettres de civilité) attaining no success. In England they gained only slight popularity, but roman type, which had not been used at all in the 15th century, made steady progress in its contest with black letters, which by the end of the century was little used save for Bibles and proclamations. The modern practice in the use of i and j, u and v dates from about 1530, though not firmly established till the reign of Charles I.

In the second quarter of the 16th century the French printers at Paris and Lyons halved the size of the Aldine octavos in their small sextodecimos, which found a ready market, though not a lasting one, the printers of Antwerp and Leiden omitting them with still smaller books in 14mo or small twelves. These little books were printed on paper much thinner than had previously been used. The size and weight of the books was also reduced by the substitution of pasteboards for wooden sides. Gold tooling came into use on bindings, and in the second half of the century very elaborate decoration was in vogue in France until checked by a sumptuary law. On the other hand a steady decline in the quality of paper combined with the abandonment of the old simple outline woodcuts for much more ambitious designs made it increasingly difficult for printers to do justice to the artists' work, and woodcuts, at first in the Low Countries and afterwards in England, were gradually superseded by copper-plates printed separately from the text, for which in the 15th century in England a ballad or Christmas Carol sold for a halfpenny and thin quarto chapbooks for 4d. (a price which lasted through the century), the Great Bible of 1541 was priced at 10s. in sheets and 12s. bound, Edward VI. 's prayer-book (1549) at 2s. 6d. unbound, and 3s. 8d. in paste or boards; Sidney's *Arcadia* and other works in 1598 sold for 9s.

*17th Century.*—Although the miniature editions issued by the Elzevirs at Leiden, especially those published about 1635, have attracted collectors, printing in the 17th century was at its worst, reaching its lowest depths in England in the second quarter. After this there was a steady improvement, partly due to slight modifications of the old printing presses, adopted first in Holland and copied by the English printers. In the first half of the century many English books, although poorly printed, were ornamented with attractive frontispieces, or portraits, engraved on copper. During the same period, English prayer-books and small Bibles and New Testaments were frequently covered with gay embroideries in coloured silks and gold or silver thread. In the second half of the century the leather bindings of Samuel Mearne, to some extent imitated from those of the great French binder Le Gascon, were the daintiest England had yet produced. For trade bindings rough calf and sheepskin were most used, and the practice of lettering books on the back, instead of on the sides or fore-edges or not at all, came gradually into favour. Owing to the increase of money, and in some cases to the action of monopolists, in others to the increased payments made to authors, book-prices rather rose than fell. Thus church Bibles, which had been sold at 10s. in 1547, rose successively to
BOOKBINDING

255, 308, and (in 1641) to 40s. Single plays in quarto cost 6d. each in Shakespeare's time. is. after the Restoration. The Shakespeare folio of 1623 is said to have been published at £.1. Bishop Walton's polyglot Bible in six large volumes was sold for £10 to subscribers, but resulted in a heavy loss. Isaac Walton's Complete Angler was, to use his own words, a 'pretty book' and was followed by Paradise Lost at 3s. The Pilgrim's Progress at 1s. 6d.; Dryden's Virgil was published by subscription at £5:5s. It was a handsome book, ornamented with plates; but in the case of this and other subscription books a desire to honour or befriend the author was mainly responsible for the high price.

18th Century.—During this century there was a notable improvement alike in paper, type and presswork in both France and England, and towards the end of the century in Germany and Italy also. Books became generally neat and sometimes elegant. Book-illustration revived with the French lettres-d-signettes, and English books were illustrated by Gravelot and other French artists. In the last quarter of the century the work of Bewick heralded a great revival in woodcut illustrations, or as the use of the graver now entitled them to be called, wood engravings. The best 18th-century binders, until the advent of Roger Payne, were inferior to those of the 17th century, but the technique of the average work was better. In trade bindings the use of sheepskin and calf became much less common, and books were mostly cased in paper boards. The practice of publishing by subscription at a very high price, which Dryden had found lucrative, was followed by Prior and Pope. Single poems by Pope, however, were sold at 1s. and 1s. 6d. Novels were mostly in several volumes. The price at the beginning of the century was mostly 1s. 6d. each. It then remained fairly steady for many years, and at the close of the century rose again. Thus Miss Burney's Evelina (3 vols., 1778) sold for 7s. 6d., her Cecilia (5 vols., 1782) for 12s. 6d., and her Camilla (5 vols., 1796) for £1:15s. Johnson's Dictionary (2 vols., folio, 1755) cost £4:4s. in sheets, £4:15s. in boards.

19th Century.—A great change in the appearance of books was caused by the use first of glazed calico (about 1820), afterwards (about 1839) of cloth for the cases of books as issued by their publishers. At first the lettering was printed on paper labels, but soon it was stamped in gilt on the cloth, and in the last quarter of the century many very beautiful covers were designed for English and American books. The designs for leather bindings were for many years chiefly imitated from older work, but towards the end of the 'eighties much greater originality began to be shown. Book illustrations passed through many phases. As subsidiary methods colour-prints, line engravings, lithographs and etchings were all used during the first half of the century, but the main reliance was on wood-engraving, in which extraordinary technical skill was developed. In the 'sixties and the years which immediately preceded and followed them many of the chief English artists supplied the engravers with drawings. In the last decade of the century wood-engraving was practically killed by the perfection attained by photographic methods of reproduction (see Process), the most popular of these methods entailing the use of paper heavily coated with china clay. During the century trade-printing, both in England and America, steadily improved, and the work done by William Morris at his Kelmscott Press (1891-1896), and by other amateur printers who imitated him, set a new standard of beauty of type and ornament, and of richness of general effect. On the other hand the demand for cheap reprints of famous works induced by the immense extension of the reading public was supplied by scores of pretty if flimsy editions at 1s. 6d. and 1s. and even less. The problem of how to produce books at moderate prices on good paper and well sewn, was left for the 20th century to settle. About 1894 the number of such medium-priced books was greatly increased in England by the substitution of single-volume novels at 6s. each (subject to discount) for the three-volume editions at 3s. 6d. The preposterous price of 1os. 6d. a volume had been adopted during the first popularity of the Waverly Novels, and despite the example of France, where the standard price was 3 fr. 50, had continued in force for the greater part of the century. Even after novels were sold at reasonable rates artificial prices were maintained for books of travel and biographies, so that the circulating libraries were practically the only customers for the first editions. (See Publishing and Bookselling.) (A. W. Po.)

BOOKBINDING. Bindings or covers to protect written or printed matter have always followed the shapes of the material on which the writing or printing was done. The first attempts on rocks or wood needed no coverings, and the earliest instances of protective covers are to be found among the smaller Assyrian tablets of about the 8th century B.C. These tablets, with cuneiform inscriptions recording sales of slaves, loans of money and small matters generally, are often enclosed in an outer shell of the same shape and impressed with a short title. Egyptian papyrus rolls were generally kept in roll form, bound round with papyrus tape and often sealed with seals of Nile mud; and the rolls in turn were often preserved in rectangular hollows cut in wood. The next earliest material to papyrus used for writing upon was tree bark. Bark books, still commonly used by uncultured nations, often consisting of collections of magical formulae or medical receipts, are generally rolls, folded backwards and forwards upon themselves like the sides of a concertina. At Pompeii in 1875 several diptychs were found, the wooden leaves hallowed on the inner sides, filled with blackened wax, and hinged together at the back with leather thongs. Writings were found scratched on the wax, one of them being a record of a journey to Umbria in January in A.D. 55. This is the earliest known Latin manuscript. The diptychs are the prototypes of the modern book. From about the 1st to the 6th century, ornamental diptychs were made of carved ivory, and presented to great personages by the Roman consuls.

Rolls of papyrus, vellum or paper were written upon in three ways. (1) In short lines, at right angles to the length of the roll. (2) In long lines each the entire length of the roll. (3) In short lines parallel to the length of the roll, each column or page of writing having a space left on each side of it. Rolls written in the Chinese or Sanskrit way, the sheets being rolled and kept in cylinders of like shape, sometimes several together, with a title tag at the end of each, in a box called a scrinium. In the case of the second form, the most obvious instances of which are to be found in the Buddhist prayer-wheels, the rolls were and are kept in circular boxes with handles through the centres so that they can revolve easily. In the third manner of arranging the manuscript the page forms show very clearly, and it is still used in the scrolls of the law in Jewish synagogues, kept on two rollers, one at each end. But this form of writing also developed a new method for its own more convenient preservation. A roll of this kind can be folded up, backwards and forwards, the bend coming in the vacant spaces between the columns of writing. When this is done it at once becomes a book, and takes the Chinese and Japanese form known as orihon—all the writing on one side of the roll or strip of paper and all the other side blank. Some books of this kind are simply guarded by two boards, but generally they are fastened together along one of the sides, which then becomes the back of the book. The earliest fastening of such books consists of a lacing with some cord or fibre run through holes stabbed right through the substance of the roll, near the edge. Now the orihon is complete, and it is the link between the roll and the book. This "stabbed" form of binding is the earliest method of keeping the leaves of a book together; it occurs in the case of a Coptic papyrus of about the 8th century found at Thebes, but it is rarely used in the case of papyrus, as the material is too brittle to retain the threads properly.

The method of folding vellum into pages seems to have been first followed about the 5th century. The sheets were folded once, and gatherings of four or more folios were thus made. Sometimes these were made in England by the substitution of single-volume novels at 6s. each (subject to discount) for the three-volume editions at 3s. 6d. The preposterous price of 1os. 6d. a volume had been adopted during the first popularity of the Waverly Novels, and despite the example of France, where the standard price was 3 fr. 50, had continued in force for the greater part of the century. Even after...
I'LAT*

Fig. 1.—WINCHESTER DOMESTIC BOOK OF THE 12TH CENTURY.
Dark brown morocco, blind stamped.

Fig. 2.—ST. CUTHBERT'S GOSPELS.
Red leather with repousse design, probably the work of the 7th or 8th century. The fine lines are impressed by hand, and painted blue and yellow.

Fig. 3.—BINDING MADE FOR JEAN GROLIER.
Pale brown morocco, gold tooled.

Fig. 4.—BINDING MADE FOR JAMES I.
Dark blue morocco, gold tooled. The red in the coat-of-arms inlaid with red morocco.

Fig. 5.—COMMON PRAYER (LONDON, 1678).
Smooth red morocco, gold tooled with black fillets. Bound by Samuel Mearne.

Fig. 6.—LE LIVRE DES STATUTS ET ORDONNANCES DE L'ORDRE DU BENVIST SAINT ESPIRIT (PARIS, 1573).

Fig. 7.—CATALOGUE OF THE PICTURES AT HAGLEY HALL.

Fig. 8.—WALTON'S COMPLEAT ANGLER (1772).
BOOKBINDING

books; it is known as "flexible" work, and has never been improved upon.

As soon as the method of sewing quires together in this way became well understood, it was found that the projecting boards at the back needed protection, so that when all the quires were joined together and, so far, finished, strips of leather were fastened all over the back. But it was also found that vellum leaves were apt to curl strongly, and to counteract this tendency strong wooden boards were put on each side. The loose ends of the boards were fastened to the boards, which hinged upon them, and the protecting strip of leather at the back was drawn over the boards far enough to cover the hinge. So we get the medieval "half-binding" which shows the strip of leather over the back of the book, and a strip of vellum over the boards, which is left uncovered. The book was usually closed by means of clasps in front.

The leather strip soon developed, and covered the whole of the boards, "whole" binding as it is called, and it was quickly found that these fine flat pieces of leather offered a splendid field for artistic decoration.

The first ornamentation on leather bindings was probably made by means of impressions from small metal points or lines, pressed upon the leather. This in time led to the wonderful cutting of small decorative stamps to be used in the same way. It is considered that English binders excelled in this art of "blind" "stamping," that is, without the use of gold leaf. Most of the stamps were cut intaglio, so that their impressions are in cameo form. Such bindings were made to perfection during the 12th and 13th centuries at Durham, Oxford, Cambridge, London and other places. One of the most charming examples left is the binding of the Winchester Domedal Book of the 12th century Plate, fig. 1), now belonging to the Society of Antiquaries of London.

From about the 7th to the 16th century illuminated manuscripts were held in the greatest esteem. Among them can be found not only exquisite calligraphy but exquisite miniature painting. Moreover, the gorgeousness of the illuminations inside suggested gorgeousness of the outside coverings, so we find splendid work in metals with jewels, enamels and carved ivory, dating from the 7th-century Gospels of Theodolinda at Monza, the Irish cumdach of the Stowe Missal, the Lindau Gospels now in America, and the Gospels of Charlemagne in the Victoria and Albert Museum at South Kensington, to the magnificent bindings of 14th-century Limoges enamel in the British Museum. Such English bindings of this kind—intrinsically precious—as may have existed have all disappeared,—most likely they were melted up by Henry VIII., or Edward VI.; but at Stonyhurst there is a book known as St Cuthbert's Gospels, which is bound in red leather with a repoussé design upon it, and is probably the work of the 7th or 8th century (Plate, fig. 2).

When printing was introduced into Europe about the middle of the 15th century, there was very soon a reaction against the large, beautiful and valuable illuminated MSS. and their equally precious covers. Printing brought small books, cheap books, ugly books, generally bound in calf, goatskin or sheepskin, and ornamented with large panel stamps in blind. But a new art came into birth very shortly, namely the art of gold tooling on leather, which in capable hands is almost a great art, and specimens of the work of the few great masters that have practised it are now much sought after and likely to increase in estimation and value. All this, as usual, brings a school of skilled faussaires into the field, and already the collector of fine bindings must be wary, or he may easily give thousands of pounds for forged or made-up objects that are worth but little.

In the matter of leather bindings with gold tooling, an art which was probably brought to Venice from the East, the finest examples are to be found in late 15th-century Italian work. The art quickly spread, and Thomas Berthelet, Royal Binder to Henry VIII., seems to have been the first binder who practised it in England. Berthelet's work is strongly Italian in feeling, especially at first, and it is likely that he was taught the new art by an Italian master; he worked until about 1558.

During the late 15th and the 16th century in England, numbers of fine printed books were bound in velvet and satin, sometimes set with enamels, sometimes embroidered. These books, having strongly three-dimensional red, finished upon them, have lasted much better than would be expected, and instances of such work made for Henry VIII. are still in excellent condition, and most decorative.

The fashion of ornamenting English royal books with heraldic designs, which is considered to have begun in the reign of Edward IV., has continued without break. The same fashion in books belonging to private owners was first followed during the later Tudor period, and then numbers were made, and have been, more or less, ever since.

Many early Venetian bindings have received panels, made by the use of double boards, the leather of which is then finished in true oriental fashion.

Jean Grolier, viscount d'Aguisy, treasurer of France in 1545, was a great collector of fine books, most of which were bound for himself, and bear upon them his legend, Portia mea domine sit in terra sivenium, and also his name, Io Grolieri et Amicorum (Plate, fig. 3). Tommaso Maioli, an Italian collector of about the same time, used the same kind of legend. Books bound for him are curiously marked with atoms of gold remaining in the irregularities of the leather.

Benito Canevari, physician to Pope Urban VIII., had his books bound in dark green or deep red morocco, and upon them is a fine cameo stamp with a design of Apollo driving a chariot with one white horse and one black horse towards a mountain on which is a silver Pegasus. The stamp was coloured, but in most cases the colour has now worn off. Round the stamp is the legend OΘΘΘΣ ΚΑΙ ΜΙ ΛΕΘΗΣ.

The Italian bindings which were made for popes and cardinals are always of much interest and often of high merit, but as a rule later Italian bindings are disappointing.

Geoffrey Tory, printer and engraver to Francis I. of France, designed some fine bindings, some for himself and quite possibly some for Jean Grolier.

For Henry II. of France much highly decorative work in binding was done, richly gilded and coloured. These bindings have upon them the king's initials, the initials of his queen, Catherine de' Medici, and the emblems of crescents and bows. Henry's device was a crescent with the legend, Donce implert totum orbem. Bindings of similar style were made for Diane de Poitiers, duchesse de Valentinos, with her initials and the same devices of crescents and bows. They are always fine work.

German bindings are mostly in pigskin, finely stamped in blind. Several are, however, in calf. Gilding, when it exists, is generally bad.

In England during the 17th century much fine work was done in binding, most of it in morocco, but Henry, prince of Wales, always had his books bound in calf. The Jacobean style is heraldic, with semi of small stamps and heavy corners, but James I. has left some very fine bindings in another style (Plate, fig. 4). very possibly done for him by John Gibson, who bound the royal books while James was king of Scotland only. During the reign of Charles I. Nicholas Ferrar founded his curious establishment at Little Gidding, and there his niece Mary Collet and her sisters set up a bindery. They made large scrap-books, harmonies of the Gospels and other parts of the Bible, with illustrations, and bound them magnificently in velvet stamped in gold and silver. They were taught by a binder who worked for John and Thomas Buck, printers to the university of Cambridge, and the Little Gidding stamps are often identical with Buck's.
Samuel Mearne (d. 1683) was royal binder to Charles II., and invented the concertina style of decoration, a style which has lasted till the present day; the Bible on which Edward VII. took the coronation oath was ornamented in that way. An inner rectangle is run parallel to the edges of the book, and the upper and lower lines, the broken outwards into the outlines of the capitals of liberty. Mearne’s work as a binder (Plate, fig. 5) is of the highest merit. Many of his books have their fore-edge painted in such a way that the work is invisible when the book is shut, and only shows when the edges are fanned out.

In France 16th- and 17th-century binding is distinguished by the work of such masters as Nicholas Eve, who bound the beautiful Livre des Statuts et Ordonnances de l’Ordre du Benêt Sainct Esprit for Henry III. (Plate, fig. 6); Clovis Eve, who is credited with the invention of the style known as “fanfare,” a delicate tracery over the boards of a book, filled out with spirals of fancy stems; and Le Gascon, who invented the dotted work which has been used more or less ever since. Le Gascon caused his small gilding tools—curves and arabesques—to be scored across, so that when impressions were made from them a dotted line showed instead of a right line. Florimond Badier worked in a style very similar to that of Le Gascon and sometimes signed his work, which Le Gascon never did. Le Gascon had many imitators, the best and closest being Poncey and Magnus, Dutch binders who worked at Amsterdam in the 17th century, and his style has been continuously followed to the present day.

The medallions and borders of the 18th century who used delicately inlaid saffron colours, Jean Charles le Monnier was perhaps the most skilled. He often signed his bindings in small capitals impressed in gold somewhere about the inlaid part. Eliot and Chapman bound the library of Robert Harley, earl of Oxford, about the middle of the 18th century. The bindings are in morocco, with broad, richly gold-tooled borders, and users a diamond-shaped centre-piece. This is known as the Harleian style.

Thomas Hollis had his books bound in fine red morocco, ornamented with small, well-cut stamps engraved by Thomas Pangborn. These stamps comprised a capital letter, a figure of liberty, a figure of Britannia and several smaller ones.

Towards the end of the 18th century, when binding in England was decoratively at a low level, Roger Payne, a native of Windsor, came to London and set up as a bookbinder. He was a splendid workman, and introduced richly gold-tooled corner-pieces, ornamental “doublures” or side linings, and also invented the graining of morocco, graining it, however, in one direction only, known as the “straight grain.” It is said that Payne cut his own binding tools of iron; they certainly are exquisitely made, and in the hands of his binders he has put a written description of loving work he has done upon them. Payne was, unfortunately, a drunkard, but he has in spite of this rendered an immortal service to the art of bookbinding in England.

In 1785 John Edwards of Halifax patented a method of making vellum transparent, and using it as a covering over delicate paintings. He also painted pictures on the fore-edges of many of his books in the same manner as that followed by Samuel Mearne in the 17th century, so that they did not show until the book was opened. John Whitaker used calf for his bindings, but ornamented the calf in a curious way with strong acids and with prints from engraved metal plates. Both Edwards and Whitaker liked classical borders and ornaments, and their bindings are in consequence often known as “Etruscan.”

The same styles used in England at the beginning of the 19th century were nothing more than distant imitations of Roger Payne. Kalthoerber, Staggenmeier, Walther and Hering were all disciples of this master, but Charles Lewis worked on original lines. He developed arabesques and paid particular attention to richly gold-tooled doublures. He also used gold end papers, and the bands at the back of his bindings are often double and always broad, flat and gold-tooled. His workmanship is excellent; he worked largely for Thomas Grenville and other great collectors.

French binding of the 19th century is remarkable for wonderful technical excellence in every part. Among the most skilled of these admirable workmen and artists may be particularly mentioned Thouvenin, Buzonnet, Lortie, Nidréé, Capé and Duru, and fortunately they generally sign their work in small gold lettering either on the back of their bindings or inside along the lower edge.

Recent years have witnessed a marked revival of interest in the art of bookbinding, but modern binders have two serious difficulties to contend with. One of these is the prevalence of bad paper, overlaid with clay and with wood pulp, and also the fact that many of the modern leathers are badly prepared and dangerously treated with sulphuric acid, which in time inevitably rots the fibre. The Society of Arts has appointed committees of experts to report upon both of these evils, and the published accounts of both inquiries are of much value, and it is to be hoped that the results of these investigations will be of great benefit. Concurrently with the revival of the artistic side of the subject, there has also arisen a remarkable development in the technical processes, owing to the invention of ingenious and delicate machinery which is capable of executing the work which had hitherto been always laboriously done by hand. The processes of folding the printed sheets, and sewing them together on bands, rounding the backs when sewn, and of making the outer cases, covering them with cloth or leather and stamping designs upon them, can now all be efficiently executed by means of machines. The saving in time and labour thus effected is very great, although it must be said that the old methods of carrying out the process of sewing and rounding the backs of books by hand labour were safer and stronger, as well as being much less liable to bruise and injure the paper. These processes unfortunately are not only slow but also necessitate highly skilled labour. Already the larger trade binders utilize machines extensively and advantageously, but exclusively high-class trade binders do not as yet materially depart from the older methods. Private binders have naturally no reason to use machines at all. Fine and delicate examples of large metal blocks or dies have been successfully used for the decoration of covers measuring about 11½ by 8½ in.

Besides the large trade binders working mainly by the help of machinery, and producing a great quantity of bound work which is not expected to last long, there also exists in London, Paris, New York and other large cities, a small class of art binders who work throughout upon the principles which have been continuously in use for first-class work ever since about the 15th century. The initial impetus to this school can be traced to William Morris, who himself made some beautiful bookbindings, to be executed by hand, and published a volume in 1896, and in 1897 he was able to open for business. Although he probably did not fully appreciate either the peculiar limitations or the possibilities of the art of gold-tooling on leather, nevertheless his genius guided him truly as to the spirit in which the designs should be conceived. The revived art soon reached its first stage of development under the guidance of Mr T. J. Cobden-Sanderson, who may fairly be considered as the founder of the modern school of design for gold-tooling on book-covers, the pre-eminence and individuality of his work in this direction being proved by the number of his imitators. Among the most successful of his pupils is Mr Douglas Cockrell. His work (Plate, fig. 7) is distinguished by a marked originality of treatment, while it shows a scholarly appreciation of ancient methods. Mr Alfred de Sauly has succeeded in developing a new and admirable style in inlaid leathers, combined with delicate pointille work. A number of women artists, both in England
and in America, have already discovered in bookbinding a fitting
and lucrative field for their energies. One, Miss Sarah Prideaux,
is not only skilled and original in her own work, but she has also
given us much valuable literature on her subject. Miss E. M.
MacColl may claim to be the inventor of the small curved gold
line produced by means of a tiny wheel, for though the possibility
of producing such a line in blind was known for a long time,
it was rarely used. The graceful curves and lines found on Miss
MacColl's work have been designed for her by her brother,
Mr D. S. MacColl (Plate, fig. 8). Miss Joanna Birkenruth
recalls the highly decorative medieval binding by her use of
jewels cut en cabochon, but set in morocco instead of gold or
silver, and there are many others who are working well and
earnestly at art binding with delicate skill and taste. Outside
full advantage of them can only be taken where there is a large
edition of one book.

Book-sewing machines (fig. 9) are of two kinds: one sews the books
on bands, either flat or round, and the other supplies the place of
bands by a kind of chain stitch. The hand-working
machines bring the return thread back by pulling it
through the upper and lower edges of the back of each section, there-
by to some extent weakening each section, but at the same time
this weakening can be to some extent neutralized by careful head-
banding. The other system, where the band is replaced by a chain
stitch, brings back the return thread inside each section; the objec-
tion to this is that there is a flattening out of the back of the book,
which becomes a difficulty when the subsequent operation of cover-
ing the book begins. The sections are sewn continuously in a long
line, and are afterwards cut apart. The threads catch into hooked
needles and are drawn through holes made by piercers set to a certain
distance; a shuttle like that used in an ordinary sewing-machine
the inner circle of professional bookbinders there has grown
up a new profession, that of the designer for pictorial book-
covers, especially those intended to be shown in colour on cloth
or paper. Among notable designers may be mentioned Lewis
F. Day, A. A. Turbayne, Walter Crane and Charles Ricketts.

**Machine-binding.**—The principal types of machine for commercial
binding are described below. They are almost all due to American
or German ingenuity. It may be noted that, while books sewn by
hand on bands have the loose ends of the bands actually drawn
through the boards and strongly fastened to them through their
substance, no machines for covering sewn books will do this so
effectively. All they will do as a rule is to pass down to the inner
surfaces of the boards the loose ends of the tapes on which the
sewing is done. So that, although it may last a long time if not
much used, a "cased" book is likely to slip out of its cover as soon
as the paste fixing it perishes. Modern bookbinding machines of all
kinds are usually driven by power, and in consequence of the neces-
sary setting of most of them accurately to some particular size
of book, they are not suitable for binding books of different sizes; the
sews the inner thread backwards and forwards. Each section is
placed upon a sort of metal saddle by the hand of the operator, one
after the other; the machine working continuously unless the action
is cut off or controlled by a foot-lever or pedal. This machine is
much quieter to work, and although the inner threads are too bulky
to be quite satisfactory, this is not a serious matter like the cutting
of the upper and lower edges of the back already described, and
moreover, is probably capable of being either improved away or so
minimized that it will become of small importance.

The Martini book-sewing machine, which sews books on tape
without cutting up head or tail—a most important improvement—
and also forms complete Kettle stitches, will sew books of any size
up to 18 in. The needles are straight, and the necessary adjustments
for various sizes of books are very simple.

The machine for rounding and backing sewn books requires a
rather elaborate and very careful setting of several parts to the
exact requirement of each size to be worked. The sewn
book with the back glued is caught in a clip and forced be-
tween two tight rollers, the result being that the hitherto
flat back is automatically turned into a rounded shape
(figs. 10 and 11). The book is then drawn forward, by a continuance

![Fig. 9.—Book-sewing Machine.](image-url)
of the onward movement, until it reaches the rounding plate, which
is a block of steel with a polished groove a little larger than the size
required. This rounding plate moves within a small arc by means of
heavy counter-weights, and on the back of the book being strongly
pressed against it, it receives the permanent form of the groove cut
in it, at the same time a strong grip on each side of the book causes
the ledge to rise up along each outer edge of the back. This ledge it
is which enables the boards to be subsequently fixed in such a way
as to hinge on a line outside the actual and natural boundary of the
book.

Before the discovery of the possibility of producing this ledge, the
boards of books hinged upon a line coincident with the inner
dges of the back, the result of which was that when the book was
opened there was an invariable tendency to open and pull away the
few outer sections of the paper or vellum itself—a destructive and
disagreeable peculiarity. These machines are capable, after they
are properly set, of rounding and backing about 750 volumes of the
same size within an hour.

The machine for making cases, or “case” covers (fig. 12), for books
is large and complicated, but beautifully effective. It contains al-
together over fifty springs, some of which are very small, like watch
fittings, while others are large and powerful. The machine is fed
with pieces of cardboard cut exactly to the sizes of the required
boards, other pieces cut to the size of the back, and a long roll of the
cloth with which the cases are to be covered, and when set working
the roll of cloth is gradually unwound and glued by contact with a
roller, which is drawn along until it reaches a point where the two
boards are ingeniously dropped upon it one by one, then on again
to where a long arm swings backwards and forwards, at each move-
ment picking up a piece of cardboard for the back and placing it
gently exactly upon the glued bed left for it between the two boards
already fixed. Next, as the cloth passes along, it comes under the
sharp influence of two rectangular gouges which cut out the corners,
the remaining side pieces being gradually but irresistibly turned up
by hollow raisers and flattened down by small rollers, a very delicate
piece of machinery finishing the corners in a masterly way. Then,
lastly, an arrangement of raisers and rollers acting at right angles
to the last mentioned turn over and press out the remaining pieces
of cloth. Of course each piece of cloth is cut across at the proper
point before the turning up begins. This machine is capable of
producing 1200 cases in an hour of any size that the machine will
take.

