Fam. 3. Pronomeoniidae. Short and truncate in front; thick cuticle, often without papillae; gills and radula present. Pronomeonia, Macelomina, Poranopalia, Dendymia, Cyclemnia, Preparamenia, Uncitomenia, Krusemiella.

Suborder II. Chaetodermonomorpha.—Aplacophora without distinct ventral groove, with single median uniserial gonad, with differentiated hepatic sac, and with calcareous oropharynx furnished with two bipectinate gills. There are only two genera in this suborder: Chaetoderma, Limfisstor from Alaska. The characters therefore are very uniform. The body is worm-like and cylindrical, the posterior half a little thicker than the anterior; the posterior extremity is somewhat rounded. The whole surface is uniformly covered with short compressed calcareous spicula embedded in the cuticle.

Brachitomy.—The single pair of branchiae are placed symmetrically right and left of the anus, and each has the structure of a ctenidium bearing a row of lamellae on each side in the Polyplacophora.

Intestine.—The mouth is anterior, terminal and crescentic, and beneath it is a rounded ventral shield. On the floor of the pharynx or buccal mass is a rudimentary radula, in which many species consists of a single large tooth, bearing two small teeth or a row of teeth. In other species the radula is more complex, in the form of a saddle, bearing several transverse rows of two to three teeth each. Two pairs of salivary glands open into the buccal cavity. The digestive tube is straight and simple, wider in its anterior part, into which opens the duct of the hepatic caecum (fig. 4, B). The latter extends backwards on the ventral side of the intestine.

Coelom, Gonads and Excretory Organs.—These are closely similar in their relations to those of the Neomeniomorpha. The chief difference is that the gonad or generative portion of the coelom is single and median, opening into the pericardium by a single posterior aperture. The excretory organs or coelomodsucts arise from the posterior corners of the pericardium, run forwards and then backwards to open by separate apertures lateral to the gills (fig. 5, A). There are no accessory generative organs.

The heart and vascular system are similar to those of the Neomeniomorpha, the only important differences being that the ventricle is nearly free in the pericardial cavity, and that the latter is traversed by the retractor muscles of the valves.

Nervous System.—There are two closely connected cerebral ganglia, from which arise the usual two pairs of nerve cords. Pallial and pedal on each side are closer together than in the other groups, and these cords unite to form the supra-rectal cord provided with median ganglionic enlargement (fig. 4, C). A small stomatogastric commissure bearing two small ganglia arises from the cerebral ganglia and surrounds the oesophagus.

The development is at present entirely unknown.

General Remarks on the Amphineura.

The most important theoretical question concerning the Amphineura is how far do they represent the original condition of the ancestral molluscs? That is to say, we have to inquire which of their structural features is primitive and which modified. Their bilateral symmetry is obviously to be regarded as primitive, and the nervous system shows an original condition from which that of the asymmetrical twisted Gastropods can be derived. But in many other features both external and internal the three principal divisions differ so much from one another that we have to consider in the case of each organ-system which condition is the more primitive. According to Paul Pelseneer the Polyplacophora are the most archaic, the Aplacophora being specialized in (1) the great reduction of the foot, (2) the disappearance of the shell (Cryptopsolus among the Polyplacophora showing both reductions in progress), (3) the disappearance of the radula. But it is a widely recognized principle of morphology that a much modified animal is by no means modified to the same degree in all its organs. A form which is primitive on the whole may show a more advanced stage of evolution in some particular system of organs than another animal which is on the whole highly developed and specialized. Thus the independent metamere of certain organs in the Chitons is not primitive but acquired within the group; e.g. the shell valves and the coelom. And although embryology seems to prove that the Neomeniomorpha are derived from a form allied with the Lamellibranchs, nevertheless it seems probable that the calcareous spicules which alone are present in adult Aplacophora preceded the solid shell in evolution.

It is held by some morphologists that the mollusc body is unsegmented, and therefore is to be compared to a single segment of a Chaetopod or Arthropod. In this case there should be only one pair of coelomodsucts in the adult, the pair of true nephridia which should also occur being represented by the larval nephridia. There should also be only a single coelom, or a pair of lateral coelomic cavities. On this view then the Aplacophora are more primitive than the Polyplacophora in the relations of coelom and coelomodsucts; and the genital ducts of the Chitons have arisen either by metameric repetition within the group, or by the gradual loss of an original connexion between the generative sac and the renal tube, as in Lamellibranchs and Gastropods, the generative sac acquiring a separate duct and opening to the exterior on each side.

CHITRAL, a native state in the North-West Frontier Province of India. The state of Chitral (see also Hindu Kush) is somewhat larger than Wales, and supports a population of about 35,000 rough, hardy hillmen. Previous estimates put the number far higher, but as the Mehtar assesses his fighting strength at...
The District of Chittagong is situated at the north-east corner of the province, occupying a strip of coast and hills between the sea and the mountains of Burma. Its area is 2,492 sq. m. In 1901 the population was 1,533,2,260, showing an increase of 5% in the decade. A large number of British officials and others also settle in Chittagong, the highest hill being the sacred Sitakund, 1,145 ft. high. The principal rivers are the Karnaphuli, on which Chittagong town is situated, navigable by sea-going ships as far as Chittagong port, and by large tramp vessels for a distance of 60 miles up the river. The Haldi and the Sangu, and which are also navigable by large boats. The wild animals are tigers, elephants, rhinoceroses, leopards and deer. The climate is comparatively cool, owing to the sea breeze which prevails during the day; but at night the lapse in temperature is very moist, with heavy dews at night and fogs. Chittagong was ceded to the East India Company by Nawab Mir Kasim in 1760. The northern portion of the district is traversed by the Assam-Bengal railway. Tea cultivation is carried on on a large scale. The Chittagong Hill Tracts formed an independent district from 1760 to 1891, were then reduced to the status of a sub-division, but were again created a district in 1900. They occupy the ranges between Chittagong proper and the south Lushai hills. The area covers 513 sq. m. In 1901 the population was 124,762, showing an increase of 16% in the decade. The inhabitants, who are either Arakanese or aboriginal tribes, are almost all Buddhists. The headquarters are at Rangamati, which was wrecked by the cyclone of October 1897.

The Division of Chittagong lies at the north-east corner of the Bay of Bengal, extending northward along the left bank of the Meghna. It consists of one district, Chittagong, the Hill Tracts, Noakhali and Tippera. Its area is 177 sq. m.; the population in 1901 was 4,737,731.

Chittagong, a seaport of British India, giving its name to a district and two divisions of Eastern Bengal and Assam. It is situated on the right bank of the Karnaphuli river, about 12 m. from its mouth. It is the terminus of the Assam-Bengal railway. The municipal area covers about 9 sq. m.; pop. (1901) 122,977. There is a sea-bathing chiefly of jute, other items being tea, raw cotton, rice and hides. There is considerable trade by country boats bringing chiefly cotton, rice, spices, sugar and tobacco. Since October 1905 Chittagong has become the chief port of the new province of Eastern Bengal and Assam.
on a hill 1305 ft. above sea-level, and is surrounded by medieval walls, in which, in places, fragments of the Etruscan wall are incorporated. The cathedral of S. Mustiola is a basilica with a nave and two aisles, with eighteen columns of different kinds of marble, from ancient buildings. It has been restored and decorated with frescoes in modern times. The campanile belongs to the 13th century. The place was devastated by malaria in the middle ages, and did not recover until the Chiana valley was drained in the 18th century. For the catacombs see Clusium.

CHIVALRY (O. Fr. chevalerie, from Lat. caballerius) the knightly class of feudal times, possessing its own code of rules, moral and social (see Knighthood and CHIVALRY). The primary sense in the middle ages is "knight" or "fully armed and mounted fighting men." Thence the term came to mean that gallantry in battle and high sense of honour in general expected of knights. Thus "to do chivalry" was a medial phrase for "to act the knight." Lastly, the word came to be used in its present very general sense of "courtesy." In English law chivalry meant the tenure of land by knights' service. It was a service due to the crown, usually forty days' military attendance annually. The Court of Chivalry was a court instituted by Edward III., of which the lord high constable and earl marshal of England were joint judges. When both sat the court had summary criminal jurisdiction as regards all offences committed by knights, and generally as to military matters. When the earl marshal alone presided, it was a court of honour deciding as to precedence, coats of arms, &c. This court sat for the last time in 1737. The hereditary side of its duties are now vested in the earl marshal as head of the Heralds' College.

CHIVASSO, a town and episcopal see of Piedmont, Italy, in the province of Turin, 18 m. N.E. by rail from the town of Turin, 600 ft. above sea-level. Pop. (1901) 4160 (town), 9804 (commune). It is situated on the left bank of the Po, near the inlet of the Orco. The cathedral is of the 15th century with a fine façade ornamented with statues in terra-cotta. It was an important fortress in the middle ages, and until 1864, when the French dismantled it. On the west wall of the old castle of the marquesses of Monferrato, who possessed the town from 1164 to 1425, remains. Chivasso is on the main line from Turin to Milan, and is the junction of branches for Astoa and Casale Monferrato.

CHIVE (Allium Schoenoprasum), a hardy perennial plant, with small narrow bulbs tufted on short root-stocks and long cylindrical hollow leaves. It is found in the north of England and in Cornwall, and growing in rocky pastures throughout temperate and northern Europe and Asiatic Russia, and also in the mountain districts of southern Europe. It is cultivated for the sake of its leaves, which are used in salads and soups as a substitute for young onions. It will grow in any good soil, and is propagated by dividing the roots into small clumps in spring or autumn; these are planted from 8 to 12 in. apart and soon form large tufts. The leaves should be cut frequently so as to obtain them tender and succulent.

CHLORIC, GREGORZ JOWEF (1772-1854), Polish general, was born in March 1772 in Podolika. He was educated at the school of the Basilians at Szarogrod, from which in 1787 he ran away in order to enlist as a volunteer in the Polish army. He was present at all the engagements fought during 1792-1794, especially distinguishing himself at the battle of Raclawice, when he was General Rymkiewicz's adjutant. On the formation of the Italian legion he joined the second battalion as major, and was publicly complimented by General Oudinot for his extraordinary valour at the storming of Peschiera. He also distinguished himself at the battles of Modena, Busano, Casablanca and Ponto. In 1807 he commanded the first Vislutan regiment, and rendered good service at the battles of Eylau and Friedland. In Spain he obtained the legion of honour and the rank of a French baron for his heroism at the battle of Toulouse and the passage of the river Agueda. In 1813 he was promoted to be general of brigade. In 1812 he accompanied the Grande Armée to Russia, was seriously wounded at Smolensk, and on the reconstruction of the Polish army in 1813 was made a general of division. On his return to Poland in 1814, he entered the Russian army with the rank of a general officer, but a personal insult from the grand duke Constantine resulted in his retiring into private life. He held aloof at first from the Polish national rising of 1830, but at the general request of his countrymen accepted the dictatorship on the 5th of December 1830, on the 23rd of January 1831, however, he resigned in order to fight as a common soldier. At Wavre (Feb. 19) and at Gruchow (Feb. 20) he displayed all his old bravery, but was so seriously wounded at the battle of Olazyna that he had to be conveyed to Cracow, near which city he lived in complete retirement till his death in 1834.

See Joseph Maczynski, Life and Death of Joseph Chłopiński (Pol.) (Cracow, 1888); Ignacy Pradzynski, The Last Polish Communist (O. Rymkiewicz's Polish Revolution) (Posen, 1895).

CHLORAL or TRICHLORACetaldehyde, CCl₃-CHO, a substance discovered by J. von Liebig in 1832 (Ann., 1832, 1, p. 189), and further studied by J. B. A. Dumas and Staedeler. It is a heavy, oily and colourless liquid, of specific gravity 1.541 at 0°C, and boiling-point 97.7°C. It has a greasy, somewhat bitter taste, and gives off a vapour at ordinary temperature which has a pungent odour and an irritating effect on the eyes. The word chloral is derived from the first syllables of chlorine and alcohol, the names of the substances employed for its preparation. Chloral is soluble in alcohol and ether, in less than its own weight of water, and in four times its weight of chloroform; it absorbs chlorine, and dissolves bromine, iodine, phosphorus and sulphur. Chloral deliquesces in the air, and in its aqueous solution it is easily converted into chloral hydrate, which converts into chloral; it combines with alcohols and mercaptans. An ammoniacal solution of silver nitrate is reduced by chloral; and nascent hydrogen converts it into aldehyde. By means of phosphorus pentachloride, chlorine can be substituted for the oxygen of chloral, the body CCl₃-CCl₃H being produced; an analogous compound, CCl₃(C₂H₅)₂H, is obtained by treating chloral with benzene and sulphuric acid. With an alkali, chloral gives chloroform (q.v.) and a formate; oxidizing agents give trichloracetic acid, CCl₄-CH₂(OH). When kept for some days, as also when placed in contact with sulphuric acid or a very small quantity of water, chloral undergoes spontaneous change into the polymeride meta-chloral (C₂H₄Cl₃O), a white porcelainous body, slowly volatile in the air, and reconverted into chloral without melting at 180°C. Chloral unites directly with hydrocyanic acid to form chlorocarbonitride (C₂H₃Cl₇O₃N), and with hydroxylamine it forms chloroglyxime, C₂H₅Cl₂N₂O₂.

Chloral is prepared by passing dry chlorine into absolute alcohol; the latter must be cooled at first, but towards the end of the operation it has to be heated nearly to boiling. The alcohol is converted finally into a syrupy fluid, from which chloral is procured by treatment with sulphuric acid (see P. Fritsch, Ann., 1894, pp. 279, 288). The crude chloral is distilled over lime, and is purified by further treatment with sulphuric acid, and by redistillation. A mixture of starch or sugar with manganese peroxide and hydrochloric acid may be employed instead of alcohol and chlorine for the manufacture of chloral (A. Staedeler, Ann. Ch. Pharm., 1847, 61, p. 101). An isomer of chloral, parachloralide, is made by passing excess of dry chlorine into absolute methyl alcohol. Chloral hydrate, CCl₃-CH(OH)₃, forms oblique, often very short, rhombic prisms. The crystals are perfectly transparent, only slightly odorous, free from powder, and dry to the touch, and do not become white by exposure. The melting-point of pure chloral hydrate is 5°C; the boiling-point 96-97°C. When heated with sulphuric acid it is converted into anhydrous chloral and chloralide, C₆H₅Cl₂O₂. When mixed with water, chloral hydrate causes a considerable degree of cold; and, as with camphor, small fragments of it placed on the lips, tongue, or under the tongue, give rise to a sensation of numbness. Chloral hydrate does not restore the colour to a solution of fuchsin which has been decolorized by sulphurous acid, and so one must assume that the water present is combined in the molecular condition (V. Meyer, Ber., 1873, 6, p. 234). However, it may be noted that the hydrate with milk of lime and measuring the volume of chloriform produced (C. H. Wood, Pharm. Journ., 1873, 3, p. 703), or by hydrolysis with a known volume of standard alkali and back titration with standard acid (V. Meyer, Ber., 1873, 6, p. 600). Chloral hydrate has the property of checking the decomposition of a great number
CHLORATES—CHLORINE

of albuminous substances, such as milk and chloral; and a mixture of it with glycerin, according to J. Persone, is suitable for the preservation of anatomical preparations. When heated with concentrated glycerin to a temperature of 180° to 190°, hydrochloric acid, CHCl₃, and allyl formate, HCO(OCH₃)₂, are produced. The hydrochloric acid, in the presence of alkalis, with the production of chloriform and formates, leads Liebig to a similar conclusion that a similar position might be adopted in this case. It is now known, however, that the drug circulates in the blood unchanged, and is excreted in the urine and perspiration. The drug is probably absorbed from the intestinal tract and acts directly on the brain, producing a slight and rapidly vanishing excitement.

Potassium chlorate is very valuable in medicine. Given in large doses it causes rapid and characteristic poisoning, with alterations in the blood and rapid degeneration of nearly all the internal organs, but a small dose—5 to 15 grains—it partly undergoes combustion in the blood and tissues, the chlorate is converted and oxygen being supplied to the body-cells in nascent form. Its special uses are in ulceration of the mouth or tongue (ulcerative stomatitis), tonsil and pharyngitis. For these conditions it is administered in the form of a lozenge, but may also be swallowed in solution, as it is excreted by the saliva and so reaches the diseased surface. Its remarkable efficacy in healing ulcers of the mouth—for which it is the specific—has been ascribed to a decomposition effected by the carbonic acid which is given off from these ulcers. This releases chloric acid, which, being an extremely powerful antiseptic, kills the bacteria to which the ulcers are due.

CHLORINE (symbol Cl, atomic weight 35·46 (0 = 16), a gaseous chemical element of the halogen group, taking its name from the Greek Khloros, green, yellow, which was its original color). It was discovered in 1774 by Scheele, who called it dephlogisticated muriatic acid; about 1785, C. L. Berthollet, regarding it as a compound of hydrochloric acid and oxygen, termed it oxygenized muriatic acid. This view was generally held until about 1810-1811, when Sir H. Davy showed definitely that it was an element, and gave it the name which it now bears.

Chlorine is never found in nature in the uncombined condition, but in combination with the alkali metals it occurs widely distributed in the form of rock-salt (sodium chloride); as sylvine and carnallite, at Stassfurt; and to a smaller extent in various other minerals such as matlockite and horn-montmorillonite. In the form of alkaline chlorides it is found in sea-water and various spring waters, and in the tissues of animals and plants; while, as hydrochloric acid it is found in volcanic gases.

The preparation of chlorine, both on the small scale and commercially, depends upon the decomposition of hydrochloric acid; the usual oxidizing agent is manganese dioxide, which, when heated with concentrated hydrochloric acid, forms manganese chloride, water and chlorine:—\[2\text{HClO}_3 + 2\text{MnO}_2 \rightarrow 2\text{HClO}_4 + 2\text{MnO}_2\]. The manganese dioxide may be replaced by various other substances, such as red lead, lead dioxide, potassium bichromate, and potassium permanganate. Instead of heating hydrochloric acid with manganese dioxide, use is frequently made of a mixture of common salt and manganese dioxide, to which concentrated sulphuric acid is added and the mixture is then heated:—\[\text{MnO}_2 + 2\text{NaCl} + 3\text{H}_2\text{SO}_4 \rightarrow \text{MnSO}_4 + 2\text{NaHSO}_4 + 2\text{HCl} + \text{Cl}_2\]. Chlorine may also be obtained by the action of dilute sulphuric acid on bleaching powder.

Owing to the enormous quantities of chlorine required for various industrial purposes, many processes have been devised, either for the recovery of the manganese (see manganese) or for the chlorination of substances. The chlorine, being a reactant in the chlorination of many organic compounds, involves much waste of valuable material. Its use is limited as a disinfectant, and for this purpose it is no longer recommended as a practical agent.

Owing to the reduction in the supply of available hydrochloric acid (on account of the increasing use of the "ammonia-soda" process in place of the "Leblanc" process for the manufacture of soda) Weldon tried to adapt the former to the production of chlorine or hydro-
CHLORINE

Alais, France), the Weldon-Pechinay process was worked out. The residual magnesium chloride of the ammonia-soda process is evaporated until it ceases to give off hydrochloric acid, and is then mixed with more magnesia; the magnesium oxychloride formed is broken into small particles by a hammer and washed in water, the chlorine being partly in the uncombined condition and partly in the form of hydrochloric acid, and leaves a residue of magnesia, which can again be utilized for the production of more ammonium chloride (W. Williams, J. Amer. Chem. Soc., 1895, 17, 381). A similar success attended the efforts of Ludwig Mond, of the firm of Brunner, Mond & Co. In this process the ammonium chloride is volatilized in large iron retorts lined with Doulton tiles, and then lifted into large upright retorts, filled with a layer of thin-walled glass retorts which are filled with pills, made of a mixture of magnesia, potassium chloride, fireclay, and the object of the potassium chloride being to prevent any formation of hydrochloric acid, which might occur if the magnesia were of the finest kind. The chlorine is decomposed by the magnesia, with the formation of magnesium chloride and ammonia. The mixture is then heated to 600° C. in a current of hot dry gas, containing no free oxygen (the gas from the carbonating plant being used), and then a current of air at the same temperature is passed in. Decomposition takes place and the issuing gas contains 18-20% of chlorine. This percentage drops gradually, and when it is reduced to about 3% the temperature of the apparatus is lowered, by the admission of air, to about 350° C., and the air stream containing the small percentage of chlorine is led off to a second cylinder of pills, which have just been treated with ammonium chloride vapour and are ready for the hot air current. Where the process is continuous (L. Mond, British Assoc. Reports, 1896, p. 734).

More recently, owing to the production of caustic soda by electrolytic methods, much chlorine has consequently been produced in the same manner (see Alkali Manufacture).

Chlorine is a gas of a greenish-yellow colour, and possesses a characteristic unpleasant and suffocating smell. It can be liquefied at −34° C. under atmospheric pressure, and at −102° C. it solidifies and crystallizes. Its specific heat at constant pressure is 0.1455, and at constant volume 0.0837; (A. Strecker, Wied. Ann., 1877 [2], 13, p. 30); and its refractive index in cold water is 1.567. The density is 2.485 (air = 1) (Treadwell and Christie, Zeit. anorg. Chem., 1905, 47, p. 446). Its critical temperature is 146° C. Liquid and solid chlorine are both yellow in colour. The gas must be collected either by downward displacement, since it is soluble in water and also attacks mercury; or over a saturated salt solution, in which it is only slightly soluble. At ordinary temperatures it unites directly with many other elements; thus with hydrogen, combination takes place in direct sunlight with explosive violence; with arsenic, antimony, thin copper foil and phosphorus take fire in an atmosphere of chlorine, forming the corresponding chlorides. Many compounds containing hydrogen are readily decomposed by the gas; for example, a piece of paper dipped in turpentine inflames in an atmosphere of chlorine, producing hydrochloric acid and carbon monoxide. Piled under chlorine the sun burns in chlorine with a dull smoky flame. The solution of chlorine in water, when freshly prepared, possesses a yellow colour, but on keeping becomes colourless, on account of its decomposition into hydrochloric acid and oxygen. It is on this property that its bleaching and disinfecting power depends (see Bleaching). Water saturated with chlorine at 0° C. deposits crystals of a hydrate Cl₂H₂O, which is readily decomposed at a higher temperature into its constituents. Chlorine hydrate has an historical importance, as by sealing it up in a bent tube, and heating the end containing the hydrate, whilst the other limb of the tube was enclosed in a freezing mixture, M. Faraday was first able to obtain liquid chlorine.

Chlorine is used commercially for the extraction of gold (q.v.) and for the manufacture of "bleaching powder" and of chlorides. It also finds an extensive use in organic chemistry as a substituting and oxidizing agent, as well as for the preparation of addition compounds. For purposes of substitution, the free element as a rule only works at low temperature and is best accelerated by the action of sunlight or on warming, or by using a "carrier." In these latter cases the reaction may proceed in different directions; thus, with the aromatic hydrocarbons, chlorine in the cold or in the presence of oxygen, combines with the double bond, but in the presence of sunlight or on warming, substitution takes place in the side chain. Iodine, antimony trichloride, molybdenum pentachloride, ferric chloride, ferric oxide, antimony, tin, stannic oxide and ferrous sulphate have all been used as chlorine carriers.

The atomic weight of chlorine was determined by J. Berzelius and by F. Penny (Phil. Trans., 1839, 13). J. S. Stas, from the synthesis of silver chloride, obtained the value 35.457 (O = 16), and C. Marié established the value 34.462. More recent determinations are: H. B. Dixon and E. C. Edgar (Phil. Trans., 1905); T. W. Rowland (J. Chem. Soc., 1907, 84, p. 53) and W. A. Noyes and H. C. Oberholtzer (J. Amer. Chem. Soc., 1911, 33, p. 1508). It is chiefly obtained by the by-product in the manufacture of soda-ash by the Leblanc process (see Alkali Manufacture). The commercial acid is usually yellow in colour and contains many impurities, such as traces of arsenic, sulphuric acid, chlorine, ferric chloride and sulphones; but these do not interfere with its application to the preparation of bleaching powder, in which it is chiefly consumed. Without further purification it is also used for "souring" in bleaching, and in tin and lead soldering.

It is a colourless gas, which can be condensed by cold and pressure to a liquid boiling at −83.7° C., and can also be solidified, the solid melting at −112.5° C. (K. Olszewski). Its critical temperature is 54.3° C., and its critical pressure is 86 atmos. The gas fumes strongly in moist air, and it is rapidly dissolved by water, one volume of water absorbing 503 volumes of the gas. The gas does not obey Henry's law, that is, its solubility in water is not proportional to its pressure. It is one of the "strong" acids, being ionized to the extent 91.4% in a 0.1-normal solution. The strongest aqueous solution of hydrochloric acid at 15° C. contains 42-9% of the acid, and has a specific gravity of 1.212. Perfectly dry hydrochloric acid gas has no action on metals, but in aqueous solution it is converted into many of them with evolution of hydrogen and formation of chlorides.

The salts of hydrochloric acid, known as chlorides, can, in most cases, be prepared by dissolving either the metal, its hydroxide, oxide, or carbonate in the acid; or by heating the metal in a current of chlorine, or by precipitation. The majority of the metallic chlorides are solids (stannic chloride, titanic chloride and antimoniate-penta-chloride are liquids) which readily volatilize on heating. Many are insoluble in water, but are exceptions the mercuric chloride, cuprous chloride and palladium chloride which are insoluble in water, and thallous chloride and lead chlorate which are only slightly soluble in cold water, but are readily soluble in hot water. Arsenite, antimonite and arsenate are all converted by hydrochloric acid into their chlorides, whilst titanium tetrachloride yields titanium chloride under the same conditions. All the metallic chlorides, with the exception of those of the alkali and alkaline earth metals, are reduced by the metallic copper and are precipitated by the addition of a lower chloride on heating in a current of hydrogen; most are decomposed by concentrated sulphuric acid. They can be distinguished from the corresponding bromides and iodides by the oxygen distillation with a mixture of potassium bichromate and concentrated sulphuric acid; they yield chromioxychloride, whereas bromides and iodides by the same treatment give bromine and iodine respectively. Some metallic chlorides readily form hydrochloric acid, the more chlorides being formed the more platinichlorides of the alkali metals. The chlorides of the non-metallic elements are usually volatile fuming liquids of low boiling-point, which can be distilled without decomposition and are decomposed by water. Hydrochloric acid and ammonium chloride can be recognized by the formation of insoluble silver chloride, on adding silver nitrate to their nitric acid solution, and also by the formation of chromium oxichloride (see above). Chlorides can be estimated quantitatively by conversion into silver chlorides, and these into the platinochlorides of the alkali metals (in the absence of other metals, and of any free acids) by titration with standard silver nitrate solution, using potassium chromate as an indicator.
CHLORITE and the alkaline metals react violently with the gas, taking fire with explosive decomposition. A. J. Balard determined the volume composition of the gas by decomposition over mercury on gentle warming. The absorbed chlorine and carbonic acid were decomposed with potassium hydroxide, and then measured the residual oxygen.

Chlorine peroxide was first obtained by Sir H. Davy in 1815 by the action of concentrated sulphuric acid on potassium chlorate.

According to Sir H. Roscoe, pure perchloric acid distils over at first, but if the distillation be continued a white crystalline mass of hydrated perchloric acid, HClO₄·H₂O, passes over; this is due to the decomposition of some of the acid into water and oxygen. The acid does not answer to the formula of the chlorate, but if the distillation be continued then it air-dries and becomes pure perchloric acid. The process is usually slow on standing, but is stable in dilute aqueous solution.

It is a very powerful oxidizing agent; wood and paper in contact with the acid inflame with explosive violence. In contact with the skin, it produces inflammation, and if taken internally it injures the stomach and kidneys. The chlorine is not freed by the fact that it does not give chlorine peroxide when treated with concentrated sulphuric acid, and that it is not reduced by sulphuric acid. The salts of the acid are known as the perchlorates, and are all available within the alkali metals. The only soluble ones are to a slight extent. Potassium perchlorate, KCIO₄, can be obtained by carefully heating the chlorate until it melts and then nearly all solidifies again. The fused mass is then treated with water, and the perchloric acid, which is obtained with hydrochloric acid to remove unaltered chlorate, and finally extracted with water again, when a residue of practically pure perchlorate is obtained. The alkaline perchlorates are isomorphous with the percarbonates.

CHLORITE, a group of green micaceous minerals which are hydrous silicates of aluminium, magnesium and ferrous iron. The name was given by A. G. Werner in 1798, from χλόριτης, "a green stone." Several species and many rather ill-defined varieties have been described, but they are difficult to recognize. Like the micas, the chlorites (or "hydromicas") are monoclinic in crystallization and have a perfect cleavage parallel to the flat face of the scales and plates. The cleavage is, however, not quite so prominent as in the micas, and the cleavage flakes though pliable are not elastic. The chlorites usually occur as salt (H₂O−3) scaly aggregates of a dark-green colour. They vary in specific gravity between 2.6 and 3.0, according to the amount of iron present. Well-developed crystals are met with only in the species chlorincoe and pennitene; those of the former are six-sided plates and are optically biaxial, whilst those of the latter have the form of acute rhombohedra and are usually optically uniaxial. The species prochlorite and corundophilite also occur as more or less distinct six-sided plates. These four better crystallized species are grouped together by G. Tschermak as orthochlorites, the finely scaly and indistinctly fibrous forms being grouped by the same author as leptochoerites.

Chemically, the chlorites are distinguished from the micas by the presence of a considerable amount of water (about 13%) and by not containing alkalis; from the soft, scaly, mineral talc they differ in containing aluminium (about 20%) as an essential constituent. The magnesia (up to 38%) is often in part replaced by ferric oxide, by the alumina (up to 20%) by ferric oxide, by the alumina (up to 20%) by ferric oxide, and finally, the latter have the form of acute rhombohedra and are usually optically uniaxial. The species prochlorite and corundophilite also occur as more or less distinct six-sided plates. These four better crystallized species are grouped together by G. Tschermak as orthochlorites, the finely scaly and indistinctly fibrous forms being grouped by the same author as leptochoerites.

Piedmont; also as large plates at West Chester in Pennsylvania and at other American localities. Crystals of penninite are found in serpentine at Zermatt in Switzerland and in the green schists of the Zillertal in Tirol.

Closely allied to the chlorites is another group of micaceous minerals known as pseudo-chlorites, which have resulted by the alteration of the micas, particularly biotite and phlogopite. The name is from the Latin *vermiculor*, "to breed worms," because when heated before the blowpipe these minerals exfoliate into long worm-like threads. They have the same chemical constituents as the chlorites, but the composition is variable and indefinite, varying with that of the original mineral and the extent of its alteration. Several indistinct varieties have been named, the most important of which is jeffersonite. (L. J. S.)

**CHLOROFORM** (trichloro-methane), CHCl₃, a valuable anaesthetic, a colourless liquid, possessing an agreeable smell and a pleasant taste. It may be prepared by the action of bleaching powder on many carbon compounds, such, for example, as ethyl alcohol and acetone (E. Soubiran, *Ann. chim. phys.*, 1831 [2], 48, p. 131; J. v. Liebig, *Ann.*, 1832, 1, p. 199), by heating chloral with alkali (Liebig), C₃C₆H₂O₂ + NaOH = CHCl₂ + NaHCO₃, or by heating trichloracetic acid with ammonia (J. Dumas, *Ann.*, 1839, 32, p. 111). In the preparation of chloroform by the action of bleaching powder on ethyl alcohol it is probable that the alcohol is first oxidised to acetaldehyde, which is subsequently chlorinated and then decomposed. Chloroform solidifies in the cold and then melts at -62° C.; it boils at 61-62° C, and has a specific gravity 1.5263 (0°4) (T. E. Thorpe). It is an exceedingly good solvent, especially for fats, alkaloids and iodine. It is not inflammable. The vapour of chloroform when passed through a red-hot tube yields hexachlorobenzene C₆Cl₆, per- chloroethane C₂Cl₆, and some perchloroethylene C₂Cl₄ (W. Ramsay and S. Young, *Jahresbericht*, 1886, p. 628). Chromic acid converts it into *phosgene* (carbonyl chloride, COCl₂). It reacts with sodium ethylate to form ortho-formic ester, CH₃OCHO₂, and when heated with aqueous ammonia forms ammonia and ammonium formate, 2CHCl₃ + 7NH₃ + 3H₂O = NH₂H₂O₄ + CO₂ + 6NH₄Cl (G. André, *Jahresbericht*, 1886, p. 627). When digested with phenols and caustic soda it forms oxaldehydes (K. Reimer, *Ber.*, 1876, 9, p. 423); and when heated with alcoholic potash it is converted into potassium formate, CHCl₃ + 4KOH = KHCO₃ + 3KCl + 2H₂O. It combines with acetoacetic ester to form the aromatic compound meta-oxyvucic acid, C₆H₄CH₂OH-C(OOH). A hydrate, of composition CHCl₃.18H₂O, has been described (G. Chancel, *Freundschafts Ztschrift f. anal. Chemie*, 1886, 25, p. 118); it forms hexagonal crystals which melt at 1-6° C.

Chloroform may be readily detected by the production of an isonitrile when it is heated with alcoholic potash and a primary amine; thus with anilin, phenyl isocyanide (recognised by its nauseating smell) is produced, CH₃C≡N+Cl⁻+3KOH=CH₂N≡C+3KCl+3H₂O.

For the action and use of chloroform as an anaesthetic, see *Anaesthésia*. Chloroform may be given internally in doses of from one to five drops. The *British Pharmacopoeia* contains a watery solution—the *Aqua Chloroformi*—which is useful in disguising the taste of nauseous drugs; a liniment which consists of equal parts of camphor liniment and chloroform, and is a useful counter-irritant; the *Spiritus Chloroformi* (erroneously known as "chloric ether"), which is a useful anodyne in doses of from five to forty drops; and the *Tinctura Chloroformi et Morphinae Composita*, which is the equivalent of a proprietary drug called chlorodyne. This tincture contains chloroform, morphia and prussic acid, and must be used with the greatest care.

Externally chloroform is an antiseptic, a local anaesthetic if allowed to evaporate, and a rubefacient, causing the vessels of the skin to dilate, if rubbed in. Its action on the stomach is practically identical with that of alcohol (q.e.), though in very much smaller doses. The uses of chloroform which fall to be mentioned here are:—as a counter-irritant; as a local anaesthetic for toothache due to caries, it being applied on a cotton-wool plug which is inserted into the carious cavity; as an antispasmodic in tetanus and hydrophobia; and as the best and most immediate and effective antidote in cases of strychnine poisoning.

**CHLOROPHYLL** (from Gr. χλορός, green, φυλός, a leaf), the green colouring matter of leaves. It is universally present in growing vegetable cells. The pigment of leaves is a complex mixture of substances; of these one is green, and to this the name, originally given in 1817 by Pelletier and Caventou, is sometimes restricted; xanthophyll (Gr. ξανθός, yellow), is dark brown; carotin is copper-coloured. Chlorophyll is related chemically to the proteids; a decomposition product, phyllloporphyrin, being very closely related to haematomorphporphyrin, which is a decomposition product of haemoglobin, the red colouring matter of the blood. Chlorophyll is neutral in reaction, insoluble in water, but soluble in alcohol, ether, &c., the solutions exhibiting a green colour and a vivid red fluorescence. Magnesium is a necessary constituent. (See S. B. Schrayer, *Science Progress*, 1906, 3, p. 425.)

**CHLOROSIS** (Gr. χλόρος, pale green), the botanical term for loss of colour in a plant-organ, a sign of disease; also in medicine, a form of anaemia (see Blood: *Pathology*).

**CHLOROPICRIN** (Nitrochloroform), CNO₂CH₃, the product of the distillation of many nitro compounds (picric acid, nitromethane, &c.) with bleaching powder; it can also be prepared by the action of concentrated nitric acid on chloral or chloroform.

A. W. von Hofmann (*Annalen*, 1866, 139, p. 111) mixed 10 parts of bleaching powder into a paste with cold water and added a solution (saturated at 30° C.) of 1 part of picric acid. A violent reaction is set up and the chloropicrin distils off, generally without the necessity for any external heating. It is a colourless liquid of boiling-point 112° C., and of specific gravity 1.692. It is almost insoluble in water, but is readily soluble in alcohol; it has a sharp smell, and its vapour affects the eyes very powerfully. Iron filings and acetic acid reduce it to trimethylamine, whilst alcoholic ammonia converts it into guanidine, HN::C(NH₂)₂, and alcoholic potassium ethylate (rubber-tar ester, C(O)(C₆H₅)(OH)). The corresponding bromopicrin is also known.

**CHMIELNICKI, BOGDAN** (c. 1593-1657), hetman of the Cossacks, son of Michael Chmielnicki, was born at Subatov, near Chigirin in the Ukraine, an estate given to the elder Chmielnicki for his lifelong services to the Polish crown. Bogdan, after learning to read and write, a rare accomplishment in those days, entered the Cossack ranks, was dangerously wounded and taken prisoner in his first battle against the Turks, and found leisure during his two years' captivity at Constantinople to acquire the rudiments of Turkish and French. On returning to the Ukraine he settled down quietly on his paternal estate, and in all probability history would never have known his name if the intolerable persecution of a neighbouring Polish squire, who stole his hayricks and flogged his infant son to death, had not converted the thrifty and acquisitive Cossack husbandman into one of the most striking and sinister figures of modern times. Failing to get redress from home, he determined to seek for justice at Warsaw, whether he had been denounced with other Cossack delegates to assist Władysław IV. in his long-projected war against the Turks. The king, perceiving him to be a man of some education and intelligence, appointed him pisar or secretary of the registered Cossacks, and he subsequently served under Koniecpolski in the Ukraine campaign of 1646. His hopes of distinction were, however, cut short by a decree of the Polish diet, which, in order to vex the king, refused to sanction the continuance of the war. Chmielnicki, now doubly hateful to the Poles as being both a royalist and a Cossack, was again maltreated and chicaned, and only escaped from gaol by bribing his gaolers. Thirsting for vengeance, he fled to the Cossack settlements on the Lower Dnieper and thence sent messages to the khan of the Crimea, urging a simultaneous invasion of Poland by the Tatars and the Cossacks (1647).

On the 11th of April 1648, at an assembly of the Zaporozhians (see Poland: *History*), he openly declared his intention of proceeding against the Poles, and was elected ataman by acclamation.
At Zheltaya Vodui (Yellow Waters) in the Ukraine he annihilated, on the 19th of May, a detached Polish army corps after three days' desperate fighting, and on the 26th routed the main Polish army under the grand hetman, Stephen Potocki, at Kruta Balka (Hard Plank), near the river Korsun. The immediate consequence of these victories was the outbreak of a "serfs' fury." Throughout the Ukraine the Polish gentry were hunted down, flayed and burnt alive, blinded and sawn asunder. Every manor-house was reduced to ashes. Every Uniat and Catholic priest was hung up before his own altar, along with a Jew and a hog. The panic-stricken inhabitants fled to the nearest strongholds, and soon the rebels were swarming all over the palatinates of Volhynia and Podolia. But the ataman was as crafty as he was cruel, and he succeeded admirably by the artifice of his position by the refusal of the tsar and the sultan to accept him as a vassal, he feigned to resume negotiations with the Poles in order to gain time, dismissed the Polish commissioners in the summer of 1648 with impossible conditions, and on the 23rd of September, after a contest of three days, utterly routed the Polish chivalry, 40,000 strong, at Pildawa, where the Cossacks are said to have reaped an immense booty after the fight was over. All Poland now lay at his feet, and the road to the defenceless capital was open before him; but he wasted the precious months in vain before the fortress of Zamosc, and was then persuaded by the new king of Poland, John Casimir, to consent to a suspension of hostilities. In June 1649, arrayed in cloth-of-gold and mounted on a white charger, Chmielnicki made his triumphal entry into Kiev, where he was hailed as the Maccabaeus of the Orthodox faith, and permitted the committal of unspeakable atrocities on the Jews and Roman Catholics. At the ensuing peace congress at Pereyaslavl he demanded terms so extravagant that the Polish commissioners dared not listen to them. In 1649, therefore, the war was resumed. A bloody battle ensued near Zborow, on the banks of the Strypa, when only the personal valour of the Polish king, the superiority of the Polish artillery, and the defection of Chmielnicki's allies the Tatars enabled the royal forces to hold their own. Peace was then patched up by the compact of Zborow (August 21, 1649), whereby Chmielnicki was virtually recognized as a semi-independent prince.

For the next eighteen months he was the absolute master of the Ukraine, which he divided into sixteen provinces, made his native place Chigirin the Cossack capital, and entered into direct relations with foreign powers. Poland and Muscovy competed for his alliance, and in his more exalted moods he meditated an Orthodox crusade against the Turk at the head of the northern Slavs. But he was no statesman, and his difficulties proved overwhelming. Instinct told him that his old ally the khan of the Crimea was unreliable, and that the tsar of Muscovy was his natural protector, yet he could not make up his mind to abandon the one or turn to the other. His attempt to carve a principality for his son out of Moldavia, which Poland regarded as her vassal, led to the outbreak in 1651 of a third war between subject and suzerain, which speedily assumed the dignity and the dimensions of a crusade. Chmielnicki was now regarded not merely as a Cossack rebel, but as the arch-enemy of Catholicism in eastern Europe, and the pope granted a plenary absolution to all who took up arms against him. But Bogdan himself was not without ecclesiastical sanction. The archbishop of Corinth girded him with a sword which had lain upon the Holy Sepulchre, and the metropolitan of Kiev absolved him from all his sins, without the usual preliminary of confession, before he rode forth to battle. But fortune, so long his friend, now deserted him, and at Beresteczko (July 1, 1651) the Cossack ataman was defeated for the first time. But even now his power was far from broken. In 1652 he openly interfered in the affairs of Transylvania and Walachia, and assumed the high-sounding title of "guardian of the Ottoman Porte." In 1653 Poland made a supreme effort, the diet voted 17,000,000 gulden in subsidies, and John Casimir led an army of 60,000 men into the Ukraine and defeated the arch-rebel at Zranta, whereupon Chmielnicki took the oath of allegiance to the tsar (compact of Pereyaslavl, February 19, 1654), and all hope of an independent Cossack state was at an end. He died on the 7th of August 1657. With all his native ability, Chmielnicki was but an eminent savage. He was the creature of every passing mood or whim, incapable of cool and steady judgment or of the slightest self-control—an incalculable weathercock, blindly obsequious to every blast of passion. He could destroy, but he could not create, and other people benefited by his exploits.

CHOATE, JOSEPH HODGES (1832–1907), American lawyer and diplomat, was born at Salem, Massachusetts, on the 24th of January 1832. He was the son of Dr George Choate, a physician of considerable note, and was a nephew of Rufus Choate. After graduating at Harvard College in 1852 and at the law school of Harvard University in 1854, he was admitted first to the Massachusetts (1855) and then (1856) to the New York bar, and entered the law office of Scudder & Carter in New York City. His success in his profession was immediate, and in 1860 he became junior partner in the firm of Evarts, Southmayd & Choate, the senior partner in which was William M. Evarts. This firm and its successor, that of Evarts, Choate & Beaman, remained for many years among the leading law firms of New York and of the country, the activities of both being national rather than local. During these busy years Mr Choate was associated with many of the most famous litigations in American legal history, including the L. & N. and Tilden, A. T. Stewart, and Stanford cases, the Kansas prohibition cases, the Chinese exclusion cases, the Maynard election returns case, and the Income Tax Suit. In 1871 he became a member of the "Committee of Seventy" in New York City, which was instrumental in breaking up the "Tweed Ring," and later assisted in the prosecution of the indicted officials. In the retrial of the General Fitz John Porter case he obtained a reversal of the decision of the original court-martial. His greatest reputation was won perhaps in cross-examination. In politics he allied himself with the Republican party on its organization, being a frequent speaker in presidential campaigns, beginning with that of 1856. He never held political office, although he was a candidate for the Republican senatorial nomination against Senator Thomas C. Platt in 1867. In 1884 he was president of the New York state constitutional convention. He was appointed, by President McKinley, ambassador to Great Britain, succeeding John Hay in 1899, and remained in this position until the spring of 1905. In England he won great personal popularity, and accomplished much in fostering the good relations of the two great English-speaking powers. He was one of the representatives of the United States at the second Peace Congress at the Hague in 1907.

Several of his notable public addresses have been published. *The Choate Story Book* (New York, 1903) contains a few of his addresses and after-dinner speeches, and is prefaced by a brief biographical sketch.

CHOATE, RUFUS (1799–1859), American lawyer and orator, was born at Ipswich, Massachusetts, on the 1st of October 1799, the descendant of a family which settled in Massachusetts in 1667. As a child he was remarkably precocious; at six he is said to have been able to repeat large parts of the Bible and of Pilgrim's Progress by heart. He graduated as a valedictorian of his class at Dartmouth College in 1810, was a tutor there in 1819-1820, spent a year in the law school of Harvard University, and studied for a like period at Washington, in the office of William Wirt, then attorney-general of the United States. He was admitted to the Massachusetts bar in 1823 and practised at what was later South Danvers (now Peabody) for five years, during which time he served in the Massachusetts House of Representatives (1825–1826) and in the state senate (1827). In 1828 he removed to Salem, where his successful conduct of several important law-suits brought him prominently into public notice. In 1830 he was elected to Congress as a Whig from the Salem district, defeating the Jacksonian candidate for re-election.
B. W. Crowninshield (1772–1851), a former secretary of the navy, and in 1832 he was re-elected. His career in Congress was marked by a notable speech in defence of a protective tariff. In 1834, before the completion of his second term, he resigned and established himself in the practice of law in Boston. Already his fame as a speaker had spread beyond New England, and he was much sought after as an orator for public occasions. For several years he devoted himself unremittingly to his profession, but in 1841 succeeded Daniel Webster in the United States Senate. Shortly afterwards he delivered one of his most eloquent addresses at the memorial services for President Harrison in Faneuil Hall, Boston. In the Senate he made a series of brilliant speeches on the tariff, the Oregon boundary, in favour of the Fiscal Bank Act, and in opposition to the annexation of Texas. On Webster's re-election to the Senate, Choate resumed (1845) his law practice, which no amount of urging could ever persuade him to abandon for public office, save for a short term as attorney-general of Massachusetts in 1853–1854. In 1853 he was a member of the state constitutional convention. He was a faithful supporter of Webster's policy as declared in the latter's famous "Seventh of March Speech" (1850) and laboured to secure for him the presidential nomination at the Whig national convention in 1852. In 1856 he refused to follow most of his former Whig associates into the Republican party and gave the support of James Buchanan, whom he considered the representative of a national instead of a sectional party. In July 1859 failing health led him to seek rest in a trip to Europe, but he died on the 13th of that month at Halifax, Nova Scotia, where he had been put ashore when it was seen that he probably could not survive the voyage across the Atlantic. Choate, besides being one of the ablest of American lawyers, was one of the most scholarly of American public men, and his numerous orations and addresses were remarkable for their pure style, their grace and elegance of form, and their wealth of classical allusion.

His Works (edited, with a memoir, by S. G. Brown) were published in 2 vols at Boston in 1862. The Memoir was afterwards published separately (Boston, 1870). See also E. G. Parker's Reminiscences of Rufus Choate (New York, 1860); E. P. Whipple's Some Recollections of Rufus Choate (New York, 1879); and the Albany Law Review (1877–1878). Choate, a large western affluent of the middle Zambesi (q.v.).

The river was discovered by David Livingstone in 1851, and to him is known as the Choate. It is also called the Linyante and the Kwando, the last name being that commonly used.

CHOCOLATE, a paste of the ground kernels of the cocoa bean, mixed with sugar, vanilla or other flavouring, made into a cake, which is used for the manufacture of various forms of sweetmeat, or in making the beverage, also known as "chocolate," obtained by dissolving cakes of chocolate in boiling water or milk (see COCOA). The word came into Eng. through the Fr. chocolat or Span. chocolate from the Mex. chocolati. According to the New English Dictionary (quoting R. Siméon, Diction. de la langue Nahuatl), this was "an article of food made of... the seeds of cacao and of the tree pochotl (Bombax ceiba)," and was etymologically distinct from the Mexican cacauatl, cacao, or cocoa.

CHOCTAWS, CHARTAS, or CHACATOS (apparently a corruption of Span. cato, flattened), a tribe of North American Indians of Muskhogean stock, who are the first known to Europeans they occupied the district now forming the southern part of Mississippi and the western part of Alabama. On the settlement of Louisiana they formed an alliance with the French, and assisted them against the Natchez and Chickasaws; but by degrees they entered into friendly relations with the English, and at last, in 1786, recognized the supremacy of the United States by the treaty of Hopewell. Their emigration westward began about 1800, and the last remains of their original territory were ceded in 1830. In their new settlements the Choctaws continued to advance in prosperity till the outbreak of the Civil War, which considerably diminished the population and ruined a large part of their property. They sided with the Confederates, and their territory was occupied by Confederate troops; and accordingly at the close of the war they were regarded as having lost their rights. Part of their land they were forced to surrender to the government; their slaves were emancipated; and provision was claimed for them in the shape of either land or money. Since then they have considerably recovered their position. They long constituted a quasi-independent people under the title of the Choctaw nation, and were governed by a chief and a national council of forty members, in addition to a written constitution, dating in the main from 1838; they possessed a regular judicial system and had employed trial by jury. Tribal government virtually ceased in 1906. The Choctaw number some 18,000. A few groups still linger in Mississippi and Louisiana. The Choctaw language has been reduced to writing, and brought to some degree of literary precision. See INDIANS, NORTH AMERICAN; Handbook of American Indians, ed. F. W. Hodge (Washington, 1907).

CHODKIEWICZ, JAN KAROL (1560–1621), Polish general, was the son of Hieronymus Chodkiewicz, castellan of Wilna. After being educated at the Wilna academy he went abroad to learn the science of war, fighting in the Spanish service under Alva, and also under Maurice of Nassau. In 1593 he married the wealthy Sophia Mielecka, by whom he had one son who predeceased him. His first military service at home was against the Cossack rising of Nalewajko as lieutenant to Zolkiewski, and he subsequently assisted Zamoyski in his victorious Molotow campaign. Horizontally successful, he was seen as a threat and was brought upon him. In 1590 he was appointed starosta of Samogitia, and in 1600 acting commander-in-chief of Lithuania. In the war against Sweden for the possession of Livonia he brilliantly distinguished himself, capturing fortress after fortress and repulsing the duke of Sudermannia, afterwards Charles IX, from Riga. In 1604 he captured Dorpat, twice defeated the Swedish generals at Bialy Kamien, and was rewarded with the grand båton of Lithuania. Criminally neglected by the diet, which from sheer niggardliness turned a deaf ear to all his requests for reinforcements and for supplies and money to pay his soldiers, Chodkiewicz nevertheless more than held his own against the Swedes. His crowning achievement was the great victory of Kirkholm (Aug. 27th, 1605), when with barely 5000 men he annihilated a threefold larger Swedish army; for which feat he received letters of congratulation from the pope, all the Catholic potentates of Europe, and even from the sultan of Turkey and the shah of Persia. Yet this great victory was absolutely fruitless, owing to the domestic dissensions which prevailed in Poland during the following five years. Chodkiewicz's own army, unpaid for years, abandoned him at last en masse in order to plunder the estates of their political opponents, leaving the grand hetman to carry on the war as best he could with a handful of mercenaries paid out of the pockets of himself and his friends. Chodkiewicz was one of the few magnates who remained loyal to the king, and after helping to defeat the rebels in Poland a fresh invasion of Livonia by the Swedes recalled him thither, and once more he relieved Riga besides capturing Parnau. Meanwhile the war with Muscovy broke out, and Chodkiewicz was sent against Moscow with an army of 2000 men—but if there had been a spark of true patriotism in Poland he could easily have marshalled 100,000. Moreover, the diet neglected to pay for the maintenance even of this paltry 2000, with the result that they mutinied and compelled their leader to retreat through the heart of Muscovy to Smolensk. Not till the crown prince Wladislaus arrived with tardy reinforcements did the war assume a different character. Chodkiewicz opening a new career of victory by taking the fortress of Drohobu in 1617. The Muscovite war had no sooner been ended by the treaty of Deulina than Chodkiewicz was hastily despatched southwards to defend the southern frontier against the Turks, who after the catastrophe of Cecora (see ZOLKIEWSKI) had high hopes of conquering Poland altogether. An army of 160,000 Turkish veterans led by Sultan Osman in person advanced from Adrianople towards the Polish frontier, but Chodkiewicz crossed the Dniéper in September 1621 and entrenched himself in the fortress of Khotin right in the path of the Ottoman advance. Here for a whole month the Polish hero held the sultan at bay, till the first fall of autumn snow compelled Osman to withdraw.
his diminished forces. But the victory was dearly purchased by Poland. A few days before the siege was raised the aged grand hetman died of exhaustion in the fortress (Sept. 24th, 1621).

(R. N. B.)

CHODOWIECKI, DANIEL NICOLAS (1726-1807), German painter and engraver of Polish descent, was born at Danzig. Left an orphan at an early age, he devoted himself to the practice of miniature painting, the elements of which his father had taught him, as a means of support for himself and his mother. In 1743 he went to Berlin, where for some time he worked as clerk in an uncle’s office, practising art, however, in his leisure moments, and gaining a sort of reputation as a painter of miniatures for snuff-boxes. The Berlin Academy, attracted by a small engraving of his, entrusted to him the illustration of its yearly almanac. After designing and engraving several subjects from the story of the Seven Years’ War, Chodowiecki produced the famous “History of the Life of Jesus Christ,” a set of admirably painted miniatures, which made him at once so popular that he laid aside all occupations save those of painting and engraving. Few books were published in Prussia for some years without plate or vignette by Chodowiecki. It is not surprising, therefore, that the catalogue of his works (Berlin, xvi. 1784), which included 3,000 items, of which, however, the picture of “Jean Calas and his Family” is the only one of any reputation. He became director of the Berlin Academy in 1797. The title of the German Hogarth, which he sometimes obtained, was the effect of an admiration rather imaginative than critical, and was disclaimed by Chodowiecki himself. The illustrator of Lavater’s Essays on Physiognomy, the painter of the “Hunt the Slipper” in the Berlin museum, had indeed but one point in common with the great Englishman—the practice of representing actual life and manners. In this he showed skilful drawing and grouping, and considerable expressional power, but no tendency whatever to the use of the grotesque.

His brother Gottfried (1728-1781) and son Wilhelm (1765-1803) painted and engraved after the style of Daniel, and sometimes co-operated with him.

CHOERILUS. (1) An Athenian tragic poet, who exhibited plays as early as 524 B.C. He was said to have competed with Aeschylus, Pratinas and even Sophocles. According to F. G. Welcker, however, the rival of Sophocles was a son of Choerilus, who bore the same name. Suidas states that Choerilus wrote 150 tragedies and gained the prize 13 times. His works are all lost; only Pausanias (i. 14) mentions a play by him entitled Alphe (a mythological personage who was the subject of dramas by Euripides and Pindarides). His reputation as a writer of satyric dramas is attested in the well-known line

ἥτις μὲν Βασιλαῖς ἤρωι καὶ Ἐρατόσῃς

The Choerilean metre, mentioned by the Latin grammarians, is probably so called because the above line is the oldest extant specimen. Choerilus was also said to have introduced considerable improvements in theatrical masks and costumes.

See A. Nauck, Tragicorum Graecorum Fragmenta (1889); F. G. Welcker, Die ersten Tragödien, pp. 18, 892.

(2) An epic poet of Samos, who flourished at the end of the 7th century B.C. After the fall of Athens he settled at the court of Archelaus, king of Macedonia, where he was the associate of Agathon, Melanippides, and Plato the comic poet. The only work that can with certainty be attributed to him is the Ἱππορίς or Περιοπέδα, a history of the struggle of the Greeks against Persia, the central point of which was the battle of Salamis. His importance consists in his having taken for his theme national and contemporary events in place of the deeds of old-time heroes. For this new departure he apologizes in the introductory verses (preserved in the scholiast on Aristotel, Rhetorici, i. 14), where he says that, the subjects of epic poetry being all exhausted, it was necessary to strike out a new path. The story of his intimacy with Herodotus is probably due to the fact that he imitated him and had recourse to his history for the incidents of his poem.

The Persis was at first highly successful and was said to have been read, together with the Homeric poems, at the Panathenaea, but later critics reversed this favourable judgment. Aristotle (Topica, viii. 1) calls Choerilus’s comparisons far-fetched and obscure, and the Alexandrians displaced him by Antimachus in the canon of epic poets. The fragments are artificial in tone.

G. Kinkel, Epitocricon Graecorum Fragm. i. (1877); for another view of his relations with Herodotus see MÜDER in Klio (1907), 29-44.

(3) An epic poet of Iasus in Caria, who lived in the 4th century B.C. He accompanied Alexander the Great on his campaigns as court-poet. He is well known from the passages in Horace (Epistles, ii. 1, 232; Ars Poetica, 357), according to which he received a piece of gold for every good verse he wrote in celebration of the glorious deeds of his master. The quality of his verses may be estimated by the fact that he was reinstated as a poet to Alexander, that he would rather be the Thersites of Homer than the Achilles of Choerilus. The epitaph on Sardanapalus, said to have been translated from the Chaldean (quoted in Athenaeus, p. viii. p. 336), is generally supposed to be by Choerilus.

See G. Kinkel, Epitocricon Graecorum Fragmenta, i. (1877); A. F. Náke, De Choerilis Samii Aetate Vito et Poeta atque Choerilis (1817), where the above poets are carefully distinguished; and the articles in Pauly-Wissowa’s Realencyclopaedie, iii. 2 (1899).

CHOEROBOSCUS, GEORGIUS (A.D. 660), deacon and professor at the ecclesiastical school at Constantinople. He is also called choroboskhis either as the holder of some ecclesiastical office or as superintendent of the university library. It is not known whether “Choeroboskus” (Gr. for ‘shinnerd’) is an allusion to his earlier occupation or an inherited family name. During his tenure of office he delivered a course of lectures on grammar, which has come down to us in the shape of notes taken by his pupils. He drew from the best authorities—Apollonius Dyscolus, Herodian, Orion, Theodosius of Alexandria. The lectures are written in simple style, but suffer from diffuseness. They were much used by Constantine Lascaris in his Greek grammar and by Urban of Belluno (end of 14th cent.). The chief work of Choeroboscus, which we have in its complete form, is the commentary on the canons of Theodosius on Decension and Conjugation. Mention may also be made of a treatise on orthography, of which a fragment (on Quantity) has been preserved; a tract on prosody: commentaries on Hephæstion and Dionysius Thrax; and grammatical notes on the Psalms.

See C. Krummacher, Geschichte der byzantinischen Literatur (1897); A. Hillgar, Grammatici Graeci, iv. (1889-1894), containing the text of the commentary on Theodosius and a full account of the life and works of Choeroboskus. Choeroboskhis, Realencyclopaedie, iii. 2 (1889); Reitzenstein, Etymologica, 190, n. 4.

CHOR (O. Fr. cuer from Lat. chorus; pronounced quire, and until the end of the 17th century so spelt, the spelling being altered to agree with the Fr. chœur), the body of singers who perform the musical portion of the service in a church, or the place set apart for them. Any organized body of singers performing full part choral works or oratorios is also called a choir.

In English cathedrals the choir is composed of men (vicars-choral or lay clerks) and boys (choirsters). They are divided into two sets, sitting on the north and south sides of the chancel respectively, called cantoris and decons, from being on the same side as the cantor (precentor) or the decreeus (dean). This arrangement, together with the custom of vesting choirmen and choirsters in surplices (traditional only in cathedrals and collegiate churches), has, since the middle of the 19th century, been adopted in a large number of parish and other churches. Surpliced choirs of women have occasionally been introduced, notably in America and the British colonies, but the practice has no warrant of traditional usage. In the Roman Catholic Church the choir plays a less conspicuous rôle than in the Church of England, its members not being regarded as ministers of the church, and non-Catholics are allowed to sing in it. The singers at Mass or other solemn services are usually placed in a gallery or some other inconspicuous place. The word ‘choir’, indeed, formerly applied to all the clergy taking part in services of the church, and the restriction of the term to the singing men and boys, who were in their origin no more than the representatives
(vicars) of the clergy, is a comparatively late development. The distinction between "choir services" (Mattins, Vespers, Compline, &c.)—consisting of prayers, lections, the singing of the psalms, &c.—and the service of the altar was sharply drawn in the middle ages, as in the modern Roman Church. "Choir vestments" (surplice, &c.) are those worn by the clergy at the altar, as distinguished from those used at the Mass (see Vestments). In England at the Reformation the choir services (Mattins, Evensong) replaced the Mass as the principal popular services, and, in general, only the choir vestments were retained in use. In the English cathedrals the members of the choir often retain privileges reminiscent of an earlier definite ecclesiastical status. At Wells, for instance, the vicars-choral form a corporation practically independent of the dean and chapter; they have their own lodgings inside the cathedral precincts (Vicsars' Close) and they can only be dismissed by a vote of their own body. (W. A. P.)

In an architectural sense a "choir" is strictly that part of a church which is fitted up for the choir services, and is thus limited to the space between the choir screen and the presbytery. Some confusion has arisen owing to the term being employed by medieval writers to express the entire space enclosed for the performance of Mass ('the choir of the cathedral'). The term is often used to include not only the choir proper, but the presbytery. In the case of a cruciform church the choir is sometimes situated under the central tower, or in the nave, and this is the case in Westminster Abbey, where it occupies four bays to the west of the transept. The choir is usually raised one step above the nave, and its sides are fitted up with seats or stalls, of which in large buildings there are usually two or three rows rising one behind the other.

In Romanesque churches there are eastern and western choirs, and in former times the term was given to chapels and subsidiary chapels, which were also called chancels. In the early Christian church the ambones where the gospels and epistles were read were placed on either side of the choir and formed part of its enclosure, and this is the case in S. Clemente, S. Lorenzo and S. Maria in Cosmedin in Rome. In English and choir seems almost universally to have assembled at the eastern part of the church to recite the breviary services, whereas on the continent it was moved from one place to another according to convenience. In Spanish churches it occupies the nave of the church, and in the church of the Escorial in Spain was at the west end above the entrance vestibule. (R. P. S.)

**CHOISEUL, ÉTIENNE FRANÇOIS, DUC DE (1719-1785), French statesman, was the eldest son of François Joseph de Choiseul, marquis de Stainville (1700-1770), and born in early life the title of comte de Stainville. Born on the 28th of June 1719, he entered the army, and during the War of the Austrian Succession served in Bohemia in 1741 and in Italy, where he distinguished himself at the battle of Coni, in 1744. From 1745 until 1748 he was with the army in the Low Countries, being present at the sieges of Mons, Charleroi and Maestricht. He attained the rank of lieutenant-general, and in 1750 married Louise Honorine, daughter of Louis François Crozat, marquis du Châtel (d. 1750), who brought her husband a large fortune and proved a most devoted wife.**

Choiseul gained the favour of Madame de Pompadour by procuring for her some letters which Louis XV. had written to her cousin Madame de Choiseul, with whom the king had formerly had an intrigue; and after a short time as bailli of the Vosges, he was appointed ambassador to Rome in 1753, where he was entrusted with the negotiations concerning the disturbances called forth by the bull Unigenitus. He acquitted himself skilfully in this task, and in 1757 his patroness obtained his transfer to Vienna, where he was instructed to cement the new alliance between France and Austria. His success at Vienna opened the way to a larger career, when in 1758 he supplantcd Antoine Louis Roulle (1689-1761) as minister for foreign affairs and so had the direction of French foreign policy during the Seven Years' War. At this time he was made a peer of France and created duc de Choiseul. Although from 1761 until 1766 his cousin César, duc de Choiseul-Praslin (1712-1783), was minister for foreign affairs, yet Choiseul continued to control the policy of France until 1770, and during this period held most of the other important offices of state. As the author of the "Family Compact" he sought to retrieve by English alliance with the Bourbon house of Spain the disastrous results of the alliance with Austria; but his action came too late. His vigorous policy in other departments of state was not, however, fruitless. Coming to power in the midst of the demoralization consequent upon the defeats of Rossbach and Crefeld, by boldness and energy he reformed and strengthened both army and navy, and although too late to prevent the loss of Canada and India, he developed French colonies in the Antilles and San Domingo, and added Corsica and Lorraine to the crown of France. His management of home affairs in general satisfied the philosophes. He allowed the Encyclopédie to be published, and brought about the banishment of the Jesuits and the temporary abolition of the order by Pope Clement IV.

Choiseul's fall was caused by his action towards the Jesuits, and by his support of their opponent La Chalotais, and of the provincial parlements. After the death of Madame de Pompadour in 1764, his enemies, led by Madame Du Barry and the chancellor Maupoue, were too strong for him, and in 1770 he was ordered to retire to his estate at Chanteloupe. The intrigues against him had, however, increased his popularity, which was already great, and during his retirement, which lasted until 1774, he lived in the greatest affluence and was visited by many eminent personages. Greatly to his disappointment Louis XVI. did not restore him to his former position, although the king recalled him to Paris in 1774, when he died on the 8th of May 1785, leaving behind him a huge accumulation of debt which was scrupulously discharged by his widow.

Choiseul possessed both ability and diligence, and though lacking in tenacity he showed foresight and liberality in his direction of affairs. In appearance he was a short, ill-featured man, with a ruddy countenance and a sturdy frame. His Mémoires were written during his exile from Paris, and are merely detached notes upon different questions. Horace Walpole, in his Mémoires, gives a very vivid description of the
duke's character, accuses him of exciting the war between Russia and Turkey in 1768 in order to be revenged upon the tsarina Catherine II., and says of his foreign policy, "He would project and plant the prestige of a country, but could not meditate a little mischief or a narrow benefit." "He divided the nation's wealth and his own; but did not repair the latter by plunder of the former," says the same writer, who in reference to Choiseul's private life asserts that "gallantry without delicacy was his constant pursuit." Choiseul's widow, a woman "in whom industrious melancholy could not find an imitation," lived in retirement until her death on the 3rd of December 1788.

CHOISEUL-STAINVILLE, CLAUDE ANTOINE GABRIEL, Duc de (1760-1838), French soldier, was brought up at Chante- loup, under the care of his relative, Étienne François, duc de Choiseul, who had been colonel of dragoons, and throughout those troublous times he was distinguished for his devotion to the royal house. He took part in the attempt of Louis XVI. to escape from Paris on the 20th of June 1791; was arrested with the king, and imprisoned. Liberated in May 1792, he emigrated in October, and fought in the "army of Condé" against the republic. Captured in 1795, he was confined at Dunkirk; escaped, set sail for India, was wrecked on the French coast, and condemned to death by the decree of the Directory. Nevertheless, he was fortunate enough to escape once more. Napoleon allowed him to return to France in 1801, but he remained in private life until the fall of the Empire. At the Restoration he was called to the House of Peers by Louis XVIII. At the revolution of 1830 he was nominated a member of the provisional government; and he afterwards received from Louis Philippe the post of aide-de-camp to the king and governor of the Louvre. He died in Paris on the 1st of December 1838.

CHOISY, FRANÇOIS TIMOLÉON, Abbé de (1644-1724), French author, was born in Paris on the 16th of August 1644, and died in Paris on the 2nd of October 1724. His father was attached to the household of the duke of Orleans, and his mother, who was on intimate terms with Anne of Austria, was regularly called upon to amuse Louis XIV. By a whim of his mother, the boy was dressed like a girl until he was sixteen, and, after appearing for a short time in man's costume, he resumed woman's dress on the advice—doubtless satirical—of Madame de la Fayette. He delighted in the most extravagant toilettes until he was publicly rebuked by the duc de Montausier, when he retired for some time to the provinces, using his disguise to assist his numerous intrigues. He had been made an abbé in his childhood, and poverty, induced by his extravagance, drove him to borrow the blessing of Sainte-Suzanne in Burgundy, where he found among his neighbours a kindred spirit in Bussy-Rabutin. He visited Rome in the suitcase of the cardinal de Bouillon in 1766, and shortly afterwards a serious illness brought about a sudden and rather frivolous conversion to religion. In 1685 he accompanied the chevalier de Chaumont on a mission to Siam. He was ordained priest, and received various ecclesiastical preferences. He was admitted to the Academy in 1687, and wrote a number of historical and religious works, of which the most notable are the following:—Quatre dialogues sur l'immortalité de l'âme... (1684), written with the Abbé Dangeau and explaining his conversion; Traduction de l'Imitation de Jésus-Christ (1692); Histoire de France sous les règnes de Saint Louis... de Charles V et Charles VI (5 vols., 1688-1695); and Histoire de l'Église (11 vols., 1703-1723). He is remembered, however, by his gossiping Mémoires (1737), which contain striking and accurate pictures of his time and remarkably exact portraits of his contemporaries, although he has otherwise small pretensions to historical accuracy.

The Mémoires passed through many editions, and were edited in 1888 by M. de Lescure. Some admirable letters of Choisy are included in the correspondence of Bussy-Rabutin. Choisy is said to have burnt some of his indiscreet revelations, but left a considerable quantity of unpublished MS. Part of this material, giving an account of his adventurous life as a woman, was surreptitiously used in an anonymous Histoire de madame la comtesse de Barres (Antwerp, 1735), and again with much editing in the Vie de M. l'abbé de Choisy (Lausanne and Geneva, 1742), ascribed by Paul Lacroix to Lenglet Dubreuil. The text was finally edited (1870) by Lacroix as Assem- tures de l'abbé de Choisy. See also Sainte-Beuve, Causers du lundi, vol. iii.

CHOLERA (from the Gr. χόλος, bile, and πέπει, to flow), the name given to two distinct forms of disease, simple cholera and malignant cholera. Although essentially different both as to their causation and their pathological relationships, these two diseases may in individual cases present many symptoms of mutual resemblance.

Simple Cholera (synonym, Cholera Europaeæ, British Cholera, Summer or Autumnal Cholera) is the cholera of ancient medical writers, as is apparent from the accurate description of the disease given by Hippocrates, Celsus and Aretaeus. Its occurrence in an epidemic form was noticed by Paracelsus in the 16th century, and an admirable account of the disease was subsequently given by Thomas Sydenham in 1666-1672. This disease is sometimes called Cholera Nostras, the word nostras, which is good Latin and used by Cicero, meaning "belonging to our country." The relations between it and Asiatic cholera (see below) are obscure. Clinically they may exactly resemble each other, and bacteriology has not been able to draw an absolute line between them. The real difference is epidemiological, cholera nostras having no epidemic significance.

The chief symptoms in well-marked cases are vomiting and purging occurring either together or alternately. The seizure is usually sudden and violent. The contents of the stomach are first ejected, and this is followed by severe retching and vomiting of thin fluid of bilious appearance and bitter taste. The diarrhoea which accompanies or succeeds the vomiting, and is likewise of bilious character, is attended with severe griping abdominal pains, and sometimes even an eruption affecting the legs or arms greatly intensifying the suffering. The effect upon the system is rapid and alarming, a few hours of such an attack sufficing to reduce the strongest person to a state of extreme prostration. The surface of the body becomes cold, the pulse weak, the voice husky, and the whole body is bathed in cold sweats. The disordered alimentary canal, rendering necessary the utmost care in regard to diet.

Attacks of this kind are of frequent occurrence in summer and autumn in almost all countries. They appear specially liable to occur with cold and damp atmosphere with heat. Occasionally the disorder prevails so extensively as to constitute an epidemic. The exciting causes of an attack are in many cases errors in diet, particularly the use of unripe fruit and new vegetables, and the excessive drinking of cold liquids during perspiration. Outbreaks of this disorder in a household or community can sometimes be traced to the use of impure water, or to noxious emanations from the sewers.

In the treatment, vomiting should be encouraged so long as it shows the presence of undigested food, after which opiates ought to be administered. Small opium pills, or Dover's powder, or the aromatic powder of chalk with opium, are likely to be retained in the stomach, and will generally succeed in allaying the pain and diarrhoea, while ice and effervescing drinks serve
to quench the thirst and subdue the sickness. In aggravated cases where medicines are rejected, enemata of starch and laudanum, or the hypodermic injection of morphia, ought to be resorted to. Counter-irritation by mustard or turpentine over the abdomen is always of use, as is also friction with the hands where cramps are present. When sinking threatens, brandy and ammonia will be called for. During convalescence the food should be in the form of milk and farinaceous diet, or light soups, and all indigestible articles must be carefully avoided.

In the treatment of this disease as it affects young children (Cholera Infantum), most reliance is to be placed on the administration of chalk and the use of starch enemata. In their case opium in any form cannot be safely employed.

Malignant Cholera (synonyms, Asiatic Cholera, Indian Cholera, Epidemic Cholera, Algide Cholera) is one of the most severe and fatal diseases. In describing the symptoms it is customary to divide them into three stages, but it must be noted that these do not always present themselves in so distinct a form as to be capable of separate recognition. The first or premonitory stage consists in the occurrence of diarrhoea. Frequently of mild and painless character, and coming on after some error in diet, this symptom is apt to be disregarded. The discharges from the bowels are similar to those of ordinary summer diarrhea, and the attack closely resembles. There is, however, at first the absence of vomiting. This diarrhoea generally lasts for two or three days, and then if it does not gradually subside either may pass into the more severe phenomena characteristic of the second stage of cholera, or on the other hand may itself prove fatal.