The Smyth casing-in machine (fig. 13) pastes the sides of a book
as required and then attaches the cover over it. Cleverly arranged
rollers catch the book, and by a carefully regulated pressure fix the
cover in the proper position. There is a “jointing-in” device which

at a critical moment forces the joints in the cover into the joints
in the book. It will work books from 4 to 22 in. in length and from
1 to 3 in. in thickness, and can cover from 10 to 15 books per minute.

Here may also be mentioned the Sheridan wrapping machine,
which covers magazines and pamphlets ranging from 5 to 12 in.
in length at the rate of 40 a minute.

Wiring is a cheap method of keeping together thin parts of periodi-
cals or tracts. The machine that executes it is simple in construction
BOOKCASE—BOOK-COLLECTING

...and use. It drives a short wire pin, bent at right angles at each end, through the folds of the sections of a book or through the entire Wiro. thickness, sideways, after the manner of stapling. The projecting ends, when through the substance of the paper, are bent over and flattened so as to grip firmly. The metal used for these pins was at first very liable to rust, and consequently did much damage to the paper near it, but this defect has now been largely remedied. At the same time the principle of use (1903; metal wire instead of flexible hempen thread is essentially vicious, and should only be used as a temporary expedient for publications of little value.

The machines (fig. 14) now used for blocking designs upon book-covers are practically the same as have been employed for many Blocking years. Several small improvements have been introduced as to better inking of the rollers for colouring. Better heating of the blocks used for gold work. A blocking press is now, in consequence of the size of many of the blocks, a large and cumbersome machine. The block itself is fixed firmly in a strong metal bed, and a movable table in front of it is fitted with gauges which keep the cover exactly in its right place. For gold

Fig. 14.—Blocking Machine.

work the block is kept at the proper temperature by means of gas jets, and the cover being properly overlaid with gold leaf is passed, on its table, directly under the block and then pressed steadily upwards against it, lowered, drawn out, and the superfluous gold rubbed off. The same process is followed in the case of colour blocks, only now the block need not be heated, but is inked by means of a roller for each impression. A separate printing is necessary for each colour. These printings always require great care on the part of the operator, who has to watch the working of each pull very carefully, and if any readjustment is wanted, to make it at once, so that it is difficult to estimate at what rate they can be made. In the matter of gold blocking there must be great care exercised in the matter of the heat of the block, for if it is too hot the gold will adhere where it is not wanted, and if too cool it will not adhere where it is required. Great nicety is also necessary as to the exact pressure required as well as the precise number of moments during which the block should be in contact with the gold, which is fastened to the cloth or leather by means of the solidification by heat of egg albumen. Blocking presses are mainly of German make, but Scottish and English presses are also largely used.

BOOKCASE, an article of furniture, forming a shelved receptacle, usually perpendicular or horizontal, for the storage of books. When books, being written by hand, were excessively scarce, they were kept in small coffers which the great carried about with them on their journeys. As manuscript volumes accumulated in the religious houses or in regal palaces, they were stored upon shelves or in cupboards, and it is from these cupboards that the bookcase of to-day directly descends. At a somewhat later date the doors were, for convenience, sake, discarded, and the evolution of the bookcase made one step forward. Even then, however, the volumes were not arranged in the modern fashion. They were either placed in piles upon their sides, or if upright, were ranged with their backs to the wall and their edges outwards. The band of leather, vellum or parchment which closed the book was then used for the inscription of the title, which was thus on the fore-edge instead of on the back. It was not until the invention of printing had greatly cheapened books that it became the practice to write the title on the back and place the edges inwards. Early bookcases were usually of oak, which is still deemed to be the most appropriate wood for a stately library. The oldest bookcases in England are those in the Bodleian library at Oxford, which were placed in position in the last year or two of the 16th century; in that library are the earliest extant examples of shelved galleries over the flat wall-cases. Long ranges of book-shelves are necessarily somewhat severe in appearance, and many attempts have been made by means of carved cornices and pilasters to give them a more riant appearance—Attempts which were never so successful as in the hands of the great English cabinet-makers of the second half of the 18th century.

Both Chippendale and Sheraton made or designed great numbers of bookcases, mostly glazed with little lozenges encased in fret-work frames often of great charm and elegance. The alluring grace of some of Sheraton's satinwood bookcases has very rarely indeed been equalled. The French cabinet-makers of the same period were also highly successful with small ornamental cases. Mahogany, rosewood, satinwood and even choicer exotic timbers were used; they were often inlaid with marqueterie and mounted with chased and gilded bronze. Dwarf bookcases were frequently finished with a slab of choice marble at the top. In the great public libraries of the 19th century the bookcases are often of iron, as in the British Museum where the shelves are covered with cowhide, of steel, as in the library of Congress at Washington, or of slate, as in the Fitzwilliam library at Cambridge. There are three systems of arranging bookcases-flat against the wall; in "stacks" or ranges parallel to each other with merely enough space between to allow of the passage of a librarian; or in bays or alcoves where cases jut out into the room at right angles to the wall-cases. The stack system is suitable only for public libraries where economy of space is essential; the bay system is not only handsome but utilizes the space to great advantage. The library of the city of London at the Guildhall is a peculiarly effective example of the bay arrangement.

The whole question of the construction and arrangement of bookcases was learnedly discussed in the light of experience by W. E. Gladstone in the Nineteenth Century for March 1890. (J. P.-B.)

BOOK-COLLECTING, the bringing together of books which in their contents, their form or the history of the individual copy possess some element of permanent interest, and either actually or prospectively are rare, in the sense of being difficult to procure. This qualification of rarity, which figures much too largely in the popular view of book-collecting, is entirely subordinate to that of interest, for the rarity of a book devoid of interest is a matter of no concern. On the other hand so long as a book (or anything else) is and appears likely to continue to be easily procurable at any moment, no one has any reason for collecting it. The anticipation that it will always be easily procurable is often unfounded; but so long as the anticipation exists it restrains collecting, with the result that Horn-books are much rarer than First Folio Shakespeares. It has even been laid down that the ultimate rarity of books varies in the inverse ratio of the number of copies originally printed, and though the generalisation is a little sweeping, it is not far from the truth. To triumph over small difficulties being the chief element in games of skill, the
different varieties of book-collecting, which offer almost as many varieties of grades of difficulty, make excellent hobbies. But in its essence the pastime of a book-collector is identical with the official work of the curator of a museum, and thus also with one branch of the duty of the librarian on the theory of respecting a age. Its ultimate function is every library is a literary workshop, with or more or less of a garden or recreation ground attached according as its managers are influenced by the humanities or by a narrow conception of utility. As the library grows, the books and editions which have been the tools of one generation pass out of use; and it becomes largely a depository or storehouse of a stock much of which is dead. But from out of this seemingly dead stock preserved at haphazard, critics and antiquaries gradually pick out books which they find to be still alive. Of some of these the interest cannot be reproduced in its entirety by any mere reprint, and it is this salvage which forms the literary museum. Book-collectors are privileged to leap at once to this stage in their relations with books, using the dealers' shops and catalogues as depositories from which to pick the books which will best fit with the aim or central idea of their collection. For in the modern private collection, as in the modern museum, the need for a central idea must be fully recognized. Neither the collector nor the curator can be content to keep a mere curiosity-shop. It is the collector's business to illustrate his central idea by his choice of examples, by the care with which he describes them and the skill with which he arranges them. In all these he is the amateur, rival, if they do not outstrip, the professional curators and librarians, and not seldom their collections are made with a view to their ultimate transference to public ownership. In any case it is by the zeal of collectors that books which otherwise would have perished from neglect are discovered, cared for and preserved, and those who achieve these results certainly deserve well of the community.

Whenever a high degree of civilization has been attained book-lovers have multiplied, and to the student with his modest allowance this has been a well-nigh inexhaustible source of information. A well-printed copy there has been added a class of owners suspected of caring more for the externals of books than for the enjoyment to be obtained by reading them. But although adumbrations of it existed under the Roman empire and towards the end of the middle ages, book-collecting, as it is now understood, is essentially of modern growth. A glance through what must be regarded as the medieval text-book on the love of books, the Philobiblon, attributed to Richard de Bury (written in 1343), shows that it deals almost exclusively with the delights of literature, and with an author's armchair from which an amateur rival, if they do not outstrip, the professional curators and librarians, and not seldom their collections are made with a view to their ultimate transference to public ownership. In any case it is by the zeal of collectors that books which otherwise would have perished from neglect are discovered, cared for and preserved, and those who achieve these results certainly deserve well of the community.

Whenever a high degree of civilization has been attained book-lovers have multiplied, and to the student with his modest allowance this has been a well-nigh inexhaustible source of information. A well-printed copy there has been added a class of owners suspected of caring more for the externals of books than for the enjoyment to be obtained by reading them. But although adumbrations of it existed under the Roman empire and towards the end of the middle ages, book-collecting, as it is now understood, is essentially of modern growth. A glance through what must be regarded as the medieval text-book on the love of books, the Philobiblon, attributed to Richard de Bury (written in 1343), shows that it deals almost exclusively with the delights of literature, and with an author's armchair from which an amateur rival, if they do not outstrip, the professional curators and librarians, and not seldom their collections are made with a view to their ultimate transference to public ownership. In any case it is by the zeal of collectors that books which otherwise would have perished from neglect are discovered, cared for and preserved, and those who achieve these results certainly deserve well of the community.

What a collector might now call the points of a book other than its fine condition and literary or informational merits. Again, not a few other more or less famous men have been dubbed book-collectors on the score of a scanty shelf-full of volumes known to have been stamped with the personal books of Thomson or Hurd, both from the formation of working libraries and from casual ownership of this latter kind, may perhaps be said to have begun in England at the time of the antiquarian reaction produced by the book-masses when the monasteries were dissolved by Henry VIII., and the university and college libraries and the parish service books were plundered and stript by the commissioners of Edward VI. To rescue good books from perishing is one of the main objects of book-collecting, and when Archbishop Parker and Sir Robert Cotton set to work to gather what they could of the scattered records of English statecraft and literature, and of the decorative art bestowed so lavishly on the books of public and private devotion, they were book-collectors in a sense and on a scale to which few of their modern imitators can pretend. Men of more slender purses, and armed with none of Archbishop Parker's special powers, worked according to their ability on similar lines. Humphrey Dyson, an Elizabethan notary, who collected contemporary proclamations and books from the early English presses, and George Thomason (d. 1666), the bookseller who bought, stored and catalogued all the pamphlet literature of the Civil War, were mindful of the future historians of the days. These many thousands of the 17th century book-collecting was in full swing all over Europe, and much of its apparatus had come into existence. In 1676 book auctions were introduced into England from Holland, and soon we can trace in priced catalogues the beginning of a taste for Caxtons, and the books prized by collectors slowly fought their way up from amid the heavy volumes of theology by which they were at first overwhelmed.

While book-collecting thus came into existence it was rather as an added grace in the formation of a fine library than as a separate pursuit. Almost all the large book-buyers of the 16th, 17th and 18th centuries were men for whom book-collecting was a hobby, and who were rewarded for their zeal by theirtreasures being thought worthy of a public resting-place. Sir Thomas Smith (d. 1577) bequeathed his books to Queens' College, Cambridge; Archbishop Parker's were left under severe restrictions to Corpus Christi College in the same university; Sir Thomas Bodley refounded during his lifetime the university library at Oxford, to which also Laud gave liberally and Selden bequeathed his books. The library of Archbishop Williams went to St John's College, Cambridge; that of Archbishop Usher was bought for Trinity College, Dublin. The small mathematical book-stocks of the learned men of Norfolk (d. 1646), were given by his grandson to the Royal Society; the heraldic collections of Ralph Sheldon (d. 1684) to Heralds' College; the library in which Pepys took so much pleasure to Magdalen College, Cambridge. Bishop Moore's books, including a little volume of Caxton quartos, almost all unique, were bought by George I and presented to the university library at Cambridge. Archbishop Marsh, who had previously bought Stillington's printed books (his manuscripts went to Oxford), founded a library at Dublin. The immense accumulations of Thomas Rawlinson (d. 1725) provided materials for a series of editions, and Harley's printed books were sold to Osbourne the bookseller. But the trend was all towards public ownership. While Richard Rawlinson (d. 1753) allowed his brother's books to be sold, the best of his own were bequeathed to Oxford, and the Harleian MSS. were offered to the nation at a sum far below their value. A similar offer of the great collections formed by Sir Hans Sloane, including some 50,000 printed books, together with the need for taking better care of what remained of the Cotton manuscripts, vested in trustees for public use in 1702 and partially destroyed by fire in 1732, led to the formation of the British Museum in 1753, and this on its opening in 1757 was almost immediately enriched by George II's gift of the old royal library, formed by the kings and queens of England from Henry VII. to Charles II., and by George, Prince of Wales, son of James I., who had bought the books belonging to Archbishop Cranmer and Lords Arundel and Lumley. A few notable book-
BOOK-COLLECTING 223

buyers could not afford to bequeath their treasures to libraries, e.g. Richard Smith, the secondary of the Poultrey Compters (d. 1675), at whose book-sale (1682) a dozen Caxtona sold for from 2s. to 18s. aplece, Dr Francis Bernard (d. 1689), Narcissus Luttrell(d. 1732) and Dr Richard Mead (d. 1744). At the end of the scale, in the ears of Sunderland (d. 1727) and Pembroke (d. 1733), we have early examples of the attempts, seldom successful, of book-loving peers to make their libraries into permanent heritums. But as has been said, the drift up to 1760 was all towards public ownership, and the libraries were for the most part general in character, though the interest in typographical antiques was already well marked.

When George III., came to the throne he found himself bookless, and the magnificent library of over 60,000 books and pamphlets and 440 manuscripts which he accumulated shows on a large scale the catholic and literary spirit of the book-lovers of his day. As befitted the library of an English king it was rich in English classics as well as in those of Greece and Rome, and the typographical first-fruits of Mainz, Rome and Venice were balanced by numerous works from the first presses of Westminster, London and Oxford. This noble library passed in 1823 to the British Museum, which had already received the much smaller but carefully chosen collection of the Rev. C. M. Cracherode (d. 1799), and in 1834 it was further enriched by the library formed by Thomas Grenville, the last of its great book-loving benefactors, who died in that year, aged ninety-one. A few less wealthy men had kept up the old public-spirited tradition during George III.'s reign, Garrick bequeathing his fine collection of English plays and Sir Joseph Banks his natural history books to the British Museum, while Capell's Shakespearean treasures enriched Trinity College, Cambridge, and those of Malone went to the Bodleian Library at Oxford, the formation of these special collections, in place of the large general library with a sprinkling of rarities, being in itself worth noting. But the noble book-buyers celebrated by the Rev. Thomas Foggshall Dibdin in his numerous bibliographical works kept mainly on the old lines, though with aims less patriotic than their predecessors. The duke of Roxburghe's books were sold in 1812, and the excitement produced by the auction, more especially by the competition between Lord Spencer and the duke of Marlborough (at that time marquess of Blandford) for an edition of Boccaccio printed by Valdarfer at Venice in 1473, led to the formation of the Roxburghe Club at a commemorative dinner. In 1819 the duke of Marlborough's books were sold to the Boccaccio for which he had paid £2,060 to Earl Spencer (d. 1834) for £750, to pass with the rest of his rare books to Mrs Rylands in 1892, and by her gift to the John Rylands library at Manchester in 1899. The books of Sir M. M. Sykes were sold in 1824, whose J. B. Inglin in 1826 (after which he collected again) and those of George Hibbert in 1829. The 15,000 volumes brought together by Richard Heber at an expense of about £100,000 were disposed of by successive sales during the years 1833-1837 and realized not much more than half their cost. The wonderful library of William Beckford (d. 1844), especially rich in fine bindings, bequeathed to his daughter, the duchess of Hamilton, was sold in 1882, with the Hamilton manuscripts, for the most part to the German government. Their dispersal was preceded in 1881 by that of the Sunderland collection, already mentioned. The library of Brian Fairfax (d. 1740), which had passed to the heirs of the earls of Jersey, was sold in 1885, that of Sir John Tholord (d. 1815) in 1884, his Gutenberg ' Bible fetching £3,000 and his Mainz Psalter £420. The Drachs collection of manuscripts formed by Sir Thomas Phillips (d. 1872) has furnished materials for numerous sales. The printed books of the earl of Ashburnham (d. 1878) kept the auctioneers busy in 1897 and 1898; his manuscripts were sold, some to the British government (the Stowe collection shared between the British Museum and Dublin), the German government (part of the Libri and Barrois collection, all save one MS. of 13th century German ballads, resold to France), the Italian government (the rest of the Libri collection Mr Yates Thompson (the MSS. known as the Appendix) and Mr J. Pierpoint Morgan (the Lindau Gospels). The collections formed by Mr W. H. Miller (d. 1848, mainly English poetry), the duke of Devonshire (d. 1858) and Mr Henry Huth (d. 1878), are still intact.

Among the book-buyers of the reign of George III., John Ratcliffe, an ex-coal-merchant, and James West had devoted themselves to the purchase of special sets of the works of Shakespeare and the latter 48 and the latter 34) and the products of other early English presses. The collections of Capell and Garrick were also small and homogeneous. Each section, moreover, of some of the great libraries that have just been enumerated might fairly be considered a collection in itself, the union of several collections in the same library being made possible by the wealth of their purchaser and the small prices fetched by most classes of books in comparison with those which are now paid. But perhaps the modern cabinet theory of book-collecting was first carried out with conspicuous skill by Henry Perkins (d. 1855), whose 865 fine manuscripts and specimens of early printing, when sold in 1870, realized nearly £26,000. If surrounded by a sufficient quantity of general literature the collection might not have seemed noticeably different from some of those already mentioned, but the growing cost of books, together with difficulties as to house-room, combined to discourage miscellaneous buying on a large scale, and what has been called the " cabinet," " theory of collecting, so well carried out by Henry Perkins, became increasingly popular among book-buyers, alike in France, England and the United States of America. Henri Béraud, in his catalogue of his own collection (printed 1892), has described how in France a little band of book-loving amateurs grew up who laughed at the bibliophile de la vieille roche as they disrespectfully called their predecessors, and prided themselves on the unity and compactness of their own treasures. In place of the miscellaneous library in which every class of book claimed to be represented, and which needed a special room or gallery to house it, they aimed at small collections which should epitomize the owner's tastes and require nothing bulkier than a neat bookcase or cabinet to hold them. The French bibliophiles whom M. Béraud celebrated applied this theory with great success to collecting the dainty French illustrated books of the 18th century which were their especial favourites. In England Richard Fisher treated his fine examples of early book-illustration as part of his collection of engravings, etchings and woodcuts (illustrated catalogue printed 1870), and Frederick Locker (Locker-Lampson) formed in two small bookcases such a gathering of first editions of English imaginations literature as to attract the attention of it (printed in 1836) produced the effect of a stately and picturesque procession. Some of the book-boards of previous generations could have spared the equivalent of the Locker collection without seeming noticeably the poorer, but the compactness and unity of this small collection, in which every book appears to have been bought for a special reason and to form an integral part of the whole, gave it an artistic individuality which was a pleasant triumph for its owner, and excised so much interest among American admirers of Mr Locker's poetry that it may be said to have set a fashion. As another example of the value of a small collection, both for delight and for historical and artistic study, mention may be made of the little roomful of manuscripts and incunabula which William Morris brought together to illustrate the history of the bookish arts in the middle ages before the Renaissance introduced new ideals. Many living collectors are working in a similar spirit, and as this spirit spreads the monotony of the old libraries, in which the same editions of the same books recurred with wearisome frequency, should be replaced by much greater individuality and variety. Moreover, if they can be grouped round some central idea cheap books may yield just as good sport to the collector as expensive ones, and the collector of quite modern works may render admirable service to posterity. The only limitation is against books specially manufactured to attract him, or artificially made rare. A quite wholesome interest in contemporary first editions was brought to nought about 1880 by the booksellers beginning to hoard copies of Browning's Asolando and Mr Lang's Blue Fairy Book on the day of publication, while a graceful but quite minor poet was made ridiculous by being asked for a set of his privately printed opuscula. The
petty gambling in books printed at the Kelmscott and Doves' presses, and in the fine paper copies of a certain Life of Queen Victoria, for which a premium of 250% was asked before publication, is another proof that until the manufacturing stage is over collecting cannot safely begin. But with this exception the field is open, and the 19th century offers as good a hunting ground as any of its predecessors.

While book-collecting may thus take an endless variety of forms the heads under which these may be grouped are few and fairly easily defined. They may be here briefly indicated together with some notes as to the literature which has grown up round them. The development which bibliographical literature has taken is indeed very significant of the changed ideals of collectors. Brunet's Manuel du libraire, first published in 1810, attained its fifth edition in 1860-1864, and has never since been re-edited (supplement, 1878-1880). The Bibliographer's Manual of English Literature by W. T. Lowndes, first published in 1834, was revised by H. G. Bohn in 1837-1864, and of this also no further edition has been printed. These two works between them gave all the information the old-fashioned collectors required, the Trésor de lettres rares et précieux by J. G. T. Graesse (Dresden, 1839-1867, supplementary volume in 1860) adding little to the information given by Brunet. The day of the omnivorous collector being past, the place of these general manuals has been taken by more detailed bibliographies and handbooks on special books, and though new editions of both Lowndes and Brunet would be useful, no book-seller nor publisher has had the courage to produce them.

To attract a collector a book must appeal to his eye, his mind or his imagination, and many famous books appeal to all three. A book may be beautiful by virtue of its binding, its illustrations or the simple perfection and harmony of its print and paper. The attraction of a fine binding has always been felt in France, the high prices quoted for Elzevirs and French first editions being often due much more to their 17th and 18th century jackets than to the books themselves. The appreciation of old bindings has greatly increased in England since the exhibition of them at the Burlington Fine Arts Club in 1891 (illustrated catalogue printed the same year), English blind stamped bindings, embossed bindings, and bindings attributable to Samuel Mearne (temp. Charles II) being much more sought after than formerly. (See Bookbinding.) Illustrated books of certain periods are also much in request, and with the exception of a few which early celebrity has prevented becoming rare have increased inordinate in price. The primitive woodcuts in Incunabula are now almost too highly appreciated, and while the Nuremberg Chronicle of 1493 seldom fetches more than £50 or the Hypnerotomachia Poliphili (Venice, 1499) more than £120, rarer books are priced in hundreds. The best books on the subject are: for Italy, Lippmann's Wood Engraving in Italy in the 15th Century (1888), Kristeller's Early Florentine Woodcuts (1897), the duc de Rivoli's (Prince d'Essling) Bibliographie des livres à figures ténues 1490-1525 (1892, new edition 1906); for Germany, Muther's Die deutsche Bücherillustration der Gotik und Frührenaissance (1884); for Holland and Belgium, Sir W. M. Conway's The Woodcutters of the Netherlands in the 15th Century (1883); for France, Lippmann's material will all be found in Claudin's Histoire de l'imprimerie en France (1900, &c.). Some information on the illustrated books of the early 16th century is given in Butsch's Die Bücherornamentik der Renaissance (1878), but the pretty French books of the middle of the century and the later Dutch and English copper-engraved book illustrations (for the latter see Colvin's Early Engraving and Engravers in England, 1905) have been imperfectly appreciated. This cannot be said of the French books of the 18th century chronicled by H. Cohen, Guide de l'amateur de livres à gravures du XVIIIe siècle (5th ed., 1886), much of the same information, with a little more about English books, being given in Lewine's Bibliography of Eighteenth Century Art and Illustrated Books (1898). English books with coloured illustrations, for which there has arisen a sudden fashion, are well described in Martin Hardie's English Colour Books (1906). Bewick's work has been described by Mr Austin Dobson.

Appreciation of finely printed books has seldom extended much beyond the 15th century. In addition to the works mentioned in the article on incunabula (q.v.) note may be made of Humphrey's Masterpieces of the Early Printers and Engravers (1870), while Lippmann's Druckschriften des XV bis XVIII Jahrhunderts (1884-1887) covers, though not very fully, the later period. Among books which other than intellectual appeal to the collectors may be classed all works of history here whose collector have not been reprinted, or of which the original editions are more authentic, or convincing, than modern reprints. It is evident that these cover a vast field, and that the collector in taking possession of any corner of it is at once the servant and rival of historical students. Lord Crawford's vast collections of English, Scottish and Irish proclamations and of papal bulls may be cited as capital instances of the work which a collector may do for the promotion of historical research, and the philological library brought together by Prince Lucien Bonaparte (An Attempt at a Catalogue by V. Collins, published 1854) and the Foxwell collection of early books on political economy (presented to the university of London by the Goldsmiths' Company) are two other instances of recent date. Much collecting of this kind is now being carried on by the libraries of institutes and societies connected with special professions and studies, but there is ample room also for private collectors to work on these lines.

Of books which appeal to a collector's imagination the most fabulous examples are those which can be associated with some famous person or event. A book which has belonged to a king or queen (more especially one who, like Mary queen of Scots, has appealed to popular sympathies), or to a great statesman, soldier or poet, which bears any mark of having been valued by him, or of being connected with any striking incident in his life, has an interest which defies analysis. Collectors themselves have a natural tenderness for their predecessors, and a copy of a famous work is all the more regarded if its pedigree can be traced through a long series of book-loving owners. Hence the production of such works as Great Book Collectors by Charles and Mary Elton (1893), English Book-Collectors by W. Y. Fletcher (1902) and Guignard's Nouvel armorial du bibliophile (1899). Books condemned to be burnt, or which have caused the persecution of their authors, have an imaginative interest of another kind, though one which seems to have appealed more to writers of books than to collectors. As has already been noted, most of the books specially valued by collectors make a double or triple appeal to the collecting instinct, and the desire to possess first editions may be accounted for partly by their positive superiority over reprints for purposes of study, partly by the associations which they can be brought to bear for the collector himself for them. The value set on them is at least to some extent fanciful. It would be difficult, for instance, to justify the high prices paid by collectors of the days of George III, for the first printed editions of the Greek and Latin classics. With few exceptions these are of no value as texts, and there are no possible associations by which they can be linked with the personality of their authors. It may be doubted whether any one now collects them save as specimens of printing, though no class of book which once has been prized ever sinks back into absolute obscurity. On the other hand, the prestige of the first editions of English and French literary masterpieces has immensely increased. A first folio Shakespeare (1623) was in 1906 sold separately for £3,000, and the MacGeorge copies of the first four folios (1623, 1632, 1663-1664 and 1685) fetched collectively the high price of £10,000. The quarto editions of Shakespeare plays have appreciated even more, several of these little books, once sold at 6d. apiece, having fetched over £10,000, while the unknown and unique copy of the 1594 edition of Titus Andronicus, discovered in Sweden, speedily passed to an American collector for £3,000. Information as to early editions of any kind of English books will be found in Lowndes' Bibliographer's Manual, in Hazlitt's Handbook to the Popular Poetical and Dramatic Literature of Great Britain from the Invention of Printing to the Restoration
BOOK-KEEPING

(1867) and his subsequent Collections and Notes (1876-1903), and as to more recent books in Slater’s Early Editions, a bibliographical survey of the works of some popular modern authors, (1894), while French classics have founded an excellent chronicle in Jules Le Petit (Bibliographie des principales editions originales d’écrivains français du XV* au XVIII* siècle, 1888).

In most cases there is a marked falling off in the interest with which the different books are regarded, and consequently in the prices paid for them, though important changes in the text give to the edition in which they first occur some shadow of the prestige attaching to an original issue. One of the recognized byways of book-collecting, however, used to be the collection of as many editions as possible of the same work. When this result in the acquisition of numerous late editions of no value for the text its only usefulness would appear to be the index it may offer to the author’s popularity. But in translations of the Bible, in liturgical works, and in editions published during the author’s life the aid offered to the study of the development of the final text by a long row of intermediate editions may be very great.

Another instance in which imagination reinforces the more positive interest a book may possess is in the case of editions which can be connected with the origin, diffusion or development of printing. Piety suggests that book-lovers should take a special interest in the history of the art which has done so much for their happiness, and in this respect they have mostly shown themselves religious. The first book printed in any town is usually buried by local antiquities, and the desire to measure the amount and quality of the work of every early printer has preserved the thousands of books which would otherwise have perished. (See INCUNABULA.)

The financial side of book-collecting may be studied in Slater’s Book-Prices Current, published annually since 1887, and in Livingston’s American Book Prices Current, and in the same author’s Auction Prices of Books (1902). While largely influenced by fashion the prices given for books are never wholly unreasonable. They are determined, firstly by the positive or associative interest which can be found in the book itself, secondly by the infrequency with which copies come into the market compared with the number and wealth of their would-be possessors, and thirdly, except in the case of books of the greatest interest and rarity, by the condition of the copy offered in respect to completeness, size, freshness and absence of stains. (A. W. Po.)

BOOK-KEEPING, a systematic record of business transactions, in a form conveniently available for reference, made by individuals or corporations engaged in commercial or financial operations with a view to enabling them with the minimum amount of trouble and of duplication to the business itself, to measure at any time (1) the detailed particulars of the transactions undertaken, and (2) the cumulative effect upon the business and its financial relations to others. Book-keeping, sometimes described as a science and sometimes as an art, partakes of the nature of both. It is not so much a discovery as a growth, the crude methods of former days having been gradually improved to meet the changing requirements of business, and this process of evolution is still going on. The ideal of any system of book-keeping is the maximum of record combined with the minimum of labour, but as dishonesty has to be guarded against, a fraudulent nature of book-keeping can be regarded as adequate which does not enable the record to be readily verified as a true and complete statement of the transactions involved. Such a verification is called an audit, and in the case of public and other large concerns is ordinarily undertaken by professional accountants (q.v.). Where the book-keeping staff is large it is usually organized so that its members, to some extent at least, check each other’s work, and to that extent an audit, known as a “staff audit” or “internal check,” is frequently performed by the book-keeping staff itself.

Formerly, when credit was a considerably less important factor than now in commercial transactions, book-keeping was frequently limited to an account of receipts and payments of money; and in early times, before money was in use, to an account of the receipt and issue of goods of different kinds. Even now what may be called the “cash system” of accounts is almost exclusively used by governments, local authorities, and charitable and other institutions; but in business it is equally necessary to record movements of credit, as a mere statement of receipts and payments of money would show only a part of the total number of transactions undertaken. As for practical purposes some account must be placed upon the movements of transactions, certain classes show only a record of cash receipts and payments, which must, when it is desired to ascertain the actual position of affairs, be adjusted by bringing into account the transactions which have not yet been completed by the receipt or payment of money. For instance, it is usual to charge customers with goods sold to them at the date when the sale takes place, and to give them credit for the amount received in payment upon the date of receipt (thus completely recording every phase of the transaction as and when it occurs); but in connexion (say) with wages it is not usual to give each workman credit for the services rendered by him from day to day, but merely to charge up the amounts, when paid, to a wages account, which thus at any date only shows the amounts which have actually been paid, and takes no cognisance of the sums accruing due. When, therefore, it is desired to ascertain the actual expenditure upon wages for any given period, it is necessary to allow for the payments made during that period in respect of work previously performed, and to add the value of work performed during the current period which remains unpaid.

In the majority of businesses these accounts which deal with various forms of standing expenses are thus dealt with, and in consequence the record, as it appears from day to day, is pro tanto incomplete. Another very important series of transactions which is not included in the ordinary day-to-day record is that representing the loss gradually accruing by reason of waste, or depreciation, of assets or general equipment of the business; proper allowance for these losses must of course be made whenever it is desired to ascertain the true position of affairs.

The origin of book-keeping is lost in obscurity, but recent researches would appear to show that some method of keeping accounts has existed from the remotest times. Babylonian records have been found dating back as far as 2600 B.C., written with a stylus on small slabs of clay, and it is of interest to note (Records of the Past, xi. 80) that these slabs or tablets “usually contain impressions from cylinder seals, and nail marks, which were considered to be a man’s natural seal,” thus showing that the modern method of identifying criminals by finger prints had its counterpart in Babylonia some 4500 years ago. Egyptian records were commonly written on papyrus and tablets, and the earliest book-keeping shows that accounting was used to keep an account of the quantities of grain brought into and removed from the government store-houses. It will thus be seen that some form of book-keeping existed long before bound books were known, and therefore the more general term accounting would seem to be preferable—the more so as the most modern developments are in the direction of again abandoning the bound book in favour of loose or easily detached sheets of paper or card, thus capable of being rearranged as circumstances or convenience may dictate. Most of the earlier accounting records are in the nature of a mere narrative of events, which, being complete in itself—failed to fulfill the second requirement of an adequate system of book-keeping already referred to. Prior to the use of money nothing in this direction could of course well be attempted; but for a long time after its employment became general money values were recorded in Roman figures, which naturally did not lend themselves to ready calculation.

At the present time it may be generally stated that all book-keeping records are kept in three distinct columns, dealing respectively with the date of the transaction, its nature, and its money value. The earliest extant example of accounts so kept is probably a ledger in the Advocates’ library at Edinburgh, dated 1697, which, it is of interest to note, is ruled by hand. Prior to that time, however, double-entry book-keeping had been in general use. The exact date of its introduction is unknown; but it was certainly not, as has been frequently stated, the
invention of Lucas de Borgo, in or about 1494. This, however,
is the date of the first issue (at Venice) of a printed book entitled
Everything about Arithmetic, Geometry and Proportion, by Luca
Paciolo, which contains inter alia an explanation of book-keeping
by double-entry as then understood; but in all probability,
the system had then been in use for something like 200 years.
It is perhaps unfortunate that from 1494 until comparatively
recent times the literature of accounting has been provided
therefor by theorists and students, rather than by practical business men, and
it may well be doubted, therefore, whether it accurately describes
contemporary procedure. Another illusion which it is necessary
to expose in the interests of truth is the value attached to
Jones's English System of Book-keeping by Single or Double
Entry, published at Bristol in 1796. Before publishing this
book, E. T. Jones issued a prospectus, stating that he had
patented an entirely new and greatly improved system, and that
subscribers (at a guinea a copy) would be entitled to a special
licensure empowering them to put the new invention into practice
in their own book-keeping. With this bait he secured thousands
of subscribers, but so far as can be gathered his system was
entirely without merit, and it is chiefly of interest as indicating
the value, even then, of advertising.

It is impossible here to describe fully all the improvements
that have been made in methods of accounting during recent
years, but it is proposed to deal with the more important
of these improvements, after the general principles upon which all systems of
book-keeping are based have been briefly described.

The centre of all book-keeping systems is the
ledger, and it may be said that all other books are
only kept as a matter of practical convenience—
hence the name "subsidiary books" that is
frequently applied thereto. Inasmuch, however, as
the transactions are first recorded in these sub-
sidiary books, and afterwards classified therefrom
into the ledger, the names books of entry or books of
first entry are often employed. Subsidiary books
which do not form the basis of subsequent entries
into the ledger, but are merely used for statistical
purposes, are known as statistical or auxiliary books.
In the early days of book-keeping the ledger com-
prised merely those accounts which it was thought
desirable to keep accessible, and was not a complete
record of all transactions. Thus in many instances
records were only kept of transactions with other
business houses, known as personal accounts. In the earliest
examples transactions tending to reduce indebtedness were
recorded in order of date, as they occurred underneath
transactions recording the creation of the indebtedness; and the
amount of the reduction was subtracted from the sum
of the indebtedness up to that date. This method was found to
be inconvenient, and the next step was to keep one
account of the transactions recording the creation of indebted-
ness and another account (called the contra account) of those
transactions reducing or extinguishing it. For convenience
these two accounts were kept on opposite sides of the ledger,
and thus was evolved the Dr. and Cr. account as at present
in general use:—

<table>
<thead>
<tr>
<th>Dr. A.B.</th>
<th>Contra. Cr.</th>
</tr>
</thead>
<tbody>
<tr>
<td>£ s. d.</td>
<td>£ s. d.</td>
</tr>
</tbody>
</table>

In this form of account all transactions creating indebtedness
due from the person named therein to the business—that is to
say, all benefits received by that person from the business—are
recorded upon the left-hand, or Dr. side, and per contra all
transactions representing benefits imparted by him, giving
rise to a liability on the part of the business, are recorded
upon the Cr. side. The account may run on indefinitely,
but as a matter of convenience is usually ruled off each time
all indebtedness is extinguished, and also at certain periodical
intervals, so that the state of the account may then be readily
apparent.

A mere collection of personal accounts is, however, obviously a
very incomplete record of the transactions of any business,
and does not suffice to enable a statement of its financial
position to be prepared. So at an early date other
accounts were added to the ledger, recording the acquisition
of and disposal of different classes of property, such accounts being generally known as real accounts.
These accounts are kept upon the same principle as personal
accounts, in that all expenditure upon the part of the business
is recorded upon the Dr. side, and all receipts upon the Cr. side;
the excess of the debit entries over the credit entries thus showing
the value placed upon those assets that still remain the property
of the business. With the aid of personal and real accounts
properly written up to date, it is possible at any time to prepare a statement of assets and liabilities showing the financial
position of a business, and the following is an example of such a
statement, which shows also how the profit made by the business
may be thus ascertained, assuming that the financial position
at the commencement of the current financial period, and the
movements of capital into and out of the business during the
period, are capable of being ascertained.

The method of accounting hitherto described represents
single-entry accounts, which—albeit manifestly incomplete—is still very
generally used by small business houses, and particularly by
retail traders. Its essential weakness is that it provides no auto-
matic check upon the clerical accuracy of the record, and,
should any mistake be made in the keeping of the books, or in
the extraction therefrom of the lists of assets and liabilities,
the statement of assets and liabilities and the profit or loss of the
current financial period, will be incorrect to an equal extent.
It was to avoid this obvious weakness of single-entry that the
system of double-entry was evolved.

The essential principle of double-entry is that it constitutes
a complete record of every business transaction, and as
these transactions are invariably cross-dealings—involving
simultaneously the receipt of a benefit by some one
and the imparting of a benefit by some one—a complete
record of transactions from both points of view necessitates an
entry of equal amount upon debit and credit sides of the ledger.
Hence it follows that, if the clerical work be correctly performed,
the aggregate amount entered upon the debit side of the ledger
must at all times equal the aggregate amount entered upon
the credit side; and thus a complete list of all ledger balances
will show an agreement of the total debit balances with the total
credit balances. Such a list is called a trial balance, an example
of which is given below. It should be observed, however, that
the test supplied by the trial balance is a purely mechanical
one, and does not prove the absolute accuracy of the ledger as
BOOK-KEEPING

227

a record of transactions. Thus transactions which have actually taken place may have been omitted from the books altogether, or they may have been recorded to the wrong accounts, or the money values attached to them may be incorrect; or, yet again, fictitious records may be entered necessary to introduce into the ledger a third class of accounts, known as impersonal or nominal accounts. These accounts record the transferences of money, or of money’s worth, which, so far from representing mere reshuffling of assets and liabilities, involve an increase in or a reduction of the amount invested in the business, i.e. a profit or a loss. Transactions representing profits are recorded upon the Cr. side of nominal accounts, and those representing losses (including expenses) upon the Dr. side. This is consistent with the rules already laid down in connexion with real and nominal accounts, inasmuch as expenditure which does not result in the acquisition of an asset is a loss, whereas receipts which do not involve the creation of liabilities represent profits. All debit balances therefore that are not assets are losses, and per contra all credit balances that are not liabilities are profits. So that, inasmuch as double-entry provides inter alia a complete statement under suitable headings of all profits and all losses, it is possible by aggregating these results to deduce therefrom the net profit or loss of carrying on the business — and that by a method entirely distinct from that previously described in connexion with single-entry, thus constituting a valuable additional check. Taking the trial balance shown above, the following represent the trading account, profit and loss account, and balance sheet compiled therefrom. The trading account may be variously regarded as the account recording the movements of goods which represent the stock-in-trade, and as a preliminary to (or a subdivision of) the profit and loss account. The balance sheet is a statement of the assets and liabilities; but—inasmuch as, by transferring the balance of the profit and loss account to the capital account, it is possible to bring the latter account up to date and to show the credit balance representing the surplus of assets over liabilities to date—the balance sheet, instead of showing a difference, or a "balance," representing what is assumed to be the amount of the capital to date, shows an absolute aggregate of assets upon the one hand and of liabilities plus capital upon the other. The two sides of the account thus balance—hence the name.

in the ledger of transactions which have never taken place. A **trial balance** is thus no very adequate safeguard against fraud, nor does it bring to light mistakes in the monetary value attaching to the various transactions recorded. This last point is of especial importance, in that the monetary value of transactions may have been correctly recorded in the first instance, but owing to altered circumstances may have become inaccurate at a later date. This of course means that the altered circumstances constitute an additional "transaction" which has been omitted. It will be observed, therefore, that in order to complete the record of the transactions by double-entry, it has become necessary to introduce into the ledger a third class of accounts, known as impersonal or nominal accounts. These accounts record the transferences of money, or of money’s worth, which, so far from representing mere reshuffling of assets and liabilities, involve an increase in or a reduction of the amount invested in the business, i.e. a profit or a loss. Transactions representing profits are recorded upon the Cr. side of nominal accounts, and those representing losses (including expenses) upon the Dr. side. This is consistent with the rules already laid down in connexion with real and nominal accounts, inasmuch as expenditure which does not result in the acquisition of an asset is a loss, whereas receipts which do not involve the creation of liabilities represent profits. All debit balances therefore that are not assets are losses, and per contra all credit balances that are not liabilities are profits. So that, inasmuch as double-entry provides inter alia a complete statement under suitable headings of all profits and all losses, it is possible by aggregating these results to deduce therefrom the net profit or loss of carrying on the business — and that by a method entirely distinct from that previously described in connexion with single-entry, thus constituting a valuable additional check. Taking the trial balance shown above, the following represent the trading account, profit and loss account, and balance sheet compiled therefrom. In the foregoing example the customary method has been followed of deducting withdrawals of capital from the capital account and of adding profits thereto. Sometimes, however, the balance of the capital account remains constant, and the drawings and net profits are transferred to a separate account called the current account. This plan is but rarely observed in the case of undertakings owned by individuals, or private firms, but is invariably adopted in connexion with joint-stock companies, although in such cases the name appropriation of profit account is generally employed.

Although it is now usual to employ several books of first-entry, in the case of comparatively small businesses one such book is sufficient for all purposes, in that it is practicable for one person to record all the transactions that take place as and when they occur. A book of this description is called the journal, and for many years represented the only book of first-entry employed in book-keeping. An example of the journal is given below. The entries appearing therein are such as would be necessary to prepare the trading and profit and loss accounts from the trial balance shown above, and to bring the capital account up to date.

In modern times, however, with the growth of business, it was soon found impracticable to keep one book of first-entry for all transactions, and accordingly it became necessary either to treat the journal as an intermediate book, in which the transactions might be brought together and focused as a preliminary to being recorded in the ledger, or else to split up the journal into numerous books of first-entry, each of which might in that case be employed for the record of a particular class of transaction.

The first method has been generally adopted in the continental countries of Europe, as will be shown later on, whereas in Great Britain and in North America the latter method more generally obtains; that is, instead of having one journal in which all classes of transactions are recorded in the first instance, it is usual to employ several journals, as follows: - a sales journal, sales book or day book, to record particulars of goods sold; a bought goods journal, of a third column for discounts the necessity of keeping an additional book of first entry as a discount journal may also be avoided. Of late years, however, most businesses pay all money received into their bankers without deduction, and pay all accounts by cheque; the necessity of an account for office cash thus no longer exists, save in connexion with petty payments, which are recorded in a separate book called the petty cash book.

With regard to the remaining ledger accounts, personal accounts—which are the most numerous—are frequently separated from the real and nominal accounts, and are therefore subdivided so that customers' accounts are kept separate from the accounts of trade creditors. The customers' accounts are kept in a ledger (or, if need be, in several ledgers) called sales ledgers, or sold ledgers; while the accounts of trade creditors are similarly kept in purchases ledgers or bought ledgers. The nominal and real accounts, if together, are kept in what is called the general ledger; but this may be further subdivided into a nominal ledger and a private ledger. This last subdivision is, however, rarely made upon a scientific basis, for such accounts as the profit and loss account and trading account are generally kept in the private ledger although strictly speaking nominal accounts; while the bills receivable account and the bills payable account are generally kept in the nominal ledger, so as to reduce to a minimum the amount of clerical work in connexion with the private ledger, which is kept either by the principal himself or by his confidential employee. By the employment of adjustment accounts, which complete the double-entry record in each ledger, these various ledgers may readily be made self-balancing, thus enabling clerical errors to be localized and responsibility enforced.

Of recent years considerable attention has been devoted to further modifications of book-keeping methods with a view to reducing clerical work, increasing the speed with which results are available, and enabling them to be handled more quickly.

invoice book or purchases book, to record particulars of goods purchased; a returns inwards book, to record particulars of goods sold but subsequently returned by customers; a returns outwards book, to record the like particulars with regard to goods purchased and subsequently returned; a bills receivable book, to record particulars of bills of exchange received from debtors; and a bills payable book, to record particulars of bills of exchange given to creditors.

With a view still further to split up the work, thus enabling a large staff to be simultaneously engaged, the ledger itself is now generally kept in sections. Thus the cash account and the bank account are frequently bound together in one separate book called the cash book, showing in parallel columns the movements of office cash and of cash at the bank, and by the addition
and with greater certainty. *Tabular book-keeping* is a device to achieve one or more of these ends by the substitution of books ruled with numerous columns for the more usual form. The system may be applied either to books of first entry or to ledgers. As applied to books of first entry it enables the same book to deal conveniently with more than one class of transaction; thus if the trading of a business is divided into several departments, by providing a separate column for the sales of each depart-

...ment it is possible readily to arrive at separate totals for the aggregate sales of each, thus simplifying the preparation of *departmental trading accounts*. As applied to ledgers, the application of the system may be best described by the aid of the above example (the proceedings of the columns being given only), which shows how a very large number of personal accounts may be recorded upon a single opening of a ledger provided the number of entries to be made against each individual be few.

![Fig. 1.—Card-Ledger Tray (Library Bureau System).](image)

Another important application of modern methods consists of what may be described as the *slip system*, which is in many respects a reversion to the method of keeping records upon movable slabs or tablets, as in the Babylonian accounts referred to at the beginning of this article. This system may be applied to books of first-entry, or to ledgers, or to both. As applied to books of first-entry it aims at so modifying the original record of the transaction—whether it represents an invoice for goods sold or an acknowledgment given for money received—that a facsimile duplicate may be taken of the original entry by the aid of a carbon sheet, which instead of being immovably bound up in a book is capable of being handled separately and placed in any desired order or position, and thus more readily recorded in the ledger. Postings are thus made direct from the original slips, which have been first sorted out into an order convenient for that purpose, and afterwards re-sorted so that the total sales of each department may be readily computed; after which they are filed away in a form convenient for reference. Sometimes the process is carried a step further, and the original slips, filed away with suitable guide-cards indicating the nature of the account, themselves constitute the ledger record—which in such cases is to be found scattered over a number of sheets, one for each transaction, instead of, as in the case of the ordinary book ledger, a considerable number of transactions being recorded upon a single page. This adaptation of the slip system is impracticable except in cases where the transactions

![Fig. 2.—Loose-Leaf Ledger (Library Bureau System).](image)

...card and bound ledgers. It consists of a number of sheets in book form, so bound as to be capable of being readily separated when desired. The loose-leaf ledger thus embraces most of the advantages of the card ledger, while remaining sufficiently like the more old-fashioned book ledger as to enable it to be readily handled by those whose previous experience has been confined to the latter. Both the card and loose-leaf systems will be frequently found of value for records in connexion with cost and stores accounts, quite irrespective of their advantages in connexion with the book-keeping records pure and simple of certain businesses.

All book-keeping methods rest upon the same fundamental principles, but their development in practice in different countries is to some extent influenced by the manner in which business is there conducted, and by the legislative requirements imposed by the several states. In France traders are required by the Code of Commerce to keep three books—a journal, an inventory and a letter book, somewhat elaborate provisions being made to identify these books, and to prevent substitution. The compulsory journal makes the employment of numerous books of first-entry impossible without an undesirable amount of duplication, and wherever
this provision obtains the book-keeping methods in an accordingly comparatively backward state. The inventory book comprises periodical lists of ledger balances and the balance sheet, records which are invariably kept under every adequate system, although not always in a book specially set aside for that purpose. In Germany the statutory requirements are similar to those in France, save that the journal is not compulsory; but there is an additional provision that the accounts are to be  bookbound books with the pages numbered consecutively—a requirement which makes the introduction of card or loose-leaf ledgers of doubtful legality. A balance sheet must be drawn up every year; but where a stock-in-trade is from its nature or its size difficult to take, it is sufficient for an inventory to be taken every two years. In Belgium the law requires every merchant to keep a journal recording his transactions from day to day, which (with the balance book) must be initialed by a prescribed officer. All letters and telegrams received, and copies of all such sent, must be preserved for ten years. The Commercial Code of Spain requires an inventory, journal, ledger, letter book and invoice book to be kept; while that of Portugal prescribes the use of a balance book, journal, ledger and copy-letter book. The law of Holland requires business men to keep books in which are correctly recorded their commercial transactions, letters received and copies of letters sent. It also provides for the preparation of an annual balance sheet. The law of Rumania makes the employment of journal, inventory book and ledger compulsory, a small tax per page being charged on the two first named. There are no special provisions as to book-keeping contained in the Russian law, nor in the United States laws, but in Russia public companies have to supply the government with copies of their annual accounts, which are published in a state newspaper, and in the United States certain classes of companies have to submit their accounts to an official audit. In general terms it may be stated that at the present time the employment of card and loose-leaf ledger systems is more general in the United States than in Great Britain.

Apart from the organizations of professional accountants, there is none of note devoted to the scientific study of book-keeping other than purely educational institutions. Among the universities those in the United States were the first to include accounting as part of their curriculum; while in Great Britain the London School of Economics (university of London), the university of Birmingham, and the Victoria University of Manchester have, so far, alone treated the subject seriously and upon adequate lines. Quite recently Japan has been making a movement in the same direction, and other countries will doubtless follow suit. In England there have for a number of years past been various bodies—such for instance as the Society of Arts, the London Chamber of Commerce and Owens College, Manchester—which hold examinations in book-keeping and grant diplomas to successful candidates, while most of the polytechnics and technical schools give instruction in book-keeping; these latter, however, for the most part regard it as a "craft" merely.

AUTHORITIES.—Those interested in the bibliography of book-keeping are referred to the catalogue of the library of the Institute of Chartered Accountants in England and Wales, which probably contains the most complete collection in existence of ancient and modern works on accounting, both British and foreign. The following short list comprises those most likely to be found of general interest: G. van de Linde, Book-keeping (1898); L. R. Dicksee, Book-keeping (5th ed., 1906) and Advanced Accounting (2nd ed., 1903); Encyclopaedia of Accounting, ed. by G. Lisle (1903); Accountants' Library, ed. by the editor of The Accountant (1901); J. W. Heaps, The Antiquity of Book-keeping (1898); History of Accounting and Accountants, ed. by R. Brown (1905). (L. R. D.)

BOOK-PLATES. The book-plate, or ex-libris, a printed label intended to indicate ownership in individual volumes, is nearly as old as the printed book itself. It bears very much the same relation to the hand-painted armorial or otherwise Symbolical personal device found in medieval manuscripts that the printed page does to the scribe's work. The earliest known examples of book-plates are German. According to Friedrich Warnecke, of Berlin (one of the best authorities on the subject), the oldest moveable ex-libris are certain woodcuts representing a shield of arms supported by an angel (fig. 1), which were pasted in books presented to the Carthusian monastery of Buxhoy by Brother Hildebrand Brandenburg of Biberach, about the year 1480—the date being fixed by that of the recorded gift. The woodcut, in imitation of similar devices in old MSS., is hand-painted. In France the most ancient ex-libris as yet discovered is that of one Jean Bertaud de la Tour-Blanche, the date of which is 1529;

![FIG. 1.—Gift-plate of Hildebrand Brandenburg of Biberach to the Monastery of Buxheim (c. 1480).](image)

N. Bacon equeus auratus & magni sigilli Anglcae Cufus librum hunc bibliothecae Cantabrig. dicavit. 1574.

![FIG. 2.—Book-plate of Sir Nicholas Bacon (slightly reduced).](image)
Holland comes next with the plate of a certain Anna van der Aa, in 1507; then Italy with one attributed to the year 1623. The earliest known American example is the plain printed label of one John Williams, 1679.

A sketch of the history of the book-plate, either as a minor work of symbolical and decorative art, or as an accessory to the binding of books, must obviously begin in Germany, not only because the earliest examples known are German, but also because they are found in great numbers long before the fashion spread to other countries, and are often of the highest artistic interest. Albrecht Dürer is known to have actually engraved at least six plates (some of very important size) between 1503 and 1516 (fig. 3), and to have supplied designs for many others. Several notable plates are ascribed to Lucas Cranach and to Hans Holbein, and to that bevy of so-called Little Masters, the some. It may be here pointed out that the expression ex-libris, used as a substantive, which is now the recognized term for book-plate everywhere on the continent, found its origin in France. The words only occur in the personal tokens of other nationalities long after they had become a recognized inscription on French labels.

In many ways the consideration of the English book-plate, in its numerous styles, from the late Elizabethan to the late Victorian period, is peculiarly interesting. In all its varieties it reflects with great fidelity the prevailing taste in decorative art at different epochs. Of English examples, none thus far seems to have been discovered of older date than the gift-plate of Sir Nicholas Bacon; for the celebrated, gorgeous, hand-painted armorial device attached to a folio that once belonged to Henry VIII., and now reposes in the King's library, British Museum, does not come under the head of book-plate in its modern sense. The next is that of Sir Thomas Tresham, dated 1585. Until the last quarter of the 17th century the number of authentic English plates is very limited. Their composition is always remarkably simple, and displays nothing of the German elaborateness. They are as a rule very plainly armorial, and the decoration is usually limited to a symmetrical arrangement of mantling, with an occasional display of palms or wreaths. Soon after the Restoration, however, a book-plate seems to have suddenly become an established accessory to most well-ordered libraries. Book-plates of that period offer very distinctive characteristics. In the simplicity of their heraldic arrangements they recall those of the previous age; but their physiognomy is totally different. In the first place, they invariably display the initials and date, and after the method originally devised in the middle of the century by Petra Sancta, the author of Tesseræ Gentilicæ, which by this time had become adopted throughout Europe. In the second, the mantling assumes a much more elaborate appearance—one that irresistibly recalls that of the periwig of the period—surrounding the face of the shield. This style was undoubtedly imported from France, but it assumed a character of its own in England. As a matter of fact, thenceforth until the dawn of the French Revolution, English modes of decoration in book-plates, as in other châtellets, follow at some years' distance the ruling French taste. The main characteristics of the style which prevailed during the Queen Anne and early Georgian periods are:—ornamental frames suggestive of carved oak, a frequent use of fish-scales, trellis or diapered patterns, for the decoration of plain surfaces; and, in the armorial display, a marked reduction in the importance of the mantling. The introduction of the scallop-shell as an almost constant element of ornamentation gives already a foretaste of the Rocaille-Cuillé, the so-called Chippendale fashions of the next reign. As a matter of fact, during the middle third of the century this rococo style (of which the Converse plate [fig. 4] gives a tolerably typical sample) affects the book-plate as universally as all other decorative objects. Its chief element is a fanciful arrangement of scroll and shell work with curveting acanthus-like sprays—an arrangement which in the examples of the best period is generally made asymmetrical in order to give freer scope for a variety of countercurves. Straight or concentric lines and all appearances of flat surface are studiously avoided; the helmet and its symmetrical mantling tends to disappear, and is replaced by the plain crest on a fillet. The earlier examples of this manner are tolerably ponderous and simple. Later, however, the composition becomes exceedingly light and complicated; every conceivable and often incongruous element of decoration is introduced, from cupids to dragons, from flowerets to Chinese pagodas. During the early part of George III.'s reign there is a return to greater sobriety of ornamentation, and a style more truly national, which may be called the urn style, makes its appearance. Book-plates of this period have invariably a physiognomy which at once recalls the decorative manner popular by architects and designers such as Chambers, the Adams, Josiah Wedgwood, Hepplewhite and Sheraton. The shield shows a plain spade-like outline, manifestly based upon that of the pseudo-classic urn then so much to the fore. The

Fig. 3.—Book-plate of Lazarus Spengler, by Albrecht Dürer, 1515 (reduced).
BOOK-PLATES

Ornamental accessories are symmetrical palms and sprays, wreaths and ribands. The architectural boss is also an important factor. In many plates, indeed, the shield of arms takes quite a subsidiary position by the side of the predominantly architectural urn. From the beginning of the 19th century, until comparatively recent days, no special style of decoration seems to have established itself. The immense majority of examples display a plain shield of arms with motto on a scroll below, and crest on a fillet above. Of late years, however, a rapid impetus appears to have been given to the designing of ex-libris; a new era, in fact, has begun for the book-plate, one of great interest.