The second stage is termed the stage of collapse or the algide or asphyxial stage. As above mentioned, this is often preceded by the premonitory diarrhoea, but not infrequently the phenomena attendant upon this stage are the first to manifest themselves. They come on often suddenly in the night with diarrhoea of the most violent character, the matters discharged being of whey-like appearance, and commonly termed the "rice-water" evacuations. They contain large quantities of disintegrated epithelium from the mucous membrane of the intestines. The discharge, which is at first unattended with pain, is soon succeeded by copious vomiting of matters similar to those passed from the bowels, accompanied with severe pain at the pit of the stomach, and with intense thirst. The symptoms now advance with rapidity. Cramps of the legs, feet, and muscles of the abdomen come on and occasion great agony, while the signs of collapse make their appearance. The surface of the body becomes cold and assumes a blue or purple hue, the skin is dry, sodden and wrinkled, indicating the intense draining away of the fluids of the body, the features are pinched and the eyes deeply sunken, the pulse at the wrist is imperceptible, and the voice is reduced to a hoarse whisper (the vox cholerae). There is complete suppression of the urine.

In this condition death often takes place in less than one day, but in epidemics cases are frequently observed where the collapse is so sudden and complete as to prove fatal in one or two hours even without any great amount of previous purging or vomiting. In most instances the mental faculties are paratively unaffected, although in the later stages there is in general more or less apathy.

Reaction, however, may take place, and this constitutes the third stage. It consists in the arrest of the alarming symptoms characterizing the second stage, and the gradual but evident improvement in the patient's condition. The pulse returns, the surface assumes a natural hue, and the bodily heat is restored. Before long the vomiting ceases, and although diarrhoea may continue for a time, it is not of a very severe character and soon subsides, as do also the cramps. The urine may remain suppressed for some time, and on returning is often found to be albuminous. Even in this stage, however, the danger is not past, for relapses sometimes occur which speedily prove fatal, while again the reaction may be of imperfect character, and there may succeed an exhausting fever (the so-called typhoid stage of cholera) which may greatly retard recovery, and under which the patient may sink at a period even as late as two or three weeks from the commencement of the illness.

Many other complications are apt to arise during the progress of convalescence from cholera, such as diphtheritic and local inflammatory affections, all of which are attended with grave danger.

When the attack of cholera is of milder character in all its stages than that above described, it has been named Cholereine, but the term is an arbitrary one and the disease is essentially cholera.

The bodies of persons dying of cholera are found to remain long warm, and the temperature may even rise after death. Peculiar muscular contractions have been observed to take place after death, so that the position of the limbs may become altered. The soft textures of the body are found to be dry and hard, and the muscles of a dark brown appearance. The blood is of dark colour and tarry consistence. The upper portion of the small intestines is generally found distended with the rice-water discharges, the mucous membrane is swollen, and there is a remarkable loss of its natural epithelium. The kidneys are usually in a state of acute congestion. This form of cholera belongs originally to Asia, more particularly to India, where, as well as in the Indian archipelago, epidemics are known to have occurred for centuries.

Much light has been thrown upon Asiatic cholera by Western experience; and the study of the disease by modern methods has resulted in important additions to our previous knowledge of its nature, causation, mode of dissemination and prevention.

The cause is a micro-organism identified by Koch in 1883 (see Parasitic Diseases). For some years it was called the "comma bacillus," from its supposed resemblance in shape to a comma, but it was subsequently found to be a vibrio or spirillum, not a bacillus. The discovery was received with much scepticism in some quarters, and the claim of Koch's vibrio to be the true cause of cholera was long disputed, but is now universally acknowledged. Few micro-organisms have been more elaborately investigated, but very little is known of its natural history, and its epidemiological behaviour is still surrounded by obscurity. At an important discussion on the subject, held at the International Hygienic Congress in 1894, Professor Gruber of Vienna declared that the deeper investigators went the more difficult the problem became, while M. Elis Metschnikoff of the Pasteur Institute made a similar admission. The difficulty lies chiefly in the variable characters assumed by the organism and the variable effects produced by it. The type reached by cultivation through a few generations may differ so widely from the original in appearance and behaviour as to be hardly recognizable, while, on the other hand, of two organisms apparently indistinguishable one may be innocuous and the other give rise to the most violent cholera. This variability offers a possible explanation of the frequent failure to trace the origin of epidemic outbreaks in isolated places. It is commonly assumed that the micro-organism is of a specific character, and always introduced from without, when cholera appears in countries or places where it is not endemic. In some cases such introduction can be proved, and in others it can be inferred with a high degree of probability, but sometimes it is impossible to trace the origin to any possible channel of communication. A remarkable case of this kind occurred at the Niedleben lunatic asylum near Halle, in 1893, in the shape of a sudden, explosive and isolated outbreak of true Asiatic cholera. It was entirely confined to the institution, and the peculiar circumstances enabled a very exact investigation to be made. The facts led Professor Arndt, of Greifswald, to propound a novel and interesting theory. No cholera existed in the surrounding district and no introduction could be traced, but for several months in the previous autumn diarrhoea had prevailed in the asylum. The sewage from the establishment was disposed of on a farm, and the effluent passed into the river Saale above the intake of the water-supply for the asylum. Thus a circulation of morbid material through the persons of the inmates was established. Dr Arndt's theory was that by virtue of this circulation cholera was
gradually developed from previously existing intestinal disease of an allied but milder type. The outbreak occurred in winter, and coincided with the freezing of the filter-beds at the waterworks. The theory is worth notice, because a similar relation exists between the drainage and the water-supply frequendy observed in places severely attacked by cholera, and it has repeatedly been observed that the latter is preceded by the prevalence of a milder form of intestinal disease. The inference is not that cholera can be developed de novo, but that the type is unstable, and that a virulent form may be evolved under favourable conditions from another so mild as to be unrecognized, and consequently undetected in its origin or introduction. This is quite in keeping with the observed variability of the micro-organism, and with the trend of modern research with regard to the relations between other pathogenic germs and the multifarious gradations of type assumed by other zymotic diseases. The same thing has been suggested of diphtheria.

Cholera is endemic in the East over a wide area, ranging from Bombay to southern China, but its chief home is British India. It principally affects the alluvial soil near the mouths of the great rivers, and more particularly the delta of the Ganges. Lower Bengal is pre-eminently the standing focus and centre of diffusion. In some years it is quiescent, though never absent; in others it becomes diffused, for reasons of which nothing is known, and its diffusive activity varies greatly from equally inscrutable causes. At irregular intervals this property becomes so heightened that the disease passes its natural boundaries and is carried east, north and west, it may be to Europe or beyond to the American continent. We must assume that the micro-organism, like those of other epidemic diseases, acquires greater vitality and toxic energy, or greater power of reproduction at some times than at others, but the conditions that govern this behaviour are quite unknown, though no problem has a more important bearing on public health. Bacteriology, as already intimated, has thrown no light upon it, nor has meteorology. Some results of modern research, indeed, tend to assign increasing importance to the relations between surface soil and certain micro-organisms, and suggest that changes in the level of the subsoil water, to which Professor Max von Pettenkofer long ago drew attention, may be a dominant factor in determining the latency or activity of pathogenic germs. But this is largely a matter of conjecture, and, so far as cholera is concerned, the conditions which turn an endemic into an epidemic disease must be admitted to be still unknown.

On the other hand, the mode of dissemination is now well understood. Diffusion takes place along the lines of human intercourse. The poison is carried chiefly by infected persons moving from place to place; but soiled clothes, rags and other articles that have come into contact with persons suffering from the disease may be the means of conveyance to a distance. There is no reason to suppose that it is air-borne, or that atmospheric influences have anything to do with its spread, except in so far as meteorological conditions may be favourable to the growth and activity of the micro-organisms. Beyond all doubt, the great manufactory of the poison is the human body, and the discharges from it are the great source of contagion. They may infect the ground, the water, or the immediate surroundings of the patient, and so pass from hand to hand, the poison finding entrance into the bodies of the healthy by means of food and drink which have become contaminated in various ways. Flies which feed upon excreta and other foul matters may be carriers of contagion. Of all the means of local dissemination, contaminated water is by far the most important, because it affects the greatest number of people. This is particularly the case in places which have a public water-supply. A small number of poisoned wells may expose the entire population to danger. All severe outbreaks of an explosive character are due to this cause. It is also possible that the cholera poison multiplies rapidly in water under favourable conditions, and that a reservoir, for instance, may form a sort of forcing-bed. But it would be a mistake to regard cholera as purely a water-borne disease, even locally. It may infect the soil in localities which have a perfectly pure water-supply, but have defective drainage or no drainage at all, and then it will be found more difficult to get rid of, though less formidable in its effects, than when the water alone is the source of disease. In all these respects it has a great affinity to enteric fever. With regard to locality, no situation can be said to be free from attack if the disease is introduced and the sanitary conditions are bad; but, speaking generally, low-lying places on alluvial soil near rivers are more liable than those standing high or on a rocky foundation. Of meteorological conditions it can only be said with certainty that a high temperature favours the development of cholera, though a low one does not prevent it. In temperate climates the summer months, and particularly August and September, are the season of its greatest activity.

Cholera spreads westwards from India by two routes—(1) by sea to the shores of the Red Sea, Egypt and the Mediterranean; and (2) by land to northern India and Afghanistan, thence to Persia and central Asia, and so to Russia. In the great invasions of Europe during the 19th century it sometimes followed one route and sometimes the other. It was not till 1817 that the attention of European physicians was specially directed to the disease by the outbreak of a violent epidemic of cholera at Jessore in Bengal. This was followed by its rapid spread over a large portion of British India, where it caused immense destruction of life both among natives and Europeans. During the next three years cholera continued to rage all over India, as well as in Ceylon and others of the Indian islands. The disease now began to spread over a wider extent than hitherto, invading China on the east and Persia on the west. In 1823 it had extended into Asia Minor and Russia in Asia, and it continued to advance steadily though slowly westwards, while at the same time fresh epidemics were appearing at intervals in India. From this period up till 1830 no great extension of cholera took place, but in the latter year it reappeared in Persia and along the shores of the Caspian Sea, and thence entered Russia in Europe. Despite the strictest sanitary precautions, the disease spread rapidly through that whole empire, causing great mortality and exciting consternation everywhere. It ravaged the northern and central parts of Europe, and spread onwards to England, appearing in Sunderland in October 1831, and in London in January 1832, during which year it continued to prevail in most of the cities and large towns of Great Britain and Ireland. The disease subsequently extended into France, Spain and Italy, and crossing the Atlantic spread through North and Central America. It had previously prevailed in Arabia, Turkey, Egypt and the Nile district, and in 1835 it was general throughout North Africa. Up till 1837 cholera continued to break out in various parts of the continent of Europe, after which this epidemic disappeared, having thus within twenty years visited a large portion of the world.

About the year 1841 another great epidemic of cholera appeared in India and China, and soon began to extend in the direction traversed by the former, but involving a still wider area. It entered Europe again in 1847, and spread through Russia and Germany on to England, and thence to France, whence it passed to America, and subsequently appeared in the West Indies. This epidemic appears to have been even more deadly than the former, especially as regards Great Britain and France. A third great outbreak of cholera took place in the East in 1850, entering Europe in 1853. During the two succeeding years it prevailed extensively throughout the continent, and fell with severity on the armies engaged in the Crimean War. Although widely prevalent in Great Britain and Ireland it was less destructive than former epidemics. It was specially severe throughout both North and South America. A fourth epidemic in 1861 and 1862 was more on the whole less extensive and destructive than its predecessors.

By some writers the epidemic of 1853 is regarded as a re-occurrence of that of 1847. The earlier ones followed the land route by way of Afghanistan and Persia, and took several years to reach Europe. That of 1865 travelled more rapidly, being carried from Bombay by sea to Mecca, from there to Suez and Alexandria, and then on to various Mediterranean ports. Within
the year it had not only spread extensively in Europe, but had reached the West Indies. In 1866 it invaded England and the United States, but during the following year it died down in the West. The subsequent history of cholera in Europe may be stated chronologically.

1869—1874.—This invasion was traced to the great gathering of pilgrims at Hardwar on the Upper Ganges in the month of April 1867. From there the returning pilgrims carried it to the Punjab, Kashmir and Afghanistan, whence it spread to Persia and the Caspian, but it did not reach Russia until 1869. During the next four years a number of outbreaks occurred in central Europe, and notably one at Munich in the winter of 1873. The irregular character of these epidemics suggests that they were rather survivals from the pandemic wave of 1867 than fresh importations, but there is no doubt that cholera was carried overland into Russia in the manner described.

1883—1887.—This visitation, again, came by the Mediterranean. In 1883 a severe outbreak occurred in Egypt, causing a mortality of about 25,000. Its origin remained unknown. During this epidemic Koch discovered the comma bacillus. The following year cholera appeared at Toulon. It was said to have been brought in a troopship from Saigon in Cochin-China, but it may have been connected with the Egyptian epidemic. A severe outbreak followed and reached Italy, nearly 8000 persons dying in Naples alone. In 1885 the south of France, Italy, Sicily and Spain all suffered, especially the last, where nearly 120,000 deaths occurred. Portugal escaped, and the authorities there attributed their good fortune to the institution of a military cordon, in which they have had implicit confidence ever since.

In 1886 the same countries suffered again, and also Austria-Hungary. From Italy the disease was carried to South America, and even travelled as far as Chile, where it had previously been unknown. In 1889 it still lingered in the Mediterranean, causing great mortality in Messina especially. According to Dr A. J. Wall, this epidemic cost 250,000 lives in Europe and at least 30,000 in America. A particular interest attaches to it in the fact that a localized revivification of the disease was caused in Spain in 1890 by the disturbance of the graves of some of the victims who had died of cholera four years previously.

1892—1895.—This great invasion reverted again to the old overland route, but the march of the disease was of unprecedented rapidity. Within less than five months it travelled from the North-West Provinces of India to St Petersburg, and probably to Hamburg, and thence in a few days to England and the United States. This speed, in such striking contrast to the slow advance of former occasions, was attributed, and no doubt rightly, to improved steam transit, and particularly the Transcaspian railway. The progress of the disease was traced from place to place, and almost from day to day, with great precision, showing how it moves along the chief highways and is obviously carried by man. The main facts are as follows:—Cholera was extensively and severely prevalent in India in 1891, causing 601,603 deaths, the highest mortality since 1877. In March 1892 it broke out at the Hardwar fair, a day or two before the pilgrims dispersed; on the 19th of April it was at Kabul, on the 1st of May at Herat, and on the 26th of May at Meshed. From Meshed it moved in three directions—due west to Teheran in Persia, north-east by the Transcaspian railway to Samarkand in Central Asia, and north-west by the same line in the opposite direction to Uzun-ada on the Caspian Sea. It reached Uzun-ada on the 6th of June; crossed to Baku, June 18th; Astrakhan, June 24th; then up the Volga to Nizhny-Novgorod, arriving at Moscow and St Petersburg early in August. The part played by steam transit is clear from the fact that the disease took no longer to travel all the way from Meshed to St Petersburg by rail and steamboat than to traverse the short distance from Meshed to Teheran by road.

On the 16th of August cases began to occur in Hamburg; on the 19th of August a fireman was taken ill at Grangemouth in Scotland, where he had arrived the day before from Hamburg; and on the 31st of August a vessel reached New York from the same port with cholera on board. On the 8th of September the disease appeared in Galicia, having moved somewhat slowly westwards across Russia into Poland, and on the 26th of September it was in Budapest. Holland and Servia were also attacked, while isolated cases were carried to Norway, Denmark and Italy. Meanwhile two entirely separate epidemics were in progress elsewhere. The first was confined to Arabia and the Somali coast of Africa, and was connected with the remains of an outbreak in Syria and Arabia in 1890—1891. The second arose mysteriously in France about the time when the overland invasion started from India. The first known case occurred in the prison at Nanterre, near Paris, on the 31st of March. Paris was affected in April, and Havre in July. The origin of this outbreak, which was of a much less violent character than that which came simultaneously by way of Russia, was never ascertained. Its activity was confined to France, particularly in the neighbourhood of Paris, together with Belgium and Holland, which was placed between two fires, but escaped with but little mortality. The number of persons killed by cholera in 1892, outside of India, was reckoned at 378,449, and the vast majority of those died within six months. The countries which suffered most severely were as follows:—European Russia, 151,625; Caucasus, 69,423; Central Asian Russia, 31,804; Siberia, 15,037—all for Russian empire, 267,809; Persia, 63,982; Somaliland, 10,000; Afghanistan, 7,000; Germany, 9563; France, 4580; Hungary, 1255; Belgium, 661. Curiously enough, the south of Europe, which had been the scene of the previous epidemic visitation, escaped. The disease of the most virulent character. In European Russia the mortality was 45-8% of the cases, the highest rate ever known in that country; in Germany it was 51-4%; and in Austria-Hungary, 57-5%. Of all the localities attacked, the case of Hamburg was the most remarkable. The presence of cholera was first suspected on the 16th of August, when two cases occurred, but it was not officially declared until the 23rd of August. By that time the daily number of victims had already risen to some hundreds, while the experts and authorities were making up their minds whether they had cholera to deal with or not. Their decision eventually came too late and was superfluous, for by the 27th of August the people were being stricken down at the rate of 1000 a day. This rate was maintained for four days, after which the vehemence of the pestilence began to abate. It gradually declined, and ceased on the 14th of November. During those three months 16,936 persons were attacked and 8605 died, the majority within the space of a few weeks. The town, ordinarily one of the gayest places of business in Germany and particularly on the continent, became a city of the dead. Thousands of persons fled, carrying the disease into all parts of Germany; the rest shut themselves indoors; the shops were closed, the trains ceased to run, the hotels and restaurants were deserted, and few vehicles or pedestrians were seen in the streets. At the cemetery, which lies about 10 m. from the town, some hundreds of men were engaged day and night digging long trenches to hold double rows of coffins, while the funerals formed an almost continuous procession along the roads; even so the victims could not be buried fast enough, and their bodies lay for days in sheds hastily run up as mortuaries. Hamburg had been attacked by cholera on fourteen previous occasions, beginning with 1831, but the mortality had never approached that of 1892; in the worst year, which was 1832, there were only 3687 cases and 1765 deaths. The disease was believed to have been introduced by Jewish emigrants passing through on their way from Russia, but the importation could not be traced. The Jews were segregated and kept under careful supervision from the middle of July onwards, and no recognized case occurred among them. The total number of places in Germany in which cholera appeared in 1892 was 260, but it took no serious hold anywhere save in Hamburg. The distribution was chiefly by the waterways, which seem to affect a larger number of places than the railways as carriers of cholera. In Paris 907 persons died, and in Havre 408. Between the 18th of August and the 27th of October 38 cases were imported into England and Scotland through eleven different ports, but the disease nowhere obtained a footing. Seven vessels brought 72 cases to the United States.
and 16 others occurred on shore, but there was no further dissemination.

During the winter of 1892-1893 cholera died down, but never wholly ceased in Russia, Germany, Austria-Hungary and France. But the return of warm weather it showed renewed activity, and prevailed extensively throughout Europe. The recorded mortality for the principal countries was as follows:

Russia (chiefly western provinces), 41,047; Austria-Hungary, 4669; France, 4000; Italy, 3036; Turkey, 1500; Germany, 293; Holland, 376; Belgium, 372; England, 139. Hardly any country escaped altogether; but Europe suffered less than Arabia, Mesopotamia and Persia. Cholera broke out at Mecca in June, and owing to the presence of an exceptionally large number of pilgrims caused an appalling mortality. The chief sheeref estimated the mortality at 50,000. The pilgrims carried the disease to Asia Minor and Constantinople. In Persia also a recrudescence took place and proved enormously destructive. Dr Barry estimated the mortality at 70,000. At Hamburg, where new waterworks had been installed with sand filtration, only a few sporadic cases occurred until the autumn, when a sudden but limited rush took place, which was traced to a defect in the masonry permitting unfiltered Elbe water to pass into the mains. In England cholera obtained a footing on the Humber at Grimsby, and to a lesser extent at Hull, and isolated attacks occurred in some 50 different localities. Excluding a few ship-borne cases the registered number of attacks was 287, with 135 deaths, of which 9 took place in London. It is interesting to compare the mortality from cholera in England and Wales, and in London, for each year in which it has prevailed since registration began:

In 1848 no deaths from cholera were recorded in England, but on the continent it still prevailed over a wide area. In Russia over 30,000 persons died of it, in Germany about 500, but the most violent outbreak was in Galicia, where upwards of 8000 deaths were registered. In 1893 it still lingered, chiefly in Russia and Galicia, but with greatly diminished activity. In that year Egypt, Morocco and Japan were attacked, the last severely. The disease then remained in abeyance until the II.

The great invasion just described was fruitful in lessons for the prevention of cholera. It proved that the one real and sufficient protection lies in a standing condition of good sanitation backed by an efficient and vigilant sanitary administration. The experience of Great Britain was a remarkable piece of evidence, but that of Berlin was perhaps even more striking, for Berlin lay in the centre of four fires, in direct and frequent communication with Hamburg, Russia, France and Austria, and without the advantage of a sea frontier. Cholera was repeatedly brought into Berlin, but never obtained a footing, and its successful repression was accomplished without any irksome interference with traffic or the ordinary business of life. The general success of Great Britain and Germany in keeping cholera in check by ordinary sanitary means completed the conversion of all enlightened nations to the policy laid down so far back as 1853 by Sir John Simon, and advocated by Great Britain at a series of international congresses—the policy of abandoning quarantine, which Great Britain did in 1873, and trusting to sanitary measures with medical inspection of persons arriving from infected places. This principle was formally adopted at the international conference held at Dresden in 1893, at which a convention was signed by the delegates of Germany, Austria, Belgium, France, Great Britain, Italy, Russia, Switzerland, Luxemburg, Montenegro and the Netherlands. Under this instrument the practice is broadly as follows, though the procedure varies to a great deal in different countries:—Ships arriving from infected ports are inspected, and if healthy are not detained, but bilge-water and drinking-water are evacuated, and persons landing may be placed under medical supervision without detention; infected ships are detained only for purposes of disinfection; persons suffering from cholera are removed to hospital; other persons landing from an infected ship are placed under medical observation, which may mean detention for five days from the last case, or, as in Great Britain, supervision in their own homes, for which purpose they give their names and places of destination before landing. All goods are freed from restrictions, except rags and articles believed to be contaminated by cholera matters. By land, passengers from infected places are similarly inspected at the frontiers and their luggage "disinfected"—in all cases at a public ceremony of no practical value, involving a short but often a vexatious delay; only those found suffering from cholera can be detained. Each nation is pledged to notify the others of the existence within its own borders of a "foyer" of cholera, by which is meant a focus or centre of infection. The precise interpretation of the term is left to each government, and is treated in a rather elastic fashion by some, but it is generally understood to imply the occurrence of non-imported cases in such a manner as to point to the local presence of infection. The question of guarding Europe generally from the danger of diffusion by pilgrims through the Red Sea was settled at another conference held in Paris in 1894. The provisions agreed on included the inspection of pilgrims at ports of departure, detention of infected or suspected persons, and supervision of pilgrims and of ships proceeding overland to Mecca.

The substitution of the procedure above described for the old measures of quarantine and other more or less drastic interferences with traffic presupposes the existence of a sanitary service and fairly good sanitary conditions if cholera is to be effectively prevented. No doubt if sanitation were perfect in any place or country, cholera, along with many other diseases, might there be ignored, but sanitation is not perfect anywhere, and therefore it requires to be supplemented by a system of notification with prompt segregation of the sick and destruction of infective material. These things imply a regular organization, and it is to the public health service of Great Britain that the complete mastery of cholera and Typhus fever has been due in recent years, and particularly in 1893. Of sanitary conditions the most important is unquestionably the water-supply. So many irrefragable proofs of this fact were given during 1892-1893 that it is no longer necessary to refer to the time-honoured case of the Broad Street pump. At Samarkand three regiments were encamped side by side on a level plain close to a stream of water. The colonel of one regiment took extraordinary precautions, placing a guard over the river, and compelling his men to use boiled water even for washing. Not a single case of cholera occurred in that regiment, while the others, in which only ordinary precautions were taken, lost over 100 men. At Askabad the cholera had almost disappeared, when a banquet was given by the governor in honour of the tsar's name-day. Of the guests one-half died within twenty-four hours; a military band, which was present, lost 40 men out of 50; and one regiment lost half its men and 9 officers. Within forty-eight hours 1300 persons died out of a total population of about 13,000. The water supply came from a small stream, and just before the banquet a heavy rain-storm had occurred, which swept into the stream all surface refuse from an infected village higher up and some distance from the town. But the classical example was Hamburg. The water-supply is obtained from the Elbe, which became infected by some means not ascertained. The drainage from the town also runs into the river, and the movement of the tide was sufficient to carry the sewage matter up above the water-intake. The water itself, which is no cleaner than that of the Thames...
at London Bridge, underwent no purification whatever before distribution. It passed through a couple of ponds, supposed to act as settling tanks, but owing to the growth of the town and increased demand for water it was pumped through too rapidly to permit of any subsidence. Eels and other fish constantly found their way into the houses, while the mains were lined with vegetation and crustaceans. The water-pipes of Hamburg had a peculiar and abundant fauna and flora of their own, and the water they delivered was commonly called Fleischbrühe, from its resemblance to thick soup. On the other hand, at Altona, which is continuous with Hamburg, the water was filtered through sand. In all other respects the conditions were identical, yet in Altona only 328 persons died, against 8065 in Hamburg. In some streets one side lies in Hamburg, the other in Altona, and cholera stopped at the dividing line, the Hamburg side being full of cases and the Altona side untouched. In the following year, when Hamburg had the new filtered supply, it enjoyed equal immunity, save for a short period when, as we have said, raw Elbe water accidentally entered the mains.

But water, though the most important condition, is not the only one affecting the incidence of cholera. The case of Grimsby furnish a striking lesson to the contrary. Here the disease was extensively spread and obtained a most disastrous character. Month by month it spread and increased, and the tailor who tried to found a pure water-supply, through the fouling of the soil by cesspits and defective drainage. At Havre also its prevalence was due to a similar cause. Further, it was conclusively proved at Grimsby that cholera can be spread by sewage-fed shell-fish. Several of the local outbreaks in England were traced to the ingestion of oysters obtained from the Grimsby beds. In short, it may be said that all insanitary conditions favour the prevalence of cholera in some degree. Preventive inoculation with an attenuated virus was introduced by W. M. W. Haffkine, and has been extensively used in India, with considerable appearance of success so far as the statistical evidence goes.

As already remarked, the latest manifestations of cholera show that it has lost none of its former virulence and fatality. Treatment. The symptoms are now regarded as the effects of the toxic action of the poison formed by the micro-organisms upon the tissues and especially upon the nervous system. But this theory has not led to any effective treatment. Drugs in great variety were tried in the continental hospitals in 1892, but without any distinct success. The old controversy between the aperient and the astringent treatment reappeared. In Russia the former, which aims at evacuating the poison, was more generally adopted; in Germany the latter, which tries to conserve strength by stopping the flux, found more favour. Two methods of treatment were invariably found to give great relief, if not to prolong life and promote recovery—the hot bath and the injection of normal saline solution into the veins or the subcutaneous tissue. These two should be tried in the cold and collapsed stages of cholera.

CHOLET—CHOLULA, a town of western France, capital of an arrondissement in the department of Maine-et-Loire, 41 m. S.E. of Nantes on the Ouest-État railway between that town and Poitiers. Pop. (1906) 16,554. Chollet stands on an eminence on the right bank of the Moine, which is crossed by a bridge of the 15th century. A public garden occupies the site of the old castle; the public buildings and churches, the finest of which is Notre-Dame, are modern. The public institutions include the sub-prefecture, a tribunal of first instance, a chamber of commerce, a board of trade-arbitrators, and a communal college. There are granite quarries in the vicinity of the town. The chief industry is the manufacture of linen and linen hangkerchiefs, which is also carried on in the neighbouring communes on a large scale. Woollen and cotton fabrics are also produced, and bleaching and the manufacture of preserved foods are carried on. Chollet is the most important centre in France for the sale of fat cattle, sheep and pigs, for which Paris is the chief market. Megalithic monuments are numerous in the neighbourhood. The town owes the rise of its prosperity to the settlement of weavers there by Edouard Colbert, count of Maulévrier, a brother of the great Colbert. It suffered severely in the War of La Vendée of 1793, but it was not till for years afterwards it was almost without inhabitants.

CHOLON ("great market"), a town of French Indo-China, the largest commercial centre of Cochin China, 33 m. S.W. of Saigon, with which it is united by railway, steam-tram and canal. Cholon was founded by Chinese immigrants about 1780, and is situated on the Chinese arroyo at the junction of the Lo-Gom and a canal. Its waterways are frequented by innumerable boats and lined in some places with native dwellings built on piles, in others by quays and houses of French construction. Its population is almost entirely Asiatic, and has more than trebled since 1880. In that year it had only 45,000 inhabitants; in 1907 it numbered about 135,000. Of these, 42,000 were Chinese, 175,000 Annamese, and 155 French (exclusive of a garrison of 92); the remainder consisted of Cambodians and Asiatic foreigners. During the rice season the town is visited by a decrease of population of 172,000 persons. The Chinese are divided into congregations according to their place of origin. Cholon is administered by a municipal council, composed of French, Annamese and Chinese traders. An administrator of native affairs, nominated by the governor, fills the office of mayor. There are a municipal hospital and municipal schools for boys and girls. The principal thoroughfares are lighted by electric light. The rice trade, almost monopolized by the Chinese, is the leading industry, the rice being treated in large steam mills. Tanning, dyeing, copper-founding, glass, brick and pottery manufacture, stone working, timber-saving and junk building are also included among the industries.

CHOLOSE, a tribe of South American Indians living on the left bank of the Huallaga river in the Amazon valley. The name is that given them by the Spanish. They were first met by the Franciscans, who established mission villages among them in 1656. They are a wild race but mild-mannered, very superstitious, and pride themselves on their skill as doctors. Their chief weapon is the blow-pipe, in the use of which they are adepts.

CHOLULA, an ancient town of Mexico, in the state and on the plateau of Puebla, 8 m. by rail W. by N. of the city of that name, and 6912 ft. above sea-level. Pop. (1900, estimate) 9000. The Interocenian railway passes through Cholula, but the city's commercial and industrial standing is overshadowed by that of its larger and more modern neighbour. At the time of the Spanish Conquest, Cholula —then known as Chololan— was a large and important town, consecrated to the worship of the god Quetzalcoatl, who had here one of the most imposing temples in Anahuac, built on the summit of a truncated pyramid, the largest of its kind in the world. This pyramid, constructed of sun-dried bricks and earth, 177 ft. high, and covering an area of nearly 45 acres, is the most conspicuous object in the town and is surrounded by a chapel dedicated to Nuestra Señora. A portion of the lower terrace of this great pyramid was cut through in the construction of the Puebla road, but nothing was discovered to explain its purpose, which was probably that of furnishing an imposing site for a temple. Nothing definite is known of its age and history, as the fanatical zeal of Cortez and his companions destroyed whatever historical data the temple may have contained. Cholula was visited by Cortez in 1519 during his eventful march inland to Montezuma's capital, Tenochtitlan, when he treacherously massacred its inhabitants and pillaged the city, pretending to distrust the hospitable inhabitants. Cortez estimated that the town then had 20,000 habitations, and its suburbs as many more, but this was undoubtedly a deliberate exaggeration. The Cholulans were of Nahua origin and were semi-independent, yielding only a nominal allegiance to Montezuma. They were a trading people, holding fairs, and exchanging their manufactures of textiles and pottery for other produce. The pyramid is believed
Chopin, Frederic François (1810–1849), Polish musical composer and pianist, was born at Zelazowa-Wola, near Warsaw, on the 22nd of February 1810 (not the 1st of March 1809). His father, of French origin, born at Nancy in 1770, had married a Polish lady, Justine Krzyzanska. Frederic was their third child. His first musical education he received from Adalbert Zliny, a Czech musician, who is said to have been a passionate admirer of J. S. Bach. He also received a good general education at one of the first colleges of Warsaw, where he was supported by Prince Antoine Radziwill, a generous protector of artistic talent, and himself well known as the composer of music to Goethe's Faust and other works. His musical genius opened to Chopin the best circles of Polish society, at that time unrivalled in Europe for its ease of intercourse, the beauty and grace of its women, and its liberal appreciation of artistic gifts. These early impressions were of lasting influence on Chopin's development. While at college he received thorough instruction in the theory of his art from Joseph Elsner, a learned musician and director of the conservatoire at Warsaw. When in 1829 he left his native town for Vienna, where his début as a pianist took place, he was in all respects a perfectly formed and developed artist. There is in his compositions little of that gradual progress which, for instance, in Beethoven necessitates a classification of his works according to different periods. Chopin's individuality and his style were distinctly pronounced in that set of variations on "La ci darem" which excited the wonder and admiration of Robert Schumann. In 1831 he left Vienna with the intention of visiting London; but on his way to England he reached Paris and settled there for the rest of his life. Here again he soon became the favourite and musical hero of society. His connexion with Madame Dudevant, better known by her literary pseudonym of George Sand (q.v.), is an important feature of Chopin's life. When in 1839 his health began to fail, George Sand went with him to Majorca, and it was mainly owing to her tender care that the composer recovered his health for a time. Chopin declared that the destruction of his relations with Madame Dudevant in 1847 broke up his life. The association of these two artists has provoked a whole literature on the nature of their relations, of which the novelist's Un Hiver à Majorque was the beginning. The last ten years of Chopin's life were a continual struggle with the pulmonary disease to which he succumbed in Paris on the 17th of October 1849. The year before his death he visited England, where he was received with enthusiasm by his numerous admirers. Chopin died in the arms of his sister, who hastened from Poland to his death-bed. He was buried in the cemetery of Père Lachaise. A small monument was erected to the memory of the composer at Wassawn in 1880. Portraits and medallions of Chopin were executed by Ary Scheffer and Eugène Delacroix, and by the sculptors Bary and Clesinger. A distinguished English amateur thus records his impressions of Chopin's style of pianoforte-playing compared with those of other masters. "His technical characteristics may be broadly indicated as negation of bravura, absolute perfection of finger-play, and of the legato insinuate touch, on which no other pianist has ever so entirely leant, to the exclusion of that high relief and point which the modern German school, after the examples of Liszt and Thalberg, has so effectively developed. It is in these features that we must recognize that Grundvorschiedheit (fundamental difference), which according to Mendelssohn distinguished Chopin's playing from that of these masters, and in no less degree from the example and teaching of Moscheles. . . . Imagine a delicate man of extreme refinement of mien and manner, sitting at the piano and playing with no sway of the body and scarcely any movement of the arms, depending entirely upon his narrow feminine hands and slender fingers. The wide arpeggios in the left hand, maintained in a continuous stream of tone by the strict legato and fine and constant use of the damper-pedal, formed an harmonious substructure for a wonderfully poetical cantabile. His delicate pianissimo, the ever-changing modifications of tone and time (tempo rubato) were of indescribable effect. Even in energetic passages he scarcely ever exceeded an ordinary mezzo-forte. His playing as a whole was unique in its kind, and no traditions of it can remain, for there is no school of Chopin the pianist, for the obvious reason that he could never be regarded as a public player, and his best pupils were nearly all amateurs." In looking through the list of his compositions, teeming with mazurkas, valses, polonaises, and other forms of national dance music, one could hardly suppose that here one of the most melancholy natures has revealed itself. This seeming paradox is solved by the type of Chopin's nationality, of which it has justly been said that its very dances are sadness intensified. But notwithstanding this melancholy temperament of his compositions, his music is always expressive of his individual feelings and sufferings to a degree rarely met with in the annals of the art. He is indeed the lyrical composer par excellence of the modern school, and the intensity of his expression finds its equal in literature only in the songs of Heinrich Heine, to whom Chopin has been justly compared. A sensation of such high-strung passion cannot be prolonged. Hence we see that the shorter forms of music, the étude, the nocturne, besides the national dances already alluded to, are chosen by Chopin in preference. Even when he treats the larger forms of the concerto or the sonata this concentrated, not to say pointed, character of Chopin's style becomes obvious. The more extended dimensions seem to encumber the freedom of his movements. The concerto for pianoforte with accompaniment of the orchestra in E may be instanced. Here the adagio takes two forms, the rhythm of the first of the polonaises, and the rhythm of the second more than a single movement, and the larger measure works (begun with the ballade Op. 23 and excepting only the sonata Op. 58 and the Allegro de Concert Op. 46) are as independent of tradition as the smallest. It is well to sift the posthumous works from those published under Chopin's direction, for the last three mazurkas are the only things he did not keep back as misrepresenting him. On these principles his mature works are summed up in the 42 mazurkas (Op. 6, 7, 17, 24, 30, 33, 41, 50, 56, 59, 63, and the beautiful concerto to the collection Notre temps); 7 polonaises (Opp. 26, 40, 53, 61); 24 preludes (in all the major and minor keys) Op. 28, and the single larger prelude Op. 45; 27 études (12 in Op. 10, 12 in Op. 25, and 3 written for the Méthode des méthodes); 18 nocturnes (Op. 9, 14, 27, 30, 32, 39, 48); 57 (in Chopin's own invention (Opp. 23, 38, 47, 52); 4 scherzos (Opp. 20, 31, 39, 54); 8 waltzes (Opp. 18, 34, 42, 64); and several pieces of various description, notably the great fantasia Op. 49 and the impromptus Op. 29, 35, 51. The posthumous works number 35 pieces, besides a small volume of songs a few of which are of great interest. Franz Liszt wrote a charmig sketch of Chopin's life and art (F. Chopin, par F. Liszt, Paris, 1851), and a very appreciative though somewhat eccentric analysis of his work appeared anonymously in 1842 (An Essay on the Works of Frédéric Chopin, London). The standard biography is the English work of Professor F. Niecks (Novello, 1891). See also W. H. Romaine, Studies in Modern Music, second series (1908). The editions of Chopin's works by his pupil Mikuli and by Klindworth are full of valuable elucidation as to methods of performance, but unfortunately they do not distinguish the original from the quantities of unauthentic pieces published by Breitkopf and Härtel, with all its mistakes, is absolutely necessary for students who wish to know what Chopin wished to put into the hands of players of independent judgment.
Chopsticks, the "pidgin-English" name for the pair of small tapering sticks used by the Chinese and Japanese in eating. "Chop" is pidgin-English for "quick," the Chinese word for the articles being kwei-isse, meaning "the quick ones." "Chopsticks" are commonly made of wood, bone or ivory, somewhat longer and slightly thinner than a lead-pencil. Held between the thumb and fingers of the right hand, they are used as tongs to take up portions of the food, which is brought to table cut up into small convenient pieces, and then, by turning the rice and small particles of food into the mouth from the bowl. Many rules of etiquette govern the proper conduct of the chopsticks; laying them across the bowl is a sign that the guest wishes to leave the table; they are not used during a time of mourning, when food is eaten with the fingers; and various methods of handling them form a secret code of signalling.

Choragus (the Lat. form of Gr. χοραγός or χοραγός, leader of the chorus), the citizen chosen to undertake the expense of furnishing and instructing the chorus at the Dionysiac festivals at Athens (see Liturgy and Finance). The name is given to an assistant to the professor of music at the university of Oxford, whose office was founded, with that of the professor, in 1526 by Dr. William Heather.

Choralis Cantus (the Lat. choralis, sc. cantus; the final e is added to show the Ger. pronunciation choral), a term in music used by English writers to indicate the hymn-tunes composed or adopted for use in church by the German reformers. German writers, however, apply the terms "Choral" and "Chorale-gesang," as Luther himself would apply them, to any solemn melody used in the church. It is thus the equivalent of canto fermo; and the German rhymed versions of the biblical and other ancient canticles, such as the Magnificat and the Te Deum, are set to curious corruptions of the corresponding Gregorian tunes, which adaptations of the composers of classical German music called chorales with no more scruple than they applied the name to tunes of secular origin, German or foreign. The peculiarity of German chorale-music, however, is that its use, and consequently much of its invention, not only arose in connexion with the Reformation, by which the liturgy of the church became "understood of the people," but also that it belongs to a musical epoch in which symmetry of melody and rhythm was beginning to assume artistic importance. The growing sense of form shown by some of Luther's own tunes (e.g. vom Himmel hoch, da komm' ich her) soon advanced, especially in the tunes of Crüger, beyond any that was shown by folk-music; and it provided an invaluable bulwark against the chaos that was threatening to swamp music on all sides at the beginning of the 17th century. By Bach's time all the polyphonic instrumental and vocal art-forms of the 16th century were mature; and though he loved to derive the design as well as the details of a large movement from the shape of the chorale-tune on which it was based, he became quite independent of any aid from symmetry in the tune as raw material. The chorus of his cantata Jesus nun sei gepreiset is one of the most perfectly designed and quite the longest of movements ever based upon a chorale-tune treated phrase by phrase. Yet the tune is one of the most unmelodious in the world; though its means of improving portion is the basis of the most impressive feature in Bach's design (the slow middle section in triple time).

The national character of the German chorale, and the recent great development of interest in folk-music, together with the unique importance of Bach's work, have combined to tempt writers on music to over-estimate the distinctiveness of the art-forms based upon the German chorale. There is really nothing in these art-forms which is not continuous with the universal practice of writing counterpoint on a canto fermo. And it should never be forgotten that, however fascinating may be the study of the relation between artistic forms and the spirit of the age, no art can successfully express more of the spirit of the age than its own technical resources will admit. Choral music in all ages has tended to consist largely of counterpoint on a canto fermo (see Contrapuntal Forms). Where there are not many canto fermos in constant use in the church, composers will be driven to use them rather unsystematically as special effects, and to rely for the most part on other artistic devices, though any use of melodies in long notes against quicker counterpoint will be aesthetically indistinguishable from counterpoint on a canto fermo. Thus Handel in his Italian and English works wrote no entire chorale movements, yet where is the passage in the "Hallelujah" chorus from "the kingdom of this world" to the end but a treatment of the second part of the chorale Wacht auf! How shall we describe the treatment of the words cry came up unto the Lord in the first chorus of Israel in Egypt, except the treatment of a phrase of chorale or canto fermo? Again, to return to the 16th century, what are the hymns of Palestrina but figured chorales? In what way, except in the lack of symmetry in the Gregorian phrasing, do they differ from the contemporary setting by Orlando di Lasso, also a Roman Catholic, of the German chorale Vater unser im Himmelreich? In modern times the use of German chorales, as in Mendelssohn's oratorios and organ-sonatas, has had rather the aspect of a revival than of a development; though the technical and spirit of Brahms's posthumous organ chorale-preludes is thoroughly modern and vital.

One of the most important, and practically the earliest collection of Chorales is that made by Luther and Johann Wulther (1496-1570), the Enchiridion, published in 1524. Next in importance we may place the Genevan Psalter (1st ed., Strassburg, 1542, final edition 1562), which is now conclusively proved to be the work of Bourgeois. The psalter was borrowed and modified by the English reformers (the English Psalter, 1542) and by the German reformers (the psalter of C. Goudimel (Paris, 1568) is another among many prominent collections showing the steps towards congregational singing, i.e. the restriction to "note-against-note" counterpoint (see Above the memory), and in, ten times, the assigning of the melody to the treble instead of to the tenor. The first hymn-book in which this latter step was acted on throughout is Osänder's Getische Lieder... also gesetzt, dass ein christliche Gemein durchaus mit-singen kann (1556). But many of the finest and most famous tunes are of much later origin than any such collections. Several (e.g. Ich freue mich in dir) cannot be traced before Bach, and were very probably composed by him.

Choriambic Verse, or Choriambics, the name given to Greek or Latin lyrical poetry in which the sound of the choriamb predominates. The choriambus is a verse-foot consisting of a trochee united with and preceding an iambus, "-\-\-\-\+.\--\-\-\-." The choriambi are never used alone, but are usually preceded by a spondee and followed by an iambus. The line so formed is called an asclepiad, traditionally because it was invented by the Aeolian poet Asclepiades of Samos. Choriambic verse was first used by the poets of the Greek islands, and Sappho, in particular, produced magnificent effects with it. The measure, as used by the early Greeks, is essentially lyrical and impassioned. Mingled with other metres, it was constantly serviceable in choral writing, to which it was believed to give a stormy and mysterious character. The Greater Asclepiad was a term used for a line in which the wild music was prolonged by the introduction of a supplementary choriambus. This was much employed by Sappho and by Alcaeus, as well as in Alexandrian times by Callimachus and Theocritus. Among the Latins, Horace, in imitation of Alcaeus, made constant use of choriambic verse. Metrical experts distinguish six varieties of it in his Odes. This is an example of his greater asclepiad (Od. i. 156-157).

Tu ne | quaeviseris | scire nefas | quem mihi, quem | tibi
Finem | Di dederint | Leucosoe | nec Babylonios
Praesidis numeros | in me nesci | abscondit
Seu plures hienes | seu trivruit | Jupiter ultimam,
Quae nunc | oppositis | debilitat | punicibus | mare
 Tyrrennum.

In later times of Rome, both Seneca and Prudentius wrote choriambic verse with a fair amount of success. Swinburne even introduced it into English poetry. "Love has called them to leave Life that was made | lovely, we thought | with love? What sweet | vision of sleep | lured thee away | down from the light | above?" Such lines as these make a brave attempt to resuscitate the medium beloved of the greater asclepiad.

Choricius, of Gaza, Greek sophist and rhetorician, flourished in the time of Anastasius I. (A.D. 491-518). He was the pupil of...
of Procopius of Gaza, who must be distinguished from Procopius of Caesarea, the historian. A number of his declamations and descriptive treatises have been preserved. The declamations, which are in many cases accompanied by explanatory commentaries, chiefly consist of panegyrics, funeral orations and the stock themes of the rhetorical schools. The Ἐνναλάδιαυσ of wedding speeches, wishing prosperity to the bride and bridegroom, strike out a new line. Choricius was also the author of so-called Ἐκφάνσεσ descriptions of works of art after the manner of Philostratus. The moral maxims, which were a constant feature of his writings, were largely drawn upon by Macarius Chrysocephalas, metropolitan of Philadelphia (middle of the 14th century), in his Rodonias (rose-garden), a voluminous collection of ethical sayings. The style of Choricius is praised by Photius as pure and elegant, but he is censured for lack of naturalness. A special feature of his style is the persistent avoidance of hiatus, peculiar to what is called the school of Gaza.

CHORIN, AARON (1766–1844), Hungarian rabbi and pioneer of religious reform. He favoured the use of the organ and of prayers in the vernacular, and was instrumental in founding schools on modern lines. Chorin was thus regarded as a leader of the newer Judaism. He also interested himself in public affairs; and his son Francis was a Hungarian deputy.

CHORIZONTES ("separators"), the name given to the Alexandrian critics who denied the single authorship of the *Iliad* and *Odyssey*, and held that the latter poem was the work of a later poet. The most important of them were the grammarians Xeno and Hellanicus; Aristarchus was their chief opponent (see Homer).

CHORLEY, HENRY POTHERGILL (1808–1872), English musical critic, one of an old Lancashire family, began in a merchant's office, but soon took to musical journalism. He began to write for the *Athenaeum* in 1830, and remained its musical critic for more than a generation; and he also became musical critic for *The Times*. In these positions he had much influence; he had strong views, and was a persistent opponent of innovation. In addition to musical criticism, he wrote voluminously on literature and art, besides novels, dramas and verse, and various libretti; and he published several books, including *Modern German Music* (1854), *Handel Studies* (1859), and *Thirty Years' Musical Recollections* (1862). He died in London on the 16th of February 1872. See his *Autobiography, Memoir and Letters*, edited by H. G. Hewlett (1873).

CHORLEY, a market town and municipal borough in the Chorley parliamentary division of Lancashire, England, on the river Yarrow, 202 m. N.W. by W. from London and 22 m. N.W. from Manchester, on the Lancashire & Yorkshire and London & North-Western railways and the Leeds & Liverpool Canal. Pop. (1891) 23,057; (1901) 26,852. The church of St Lawrence is of Perpendicular and earlier date, largely restored; it contains fine woodwork and some interesting monuments. Cotton spinning and the manufacture of cotton and muslin are extensively carried on, and there are also iron and brass foundries and boiler factories. Railway-wagon building is an important industry. The district contains a number of coal-mines and stone-quarries. Close to the town is the beautiful Elizabethan mansion of Astley Hall, which is said to have sheltered Oliver Cromwell after the battle of Preston (1648). The corporation consists of a mayor, 6 aldermen and 24 councillors. Area, 3614 acres.

CHORLU, TCHEORLU or SCHORLU, a town of European Turkey, in the vilayet of Adrianople; on the left bank of the Chorlu, a small left-hand tributary of the Ergene, 20 m. N.E. of Rodosto. Pop. (1905) about 12,000, of whom one-half are Greeks, one-third Turks, and the remainder Armenians and Jews. Chorlu has a station on the Constantinople-Adrianople branch of the Oriental railways. It manufactures woollen cloth (shayak) and native carpets, and exports cereals, oil-cloth, carpets, cattle, poultry, fresh meat, game, fruits, wine, alcohol, hides and bones.

CHOROGRAPHY. (1) From the Gr. χώρα, a tract of country, and γραφέω, to write, a description or delineation on a map of a district or tract of country; it is to be distinguished from "geography" and "topography," which treat of the earth as a whole and of particular places respectively. The word is common in old geographical treatises, but is now superseded by the wider use of "topography." (2) From the Gr. χορός, dance, the art of dancing, or a system of notation to indicate the steps and movements in dancing.

CHORUS, the chief canto of a sanjak of the Angora vilayet in Asia Minor, altitude 2300 ft., situated on the edge of a wide plain, almost equidistant from Amasia and Yuzgan. Pop. about 12,500, including a few Christians. Its importance is largely due to its situation on the great trade-route from Kaisarlieh (Caesarea) by Yuzgan and Marzivan to Samsun on the Black Sea. It corresponds to the ancient Euchaita, which lay 15 m. E. Euchaita was attacked by the Huns A.D. 508, and became a bishopric at an early period and a centre of religious enthusiasm, as containing the tomb of the revered St Theodore, who slew a dragon in the vicinity and became one of the great warrior saints of the Greek Church. Some of this enthusiasm seems to have passed to the inhabitants of Chorum, whom most travellers have found bigoted and fanatical Mahomedans (see J. C. Anderson, *Studia Fontica*, pp. 6 ff.).

CHORUS (Gr. χορό), properly a dance, and especially the sacred dance, accompanied by song, of ancient Greece at the festivals of the gods. The word χορό seems originally to have referred to a dance in an enclosure, and is therefore usually connected with the root appearing in Gr. χόρος, hedge, enclosure, Lat. horus, garden, and in the Eng. "yard," "garden" and "garth." Of choral dances in ancient Greece other than those in honour of Dionysus we know of the Dance of the Cranes at Delos, celebrating the escape of Theseus from the labyrinth, one telling of the struggle of Apollo and the Python at Delphi, and one in Crete recounting the saving of the new-born Zeus by the Curetes. In the chorus sung in honour of Dionysus the ancient Greek drama had its birth. From that of the winter festival, consisting of the κώμος or band of revellers, chanting the "phallic songs," with ribald dialogue between the leader and his band, sprang "comedy," while from the dithyrambic chorus of the spring festival came "tragedy." For the history of the chorus in Greek drama, with the gradual subordination of the lyrical to the dramatic side in tragedy and its total disappearance in the middle and new comedy, see DRAMA: Greek Drama.

The chorus as a factor in drama survived only in the various imitations or revivals of the ancient Greek theatre in other languages. A chorus is found in Milton's *Samson Agonistes*. The Elizabethan dramatists applied the name to a single character employed for the recitation of prologues or epilogues. Apart from the uses of the term in drama, the word "chorus" has been employed chiefly in music. It is used of any organized body of singers, in opera, oratorio, cantata, &c., and, in the form "chori," of the trained body of singers of the musical portions of a religious service in a cathedral or church. As applied to musical compositions, a "chorus" is a composition written in parts, each to be sung by groups of voices in a large body of singers, and having "a" (p. 177) character, i.e. for a single voice. The word is also used of that part of a song repeated at the close of each verse, in which the audience or a body of singers may join with the soloist.

In the early middle ages the name chorus was given to a primitive bagpipe without a drone. The instrument is best known by the Latin description contained in the apocryphal letter of St Jerome, *ad Dardanum*: "Chorus quoque simplex, pellis cum duabus cicitis aereis, et per primam inspiratur per secundum..."
vocem emitit." Several illuminated MSS. from the 9th to the 11th century give fanciful drawings, accompanied by descriptions in barbarous Latin, evidently meant to illustrate those described in the letter to Dardanus. The original MS., probably an illustrated transcript of this letter, which served as a copy for the others, was apparently produced at a time when the Roman bagpipe (tibia utricularia) had fallen into disuse in common with other musical instruments, and was unknown except to the few. The Latin description given by those choises could not be applicable to any one who knows the primitive form of bagpipe; the illustrations must therefore represent the efforts of an artist to depict an unknown instrument from a description. Virdung, Luscinius and Pratorius seem to have had access to a MS. of the Dardanus letter now lost, and to have reproduced the drawings without understanding them. In a MS. of the 14th century at the British Museum, containing a chronicle of the world's history to the death of King Edward I., the chorus is mentioned and described in similar words to those quoted above; in the margin is an elementary sketch of a primitive bagpipe by blowpipe and chanter with three holes, but no drone. Bagpipes with drones abound on sculptured monuments and in miniatures of that century. Gerbert gives illustrations of the fanciful chorus from the Dardanus letter and of two other instruments of later date; one of these represents a musician playing the two bagpipes of the bagpipe, known above to possess the bagpipe, bagpipe, which in the whole skin of the animal (a kid or pig), with head and feet, has been used for the bag. Edward Buhle, in his admirable work on the musical instruments in the illuminated MSS. of the middle ages, points out that Gerbert, who gives the dates of his two MSS. as "6th and 9th centuries," has a singular method of reckoning the date of a MS.; he refers to the age of a MS. at the time of writing (18th century), not to the date at which it was produced. The MS. containing the two figures of musicians mentioned above, instead of being ascribed to the 6th century, was six centuries old when Gerbert wrote in 1774, and dates therefore from the 12th century. It is interesting to note that Giralduus Cambrensis mentions the chorus as one of the three instruments of Wales and Scotland, ascribing superior musical skill to the latter. Historians record that King James I. of Scotland was renowned for his skill as a performer on various musical instruments, one of which was the chorus. This bears out the traditional belief that the bagpipe had been a Scottish attribute from the earliest times. The word "chorus" occurs once or twice in French medieval poems with other instruments, but without indication as to the kind of instrument thus designated. The word was probably the French equivalent for the Plateresque.

See also G. Kastner, Danses des morts (pp. 200 to 202, pl. xvi., No. 103); and Dom Pedro Cerone, El Meléope y maestro (Naples, 1613), p. 248.

CHOSE—CHOSROES

Fr. for "thing"); a term used in English in older times to designate different senses. Chose local is a thing annexed to a place, as a mill. A chose transitory is that which is movable, and can be carried from place to place. But the use of the word "chose" in these senses is practically obsolete, and it is now used only in the phrases chose in action and chose in possession. A "chose in action," sometimes called a chose in suspense, in its more limited meaning, denotes the right of enforcing by legal process the payment of a debt, or the obtaining money by way of damages for breach of contract, or as a recompense for a wrong. Less accurately, the money itself which could be recovered is frequently termed a chose in action, as is also sometimes the document evidencing a title to a chose in action, such as a bond or a policy of insurance, though strictly it is only the right to recover the money which can be so termed. Choses in action were, before the Judicature Acts, either legal or equitable. They were not recoverable at law, as a debt (whether arising from contract or tort), it was termed a legal chose in action; where the chose was recoverable only by a suit in equity, as a legacy or money held upon a trust, it was termed an equitable chose in action. Before the Judicature Act, a legal chose in action was not assignable, i.e., the assignee could not sue at law in his own name. To this rule there were two exceptions:—(1) the crown has always been able to assign choses in action that are certain, such as an ascertained debt, but not those that are uncertain; (2) assignments valid by operation of law, e.g., on marriage, death or bankruptcy. On the other hand, however, by the law merchant, which is part of the law of England, and which disregards the rules of common law, bills of exchange were freely assignable. The consequence was that, with these and certain statutory exceptions (e.g. the equitable chose in action), an action on an assigned chose in action must have been brought at law in the name of the assignor, though the sum recovered belonged in equity to the assignee. All choses in action being in equity assignable, except those which are altogether incapable of being assigned, in equity the assignee might have sued in his own name, making the assignor a party as co-plaintiff or as defendant. The Judicature Acts made the distinction between legal and equitable choses in action of no importance. The Judicature Act of 1873, s. 25 (6), enacted that the legal right to a debt or other legal chose in action could be passed by absolute assignment in writing under the hand of the assignor.

"Chose in possession" is opposed to chose in action, and denotes not only the right to enjoy or possess a thing, but also the actual or constructive enjoyment of it. The possession may be absolute or qualified. It is absolute when the person is fully and completely the proprietor owner of the thing; it is qualified when he "has not an exclusive right, or not a permanent right, but a right which may sometimes subsist and at other times not subsist," as in the case of animals ferae naturae. A chose in possession is freely transferable by delivery. Previously to the Married Women's Property Act 1882, a wife's choses in possession vested in her husband immediately on her marriage, while her choses in action did not belong to the husband until he had reduced them into possession, but this difference is now practically obsolete.

CHOSROES, in Middle and Modern Persian Khosrau ("with a good name"), a very common Persian name, borne by a famous king of the Iranian legend (Kal Khosrau); by a Parthian king, commonly called by the Greeks Oroses (g.v.); and by the following two Sassanid kings.

CHOSROES I., "the Blessed" (Anushirvan), 531-579, the favourite son and successor of Kavadh I., and the most famous of the Sassanid kings. At the beginning of his reign he concluded an "eternal" peace with the emperor Justinian, who wanted to have his hands free for the conquest of Africa and Sicily. But his successes against the Vandals and Goths caused Chosroes to begin the war again in 540. He invaded Syria and carried the inhabitants of Antioch to his residence, where he built for them a new city near Ctesiphon under the name of Khosrau-Antioch or Chosro-Antioch. During the next years he fought successfully in Lazica or Lazastan (the ancient Colchis, g.v.), on the Black Sea, and in Mesopotamia. The Romans, though led by Belisarius, could do little against him. In 545 an armistice was concluded, but in Lazica the war went on till 556. At last, in 562, a peace was concluded for 50 years, in which the Persians left Lazistan to the Romans, and promised not to persecute the Christians, if they did not attempt to make proselytes among the Zarathustrians; on the other hand, the Romans had again to pay
subsidiaries to Persia. Meanwhile in the east the Hephthalites had been attacked by the Turks, who now appear for the first time in history. Chosroes united with them and conquered Bactria, while he left the country north of the Oxus to the Turks. Many other rebellious tribes were subjected. About 570 the dynasts of Yemen, who had been subdued by the Ethiopians of Axum, applied to Chosroes for help. He sent a fleet with a small army under Vahriz, who expelled the Ethiopians. From that time till the conquests of Mahomet, Yemen was dependent on Persia, and a Persian governor resided here. In 571 a new war with Rome broke out about Armenia, in which Chosroes conquered the fortress Dara on the Euphrates, invaded Syria and Cappadocia, and returned home, laden with a large booty. During the negotiations to come to terms, the Persians broke off the negotiations. Chosroes died in 579, and was succeeded by his son Hormizd IV.

Although Chosroes had in the last years of his father extirpated the heretical and communistic Persian sect of the Mazdakites (see Kavadh) and was a sincere adherent of Zoroastrian orthodoxy, he was not fanatical or prone to persecution. He tolerated every Christian confession. When one of his sons had rebelled about 550 and was taken prisoner, he did not execute him; nor did he punish the Christians who had supported him. He introduced a rational system of taxation, based upon a survey of landed possessions, which his father had begun, and tried in every way to increase the welfare and the revenues of his empire. In Babylonia he built or restored the canals. His army was in discipline decidedly superior to the Romans, and apparently was well paid. He was also interested in literature and philosophical discussions. Under his reign chess was introduced from India, and the famous book of Kalilah and Dimnah was translated. He thus became renowned as a wise prince. When Justinian in 529 closed the university of Athens, the last seat of paganism in the Roman empire, the last seven teachers of Neoplatonism emigrated to Persia. But they soon found out that neither Chosroes nor his state corresponded to the Platonic ideal, and Chosroes, in his treaty with Justinian, stipulated that they should return unmolested.

2. CHOSROES II., "the Victorious" (Parsee), son of Hormizd IV., grandson of Chosroes I., 590-628. He was raised to the throne by the magnates who had rebelled against Hormizd IV. in 590, and soon after his father was blinded and killed. But at the same time the general Bahram Chobin had proclaimed himself king, and Chosroes II. was not able to maintain himself. The war with the Romans, which had begun in 571, had not yet come to an end. Chosroes fled to Syria, and persuaded the emperor Maurice (q.v.) to send help. Many leading men and part of the troops acknowledged Chosroes, and in 592 he was brought back to Ctesiphon. Bahram Chobin was beaten and fled to the Turks, among whom he was murdered. Peace with Rome was then concluded. Maurice made no use of his advantage; he merely restored the former frontier and abolished the subsidies which had formerly been paid to the Persians. Chosroes II. was much inferior to his grandfather. He was haughty and cruel, rapacious and given to luxury; he was neither a general nor an administrator. At the beginning of his reign he favoured the Christians; but when in 602 Maurice had been murdered by Phocas, he began war with Rome to avenge his death. His armies plundered Syria and Asia Minor, and in 608 advanced to Chalcedon. In 613 and 614 Damascus and Jerusalem were taken by the general Shahbaraz, and the Holy Cross was carried away in triumph. Soon after, even Egypt was conquered. The Romans could offer but little resistance, as they were torn by internal dissensions, and pressed by the Avars and Slavs. At last, in 622, the emperor Heraclius (who had succeeded Phocas in 610) was able to take the field. In 624 he advanced into northern Media, where he destroyed the great fire-temple of Gandzak (Gazaza); in 626 he fought in Lazistan (Colchis), while Shahbaraz advanced to Chalcedon, and tried in vain, united with the Avars, to conquer Constantinople. In 627 Heraclius defeated the Persian army at Nineveh and advanced towards Ctesiphon. Chosroes fled from his favourite residence, Dastagerd (near Bagdad), without offering resistance, and as his despotism and indolence had roused opposition everywhere, his eldest son, Kavadh II., whom he had imprisoned, was set free by some of the leading men and proclaimed king. Four days afterwards, Chosroes was murdered in his palace (February 628). Meanwhile, Heraclius returned in triumph to Constantinople, in 629 the Cross was given back to him and Egypt evacuated, while the Persian empire, from the apparent greatness which it had reached ten years ago, sank into hopeless anarchy.

See Persia: Ancient History. For the Roman wars see authorities quoted under MAURICE and HERACLIIUS.

CHOTA NAGPUR—CHOUANS

(ED. M.)

CHOTA NAGPUR, a division of British India in Bengal, consisting of five British districts and two feudatory states. It is a hilly, forest-clad plateau, inhabited mostly by aboriginal races, the Oraons and the Kagods, whose countenance is not remarkable, save for those who dwell near the principal towns. The tribes are of varied origin. Their language is a mixture of Sanscrit and of the vernaculars of their respective districts.

The population of the Chota Nagpur plateau is 27,101 sq. m. The total area of the British districts is 1,400,420. The tributary states are noticed separately. The Chota Nagpur plateau is an offshoot of the great Vindhyan range, and its mean elevation is upwards of 2000 ft. above the sea-level. In the W. it rises to 3600 ft., and to the E. and S. its lower steppe, from 800 to 1000 ft. in elevation, comprises a great portion of the Manbhum and Singhbhum districts. The whole is about 14,000 sq. m. in extent, and forms the source of the Barakhar, Damodar, Kasai, Subanreka, Batairann, Brahman, Ib and other rivers. Sal forests abound. The principal jungle products are timber, various kinds of medicinal fruits and roots, and a variety of flowers, which are used to make the strong country liquor. Coal exists in large quantities, and is worked in the Jherra, Hazaribagh, Giridih and Gobindpur districts.

The chief works are at Jherria, which were started in 1831, and have developed into one of the largest coal-fields in India. Formerly gold was washed from the sands in the bed of the Subanreka river, but the operations are now almost wholly abandoned. Iron-ore abound, together with good building stone. The indigenous inhabitants consist of non-Aryan tribes, who were driven from the plains by the Hindus and took refuge in the mountain fastnesses of the Chota Nagpur plateau. The principal of them are Kols, Santals, Oraons, Domgars, Mundas and Bhumij. These tribes were formerly turbulent, and a source of trouble to the Mahommmedan governors of Bengal and Behar; but the introduction of British rule has secured peace and security, and these aboriginal races of the Chota Nagpur are now peaceful and orderly subjects. The principal agricultural products are rice, Indian corn, pulses, oil-seeds and potatoes. A small quantity of tea is grown in Hazaribagh and Ranchi districts. Lac and tussur silk-cloth are largely manufactured.

The climate of Chota Nagpur is dry and healthy. The Jherra extension branch of the East India railway runs to Katrasgarh, while the Bengal-Nagpur railway also serves the division.

The Chota Nagpur States were formerly nine in number. But the five states of Chang Bhakar, Korea, Sirguja, Udaipur and Jashpur were transferred from Bengal to the Central Provinces in October 1905, and the two Uriya-speaking states of Gangpur and Bonai were attached to the Orissa Tributary States. There now remain, therefore, only the two states of Kharsawan and Sarrakela. At the decline of the Mahatta power in the early part of the 19th century, the Chota Nagpur states came under British protection. Before the rise of the British power in India their chiefs exercised almost absolute sovereignty in their respective territories.

See F. B. Bradley-Birt, Chota Nagpur (1903).

CHOUANS (a Bas-Breton word signifying screech-owls), the name applied to smugglers and dealers in contraband salt, who rose in insurrection in the west of France at the time of the Revolution and joined the royalists of La Vendée. It has been suggested that the name arose from the cry they used when approaching their nocturnal rendezvous; but it is more probable that it was derived from a nickname applied to their leader Jean Cottinereau (1767-1794). Originally a contraband manufacturer of salt, Cottinereau along with his brothers had several times been
condemned and served sentence; but the Revolution, by destroying the inland customs, ruined his trade. On the 15th of August 1792, he led a band of peasants to prevent the departure of the volunteers of St Ouen, near Laval, and retired to the wood of Misdon, where they lived in huts and subterranean chambers. The Chouans then waged a guerrilla warfare against the republicans and, sustained by the royalists and from abroad, carried on their assassinations and brigandage with success. From Lower Maine the insurrection soon spread to Brittany, and throughout the west of France. In 1793 Cottereau came to Laval with some 500 men; the band grew rapidly and swelled into a considerable army, which assumed the name of La Petite Vendée. But after the decisive engagements at Le Mans and Savennières, Cottereau retired again to his old haunts in the wood of Misdon, and resumed his old course of guerrilla warfare. Misfortunes here increased upon him, until he fell into an ambuscade and was mortally wounded. He died among his followers in February 1794. Cottereau's brothers also perished in the war, with the exception of René, who lived until 1846. Royalist authors have made of Cottereau a hero and martyr, titles to which his claim is not established. After the death of Cottereau, the chief leaders of the Chouans were Georges Cadoudal (q.v.) and a man who went by the name of Jambe d'Argent. For several months the Chouans continued their petty war, which was disgraced by many acts of ferocity and rapine; in August 1793 they dispersed; but they were guilty of several conspiracies up to 1815. (See also VENDÉE.)

See the articles in La Révolution française, vol. 29, La Chouannerie dans le Maine, 1792-1793, La Chouannerie, vol. 40, La Chouannerie dans le Morbihan, 1792-1794 (Sarot, Les Tribunaux répressifs ordinaires de la Manche en matière politique pendant la première Révolution (Paris, 1881), 4 vols.; Th. de Cloasmadeux, Quiberon (1795), Emirats et Chouans, commissions militaires, interrogations et jugemens (Paris, 1808), the only authority on the celebrated affair of Quiberon; E. Daude, La Police et les Chouans dans le Consulat et l'Empire, 1800-1815 (Paris, 1895). Also the works of Ch. L. Chesson mentioned under VENDÉE.

CHRESMOGRAPHION (from Gr. χρησμός, oracle, and γράφειν, to write), an architectural term sometimes given to the chamber between the pronoia and the cela in Greek temples where oracles were delivered.

CHRESTIEN, FLORENT (1541-1596), French satirist and Latin poet, the son of Guillaume Chrestien, an eminent French physician and writer on physiology, was born at Orleans on the 26th of January 1541. A pupil of Henri Estienne, the Hellenist, at an early age he was appointed tutor to Henry of Navarre, afterwards Henry IV., who made him his librarian. Brought up as a Calvinist, he became a convert to Catholicism. He was the author of many good translations from the Greek into Latin verse,—amongst others, of versions of the Hero and Leander attributed to Musaeus, and of many epigrams from the Anthology. In his translations into French, among which are remarked those of Buchanan's Jephthé (1567), and of Oppian De Venatione (1575), he is not so happy, being rather to be praised for fidelity to his original than for excellence of style. His principal claim to a place among memorable satirists is as one of the authors of the Sature Minippe, the famous pasquinade in the interest of old pupil, Henry IV., in which the parangue put into the mouth of cardinal of Pelvé is usually attributed to him. He died on the 3rd of October 1596 at Vendôme.

CHRÉTIEN, or CHRESTIEN, DE TROYES, a native of Champagne, and the most famous of French medieval poets. Unfortunately we have few exact details as to his life, and opinion differs as to the precise dates to be assigned to his poems. We know that he wrote the Chevalier de la Charrette at the command of Marie, countess of Champagne (the daughter of Louis VII. and Eleanor, who married the count of Champagne in 1164), and Le Conte del Graal or Perceval for Philip, count of Flanders, who died of the plague before Acre in 1191. This prince was guardian to the young king, Philip Augustus, and held the regency from 1180 to 1182. As Chrestien refers to the story of the Graal as the best tale told au cor roi, it seems very probable that it was composed during the period of the count's regency. It was left unfinished, and added to at divers times by at least three writers, Wauchier de Dénain, Gerbert de Montreuil and Manessier. The second of these states definitely that Chrestien died before he could finish his poem. Probably the period of his literary activity lies between the dates 1150 and 1182, when his patron, Count Philip, fell into disgrace at court. The extant poems of Chrétien de Troyes, in their chronological order are, Érec et Énide, Chênis, Le Chevalier de la Charrette (or Lancelot), Le Chevalier au Lion (or Yvain), and Le Conte del Graal (Percéval), all dealing with Arthurian legend. Besides these he states in the opening lines of Chênis that he had composed a Tristan (of which so far no trace has been found), and had made certain translations from Ovid's Ars Amatoria and Metamorphoses. A portion of the last has been found and published by Gaston Paris included in the translation of Ovid made by Chrestien Legouais. There exists a version, the chapitre d'Angleterre, purporting to be by Chrestien, but the authorship is a matter of debate. Professor Foerster claims it as genuine, and includes it in his edition of the poems, but Gaston Paris never accepted it.

Chrestien's poems enjoyed widespread favour, and of the three most popular (Érec, Yvain and Perceval) there exist old Norse translations, while the two first were admirably rendered into German by Hartmann von Aue. There is an English translation of the Yvain, Yvain and Gawain, and there are Welsh versions of all three stories, though their exact relation to the French has not been determined. Chrestien's style is easy and graceful, such as might be expected from a court poet; he is analytical, but not dramatic; in depth of thought and power of characterization he is distinctly inferior to the French translators. But it seems probable that he was probably to be ranked below Thomas à Becket, the author of the Tristian, and the translator of Thomas, Gottfried von Strassburg. Much that has been claimed as characteristic of his work has been shown by M. Willmote to be merely reproductions of literary conceits employed by his predecessors; in the words of a recent writer, M. Bédir, "Chrestien semble moins avoir été un créateur épicque qu'un habilé arrangeur." The special interest of his poems lies in the problems surrounding their origin. So far as the MSS. are concerned they are the earliest Arthurian romances we possess. Did Chrestien invent the genre, or did he simply turn to account the work of earlier, and less favoured, poets? Round this point the battle still rages hotly, and though the extensive claims made by the enthusiastic editor of his works are gradually yielding to the force of critical investigation, it cannot be said that the question is in any way settled (see ARTHURIAN LEGEND).

Chrestien's poems, especially Perceval, have been translated by Professor Foerster (4 vols.). There is no easily available edition of the Perceval, which was printed from the Mons MS. by M. Potvin (6 vols., 1866-1871), but is difficult to procure. For Yvain and Gawain the edition by M. willmote (1883) is the best. Editions are in Deutsche Classiker des Mittelalters, 1888 (Iovin), 1893 (Erec); the Welsh, in Lady Charlotte Guest's translation of the Mabinogion (Nutt, 1902); Scandinavian translations, ed. E. Kölbing (1872). For general criticism see Willmote, L'Évolution du roman français aux environs de 1150 (1905); also Legend of Sir Lancelot and Legend of Sir Perceval (Grimm Library); and M. Borodine, La Femme et l'amour au XIIe siècle, d'après les poèmes de Chrétien de Troyes (1905).