The main styles of decoration (and these, other data being absent, must always in the case of old examples remain the criteria of date) have already been noticed. It is, however, necessary to point out that certain styles of composition were also prevalent at certain periods. Many of the older plates (like the majority of the most modern ones) were essentially pictorial.

Of this kind the best-defined English genus may be recalled: the library interior—a term which explains itself—and book-plates, exemplified by the ex-libris (fig. 6) of W. Hewer, Samuel Pepys's secretary. We have also many portrait-plates, of which, perhaps, the most notable are those of Samuel Pepys himself and of John Gibbs, the architect; allegories, such as were engraved by Hogarth, Bartolozzi, John Pine and George Vertue; landscape-plates, by wood engravers of the Bewick school (see Plate), &c. In most of these the armorial elements play but a secondary part.

The value attached to book-plates, otherwise than as an object of purely personal interest, is comparatively modern. The study of and the taste for collecting these private tokens of book-ownership hardly date farther back than the year 1875. The first real impetus was given by the appearance of the Guide to the Study of Book-Plates, by Lord de Tabley (then the Hon. Leicester Warren) in 1880. This work, highly interesting from many points of view, established what is now accepted as the general classification of styles: early armorial (i.e. previous to Restoration, exemplified by the Nicholas Bacon plate); Jacobean, a somewhat misleading term, but distinctly understood to include the heavy decorative manner of the Restoration, Queen Anne and early Georgian days (the Lansanor plate, fig. 5, is typically Jacobean); Chippendale (the style above described as rococo, tolerably well represented by the French plate of Convers); wreath and ribbon, belonging to the period described as that of the urn, &c.

Since then the literature on the subject has grown considerably. Societies of collectors have been founded, first in England, then in Germany and France, and in the United States, most of them issuing a journal or archives: The Journal of the Ex-libris Society (London), the Archives de la société française de collectionneurs d'ex-libris (Paris), both of these monthlies; the Ex-libris Zeitschrift (Berlin), a quarterly.

Much has been written for and against book-plate collecting. If, on the one hand, the more enthusiastic ex-librisists (for such a word has actually been coined) have made the somewhat ridiculous claim of science for "ex-librisme," the bitter animadversion, on the other, of a certain class of intolerant bibliophiles upon the vandalism of removing book-plates from old books has at times been rather extravagant. Book-plates are undoubtedly very often of high interest (and of a value often far greater than the odd volume in which they are found affixed), either as specimens of bygone decorative fashion or as personal relics of well-known personages. There can be no

question, for instance, that engravings or designs by artists such as Holbein and Dürer and the Little Masters of Germany, by Charles Eisen, Hubert François Bourguignon, dit Gravelot; D. N. Chodowiecki or Simon Grébiline; by W. Marshall, W. Falthorne, David Loggan, Sir Robert Strange, Francesco Piranesi; by Hogarth, Cipriani, Bartolozzi, John Keyse Sherwin, William Henshall, Hewitt or Bewick and his imitators; or, to come to modern times, that the occasional examples traced to individual book-sellers and book-publishers, as E. M. Gale, Maclise, Bell Scott, T. G. Jackson, Walter Crane, Caldecott, Stacy Marks, Edwin Abbey, Kate Greenaway, Gordon Browne, Herbert Railton, Aubrey Beardsley, Alfred Parsons, D. Y. Cameron, Paul Avril—are worth collecting.

Until the advent of the new taste the devising of book-plates was almost invariably left to the routine skill of the heraldic stationer. Of late years the composition of personal book-tokens has become recognized as a minor branch of a higher art, and there has come into fashion an entirely new class of designs which, for all their wonderful variety, bear as unmistakable a character as that of the most definite styles of bygone days. Broadly speaking, it may be said that the purely heraldic element tends to become subsidiary and the allegorical or symbolic to assert itself more strongly. Among modern English artists who have more specially paid attention to the devising of book-plates, and have produced admirable designs, may be mentioned C. W. Sherborn, G. W. Eve, Robert Anning Bell, J. D. Batten, Erat Harrison, J. Forbes Nixom, Charles Ricketts, John Vinycomb, John Leighton and Warrington Hogg. The development in various circles of the interest is evidenced in the technical aspect of the art, and in the reproduction of beautiful and elaborate designs, has no doubt helped much to popularize the book-plate—a thing which in older days was almost invariably restricted to ancestral libraries or to collections otherwise important. Thus the great majority of modern plates are reproduced by process. The technique, however, a few artists left who devote to book-plates their skill with the graver. Some of the work they produce challenges comparison with the finest productions of bygone engravers. Of these the best-known are C. W. Sherborn (see Plate) and G. W. Eve in England, and in America J. W. Spenceley of Boston, Mass., K. W. F. Hopson of New Haven, Conn., and E. D. French of New York City (see Plate).

AUTHORITIES.—The curious in the matter of book-plate composition will find it treated in the various volumes of the Ex-libris Society (London). See also A. Poulet Massé, Les Ex-libris de la France moderne (1875); Lewis Donnson de Tabley, A General Study of Book-plates (1880); Sir A. W. Franks, Notes on Book-plates 1554–1800 (private, 1887); Friedrich Warnecke, Die deutschen Book-plates (1890); Henri Bouchot, Les Ex-libris et les marques de possession du livre (1891); Egerton Castle, English Book-plates (1892). Walter Hamilton, French Book-plates (1892). Dated Book-plates (1898); H. W. Fincham, Artists and Engravers of British and American Book-plates (1897); German Book-plates, by Count K. E. zu Leiningen-Westemberg, translated by G. R. Denis (1901). (E. C.)

BOOK-SCORPION, or FALSE SCORPION, minute arachnids superficially resembling tailless scorpions and belonging to the order Pseudoscorpiones of the class Arachnida. Occurring in all temperate and tropical countries, book-scorpions live for the most part under stones, beneath the bark of trees or in vegetable debris. A few species, however, like the common British forms Chelifer cancinnatus and Chelifer cristatus, burrow in dwellings and are found in books, old chests, furniture, &c., others like Gyancy litoralis and allied species may be found under stones or pieces of coral between tide-marks; while others, which are for the most part blind, live permanently in dark caves. Their food consists of minute insects or mites. It is possibly for the purpose of feeding on parasitic mites that book-scorpions lodge themselves beneath the wing-cases of large tropical beetles; and the same explanation, in default of a better, may be extended to their well-known and oft-recorded habit of seizing hold of the legs of horse-flies or other two-winged insects. For safety during hibernation and moulting, book-scorpions spin a small spherical cocoon. They are oviparous; and the eggs after being laid are carried about by the mother, attached to the lower surface of her body, the young remaining with their parent until they have acquired their definite form and are able to shift for themselves. (R. I. P.)

BOOKSELLING. The trade in books is of a very ancient date. The early poets and orators recited their effusions in public to induce their hearers to possess written copies of their poems or orations. Frequently, they were taken down vivo voce, and transcripts sold to such as were wealthy enough to purchase. In the book of Jeremiah the prophet is represented as dictating to Baruch the scribe. Whatever was done, when questioned, described the mode in which his book was written. These scribes were, in fact, the earliest booksellers, and supplied copies as they were demanded. Aristotle, we are told, possessed a somewhat extensive library; and Plato is recorded to have paid the large sum of one hundred minae for three small treatises of Philolaus the Pythagorean. When the Alexandrian library was founded about 300 B.C., various expedients were resorted to for the purpose of procuring books, and this appears to have stimulated the energies of the Athenian booksellers, who were termed βιβλαίοι εκδότες. In Rome, towards the end of the republic, it became the fashion to have a library as part of the household furniture; and the booksellers, _librarii_ (Civ. D. Leg. iii. 20) or _bibliopolae_ (Martial iv. 71, xii. 3), carried on a flourishing trade. Their shops (taberna libraria, Cicero, Phil. ii. 9) were chiefly in the Argiletum, and in the Vicus Sandalarius. On the door, or on the side posts, was a list of the books on sale; and Martial (i. 118), who mentions this also, says that a copy of his First Book of Epigrams might be purchased for five denari. In the time of Augustus the great booksellers were the Sosii. According to Justinian (B. i. 33), a law was passed securing to the booksellers the property in the materials used; and in this may, perhaps, be traced the first germ of the modern law of copyright.

The spread of Christianity naturally created a great demand for copies of the Gospels and other sacred books, and later on for missals and other devotional volumes for church and private use. Benedict Bishop, the founder of the abbey at Wearmouth in England, brought home with him from France (671) a whole cargo of books, part of which he had "bought," but from whom he was not mentioned. Passing by the intermediate ages we find that previous to the Reformation, the text writers or stationers (_stacyoneres_), who sold copies of the books then in use—the A B C, the Paternoster, Creed, Ave Maria and other MS. copies of prayers, in the neighbourhood of St. Paul's, London,—were, in 1493, formed into a guild. Some of these _stacyoneres_ had stalls or stations built against the very walls of the cathedral itself, in the same manner as they are still to be found in some of the older continental cities. In Henry Anstey's _Munimenta Academica_ published under the direction of the master of the rolls, we catch a glimpse of the "sworn" university book-seller or stationer, John More of Oxford, who apparently first supplied pupils with their books, and then acted the part of a pawnbroker. Anstey says (p. 77), "The fact is that they (the students) mostly could not afford to buy books, and had they been able, would not have found the advantage so considerable as might be supposed, the instruction given being almost wholly oral. The chief source of supplying books was by purchase from the university sworn stationers, who had to a great extent a monopoly. Of such books there were plainly very large numbers—"the books changing hands," "the frequent changes of owners..." There were, however, other booksellers there were many booksellers in Oxford who were not sworn; for one of the statutes, passed in the year 1373, expressly recites that, in consequence of their presence, "books of great value are sold and carried away from Oxford, the owners of them are cheated, and the sworn stationers are deprived of their lawful business."

It was, therefore, enacted that no bookseller except two sworn stationers or their deputies, should sell any book being either his own property or that of another, exceeding half a mark in value, under a pain of imprisonment, or, if the offence was repeated, of abjuring his trade within the university. "The trade in bookselling seems," says Hallam, "to have been established at Paris and Bologna in the 12th century; the lawyers and universities called it into life. It is very improbable that it existed in what we properly call the dark ages. Peter of
Blois mentions a book which he had bought of a public dealer (a quodam publico mangone librorum); but we do not find many distinct accounts of them till the next age. These dealers were denominated stationarii, perhaps from the open stalls at which they carried on their business, though status is a general word for a shop in low Latin. They appear, by the old statutes of the university of Paris, and by those of Bologna, to have sold books upon commission, and are sometimes, though not uniformly, distinguished from librarii, a word which, having originally been confined to the copyists of books, was afterwards applied to those who traded in them. They sold parchment and other materials of writing, which have retained the name of stationery, and they naturally exercised the kindred occupations of binding and decorating. They probably employed transcribers; we find at least that there was a profession of copyists in the universities and in large cities.

The modern system of bookselling dates from soon after the introduction of printing. The earliest printers were also editors and booksellers; but being unable to sell every copy of the works they printed, they had agents at most of the seats of learning. Antony Koberger, who introduced the art of printing into Nuremberg in 1470, although a printer, was more of a bookseller; for, besides his own sixteen shops, we are informed by his biographers that he had agents for the sale of his books in every city of Christendom. Wynken de Worde, who succeeded to Caxton’s press in Westminster, had a shop in Fleet Street.

The religious dissensions of the continent, and the Reformations in England under Henry VIII. and Edward VI., created a great demand for books; but in England neither Tudor nor Stuart could tolerate a free press, and various efforts were made to curtail it. The first patent for the office of king’s printer was granted to Thomas Berthelet by Henry VIII. in 1529, but only such books as were first licensed were to be printed. At that time even the purchase or possession of an unlicensed book was a punishable offence. In 1556 the Company of Stationers was incorporated, and very extensive powers were granted in order to obnoxious books might be repressed. In the following reign the Star Chamber exercised a great effectual censorship; but, in spite of all precaution, such was the demand for books of a polemical nature, that many were printed abroad and surreptitiously introduced into England. Queen Elizabeth interfered but little with books except when they emanated from Roman Catholics, or touched upon her royal prerogatives; and towards the end of her reign, and during that of her pedantic successor, James, bookselling flourished. Archbishop Laud, who was no friend to booksellers, introduced many arbitrary restrictions; but they were all, or nearly all, removed during the time of the Commonwealth. So much had bookselling increased during the Protectorate that, in 1658, was published A Catalogue of the most Vendible Books in England, digested under the heads of Divinity, History, Physic, &c., with School Books, Hebrew, Greek, and Latin, and an Introduction, for the use of Schools, by W. London. A bad time immediately followed. The Restoration also restored the office of Licenseur of the Press, which continued till 1694.

In the first English Copyright Act (1709), which specially relates to booksellers, it is enacted that, if any person shall think the published price of a book unreasonably high, he may thereupon make complaint to the archbishop of Canterbury, and to certain other persons named, who shall thereupon examine into his complaint, and if well founded reduce the price; and any bookseller charging more than the price so fixed shall be fined £5 for every copy sold. Apparently this enactment remained a dead letter.

For later times it is necessary to make a gradual distinction between booksellers, whose trade consists in selling books, either by retail or wholesale, and publishers, whose business involves the production of the books from the author’s manuscripts, and who are the intermediaries between author and bookseller, just as booksellers are the intermediaries between the bookseller and public. The trade on PUBLISHING (q.v.) deals more particularly with this second class, who, though originally booksellers, gradually took a higher rank in the book-trade, and whose influence upon the history of literature has often been very great. The convenience of this distinction is not impaired by the fact either that a publisher is also a wholesale bookseller, or that a still more recent development in publishing (as in the instance of the direct sale in 1902, by the London Times, of the supplementary volumes to the 9th edition of the Encyclopaedia Britannica, which were also “published” by The Times) started a reaction to some extent in the way of amalgamating the two functions. The scheme of The Times Book Club (started in 1905) was, again, a combination of a subscription library with the business of bookselling (see Newspapers); and it brought the organization of a newspaper, with all its means of achieving publicity, into the work of pushing the sale of books, in a way which practically introduced a new factor into the bookselling business.

During the 19th century it remains the fact that the distinction between publisher and bookseller—literary promoter and bookseller—became fundamental. The booksellers, as such, were engaged either in wholesale bookselling, or in the retail, the old or new system, and the periodical trades.

Coming between the last class of the retail bookseller is the important distributing agency of the wholesale bookseller. It is not to him that the retailer looks for his miscellaneous supplies, as it is to the wholesaler that booksellers turn for his selection and the best and latest publications of the books published. In Paternoster Row, London, which has for over a hundred years been the centre of this industry, may be seen the collectors from the shops of the retail booksellers, busily engaged in obtaining the books which are published weekly, if not daily. It is during this book-buying part that the country bookseller obtains his miscellaneous supplies. At the leading house in this department of bookselling almost any book desired, or information obtained concerning it. At one of these establishments over 1,000,000 books are constantly kept in stock.

It is here that the publisher calls first on showing or “subscribing” a new book, a critical process, for by the number thus subscribed the fate of a book is sometimes determined.

What may be termed the third partner in publishing and its ramifications is the retail bookseller; and to protect his interests there was established in 1836 a London booksellers’ society, which had for its object the restriction of discounts to 25%, and also to arrange prices generally and control all details connected with the trade. The society a few years afterwards widened its field of operations so as to include the whole of the United Kingdom, and its designation then became “The Associated Booksellers of Great Britain and Ireland.”

The trade in old or (as they are sometimes called) second-hand books is in a sense, no doubt, a higher class of business, requiring a knowledge of bibliography, while the transactions are with individual books rather than with numbers of copies. Occasionally dealers in this class of books replenish their stocks by purchasing remaindered books, if such, having been rejected from the publishers, to the publisher, they offer to the public as bargains. The periodical trade grew up during the 19th century, and was in its infancy when the first periodical, The Magazine, appeared in 1762. When first appeared. The growth of this important part of the business was greatly promoted by the abolition of the newspaper stamp and of the duty upon paper, the introduction of attractive illustrations, and the facilities offered for purchasing books by instalments.

The history of bookselling in America has a special interest. The Spanish settlements drew away from the old country much of its enterprise and best talent, and the presses of Mexico and other cities teemed with publications mostly of a religious character, but many others, especially linguistic and historical, were also published. Bookselling in the United States was of a somewhat later growth, although printing was introduced into Boston as early as 1676, Philadelphia in 1683, and New York in 1689. Franklin had served to make the trade illustrious, yet few persons were engaged in it at the commencement of the 19th century. Books chiefly for scholars and libraries were imported from Europe; but after the second war printing-presses multiplied rapidly, and with the spread of newspapers and education there also arose a demand for books, and publishers set to work to secure the advantages offered by the wide field of English literature, the whole of which they had the liberty of reaping free of all cost beyond that of production. The works of Scott, Byron, Moore, Southey, Wordsworth, and indeed of every author without the smallest payment to author or proprietor. Half the names of the authors in the so-called “American” catalogue of books printed between 1820 and 1832 are British. By this means the works of the best
BOOLE

authors were brought to the doors of all classes in the cheapest variety of forms. In consequence of the Civil War, the high price of labour, and the restrictive duties laid on in order to protect native industry, coupled with the frequent intercourse with England, a great change took place, and American publishers and booksellers, while there was still no international copyright, made liberal offers for early sheets of new publications. Boston, New York and Philadelphia still retained their old supremacy as bookselling centres. Meanwhile, the distinct publishing business had been established. Essentially the conditions of business became assimilated to those of Europe.

In the course of the 16th and 17th centuries the Low Countries for a time became the chief centre of the book selling world, and many of the finest folios and quarto in our libraries bear the names of Jansen, Blauw or Plantin, with the imprint of Amsterdam, Utrecht, Leiden or Antwerp, while the Elzevirs besides other works produced their charming little pocket classics. The southern towns of Douai and St Omer at the same time furnished polemical works in English.

Under Publishing are noticed various further developments of this subject. Much interesting information on the history of the book trade will be found in Charles Knight's Biography of William Caxton, and in the same author's Shadows of the Old Booksellers (1851); and the History of Booksellers (1873); and Heinrich Lempertz, Bilder-Illustre Geschichte des Buchhändels (Cologne, 1854).

BOOLE, GEORGE (1815-1864), English logician and mathematician, was born in Lincoln on the 2nd of November 1815. His father was a tradesman of limited means, but of studious character and active mind. Being especially interested in mathematical science, the father gave his son his first lessons; but the extraordinary mathematical powers of George Boole did not manifest themselves in early life. At first his favourite subject was classics. Not until the age of seventeen did he attack the higher mathematics, and his progress was much retarded by the want of efficient help. When about sixteen years of age he became assistant-master in a private school at Doncaster, and he maintained himself to the end of his life in one grade or other of the scholastic profession. Few distinguished men, indeed, have had a less eventful life. Almost the only changes which can be called events are his successful establishment of a school at Lincoln, its removal to Waddington, his appointment in 1849 as professor of mathematics in the Queen's College at Cork, and his marriage in 1853 to Miss Mary Everest, who, as Mrs Boole, afterwards wrote several useful educational works on her husband's principles.

To the public Boole was known only as the author of numerous abstruse papers on mathematical topics, and of three or four distinct publications which have become standard works. His earliest work of any extent was one upon "The Calculus of Translations," printed in the Cambridge Mathematical Journal for 1849, and it led to a friendship between Boole and D. F. Gregory, the editor of the journal, which lasted until the premature death of the latter in 1844. A long list of Boole's memoirs and detached papers, both on logical and mathematical topics, will be found in the Catalogue of Scientific Memoirs published by the Royal Society, and in the supplementary volume on Differential Equations, edited by Isaac Todhunter. To the Cambridge Mathematical Journal and its successor, the Cambridge and Dublin Mathematical Journal, Boole contributed in all twenty-two articles. In the third and fourth series of the Philosophical Magazine will be found sixteen papers. The Royal Society printed six important memoirs in the Philosophical Transactions, and a few other memoirs are to be found in the Transactions of the Royal Society of Edinburgh and of the Royal Irish Academy, in the Bulletin de l'Academie de St-Pétersbourg for 1862 (under the name G. Boldt, vol. iv. pp. 198-213), and in Crelle's Journal. To these lists should be added a paper on the mathematical basis of logic, published in the Mechanic's Magazine for 1848. The works of Boole are thus contained in about fifty scattered articles and a few separate publications.

Only two systematic treatises on mathematical subjects were completed by Boole during his lifetime. The well-known Treatise on Differential Equations appeared in 1859, and was followed, the next year, by a Treatise on the Calculus of Finite Differences, designed to serve as a sequel to the former work. These treatises are valuable contributions to the important branches of mathematics in question, and Boole, in composing them, seems to have combined elementary exposition with the profound investigation of the philosophy of the subject in a manner hardly admitting of improvement. To a certain extent these works embody the more important discoveries of their author. In the 16th and 17th centuries the Differential Equations we find, for instance, a lucid account of the general symbolic method, the bold and skilful employment of which led to Boole's chief discoveries, and of a general method in analysis, originally described in his famous memoir printed in the Philosophical Transactions for 1844. Boole was one of the most eminent of those who perceived that the symbols of operation could be separated from those of quantity and treated as distinct objects of calculation. His principal characteristic was perfect confidence in any result obtained by the treatment of symbols in accordance with their primary laws and conditions, and an almost unrivalled skill and power in tracing out these results.

During the last few years of his life Boole was constantly engaged in extending his researches with the object of producing a second edition of his Differential Equations much more complete than the first edition; and part of his last vacation was spent in the libraries of the Royal Society and the British Museum. But this new edition was never completed. Even the manuscripts left at his death were so incomplete that Todhunter, into whose hands they were put, found it impossible to use them in the publication of a second edition of the original treatise, and wisely printed them, in 1865, in a supplementary volume.

With the exception of Augustus de Morgan, Boole was probably the first English mathematician since the time of John Wallis who had also written upon logic. His novel views of logical method were due to the same profound confidence in symbolic reasoning to which he had successfully trusted in mathematical investigation. Speculations concerning a calculus of reasoning had at different times occupied Boole's thoughts, but it was not till the spring of 1847 that he put his ideas into the pamphlet called Mathematical Analysis of Logic. Boole afterwards regarded this as a hasty and imperfect exposition of his logical system, and he desired that his much larger work, An Investigation of the Laws of Thought, on which are founded the Mathematical Theories of Logic and Probabilities (1854), should alone be considered as containing a mature statement of his views. Nevertheless, there is a charm of originality about his earlier logical work which no competent reader can fail to appreciate. He did not regard logic as a branch of mathematics, as the title of his earlier paper implies, but theory as an instrument for the study of deep analogy between the symbols of algebra and those which can be made, in his opinion, to represent logical forms and syllogisms, that we can hardly help saying that logic is mathematics restricted to the two quantities, 0 and 1. By unity Boole denoted the universe of thinkable objects; literal symbols, such as x, y, z, v, u, &c., were used with the elective meaning attaching to common adjectives and substantives. Thus, if x = horned and y = sheep, then the successive acts of election represented by x and y, if performed on unity, give the whole of the class horned sheep. Boole showed that elective symbols of this kind obey the same primary laws of combination as algebraical symbols, whence it followed that they could be added, subtracted, multiplied and even divided, almost exactly in the same manner as numbers. Thus, 1-x would represent the operation of selecting all things in the world except horned things, that is, all not horned things, and (1-2) (1-y) would give us all things neither horned nor sheep. By the use of such symbols propositions could be reduced to the form of equations, and the syllogistic conclusion from two premises was obtained by eliminating the middle term according to ordinary algebraic rules.

Still more original and remarkable, however, was that part of his system, fully stated in his Laws of Thought, which formed
a general symbolic method of logical inference. Given any propositions involving any number of terms, Boole showed how, by the purely symbolic treatment of the premises, to draw any conclusion logically contained in those premises. The second part of the Laws of Thought contained a corresponding attempt to discover a general method in probabilities, which should enable us from the given probabilities of any system of events to determine the consequent probability of any other event logically connected with the given events.

Though Boole published little except his mathematical and logical works, his acquaintance with general literature was wide and deep. Dante was his favourite poet, and he preferred the Paradiso to the Inferno. The metaphysics of Aristotle, the ethics of Spinoza, the philosophical works of Cicero, and many kindred works, were also frequent subjects of study. His reflections upon scientific, philosophical and religious questions are contained in four addresses upon The Genius of Sir Isaac Newton, The Right Use of Leisure, The Claims of Science and The Social Aspect of Intellectual Culture, which he delivered and printed at different times.

The personal character of Boole inspired all his friends with the deepest esteem. He was marked by the modesty of true genius, and his life was given to the single-minded pursuit of truth. Though he received a medal from the Royal Society for his memoir of 1844, and the honorary degree of D.L.L. from the university of Dublin, he neither sought nor received the ordinary rewards to which his discoveries would entitle him. On the 8th of December 1864, in the full vigour of his intellectual powers, he died of an attack of fever, ending in suffusion on the lungs.

An excellent sketch of his life and works, by the Rev. R. Harley, F.R.S., is to be found in the British Quarterly Review for July 1864, No. 87. (W. S. J.)

BOOM, a word of Teutonic origin (cf. the Ger. Baum, tree, and the Eng. beam) for a pole, bar or barrier, used especially as a nautical term, for a long spar, used to extend a sail at the foot (main-boom, jib-boom, &c.). The “boom” of a cannon (note of a bell, cry of the bittern) is distinct from this, being onomatopoecic. In the sense of a barrier, a boom is generally formed of timber lashed together, or of chains, built across the mouth of a river or harbour as a means of defence. Possibly from the metaphor of a breaking boom, and the accompanying rush and roar, or from the rush of rising waters (mingled with the onomatopoecic use), “boom” began in America to be used of a sudden “spurt” or access of industrial activity, as in the phrase “a boom in cotton.” Hence the verb “to boom,” meaning to advertise or push into public favour.

BOOMERANG, a missile weapon of the Australian aborigines and other peoples. The word is taken from the native name used by a single tribe in New South Wales and was mentioned in 1873 as “the Pom Jacks term” (Nat. Sour. Coast Ausral. i. 355). It has been erroneously connected with the woomera or spear-thrower, and equally erroneously regarded as onomatopoecic—for it does not “boom” but whistles in the air. Two main types may be distinguished: (a) the return boomerang; (b) the non-return or war boomerang. Both types are found in most parts of Australia; the return form was, according to General Pitt-Rivers, used in ancient Egypt; and a weapon which has a close resemblance to the boomerang survives to the present day in North-East Africa, whence it has spread in allied forms, made of metal (throwing knives). Among the Dravidians of South India is found a boomerang-shaped instrument which may be returned. It is, however, still uncertain whether the so-called boomerangs of Egypt and India have any real resemblance to the Australian return boomerang. The Hopis (Moquis) of Arizona use a non-return form. The general form of both weapons is the same. They are sickle-shaped, and made of wood (in India of ivory or steel), so modelled that the thickness is about 4th of the breadth, which again is 44th of the length, the last varying from 6 in. to 3 or 4 ft. The return boomerang, which may have two straight arms at right angles from 70° to 130°, but in Australia is always curved at an angle of 90° or more, is usually 2 to 3 ft. in length and weighs some 8 oz.; the arms have a skew, being twisted 2° or 3° from the plane running through the centre of the weapon, so that B and D (fig. 1) are above it, A and E below it; the ends AB and DE are also to some extent raised above the plane of the weapon at C; the cross section is asymmetrical, the upper side in the figure being convex, the lower flat or nearly so; this must be thrown with the right hand. The non-return boomerang has a skew in the opposite direction but is otherwise similar.

The peculiarity of the boomerang’s flight depends mainly on its skew. The return boomerang is held vertically, the concave side forward, and thrown in a plane parallel to the surface of the ground, as much rotation as possible being imparted to it. It travels straight for 30 yds. or more, with nearly vertical rotation; then it inclines to the left, lying over on the flat side and rising in the air; after describing a circle of 50 or more yards in diameter it returns to the thrower. Some observers state that it returns after striking the object; it is certainly possible to strike the ground without affecting the return. Throws of 100 yds. or more, before the leftward curve begins, can be accomplished by Australian natics, the weapon rising as much as 150 ft. in the air and circling five times before returning. The non-return type may also be made to return in a nearly straight line by throwing it at an angle of 45°, but normally it is thrown like the return type, and will then travel an immense distance. No accurate measurements of Australian throws are available, but an English thrower of 180 yds. has been recorded, compared with the same thrower’s 70 yds. with the cricket ball.