CHRISM (through Lat. chrismos, from Gr. χρησμός, an anointing substance, χρύσος, to anoint; through a Roman form, chrisma comes the Fr. crême, andEng; chrysé, a mixture of olive oil and balm, used for anointing in the Roman Catholic church in baptism, confirmation and ordination, and in the consecrating and blessing of altars, chalices, baptismal water, &c. The consecration of the "chrism" is performed by a bishop, and since the 5th century has taken place on Maundy Thursday. In the Orthodox Church the chrisum contains, besides olive oil, many precious spices and perfumes, and is known as "muron" or "myron." The word is sometimes used loosely for the unmixed olive oil used in the sacrament of extreme unction. The "chrisom" or "chrysom," a variant of "chrisim," lengthened through pronunciation, is a white cloth with which the head of a newly baptized child was covered to prevent the holy oil from being rubbed off. If the baby died within a month of its baptism, it was shrouded in its chrisom; otherwise the cloth or its value was given to the church as an offering by the mother at her churching. Children dying within the month were called
CHRIST—CHRISTIAN II.

"christen-children" or "christians," and up to 1726 such entries occur in bills of mortality. The word was also used generally for a very young and innocent child, thus Shakespeare, *Henry V*, ii. 3, says of Falstaff: "A made a finer end and went away an it had been any Christon Child."

CHRIST (Gr. Χριστός, Anointed), the official title given in the New Testament to Jesus of Nazareth, equivalent to the Hebrew Messiah. See Jesus Christ; Messiah; Christianity.

CHRIST, WILHELM VON (1831-1906), German classical scholar, was born in Gelsenheim in Hesse-Nassau on the 2nd of August 1831. From 1842 till 1850 he taught in the Maxmillians-gymnasium at Munich, and in 1861 was appointed professor of classical philology in the university. His most important works are his Geschichte der griechischen Literatur (5th ed., 1908 f.), a history of Greek literature down to the time of Justinian, one of the best works on the subject; Metrik der Griechen und Römer (1879); editions of Pindar (1887); of the Poetica (1878) and Metaophysica (1895) of Aristotle; Hliad (1884). His contributions to the Sitzungsberichte and Abhandlungen of the Bavarian Academy of Sciences are particularly valuable.

See O. Crusius, Gedächtnissrede (Munich, 1907).

CHRISTADELPHIANS (Χρισταδέλφοι, "brothers of Christ"), sometimes also called Thomasites, a community founded in 1848 by John Thomas (1805-1871), who, after studying medicine in London, migrated to Brooklyn, N.Y., U.S.A.

There he at first joined the "Cambridgeites," but afterwards struck out independently, preaching largely upon the application of Hebrew prophecy and of the Book of Revelation to current and future events. Both in America and in Great Britain he gathered a number of adherents, and formed a community which has extended to several English-speaking countries. It consists of exclusive "ecclasis," with neither ministry nor organization. The members meet on Sundays to "break bread" and discuss the Bible. Their theology is strongly millennial, centering in the hope of a world-wide theocracy with its seat at Jerusalem. Holding a doctrine of "conditional immortality," they believe that they alone have the true exegesis of Scripture, and that the "faith of Christendom" is compounded of the fables predicted by Paul. No statistics of the community are published. It probably numbers from two to three thousand members. A monthly magazine, The Christadelphian, is published in Birmingham.

See R. Roberts, Dr Thomas, his Life and Work (1884).

CHRISTCHURCH, a municipal and parliamentary borough of Hampshire, England, at the confluence of the rivers Avon and Stour, 14 m. from the sea, and 104 m. S.W. by W. from London by the London and South Western railway. Pop. (1901) 42,924. It is famous for its magnificent priory church of the Holy Trinity. The church is cruciform, lacking a central tower, but having a Perpendicular tower at the west end. The nave and transepts are principally Norman, and very fine; the choir is Perpendicular. Early English additions appear in the nave, clerestory and elsewhere, and the rood-screen is of ornate Decorated workmanship. Other noteworthy features are the Norman turrets at the north-east angle of the north transept, covered with arcading and other ornament, the beautiful reredos, similar to that in Winchester cathedral, and several interesting monuments, among which is one to the poet Shelley. Only fragments remain of the old castle, the interesting ruin adjoins it known as the Norman House, apparently dating from the later part of the 12th century. Hosiery, and chains for clocks and watches are manufactured, and the salmon fishery is valuable. There is a small harbour, but it is dry at low water. The parliamentary borough, returning one member, includes the town of Bournemouth. The municipal borough is under a mayor, 4 aldermen and 12 councillors. Area, 832 acres.

Christchurch is mentioned in Saxon documents under the name of Twetonam or Tweonacem, which long survived in the form Christchurch Twineham. In 901 it was seized by Aethelwald, but was recaptured by Edward the Elder. In the Domesday Survey, under the name of Thulinam, it appears as a royal manor, comprising a mill and part of the king's forest; its value since the time of Edward the Confessor had decreased by almost one-half. Henry I. granted Christchurch to Richard de Redvers, who erected the castle. The first charter was granted by Baldwin earl of Exeter in the 13th century; it exempted the burgesses from certain tolls and customs, including the tolls on salt within the borough, and the custody of thieves. The 2nd Earl Baldwin granted to the burgesses the tolls of the fair at St Faith and common of pasture in certain meads. The above charters were confirmed by Edward II., Henry VII. and Elizabeth. The Holy Trinity fair is mentioned in 1226. Christchurch was incorporated by a bill of the 13th century, and was not incorporated till 1769, when the government was vested in a mayor and 24 capital burgesses, but this charter was shortly abandoned. The borough was summoned to send representatives to parliament in 1307 and 1308, but no returns are registered until 1572, from which date it was represented by two members until the Reform Act of 1832 reduced the number to one. The secular canons of the church of Holy Trinity held valuable possessions in Hampshire at the time of Edward the Confessor, including a portion of Christchurch, and in 1150 the establishment was constituted a priory of regular canons of St Augustine. Baldwin de Redvers confirmed the canons in their right to the first salmon caught every year and the tolls of Trinity fair. The priory, which attained to such fame that its name of Christchurch finally replaced the older name of Twineham, was dissolved in 1539.

See Victoria County History—Hampshire; Benjamin Ferrey, Antiquities of the Priory of Christchurch, 2nd edition, revised by J. Britton (London, 1841).

CHRISTCHURCH, a city near the east coast of South Island, New Zealand, to the north of Banks Peninsula, in Selwyn county, the capital of the provincial district of Canterbury and the seat of a bishop. Pop. (1906) 49,928; including suburbs, 67,878. It stands upon the great Canterbury plain, which here is a dead level, though the monotony of the site has been much relieved by extensive plantations of English and Australian trees. A background is supplied by the distant mountains to the west, and by the nearer hills to the south. The small river Avon winds through the city, pleasantly bordered by terraces and gardens. The wide streets cross one another for the most part at right angles. The predominance of stone and brick as building materials, the dominating cathedral spire, and the well-planted parks, avenues and private gardens, recall the aspect of an English residential town. Christchurch is mainly dependent on the rich agricultural district which surrounds it, the plain being mainly devoted to cereals and grazing. Wool is extensively worked, and meat is frozen for export. Railways connect with Culverden to the north and with Dunedin and the south coast, with many branches through the agricultural districts; also with Lyttelton, the port of Christchurch, 8 m. S.E. There are trams in the city, and to New Brighton, a seaside suburb, and other residential quarters. The principal public buildings are the government buildings and the museum, with its fine collection of remains of the extinct bird, moa. The cathedral is the best in New Zealand, built from designs of Sir G. Gilbert Scott in Early English style, with a tower and spire 240 ft. high. Among educational foundations are Canterbury College (for classics, science, engineering, &c.), Christ's College (mainly government), and the school of art. There is a Roman Catholic pro-cathedral attached to a convent of the Sacred Heart. A large extent of open ground, to the west of the town, finely planted, and traversed by the river, comprises Hagley Park, recreation grounds, the Government Domain and the grounds of the Acclimatization Society, with fish ponds and a small zoological garden. The foundation of Christchurch is connected with the so-called "Canterbury Pilgrims," who settled in this district in 1850. Lyttelton was the original settlement, but Christchurch came into existence in 1851, and is thus the latest of the settlements of the colony. It became a municipality in 1862. In 1903 several populous suburban boroughs were amalgamated with the city.

CHRISTIAN II. (1481-1559), king of Denmark, Norway and Sweden, son of John (Hans) and Christina of Saxony, was
born at Nyborg castle in 1481, and succeeded his father as king of Denmark and Norway in 1513. As viceroys of Norway (1506–1512) he had already displayed a singular capacity for ruling under exceptionally difficult circumstances. Patriotism, insight, courage, statesmanship, energy,—these great qualities were indisputably his; but unfortunately they were vitiated by obstinacy, suspicion and a sulky craftiness, beneath which simmered a 'very volcano of revengeful cruelty. Another peculiarity, more fatal to him in that aristocratic age than any other, was his fondness for the common people, which was increased by his passion for a pretty Dutch girl, named Dyveke, who became his mistress in 1507 or 1509.

Christian's succession to the throne was confirmed at the Herredag, or assembly of notables from the three northern kingdoms, which met at Copenhagen in 1513. The nobles and clergy of all three kingdoms regarded with grave misgivings a ruler who had already shown in Norway that he was not afraid of enforcing his authority at the uttermost. The Rigsrads of Denmark and Norway insisted, in the haandfaesning or charter extorted from the king, that the crowns of both kingdoms were elective and not hereditary, providing explicitly against any transgression of the charter by the king, and expressly reserving to themselves a free choice of Christian's successor after his death. But the Swedish delegations could not be prevailed upon to accept Christian as king at all. "We have," they said, "the choice between peace at home and strife here, or peace here and civil war at home, and we prefer the former." A decision as to the Swedish succession was therefore postponed. On the 12th of August 1515 Christian married Isabella of Burgundy, the grand-daughter of the emperor Maximilian. But he would not give up his liaison with Dyveke, and it was only the death of the unfortunate girl in 1517, under suspicious circumstances, that prevented serious complications with the emperor Charles V. Christian revenged himself by executing the magistrate Torsten Oxé, who had been Dyveke's murderer, despite the strenuous opposition of Oxé's fellow-peers; and henceforth the king lost no opportunity of depressing the nobility and raising plebeians to power. His chief counsellor was Dyveke's mother Sigbrit, a born administratrix and a commercial genius of the first order. Christian first appointed her controller of the Sound tolls, and ultimately committed to her the whole charge of the finances. A bourgeoise herself, it was Sigbrit's constant policy to elevate and extend the influence of the middle classes. She soon became the soul of a middle-class inner council, which competed with the Rigsrads, or national assembly, itself. The patricians naturally resented their suppersession and nearly every unpopular measure was attributed to the influence of "the foul-mouthed Dutch sorceress who had bewitched the king." Meanwhile Christian was preparing for the inevitable war with Sweden, where the patriotic party, headed by the freely elected governor Sten Sture the younger, stood face to face with the philo-Danish party under Archbishop Gustavus Trolle. Christian, who had already taken measures to isolate Sweden politically, hastened to the relief of the archbishop, who was beleaguered in his fortress of Ståke, but was defeated by Sture and his peasant levies at Vedla and forced to return to Denmark. A second attempt to subdue Sweden in 1518 was also frustrated by Sture's victory at Bränkyrka. A third attempt made in 1520 with a large army of French, German and Scottish mercenaries proved successful. Sture was mortally wounded at the battle of Börger, on the 19th of January, and the Danish army, unopposed, was approaching Upsala, where the members of the Swedish Rigsrads had already assembled. The senators consented to render homage to Christian on condition that he gave a full indemnity for the past and a guarantee that Sweden should not be ruled according to Swedish laws and custom; and a convention to this effect was confirmed by the king and the Danes in the Rigsrads on the 31st of March. But Sture's widow, Dame Christina Gyllenstjerna, still held out stoutly at Stockholm, and the peasantry of central Sweden, stimulated by her patriotism, flew to arms, defeated the Danish invaders at Balundsås (March 19th), and were only with the utmost difficulty finally defeated at the bloody battle of Upsala (Good Friday, April 6th). In May the Danish fleet arrived, and Stockholm was invested by land and sea; but Danish assault was repulsed, and Christians resolved valiantly for four months longer, and took care, when she surrendered on the 7th of September, to exact beforehand an amnesty of the most explicit and absolute character. On the 1st of November the representatives of the nation swore fealty to Christian as hereditary king of Sweden, though the law of the land distinctly provided that the Swedish crown should be elective. On the 4th of November he was appointed by Gustavus Trolle in Stockholm cathedral, and took the usual oath to rule the realm through native-born Swedes alone, according to prescription. The next three days were given up to banqueting, but on the 7th of November "an entertainment of another sort began." On the evening of that day Christian summoned his captains to a private conference at the palace, the result of which was quickly apparent, for at dusk a band of Danish soldiers, with lanterns and torches, broke into the great hall and carried off several carefully selected persons. By 10 o'clock the same evening the remainder of the king's guests were safely under lock and key. All these persons had previously been marked down on Archbishop Trolle's prescription list. On the following day a council, presided over by Trolle, solemnly pronounced judgment of death on the proscribed, as manifest heretics. At 12 o'clock that night the patriotic bishops of Skara and Strängnäs were led out into the great square and beheaded. Fourteen noblemen, three burgomasters, fourteen town-councillors and about twenty common citizens of Stockholm were then drowned or decapitated. The executions continued throughout the following day; in all, about eighty-two people are said to have been thus murdered. Moreover, Christian revenged himself upon the dead as well as upon the living, for Sten Sture's body was dug up and burned, as well as the body of his little child. Dame Christina, and many other noble Swedes, including the king's brother, were also beheaded. Christian had thus disposed of all those who had stood in his way. It was impossible now, and for all time, for any other noble Swedishborn to go to Denmark. It has well been said that the manner of this atrocious deed (the "Stockholm Massacre" as it is generally called) was even more detestable than the deed itself. Christian suppressed his political opponents under the pretence of defending an ecclesiastical system which in his heart he despised. Even when it became necessary to make excuses for his crime, we see the same double-mindedness. Thus, while in a proclamation to the Swedish people he represented the massacre as a measure necessary to avoid a papal interdict, in his apology to the pope for the decapitation of the innocent bishops he described it as an unauthorized act of vengeance on the part of his own people. It was with his brain teeming with great designs that Christian II. returned to his native kingdom. That the welfare of his dominions was dear to him there can be no doubt. Inhuman as he could be in his wrath, in principle he was as much a humanist as any of his most enlightened contemporaries. But he would do things his own way; and deeply distracting the Danish nobles with whom he shared his powers, he sought helpers from among the wealthy and practical middle classes of Flanders. In June 1521 he paid a sudden visit to the Low Countries, and remained there for some months. He visited most of the large cities, took into his service many Flemish artisans, and made the personal acquaintance of Quintin Matsys and Albrecht Dürer, the latter of whom painted his portrait. Christian also entertained Erasmus, with whom he discussed the Reformation, and let fall the characteristic expression: "Mild measures are of no use; the remedies that give the whole body a good shaking are the best and surest."

Never had King Christian seemed so powerful as on his return to Denmark on the 5th of September 1521, and with the confidence of strength he at once proceeded reckless to inaugurate the most sweeping reforms. So soon after his return he issued his great reform charter, or Codex of Laws. This charter is founded on Dutch models, and testifies in a high degree to the king's progressive aims. Provision was made for the better education of the lower, and the restriction of the political influence of the higher clergy; there were stern prohibitions against
wreckers and "the evil and unchristian practice of selling
peasants as if they were brute beasts"; the old trade gilds were
retained, but the rules of admittance thereto made easier,
and trade combinations of the richer burghers, to the detriment
of the smaller traders, were sternly forbidden. Unfortunately
these reforms, excellent in themselves, suggested the standpoint
not of an elected ruler, but of a monarch by right divine. Some
of them were even in direct contravention of the charter; and
the old Southern kingdom, of which the crowned Duke of Holstein
by the preference given to the Dutch. Sweden too was now in
open revolt; and both Norway and Denmark were taxed to
the uttermost to raise an army for the subjection of the sister
kingdom. Foreign complications were now superadded to these
domestic troubles. With the laudable object of releasing Danish
trade from the grinding yoke of the Hansa, and making Copen-
hagen the greatemporium of the north, Christian had arbitrarily
raised the Sound tolls and seized a number of Dutch ships which
presumed to evade the tax. Thus his relations with the Nether-
lands were strained, while with Lübeck and her allies he was
openly at war. Finally Jutland rose against him, renounced its
alliance and offered the Danish crown to Duke Frederick of
Holstein (January 20th, 1532). So overwhelming did Christian's
difficulties appear that he took ship to seek help abroad, and on
May 1st landed at Veere In Zealand. Eight years later (October
24th, 1540) he attempted to invade his kingdom, but a tenuous
seal of his fleet off the Norwegian coast, and on the 1st of July
1533, by the convention of Oslo, he surrendered to his rival,
King Frederic, and for the next 27 years was kept in solitary
confinement, first in the Blue Tower at Copenhagen and after-
wards at the castle of København. He died in January 1559.

1890); Paul Frederik Barfoø, Danmarks Historie fra 1319 til 1550
(Copenhagen, 1888); Danmarks Riges Historie, vol. 3 (Copenhagen,
1897-1908); Robert Nisbet Bain, Scandinavia, chap 2 (Cambridge,
1905). (R. N. B.)

CHRISTIAN III. (1530-1559), king of Denmark and Norway,
was the son of Frederick I. of Denmark and his first consort,
Anne of Brandenburg. His earliest teacher, Wolfgang von
Utendof, who came straight from Wittenberg, and the Lutheran
bishop Johann Rantzau, who became his tutor, were both
active and zealous reformers. In 1521 Christian travelled in
Germany, and was present at the diet of Worms, where Luther's
behaviour profoundly impressed him. On his return he found
that his father had been elected king of Denmark in the place of
Christian II., and the young prince's first public service was the
reduction of Copenhagen, which stood firm for the fugitive
Christian II. He made no secret of his Lutheran views, and his
outspokenness brought him into collision, not only with the
Catholic Rigsrbaad, but also with his cautious and temporizing
father. At his own court at Schleswig he did his best to introduce
the Reformation, despite the opposition of the bishops. Both
as stadtholder of the Duchies in 1526, and as viceroy of Norway
in 1529, he displayed considerable administrative ability, though
here too his religious intolerance greatly provoked the Catholic
party. There was even some talk of passing him over in the
succession to the throne, in favour of his half-brother Hans, who
had been brought up in the old religion. On his father's death
Christian was proclaimed king at the local diet of Viborg,
and took an active part in the "Grevens Fejde" or "Count's War."
The triumph of so fanatical a reformer as Christian brought
about the fall of Catholicism, but the Catholics were still so strong
in the council of state that Christian was forced to have recourse
to a coup d'état, which he successfully accomplished by means
of his German mercenaries (12th of August 1536), an absolutely
inexcusable act of violence loudly blamed by Luther himself,
and accompanied by the wholesale spoliation of the church.
Christian's finances were certainly readjusted thereby, but the
ultimate gains by the confiscation were the nobles, and both
education and morality suffered grievously in consequence.
The circumstances under which Christian III. ascended the throne
naturally exposed Denmark to the danger of foreign domination.
It was with the help of the gentry of the duchies that Christian
had conquered Denmark. German and Holstein noblemen had
led his armies and directed his diplomacy. Naturally, a mutual
confidence between a king who had conquered his kingdom and
a people who had stood in arms against him was not attainable
immediately, and the first six years of Christian III.'s reign were
marked by a contest between the Danish Rigsrbaad and the
German counsellors, both of whom sought to rule the plious
king "exclusively. Though the Danish party won the signal
victory at the outset, by obtaining the insertion in the charter
of provisions stipulating that only native-born Danes should fill
the highest dignities of the state, the king's German counsellors
continued paramount during the earlier years of his reign.
The ultimate triumph of the Danish party dates from 1539, the
dangers threatening Christian III. from the emperor Charles V.
and other kinsmen of the imprisoned Christian II. convincing
him of the absolute necessity of removing the last trace of dis-
content in the land by leaning exclusively on Danish magnates
and soldiers. The complete identification of the Danish king
with the Danish people was accomplished at the Herredag
of Copenhagen, 1542, when the nobility of Denmark voted
Christian a twentieth part of all their property to pay off his
heavy debt to the Holsteiners and Germans.

The pivot of the foreign policy of Christian III. was his alliance
with the German Emperor, and in fourteen years after the
first Danish-French conflict which was a foretaste of the
persistent hostility of Charles V., who was determined to support
the hereditary claims of his nieces, the daughters of Christian II.,
to the Scandinavian kingdoms. War was actually declared
against Charles V. in 1542, and, though the German Protestant
princes proved faithless allies, the closing of the Sound against
Dutch shipping proved such an effective weapon in King
Christian's hand that the Netherlands compelled Charles V. to
make peace with Denmark at the diet of Spires, the 23rd of May
1544. The foreign policy of Christian's later days was regulated
by the peace of Spires. He carefully avoided all foreign complica-
tions; refused to participate in the Schmalkaldic war of 1546;
mediated between the emperor and Saxony after the fall
of Maurice of Saxony at the battle of Sievershausen in 1553, and
contributed essentially to the conclusion of peace. King Christian
III. died on New Year's Day 1559. Though not perhaps a great,
he was, in the fullest sense of the word, a good ruler. A strong
sense of duty, genuine piety, and a cautious but by no means
pusillanimous common-sense coloured every action of his
patient, laborious and eventful life. But the work he left
behind him is the best proof of his statesmanship. He found
Denmark in ruins; he left her stronger and wealthier than she had
ever been before.

See Danmarks Riges Historie, vol. 3 (Copenhagen, 1897-1901);
Hüttfeld, King Christian III.'s Historie (Copenhagen, 1895); Bain,

CHRISTIAN IV. (1577-1648), king of Denmark and Norway,
the son of Frederick II., king of Denmark, and Sophia of Mecklen-
burg, was born at Fredriksborg castle in 1577, and succeeded to
the throne on the death of his father (4th of April 1588), attaining
his majority on the 17th of August 1596. On the 27th of November
1597 he married Anne Catherine, a daughter of Joachim Frederick,
margrave of Brandenburg. The queen died ten years later. Four
years after her death the king privately wedded a handsome
young gentlewoman, Christina Munk, by whom he had twelve
children,—a connexion which was to be disastrous to Denmark.

The young king's court was one of the most joyous and
magnificent in Europe; yet he found time for work of the most
various description, including a series of domestic reforms (see
DENMARK: History). He also did very much for the national
armaments. New fortresses were constructed under the direction
of Dutch engineers. The Danish navy, which in 1596 consisted of
but twenty-two vessels, in 1610 rose to sixty, some of them being
built after Christian's own designs. The formation of a national
army was more difficult. Christian had to depend mainly upon
hired troops, supported by native levies recruited for the most
part from the peasantry on the crown domains. His first
experiment with his newly organized army was successful. In
the war with Sweden, generally known as the “Kalmar War,” because its chief operation was the capture of the Danes of Kalmar, the eastern fortress of Sweden, Christian compelled Gustavus Adolphus to give way on all essential points (treaty of Knäred, 20th of January 1613). He now turned his attention to Germany. His object was twofold: first, to obtain the control of the great German rivers the Elbe and the Weser, as a means of securing his dominion of the northern seas; and secondly, to acquire the secularized German bishoprics of Bremen and Verden as appanages for his younger sons. He skilfully took advantage of the alarm of the German Protestants after the battle of White Hill in 1620, to secure the coadjutorship to the see of Bremen for his son Frederick (September 1621), a step followed in November by a similar arrangement as to Verden; while Hamburg by the compact of Steinbug (July 1621) was induced to acknowledge the Danish overlordship of Holstein.

The growing ascendency of the Catholics in North Germany in and after 1623 almost induced Christian, for purely political reasons, to intervene directly in the Thirty Years’ War. For a time, however, he stayed his hand, but the urgent solicitations of the western powers, and, above all, his fear lest Gustavus Adolphus should supplant him as the champion of the Protestant cause, finally led him to plunge into war against the combined forces of the emperor and the League, without any adequate guarantees of co-operation from abroad. On the 9th of May 1625 Christian quitted Denmark for the front. He had disposed from 10,000 to 25,000 men, and at first gained some successes but on the 27th of August 1626 he was utterly routed by Tilly at Lutter-am-Barenberge, and in the summer of 1627 both Tilly and Wallenstein, ravaging and burning, occupied the duchies and the whole peninsula of Jutland. In his extremity Christian now formed an alliance with Sweden (1st of January 1628), whereby Gustavus Adolphus pledged himself to assist Denmark with a fleet in case of need, and shortly afterwards a Swedo-Danish army and fleet compelled Wallenstein to raise the siege of Stralsund. Thus the possession of a superior sea-power enabled Denmark to tide over her worst difficulties, and in May 1629 Christian was able to conclude peace with the emperor at Lübeck, without any diminution of territory.

Christian IV. was now a broken man. His energy was temporarily paralysed by accumulated misfortunes. Not only his political hopes, but his domestic happiness had suffered shipwreck. In the course of 1626 he discovered a scandalous intrigue of his wife, Christina Munk, with one of his German officers; and when he put her away she endeavoured to cover up her own disgrace by conniving at an intrigue between Vibeke Kruse, one of her discharged maids, and the king. In January 1630 the rupture became final, and Christina retired to her estates in Jutland. Meanwhile Christian openly acknowledged Vibeke as his mistress, and she bore him a numerous family. Vibeke’s children were of course the natural enemies of the children of Christina Munk, and the hatred of the two families was not without influence on the future history of Denmark. Between 1629 and 1643, however, Christian gained both in popularity and influence. During that period he obtained once more the control of the foreign policy of Denmark as well as of the Sound tolls, and towards the end of it he hoped to increase his power still further with the assistance of his sons-in-law, Korfits Ullefeld and Hannibal Schestel, who now ran the prominently forward. Even at the lowest ebb of his fortunes Christian had never lost hope of retrieving them, and between 1629 and 1643 the European situation presented infinite possibilities to politicians with a taste for adventure. Unfortunately, with all his gifts, Christian was no statesman, and was incapable of a consistent policy. He would neither conciliate Sweden, henceforth his most dangerous enemy, nor guard himself against her by a definite system of counter-alliances. By mediating in favour of the emperor, after the death of Gustavus Adolphus in 1632, he tried to minimize the influence of Sweden in Germany, and did glean some minor advantages. But his whole Scandinavian policy was so irritating and vexatious that Swedish statesmen made up their minds that a war with Denmark was only a question of time; and in the spring of 1643 it seemed to them that the time had come. They were now able, thanks to their conquests in the Thirty Years’ War, to attack Denmark from the south as well as the east; the Dutch alliance promised to secure them at sea, and an attack upon Denmark would prevent her from utilizing the impending peace negotiations to the prejudice of Sweden. In May the Swedish Riksråd decided upon war; on the 12th of December the Swedish marshal Lennart Torstensson, advancing from Bohemia, crossed the northern frontier of Denmark; by the end of January 1644 the whole peninsula of Jutland was in his possession. This totally unexpected attack, conducted from first to last with consummate ability and lightning-like rapidity, had a paralyzing effect upon Denmark. Fortunately, in the midst of almost universal helplessness and confusion, Christian IV. knew his duty and had the courage to do it. In his sixty-sixth year he once more displayed something of the magnificent energy of his triumphant youth. Night and day he laboured to levy armies and equip fleets. Fortunately too for him, the Swedish government delayed hostilities in Scania till February 1644, so that the Danes were able to make adequate defensive preparations and save the important fortress of Malmö. Torstensson, too, was unable to cross from Jutland to Fünen for want of a fleet, and the Dutch auxiliary fleet which came to his assistance was defeated between the islands of Sylt and Rönne on the west coast of Schleswig by the Danish fleet. Another attempt to transport Torstensson and his army to the Danish islands by a large Swedish fleet was frustrated by Christian IV. in person on the 1st of July 1644. On that day the two fleets encountered off Kolberge Heath, S.E. of Kiel Bay, and Christian displayed a heroism which endeared him ever after to the Danish nation and made his name famous in song and story. As he stood on the quarter-deck of the “Trinity” a cannon close by was exploded by a Swedish bullet, and splinters of wood and metal wounded the king in thirteen places, blinding one eye and flinging him to the deck. But he was instantly on his feet again, cried with a loud voice that it was well with him, and set every one an example of duty by remaining on deck till the fight was over. Darkness at last separated the contending fleets; and though the battle was a drawn one, the Danish fleet showed its superiority by blocking the Swedish ships in Kiel Bay. But the Swedish fleet escaped, and the annihilation of the Danish fleet by the combined navies of Sweden and Holland, after an indecisive engagement at the several on the 3rd of September, exhausted the military resources of Denmark and compelled Christian to accept the mediation of France and the United Provinces; and peace was finally signed at Brömsebro on the 8th of February 1645.

The last years of the king were still further embittered by sordid differences with his sons-in-law, especially with the most ambitious of them, Korfits Ullefeld. On the 21st of February 1648, at his earnest request, he was carried in a litter from Fredriksborg to his beloved Copenhagen, where he died a week later. Christian IV. was a good linguist, speaking, besides his native tongue, German, Latin, French and Italian. Naturally cheerful and hospitable, he delighted in lively society; but he was also passionate, irritable and sensual. He had courage, a vivid sense of duty, an indefatigable love of work, and all the inquisitive zeal and inventive energy of a born reformer. Yet, though of the stuff of which great princes are made, he never attained to greatness. His own pleasure, whether it took the form of love or ambition, was always his first consideration. In the heyday of his youth his high spirits and passion for adventure enabled him to surmount every obstacle with élan. But in the decline of life he reaped the bitter fruits of his lack of self-control, and sank into the grave a weary and broken-hearted old man.

(R. N. B.)

CHRISTIAN V. (1646–1699), king of Denmark and Norway, the son of Frederick III. of Denmark and Sophia Amelia of Sweden.
Brunswick-Luneburg, was born on the 13th of April 1846 at Flensberg, and ascended the throne on the 9th of February 1879. He was a weak despot with an exaggerated opinion of his dignity and his prerogatives. Almost his first act on ascending the throne was publicly to insult his consort, the amiable Charlotte Amelia of Hesse-Cassel, by introducing into court, as his officially recognized mistress, Amelia Moth, a girl of sixteen, the daughter of his former tutor, whom he made countess of Samsö.

His personal courage and extreme affability made him highly popular among the lower orders, but he showed himself quite incapable of taking advantage permanently of the revival of the national energy, and the extraordinary overflow of native middle-class talent, which were the immediate consequences of the revolution of 1864. Under the guidance of his great chancellor Griffenfeldt, Denmark seemed for a brief period to have a chance of regaining her former position as a great power. But in sacrificing Griffenfeldt to the clamor of his adversaries, Christian did serious injury to the monarchy. He frittered away the resources of the kingdom in the unremitting Swedish war of 1675-79, and did nothing for internal progress in the twenty years of peace which followed. He died in a hunting accident on the 25th of August 1899.

See Peter Edvard Holm, Danmarks indre Historie under Enevælden (Copenhagen, 1881-1886); Adolf Ditleva Jørgensen, Peter Griffenfeldt (Copenhagen, 1893); Robert Nisbet Bain, Scandinavia cap. x., xi. (Cambridge, 1905).

CHRISTIAN VII. (1749-1808), king of Denmark and Norway, was the son of Frederick V., King of Denmark, and his first consort, Louise, daughter of Gottorp, great-grandson of Great Britain. He became king on his father’s death on the 14th of January 1766. All the earlier accounts agree that he had a winning personality and considerable talent, but he was badly educated, systematically terrorized by a brutal governor and hopelessly debauched by corrupt pages, and grew up a semi-idiot. After his marriage in 1766 with Caroline Matilda (1751-1775), daughter of Frederick, prince of Wales, he abandoned himself to the worst excesses. He ultimately sank into a condition of mental stupor, and became the obedient slave of the upstart Struensee (g.v.). After the fall of Struensee (the warrant for whose arrest he signed with indifference), for the last six-and-twenty years of his reign, he was only nominally king. He died on the 13th of March 1808. In 1772 the king’s marriage with Caroline Matilda, who had been seized and had confessed to criminal familiarity with Struensee, was dissolved, and the queen, retaining her title, passed her remaining days at Celle, where she died on the 11th of May 1775.

See E. S. F. Reverdil, Struensee et la cour de Copenhague, 1760-1772 (Paris, 1858); Danmarks Rige Historie, vol. v. (Copenhagen, 1897-1905); and for Caroline Matilda, Sir F. C. L. Wraxall, Life and Times of Queen Caroline Matilda (1864), and W. H. Wilkins, A Queen of Tears (1904).

CHRISTIAN VIII. (1786-1848), king of Denmark and Norway, the eldest son of the crown prince Frederick and Sophia Frederica of Mecklenburg-Schwerin, was born on the 18th of September 1786 at Christiansborg castle. He inherited the talents of his highly gifted mother, and his amiability and handsome features made him very popular in Copenhagen. His unfortunate first marriage with his cousin Charlotte Frederica of Mecklenburg-Schwerin was dissolved in 1810. In May 1813 he was sent as stadtholder to Norway to promote the loyalty of the Northmen to the dynasty, which had been very rudely shaken by the disastrous results of Frederick VI.’s adhesion to the falling fortunes of Napoleon. He did all he could personally to strengthen the bonds between the Norwegians and the royal house of Denmark, and though his endeavours were opposed by the so-called Swedish party, which desired a dynastic union with Sweden, he placed himself at the head of the Norwegian party of independence, and was elected regent of Norway by an assembly of notables on the 16th of February 1814. This election was confirmed by a Storkihning held at Eidsvold on the 10th of April, and on the 17th of May Christian was elected king of Norway, despite the protests of the Swedish party. Christian next attempted to interest the great powers in his cause, but without success. On being summoned by the commissioners of the allied powers at Copenhagen to bring about a union between Norway and Sweden in accordance with the terms of the treaty of Kiel, and then return to Denmark, he replied that, as a constitutional king, he could do nothing without the consent of the Storting, to the conviction of which a suspension of hostilities on the part of Sweden was the condition precedent. Sweden refusing Christian’s conditions, a short campaign ensued, in which Christian was easily worsted by the superior skill and forces of the Swedish crown prince (Barnadotte). The brief war was finally concluded by the convention of Moss on the 14th of August 1814 (see NORWAY: History). Henceforth Christian’s suspected democratic principles made him persona ingratissima at all the reactionary European courts, his own court included, and he and his second wife, Caroline Amalia of Augustenborg, whom he married in 1815, lived in comparative retirement as the leaders of the literary and scientific society of Copenhagen. It was not till 1831 that old King Frederick gave him a seat in the council of state. On the 13th of December 1839 he ascended the Danish throne as Christian VIII. The Liberal party had high hopes of “the giver of constitutions,” but he disappointed his admirers by steadily rejecting every Liberal project. Administrative reform was the only reform he would promise. He died of blood-poisoning on the 20th of January 1848.

See Just Matthias Thilde, Christian den Ottende (Copenhagen, 1848); Yngvar Nielsen, Bidrag til Norges Historie (Christiania, 1882-1886).

CHRISTIAN IX. (1813-1906), king of Denmark, was a younger son of William, duke of Schleswig-Holstein-Sonderburg-Glücksburg (d. 1834), a direct descendant of the Danish king Christian III. by his wife Louise, a daughter of Charles, prince of Hesse-Cassel (d. 1836), and grand-daughter of King Frederick V. Born at Gottorp on the 8th of April 1818, Christian entered the army, and alone among the members of his family served with the Danish troops in Schleswig during the insurrection of 1848; he was awarded a brevet of a major-general in 1852, ten years after his marriage with Louise (1817-1898), daughter of William, prince of Hesse-Cassel (d. 1867), and cousin of King Frederick VIII. At this time it became imperative that satisfactory provision should be made for the succession to the Danish throne. The reigning king, Frederick VII., was childless, and the representatives of the great powers met in London and settled the crown on Prince Christian and his wife (May 1852), an arrangement which became part of the law of Denmark in 1853. The “protocol king,” as Christian was sometimes called, ascended the throne on Frederick’s death in November 1863, and was at once faced by formidable difficulties. Reluctantly he assented to the policy which led to war with the combined power of Austria and Prussia, and to the separation of the duchies of Schleswig, Holstein and Lauenburg from Denmark (see SCHLESWIG-HOLSTEIN QUESTION). Within the narrowed limits of his kingdom Christian’s difficulties were more protracted and hardly less serious. During almost the whole of his reign the Danes were engaged in a political struggle between the “Right” and the “Left,” the party of order and the party of progress, the former being supported in general by the Landsting, and the latter by the Folketing. The king’s sympathies lay with the more conservative section of his subjects, and for many years he was successful in preventing the Radicals from coming into office. The march of events, however, was too strong for him, and in 1901 he assented in a dignified manner to the formation of a cabinet of the Left” (see DENMARK: History). In spite of these political disturbances Christian’s popularity with his people grew steadily, and was enhanced by the patriarchal and unique position which in his later years he occupied in Europe. With his wife, often called “the aunt of all Europe,” he was related to nearly all the European sovereigns. His eldest son Frederick had married a daughter of Charles XV. of Sweden; his son on the Gottingen, the son of the bride of 1867; and his youngest son Waldemar (b. 1858) was married to Marie d’Orléans, daughter of Robert, duc de Chartres. Of his three daughters, Alexandra married Edward VII. of Great Britain;
CHRISTIANIA, W.—CHRISTIANIA

Dagmar (Marie), the taar Alexander III.; and Thryra, Ernest Augustus, duke of Cumberland. One of his grandchildren, Charles, became king of Norway as Haakon VII. in 1905, and another, Constantine, crown prince of Greece, married a sister of the German emperor William II. Christian was also the ruler of Iceland, where he was received with great enthusiasm when he visited the island in 1874. He died at Copenhagen on the 20th of January 1906, and was buried at Roskilde.

See Barfod. Kong Kristian IX.'s Regerings-Dagbog (Copenhagen, 1876); and Hans Majestet Kong Kristian IX. (Copenhagen, 1888).

CHRISTIAN, WILLIAM (1668-1693), Manx politician, a son of Ewan Christian, one of the Manx deemsters, was born on the 14th of April 1668, and was known as Iliam Dhone, or Brown William. In 1648 the lord of the Isle of Man, James Stanley, 7th earl of Derby, appointed Christian his receiver-general; and when in 1651 the earl crossed to England to fight for Charles II. he left him in command of the island militia. Derby was taken prisoner at the battle of Worcester, and his famous countess, Charlotte de la Tremouille, who was residing in Man, sought to obtain her husband's release by negotiating with the victorious parliamentarians for the surrender of the island. At once a revolt headed by Christian broke out, partly as a consequence of this step, partly owing to the discontent caused by some agrarian arrangements recently introduced by the earl. The rebels seized many of the forts; then Christian in his turn entered into negotiations with the parliamentarians; and probably owing to his connivance the island was soon in the power of Colonel Robert Duckenfield, who had brought the parliamentary fleet to Man in October 1651. The countess of Derby was compelled to surrender her two fortresses, Castle Rushen and Peel castle, while Christian remained receiver-general, becoming governor of the island in 1656. Two years later, however, he was accused of misappropriating some money; he fled to England, and in 1660 was arrested in London. Having undergone a year's imprisonment he returned to Man, hoping that his offence against the earl of Derby would be condoned under the Act of Indemnity of 1661; but, anxious to punish his conduct, Charles, the new earl of Derby, ordered his seizure; he refused to plead, and a packed House of Keys declared that in this case his life and property were at the mercy of the lord of the island. The deemsters then passed sentence, and in accordance therewith Christian was executed by shooting on the 2nd of January 1663. This arbitrary act angered Charles II. and his advisers; the deemsters and others were punished, and some reparation was made to Christian's family. Christian is chiefly celebrated through the Manx ballad Baase Illiam Dhone, which has been translated into English verse by S. W. G. Whitaker, and through the references to him in Sir Walter Scott's Peveril of the Peak.

See A. W. Moore, History of the Isle of Man (1900).

CHRISTIAN OF BRUNSWICK (1509-1626), bishop of Halberstadt and a general during the earlier part of the Thirty Years' War, a younger son of Henry Julius, duke of Brunswick-Wolfenbüttel, was born at Grönningen on the 20th of September 1509. Having succeeded his father as "bishop" of Halberstadt in 1616, he obtained some experience of warfare under Maurice, prince of Orange, in the Netherlands. Raising an army he entered the service of Frederick V., elector palatine of the Rhine, just after that prince had been driven from Bohemia; glorying in his chivalrous devotion to Frederick's wife Elizabeth, he attacked the lands of the elector of Mainz and the bishops of Westphalia. After some successes he was defeated by Tilly at Höchst in June 1622; then, dismissed from Frederick's service, he entered that of the United Provinces, losing an arm at the battle of Flereus, a victory he did much to win. In 1623 he gathered an army and broke into lower Saxony, but was beaten by Tilly at Stadtlohn and driven back to the Netherlands. When in 1625 Christian IV., king of Denmark, entered the arena of the war, he took the field again in the Protestant interest, but after some successes he died at Wolfenbüttel on the 16th of June 1626. Christian, who loved to figure as "the friend of God, the enemy of the priests," is sometimes called "the mad bishop," and was a merciless, coarse, and blasphemous man.

CHRISTIAN CATHOLIC CHURCH, the name assumed by a religious organization founded at Zion City near Chicago, Illinois, U.S.A., in 1856, by John Alexander Dowie (q.v.). Its members added to the usual tenets of Christianity a special belief in faith-healing, and laid much stress on united consecration services and the threefold immersion of believers. To assist Dowie, assistant overseers were appointed, and the operations of the community included religious, educational and commercial departments. Small branches sprang up in other parts of the United States, Mexico, Canada, Europe and Australasia. At the end of 1901 there were nearly 12,000 baptized believers. After 1903 considerable dissension arose among Dowie's followers: he was deposed in 1906; and after his death (1907) the city gradually became a community of normal type.

CHRISTIAN IX., THE, a dynasty, whose members ascended the Danish throne as Christian IX. in 1863 and reigned until 1906. (1) Christian VIII. (1839-1848); (2) Christian IX. (1848-1906), and (3) Christian X. (1906-1912). Their crowning interest was the leading of Denmark into the Danish-German Union, which was founded in 1864. The main part of this union was the incorporation of Denmark with the North German Confederation, which had been formed in 1866. Denmark retained, however, her independence, though sovereign, as a member of the union. The union was dissolved in 1866, when Christian VIII. died, but was renewed in 1875.

CHRISTIAN ENDEAVOUR SOCIETIES, organizations formed for the purpose of promoting spiritual life among young people. They date from 1881, in which year Dr Francis E. Clark (q.v.) formed a Young People's Society of Christian Endeavour in his (Congregational) church at Portland, Maine, U.S.A. The idea was taken up elsewhere in America and spread to other countries; till, under the presidency of Dr Clark, a huge number of affiliated societies came into operation throughout the world. They take as their motto "For Christ and the Church," and have done much, especially in the non-episcopal churches, to prepare young men and women for active services in the Church. The organization is international and interdenominational, a World's Christian Endeavour Union being formed in 1895. The members do not form a separate denomination, but remain attached to their respective churches, being grouped in voluntary district federations.

CHRISTIANIA (officially KRISTIANIA), the capital of Norway, forming a separate county (amt), and the seat of a bishopric (stift). Pop. (1901) 229,101. It lies on the south-eastern coast, at the head of Christiania Fjord, about 80 m. from the open waters of the Skagerrack, is 50° 54' N. (about the latitude of the southern extremity of the Shetland Islands) and 10° 45' E., mainly on the west bank of the small Aker river. The situation is very beautiful, pine-wooded hills rising sharply behind the city, while several islands stud the fjord. The town is mainly modern, having increased rapidly in and since the second half of the 19th century, when brick and stone largely superseded wood as the building material. It is the seat of government, of the supreme courts, of the parliament (Storting), and of a university. The harbour is of two parts, the Bjørvik, where the larger steamers lie, and the Pipervik, west of this. On the promontory intervening between these two inlets stands the old fortress of Akershus, occupied as an arsenal and prison, and having a pleasant promenade upon its ramparts. Until 1710 it was a royal palace. At the head of the Bjørvik the principal railway station (Hovedbanelag) stands in the Jernbanetorv (railway square), and north-west from this runs the principal street, Karl-Johans-gade. In this street, passing the Vor Frelsers Kirke (Church of our Saviour), the Storchings-Bygning

The Religious of Protestants (1637-1638).
CHRISTIANITY

(parliment-house, 1866) is seen, facing a handsome square planted with trees. Beyond this is the National theatre (1899), with colossal statues of the dramatists Ibsen and Bjørnson. It faces the Frederician University, founder of which in 1825, but founded by Frederick VI. of Denmark, in 1895, embracing the five faculties of theology, law, medicine, history and philology, mathematics and natural sciences. The equipment of the university is very complete: it has attached to it a large and valuable library, natural history, ethnological and numismatic collections, with one of Scandinavian antiquities; also botanical gardens and an observatory. The Karl-Johans-gade gives upon the beautiful Slotspark, a wooded elevation crowned with the royal palace (Slot), a plain building completed in 1848. North of the university is the museum of art, containing a noteworthy collection of sculpture and paintings of ancient and modern foreign masters, and of native works. The historical museum adjoining this contains northern antiquities, including two viking's ships, excavated, in 1867 and 1880 respectively, from the burial-places of the viking chiefs who owned and, according to custom, were buried in them. Another noteworthy collection is that of industrial art. The Bank of Norway, the exchange, and the courts of law lie between the harbours. Other institutions are the Freemasons' Lodge, housed in one of the handsomest buildings in the city (1844), a conservatory of music, naval, military and art schools, Athenaeum, and the great Dampkøkken or kitchen (1838), where dinners are provided for the poor.

The suburbs of Christiania are attractive and rapidly growing. On the east side of the river Aker is that of Oslo, with the existing episcopal palace, and an old bishop's palace, in which James VI. of Scotland (I. of England) was betrothed to Princess Anne of Denmark (1596). In the environs of the city are the royal pleasure castle of Oscarshall (1847-1852), on the peninsula Bygdøy (Ladugard) to the west of the city, and the Norwegian national museum (1881), containing industrial and domestic exhibits from the various provinces. Close at hand is an interesting collection of old Norwegian buildings, brought here from all parts, and re-erected, including an example of the timber church of the 12th century (Stavekirke). A collection of ancient agricultural implements is also shown. On Hovedøya (Head Island) in the fjord, immediately opposite to the Akershus, are the ruins of a Cistercian monastery, founded in 1147 by monks from Kirkstead in Lincolnshire, England, and burnt down in 1532. There are sanatoria and inns among the surrounding hills, on which beautiful gardens are laid out, such as Hans Haugen, Frognerseter, Holmenkollen, where the famous ski (snow-shoe) races are held in February, and Voksenkollen. Electric tramways connect the city and suburbs, and local steamers run from the Pipervik to the neighbouring islands and fjord-side towns and villages.

Christiania has two railway stations, the Hovedbanegaard by the Bjørvik, and the Vestbanegaard by the Pipervik. From the first trains run south to Fredrikshald and Gothenburg, east to Charloettenberg and Stockholm, north to Hamar and Trondhjem, and Otta in Gudbrandsdal, and to Gjøvik and the Valdres district. From the west station start the lines to Drammen, Laurvik, Skien and Kongsvinger (for the Telemark district). The eastward extension of the railway between Bergen and Voss, undertaken in 1856, had as its ultimate object the connexion of Christiania and Bergen by rail. With these extensive land communications Christiania is at once the principal emporium of southern Norway, and a favourite centre of the extensive tourist traffic. Regular passenger steamers serve the port from Hull, Newcastle, Grangemouth and London, from Trondhjem, Bergen and the Norwegian coast towns, from Hamburg, Amsterdam, Antwerp, &c. Except for two large shipbuilding yards, one with a floating dock, the other with a dry dock, most of the manufactories are concentrated in the suburb of Sagene, on the north side of the city, deriving their motive power from the numerous falls of the river Aker. They embrace factories for cotton and woolen spinning and weaving, paper, flour, soap and oil, bricks and tiles, matches, nails (especially horse-shoe nails), margarine, foundries and engineering shops, wood-pulp, tobacco, matches, linen, glass, sail-cloth, hardware, gunpowder, chemicals, with sawmills, breweries and distilleries. There is also a busy trade in the preparation of granite paving-stones, and in the storing and packing of ice. Imports greatly exceed exports, the annual value of the former being about £1,000,000, the latter respectively. The former consist principally of grain and flour, cottons and woollens, coffee, iron (raw and manufactured), coal, bacon and salt meat, oils, sugar, machinery, flax, jute and hemp, paper-hangings, paints, colours, &c., wines and spirits, raw tobacco, copper, zinc, lead and tin, silk, molasses and other commodities. The principal exports are wood-pulp, timber, nails, paper, butter and margarine, matches, condensed milk, fish, leather and hides, ice, sealskins, &c. Of the imports, Great Britain supplies the greater part of the cotton and woollen yarn, the machinery (including ships), and the raw metals; the United States about one-half of the oils and fats, and a large proportion of the food-stuffs, and skins, feathers, &c. Of the exports, almost the whole of the timber goes to Great Britain, together with the larger portion of the paper and food-stuffs (butter, &c.). The harbour is ice-bound for three or four months in the winter, when ships lie at Drøbak, lower down the fjord; but ice-breakers are also used. Early in 1890 the municipality voted £47,000 for the construction of a pier, a harbour for fishing-boats, protected by a mole, and a quay, 345 ft. long, on the shore underneath the Akershus. These works signalized a great scheme of improvement, involving a general rearrangement of the entire harbour.

The present suburb of Oslo represents the original city, which was founded on this site under that name (or Oslo) by Harald Sigurdsson in 1048. By the close of the 14th century it was established as the chief city of Norway. Trade was long dominated by the powerful Hanseatic League, at least until the beginning of the 16th century. The town, built mainly of wood, was no less subject to fires than all Norwegian towns have always been, and after one of these King Christian IV. refounded the capital on the new site it now occupies, and gave his name to it in 1624. By the close of the century it was fortified, but this could not prevent Charles XII. from gaining possession of it in 1716.

See L. Daae, "Det gamle Christiania, 1624-1824" (Christiania, 1890); Y. Nielsen, "Christiania und Umgebung" (Christiania, 1894); G. Amnéus, "La Ville de Christiania ... Résumé historique, &c." (Christiania, 1900).

CHRISTIANITY, the religion which accepts Jesus Christ as Lord and Saviour, embracing all who profess and call themselves Christians, the term derived from his formal title (Xpáthios, i.e. the anointed). Within this broad characterization are found many varieties of cult, organization and creed (see Church History). Christianity is classed by the students of the science of religion as a universal religion; it proclaims itself as intended for all men without distinction of race or caste, and as in possession of absolute truth. In fact, Christianity has been widely accepted by varied races in very different stages of culture, and it has maintained itself through a long succession of centuries in lands where the transformations in political structure, the revolutions in social conditions, and the changes in science and philosophy, have been numerous and extreme.

Beginning in Asia, Christianity extended itself rapidly throughout the Roman empire and beyond its borders among the barbarians. When the Empire in the 4th century adopted it, its cult, organization and teaching were carried throughout the western world. The influences and motives and processes which led to the result were many and varied, but ultimately in one way or another it became the religion of Europe and of the nations founded by the European races beyond the seas and in the northern part of Asia called Siberia. Beyond these bounds it has not greatly prospered. The explanation of the apparent boundlessness of Christianity by Europe and its offspring is not, however, to be found in any psychological peculiarity separating the European races from those of other continents, nor in any special characteristic of Christianity which fits it for European soil. For not only were its founder and his disciples Asians, and the original authoritative writings Semitic, but Asiatic tribes and nations coming into Europe have been readily converted.
Missions in Asia too have achieved sufficient success to prove that there exists no inherent obstacle either in the gospel or in the Asiatic mind. Moreover, Christianity was once represented in Asia by a powerful organization extending throughout Persia and central Asia into India (see Persia). *Matutis mutundis,* the same applies to Africa also, and Christianity still survives in both continents in the Coptic, Abyssinian and Armenian Churches. The explanation is rather to be sought in the political condition of the early centuries of the Christian era, especially in the rise of Mahomedanism. This may be regarded indeed as a form of Christianity, for it is not more foreign perhaps to the prevailing type than are some sects which claim the name. It exerted a strong influence upon Europe, but its followers have been peculiarly unsusceptible to missionary labours, and even in Europe have retained the faith of the Prophet. In the limitations of the Roman empire and in the separation of East and West consequent upon its decline, Christianity, as a dominant religion, was confined for a thousand years to Europe, and even portions of this continent for centuries were in the hands of its great foe. The East appeared as the Mahomedian dominions, and beyond these the continents of Asia and Africa were so dimly discerned that little reciprocal influence was felt. Thus the development of the two great civilized portions of the race in Europe and Asia followed independent lines in religion as in all else; and Africă, excepting its northern border, was left untouched by the progress of enlightenment.

Not only is Christianity thus the religion of a wide variety of races but across the divisions there cut other lines. In its organization Christianity exists in three great divisions, Roman, Greek and Protestant, and in various ancient sects in the Orient. The Roman Catholic and Greek divisions of the Christian Church are homogeneous in organization, but in Protestantism certain denominations are national, established by differing governments, and others are independent of governmental aid, making for a large number of differing denominations. Some of these divisions are mutually antagonistic, denying to each other the name of Christian and even the hope of salvation.

According to a second classification, Christianity may be placed among the "individual" religions, since it traces its origin, like Islam and Buddhism, to an individual as its founder. This beginning is not in the dinness of antiquity nor in a multitude of customs, beliefs, traditions, rites and personalities, as is the case with the so-called "natural" religions. It is not implied that in the formation of the "natural" religions individuals were not of great importance, nor, on the other hand, that in individual religions the founder formed his faith independently of the community of which he was a part; but only that as undoubted historic facts certain religions, in tracing their lines to individuals, thereby acquired a distinctive character, and retain the impress of their founder. Such religions begin as a reform or a protest or revolt. They proclaim either a new revelation or the return to an ancient truth which has been forgotten or distorted. They demand repentance and change of heart, i.e., the renouncing of the ordinary faith of the community and the acceptance of a new gospel. Thus demanding an act of will on the part of individuals, they are classed once more as "ethical" religions. To be sure, the new is built upon the old—in part unconsciously—and the rejection of the faith of the past, however violent, is never thoroughgoing. In consequence the old affects the new in various ways. Thus in Buddhism the presuppositions which Buddha uncritically took over work out their logical results in the Mahāyāna, so that great sects calling themselves "Buddhist" affirm what the Master denied and deny what he taught. Christianity takes Judaism (see Hebrew Religion) for granted—rejects it in part as a merely preparatory stage, in part reinterpret's it, and does not submit what it accepts to rigorous scrutiny. As a result the Old Testament (see Bible) remains not only as the larger part of the Christian canon, but, sometimes, in some churches, as obscuring its distinctive truth. Moreover, in the transference of Christianity from the Jewish to the Greek-Roman world again various elements were taken into it. More properly perhaps we might consider the Greek and Roman civilization as the permanent element—so that the relationship to it was not different from the relationship to Judaism—in part it was denied, in part it was of purpose accepted, and in still larger part unconsciously the Greek-Roman convention, over with them the presuppositions of their older world view—and thus formed the moulds into which the Christian truth was run. Here again, in some instances the pre-Christian elements so asserted themselves as to obscure the new and distinctive teaching.

Christianity, regarded objectively as one of the great religions of the world, owes its rise to Jesus of Nazareth, in ancient Galilee. (See Jesus Christ.) By reverent disciples his ancestry was traced to the royal family of David, and his birth inscribed by the church to the miraculous act of God. His life was spent, until the beginning of his public ministry, in humble circumstances as the son of a carpenter and his wife, Joseph and Mary. Of Joseph we hear nothing after the boyhood of Jesus, who followed the same trade, supporting himself and perhaps his mother and younger brothers and sisters. Of this period we have only a few fragmentary anecdotes and a stray reference or two. At thirty years of age he appeared in public, and after a short period (we cannot determine how long, but possibly eighteen months) he was crucified, upon the accusation of his countrymen, by the Roman authorities. He was without technical education, but he had been carefully trained in the sacred books, as was usual with his people. Belonging neither to the aristocracy nor to the learned class, he was one of the common people yet separate from them—a separation not of race or caste or education, but of unique personality.

His career is understood only in the light of his relations to Judaism (see Hebrew Religion). This faith, in a peculiarly vivid fashion, illustrates the growth and development of religion, for its great teachers in the highest degree possessed what the Germans call God-consciousness. The Hebrew national literature centres in the thought of God. It is Yahweh who is all in all, the father, the leader, the hope, the hero of his people. No other national literature is so continuously and so highly religious. Another factor gives it still greater interest for the student of religion,—in it the progress of religious thought can be traced, and the varying elements of the religious life seen in harmony and in conflict.

In the early period the Hebrew religion was of the ordinary Semitic type. In its ancient stories were remnants of primitive religion, of tabu, of anthropomorphic gods, of native forms of worship, of magic and divination, of local and tribal cults. Out of these developed, by the labours of the prophets, a religion of high spirituality and exalted ethical ideals. According to it God demands not ritual nor sacrifice nor offerings. He does not delight in prayers and praise, but he demands truth in the soul and bids man to walk humbly and deal righteously and mercifully with his brother (Micah vi. 6-8; Isa. i. 2-6). He requires kindness, forgiveness and loving sacrifice from all to all (Isa. lviii. 3-12).

This conception of God revealed itself as so essential to the prophets that their intense national feeling was modified. God would not deliver Israel because it was his people, descended from Abraham, his chosen, but he would punish it even more severely than the other nations because it denied him by its sins (Amos iii. 1-2). Yet Israel would not be destroyed, for a spiritual remnant, loving and obeying God, would be saved and purified (Ezek. xxxvi.-xxxvii.). Thus Israel survived its misfortunes. When the national independence was destroyed, the prophetic teaching held the people together in the hope of a re-establishment of the Kingdom when all nations should be subject to it and blessed in its everlasting reign of righteousness and peace (Isa. xlix., lx.).

Some of the prophets associated the restoration of the Kingdom with the coming of the Messiah, the anointed one, who should re-establish the line of David (Isa. ix. 6 f., xi. 1 f.; Micah v. 2; Ezek. xxxiv. 23, xxxvii. 24; Zech. ix. 9; Ps. li. 72). Others said nothing of such a one, but seemed to expect the regeneration of Israel through the labours, sufferings and triumphs of
CHRISTIANITY

the righteous remnant (Isa. liii., Ezek. xxxvi.-xxxvii.). By the strong emphasis upon righteousness, the tribal Lord of Israel was revealed as the universal God, of one relationship to all men. This monotheism was not primarily cosmological nor metaphysical, but ethical. The Jews showed little capacity for abstract reasoning and never pursued their inquiries to the discovery of ultimate principles. Thus they did not develop a systematic cosmology, nor formulate a system of metaphysics. Their religion was pre-eminently "theocratic"; God was thought of as King, enthroned in heaven and supreme. In the beginning as a tribal deity his powers were limited and he was involved in the fortunes of his people. But as the conception of Yahweh was deepened and broadened, and, especially after the development of ethical monotheism, not only was he believed to possess power sufficient to ensure the triumph of his chosen people, but to be the creator and ruler of all things in heaven and on earth, the God whom all peoples should worship and obey.

But the prophetic teaching was obscured in part by the nationalism of the prophets themselves, who exalted Israel as at once God's instrument and the peculiar object of his love; and in part by the triumph of a legal-ritualistic sacrificial system. In the downfall of Jerusalem, the experiences of the exile in Babylon, and the return to Judaea, the nation was transformed into a church. Apart from the brief Maccabaean period, the intense patriotism of the people centered in the ecclesiastical organization. As a result, cult and organization and code hardened, forming a shell which proved strong enough to resist all disintegrating tendencies. Inevitably the freedom, spirituality and universality of the prophetic teaching were obscured. In the 1st century A.D. the national and priestly elements controlled; doubtless many individuals still were faithful to the purer prophetic message, though also zealous for the system of ritual and sacrifice, but for the ruling majority ritualistic service was the chief thing, justice, purity and mercy being subordinate. Hence in their view all who did not participate in the national worship and conform to the national usages were outcasts. The triumph of Israel was to be accomplished by the miraculous power of a Messiah who should descend out of heaven. His coming was delayed, in part by the opposition of demons, in part by the failure of the people to obey the law. This law embraced both moral and ceremonial elements derived from varied sources, but in the apprehension of the people it was all alike regarded as of divine origin. It was to be obeyed without question and without inquiry as to its meaning, because established by God. It was contained in the Sacred Scriptures (see Bible: Old Testament), which had been revealed by God supernaturally, and its meaning was set forth by schools of learned men whose interpretations were authoritative. The conception of salvation was mingled with ideas derived from the East during and after the period of captivity. The priesthood held still the ancient ideas. Salvation was for the nation, and the individual was not necessarily participant in it. Life after death was disbelieved or held as the existence of shades. There could be no resurrection of the body and no immortality (in the Greek sense). With these beliefs were associated a certain worldliness and want of fervor. The more actively and aggressively religious party, on the other hand, adopted the belief in the resurrection of the body, and in the individual's participation in the Messiah's kingdom; all the pious would have their share in it, while the wicked would be outcast. But these doctrines were variously conceived. By some the Messianic kingdom was thought of as permanent, by others as intermediary, the external kingdom being transcient. So too some thought of a literal resurrection of the body of flesh and blood, while others thought that it would be transformed. The rudiments of some of these ideas can be found in the prophets, but their development took place after the exile, and indeed for the most part after the conclusion of the writing accounts of the canonical. Thus too the belief in a kingdom of demons held a large place in the mind of the people, though the references to such evil beings are almost absent from the sacred writings of the Old Testament. Again it is to the East that we must look for the origin of these ideas.

Jesus completed the prophetic teachings. He employed the old phraseology and imagery, but he was conscious that he used them in a new sense, and that he preached a new gospel of great joy. Jesus was not a historian, a critic or a theoretician. He used the words of common men in the life in which common men understood them. He did not employ the Old Testament as now reconstructed by scholarship or judged by criticism, but in its simple and obvious and traditional sense. And his background is the intellectual and religious thinking of his time. The ideas of demons and of the future, of the Bible and many other traditional conceptions, are taken over without criticism. So the idea of God which he sets forth is not that of a theologian or a metaphysician, but that of the unlearned man which even the child could understand. Yet though thus speaking in untechnical language, he revolutionized his terms and filled them with new meaning. His emphasis is his own, and the traditional material affords merely the setting for his thought. He was not concerned with speculative questions about God, nor with abstract theories of his relationship to the soul and to the world. God's continual presence, his fatherly love, his transcendent righteousness, his mercy, his goodness, were the facts of immediate experience. Not in proofs by formal logic but in the reality of consciousness was the certainty of God. Thus religion was freed from all particular and national elements in the simplest way. For Jesus did not denounce these elements, nor argue against them, nor did he seek converts outside of Israel, but he set forth communion with God as the most certain fact of man's experience and as simple reality made it accessible to every one. Thus his teaching contains the note of universality—nòi in terms and proclamations but as plain matter of fact. His way for others to this reality is likewise plain and level to the comprehension of the unlearned and of children.

For him repentance is put first, for how vastly changed is the conception of the religious life! The intricacies of ritual and theology are ignored, and ancient laws which contradict the fundamental belief are unhesitatingly abrogated or denied. He seizes upon the most spiritual passages of the prophets, and revives and deepens them. He sums up his teaching in supreme love to God and a love for fellow-man like that we hold for ourselves (Mark xii. 20-31). This supreme love to God is a complete oneness with him in will, a will which is expressed in service to our fellow-men in the simplest and most natural relationship (Luke x. 25-37). Thus religion is ethical through and through, as God's inner nature, expressed in forgiveness, mercy, righteousness and truth, is not something transciental, but belongs to the realm of daily life. We become children of God and he our Father in virtue of a moral likeness (Matt. v. 43-48), while of any metaphysical, or (so to speak) physical relationship to God Jesus says nothing. With this clearly understood, man is to live in implicit trust in the divine love, power, knowledge and forgiveness. Hence he attains salvation, being delivered from sin and death, and, for the divine attributes are not ontological entities to be discussed and defined in the schools, but they are realities, entering into the practical daily life. Indeed they are to be repeated in us also, so that we are to forgive our brethren as we are to be forgiven (Matt. vi. 12; Luke xi. 4).

As religion thus becomes thoroughly ethical, so is the notion of the Messianic kingdom transformed. Its essential characteristic is the doing of the Father's will on earth as in heaven. Jesus uses parable after parable to establish its meaning. It is a seed cast into the ground which grows and prospers (Matt. xiii. 31-32). It is a seed sown in good ground and bringing forth fruit, or in bad ground and fruitless (Luke viii. 5-8; Mark iv. 1-2). It is a pearl of great price for which a man should sell all that he possesses (Mark xii. 44-46). It is not come "with observation," so that men shall say "Lo here and lo there" (Luke xvii. 20-21). It is not of this world, and does not possess the characteristics or the glory of the man of the earth (Luke xxi. 24-26; Mark x. 13-16). It is already present among us (Luke xii. 21). Together with these statements in our sources are still mingled fragments of the more ordinary cataclysmic, apocalyptic conceptions, which in spite of much
ingenious exegesis, cannot be brought into harmony with Christ's predominant teaching, but remain as foreign elements in the words of the Messianic prophecies, likely brought back through his adherents, or, more probably, used by Jesus untruthfully—a part of the current religious imagery in which he shared.

It is often declared that in these teachings there is nothing new, and indeed analogies can be found for many sayings; yet nowhere else do we gain so strong an impression of originality. The net result is not only new but revolutionary; so was it understood by the Pharisees. They and Jesus spoke indeed the same words and appealed to the same authorities, but they rightly saw in him a revolutionary who threatened the existence of their most cherished hopes.

The Messianic kingdom which they sought was opposed both by point to point to the kingdom of which he spoke, and their God and his Father—though called by the same sacred name—were different. Hence almost from the beginning of his public ministry they constantly opposed him, the conflict deepening into complete antagonism.

Jesus has already been termed unique, one of the common people yet separated from them, and this description applies to the breadth, depth and reality of his sympathy. In the meager records of his life there is evidence that he deemed no form of suffering humanity foreign to himself. This was not a mere sentiment, nor was his sympathy superficial, for it constituted the essential characteristic of his personality—"He went about doing good." In him, the will of the Father for the redemption of the race was incarnate. This led him into the society of those outcasts who were condemned and rejected by the respectable and righteous classes. In contemptuous condemnation he was called the friend of the outcasts (Matt. xi. 19; Mark ii. 16-17), and on his part he proclaimed that these sinners would enter into the Kingdom of Heaven before the self-righteous saints (Matt. xvi. 31). Even the most repulsive forms of disease and sin drew from him only loving aid, while he recognized in all other men who laboured for the welfare of their fellows the most intimate relationship to himself. These constituted his family, and these were they whom his Father will bless.

Jesus recognized his unique position; he could not be ignorant of his powers. Even the prophets had spoken in the name of God; they accepted neither book nor priesthood as authoritative, but uttered their truth as they were inspired to speak, and commanded men to listen and obey. As in Jesus the whole prophetic line culminates, so does its consciousness. Reverting toward the Holy Scriptures, he spoke not as their expositor but with a divine power which invests his words with immediate and full authority. The prophets use the formula, "Thus saith the Lord," but he goes beyond them and speaks in his own name, "Amen, I say unto you." He knew himself as greater than the prophets, indeed as him of whom the prophets spoke—the Messiah. Only through this self-consciousness can we explain his mission and the career of his disciples. The prophets up to John foretold the coming of the kingdom (Matt. xi. 11-13; Luke xvi. 16), but Jesus opened its doors and made possible entrance into it. Where he is there is it, and hence those who follow him are God's children, and those who refuse his message are left outside in darkness. He is to sit as enthroned, judge and king, and by him is men's future to be determined (Matt. xxv. 31 f.; Mark xiii. 26). Indeed it was his presence more than his teaching which created his church. Great as were his words, greater was his personality. His disciples misunderstood what he said, but they trusted and followed him. By him they felt themselves freed from sin and fear—and under the influence of a divine power.

Though his claims to authoritative pre-eminence thus took him out of the class of prophets and put him even above Elijah and Moses (Mark ix. 2-7; Luke vii. 28; Luke x. 46), and though naturally this self-assertion seemed blasphemous to those who did not accept him, yet as he had transformed the traditional notion of the kingdom, so did he the current thought of the Messiah. The pre-eminence was not to be of rank and glory but of service and self-sacrifice. In his kingdom there can be no strife for precedence, since its King comes not to be ministered unto but to minister and to give his life in the service of others (Mark ix. 33 f., x. 42-45). The formal acknowledgment of the Messiah's worth and position matters little, for to call him Lord does not ensure entrance into his kingdom (Matt. vii. 21-23). It is those who fail to recognize the spirit of sympathy and self-sacrificing service as divine and blameworthy redeeming love, who are in danger of eternal sin (Mark iii. 28-29). All who do the will of the Father, i.e. who serve their fellows, are the brethren of Christ, even though they do not call him Lord (Mark iii. 31-35; Matt. vii. 21); and those are blessed who minister to the needy even though ignorant of any relation to himself (Matt. xxv. 37-40). Finally, membership in his own selected company, or a place in the chosen people, is not of prime importance (Mark iii. 38-40; Luke xiii. 24-30).

Jesus refused to conform to the current ideas as to the establishment of the kingdom. He wrought miracles, it is true, because of his divine sympathy and compassion, but he refused to show miraculous signs as a proof of his Messianic character (Mark viii. 12). The tradition of the people implied a sudden appearance of the Messiah, but Jesus made no claims to a supernatural origin and was content to be known as the son of Joseph and Mary (Mark vi. 3-4). His kingdom is not to be set up by wonders and miraculous powers, nor is it to be established by force (Matt. xxv. 52). Such means would contradict its fundamental character, for as the kingdom of loving service it can be established only by loving service. And as God is love, he can be revealed not by prodigies of power but only by a love which is faithful unto death.

Even the disciples of Jesus could not grasp the simplicity and profoundity of his message; still less could his opponents. When the crisis came, he alone remained unshaken in his faith. He was accused of blasphemy to the ecclesiastical authorities and of insurrection to the civil rulers. He was condemned and crucified. His followers were scattered every man to his own place as sheep without a shepherd. Of his work nothing remained, not a written word, nor more than the rudiments of an organization. The decisive event, which turned defeat into victory and re-established courage and faith, was the resurrection of Jesus from the dead and his reappearance to his disciples. Our sources will not permit the precise determination of the order or the nature of these appearances, but in any case from them arose the faith which was the basis of the Christian Church and the starting-point of its theology.

The death of Jesus as a criminal, and his resurrection, profoundly aroused the belief and hopes of the little group of Jews who were his followers. His person and mission assumed the first place in their affections and their thinking. He had been to them a prophet, mighty in word and deed, but he now becomes to them the Messiah, Christ. It is not his word but his person which assumes first place, and faith is acceptance of him—crucified and risen—as Messiah. Hence his followers early acquire the name Christians from the Greek form of the word. With this emphasis upon the Messiah the Jewish element would seem to be predominant, but as a matter of fact it was not so. The earlier group of disciples, it is true, did not appreciate the universality of the teaching of Jesus, and they continued zealous for the older forms, but St Paul through his prophetic consciousness grasped the fundamental fact and became Jesus' true interpreter. As a result Christianity was rejected by the Jews and became the conquering religion of the Roman empire. In this it underwent another modification of far-reaching consequence.

In our earliest sources—the epistles of St Paul—Christ is the pre-existent man from heaven, who had there existed in the form of God, and had come to earth by a voluntary act of self-humiliation. He is before and above all things. By him all things exist. In the Johannine writings he is the Son of God—the Logos who in the beginning was with God—of whom are all things—who lightens every man—and who was incarnate in Jesus. Here the cosmological element is
CHRISTIANITY

again made prominent though not yet supreme, and the metaphysical problems are so close at hand that their discussion is imperative. Even in Paul the term Messiah thus lost its definite meaning and became almost a proper name. Among the Greek Christians this process was complete. Jesus is the "Son of God"; and the great problem of theology becomes explicit. Religion is in our emotions of reverence and dependence, and theology is the intellectual attempt to describe the object of worship. Doubtless the two do not exactly coincide, not only because accuracy is difficult or even impossible, but also because elements are admitted into the definition of God which are derived from various sources quite distinct from the religious experience. Like all concepts the meaning of religious terms is changed with a changing experience and a changing world-view. Transplanted into the Greek world-view, inevitably the Christian teaching was modified—indeed transformed. Questions which had never been asked came into the foreground, and the Jewish presuppositions tended to disappear. Especially were the Messianic hopes forgotten or transferred to a transcendent sphere beyond death. When the empire became Christian in the 4th century, the notion of a kingdom of Christ on earth to be introduced by a great struggle all but disappeared, remaining only as the faith of obscure groups. Immortality—the philosophical conception—took the place of the resurrection of the body. Nevertheless the latter continues because of its presence in the primary sources, but it is no longer a determining factor, since its presupposition—the Messianic kingdom on earth—has been obscured. As thus the background is changed from Jewish to Greek, so are the fundamental religious conceptions.