The war boomerang in an expert’s hand is a deadly weapon, and the lighter Hunting boomerang is also effective. The return boomerang is chiefly used as a plaything or for killing birds, and is often as dangerous to the thrower as to the object at which it is aimed.

BOONE, DANIEL (1734-1820), American pioneer and backwoodman, of English descent, was born near the present city of Reading, Pennsylvania, on the 2nd of November (N.S.) 1734. About 1751 his father, Squire Boone, with his family settled in the Yadkin Valley in what is now Davie county, North Carolina, then on the frontier. Daniel worked on his father’s farm, and spent much of his time hunting and trapping. In 1755 he served as a wagoner and blacksmith in Braddock’s disastrous expedition against the Indians. In 1765 he visited Florida, and in 1767 he first visited the Kentucky region. With several companions, including John Finley, who had been there as early as 1752, he spent two years, 1769-1771, roaming about what is now Kentucky, meeting with numberless adventures, coming in conflict with roving bands of Indians, and collecting bear, beaver and deer skins. He served in Lord Dunmore’s War (1774), and in 1775 led to Kentucky the party of settlers who founded Boonesborough, long an important settlement. On the 7th of February 1778 he,
and the party he led, were captured by a band of Shawnees. He was adopted into the Shawnee tribe, was taken to Detroit, and on the return from that place escaped, reaching Booneborough, after a perilous journey of three months within four days, in time to give warning of a formidable attack by his captors. In repelling this attack, which lasted from the 8th to the 17th of September, he bore a conspicuous part. He also took part in the sanguinary "Battle of Blue Licks" in 1782. For a time he represented the settlers in the Virginia legislature (Kentucky then being a part of Virginia), and he also served as deputy surveyor, sheriff and county lieutenant of Fayette county, one of the three counties into which Kentucky was then divided. Having lost all his land through his carelessness in regard to titling it, he went in 1803 to Point Pleasant, Virginia, (now W. Va.), whence about 1790 he removed to a place in what is now Missouri, about 45 m. west of St Louis, in territory then owned by Spain. He received a grant of 1000 arpents (about 845 acres) of land, and was appointed syndic of the district. After the United States gained possession of "Louisiana" in 1803, Boone's title was found to be defective, and he was again dispossessed. He died on the 22nd of September 1820, and in 1845 his remains were removed to Frankfort, Kentucky, where a monument has been erected to his memory. Boone was a typical American pioneer and backwoodsman, a great hunter and trapper, highly skilled in all the arts of woodcraft, familiar with the Indians and their methods of warfare, a famous Indian fighter, restless, resourceful and fearless. His services, however, have been greatly over-estimated, and he was not, as is popularly believed, either the first to explore or the first to settle the Kentucky region.

The best biography is that by Reuben G. Thwaites, Daniel Boone (New York, 1902).

BOONE, a city and the county-seat of Boone county, Iowa, U.S.A., a short distance from the Des Moines river and near the centre of the state. Pop. (1890) 6520; (1900) 8880; (1910) 33777, including 1111 negroes; (1920) 4752. It is served by the Chicago & North-Western (which has construction and repair shops here), the Chicago, Milwaukee & St Paul railways, and by the Fort Dodge, Des Moines & Southern (interurban) railway, which connects with Des Moines, Ames, &c. Boone is an important coal centre; bricks and tiles are manufactured from the clay obtained near by; there is a packing plant for the manufacture of beef and pork products; and from the rich farming section by which the city is surrounded come large quantities of grain, some of which is milled here, and live-stock. Boone was laid out in 1856, was incorporated as a town in 1866, and was chartered as a city in 1868.

BOONVILLE, a city and the county-seat of Cooper county, Missouri, U.S.A., on the right bank of the Missouri river, about 210 m. W. by N. of St Louis. Pop. (1890) 4114; (1900) 4377, including 1111 negroes; (1910) 4752. It is served by the Missouri Pacific, and the Missouri, Kansas & Texas railways. The city lies along a bluff about 100 ft. above the river. It is the seat of the Missouri training school for boys (1889), and of the Kemper military school (1844). Among its manufactures are earthenware, tobacco, vinegar, flour, farm-gates (iron), sash and doors, marble and granite monuments, carriages and bricks. Iron, zinc and lead are found in the vicinity, and some coal is mined.

Boonville, named in honour of Daniel Boone, was settled in 1810, was laid out in 1817, incorporated as a village in 1839, and chartered as a city of the third class in 1866. Here on the 17th of June 1861, Captain (Major-General) Nathaniel Lyon, commanding about 2000 Union troops, defeated a slightly larger, but undisciplined Confederate force under Brigadier-General John S. Marmaduke. David Barton (d. 1837), one of the first two United States senators from Missouri, was buried here.

BOORDE (or BORDE), ANDREW (1400? - 1540), English physician and author, was born at Borde's Hill, Holme Dale, Sussex. He was educated at Oxford, and was admitted a member of the University in 1420, while under age. In 1521 he was "dispensed from religion" in order that he might act as suffragan bishop of Chichester, though he never actually filled the office, and in 1529 he was freed from his monastic vows, not being able to endure, as he said, the "ruggedate your rellgyon." He then went abroad to study medicine, and on his return he attended the university of Paris. He subsequently visited the universities of Orleans, Poitiers, Toulouse, Montpellier and Wittenberg, saw the practice of surgery at Rome, and went on pilgrimage with others of his nation to Compostella in Navarre. In 1534 Boorde was again in London at the Charterhouse, and in 1536 wrote to Thomas Cromwell, complaining that he was in "thraldom" there. Cromwell set him at liberty, and after entertaining him at his house at Bishops Waltham in Hampshire, seems to have entrusted him with a mission to the French courts. He returned to England without further feeling abroad with regard to the English king. He writes to Cromwell from various places, and from Catalonia he sends him the seeds of rhubarb, two hundred years before that plant was generally cultivated in England. Two letters in 1535 and 1536 to the prior of the Charterhouse anxiously argue for his complete release from monastic vows. In 1536 he was studying medicine at Glasgow and gathering his observations about the Scots and the "devilishse dysposicion of a Scottish man, not to love nor favour an English man." About 1538 Boorde set out on his extensive journeying, and visited all the countries of Europe except Russia and Turkey, and making his way to Jerusalem. Of these travels he wrote a full itinerary, lost unfortunately by Cromwell, to whom it was sent. He finally settled at Montpellier and before 1542 had completed his First Boke of the Introduction of Knowledge, which ranks as the earliest continental guide book, his Dietary and his Brewey. He probably returned to England in 1542, and lived at Winchester and perhaps at Pevensey. John Ponet, bishop of Winchester, in an Apology against Bishop Gardiner, relates as matter of common knowledge that in 1547 Doctor Borde, a physician and a holy man, who still kept the Cartusian rules of fasting and wearing a hair shirt, was convicted in Winchester of keeping in his house three loose women. For this offence, apparently, he was imprisoned in the Fleet, where he made his will on the 9th of April 1549. It was proved on the 25th of the same month. Thomas Hearne (Benedictus Abbas, i. p. 52) says that he went round like a quack doctor to country fairs, and therefore rashly supposed him to have been the original merry-andrew.

Andrew Boorde was no doubt a learned physician, and he has left two amusing and often sensible works on domestic hygiene and medicine, but his most entertaining book is The First Boke of the Introduction of Knowledge. The wychke dothe teach a man to speake partie of all maner of languages, and to know the usage and fashion of all maner of countreys. And for to know the moste partie of all maner of coynes of money, the wychke is currant in every region. Made by Andrew Borde, of Physische Doctor. Dedicated to the right honourable and gracious lady Mary daughter of our severyne Lorde Kyng Henry the euyght (c. 1547). The Englishman describes himself and his foibles—his meekness, his fondness for new fashions and his obstinacy—in lively verse. Then follows a geographical description of the country, followed by a model dialogue in the Cornish language. Each country in turn is dealt with on similar lines. His other authentic works are: Here foloweth a Compendiouses Regimines or Dyetary of health, in made in Montypillor (Thomas Colwell, 1562), of which there are undated and doubtless earlier editions; The Brewey of Health (1547?); The Princeyses of Astromery (1547?); "The Peregrination of Doctor Board," printed by Thomas Hearne in Benedictus Abbas Petroburgensis, vol. ii. (1733); A Pronostycacyon or an Almanacke for the yeare of our lorde MCCXXXCV, made by Andrew Boorde. His Itinerary of Europe and Treatise upon Berdes are lost. Several jest-books are attributed to him without authority—The Merie Tales of the Mad Men of Gotam (earliest extant edition, 1630), Scogin's Jests (1626), A Merry jest of the Miyllner of Abyngton, with his wffe, and his daughter, and of two poor scholes of Cambrige (printed by Wynkyn de Worde), and a Latin poem, Nos Vagabunduli. See Dr F. J. Furnivall's reprint of the Introduction and some other selections for the Early English Text Society (new series, 1870).
BOOS, MARTIN (1762–1825), German Roman Catholic theologian, was born at Hattenried in Bavaria on the 25th of December 1762. Orphaned at the age of four, he was reared by an uncle at Augsburg, who finally sent him to the university of Dillingen. There he laid the foundation of the modest piety by which his whole life was distinguished. After serving as priest in several Bavarian towns, he made his way in 1799 to Linz in Austria, which was then governed by Archduke Gall, and set up the parish first at Leonding and then at Waldneukirchen, becoming in 1806 pastor at Gallneukirchen. His pietistic movement won considerable way among the Catholic laity, and even attracted some fifty or sixty priests. The death of Gall and other powerful friends, however, exposed him to bitter enmity and persecution from about 1812, and he had to answer endless accusations in the consistorial courts. His enemies followed him when he returned to Bavaria, but in 1817 the Prussian government appointed him to a professorship at Düsseldorf, and in 1819 gave him the pastorate at Sayn near Neuwied. He died on the 30th of August 1825.

See Life by J. Goessner (1834).

BOOT. (1) From the O. Eng. bôt, a word common to Teutonic languages, e.g. Goth. bota, “good, advantage,” O.H.G. Buwea, Mod. Ger. Buze, “penance, fine”; cf. “better,” the comparative of “good”), profit or advantage. The word survives in “bootless,” i.e. useless or unavailing, and in such expressions, chiefly archaistic, as “what boots it?” “Bote,” an old form, survives in some old compound legal words, such as “housebote,” where he was the first to make “hedge-bote,” &c., for particular rights of “estover,” the Norman bread word corresponding to the Saxem “bote” (see ESTOVERS and COMMONS). The same form survives also in such expressions as “chief-bote” for the Old English customary compensation paid for injuries.

(2) A word of uncertain origin, which came into English through the O. Fr. bote, modern botte; Med. Lat. bota or bota), a covering for the foot. Properly a boot covers the whole lower part of the leg, sometimes reaching to or above the knee, but in common usage it is applied to one which reaches only above the ankle, and is thus distinguished from “shoe” (see COSTUME and SHOE).

The “boot” of a coach has the same derivation. It was originally applied to the fixed outside step, the French botte, then to the uncovered spaces on or beside the step on which the attendants sat facing sideways. Both senses are now obsolete, the term now being applied to the covered receptacles under the seats of the guard and coachman.

The Boot, Boots or Bootkin was an instrument of torture formerly in use to extort confessions from suspected persons, or obtain evidence from unwilling witnesses. It originated in Scotland in the first quarter of the 16th century. It was frequently employed there in the latter years of the 16th century. In a case of forgery in 1579 two witnesses, a clergyman and an attorney, were so tortured. In a letter dated 1583 at the Record Office in London, Walsingham instructs the English ambassador at Edinburgh to have Father Holt, an English Jesuit, “put to the boots.” It seems to have fallen into disuse after 1630, but was revived in 1666 on the occasion of the Covenanters’ rebellion, and was employed during the reigns of Charles II. and James II. Upon the accession of William III. the Scottish convention denounced “the use of torture, without evidence and in ordinary crimes, as contrary to law.” However, a year or so later, one Neville Payne, an Englishman suspected of treasonable motives for visiting Scotland, was put to the torture under the authority of a warrant signed by the king. This is the last recorded case of its use, torture being finally abolished in Scotland in 1709. It was not used in England after 1640. The boot was made of iron or wood and iron fastened on the leg, between which and the boot wedges were driven by blows from a mallet. After each blow a question was put to the victim, and the ordeal was continued until he gave the information or fainted. The wedges were usually placed against the calf of the leg, but Bishop Burnet says that they were sometimes put against the shin-bone. A similar instrument, called “Spanish boots,” was used in Germany.

There were also iron boots which were heated on the victim’s foot. A less cruel form was a boot or buskin made wet and drawn upon the legs and then dried with fire.

BOÛTES (Gr. βούτα, a ploughman, from βόεις, an ox), a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and perhaps alluded to in the book of Job (see ARCTURUS), and by Homer and Hesiod. The ancient Greeks symbolized it as a man walking, with his right hand grasping a club, and his left extending upwards and holding the leash of two dogs, which are apparently barking at the Great Bear. Ptolemy catalogues twenty-three stars, Tycho Brahe twenty-eight, Hevelius fifty-two. In addition to Arcturus, the brightest in the group, the most interesting stars of this constellation are: e Boötis, a beautiful double star composed of a yellow star of magnitude 3, and a blue star of magnitude 6; f Boötis, a double star composed of a yellow star, magnitude 4.5, and a purple star, magnitude 6; and W Boötis, an irregularly variable star. This constellation has been known by many other names—Arctophylax, Arcturus minor, Bubuleus, Babulus, Canis latrans, Clamator, Icarus, Lycaon, Philometus, Plautius custos, Florana, Thegis, Vociferator; the Arabs termed it Aramech or Archamech; Hesychius named it Orion; Jules Schiller, St Sylvester; Schickard, Nimrod; and Weigelius, the Three Swedish Crowns.

BOOTH, BARTON (1682–1733), English actor, who came of a good Lancashire family, was educated at Westminster school, where his success in the Latin play Andria gave him an inclination for the stage. He was intended for the church; but in 1688 he ran away from Trinity College, Cambridge, and obtained employment in a theatrical company in Dublin, where he made his first appearance as Oroonoko. After two seasons in Ireland he returned to London, where Betterton, who on an earlier application had withheld his active aid, probably out of regard for Booth’s family, now gave him all the assistance in his power. At Lincoln’s Inn Fields (1700–1704) he first appeared as Maximus in Valentinian, and his success was immediate. He was at the Haymarket with Betterton from 1705 to 1708, and for the next twenty years at Drury Lane. Booth died on the 10th of May 1733, and was buried in Westminster Abbey. His greatest parts, after the title-part of Addison’s Cato, which established his reputation as a tragedian, were probably Hotspur and Brutus. His Lear was esteemed worthy of comparison with Garrick’s. As the ghost in Hamlet he is said never to have had a superior. Among his other Shakespearean roles were Mark Antony, Timon of Athens and Othello. He also played to perfection the gay Lothario in Rowe’s Fair Penitent. Booth was twice married; his second wife, Hester Santlow, an actress of some merit, survived him.

BOOT, CHARLES (1840–1916), English sociologist, was born at Liverpool on the 30th of March 1840. In 1862 he became a partner in Alfred Booth & Company, a Liverpool firm engaged in the Brazil trade, and subsequently chairman of the Booth Steamship Company. He devoted much time, and no inconsiderable sums of money, to inquiries into the statistical aspects of social questions. The results of these are chiefly embodied in a work entitled Life and Labour of the People in London (1861–1903), of which the earlier portion appeared under the title of Life and Labour in 1889. The book is designed to show “the numerical relation which poverty, misery and depravity bear to regular earnings and comparative comfort, and to describe the general conditions under which each class lives.” It contains a most striking series of maps, in which the varying degrees of poverty are represented street by street, by shades of colour. The data for the work were derived in part from the detailed records kept by school-board “visitors,” partly from systematic inquiries directed by Mr Booth himself, supplemented by information derived from relieving officers and the Charity Organization Society. Mr Booth also paid much attention to a kindred subject—the lot of the aged poor. In 1894 he published a volume of statistics on the subject, and, in 1891
and 1895, works on Old-age pensions, his scheme for the latter depending on a general provision of pensions of five shillings a week to all aged persons, irrespective of the cost to the state. He was the father of the actress, and the grandson of the Shakespearean actor Edwin Booth, and was born in Belair, Maryland, on the 13th of November 1833. His father (1796–1852) was born in London on the 1st of May 1796, and, after trying printing, law, painting and the sea, made his first appearance on the stage in 1813, and appeared in London at Covent Garden in 1815. He became almost at once a favourite, and a rival of Kean, whom he was thought to resemble. To Kean's Othello nevertheless he played Iago on several occasions. Richard III., Hamlet, King Lear, Shylock and Sir Giles Overreach were his best parts, and in America, whither he removed in 1821, they brought him great popularity. His eccentricities sometimes bordered on insanity, and his excited and furious fencing as Richard III. and as Hamlet frequently compelled the Richmond and Laertes to fight for their lives in deadly earnest.

Edwin Booth's first regular appearance was at the Boston Museum on the 10th of September 1849, as Tressel to his father's Richard, in Colley Cibber's version of Richard III. He was lithe and graceful in figure, buoyant in spirits; his dark hair fell in waving curls across his brow, and his eyes were soft, luminous and most expressive. His father watched him with great interest, but with evident disappointment, and the members of the theatrical profession, who held the acting of the elder Booth in great reverence, seemed to agree that the genius of the father had not descended to the son. Edwin Booth's first appearance in New York was in the character of Willford in The Iron Chest, which he played at the National theatre in Chatham Street, on the 27th of September 1850. A year later, on the illness of the father, the son took his place in the character of Richard III. It was not until after his parent's death that the son conquered for himself an unsailable position on the stage. Between 1852 and 1856 he played in California, Australia and the Sandwich Islands, and those who had known him in the east were surprised when the news came that he had captivated his audiences with his brilliant acting. From this time forward his dramatic triumphs were warmly acknowledged. His Hamlet, Richard and Richilieu were pronounced to be superior to the performances of Edwin Forrest; his success as Sir Giles Overreach in A New Way to Pay Old Debts surpassed his father's. In 1852 he became manager of the Winter Garden theatre, New York, where he gave a series of Shakespearean productions of then unexemplified magnificence (1864–1867), including Hamlet, Othello and The Merchant of Venice. The splendour of this period in his career was dashed for many months when in 1865 his brother, John Wilkes Booth, assassinated President Lincoln (see LINCOLN, ABRAHAM). The three Booth brothers, Junius Brutus (1821–1883), Edwin and John Wilkes (1839–1865), had played together in Julius Caesar in the autumn of the previous year—the performance being memorable both for its own excellence, and for the tragic situation into which two of the principal performers were subsequently hurled by the crime of the third. Edwin Booth did not reappear on the stage until the 3rd of January 1866, when he played Hamlet at the Winter Garden theatre, the audience showing by unstinted applause their conviction that the glory of the one brother would never be imperilled by the infamy of the other.

In 1868–1869 Edwin Booth built a theatre of his own—Booth's theatre, at the corner of 23rd Street and 6th Avenue, New York—and organized an excellent stock company, which produced Romeo and Juliet, The Winter's Tale, Julius Caesar, Macbeth, Much Ado about Nothing, The Merchant of Venice and other plays. In all cases Booth used the true text of Shakespeare, thus antedating by many years a similar reform in England. Almost invariably his ventures were successful, but he was of a generous and confiding nature, and his management was not economical. In 1874 the grand dramatic structure he had raised was taken from him, and with it went his entire fortune. By arduous toil, however, he again accumulated wealth, in the use of which his generous nature was shown. He played the role of Hamlet in New York City. He was made a life member into a club—The Players—for the elect of his profession, and for such members of other professions as they might choose. The house, with all his books and works of art, and many invaluable mementos of the stage, became the property of the club. A single apartment he kept for himself. In this he died on the 7th of June 1893.

Among his parts were Macbeth, Lear, Othello, Iago, Shylock, Wolsey, Richard II., Richard III., Benedick, Petruchio, Richelieu, Sir Giles Overreach, Brutus (Rome's), Bertuccio (in Tom Taylor's The Foot's Revenge), Ruy Blas, Dr. Faustus, Shylock, Richelieu, and many more. His most noted part was Hamlet, for which his extraordinary grace and beauty and his eloquent sensibility peculiarly fitted him. He probably played the part oftener than any other actor before or since. He visited London in 1851, and again in 1858 and in 1882, playing at the Haymarket theatre with brilliant success. In the last year he also visited Germany, where his acting was received with the highest enthusiasm. His last appearance was in Brooklyn as Hamlet in 1891. Booth was twice married: in 1860 to Mary Devlin (d. May 3), and in 1870 to Mary P. McVeigh (d. 1911). He left his first wife one daughter, Edwina Booth Garner, who published Edwin Booth: Recollections (New York, 1894).

Edwin Booth's prompt-books were edited by William Winter (1879). In a series of volumes, Actors and Actresses of Great Britain edited by his son, the late Vere Hutton, Edwin Booth's contributions to the acting of his father, which contain much valuable autobiographic material. For the same series Lawrence Barrett contributed an article on Edwin Booth. See also Boote and Coke, Life and Art of Edwin Booth (1863); Lawrence Hutton, Edwin Booth (1893); Henry A. Clapp, Reminiscences of a Dramatic Critic (Boston, 1902); A. B. Clarke. The Elder and the Younger Booth (Boston, 1883).

BOOTH, WILLIAM (1829— ) was born at Nottingham on the 10th of April 1829. At the age of fifteen his mind took a strongly religious turn, under the influence of the Wesleyan Methodists, in which body he became a local preacher. In 1849 he came to London, where, according to his own account, his passion for open-air preaching caused his severance from the Wesleyans. Joining the Methodist New Connexion, he was ordained a minister, but, not being employed as he wished in active "travelling evangelization," left that body also in 1861. Meanwhile he had (1855) married Miss Catherine Mumpford, and had a family of four children. Both he and his wife occupied themselves with preaching, first in Cornwall and then in Cardiff and Walsall. At the last-named place was first organized a "Hallelujah band" of converted criminals and others, who testified in public of their conversion. In 1864 Booth went to London and continued his services in tents and in the open air, and founded a body which was successively known as the East London Revival Society, the East London Christian Mission, the Christian Mission and (in 1878) the Salvation Army. The Army operates (1) by outdoor meetings and processions; (2) by visiting public-houses, prisons, private houses; (3) by holding meetings in theatres, factories and other unusual buildings; (4) by using the most popular song-tunes and the language of everyday life, &c.; (5) by making every convert a daily witness for Christ, both in public and private. The army is a quasi-military organization, and Booth modelled its "Orders and Regulations" on those of the British army. Its early campaigns "excited violent opposition, a "Skeleton Army" being organized to break up the meetings, and for many years Booth's followers were subjected to fine and imprisonment as breakers of the peace. Since 1889, however, these disorders have been little heard of. The operations of the army were extended in 1886 to the United States, in 1881 to Australia, and spread to the European continent, to India, Ceylon and elsewhere, "General" Booth himself being an indefatigable traveller, organizer and speaker. His wife (b. 1830) died in 1890. By her preaching at Gateshead, where her husband was circuit minister, in 1860, she began the women's ministry which is so prominent a feature of the army's work. A biography of her by Mr. Booth Tucker appeared in 1892.
In 1890 "General" Booth attracted further public attention by the publication of a work entitled *In Darkest England, and the Way Out*, in which he proposed to remedy pauperism and vice by a series of ten expeditions: (1) the city colony; (2) the farm colony; (3) the over-seas colony; (4) the household salvage bent; (5) the rescue homes for fallen women; (6) delivery for the drunkard; (7) the prison-gate brigade; (8) the poor man's bank; (9) the poor man's lawyer; (10) Whitechapelpbythe-Sea. Money was liberally subscribed and a large part of the scheme was carried out. The opposition and ridicule with which Booth's work was for many years received gave way, towards the end of the 19th century, to very widespread sympathy as his genius and its results were more fully realized.

The active encouragement of King Edward VII., at whose instance in 1902 he was invited officially to be present at the coronation ceremony, marked the completeness of the change; and when, in 1905, the "general" went on a progress through England, he was received in state by the mayors and corporations of many towns. In the United States also, and elsewhere, his work was cordially encouraged by the authorities.

**BOOTH** (connected with a Teutonic root meaning to dwell, whence also "bower"), primarily a temporary dwelling of boughs or other slight materials. Later the word gained the special meaning of a market stall or any non-permanent erection, such as a tent at a fair, where goods were on sale. Later still it was applied to the temporary structure where votes were registered, viz. polling-booth. Temporary booths erected for the weekly markets naturally tended to become permanent shops. Thus Stow states that the houses in Old Fish Street, London, "were at first but movable boards set out on market days to show their fish there to be sold; but procuring licence to set up sheds, they grew to shops, and by little and little, to tall houses."

As *booth* or *bough*, in Scotland, meaning generally a hut or other small enclosure, it was used by the barrack-like room on large farms where the unmarried labourers were lodged. This, known as the *Booth system*, was formerly common in Aberdeenshire and other parts of northern Scotland.

**BOOTHIA (Boothia Felix),** a peninsula of British North America, belonging to Franklin district, and having an area of 13,100 sq. m., between 69° 30' and 71° 50' N. and 91° 30' and 97° W. Its northermost promontory, Murchison Point, is also the northermost point of the American mainland. It was discovered by Captain (afterwards Sir James) Ross, during his expedition of 1829–1832, and was named after Sir Felix Booth, who had been chiefly instrumental in fitting out the expedition. Boothia forms the western side of Boothia Gulf. From the main mass of the continent the peninsula is almost separated by lakes and inlets; and a narrow channel known as Bellot Strait intervenes between it and North Somerset Island, which was discovered by Sir E. Parry in 1819. The peninsula is not only interesting for its connexion with the Franklin expedition and the Franklin search, but is of scientific importance from the north magnetic pole having been first distinctly localized here by Ross, on the western side, in 76° 6' N., 96° 45' W.

Boothia Gulf separates the north-western portion of Baffin Land and Melville Peninsula from Boothia Peninsula. It is connected with Barrow Strait and Lancaster Sound by Prince Regent Inlet, with Franklin Strait by Bellot Strait, and with Fox Channel by Fury and Hecla Strait. The principal bays are Committee and Pelly in the southern portion, and Lord Mayor in the western.

**BOOTLE, a municipal and county borough in the Bootle parliamentary division of Lancashire, England; at the mouth of the Mersey, forming a northern suburb of Liverpool. Pop. (1901) 58,566; an increase by nearly nine times in forty years. The great docks on this, the east bank of the Mersey, extend into the borough, but are considered as a whole under LIVERPOOL (q.v.). Such features, moreover, as communications, water-supply, &c., may be considered as part of the greater systems of the same city. The chief buildings and institutions are a hand-
After a short residence at Göttingen, Bopp was, on the recommendation of Humboldt, appointed to the chair of Sanskrit and comparative grammar at Berlin in 1821, and was elected a member of the Royal Prussian Academy in the following year. He brought out, in 1827, his *Auszählhes Lehrbüchle der Sanskrit-Sprache*, on which he had been engaged since 1821. A new edition, in Latin, was commenced in the following year, and completed in 1832; and a shorter grammar appeared in 1834. At the same time he compiled a Sanskrit and Latin glossary (1830) in which, more especially in the second and third editions (1847 and 1867), account was also taken of the cognate languages. In 1829, however, he ceased on the elaboration of the *Comparative Grammar*, which appeared in six parts and concluded in three volumes (Berlin, 1833, 1835, 1842, 1847, 1849, 1852), under the title *Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Lithauischen, Altislavischen, Göthischen, und Deutschen*. How carefully this work was matured may be gathered from the series of monographs printed in the *Transactions of the Berlin Academy* (1834 to 1831), by which it was preceded. They bear the general title, *Vergleichende Zergliederung der Sanskrit und der mit ihm verwandten Sprachen*. Two other essays (on the *Numerals, * 1839) followed the publication of the first part of the *Comparative Grammar*. The Old-Slavonian began to take its stand among the languages compared from the second part onwards. The work was translated into English by E. B. Eastwick in 1845. A second German edition, thoroughly revised (1856-1861), comprised also the Old-Armenian. From this edition an excellent French translation was made by Professor Michel Bréal in 1866. The task which Bopp endeavoured to carry out in his *Comparative Grammar* was threelof, — to give a description of the original grammatical structure of the languages as deduced from their intercomparison, to trace their phonetic laws, and to investigate the origin of their grammatical forms. The first and second points were subservient to the third. As Bopp's researches were based on the best available sources, and incorporated every new item of information that came to light, so they continued to widen and deepen in their progress. Witness his monographs on the vowel system in the Teutonic languages (1836), on the Celtic languages (1839), on the Old-Prussian (1853) and Albanian languages (1854), on the accent in Sanskrit and Greek (1854), on the relationship of the Malay-Polynesian with the Indo-European languages (1840), and on the Caucasian languages (1846). In the two last mentioned the impetus of his genius led him on a wrong track. Bopp has been charged with neglecting the study of the native Sanskrit grammars, but in those early days of Sanskrit studies the requisite materials were not accessible in the great libraries of Europe; and if they had been, they would have absorbed his exclusive attention for years, while such grammars as those of Wilkins and Colebrooke, from which his grammatical knowledge was derived, were all based on native grammars. The further charge that Bopp, in his *Comparative Grammar*, gave undue prominence to Sanskrit may be disproved by his own words; for, as early as the year 1830, he gave it as his opinion that frequently the cognate languages serve to elucidate grammatical forms lost in Sanskrit (Annals of Or. Lit. i. 3), — an opinion which he further developed in all his subsequent writings. Bopp's researches, carried with wonderful penetration into the most minute and almost microscopical details of linguistic phenomena, have led to the opening up of a wide and distant view into the original seats, the closer or more distant affinity, and the tenets, practices and domestic usages of the ancient Indo-European nations, and the science of comparative grammar may truly be said to date from his earliest publication. In grateful recognition of that fact, on the fiftieth anniversary (May 10, 1866) of the date of Windischmann's preface to that work, a fund called *Die Bopp-Stiftung*, for the promotion of the study of Sanskrit and comparative grammar, was established at Berlin, to which liberal contributions were made by his numerous pupils and the principal libraries in all parts of the globe. Bopp lived to see the results of his labours everywhere accepted, and his name justly celebrated. But he died, on the 23rd of October 1867, a poor man,—though his genuine kindliness and unselfishness, his devotion to his family and friends, and his rare modesty, endeared him to all who knew him.