The Semitic peoples were essentially theocratic in their religion; they used the forms of the sensuous imagination in setting forth the realities of the unseen world. They were not given to metaphysical speculation, nor long insistent in their inquiries as to the meaning and origin of things. With the Greeks it was far otherwise. For them ideas and not images set forth fundamental reality, and their restless intellectual activity would be content with nothing else than the ultimate truth. Their speculation as to the nature of God had led them gradually to separate him by an infinite distance from all creation, and to feel keenly the opposition of the finite and the infinite, the perfect and the imperfect, the eternal and the temporal. To them, therefore, Christianity presented itself not primarily as the religion of a redemption through the indwelling power of a risen saviour, as with Paul, nor even as the solution of the problem how the sins of men could be forgiven, but as the reconciliation of the antimony of the intellect, indicated above. The incarnation became the great truth: God is no longer separated by a measureless distance from the human race, but by his entering into humanity he redeems it and makes possible its ultimate unity with himself. Such lines of thought provoke discussion as to the relationship of Jesus to God the Father, and, at a later period, of the nature of the Holy Spirit who enters into and transforms believers.

Greek philosophy in the second century A.D. had sunk for the most part into scepticism and impotence; its original impulse had been lost, and no new intellectual power took its place; only in Alexandria was there a genuine effort made to solve the fundamental problems of God and the world. Plato had made God accessible to the highest knowledge as the transcendent idea, remote from the world. For Aristotle, too, God in his essence is far above the world and at most its first mover. The stoics, on the other hand, taught his immateriality, while the electics sought truth by the musing of the two ideas. They accomplished their purpose in various ways, by distinguishing between God and his power—or by the notion of a hierarchy of super-sensible beings, or in a doctrine which taught that the operations of nature are the movement of pure spirit; or by the use of the "Word" of "Wisdom," half personified as intermediate between God and the world, while the theists who held that spiritual doctrines were taught in the schools, the people were left to a debased polytheism and to new superstitions imported from the Orient; the philosophers themselves were by no means unaffected by the popular beliefs. Mingled with all these were the ancient legends of gods and heroes, accepted as inspired scripture by the people, and by philosophers in part explained away by an allegorical exegesis and in part felt increasingly as a burden to the intelligence. In this period of degeneracy there were none the less an awakening to religious needs and a profound longing for a new revelation of God, which should satisfy at once the intellect and the religious emotions.

Christianity came as supplying a new power; it freed philosophy from scepticism by giving a definite object to its efforts and a renewed confidence in its mission. Monotheism henceforth was to be the belief not of philosophers only but even of the ignorant, and in Jesus Christ the union of the divine and the human was effected. The Old Testament, allegorically explained, became the substitute for the outgrown mythology; intellectual activity revived; the new facts gained predominant influence in philosophy, and in turn were shaped according to its canons. In theology the fundamental problems of ontological philosophy were faced; the relationship of unity to multiplicity, of noumenon to phenomena, of God to man. The new element is the historical Jesus, at once the representative of humanity and of God. As in the philosophy of the Greek their history is the key of the whole; the problem was the denial of one of its factors: and successively these efforts were made, until a solution was found in the doctrine of the Trinity, which satisfied both terms of the equation and became the fundamental creed of the church. Its moulds of thought are those of Greek philosophy, and into these were run the Jewish teachings. We have thus a peculiar combination—the religious doctrines of the Bible, as cultivating in the person of Jesus, run through the forms of an alien philosophy.

The Jewish sources furnished the terms Father, Messiah, Son and Spirit. Jesus seldom employed the last term, and St Paul's use of it is not altogether clear. Already in Jewish literature it had been all but personified (cf. the Wisdom of Solomon) and thus the material is Jewish, though already modified doubtless by Greek influence. But the problem is Greek. It is not primarily ethical nor even religious, but it is metaphysical. What is the ontological relationship between these three factors? The answer is given in the Nicene formula, which is characteristically Greek. By it we perceive how God, the infinite, the absolute, the eternal, is yet not separated from the finite, the temporal, the relative, but, through the incarnation, enters into humanity. We further see how this entering into humanity is not an isolated act but continues in all the children of God by the indwelling spirit. Thus, according to the canons of the ancient philosophy, justice is done to all the factors of our problem—God remains as Father, the infinitely remote and absolute source of all; as Son, the Word who is revealed to man and incarnate in him; as Spirit, who dwells even in our own souls and by his substance unites us to God. While thus the Greek philosophy furnished the dialectic and the mould for the characteristic Christian teaching, the doctrine of the Trinity preserved religious values. By Jesus the disciples had been led to God, and he was the central fact of faith. After the resurrection he was the object of praise, and soon prayers were offered in his name and to him. Already to the apostle Paul he dominates the world and is above all created things, visible and invisible, so that he has the religious value of God. It is not God as abstract, infinite and eternal, as the far-away creator of the universe, or even as the ruler of the world, which Paul worships, but it is God revealed in Jesus Christ, the Father of Jesus Christ, the grace and mercy in Jesus Christ which deliver from evil. Metaphysics and speculative theories were valueless for Paul; he was conscious of a mighty power transforming his own life and filling him with joy, and that this power was identical with Jesus of Nazareth he knew. In all this Paul is the representative of that which is highest and best in early Christianity. Speculation and hyperspiritualization were ever tending to obscure the fundamental religious fact: in the intensity of a higher doctrine of God his true presence in Jesus was denied, and by exaggeration of Paul's doctrine of "Christ in us" the significance of the historic Jesus was given up. The Johannine writings,
which presupposed the Pauline movement, are a protest against
the hyperspiritualizing tendency. The idea that the Son of
God has been incarnate in Jesus of Nazareth, and that our hands
have handled and our eyes have seen the word of life. This same
purpose, namely, to hold fast to the historic Jesus, triumphed
in the doctrine of the Trinity; Jesus was not to be resolved
into an aeon or into some mysterious tertium quid, neither God
nor man, but to be recognized as very God who redeemed the
soul. Through him men were to understand the Father and
to understand themselves as God's children. Thus the doctrine
of the Trinity satisfied at once the philosophic intelligence of
scholars and the religious needs of Christians. Only thus can its
adoption and ultimate acceptance be explained. Its doctrinal
form is the philosophic statement of beliefs held by the common
people, who had little interest in theology, but whose faith
centred in Jesus. It marks the naturalization of Christianity in
the Greek world for the common people who believed in Christ,
and for the philosophers who justified the faith to reason.
The historic and religious values of the doctrine of the Trinity
may be illustrated by way of contrast. The Mahâyâna systems
are the union of Buddha's teaching with the forms of the Brah-
man philosophy. The historic Buddha—the man Gautama—is
taught as only one of a limitless series of incarnations or
(better) appearances. For his life on earth with his material
body was only an appearance, a seeming, a phenomenon, and
simultaneously with its activities the true Buddha existed
unmoved and eternal. Thus the way was opened for other
apparitional Buddhas, and different sects take different ones
as the objects of faith and worship. Moreover, our true nature
is also Buddha. The conscious life of all men is apparitional and
illusive. Salvation is the comprehension of this fact, and in
the apprehension of our essential oneness with the absolute.
Hence the way of salvation is by knowledge. In the Mahâyâna
gnosticism was triumphant, and the historic values of Gautama's
teaching and personality are lost. The Mahâyâna illustrates in
part what would have followed the triumph of gnosticism in
Christianity, for not only would the historic value of the life
and teaching of Jesus have been lost, but with it the significance
of humanity.

It is apparent that such a doctrine as the Trinity is itself
susceptible of many explanations, and minds differently con-
stituted lay emphasis upon its different elements. Especially
is this true as its Greek terminology was translated into Latin,
and from Latin came into modern languages—the original
meaning being obscured or disguised, and the original issues
forgotten. For some the first thought of God, the infinite and
ultimate reality lying beyond and behind all phenomena, pre-
dominates. With these the historic manifestation of Jesus
becomes only a guide to lead us to that immediate apprehen-
sion of God which is the end of theology, and to that immediate union
with God which is the end of religion. Such an end is accom-
plished either by means of pure thought or by a oneness of pure
feeling, giving as results the theological or philosophic con-
struction of the concept God, or a mystical ecstasy which is itself
at once immediate, inexplicable and indescribable. On the other
hand, minds of a different and more concrete character so
emphasize the distinctions God, Son and Holy Spirit, that a
tritheistic construction appears—three individuals in the one
Godhead: these individuals appearing, as for example in the
Father and the Son, even in opposition to each other. In general
we may say then that the Trinity takes on four differing aspects
in the Christian church: in its more common and easily appre-
hended form as three Gods, in its ecclesiastical form as a mystery
which is above reason to be accepted by faith, in its philosophic
form as the highest reason which solves the ultimate problems of
the universe, and finally, as a mode by which the spirit through
an emotional content enters into communion with God himself.

To some Christians the doctrine of the Trinity is alleged
inconsistent with the unity of God which is emphasized in the
Scriptures. They therefore denied it, and accepted Jesus Christ,
not as incarnate God, but as God's highest creature by whom
all else was created, or as the perfect man who taught the true
doctrine of God. The first view in the early Church long con-
tended with the orthodox doctrine, but finally disappeared,
and the second doctrine in the modern Church was set forth as
easily intelligible, but has remained only as the faith of sects
relatively small in number.

Allied with the doctrine of God which seeks the solution of
the ultimate problem of all philosophy, the doctrine of salvation
has taken the most prominent place in the Christian faith:
so prominent, indeed, that to a large portion of believers
it has been the supreme doctrine, and the doctrine of the
deity of Jesus has been valued only because of its
necessity on the effect of the atonement. Jesus alone of the great
founders of religion suffered an early and violent death, even
the death of a criminal. It became therefore the immediate task of
his followers to explain this fact. This explanation was the more
urgent because under the influence of Jewish monotheism the
rule of God was accepted as an undoubted presupposition, so that
the death of Jesus must be in accordance with his will. The early
Church naturally used the terms and phrases of the prophets.
He died the death of a criminal, not for his sins, but for our.
Isaiah lili. was suggested at once and became the central ex-
planation: Christ is the suffering servant who is numbered with
the transgressors and who bears the sins of many.

Jesus faced this problem perhaps before the opening of his
ministry, certainly from his break with the ecclesiastical
authorities. As his violent death drew near, his words indicated
how he preserved his deep faith unshaken while yet recognizing
the seeming failure of his mission. He devotes himself more
exclusively to the little body of his faithful friends and commits
his mission to them. As his work is sealed by his death his body
is broken and his blood is shed for them. Through this is come
the victory which is denied to his life, as the seed cast into the
ground and dead brings forth fruit. Our hints are few of Jesus' teaching, but this much, at least, we cannot doubt unless we
suppose that death took him unawares, or that this explanation
of the impending fact took on some un-Jewish form; and further,
that the earliest tradition misrepresents him. But these hypo-
theses do not commend themselves, and we accept the tradition
that Jesus taught that his death was an atonement for others.

Beyond this the gospel does not go. Why vicarious suffering
is needed, or why the God who is the loving Father does not
simply forgive, as in the parable of the prodigal son, is not asked.
For after all it is not theory which is central, but the fact of
the death, and the reason assigned is simply "for others."

In St Paul we find the beginnings of explanation, indeed of two
explanations, and in the Epistle to the Hebrews the whole
sacrificial system is found to culminate in Christ, of whom all
priests and sacrifices are symbols, so that they are abolished
with the coming of the great reality.

In the Greek world further questions are raised and the thought
of the death as a ransom is prominent with his will. The early
Church naturally used the terms and phrases of the prophets.
He died the death of a criminal, not for his sins, but for our.
Isaiah liii. was suggested at once and became the central ex-
planation: Christ is the suffering servant who is numbered with
the transgressors and who bears the sins of many.

Jesus faced this problem perhaps before the opening of his
ministry, certainly from his break with the ecclesiastical
authorities. As his violent death drew near, his words indicated
how he preserved his deep faith unshaken while yet recognizing
the seeming failure of his mission. He devotes himself more
exclusively to the little body of his faithful friends and commits
his mission to them. As his work is sealed by his death his body
is broken and his blood is shed for them. Through this is come
the victory which is denied to his life, as the seed cast into the
ground and dead brings forth fruit. Our hints are few of Jesus' teaching, but this much, at least, we cannot doubt unless we
suppose that death took him unawares, or that this explanation
of the impending fact took on some un-Jewish form; and further,
that the earliest tradition misrepresents him. But these hypo-
theses do not commend themselves, and we accept the tradition
that Jesus taught that his death was an atonement for others.

Beyond this the gospel does not go. Why vicarious suffering
is needed, or why the God who is the loving Father does not
simply forgive, as in the parable of the prodigal son, is not asked.
For after all it is not theory which is central, but the fact of
the death, and the reason assigned is simply "for others."

In St Paul we find the beginnings of explanation, indeed of two
explanations, and in the Epistle to the Hebrews the whole
sacrificial system is found to culminate in Christ, of whom all
priests and sacrifices are symbols, so that they are abolished
with the coming of the great reality.
with the effect of the death of Christ upon the sinner. One of these is the so-called governmental theory, wherein the death of Christ is set forth as for the sake of good government, so that the forgiveness of sins shall not be thought a sign of laxity. Again, by other theologians the death of Jesus is extolled because of the moral influence it exerts, since Christ's devotion unto death incites a like devotion in us.

Excepting in relatively narrow circles these theories have been seriously studied only by professed theologians. That Christ died for us, and that we are saved by him, is indeed the living truth of the Church in all ages, and a false impression of the fact is given by dwelling upon theories as if they were central. At best they bear only the relationship of philosophy to life.

Another explanation, or (better) system of beliefs, has been far more influential in the Church. Belief in mysterious powers attached to food, feasts, ceremonial rites and sacred things is all but universal. Primitive man seldom connects sacrifice with notions of propitiation, indeed only in highly ethicalized religions is the consciousness of sin or of guilt pre-eminent. Sacrifice was believed to exert an influence on the deity which is quasi-physical, and in sacrificial feasts God and worshipper are in mysterious union. Sometimes, indeed, such contact with deity is thought to be dangerous, and the rites indicate avoidance (tabu), and sometimes it is thought desirable.

So universal are such ideas that the problem in particular religions is not their origin but their form. In the Old Testament repeatedly they are found in conflict with the prophetic ideals. Sometimes the prophets denounce them, sometimes ignore them, sometimes attempt to reform and control them. Jesus ignores them, his emphasis being so strong upon the ethical and spiritual that the rest is passed by. In the early Church, still Jewish, the belief was in the coming of a mysterious power from God which produced ecstasy and worked wonders. St. Paul also believes in this, but insists that it is subordinate to the peaceable fruits of righteousness. With the naturalization of the Church in the Gentile world ethical ideas became less prominent, and the sacramental system prevailed. By baptism and the Lord's Supper grace is given (ex opere operato), so that man is renewed and made capable of salvation. Already in the 2nd century baptism was described as a bath in which the health of the soul is restored, and the Lord's Supper as the potion of immortality. Similar notions present in the ethnic faiths take the Christian facts into their service, the belief of the multitude without essential change remaining vague and undefined. While the theologians discussed doctrine the people longed for mystery, as it satisfied their religious natures. By sacraments they felt themselves brought into the presence of God, and to sacraments they looked for aid. Many sacraments were adopted by portions of the Church, until at last the sacred number seven was agreed upon.

As the way of salvation was modified, so too was the idea of salvation: the dream of a Messianic kingdom on earth, with its corollary the resurrection of the physical body, faded away, especially after the Roman empire adopted Christianity. It was no longer the Jewish nation against the heathen empire, for the Jewish nation had ceased to be, and the empire and the Church were one. Salvation henceforth is not the descent of the New Jerusalem out of heaven, but the ascent of the saints to heaven; for the individual it is not the resurrection of the body but the immortality of the soul. So Jesus is no longer Christ or Messiah, but the Son of God. These terms again are variously-interpreted: heaven is still thought of by many under the imagery of the book of Revelation, and by others it is conceived as a mystical union of the soul with God through the intelligence or of feelings. Yet the older conceptions still continue, Christianity not becoming purely and simply Greek. Again and again individuals and groups turn back to the Semitic cycle of hopes and ideas, while the reconciliation of the two systems, Jewish and Graeco-Roman, becomes the task of exegetes and theologians.

These hopes and theories of salvation, however, do not explain the power of Christianity. Jesus3693; died with himself with the healing of man's physical ailments, and he was remembered as the great physician. Early Christian literature is filled with medical terms, applied (it is true) for the greater part to the cure of souls. The records of the Church are also filled with the efforts of Jesus' followers to heal the sick, to feed the hungry, to succour the diseased, to rescue the fallen, to visit the prisoners, to forgive the erring, to teach the ignorant, were ministries of salvation. A mighty power impelled men to deny themselves in the service of others, and to find in this service their own true life. None the less the first place is given to the salvation of the soul, since, created for an unending existence, it is of transcendent importance. While man is fallen and by nature vile, nevertheless his possibilities are so vast that in comparison the affairs of earth are insignificant. The word, "What shall it profit a man if he gain the whole world and lose his own soul?" comes to mean that the individual soul outweighs the whole world. With emphasis upon God as creator and ruler, and upon man as made in God's image, endowed with an unending existence, and subject to eternal torture if not redeemed, the concept of personality has been exalted at the expense of that of nature, and the future has been magnified at the expense of the present. Thus a future heaven is man's true home, and theology instead of philosophy or natural science is his proper study.

Indeed, intellectual interest centred in religion. Natural science was forsaken, except in so far as it ministered to theology. Because the Old Testament contained references to the origin and the objects of the universe, a certain amount of natural science was necessary, but it was only in this connexion that it had any value. By Augustine's time this process is complete. His writings contain most of the knowledge of his age, but it is strictly subordinate to his theological purpose. Hence, when the barbarians submerged southern Europe, theology alone survived. The Church entered upon a new task. In the beginning Christianity had been the teacher of religion to highly civilized nations; now it became the civilizing agent to the barbarians, the teacher of better customs, the upholder of law and the source of knowledge. The learned men were monks and priests, the universities were Church institutions, and theology was the queen of the sciences.

The relation of cult to creed is still undetermined. Theoretically the first depends on the second, for its purpose is twofold: the excitation of worthy religious emotions and the attaining of our desires; and how shall these objects be attained unless we know whom we worship and to whom we pray? But it is plausibly maintained that the reverse is true, namely, that theology rests on cult. In the beginnings of consciousness instinctive reactions precede definite thoughts, and even in mature life thoughts often follow acts instead of preceding them. Our religious consciousness is simply our ordinary consciousness obeying its laws. So unpurposed does cult grow up that it combines many elements of diverse origin, and is seldom precisely and wholly in accordance with the creed. No doubt the two interact, cult influencing creed and creed modifying cult—cult, perhaps, being most powerful in forming the actual religious faith of the multitude. Cult divides into two unequal parts, the stimulation of the religious emotions and the control of piety. In the Church service it came early to centre in the sacrament of the Eucharist (q.v.). In the earliest period the services were characterized by extreme freedom, and by manifestations of ecstasy which were believed to indicate the presence of the spirit of God; but as the years went by the original enthusiasm faded away, the cult became more and more controlled, until ultimately it was completely subject to the priesthood, and through the priesthood to the Church. In the Roman communion the structure of the sacred edifice, the positions and attitudes of the priest and the congregation, the order of service, emphasize the mystery and the divine efficacy of the sacrament. The worshipper feels himself in the immediate presence of God, and enters into physical relations with him. Participation in the mass also releases from guilt, as the Lamb of God offered up atones for sin and intercedes.
with the Father in our behalf. Thus in this single act of devotion both objects of all cults are attained.

As the teaching and person of Jesus were fitted into the framework of the Greek philosophy, and the sacraments into the deeper and broader forms of popular belief, so was the organization shaped by the polity of the Roman empire. Jesus gathered his group of followers and committed to it his mission, and after his resurrection the necessities of the situation brought about the choice of quasi-officials. Later the familiar polity of the synagoge was loosely followed. A complete organization was retarded by two factors, the presence of the apostles and the inspiration of the prophets. But when the apostles died and the early enthusiasm disappeared, a stricter order arose. Practical difficulties called for the enforcement of discipline, and differences of opinion for authority in doctrine; and, finally, the sacramentary system required a priesthood. In the 2nd century the conception of a Catholic Church was widely held and a loose embodiment was given it; after the conversion of the empire the organization took on the official forms of the empire. Later it was modified by the rise of the feudal system and the re-establishment of the modern European nationalities (see Church History).

The polity of the Church was more than a formal organization; it touched the life of each believer. Very early, Christianity was conceived to be a new system of law, and faith was interpreted as obedience. Legalism was joined with sacramentarianism, doubling the power of the priest. Through him Church discipline was administered, a complete system of ecclesiastical penalties, i.e., penance, growing up. It culminated in the doctrine of purgatory, a place of discipline, of purifying suffering after death. The Roman genius for law strengthened and systematized this tendency.

The hierarchy which centres in the pope constitutes the Church of which the sacramental system is the inner life and penance is the sanctions. It is thus a divine-humane organization. It teaches us the divine-human Son of God established it, and returning to heaven committed to the apostles, especially to St. Peter, his authority, which has descended in an unbroken line through the popes. This is the charter of the Church, and its acceptance is the first requisite for salvation; for the Church determines doctrine, exercises discipline and administers sacraments. Its authority is accompanied by the spirit of God, who guides it into truth and gives it miraculous power. Outside the Church there are only the "broken lights" of man's philosophy and the vain efforts of weak human nature after virtue.

Christianity in its complete Roman development is thus the coming of the supernatural into the natural. The universe falls into these orders, the second for the sake of the first, as nature is of and for God. Without him nature at its highest is like a beautiful statue, devoid of life; it is of secondary moment compared even to men, for while it passes away he continues for ever. He is dependent, therefore, not upon nature, but upon God's grace for salvation, and this comes through the Church. In the book of Revelation the New Jerusalem descending from heaven to the earth may be taken as a symbol of a continuing process: the human receives the divine, as the Virgin Mary received the Holy Spirit and brought forth Jesus, perfect man and perfect God. Thus the Church ever receives God and has a twofold nature; its sacraments through material and earthly elements impart a divine power; its teachings agree with the highest truths of philosophy and science, yet add to these the knowledge of mysteries which eye hath not seen, nor ear heard, neither hath it entered into the heart of man to conceive; it sanctifies human relationships, but the happiness of earth at purest and best is only a shadow of the divine bliss which belongs to the redeemed soul. Hence the Church is the twin pole of all things. In all this world, and the title "religious" belongs distinctly to the monastic and priestly life. Theology is the queen of the sciences, and nothing should be taught in school or university which contradicts its conclusions. Moreover, nothing should be done by the state which interferes with the transcendent interest committed to the Church. Thus the Church touches and controls all realms of life, and the cycle is complete. It began as separate from the world and proscribed by it; next it adapted itself to the learning, the customs and the polity of the world. Finally, it asserted its mastery and assumed sovereign power over all. The Church in its completed form was the outcome of a long development; if the seed was Jewish the environment was Gentile. Into the full tree were gathered the effects, not only of the initial energy, but of the forces of earth, air, water and sun. The Roman Church expressed the beliefs and answered the needs of the people, and this explains in part both its forms and its power, its long continuance and wide supremacy.

The Church was never completely successful in unifying its organization. In part it shared the destiny of the Roman empire, and with it fell into two parts, East separating from West. Indeed the East never really acknowledged the Roman primacy nor shared in its development, and it still remains apart. With characteristic oriental conservatism it claims the title of "Orthodox," and retains the creed and organization of the early Church. In general its conception of the relation of the world to the super-world is identical with that of the Roman Church, though somewhat less defined, as its organization is less complete. It has remained in the second stage mentioned above; established, as in Russia, by the empire, it is dependent upon it and in alliance with it. In the Mahomedan dominions it has been recognized as a state within the state, and in these communities faith and patriotism are one.

The idea of the Roman Church was imperfectly embodied at the best; the divine gift was in earthen vessels. The world was never completely cast out; indeed the Church became the scene for ambition and the home of luxury and pleasure. It was entangled also in the political strife of the feudal ages and of the beginning of modern empire. It was not to control the sciences embroiled it with its own philosophers and scholars, while saints and pure-minded ecclesiastics attempted, without success, its reform from within. Finally, through Luther, the explosion came, and western Christendom broke into two parts—Catholic and Protestant.

Protestantism in its primary principle is the return to primitive Christianity. The whole development which we have traced, culminating in the ecclesiastical-doctrinal system of the Roman Church, is regarded as a corruption, since foreign and even heathen elements have been brought in, so that the religion established by Christ is obscured or lost. For Protestants the Bible only now becomes the infallible, inspired authority in faith and morals. Interpretations by the Fathers or by the councils are to be taken only as aids to its understanding. With this principle is associated a second, the liberty of the individual; he reads the sacred Scriptures and interprets them for himself without the intervention of priests or church; and he enters by faith in Christ into communion with God, so that all believers are priests. Here may be noted a fundamental difference in the psychology of religion, since in the Roman Church the chief appeal is to the emotions, while in the Reformed it is to the intelligence. Yet this appeal to the intelligence is not rationalism; the latter makes reason the supreme authority, rejecting all which does not conform to it; the Bible is treated like any other book, to be accepted or rejected in part or in whole as it agrees with our canons of logic and our general science, while religion submits to the same process as do other departments of knowledge. But in Protestantism reason and the light of nature are in themselves as impotent as in the Roman Church. The Bible interpreted by man's unaided intelligence is as valueless as other writings, but it has a sacramental value when the Holy Spirit accompanies its teaching, and the power of God uses it and makes the soul capable of connecting its own thoughts with the divine. In the Roman Church it is only its mediation which is different.

These principles are variously worked out in the different churches and variously expressed. In part because of historical circumstances, the divergence from the older systems is more marked in some Protestant churches than in others, yet on the
CHRISTIANITY

whole these two principles determine cult and in part organization. As in the Roman Church cult centres in the mass, so in the Reformed Church it centres in the sermon. The Holy Spirit, the determining factor in the religious life, used the Bible as His means, and calls the intelligence into action. The clergyman is primarily the preacher, and all the power and enlightenment of God's spirit and powereby the Spirit, so that he speaks with divine authority. The ancient Jewish prophetic office is revived, yet with a difference: the ancient prophets acknowledged no external authority, but the Protestant preacher is strictly subordinate to the Scriptures of which he is the interpreter. Beside the sermon the sacraments are observed as established by Christ—two in number, baptism and the Lord's Supper. But these do not exert a quasi-physical or magical influence, ex opere operato. Unless there be faith in the recipient, an understanding of the meaning of the sacrament and an acceptance of it, it is valueless or harmful. Prayer and praise also are effective only as the congregation intelligently join in them; hence they are not to be solely by a priest nor in a strange tongue, as the clergyman is simply the leader of the devotions of the people. In large portions of the Church also opportunity for the free expression of the religious experience of the laity is found.

The emphasis upon the believer and his freedom from all external authority do not result in a thoroughgoing individualism. Luther clearly held to the unity of all Christians, and Protestants are agreed in this. For them, as for the Roman Church, there is a belief in a catholic or all-embracing Church, but the unity is not that of an organization; Christians are one through an indwelling spirit; they hold the same faith, undergo the same experience and follow the same purpose. This inner life constitutes the oneness of believers and forms the true Church which is invisible. It expresses itself in outward forms, yet there are not two Churches visible and invisible, but only one. The spiritual experience of the individual utters itself in words, and desires association with others who know the same grace. There is formed a body of teaching in which all agree, and an organization in which the common experience finds expression and aid. While then membership in this organization is not primary, it assumes a higher and even a vital importance, since a true experience recognizes the common faith and the common fellowship. Were it to refuse assent to these, doubt would be thrown upon its own trustworthiness.

Historically these principles were only in part embodied, for the Reformation was involved in political strife. The Reformers turned to the government for aid and protection, and throughout Europe turmoil and war ensued. In consequence, in the Protestant nations the state assumed the ultimate authority over the Church. Moreover, in the early days of the Reformation the Catholic Church charged it with a lawless individualism, a charge which was seemingly made good by an extreme divergence in theological opinion and by riots in various parts of the Protestant world. The age was indeed one of ferment, so that the foundations of society seemed threatened. The Reformers turned to the state for protection against the Roman Church, and ultimately as a refuge from anarchy, and they also returned to the theology of the Fathers as their safeguard against heresy. Instead of the simplicity of Luther's earlier writings, a dogmatic theology was formed, and a Protestant ecclesiasticism established, indistinguishable from the Roman Church in principle. The main difference was in the attitude to the Roman allegiance and to the sacramentary system. There was thus by no means a complete return to the Bible as the sole authority, but the Bible was taken as interpreted by the earlier creeds and as worked into a doctrinal system by the scholastic philosophy. Thus Protestantism also came to identify theology with the whole range of human knowledge, and in its official forms it was as hostile to the progress of science as was the Roman Church itself.

Many Protestants rebelled against this radical departure from the principles of the Reformation and of Biblical Christianity. To them it seemed the substitution of the authority of the Church for the authority of a living experience and of intellectual adherence to theological propositions for faith. The freedom of the individual was denied when the state enforced religious conformity. Thus a struggle within Protestantism arose, with persecutions of Protestants by Protestants. Moreover, many failed to find the expression of their faith in the official creed or in the established organization, and Protestantism divided into many sects and denominations, founded upon special types of religious experience or upon particular points in doctrine or in cult. Thus Protestantism presents a wide diversity in comparison with the regularity of the Roman Church. This we should expect indeed from its insistence upon individual freedom; yet, notwithstanding certain notable exceptions, amid the diversity there is a substantial unity, a unity which in our day finds expression in common organizations for great practical ends, for example in the "Bible Societies," "Tract Societies," the "Young Men's Christian Associations," "Societies of Christian Endeavour," etc., which disregard denominational lines.

The coming of the northern peoples into the Roman world profoundly modified Christianity. It shared indeed in the dreariness and corruption of the times commonly called the "dark ages," but when at last a productive period began the Church was the first to profit by it. Since all educated men were priests, it assimilated the new learning—the revived Aristotelianism—and continued its control of the universities. In the 13th century it was supreme, and Christianity was identified with world systems of knowledge and politics. Both were deemed alike divine in origin, and to question their validity was an offence against God. Christianity thus had passed through three stages in politics as in science. At first it was persecuted by the state, then established by it, and finally dominated over it; so its teaching was at first alien to philosophy and despised by it, next was accepted by it and given form and rights through it, and finally became queen of the sciences as theology and ruled over the whole world of human knowledge. But the triumph by its completeness ensured new conflicts; from the disorder of the middle ages arose states which ultimately asserted supreme autonomy, and in like fashion new intellectual powers came for which the ultimate establishment of independence of the sciences.

In the broadest sense the underlying principle of the struggle is the reassertion of interest in the world. It is no longer merely the scene for the drama of the soul and God, nor is man independent of it, but man and nature constitute an organism, humanity being a part of the vaster whole. Man's place is not even central, as he appears a temporary inhabitant of a minor planet in one of the lesser stellar systems. Every science is involved, and theology has come into conflict with metaphysics, logic, astronomy, physics, chemistry, geology, zoology, biology, history and even economics and medicine. From the modern point of view this is unavoidable and even desirable, since "theology "here represents the science of the 13th century. As in the political world the states gained first the undisputed control of matters secular, rejecting even the proffered counsel of the Church, and then proceeded to establish their sovereignty over the Church itself, so was it in the empire of the mind. The rights gained for independent research were extended over the realm of religion also; the two indeed cannot remain separate, and man must subordinate knowledge to the authority of religion—or make science supreme, submitting religion to its scrutiny and judging it like other phenomena. Under this investigation Christianity does not appear altogether exceptional. Its early logic, ontology and cosmology, with many of its distinctive doctrines, are shown to be the natural offspring of the races and ages which gave them birth. Put into their historical environment they are freed from adverse criticism, and indeed valued as steps in the intellectual development of man's mind. Advanced seriously, however, as truths to-day, they are put aside as anachronisms not worthy of dispute. The Bible is not interpreted as literal history of a period or place in comparative religion assigned. It does not appear as altogether unique, but it is put among the other sacred books. For the great religions of the world show similar cycles of development,
similar appropriations of prevalent science and philosophy, similar conservative insistence upon ancient truth, and similar claims to an exclusive authority.

With this interest is involved an attitude of mind toward the supernatural. As already pointed out, nature and super-nature were taken as physically and spatially distinct. The latter could descend upon the former and be imparted to it, neither subject to nature nor intelligible by reason. In science the process has been reversed; nature ascends, so to speak, into the region of the supernatural and subdues it to itself; the marvellous or miraculous is brought under the domain of natural law, the canons of physics extend over metaphysics; and religion takes its place as one element in the natural relationship of man to his environment. Hence the new world-view threatens the foundations of the ecclesiastical edifice. This revolution in the world-view is no longer the possession of philosophers and scholars, but the multitude accepts it in part. Education in general has rendered many familiar with the teachings of science, and, moreover, its practical benefits have given authority to its maxims and theories. The world's problem is not only therefore acute, but the demand for its solution is wider than ever before.

The Roman Catholic Church uncompromisingly reasserts its ancient propositions, political and theological. The cause is lost indeed in the political realm, where the Church is obliged to submit, but it protests and does not waive or modify its claims (see the Syllabus of 1864, paragraphs 199, 27, 54 and 59). In point of fact Protestant churches this situation cannot arise, as they make no claims to governmental sovereignty. In the intellectual domain the situation is more complex. Again the Roman Church unhesitatingly reaffirms the ancient principles in their extreme form (Syllabus, paragraphs 8-9-13; Decrees of the Vatican Council, chapter 4, note especially canon 4-2). The works of St Thomas Aquinas are recommended as the standard authority in theology (Encyc. of Leo XIII., Aeterni Patris, Aug. 4, 1879).

In details also the conclusions of modern science are rejected, as for example the origin of man from lower species, and, in a different sphere, the conclusions of experts as to the origins of the Bible. Faith is defined as "assent upon authority," and the authority is the Church, which maintains its right to supremacy over the whole domain of science and philosophy.

The Greek Church remains untouched by the modern spirit, and the Protestant Churches also are bound officially to the scholastic philosophy of the 13th century; their con-
ingsions of faith still assert the formation of the world in six days, and require assent to propositions which can be true only if the old cosmology be correct. Officially then the Church identifies Christianity with the position outlined above, and hostile critics agree to this identification, rejecting the faith in the name of philosophic and scientific truth.

On the other hand there are not wanting individuals and even large bodies of Christians who are intent upon a reinterpretation. Even in the official circles of the Church, not excepting the Roman Church, there are many scholars who find no difficulty in remaining Christian while accepting the modern scientific view of the world. This is possible to some because the situation in its sharp antithesis is not present to their minds: by making certain compromises on the one side and on the other, and by framing private interpretations of important dogmas, they can retain their faith in both and yet preserve their mental integrity. A large literature is produced, reconciling science and theology by softening and compromising and adapting; a procedure in accordance with general historical development, for men do not love sharp antagonisms, nor are they prepared to carry principles to their logical conclusions. By a fortunate power of mind they are able to believe as truths mutually inconsistent propositions.

Thus the crisis is in fact not so acute as it might seem. No great institutions lives or dies by logic. Christianity rests on great religious needs which it meets and gratifies, so that its life (like all other lives) is in unreasonized emotions. Reason seeks ever to rationalize these, an attempt which seems to destroy yet really fulfils. As thus the restless reason tests the emotions of the soul, criticizes the traditions to which they cling, rejects the ancient dogmas in which they have been defined, the Church slowly participates in the process: silently this position and that are forsaken, legends and beliefs once of prime importance are forgotten, or when forced into controversy many ways are found by which the old and the new are reconciled: the sharpness of distinctions can be rubbed off, expressions may be softened, definitions can be modified and half-way resting-places afforded, until the momentous transition has been made and the continuity of tradition is maintained. Finally, as the last step, even the official documents may be revised. Such a process in Christianity is everywhere in evidence, for even the Roman Church admits the modern astronomy. So too it accepts the changes in the world of politics with qualified approval. In the Syllabus of 1864 the separation of state and church was anathematized, yet in 1906 this separation in the United States was held up as an example to be followed by the French government. In the Protestant Churches the process is precisely similar. No great church has yet modified its articles of religion so as to admit, for example, that the Garden of Eden was not a definite place where Eve was tempted, yet the doctrine is contradicted with approval by individuals, and the results of modern science are accepted and taught without rebuke. In all this the Church shows its essential oneness with other organizations of society, the government, the family, which are at once deeply rooted in the past, and yet subject to the influences of the present. For Christianity is by no means wholly intellectual, nor chiefly so. It would be fully as true to facts to describe this religion as a vast scheme for the amelioration of the condition of humanity. In education, in care for the sick, the poor, the outcast, it has retained the spirit of its Lord. Though it has at times denied this spirit, been guilty of crimes, persecutions, wars and greed—still the Church has never quite forgotten him who went about doing good, nor freed itself from the contagion of his example. No age has been so responsive to the needs of man as our own; whatever doubts men have as to the doctrines or the cults there is an agreement wider than in the past in the good works whose inspiration is a divine love.

Yet the intellectual crisis cannot be ignored in the interest of the practical life. Men must rationalize the universe. On the one hand there are churchmen who attempt to repeat the historical process which has naturalized Christianity. The church is a symbol of the new environment, and who hold that the entire process is inspired and guided by the spirit of God. Hence Christianity is the absolute religion, because it does not preclude development but necessitates it, so that the Christianity that is to come shall not only retain all that is important in the Christianity of the past and present but shall assimilate new truth. On the other hand some seek the essential Christianity in a life beneath and separable from the historic forms. In part under the influence of the Hegelian philosophy, and in part because of the prevalent evolutionary scientific world-view, God is represented under the form of pure thought, and the world process as the unfolding of himself. Such truth can be apprehended by the multitude only in symbols which guide the will through the imagination, and through historic facts which are embodiment of ideas. The Trinity is the essential Christian doctrine, the historic facts of the Christian religion being the embodiment of religious ideas. The chief critical difficulty felt by this school is in identifying any concrete historic fact with the unchanging idea, that is, in making Jesus of Nazareth the incarnation of God. God is reinterpreted, and in place of an extra-mundane creator is an omnipresent life and power. The Christian attainment is nothing else than the thorough intellectual grasp of the absolute idea and the identification of our essential selves with God. With a less thorough-going intellectualism other scholars reinterpret Christianity in terms of current scientific phraseology. Christianity is dependent upon the understanding of the universe; hence it is the duty of believers to put it into the new setting, so that it adopts and adapts astronomy, geology, biology and
psychology. With this accomplished, Christianity will resume its ancient place. Consciously and of purpose the attempt is made to do once more what has been done repeatedly before, to restate Christianity in the terms of current science.

From all these efforts to reconstruct systematic theology with its appropriations of philosophy and science, groups of Christians turn to the inner life and seek in its realities to find the confirmation of their faith. They also claim oneness with a long line of Christians, for in every age there have been men who have ignored the dogma and the ritual of the Church, and in contemplation and retirement have sought to know God immediately in their own experience. To them at best theology with its cosmology and its logic is only a shadow of shadows, for God reveals himself to the pure in heart, and it matters not what science may say of the material and fleeting world. This spirit manifests itself in wide circles in our day. The Gordian knot is cut, for philosophy and religion no longer touch each other but abide in separate realms.

In quite a different way a still more influential school seeks essential Christianity in the sphere of the ethical life. It also would disentangle religion from cosmology and formal philosophy. It studies the historic development of the Church, noting how element after element has been introduced into the simplicity of the gospel, and from all these it would turn back to the Bible itself. In a thorough-going fashion it would accomplish what Luther and the Reformation attempted. It regards even the earliest creeds as only more or less satisfactory attempts to translate the Christian facts into the current language of the heathen world. But the process does not stop with this rejection of the ancient and the scholastic theology. It recognizes the scientific results attained in the study of the Bible itself, and therefore it does not seek the entire Bible as its rule of truth. To it Jesus Christ, and he alone, is supreme, but this supremacy does not carry with it infallibility in the realm of cosmology or history. In these two Jesus participated in the views of his own time; even his teaching of God and of the future life is not lacking in Jewish elements, yet none the less he is the essential element in Christianity, and to his life-purpose must all that claims to be Christianity be brought to be judged. To this school Christianity is the culmination of the ethical monotheism of the Old Testament, which finds its highest ideal in self-sacrificing love. Jesus Christ is the complete embodiment of this ideal, in life and in death. This ideal he sets before men under the traditional forms of the kingdom of God as the object to be attained, a kingdom which takes upon itself the forms of the family, and realizes itself in a new relationship of universal brotherhood. Such a religion appeals for its self-verification not to its agreement with cosmological conceptions, either ancient or modern, or with theories of philosophy, however true these may be, but to the moral sense of man. On the one hand, in its ethical development, it is nothing less than the outworking of that principle of Jesus Christ which led him not only to self-sacrificing labour but to the death upon the cross. On the other hand, it finds its religious solution in the trust in a power not ourselves which makes for the same righteousness which was incarnate in Jesus Christ.

Thus Christianity, as religion, is on the one hand the adoration of God, that is, the highest and noblest, and this highest and noblest as conceived not under forms of power or knowledge but in the form of ethical self-devotion as embodied in Jesus Christ, and on the other hand it meets the requirements of all religion in its independence, not indeed upon some absolute idea or omnipotent power, but in the belief that that which appeals to the soul as worthy of supreme worship is also that in which the soul may trust, and which shall deliver it from sin and fear and death. Such a conception of Christianity can recognize many embodiments in ritual, organization and dogma, but its test in all ages and in all lands is conformity to the purpose of the life of Christ. The Lord's Prayer in its oldest and simplest form is the expression of its faith, and Christ's separation of mankind on the right hand and on the left in accordance with their service or refusal of service to their fellow-men is its own judgment of the right of any age or church to the name Christian. This school also represents historic Christianity, and maintains the continuity of its life through all the ages past with Christ himself. But this continuity is not then in theological systems or creeds, nor in sacraments and cult, nor in organization, but in the noble company of all who have lived in simple trust in God and love to humanity. It is this true Church of the spirit and purpose of Jesus which has been the supreme force for the uplifting of humanity.

Christianity has passed through too many changes, and it has found the time to come. Thoroughgoing reconstruction in every item of theology and in every detail of polity there may be, yet shall the Christian life go on—the life which finds its deepest utterance in the words of Christ, "Thou shalt love the Lord thy God with all thy heart and thy neighbour as thyself"; the life which expresses its profound faith in the words Christ taught it to pray, "Our Father"; the life which finds its highest rule of conduct in the words of its first and greatest interpreter, "Let this mind be in you which was also in Christ Jesus our Lord."

Bibliography. Detailed bibliographies accompany the separate articles on subjects connected with the Christian religion and Church. In the following list a selection is given of books on the wider and general subject:

Prophets of Israel.—Rudolf Smend, Lehrbuch der altestamentlichen Religionsgeschichte (2nd ed., 1899); A. B. Davidson, Old Testament Prophecy (1903); A. O. Parrot, History of Israel, the Book of (1899); W. Robertson Smith, The Prophets of Israel and their Place in History (1889); A. F. Kirkpatrick, Doctrine of the Prophets (3rd ed., 1901).

Berfit Duhm, Die Theologie der Propheten (1873).

The Beginnings of Christianity.—Ernst von Dobschütz, Christian Life in the Primitive Church (Eng. trans., 1904); A. C. McGeil, The Apostolic Age (1900); Carl Wetzlaker, The Apostolic Age (Eng. trans., 1897); Otto Pfleiderer, Das Christentum (1902).

The Influence of Christianity.—Edwin Hatch, "The Influence of Greek Ideas and Usages upon the Christian Church," the Hibbert Lectures, 1892; Fred H. Scranton, Christianity in the First Three Centuries (Eng. trans., 1904); Sir W. M. Ramsay, The Church in the Roman Empire (1893).

The Roman Church.—Joseph Wilhelm and Thomas E. Scannell, Manual of Catholic Theology (1906); J. A. Mowbray, Symbolism (trans., 1844); Thomas Aquinas, The Summa (Eng. trans., 1907); William Ward, The Ideal of a Christian Church (1842).

Protestantism.—John Calvin, Institutiones Christianae (1536; Eng. trans., Hodge, Systematic Theology (3 vols., 1872); Ernst Troeltsch, Die Absolutheit des Christentums und die Religionsgeschichte (1902); First Principles of the Reformation, or the Ninety-Five Theses and the Three Primary Works, trans. by Henry Ward and C. A. Buchhein (1883).

Christianity in the Modern World.—Andrew D. White, Conflict of Science with Theology (2 vols., 1896); D. F. Strauss, Der ale und der neue Glaube (1872; Eng. trans., 1873); A. J. Balfour, The Foundation of Christian Theology (1893); A. R. Smillie, Modern Adaptations of Christianity—William Adams Brown, Christian Theology in Outline (1906); Augustus Sabatier, Religions of Authority and the Religion of the Spirit (1904); J. A. Zahn, Entstehung der Dogmenlehre (1899); Otto Pfleiderer, The Evolution of Religion (1893); Otto Pfleiderer, Philosophy of Religion (Eng. trans., 1888, especially volumes 3 and 4); Newman Smyth, Old Faiths in New Lights (1893). Through Science to Faith (1902).

CHRISTIANSAND—CHRISTINA

The profession of the paid Christian Science "healer" has been very prominent in recent years both in America and in England, and very remarkable successes have been claimed for the treatment. In some serious cases of death after illness, where a coroner's inquest has shown that the only medical attendance was that of a Christian Science "healer," the question of criminal responsibility has been prominently canvassed; but an indictment in England against a healer for manslaughter in 1906 resulted in an acquittal. The theosophical and the medical aspects of Christian Science may perhaps be distinguished; the latter at all events is open to grave abuse. But the modern reaction in medical practice against drugs, and the increased study of the subject of "suggestion," have done much to encourage a belief in faith-healing and in "psychotherapy" generally. In 1908, indeed, a separate movement (Emmanuel), inspired by the success of Christian Science, and also emanating from America, was started within the Anglican Communion, its object being to bring prayer to work on the curing of disease; and this movement obtained the approval of many leaders of the church in England.

An "authorized" Life of Mrs Eddy, by Sibyl Wilbur (1908), deals with the subject acceptably to her disciples. Georgine Milmine's Life of Mrs. Eddy, by J. G. Eddy, and Mrs. Eddy, a History of Christian Science (1907), though not so acceptable, is a judicious critical account. A detailed indictment against the whole system, by a competent English doctor (Stephen Paget), will be found in The Faith and Works of Christian Science (1909).

CHRISTIANIA (CHRISTIANSUND), a seaport on the west coast of Norway, in Romedal amt (county), 250 m. N.E. by N. of Bergen, in the latitude of the Faeroe Islands. Pop. (1901) 11,982. It is built on four small islands, by which its harbour is enclosed. The chief exports are wood, cod, herrings and fish products, and butter to Great Britain. The town is served by the principal steamers between the south Norwegian ports, Hull, Hamburg, &c., and Trondhjem, and it is the chief port of the district of Nordmøre. Local steamers serve the neighbouring fjords, including the Sundsfsjord, from which at Sundalsorgen a driving road past the fine Dovefield connects with the Gudbrandsdals route. Till 1742, when it received town privileges from Christian VI., Christiansund was called Lille-Fosen.

CHRISTIE, RICHARD COPLEY (1830–1901), English scholar and bibliophile, was born on the 22nd of July 1830 at Lenton in Nottinghamshire, the son of a millowner. He was educated at Lincoln College, Oxford, and was called to the bar at Lincoln's Inn in 1857, and in 1872 became chancellor of the diocese of Manchester. This he resigned in 1893. He held numerous appointments, notably the professorships of history (from 1854 to 1866) and of political economy (from 1855 to 1866) at Owens College, Manchester. He always took an active interest in this college, of which he was one of the governors; in 1893 he gave the Christie library building designed by Alfred Waterhouse, and in 1897 he devoted £50,000 of the funds at his disposal as a trustee of Sir Joseph Whitworth's estate for the building of Whitworth Hall, which completed the front quadrangle of the college. He was an enthusiastic book collector, and bequeathed to Owens College his library of about 75,000 volumes, rich in a very complete set of the books printed by Dolet, a wonderful series of Aldines, and of volumes printed by Sebastian Gryphius. His Etienne Delot, the Martyr of the Renaissance (1880), is the most exhaustive work on the subject. He died at Ribden on the 9th of January 1901.

CHRISTINA (1626–1689), queen of Sweden, daughter of Gustavus Adolphus and Maria Eleonora of Brandenburg, was born at Stockholm on the 8th of December 1626. Her father died when she was only six years old. She was educated, principally, by the learned Johannes Matthiae, in as masculine a way as possible, while the great Oxenstjerna himself instructed her in politics. Christina assumed the sceptre in her eighteenth year (Dec. 8, 1644). From the moment when she took her seat at the head of the council board she impressed her veteran counsellors with the conviction of her superior genius. Axel Oxenstjerna himself said of her, when she was only fifteen: "Her majesty is not like women-folk, but is stout-hearted and of a good understanding, so that, if she be not corrupted, we have

Modern Definitions of Christianity.—Alfred Loisy, The Gospel and the Church (1904); Adolf Harnack, What is Christianity? (1901); William Adams Brown, The Essence of Christianity (1902); Ernst Troeltsch, Das Wesen des Christentums: J. Kaftan, Das Wesen der christianlichen Religion (1888); J. Cairns, The Fundamental Ideas of Christianity (1899). (G. W. Kn.)
good hopes of her." Unfortunately her brilliant and commanding qualities were vilified by an inordinate pride and egoism, which exhibited themselves in an utter contempt for public opinion, and a prodigality utterly regardless of the necessities of the state. She seemed to consider Swedish affairs as far too petty to occupy her full attention; while her unworthy treatment of the great chancellor was mainly due to her jealousy of his extraordinary reputation and to the unjustified fiction that, so long as he lived, his influence must at least be equal to her own.

Recognizing that he would be indispensable so long as the Thirty Years' War lasted, she used every effort to bring it to an end; and her impulsive interference seriously hampered the diplomacy of the chancellor, and materially reduced the ultimate gains of Sweden. The general peace congress was not opened till April 1645. The Swedish plenipotentiaries were Johan Oxenstierna, the chancellor's son, and Adler Salvius. From the first the relations between them were strained. Young Oxenstierna, haughty and violent, claimed, by right of birth and rank, to be caput legationis. The chancellor, at home, took his son's part, while Salvius was warmly supported by Christina, who privately assured him of her exclusive favour and encouraged him to hold his own. So acute did the quarrel become that there was a violent schism in still Senate between the queen and the chancellor; and she urged Salvius to accelerate the negotiations, against the better judgment of the chancellor, who hoped to get more by holding out longer.

The longer Christina ruled, the more anxious for the future fate of her empire grew the men who had helped to build it up. Yet she gave fresh privileges to the towns; she encouraged trade and manufactures, especially the mining industries of the Dales; in 1649 she issued the first school ordinance for the whole kingdom; she encouraged foreign scholars to settle in Sweden; and native science and literature, under her liberal encouragement, flourished as they had never flourished before. In one respect, too, she showed herself wiser than her wisest counsellors. The Senate and the estates, naturally anxious about the succession to the throne, had repeatedly urged her majesty to marry, and had indicated her cousin, Charles Gustavus, as her most befitting consort. Weary of their importunities, yet retaining at the idea of submission to any member of the opposite sex, Christina settled the difficulty by appointing Charles her successor, and at the Riksdag of 1650 the Swedish crown was declared hereditary in Charles and his heirs male. In the summer of 1651 Christina was, with difficulty, persuaded to reconsider her resolution to abdicate, but three years later the nation had become convinced that her abdication was highly desirable, and the solemn act took place on the 6th of July 1654 at the castle of Upsala, in the presence of the estates and the great dignitaries of the realm. Many were the causes which predisposed her to what was, after all, anything but an act of self-renunciation. First of all she could not fail to remark the increasing discontent with her arbitrary and wasteful ways. Within ten years she had created 17 counts, 46 barons and 428 lesser nobles; and, to provide these new peers with adequate appanages, she had sold or mortgaged crown property representing an annual income of 1,200,000 rix-dollars. Signs are also not wanting that Christina was conscious of the importance of government; while the importance of the senate and Riksdag on the question of her marriage was a constant source of irritation. In retirement she could devote herself wholly to art and science, and the opportunity of astonishing the world by the unique spectacle of a great queen, in the prime of life, voluntarily resigning her crown, strongly appealed to her vivid imagination.

Anyhow, it is certain that, towards the end of her reign, she behaved as if she were determined to do everything in her power to make herself as little missed as possible. From 1651 there was a notable change in her behaviour. She cast away every regard for the feelings and prejudices of her people. She ostentatiously exhibited her contempt for the Protestant religion. Her foreign policy was flighty to the verge of foolishness. She contemplated an alliance with Spain, a state quite outside the orbit of Sweden's influence, the firstfruits of which were to have been an invasion of Portugal. She utterly neglected affairs in order to plunge into a whirl of dissipation with her foreign favourites. The situation became impossible, and it was with an intense feeling of relief that the Swedes saw her depart, in masculine attire, under the name of Count Dohna. At Innsbruck she openly joined the Catholic Church, and was rechristened Alexandra. In 1656, and again in 1657, she visited France, on the second occasion ordering the assassination of her major-domo Montaldischi, a crime still unexplained. Twice she returned to Sweden (1660 and 1667) in the vain hope of recovering the succession, finally settling in Rome, where she died on the 19th of April 1689, poor, neglected and forgotten.

CHRISTINA [MARIA CHRISTINA HENRIETTA DÉSIRÉE FÉLICITE RÉSIRE], for some years queen-regent of Spain (1655-7), widow of Alphonso XII. and mother of Alphonso XIII., was born at Gross Sedowitz, in Austria, on the 21st of July 1656, being the daughter of the archduke Ferdinand and the archduchess Elizabeth of Austria. She was brought up by her mother as a rigid Catholic, and great care was taken with her education. At eighteen she was appointed by the emperor Francis Joseph, abbess of the House of Noble Ladies of Saint Theresa in Prague, where she made herself very popular and distinguished herself by her intellectual parts. It is said that at the court of Vienna the archduchess saw the young prince Alphonso of Spain when he was only a pretender in exile, before the restoration of the Bourbons. A few years later, when Alphonso XII. had lost his first wife and cousin, Queen Mercedes, daughter of the duc de Montpensier, his ministers, especially Señor Canovas, urged him to marry again.

He told them that if he did so it would only be with the young Austrian archduchess María Christina. After some negotiations between the two courts and governments it was agreed that the archduchess Elizabeth and her daughter should meet Alphonso XII. at Arcachon, in the south of France, where a few days' personal acquaintance was sufficient to make both come to a decision. The duke of Bailen went officially to Vienna to get the emperor of Austria's authorization, and on the 14th of November 1879, in the throne-room of the Imperial palace, the archduchess solemnly abdicated all her rights of succession in Austria, in accordance with the law obliging all princesses of the imperial house to do so when they wed a foreign prince. On the 17th of November the archduchess and her mother, with a numerous suite, started for Spain, arriving at the royal castle of El Pardo, near Madrid, on the 24th of November. The wedding took place in the Atocha cathedral, on the 26th of November, in great state, and was followed by splendid festivities. Queen Christina bore her husband two daughters before he died in 1885—Dona Mercedes, born on the 11th of September 1880, and Dona María Theresa, born on the 12th of November 1882. During her husband's lifetime the young queen kept studiously apart from politics, of the idea that Christina's inexperience caused much anxiety in November 1885, when she was called upon to take the arduous duties of regent. During the long minority of the posthumous son of Alphonso XII., afterwards King Alphonso XIII., the Austrian queen-regent acted in a way that obliged even the adversaries of the throne and the dynasty to respect the mother and the woman. The people of Spain, and the ever-tireless civil and military politicians, found that the gloved hand of their constitutional ruler was that of a strong-minded and tenacious regent, who often asserted herself in a way that surprised them much, but always, somehow, enforced obedience and respect. More could not be expected by a foreign ruler from a nation little prone to waste attachment or demonstrative loyalty upon anybody not Castilian born and bred.

CHRISTISON, SIR ROBERT, Bart. (1797-1882), Scottish toxicologist and physician, was born in Edinburgh on the 10th of July 1797. After graduating at the university of that city in 1819, he spent a short time in London, studying under John
Abernethy and Sir William Lawrence, and in Paris, where he learned analytical chemistry from P. J. Robiquet and toxicology from M. J. B. Orfila. In 1832 he returned to Edinburgh as professor of medical jurisprudence, and set to work to organize the study of his subject on a sound basis. On poisons in particular he speedily became a high authority; his well-known treatise on them was published in 1829, and in the course of his inquiries he did not hesitate to try such dangerous experiments on himself as taking large doses of Calabar bean. His attainments in medical jurisprudence and toxicology procured him the appointment, in 1829, of medical officer to the crown in Scotland, and from that time till 1866 he was called as a witness in many celebrated criminal cases. In 1832 he gave up the chair of medical jurisprudence and accepted that of medicine and therapeutics, which he held till 1877; at the same time he became professor of clinical medicine, and continued in that capacity till 1855. His fame as a toxicologist and medical jurist, together with his work on the pathology of the kidneys and on fevers, secured him a large private practice, and he succeeded to a fair share of the honours that commonly attend the successful physician, being appointed physician to Queen Victoria in 1848 and receiving a baronetcy in 1871. Among the books which he published were a treatise on Granular Degeneration of the Kidneys (1839), and a Commentary on the Pharmacopoeias of Great Britain (1842). Sir Robert Christison, who retained remarkable physical vigour and activity down to extreme old age, died at Edinburgh on the 23rd of January 1882.

See the Life by his sons (1885-1886).

CHRISTMAS (i.e. the Mass of Christ), in the Christian Church, the festival of the nativity of Jesus Christ. The history of this feast coheres so closely with that of Epiphany (q.v.), that what follows must be read in connexion with the article under that heading.

The earliest body of gospel tradition, represented by Mark no less than by the primitive non-Marcan document embodied in the first and third gospels, begins, not with the birth and childhood of Jesus, but with his baptism; and this order of accretion of gospel matter is faithfully reflected in the time order of the invention of feasts. The great church adopted Christmas much later than Epiphany; and before the 5th century there was no general consensus of opinion as to when it should come in the calendar, whether on the 6th of January, or the 25th of March, or the 25th of December.

The earliest identification of the 25th of December with the birthday of Christ is in a passage, otherwise unknown and probably spurious, of Theophilus of Antioch (A.D. 171-183), preserved in Latin by the Magdeburg centurarians (i. 3, 118), to the effect that the Gauls contended that as they celebrated the birth of the Lord on the 25th of December, whatever day of the week it might be, so they ought to celebrate the Pascha on the 25th of March when the resurrection befell.

The next mention of the 25th of December is in Hippolytus' (c. 202) commentary on Daniel iv. 23. Jesus, he says, was born at Bethlehem on the 25th of December, a Wednesday, in the forty-second year of Augustus. This passage also is almost certainly interpolated. In any case he mentions no feast, nor was such a feast congruous with the orthodox ideas of that age. As late as 245 Origen, in his eighth homily on Leviticus, repudiates as sinful the very idea of keeping the birthday of Christ "as if he were a king Pharaoh." The first certain mention of Dec. 25 is in a Latin chronographer of A.D. 354, first published entirely by Mümssen. 1 It runs thus in English: "Year 1 after Christ, in the consulate of Caesar and Paulus, the Lord Jesus Christ was born on the 25th of December, a Friday and 15th day of the new moon." Here again no festal celebration of the day is attested.

There were, however, many speculations in the 2nd century about the date of Christ's birth. Clement of Alexandria, towards its close, mentions several such, and condemns them as superstitions. Some chronologists, he says, alleged the birth to have occurred in the twenty-eighth year of Augustus, on the 25th of Pachon, the Egyptian month, i.e. the 20th of May. These were probably the Basilidian gnostics. Others set it on the 24th or 25th of Pharnabazus, i.e. the 19th or 20th of April. Clement himself sets it on the 17th of November, 3 B.C. The author of a Latin tract, called the De Pascha computis, written in Africa in 423, sets it by private revelation, ab ipso deo inspirati, on the 28th of March. He argues that the world was created perfect, flowers in bloom, and trees in leaf, therefore in spring; also at the equinox, and when the moon just created was full. Now the moon and sun were created on a Wednesday. The 28th of March suits all these considerations. Christ, therefore, being the Sun of Righteousness, was born on the 26th of March. The same symbolic reasoning led Polycarp (before 160) to set his birth on Sunday, when the world's creation began, but his baptism on Wednesday, i.e. it was the analogue of the sun's creation. On such grounds certain Latins as early as 354 may have transferred the human birthday from the 6th of January to the 25th of December, which was then a Mithraic feast and is by the chronographer above referred to, but in another part of his compilation, termed Natalis invicti solis, or birthday of the unconquered Sun. Cyprian (de orat. dom. 35) calls Christ Sol verus, Ambrose Sol novus noster (Sermon vii. 13), and such rhetoric was widespread. The Syrians and Armenians, who clung to the 6th of January, accused the Romans of sun-worship and idolatry, contending with great probability that the feast of the 25th of December had been invented by disciples of Cerinthus and its lections by Artemon to commemorate the natural birth of Jesus. Chrysostom also testifies the 25th of December to have been from the beginning known in the West, from Thrace even as far as Gades. Ambrose, On Virginis, ill. ch. r, writing to his sister, implies that as late as the papacy of Liberius (352-356), the Birth from the Virgin was feasted together with the Marriage of Cana and the Banquet of the 4000 (Luke ix. 13), which were never feasted on any other day but Jan. 6.

Chrysostom, in a sermon preached at Antioch on Dec. 26, 386 or 388, says that some held the feast of Dec. 25 to have been held in the West, from Thrace as far as Cadiz, from the beginning. It certainly originated in the West, but spread quickly eastwards. In 353-361 it was observed at the court of Constantius. Basil of Caesarea (died 379) adopted it. Honorius, emperor (395-423) in the West, informed his mother and brother Arcadius (395-408) in Byzantium of how the new feast was kept in Rome, separate from the 6th of January, with its own troparia and stichariar. They adopted it, and recommended it to Chrysostom, who had long been in favour of it. Epiphanius of Crete was won over to it, as were also the three patriarchs, Theophilus of Alexandria, John of Jerusalem, Flavian of Antioch. This was under Pope Anastasius, 398-400. John or Wahaj of Nice, in a letter printed by Combes in his Historia monothelitistarum, affords the above details. The new feast was communicated by Proclus, patriarch of Constantinople (434-446), to Sahak, Catholicos of Armenia, about 440. The letter was betrayed to the Persian king, who accused Sahak of Greek intrigues, and deposed him. However, the Armenians, at least those within the Byzantine pale, adopted it for about thirty years, but finally abandoned it together with the decrees of Chalcedon early in the 8th century. Many writers of the period 375-450, e.g. Epiphanius, Cassian, Asterius, Basil, Chrysostom and Jerome, contrast the new feast with that of the Baptism as that of the birth after the flesh, from which we infer that the latter was generally regarded as a birth according to the Spirit. Instructive as showing that the new feast travelled from West eastwards is the fact (noticed by Usener) that in 387 the new feast was reckoned according to the Roman calendar by writers of the province of Asia, who in referring to other feasts use the reckoning of their local calendars. As early as 400 in Rome an imperial rescript includes Christmas among the three feasts (the others are Easter and Epiphany) on which theatres must be closed. Epiphany and Christmas were not made judicial non dies until 534.

1 In a fragment preserved by an Armenian writer, Ananas of Shirak.
CHRISTMAS ISLAND

For some years in the West (as late as 353 in Rome) the birth feast was appended to the baptismal feast on the 6th of January, and in Jerusalem it altogether supplanted it from about 360 to 440, when Bishop Juvenal introduced the feast of the 23rd of December. The new feast was about the same time (440) finally established in Alexandria. The quadragesima of Epiphany (i.e. the feast of the presentation in the Temple, or hubapomēn) continued to be celebrated in Jerusalem on the 14th of February, forty days after the 6th of January, until the refusal of Justinian. In most other places it had long been put back to the 2nd of February to suit the new Christmas. Armenian historians describe the riots, and display of armed force, without which Justinian was not able in Jerusalem to transfer this feast from the 14th to the 2nd of February.

The grounds on which the Church introduced so late as 350-440 a Christmas feast till then unknown, or, if known, precariously linked with the baptism, seem in the main to have been the following. (1) The transition from adult to infant baptism was proceeding rapidly in the East, and in the West was well-nigh completed. Its natural complement was a festal recognition of the fact that the divine element was present in Christ from the first, and was no new stage of spiritual promotion coeval only with the descent of the Spirit upon him at baptism. The general adoption of child baptism helped to extinguish the old view of the divine life in Jesus Christ from his baptism, a view which led the Epiphany feast to be regarded as that of Jesus' spiritual rebirth. This aspect of the feast was therefore forgotten, and its importance in every way diminished by the new and rival feast of Christmas. (2) The 4th century witnessed a rapid diffusion of Marcionite, or, as it was now called, Manichaean propaganda, the chief tenet of which was that Jesus either was not born at all, was a mere phantasm, or anyhow did not take flesh of the Virgin Mary. Against this view the new Christmas was a protest, since it was peculiarly the feast of his birth in the flesh, or as a man, and is constantly spoken of as such by the fathers who witnessed its institution.

In Britain the 25th of December was a festival long before the conversion to Christianity, for Bede (De temp. pat. ch. 13) relates that "the ancient peoples of the Angil began the year on the 25th of December when we now celebrate the birthday of the Lord; and the very night which is now so holy to us, they called in their tongue modranecht (módra niht), that is, the mothers' night, by reason we suspect of the ceremonies which in that night-long vigils they performed." With its usual reticence about matters pagan or not orthodox, Bede abstains from recording who the mothers were and what the ceremonies were. In 1644 the English puritans forbade any merriment or religious services by act of Parliament, on the ground that it was a heathen festival, and ordered it to be kept as a fast. Charles II. revived the feast, but the Scots adhered to the Puritan view.

Outside Teutonic countries Christmas presents are unknown. Their place is taken in Latin countries by the sirenes, French âneres, given on the 8th of January; this was in antiquity a great holiday, wherefore until late in the 4th century the Church observed a day of fasting and gloom. The setting up in Latin churches of a Christmas crièche is said to have been originated by St. Francis.

CHRISTMAS ISLAND, a British possession under the government of the Straits Settlements, situated in the eastern part of the Indian Ocean (in 10° 25' S., 105° 42' E.), about 190 m. S. of Java. The island is a quadrilateral with hollowed sides, about 12 m. in greatest length and 9 in extreme breadth. It is probably the only tropical island that had never been inhabited by man before the European settlement. When the first settlers arrived, in 1807, it was covered with a dense forest of great trees and luxuriant under-shrubbery. The settlement in Flying Fish Cove now numbers some 250 inhabitants, consisting of Europeans, Sikhs, Malays and Chinese, by whom roads have been cut and patches of cleared ground cultivated.

The island is a volcanic submarine mountain more than 15,000 ft. high, the depth of the platform from which it rises being about 14,000 ft., and its height above the sea being upwards of 1000 ft. The submarine slopes are steep, and within 20 m. of the shore the depth of the sea reaches 2400 fathoms. It consists of a central plateau descending to the water in three terraces, each with its "tread" and "rise." The shore terrace descends by a steep cliff to the sea, forming the "rise" of a submarine "tread" in the form of fringing reef which surrounds the island and is never uncovered, even at low water, except in Flying Fish Cove, where the only landing-place exists. The central plateau is a plain whose surface presents "rounded, flat-topped hills and low ridges and reefs of limestone," with narrow intervening valleys. On its northern aspect this plateau has a raised rim having all the appearances of being once the margin of an atoll. On these upward hills occurs the deposit of phosphatic lime, which gives the island a commercial value. The phosphatic deposit has doubtless been produced by the long-continued action of a thick bed of sea-fowl dung, which converted the carbonate of the underlying limestone into phosphate. The flat summit is formed by a succession of limestones—all deposited in shallow water—from the Eocene (or Oligocene) up to recent deposits in the above-mentioned atoll with islands on its reef. The geological sequence of events appears to have been the following:—After the deposition of the Eocene (or Oligocene) limestone—which reposes upon a floor of basalts and trachytes—basalts and basic tufts were ejected, over which, during a period of very slow depression, orbital limestones of Miocene age—which seem to make up the great mass of the island—were deposited; then elapsed a long period of rest, during which the atoll condition existed and the guano deposit was formed; from then down to the present time there has succeeded a series of sea-level subsidences, resulting in the formation of the terraces and the accumulation of the detritus now seen on the first island cliff, the old submarine slope of the island. The occurrence of such a series of Tertiary deposits appears to be unknown elsewhere. The whole series was evidently deposited in shallow water on the summit of a submarine volcano standing in its present isolation, and round which the ocean floor has probably altered but a few hundred feet since the Eocene age. Thus although the rocks of the southern coast of Java in their general character and succession resemble those of Christmas Island, there lies between them an abyssal trough 18,000 ft. in depth, which renders it scarcely possible that they were deposited in a continuous area, for such an enormous depression of the sea-floor could hardly have occurred since Miocene times without involving also Christmas Island. One of the main purposes of the exploration was to obtain light on the question of the foundation of atolls.

The flora consists of 129 species of angiosperms, 1 Cyanus, 22 ferns, and a few mosses, lichens and fungi, 17 of which are endemic, while a considerable number—not specifically distinct—form local varieties nearly all presenting Indo-Malayan affinities, as do the single Cynas, the ferns and the cryptogams. As to its fauna, the island contains 319 species of animals—54 only being vertebrates—145 of which are endemic. A very remarkable distributional fact in regard to them, and one not yet fully explained, is that a large number show affinity with species in the Austro-Malayan rather than in the Indo-Malayan, their nearer, region. The ocean currents, the trade-winds blowing from the Australian mainland, and north-westery storms from the Malayan islands, are no doubt responsible for the introduction of many, but not all, of these Malayan and Australasian species. The climate is healthy, they temperature varying from 75° to 84° F. The prevailing wind is the S.E. trade, which
blows the greater part of the year. The rainfall in the wet season is heavy, but not excessive, and during the dry season the ground is refreshed with occasional showers and heavy dew. Malarial fever is not prevalent, and it is interesting to note that there are no swamps or standing waters on the island.

It is not known when and by whom the island was discovered, but under the name of Moom it appears on a Dutch chart of 1666. It was first visited in 1688 by Dampier, who found it uninhabited. In 1886 Captain Maclear of H.M.S. "Flying Fish," having discovered an anchorage in a bay which he named Flying Fish Cove, landed a party and made a small but interesting collection of the flora and fauna. In the following year Captain Aldrich on H.M.S. "Egeria" visited it, accompanied by Mr. J. J. Lister, F.R.S., who formed a larger biological and mineralogical collection.

Among the rocks then obtained and submitted to Sir John Murray for examination there were detected specimens of nearly pure phosphate of lime, a discovery which eventually led, in June 1888, to the annexation of the island to the British crown. Soon afterwards a small settlement was established in Flying Fish Cove by Mr. G. Clunies Ross, the owner of the Keeling Islands, which lie about 750 m. to the westward. In 1891 Mr. Ross and Sir John Murray were granted a lease, but on the further discovery of phosphatic deposits they disposed of their rights in 1897 to a company. In the same year a thorough scientific exploration was made, at the cost of Sir John Murray, by Mr. C. W. Andrews, of the British Museum.

CHRISTODORUS, of Coptos in Egypt, epic poet, flourished during the reign of Anastasius I. (A.D. 491-518). According to Suidas, he was the author of Haska, accounts of the foundation of various cities; Avka, the mythical history of Libya; Iaukha, the conquest of Iauria by Anastasius; three books of epigrams; and many other works. In addition to two epigrams (Anthol. Pal. vii. 697, 698) we possess a description of eighty statues of gods, heroes and famous men and women in the gymnasion of Zeuxippus at Constantinople. This Epikôras, consisting of 416 hexameters, forms the second book of the Palatine Anthology. The writer's chief models are Homer and Nonnus, whom he follows closely in the structure of his hexameters. Opinions are divided as to the merits of the work. Some critics regard it as of great importance for the history of art and a model of description; others consider it valueless, alike from the historical, mythological and archaeologica points of view.

See F. Baumgarten, De Christodoro poeta Thébano (1881), and his article in Revue d'histoire littéraire de la Grèce (1899). W. Christ, Geschichte der griechischen Literatur (1898).

CHRISTOPHER, SAINT (Christopherus, Christoforus), a saint honoured in the Roman Catholic (25th of July) and Orthodox Eastern (9th of May) Churches, the patron of ferrymen. Nothing that is authentic is known about him. He appears to have been originally a pagan and to have been born in Syria. He was baptized by Babylas, bishop of Antioch; preached with much success in Lycia; and was martyred about A.D. 250 during the persecution under the emperor Decius. Round this small nucleus of possibility, however, a vast mass of legendary matter gradually collected. All accounts agree that he was of great stature and singularly handsome, and that this helped him not a little in his evangelistic work. But according to a story reproduced in the New Uniat Anthology of Arcadius, and mentioned in Basil's Monologue, Christopher was originally a hideous man-eating ogre, with a dog's face, and only received his human semblance, with his Christian name, at baptism. Most of his astounding miracles are of the ordinary type. He thrusts his hand into the ground; whereupon it sprouts into a date palm, and thousands are converted. Courtesans sent to seduce him are turned by his mere aspect into Christians and martyrs. The Roman governor is confounded by his insensi-

bility to the most refined and ingenious tortures. He is roasted over a slow fire and basted with boiling oil, but tells his tormentors that by the grace of Jesus Christ he feels nothing. When at last, in despair, they cut off his head, he had converted 48,000 people.