**BOPPARD.** a town of Germany, in the Prussian Rhine province, on the left bank of the Rhine, 12 m. S. of Coblenz on the main line to Cologne. Pop. (1900) 9866. It is an old town still partly surrounded by medieval walls, and its most noteworthy buildings are the Roman Catholic parish church (12th and 13th centuries); the Carmelite church (1318), the former castle, now used for administrative offices; the Evangelical church (1851, enlarged in 1887); and the former Benedictine monastery of the Marienberg, founded 1173 and since 1839 a hydropathic establishment, crowning a hill 100 ft. above the Rhine. Boppard is a favourite tourist centre, and being less pent in by hills than many other places in this part of the picturesque gorge of the Rhine, has in modern times become a residential town. It has some comparatively insignificant industries, such as tanning and tobacco manufacture; its direct trade is in wine and fruit.

Boppard (Baudabriga) was founded by the Romans; under the Merovingian dynasty it became a royal residence. During the middle ages it was a considerable centre of commerce and shipping, and under the Hohenstaufen emperors was raised to the rank of a free imperial city. In 1312, however, the emperor Henry VII. pledged the town to his brother Baldwin, archbishop-elector of Trier, and it remained in the possession of the electors until it was absorbed by France during the Revolutionary epoch. It was assigned by the congress of Vienna in 1815 to Prussia.

**BORA,** an Italian name for a violent cold northerly and north-easterly wind, common in the Adriatic, especially on the Istrian and Dalmatian coasts. There is always a northern tendency in the winds on the north Mediterranean shores in winter owing to the cold air of the mountains sliding down to the sea where the pressure is less. When, therefore, a cyclone is formed over the Mediterranean, the currents in its north-western area draw the air from the cold northern regions, and during the passage of the cyclone the bora prevails. The bora also occurs at Novorossiysk on the Black Sea. It is precisely similar in character to the mistral which prevails in Provence and along the French Mediterranean littoral.

**BORACITE,** a mineral of special interest on account of its optical anomalies. Small crystals bounded on all sides by sharply defined faces are found in considerable numbers embedded in gypsum and anhydrite in the salt deposits at Lüneburg in Hanover, where it was first observed in 1787. In external form these crystals are cubic with inclined hemihedrisi, the symmetry being the same as in blende and tetrahedrite. Their habit varies according to whether the tetrahedron (fig. 1), the cube (fig. 2), or the rhombic dodecahedron (fig. 3) predominates. Penetration twins with a tetrahedron face as twin-plane are sometimes observed. The crystals vary from translucent to transparent, are possessed of a vitreous lustre, and are colourless or white, though often tinged with grey, yellow or green. The hardness is as high as 7 on Mohs' scale; specific gravity 3.0. As first observed by R. J. Hâüy in 1791, the crystals are markedly pyroelectric; a cube when heated becomes positively electrified on four of its corners and negatively on the four opposite corners. In a

**Fig. 1.** Crystals of Boracite.
BORAGINACEAE

crystal such as represented in fig. 3, the smaller and dull tetrahedral faces \( s \) are situated at the analogous poles (which become positively electrified when the crystal is heated), and the larger and bright tetrahedral faces \( s' \) at the antipodal poles.

The characters so far enumerated are strictly in accordance with the cubic symmetry, but when a crystal is examined in polarized light, it will be seen to be doubly refracting, as was first observed by Sir David Brewster in 1821. Thin sections show twin lamellae, and a division into definite areas which are optically biaxial. By cutting sections in suitable directions, it may be proved that a rhombic dodecahedral crystal is really built up of twelve orthorhombic pyramids, the apices of which meet in the centre and the bases coincide with the dodecahedral faces of the compound (pseudo-cubic) crystal. Crystals of other forms show other types of internal structure. When the crystals are heated these optical characters change, and at a temperature of 265° the crystals suddenly become optically isotropic; on cooling, however, the complexity of internal structure reappears. Various explanations have been offered to account for these "optical anomalies" of boracite. Some observers have attributed them to alteration, others to internal strains in the crystals, which originally grew as truly cubic at a temperature above 265°. It would, however, appear that there are really two crystalline modifications of the boracite substance, a cubic modification stable above 265° and an orthorhombic (or monoclinic) one stable at a lower temperature. This is strictly analogous to the case of silver iodide, of which cubic and rhombohedral modifications exist at different temperatures; but whereas rhombohedral as well as pseudo-cubic crystals of silver iodide (iodyrite) are known in nature, only pseudo-cubic crystals of boracite have as yet been met with.

Chemically, boracite is a magnesium borate and chloride with the formula \( \text{Mg}_2\text{Cl}_2\text{B}_2\text{O}_6 \). A small amount of iron is sometimes present, and an iron-borate with half the magnesium replaced by ferrous iron has been called huyssenite. The mineral is insoluble in water, but soluble in hydrochloric acid. On exposure it is liable to slow alteration, owing to the absorption of water by the magnesium chloride: an altered form is known as parasite.

In addition to embedded crystals, a massive variety, known as stassfurtite, occurs as nodules in the salt deposits at Stassfurt in Prussia: that from the carnallite layer is compact, resembling fine-grained marble, and white or greenish in colour, whilst that from the kainite layer is soft and earthy, and yellowish or reddish in colour (L.J.S.).

BORAGE (pronounced like "courage"); possibly from Lat. *borra*, rough hair, a herb (*Borago officinalis*) with bright blue flowers and hairy leaves and stem, considered to have some virtue as a cordial and a febrifuge; used as an ingredient in salads or in making claret-cup, &c.

BORAGINACEAE, an order of plants belonging to the sympetalous section of dicotyledons, and a member of the series Tubiflorae. It is represented in Britain by bugloss (*Echium*) (fig. 1), comfrey (*Symphytum*), *Myosotis*, hounds-tongue (*Cynoglossum*) (fig. 2), and other genera, while borage (*Borago officinalis*) (fig. 3) occurs as a garden escape in waste ground. The plants are rough-haired annual or perennial herbs, more rarely shrubby or arboreal, as in *Cordia* and *Ekretia*, which are tropical or sub-tropical. The leaves, which are generally alternate, are usually entire and narrow: the radical leaves in some genera, as *Pulmonaria* (lungwort) and *Cynoglossum*, differ in form from the stem-leaves, being generally broader and sometimes heart-shaped. A characteristic feature is the one-sided (*dorsiveniral*) inflorescence, well illustrated in forget-me-not and other species of *Myosotis*; the cyme is at first closely coiled, becoming uncoiled as the flowers open. At the same time there is often a change in colour in the flowers, which are red in bud, becoming blue as they expand, as in *Myosotis*, *Echium*, *Symphytum* and others. The flowers are generally regular; the form of the corolla varies widely. Thus in borage it is rotate, tubular in comfrey, funnel-shaped in hounds-tongue, and salver-shaped in alkanet (*Anchusa*); the throat is often closed by scale-like outgrowths from the corolla, forming the so-called corona. A departure from the usual regular corolla occurs in *Echium* and a few allied genera, where it is oblique; in *Lycopsis* it is also bent.

The five stamens alternate in position with the lobes of the corolla. The ovary, of two carpels, is seated on a ring-like disk which secretes honey. Each carpel becomes divided by a median constriction in four portions, each containing one ovule; the style springs from the centre of the group of four divisions.

The flowers show well-marked adaptation to insect-visits. Their colour and tendency to arrangement on one surface, with the presence of honey, serve to attract insects. The scales around the throat of the corolla protect the pollen and honey from wet or undesirable visitors, and by their difference in colour from the corolla-lobes, as in the yellow eye of forget-me-not, may serve to indicate the position of the honey. In most genera the fruit consists of one-seeded nutlets, generally four, but one or more may be undeveloped. The shape of the nutlet and the character of its coat are very varied. Thus in *Lithospermum* the nutlets are hard like a stone, in *Myosotis* usually polished, in *Cynoglossum* covered with bristles, &c.

The order is widely spread in of Forget-me-not; (2) ripe temperate and tropical regions, and fruits.

contains 85 genera with about 1200 species. Its chief centre is the Mediterranean region, whence it extends over central
Europe and Asia, becoming less frequent northwards. A smaller centre occurs on the Pacific side of North America. The order is less developed in the south temperate zone.

The order is of little economic value. Several genera, such as borage and Pulmonaria, were formerly used in medicine, and the roots yield purple or brown dyes, as in Alkanna tinctoria (alcanet). Heliotrope or cherry-pie (Heliotropium peruvianum) is a well-known garden plant.

BORÁS, a town of Sweden, in the district (län) of Elfsborg, 45 m. E. of Gothenburg by rail, on the river Viske. Pop. (1880) 4773; (1900) 15,872. It ranks among the first twelve towns in Sweden both in population and in the value of its manufacturing industries. These are principally textile, as there are numerous cotton spinning and weaving mills, together with a technical teaching school. The town was founded in 1632 by King Gustavus Adolphus.

BORAX (sodium pyroborate or sodium bibrorate), Na₂B₄O₆, a substance which appears in commerce under two forms, namely "common" or prismatic borax, Na₂B₄O₆·10H₂O, and "jewellers'" or octahedral borax, Na₂B₄O₆·5H₂O. It is to be noted that the term "borax" was used by the alchemists in a very vague manner, and is therefore not to be taken as meaning the substance now specifically known by the name. Prismatic borax is found widely distributed as a natural product (see below). Mineralogy (Heliotropium rupinum) in Tibet, and in Canada, Peru and Transylvania, while the bed of Borax Lake, near Clear Lake in California, is occupied by a large mass of crystallized borax, which is fit for use by the assayer without undergoing any preliminary purification.

The supply of borax is, however, mainly derived from the boric acid of Tuscany, which is fused in a reverberatory furnace with half its weight of sodium carbonate, and the mass after cooling is extracted with warm water. An alternative method is to dissolve sodium carbonate in lead-lined steam-heated pans, and add the boric acid gradually; the solution then being concentrated until the borax crystallizes. Borax is also prepared from the naturally occurring calcium borate, which is mixed in a finely divided condition with the requisite quantity of soda ash; the mixture is fused, extracted with water and concentrated until the solution commences to crystalize.

From a supersaturated aqueous solution of borax, the pentahydrate, Na₂B₄O₆·5H₂O, is deposited when evaporation takes place at somewhat high temperatures. The same hydrate can be prepared by dissolving borax in water until the solution has a specific gravity of 1.246 and then allowing the solution to cool. The pentahydrate is deposited between 79° C. and 86° C.; below this temperature the dehydrate of ordinary borax, Na₂B₄O₆·10H₂O, is deposited. Crystals of ordinary borax swell up to a very great extent on heating, losing their water of crystallization and melting to a clear white glass. The crystals of octahedral borax fuse more easily than those of the prismatic form and are less liable to split when heated, so that they are preferable for soldering or fluxing. Fused borax dissolves many metallic oxides, forming complex borates which in many cases show characteristic colours. Its use in soldering depends on the fact that solder only adheres to the surface of an unannealed metal, and consequently a little borax is placed on the surface of the metal and heated by the soldering iron in order to remove any superficial film of oxide. It is also used for glazing pottery, in glass-making and the glazing of tiles.

Boric acid (g.v.) being only a weak acid, its salts readily undergo hydrolytic dissociation in aqueous solution, and this property can be utilized with a concentrated aqueous solution of borax, for by adding litmus and then just sufficient acetic acid to turn the litmus red, the addition of a large volume of water to the solution changes the colour back to blue again. The boric acid being scarcely ionized gives only a very small quantity of hydroxyl ions, whilst the sodium ion produced by hydrolysis, being, as the name suggests, by the dilution of the solution, being a "strong base," is highly ionized and gives a comparatively large amount of hydroxyl ions. In the solution, therefore, there is now an excess of hydroxyl ions, consequently it has an alkaline reaction and the litmus turns blue.

Mineralogy.—The Tibetan mineral deposits have been known since very early times, and formerly the crude material was exported to Europe, under the name of tincal, for the preparation of pure borax and other boron salts. The most westerly of the Tibetan deposits are in the lake-plain of Pumna on the Rulangchu, a tributary of the Indus, at an elevation of 15,000 ft.: here the impure borax (sohage) occurs over an area of about 2 sq. m., and is covered by a saline efflorescence; successive crops are obtained by the agency of rain and wind. The deposit is probably of volcanic origin, and is extensive enough to warrant exploitation. Deposits of pure material (châl tal or water borax) occur at the lakes of Rudok, situated to the east of the Pumna district; also still farther to the east at the great lakes Tengri Nor, north of Lhasa, and several other places. More recently, the extensive deposits of borates (chiefly, however, of calcium; see Colemanite) in the Mohave desert on the borders of California and Nevada, and in the Atacama desert in South America, have been the chief commercial sources of boron compounds. The boron contained in solution in the salt lakes has very probably been supplied by the borate solution, which is produced by the evaporation of the waters of the lagoons in Tuscany with boracic acid. The deposits formed by evaporation from these lakes and marshes or saline, are mixtures of borates, various alkaline salts (sodium carbonate, sulphate, chloride), gypsum, &c. In the mud of the lakes and in the surrounding marshy soil fine isolated crystals of borax are frequently found. For example, crystals up to 7 in. in length and weighing a pound each have been found in large numbers at Borax Lake in Lake county, and at Borax Lake in San Bernardino county, both in California. Borax crystallizes with ten molecules of water, the composition of the crystals being Na₂B₄O₆·10H₂O. The crystals belong to the monoclinic system, and it is a curious fact that in habit and angles they closely resemble pyroxene (a silicate of calcium, magnesium and iron). There is a perfect cleavage parallel to the orthopinacoid and less perfect cleavages parallel to the faces of the prism. The mineral is transparent to opaque and white, sometimes greyish, bluish or greenish in colour.

BORDA, JEAN CHARLES (1732-1790), French mathematician and nautical astronomer, was born at Dax on the 4th of May 1733. He studied at La Flèche, and at an early age obtained a commission in the cavalry. In 1756 he presented a Mémoire sur le mouvement des projectiles to the Academy of Sciences, which elected him a member. He was present at the battle of Hastenbeck, and soon afterwards joined the naval service. He visited the Azores and the Canaries, of which he constructed an admirable map. In 1782 his frigate was taken by a British squadron; he himself was carried to England, but was almost immediately released on parole and returned to France. He died at Paris on the 20th of February 1790. Borda contributed a long series of valuable memoirs to the Academy of Sciences. His researches in hydromechanics were highly useful for marine engineering, while the reflecting and repeating circles, as improved by him, were of great service in nautical astronomy, being associated with J. B. J. Delambre and P. F. A. Méchain in the attempt to determine an arc of the meridian, and the greater number of the instruments employed in the task were invented by him.

BORDAGE. (1) A nautical term (from Fr. bord, side) for the planking on a ship's side. (2) A feudal term (from Lat. borda, a cottage) for the tenure by which a certain class of villein held
BORDEAUX, a city of south-western France, capital of the department of Gironde, 359 m. S.S.W. of Paris by a main line of the Orléans railway and 139 m. N.W. of Toulouse on the main line of the South-Western Railway. It is one of the finest and most extensive cities in France, and is situated on the left or west bank of the Garonne about 60 m. from the sea, in a plain which comprises the wine-growing district of Médoc. The Garonne at this point divides a semicircle, separating the city proper on the left bank from the important suburb of La Bastide on the right bank. The river is crossed by the Pont de Bordeaux, a fine stone structure of the early 19th century, measuring 1534 ft. in length, and by a railway bridge connecting the station of the Orléans railway company in La Bastide with that of the Southern company on the left bank. Looking west from the Pont de Bordeaux, the view embraces a crescent of wide and busy quays with a background of lofty warehouses, factories and mansions, behind which rise towers and steeples. Almost at the centre of the line of quays is the Place des Quinconces, round which lie the narrow, winding streets in which the life of the city is concentrated. Outside this quarter, which contains most of the important buildings, the streets are narrow and quiet and bordered by the low white houses which at Bordeaux take the place of the high tenements characteristic of other large French towns. The whole city is surrounded by the boulevards, one of which, the principal, is the suburb of Le Boucau, Caudran, Métrignac, Talence and Bègues. The principal promenades are situated close together near the centre of the city. They comprise the beautiful public garden, the allees de Tourny and the Place des Quinconces. The latter is planted with plane trees, among which stand two huge statues of Montaigne and Montesquieu, and terminates upon the quays with two rostral columns which serve as lighthouses. On its west side there is a monument to the Girondin deputies proscribed under the convention in 1793. At its south-west corner the Place des Quinconces opens into the Place de la Comédie, which contains the Grand Théâtre (18th century), the masterpiece of the architect Victor Louis. The Place de la Comédie, the centre of business in Bordeaux, is traversed by a street which, under the names of Cours du Chapeau-Rouge, rue de l’Intendance and rue Judaïque, runs from the Place de la Bourse and the quai de la Douane on the east to the outer boulevards on the west. Another important thoroughfare, the rue Sainte Catherine, runs at right angles to the rue de l’Intendance and enters the Place de la Comédie on the south. The Pont de Bordeaux is continued by the Cours du Chapeau-Rouge, then curved by the rue Sainte Catherine and ending to the cathedral of St. André. This church, dating from the 11th to the 14th centuries, is a building in the Gothic style with certain Romanesque features, chief among which are the arches in the nave. It consists of a large nave without aisles, a transept at the extremities of which are the main entrances, and a choir, flanked by double aisles and chapels and containing many works of art. Both the north and south façades are richly decorated with sculpture and statuary. Of the four towers flanking the principal portals, only those to the north are surmounted by spires. Near the choir stands an isolated tower. It contains the great bell of the cathedral and is known as the Clocher Pey-Berland, after the archbishop of Bordeaux who erected it in the 15th century. Of the numerous other churches of Bordeaux the most notable are St Seurin (11th to the 15th centuries), with a finely sculptured southern portal; Ste Croix (12th and 13th centuries), remarkable for its Romanesque façade; and St Michel, a fine Gothic building of the 13th and 16th centuries. The bell tower of St Michel, which has the highest spire (354 ft.) in the south of France, dates from the end of the 15th century, and, like that of the cathedral, stands apart from it. The palace of the Faculties of Science and of Letters (1881-1886) contains the tomb of Michel de Montaigne. The prefecture, the hôtel de ville, the bourse and the custom-house belong to the 15th century. The law-courts and the hospital of St André (the foundation of which dates from 1390) belong to the first half of the 14th century. Of greater antiquarian interest is the Palais Gallien, situated near the public garden, consisting of remains of lofty arcades, vaulting and fragments of wall, which once formed part of a Roman amphitheatre. Bordeaux lost its fortifications in the 18th century, but four of its old gates or triumphal arches belonging to that period still remain. Still older are the Porte de Calhau, once the entrance to the Palais de l’Ombrière, which before its destruction was the residence of the duke of Aquitaine, and the Porte de l’Hôtel de Ville, the former of the 15th, the latter of the 15th and 16th centuries.

Bordeaux is the seat of an archbishop, the headquarters of the XVIII army corps, the centre of an académie (educational division) and the seat of a court of appeal. A court of assizes is held there, and there are tribunals of first instance and of commerce, a council of trade-arbitrators, a chamber of commerce and a branch of the Bank of France. Its educational institutions include faculties of law, of science, of letters and of medicine and pharmacy, a faculty of Catholic theology, lycées, training colleges, a higher school of commerce, a chair of agriculture, a school of fine art and a naval school of medicine. There are several museums, including one with a large collection of pictures and sculptures, a library with over 200,000 volumes and numerous learned societies.

The trade of Bordeaux, the fourth port in France, is chiefly carried on by sea. Its port, 54 m. long and on the average 350 yds. wide, is formed by the basin of the Garonne and is divided into two portions by the Pont de Bordeaux. That to the south is used only by small craft; that to the north is accessible to vessels drawing from 21 to 26 ft. according to the state of the tide. From 1000 to 1200 vessels can be accommodated in the harbour, which is lined on both sides by quays and sloping wharves served by railway lines. At the northern extremity of the harbour, on the left bank, there is a floating basin of 25 acres in extent, capable of receiving the largest vessels; it has over 1900 yds. of quays and is furnished with a repairing dock and with elaborate machinery for the loading and unloading of goods. In 1907 the construction of new docks behind this basin was begun. The city maintains commercial relations with nearly all countries, but chiefly with Great Britain, Spain, Argentina, Portugal and the United States. The most important line of steamers using the port is the South American service of the Messageries Maritimes. The total value of the exports and imports of Bordeaux averages between 25 and 26 millions sterling yearly. Of this amount exports make up 131 millions, of which the sales of wine bring in about one quarter. The city is the centre of the wine trade, and the wine-cellars of the quays are one of its principal sights. Other principal exports are brandy, hides and skins, sugar, rice, woolen and cotton goods, salt-fish, chemicals, oil-cake, pitwood, fruit, potatoes and other vegetables. The chief imports are wool, fish, timber, rice, wine, rubber, coal, oil-grains, hardware, agricultural and other machinery and chemicals. A large fleet is annually despatched to the cod-fisheries of Newfoundland and Iceland. The most important industry is ship-building and refitting. Ironclads and torpedo-boats as well as merchant vessels are constructed. Railway carriages are also built. The industries subsidiary to the wine-trade, such as wine-mixing, cooperage and the making of bottles, corks, capsules, straw envelopes and wooden cases, occupy many hands. There are also flour-mills, sugar-refineries, breweries, distilleries, oil-works, cold-drying works, manufactories of canned and preserved fruits, vegetables and meat, and of chocolate. Chemicals, leather, iron-ware, machinery and pottery are manufactured, and a tobacco factory employs 1500 hands.

Bordeaux (Burdigala) was originally the chief town of the Bituriges Vivisci. Under the Roman empire it became a flourishing commercial city, and in the 4th century it was made the capital of Aquitania Secunda. Ausonius, a writer of the 4th century, who was a native of the place, describes it as four-square.
and surrounded with walls and lofty towers, and celebrates its importance as one of the greatest educational centres of Gaul. In the evils that resulted from the disintegration of the empire Bordeau had its full share, and did not recover its prosperity till the beginning of the 10th century. Along with Guinene it belonged to the English kings for nearly three hundred years (1024-1324). It was a time of brilliant court life of the brilliant court of Edward the Black Prince, whose son Richard was born in the city. An extensive commerce was gradually developed between the Bordeaux merchants and their fellow-subjects in England,—London, Hull, Exeter, Dartmouth, Bristol and Chester being the principal ports with which they traded. The English administration was favourable to the liberties as well as to the trade of the city. In 1235 it received the right of electing its mayors, who were assisted in the administration by a "jurade" or municipal council. The influence of Bordeaux was still further increased when several important towns of the region, among them St Emilion and Libourne, united in a federation under its leadership. The defeat of the English at the battle of Castillon in 1453 was followed, after a siege of three months, by the submission of Bordeaux to Charles VII. The privileges of the city were at once curtailed, and were only partially restored under Louis XI., who established there the parlement of Guinene. In 1548 the inhabitants resisted the imposition of the salt-tax by force of arms, a rebellion for which they were punished by the constable Anne de Montmorency with merciless severity.

The reformed religion found numerous adherents at Bordeaux, and after the massacre of St Bartholomew nearly three hundred of its inhabitants lost their lives. The 17th century was a period of disturbance. The city was for a time the chief support of the Fronde, and on two occasions, in 1653 and 1675, troops were sent to repress insurrections against royal measures. In the middle of the 18th century, a period of commercial and architectural activity for Bordeaux, the marquis de Tourny, intendant of Guinene, did much to improve the city by widening the streets and laying out public squares. It was the head-quarters of the Girondists at the Revolution, and during the Reign of Terror suffered almost as severely as Lyons and Marseilles. Its commerce was greatly reduced under Napoleon I. In 1814 it declared for the house of Bourbon; and Louis XVIII. afterwards gave the title of duc de Bordeaux to his grand-nephew, better known as the comte de Chambord. In 1870 the French government was transferred to Bordeaux from Tours on the approach of the Germans to the latter city.

See Camille Jullian, Hist. de Bordeaux, depuis les origines jusqu'en 1815 (Bordeaux, 1896); T. Malvezin, Hist. du commerce de Bordeaux (Bordeaux, 1892); Bordeaux, aperçu historique, sol, population, industrie, commerce, administration (Bordeaux, 1892).

BORDEN, SIR FREDERICK WILLIAM (1847— ), Canadian statesman, was born at Cornwallis, Nova Scotia, on the 14th of May 1847. He was educated at King's College, Windsor, and at Harvard University, and for some years practised medicine at Canning, Nova Scotia. In 1874 he was elected to the Canadian parliament as Liberal member for King's county. In 1896 he became minister of militia and defence in the Liberal ministry.

BORDEN, ROBERT LAIRD (1854— ), Canadian statesman, was born at Grand Pré, Nova Scotia, on the 26th of June 1854. In 1878 he was called to the bar, and became a leading lawyer in his native province. In 1886 he was elected to the Canadian parliament for the city of Halifax, but later lost his seat there and was elected for Carlton. In February 1901, on the resignation of Sir Charles Tupper, he became leader of the Conservative opposition. At the general election of 1908 he was returned again for the city of Halifax.

BORDENTOWN, a city of Burlington county, New Jersey, U.S.A., on the E. bank of the Delaware river, 6 m. S. of Trenton and 28 m. N.E. of Philadelphia. Pop. (1890) 4239; (1900) 4170; (1905) 4073; (1910) 4250. It is served by the Pennsylvania railway, the Camden & Trenton railway (an electric line, forming part of the line between Philadelphia and New York) and by freight and passenger steamboat lines on the Delaware. Bordentown is attractively situated on a broad, level plain, 65 ft. above the river, with wide, beautifully shaded streets. The city is the seat of the Bordentown Military Institute (with the Woodward memorial library), of the state manual training and industrial school for coloured youths, of the St Joseph's convent and mother-house of the Sisters of Mercy, and of St Joseph's academy for girls. There are ship-yards, iron foundries and machine shops, a woollen mill and canning factories. The first settlers on the site of the city were several Quaker families who came in the 18th century. Bordentown was laid out by Joseph Borden, in whose honour it was named; was incorporated as a borough in 1825; was re-incorporated in 1849, and was chartered as a city in 1867. It was the home for some years of Francis Hopkinson and of his son Joseph Hopkinson (whose residences are still standing), and from 1817 to 1832 and in 1837-1839 was the home of Joseph Bonaparte, ex-king of Spain, who lived on a handsome estate known as "Bonaparte's Park," which he laid out with considerable magnificence. Here he entertained many distinguished visitors, including Lafayette. The legislature of New Jersey passed a special law, enabling him, as an alien, to own real property, and it is said to have been in reference to this that the state received its nickname "Spain." Prince Napoleon Lucien Charles Murat, the second son of Joachim Murat, also lived here for many years; and the estate known as "Ironside's" was long the home of Rear-Admiral Charles Stewart. The Camden & Amboy railway, begun in 1831 and completed from Bordentown to South Amboy (4 m.) in 1832, was one of the first railways in the United States; in September 1831 the famous engine "Johnny Bull," built in England and imported for this railway, had its first trial at Bordentown, and a monument now marks the site where the first mills were laid.