The more conspicuous of these legends are included in the Mozarabic Breaviary and Missal, and are given in the thirty-third sermon of Peter Damien, but the best-known story is that which is given in the Golden Legend of Jacobus de Voragine. According to this, Christopher—or rather Reprobus, as he was then called—was a giant of vast stature who was in search of a man stronger than himself, whom he might serve. He left the service of the king of Canaan because the king feared the devil, and that of the devil because the devil feared the Cross. He was converted by a hermit; but as he had neither the gift of fasting nor that of prayer, he decided to do himself the work of charity, and to carry himself to carry wayfarers over a bridgeless river. One day a little child asked to be taken across, and Christopher took him on his shoulder. When half way over the stream he staggered under what seemed to him a crushing weight, but he reached the other side and then upbraided the child for placing him in peril. "Had I borne the whole world on my back," he said, "it could not have weighed heavier than thou!" "Marvel not!" the child replied, "for thou hast borne upon thy back the world and him who created it!" It was this story that gave Christopher his immense popularity throughout Western Christendom.

See Bolland. Acta Sanct. vi. 146; Guenebault, Dict. icono-

-graphique des saints figures et des legendes. Diction. (1850); Smich and Wace, Dic. of Christ. Biog. (London, 1877, &c., 4 vols.); A. Sinemus, Die Legende vom h. Christophorus (Hanover, 1868); and other literature cited in Herzog-Hauck, Realencyk. iv. 60.

CHRISTOPHORUS, pope or anti-pope, elected in 903 against Leo V. (Philemon), whom he threw into prison. In January 904 he was treated in the same fashion by his competitor, Sergius III, who had him strangled.

CHRISTOPHOLUS, ATHANASIOS (1772-1847), Greek poet, was born at Castoria in Macedonia. He studied at Buda and Padua, and became teacher of the children of the Vlach prince Mouroud. After the fall of that prince in 1811, Christopholus was employed by Prince Caradja, who had been appointed hospodar of Moldavia and Walachia, in drawing up a code of laws for that country. On the removal of Caradja, he retired into private life and devoted himself to literature. He wrote drinking songs and love ditties which are very popular among the Greeks. He is also the author of a tragedy, of Politika Parallela (a comparison of various systems of government), of translations of Homer and Herodetus, and of some philosophic works on the connexion between ancient and modern Greek.

His Hellenika Archiologomata (Athens, 1853) contains an account of his life.

CHRIST'S HOSPITAL (the "Blue-coat School"), a famous English educational and charitable foundation. It was originally one of three royal hospitals in the city of London, founded by Edward VI., who is said to have been inspired by a sermon of Bishop Ridley on charity. Christ's hospital was specially devoted to fatherless and motherless children. The buildings of the monastery of Grey Friars, Newgate Street, were appropriated to it; liberal public subscription added to the king's grant endowed it richly; and the mayor, commonalty and citizens of London were nominated its governors in its charter of 1553. At first Christ's hospital shared a common fund with the two other hospitals of the foundation (Bridewell and St Thomas's), but the three soon became independent. Not long after its opening Christ's was providing home and education (or, in the case of the very young, nursing) for 400 children. The popular name of the Blue-coat School is derived from the dress of the boys—originally (almost from the time of the foundation) a blue gown, with knee-breeches, yellow petticoat and stockings, neckbands and a blue cap. The petticoat and cap were given up in the middle of the 19th century, and thereafter no head-covering was worn. The buildings on the Newgate Street site underwent reconstruction from time to time, and in 1902 were vacated by

296

the school, which was moved to extensive new buildings at Horsham. The London buildings were subsequently taken down. The school at Horsham is conducted on the ordinary lines of a public school, and can accommodate over 800 boys. It includes a preparatory school for boys, established in 1683 at Hertford, where the buildings have been greatly enlarged for the use of the girls' school on the same foundation. This was originally in Newgate Street, but was moved to Hertford in 1778. In the boys' school the two highest classes retain their ancient names of Grecians and Deputy Grecians. Children were formerly admitted to the schools only on presentation. Admission is now (1) by presentation of donation governors (i.e. the royal family, and contributors of £500 or more to the funds), of the council of almoners (which administers the endowments), or of certain of the city companies; (2) by competition, on the nomination of a donation governor (for boys only), or from public elementary schools in London, certain city parishes and certain endowed schools elsewhere. The main school is divided into two parts—the Latin school, corresponding to the classical side in other schools, and the mathematical school or modern side. Large pension charities are administered by the governing body, and part of the income of the hospital (about £60,000 annually) is devoted to apprenticing boys and girls, to leaving exhibitions from the school, &c.

CHRISTY, HENRY (1810–1869), English ethnologist, was born at Kingston-on-Thames on the 26th of July 1810. He entered his father's firm of hatters, in London, and later became a director of the London Joint-Stock Bank. In 1850 he started on a series of journeys, which interested him in ethnological studies. Encouraged by what he saw at the Great Exhibition of 1851, Christy devoted the rest of his life to perpetual travel and research, making extensive collections illustrating the early history of man, now in the British Museum. He travelled in Norway, Sweden, Denmark, Mexico, British Columbia and other countries; but in 1858 came the opportunity which brought him fame. It was in that year that the discoveries by Boucher de Perthes of flint implements in France and England were first held to have clearly proved the great antiquity of man. Christy joined the Geological Society, and in company with his friend Edward Lartet explored the caves in the valley of the Vézère, a tributary of the Dordogne in the south of France. To his task Christy devoted money and time ungrudgingly, and an account of the explorations appeared in Comptes rendus (Feb. 20th, 1864) and Transactions of the Ethnological Society of London (June 21st, 1864). He died, however, on the 4th of May 1865, of inflammation of the lungs supervening on a severe cold contracted during excavation work at La Palisse, leaving a half-finished book, entitled Religion and Art among the French, being Contributions to Ethnography and Palentontology of Perigord and the adjacent provinces of Southern France; this was issued in parts and completed at the expense of Christy's executors, first by Lartet and, after his death in 1870, by Professor Rupert Jones. By his will Christy bequeathed his magnificent archaeological collection to the nation. In 1884 it found a home in the British Museum. Christy took an earnest part in many philanthropic movements of his time, especially identifying himself with the efforts to relieve the sufferers from the Irish famine of 1847.

CHROMATIC (Gr. χρωματικός, coloured, from χρώμα, colour), a term meaning "coloured," chiefly used in science, particularly in the expression "chromatic aberration" or "dispersion" (see ABERRATION). In Greek music χρωματική μορφή was one of three divisions—diatonic, chromatic and enharmonic—of the tetrachord. Like the Latin color, χρώμα was often used of ornaments and embellishments, and particularly of the modification of the three genera of the tetrachord. The chromatic, being subject to three such modifications, was regarded as particularly "coloured." To the Greeks chromatic music was sweet and plaintive. From a supposed resemblance to the notes of the chromatic tetrachord, the term is applied to a succession of notes outside the diatonic scale, and marked by accidentals. A "chromatic scale" is thus a series of semi-tones, and is commonly written with sharps in ascending and flats descending. The most correct method is to write such accidentals as do not involve a change of key.

CHRYSOMELITE, a member of the spinel group of minerals; an oxide of chromium and ferrous iron, FeCr₂O₄. It is also known as chronic iron or as chrome-iron-ore, and is the chief commercial source of chromium and its compounds. It crystallizes in regular octahedra, but is usually found as grains or as granular to compact masses. In its iron-black colour with submetallic lustre and absence of cleavage it resembles magnetite (magnetic iron-ore) in appearance, but differs from this in being only slightly if at all magnetic and in the brown colour of its powder. The hardness is 5½; specific gravity 4.5. The theoretical formula FeCr₂O₄ corresponds with chromium oxide (Cr₂O₃) 68% and ferrous oxide 32%; the ferrous oxide is, however, usually partly replaced by magnesia, and the chromic oxide by alumina and ferric oxide, so that there may be a gradual passage to picotite or chromespinel. Much of the material mined as ore does not contain more than 20 to 50% of chromium oxide. In the form of isolated grains the mineral is a characteristic constituent of ultrabasic igneous rocks, namely the peridotites and the serpentines which have resulted from their alteration. It is also found under similar conditions in meteoric stones and irons. Often these rocks enclose large segregated masses of granular chromeite. The earliest worked deposits were those in the serpentinite of the Bare Hills near Baltimore, Maryland, U.S.A.; it was also formerly extensively mined in Lancaster county, Pennsylvania, and is now mined in California, as well as in Turkey, the Urals, Dun Mountain near Nelson in New Zealand, and Unat in the Shetlands.

Chromite-iron-ore is largely used in the preparation of chromium compounds for use as pigments (chrome-yellow, &c.) and in calico-printing; it is also used in the manufacture of chrome-steel.

CHROMIUM (symbol Cr. atomic weight 52.1), one of the metallic chemical elements, the name being derived from the fine colour (Gr. χρώμα) of its compounds. It is a member of the sixth group in the periodic classification of the elements, being included in the natural family of elements containing molybdenum, tungsten and uranium. The element is not found in the free state in nature, nor to any large extent in combination, occurring chiefly as chrome-ironstone, Cr₂O₃FeO, and occasionally being found as crocoite, PbCrO₄, chrome-ochre, Cr₂O₃, and chromegarnet, CaO·Cr₂O₃·SiO₂, while it is also the cause of the colour in serpentine, chrome-mica and the emerald. It was first investigated in 1789 by L. N. Vauquelin and Macquart, and in 1797 by Vauquelin, who found that the lead in crocoite was in combination with an acid, which he recognized as the oxide of a new metal. The metal can be obtained by various processes. Thus Saint Claire Deville prepared it as a very hard substance of steel-grey color, capable of taking a high polish, by strong ignition of the chromic oxide and sugar charcoal in a lime crucible. F. Wehler reduced the sesquisioxide by zinc, and obtained a shining green powder of specific gravity 6.81, which tarnished in air and dissolved in hydrochloric acid and warm dilute sulphuric acid, but was unaffected by concentrated nitric acid. H. Moissan (Comptes rendus, 1893, 116, p. 340; 1894, 119, p. 185) reduces the sesquisioxide with carbon, in an electric furnace; the product so obtained (which contains carbon) is then strongly heated with lime, whereby most of the carbon is removed as calcium carbide, and the remainder by heating the purified product in a crucible lined with the double oxide of calcium and chromium. An easier process is that of H. Goldschmidt (Annalen, 1898, 301, p. 19) in which the oxide is reduced by metallic aluminium; and if care is taken to have excess of the sesquisioxide of chromium present, the metal is obtained in the form of free metal. The metal as obtained in this process is lustrous and takes a polish, does not melt in the oxyhydrogen flame, but liquefies in the electric arc, and is not affected by air at ordinary temperatures. Chromium as prepared by the Goldschmidt process is in a passive condition as regards dilute sulphuric acid and dilute hydrochloric acid at ordinary temperatures; but by heating the metal with the acid it passes into the active condition, the same effect being produced by heating the inactive form with a solution of an alkaline halide.
W. Hitdorf thinks that two allotropic forms of chromium exist (Zeit. für phys. Chem., 1898, 25, p. 720; 1899, 30, p. 481; 1900, 34, p. 383), namely active and inactive chromium; while W. Ostwald (ibid., 1900, 35, pp. 33, 204) has observed that on dissolving chromium in dilute acids, the rate of solution as measured by the evolution of gas is not continuous but periodic. It is largely made as ferro-chrome, an alloy containing about 60-70% of chromium, by reducing chrome in the electric furnace or by aluminium. Certain salts may be detected by the fact that they give a deep green bead when heated with borax, or that on fusion with sodium carbonate and nitre, a yellow mass of an alkaline chrome is obtained, which, on solution in water and acidification with acetic acid, gives a bright yellow precipitate on the addition of soluble lead salts. Sodium and potassium hydroxyde solutions precipitate green chromium hydroxide from solutions of chrome salts; the precipitate is soluble in excess of the cold alkali, but is completely thrown down on boiling the solution. Chromic acid and its salts, the chrome and bichromates, can be detected by the violet colouration which they give on addition of hydrogen peroxide to their dilute acid solution, or by the fact that on distillation with concentrated sulphuric acid and an alkaline chloride, the red vapours of chromium oxychloride are produced. The yellow colour of normal chrome changes to red on the addition of an acid, but goes back again to yellow on making the solution alkaline. Normal chrome on the addition of silver nitrate gives a precipitate of silver chrome, easily soluble in ammonia, and with barium chloride a yellow precipitate of barium chrome, insoluble in acetic acid. Reducing agents, such as sulphurous acid and sulphuretted hydrogen, convert the chrome into chrome salts. Chromium in the form of its salts may be estimated quantitatively by precipitation from boiling solutions with a slight excess of ammonia, and boiling until the free ammonia is nearly all expelled. The precipitate obtained is filtered, well washed with hot water, dried and then ignited until the weight is constant. In the form of a chrome, it may be determined by precipitation, in acetic acid solution, with lead acetate; the lead chrome precipitate collected on a tared filter paper, well washed, dried at 100° C. and weighed; or the chrome may be reduced by means of sulphur dioxide to the condition of chrome. When boiling with sulphur dioxide expelled by boiling, and the estimation carried out at 70° C.

The atomic weight of chromium has been determined by S. G. Rawson, by the conversion of pure ammonium bichromate into the trioxide (Journal of Chem. Soc., 1899, 55, p. 213), the mean value obtained being 52-60; and also by C. Meinecke, who estimated the amount of silver, chromium and oxygen in silver chrome, the amount of oxygen in potassium bichromate, and the amount of oxygen and chromium in ammonium bichromate (Ann., 1891, 261, p. 339), the mean value obtained being 51-99.

Chromium forms three series of compounds, namely the chrome salts corresponding to CrO, chromium oxide, chrome salts, corresponding to Cr₂O₃, chrome sesquisulphide, and the chrome sesquioxide, or Cr₂O₃CH₂O. The sesquioxide is a basic oxide, although like alumina it acts as an acid-forming oxide towards strong bases, forming salts called chromates, the most active other oxides of chromium, intermediate in composition between the sesquioxide and the chrome. The sesquioxide is described, namely chromium oxide, Cr₂O₃, and the oxide CrO₂·Cr₂O₃.

Chromium oxide, CrO₂, is unknown in the free state, but in the hydrated condition as CrO₂·H₂O or Cr₂O₃H₂O, it may be prepared by precipitating chromium chloride by a solution of potassium hydroxide in air-free water. The precipitate so obtained is a brown amorphous solid which readily oxidizes on exposure, and is decomposed by heat with liberation of hydrogen and formation of chrome sesquioxide. The sesquioxide, Cr₂O₃, occurs native, and can be artificially obtained in different several ways, e.g., by igniting the corresponding hydroxide, or chromium trioxide, or chromium sesquioxide, or chromium sesquioxide, or chromium sesquioxide. The sesquioxide is obtained by the action of hot potassium hydroxide on the chrome sesquioxide, which is dissolved by boiling the mixture of the two solutions in a red-hot tube, or by ignition of mercurechrome. In the amorphous state it is a dull green, almost insubitable powder, but taken from chromium oxychloride it is deposited in the form of dark green hexagonal crystals of specific gravity 3-4. After ignition it becomes almost insoluble in acids, and on fusion with silicates it colours them green; consequently it is used as a pigment for colouring glass and china. By the fusion of potassium bichromate with boric acid, and extraction of the melt with water, a residue is left which possesses a green colour, and is used as a pigment under the name of Guignet's green. In the form of sesquioxide, Cr₂O₃, it is well known to chemists as chrome oxide. It is used to produce chrome yellow, Cr₃O₄, but it always contains more or less boron trioxide. Several forms of hydrated chromium sesquioxide are known; thus on precipitation of a chrome salt, free from alkali, by ammonium, a light blue precipitate, Cr₂O₃·H₂O, is obtained, which, after decomposition, gives a chromosome hydrate, Cr₂O₃·H₂O, and this after being heated to 200° C. in a current of hydrogen leaves a residue of composition CrO₂·H₂O or Cr₂O₃·3H₂O with properties naturally as chrome ochre. Other hydrated oxides such as Cr₂O₃·H₂O have also been described. Chromium trioxide, Cr₂O₃, is obtained by adding concentrated sulphuric acid to a cold saturated solution of potassium bichromate, when it separates in large red needles; the mother liquor is drained off and the crystals washed with water; the crystals obtained are decomposed by boiling with a current of dry air. It is readily soluble in water, melts at 193° C., and is decomposed at a higher temperature by water, forming a solution of potassium sesquisulphide and oxygen; it is a very powerful oxidizing agent, acting violently on alcohol, converting it into acetone, and in glacial acetic acid solution converting naphthalene and anthraene into the corresponding quinones. Heated with concentrated hydrochloric acid it liberates chlorine, and with sulphuric acid it liberates oxygen. Gaseous ammonia passed over the oxide reduces it to the sesquioxide with formation of nitrogen and water. Dissolved in hydrochloric acid at -20°, it yields with solutions of the alkaline chlorides compounds of the type MCrO₃Cl₂, pointing to pentachloride. For some acids, this acidforming oxide and for perchromic acid see Bichromates.

The chrome oxide, Cr₂O₃·H₂O, isomorphous with ferric sulphate, results on dissolving the metal in dilute sulphuric acid or, better dissolving chrome acetate in dilute nitric acid; it is much less soluble in cold water, and when it is heated in boiling water to form a blue solution, it rapidly absorbs oxygen, forming basic chrome salts, and acts as a very strong reducing agent. The compounds of the type Cr₂O₃(OR)₂, are very much similar in their properties to the metal in gaseous hydrogen or hydriodic acids.

Chromic sulphate, Cr₂O₇·H₂O, isomorphous with ferrous sulphate, results on dissolving the metal in dilute sulphuric acid or, better dissolving chrome acetate in dilute nitric acid; it is much less soluble in cold water, and when it is heated in boiling water to form a blue solution, it rapidly absorbs oxygen, forming basic chrome salts, and acts as a very strong reducing agent. The compounds of the type Cr₂O₇(OR)₂, are very much similar in their properties to the metal in gaseous hydrogen or hydriodic acids.

Chromate, Cr₂O₇·H₂O, isomorphous with ferric sulphate, results on dissolving the metal in dilute sulphuric acid or, better dissolving chrome acetate in dilute nitric acid; it is much less soluble in cold water, and when it is heated in boiling water to form a blue solution, it rapidly absorbs oxygen, forming basic chrome salts, and acts as a very strong reducing agent. The compounds of the type Cr₂O₇(OR)₂, are very much similar in their properties to the metal in gaseous hydrogen or hydriodic acids.
Analogous bromine and iodine compounds are unknown, since bromides and iodides on heating with potassium bichromate and concentrated sulphuric acid give free bromine or free iodine.

Sodium chromate, Na$_2$CrO$_4$, is obtained in a similar way by decomposing the oxochlorides by using fluor spar in place of common salt. It may be condensed to a dark red liquid which is decomposed by moist air into chromic acid and chromous fluoride. The semi-acid CrO$_2$.OH, chromic acid, is only known in the form of its salts, the chlorochromates.

Potassium chromate, CrO$_3$.Cl-OK, is produced when potassium bichromate is heated with concentrated hydrochloric acid and a little potassium chloride. The resulting chromyl chloride is slowly decomposed by boiling water, and also by nitric acid, with liberation of nitrogen.

Chromic sulphide, Cr$_2$S$_3$, results on heating chromium and sulphur or iron with chromic oxide in a current of hydrogen; it forms a dark green crystalline powder, and on ignition gives the sesquisulphide.

Chromic sulphate, Cr$_2$(SO$_4$)$_3$, is prepared by mixing the hydroxide with concentrated sulphuric acid and allowing the mixture to stand. A green solution is first formed which gradually changes to blue, and deposits violet-blue crystals, which are purified by dissolving in water and then precipitating with alcohol. It is soluble in cold water, but slowly decomposes on boiling. The solutions of chromic sulphate are used for dyeing, in which it is employed for producing an amido-chromate. The violet solution is allowed to evaporate slowly at ordinary temperatures, and the salt crystallizes out as Cr$_2$(SO$_4$)$_3$.15H$_2$O. The green solution on evaporation leaves only an amorphous mass. In some cases the green solution changes to a inkish blackish solution due to the splitting off of sulphuric acid during the process, and that green-coloured chromium-sulphuric acids are formed thus:

$$2Cr_2(SO_4)_3 + 3H_2O = H_2SO_4 + [Cr_2(OH)(SO_4)_3]$$

Since, on adding barium chromate to the green solution, only one-third of the total sulphuric acid is precipitated as barium chromate, whence it follows that only one-third of the original SO$_4$ ions are present in the green solution. The green salt in aqueous solution, on standing, gradually decomposes back to the violet form. Several other complex chrom-sulphuric acids are known, e.g.

$$[Cr(SO_4)OH]_2; [Cr(SO_4)O]_2; [Cr(SO_4)_2]$$

(see A. Recourea, Annales de Chimie et de Physique, 1895(7), 4, p. 505.)

Chromic sulphate combines with the sulphates of the alkali metals to form double sulphates, which correspond to the alums. Chrome alum, K$_2$SO$_4$.Cr$_2$(SO$_4$)$_3$.24H$_2$O, is best prepared by passing sulphuric acid through a solution of potassium bichromate containing the calculated quantity of sulphuric acid,

$$K_2CrO_4 + 3SO_4 + H_2SO_4 = H_2O + K_2SO_4 + Cr_2(SO_4)_3$$

On evaporating the solution the dark purple octahedron of the alum is obtained and is slowly soluble in water, forming a liquid of a dull blue tint, and is used in calico-printing, dyeing and tanning. Chromium ammonium sulphate, (NH$_4$)$_2$SO$_4$.Cr$_2$(SO$_4$)$_3$.24H$_2$O, results on mixing equivalent quantities of chromic sulphate and ammonium sulphate in white solution and allowing the mixture to stand. It forms red octahedra and is less soluble in water than the corresponding potassium compounds. The salt Cr$_2$CISO$_4$.8H$_2$O has been described. By passing ammonia over heated chromic chloride, the nickel oxide is evolved, and the chromic acid is converted into a current of sulphuric acid. It is transformed into chromium ammonium sulphate.

The nitrate, Cr(NO$_3$)$_3$.2H$_2$O, crystallizes in purple prisms and results on dissolving the hydroxide in nitric acid, its solution turns green on boiling. A phosphide, PCr$_3$, is known; it burns in oxygen forming the phospho-chromate. By adding sodium phosphoric acid to a solution of chromic acid, CrPO$_4$.6H$_2$O, is obtained, whereby CrPO$_4$.3H$_2$O, on adding an excess of sodium phosphoric acid to chromic chloride solution.

Cardbides of chromium are known; when the metal is heated in an electric furnace with carbon, Cr$_2$C$_3$ is formed; this scratches quartz and topaz, and the crystals are very resistant to the action of acids. C$C_r$ has also been described (H. Moisson, Comptes rendus, 1894, 119, p. 185).

A number of compounds of chromium, analogous to those of iron, have been prepared; thus potassium chromoacetoxyde, K$_2$Cr(CN)$_2$.2H$_2$O, is formed from potassium cyanide and chromium acetate; on exposure to air it is converted into the chromic anhydride, K$_2$CrO$_4$. After a while it also may be prepared by adding chromic oxide to boiling potassium cyanide solution. Chromic thiocyanate, Cr(SCN)$_2$, an amorphous deliquescent mass, is formed by dissolving the hydrochloric acid and dissolving up sulphuric acid. The double chromite, Cr(SCN)$_2$.9H$_2$O, is also known.

Chromium salts readily combine with ammonia to form complex salts in which the ammonia molecule is in direct combination with the chromium atom. In many of these salts one finds that the elements of water are frequently found in combination with the metal, and further, that the ammonia molecule may be replaced by such other molecular groups as -NO$_2$, &c. Of the types studied the following may be mentioned: the diammine chromium thiochloride of the papers of S. F. Jorgensen and of A. Werner in the Zeitsehrift für anorganische Chemie from 1892 onwards should be consulted.

P. Pfister (Berichte, 1904, 37, 4255) has shown that chromium salts of the type [Cr(C$_2$(NH$_2$)$_4$)].X exist in two structural forms, namely, the cis- and trans- forms, the dithiocyanate-diamine-chromium salts being the trans- salts. Their configuration was determined by their relationship to their ozaline-derivatives; the cis-dichromic chloride, [Cr$_2$Cl$_2$(NH$_2$)$_4$]Cl$.H_2$O, the luto- or hexammine chromium salts, R]$^+$(NH$_2$)$_6$.Cr, and the rhodochromic salts: where $R^+$ is a monovalent acid radical and M is a monovalent basic radical. For their preparation and properties of these salts and a discussion on their relationship see the papers of S. F. Jorgensen and of A. Werner in the Zeitsehrift für anorganische Chemie from 1892 onwards should be consulted.

CHRONOS (from Gr. Χρόνος, colour, and σφάεια, a sphere), in astronomy, the red-coloured envelope of the sun, outside of the photosphere. It can be seen with the eye at the beginning or ending of a total eclipse of the sun, and with a suitable spectroscope at any time under favourable conditions. (SSE.)

CHRONICLE (from Gr. χρονος, time). The historical works written in the middle ages are variously designated by the terms “histories,” “annals,” or “chronicles”; it is difficult, however, to give an exact definition of each of these terms, since they do not correspond to determinate classes of writings. The definitions proposed by A. Giry (in La Grande Encyclopédie), by Ch. V. Langlois (in the Manuel de bibliographie historique), and by E. Bernheim (in the Lehrbuch der historischen Methode), are manifestly insufficient. Perhaps the most reasonable is that propounded by H. F. Delaborde at the Ecole des Chartes, that chronicles are accounts of a universal character, while annals relate either to a locality, or to a religious community, or even to a whole people, but without attempting to treat of all periods or all peoples. The primitive type, he says, was furnished by Eusebius of Caesarea, who wrote (c. 203) a chronicle in Greek, which was soon translated into Latin and frequently recycled throughout the middle ages; in the form of synoptic and synchronistic tables it embraced the history of the world, both Jewish and Christian, since the Creation. This ingenious opinion, however, is only partially exact, for it is certain that the medieval authors or scribes were not conscious of any well-marked distinction between annals and chronicles; indeed, they often apparently employed the terms indiscriminately.

Whether or not a distinction can be made, chronicles and annals (q.v.) have points of great similarity. Chronicles are accounts generally of an impersonal character, and often anonymous, composed in varying proportions of passages reproduced textually from sources which the chronicle is seldom at pains to indicate, and of personal recollections the veracity of which are not always determined. Some of them are written with so little intelligence as to reduce the work of composition as a piece of drudgery imposed on the clergy and monks by their superiors. To distinguish what is original from what is borrowed, to separate fact from falsehood, and to establish the value of each piece of evidence, are in such circumstances a difficult undertaking, and one which has exercised the sagacity of scholars, especially since the 17th century. The work, moreover, is immense, by reason of the enormous number of medieval chronicles, both Christian and Mahomedan.

The Christian chronicles were first written in the two learned languages, Greek and Latin. At an early stage we have proof of the employment of national languages, the most famous instances being found at the two extremities of Europe, the Anglo-Saxon Chronicle (q.v.), the most ancient form of which goes back to the 10th century, and the so-called Chronicle of Nestor, in Palaeo-Slavonic, written in the 11th and 12th centuries.
In the 13th and 14th centuries the number of chronicles written in the vulgar tongue continued to increase, at least in continental Europe, which far exceeded others and in this respect in the 15th century. With the revived study of Greek and Roman literature, the traditional form of chronicles, as well as of annals, tended to disappear and to be replaced by another and more scientific form, based on the models of antiquity—that of the historical composition combining skilful arrangement with elegance of literary style. The transition, however, was very gradual, and it was not until the 17th century that the traditional form became practically extinct.

CHRONICLES, BOOKS OF, two Old Testament books of the Bible. The name is derived from Chronicon, first suggested by Jerome as a rendering of the title which they bear in the Hebrew Canon, viz., Events of the Times. The full Hebrew title would be Book of Events of the Times, and this again appears to have been a designation commonly applied to special histories in the more definite shape—Events of the Times of King David, or the like (1 Chron. xxvii. 24; Esth. x. 2, &c.). The Greek translators divided the long book into two, and adopted the title Παραδείγματα, Things omitted [scil. in the other historical books].

The book of Chronicles begins with Adam and ends abruptly in the middle of Cyrus' decree of restoration, which reappears complete at the beginning of Ezra. A closer examination of those parts of Ezra and Nehemiah which are not extracted from earlier documents or original memoirs leads to the conclusion that Chronicles-Ezra-Nehemiah was originally one work, displaying throughout the peculiarities of language and thought of a single editor, who, however, cannot be Ezra himself as tradition would have it. Thus the fragmentary close of 2 Chronicles marks the disruption of a previously-existing continuity,—due, presumably, to the fact that in the gradual compilation of the Canon the necessity for incorporating in the Holy Writings an account of the establishment of the post-Exile theocracy was felt, before it was thought desirable to supplement Samuel and Kings by adding a second history of the period before the Exile. Hence Chronicles is the last book of the Hebrew Bible, following the book of Ezra-Nehemiah, which properly is nothing else than the sequel of Chronicles.

Of the authorship of Chronicles we know only what can be determined by internal evidence. The style of the language, and also the position of the book in the Jewish Canon, stamp the book as one of the latest in the Old Testament, but lead to no exact determination of the date. In 1 Chron. xxix. 7, which refers to the time of David, a sum of money is reckoned by darics, which certainly implies that the author wrote after this Persian coin had been long current in Judaea. In 1 Chron. iii. 19 seq. the descendants of Zerubbabel seem to be reckoned to six generations (the Septuagint reads it so as to give as many as eleven generations), and this agrees with the suggestion that Hattush (verse 22), who belongs to the fourth generation from Zerubbabel, was a contemporary of Ezra (Ezra viii. 2). Thus the compiler lived at least two generations after Ezra. With this it accords that in Nehemiah five generations of high priests are enumerated from Joshua (xii. 10 seq.), and that the last name that is of Jaddua, who, according to Josephus, was a contemporary of Alexander the Great (333 B.C.). That the compiler wrote after the fall of the Persian monarchy has been argued by Ewald and others from the use of the title king of Persia (2 Chron. xxxvi. 23), and from the reference to the title in Neh. xii. 22 to Darius III. (336-323 B.C.). A date sometime after 333 B.C. is now accepted by most modern critics. See further Ezra and Nehemiah.

the book is that the writer lived a considerable time after Ezra, and stood entirely under the influence of the religious institutions of the Jewish theocracy. This stance has determined the nature of his interest in the early history of his people.

The true importance of Hebrew history had always centred in the fact that this petty nation was the people of Yahweh, the spiritual God. The tragic interest which distinguishes the annals of Israel from the forgotten history of Moab or Damascus lies wholly in that long contest which finally vindicated the reality of spiritual things and the supremacy of Yahweh's purpose, in the political ruin of the nation which was the faithless depository of these sacred truths. After the return from the Exile it was impossible to write the history of Israel's fortunes otherwise than in a spirit of religious pragmatism. But within the limits of the religious conception of the plan and purpose of the Hebrew history more than one point of view might be taken up. The book of Kings looks upon the history in the spirit of the prophets—in that spirit which is still echoed by Zech. i. 5 seq., but which had become extinct before the Chronicler wrote. The New Jerusalem of Ezra was organized as a municipality and a church, not as a nation. The centre of religious life was no longer the living prophetic word but the ordinances of the Pentateuch and the liturgical service of the sanctuary. The religious vocation of Israel was no longer national but ecclesiastical or municipal, and the historical continuity of the nation was vividly realized only within the walls of Jerusalem and the courts of the Temple, in the solemn assembly and stately ceremonial of a feast day. These influences naturally operated most strongly on those who were officially attached to the sanctuary. To a Levite, even more than to other Jews, the history of Israel meant above all things the history of Jerusalem, of the Temple, and of the Temple ordinances. Now the writer of Chronicles betrays on every page his essentially Levitical habit of mind. It even seems possible from a close attention to his descriptions of sacred ordinances to conclude that his special interests are those of a common Levite rather than of a priest, and that of all Levitical functions he is most partial to those of the singers, a member of whose guild he may have been. From the standpoint of the post-exilic age, the older delineation of the history of Israel, especially in the books of Samuel and Kings, could not but appear to be deficient in some directions, while in other respects its narrative seemed superficial or open to misunderstanding, as for example by recording, and that without condemnation, things inconsistent with the later post-exilic law. The history of the ordinances of worship holds a very small place in the older record. Jerusalem and the Temple have not that central place in the book of Kings which they occupied in the minds of the Jewish community after the Exile. Large sections of the old history are devoted to the religion and politics of the ten tribes, which are altogether unintelligible and uninteresting when presented in the spirit of the Levitical ordinances, in that spirit which is still the whole problems and struggles of the prophetic period turn on points which had ceased to be cardinal in the life of the New Jerusalem, which was no longer called to decide between the claims of the Word of Yahweh and the exigencies of political affairs and social customs, and which could not comprehend that men absorbed in deeper spiritual contests had no leisure for the niceties of Levitical legislation. Thus there seemed to be room for a new history, which should confine itself to matters still interesting to the theocracy of Zion, keeping Jerusalem and the Temple in the foreground, and developing the divine pragmatism of the history, not so much with reference to the prophetic word as to the fixed legislation of the Pentateuch, so that the whole narrative might be made to teach that the glory of Israel lies in the observance of the divine law and ritual.

For the sake of systematic completeness the book begins with Adam, as is the custom with later Oriental writers. But there is no longer any need to try to find in the name of Moses-Adam contained little that served the purpose. The early history is therefore contracted into a series of tribal and priestly genealogies, which were doubtless by no means the least interesting part of the work at a time when every
Israelite was concerned to prove the purity of his Hebrew descent (cp. Ezra ii. 59, 62). Commencing abruptly (after some Benjamite genealogies) with the death of Saul, the history becomes fuller and runs parallel with the books of Samuel and Kings. The limitations of the compiler’s interest in past times appear in the omission, among other particulars, of David’s reign in Hebron, of the disorders in his family and the revolt of Absalom, of the circumstances of Solomon’s accession, and of many details as to the wisdom and splendour of that sovereign, as well as of his fall into idolatry. In the later history the ten tribes are quite neglected (‘Yahweh is not with Israel,’ 2 Chron. xxv. 7), and political affairs in Judah receive attention, not in proportion to their intrinsic importance, but according as they serve to exemplify the principles to the objects of the work. In three chronicles, the compiler is always unwilling to speak of the misfortunes of good rulers is not necessarily to be ascribed to a deliberate suppression of truth, but shows that the book was throughout composed not in purely historical interests, but with a view to inculcating a single practical lesson. The more important additions to the older narrative consist partly of statistical lists (1 Chron. xiii.), partly of details on points connected with the history of the sanctuary and the great feasts or the archaeology of the Levitical ministry (1 Chron. xiii., xv. xvi., xxii.-xxix.; 2 Chron. xxxix.-xxxi., &c.), and partly of narratives of victories and defeats, of sins and punishments, of obedience and its reward, which could be made to point a plain religious lesson in favour of faithful observance of the law (2 Chron. xiii., xiv. 9 sqq.; xx., xxi. 11 sqq., &c.).

The minor variations of Chronicles from the books of Samuel and Kings are analogous in principle to the larger additions and omissions, so that the whole work has a consistent and well-marked character, presenting the history in quite a different perspective from that of the old narrative.

The compiler makes frequent reference to earlier histories which he cites by a great variety of names. That the names of the Books of Kings and but, ‘Book of the Kings of Israel and Judah,’ ‘Book of the Judges of Israel and the things of old,’ ‘Book of the Kings of Israel,’ and ‘Affairs of the Kings of Israel’ (2 Chron. xxxiii. 18), refer to a single work is not disputed. Under one or other title this book is cited some ten times. Whether it is identical with the Midrash of the book of Kings (2 Chron. xxiv. 27) is not certain. That the work so often cited is not the Biblical book of the same name is manifest from what is said of its contents. It must have been quite an extensive work, for among other things it contained genealogical statistics (1 Chron. i., and it incorporated certain older prophetic writings—in particular, the didašta (‘words’ or ‘history’) of Jeth the son of Hanania (2 Chron. xx. 34) and possibly the vision of Isaiah (2 Chron. xxxii. 32). Where the chronicler does not cite this comprehensive work at the close of a king’s reign he generally refers to some special authority which bears the name of a prophet or seer (2 Chron. ix. 29; xii. 15, &c.). But the book of the Kings and a special prophetic writing are not cited for the same reign. It is therefore probable that in other cases than those of Isaiah and Jeth the writings of, or rather, about the prophets which are cited in Chronicles were known only as parts of the great book of the Kings.” Even the genealogical lists may have been derived from that work (1 Chron. ix. 1), though for these other materials may have been accessible.

The two chief sources of the canonical book of Kings were entitled Annals (‘events of the times’) of the Kings of Israel and Judah respectively (see Kings). That the lost source of the Chronicles was not independent of these works appears probable both from the nature of the case and from the close and often verbal parallelism between many sections of the two Biblical narratives. But while the canonical book of Kings refers to separate sources for the northern and southern kingdoms, the source of Chronicles was a history of the two kingdoms combined, and so, no doubt, was a more recent work which in great measure was doubtless based upon older annals. Yet it contained also matter not derived from these works, for it is pretty clear from 2 Kings xxi. 17 that the Annals of the Kings of Judah gave no account of Manasseh’s repentance, which, according to 2 Chron. xxxiii. 18, 19, was narrated in the great book of the Kings of Israel. It was the opinion of Bertheau, Keil and others, that the parallelisms of Chronicles with Samuel and Kings are sufficiently explained by the ultimate common source from which both narratives drew. But most critics hold that the chronicler also drew directly from the canonical books of Samuel and Kings as he apparently did from the Pentateuch. This opinion is not improbable, as the earlier books of the Old Testament cannot have been unknown in his age; and the critical analysis of the canonical book of Kings is advanced enough to enable them to see that the parallel passages in Chronicles were cases which were not written in the annals but by one of the compilers of Kings himself. In particular, the Chronicles agrees with Kings in those short notes of the moral character of individual monarchs which can hardly be ascribed to an earlier hand than that of the redactor of the latter book.

For the criticism of the book it is important to institute a careful comparison of Chronicles with the parallel narratives in Samuel-Kings. It is found that in the cases where Chronicles directly contradicts the earlier books there are few in which an impartial historical judgment will decide in favour of the later account, and in any point that touches difference of usage between its time and that of the old monarchy it is of no authority. The characteristic feature of the post-exilic age was the re-shaping of older tradition in the interest of parochial and practical purposes, and for this object a certain departure from the letter of the older narratives was permissible.

The typical speeches in Chronicles are of little value for the periods to which they relate, and where they are inconsistent with the evidence from earlier writings or contain inherent improbabilities are scarcely of historical worth. According to the ordinary laws of research, the book, being written at a time long posterior to the events it records, can have only a secondary value, although that is no reason why here and there valuable material should not have been preserved. But the general picture which it gives of life under the old monarchy cannot have the same value for us as the records of the book of Kings. On the other hand, it is of distinct value for the history of its time, and presents a clear picture of the spirit of the age. The ecclesiastical chronicle of Jerusalem, as Reuss has aptly called it, represents the culminating point (as far as the O. T. Canon is concerned) of that theory of which examples recur in Judges, Samuel and Kings, and in which the identification with religious or ethical doctrines finds its continuation in the didactic aims which characterize the later non-canonical writings (cf. Jubilees, Midrash).

The most prominent examples of disagreement with earlier sources may be briefly noticed. Thus, it would appear that the book has confused Jehoiakim and Jehoiachin (2 Chron. xxxvi. 5-9) and has statements which directly conflict with 2 Sam. xxi. 10 (1 Chron. xx. 5; see Goliath), and 1 Kings ix. 10 seq. (2 Chron. viii. 2); it has changed Hezekiah’s submission (2 Kings xix. iii.) into a brave resistance (2 Chron. xxxiii. 7-8) and ignored the humiliating payment of tribute by this king and by Josiah (2 Kings xii. 18; 2 Chron. xxiv. 23 sqq.).

The problem of the sources is one of considerable intricacy and cannot be discussed here; the introduction to the commentaries of Benzinger and Kittel (see Bibliography below) should be consulted. The questions depend partly upon the view taken of the origin and structure of the book of Kings (g.b.) and partly upon the results of historical criticism.

A careful comparison of Chronicles with Samuel and Kings is a striking object lesson in ancient historical composition. It is an able and indispensable introduction to the study of the Pentateuch and the older historical works (W. H. Bennett, Chronicles, p. 20 seq.).

But xxxii. 1-8 may preserve a tradition of the account of the city’s wonderful deliverance mentioned in Kings (see HEZEKIAH), and the idea of the invasion of Judah in the time of Josiah differs essentially from those in the earlier source. Even 2 Chron. vii. 18 cannot be regarded as a deliberate alteration since the writer does not appear to be quoting from 1 Kings ix. 10 sqq. (the two passages should be carefully compared), and his view of Solomon’s greatness which is already supported by allusions in the earlier but extremely composite sources in Kings (see SOLOMON).
David to number Israel (1 Chron. xxii; 2 Sam. xxiv. 1) accords with later theological development.

A particular tendency to arrange history according to a mechanical rule appears in the constant endeavour to show that recompense and reward are meted out in kind, and that punishment proportioned to sin, especially on obedience or disobedience to prophetic advice. Thus, the invasion of Shishak (see REHOBOAM) becomes a typical romance (2 Chron. xiii.; the illness of Asa is preceded by a denunciation for relying upon Egypt for protection) with the idea that he was punished near the punishment (2 Chron. xv. seq.). The ships which Jehoshaphat made were wrecked at Ezion-geber because he had allied himself with Ahaziah of Israel despite prophetic warning (2 Chron. xx. 35 sqq.; see 1 Kings xiv. 25, 26, 27; xvi. 1-3; cf. 2 Kings x. 32; xxi. 1-3), and the later writer supposes that the "Tarshish ships" (large vessels such as were used in trading with Spain—cf. "Indians") built in the Red Sea were intended for the Mediterranean trade (2 Chron. xxvii. 6-22). The Kings under Jehoram of Judah becomes the penalty for the king's apostasy (2 Chron. xxi. 10-20; 2 Kings viii. 22). Ahaziah was slain because of his friendship with Jehoram (2 Chron. xxii. 7). The Aramaean invasion of the time of Joash of Judah was a premonition of the murder of Jehoash's son (2 Chron. xxiv.; 2 Kings xii.). Amaziah, after defeating Edom (2 Chron. xxxiv., esp. verses 19-21; see 2 Kings xiv. 10 sqq.), worshipped strange gods, for which he was defeated by Joash of Israel, and subsequently met with his death (2 Chron. xxv. 27; 2 Kings xiv. 19). Uzziah's leprosy is attributed to a ritual fault (2 Chron. xxxvi. 4 sqq.; 16 sqq.; cf. 2 Kings xv. 3-5; see UZZIAH). The defeat and death of the good king Josiah came through disobedience to the Divine will (2 Chron. xxxv. 21 sqq.; see 2 Kings xxii. 26 sqq.).

In addition to such supplementary information, another tendency of the chronicler is the alteration of narratives that do not agree with his view of events. He does not content himself with the events before and after the exile. Thus, the reformation of Josiah has been thrust back from his eighteenth to his twelfth year (when he was nineteen years old) apparently because it was felt that so good a king could not be so young. It would be difficult to say whether this is right or wrong, but the result of this is to leave an interval of ten years between his conversion and the subsequent act of repentance (2 Chron. xxxiv. 6; 2 Kings xxii. seq.). References to Judaea's idolatry are omitted (1 Kings xxiv. 4 sqq.; see CHRON.; 2 Kings xxiii. 13 sqq.; 2 Kings xxiv. 3 sqq. (from unknown sources) abbreviated 2 Kings xxiv. 1-20; 2 Chron. xxxiv. 39-52); and if the earlier detailed accounts of Judaea heathenism were repulsive, so the tragic account of the fate of Jerusalem was a painful detail that could not be allowed to stand when the Chronicler dwelt (contrast 2 Kings xxiv. 8-20, with the brief 2 Chron. xxxvi. 9-21). At an age when the high places were regarded as idolatrous it was considered only natural that the good kings should not have tolerated them. So 2 Chron. iv. 6, 7 (from unknown sources) contradicts 1 Kings xxv. 14, xxii. 43 (that Asa and Jehoshaphat did not demolish the high places), whereas xv. 16-18, xx. 31-34, are quoted from the book of Kings and give the older view. The example is an illustrative hypothesis and not a matter of history. It is assumed that the high place at Gibon was a legitimate sanctuary (2 Chron. i. 4-6; 1 Kings xiv. 15-25; 2 Sam. xxiv.), that the ark was borne not by priests (1 Kings viii. 3) but by Levites (2 Chron. xii. 6; xxvii. 13 sqq.); that the Levites were not and not the foreign bodyguard of the temple, helped to place Josiah on the throne (2 Chron. xxiii. 1). Conversely 1 Chron. xv. 12 seq. explains xii. 10 (2 Sam. vi. 7) on the view that Uzza was not a Levite and his death a divine vengeance.

Throughout it is assumed that the Levitical organization had been in existence from the days of David, to whom its foundation is ascribed. In connexion with the installation of the ark considerable space is devoted to the arrangements for the immediate temple-service, upon which the earlier books are silent, and elaborate notices of the part played by the Levites and singers give expression to a view of the history of the monarchy which the book of Kings has not. Alas! it be only apparent, (1 Chron. xii. 5 sqq.; xlvii.) as in the Levitical institutions, and not the foreign bodyguard of the temple, helped to place Josiah on the throne (2 Chron. xxiii.).

The historical value of these lists is very unequal; a careful study of the names often proves the lateness of the source, although an appreciation of the principles of genealogies sometimes reveals important historical information; see CALIF.,genealogy, JUDAH. But the Levitical system as it appears in its most complete form in Chronicles is the result of the development of earlier schemes, of which some traces are still preserved in Chronicles itself and in Ezra-Nehemiah. (See further Levites.)

The tendency of numbers to grow is one which must always be noted. From 2 Kings xvii. 1 to 1 Chron. viii. 14, xiv. 18 (2 Sam. viii. 6 [but see LXX]), x. 18, 1 Chron. xxx. 5, 25 (2 Sam. xxiv. 9, 24); consequently little importance can be attached to details which appear to be exaggerated (1 Chron. v. 21, xii., xiii. 14; 2 Chron. xiii. 3, 17), and are in agreement with other peculiarities elsewhere (Num. xxxi. 32; Judg. xx. 2, 21, 25).

But when allowance is made for all the above tendencies of the late post-exilic age, there remains a certain amount of additional matter in Chronicles which may have been derived from relatively old sources. These items are of purely political or personal nature and contain several details which taken by themselves have every appearance of genuineness. Where there can be no suspicion of such a tendency as has been noticed above there is less ground for scepticism, and it must be remembered that the earlier books contain only a portion of the material to which the compilers had access. Hence it may well happen that the details which unfortunately cannot be checked were ultimately derived from sources as reputable as those in the books of Samuel, Kings, &c. As examples may be cited Rehoboam's buildings, &c. (2 Chron. xi. 5-12, 18 sqq.); Jeroboam's attack upon Abijah (2 Chron. xiii., xi., cf. 1 Kings xv. 7); the invasion of Zerah in Asa's reign (2 Chron. xiv.; see Asa); Jehoshaphat's wars and judicial measures (2 Chron. xvii. xx.; see 1 Kings xxi. 4-5); Jehoram's family (2 Chron. xxii. 2-4); relations between Jehoia and Joash (2 Chron. xxiv. 3, 15 sqq.); conflicts between Ephraim and Judah (2 Chron. xxv. 6-13); wars of Uzziah and Jotham (2 Chron. xxiv. seq.); events in the reign of Ahaz (2 Chron. xxvii. 8-14, 15 sqq.); reforms of Hezekiah (2 Chron. xxix. sqq., cf. Jer. xxvi. 15); Manasseh's captivity, repentance and buildings (2 Chron. xxxiii. 10-20; see 2 Kings xxiii. and MANASSEH); the death of Josiah (2 Chron. xxxv. 20-25). In addition to this reference may be made to such tantalizing statements as those in 1 Chron. ii. 23 (R.V.), iv. 40 (2 Sam. xxvii. sqq.); vi. 13, xii., xv. examples of the kind of tradition, national, or local, upon which writers could draw. Although in their present form the additional narratives are in the chronicler's style, it is not necessary to deny an older traditional element which may have been preserved in sources now lost to us. 4

BIBLIOGRAPHY.—Robertson Smith's article in the 9th ed. of the Ency. Brit. was modified by his later views in Old Test. in the Jewish Antiquities, ii. 148. Robertson Smith's History of Israel and of JudgesDriver in his revision of Smith's article in Ency. Bib. and in his Lit. of Old Test., and by F. Brown in Hastings' Dict. Bib. (a very comprehensive article). Many parts of the book offer a very hard task to the commentator. In the first place the sources are so mixed that the difficulties are added the extreme corruption and many variations of the proper names in the versions; on these see the articles in the Ency. Bib. Valuable contributions to the exegesis of the book will be found in Pfeiffer, J. F. A. xxiv. 3, 4 (1873); Benzinger in Marti's Hand-Kommentar (1901); Kittel in Sacred Books of the Old Test. (1895); History of the Hebrews, ii. 224 sqq. (1896), and in Nowack's Hand-Kommentar (1902). W. H. Bennett Smith's Bible (1840). W. E. Barnes in Cambridge Bible (1869), and Harvey-Jellie in the Century Bible (1906), are helpful. Among more recent investigations are those of Howorth, Proc. Soc. Bibl. Archad. xxvii. 267-278 (Chronicles a late translation from the Aramaic). (W. R. S.; S. A. C.)

CHRONOGRAPH from Gr. τρίχρονη, time, and γράφων, to write), Instrument which was, in periods of time are measured and recorded were commonly called chronographs, but it would be more correct to give the name to the means of producing them. Instruments such as "stop watches" (see Watch), by means of which the time between events is shown on a dial, are also called chronographs; they were originally rightly called chronoscopes (οχροσκόπος, to see).

The view that the chronicler invented such narratives is inconceivable, and in the present stage of historical criticism is as unsound as an implicit reliance upon those sources in the earlier days which have come with similar trust upon which they record. Although Graf, in a critical and exhaustive study (Geschichtlichen Bücher der A.T., Leipzig, 1866), concluded that the Chronicles have almost no value as a documentary source of the age, he subsequently admitted in private correspondence with Bertheau that this statement was too strong (preface to Bertheau's Commentary, 2nd ed., 1873).
In the first experiments in ballistics by B. Robins, Count Rumford and Charles Hutton, the velocity of a projectile was found by means of the ballistic pendulum, in which the principle of momentum is applied in finding the velocity of a projectile (Principles of Gunnery, by Benjamin Robins, edited by Hutton, 1839, p. 84). It consisted of a pendulum of considerable weight, which was displaced from its position of rest by the impact of the bullet, the velocity of which was required. A modification of the ballistic pendulum was also employed by W. E. Metford (1824–1899) in his researches on different forms of rifling; the bob was made in the form of a long cylinder, weighing about 140 lb, suspended with its axis horizontal from four wires at each end, all moving points being provided with knife edges. The true length of suspension was deduced from observations of the time of a complete small oscillation. The head of the pendulum was furnished with a wooden block, which caught the fragments of bullets fired at it, and its displacement was recorded by a rod moved by the bob (The Book of the Rifle, by the Hon. T. F. Fremantle, p. 336). An improved ballistic pendulum in which the geometric method of suspension is introduced has been used by A. Mallock, to determine the resistance of the air to bullets having a velocity up to 4500 F/S (Proc. Roy. Soc., Nov. 1904). A ballistic pendulum, carried by a geometric suspension from five points, has also been employed by C. V. Boys in a research on the elasticity of golf balls, the displacement of the bob being recorded on a sheet of smoked glass. For further information on the dynamics of the subject see Text Book of Gunnery, 1897, p. 101.

In nearly all forms of chronographs in which the ballistic pendulum method is not used, the beginning and end of a period of time is recorded by means of some kind of electrically controlled mechanism; and in order that small fractions of a second may be measured, tuning-forks are employed, giving any convenient number of vibrations per second, a light style or scribbling point, usually of aluminium, being attached to one of the legs of the tuning-fork. A trace of the vibration is made on a surface blackened with the deposit from the smoke of a lamp. Glazed paper is often employed when the velocity of the surface is slow, but when a high velocity of smoked surface is necessary, smoked glass offers far the least resistance to the movement of the scribining points. If the surface be cylindrical, thin sheet mica attached to it, and smoked, gives excellent results, and offers but little resistance to all the scribining points employed. The period of vibration of tuning-forks is determined by direct or indirect comparison with the mean solar second, taken from a standard clock, the rate of which is known from transit observations (or from vibrations d'un pendule égal, R. Koenig, Wid. Ann., 1850). In the celebrated ballistic experiments of the Rev. F. Bashforth, the time markings were made electrically from a standard clock, and fractions of a second were estimated by interpolation. Regnault (Mémoires de l'acad. des sciences, t. xxxvii) employed both a standard clock and a clock in his determination of the velocity of sound. The effect of temperature on tuning-forks has been determined by

The velocity of the projectile is found thus. Let \( V \) be the velocity of the bob, due to the impact of the projectile, \( v \) the velocity of the projectile, \( h \) the height through which the bob is raised vertically, then

\[
h = \frac{V^2}{2g} \quad \text{and} \quad V = \sqrt{2gh}.
\]

If \( W \) be the weight of the bob, and \( w \) the weight of the projectile, then

\[
w = (W + w)V, \quad \text{and} \quad v = \left( \frac{W}{w+1} \right)^2 \sqrt{2gh}.
\]

If \( l \) be the true length of suspension, and \( C \) the chord of the arc of displacement of the bob after being struck, then

\[
C = 2hl, \quad \text{and} \quad v = \left( \frac{W}{w+1} \right)^2 \sqrt{\frac{2l}{C}}.
\]

Also if \( T \) be the time of a complete small oscillation of the pendulum, so that

\[
v = \left( \frac{W}{w+1} \right)^2 \sqrt{\frac{2l}{T}}
\]

Lord Rayleigh and Professor H. McLeod (Proc. Roy. Soc., 1880, 26, p. 162) who found the coefficient to be \( 0.0001 \) per degree C. between 9° C. and 27 C. The beginning and end of a time period are indicated on a moving surface. Usually an electromagnetic stylus is employed, in which a scribining point suddenly moves when the electric circuit is broken by a projectile. Another method is to arrange the terminals of the secondary circuit of an induction coil, so that when the primary circuit is opened a small spark punctures or marks a moving surface (Helmholtz, Phil. Mag., 1853, p. 6). A photographic plate or film, moving in a dark chamber, is also used to receive markings produced by a beam of light interrupted by a small screen attached to an electromagnetic stylus, or by the legs of a tuning-fork, or by the mercury column of a capillary electrometer. In certain researches on the explosive wave of gases the light given by the burning gases made the time trace on a rapidly moving photographic film (H. B. Dixon, Phil. Trans., 1905, 200, p. 323). In physiological chronography the stylus is in many cases actuated directly by the piece of muscle to which it is attached; when the muscle is stimulated its contraction moves the stylus on the moving surface of the myograph (M. Foster, Text Book of Physiology, 1879, p. 39).

Gun Chronographs.—Probably the earliest forms of chronographs, not based on the ballistic pendulum method, are due to Colonel Grobert, 1804, and Colonel Dabooz, 1818, both officers of the French army. They employed large disks, attached to the same axle 13 ft. apart, were rapidly rotated; the shot pierced each disk, the angle between two holes giving the time of flight of the ball, when the speed was employed. A device of the velocity of the projectile was by an instrument by Colonel Dabooz a cord passing over two light pulleys, one close to the gun, the other at a given distance from it, was stretched by a weight at the gun end and by a heavy screen at the other end. When the shot traversed the screen the cord cut the cord and liberated the screen, which was perforated during its fall. The height of fall was measured by superposing the hole in the moving screen upon that in the fixed one. This gave the approximate time of flight of the shot over a given distance, and hence its velocity.

In the early form of chronoscope invented by Sir C. Wheatstone in 1830 the period of time was measured by means of a species of clock suspended by a long thread, and stopped and started by the action of an electromagnet which moved a pawl engaging with a toothed wheel fixed on the axle to which the dial pointer was attached. The instrument applied to the determination of the velocity of shot is described thus by Wheatstone:—"A wooden ring embraced the mouth of the gun, a wire connected the opposite sides of the ring. At a proper distance the target was erected, and so arranged that the least motion given to the ring would produce a mark between two metal points. One of the extremities of the wire of the ring was (as before mentioned) was attached to one pole of a small battery; to the other extremity of the electromagnet were attached two wires, one of which was connected with a piece of the target, and the other with one of the ends of the wire, by which the mouth of the gun; from the other extremity of the voliac battery two wires were taken, one of which came to the contact piece of the target, and the other to the opposite extremity of the wire across the mouth of the gun. Before the firing of the gun a continuous circuit existed, including the gun wire; when the target was struck the second circuit was completed; but during the passage of the projectile the two wires were interrupted, and the duration of this interruption was indicated by the instrument." Professor Joseph Henry (Journal Franklin Inst., 1836) employed a cylinder driven by clockwork, making ten revolutions per second. The surface was divided into equal parts, each equal to \( \frac{1}{1000} \) second. The time marks were made with a needle, when successive screws were broken by a shot. Henry also used an induction-coil spark to make the cylinder, the primary of the coil being circuit with a battery and screen. This form of chronograph is in many respects similar to the instrument of Konstantinoff, which was constructed by L. F. C. Breguet and has been sometimes attributed to him (Comptes rendus, 1845). This chronograph, which consisted of a cylinder 1 metre in circumference and 0.36 metre long, driven by clockwork, the rotation being regulated by a governor provided with wings. A small carriage geared to the wheel traversed its length, carrying electromagnetic signals. The magnetic chronograph signal usually consists of a small armature (furnished with a style which marks a moving surface across in front of an electromagnet, the armature being suddenly pulled off the poles of the electromagnet by a spring when the circuit is broken (Journal of Physiology, Aug. 1906). The signals in Breguet's instrument were in a circuit, using the screens and batteries of a gun range. The measurement of time depended on the
regularity of rotation of the cylinder, on which each mm. represented 1048 second.

The Chronograph of A. J. A. Navez (1848) the time period is found by means of a pendulum held at a large angle from the vertical by an electromagnet, which is in circuit with a screen on the gun range. When the shot cuts this screen the circuit is broken, and a current of 1500 A. for 0.435 sec. flows from the next screen on the range by the shot, the position of the pendulum is recorded and the distance it has passed through measured on a divided arc. From this the time of traversing the space between the screens is deduced. By putting the disjunctor in the instrument the time-loss or latency of the chronograph is determined.

In Benton's chronograph (1859) two pendulums are liberates, in the same manner as in the instrument of Navez, one on the cutting of the first screen, the other on the cutting of the second. The difference between the swings of the two pendulums gives the time period sought for. The disjunctor is also used in connexion with this instrument. In Vignotti's chronograph the cutting of a paper is measured by an electromagnet, which moves closed to paper impregnated with ferro-cyanide of potassium. The gun-range screens are included in the primary circuits of induction coils; when these circuits are broken a spark is struck between the plates. This marks the time of traverse of the shot between the screens is determined.

In the Bashforth chronograph a platform, arranged to descend slowly along side of a vertical rotating cylinder, carries two markers, which are connected by electromagnets, which describe a double spiral on the prepared surface of the cylinder. One electromagnet is in circuit with a clock, and the marker actuated by it marks seconds on the cylinder; the circuit of the other is composed of one closed circuit, through which the shot passes in succession. On the gun range, when the shot reaches the first screen, it breaks a weighted cotton thread, which keeps a flexible wire in contact with a conductor. When the shot reaches the second screen, it is attracted by a magnet and the current is divided and almost immediately establishes the circuit through the next screen, by engaging with a second contact, the time of the rupture being recorded on the cylinder by the second marker. The velocity of the shot is then calculated from the double clock marks indicating seconds is about 18 m.; hence the marks corresponding with the severance of a thread can be allotted their value in fractions of seconds with great accuracy. The wires are wound on each side of the cylinder, so that the double clock marks, which are divided into the spiral described by the second marker, and the distance between each screen being known, the velocity of the shot can be calculated.

The chronoscope invented by Sir Andrew Noble is so well adapted to the measurements of the time of flight of a projectile that it is capable of being used to ascertain the velocity acquired by a shot at different parts of the bore in moving from a state of rest inside the gun. A series of cutting plugs is inserted into the sides of the gun at measured intervals, and in each is inserted a loop of wire which forms part of the primary circuit of an induction coil. On the passage of a shot this wire is severed by means of a small knife which projects into the bore and is actuated by the shot as it passes; the circuit being thus broken, a spark passes between the prongs of the electromagnet, which consists of two separate coils and circuit for each plug. The recording arrangement consists of a series of small cards, one for each plug, mounted on one axle and rotating at a high angular velocity. The edges of these cards are provided with a coating of lamp-black, which leaves the hair of the hairs of the cylinder, which is weighed against them, so that a minute spot burnt in the lamp-black of each disk indicates the moment of the cutting of the wire in the corresponding plug. Hence measurement of the distance between two successive spots gives the time occupied by the shot in moving over the distance between the edges of the bore between two successive plugs. By the aid of a vernier, readings are made to thousands of an inch, and the peripheral velocity of the disks being 1010 m. a second, the machine indicates roughly the speed of the shot throughout the bore, in fact, practically correct to hundred-thousandths of a second (Phil. Trans., 1875, pt. 1).

In the Le Boulangé chronograph ("Chronograph le Boulangé," by M. Boulangé, Commission de l'Observ. Sept. 1856) two screens are used. The wire of the first forms part of the circuit of an electromagnet which, so long as it is energized, supports a vertical rod called the "chromometer." Hence when the circuit is broken by the passage and setting through of a disc of iron by the rod. The wire of the second screen conveys a current through another electromagnet which supports a much shorter rod. This is called the "registrar," as it is called, when released by the shot severing the two secondary circuits Passing through the wires of the rod, and causes a horizontal knife to fly forward and cut a nickel tube with which the chromometer rod is sheathed. Hence the long rod will be falling for a certain time, while the shot is travelling between the two secondary circuits, and the horizontal knife can be arranged so that the shot takes to travel this distance, the farther the long rod falls, and the higher up on it will be the nick made by the knife. A simple calculation connects the distance through which the rod falls with the time occupied by the shot in travelling over the distance between the screens, and thus its velocity ascertained. The nick made by the knife, if released while the chromometer rod is still suspended, is the zero point. If both rods are released simultaneously, as is done by breaking both circuits at once by means of a "disjunctor," a second chronograph is composed of a second disk, which is set free the spring and cutting a nick in the zinc; and during this time the long rod is falling into a recess in the stand deep enough to receive its full length. The instrument is so adjusted that the nick thus made is produced at the instant when the second rod has fallen 0.15 sec. This is the disjunctor reading, and requires to be frequently corrected during experiments. The instrument was modified and improved by Colonel H. C. Holden, F.R.S. For further information respecting the manufacture, see "The Chronograph," by Geo. H. H. Burgess, 1880. The electric chronograph of the late H. S. Watkin consists of two long cylinders rotating on vertical axes, and between them a cylindrical weight, having a pointed head, is free to fall. The weight passes through it at right angles to its longest axis. When the weight falls the ends of the insulated wire move very close to the surfaces of the cylinders which form part of a secondary circuit of a battery; in this way a current flows. When a screen is fired, the screen is ruptured by a shot. A minute mark is made by the induced spark on the smoked paper with which the cylinders are covered. The time period between events is deduced from the space fallen through by the weight, and it is important to give a given distance between the screens, the velocity of a shot is at once found. It may be noted that the method of release is such that the falling weight is not subjected, after it has begun to fall, to a diminishing magnetic field, which would be the case if it were directly supported by an electromagnet. An iron rod when falling from an electromagnet, during a minute portion of its fall, is subject to a diminishing force acting in the opposite sense to that of gravity, whereby its time of flight is increased.

Colonel Sebert (Extraits du mémorial de l'artillerie de la marine) devised a chronograph to indicate graphically the motion of recoil of a cannon when fired. A pillar fixed to the ground at the back of the cannon is provided with a tracing point, and a long piece of smoked paper is wound around the pillar, which is divided into equal parts for the recoil of the cannon, the distance of which is maintained electrically. The paper was provided with a tracing point attached to one of the prongs, and so adjusted that it drew its path on a polished sheet of smoke-blackened paper, which was wound around the pillar. The recoil of the cannon was recorded by the tracing point of the paper as it passed over the roller at a slow rate of 200 per second. The diagram so produced gave the total time of the accelerated motion of recoil of the gun, the maximum velocity of recoil, and the rate of acceleration of recoil from the beginning to the end of the recoil.

By means of the chronoscope and microscopic methods, the velocity of light was measured. The whole time taken for the light to make a round trip between a mirror and the eye is the time of flight of a projectile between two screens is found. When
34

CHRONOGRAPH

very close readings are required, they are made by means of a
traversing geometric micrometer microscope. When the distance
between the screens is known, and also the time of flight, the midpoint velocity is found by applying Bashforth's formula. When the
velocity of shot from a shot-gun has to be found, a thin wire stretched
across the muzzle takes the place of the first screen, and a thin sheet
of metal or cardboard carrying an electric contact, or a Branly
coherer, the conductivity of which is restored by means of an induced
current, takes the place of the second screen. The electric firing
circuit is provided with a safety key attached by a cord to the man

loads the gun and prepares the electric fuse. The firing circuit
closed by inserting the key in a switch at the rear of the gun,
thus preventing him from getting into the line of fire when the gun

adjusted, has a practically constant velocity of traverse.
The polarizing photo-chronograph, designed and used by A. C.
Crehore and G. O. Squier -at the United States Artillery School
United States Artillery, 1895, 6, p. 271), depends for its
indications upon the rotation of a beam of light by a
magnetic field, produced by a solenoidal current which is opened
ana closed by the passage of the projectile. The general arrangement
A beam of light from an electric lamp traverses a
is as follows:
lens, then a Nicol prism, next a glass cylinder furnished with plane
glass ends and coiled with insulated wire, then an analyser and two
lenses, finally impinging on a photographic plate to which rotation
is given by an electric motor, the plane of rotation being perpendicular to the direction of the beam of light. The same plate also
records the shadow of a pierced projection attached to a tuningfork, light from the electric lamp being diverted by a mirror for this
purpose. The solenoid used to produce a magnetic field across the
is

which is filled with carbon bisulphide, is in circuit
with a dynamo, resistances, and the screens on the gun range. It is
a well-known phenomenon in physics that when, with the abovementioned combination of polarizing Nicol prism and analyser, the
light is shut off by rotating the analyser, it is instantly restored when
the carbon bisulphide is placed in a magnetic field. This phenomenon
is utilized in this instrument.
The projectile, by cutting the wire
screens, causes the magnetic field to cease and light to pass.
By
means of an automatic switch the projectile, after cutting a screen,
restores the electric circuit, so that successive records are registered.
After a record has been made it is read by means of a micrometer
microscope, the angle moved through by the photographic disk is
found, and hence the time period between two events. In the photochronograph described in Untersuchungen tiber die Vibration des
Gewehrlaufs, by C. Cranz and K. R. Koch (Munich, 1899), also
note on the same, Nature, 61,

pins, screwed into a frame of ebonite, can be brought within
of the surface of the drum.
Each pin is a part of the secondary
circuit of an induction coil, the
space between the pins and the drum
forming spark-gaps. The drum is rubbed over with a weak solution
of paraffin wax in benzol, which causes the markings produced by
the sparks to be well defined. The records are read by means of a
fine hair stretched along the drum and just clear of it, the dots
being located under the hair by means of a lens. The velocity of
rotation is found by obtaining spark marks, due to the primary
circuits of two induction coils being successively broken by a weight
falling and breaking the two electric circuits of the coils in succession
at a known distance apart. This chronograph has been used for
finding the velocity of projectiles after leaving the gun, and also for
finding the rate at which a shot traverses the bore. For the latter
purpose the shot successively cuts insulated wires fixed in plugs
screwed into the gun at known intervals; each wire forms a part
of the primary of an induction coil, and as each is cut a dot is made
on the rotating drum by the induced spark.

volving cylinder. A metal cylinder covered with a sheet of
paper is rotated by clockwork controlled by a conical pendulum, or
by a centrifugal clock governor such as is used for driving a telescope.
By means of a screw longer than the cylinder, mounted parallel
with the axis of the cylinder and rotated by the clockwork, a carriage
is made to traverse close to the
paper. In some instruments this
carriage is furnished with a metal point, and in others with a styloglass cylinder,

^

graphic ink pen. The point or pen is made to touch the paper by an
electromagnet, the electric current of which is closed by the observer
at the transit instrument, and a mark is recorded on the revolving
cylinder. The movement of the same point or pen is also controlled
by a standard clock, so that at the end of each second a mark is
made. The cylinder makes one revolution per minute, and the
minute is indicated by the omission of the mark. In E. J. Dent's
form (Nature, 23, p. 9) continuous observations can be recorded for
6| hours. The conical pendulum used to govern the rotation of
the cylinder was the invention of Sir G. B. Airy. The lower end is
geared to a metal plate which sweeps through an annular trough
filled with glycerin and water.
When the path of the pendulum
exceeds a certain aiameter it causes the plate to enter the liquid more
deeply, its motion being thereby checked also, when the pendulum
moves in a smaller circle the plate is lifted out of the liquid and the
resistance is diminished in the same proportion as the force. The
compensatory action is considerable; doubling the driving power
produces no perceptible difference in the time. To prevent the
injury of the conical pendulum and the wheel work by any sudden
check of the cylinder, a ratch-wheel connexion is placed between
the cylinder and the train of wheel work; this enables the pendulum
to run on until it gradually comes to rest. The pendulum, which
weighs about i81b, is compensated, and makes one revolution
in two seconds; it is suspended from a bracket by means of two
flexible steel springs placed at right angles to one another.
The observatory of Washburn, University of Wisconsin, is
furnished with a chronograph of the same type as that of Dent
(Annals Harvard Coll. Obs. vol. i. pt. ii. p. 34), but in this instrument
the rotation of the cylinder is controlled by a double conical pendulum governor of peculiar construction. When the balls fly out
beyond a certain point, one of them engages with a hook attached
to a brass cylinder which embraces the vertical axle loosely. When
this mass is pulled aside the work done on it diminishes the speed of
the governor. The pendulum ball usually strikes the hook from 60
to 70 times per minute. Governors on this principle were adopted
by Alvan Clark for driving heliostats in the United States Transit of
Venus Expedition, 1874.
In the astronomical chronograph designed by Sir Howard Grubb
(Proc. Inst. Mech. Eng., July 1888), the recording cylinders two in
number are driven by a weight acting on a train of wheel
orubb.
work controlled by an astronomical telescope governor.
The peculiar feature of this instrument is that the axle is geared to
a shaft which communicates motion to the cylinders through a
mechanism whereby the speed of rotation is constantly corrected
by a standard clock. Should the rotation fall below the correct
speed it is automatically accelerated, and if its speed of rotation
rises above the correct one it is retarded.
The accelerator and
retarder are thrown into action by electromagnets, controlled by a
"
"
detector
mounted on the same shaft. The rather complicated
mechanism employed to effect the correction is described and
fully
illustrated in the reference given. The cylinders are covered with
paper, but all the markings are made with a stylographic pen. The
marks indicating seconds are dots, but those made by the observer
are short lines.
When an observation is about to be made the
observer first notes the hour and minute, and, by pressing a contact
attached
to a flexible cord at the transit instrument, marks
key
the paper with a letter in Morse telegraph characters, indicating
the hour and minute; he then waits till a micrometer wire cuts a
star and at the instant closes the circuit, so that the second and
fraction of a second are registered on the chronograph paper. When
a set of observations have been taken, the paper is removed from
the cylinder, and the same results are obtained by applying a
suitably divided rule to the marked paper, fractions of a second
being estimated by applying a piece of glass ruled with eleven
straight lines converging to a point. The ends of these lines on
the base of the triangle so formed are equidistant on one edge of
the glass, so that when the first and last lines are so placed as to
coincide with the beginning and end of the markings of a second,
that second is'divided into ten equal parts. The base of the triangle
is always kept parallel with the line of dots.
The papers, after they
have been examined and the results registered, are kept for reference.
In the astronomical chronograph of Hipp, used in determining
longitudes, the movement cf a recording cylinder is regulated by
means of a toothed wheel, the last of a clockwork train,
...
controlled by a vibrating metal tongue; this important
feature is described in detail in Favarger's work cited above.
Acoustic Chronographs.
In the chronograph devised by H. V.
Regnault (Acad. des Sc., 1868) to determine the velocity of sound
propagated through a great length of pipe, a band of R elmauti.
paper 27 mm. wide was continuously unrolled from a
Dobbin by means of an electromagnetic engine. In its passage over a
pulley it passed over a smoky lamp flame, which covered it with a
thin deposit of carbon. It next passed over a
cylinder in contact
with the style of a tuning-fork kept in vibration by electromagnets
placed on either side of its prongs, the current being interrupted by
the fork it was also in contact with an electric signal controlled by
a standard clock. Also an electromagnetic signal marked the
beginning and end of a time period. Thus three markings were
registered on the band, viz. the time of the pendulum, the vibrations
of the fork, and the marking of the signal due to the opening and

In the photo-electric chronograph devised by G. J. Burch, F.R.S. (Journal of Physiology, 18, p. 125; Electrician, 37, p. 436), the rapid movements of the column of mercury in a capillary electrometer used in physiological research are recorded on a sensitive plate. If only one point of contact of the vibration-prongs of a tuning-fork of known period is also recorded on the plate, the light used being that of the electric arc. The images of the meniscus of the mercury column and of the moving fork are focused on the plate by a lens. Excellent results have been obtained with this instrument.

An important development of a branch of chronography is due to E. Marey (Comptes rendus, 7, aout 1882, and Le Mouvement, par E. J. Marey, 1894), who employed a photograph of a plate for receiving successive pictures of moving objects, at definite times, when investigating the movements of animals, birds, fishes, insects, and also microscopic objects such as vorticelle. The instrument consists of a recording cylinder rotated at a uniform angular velocity by clockwork, with a fan governor, and a pneumatic signal, constructed thus. One end of a closed shallow cylinder, about 4 cm. in diameter, is furnished with a stretched rubber membrane. A light lever, moving about an axis near the edge of the cylinder, is attached to the centre of the membrane by a short rod, its free end moving as the membrane is depressed. The lever is thus made to form a similar cylinder and membrane, but without a lever, which is attached to that part of the body of the animal the movement of which is under investigation. The system is full of air, so that when the membrane attached to the animal is depressed, the lever is extended and the lever moved. Its end, which carries a scribbling point, marks the smoked paper on the rotating cylinder. The pneumatic signal is called by Marey "tambour à décloisonnement 1/2".

CHRONOLOGY (Gr. χρονολογία, computation of time, χρόνος), the science which treats of time, its object being to arrange and exhibit the various events which have occurred in the history of the world in the order of their succession, and to ascertain the intervals of time between them. The term "chronology" is also used of the order in time itself, as adopted, and of the system by which the order is fixed. The accumulation of long traditions, the length of the lapse of time implies some knowledge of the celestial motions, by which alone time can be accurately measured, and some advancement in the arts of civilized life, which could be attained only by the accumulated experience of many generations (see TIME). Before
the invention of letters the memory of past transactions could not be preserved beyond a few years with any tolerable degree of accuracy. Events which greatly interested the condition of the human race, or were of a nature to make a deep impression on the minds of the rude inhabitants of the earth, might be vaguely transmitted through several ages by traditional narrative; but intervals of time, expressed by abstract numbers, and these constantly varying besides, would soon escape the memory. The invention of the art of writing afforded the means of substituting precise and permanent records for vague and evanescent tradition; but in the infancy of the world, mankind had learned neither to estimate accurately the duration of time, nor to refer passing events to any fixed epoch.

For these reasons the attempt at an accurate chronology of the early ages of the world is only of recent origin. After political relations began to be established, the necessity of preserving a register of passing seasons and years would soon be felt, and the practice of recording important transactions must have grown up as a necessary consequence of social life. But of these deliberate early records a very small portion only has escaped the ravages of time and barbarism.

The earliest written annals of the Greeks, Etruscans and Romans are irretrievably lost. The traditions of the Druids perished with them. A Chinese emperor has the credit of burning "the books" extant in his day (about 220 B.C.), and of burning alive the scholars who were acquainted with them. And a Spanish adventurer destroyed the picture records which were found in the pueblos of Montezuma.

Of the more formal historical writings in which the first ineffectual attempts were made in the direction of systematic chronology we have no knowledge at first-hand. Of Hellanicus, the Greek logographer, who appears to have lived through the greater part of the 5th century B.C., and who drew up a chronological list of the priestesses of Hera at Argos; of Ephorus, who lived in the 4th century B.C., and is distinguished as the first Greek who attempted the composition of a universal history; and of Timaeus, who in the following century wrote an elaborate history of Sicily, in which he set the example of using the Olympiads as the basis of chronology, the works have perished and our meagre knowledge of their contents is derived only from fragmentary citations in later writers. The same fate has befallen the works of Berossus and Manetho, Eratosthenes and Apollodorus. Berossus, a priest of Belus living at Babylon in the 3rd century B.C., added to his historical account of Babylonia a chronological list of its kings, which he claimed to have compiled from genuine archives preserved in the temple. Manetho, likewise a priest, living at Sais, or in Lower Egypt in the 3rd century B.C., wrote in Greek a history of Egypt, with an account of its thirty dynasties of sovereigns, which he professed to have drawn from genuine archives in the keeping of the priests. Of these works fragments only, more or less copious and accurate, have been preserved. Eratosthenes, who in the latter half of the 2nd century B.C. was keeper of the famous Alexandrian library, not only made himself a great name by his important work on geography, but by his treatise entitled Chronographia, one of the first attempts to establish an exact scheme of general chronology, earned for himself the title of "father of chronology." His method of procedure, however, was usually conjectural; and guess-work, however careful, acute and plausible, is still guess-work and not testimony. Apollodorus, an Athenian who flourished in the middle of the 2nd century B.C., wrote a metrical chronicle of events, ranging from the supposed period of the deluge to the 20th year of his own reign. These writers were followed by other investigators and systematizers in the same field, but their works are lost. Of the principal later writers whose works are extant, and to whom we owe what little knowledge we possess of the labours of their predecessors, mention will be made hereafter.

The absence or incompleteness of authentic records, however, is not the only source of obscurity and confusion in the chronology of remote ages. There can be no exact computation of time or placing of events without a fixed point or epoch from which the reckoning takes its start. It was long before this was apprehended. When it began to be seen, various epochs were selected by various writers; and at first each small separate community had its own epoch and method of time-reckoning. Thus in one city the reckoning was by succession of kings, in another by archons or annual magistrates, in a third by succession of priests. It seems now surprising that vague counting by generations should so long have prevailed and satisfied the wants of inquiring men, and that so simple, precise and seemingly obvious a plan as counting by years, the largest natural division of time, did not occur to any investigator before Eratosthenes.

Precision, which was at first unattainable for want of an epoch, was afterwards no less unattainable from the multiplicity, and sometimes the variation, of epochs. But by a natural process the mischief was gradually and partially remedied. The extension of intercourse between the various small groups or societies of men, and still more their union in larger groups, made a common epoch necessary, and led to the adoption of such a starting point by each larger group. These leading epochs continued in use for many centuries. The task of the chronologist was thus simplified and reduced to a study-and comparison of dates in a few leading systems.

The most important of these systems in what we call ancient times were the Babylonian, the Greek and the Roman. The Jews had no general era, properly so called. In the history of Babylonia, the fixed point from which time was reckoned was the era of Nabonassar, 747 B.C. Among the Greeks the reckoning was by Olympiads, the point of departure being the year in which Coroebus was victor in the Olympic Games, 776 B.C. The Roman chronology started from the foundation of the city, the year of which, however, was variously given by different authors. The most generally adopted was that assigned by Varro, 753 B.C. It is noteworthy how nearly these three great epochs approach each other,—all lying near the middle of the 8th century B.C. But it is to be remembered that the beginning of an era and its adoption and use as such are not the same thing, nor are they necessarily synchronous. Of the three ancient eras above spoken of, the earliest is that of the Olympiads, next that of the foundation of Rome, and the latest the era of Nabonassar. But in order of adoption and actual usage the last is first. It is believed to have been in use from the year of its origin. It is not known when the Romans began to use their era. The Olympiads were not in current use till about the middle of the 3rd century B.C., when Timaeus, as already mentioned, set the example of reckoning by them.

Even after the adoption in Europe of the Christian era, a great variety of methods of dating—national, provincial and sectional—existed for a long time in different countries, thus renewing in modern times the difficulties experienced in ancient times from diversities of reckoning. An acquaintance with these various methods is indispensable to the student of the charters, chronicles and legal instruments of the middle ages.

In reckoning years from any fixed epoch in constant succession, the number denoting the years is necessarily always on the increase. But rude nations and illiterate people seldom attach any definite idea to large numbers. Hence it has been a practice, very extensively followed, to employ cycles or periods, consisting of a moderate number of years, and to distinguish and reckon the years by their number in the cycle. The Chinese and other nations of Asia reckon, not only the years, but also the months and days, by cycles of sixty. The Saros of the Chaldaeans, the Olympiad of the Greeks, and the Roman Indiction are instances of this mode of reckoning time. Several cycles were formerly known in Europe; but most of them were invented for the purpose of adjusting the solar and lunar divisions of time, and were rather employed in the regulation of the calendar than as chronological eras. They are frequently, however, of very great use in fixing dates that have been otherwise imperfectly expressed, and consequently form important elements of chronology.
Modern Results of Archaeological Research.

When Queen Victoria came to the English throne, 4004 B.C. was still accepted, in all sobriety, as the date of the creation of the world. Perhaps no single statement could more vividly emphasize the change in the point of view from which scholars regard the chronology of ancient history than the citation of this indisputable fact. To-day, though Bibles are still printed with the year 4004 B.C. in the margin of the first chapter of Genesis, no scholar would pretend to regard this reference seriously. On the contrary, the scholarship of to-day regards the fifth millennium B.C. as well within the historical period for such nations as the Egyptians and the Babylonians. It has come to be fully accepted that when we use such a phrase as "the age of the world" we are dealing with a period that must be measured not in thousands but in millions of years; and that to the age of man must be allotted a period some hundreds of times as great as the five thousand and odd years allowed by the old chronologists. This changed point of view, needless to say, has not been reached without ardent and even bitter controversy. Yet the transformation is unequivocal; and the revised conception no longer seems to connote the theological implications that were at first ascribed to it. It has now become obvious that the data afforded by the Hebrew writings should never have been regarded as sufficiently accurate for the purpose of exact historical computations: that, in short, no historian working along modern scientific lines could well have made the mistake of supposing that the genealogical lists of the Pentateuch afforded an adequate chronology of world-history. But it should not be forgotten that to many generations of close scholarship these genealogical lists seemed to convey such knowledge in the most precise terms, and that at so recent a date as, for example, the year in which Queen Victoria came to the throne, it was nothing less than a rank heresy to question the historical accuracy and finality of the chronologies which had no other source or foundation.

This changed point of view regarding the chronology of history may without hesitation be ascribed to the influence of evidence obtained in a single field of inquiry, the field, namely, of archaeology. No doubt the evidence as to the age of the earth and as to the antiquity of man was gathered by a class of workers not formally included in the ranks of the archaeologist: workers commonly spoken of as palaecologists, anthropologists, etnologists and the like. But the distinction scarcely covers a real difference. The scope of the archaeologist's studies must include every department of the ancient history of man as preserved in antiquities of whatever character, be they tumuli along the Baltic, fossil skulls and graven bones from the caves of France, the flint implements, pottery, and mummies of Egypt, tablets and bas-reliefs from Mesopotamia, coins and sculptures of Greece and Rome, or inscriptions, wax tablets, parchment rolls, and papyri of a relatively late period of classical antiquity. If at one time the monuments of Greece and Rome claimed the almost un disputated attention of the archaeologist, that time has long since passed. For the most important historical records that have come to us in recent decades we have to thank the Orientalist, though the classical explorer has been by no means idle. It will be sufficient here to point out in general terms the import of the message of archaeological discovery in the Victorian Era in its bearings upon the great problems of world-history.

A start was made through the efforts of the palaecologists and geologists, with only indirect or incidental aid from the archaeologists. The new movement began actively with James Hutton in the later years of the 18th century, and was forwarded by the studies of William Smith in England and of Cuvier in France; but the really efficient champion of the conception that the earth is very old was Sir Charles Lyell, who published the first edition of his epoch-making Principles of Geology only a few years before Queen Victoria came to the throne. Lyell demonstrated to the satisfaction, or—perhaps it should rather be said—to the dissatisfaction, of his contemporaries that the story of the geological ages as recorded in the strata of the earth becomes intelligible only when vast stretches of time are presupposed. Of course the demonstration was not accepted at once. On the contrary, champions of the tradition that the earth was less than six thousand years old held their ground most tenaciously, and the earlier years of the Victorian era were years of bitter controversy. The result of the contest was never in doubt, however, for the geological evidence, once it had been gathered, was unequivocal; and by about the middle of the century it was pretty generally admitted that the age of the earth must be measured by an utterly different standard from that hitherto in vogue. This concession, however, by no means implied a like change of view regarding the age of man. A fresh volume of evidence required to be gathered, and a new controversy to be waged, before the old data for the creation of man could be abandoned. Lyell again was in the forefront of the progressive movement, and his work on The Antiquity of Man, published in 1863, gave currency for the first time to the new opinions. The evidence upon which these opinions were based had been gathered by such anthropologists as Schmerling, Boucher de Perthes and others, and it had to do chiefly with the finding of implements of human construction associated with the remains of extinct animals in the beds of caves, and with the recovery of similar antiquities from alluvial deposits the great age of which was demonstrated by their depth. Every item of the evidence was naturally subjected to the closest scrutiny, but at last the conservatives were forced reluctantly to confess themselves beaten. Their traditional arguments were powerless before the array of data marshalled by the new science of prehistoric archaeology. Looking back even at the short remove of a single generation, it is difficult to appreciate how revolutionary was the conception of the antiquity of man thus inculcated. It rudely shocked the traditional attitude of scholarship towards the history of our race. It disturbed the most cherished traditions and the most sacred themes. It seemed to threaten the very foundations of religion itself. Yet the present generation accepts the antiquity of man as a mere matter of fact. Here, as so often elsewhere, the heresy of an elder day has come to seem almost an axiomatic truth.

If we go back in imagination to the beginning of the Victorian era and ask what was then known of the history of Ancient Egypt, Mesopotamia and Asia Minor, we find ourselves confronted with a startling paucity of knowledge. The key to the mysteries of Egyptian history had indeed been found, thanks to the recent efforts of Thomas Young and Champollion, but the deciphering of inscriptions had not yet progressed far enough to give more than a vague inkling of what was to follow. It remained, then, virtually true, as it had been for two thousand years, that for all that we could learn of the history of the Old Orient in pre-classical days, we must go solely to the pages of the Bible and to a few classical authors, notably Herodotus and Diodorus. A comparatively few pages summed up, in language often vague and mystical, all that the modern world had been permitted to remember of the history of the greatest nations of antiquity. To these nations the classical writers had ascribed a traditional importance, the glamour of which still lighted their names, albeit revealing them in the vague twilight of tradition rather than in the clear light of history. It would have been a bold, not to say a reckless, dreamer who dared predict that any future researches could restore to us the lost knowledge that had been forgotten for more than two millennia. Yet the Victorian era was scarcely ushered in before the work of rehabilitation began, which was to lead to the most astounding discoveries and to an altogether unprecedented extension of historical knowledge. Early in the 'forties the Frenchman Botta, quickly followed by Sir Henry Layard, began making excavations on the site of ancient Nineveh, the name and fame of which were a tradition having scarcely more than mythical status. The spade of the discoverer soon showed that all the fabled glories of the ancient Assyrian capital were founded on realities, and evidence was afforded of a state of civilization and culture such as few men supposed to have existed on the earth before the Golden Age of Greece. Not merely were artistic sculptures and bas-reliefs
found that demonstrated a high development of artistic genius, but great libraries were soon revealed,—books consisting of bricks of various sizes, or of cylinders of the same material, inscribed with characters in the state of clay with curious characters which became indelible when baking transformed the clay into brick. No one was able to guess, even in the vaguest way, the exact interpretation of these odd characters; but, on the other hand, no one could doubt that they constituted a system of writing, and that the piles of inscribed tablets were veritable books. There were numerous sceptics, however, who did not hesitate to assert that the import of the message so obviously locked in these curious inscriptions must for ever remain an absolute mystery. Here, it was said, were inscriptions written in an unknown character and in a language that for at least two thousand years had been absolutely the step of analysis which demonstrated that only a few fundamental sounds are involved in human speech, and hence that it is possible to express all the niceties of utterance with an alphabet of little more than a score of letters. Halting just short of this analysis, the Assyrian ascribed syllabic values to the characters of his script, and hence, instead of finding twenty odd characters sufficient, he required about five hundred. There was a further complication in that each one of these characters had at least two different phonetic values; and there were other intricacies of usage which, had they been foreknown by inquirers in the middle of the 19th century, might well have made the problem of decipherment seem an utterly hopeless one. Fortunately it chanced that another people, the Persians, had adopted the Assyrian wedge-shaped stroke as the foundation of a written character, but making that analysis of the basal character the step of analysis which demonstrated that only a few characters as were necessary to represent the alphabetical sounds. This made the problem of deciphering Persian inscriptions a relatively easy one. In point of fact this problem had been partially solved in the early days of the 19th century, thanks to the sagacious guesses of the German philologist Grotefend. Working with some inscriptions from Persepolis which were found to contain references to Darius and Xerxes, Grotefend had established the phonetic values of certain of the Persian characters, and his successors were perfecting the discovery just about the time when the new Assyrian finds were made. It chanced that there existed on the polished surface of a cliff at Behistun in western Persia a tri-lingual inscription which, according to Diodorus, had been made by Queen Semiramis of Nineveh, but which, as is now known, was really the work of King Darius. One of the languages of this inscription was Persian; another, as it now appeared, was Assyrian, the language of the newly discovered books from the libraries of Nineveh. There was reason to suppose that the inscriptions were identical in meaning; and fortunately it proved, when the inscriptions were made accessible to investigation through the efforts of Sir Henry Rawlinson, that the Persian inscription contained a large number of proper names. It was well known that proper names are usually transcribed from one language into another with a tolerably close retention of their original sounds. For example, the Greek names Ptolemaios and Cleopatra became a part of the Egyptian language and appeared regularly in Egyptian inscriptions after Alexander's general became king of Egypt. Similarly, the Greek names Kyros, Dareios and Xerxes were as close an imitation as practicable of the native names of these Persian monarchs. Assuming, then, that the proper names found in the Persian portion of the Behistun inscription occurred also in the Assyrian portion, containing virtually the same sound in each, a clue to the phonetic values of a large number of the Assyrian characters was obviously at hand. Phonetic values known, Assyrian was found to be a Semitic language cognate to Hebrew.

These clues were followed up by a considerable number of investigators, with Sir Henry Rawlinson in the van. Thanks to their efforts, the new science of Assyriology came into being, and before long the message of the Assyrian books had ceased to be an enigma. Of course this work was not accomplished in a single year, but, considering the difficulties to be overcome, it was carried forward with marvellous expedition. In 1857 the new scholarship was put to a famous test, in which the challenge thrown down by Sir George Cornewall Lewis and Ernest Renan was met by Rawlinson, Hincks, Oppert and Fox Talbot in a conclusive manner. The sceptics had declared that the new science of Assyriology was itself a myth: that the investigators, self-deceived, had in reality only invented a language and read into the Assyrian inscriptions something utterly alien to the minds of the Assyrians themselves. But when a committee of the Royal Asiatic Society, with George Grote at its head, decided that the translations of an Assyrian text made independently by the scholars just named were at once perfectly intelligible and closely in accord with one another, scepticism was silenced, and the young science was at least to have made good its claims.

Naturally the early investigators did not fathom all the niceties of the language, and the work of grammatical investigation has gone on continuously under the auspices of a constantly growing band of workers. Doubtless much still remains to be done; but the essential thing, from the present standpoint, is that a sufficient knowledge of the Assyrian language has been acquired to ensure trustworthy translations of the cuneiform texts. Meanwhile, the material found by Botta and Layard, and other successors, in the ruins of Nineveh, has been constantly augmented through the efforts of companies of other investigators, and not merely Assyrian, but much earlier Babylonian and Chaldaean texts in the greatest profusion have been brought to the various museums of Europe and America. The study of these different inscriptions has utterly revolutionized our knowledge of Oriental history. Many of the documents are strictly historical in their character, giving full and accurate contemporary accounts of events that occurred some thousands of years ago. Exact dates are fixed for long series of events that previously were quite unknown. Monarchs whose very names had been forgotten are restored to history, and the records of their deeds inscribed under their very eyes are before us,—contemporary documents such as neither Greece nor Rome could boast, nor any other nation, with the single exception of Egypt, until strictly modern times. There are, no doubt, gaps in the record; there are long periods for which the chronology is still uncertain. Naturally there is an increasing vagueness as one recedes farther into the past, and for the earlier history of Chaldaea there is great uncertainty. Nevertheless, the Assyriologist speaks with a good deal of confidence of dates as remote as 5800 B.C., the time ascribed to King Sargon, who was once regarded as a mythical person, but is now known to have been an actual monarch. Indeed, there are tablets in the British Museum labelled 4500 b.c.; and later researches, particularly those of the expedition of the University of Pennsylvania to Nippur, have brought us evidence which, interpreted with the aid of estimates as to the average rate of accumulation of dust deposits, leads to the inference that a high state of civilization had been attained in Mesopotamia at least 9000 years ago.

While the Assyriologists have been making these astonishing revelations, the Egyptologists have not been behindhand. Such scholars as Lepsius, Brugsch, de Rouge, Lhennorant, Birch, Mariette, Maspero and Erman have perfected the studies of Young and Champollion; while at the same time these and a considerable company of other explorers, most notable of whom
are Gardner Wilkinson and Professor Flinders Petrie, have brought to light a vast accumulation of new material, much of which has the highest importance from the standpoint of the historian. Lists of kings found on the temple wall at Abydos, in the fragments of the Turin papyrus and elsewhere, have cleared up many doubtful points in the lists of Manetho, and at the same time, as Professor Petrie has pointed out, have proved to us how true a historian that much-discussed writer was. Manetho itself, it will be recalled, was the Egyptian who wrote the history of Egypt in Greek in the time of the Ptolemies. His work in the original unfortunately perished, and all that we know of it we learn through excerpts made by a few later classical writers. These fragments have until recently, however, given us our only clue to the earlier periods of Egyptian history. Until corroboration was found in the Egyptian inscriptions themselves, not one of the facts Manetho mentions was in doubt, but scepticism had carried to the point of denying that Manetho himself had ever existed. This is only one of many cases where the investigations of the archaeologist have proved not iconoclastic but reconstructive, tending to restore confidence in classical traditions which the scientific historians of the age of Niebuhr and George Cornwall Lewis regarded with scepticism.

As to the exact dates of early Egyptian history there is rather more of vagueness than for the corresponding periods of Mesopotamia. Indeed, approximate accuracy is not attained until we are within sixty or seven hundred years of our own era; but the sequence of events of a period preceding this by two thousand years is well established, and the recent discoveries of Professor Petrie carry back the record to a period which cannot well be less than five thousand, perhaps not less than six thousand years B.C. Both from Egypt and Mesopotamia, then, the records of the archaeologist have brought us evidence of the existence of a highly developed civilization for a period exceeding a hundred or perhaps by thousands, of years the term which had hitherto been considered the full period of man's existence.

We may note at once how these new figures disturb the historical balance. If our forerunners of eight or nine thousand years ago were in a noontide glare of civilization, where shall we look for the much-talked-of "dawnings of history"? By this new standard the Romans seem our contemporaries in latter-day civilization; the "Golden Age" of Greece is but of yesterday; the pyramid-builders are only relatively remote. The men who built the temple of Bel at Nippur, in the year (say) 5000 B.C., must have felt themselves at a pinnacle of civilization and culture. As Professor Mahaffy has suggested, the era of the Pyramids may have been the veritable autumn of civilization. Where, then, must we look for its springtime? The answer to that question must come, if it come at all, from what we now speak of as prehistoric archaeology; the monuments from Memphis and Nippur, Ninewah, covering a mere ten thousand years or so, are the records of recent history.

The efforts of the students of Oriental archaeology have been constantly stimulated by the fact that their studies brought them more or less within the field of Bible history. A fair proportion of the workers who have delved so enthusiastically in the fields of Egyptian and Assyrian exploration would never have taken up the work at all but for the hope that their investigations might substantiate the Hebrew records. For a long time this hope proved illusory, and in the case of Egyptian archaeology the results have proved disappointing even up to the very present. Considering the important part played by the Egyptian sojourn of the Hebrews, as narrated in the Scriptures, it was certainly not an over-enthusiastic prediction that the Egyptian monuments when fully investigated would divulge important references to Joseph, to Moses, and to the all-important incidents of the Exodus; but half a century of expectant attention in this direction has led only to disappointment. It would be rash, considering the buried treasures that may yet await the future explorer, to assert that such records as those in question can never come to light. But, considering the fulness of the contemporary Egyptian records of the XIXth dynasty that are already known, it becomes increasingly doubtful whether the Hebrews in Egypt played so important a part in history, when viewed from the Egyptian standpoint, as their own records had seemed to imply. As the forgotten history of Oriental antiquity has been restored to us, it has come to be understood that, politically speaking, the Hebrews were a relatively insignificant people, whose chief importance from the standpoint of material history was derived from the geographical accident that made them a sort of buffer between the greater nations about them. Only once, and for a brief period, in the reigns of David and Solomon did the Hebrews rise to anything like an equal plane of political importance with their immediate neighbours. What gave them a seeming importance in the eyes of posterity was the fact that the true history of the Egyptians, Mesopotamians, Arabs and Hittites had been well-nigh forgotten. The various literatures of these nations were locked from view for more than two thousand years, while the literature of Israel had been preserved, but had come to be regarded as inspired and sacred among all the cultured nations of the Western world. Now that the lost literatures have been restored to us, the status of the Hebrew writings could not fail to be disturbed. Their very isolation had in some measure accounted for their seeming importance.

All true historical perspective is based upon comparison, and where only a single account has been preserved of any event or of any period of history, it is extremely difficult to judge that account with historical accuracy. An illustration of this truth is furnished in profane history by the account which Thucydides has given us of the Peloponnesian War. For most of the period in question Thucydides is the only source; and despite the inherent merits of a great writer, it can hardly be doubted that the tribute of almost unqualified praise that successive generations of scholars have paid to Thucydides must have been in some measure qualified if, for example, a Spartan account of the Peloponnesian War had been preserved to us. Professor Mahaffy has pointed out that many other events in Greek history are viewed by us in somewhat perverted perspective because the great writers of Greece were Athenians rather than Spartans or Thebans. Even in so important a matter as the great conflict between Persia and Greece it has been suggested more than once that we should be able to gain a much truer view were Persian as well as Greek accounts accessible.

Not many years ago it would have been accounted a heresy to suggest that the historical books of the Old Testament had conveyed to our minds estimates of Oriental history that suffered from this same defect; but to-day no one who is competent to speak with authority pretends to doubt that such is really the fact. Even conservative students of the Bible urge that its historical passages must be viewed precisely in the light of any other historical writings of antiquity; and the fact that the oldest Hebrew manuscript dates only from the 8th century A.D., and therefore of necessity brings to us the message of antiquity through the fallible medium of many generations of copyists, is far more clearly kept in mind than it formerly was. Every belief of mankind is in the last analysis amenable to reason, and finds its origin in evidence that can appeal to the arbitrament of common sense. This evidence may in certain cases consist chiefly of the fact that generations of our predecessors have taken a certain view regarding a certain question; indeed most of our cherished beliefs have this foundation. But when such is the case, mankind has never failed in the long run to vindicate its claim to rationality by showing a readiness to give up the old belief whenever tangible evidence of its fallaciousness was forthcoming. The case of the historical books of the Old Testament furnishes no exception. These had been sacred to almost a hundred generations of men, and it was difficult for the eye of faith to see them as other than absolutely infallible documents. Yet the very eagerness with which the champions of the Hebrew records searched for archaeological proofs of their validity was a tacit confession that even the most unwavering faith was not beyond the reach of external evidence. True, the believer sought corroboration with full faith that he would find it; but the very
fact that he could think such external corroboration valuable implied, however little he may have realized it, the subconscious concession that he did not accept external evidence at its full value, even if he would prove contradictory. If, then, an Egyptian inscription of the XIXth dynasty had come to hand in which the names of Joseph and Moses, and the deeds of the Israelites as a subject people who finally escaped from bondage by crossing the Red Sea, were recorded in hieroglyphic characters, such a monument would have been hailed with enthusiastic delight by every champion of the Pentateuch, and a wave of supreme satisfaction would have passed over all Christendom. It is not too much, then, to say that failure to find such a monument has caused deep disappointment to Bible scholars everywhere. It does not follow that faith in the Bible record is shaken, although in some quarters there has been a pronounced tendency to regard the history of the Egyptian sojourn as mythical; yet it cannot be denied that Egyptian records, corroborating at least some phases of the Biblical story, would have been a most welcome addition to our knowledge. Some recent finds have, indeed, seemed to make inferential reference to the Hebrews, and the marvellous collection of letters of the XVIIIth dynasty found at Tel el-Amarna—letters to which we shall refer later—have the utmost importance as proving a possible early date for the Mosaic accounts. But such inferences as these are but a vague return for the labour expended, and an almost cruelly inadequate response to seemingly well-founded expectations.

When we turn to the field of Babylonian and Assyrian archaeology, however, the case is very different. Here we have documents in abundance that deal specifically with events more or less referred to in the Bible. The records of kings whose names liherto were known to us only through Biblical references have been found in the ruins of Nineveh and Babylon, and personages hitherto but shadowy now step forth as clearly into the light of history as an Alexander or a Caesar. Moreover, the newly discovered treasures deal with the beliefs of the people as well as with their history proper. The story of the books now spoken of as the “Creation” and “Deluge” tablets of the Assyrians, in the British Museum, which were discovered in the ruins of Nineveh by Layard and by George Smith, has been familiar to every one for a good many years. The acute interest which they excited when George Smith deciphered their contents in 1872 has to some extent abated, but this is only because scholars are now pretty generally agreed as to their bearing on the corresponding parts of Genesis. The particular tablets in question date only from about the 7th century B.C., but it is agreed among Assyriologists that copies of older texts current in Babylon for many centuries before, and it is obvious that the compilers of Genesis had access to the Babylonian stories. In a word, the Hebrew Genesis shows unequivocal evidence of Babylonian origin, but, in the words of Professor Sayce, it is but “a paraphrase and not a translation.” However disconcerting such a revelation as this would have been to the theologians of an elder day, the Bible scholars of our own generation are able to regard it with entire composure.

From the standpoint of the historian even greater interest attaches to the records of the Assyrian and Babylonian kings when compared with the historical books of the Old Testament. For some centuries the inhabitants of Palestine were subject to periodical attacks from the warlike inhabitants of Mesopotamia, as even the most casual reader of the Bible is aware. When it became known that the accounts of these invasions formed a part of the records preserved in the Assyrian libraries, historian and theologian alike waited with breathless interest for the exact revelations in store; and this time expectation was not disappointed. As, one after another, the various tablets and cylinders and annalistic tablets have been translated, it has become increasingly clear that here are almost inexhaustible fountains of knowledge, and that sooner or later it may be possible to check the Hebrew accounts of the most important periods of their history with contemporaneous accounts written from another point of view. It is true that the cases are not very numerous where precisely the same event is described from opposite points of view, but, speaking in general terms rather than of specific incidents, we are already able to subject considerable portions of history to this test. The records of Shalmaneser II., Tiglath-Pileser III. and Sennacherib, kings of Assyria, of Nebuchadrezzar, king of Babylon, and of Cyrus, king of Persia, all contain direct references to Hebrew history. An obelisk of Shalmaneser II. contains explicit reference to the tribute of Jehu of Samaria, and graphically depicts the Hebrew captives. Tiglath-Pileser III., a usurper who came to the throne of Assyria in 745 B.C., and whose earlier name of Pul proved a source of confusion to the later Hebrew writers, left records that have served to clear up the puzzling chronology of a considerable period of the history of Samaria. Most interesting of all, perhaps, are the annals of Sennacherib, the destruction of whose hosts by the angel of the Lord is so strikingly described in the Bible.

The court historian of Sennacherib naturally does not dwell upon this event, but he does tell of an invasion and conquest of Palestine. The Hebrew account of the death of Sennacherib is corroborated by a Babylonian inscription. Here, however, there is an interesting qualification. The account in the Book of Kings is so phrased that one might naturally infer from it that Sennacherib was assassinated by his sons immediately after his return from the disastrous campaign in Palestine; but in point of fact, as it now appears, the Assyrian king survived that campaign by twenty years. One cannot avoid the suspicion that in this instance the Hebrew chronicler purposely phrased his account to convey the impression that Sennacherib’s tragic end was but the slightly delayed culmination of the punishment inflicted for his attack upon the “chosen people.” On the other hand, the ambiguity may be quite unintentional, for the Hebrew writers were notoriously lacking in the true historical sense, which shows itself in a full appreciation of the value of chronology.

One of the most striking instances of the way in which mistakes of chronology may lead to the perversion of historical records is shown in the Book of Daniel in connexion with the familiar account of the capture of Babylon by Cyrus. Within the past generation records of Cyrus have been brought to light, as well as records of the conquered Babylonian king himself, which show that the Hebrew writers of the later day had a peculiarly befogged impression of a great historical event—their misconception being shared, it may be added, by the Greek historian Herodotus. When the annalistic tablet of Cyrus was translated, it was made to appear, to the consternation of Bible scholars, that the city of Babylon had capitulated to the Persian—or more properly to the Elamite—conqueror without a struggle. It appeared, further, that the king’s rule in Babylon at the time of the capitulation was named not Belshazzar, but Nabonidos. This king, as appears from his own records, had a son named Belshazzar, who commanded Babylonian armies in outlying provinces, but who never came to the throne. Nothing could well be more disconcerting than such a revelation as this. It is held, however, that the startling discrepancies are not so difficult to explain as may appear at first sight. The explanation is found, so the Assyriologist assures us, in the fact that both Hebrew and Greek historians, writing at a considerable interval after the events, and apparently lacking authentic sources, confused the peaceful occupation of Babylon by Cyrus with its siege and capture by a successor to that monarch, Darius Hystaspes. As to the confusion of Babylonian names—in which, by the way, the Hebrew and Greek authors do not agree—it is explained that the general, Belshazzar, was perhaps more directly known in Palestine than his father the king. But the vagueness of the Hebrew knowledge is further shown by the fact that Belshazzar, alleged king, is announced as the son of Nebuchadrezzar (misspelled Nebuchadnezzar in the Hebrew writings), while the three kings that reigned after Nebuchadrezzar, and before Nabonidos usurped the throne, are quite overlooked.

Our present concern with the archaeological evidence thus briefly outlined, and with much more of the kind, may be summed up in the question: What in general terms is the inference to be drawn by the world-historian from the Assyrian records in their bearings upon the Hebrew writings? At first sight this
might seem an extremely difficult question to answer. Indeed, to answer it to the satisfaction of all concerned might well be pronounced impossible. Yet it would seem as if a candid and impartial historian could not well be greatly in doubt in the matter. On the one hand, the general agreement everywhere between the Hébrew accounts and contemporaneous records from Mesopotamia proves beyond cavil that, broadly speaking, the Bible accounts are historically true, and were written by persons who in the main had access to contemporaneous documents. On the other hand, the discrepancies as to details, the confusion as to exact chronology, the manifest prejudice and partisanship, and the obvious limitations of knowledge make it clear that the writers were not in full fault of the shortcomings of other historians, and that their work must be adjusted by ordinary historical standards. As much as this is perhaps conceded by most, if not all, schools of Bible criticism of to-day. Professor Sayce, one of the most distinguished of modern Assyriologists, writing as an opponent of the purely destructive "Higher Criticism," demands no more than that the Book of Genesis "shall take rank by the side of the other monuments of the past as the record of events which have actually happened and been handed on by credible men," that it shall, in short, be admitted to be "a collection of ancient documents which have all the value of contemporaneous testimony," but which being in themselves "wrecks of vast literatures which extended over the Oriental world from a remote epoch," cannot be understood except in the light of the contemporaneous literature of which they form a portion." From the point of view implied by such words as these, it is only necessary to recall the mental attitude of our grandfathers to appreciate in some measure the revolution in thought that has been wrought in this field within the last half-century, largely through the instrumentality of Oriental archaeology.

We have seen that the general trend of Oriental archaeology has been reconstructive rather than iconoclastic. Equally true is this of recent classical archaeology. Here no such revolution has been effected as that which virtually created anew the history of Oriental antiquity; yet the bearings of the new knowledge are similar in kind if different in degree. The world had never quite forgotten the history of the primitive Greeks as it had forgotten the Mesopotamians, the Hymaratic nations and the Hittites; but it remembered their deeds only in the form of poetical myths and traditions. These traditions, finding their clearest delineation in the lines of Homer, had been subjected to the criticism of the critical historians of the early decades of the 19th century, and their authenticity had come to be more than doubted. The philological analysis of Wolf and his successors had raised doubts as to the very existence of Homer, and at one time the main current of scholarly opinion had set strongly in the direction of the belief that the Iliad and the Odyssey were in reality but latter-day collections of divers recitals that had been handed down by word of mouth from one generation to another of bards through ages of illiteracy. It was strenuously contended that the case could not well be otherwise, inasmuch as the art of writing must have been quite unknown in Greece until after the alleged age of the traditional Homer, whose date had been variously estimated at from 1000 to 800 B.C. by less sceptical generations. It had come to be a current belief that the Iliad was first committed to writing in the age of Peisistratus. A prominent controversialist, F. A. Pauch, even went so far as to doubt whether a single written copy of the Iliad existed in Greece at the time of the Peloponnesian War. The doubts thus cast upon the age when the Homeric poems first assumed the fixed form of writing were closely associated with the universal scepticism as to the historical accuracy of any traditions whatever regarding the early history of Greece. Cautious historians had come to regard the so-called "Heroic Age" as a prehistoric period regarding which nothing definite was known, or in all probability could be known. It was ably argued by Sir George Cornewall Lewis, in connexion with his inquiries into early Roman history, that a verbal tradition is not transmitted from one generation to another in anything like an authentic form for a longer period than about a century. If, then, the art of writing was unknown in Greece before, let us say, the 6th century B.C., it would be useless to expect that any events of Grecian history prior to about the 7th century B.C. could have been transmitted to posterity with any degree of historical accuracy.

Notwithstanding the allures of the subject, such conservative historians as Grote were disposed to regard the problems of early Grecian history as inscrutable, and to content themselves with the recital of traditions without attempting to establish their relationship with actual facts. It remained for the more robust faith of a Schliemann to show that such scepticism was quite unfounded, by proving that at such sites as Tiryns, Mycenae and Hissarlik evidences of a very early pre-Greek civilization awaited the spade of the excavator. Thanks to the enthusiasm of Schliemann and his successors, we can now substitute for the mythical "Age of Heroes" a historical "Mycenaean Age" of Greece, and give tangible proof of its relatively high state of civilization. Schliemann may or may not have been correct in identifying one of the seven cities that he unearthed at Hissarlik as the fabled Troy itself, but at least his efforts sufficed to give verisimilitude to the Homeric story. With the lessons of recent Oriental archaeology in mind, few will be sceptical enough to doubt that some such contest as that described in the Iliad actually occurred. And now, thanks to the efforts of a large company of workers, notably Dr Arthur Evans and his associates in Cretan exploration, we are coming to speak with some confidence not merely of a Mycenaean but of a pre-Mycenaean Age.

As yet we see these periods somewhat darkly. The illuminative witness of written records is in the main denied us here. Some most archaic inscriptions have been indeed found by the explorers in Crete, but these for the present serve scarcely any other purpose than to prove the antiquity of the art of writing among a people who were closely in touch with the inhabitants of Hellas proper. Most unfortunately for posterity, the Greeks wrote mainly on perishable materials, and hence the chief records even of their later civilization have vanished. The only fragments of Greek manuscripts antedating the Christian era that have been preserved to us have been found in Egypt, where a hospitable climate granted them a term of existence not to be hoped for elsewhere. No fragment of these papyri, indeed, carries us further back than the age of the Ptolemies; but the Greek inscriptions on the statues of Rameses II. at Abu-Simbel, in Nubia, give conclusive proof that the art of writing was widely known among the Greeks at least three centuries before the age of Alexander. This carries us back to the traditional age of Homer.

The Cretan inscriptions belong to a far older epoch, and are written in two non-Grecian scripts of undetermined affinities. Here, then, is direct evidence that the Aegean peoples of the Mycenaean Age knew how to write, and it is no longer necessary to assume that the verses of the Iliad were dependent on mere verbal transmission for any such period as has been supposed.

But even were direct evidence of the knowledge of the art of writing in Greece of the early day altogether lacking, none but the hardest sceptic could doubt, in the light of recent archaeological discoveries elsewhere, that the inhabitants of ancient Hellas of the "Heroic Age" must have shared with their contemporaries the capacity to record their thought in written words. We have seen that Oriental archaeology has in recent generations revolutionized our conceptions of the antiquity of civilization. We have seen that written documents have been preserved in Mesopotamia to which such a date as 4500 B.C. may be ascribed with a good deal of confidence; and that from the third millennium B.C. a flood of contemporary literary records comes to us both from Egypt and Mesopotamia. But until recently it had been supposed that Hellas was shut out entirely from this Oriental culture. Historians have found it hard to dispel the idea that civilization in Greece was a very late development, and that the culture of the age of Solon sprang, in fact, suddenly into existence, as it seems to do in the records of the
historian. But the excavations that have given us a knowledge of the Mycenaean Age have proved conclusively, not alone that civilization existed in Greece in an early day, but that this civilization was closely linked with the civilization of Egypt. Not only have antiquities been found in Crete that point to Egyptian inspiration, but quite recently Professor Petrie has found at Tel el-Amarna Mycenaean pottery. The latter find has a peculiar significance, since the date of the Tel el-Amarna collection is definitely fixed between the years 1400 and 1370 B.C. It is demonstrated, then, that as early as the beginning of the 15th century B.C. the Mycenaean civilization was in touch with the ancient civilization of Egypt. One must not infer from this, however, that the two civilizations met on anything like an equality. Indeed, in the wonderful Tel-el-Amarna collection there is a suggestive absence of literary documents from the Aegean that demands a word of notice. The Tel el-Amarna collection, it will be recalled, consists of the royal archives of King Amenophis IV. of the XVIIIth Egyptian dynasty, who in the latter years of his reign chose to be known as Akhenaton, "the glory of the solar disk." This monarch had retired from Thebes and established his court on the site now known as Tel el-Amarna, where he founded the city which existed only during the brief period of thirty years ending with the death of the monarch about 1370 B.C. The date of the documents found in the royal library is, therefore, fixed within very narrow limits. The documents in question consist chiefly of letters, and constitute one of the most important of archaeological finds. These letters came to the king from almost every part of western Asia, including Palestine and Phoenicia, Babylonia and Asia Minor. Strangely enough, all the letters are written in the Babylonian character, and most of them are in the Babylonian language. They afford, therefore, most striking evidence of a widespread diffusion of Babylonian culture. Incidentally they prove, to the utter confusion of a certain school of Bible critics, that the art of writing was familiarly known in Canaan, and that Egypt and western Asia were in full literary connexion with one another, long before the time of the Exodus. Hence all the elaborate arguments based on the supposition that Moses probably could not write fell to the ground. On the other hand, the absence of letters from Mycenae among the tablets of Tel el-Amarna must be regarded as at least suggestive. Seemingly the widespread Babylonian culture had not reached the Aegean peoples; yet these peoples cannot have been wholly ignorant of things with which commercial intercourse brought them in contact. The point is of no very great significance, however, since no one has pretended that the Western civilization compared with the Eastern in point of antiquity; and in any event, no amount of negative evidence weighs a grain in the balance against the positive evidence of the Cretan inscriptions.

The researches of the archaeologist are, in short, tending to reconstruct the primitive classical history; and here, as in the Orient, it is evident that historians of the earlier day were constantly blinded by a misconception as to the antiquity of civilizations. Such a fruitage as that of Greek culture of the age of Pericles does not grow to maturity without a long period of preparation. Here, as elsewhere, knowledge of the solution holds, permitting no sudden stupendous leaps. But it is among the arduous labours of the archaeologist to prove a proposition that, once proven, seems self-evident. (H. S. Wl.)

Eras and Periods.

In the article Calendar (q.v.), that part of chronology is treated which relates to the measurement of time, and the principal methods are explained that have been employed, or are still in use, for adjusting the lunar months of the solar year, as well as the intercalations necessary for regulating the civil year according to the celestial motions. But it is necessary to notice here the different Eras and Periods that have been employed by historians, and by the different nations of the world, in recording the succession of time and events, to fix the epochs at which the eras respectively commenced, to ascertain the form and the initial day of the year made use of, and to establish their correspondence with the years of the Christian era. These elements will enable us to convert, by a simple arithmetical operation, any historical date, of which the chronological characters are given according to any era whatever, into the corresponding date in the Christian era.

Julian Period.—Although the Julian period (the invention of Joseph Scaliger, in 1582) is not, properly speaking, a chronological system, yet, on account of its affording considerable facilities in the comparison of different eras with one another, and in marking without ambiguity the years before Christ, it is very generally employed by chroniclers. It consists of 7980 Julian years; and the first year of the Christian era corresponded with the year 4714 of the Julian period.

Olympiads.—The Olympic games, so famous in Greek history, were celebrated once every four years, between the new and full moon following the summer solstice, on the small plain named Olympia in Elis, which was bounded on one side by the river Alpheus, on another by the small tributary stream the Cladeus, and on the other two sides by mountains. The games lasted five days. Their origin, lost in the dimness of remote antiquity, was invested by priestly legends with a sacred character. They were said to have been instituted by the Idaean Heracles, to commemorate his victory over his four brothers in a foot-race. According to a tradition, possibly more authentic, they were re-established by Iphitus, king of Elis, in concert with Libanus and Clearchus of Pisidia. The practice was long afterwards adopted of designating the Olympic period of four years, by the name of the victor in the contests of the stadium, and of inscribing his name in the gymnasion of Olympia. The first who received this honour was Coroebus. The games in which Coroebus was victor, and which form the principal epoch of Greek history, were celebrated about the time of the summer solstice 776 B.C. before the common era of the Incarnation, in the 3938th year of the Julian period, and twenty-three years, according to the account of Varro, before the foundation of Rome.

Before the introduction of the Metonic cycle, the Olympic year began sometimes with the full moon which followed, at other times with that which preceded the summer solstice, because the year sometimes contained 384 days instead of 354. But subsequently to its adoption, the year always commenced with the eleventh day of the moon which followed the solstice. In order to avoid troublesome computations it was necessary to recommence for every year, and of which the results differ only by a few days, chronologers generally regard the 1st of July as the commencement of the Olympic year. Some authors, however, among whom are Eusebius, Jerome and the historian Socrates, place its commencement at the 1st of September; these, however, appear to have confounded the Olympic year with the civil year of the Greeks, or the era of the Seleucidae.

It is material to observe, that as the Olympic years and periods begin with the 1st of July, the first six months of a year of our era correspond to one Olympic year, and the last six months to another. Thus, when it is said that the first year of the Incarnation corresponds to the first of the 150th Olympiad, we are to understand that it is only with respect to the last six months of that year that the correspondence takes place. The first six months belonged to the fourteenth year of the 19th Olympiad, as reckoned by Olympiads to our era, or the contrary, we must therefore distinguish two cases.

1st. When the event in question happened between the 1st of January and the 1st of the following July, the sum of the Olympic year and of the year before Christ is always equal to 776. The year of the era, therefore, will be found by subtracting the number of the Olympic year from 776. For example, Varro refers the foundation of the city of Rome to the 3rd Olympiad, and the 1st of January, B.C. the 23rd of July. The 1st of January is 776 years before Christ, and the 3rd Olympiad, and it is required to find the year before our era. Since five Olympic periods have elapsed, the third year of the sixth Olympiad is 5×4 +3 =23; therefore, subtracting 23 from 776, we have 753 B.C., which is the year before Christ to which the foundation of Rome is referred by Varro.

2nd. When the event took place between the summer solstice and the 1st of January following, the sum of the Olympic year and of the year before Christ is equal to 777. The difference, therefore, between 777 and the year in one of the dates will give the year in the other date. Thus, the moon was eclipsed on the 27th of August, a little before midnight, in the year 413 before our era; and it is required.
to find the corresponding year in the Olympic era. Subtract 413 from 777, the remainder is 364; and 364 divided by four gives 91 without a remainder; consequently, the eclipse happened in the fourth year of the ninety-first Olympiad, which is the date to which it is referred by Censorinus.

If the year is after Christ, and the event took place in one of the first six months of the Olympic year, that is to say, between July and January, we must subtract 776 from the number of the Olympic year to find the corresponding year of our era; but if it took place in one of the last six months of the Olympic year, or between January and July, we must deduct 777. The computation by Olympiads seldom occurs in historical records after the middle of the 5th century of our era.

The names of the months were different in the different Grecian states. The Attic months, of which we possess the most certain knowledge, were named as follows:—

Era of the Foundation of Rome.—After the Olympiads, the era most frequently met with in ancient history is that of the foundation of Rome, which is the chronological epoch adopted by all the Roman historians. There are various opinions respecting the year of the foundation of Rome. (1) Fabius Pictor places it in the latter half of the first year of the eighth Olympiad, which corresponds with the 3967th of the Julian period, and with the year 747 B.C. (2) Polybius places it in the second year of the seventh Olympiad, corresponding with 3968 of the Julian period, and 750 B.C. (3) Porcius Cato places it in the first year of the seventh Olympiad, that is, in 3963 of the Julian period, and 751 B.C. (4) Terentius Flaccus places it in the fourth year of the sixth Olympiad, that is, in the year 3962 of the Julian period, and 752 B.C. (5) Varro places it in the third year of the sixth Olympiad, that is, in the year 3961 of the Julian period, and 753 B.C. A knowledge of these different computations is necessary, in order to reconcile the Roman historians with one another, and even any one writer with himself. Livy in general adheres to the epoch of Cato, though he sometimes follows that of Fabius Pictor. Cicero follows the account of Varro, which is also in general adopted by Pliny. Dionysius of Halicarnassus follows Cato. Modern chronologists for the most part adopt the account of Varro, which is supported by a passage in Censorinus, where it is stated that the 901st year of Rome commenced with the festival of the Palilia, in the consulship of Usius Pumilia and Postumius Rufus. Now the Palilia is usually celebrated in the 23rd year of our era; therefore, deducting 238 from 901, we have 753 to denote the year before Christ. The Palilia commenced on the 21st of April; and all the accounts agree in regarding that day as the epoch of the foundation of Rome.

The Romans employed two sorts of years, the civil year, which was used in the transaction of public and private affairs, and the consular year, according to which the annals of their history have been composed. The civil year commenced with the birthdays of Janus, on the 21st of January, but this did not hold a fixed place in the solar year till the time of Julius Caesar (see Calendar). The installation of the consula regulated the commencement of the consular year. The initial day of each consulship was the second before the ides of March. The birthday of the Roman king, rather than that of the first consul, was celebrated as the birthday of Rome, but varied with the different accidents which in times of political commotion so frequently occurred to accelerate or retard the elections. Hence it happens that a consular year, generally speaking, commences either 1st or 3d, but never 2d before the ides of March, and also of two civil years. The consulate is the date employed by the Latin historians generally, and by many of the Greeks, down to the 6th century of our era.

In the era of Rome the commencement of the year is placed at the 21st of April: an event therefore which happened in the months of January, February, March, or during the first twenty days of April, in the year (for example) 300 of Rome, belongs to the civil year 300 B.C. and the consular year 300, and is the first day of the 300th year of the calendar, which is the last month of the year. Many authors confound the year of Rome with the civil year, supposing them both to begin on the 1st of January. Others again confound both the year of Rome and the civil year with the Julian year, which in fact became the civil year after the regulation on the calendar by Julius Caesar. Through a like want of attention, many writers also, particularly among the moderns, have confounded the Julian and Olympic years, by making an entire Julian year correspond to an entire Olympic year, as if both had commenced at the same epoch. Much attention to these particulars is required in the comparison of ancient dates.

The Christian Era.—The Christian or vulgar era, called also the era of the Incarnation, is now almost universally employed in Christian countries, and is even used by some Eastern nations. Its epoch or beginning is the 1st of January in the fourth year of the 104th Olympiad, the 753rd from the foundation of Rome, and the 4714th of the Julian period. This epoch was introduced in Italy in the 6th century, by Dionysius the Little, a Roman abbot, and began to be used in Gaul in the 8th, though it was not generally followed in that country till a century later. From extant charters it is known to have been in use in England before the close of the 8th century. Before its adoption the usual practice in Latin countries was to distinguish the years by their number in the cycle of Indiction.

In the Christian era the years are simply distinguished by the cardinal numbers; those before Christ being marked b.c. (Before Christ), or a.c. (Ante Christum), and those after Christ a.n. (Anno Domini). This method of reckoning time is more convenient than those which employ cycles or periods of any length whatever; but it still fails to satisfy in the simplest manner all the conditions that are necessary for registering the succession of events. For, since the commencement of the era is placed at an intermediate period of history, we are compelled to resort to a double manner of reckoning, backward as well as forward. Some ambiguity is also occasioned by the want of uniformity in the method of numbering the preceding years. Astronomers denote the year which preceded the first of our era by o, and the year previous to that by 1 B.C.; but chronologers, in conformity with common notions, call the year preceding the era 1 B.C., the previous year 2 B.C., and so on. By reckoning in this manner, there is an interruption in the regular succession of the numbers; and in the years preceding the era, the leap years, instead of falling on the fourth, eighth, twelfth, &c., fall, or ought to fall, on the first, fifth, ninth, &c.

In the chronicles of the middle ages much uncertainty frequently arises respecting dates on account of the different epochs assumed for the beginning of the Christian year. Dionysius, the author of the era, adopted the day of the Annunciation, or the 25th of March, which preceded the birth of Christ by nine months, as the commencement of the first year of the era. This epoch therefore precedes that of the vulgar era by nine months and seven days. This manner of dating was followed in some of the Italian states, and continued to be used at Pisa even down to the year 1745. It was also adopted in some of the Papal bulls; and there are proofs of its having been employed in France about the middle of the 11th century. Some chroniclers, who adhere to the day of the Annunciation as the commencement of the new era, assign it to the 25th of March, thus following the Florentines in the 10th century. Gregory of Tours, and some writers of the 6th and 7th centuries, make the year begin sometimes with the 1st of March, and sometimes with the 1st of January. In France, under the third race of kings, it was usual to begin the year with Easter; and this practice continued at least till the middle of the 16th century, for an edict was issued by Charles IX. in the month of January 1663, ordaining that the beginning of the year should thenceforth be considered as taking place on the 1st of January. An instance is given, in L'Art de vérifier les dates, of a date in which the year is reckoned from the 18th of March; but it is probable that this refers to the astronomical year, and that the 18th of March was taken for the day of the vernal equinox. In Germany, about the 11th century, it was usual to begin the year at Christmas; and this practice also prevailed at Milan, Rome and other Italian cities, in the 15th, 14th and 13th centuries. The practice of placing the beginning of the year at Christmas was introduced in the 7th century, and traces of it are found even in the 13th. Gervase of Canterbury, who lived in the 13th century, mentions that almost all writers of his country agreed in regarding Christmas day as the first of the year, because it forms, as it were, the term at which the sun finishes and recommences his annual course. In the 12th century, however, the custom of beginning the civil year with the day of the Annunciation, or the 25th of March, began to prevail.
continued to be generally followed from that time till the reformation of the calendar in 1752. The historical year has always been reckoned by English authors to begin with the 1st of January. The liturgical year of the Church of England commences with the first Sunday of Advent.

A knowledge of the different epochs which have been chosen for the commencement of the year in different countries is indispensably necessary to a right interpretation of ancient chronicles, characters and other documents in which the dates of events are often contradictory. We may cite an example or two.

It is well known that Charles the Great was crowned emperor at Rome on Christmas day in the year 800, and that he died in the year 814, according to our present manner of reckoning. But in the annals of Metz and Moissac, the coronation is stated to have taken place in the year 801, and his death in 813. In the first case the annalist supposes the year to begin with Christmas, and accordingly reckons the 25th of December and all the following days of that month to belong to 801, whereas in the common reckoning they would be referred to the year 800. In the second case the year has been supposed to begin with the 25th of March, or perhaps with Easter; consequently the first three months of the year 814, reckoning from the 1st of January, would be referred to the end of the year 813. The English Revolution is popularly called the Revolution of 1688. Had the year then begun, as it now does, with the 1st of January, it would have been the revolution of 1689, William and Mary being received as king and queen in February in the year 1689; but at that time the year was considered in England as beginning on the 25th of March. Another circumstance to which it is often necessary to pay attention in the comparison of dates, is the alteration of style which took place on the adoption of the Gregorian Calendar (see Calendar).

Era of the Creation of the World.—As the Greek and Roman methods of computing time were connected with certain pagan rites and observances which the Christian Church in abhorrence, the latter began an entirely new period to imitate the Jews in reckoning their years from the supposed period of the creation of the world. Various computations were made at different times, from Biblical sources, as to the age of the world; and Des Vignoles, in the preface to his Chronology of Sacred History, asserts that he collected upwards of two hundred different calculations, the shortest of which reckons only 3483 years between the creation of the world and the commencement of the vulgar era and the longest 6984. The so-called era of the creation of the world is therefore a purely conventional and arbitrary epoch; practically, it means the year 4004 B.C.,—this being the date which, under the sanction of Archbishop Usher's opinion, won its way, among its hundreds of competitors, into general acceptance.

Jewish Year and Era.—Before the departure of the Israelites from Egypt their year commenced at the autumnal equinox; but in order to solemnize the memory of their deliverance, the month of Nisan or Abb, in which that event took place, and which falls about the time of the vernal equinox, was afterwards regarded as the beginning of the ecclesiastical or legal year. In civil affairs, and in the regulation of the jubilees and sabbatical years, the Jews still adhere to the ancient year, which begins with the month Tisri, about the time of the autumnal equinox.

After their dispersion the Jews were constrained to have recourse to the astronomical rules and cycles of the more enlightened heathen, in order that their religious festivals might be observed on the same days in all the countries through which they were scattered. For this purpose they adopted a cycle of eighty-four years, which is mentioned by several of the ancient fathers of the church, and which the early Christians borrowed from them for the regulation of Easter. This cycle seems to be neither more nor less than the Calippic period of seventy-six years, with the addition of a Greek octaeteris, or period of eight years, in order to disguise its true source, and give it an appearance of originality. In fact, the period of Calippus containing 27,759 days, and the octaeteris 2022 days, the sum, which is 30,681, is exactly the number of days in eighty-four Julian years. But the addition was very far from being an improvement on the work of Calippus; for instead of a difference of only five hours and fifty-three minutes between the places of the sun and moon, which was the whole extent of the Calippic period, this difference in the period of eighty-four years, amounted to one day, six hours and forty-one minutes. Buccherius places the beginning of this cycle in the year 162 B.C.; Prideaux in the year 291 B.C. According to the account of Prideaux, the fifth cycle must have begun in the year 46 of our era; and it was in this year, according to St. Prosperus, that the Christians began to employ the Jewish cycle of eighty-four years, which they followed, though not uniformly, for the regulation of Easter, till the time of the Council of Nice.

Soon after the Nicene council, the Jews, in imitation of the Christians, abandoned the cycle of eighty-four years, and adopted that of Meton, by which their lunisolar year is regulated at the present day. This improvement was first proposed by Rabbi Samuel, rector of the Jewish school of Sora in Mesopotamia, and was finally accomplished in the year 360 of our era by Rabbi Hillel, who introduced that form of the year which the Jews at present follow, and which, they say, is to endure till the coming of the Messiah.

Till the 15th century the Jews usually followed the era of the Seleucidae or of Contracts. Since that time they have generally employed a mundane era, and dated from the 'creation of the world, which, according to their computation, took place 3760 years and about three months before the beginning of our era. No rule can be given for determining with certainty the day on which any given Jewish year begins without entering into the minutiae of their irregular and complicated calendar.

Era of Constantinople.—This era, which is still used in the Greek Church, and was followed by the Russians till the time of Peter the Great, dates from the creation of the world. The Incarnation falls in the year 5509, and corresponds, as in our era, with the fourth year of the 194th Olympiad. The civil year commences with the 1st of September; the ecclesiastical year, sometimes with the 21st of March, sometimes with the 1st of April. It is not certain whether the year was considered at Constantinople as beginning with September before the separation of the Eastern and Western empires.

At the commencement of our era there had elapsed 5508 years and four months of the era of Constantinople. Hence the first eight months of the Christian year 1 coincide with the Constantinopolitan year 5509, while the last four months belong to the year 5510. In order, therefore, to find the year of Christ corresponding to any given year in the era of Constantinople, we have the following rule: If the event took place between the 1st of January and the end of August subtract 5508 from the given year; but if it happened between the 1st of September and the end of the year, subtract 5509.

Era of Alexandria.—This chronological computation of Julius Africanus was adopted by the Christians of Alexandria, who accordingly reckoned 5500 years from the creation of Adam to the birth of Christ. But in reducing Alexandrian dates to the common era it must be observed that Julius Africanus placed the epoch of the Incarnation three years earlier than it is placed in the usual reckoning, so that the initial day of the Christian era fell in the year 5503 of the Alexandrian era. This correspondence, however, continued only from the introduction of the era till the accession of Diocletian, when an alteration was made by dropping ten years in the Alexandrian account. Diocletian ascended the imperial throne in the year of Christ 284. According to the Alexandrian computation, this was the year 5787 of the world, and 287 of the Incarnation; but on this occasion ten years were omitted, and that year was thenceforth called the year 5777 of the world, and 277 of the Incarnation. There are, consequently, two distinctions of Alexandria, the one being used before and the other after the accession of Diocletian. It is not known for what reason the alteration was made; but it is conjectured that it was for the purpose of causing a new revolution of the cycle of nineteen years (which was introduced into the ecclesiastical computation about this time by Anatolius, bishop of Hierapolis) to begin with the first year of the reign of Diocletian. In fact, 5777 being divided by 19 leaves 1 for the year of the cycle. The Alexandrian
era continued to be followed by the Copis in the 15th century, and is said to be still used in Abyssinia.

Dates expressed according to this era are reduced to the common era by subtracting 5502, up to the Alexandrian year 5786 inclusive, and after that year by subtracting 5492; but if the date belongs to one of the four last months of the Christian year, we must subtract 5503 till the year 5786, and 5493 after that year.

Mundane Era of Antioch.—The chronological reckoning of Julius Africanus formed also the basis of the era of Antioch, which was adopted by the Christians of Syria, at the instance of Panodorus, an Egyptian monk, who flourished about the beginning of the 4th century. Panodorus struck off ten years from the account of Julius Africanus with regard to the years of the world, and he placed the Incarnation three years later, referring it to the fourth year of the 104th Olympiad, as in the common era. Hence the era of Antioch differed from the original era of Alexandria by ten years; but after the alteration of the latter at the accession of Diosclitan, the two eras coincided.

In reckoning from the Incarnation, however, there is a difference of seven years, that epoch being placed, in the reformed era of Alexandria, seven years later than in the mundane era of Antioch or in the Christian era.

As the Syrian year began in autumn, the year of Christ corresponding to any year in the mundane era of Antioch is found by subtracting 5492 or 5493 according as the event falls between January and September or from September to January.

Era of Nabonassar.—This era is famous in astronomy, having been generally followed by Hipparchus and Ptolemy. It is believed to have been in use from the very time of its origin; for the observations of eclipses which were collected in Chaldaea by Callisthenes, the general of Alexander, and transmitted by him to Aristotle, were for the greater part referred to the beginning of the reign of Nabonassar, founder of the kingdom of the Babylonians. It is the basis of the famous Canon of kings, also called Mathematical Canon, preserved to us in the works of Ptolemy, which, before the astonishing discoveries at Nineveh, was the sole authentic monument of Assyrian and Babylonian history known to us. The epoch from which it is reckoned is precisely determined by numerous celestial phenomena recorded by Ptolemy, and corresponds to Wednesday at mid-day, the 26th of February of the year 747 before Christ. The year was in all respects the same as the ancient Egyptian year. On account of the difference in the length of the Julian and Babylonian years, the conversion of dates according to the era of Nabonassar into years before Christ is attended with considerable trouble. The surest way is to follow a comparative table. Frequently the year cannot be fixed with certainty, unless we know also the month and the day.

The Greeks of Alexandria formerly employed the era of Nabonassar, with a year of 365 days; but soon after the reformulation of the calendar of Julius Caesar, they adopted, like other Roman provincials, the Julian intercalation. At this time the first of Thoth had reeded to the 20th of August. In the year 136 of our era, the first of Thoth in the ancient Egyptian year corresponded with the 20th of July, between which and the 29th of August there are forty days. The adoption of the Julian year must therefore have taken place about 160 years before the year 136 of our era (the difference between the Egyptian and Julian years being one day in four years), that is to say, about the year 25 B.C. In fact, the first of Thoth corresponded with the 29th of August in the Julian calendar, in the years 25, 24, 23 and 22 B.C.

Era of the Seleucidae, or Macedonian Era.—The era of the Seleucidae dates from the time of the occupation of Babylon by Seleucus Nicator, 311 years before Christ, in the year of Rome 442, and twelve years after the death of Alexander the Great. It was adopted not only in the monarchy of the Seleucidae but in general in all the Greek countries bordering on the Levant, was followed by the Jews till the 15th century, and is said to be used by some Arabsians even at the present day. By the Jews it was called the Era of Contracts, because the Syrian governors compelled them to make use of it in civil contracts; the writers of the books of Maccabees call it the Era of Kings. But notwithstanding its general prevalence in the East for many centuries, authors using it differ much with regard to their manner of expressing dates, in consequence of the different epochs adopted for the beginning of the year. Among the Syrian Greeks the year began with the month Elul, which corresponds to our September. The Nestorians and Jacobites at the present day suppose it to begin with the following month, or October. The author of the first book of Maccabees makes the era commence with the month Nisan, or April; and the author of the second book with the first Tishrin, or October. Albategni, a celebrated Arabian astronomer, dates from the 1st of October. Some of the Arabian writers, as Alfergani, date from the 1st of September. At Tyre the year was counted from the 19th of our October, at Gaza from the 25th of the same month, and at Damascus from the vernal equinox. These discrepancies render it extremely difficult to determine the exact correspondence of Macedonian dates with those of other eras; and the difficulty is rendered still greater by the want of uniformity in respect of the length of the year. Some authors who follow the Macedonian era, use the Egyptian or vague year of 365 days; Albagatti adopts the Julian year of 365 1/4 days.

According to the computation most generally followed, the year 312 of the era of the Seleucidae began on the 1st of September in the Julian year preceding the first of our era. Hence, to reduce a Macedonian date to the common era, subtract 311 years and four months.

The names of the Syrian and Macedonian months, and their correspondence with the Roman months, are as follows:

- Syrian
- Macedonian
- English

Era of Alexander.—Some of the Greek historians have assumed as a chronological epoch the death of Alexander the Great, in the year 325 B.C. The form of the year is the same as in the preceding era. This era has not been much followed; but it requires to be noticed in order that it may not be confounded with the era of the Seleucidae.

An Era of Tyre.—The era of Tyre is reckoned from the 19th of October, or the beginning of the Macedonian month Hyperberetaeus, in the year 126 B.C. In order, therefore, to reduce it to the common era, subtract 125; and when the date is B.C., subtract it from 126. Dates expressed according to this era occur only on a few medals, and in the acts of certain councils.

Caesarean Era of Antioch.—This era was established to commemorate the victory obtained by Julius Caesar on the plains of Pharsalia, on the 9th of August in the year 48 B.C., and the 706th of Rome. The Syrians computed it from their month Tishrin I.; but the Greeks threw it back to the month Gorpaeus of the preceding year. Hence there is a difference of eleven months between the epochs assumed by the Syrians and the Greeks. According to the computation of the Greeks, the 49th year of the Caesarean era began in the autumn of the year preceding the commencement of the Christian era; and, according to the Syrians, the 49th year began in the autumn of the first year of the Incarnation. It is followed by Evagrius in his Ecclesiastical History.

Julian Era.—The Julian era begins with the 1st of January, forty-five years B.C. It was designed to commemorate the reformation of the Roman calendar by Julius Caesar.

Era of Spain, or of the Caesars.—The conquest of Spain by Augustus, which was completed in the thirty-ninth year A.C., gave rise to this era, which began with the first day of the following...
CHRONOLOGY

year, and was long used in Spain and Portugal, and generally in all the Roman provinces subdued by the Visigoths, both in Africa and the South of France. Several of the councils of Carthage, and also that of Arles, are dated according to this era. After the 9th century it became usual to join with it in public acts the year of the Incarnation. It was followed in Catalonia till the year 1180, in the kingdom of Aragon till 1350, in Valencia till 1358, and in Castile till 1382. In Portugal it is said to have been in use so late as the year 1415, or 1422, though it would seem that after the establishment of the Portuguese monarchy, no other era was used in the public acts of that country than that of the Incarnation. As the era of Spain began with the 1st of January, and the months and days of the year are those of the Julian calendar, any date is reduced to the common era by subtracting thirty-eight from the number of the year.

Era of Actium, and Era of Augustus.—This era was established to commemorate the battle of Actium, which was fought on the 3rd of September, in the year 31 B.C., and in the 17th of the Julian era. By the Romans the era of Actium was considered as beginning on the 1st of January of the 16th of the Julian era, which is the 30th B.C. The Egyptians, who used this era till the time of Dioctelian, dated its commencement from the beginning of their month Thoth, or the 29th of August; and the Eastern Greeks from the 2nd of September. By the latter it was also called the era of Antioch, and it continued to be used till the 9th century. It must not be confounded with the Caesarean era of Antioch, which began seventeen years earlier. Many of the medals struck by the city of Antioch in honour of Augustus are dated according to this era.

Besides the era of Actium, there was also an Julian era, which began four years later, or 27 B.C., the year in which Augustus prevailed on the senate and people of Rome to decree the title of Augustus, and to confirm him in the supreme power of the empire.

Era of Diocletian, or Era of Martyrs.—It has been already stated that the Alexandrians, at the accession of the emperor Diocletian, made an alteration in their mundane era, by striking off ten years from their reckoning. At the same time they established a new era, which is still followed by the Abyssinians and Copts. It begins with the 29th of August (the first day of the Egyptian year) of the year 284 of our era, which was the first of the reign of Diocletian. The denomination of Era of Martyrs, subsequently given to it in commemoration of the persecution of the Christians, would seem to imply that its commencement ought to be referred to the year 303 of our era, for it was in that year that Diocletian issued his famous edict; but the practice of dating from the accession of Diocletian has prevailed. The ancient Egyptian year consisted of 365 days; but after the introduction of the Julian calendar, the astronomers of Alexandria adopted an intercalary year, and added six additional days instead of five to the end of the last month of every fourth year. The year thus became exactly similar to the Julian year. The Egyptian intercalary year, however, does not correspond to the Julian leap year, but is the year immediately preceding; and the intercalation takes place at the end of the year, or on the 29th of August. Hence the first three years of the Egyptian intercalary period begin on the 29th of our August, and the fourth begins on the 29th of that month. Before the end of that year the Julian intercalation takes place, and the beginning of the following Egyptian year is restored to the 29th of August. Hence to reduce a date according to this era to our own reckoning, it is necessary, for common years, to add 283 days and 240; but if the date belongs to the first three months of the year following the intercalation, or, which is the same thing, if in the third year of the Julian cycle it falls between the 30th of August and the end of the year, we must add 283 days and 241 days. The Ethiopians do not reckon the years from the beginning of the era in a consecutive series, but employ a period of 532 years, after the expiration of which they again begin with 1. This is the Dionysian or Great Paschal Period, and is formed by the multiplication of the numbers 28 and 19, that is, of the solar and lunar cycles, into each other.

The following are the names of the Ethiopian or Abyssinian months, with the days on which they begin in the Julian calendar, or old style:

<table>

</table>

The additional or epagomenal days begin on the 24th of August. In intercalary years the first seven months commence one day later. The Ethiopian months, followed by the modern Copts, agree with the above in every respect excepting the names.

Indiction.—The cycle of Indiction was very generally followed in the Roman empire for some centuries before the adoption of the Christian era. Three Indictions may be distinguished; but they differ only in regard to the commencement of the year.
1. The Constantinopolitan Indiction, like the Greek year, commenced with the month of September. This was followed in the Eastern empire, and in some instances also in France.
2. The Imperial or Constantinian Indiction is so called because its establishment is attributed to Constantine. This was also called the Caesarean Indiction. It begins on the 24th of September. It is not infrequently met with in the ancient chronicles of France and England.
3. The Roman or Pontifical Indiction began on the 25th of December or 1st of January, according as the Christian year was held to begin on the one or other of these days. It is often employed in papal bulls, especially after the time of Gregory VII., and traces of its use are found in early French authors.

Era of the Armenians.—The epoch of the Armenian era is that of the council of Ierba, in which the Armenians consummated their schism from the Greek church by condemning the acts of the council of Chalcedon; and it corresponds to Tuesday, the 9th of July of the year 552 of the Incarnation. In their civil affairs the Armenians follow the ancient vague year of the Egyptians; but their ecclesiastical year, which begins on the 11th of August, is regulated in the same manner as the Julian year, every fourth year consisting of 366 days, so that Easter and the other festivals are retained at the same place in the seasons as well as in the civil year. The Armenians also make use of the mundane era of Constantinople, and sometimes conjoin both methods of computation in the same documents. In their correspondence and transactions with Europeans, they generally follow the era of the Incarnation, and adopt the Julian year.