BORDERS, THE, a name applied to the territory on both sides of the boundary lines between England and Scotland. The territory has also a literary and historical as well as a geographical sense, and is most frequently employed of the Scottish side. The line begins on the coast of Berwickshire at a spot 3 m. N. by W. of Berwick, and, after running a short distance W. and S., reaches the Tweed near the village of Paxton, whence it keeps to the river to a point just beyond Carham. There it strikes off S.S.E. to the Cheviot Hills, the watershed of which for 35 m. constitutes the boundary, which is thereafter formed by a series of streams—Bells Burn, the Kershope, Liddel and Esk. After following the last named for 10 m. it cuts across country due west to the Sark, which it follows to the river's mouth at the head of the Solway Firth. The length of the boundary thus described is 108 m., but in a direct line from the Solway to the North Sea the distance is only 70 m. At the extreme east end a small district of 8 sq. m., consisting of the tract north of the Tweed which is not included in Scotland, forms the "bounds" or "liberties" of Berwick, or the country of the borough and town of Berwick-on-Tweed. At the extreme west between the Sark and Esk as far up the latter as its junction with the Liddel, there was a strip of country, a "no man's land," for generations the haunt of outlaws and brigands. This was called the Debatable Land, because the possession of it was a constant source of contention between England and Scotland until its boundaries were finally adjusted in 1552. The English Border counties are Northumberland and Cumberland, the Scottish Berwick, Roxburgh and Dumfries; though historically, and still by usage, the Scottish shires of Selkirk and Peebles have always been classed as Border shires. On the English side the region is watered by the Till, Bowmont, Coquet, Rede and North Tyne; on the Scottish side the Tweed, Leader, Leet, Kale, Jed, Kershope, Liddel, Esk and Sark. Physically there is a marked difference between the country on each side. On the southern it mostly consists of lofty, bleak moorland, affording subsistence for sheep and cattle, and rugged gles and ravines, while on the northern there are many stretches of fertile soil, especially in the valleys and dales, and the landscape is often romantic and beautiful. Railway communication is
supplied by the east coast route to Berwick, the Waverley route through Liddesdale, the London & North-Western by Carlisle, the North British branch from Berwick to St Boswells, and the North Eastern lines from Berwick to Kelso, Alnwick to Coldstream, and Newcastle to Carlisle.

At frequent intervals during a period of 1500 years the region was the scene of strife and lawlessness. The Roman road of Watling Street crossed the Cheviots at Brownhawlaw (1664 ft.), close to the camp of Ad Fines, by means of which the warlike Brigantes on the south and the Gadreni and Otadeni on the north were held in check, while another Roman road, the Wheel Causeway, passed through Scotland to the headwaters of the North Tyne and Liddel. (For early history see LETHIAN; NORTHUMBRIA; STRATHCLYDE.) In the 12th century were founded the abbeys of Hexham and Alnwick, the priory church of Lindisfarne and the cathedral of Carlisle on the English side, and on the Scottish the abbeys of Jedburgh, Melrose and Dryburgh. The deaths of Alexander III. (1286) and Margaret the Maid of Norway (1290), whose right to the throne had been acknowledged, plunged the country into the wars of the succession and independence, and until the union of the crowns in 1603 the borders were frequently disturbed. The English and Carlisle forces were engaged, and battles took place at Haldon Hill (1335), Otterburn (1388), Nisbet (1402), Homildon (1402), Piperden (1413), Hedgeley Moor (1464), Flodden (1513), Solway Moss (1542), and Ancrum Moor (1544), in addition to many fights arising out of family feuds and raids fomented by the Armstrongs, Elliot's, Grahams, Johnstones, Maxwells and other families, of which the most serious were the encounters at Arkenholme (Langholm) in 1455, the Raid of Reidswire (1575), and the bloody combat at Dryfe Sands (1593). The English expeditions of 1544 and 1545 were exceptionallly disastrous, since they involved the destruction of the four Scottish border abbeys, the sack of many towns, and the obliteration of Roxburgh. The only other important conflict belongs to the Covenanters' time, when the marquess of Montrose was defeated at Philiphaugh in 1645. Partly for the defence of the kingdom and partly to awe the freebooters and moostroopers who were a perpetual menace to the peace until they were suppressed in the 17th century, castles were erected at various points on both sides of the border.

Even during the period when relations between England and Scotland were strained, the sovereigns of both countries recognized it to be their duty to protect property and regulate the lawlessness of the borders. The frontier was divided into the East, Middle and West Marches, each under the control of an English and a Scots warden. The posts were generally filled by eminent and capable men who had to keep the peace, enforce punishment for breach of the law, and take care that neither country encroached on the boundary of the other. The wardens usually conferred once a year on matters of common interest, and as a rule their meetings were conducted in a friendly spirit, though in 1575 a display of temper led to the affair of the Raid of Reidswire. The appointment was not only one of the most important in this quarter of the kingdom, but lucrative as well, part of the fines and forfeits falling to the warden, who was also entitled to ration and forage for his retinue. On the occasion of his first public progress to London, James I. of England attended service in Berwick church (March 27, 1603) "to return thanks for his peaceful entry into his new dominions." Anxious to blot out all memory of the bitter past, he forbade the use of the word "Borders," hoping that the designation Middle Shires "might take its place. Frontier fortresses were also to be dismantled and their garrisons reduced to nominal strength. In course of time this policy had the desired effect, though the expression "Borders" proved too convenient geographically to be dropped, the king's proposed amendment being in point of fact merely sentimental and, in the relative positions then and now of England and Scotland, meaningless. Some English strongholds, such as Alnwick, Chillingham, Ford and Naworth, have been modernized; others, like Norham, Wark and Wardworth, are picturesque ruins; but most of the Scottish fortresses have been demolished and their sites built over, or are now represented by grass-grown mounds. Another familiar feature in the landscape is the chain of peel towers crossing the country from coast to coast. Many were homes of marauding chiefs, and nearly all were used as beacon-stations to give alarm of foray or invasion. Early in the 18th century the Scottish gipsies found a congenial home on the Roxburghshire side of the Cheviots; and at a later period the Scottish border became notorious for a hundred years as offering hospitality to runaway couples who were clandestinely married at Gretna Green, Coldstream or Lamberton. The toll-house of Lamberton displayed the following inscription: "This is an asylum for all here and marriages performed on the most reasonable terms."

Border ballads occupy a distinctive place in English literature. Many of them were rescued from oblivion by Sir Walter Scott, who ransacked the district for materials for his Minstrelsy of the Scottish Border, which appeared in 1802 and 1803. Border traditions and folklore, and the picturesque, pathetic and stirring incidents of which the country was so often the scene, appealed strongly to James Hogg ("the Etrick Shepherd"), John Wilson ("Christopher North"), and John Mackay Wilson (1804-1853), whose Tales of the Borders, published in 1835, long enjoyed popular favour.

Besides the works just mentioned see Sir Herbert Maxwell, History of Dumfries and Galloway (1896); George Ridpath, Border History of England and Scotland (1776); Professor John Veitch, History and Poetry of the Scottish Border (1879); Sir George Douglas, History of the Border Counties (1903), and W. S. Crockett, The Scott Country (1902).

BORDIGHERA, a town of Liguria, Italy, in the province of Porto Maurizio, 91 m. S.W. of Genoa by rail, and 3 m. E.N.E. of Ventimiglia. Pop. (1901) 4073. It is a favourite winter resort, especially for visitors from England, and is situated in a beautiful coastal scenery. It has fine gardens, and its flowers and palms are especially famous: the former are largely exported, while the latter serve for the supply of palm branches for St Peter's at Rome and other churches on Palm Sunday. The new museum contains a unique collection of the flora of the Riviera. From 1682 until the Napoleonic period, Bordighera was the capital of a small republic of the villages of the neighbouring valleys.

BORDONE, PARIS (1495-1570), Venetian painter, was born at Treviso, and entered the bottom of Titian in 1590. Vasari, to whom we are indebted for nearly all the facts of Bordone's life—later research has not added much—to our knowledge—holds that he did not spend many years with Titian and set himself to imitate the manner of Giorgione to the utmost of his power. As a matter of fact, the Giorgionesque traits in Bordone's earlier works are derived entirely from Titian, whom he imitated so closely that to this day some of his paintings pass under Titian's name. Crowe and Cavalcaselle and Dr Bode ascribe to Bordone the "Baptism of Christ" in the Capitoline gallery, but Morelli sees in it an early work of Titian. Paris Bordone subsequently executed many important mural paintings in Venice, Treviso and Vicenza, all of which have perished. In 1538 he was invited to France by Francis I., at whose court he painted many portraits, though no trace of them is to be found in French collections, the two portraits at the Louvre being later acquisitions. On his return journey he undertook works of great importance for the Fugger palace at Augsburg, which again have been lost sight of. Bordone's pictures are of very unequal merit. They have a certain nobility of style, and that golden harmony of colour which he derived from Titian, together with the realistic conception of the human figure and the dignified character of the heads. Many of his nudes are a little coarse in form, and the action of his figures is frequently unnatural and affected. A true child of the Renaissance, he also painted a number of religious pictures, numerous mythological scenes, allegories, nymphs, cupids and subjects from Ovid's fables, but he excelled as a portraitist. His principal surviving work is the "Fisherman and Dog" at the Venice Academy. The National Gallery, London, has a "Daphnis and Chloe" and a portrait of a lady, whilst a "Holy Family" from his brush is at Bridgewater House. Other important works of
his are the “Madonna” in the Tadini collection at Loreve, the paintings in the Duomo of Treviso, two mythological pictures at the Villa Borghese and the Doria palace in Rome, the “Chess Players” in Berlin, a very little-known portrait of superb quality in the possession of the Council of the French at Hesse at Kronberg, and “The Greek Christ” in Philadelphia. Besides these, there are examples of his art in Bergamo, Milan, Genoa, Padua, Siena, Venice, Florence, Munich, Dresden and Vienna.

Beyond some references in general works on Italian painting, very little has been written on Paris Bordone since the days of Vasari. In the fourth century of the fourth century, Paris Bordone, Treviso, published L. Barlo and G. Biscari’s Della Vila e delle Opere di Paris Bordone: and the Nuova Antologia (November 16, 1900), contains a sixteen-page paper on Paris Bordone, by L. Musi (P. G. K.).

BORE, a high tidal wave rising up a narrow estuary or tidal river. The bore of the Severn is produced by a tide that rises 18 ft. in an hour and a half. This body of water becomes compressed in the narrowing funnel-shaped estuary, and heaped up into an advancing wave extending from bank to bank. The phenomenon is also particularly well illustrated in the Bay of Fundy. The origin of this word is doubtful, but it is usually referred to a Scandinavian word bora, a wave, billow. The other name by which the phenomenon is known, “eagre,” is also of unknown origin. There is, of course, no connexion with “bore,” to make a hole by piercing or drilling, which is a common Teutonic word, cf. Ger. bohren, the Indo-European root being seen in Lat. forare, to pierce, Gr. ἄφων, plough. For the making of deep holes for shafts, wells, &c., see BORING. The substantival use of this word is generally confined to the circular cavity of objects of tubular shape, particularly of a gun, hence the internal diameter of a gun, its “calibre” (see GUN). A “bore” is also a tiresome, wearying person, particularly one who persistently harps on one subject, in or out of season, whose audience may take it in. This has generally been taken to be merely a metaphorical use of “bore,” to pierce. The earliest sense, however, in which it is found in English (1766, in certain letters printed in Jesse’s Life of George Selwyn) is that of ennui, and a French origin is suggested. The New English Dictionary conjectures a possible source in Fr. borrar, to stuff, satiate.

BOREAS, in Greek mythology, a personification of the north wind. He was described as the son of Astraus and Eos, brother of Hesperus, Notus and Zephyrus. His dwelling-place was Haemus in Thrace, or at Samydessus, near the country of the Hyperboreans. He was said to have carried off the beautiful Oreithya, a daughter of Erechtheus, king of Athens, when he found her leading the dance at a festival, or gathering flowers on the banks of the Ilissus or some other spot in the neighbourhood of Athens. He had before wooed her in vain, and now carried her off to Mount Haemus, where they lived as king and queen of the winds, and had two sons, Zetes and Calais, and two daughters, Cleopatra and Chione (Apollodorus ii. 15; Ovid, Metam. vi. 67). For the loss of Oreithya the Athenians in after times counted on Boreas’s friendliness, and were assured of it when he sent storms which wrecked the Persian fleet at Athos and at Sepias (Herodotus vii. 180). For this they erected to him a sanctuary or altar near the Ilissus, and held a festival (Boreasmus) in his honour. Thruri also, which was a colony of Athens, offered sacrifice to him as Euergetes every year, because he had destroyed the hostile fleet of Dionysius the elder (Aelian, Var. Hist. xii. 61). In works of art Boreas was represented as bearded, powerful, draped against cold, and winged. On the Tower of the Winds at Athens he is figured holding a shell, such as is blown by Tritons. Boreas carrying off Oreithya is the subject of a beautiful bronze relief in the British Museum, found in the island of Calymna. The same subject occurs frequently on painted Greek vases.

BOREL, PETRUS, whose full name was PIERRE JOSEPH BOREL D’HAUTERIVE (1809-1859), French writer, was born at Lyons on the 26th of June 1809. His father had been ruined by taking part in the resistance offered by the Lyonnais royalists against the Convention, and Petrus Borel was educated in Paris to be an architect. He soon abandoned his profession to become one of the most violent partisans of the Revolutionary movement. His extravagant sentiments were illustrated in various volumes: Rhapsodies (1833), poems; Chantep器官, another of his poems (1839); Madame Politkna (1839), &c. His work does not rescue him from poverty, but through the kindness of Théophile Gautier and Mme de Girardin he obtained a small place in the civil service. He died at Mostaganem in Algeria on the 14th of July 1859.

See Jules Clarétie, Petrus Borel, le Lyceanthrope (1865); and Ch. Asselineau, Bibliographie romantique (1872).

BORELLI, GIOVANNI ALFONSO (1660-1749), Italian physiologist and physician, was born at Naples on the 28th of January 1668. He was appointed professor of mathematics at Naples in 1667, and in 1649, when he returned to Messina, but in 1747 was obliged to retire to Rome, where he lived under the protection of Christina, queen of Sweden, and died on the 31st of December 1749. His best-known work is De motu animalium (Rome, 1668-1681), in which he sought to explain the movements of the animal body on mechanical principles; he thus ranks as the founder of the 17th-century school. In a letter, Del movimento della cometa opposto il mese di dicembre 1664, published in 1665 under the pseudonym Pier Maria Moutoli, he was the first to suggest the idea of a comet. His other famous work was Teoriae medicae planetarum ex causis Physica deducta (Florence, 1666), in which he considered the influence of altitude on the satellites of Jupiter. He also wrote: Della Causa delle Febbre maligni (Pisa, 1658); Del Remum usu Judicium (Strassburg, 1664); Euclides Restitutus (Pisa, 1658); Apollinis Pergaei Conicorum libri vi, vii et viii (Florence, 1661); De vi percussionis (Bologna, 1667); Meteorologia Aetnea (Reggio, 1669); and De motilium naturalibus a gradulato pendulibus (Bologna, 1670). BORGÁ (Finnish Poros), a sea-port in the province of Nyland, grand duchy of Finland, situated at the entrance of the river Borgá into the Gulf of Finland, about 33 m. by rail N.W. of Helsingfors. Pop. (1810) 1693; (1870) 3478; (1904) 5255. It is the seat of a Lutheran bishopric which extends over the provinces of Viborg and St Michæl with portions of Tavastehus and Nyland; it possesses a beautiful cathedral, and a high school (where the well-known Finnish poet Runeberg lectured for many years), and is the seat of a court of appeal. The weaving of sail-cloth and the manufacture of tobacco are the principal industries, and the chief articles of trade are wood, butter, and meal. It was once a city of great dignity and importance, but the rapid growth of Helsingfors has somewhat eclipsed it. In 1809, when the estates of Finland were summoned to a special diet to decide the future of the country, Borgå was the place of meeting, and it was in the cathedral that the emperor Alexander I. pledged himself as grand duke of Finland to maintain the constitution and liberties of the grand duchy.

BORGHESE, a noble Italian family of Sienese origin, first mentioned in 1238, a member of which, Marcantonio Borghese, settled in Rome and was the father of Camillo Borghese (1550-1620), elected pope under the title of Paul V. (1605). Paul created his nephew prince of Vivero on the 17th of November 1600, and Philip III. of Spain conferred the title of prince of Sulmona on him in 1610. The family took its place among the higher Roman nobility by the marriage of the prince’s son Paolo with Olimpia, heiress of the Aldobrandini family, in 1614. In 1603 Camillo Filippo Ludovico, Prince Borghese (b. 1775), married Pauline, sister of the emperor Napoleon, and widow of General Leclerc. In 1806 he was made duke of Guastalla, and for some years acted as governor of the Piedmontese and Genoese provinces. After the fall of Napoleon he fixed his residence at Florence, where he died in 1832. The Borghese palace at Rome is one of the most magnificent buildings in the city, and contained a splendid gallery of pictures, most of which have been transferred to the Villa Borghese outside the Porta del Popolo, now Villa Umberto I., the property of the Italian government.

BORGESI—BORGIA, C.

BORGESI, BARTOLOMEO (1781–1860), Italian antiquarian, was born at Savignano, near Rimini, on the 11th of July 1781. He studied at Bologna and Rome. Having weakened his eyesight by the study of documents of the middle ages, he turned his attention to epigraphy and numismatics. At Rome he arranged and catalogued several collections of coins, amongst those those of the Vatican, a task which he undertook for Pius VII and the other popes. In 1821, Borghesi retired to San Marino, where he died on the 16th of April 1860. Although mainly an enthusiastic student, he was for some time podestà of the little republic. His monumental work, Nuovi Frammenti dei Fasti Consolari Capitoline (1818–1820), attracted the attention of the learned world as furnishing positive bases for the chronology of Roman history, while his contributions to Italian archaeological journals established his reputation as a numismatist and antiquarian. Before his death, Borghesi conceived the design of publishing a collection of all the Latin inscriptions of the Roman world. The work was taken up by the Academy of Berlin under the auspices of Mommsen, and the result was the Corpus Inscriptionum Latinarum. Napoleon III. ordered the publication of a complete edition of the works of Borghesi. This edition, in ten volumes, of which the first appeared in 1862, was not completed until 1897.

BORGIA, CESARE, duke of Valentinois and Romagna (1476–1507), was the son of Pope Alexander VI. by Vanozza dei Cattanei. He was born at Rome while his father was cardinal, and on the latter's elevation to the papacy (1492) he was created archbishop of Valencia and had a palace built for him by Alexander's favourite son, and it was for him that the pope's notorious nepotism was most extensively practised. In the early years of his father's pontificate he led a prodigal life at the Vatican. When Charles VIII. left Rome for the conquest of Naples (January 25, 1495), Cesare accompanied him as a hostage for the pope's good behaviour, but he escaped at Velletri and returned to Rome. He soon began to give proofs of the violence for which he afterwards became notorious; when in 1497 his brother Giovanni, duke of Gandia, was murdered, the deed was attributed, in all probability with reason, to Cesare. It was suggested that the motive of the murder was the brothers' rivalry in the affection of Donna Sancha, wife of Giurfrè, the pope's youngest son, while there were yet darker hints at incestuous relations of Cesare and the duke with their sister Lucrezia. But it is more probable that Cesare, who contemplated exchanging his ecclesiastical dignities for a secular career, regarded his brother's splendid position with envy, and was determined to enjoy the whole of his father's favours. In July 1497 Cesare went to Naples as papal legate and crowned Frederick of Aragon king. Now that the duke of Orleans needed men to carry out his political schemes, and tried to arrange a wealthy marriage for him, Cesare wished to marry Carlotta, the daughter of the king of Naples, but both she and her father resolutely refused an alliance with "a priest, the bastard of a priest." In August 1498, Cesare in the consistory asked for the permission of the cardinals and the pope to renounce the priesthood, and the latter granted it "for the good of his soul." On the 1st of October he set forth for France with a magnificent retinue as papal legate to Louis XII., to bring him the pope's bull annulling his marriage with Jeanne of France. He arrived at Milan, and exchanged gifts with Carlotta, of Naples, for the dukedom of Valentinois. In exchange he received the dukedom of Valentinois, as well as military assistance for his own enterprises. He found Carlotta of Naples in France, and having again tried to win her over in vain, he had to content himself with Charlotte d'Albret, sister of the king of Navarre (May 1499). Alexander now contemplated sending Cesare to Romagna to subdue the turbulent local despot, and with the help of the French king carve a principality for himself out of those territories owing nominal allegiance to the pope. Cesare made Cesena his headquarters, and with an army consisting of 30 French lances, 40 Genoese and Swiss, besides Italian troops, he attacked Imola, which surrendered at once, and then besieged Forlí, held by Caterina Sforza (q.v.), the widow of Girolamo Riario. She held out gallantly, but was at last forced to surrender on the 22nd of January 1500; Cesare treated her with consideration, and she ended her days in a convent. The Sforzas having expelled the French from Milan, Cesare returned to Rome in February, his schemes checked for the moment; his father rewarded him for his successes by making him gonfaloniere of the church and conferring many honours on him, he remained in Rome and took part in bull fights and military carnival festivities. In July occurred the murder of the duke of Bisceglie, Lucrezia Borgia's third husband. He was attacked by assassins on the steps of St Peter's and badly wounded; attendants carried him to a cardinal's house, and, fearing poison, he was nursed only by his wife and Sancha, his sister-in-law. Again Cesare was suspected as the instigator of the deed, and in fact he almost admitted it himself. Bisceglie was related to the Neapolitan dynasty, with whose enemies the pope was allied, and he had had a quarrel with Cesare. When it appeared that he was recovering from his wounds, Cesare had him murdered, but not apparently without provocation, for, according to the Venetian ambassador Cappello, the duke had tried to murder Cesare first.

In October 1500 Cesare again set out for the Romagna, on the strength of Venetian friendship, with an army of 10,000 men. Pandolfo Malatesta of Rimini and Giovanni Sforza of Pesaro fled, and those cities opened their gates to Cesare. Faenza held out, for the people were devoted to their lord, Astorre Manfredi, a handsome and virtuous youth of eighteen. Manfredi surrendered in April 1501, on the promise that his life should be spared; Rome in September, unwilling to be buffeted by Cesare for his bad old enemy the Valentinois, who at that time was afterwards foully outraged and put to death. After taking Castel Bolognese he returned to Rome in June, to take part in the Franco-Spanish intrigues for the partition of Naples. He was now lord of an extensive territory, and the pope created him duke of Romagna. His cruelty, his utter want of scruple, and his good fortune made him a terror to all Italy. His avidity was insatiable and he could brook no opposition; but, unlike his father, he was morose, silent and unsympathetic. His next conquests were Camerino and Urbino, but his power was now greatly shaken by the conspiracy of La Magione (a castle near Perugia where the plotters met). Several of the princes deposed by him, the Orsinis, and some of his own captains, such as Vitellozzo Vitelli (q.v.), Oliverotto da Fermo, and G. P. Baglioni, who had been given estates but feared to lose them, joined forces to conspire against the Borgias. Raisings broke out at Urbino and in Romagna, and the papal troops were defeated; Cesare could find no allies, and it seemed as though all Italy was about to turn against the hated family, when the French king promised help, and this was enough to frighten the confederates into coming to terms. The Duke of Urbino had shown very little local military skill, and all were ready to betray each other. But Cesare, while trusting no one, proved a match for them all. During his operations in northern Romagna, Vitelli, Oliverotto, Paolo Orsini, and the duke of Gravina, to show their repentance, seized Senigallia, which still held for the duke of Urbino, in his name. Cesare arrived at that town, decoyed the unsuspecting condottieri into his house, had them all arrested, and two of them, Vitelli and Oliverotto, strangled (December 31, 1502). He was back in Rome early in 1503, and took part in reducing the last rebel Orsini. He added gathering influences, and presently made himself master of central Italy: the summer in which both he and his father were simultaneously seized with fever. The pope died on the 18th of August, while Cesare was still incapacitated, and this unfortunate coincidence proved his ruin; it was the one contingency for which he had not provided. On all sides his enemies rose up against him; in Romagna the deposed princes prepared to regain their own, and the Orsinis raised their heads once more in Rome. Cesare's position was greatly shaken, and when he tried to browbeat the cardinals by means of Don Michelotto and his braves, they refused to be intimidated; he had to leave Rome in September, telling the people that the Spanish cardinals would elect a candidate friendly to his house. At the conclave Francesco Todeschini-Picolomini was elected as Pius III., and he showed every disposition to be peaceful and respectable, but he was old.
BORGI A, F.— BORGIA, L. 249

and in bad health. Cesare’s dominion at once began to fall to pieces; Guidobaldo, duke of Urbino, returned to his duchy with Venetian help; and the lords of Piombino, Rimini and Pesaro soon regained their own; Cesena, defended by a governor faithful to Cesare, alone held out. Pius III. died on the 18th of October 1503. You now conclude that Cesare, still count on the Spanish cardinals, wished to prevent the election of Giuliano della Rovere, the enemy of his house, but the latter’s chances were so greatly improved that it was necessary to come to terms with him. On the 1st of November he was elected, and assumed the name of Julius II. He showed no ill-will towards Cesare, but declared that the latter’s territories must be restored to the church, for “we desire the honour of recovering what our predecessors have wrongfully alienated.” Venice hoped to intervene in Romagna and establish her protectorate over the principalities, but this Julius was determined to prevent, and after trying in vain to use Cesare as a means of keeping out the Venetians, he had him arrested. Borgia’s power was now at an end, and he was obliged to surrender all his castles in Romagna save Cesena, Forli and Bettinoro, whose governors refused to accept an order of surrender from a master who was a prisoner. Finally, it was agreed that if Cesare were at liberty he would surrender the castles; this having been accomplished, he departed for Naples, where the Spaniards were in possession. The Spanish governor, Gonzalo de Cordova, had given him a safe-conduct, and he was meditating fresh plans, when Gonzalo arrested him by the order of Ferdinand of Spain as a disturber of the peace of Italy (May 1504). In August he was sent to Spain, where he remained a prisoner for two years; in November 1506 he made his escape, and fled to the court of his brother-in-law, the king of Navarre, under whom he took service. While besieging the castle of Viana, held by the rebellious count of Lerin, he was killed (March 12, 1507).

Cesare Borgia was a type of the adventurers with which the Italy of the Renaissance swarmed, but he was cleverer and more unsuccessful than the minor Cornelio viz. the ferocious and treacherous; but once the conquest was made he governed his subjects with firmness and justice, so that his rule was preferred to the anarchy of factions and local despots. But he was certainly not a man of genius, as has long been imagined, and his success was chiefly due to the support of the papacy; once his father was dead his career was at an end, and he could no longer play a prominent part in Italian affairs. His fall proved on how unsound a basis his system had been built up.

The chief aim of the life of Cesare Borgia are the same as those of Alexander VI., especially M. Creighton’s History of the Papacy, vol. v. (London, 1897); F. Gregorovius’s Geschichte der Stadt Rom, vol. vii. (Stuttgart, 1881); and P. Villari’s Machiavelli (London 1897); also, L. Wadding, Rerum Belgarum Annalyses (Paris, 1889), is still a very useful piece of writing; Schubert-Soldern, Die Borgia und ihre Zeit (Dresden, 1902), which contains the latest discoveries on the subject; and E. Alvisi, Cesare Borgia, Duca di Romagna (Imola, 1878). (L. V.)