To reduce the civil dates of the Armenians to the Christian era, proceed as follows. Since the epoch is the 9th of July, there were 176 days from the beginning of the Armenian era to the end of the year 552 of our era; and since 552 was a leap year, the year 553 began a Julian intercalary period. Multiply, therefore, the number of Armenian years elapsed by 365; add the number of days from the commencement of the current year to the given date; subtract 176 from the sum, and the remainder will be the number of days from the 1st of January 553 to the given date. This number of days being reduced to Julian years, add the result to 552, and the sum gives the day in the Julian year, or old style.

In the ecclesiastical reckoning the year begins on the 11th of August. To reduce a date expressed in this reckoning to the Julian date, add 551 years, and the days elapsed from the 1st of January to the 10th of August, both inclusive, of the year 551— that is to say (since 552 is a leap year), 223 days. In leap years one day must be subtracted if the date falls between the 1st of March and 10th of August.

The following are the Armenian ecclesiastical months with their correspondence with those of the Julian calendar:

1. Navazardi begins 11th August.
2. Hori 10th September.
3. Shemni 9th October.
4. Dre Thari 8th November.
5. Kagoths 8th December.
6. Aracz 7th January.
7. Malegi 7th February.
8. Arci 27th March.
CHRONOLOGY

The Mahomedan Era, or Era of the Hegira.—The era in use among the Turks, Arabs and other Mahomedan nations is that of the Hegira or Hejra, the flight of the prophet from Mecca to Medina, 622 A.D. Its commencement, however, does not, as is sometimes stated, coincide with the very day of the flight, but precedes it by sixty-eight days. The precept, after leaving Mecca, to escape the pursuit of his enemies, the Korrishites, hid himself with his friend Abubekr in a cave near Mecca, and there lay for three days. The departure from the cave and setting out on the way to Medina is assigned to the ninth day of the third month, Rabia I.—corresponding to the 22nd of September of the year 622 A.D. The era begins from the first day of the month of Muharram preceding the flight, or first day of that Arabian year which coincides with Friday, July 16, 622 A.D. It is necessary to remember that by astronomers and by some historians the era is assigned to the preceding day, July 15.

It is stated by D’Herbelot that the era of the Hegira was instituted by Omar, the second caliph, in imitation of the Christian era of the martyrs.

Era of Yazdegerd, or Persian or Jadalcian Era.—This era begins with the elevation of Yazdegerd III. to the throne of Persia, on the 16th of June in the year of our era 632. Till the year 797 the Persian year resembled that of the above-mentioned Egyptian, consisting of 365 days without intercalation; but at that time the Persian calendar was reformed by Jalal ud-Din Malik Shah, sultan of Khorasan, and a method of intercalation adopted which, though less convenient, is considerably more accurate than the Julian. The intercalary period is 33 years,—one being added to the common year seven times successively at the end of four years, and the eighth intercalary being deferred till the end of the fifth year. This era was at one period universally adopted in Persia, and it still continues to be followed by the Parsees of India. The months consist of thirty days each, and each day is distinguished by a different name. According to Alfaraghi, the names of the Persian months are as follows:—

1. Afrudin-meh.
3. Adar-meh.
5. Schaharir-meh.
6. Di-meh.
7. Cardi-meh.
10. Tir-meh.

The five additional days (in intercalary years six) are named Mustarca.

As it does not appear that the above-mentioned rule of intercalation was ever regularly followed, it is impossible to assign exactly the days on which the different years begin. In some provinces of India the Parsees begin the year with September, in others they begin it with October. We have stated that the era began with the 16th June 632. But the vague year, which was followed till 797, anticipated the Julian year by one day every four years. In 447 years the anticipation would amount to about 112 days, and the beginning of the year would in consequence be thrown back to the beginning of the Julian year 637. For the ordinary year of the Persian era, therefore, add 631, and the year will be the year of our era in which the Persian year begins.

Chinese Chronology.—From the time of the emperor Yao, upwards of 2000 years B.C., the Chinese had two different eras; a civil year, which was regulated by the moon, and an astro-nomical year, which was solar. The civil year consisted in general of twelve months or lunations, but occasionally a thirteenth was added in order to preserve its correspondence with the solar year. Even at that early period the solar or astronomical year consisted of 365 1/4 days, like our Julian year; and it was arranged in the same manner, a day being intercalated every fourth year.

According to the missionary Gaubil, the Chinese divided the day into 100 ke, each ke into 100 minutes, and each minute into 100 seconds. This practice continued to prevail till the 17th century, when, at the instance of the Jesuit Schall, president of the tribunal of mathematics, they adopted the European method of dividing the day into twenty-four hours, each hour into sixty minutes, and each minute into sixty seconds. The civil day begins at midnight and ends at the middle of the following day.

Since the accession of the emperors of the Han dynasty, 206 B.C., the civil year of the Chinese has begun with the first day of that moon in the course of which the sun enters into the sign of the zodiac which corresponds with our sign Pisces. From the same period also they have employed, in the adjustment of their solar and lunar years, a period of nineteen years, twelve of which are common, containing twelve lunations each, and the remaining seven intercalary, containing thirteen lunations. It is not, however, precisely known how they distributed their months of thirty and twenty-nine days, or, as they termed them, great and small moons. This, with other matters appertaining to the calendar, was probably left to be regulated from time to time by the mathematical tribunal.

The Chinese divide the time of a complete revolution of the sun with regard to the solstitial points into twelve equal portions, each corresponding to thirty days, ten hours, thirty minutes. Each of these periods, which is denominated a tsie, is subdivided into two equal portions called chung-ki and tsie-ki, the chung-ki denoting the first half of the tsie, and the tsie-ki the latter half. Though the tsie are thus strictly portions of solar time, yet what is remarkable, though not peculiar to China, they give their name to the lunar months, each month or lunation having the name of the chung-ki or sign at which the sun arrives during that month. As the tsie is longer than a synodic revolution of the moon, the sun cannot arrive twice at a chung-ki during the same lunation; and as there are only twelve tsie, the year can contain only the months having different names. It must happen sometimes that in the course of a lunation the sun enters into no new sign; in this case the month is intercalary, and is called by the same name as the preceding month.

For chronological purposes, the Chinese, in common with some other nations of the east of Asia, employ cycles of sixty, by means of which they reckon their days, moons and years. The days are distributed in the calendar into cycles of sixty, in the same manner as the months are distributed into weeks, or cycles of seven. Each day of the cycle has a particular name, and as it is a usual practice, in mentioning dates, to give the name of the day along with that of the month and the year, this arrangement affords great facilities in verifying the epochs of Chinese chronology. The order of the days in the cycle is never interchanged, and it is usual practice, for the sake of regularity, to prolong an intercalation of a day till it falls on the first day of the month, which is the same as the last.

The cycle of sixty is of two subordinate cycles or series of characters, one of ten and the other of twelve, which are joined together so as to afford sixty different combinations. The names of the characters in the cycle of ten, which are called celestials, are—

The name of the first year, or of the first day, in the sexagenary cycle is formed by combining the first words in each of the above series; the second is formed by combining the second of each series, and so on to the tenth. For the next year the first word of the first series is combined with the second word of the second series, the second of the first series with the twelfth of the second, after this the third of the first series with the first of the second, and so on till the sixtieth combination, when the last of the first series concurs with the last of the second. Thus Kei, the first character of the first series, corresponds with Yih-Chow that of the second, Kei-sei-h that of the eleventh, Yih-hae of the twelfth, Ping-tsze that of the thirteenth, and so on. The order of proceeding is obvious.

In the Chinese history translated into the Tatar dialect by order of the emperor K’ang-hi, who died in 1721, the characters of the cycle begin to appear at the year 2357 B.C. From this it has been inferred
CHRUDIM—CHRYSANTHEMUM

that the Chinese empire was established previous to that epoch: but it is obviously so easy to extend the cycles backwards indefinitely, that the inference can have very little weight. The characters given to that year 2357 B.C. are Kea-shin, which denote the 41st of the 28 lunar months, if we suppose it to have begun 2397 B.C., or forty years before the reign of Yao. This is the epoch assumed by the authors of L'art de vérifier les dates. The mathematical tribunal has, however, from time immemorial counted the first 80 years of the reign of Yao from the eighty-first of the earlier dynasty. This, it must be supposed, was the true point of years of his reign. He ordains, for example, that they shall be called Ta-te.

In consequence of this edict, the following year is called the first of Ta-te, and the succeeding years the second, third, &c. of Ta-te. Mr. C. in our account, therefore assumes the emperor or his successor to order that the years shall be called by some other appellation. The periods thus formed are called by the Chinese Nien-hao. According to this method of dating the years, a new era commences with every reign, and the year corresponding to a Chinese date can only be found when we have before us a catalogue of the Nien-hao, with their relation to the years of our era.

For Hindu Chronology, see the article under that heading.

BIBLIOGRAPHY.—In addition to the early Greek writings already named, there are the forty books (some fifteen only extant in their entirety) of universal history compiled (about 8 B.C.) by Diodorus Siculus, and arranged in the form of annals; the Pontica, by Julius Caesar (about 240–230 A.D.); the treatise of Censorinus, entitled De die natali, written 238 A.D.; the Chronicon, in two books, of Eusebius Pamphil, bishop of Caesarea (about 325 A.D.), distinguished as the first book of a purely chronological character which has come down to us; and three important works forming parts of the Corpus Scriptorum Historiae Byzantinae, namely, the Chronographia of Georgius Synkellos (800 A.D.), the Chronographia of Johannes Malalas (7th century), and the Chronicon Paschale.

A monograph on Chronology, the following, which are arranged in the order of their publication, have an historical interest, as leading up to the epoch of modern research:

1583. De Emendatione Temporum, by Joseph Scaliger, in which were laid the foundations of the chronological science.

1603. Opus Chronologicum, by Sethus Calvisius.

1607. De Doctrina Temporum, by Petavius (Denis Petan), with its commentation in 1630, and an abridgment entitled Rationarium Temporum, in 1633–1634.

1650. Annales Vetusti et Novi Testamenti, by Archbishop Ussher, whose dates have by some means gained a place in the authorized version of the Bible.

1651. Regia Epitome Historiae Sacrae et Profanae, by Philippe Labbe, of which a French version was also published.

1699. Institutionum Chronologicarum libri duo, by Bishop Beveridge.

1709. L'Antiquité des temps rétablie et défendue, by Paul Pezron, with his Corrigendum in 1710, and an abridgment entitled Rationarium Temporum, in 1633–1634.

1728. The Chronology of Ancient Kingdoms amended, by Sir Isaac Newton, as a table as an instrument to construct a system on new bases, independent of the Greek chronologers.

1738. Chronologie de l'histoire sainte, by Alphonse de Vignoles.

1744. Tabletae chronologicae de historiae universelle, by N. Lenglet-Dufresnoy.

1750. The first edition in one vol. 4to of L'art de vérifier les dates, which in its third edition (1818–1831) appeared in 38 vols. 8vo, a colossal monument of the learning and labours of various members of the Comité de l'Observation temporelle.

1803. Handbuch der alten Geschichte, Geographie, und Chronologie, by G. G. Bredow, as a supplement to his Historische Tabellen.

1821. Tableaux historiques, chronologiques, et géographiques, by Buret, a work of 64 plates.

1824–1834. Fasti Hellenici, and 1845–1860, Fasti Romani, by H. Fynes Clinton. Epitomes of these elaborate works were published, 1851–1858.

1842. Fasti Temporibus Caritii, by Edward Greywell; and by the same author (1854), Origines Kalendariae Italicae; and 1862, Origines Kalendariae Helveticae.

More modern works are the Encyclopædia of Chronology, by B. B. Woodward and W. L. R. Cates (1872); and J. C. Macdonald's Chronologies and Calendars (1897). But see the separate historical articles in this work.

CHRUDIM, a town of Bohemia, Austria, 74 m. E.S.E. of Prague by rail. Pop. (1890) 13,017, mostly Czech. It has an important horse market, besides manufactures of sugar, spirits, beer, soap, paper and various chemical products. There are also several corn-mills and saw-mills. Chrudim is mentioned as the castle of a gaugraf as early as 993. The new town was founded by Ottokar II., who settled many Germans in it and gave it many privileges. After 1421 Chrudim was held by the Hussites, and though Ferdinand I. confiscated most of the town property, it prospered greatly till the outbreak of the Thirty Years' War. In 1625 the greater part of its Hussite inhabitants left the town, which suffered much later on from the Sweedes. Chrudim was the birthplace of Joseph Ressel (1793–1857), honoured in Austria as the inventor of the screw propeller.

CHRYSANTHEMUM ¹ (Chrysanthemum sinense; nat. ord. Compositae), one of the most popular of autumn flowers. It is a native of China, whence it was introduced to Europe. The first chrysanthemum in England was grown at Kew in 1790, whereas it had been sent by Mr. Celsius, a French gardener. It was not, however, till 1795 that the first chrysanthemum was actually grown in England. There were introduced by Mr. Fortune in 1846, and the latter having also been introduced by the same traveller about 1862. The Japanese kinds are unquestionably the most popular for decorative purposes as well as for exhibition. They afford a wide choice in colour, form, habit and times of flowering. The incurved Chinese kinds are severely neat-looking flowers in many shades of colour. The anemone-flowered kinds have long outer or ray petals, the interior or disk petals being short and tubular. These are to be had in many pleasing colours. The pompom kinds are small flowered, the petals being short. The plants are mostly dwarf in habit. In the single varieties the outer or ray florets alone are large and attractively coloured.

Plants for the Border.—As a border plant out of doors the chrysanthemum is of the easiest culture. It is an exceptionally good town plant, and in a judiciously chosen position it is equally well suited to the large beds of flowers, and the smaller beds of flowers, to which the temperature is not raised above 50° by artificial heat. This has the advantage of being accessible in all weathers. The bottom of the frame is covered with sifted coal ashes or coco-nut fibre, on which the shallow boxes or pots used in propagating are placed. These are well drained with broken crocks, the bottoms of the boxes being drilled to allow water to pass out quickly. The soil should consist of about equal parts of fibrous loam and leaf-mould, half a part of coarse sugar-sand, and about one quarter of vegetable soil. Most of the edges of the plant should be exposed to the direct rays of the sun; the compost is the whole should be passed through a quarter inch sieve and thoroughly mixed. The coarse leaf-mould, &c., from the sieve should be spread thinly over the drainage, and the boxes or pots filled almost to the rims with the compost, and

¹ The Gr. χρυσόθεμος (χρυσός, gold, and θέμος, flower) was the herbalists' name for C. segetum, the "corn marigold," with its yellow bloom, and was transferred by Linnaeus to the genus, being commonly restricted now to the species C. sinense.
Chrysanthemium: Chrysippus

covered, if possible, with a thin layer of silver-sand. It should be dressed firmly, watered with a fine rose, and allowed to drain for an hour. The cuttings should then be dabbled into the boxes in rows, just clear, the soil being gritty compost. Shoots which vary greatly in size from the rootstock make the best cuttings. In their absence cuttings from the stems are used. The ideal length for a cutting is about 2 in. Cut the stem squarely with a sharp knife just below a joint, and replace the lower portion as soon as possible and water it, CigH^2O. The fine rose should settle the soil around them.

The soil is not allowed to become dry. The cuttings should be looked over daily, decayed leaves removed, and surplus moisture, condensed on the glass, wiped away. Ventilate gradually as soon as possible, allowing the soil to become quite dry before another shift will be necessary, this time into pots about 5 in. in diameter. The soil should be similar to that advised for the previous potting, enriched with half a part of horse manure that has been thoroughly sweated by exposure. Plant out during May. Soil borders intended for potting should be thoroughly dug and manured. The strong growing kinds should be planted about 3 ft. apart, the smaller kinds being allowed a little less room.

In the summer, water in dry weather, syringe in the evenings whenever practicable. Protect the plants from the sun by shading the frames and keep close for a few days after allowing the little plants to recover from the check occasioned by the potting. Ventilation should be gradually increased until the plants are able to bear full exposure during favourable weather, without showing signs of distress by flagging. They should be carefully protected at all times from cold cutting winds. In April, should the weather be favourable, the plants may be transferred to the borders, especially should the positions happen to be sheltered. If this is not practicable, another shift will be necessary, this time into pots about 5 in. in diameter. The soil must be kept moist, but very strong growers may be given a larger size. The soil, prepared a fortnight in advance, should consist of four parts loam, two parts leaf-mould, one part fibrous coal, and one part of vegetable ash, and half a part of coarse silver-sand, half a part of vegetable ash, and a quart of bone-meal or a sprinkling of basic slag to every bushel of the mixture. Mix thoroughly and turn over the material in the bottom of the pots with a hoe. Work around the roots with a lath. The main stake for the support of the plant should now be given; other and smaller stakes may later be necessary when the plants are grown in a bushy form, but their number should not be overdone. The stakes should be as few as possible consistent with the safety of the shoots, which should be looped up loosely and neatly. The shoots may be placed in their summer quarters directly after potting. Stand them in rows in a sunny situation, the pots clear of one another, and the room being allowed between the rows for the cultivator to move freely among them. The main stakes are tied to rough trellis made by straining wire in two rows about 2 ft. apart, between which poles driven into the ground close enough to hold the shoots, should be allowed to stand on, there being little risk of worms working through into the pots. The plants, which are required to produce as many flowers as possible, should have their tips pinched out at frequent intervals during the summer months. April to the last week in June, for the main season kinds; and about the middle of July for the later kinds.

Towards the end of July the plants will need feeding at the roots with weak liquid manure or sugar water, or dusting of soluble chemical manure such as guano. The soil should be moderately moist when manure is given. In order that the flowers may be of good form, all lateral flower buds should be removed as soon as they appear, as well as terminating each shoot. Towards the end of September—earlier should the weather prove wet and cold—remove the plants to well-ventilated greenhouses where they are intended to flower. Feeding may then be given once or twice a week, but it should be noted that the flowers are likely to be injured if the plant is kept too warm. The leaves may be gradually reduced. The large mop-headed blooms seen at exhibitions in November are grown in the way described, but only one or two shoots are allowed to develop on a plant, each shoot eventually having one only bloom.

The chrysanthemum is subject to the attack of black aphis and green-fly. These pests may be destroyed, out of doors, by syringing with quassia and soft soap solutions, by dusting the affected parts with tobacco-powder, and indoors also by fumigating. Mildew occasionally affects the lower leaves after the flowering period. It should be checked by dusting the leaves attacked with sublimed sulphur. Rust is a fungoid disease of recent years. It is best checked by syringing the plants with liver of sulphur (1 oz. to 3 gallons of water) occasionally. It may also be checked by stopping up the ventilators in the greenhouse. Earwigs and slugs must be trapped and destroyed.

Flowers for Exhibition.—Flowers of exhibition standard must be as broad and as deep as the various varieties are capable of producing; they must be irregardless in colour. They should also exhibit the form peculiar to the variety in which at its best, very few kinds being precisely alike in this respect. New varieties are introduced in large numbers annually, some of which supplant the older; it, however, the cultivator must therefore study the peculiarities of several new kinds each year if he would be a successful exhibitor.

For lists of varieties, &c. see the catalogues of chrysanthemum growers, the Gardening Press, and the excellence cultural pamphlets which are published from time to time.

Chrysanthemum: Chrysippus, a Greek philosopher of the 4th century A.D., of the school of Lampsacus. He was one of the favourite pupils of Aesopus, and devoted himself mainly to the mystical side of Neoplatonism (p. e.). The emperor Julian (p. e.) went to him by the advice of Aesopus, and subsequently invited him to come to court, and assist in the projected resuscitation of Hellenism. But Chrysippus declined on the strength of unfavourable omens, as he said, but probably because he realized that the scheme was unlikely to bear fruit. For the same reason he abstained from drastic religious reforms in his capacity as high-priest of Lydia. As a result of his moderation, he remained high-priest till his death, venerated alike by Christians and pagans. His wife Melite, who was associated with him in the priestly office, was a kinwoman of Eunapius the biographer.

Chryselephantine (Gr. χρυσός, gold, and ἐλάφις, ivory), the architectural term given to statues which were built up on a wooden core, with ivory representing the flesh and gold the drapery. The two most celebrated examples are those by Phidias of the statue of Athena in the Parthenon and of Zeus in the temple at Olympia.

Chryseene C23H30, a hydrocarbon occurring in the high boiling fraction of the coal tar distillate. It is produced in small quantity in the distillation of amber, on passing the vapour of phenyl-naphthyl-methane through a red-hot tube, on heating indene, or by passing the mixed vapours of coumarone and naphtalene through a red-hot tube. It crystallizes in plates or octahedra (from benzene), which exhibit a violet fluorescence, and melt at 250° C. Chromic acid in glacial acetic acid solution oxidizes it to chrysosquione C16H6O4, which when distilled with lead oxide gives chryseketone C10H6O. When chryseene is fused with alkalis, chrysenic acid, C6H14O4, is produced, which, on heating gives β-phenyl-naphtalene. On heating chryseene with hydriodic acid and red phosphorus to 260° C., the hydroderivative C19H22 and C20H20 are produced. It gives characteristic addition products with picric acid and dinitroaniline. Impure chryseene is of a yellow colour; hence its name (χρυσός, golden yellow).

Chrysippus (c. 280–206 B.C.), Greek philosopher, the third great leader of the Stoics. A native of Soli in Cilicia (Diog. Laer. vii. 179), he was robbed of his property and came to Athens, where he studied possibly under Zeno, certainly under Cleaneithes. It is said also that he became a pupil of Arcesilaus and Laconides, heads of the Middle Academy. This impartiality in his early studies is the key of his philosophic work, the dominant characteristic of which is comprehensiveness rather than originality. He took the doctrines of Zeno and Cleanthes and crystallized them into a definite system; he further defended them against the attacks of the Academy. His polemic skill earned him the title of the "Column of the Portico." Diogenes Laertius says, "If the gods use dialectic, they can use nothing more than he, the genius of whom are: φύσιν ἐν ἑαυτῷ, ἐν τῷ σοφωτάτῳ, ""Without Chrysippus, there had been no Porch." He excelled in logic, the theory of knowledge, ethics and physics. His relations with Cleanthes, contemporaneously criticized by Antipater, are considered under Stoics.
It is said to have composed seven hundred and fifty treatises, fragments alone of which survive. Their style, we are told, was unpolished and arid in the extreme, while the example was lucid and impartial.

**CHRYSOBERYL**, a yellow or green gem-stone, remarkable for its hardness, being exceeded in this respect only by the diamond and corundum. The name suggests that it was formerly regarded as a golden variety of beryl; and it is notable that though differing widely from beryl it bears some relationship to it, inasmuch as it contains the element beryllium. In chrysoberyl, however, the beryllium exists as an aluminate, having the formula BeAlO₃, or BeO₂AlO. The analysis of a specimen of Brazilian chrysoberyl gave alumina 78-10, beryllia 17-94, and ferric oxide 4-88%.

The typical yellow colour of the stone inclines in many cases to pale green, occasionally passing into shades of dark green and brown. The iron usually present in the mineral seems responsible for the green colour. Chrysoberyl is often mistaken for its chrysole (q.v.), and has indeed been termed Oriental chrysole. In its crystalline forms it bears some relationship to chrysole, both crystallizing in the orthorhombic system, but it is a much harder and a denser mineral. As the two stones are apt to be confounded, it may be convenient to contrast their chief characters:

Chrysoberyl is not infrequently cloudy, opalescent and chatoyant, and is then known as "cypomene" (Gr. κυπαμα, a "cloud"). The cloudiness is referable to the presence of multitudes of microscopic cavities. Some of the cymophane, when cut with a convex surface, forms the most valuable kind of cat's-eye (see Cat's-Eye). A remarkable dichroic variety of chrysoberyl is known as alexandrite (q.v.).

Most chrysoberyl comes from Brazil, chiefly from the district of Minas Novas in the state of Minas Geraes, where it occurs as small water-worn pebbles. The cymophane is mostly from the gem-gravels of Ceylon. Chrysoberyl is known as a constituent of certain kinds of granite, pegmattite and gneiss. In the United States it occurs at Haddam, Conn.; Greenfield Centre, near Saratoga Springs, N.Y.; and in Manhattan Island. It is known also in the province of Quebec, Canada, and has been found near Gweilo in Rhodasia.

(F. W. R. *)

**CHRYSOCOLLA**, a hydrous copper silicate occurring as a decomposition product of copper ores. It is never found as crystals, but always as encrusting and botryoidal masses with a microcrystalline structure. It is green or bluish-green in colour, and often accompanied by metallic copper, being translucent and having a conchoidal fracture with vitreous lustre; sometimes it is earthy in texture. Not being a definite crystallized substance, it varies widely in chemical composition, the copper oxide (CuO), for example, varying in different analyses from 17 to 67%; the formula is usually given as Cu₆SiO₄·2H₂O.

The hardness (2-4) and specific gravity (2-0-2-8) are also variable. It has recently been suggested that the material may really be a mixture of more than one hydrous copper silicate, since differences in the microcrystaline structure of the different concentric layers of which the masses are built up may be detected. Various impurities (silica, &c.) are also commonly present, and several varieties have been distinguished by special names: thus dillenburgite, from Dillenburg in Nassau, contains copper carbonate; demidoffite and cyano-chalcite contain copper phosphate; and pilarite contains alumina (perhaps as allophane). The mineral occurs in the upper parts of veins of copper ores, and has resulted from their alteration by the action of waters containing silica in solution. Pseudomorphs of chrysocolla after various copper minerals (e.g. cuprite) are not uncommon. It is found in most copper mines.

The name chrysocolla (from χρυσός, gold, and κόλλα, glue) was applied by Theophrastus and other ancient writers to materials used in soldering gold, one of which, from the island of Cyprus, may have been identical with the mineral now known by this name.

A mineral known as pitchy copper-ore (Ger. Kupferpecker), and of some importance as an ore of copper, is usually classed as a variety of chrysocolla containing much admixed limonite. It is dark brown to black in colour, with a dull to glassy or resinous lustre, and resembles pitch in appearance. In thin sections it is translucent and optically isotropic, and recent examinations seem to prove that it is a homogeneous mineral and not a mechanical mixture of chrysocolla and limonite. (L. J. S.)

**CHRYSOHITE**, a transparent variety of olivine, used as a gem-stone and often called peridot. The name chrysolite, meaning "golden stone" (χρυσός and λιθος), has been applied to various yellowish gems, notably to topaz, to some kinds of beryl and to chrysoberyl. The true chrysoberyl, or chrysole, is a magnesium silicate, referable to the species olivine, and is appropriately called the lighter coloured member, inclining to yellow chrysoberyl, and the darker green stones peridot. Certain kinds of peridot, from the Schneckenstein in Saxony, are known as Saxone chrysolite; while moldavite, a substance much like a green obsidian, is sometimes called water chrysolite or pseudo-chrysoberyl.

See Chrysoberyl; Olivine; Peridot.

**CHRYSOOLORS, MANUEL** [or Emmanuel] (c. 1355-1415), one of the pioneers in spreading Greek literature in the West, was born at Constantinople of a distinguished family, which had removed with Constantine the Great to Byzantium. He was a pupil of Gemistus (q.v.). In 1393 he was sent to Italy by the emperor Manuel Palaeologus to implore the aid of the Christian princes against the Turks. He returned to Constanti- nople, but at the invitation of the magistrates of Florence he became about 1395 professor of the Greek language in that city, where he taught three years. He became famous as a translator of Homer and Plato. Having visited Milan and Pavia, and resided for several years at Venice, he went to Rome upon the invitation of Bruni Leonardo, who had been his pupil, and was then secretary to Gregory XII. In 1408 he was sent to Paris on an important mission from the emperor Manuel Palaeologus. In 1413 he went to Germany on an embassy to the emperor Sigismund, the object of which was to fix a place for the assembling of a general council. It was decided that the meeting should take place at Constance; and Chrysoolors was on his way thither, having been chosen to represent the Greek Church, when he died suddenly on the 15th of April 1415. Only two of his works have been printed, his *Erotema* (published at Venice in 1484), which was the first Greek grammar in use in the West, and *Epistolae III. de comparatione vetern et novae Romae*.

John Chrysoolors, a relative of the above (variously described as "the new, brother, son"); who, like him, had studied and taught at Constantinople, and had then gone to Italy, shared Manuel's reputation as one of those who spread the influence of Greek letters in the West. His daughter married Filelfo (q.v.).

**CHRYSPRASE** (Gr. χρυσός, gold, and πράσις, leek), a name applied by modern mineralogists to an apple-green variety of chalcedony or hornstone, used as an ornamental stone. The colour is due to the presence of nickel, probably in the form of a hydrous silicate. By exposure to a moderate heat, or to strong light, the chrysprase becomes paler, or even colourless, but it may regain its colour by absorption of moisture. Chrysprase is a mineral of rather limited distribution. Most of it comes from the neighbourhood of Franklinstein in Silesia, where it occurs in association with altered serpentine. It is found to a limited extent at Revdinsk, near Ekaterinburg, in the Urals; and it occurs also in India. It is known, too, at several localities.
CHRYSTOSTOM

in North America, notably at Nickel Mount, Douglas county, Oregon, where it occurs in nickeliferous serpentine.

The chrysoprase of the moderns is certainly not the chryso-

prassos of Pliny, or the χρυσοπράσιον of Greek writers. The

anthony stone was not improbably our chrysoberyl, and it is
doubtful whether the modern chrysoprase was known until a

comparatively late period. The chrysoprase of Kosmetz, near
Frankenstein in Silesia, was discovered in 1740, and used by
Frederick the Great in the decoration of the palace of Sans
Souci at Potsdam. But at a much earlier date the Silesian
chrysoprase was used for mural decoration at the Wenzel chapel
in Prague. Chrysoprase was a favourite stone in England at
the beginning of the 19th century, being set round with small
brilliants and used for brooches and rings. At the present time
it is said to be regarded by some as a "lucky stone." Much
commercial chrysoprase is chalcedony artificially stained by
impregnation with a green salt of nickel.

F. W. R.*

CHRYSTOSTOM. St John Chrysostom (Χρυσοστόμος, golden-
mouthed), the most famous of the Greek Fathers, was born of
a noble family at Antioch, the capital of Syria, about A.D. 345
or 347. At the school of Libanius the sophist he gave early
indications of his mental powers, and would have been the
successor of his teacher, master, had he not been stolen away,
to use the expression of his teacher, to a life of piety (like
Augustine, Gregory of Nazianus, and Thodoret) by the
influence of his pious mother. At an age of 370 by the
influence of the bishop of Antioch, he gave up all his
forensic prospects, and buried himself in an adjacent desert,
where for nearly ten years he spent a life of ascetic self-denial
and theological study, to which he was introduced by Diodorus,
bishop of Tarsus, a famous scholar of the Antiochene type.
Illness, however, compelled him to return to the world; and the
authority of Meletius gained his services to the church. He was
ordained deacon in his thirty-fifth year (381), and afterwards
presbyter (386) at Antioch. On the death of Nectarius he was
appointed archbishop of Constantinople by Eutropius, the
favourite minister of the emperor Arcadius. He had, ten years
before this, only escaped promotion to the episcopate by a very
questionable stratagem—which, however, he defends in his
instructive and eloquent treatise De Sacerdoto. As a presbyter,
he won high reputation by his preaching at Antioch, more especi-
ally by his homilies on The Statutes, a course of sermons delivered
when the citizens were justly alarmed at the prospect of severe
measures being taken against them by the emperor Theodosius,
whose statutes had been demolished in a riot.

On the archiepiscopal throne Chrysostom still persevered in
the practice of monastic simplicity. The ample revenues which
his predecessors had consumed in pomp and luxury he diligently
applied to the establishment of hospitals; and the multitudes
who were supported by his charity preferred the eloquent
discourses of their benefactor to the amusements of the theatre
or of the circus. His homilies, which are still preserved, furnish
ample apology for the partiality of the people, exhibiting the
free command of a pure and copious vocabulary, an inexhaustible
fundi of metaphors and similitudes, giving variety and grace to
the most familiar topics, with an almost dramatic exposure of
the folly and turpitude of vice, and a deep moral earnestness.
His zeal as a bishop and eloquence as a preacher, however,
gained him enemies both in the church and at the court. The
ecclesiastics who were parted at his command from the lay-

sisters (whom they kept ostensibly as servants), the thirteen
bishops whom he deposed for simony and licentiousness at a
single visitation, the idle monks who thronged the avenues to
the court and found themselves the public object of his scorn—all
enraged against the powerful author of their wrongs. Their
resentment was inflamed by a powerful party, embracing the
magistrates, the ministers, the favourite eunuchs, the ladies of
the court, and Eudoxia the empress herself, against whom the
preacher thundered daily from the pulpit of St Sophia. A
favourable pretext for gratifying their revenge was discovered in
the shelter which Chrysostom had given to four Nitrian monks,
known as the tall brothers, who had come to Constantinople on
being excommunicated by their bishop, Theophilius of Alexandria,
a man who had long circulated in the East the charge of Origenism
against Chrysostom. By Theophilius's instrumentality a synod
was called to try or rather to condemn the archbishop; but
feeling the violence of the mob in the metropolis, who idolized
him for the fearlessness with which he exposed the vices of their
superiors, it held its sessions at the imperial estate named "The
Oak." (Synodos ad quercum), near Chalcedon, where Rufinus
had erected a stately church and monastery. A bishop and a
deacon were sent to accuse the archbishop, and presented him
a list of charges, in which pride, inhospitality and Origenism
were brought forward to procure the votes of those who hated
him for his austerity, or were prejudiced against him as a sus-
pected heretic. Four successive summonses were signified to
Chrysostom, but he indignantly refused to appear until four of
his notorious enemies were removed from the council. Without
entering into any examination of the charges brought before
them, the synod condemned him on the ground of contumacy,
and, hinting that his audacity merited the punishment of treason,
called on the emperor to ratify and enforce their decision. He
was immediately arrested and hurried to Nicaea in Bithynia.

As soon as the news of his banishment spread through the
city, the astonishment of the people was quickly exchanged for
a spirit of irresistible fury, which was increased by the occurrence
of an earthquake. In crowds they besieged the palace, and had
an armed body of foreign monks and sailors who had come from Chalcedon to the metropolis, despised at
the entreaty of Eudoxia, the emperor consented to his recall.
His return was greeted with all the pomp of a triumphal entry,
but in two months after he was again in exile. His fierce zeal
could not blind him to the vices of the court, and heedless of
personal danger he thundered against the profane honours that
were addressed almost within the precincts of St Sophia to the
statue of the empress. The haughty spirit of Eudoxia was
inflamed by the report of a discourse commencing with the
words—"Herodias is again furious; Herodias again dances;
she once more demands the head of John"; and though the
report was false, it sealed the doom of the archbishop. A new
council was summoned, more numerous and more subservient
to the wishes of Theophilius; and troops of barbarians were
quartered in the city to overawe the people. Without examining
it, the council confirmed the former sentence, and, in accordance
with canon 12 of the Synod of Antioch (341), pronounced his
deposition for having resused his functions without their
permission.

He was hurried away to the desolate town of Cucusus (Cocysus),
among the ridges of Mount Taurus, with a secret hope, perhaps,
that he might be a victim to the Isaurians on the march, or to
the more implacable fury of the monks. He arrived at his
destination in safety; and the sympathies of the people, which
had roused them to fire the cathedral and senate-house on the
day of his exile, followed him to his obscure retreat. His
influence also became more powerfully felt in the metropolis than before.
In his solitude he had ample leisure for forming schemes of
missionary enterprise among Persians and Goths, and by his
 correspondence with the different churches he established
at once baffled his enemies and gave greater energy to his friends.
This roused the emperor to visit him with a severer punishment, though
Innocent I. of Rome and the emperor Honorius recognized his
orthodoxy and besought his return. An order was despatched for
his removal to the extreme desert of Pityus; and his guards so
faithfully obeyed their instructions that, before he reached the
sea-coast of the Euxine, he expired at Comana in Pontus, in
the year 407. His exile gave rise to a schism in the church, and the
Johannists (as they were called) did not return to communion
with the archbishop of Constantinople till the relics of the saint
were, 30 years after, brought back to the Eastern metropolis with
great pomp and the emperor publicly implored forgiveness
from Heaven for the guilt of his ancestors. The festival of St
Chrysostom is kept in the Greek Church on the 13th of
November, and in the Latin Church on the 27th of January.

In his general teaching Chrysostom elevates the ascetic
element in religion, and in his homilies he inculcates the need of personal acquaintance with the Scriptures, and denounces ignorance of them as the source of all heresy. If on one or two points, as, for instance, the invocation of saints, some germs of subsequent Roman teaching may be discovered, there is a want of anything like the doctrine of indulgences or of compulsory private confession.

However, in 1641 to Innocent, bishop of Rome, he addresses him as a brother metropolitan, and sends the same letter to Venerius, bishop of Milan, and Chromatius, bishop of Aquileia. His correspondence breaths a most Christian spirit, especially in its tone of charity towards his persecutors.

In exegesis he is a pure Antiochene, basing his expositions upon thorough grammatical study, and proceeding from a knowledge of the original circumstances of composition to a forcible and practical application to the needs of his day and of all time. With his exegetical skill (he was inferior in pure dogma to Theodore of Mopsuestia) he united a wide sympathy and a marvellous power of oratory.

The voluminous works of Chrysostom fall into three groups. To the days of his early desert life is probably to be ascribed the treatise On Priesthood, a book full of wise counsel. To the years of his pontificate and episcopate belong the great mass of homilies and commentaries, among which those On the Statues, and on Matthew, Romans and Corinthians, stand out preeminently. His letters belong to the last years, the time of exile, and with his other works are valuable sources for the history of his time.

The manuscripts are very numerous, and many of them are of great antiquity, as are the Syriac and other translations. The best edition is that of Bernard de Montfaucon in 13 vols. fol. (1718–1738), reproduced with some improvements by Migne (Patrol. Græcæ, vol. i-iv.); but this edition is greatly indebted to the issue more than a century earlier (1612) by Sir Henry Savile, provost of Eton College, from a press established at Eton by himself, which Hallam (Lit. and Art., 1879, p. 138) has pronounced "the first work for learning in any large scale, published in England." F. Field admirably edited S. Matthew (Cambridge, 1839) and Epistles of S. Paul (Oxford, 1840–1855). J. A. Bengel’s edition of De Sacerdoto (1725) has been often reprinted (e.g. Leipzig, 1885).

As authorities for the life, the most valuable are the ecclesiastical histories of Socrates, Sozomen and Theodoret; and amongst the moderns, Erasmus, Cave, Larduer and Tillemont, with the church history of Neander, and his monograph on the Life and Times of Chrysostom, translated by J. C. Stapleton. More recent are the lives by W. R. W. Stephens (London, 1871), R. W. Bush (London, 1885) and A. Peach (Paris, 1891). F. W. Farrar’s romance Gathering Clouds gives a good idea of the life and times. For graphic and spiritual points such as Chrysostom’s theological position and his preaching, see the very full bibliography in E. Preuschen’s article in Herzog-Hauck’s Realency. iv.; also A. Harnack, Hist. of Dogma, iii. and iv. Some of the commentaries and homilies are translated in the Oxford Library of the Fathers.

CHUB (Leuciscus cephalus), a fish of the Cyprinid family, belonging to the same genus as the roach and dace. It is one of the largest of its family, attaining a length of 2 ft. and a weight of 5 to 7 lb. It does not avoid running waters, and is fond of insects, taking the fly readily, but its flesh, like that of the other Leucisci, is tasteless and full of bones. It is common in Great Britain and the continent of Europe. In America the name of "chub" is given to some other members of the family, and commonly to the horned dace (Semotilus atronmaculatus); well-known varieties are the river chub (Hybopsis kentuckiensis) and Columbia river chub (Myloichius caurinus).

CHUBB, CHARLES (d. 1843), English locksmith, started a hardware business at Winchester, subsequently removing to Portsea. Here he improved on the "detector" lock (q.v.), originally patented in 1818 by his brother, Jeremiah Chubb. He soon moved to London and then to Wolverhampton, where he employed two hundred hands. In 1835 he patented a process to render safes (q.v.) burglar-proof and fireproof, and subsequently established a large safe-factory in London. He died on the 16th of May 1845, and was succeeded in the business by his son, John Chubb (1816–1872), who patented various improvements in the products of the firm and largely increased its output. The factories were combined under one roof in a model plant, and the business grew to enormous proportions.

After John Chubb’s death the business was converted into a limited company under the management of his three sons.

CHUBB, THOMAS (1679–1746), English deist, the son of a malster, was born at East Harinn, near Salisbury, on the 29th of September 1750. The death of his father (1688) cut short his educational career, and in 1694 he was apprenticed to a glove-maker in Salisbury, but subsequently entered the employment of a tallow-chandler. He picked up a fair knowledge of mathematics and geography, but theology was his favourite study. His habit of committing his thoughts to writing gave him a clear and fluent style. He made his first appearance as an author in the Arian controversy. A dispute having arisen about Whiston’s argument in favour of the supremacy of the one God and Father, he wrote an essay, The Supremacy of the Father Asserted, which Whiston pronounced worthy of publication, and it was printed in 1715. A number of tracts followed, which were collected in 1730. For several years Chubb lived in the house of Sir Joseph Jekyll, master of the rolls, in what capacity it is not known; there are stories of his having waited at table as a servant out of livery. His love of independence drew him back to Salisbury, where by the kindness of friends he was enabled to devote the rest of his days to his studies. He died on the 8th of February 1746. Chubb is interesting mainly as showing that the rationalism of the intellectual classes had taken considerable hold upon the popular mind. Though he acquired little renown in England he was regarded by Voltaire and others as among the most logical of the deist school (see Deism). His principal works are A Discourse Concerning Reason (1731), The True Gospel of Jesus Christ (1739), and Posthumous Works, 2 vols. (1748), the last containing “The Author’s Farewell to his Readers.”

CHUBUT, a territory of the southern Argentine Republic, part of what was formerly called Patagonia, bounded N. by Rio Negro, S. by Santa Cruz, E. by the Atlantic and W. by Chile. Pop. (1895) 3748; (1904, estimate) 9060; area, 93,479 sq. m. Except for the valleys in the Andean foothills, which are fertile and well forested, and the land along the banks of the Chubut river, which flows entirely across the territory from the Andes to the Atlantic, the country is a barren waste, covered with pebbles and scanty clumps of dwarfed vegetation, with occasional shallow saline lakes. The larger rivers are the Chubut and the Senguerr, the latter flowing into Lake Colhuapi. There are a number of large lakes among the Andean foothills, the best known of which are Fontana, La Plata and General Paz, and, in the interior, Colhuapi or Colhué and Musters, the latter named after the English naval officer who traversed Patagonia in 1870. Petroleum was found at Comodoro Rivadavia, in the S. part of the territory, toward the close of 1907, at a depth of 768 ft. Chubut is known chiefly by the Welsh colony near the mouth of the Chubut river. The chief town of the Welsh, Rawson, is the capital of the territory, and Port Madryn on Bahia Nueva is its best port. Other colonies have been founded in the fertile valleys of the Andean foothills, but their growth is greatly impeded by lack of transportation facilities. (See further PATAGONIA.)

CHUDE, a tribal name used in both a special and a general sense. (1) It was the name given by the Russians to certain Estonian tribes with whom they came in contact as they spread gradually over their present empire. It would seem that the northern Chudes are the Vepsas, of whom about 21,000 are said to live near Lake Onega and in the northern parts of the government of Novgorod, and that the southern Chudes are the Votes who occupy about thirty parishes in north-west Ingeria. (2) As the Russians advanced eastwards they extended the name to various tribes whom they considered to be like the Estonians, and in popular use it has come to be applied to any ancient non-Russian people in Siberia, at least as far east as the Altai. In particular, ancient mines, tumuli and the metal work often found in them are commonly known as Chudish. Some investigators consider the Chudes to be the ancient builders of Patagonia, and in particular the name itself is translated into modern Spanish as Chubut, a river in the Argentine Republic, and thus in this sense it may be an expression of which the Chubut rive is the source.
CHUGUYEV—CHUNAR

CHUGUYEV, a town of Russia, in the government of Kharkov, 25 m. E.S.E. of the town of Kharkov, on the right bank of the northern Donets. It is a place of some strategic importance, and had in 1897 a population of 11,877.

CHUKCHI, CHANKTUS ("Men") or TUSSKI ("Brothers" or "Confederates"), a Mongoloid people inhabiting the north-easternmost portion of Siberia on the shores of the Arctic Ocean and Bering Sea. They are settled in small groups along the Arctic coast between the Bering Straits and the Kolyma river, or wandering as far inland as the Anadyr basin. Though their territory embraces some 300,000 odd sq. m., the most trustworthy estimates put their numbers at but a few thousands.

They were first carefully studied by the members of the Nordenskjöld expedition (1878-79), who describe them as tall, lean, with somewhat irregular features—hence de Quadrefages classes them as "Allophylian Whites." The accounts of their physical characteristics are somewhat confused owing to the presence of the true Eskimo in the Chukchi domain. The typical Chukchi is round-headed, and thus distinct from the long-headed Eskimo, with broad, flat features and high cheek-bones. The nose is often so buried between the puffed cheeks that a ruler might be laid across the face without touching it. The lips are thick, and the brow low. The hair is coarse, lank and black. The general muscular development is good, though usually the body is stunted. It has been suggested that they emigrated from the south, possibly from the Amur basin. In their arctic homes they long carried on war with the Ongkilon (Ang-kall) aborigines, gradually merging with the survivors and also mixing both with the Kusmen Koryaks (q.v.) and the Chuklukmuit Eskimo settled on the Asiatic side of Bering Strait. Their racial characteristics make them an ethnological link between the Mongols of central Asia and the Indians of America. Some authorities affiliate them to the Eskimo because they are believed to speak an Eskimo dialect. But this is merely a trade jargon, a hotchpotch of Eskimo, Chukchi, Koryak, English and even Hawaiian. The true Chukchi language, of which Nordenskjöld collected a thousand words, is distinct from Eskimo and akin to Koryak, and Nordenskjöld sums the problem up with the remark—"this race settled on the primeval route between the Old and New World bears an unmistakable stamp of the Mongols of Asia and the Eskimo and Indians of America."

The Chukchi are divided into the "Fishing Chukchi," who have settled homes on the coast, and the "Reindeer Chukchi," who are nomads. The latter breed reindeer (herds of more than 10,000 are not uncommon), live on the flesh and milk, and are generally fairly prosperous; while the fishing folk are very poor, begging from their richer kinsfolk hides to make tents and clothes. The Chukchi were formerly warlike and vigorously resisted the Russians, but to-day they are the most peaceable of folks, amiable in their manners, affectionate in family life and good-humoured. But this gentleness does not prevent them from killing off the old and infirm. They believe in a future life, but only for those who die a violent death. Thus it is regarded as an act of filial piety for a son to kill his parent or a nephew his uncle. This tribal custom is known as kamitok; and of it Mr Harry de Windt writes (Through the Gold Fields of Alaska to Bering Strait, 1898), "The doomed one takes a lively interest in the proceedings, and often assists in the preparation for his own death. The execution is always preceded by a feast, where seal and walrus meat are greedily devoured, and whisky consumed till all are intoxicated. A spontaneous burst of singing and the muffled roll of walrus-hide drums then herald the fatal moment. At a given signal a ring is formed by the relations and friends, the entire settlement looking on from the background. The executioner (usually the victim's son or brother) then steps forward, and placing his right foot behind the back of the condemned, slowly strangles him to death with a walrus thong. A kamitok took place during the latter part of our stay." The Chukchi are nominally Christians, but sacrifice animals to the spirits of the rivers and mountains, and also practise Shamanism. In personal habits the people are indescribably filthy. They are polygamous, but the women are treated kindly. The children are specially petted, and are so wrapped up to protect them from the cold that they have been described as resembling huge balls crossed by a bar, their arms having to remain outstretched owing to the bulk of their wrappings. Chukchi women are often tattooed with two black-blue convex lines running from the eye to the chin. Since their adoption of Christianity the men sometimes have a Latin cross tattooed on their chins. The Chukchi burn their dead or expose them on platforms to be devoured by ravens.

CHULALONGKORN, PHRA PARAMINDRA MAHA (1853-1910), king of Siam, eldest son of King Maha Mongkut, was born on the 21st of September 1853. His full signature, used in all important state documents, consists of twenty-seven names, but it is by the first four that he is usually known. Educated in his childhood by English teachers, he acquired a good knowledge of the English language and of Western culture. But his surroundings were purely oriental, and his boyhood was spent, according to custom, in a Buddhist monastery. He succeeded to the throne on the death of his father, 1st October 1868, and was crowned on the 11th of November following, a ceremony marked by the innovation of permitting the presence of Europeans. Until his majority in 1873 the government was carried on by a regent, the young king retiring to a Buddhist monastery, and later making a tour through India and the Dutch East Indies, an undertaking until then without precedent among the potentates of eastern Asia. He had no sooner taken the reins of power than he gave evidence of his recognition of the importance of modern culture by abolishing slavery in Siam. He simplified court etiquette, no longer demanding, for example, that his subjects should approach him on hands and knees. Still more important, in view of the numerous races and creeds included among his subjects, was the proclamation of liberty of conscience. This was followed by the erection of schools and hospitals, the construction of roads and railways, and the further development of the army and fleet which his father had initiated. To him Siam is indebted for its standard coinage, its postal and telegraph service, and for the policing, sanitation and electric-lighting of Bangkok. Several of his sons, including the crown prince, were educated in England, and in the summer of 1897 he himself visited England, arriving at Portsmouth in his yacht on the 29th of July. On the 4th of August he was received by Queen Victoria at Osborne. After a tour in Great Britain he proceeded to Berlin, Brussels, and the Hague and Paris. (See also SIAM.)

CHUMBI VALLEY, a valley connecting Tibet (g.v.) with the frontier of British India. Lying on the southern slopes of the Himalayas at an altitude of about 9,500 ft. above the sea, the valley is wedged in between Bhutan and Sikkim, and does not belong geographically but only politically to Tibet. This was the route by which the British mission of 1904 advanced. Before the date of that expedition the valley had acquired a reputation for beauty and fertility, which was subsequently found to be only comparative in relation to the barrenness of the rest of the Tibetan frontier. The summer months, though not hot, are relaxing and enervating.

CHUNAR, or CHUNARGUR, a town and ancient fortress of India, in the district of Mirzapur, in the United Provinces, situated on the south bank of the Ganges. Pop. (1901) 9226. The fort occupies a conspicuous site on the summit of an abrupt rock which commands the river. It was at one time a place of great strength, and still contains a magazine, and is fortified with batteries. In the old citadel on the height, the remains of a Hindu palace with some interesting carvings indicate the former importance of the place. The town, which consists of one or two straggling streets, contains a handsome English church. Chunar is first mentioned in the 16th century, when in possession of Sing Joapore. In 1530 it became the residence of Shere Shah the Afghan, and forty-five years later was recovered by the emperor Akbar after sustaining a siege of six months. It fell into the
hands of the English under General Carnac in 1763 after a prolonged resistance which caused considerable loss to the assailants. A treaty with the nawab of Oudh was signed here by Warren Hastings on behalf of the East India Company in September 1781.

CHUNCHU, a tribe of South American Indians, living in the forests east of Cuzco, central Peru. They are a fierce and savage people who have preserved their independence. They are said to be akin to their neighbours the Antis. They dwell in communal houses, and live chiefly by hunting. Chunchu has also been used to describe one of three aboriginal stocks of Peru, the others being Quichua and Aymara.

CH'UNGK'ING, a city in the province of Szech'uen, China, on the left bank of the Yangtsze, at its point of junction with the Kialing, in 29° 33' N. and 107° 2' E. It is surrounded by a crenelated stone wall, which is 5 m. in circumference and is pierced by nine gates. It is the commercial centre for the trade, not only of Szech'uen, but of all south-western China. The one highway between Szech'uen and the eastern provinces is the Yangtsze river route, as owing to the mountainous nature of the intervening country land transit is almost impracticable. The import trade brought up by large junks from Ich'ang, and consisting of cotton cloth, yarn, metals and foreign manufactures, centres here, and is distributed by a class of smaller vessels up the various rivers of the provinces. Native produce, such as yellow silk, white wax, hides, rhabarbar, musk and opium, is here collected and at various points to the mouth of the river. The great rise in the river during the summer months, at Ch'ungk'ing, ordinarily 70 ft. and occasionally as much as 120 ft., added to the difficulties. The population of Ch'ungk'ing, including the city of Kiangpei on the opposite bank of the Kialing river, is about 300,000. The foreign residents are very few. In 1895 the value of the trade passing through the port was £2,614,000, and in 1904 £4,214,568, of which imports counted for £2,644,777 and exports for £1,560,791.

CHUPATTY, an Anglo-Indian term for an unleavened cake of bread. The word represents the Hindustani chappati, and is applied to the usual form of native bread, the staple food of upper India. The chappaty is generally made of coarse wheat flour, patted flat with the hand, and baked upon a griddle. In the troubled times that preceded the mutiny of 1857 chappatties were circulated from village to village throughout India, apparently as a token of discontent.

CHUPRIYA (somesymes with Chupriya; Croatian Cuprija), the capital of the Morava department of Servia, on the railway from Belgrade to Nish, and on the right bank of the Morava, which is navigable up to this point by small sailing-vessels. Pop. (1900) about 6000. Some of the finest Servian cattle are bred in the neighbouring lowlands, and the town has a considerable trade in plums and other farm-produce. A light railway, leading to several important collieries, runs for 13 m. through the beech-forests and mountains on the east. Cloth is woven at Parachin, 5 m. S.; and Yagodina, 8 m. W. by N., is an important market town. Among the foothills of the Golubine Range, 7 m. E.N.E., is the 14th-century Ravanitsa monastery, with a ruined fort and an old church—their walls and frescoes pitted by Turkish bullets. There is a legend that here the Servian tsar Lazar (1374-1380) was visited by an angel, who bade him choose between an earthly and a heavenly crown. In accordance with his choice, Lazar fell fighting at Kossovo, and was buried at Ravanitsa; his body being afterwards transferred, through fear of the Turks, to another Ravanitsa, in eastern Slavonia. His crucifix is treasured among the monastic archives, which also contain a charter signed by Peter the Great of Russia (1672-1725). Manasia (Manassia), the still more celebrated foundation of Stephen, the son and successor of Lazar, lies 12 m. N. of Ravanitsa. Built in a cleft among the hills which line the river Resava, an affluent of the Morava, this monastery is enclosed in a fortress, whose square towers, and curtain without loopholes of members of the National Academy of Architecture. It remains largely intact. Within the curtain stand the monastic buildings, a large garden and a cruciform chapel, with many curious old stone carvings, half hidden beneath whitewash. Numerous gifts from the Russian court, such as gospels lettered in gold and silver relief, or jewelled crucifixes, are preserved on the spot; but the valuable library was removed, in the 19th century, to Mount Athos.

CHUQUISACA, a department of S.E. Bolivia, bounded N. by Cochabamba and Santa Cruz, E. by Santa Cruz and Brazil, S. by Tarjia, and W. by Potosi. It lies partly upon the eastern plateau of Bolivia and partly upon the great plains of the upper La Plata basin; area, 26,418 sq. m. The Pilcomayo, a large tributary of the Paraguay, crosses N.W. to S.E. the western part of the department. The climate of the lowlands is hot, humid and unhealthy, but that of the plateau is salubrious, though subject to greater extremes in temperature and rainfall. The seasons are sharply divided into wet and dry, the eastern plains becoming great lagoons during the wet season, and parched deserts during the dry. The mineral resources are important, but are less developed than those of Potosi and Oruro. Grazing is the principal industry of the plains, and cattle, sheep, goats and llamas are raised and cereals grown in the fertile valleys of the plateau. Three rough highways connect the department with its neighbours on the N. and W., and pack animals are the common means of transporting merchandise. The population was estimated at 204,434 in 1900, and is largely composed of Indians and mestizos. The plateau Indians are generally Aymaras, but on the eastern plains there are considerable settlements of partly civilized Chiriguanos, of Guarani origin. The department is divided into four provinces, the greater part of the lowlands being unsettled and without effective political organization. Its principal towns are Sucré, Camargo, Paticola and Yotala.

CHURCH, FREDERICK EDWIN (1826-1900), American landscape painter, was born at Hartford, Connecticut, on the 4th of May 1826. He was a pupil of Thomas Cole at Catskill, New York, where his first pictures were painted. Developing unusual technical dexterity, Church from the beginning sought for his themes such marvels of nature as Niagara Falls, the Andes, and tropical forests—he visited South America in 1853 and 1857,—volcanoes in eruption, and icebergs, the beauties of which he portrayed with great skill in the management of light, colour, and the phenomena of rainbow, mist and sunset, rendering these plausible and effective. In their time these paintings awoke the wildest admiration and sold for extravagant prices, collectors in the United States and in Europe eagerly seeking them, though their vogue has now passed away. In 1849 Church was made a member of the National Academy of Design. His “Great Fall at Niagara” (1857) is in the Corcoran Art Gallery, Washington, D.C., and a large “Twilight” is in the Walters Gallery, Baltimore, Maryland. Among his other canvases are “Andes of Ecuador” (1855), “Heart of the Andes” (1859), “Cotopaxi” (1862), “Jerusalem” (1870), and “Morning in the Tropics” (1877). He died on the 7th of April 1900, at his house on the Hudson river above New York City, where he had lived and worked for many years. He was the most prominent member of the so-called “Hudson River School” of American artists.

CHURCH, GEORGE EARL (1835-1910), American geographer, was born in New Bedford, Massachusetts, on the 7th of December 1835. He was educated as a civil engineer, and was early engaged on the Hoosac Tunnel. In 1858 he joined an exploring expedition to South America. During the American Civil War he
served (1862–1865) in the Army of the Potomac, rising to the command of a brigade and the rank of colonel; and in 1866–1867 he was war correspondent of the *New York Herald* in Mexico. He explored the Amazon (1868–1870), and gradually became the leading authority on that region of South America, being appointed United States commissioner to report on Ecuador in 1880, and visiting Costa Rica in 1885 to report on its debt and railways. He wrote extensively on South and Central American geography, and became a vice-president of the Royal Geographical Society (London), and in 1898 president of the geographical section of the British Association.

**CHURCH, SIR RICHARD** (1784–1873), British military officer and general in the Greek army, was the son of a Quaker, Matthew Church of Cork. He was born in 1784, and at the age of sixteen ran away from home and enlisted in the army. For this violation of its principles he was disowned by the Society of Friends, but his father bought him a commission, dated the 3rd of July 1800, in the 13th (Somersetshire) Light Infantry. He served in the demonstration against Ferrol, and in the expedition to Egypt under Sir Ralph Abercomby in 1801. After the expulsion of the French from Egypt he returned home, but came back to the Mediterranean in 1805 among the troops sent to defend the island of Sicily. He accompanied the expedition which landed in Calabria, and fought a successful battle against the French at Maida on the 6th of July 1806. Church was present on this occasion as captain of a recently raised company of Corsican Rangers. His zeal attracted the notice of his superiors, and he had begun to show his capacity for managing and drilling foreign levies. His Corsicans formed part of the garrison of Capri from October 1806 till the island was taken by an expedition directed against it by Murat, in September 1808, at the very beginning of his reign as king of Naples. Church, who had distinguished himself in the defence, returned to Malta after the capitulation.

In the summer of 1809 he sailed with the expedition sent to occupy the Ionian Islands. Here he increased the reputation he had already garnered as a brigadier of the French army in London. It included many of the men who were afterwards among the leaders of the Greeks in the War of Independence. Church commanded this regiment at the taking of Santa Maura, on which occasion his left arm was shattered by a bullet. During his slow recovery he travelled in northern Greece, and Macedonia, and to Constantinople. In the years of the fall of Napoleon (1813 and 1814) he was present as English military representative with the Austrian troops until the campaign which terminated in the expulsion of Murat from Naples. He drew up a report on the Ionian Islands for the congress of Vienna, in which he argued in support, not only of the retention of the islands under the British flag, but of the permanent occupation by Great Britain of Parga and of other formerly Venetian coast towns on the mainland, then in the possession of Ali Pasha of Iannina. The peace and the disbanding of his Greek regiment left him without employment, though his reputation was high at the war office, and his services were recognized by the grant of a companionship of the Bath. In 1817 he entered the service of King Ferdinand of Naples as lieutenant-general, with a commission to suppress the brigandage then rampant in Apulia. Ample powers were given him, and he attained a full measure of success. In 1820 he was appointed governor of Palermo and commander-in-chief of the troops in Sicily. The revolution which broke out in that year led to the termination of his services in Naples. He escaped from violence in Sicily with some difficulty. At Naples he was imprisoned and put on his trial by the government, but was acquitted and released in January 1821; and King George IV. conferred on him a knight commandership of the Hanoverian order.

The rising of the Greeks against the Turks, which began at this time, had his full sympathy from the start. But for some years he had to act only as the friend of the insurgents in England. In 1827 he took the honourable but unfortunate step of accepting the commander-in-chief of the Greeks. At the point of anarchy and indiscipline to which they had now fallen, the Greeks could no longer form an efficient army, and could look for salvation only to foreign intervention. Sir Richard Church, who landed in March, was sworn "archistrategos" on the 15th of April 1827. But he could not secure loyal co-operation or obedience. The rout of his army in an attempt to relieve the Greeks was an additional blow to his prestige. He was incapable of conducting regular operations. The acropolis capitulated, and Sir Richard turned to partisan warfare in western Greece. Here his activity had beneficial results, for it led to a rectification in 1832, in a sense favourable to Greece, of the frontier drawn by the powers in 1830 (see his Observations on an Eligible Line of Frontier for Greece, London, 1830). Church had, however, surrendered his commission, as a protest against the unfriendly government of Capo d'Istria, on the 25th of August 1829. He lived for the rest of his life in Greece, was created general of the army in 1854, and died at Athens on the 30th of March 1873. Sir Richard Church married in 1826 Elizabeth Augusta Wilmot-Horton, who survived him till 1878.

See *Sir Richard Church*, by Stanley Lane Poole (London, 1890); *Sir Richard Church in Italy and Greece*, by E. M. Church (Edinburgh, 1895), based on family papers (an Italian version, *Brigantaggio e società segrete nelle Puglie*, 1817–1828, executed under the direction of Carlo Lacaita, appeared at Florence in 1890). The MS. Correspondence and Papers of Sir Richard Church, in 29 vols., now in the British Museum (Add. MSS. 36543–36571), contain invaluable material for the history of the War of Greek Independence, including a narrative of the war during Church's tenure of the command which correctly states the errors in the published account, and successfully vindicates Church's reputation against the strictures of Finlay, Mendelssohn-Bartholdy, and other historians of the war (see *Cam. Mod. Hist.* x. p. 804). (D. II.)

**CHURCH, RICHARD WILLIAM** (1815–1890), English divine, son of John Dearman Church, brother of Sir Richard Church (q.v.), a merchant, was born at Lisbon on the 25th of April 1815, his early years being mostly spent at Florence. After his father's death in 1828 he was sent to a school of a pronounced evangelical type at Redlands, Bristol, and went in 1833 to Wadham College, Oxford, then an evangelical college. He took first-class honours in 1836, and in 1838 was elected fellow of Oriel. He contributed to the literary periodicals, and in 1842 published *Observations*. He was appointed tutor of Oriel in 1839, and was ordained the same year. He was an intimate friend of J. J. Newman at this period, and closely allied to the Tractarian party. In 1841 No. 90 of *Tracts for the Times* appeared, and Church resigned his tutorship. In 1844–1845 he was junior proctor, and in that capacity, in concert with his senior colleague, vetoed a proposal to censure Tract 90 publicly. In 1846 Church, with others, started *The Guardian* newspaper, and he was an early contributor to *The Saturday Review*. In 1850 he became engaged to Miss H. F. Bennett, of a Somersetshire family, a niece of George Moberly, bishop of Salisbury. After again holding the tutorship of Oriel, he accepted in 1852 the small living of Whatley in Somersetshire, near Frome, and was married in the following year. He was a diligent parish priest and a serious student, and contributed largely to current literature. In 1856 he refused a canonry at Worcester, but in 1871 he accepted, most reluctantly (calling it "a sacrifice en pure perte"), the deanship of St Paul's, to which he was nominated by W. E. Gladstone.

His task as dean was a complicated one. It was (1) the restoration of the cathedral; (2) the adjustment of the question of the cathedral revenues with the Ecclesiastical Commissioners; (3) the reorganization of a conservative cathedral staff with anomalous vested rights. He described the intention of his appointment to be "that St Paul's should wake up from its long slumber." The first year that he spent at St Paul's was, writes one of his friends, one of "misery" for a man who loved study and quiet and the country, and hated official pomp and financial business and ceremonious appearances. But he performed his difficult and uncongenial task with almost incredible success, and is said never to have made an enemy or a mistake. The dean was distinguished for uniting in a singular degree the virtues of austerity and sympathy. He was pre-eminently endowed with the faculty of judgment, characterized by Canon Scott Holland as the gift of "high and fine and same
and robust decision." Though of unimpressive stature, he had a strong magnetic influence over all brought into contact with him, and though of naturally gentle temperament, he never hesitated to express censure if he was convinced it was deserved. In the pulpit the voice of the dean was deliberately monotonous, and he employed no adventitious gesture. He may be described as a High Churchman, but of an essentially rational type, and with an enthusiasm for religious liberty that made it impossible for him to sympathize with any unbalanced or inconsistent demands for deference to authority. He said of the Church of England that there was "no more glorious church in Christendom than this inconsistent English Church." The dean often meditated resigning his office, though his reputation as an ecclesiastical statesman stood so high that he was regarded in 1882 as a possible successor to Archbishop Tait. But his health and mode of life made it out of the question. In 1888 his only son died; his own health declined, and he appeared for the last time in public at the funeral of Canon Liddon in 1890, dying on 9th December 1890, at Dover. He was buried at Whatley.

The dean's chief published works are a Life of St Anselm (1870), the lives of Spenser (1879) and Bacon (1884) in Macmillan's "Men of Letters" series, an Essay on Dante (1878), The Oxford Movement (1891), together with many other volumes of essays and sermons. A collection of his journalistic articles was published in 1897 as Occasional Papers. In these writings he exhibits a great grasp of principles, an accurate mastery of detail, and the same fusion of intelligent sympathy and dispassionate judgment that appeared in his handling of business. His style is lucid, and has the charm of austerity. He stated that he had never studied style per se, but that he had acquired it by the exercise of translation from classical languages; that he watched against the temptation of using unreal and fine words; that he employed care in his choice of verbs rather than in his use of adjectives; and that he fought against self-indulgence in writing just as he did in daily life. His sermons have the same quality of self-restraint. His private letters are fresh and simple, and contain many unadulterated epigrams; in writing of religious subjects he resolutely avoided dogmatism without ever sacrificing precision. The dean was a man of genius, whose moral stiffness and instinctive fire were indicated rather than revealed by his writings.

See Life and Letters of Dean Church, by his daughter, M. C. Church (1895); memoir by H. C. Beeching in Dict. Nat. Biog.; and D. C. Lathbury, Dean Church (1907). (A. L. B.)

CHURCH (according to most authorities derived from the Gr. κοιναόν [koinon], "the Lord's [house]," and common to many Teutonic, Slavonic and other languages under various forms—Scottish kirk, Gee. Kirche, Swed. kyrka, Dan. kirke, Russ. isker, Bulg. kerkva, Czech k cerkva, Finn. kirkko, &c.), a word originally applied to the building used for Christian worship, and subsequently extended to the Christian community (ecclesia) itself. Similarly the Greek word εκκλησία (ekklesia), "assembly," was very early transferred from the community to the building, and is used in both senses, especially in the modern Romance and Celtic languages (e.g. Fr. église, Welsh eglwys, &c.).

(i) Church Architecture.—From the strictly architectural point of view the subject of church building, including the development of the various styles and the essential features of the construction and arrangement of churches, is dealt with elsewhere (see ARCHITECTURE; ABBEY; BASILICA). It is, however, impossible to understand the development of church architecture without realizing its intimate connexion with that of the doctrine, organization and ritual of the Christian Church as a religious community, and a brief sketch of this connexion may be given here by way of introduction to the more technical treatment of the subject. In general it may be said of church architecture, more truly than of any other, that artistically it is "frozen music." It is true that at all times churches have been put to secular uses; in periods of unrest, as among the Nestorian Christians now, they were sometimes built to serve at need as fortresses; their towers were used for beacons, their naves for meetings on secular affairs. But as a rule, and especially in the great periods of church architecture, their builders were unhampered by any utilitarian considerations; they built for the glory of God, for their own glory perhaps, in honour of the saints; and their work, where it survives, is (as it were) a petrifaction of their beliefs and ideals. This is, of course, more true of the middle ages than of the times that preceded and followed them; the Church under the Roman empire hardly as yet realized the possibilities of "sermons in stones," and took over, with little change, the model of the secular and religious buildings of pagan Rome; the Renaissance, essentially a neo-pagan movement, introduced disturbing factors from outside, and, though developing a style very characteristic of the age that produced it, started that archaeological movement which has tended in modern times to substitute mere imitations of old models for any attempt to express in church architecture the religious spirit of the age.

The earliest type of Christian Church, out of which the others developed, was the basilica. The Church, emerging in the 4th century into imperial favour, and established as part of the organization of the Roman empire, simply adopted that type of secular official building which she found convenient for her purposes. The clergy, now Roman officials, vested in the robes of the civil dignitaries (see VESTMENTS), took their seats in the apse of the basilica where the magistrates were wont to sit, in front of them the holy table, facing the congregation. The cancelli, the lattice or bar, which in the civil tribunal had divided the court from the litigants and the public, now served to separate clergy and laity. This arrangement still survives in some of the ancient churches of Rome; it has been revived in many Protestant places of worship. It symbolized principally an official distinction; but with the theocratizing of the empire in the East and its decay in the West the accentuation of the mystic powers of the clergy led to a more complete separation from the laity, a tendency which left its mark on the arrangements of the churches. In the East the cancelli, under the influence possibly of the ritual of the Jewish temple, developed into the iconostasis, the screen of Holy pictures, behind the closed doors of which the supreme act of the eucharistic mystery is hidden from the lay people. In the West the high altar was moved to the east end (the presbyterium) with a space before it for the assisting deacons and subdeacons (the chancel proper) reared off as a spot peculiarly holy (now usually called the sanctuary); between this and the nave, where the laity were, was the choir, with seats for the clergy on either side. The whole of this space (sanctuary and choir) came to be known as the "chancel." This was divided from the nave, sometimes by an arch forming part of the structure of the building, sometimes by a screen, or by steps, sometimes by all three (see CHANCEL). The division of churches into chancel and nave, the outcome of the sacramental and sacerdotal spirit of the Catholic Church, may be taken as generally typical of church construction in the medieval West, though there were exceptions, e.g. the round churches of the Templars. There were, however, further changes, the result partly of doctrinal developments, partly of that passion for symbolism which by the 15th century had completed the evolution of the Catholic ritual. Transepts were added, to give to the ground-plan of the building the figure of the cross. The insistence on the unique efficacy of the sacrifice of the altar led to the multiplication of masses, and so of altars, which were placed in the transepts or aisles or in chapels, dedicated to the saints whose relics they enshrined. The chief of these subsidiary chapels, that of the Blessed Virgin (or Lady chapel), behind the high altar, was often of large size. Finally, for the convenience of processions, the nave and chancel aisles were carried round behind the high altar as ambulatories.

The Romanesque churches, still reminiscent of antique models, had preserved all the simplicity of the ancient basilicas with much more than their grandeur; but the taste for religious symbolism which culminated in the 13th century, and the imaginative genius of the northern peoples, transformed them into the marvellous dreams in stone of the "Gothic" period. Churches now became, in form and decoration, epitomes of the Christian scheme of salvation as the middle ages understood it.
In the plan of the buildings and their decoration everything still remained subordinate to the high altar; but though on this and its surroundings ornament was most lavishly expended, the churches were never wealth permitted to be covered within and without with the material painting; scenes from Old and New Testaments, from the lives of saints, even from every-day life; figures of the Almighty, of Christ, of the Virgin Mother, of apostles, saints, confessors; pictures of the joys of heaven and the torments of hell; and outside, grimacing from every angle, demons and goblins, amusing enough to us but terrible to the age that set them there, visible embodiments of the evil spirits driven from within the sacred building by the efficacy of the holy rites.

In considering the origins of medieval churches, moreover, it must be borne in mind that as a general rule their builders were not actuated by the motives usual in modern times, at least among Protestants. The size of churches was not determined by the needs of population but by the piety and wealth of the founders; and the same applies to their number. Often they were founded as acts of propitiation of the Almighty or of the saints, and the greater their size and splendour the more effective they were held to be for their purpose. Local rivalry, too, played a large part, one wealthy abbey building "against" another, much in the same way as modern business houses endeavour to outshine each other in the magnificence of their buildings.

Of all the mixed motives that went to the evolution of church architecture in the middle ages, this rivalry in ostentation was probably the most fertile in the creation of new forms. A volume might be written on the economic effects of this locking up of vast capital in unproductive buildings. In Catholic countries (notably in Ireland) great churches are still built out of the savings of a poverty-stricken peasantry; and from this point of view the destruction of churches in the 16th century was probably a benefit to the world. This, however, is a consideration altogether alien to the Christian spirit, the aspiration of which is to lay up treasures not on earth but in heaven.