BORGI A, FRANCIS (1510-1572), Roman Catholic saint, duke of Gandia, and general of the order of Jesus, was born at Gandia (Valencia) on the 10th of October 1510, and, from boyhood was remarkable for his piety. Educated from his twelfth year at Saragossa under the charge of his uncle the archbishop, he had begun to show a strong inclination towards the monastic life, when his father sent him in 1528 to the court of Charles V. Here he distinguished himself, and on his marriage with Eleanor de Castro, a Portuguese lady of high rank, he was created marquis of Lombay, and was appointed master of the horse to the empress. He accompanied Charles on his African expedition in 1535, and also into Provence in 1536; and on the death of the empress in 1539 he was deputed to convey the body to the burial-place in Granada. This sad duty confirmed his determination to leave the court, and also, should he survive his consort, to embrace the monastic life. On his return to Toledo, however, new honours were thrust upon him, much against his will; he was made vicerey of Catalonia and commander of the order of St. James. At Barcelona, the seat of his government, he lived a life of great austerity, but discharged his official duties with energy and efficiency until 1543, when, having succeeded his father in the dukedom, he at length obtained permission to resign his viceroyalty and to retire to a more congenial mode of life at Gandia. Having already held some correspondence with Ignatius Loyola, he now powerfully encouraged the recently founded order of Jesus. One of his first cares at Gandia was to build a Jesuit college; and when the death of Eleanor in 1546, he resolved to become himself a member of the society. The difficulties arising from political and family circumstances were removed by a papal dispensation, which allowed him, in the interests of his young children, to retain his dignities and worldly possessions for four years after taking the vows. In 1550 he visited Rome, where he was received with every mark of distinction, and where he furnished the means for building the Collegium Romanum. Returning to Spain in the following year, he formally resigned his rank and estate in favour of his eldest son, assumed the Jesuit habit, was ordained priest, and entered upon a life of penance and prayer. At his own earnest request, seconded by Loyola, a proposal that he should be created a cardinal by Julius III. was departed from; and at the command of his superior he employed himself in the work of itinerant preaching. In 1554 he was appointed commissary-general of the order in Spain, Portugal and the Indies, in which capacity he showed great activity, and was successful in founding many new and thriving colleges. In 1556, shortly after Charles V. retired, Borgia had an interview with him, in which reports were transferred to his allegiance to the order of Hieronymites. Some time afterwards Borgia was employed by Charles to conduct negotiations with reference to a project which was to secure for Don Carlos of Spain the Portuguese succession in the event of the death of his cousin Don Sebastian. On the death of Lainez in 1565, Francis Borgia was chosen to succeed him as third general of the Jesuits. In this capacity he showed great zeal and administrative skill; and so great was the progress of the society under his government that he has sometimes been called “its second founder.” The peculiarities which are most characteristic of the Borgia, were, however, derived from Loyola and Lainez, rather than from Borgia, whose ideal was a simple monasticism rather than a life of manifold and influential contact with the world. He died at Rome on the 30th of September 1572. He was beatified by St. Pius V. in 1624, and canonized by Clement X. in 1671, his festival being afterwards (1683) fixed by Innocent XI. for the 10th of October.

Several works by St. Francis Borgia have been published, the principal of these being Exercitationes Spirituæs, published at Antwerp (1614), and a treatise Rhetorica Consonantia. The Opera Omnia were published at Brussels in 1675. His life was written by his confessor Pedro de Ribaudegui. See also A. Butler’s Lives of the Popes, and the Breviarium Romanum (second nocturn for October 10).

BORGI A, LUCREZIA (1480-1519), daughter of Ferrara, daughter of Cardinal Rodrigo Borgia, afterwards Pope Alexander VI. (q.v.), by his mistress Vanozza de’ Cattanei, was born at Rome in 1480. Her early years were spent at her mother’s house near her father’s splendid palace; but later she was given over to the care of Adriano de Mila, a relation of Cardinal Borgia and mother-in-law of Giulia Farnese, another of his mistresses. Lucrezia was educated according to the usual curriculum of Renaissance ladies of rank, and was taught languages, music, embroidery, painting, &c.; she was famed for her beauty and charm, but the corrupt court of Rome in which she was brought up was not conducive to a good moral education. Her father at first contemplated a Spanish marriage for her, and at the age of eleven she was betrothed to Don Cherubin de Centelles, a Spanish nobleman. But the engagement was broken off almost immediately, and Lucrezia was married by proxy to another Spaniard, Don Gasparo de Prociola, son of the count of Avresa. On the death of Innocent VIII. (1492), Cardinal Borgia was elected pope as Alexander VI., and, contemplating a yet more ambitious marriage for his daughter, he annulled the union with Prociola; in February 1493 Lucrezia was betrothed to Giovanni Sforza, lord of Pesaro, with whose family Alexander was now in close alliance. The wedding was celebrated in June; but when the pope’s policy changed and he became friendly to the king
of Naples, the enemy of the house of Sforza, he planned the subjugation of the vassal lords of Romagna, and Giovanni, feeling his position insecure, left Rome for Pesaro with his wife. By Christmas 1495 they were back in Rome; the pope had all his children around him, and celebrated the carnival with a series of magnificent festivities. But he decided that he had done with Sforza, and annulled the marriage on the ground of the husband's impotence (March 1497). In order to cement his alliance with Naples, Borgia tried to have his son Lorenzo of Aragon, a handsome youth of eighteen, related to the Neapolitan king. But he too realized the futility of the Borgia's favour when Alexander backed up Louis XII. of France in the latter's schemes for the conquest of Naples. Bisceglie fled from Rome, fearing for his life, and the pope sent Lucrezia to receive the homage of the city of Spoleto as governor. On her return to Rome in 1499, her husband, who really loved her, was induced to join her once more. A year later he was murdered by the order of her brother Cesare. After the death of Bisceglie, Lucrezia retired to Nepi, and then returned to Rome, where she acted for a time as regent during her son Alexander the Great.

The latter now was anxious for a union between his daughter and Alphonso, son and heir to Ercole d'Este, duke of Ferrara. The negotiations were somewhat difficult, as neither Alphonso nor his father was anxious for a connexion with the house of Borgia, and Lucrezia's own reputation was not unblemished. However, by bribes and threats the opposition was overcome, and in September 1501 the marriage was celebrated by proxy with great magnificence in Rome. On Lucrezia's arrival at Ferrara she won over her reluctant husband by her youthful charm and her youthful plausibility. From that time forth she led a peaceful life, about which there was hardly a breath of scandal. On the death of Ercole in 1505, her husband became duke, and she gathered many learned men, poets and artists at her court, among whom were Ariosto, Cardinal Bembo, Aldus Manutius the printer, and the painters Titian and Dosso Dossi. She devoted herself to the education of her children and to charitable works; the only tragedy connected with this period of her life is the murder of Ercole Strozzi, who is said to have admired her and fallen a victim to Alphonso's jealousy. She died on the 24th of June 1510, leaving three sons and a daughter by Alphonso, and a son and a daughter by Rodrigo, the Duke of Bisceglie, and possibly another of doubtful paternity. She seems to have been a woman of very mediocre talents, and only played a part in history because she was the daughter of Alexander VI. and the sister of Cesare Borgia. While she was in Rome she was probably no better and no worse than the women around her, but there is no serious evidence for the charges of incest with her father and brothers which were brought against her by the scandal-mongers of the time.

See the bibliographies for Alexander VI. and Borgia, Cesare; and especially F. Gregorovius's Lucrezia Borgia (Stuttgart, 1874), the standard work on the subject; also W. Gilbert's Lucrezia Borgia, Duchess of Ferrara (London, 1869), which, while containing much information, is quite without historic value; and G. Campori's Una Vittima della Storia, Lucrezia Borgia, in the Nuova Antologia (August 31, 1866), which aims at the rehabilitation of Lucrezia. (L. V.)

BORGLUM, SOLON HANNIBAL (1868- ), American sculptor, was born in Ogden, Utah, on the 22nd of December 1868, the son of a Danish wood-carver. He studied under Louis F. Rebisso in the Cincinnati art school in 1895-1896, and under Frémiet in Paris. He took as his chief subjects incidents of western life, cowboys and Indians, with which he was familiar from his years on the ranch; notably "Lassoing Wild Horses," "Stampeding Wild Horses," "Last Round-up," "On the Border of White Man's Land," and "Burial on the Plains." His elder brother, Guttron Borlum (b. 1887), also showed himself an artist of some originality.

BORGONONE, AMBROGIO (fl. 1473-1524). Italian painter of the Milanese school, whose real name was Ambrogio Stefani da Fossano, was approximately contemporary with Leonardo da Vinci, but represented, at least during a great part of his career, the tendencies of Lombard art anterior to the arrival of that master—the tendencies which he had adopted and perfected from the hands of his predecessors Foppa and Zenale. We are not precisely informed of the dates either of the death or the birth of Borgognone, who was born at Fossano in Piedmont, and whose appetite was due to his artistic affiliation to the Burgundian school. His fame is principally associated with that of one great building, the Certosa, or church and convent of the Carthusians at Pavia, for which he worked much and in many different ways. It is certain, indeed, that there is no truth in the tradition which represents him as having designed, in 1473, the celebrated façade of the Certosa itself. Residence there appears to have been of eight years' duration, from 1486, when he furnished the designs of the figures of the virgin, saints and apostles for the choir-stalls, executed in tarsia or inlaid wood work by Bartolommeo Pola, till 1494, when he returned to Milan. Only one known picture, an altar-piece at the church San Eustorgio, can with probability be assigned to a period of his career earlier than 1486. For two years after his return to Milan he worked at the church of San Satiro in that city. From 1497 he was engaged for some time in decorating with paintings the staterooms of the Incurabili in the neighbouring town at Lodis. Our notice of him thenceforth are few and far between. In 1508 he painted for a church in Bergamo; in 1522 his signature appears in a public document of Milan; in 1524—and this is our last authentic record—he painted a series of frescoes illustrating the life of St. Sisinius in the portico of San Simpliciano at Milan. Without having produced any works of signal power or beauty, Borgognone is a painter of marked individuality. He holds an interesting place in the most interesting period of Italian art. The National Gallery, London, has two fair examples of his work from the time he was in Milan. In 1502 he painted for the Certosa di Pavia a series of frescoes, now destroyed, and containing the heads of two kneeling groups severally of men and women; and a large altar-piece of the marriage of St. Catherine, painted for the chapel of Rebecchino near Pavia. But to judge of his real powers and peculiar ideals—his system of faint and clear colouring, whether in fresco, tempera or oil; his somewhat slender and pallid types, without something that reminds us of northern art in their Teutonic sentimentality as well as their Teutonic fidelity of portraiture; the conflict of his instinctive love of placidity and calm with a somewhat forced and borrowed energy in figures where energy is demanded, his conservatism in the matter of stories and minutely diversified backgrounds—to judge of these qualities of the master as they are, it is necessary to study first the great series of his frescoes and altar-pieces at the Certosa, and next those remains of later frescoes and altar-pieces at Milan and Lodis, in which we find the influence of Leonardo and of the new time mingling with, but not expelling, his first predilections.

BORGÔ S AN DONNO, a town and episcopal see of Emilia, Italy, in the province of Parma, 14 m. N.W. by rail from the town of Parma. Pop. (1901) town, 62,511; commune, 12,109. It occupies the site of the ancient Fidentia, on the Via Aemilia; no doubt, as its name shows, of Roman origin. Here M. Lucullus defeated the democrats under Carbo in 82 B.C. It was independent under Vespasian, but seems soon to have become a village dependent on Parma. Its present name comes from the martyrdom of S. Dominus under Maximian in A.D. 304. The cathedral, erected in honour of this saint, is one of the finest and best-preserved Lombardo-Romanesque churches of the 11th-12th centuries in north Italy. The upper part of the façade is incomplete, but the lower, with its three portals and sculptures, is very fine; the interior is simple and well-proportioned, and has not been spoiled by restorations. For the bénitier, a work of the early 11th century, see RASSEGNA d'Arte, 1905, 180. Not far from the town is the small church of S. Antonio dei Viennese, a 13th-century structure in brick (ib., 1906, 22). The Palazzo Comunale, in the Gothic-Lombard style, is a work of the 14th century. Borgo S. Dominno is an important centre for the produce and cattle of Emilia.

BORGU, or BARBA, an inland country of West Africa. The western part is included in the French colony of Dahomey, the eastern division forms the Borgu province of the British protectorate of Nigeria. Borgu is bounded N.E. and E. by the
Boric Acid—Boring

Niger, S. by the Yoruba country, N.W. by Gurma. The country consists of an elevated plain traversed by rivers draining north or east to the Niger. The water-parting between the Niger basin and the coast streams of Dahomey and Lagos runs north-east and south-west near the western frontier. In about 10° N., below the town of Bussa, rapid stream courses the course of the Niger, navigable up to that point from the sea. The soil is mostly fertile, and is fairly cultivated, producing in abundance millet, yams, plantains and limes. The acacia tree is common, and from it gum-arabic of good quality is obtained. From the nut of the horse-radish tree ben oil is expressed. Cattle are common and of a extinct breed, and game is abundant. The Niger is inhabited by a number of pagan negro tribes, several of whom were dependent on the chief of Nikki, a town in the centre of the country, the chief being spoken of as sultan of Borgu. The king of Bussa was another more or less powerful potentate. In the early years of the 19th century Borgu was invaded by the Fula (q.v.), but the Bariba (as the people are called collectively) maintained their independence. In 1894 Borgu became the object of rivalry between France and England. The Royal Niger Company, which had already concluded a treaty of protection with the King of Bussa, sent out Captain (afterwards Sir) F. D. Lugard to negotiate treaties with the king of Nikki and other chiefs, and Lugard succeeded in doing so a few days before the arrival of French expeditions from the west. Disregarding the British treaties, French officers concluded others with various chiefs, invaded Bussa and established themselves at various points on the Niger. To defend British interests, the West African Frontier Force was raised locally under Lugard's command, and a period of great tension ensued, British and French troops facing one another at several places. A conflict was, however, avoided, and by the convention of June 1898 the western part of Borgu was declared French and the eastern British, the French withdrawing from all places on the lower Niger.

The British portion of Borgu has an area of about 12,000 sq. m. Up to the period of inclusion within the protectorate of Nigeria little or nothing was known of the country, though there were interesting legends of the antiquity of its history. The population was entirely independent, and resisted with success not only the Fula from the north but also the armies of Dahomey and Mossi from the south and west. Travellers who attempted to penetrate this country had never returned. Since 1898 the country has been opened, and from being the most lawless and turbulent of people the Bariba have become singularly amenable and law-abiding. Provincial courts are established, but there is little crime in the province. The British garrisons have been replaced by civil police. The assessment of taxes under British administration was successfully carried out in 1904, and taxes are collected without trouble. In south Borgu the people are agricultural but not industrious or inclined for trade. In the north there are some pastoral settlements of Fula. The Bariba themselves remain agricultural. Cart-roads have been constructed between the town of Kiama and the Niger. The agricultural resources of Borgu are great, and as the population increases with the cessation of war and by immigration the country should show marked development. Shea trees are abundant. Elephants are still to be found in the fifty-mile strip of forest land which stretches between the Niger and the interior of the province. The forest contains valuable sylvan products, and there are great possibilities for the cultivation of rubber. There are also extensive areas of fine land suitable for cotton, with the water-way of the Niger close at hand. Labour might be brought from Yorubaland close by, and a Yoruba colony has been experimentally started. (See NIGERIA and BUSA.)

Boric Acid, or Boracic Acid, H₃BO₃, an acid obtained by dissolving boron trioxide in water. It was first prepared by Wilhelm Homberg (1652–1715) from borax, by the action of mineral acids, and was given the name sal sudarium Hombergi. The reaction is essentially the same as the dissolution in sea-water, whilst it is also said to exist in plants and especially in fleshy fruits (A. H. Allen, Analyst, 1904, 301). The free acid is found native in certain volcanic districts such as Tuscany, the Lipari Islands and Nevada, issuing mixed with steam from fissures in the ground; it also is found as a constituent of many minerals (borax, boracite, boronatrocalcite and colemannite). The chief source of boric acid for commercial purposes is the Mareaum of Tuscany, an extensive and desolate tract of country over which jets of vapour and heated gases (solfonii) and springs of boiling water spurt out from chasms and fissures. In some places the fissures open directly into the air, but in other parts of the district they are covered by small muddy lakes (lagons). The sofonii contain a small quantity of boric acid (usually less than 0.1%), together with a certain amount of ammonium nitrate. In order that the plant may be set in the sun and its leaves be kept in a continuous system, the liquor in the first being concentrated and run off into a second, and so on, until it is sufficiently concentrated to crystallize. The crystals are purified by recrystallization from water. Artificial sofonii are sometimes prepared by boring through the rock until the fissures are reached, and the water so obtained is occasionally sufficiently impregnated with boric acid to be evaporated directly. Boric acid is also obtained from boronatrocalcite by treatment with sulphuric acid, followed by the evaporation of the solution so obtained. The residue is then heated in a current of superheated steam, in which the boric acid volatilizes and distils over. It may also be obtained by the decomposition of boracite with hot hydrochloric acid. In small quantities, it may be prepared by the addition of concentrated sulphuric acid to a cold saturated solution of borax.

\[
\text{Na}_2\text{B}_4\text{O}_5 + \text{H}_2\text{SO}_4 + \text{H}_2\text{O} = \text{Na}_2\text{SO}_4 + 4\text{H}_2\text{BO}_3
\]

Boric acid crystallizes from water in white nacreous laminae belonging to the triclinic system; it is difficult soluble in cold water, but dissolves readily in hot water. It is one of the "weak" acids, its dissociation constant being only 0.0169 (J. Walker, Jour. of Chem. Soc., 1900,lixvii. 7), and consequently its salts are appreciable in aqueous solution. The trioxide, B₂O₃, is a pyrogenic, and on being dissolved in water it forms boric acid, H₃BO₃, with the liberation of a large quantity of heat, which may be utilized. The trioxide is a fine white crystalline powder, of a faint acid reaction, and is only slightly soluble in water. When heated, the weight of the anhydrous acid increases to 1.17 g. Boric acid is easily soluble in alcohol, and if the vapour of the solution be inflamed it burns with a characteristic vivid green colour. The substance is a powerful disinfectant. It is used as the active principle of boric acid, H₂BO₃, or 40% aqueous solution. Boric acid, H₂BO₃, is produced; at still higher temperatures, boron trioxide is formed. The salts of the normal or orthoboric acid in all probability do not exist; meta- and paraboric acid, however, forms several well-defined salts which are readily converted, even by carbon dioxide, into salts of pyroboric acid. That orthoboric acid is a tribasic acid is shown by the formation of ethyl orthoborate on esterification, the vapour density of which corresponds to the molecular formula B(OH)₃; the molecular formula of the acid must consequently be B(OH)₃ or H₂BO₃. The metallic borates are generally obtained in the hydrated condition, although the exception of those of the alkali metals, are insoluble in water. The most important of the borates is sodium pyroborate or borax (q.v.).

Boron and boracic acid are feeble but useful antiseptics. Hence they may be used to preserve food-substances, such as milk and butter (see ANULATION). In medicine boracic acid is used in solution to relieve itching, but its chief use is as a mild antiseptic to impregnate lint or cotton-wool. Recent work has shown it to be effective to be relied upon alone, but where really efficient antiseptics, such as mercuric chloride and iodide, and carbolic acid, have been employed, boracic acid (which, unlike these, is non-poisonous and non-irritant) may legitimately be used to maintain the aseptic or non-bacterial condition which they have obtained. Borax taken internally is of some value in irritability of the bladder, but as a sedative antiseptic it is surpassed by several recently introduced drugs, such as urotropine.

Boring. The operations of deep boring are resorted to for ascertaining the nature, thickness and extent of the various
geological formations underlying the surface of the earth. Among the purposes for which boring is specifically employed are: (i) prospecting or searching for mineral deposits; (ii) sinking petroleum, natural gas, artesian or salt wells; (iii) determining the depth below the surface of bed-rock or other firm substratum, together with the character of the overlying materials, preparatory to mining or civil engineering operations; (iv) carrying on geological or other scientific explorations.

Prospecting by boring is practised most successfully in the case of mineral deposits of large area, which are nearly horizontal, or at least not highly inclined; e.g. deposits of coal, iron, lead and salt. Wide, flat beds of such minerals may be pierced at any desired number of points. The depth at which each hole enters the deposit and the thickness of the material itself are readily ascertained, so that a map may be constructed with some degree of accuracy. Samples of the mineral are also secured, furnishing data as to the value of the deposit. While boring is sometimes adopted for prospecting irregular and steeply inclined mineral deposits of small area, the results are obviously less trustworthy than under the conditions named above, and may be actually misleading unless a large number of holes are bored. Incidentally, bore-holes supply information as to the character and depth of the valueless deposits of earth or rock overlying the mineral deposit. Such data assist in deciding upon the appropriate method for, and in estimating the cost of, sinking shafts or driving tunnels for the development of the deposit. Sounding of petroleum wells is not only for discovering the oil-bearing strata but also for extracting the oil. This industry has become of great importance in many parts of the United States, in southern Russia and elsewhere. Rock salt deposits are sometimes worked through bore-holes, by introducing water and pumping out the solution of brine for further treatment. The sinking of artesian wells is another application of boring. They are often hundreds, and sometimes thousands, of feet in depth. A well in St Louis, Missouri, has a depth of 3843 ft.

Boring is useful in mines themselves for a variety of purposes, such as: (a) exploring the deposit ahead of the workings, searching for neighbouring veins, and sounding the ground on approaching dangerous inundated workings. In the coal regions of Pennsylvania, bore-holes are often sunk for carrying steam pipes and hoisting ropes underground at points remote from a shaft.

Several of the methods of boring in soft ground are employed in connexion with civil engineering operations; as for ascertaining the depth below the surface to solid rock, preparatory to excavating for and designing deep foundations for heavy structures, and for estimating the cost of large scale excavations in case of the site.

Lastly, a number of deep holes have been bored for geological exploration or for observing the increase of temperature in depth in the earth's crust; for example, at Parachowitz, Silesia, about 6700 ft. deep; at Leipzig, Germany, 6165 ft.; near Pittsburgh, Pennsylvania, 5532 ft.; and at Wheeling, West Virginia, nearly 5000 ft. The two last mentioned were intended to obtain as complete a knowledge as possible of the bituminous coal and oil-bearing formations.

There are five methods of boring, viz.: (i) (earth) augers, (ii) (wood) augers, (iii) jointed rods and drop drill, (iv) the rope system, in which the rods are replaced by rope, (v) rotary drills. The first two methods are adapted to soft or earthy soils; the others are for rock.

1. Earth augers comprise spiral and pod augers. The ordinary spiral auger resembles the wood auger commonly used by carpenters. It is attached to the rod or stem by a socket joint, successive sections of rod being added as the hole is deepened. The auger is rotated by means of horizontal levers, clamped to the rod—by hand for holes of small diameter (2 to 6 in.), the larger sizes (8 to 16 in.) by horse power. Clayey, cohesive soils, containing few stones, are readily bored; stony ground with difficult wells, boring operations of the auger are intermittent. After a few revolutions it is raised and emptied, the soil clinging between the spirals. Depths to 50 or 60 ft. are usually bored by hand; deeper holes by horse power. For sandy, non-cohesive soils, the auger may be encircled by a close-fitting sheet-iron cylinder to prevent the soil from falling out.

Pod augers generally vary in diameter from 8 to 20 in. A common form (fig. 1) consists of two curved iron plates, one attached to the other, and revolved, by being turned through a few revolutions the pod is filled, and then raised and emptied. For boring in sandy soils, the open sides are closed by hinged plates. They are another kind of auger. For holes of large diameter, earth augers are handled with the aid of a light derrick.

2. Drive pipes are widely used, both for testing the bearing power of a character of soft material overlying solid rock and as a necessary preliminary to rock boring. In the simplest form the drive pipe consists of one or more lengths of tapering pipe, open at both ends and from \( \frac{3}{4} \) in. to 6 in. diameter. When of small size the pipe is driven by a heavy hammer; for deep and large holes, a light pile-driver becomes necessary. The lower end of the pipe is provided with an annular steel shoe; the upper end has a drivehead for receiving the blows of the hammer. Successive lengths are screwed on as required. For shallow holes the pipe is cleaned out by a "bailer" or "sand-pump"—a cylinder 4 to 6 ft. long, filled with water, and lowered at intervals, filled by being dashed up and down, and then raised and emptied. If, after reaching some depth, the external frictional resistance prevents the pipe from sinking farther, another pipe of small diameter may be inserted, and the drive-pipes are often sunk by applying weights at the surface and slowly rotating by a lever. Two pipes are then used, one inside the other. Water is pumped down the inner pipe and entering the soil, raising the debris and increasing the speed of driving. The driven "well" for water supply is an adaptation of the drive-pipe, and put down in the same way.

3. Drill and Rods.—The method has long been used in Europe and elsewhere for deep boring, and in United States it is rarely employed for depths greater than 200 or 300 ft. The usual form of cutting tool or drill is shown in fig. 3. The iron rods are from 1 to 2 in. square, in long lengths with screw joints (fig. 4). Wooden rods are also occasionally used. For shallow holes (50 to 75 ft.) the work is done by hand, one or two cross-bars being clamped to the rod. The men alternately raise and drop the drill, meanwhile slowly walking forward and advancing to the bit and so keep the hole true.

The cuttings are cleaned out by a bailer, as for drive pipes. In boring by hand, the practical limit of depth is soon reached, on account of the increasing weight of the rods. For going deeper, the "pole" method is used. The drill is suspended from a heavy "walking beam" or lever, usually oscillated by a steam engine. By means of a screw-feed device, the rods, which are rarely more than 10 ft. long, are graduated near the top in the rod and may be attached rigidly to the rods as in shallow boring, because the momentum of the heavy moving parts, transmitted directly to the bit as the blow is struck, would cause excessive vibration if it became necessary, therefore, to introduce a sliding-link joint between the rods and bit. One form of link is shown in fig. 5. On striking, the link comes to rest, while the rods continue to descend to the end of the stroke, the upper member of the link sliding down upon the lower. Then, on the up stroke the lower link, with the bit, is raised for delivering another blow. For large holes the striking weight is, say, 800 to 1000 lb., length of stroke 20 to 35 ft., and speed from 20 to 30 strokes per minute.
By using the sliding link the cross-section and weight of the rods may be greatly reduced, the only strain being that of tension. To deliver a sharp, effective blow, however, the rods must drop with a quick stroke, which brings a heavy strain upon the operating mechanism, requiring ordinary "free-falling tools" to be devised. By these the bit is allowed to fall by gravity; the rod follows on its measured downward stroke, and picks up the bit. Free-falling tools are of two classes: (1) those by which the bit is released automatically; (2) those operated by a sudden twist imparted to the rod by the drillman. One of the best known of the first class is the Kind free-fall (fig. 6). The shank of the bit is gripped and released by the jaws J, J', worked through a toggle joint by movements of the disk D. When the rod begins its downward stroke, the resistance of the water in the hole slightly raises D, thus opening the jaws and releasing the bit, which falls by gravity. On reaching the end of the stroke the jaws again catch the shank of the bit and raise it for delivering another blow. The Fabian free-fall may be noted as an example of the second class (see Köhler, Lehrbuch der Bergbaukunde, p. 57). Tools are sometimes used for cutting an annular groove in the bottom of the hole, and raising to the surface the core so formed, for observing the character of the rock.

4. Rope and Drop Tools.—This method was long ago used in China. Because of its extensive application in the oil-fields it is generally designated in the United States as the "oil-well system." In its various modifications it is often employed also in general prospecting of mineral deposits and in sinking shallow shafts, natural gas and salt wells. One of its forms is known in England as the Mather & Platt system.

The chief point of difference from rod-boring is the substitution of rope for the jointed rods. For the deep boring it possesses the advantage of saving the large amount of time consumed in raising and lowering the rods, as required whenever the hole is to be cleaned out, or a dull bit replaced, since the tools are rapidly run up or down by means of the rope which is generally kept going while drilling. The speed of rope-boring is therefore but little affected by increase of depth, while with rod-boring it falls off rapidly. In its simplest form the so-called "rope-drill" consists of a hollow rope, with an annular groove along the inner side, fed into the hole, and having a roller at the lower end. The rope is composed of the bit or drill, jars and rope-socket. The jigs are a pair of sliding links, similar to those used for rod-boring, but serving a different purpose, viz., to produce a sharp shock on the upward stroke, as the jigs come together, for loosening the bit should it tend to stick fast in the hole. A heavy bar (auger stem) is generally inserted between the jars and bit, for increasing the force of the blow. The weight of another bar above the jars (sinker-bar) keeps the rope taut. The length of stroke and feed are regulated by the "temper-screw" (fig. 7), a feed device resembling that used for rod-boring. Clamped to the eye of the drill rope, which is let out at intervals, as the hole is deepened. The bits usually range from 3 to 8 in. diameter, the speed of boring being generally between 5 and 10 ft. per minute, and 40 ft. per 24 hours, according to the kind of rock. A great variety of special "fishing tools" are made, for use in case of breakage of parts in the hole or other accidents.