The Reformation was a fateful epoch in the history of church architecture. The substitution of the Bible for the Mass destroyed the raison d'être of churches as the middle ages had made them. Pictures and stories, carved or painted, seemed no longer necessary now that the open Bible was in the hands of the common people; they had been too often prostituted, moreover, to idolatrous uses,—and "idolatry" was the worst of blasphemies to the re-discoverers of the Old Testament. Save in some parts of Germany, where the influence of Luther saved the churches from wreck, an iconoclastic wave spread over the greater part of Western Europe, wherever the "new religion" prevailed; everywhere churches were cleared of images and reduced to the state of those described by William Harrison in his Description of England (1570), only the "pictures in glass" being suffered in some cases to survive for a while "by reason of the extreme cost of replacing them." The structures of the churches, however, remained; and these, even in countries which departed further from the Catholic system, served in some measure to keep its tradition alive. Protestantism has, indeed, produced a distinctive church architecture, i.e. the conventicle type, favoured more especially by the so-called "Free Churches." Its distinctive features are pulpits and auditorium, and it is symbolic of the complete equality of ministers and congregation. In general, however, Protestant builders have been content to preserve or to adapt the traditional models. It would be interesting in this connexion to trace the reverse effect of church architecture upon church doctrine. In England, for instance, the chancels were for the most part disused after the Reformation (see Harrison, op. cit.), but presently they came into use again, and on the Catholic revival in the Church of England in the 19th century it is certain that the medieval churches exercised an influence by giving a sense of fitness, which might otherwise have been lacking in the restoration of medieval ritual. A similar tendency has of late years been displayed in the Established Church of Scotland.

Churches, as the outcome of the organization of the Catholic Church, are divided into classes as "cathedral," "conventional," and "collegiate," "parochial," and "district" churches. It must be noted, however, that the term cathedral (q.v.), ecclesiastically applicable to any church which happens to be a bishop's see, architecturally connotes a certain size and dignity, and is sometimes thus applied to churches which have never been, or have long ceased to be, bishop's seats.

(2) The Religious Community.—In the sense of Christian community (ecclesia) the word "Church" is applied in a narrow sense to any one of the numerous separate organizations into which Christendom is divided (e.g. Roman Catholic Church, Orthodox Eastern Church, Church of England, Evangelical [Lutheran] Church)—these are dealt with under their several headings—and in a comprehensive sense (with which we are now concerned) to the general body of all those "who profess and call themselves Christians." Religion, according to the old definition, is the bond which binds the soul of man to God. It begins as the relation of a tribe to its God. Personal religious conviction grows out of the tribal (corporate) religious bond. But the social instinct is strong. Men owning the same religious convictions will naturally draw together into some sort of association. Using the word religion to cover all the imperfect ways in which men have felt after God, we note that in every case men have found the need alike of a teacher and of fellowship. Thus the idea of a church as "the pillar and ground of the truth" (1 Tim. iii. 15) corresponds to some of the primary needs of man. Even at Stonehenge, the oldest relic of prehistoric religion in England, where we picture in imagination the worship of the rising sun, nature worship degraded to a horrible depth by human sacrifice, we find struggling for expression the idea of a corporate religious life. From all the lower levels where superstition and cruelty reign, from the depths of fear inspired by fetichism, we look on to the higher level of Judaism as the progressive religion of the old world. This does not mean that we shut our eyes to the ideals of Greek philosophers, with whom morality was constantly outgrowing religion.

The vision of an ideal state which the master-mind of Plato contemplated, but thought too good ever to become true in actual realization, is full of aspirations which the Christian Church claims to satisfy. The problems of the relations of the life of the State and the life of the individual, which Aristotle ever suggests and never solves, are problems with which the Christian Church has at least attempted to deal.1

1. Laerantius, Inst. Div. iv, 28 "Vinculo pietatis obstricti, Deo religati sumus unde ipsa religio nomen accept." The etymology may be wrong; but this is the popular sense of the word.

kingdom of righteousness ruled over by a present God. The preaching of John the Baptist was thus in sympathy with the ideals of his generation, though the sternness of the repentance which he set forth as the necessary preparation for entrance into the new kingdom of heaven, which was to be made visible on earth, was not less repugnant to the men of his day than of later times.

Christ’s own teaching and that of his disciples began with the proclamation of the kingdom of God (or of heaven) (Luke iv. 14, viii. 1, ix. 22; Matt. x. 7). That he intended it to find outward expression in a visible society appears from the careful way in which he trained the apostles to become leaders hereafter, crowning that work by the institution of the sacraments of baptism and the Eucharist. It was not from accident or for convenience that Christ formed a society. His purpose in this, more than in his teaching, was to express the principles of his endeavour. But he seldom used the word ecclesia, church, which became the universal designation of his society.

All the more emphatic is Christ’s use of the term ecclesia upon the distinct advance in faith made by the apostles when St Peter as their spokesman confessed him to be “the Christ, the Son of the living God” (Matt. xvi. 16). Instantly came the reply, “I say unto thee, that thou art Peter (rockman), and on this Petra (rock) I will build my ecclesia (church); and the gates of Hades shall not prevail against it.” On the rock of a human character, ennobled by faith in his divine Sonship, he could raise the church of the future, which should be at the same time continuous with the old, new in spiritual power, one in worship and in work.

To the Jew the word ecclesia was as useless as it was to the Greeks. It suggested the assembly of freeborn citizens in a city state. Without ceasing to be the congregation of Jehovah, it would claim for itself all the hopes of an ideal state over which Greek philosophers had sighed in vain.

Opinions differ upon the question whether the apostles were chosen as representatives of the ecclesia to be founded (Hort) or as men fitted to become its duly authorized teachers and leaders from the beginning (Stone). But as Mr Stone well puts it, “It would not be a necessary inference [from Dr Hort’s opinion] that there ought to be no ministry in the Christian Church.”

At first the church was limited to the Christian believers in the city of Jerusalem, then by persecution their company was broken up, and, since those who were scattered went everywhere preaching the word, the conception was enlarged to include all “of the circumcision” (Rom. x. 15, 16) in the Holy Land. A new epoch began from the return of St Paul and St Barnabas to Antioch after their first missionary journey, when they called together the church and narrated their experiences, and told how “God had opened to the Gentiles the door of faith” (Acts xiv. 27). Hitherto the term Church had been “ideally conterminous” with the Jewish Church. Now it was to contain members who had never in any sense belonged to the Jewish Church. Thus the way was opened for new developments and for illimitable extension.

St Paul, in his address to the elders at Ephesus (Acts xx. 28), adapted the words of Ps. lxxiv. 2, “Remember the congregation, whom thou hast purchased of old,” claiming for the Christian ecclesia the title of God’s ancient ecclesia. But he never, however fiercely opposed by Judaizers, set a new ecclesia of Christ in opposition to the old. We wait, however, for the Epistles of his captivity at Rome to find the full meaning of the idea of the church dawning upon his imagination. “Here at least, for the first time in the Acts and Epistles, we have the ecclesia spoken of in the sense of the one universal ecclesia, and it comes more from the theological than from the historical side; i.e. less from the actual circumstances of the actual Christian communities than from a development of thoughts respecting the place and office of the Son of God: his headship was felt to involve the unity of all those who were united to him.”

Similar development of the idea of the one ecclesia as including all members of all local

5 The Conception of Priesthood, p. 13.
6 eccl. does not lead St Paul to regard membership of the universal church as invisible.
7 The more history of the word ecclesia does not exhaust the subject. We must take into account not only the idea of the visible actual church, but also the ideal pictured by St Paul in the metaphors of the Body (Rom. vii. 4), the Temple (i Cor. iii. 10-15) and the Bride of Christ (s Cor. xi. 2). The actual church is always falling short of its profession; but its successive reformation witness to the strength of its longing after the beauty of holiness.
8 Membership in the actual church is acquired through baptism “in the name of the Father and of the Son and of the Holy Ghost” (Acts ii. 28).
9 The references in the New Testament to baptism in the name of Jesus (or the Lord Jesus) (Acts ii. 38, viii. 16, x. 48, xix. 5; Rom. vi. 3; Gal. iii. 27), which are by some critics taken to refer to a primitive Christological baptismal formula, seem to refer to the confession made by the baptized, or to the new relationship into which they are brought as “members of Christ.” Candidates for baptism were exhorted to prepare for it by repentance and faith (Acts ii. 38). The laying on of hands (Heb. vi. 2), in the rite called in later times confirmation, followed baptism (Acts viii. 17). In the modern Greek Church it is administered by priests with oil which has been consecrated by the bishop, in the Roman Church by the bishop himself. Such use of the chrism can be traced from the 2nd century. The Anglican Church retains only the Biblical symbolism of the blessing of the hands. Presbyterians and other Protestant churches have abandoned the use except the Luthera. We need not here trace the history of Christian worship, in daily services (Acts ii. 46), or on the Lord’s Day (Acts xx. 7), meeting for the Lord’s Supper (1 Cor. xi. 27-34), or for mutual edification in prayer, praise and prophecy (1 Cor. xiv.). These things represent the ideal of Christendom. In the words of an eminent Roman Catholic scholar, Monsignor Duchesne, “Faith unites, theology often separates.” It must be our task to summarize the leading ideas of the church in which all Christians are agreed.
9 (a) The first is certainly fellowship with Christ and with the brethren. The early Christians earnestly believed that their life was “hidden with Christ in God” (Col. iii. 3), and found in their union with Christ the lasting and strongest motive of love to the brethren. Such fellowship is attributed by St Paul preeminently to the work of the Holy Spirit (2 Cor. xiii. 14). Its strength is shown in England in the growing readiness of the different religious bodies to co-operate in movements for the purifying of public morality and for the better observance of Sunday.
10 (b) The second is unity. We have seen how St Paul was led on to grasp the conception of one church universal manifested in all the local churches. Its unity is not purely accidental in that individuals have been forced to act together under pressure of chance circumstances. Nor is the ideal of unity adopted simply because experience teaches that “union is strength.” Nor is it even based on the philosophical conception of the incompleteness of the individual life. As Dr Sanday finely says, “If the church is in something more than mere metaphor the Body of Christ, if there is circulating through it a continual flow and return of spiritual forces, derived directly from him, if the Spirit which animates the Body is one, then the body itself also must be in essence one. It has its centre not on earth but in heavenly places, where Christ sitteth at the right hand of God.”
11 (c) Thirdly, there is no question that the Lord intended the one fellowship of his saints to be a visible fellowship. The idea of an invisible church has only commended itself in dark hours when men dispaired of unity even as an ideal. The view of Zwingli and Calvin in the 16th century was not by any means acceptable to other reformers. Luther distinguished between the Spiritual Church, which he identified with the Communion of Saints, and the Corporal Church, the outward marks of which are Baptist, Sacrament and Gospel. But he regarded them
As different aspects of the same church, and Melanchthon was even more explicit. As the saint purified in heaven is he who struggled with his sins on earth, so is the church triumphant one with the church militant. In Dr Lindsay's words, "it is one of the privileges of faith, when strengthened by hope and by love, to see the glorious ideal in the somewhat poor material reality. It was thus that St Paul saw the universal Church of Christ made visible in the Christian community of Corinth."

But it is at this point that we come to the dividing line which has been drawn by different conceptions of catholicity. Dr Lindsay goes on to argue that all insistence on the principle of historical continuity, whether urged by members of the Anglican or the Roman Catholic Church, as upholders of episcopacy, is a deliberate return to the principle of Judaism, which declared that no one who was outside the circle of the "circumcised," no matter how strong his faith nor how the fruits of the Spirit were manifest in his life and deeds, could plead "the security of the Divine Covenant." Without entering into controversy it must suffice to point out that, from the point of view of all episcopal churches, the ministry of the bishops succeeding the ministry of the apostles, however it came to pass, was for fifteen centuries accepted as the pledge of unity. This principle, however, of continuity in ministry, belongs to a different department of Christian thought from the sacrament of baptism, which really corresponds to the Jewish rites of admission to the covenant. And it has been an established principle of the undivided church since the 3rd century, the bishop of Rome in this case upholding against St Cyprian the view which subsequent generations have ratified as "the spiritual个 truths of the Divine Covenant." The church, as a body, admin-istered is valid if water is used with the right words. From this point, alas, divergence begins.

The fourth element is authority. Probably all Christians can agree in the statement that the Christian democracy is also a theocracy, that Christ is the source of all authority. There are three passages in the Gospel which claim notice: (i.) the promise to St Peter (Matt. xvi. 18 f.), as spokesman for the apostles, of the key of the household of God, of power to admit and exclude; (ii.) the promise (Matt. xvii. 20) that to the Twelve, regarding offences against the peace of the society, advocating exclusion only when brotherly appeals had failed; (iii.) the commission of the whole earth or of the Christian ministry (John xx. 22, 23). Again the root difference between the Presbyterian and Episcopal conceptions of the church comes to light. Is the authority of the church manifested in the decisions which a local church arrives at by a majority of votes, or in the decisions of apostles and prophets after taking counsel, of the episcopate in later times, ratified by common consent of Christendom? As has been well said, "the church is primarily a witness—the strength of its authority lies in the many sides from which the witness comes." It witnesses to the Divine Life of Christ as a power of the present and of the future as of the past, ministered in the Word and sacraments.

The church is a sacerdotal society. St Paul delighted to represent it as the "ideal Israel," and St John echoes the thought in the words of praise (Rev. i. 5, 6), "Un to him that hath loved us . . . and made us to be a kingdom, and priests unto his God and Father." This idea of the priesthood of the whole church has three elements—the divinity element, the human element, and self-sacrifice. The promise that Christians should be temples of the living God has been fulfilled. As Dr Milligan has said very well, "it is not only in things to which we commonly confine the word miracle that the Divine appears. It may appear not less in the whole soul and spirit of the Church's life, in the varied Christian virtues of her members, in the general character of their Christian work, and in the grace received by them in the Christian sacraments. When that life is exhibited, as it ought to be, in its distinctively heavenly character, it bears witness to the presence of a power in Christian men which no mere recollection of a past example, however heroic or beautiful, can supply. The difficulties of exhibiting and maintaining it are probably far greater now than they were in the apostolic age; and as nothing but a present divine support can enable us to overcome these, so, when they are overcome, a testimony is given to the fact that God is with us."

But this life is to be a human life still, to be in touch with all that is noble and of good report in art and literature, keenly interested in all the discoveries of science, active in all movements for social progress. It cannot, however, be denied that to live such a life, divine in its powers and human in its sympathies, demands daily and hourly self-sacrifice. As the author of the Imitation of Christ put it long ago, "There is no living in love without pain." The thought of self-sacrifice has been emphasized from the earliest times in the liturgies. By a true instinct the early Christian writers called widows and orphans the altar of God on which the sacrifices of almsgiving are offered up. Such works of charity, however, represent only one of the channels by which self-sacrifice is ministered, to which all prayers and thanksgiving and instruction of psalms, prophecy and preaching contribute. Thus in the Eucharist the offering of the church is made one with the offering of the Great High Priest.

All this represents an ideal. It suggests in a modern form the perpetual paradox of the Christian life: we are what we are to be. The church is the divine society in which all other religious communities are secondary to its aims. And it is the church that ushers in the "Thy kingdom come," embraces all the spiritual forces which make for righteousness. They were acknowledged in Christ's words, "He that is not against you is for you" (Luke ix. 50). But the divisions of Christendom testify to the harm done by undue insistence on the claims of the individual to gain scope to extend the kingdom in his own way. As in a choir all the resources of an individual voice are used to strengthen the general effect, so must the individual lose his life that he may find it, witnessing by his share in the common service of the church to the ultimate unity of knowledge and harmony of truth.

For the various conceptions of the church as an organized body see CHURCH HISTORY, sec. 3, and the articles on the various churches.

CHURCH ARMY, an English religious organization, founded in 1882 by the Rev. Wilson Carlile (afterwards prebendary of St Paul's), who banded together in an orderly army of "soldiers" and "officers" a few working men and women, whom he and others trained to act as "Church of England evangelists" among the outcasts and criminals of the Westminster alms. Previous experience had convinced him that the moral condition of the lowest classes of the people called for new and aggressive action on the part of the Church, and that this work was most effectively done by laymen and women of the same class as those whom it was desired to touch. "Evangelistic zeal with Church order" is the principle of the Church Army, and it is essentially a working men's and women's mission to working people. As the work grew, a training institution for evangelists was started in Oxford, but soon moved (1886) to London, where, in Bryantstone Street near the Marble Arch, the headquarters of the army are now established. Working men are trained as evangelists, and working women as mission sisters, and are supplied to the army. The men evangelists have to pass an examination by the archdeacon of Middlesex, and are then (since 1896) admitted by the bishop of London as "lay evangelists in the Church;"); the mission sisters must likewise pass an examination by the diocesan inspector of schools. All Church Army workers (of whom there are over 1800 of one kind and another) are entirely under the control of the incumbent of the parish to which they are sent. They never go to a parish unless invited, nor stay when asked to go by the parish priest. Officers and sisters are paid a limited sum for their services either by the vicar or by voluntary local contributions. Church Army mission and colportage vans circulate throughout the country parishes, if desired, with

5 The Ascension, p. 254.
itinerant evangelists, who hold simple missions, without charge, and distribute literature. Each van missioner has a clerical "adviser." Missions are also held in prisons and workhouses, at the invitation of the authorities. In 1888 (before the similar work of the Salvation Army was inaugurated) the Church Army established labour homes in London and elsewhere, with the object of giving a "fresh start in life" to the outcast and destitute. These homes deal with the outcast and destitute in a plain, straightforward way. They demand that the persons should show a desire for amendment; they subject them to firm discipline, and give them hard work; they give them decent clothes, and strive to win them to a Christian life. The inmates earn their board and lodging by piece-work, for which they are paid at the current trade rates, while by a gradually lessening scale of work and pay they are stimulated to obtain situations for themselves and given time to seek for them. There are about 120 homes in London and the provinces, and 66% of the inmates are found to make these the successful beginning of an honest self-supporting life. The Church Army has lodging homes, employment bureaux, cheap food depots, old clothes department, dispensary and a number of other social works. Every winter employment is found for a large number of the unemployed in special occupations, among them being the King's Labour Tents and the Queen's Labour Relief Depots. There is also an extensive emigration system, under which many hundreds (3000 in 1906) of carefully tested men and families, of good character, chiefly of the unemployed class, are placed in permanent employment in Canada through the agency of the local clergy. The whole of the work is done in loyal subordination to the diocesan and parochial organization of the Church of England. See Edgar Rowans, Wilson Carlile and the Church Army.

CHURCH CONGRESS, an annual meeting of members of the Church of England, lay and clerical, to discuss matters religious, moral or social, in which the church is interested. It has no legislative authority, and there is no voting on the questions discussed. The first congress was held in 1861 in the hall of King's College, Cambridge, and was the outcome of the revival of convocation in 1852. The congress is under the presidency of the bishop in whose diocese it happens to be held. Recent places of meeting are Brighton (1901), Northampton (1902), Bristol (1903), Liverpool (1904), Weymouth (1905), Barrow-in-Furness (1906), Great Yarmouth (1907), Manchester (1908), Swansea (1909). The meetings of the congress have been mainly remarkable as illustrating the wide divergences of opinion and practice in the Church of England, no less than the broad spirit of tolerance which has made this possible and honourably differentiates these meetings from so many ecclesiastical assemblies of the past. The congress of 1908 was especially distinguished, not only for the expression of diametrically opposed views on such questions as the sacrifice of the mass or the "higher criticism," but for the very large proportion of time given to the discussion of the attitude of the Church towards Socialism and kindred subjects.

CHURCH HISTORY. The sketch given below of the evolution of the Christian Church (see CHURCH) may well be prefaced by a summary of the history of the great Church historians, concerning whom fuller details are given in separate articles. Hegesippus wrote in the 2nd century a collection of memoirs containing accounts of the early days of the church, only fragments of which are extant. The first real church history was written by Eusebius of Caesarea in the early part of the 4th century. His work was continued in the 5th century by Philostorgius, Socrates, Sozomen and Theodoret, and in later centuries by Theodorus Lector, Evagrius, Theophanes and others. In the 14th century Nicephorus Callisti undertook a complete church history which covers in its extant form the first six centuries. In the West Eusebius' History was translated into Latin by Rufinus, and continued down to the end of the 4th century. Augustine's City of God, published in 412, was not apologetic, not an historical work, but it had great influence in our field, for in it he undertook to answer the common heathen accusation that the growing misfortunes of the empire were due to the prevalence of Christianity and the forsaking of the gods of Rome. It was to sustain Augustine's thesis that Orosius produced in 417 his Historiarum libri septem, which remained the standard text-book on world history during the middle ages. About the same time Sulpicius Severus wrote his Historia Sacra, covering both biblical and Christian history. In the 6th century Cassiodorus had a translation made of the histories of Socrates, Sozomen and Theodoret, which were reduced into one continuous narrative and brought down to 518. The work was known as the Historia Ecclesiastica Tripartita, and constituted during the middle ages the principal text-book of church history in the West. Before writing his history Eusebius produced a world chronicle which was based upon a similar work by Julius Africanus and is now extant only in part. It was continued by Jerome, and became the basis of the model for many similar works of the 7th and following centuries by Prosper, Idatius, Marcellinus Comes, Victor Tununensis and others. Local histories containing more or less ecclesiastical material were written in the 6th and following centuries by Jordane (History of the Goths), Gregory of Tours (History of the Franks), Isidore of Seville (History of the Goths, Vandals and Swerts), Bede (Ecclesiastical History of England), Paulus Diaconus (History of the Lombards), and others. Of the many biographies of the saints of the early centuries there were biographies, chronicles, cloister annals, &c., may be mentioned Haymo, Anastasius, Adam of Bremen, Ordericus Vitalis, Honorius of Autun, Otto of Freising, Vincent of Beauvais and Antoninus of Florence.

The Protestant reformation resulted in a new development of historical writing. Polemical interest led a number of Lutheran scholars of the 16th century to publish the Magdeburg Centuries (1559 ff.), in which they undertook to show the primitive character of the Protestant faith in contrast with the alleged corruptions of Roman Catholicism. In this design they were followed by many other writers. The opposite thesis was maintained by Baronius (Annales Ecclesiastici, 1588 ff.), whose work was continued by a number of Roman Catholic scholars. Other notable Roman Catholic historians of the 17th and 18th centuries were Natalis Alexander, Bossuet, Tillemont, Fleury, Dupin and Cellier.

Church history began to be written in a genuinely scientific spirit only in the 18th century under the leadership of Mosheim, who is commonly called the father of modern church history. With wide learning and keen critical insight he wrote a number of historical works of which the most important is his Institutiones Hist. Eccles. (1755; best English trans. by Murdock). He was followed by many disciples, among them Schroeckh (Christliche Kirchengeschichte, 1772 ff. in 45 vols.). Other notable names of the 18th century are Semler, Spittler, Henke and Planck.

The new historical spirit of the 19th century did much for church history. Among the greatest works produced were those of J. C. L. Gieseler (Lehrbuch der Kirchengeschichte, 1824 ff., best Eng. tr. revised and edited by H. B. Smith), exceedingly objective in character and still valuable, particularly on account of its copious citations from the sources; Neander (Allgemeine Geschichte der christlichen Religion und Kirche, 1852 ff., Eng. tr. by Torrey), who wrote in a sympathetic spirit and with special stress upon the religious side of the subject, and has been followed by many disciples, for instance, Hagenbach, Schaff and Herzog; and Baur (Das Christentum und die christliche Kirche, 1853 ff.), the most brilliant of all, whose many historical works were dominated by the principles of the Hegelian philosophy and evinced both the merits and defects of that school. Baur has had tremendous influence, even though many of his positions have been generally discredited. The problems particularly of the primitive history were first brought into clear light by him, and all subsequent work upon the subject must acknowledge its indebtedness to him.

A new era was opened by the publication in 1857 of the second edition of Ritschl's Entstehung der altkatholischen Kirche, in which he broke away from the Tubingen school and introduced new points of view that have revolutionized the interpretation of the early church. Of recent works the most important are the Kirchengeschichte of Carl Müller (1892 ff.) and that of W. Möller (1889 ff., second edition by von Schubert, 1898 ff.)
greatly enlarged and improved), the translation of the latter (1892 ff.) being the most useful text-book in English. Of modern Roman Catholic works may be mentioned those by J. A. Mohler, T. B. Alzog, F. X. Kraus, Cardinal Joseph von Hergenröther and C. J. v. Hefele (edited by Knöpfler.)

In addition to these general works on church history should be named the histories of doctrine by Harnack, Loofs, Seeberg and Fisher; and on the early Church the works on the apostolic age by Weisäcker (1886, English translation 1894), Mc. Giffert (1897), and Bartlet (1899); Renan's Histoire des origines du christianisme (1887 ff., in 7 vols., translated in part); Pfeiderer's Urschristentum (1889); S. Cheetham's History of the Christian Church during the first Six Centuries (1894); Wernle's Anfänge unserer Religion (1901; Eng. tr. 1902 ff.); Rainy's Ancient Catholic Church (1902); Knopf's Nachapostolisches Zeitalter (1905); Duschesne's Histoire ancienne de l'Église (vol. i., 1906).

(A. C. McG.)

In the following account of the historical evolution of the Church, the subject will be treated in three sections:

(A) The ancient Church to the beginning of the pontificate of Gregory the Great (A.D. 590); (B) The Church in the middle ages; (C) The modern Church.

A. THE ANCIENT CHURCH

1. Origin and Growth.—The crucifixion of Jesus Christ resulted in the scattering of his followers, but within a short time they became convinced that he had risen from the dead, and would soon return to set up the expected Messianic kingdom, and so to accomplish the true work of the Messiah (cf. Acts i. 6 ff.). They were thus enabled to retain the belief in his Messiahship which his death had threatened to destroy permanently. This belief laid upon them the responsibility of bringing as many of their countrymen as possible to recognize him as Messiah, and to prepare themselves by repentance and righteousness for the coming kingdom (cf. Acts ii. 21, 38, iii. 19 sq.). It was with the sense of this responsibility that they gathered again in Jerusalem, the political and religious metropolis of Judaism. In Jerusalem the new movement had its centre, and the church established there is rightly known as the mother church of Christendom. The life of the early Jewish disciples, so far as we are able to judge from our meagre sources, was very much the same as that of their fellows. They continued faithful to the established synagogue and temple worship (cf. Acts iii. 2), and did not think of founding a new sect, or of separating from the household of Israel (cf. Acts x. 14, xv. 5, xxi. 21 sq.). There is no evidence that their religious or ethical ideals differed in any marked degree from those of the more serious-minded among their countrymen, for the emphasis which they laid upon the need of righteousness was not at all uncommon. In their belief, however, in the Messiahship of Jesus, and their consequent assurance of the speedy establishment by him of the Messianic kingdom, they stood alone. The first need of the hour, therefore, was to show that Jesus was the promised Messiah in spite of his crucifixion, a need that was met chiefly by testimony to the resurrection, which became the burden of the message of the early disciples to their fellow-countrymen (cf. Acts ii. 24 ff., iii. 15 ff., v. 31). It was this need which led also to the development of Messianic prophecy and the ultimate interpretation of the Jewish Bible as a Christian book (see Bible). The second need of the hour was to bring the nation to repentance and righteousness in order that the kingdom might come (cf. Acts iii. 19). The specific gospel of Jesus, the gospel of divine fatherhood and human brotherhood, received no attention in the earliest days, so far as our sources enable us to judge.

Meanwhile the new movement spread quite naturally beyond the confines of Palestine and found adherents among the Jews of the dispersion, and at an early day among the Gentiles as well. Many of the latter had already come under the influence of Judaism, and were more or less completely in sympathy with Jewish religious principles. Among the Christians who did most to spread the gospel in the Gentile world was the apostle Paul, whose conversion was the greatest event in the history of the early Church. In his hands Christianity became a new religion, fitted to meet the needs of all the world, and freed entirely of the local and national meaning which had hitherto attached to it. According to the early disciples Jesus was the Jewish Messiah, and had significance only in relation to the expected Messianic kingdom.

To establish that kingdom was his one great aim. For the Gentiles he had no message except as they might become members of the family of Israel, assuming the responsibilities and enjoying the privileges of proselytes. But Paul saw in Jesus much more than the Jewish Messiah. He saw in Christ the divine Spirit, who had come down from heaven to transform the lives of men, all of whom are sinners. Thus Jesus had the same significance for one man as for another, and Christianity was meant as much for Gentiles as for Jews. The kingdom of which the early disciples were talking was interpreted by Paul as righteousness and peace and joy in the Holy Ghost (Rom. xiv. 17), a new principle of living, not a Jewish state. But Paul taught also, on the basis of a religious experience and of a distinct theory of redemption (see Mc. Giffert's Apostolic Age, ch. iii.), that the Christian is freed from the obligation to observe the Jewish law. He thus did away with the fundamental distinction between Jews and Gentiles. The transformed spiritual life of the believer expresses itself not in the observance of the Jewish law, but in love, purity and peace. This precipitated a very serious conflict, of which we learn something from the Epistle to the Galatians and the Book of Acts (cf. Acts xiii. 51 sq.; xviii. 10). Other fundamental principles of Paul's failed of comprehension and acceptance, but the belief finally prevailed that the observance of Jewish law and custom was unnecessary, and that in the Christian Church there is no distinction between the circumcised and the uncircumcised. Those Jewish Christians who refused to go with the rest of the Church in this matter lived their separate life, and were regarded as an heretical sect known as the Ebionites.

It was Christianity in its universal form which won its great victories, and finally became permanently established in the Roman world. The appeal which it made to that world was many-sided. It was a time of moral reformation, when men were awaking to the need of better and purer living. To all who felt this need Christianity offered high moral ideals, and a tremendous moral enthusiasm, in its devotion to a beloved leader, in its emphasis upon the ethical possibilities of the meanest, and in its faith in a future life of blessedness for the righteous. It was a time of political and religious dispersion; old ties were being broken, and new ones were finding acceptance on all sides. Christianity, with its one God, and its promise of redemption and a blessed immortality based upon divine revelation, met as no other contemporary faith the awakening religious needs. It was a time also of great social unrest. With its principle of Christian brotherhood, its emphasis upon the equality of all believers in the sight of God, and its preaching of a new social order to be set up at the return of Christ, it appealed strongly to multitudes, particularly of the poorer classes. That it won a permanent success, and finally took possession of the Roman world, was due to its combination of appeals. No one thing about it commended it to all, and to no one thing alone did it owe its victory, but to the fact that it met a greater variety of needs and met them more satisfactorily than any other movement of the age. Contributing also to the growth of the Church was the zeal of its converts, the great majority of whom regarded themselves as missionaries and did what they could to extend the new faith. Christianity was essentially a proselytizing religion, not content to appeal simply to one class or race of people, and to be one among many faiths, but believing in the falsity or insufficiency of all others and eager to convert the whole world. Moreover, the feeling of unity which bound Christians everywhere together and made of them one compact whole, and which found expression before many generations had passed in a strong organization, did much for the spread of the Church. Identifying himself with the Christian circle from the 2nd century on, a man became a member of a society existing in all quarters of the empire, every part conscious of its oneness with the larger whole and all compactly organized to do the common work. The growth of the Church during the
The Church in the earlier centuries was chiefly in the middle and lower classes, but it was not solely there. No large number of the aristocracy were reached, but in learned and philosophical circles many were won, attracted both by Christianity’s evident ethical power and by its philosophical character (cf. the Apologists of the 2nd century). That it could seem at once a simple way of living for the common man and a profound philosophy of the universe for the speculative thinker meant much for its success.1

But it did not win its victory without a struggle. Superstition, misunderstanding and hatred caused the Christians trouble for many generations, and governmental repression they had to suffer occasionally, as a result of popular disturbances. No systematic effort was made by the imperial authorities to put an end to the movement until the reign of Decius (250–251), whose policy of suppression was followed by Diocletian (303 ff.) and continued for some years after his abdication. In spite of all opposition the Church steadily grew, until in 311 the emperor Galerius upon his death-bed granted toleration (see Eusebius, Hist. Eccl. x. 4, and Lactantius, De mortuibus persecutorum, 34), and in 313 the emperors Constantine and Licinius published the edict of Milan, proclaiming the principle of complete religious liberty, and making Christianity a legal religion in the full sense (see Eusebius x. 5, and Lactantius 48). Seeck, Zeitschrift für Kirchengeschichte, xii. 381 sq., has attempted to show that the edict of Milan had no significance, but without success.

Constantine, recognizing the growing strength of the Church and wishing to enlist the loyal support of the Christians, treated them with increasing favour, and finally was baptized upon his death-bed (337). Under his successors, except during the brief reign of Julian (361–363), when the effort was made to reinstate paganism in its former place of supremacy, the Church received growing support, until, under Theodosius the Great (379–395), orthodox Christianity, which stood upon the platform adopted at Nicea in 325, was finally established as the sole official religion of the state, and heathen worship was put under the ban. The union between Church and State thus constituted continued unbroken in the East throughout the middle ages. The division of the Empire resulted finally in the division of the Church, which was practically complete by the end of the 6th century, but was made official and final only in 1854, and the Eastern and Western halves, the Greek Catholic and the Roman Catholic Churches, went each its separate way. (See Theodosian Code, book 16, for the various imperial edicts relating to the Church, and for fuller particulars touching the relation between Church and Empire see the articles Constantinople; Gratian; Theodosius; Justinian.)

For a long time after the establishment of Christianity as the state religion, paganism continued strong, especially in the country districts, and in some parts of the world had more adherents than Christianity, but at length the latter became, at any rate nominally, the faith of the whole Roman world. Meanwhile already before the beginning of the 3rd century it went beyond the confines of the Empire in Asia, and by the end of our period was strong in Armenia, Persia, Arabia and even farther east. It reached the barbarians on the northern and western borders at an early day, and the Goths were already Christians of the Arian type before the great migrations of the 4th century began. Other barbarians became Christian, some in their own homes beyond the confines of the Empire, some within the Empire itself, so that when the hegemony of the West passed from the Romans to the barbarians the Church lived on. These for centuries it was not only the chief religious, but also the chief civilizing, force at work in the occident. Losing with the dissolution of the Western Empire its position as the state church, it became itself a new empire, the heir of the glory and dignity of Rome, and the greatest influence making for the peace and unity of the western world.

2. The Christian Life.—The most notable thing about the life of the early Christians was their vivid sense of being a people of God, called and set apart. The Christian Church in their thought was a divine, not a human, institution. It was founded and controlled by God, and even the world was created for its sake (cf. the Shepherd of Hermas, vii. 4, and 2 Clement 14). This conception, which came over from Judaism, controlled all the life of the early Christians both individual and social. They regarded themselves as separate from the rest of the world and bound together by peculiar ties. Their citizenship was in heaven, not on earth (cf. Phil. iii. 20, and the epistle to Diognetus, c. 5), and the principles and laws by which they strove to govern themselves were from above. The present world was but temporary, and their true life was in the future. Christ was soon to return, and the employments and labours and pleasures of this age were of small concern. Some went so far as to give up their accustomed vocations, and with such Paul had to exhort to in his epistles to the Thessalonians. A more or less ascetic mode of life was also natural under the circumstances. Not necessarily that the present world was evil, but that it was temporary and of small worth, and that a Christian’s heart should be set on higher things. The belief that the Church was a supernatural institution found expression in the Jewish notion of the presence and power of the Holy Spirit. It was believed among the Jews that the Messianic age would be the age of the Spirit in a marked degree, and this belief passed over into the Christian Church and controlled its thought and life for several generations. The Holy Spirit was supposed to be manifest in various striking ways, in prophecy, speaking with tongues and miracle working. In this idea Paul also shared, but he carried the matter farther than most of his contemporaries and saw in the Spirit the abiding power and ground of the Christian life. Not simply in extraordinary phenomena, but also in the everyday life of Christians, the Holy Spirit was present, and all the Christian graces were the fruits (cf. Gal. v. 22). A result of this belief was to give their lives a peculiarly enthusiastic or inspirational character. Theirs were not the everyday experiences of ordinary men, but of men lifted out of themselves and transported into a higher sphere. With the passing of time the early enthusiasm waned, the expectation of the immediate return of Christ was widely given up, the conviction of the Spirit’s presence became less vivid, and the conflict with heresy in the 2nd century led to the substitution of official control for the original freedom (see below). The late 2nd century movement known as Montanism was in essence a revolt against this growing secularization of the Church, but the movement failed, and the development against which it protested was only hastened. The Church as an institution now looked forward to a long life upon earth and adjusted itself to the new situation, taking on largely the forms and customs of the world in which it lived. This did not mean that the Church ceased to regard itself as a supernatural institution, but only that its supernatural character was shown in a different way. A Christian was still dependent upon divine aid for salvation, and his life was still supernatural at least in theory. Indeed, the early conviction of the essential difference between the life of this world and that of the next lived on, and, as the Church became increasingly a world-institution, found vent in monasticism, which was simply the effort to put into more consistent practice the other-worldly life, and to make more thoroughgoing work of the saving of one’s soul. Contributing to the same result was the emphasis upon the necessity of personal purity or holiness, which Paul’s contrast between flesh and spirit had promoted, and which early took the supreme place, given by Christ to love and service. The growing difficulty of realizing the ascetic ideal in the midst of the world, and within the world-church, inevitably drove multitudes of those who took their religion seriously to retire from society and to seek salvation and the higher life, either in solitude, or in company with kindred spirits.

There were Christian monks as early as the 3rd century, and before the end of the 4th monasticism (q.v.) was an established institution both in East and West. The monks and nuns were looked upon as the most consistent Christians, and were honoured accordingly. Those who did not adopt the monastic life
endeavoured on a lower plane and in a less perfect way to realize the common ideal, and by means of penance to atone for the deficiencies in their performance. The existence of monasticism made it possible at once to hold up a high moral standard before the world and to permit the ordinary Christian to be content with something lower. With the growth of clerical sacerdotalism the higher level was demanded also of the clergy, and the principle came to be generally recognized that they should live the monastic life so far as was consistent with their active duties in the world. The chief manifestation of this was clerical celibacy, which had become widespread already in the 4th century. Among the laity, on the other hand, the ideal of holiness found realization in the observance of the ordinary principles of morality recognized by the world at large, in attendance upon the means of grace provided by the Church, in fasting at stated intervals, in eschewing various popular employments and amusements, and in almsgiving and prayer. Christ's principle of love was widely interpreted to mean chiefly love for the Christian brotherhood, and within that circle the virtues of hospitality, charity and helpfulness were widely exercised; and if the salvation of his own soul was regarded as the most important affair of every man, the service of the brethren was recognized as an imperative Christian duty. The fulfilling of that duty was one of the most beautiful features of the life of the early Church, and it did perhaps more than anything else to make the Christian circle attractive.

Worship. — The primitive belief in the immediate presence of the Spirit affected the religious services of the Church. They were regarded in early days as occasions for the free exercise of spiritual gifts. As a consequence the complete liberty accorded to all Christians to take such part as they chose, it being assumed that they did so only under the Spirit's prompting. But the result of this freedom was confusion and discord, as is indicated by Paul's First Epistle to the Corinthians (see chapters xi., xiv.). This led to the erection of safeguards, which should prevent the continuance of the unseemly conditions (on Paul's action in the matter, see McGiffert's *Apostolic Age*, p. 523). Particularly the Christians were designated to take charge of the services, and orders of worship were framed out of which grew ultimately elaborate liturgies (see Liturgy). The Lord's Supper first took on a more stereotyped character, and prayers to be used in connexion with it are found already in the Didachê (chapters ix. and x.). The development cannot here be traced in detail. It may simply be said that the general tendency was on the one hand toward the elaboration and growing magnificence of the services, especially after the Church had become a state institution and had taken the place of the older pagan cults, and on the other hand toward the increasing solemnity and mystery of certain parts, particularly the eucharist, the sacred character of which was such as to make it sacrilegious to admit to it the unholy, that is, outsiders or Christians under discipline (cf. Didachê, ix.). It was, in fact, from the Lord's table that offending disciples were first excluded. Out of this grew up in the 3rd or 4th century what is known as the *arcus disciplinae*, or secret discipline of the Church, involving the concealment from the initiated and unholy of the more sacred parts of the Christian cult, such as baptism and the eucharist, with their various accompaniments, including the Creed and the Lord's Prayer. The same interest led to the division of the services into two general parts, which became known ultimately as the *misca catechumenorum* and the *misca fidelium*, that is, the more public service of prayer, praise and preaching open to all, including the catechumens or candidates for Church membership, and the private service for the administration of the eucharist, open only to full members of the Church in good and regular standing. Meanwhile, as the general service tended to grow more elaborate, the *misca fidelium* tended to take on the character of the current Greek mysteries (see Eucharist; Hatch, *Influence of Greek Religion on the Christian Religion*, 1888). Anich, *Das antike Mysterienwesen* in seinem Einfuss auf das Christentum, 1894; Wobbermin, *Religionsgeschichtliche Studien zur Frage der Beeinflussung des Urgchristentums durch das antike Mysterienwesen*, 1896). Many of the terms in common use in them in connexion with the Christian rites, and many of the conceptions, particularly that of sharing in immortality by communion with deity, became an essential part of Christian doctrine. Thus the early idea of the sacrifices, as occasions for mutual instruction and mutual indulgence, and the interchange of spiritual gifts, gave way in course of time to the theory that they consisted of sacred and mysterious rites by means of which communion with God is promoted. The emphasis accordingly came to be laid increasingly upon the formal side of worship, and a value was given to the ceremonies as such, and their proper and correct performance by duly qualified persons, i.e. ordained priests, was made the all-important thing.

4. The Church and the Sacraments. — According to Paul, man is flesh and so subject to death. Only as he becomes a spiritual being through mystical union with Christ can he escape death and enjoy eternal life in the spiritual realm. In the Epistle to the Ephesians the Christian Church is spoken of as the body of Christ (iv. 12 ff., v. 30); and Ignatius, bishop of Antioch, early in the 2nd century, combined the two ideas of union with Christ, as the necessary condition of salvation, and of the Church as the body of Christ, teaching that no one could be saved unless he were a member of the Church (cf. his Epistle to the Ephesians 4, 5, 15; Trall. 7; Phil. 3, 8; Smyr. 8; Magn. 2, 7). Traces of the same idea are found in Irenaeus (cf. *Adv. Haer.* iii. 24, 1, iv. 26, 2), but it is first clearly set forth by Cyprian, and receives from him its classical expression in the famous sentence "Salus extra ecclesiam non est" (Ep. 73, 21; cf. also Ep. 4, 41; 74, 71; and *De unitate ecclesiae*, 6: "habere non potest Deum patrem qui ecclesiam non habet matrem"). The Church thus became the sole ark of salvation, outside of which no one could be saved.

Intimately connected with the idea of the Church as an ark of salvation are the sacraments or means of grace. Already as early as the 2nd century the rite of baptism had come to be thought of as the sacrament of regeneration, by means of which a new divine nature is born within a man (cf. Irenaeus, *Adv. Haer.* x. 1, 11, 12; and his newly discovered *Demonstration of the Apostolic Teaching*, chap. 3), and the eucharist as the sacrament of the body and blood of Christ, feeding upon which one is endowed with immortality (cf. Irenaeus, *Adv. Haer.* iv. 18, 5, 2, 2). In the early days the Church was thought of as a community of saints, all of whose members were holy, and as a consequence discipline was strict, and offenders excluded from the Church were commonly not readmitted to membership but left to the mercy of God. The idea thus became general that baptism, which had been almost from the beginning the rite of entrance into the Church, and which was regarded as securing the forgiveness of all pre-baptismal sins, should be given but once to any individual. Meanwhile, discipline grew less strict (cf. the *Shepherd of Hermas*, Vis. v. 3; M. iv. 71; Simii. vii. 6, ix. 19, 26, &c.) until finally, under the influence of the idea of the Church as the sole ark of salvation, it became the custom to readmit all penitent offenders on condition that they did adequate penance. Thus there grew up the sacrament of penance, which secured for those already baptized the forgiveness of post-baptismal sins. This sacrament, unlike baptism, might be continually repeated (see Penance). In connexion with the sacraments grew up also the theory of clerical sacerdotalism. Ignatius had denied the validity of a eucharist administered independently of the bishop, and the principle finally established itself that the sacraments, with an exception in cases of emergency in favour of baptism, could be performed only by men regularly ordained and so endowed with the requisite divine grace for their due administration (cf. Tertullian, *De Exhort. cast.* 7; *De Bapt.* 7, 17; *De Praescriptione Haer.* 41; and Cyprian, Ep. 67. For the later influence of the Donatist controversy upon the sacramental development see Donatists). Thus the clergy as distinguished from the laity became true priests, and the latter were made wholly dependent upon the eucharist as the sacrament of grace, without which there was hereby no salvation (see Order, Holy).

5. Christian Doctrine. — Two tendencies appeared in the thought
of the primitive Church, the one to regard Christianity as a law given by God for the government of men's lives, with the promise of a blessed immortality as a reward for its observance; the other to view it as a means by which the corrupt and mortal nature of man is transformed, so that he becomes a spiritual and holy being. The latter tendency appeared first in Paul, afterwards in the Gospel and First Epistle of John, in Ignatius of Antioch and in the Gnostics. The former found expression in most of our New Testament writings, in all of the apostolic fathers except Ignatius, and in the Apologists of the 2nd century. The two tendencies were not always mutually exclusive, but the one or the other was predominant in every case. Towards the end of the 2nd century they were combined by Irenaeus, bishop of Lyons. To him salvation bears a double aspect, involving both release from the control of the devil and the transformation of man's nature by the indwelling of the Divine. Only he is saved who on the one hand is forgiven at baptism and so released from the power of Satan, and then goes on to live in obedience to the divine law; and on the other hand receives in baptism the germ of a new spiritual nature and is progressively transformed by feeding upon the body and blood of the divine Christ in the eucharist. This double conception of salvation and of the means thereto was handed down to the Church of subsequent generations and became fundamental in its thought. Christianity is at once a revealed law which a man must keep, and by keeping which he earns salvation, and a supernatural power whereby his nature is transformed and the divine quality of immortality imparted to it. From both points of view Christianity is a supernatural system without which salvation is impossible, and in the Christian Church it is preserved and mediated to the world.

The twofold conception referred to had its influence also upon the Church's doxology. The effect of the legal view of Christianity was to make Christ an agent of God in the revelation of the divine will and truth, and so a subordinate being between God and the world, the Logos of current Greek thought. The effect of the mystical conception was to identify Christ with God in order that by his incarnation the divine nature might be brought into union with humanity and the latter be transformed. In this case too a combination was effected, the idea of Christ as the incarnation of the Logos or Son of God being retained and yet his deity being preserved by the assertion of the deity of the Logos. The recognition of Christ as the incarnation of the Logos was practically universal before the close of the 3rd century, but his deity was still widely denied, and the Arian controversy which distracted the Church of the 4th century concerned the latter. The council of Nicaea in 325 the deity of Christ received official sanction after all, given formulae, and the original Nicene Creed. Controversy continued for some time, but finally the Nicene decision was recognized both in East and West as the only orthodox faith. The deity of the Son was believed to carry with it that of the Spirit, who was associated with Father and Son in the baptismal formula and in the current symbols, and so the victory of the Nicene Christology meant the recognition of the doctrine of the Trinity as a part of the orthodox faith (see especially the writings of the Cappadocian fathers of the late 4th century, Gregory of Nyssa, Basil and Gregory Nazianzen).

The assertion of the deity of the Son incarnate in Christ raised another problem which constituted the subject of dispute in the Christological controversies of the 4th and following centuries. What is the relation of the divine and human natures in Christ? At the council of Chalcedon in 451 it was declared that in the person of Christ are united two complete natures, divine and human, which retain after the union all their properties unchanged. This was supplemented at the third council of Constantinople in 680 by the statement that each of the natures contains a will, so that Christ possesses two wills. The Western Church accepted the decisions of Nicaea, Chalcedon and Constantinople, and so the doctrines of the Trinity and of the two natures in Christ were handed down as orthodox dogma in West as well as East.

Meanwhile in the Western Church the subject of sin and grace, and the relation of divine and human activity in salvation, received especial attention; and finally, at the second council of Trent in 1563 after both Pelagianism and semi-Pelagianism had been repudiated, a moderate form of Augustinianism was accepted, involving the theory that every man as a result of the fall is in such a condition that he can take no steps in the direction of salvation until he has been renewed by the divine grace given in baptism, and that he cannot continue in the good thus begun except by the constant assistance of that grace, which is mediated only by the Catholic Church. This decision was confirmed by Pope Boniface VIII. and became the accepted doctrine in the Western Church of the middle ages. In the East, Augustine's predestination of little influence, but East and West were one in their belief that human nature had been corrupted by the fall, and that salvation therefore is possible only to one who has received divine grace through the sacraments. Agreeing as they did in this fundamental theory, all differences were of minor concern.

In general it may be said that the traditional theology of the Church took its material from various sources—Hebrew, Christian, Oriental, Greek and Roman. The forms in which it found expression were principally those of Greek philosophy on the one hand and of Roman law on the other (see Christianity).

6. Organisation.—The origin and early development of ecclesiastical organization are involved in obscurity. Owing to the once prevalent desire of the adherents of one or another polity to find support in primitive precept or practice, the question has assumed a prominence out of proportion to its real importance, and the few and scattered references in early Christian writings have been made the basis for various elaborate theories. In the earliest days the Church was regarded as a divine institution, ruled not by men but by the Holy Spirit. At the same time it was believed that the Spirit imparted different gifts to different believers, and each gift fitted its recipient for the performance of some service, being intended not for his own good but for the good of his brethren (cf. 1 Cor. xii.; Eph. iv. 11). The chief of these was the gift of teaching, that is, of understanding and interpreting to others the will and truth of God. Those who were endowed more largely than their fellows with this gift were commonly known as apostles, prophets and teachers (cf. Acts xiii. 1; 1 Cor. xii. 28; Eph. ii. 20, iii. 5, iv. 11; Didache, xi.). The apostles were travelling missionaries or evangelists. There were many of them in the primitive Church, and only gradually did the term come to be applied exclusively to the twelve and Paul. There is no sign that the apostles, whether the twelve or others, held any official position in the Church. That they had a large measure of authority of course there was no denying, but it depended always upon their brethren's recognition of their possession of the divine gift of apostleship, and the right of Churches or individuals to test their claims and to refuse to listen to them if they did not vindicate their divine call was everywhere recognized. Witness, for instance, Paul's reference to false apostles in 2 Cor. xi. 13, and his efforts to establish his own apostolic character to the satisfaction of the Corinthians and Galatians (1 Cor. ix. 1 ff.; 2 Cor. x. 13; Gal. i. 8 ff.); witness the reference in Rev. ii. 2 to the fact that the Church at Ephesus had tried certain men who claimed to be apostles and had found them false, and also the directions given in the Didache for testing the character of those who travelled about as apostles. The passage in the Didache is especially significant: "Concerning the apostles and prophets, so do ye according to the ordinance of the gospel. Let every apostle and prophet be judged by you to be received as the Lord. But he shall not abide more than a single day, or if there be need a second likewise. But if he abide three days be he a false prophet. And when the apostle departeth let him receive nothing save bread until he findeth shelter. But if he ask money he is a false prophet" (ch. xi.). It is clear that a man who is to be treated in this way by the congregation is not an official ruler over it.

Between the apostles, prophets and teachers no hard-and-fast lines can be drawn. The apostles were commonly missionary
prophets, called permanently or temporarily to the special work of evangelization (cf. Acts xiii. 1; Did. xi.), while the teachers seem to have been distinguished both from apostles and prophets by the fact that their spiritual endowment was less strictly supernatural. The indefiniteness of the boundaries between the three classes, and the free interchange of names, show how far they were from being definite offices or orders within the Church. Apostleship, prophecy, and teaching were only functions, whose frequent or regular exercise by one or another, under the inspiration of the Spirit, led his brethren to call him an apostle, prophet, or teacher.

But at an early day we find regular officers in this and that local Church, and early in the 2nd century the three permanent offices of bishop, presbyter, and deacon existed at any rate in Asia Minor (cf. the Epistles of Ignatius of Antioch). Their rise was due principally to the necessity of administering the charities of the Church, putting an end to disorder and confusion in the religious services, and disciplining offenders. It was naturally to the apostles, prophets and teachers, its most spiritual men, that the Church looked first for direction and control in all these matters. But such men were not always at hand, or sometimes they were absorbed in other duties. Thus the need of substitutes began to be felt here and there, and as a consequence regular offices within the local Churches gradually made their appearance, sometimes simply recognized as charged with responsibilities which they had already voluntarily assumed (cf. 1 Cor. xvi. 19), sometimes appointed by an apostle or prophet or other specially inspired man (cf. Acts xiv. 23; Titus i. 5; i Clement 44), sometimes formally chosen by the congregation itself (cf. Acts vi., Did. xi.). These men naturally acquired more and more as time passed the control and leadership of the Church in all its activities, and out of what was in the beginning more or less informal and temporary grew fixed and permanent offices, the incumbents of which were recognized as having a right to rule over the Church, a right which once given could not lawfully be taken away unless they were unfaithful to their trust. Not continued endowment by the Spirit, but the possession of an ecclesiastical office now became the basis of authority. The earliest expression of this genuinely official principle is found in Clement’s Epistle to the Corinthians, ch. xiv. Upon these officers devolved ultimately not only the disciplinary, financial and liturgical duties referred to, but also the still higher function of instructing their fellow-Christians in God’s will and truth, and so they became the substitutes of the apostles, prophets and teachers in all respects (cf. 1 Tim. iii. 2, v. 17; Titus i. 9; Did. 15; i Clement 44; Justin’s first Apology, 57).

Whether in the earliest days there was a single officer at the head of a congregation, or a plurality of officers of equal authority, it is impossible to say with assurance. The few references which we have look in the later direction (cf., for instance, Acts vi.; Phil. i. 1; i Clement 42, 44; Did. 14), but we are not justified in asserting that they represent the universal custom. The earliest distinct evidence of the organization of Churches under a single head is found in the Epistles of Ignatius of Antioch, which date from the latter part of the reign of Trajan (c. 116). Ignatius bears witness to the presence in various Churches of Asia Minor of a single bishop in control, with whom are associated as his subordinates a number of elders and deacons. This form of organization ultimately became universal, and already before the end of the 2nd century it was established in all the parts of Christendom with which we are acquainted, though in Egypt it seems to have been the exception rather than the rule, and even as late as the middle of the 3rd century many churches there were governed by a plurality of officers instead of by a single head (see Harnack, Mission und Ausbreitung des Christenthums, pp. 337 seq.). Where there were one bishop and a number of presbyters and deacons in a church, the presbyters constituted the bishop’s council, and the deacons his assistants in the management of the finances and charities and in the conduct of the services. (Upon the minor orders which arose in the 3rd and following centuries, and became ultimately a training school for the higher clergy, see Harnack, Texte und Untersuchungen, ii. 57; English translation under the title of Sources of the Apostolic Canons, 1895.)

Meanwhile the rise and rapid spread of Gnosticism produced a great disturbance within the Church of the 2nd and 3rd centuries, and profoundly affected the ecclesiastical organization. The views of the Gnostics, and of Marcion as well, seemed to the majority of Christians destructive of the gospel, and it was widely felt that they were too dangerous to be tolerated. The original dependence upon the Spirit for light and guidance was inadequate. The men in question claimed to be Christians and to enjoy divine illumination as truly as anybody, and so other safeguards appeared necessary. It was in the effort to find such safeguards that steps were taken which finally resulted in the institution known as the Catholic Church. The first of these steps was the recognition of the teaching of the apostles (that is, of the twelve and Paul) as the exclusive standard of Christian truth. This found expression in the formulation of an apostolic scripture canon, our New Testament, and of an apostolic rule of faith, of which the old Roman symbol, the original of our present Apostles’ Creed, is one of the earliest examples. Over against the claims of the Gnostics that they had apostolic authority, either oral or written, for their preaching, were set these two standards, by which alone the apostolic character of any doctrine was to be tested (cf. Irenaeus, Adv. Haer. i. 10, iii. 3, 4; and Tertullian, De prescriptione Haer. passim). But these standards proved inadequate to the emergency, for it was possible, especially by the use of the allegorical method, to interpret them in more than one way, and their apostolic origin and authority were not everywhere admitted. In view of this difficulty, it was claimed that the apostles had appointed the bishops as their successors, and that the latter were in possession of special divine grace enabling them to transmit and to interpret without error the teaching of the apostles committed to them. This is the famous theory known as “apostolic succession.” The idea of the apostolic appointment of church officers is as old as Clement of Rome (see i. Clement 44), but the use of the theory to guarantee the apostolic character of episcopal teaching was due to the exigencies of the Gnostic conflict. Irenaeus (Adv. Haer. iii. 3 ff., iv. 26, iv. 33, v. 20), Tertullian (De prescriptione, 32), and Hippolytus (Philosophumena, bk. i., preface) are our earliest witnesses to it, and Cyprian sets it forth clearly in his epistles (e.g. Ep. 33, 43, 59, 66, 66). The Church was thus in possession not only of authoritative apostolic doctrine, but also of a permanent apostolic office, to which alone belonged the right to determine what that doctrine is. The combination of this idea with that of clerical sacerdotalism completed the Catholic theory of the Church and the clergy. Saving grace is recognized as apostolic grace, and the bishops as successors of the apostles become its sole transmitters. Bishops are therefore necessary to the very being of the Church, which without them is without the saving grace for the giving of which the Church exists (cf. Cyprian, Ep. 33, “ecclesia super episcopos constitutur” 66, “ecclesia in episcopo”; also Ep. 59, and De unitate eccles. 17).

These bishops were originally not diocesan but congregational, that is, each church, however small, had its own bishop. This is the organization testified to by Ignatius, and Cyprian’s insistence upon the bishop as necessary to the very existence of the Church seems to imply the same thing. Congregational episcopacy was the rule for a number of generations. But after the middle of the 3rd century diocesan episcopacy began to make its appearance here and there, and became common in the 4th century under the influence of the general tendency toward centralization, the increasing power of city bishops, and the growing dignity of the episcopate (cf. canon 6 of the council of Sardica, and canon 57 of the council of Laodicea; and see Harnack, Missions und Ausbreitung, pp. 310 seq.). This enlargement of the bishop’s parish and multiplication of the offices led to a change in the functions of the presbyterate. So long as each church had its own bishop the presbyters constituted simply his council, but with the growth of diocesan episcopacy it became the custom to put each congregation under the care of a particular presbyter, who performed within it most of the pastoral duties.
formerly discharged by the bishop himself. The presbyters, however, were not independent officers. They were only representatives of the bishop, and the churches over which they were set were all a part of his parish, so that the Cyprianic principle, that the bishop is necessary to the very being of the Church, held good of diocesan as well as of congregational episcopacy. The bishop alone possessed the right to ordain; through him alone could be derived the requisite clerical grace; and so the clergy like the laity were completely dependent upon him.

The growth of the diocesan principle promoted the unity of the churches gathered under a common head. But unity was carried much further than this, and finally resulted in at least a nominal consolidation of all the churches of Christendom into one whole. The belief in the unity of the entire Church had existed from the beginning. Though made up of widely scattered congregations, it was thought of as one body of Christ, one people of God. This ideal unity found expression in many ways. Intercommunication between the various Christian communities was very active. Christians upon a journey were always sure of a warm welcome and hospitable entertainment from their fellow-disciples. Messengers and letters were sent freely from one church to another. Missionaries and evangelists went continually from place to place. Documents of various kinds, including gospels and the New Testament, epistles, and various parts of the Scriptures, circulated widely, and the feeling of unity found expression, and the development of widely separated parts of Christendom conformed more or less closely to a common type. It was due to agencies such as these that the scattered churches did not go each its own way and become ultimately separate and diverse institutions. But this general unity became official, and expressed itself in organization, only with the rise of the conciliar and metropolitan systems. Already before the end of the 3rd century local synods were held in Asia Minor to deal with Montanism, and in the 3rd century provincial synods became common, and by the council of Nicaea (canon 5) it was decreed that they should be held twice every year in every province. Larger synods representing the churches of a number of contiguous provinces also met frequently; for instance, in the early 4th century at Elvira, Ancyra, Neo-Caesarea, and Arles, the last representing the entire Western world. Such gatherings were especially common during the great doctrinal controversies of the 4th century. In 325 the first general or ecumenical council, representing theoretically the entire Christian Church, was held at Nicaea. Other councils of the first period now recognized as ecumenical by the Church both East and West are Constantinople I. (381), Ephesus (431), Chalcedon (451), Constantinople II. (553). All these were called by the emperor, and to their decisions he gave the force of law. Thus the character of the Church as a state institution voiced itself in them. (See COUNCIL.)

The theory referred to above, that the bishops are successors of the apostles, and as such the authoritative conservators and interpreters of apostolic truth, involves of course the solidarity of the episcopate, and the assumption that all bishops are in complete harmony and bear witness to the same body of doctrine. This assumption, however, was not always sustained by the facts. Serious disagreements even on important matters developed frequently. As a result the ecumenical council came into existence especially for the purpose of settling disputed questions of doctrine, and giving to the collective episcopate the opportunity to express its voice in a final and official way. At the council of Nicaea, and at the ecumenical councils which followed, the idea of an infallible episcopate giving authoritative and permanent utterance to apostolic and therefore divine truth, found clear expression, and has been handed down as a part of the faith of the Catholic Church both East and West. The infallibility of the episcopate guarantees the infallibility of a general council in which the bishop either does not the clergy in general, but the bishops as successors of the apostles (Pseudo-Dionysius). Another organized expression of the unity of the Church was found in the metropolitan system, or the grouping of the churches of a province under a single head, who was usually the bishop of the capital city, and was known as the metropolitan bishop. The Church thus followed in its organization the political divisions of the Empire (cf. for instance canon 12 of the council of Chalcedon, which forbids more than one metropolitan see in a province; also canon 17 of the same council: "And if any city has been or shall hereafter be newly erected by imperial authority, let the arrangement of ecclesiastical parishes follow the political and municipal laws "). These metropolitan bishops were common before the close of the 3rd century, and so the general existence of the organization was taken for granted by the council of Nicaea (see canons 4, 6, 7). In the West, on the other hand, the development was much slower.

Meanwhile the tendency which gave rise to the metropolitan system resulted in the grouping together of the churches of a number of contiguous provinces under the headship of the bishop of the most important city of the district, as, for instance, Antioch, Ephesus, Alexandria, Rome, Milan, Carthage, Arles. In canon 6 of the council of Nicaea the jurisdiction of the bishops of Alexandria, Rome and Antioch over a number of provinces is recognized. At the council of Constantinople the bishop of Constantinople or New Rome was ranked next after the bishop of Rome (canon 3), and at the council of Chalcedon (451) he was given authority over the churches of the political dioceses of Pontus, Asia and Thrace (canon 28). To the bishops of Rome, Constantinople, Antioch and Alexandria was added at the council of Chalcedon (session 7) the bishop of Jerusalem, the mother church of Christendom, and the bishops thus recognized as possessing supreme jurisdiction were finally known as patriarchs.

Meanwhile the Roman episcopate developed into the papacy, which claimed supremacy over the entire Christian Church, and actually exercised it increasingly in the West from the 5th century on. This development was forwarded by Augustine, who in his famous work De civitate Dei identified the Church with the kingdom of God, and claimed that it was supreme over all the nations of the earth, which make up the civitas terrena or earthly state. Augustine's theory was ultimately accepted everywhere in the West, and thus the Church of the middle ages was regarded not only as the sole ark of salvation, but also as the ultimate authority, moral, intellectual and political. Upon this doctrine was built, not by Augustine himself but by others who came after him, the structure of the papacy, the bishop of Rome being finally recognized as the head under Christ of the civitas Dei, and the supreme organ of divine authority on earth (see Papacy and Pope).

**Historical Sources of the First Period.**—These are of the same general character for Church history as for general history—on the one hand monumental, on the other hand documentary. Among the monuments are churches, catacombs, tombs and inscriptions of various kinds, few antedating the 3rd century, and none adding greatly to the knowledge gained from documentary sources (see Lactantius, De mortuorum animarum, 1864 ff., and its English abridgment by Northcote and Brownlow, 1870; André Pératé, L'Archéologie chrétienne, 1892; W. Lowrie, Monuments of the Early Church, 1901, with good bibliography). The documents comprise imperial edicts, rescripts, &c., liturgies, acts of councils, decretals and letters of bishops, references in contemporary heathen writings, and above all the works of the Church Fathers. Written sources from the 1st and 2nd centuries are relatively few, comprising, in addition to some scattered allusions by outsiders, the New Testament, the Apostolic Fathers, the Greek Apologists, Clement of Alexandria, the old Catholic Fathers (Irenaeus, Tertullian and Hippolytus) and a few others. For the 3rd and especially the 4th and following centuries, the writers are much more numerous; for instance, in the East, Origen and his disciples, and later Eusebius of Caesarea, Athanasius, Apollinaris, Basil and the two Gregorys, Cyril of Alexandria, Pseudo-Dionysius; in the West, Novatian, Cyprian, Commodian, Arnobius, Laetantius, Hilary, Ambrose, Rufinus, Jerome, Augustine, Prosper, Leo the Great, Cassian, Vincent of Lérins, Augustus, Gennadius, Emodus, Avitus, Caesarius, Felix, and many others.

The Christian Church in the Middle Ages

The ancient Church was the church of the Roman empire. It is true that from the 4th century onwards it expanded beyond the borders of that empire to east and west, north and south; but the infant churches which gradually arose in Persia and Abyssinia, among some of the scattered Teutonic races, and among the Celts of Ireland, were at first not co-operating factors in the development of Christendom: they received without giving in return. True historic life is only to be found within the church of the empire.

The middle ages came into being at the time when the political structure of the world, based upon the conquests of Alexander the Great and the achievements of Julius Caesar, began to disintegrate. They were present when the believers in Mahomet held sway in the Asiatic and African provinces which Alexander had once brought under the intellectual influence of Hellenism; while the Lombards, the West Goths, the Franks and the Anglo-Saxons had established kingdoms in Italy, Spain, Gaul and Britain. The question is: what was the position of the Church in this great change of circumstances, and what form did the Church's development take from this time onwards? In answering this question we must consider East and West separately; for their histories are no longer coincident, as they had been in the time of the Roman dominion.

I. THE EAST. (a) THE ORTHODOX CHURCH.

Ancient and medieval times were not separated by so deep a gulf in the East as in the West; for in the East the Empire continued to exist, although within narrow limits, until towards the end of the middle ages. Constantinople only fell in 1453. Ecclesiastical Byzantium is therefore not a product of the middle ages: it is the outcome of the development of the eastern half of the empire from the time of Constantine the Great. Under Justinian I. all its essential features were already formed: imperial power extended equally over State and Church; indeed, care for the preservation of dogma and for the purity of the priesthood was the chief duty of the ruler. To fulfill this duty was to serve the interests of both State and people; for thus 'a fine harmony is established, and whatever good exists becomes the portion of the whole human race.' Since the emperor ruled the Church there was no longer any question of independence for the bishops, least of all for the patriarch in Constantinople; they were in every respect subordinate to the emperor.

The orthodoxy of the Eastern Church was also a result of the Church's development after the time of Constantine. In the long strife over dogma the old belief of the Greeks in the value of knowledge had made itself felt, and this faith was not extinct in the Eastern Church. There is no doubt that in the beginning of the middle ages both general and theological education stood higher among the Greeks than in more western countries. In the West there were no learned men who could vie with Photius ('ca. 820-891') in range of knowledge and variety of scientific attainment. But the strife over dogma came to an end with the 7th century. After the termination of the monothelite controversy (638-680), creed and doctrines were complete; it was only necessary to preserve them intact. Theology, therefore, now resolved itself into the collection and reproduction of the teaching of ancient authorities. The great dogmatist of the Eastern Church, John of Damascus (ca. 699-755), who stood on the threshold of the middle ages, formulated clearly and precisely his working principle: to put forward nothing of his own, but to present the truth according to the authority of the Bible and of the Fathers of the Church. Later teachers, Euthymius Zigadenus (d. circa 1120), Nicetas Choniates (d. circa 1200), and others, proceeded further on the same lines; Euthymius, in particular, often uses an excerpt instead of giving his own exposition.

The attitude towards dogma did not mean that it was less prized than during the period of strife. On the contrary, the sacred formulae were revered because they were believed to contain the determination of the highest truths: the knowledge of God and of the mystery of salvation. Yet it is intelligible that religious interest should have concerned itself more keenly with the mystic rites of divine worship than with dogma. Here was more than knowledge; here were representations of a mystic sensuousness, solemn rites, which brought the faithful into immediate contact with the Divine, and guaranteed to them the reception of heavenly powers. What could be of more importance than to be absorbed in this transcendent world? We may gauge the energy with which the Greek intellect turned in this direction if we call to mind that the controversy about dogma was replaced by the controversy about images. This raged in the Eastern Church for more than a century (726-843), and only after many reversals. When the worship of images was unconditionally conceded. In this connexion the image was not looked upon merely as a symbol, but as the vehicle of the presence and power of that which it represented: in the image the invisible becomes operative in the visible world. Christ did not seem to be Christ unless he was visibly represented. What an ancient teacher had said with regard to the worship of Christ as the revelation of the Eternal Father—"Honours paid to the earthly representative are shared by the heavenly Archetype"—was now transferred to the painted image: it appeared as an analogy to the Incarnation. It was for this reason that the victory of image worship was celebrated by the introduction of the festival of the Orthodox Faith.

It is consistent with this circle of ideas that initiation into the profound mysteries of the liturgy was regarded, together with the preservation of dogma, as the most exalted function of theology. A beginning had been made, in the 5th century, by the neoplatonic Christian who addressed his contemporaries under the mask of Dionysius the Areopagite. He is the first of a series of theological mystics which continued through every century of the middle ages. Maximus Confessor, the heroic defender of Dyotheletism (d. 662), Symeon, the New Theologian (d. circa 1040), Nicolaus Cabasilas (d. 1371), and Symeon, like Nicholas, archbishop of Thessalonica (d. 1420), were the most conspicuous representatives of this Oriental mysticism. They left all the dogmas and institutions of the Church untouched; aspiring above and beyond these, their aim was religious experience.

It is this striving after religious experience that gives to the Oriental monachism of the middle ages its peculiar character. In the 5th and 6th centuries Egypt and Palestine had been the classic lands of monks and monasteries. But when, in consequence of the Arab invasion, the monasticism of those countries was cut off from intercourse with the rest of Christendom, it decayed. Constantinople and Mount Athos gained proportionately in importance during the middle ages. At Constantinople the monastery of Studium, founded about 460, attained to supreme influence during the controversy about images. On Mount Athos the first monastery was founded in the year 963, and in 1045 the number of monastic foundations had reached 180. In Greek monachism the old Hellenic idea of the wise man who has no wants (ἀμφιλεγόμενος) was from the first fused with the Christian conception of unreserved self-surrender to God as the highest aim and the highest good. These ideas governed it in medieval times also, and in this way monastic life received a decided bent towards mysticism: the monks strove to realize the heavenly life even upon earth, their highest aim being the contemplation of God and of His ways. The teachings of
Symeon, "the New Theologian," on these matters lived on in the cloisters; it was taken up by the hesychasts of the 14th century, and developed into a secular theory as to the perception of the Divine Light. In spite of all opposition their teaching was finally justified by the Eastern Church (sixth synod of Constantinople, 1351). And rightly so, for it was the old Greek piety minted afresh.

The Eastern Church, then, throughout the middle ages, remained true in every particular to her ancient character. It cannot be said that she developed as did the Western Church during this period, for she remained what she had been; but she freely developed her original characteristics, consistently, in every direction. This too is life, though of a different type from that of the West.

That there was life in the Eastern Church is also proved by the fact that the power of expansion was not denied her. Through her agency an important bulwark for the Christian faith was created in the new nations which had sprung into existence since the beginning of the middle ages: the Bulgarians, the Servians, and the multi-faceted peoples grouped under the name of Russians. There is a vast difference in national character between these young peoples and the successors of the Hellenes; and it is therefore all the more significant to find that both the Church and religious sentiment should in their case have fully preserved the Byzantine character. This proves once more the ancient capacity of the Greeks for the assimilation of foreign elements.

There was yet another outcome of this stubborn persistency of a peculiar type—the impossibility of continuing to share the life of the Western Church. Neither in the East nor in the West was a separation desired; but it was inevitable, since the lives of East and West were moving in different directions. It was the fall of Constantinople that first weakened the vital force of the Eastern Church. May we hope that the events of modern times are leading her towards a renaissance?

The Nestorian and the Monophysite Churches.—Since the time when the Church of eastern Syria had decided, in opposition to the church of the Empire, to cling to the ancient views of Syrian theologians—therefore also to the teaching and person of Nestorius—her relations were broken off with the church in western Syria and in Greek and Latin countries; but the power of Nestorian, or, as it was termed, Chaldaic Christianity, was not thereby diminished. Separated from the West, it directed its energies towards the East, and here its nearest neighbour was the Persian church. The latter followed, almost without opposition, the impulse received from Syria; from the rule of the patriarch Babæus (cyr. Bâbâhâ, 490–503) she may be considered definitely Nestorian. A certain number, too, of Arabian Christians, believers living on the west coast of India, the so-called Christians of St Thomas, and finally those belonging to places nearer the middle of Asia (Merv, Herat, Samarkand), remained in communion with the Nestorian church. Thus there survived in mid-Asia a widely-scattered remnant, which, although out of touch with the ancient usages of Christian civilization, yet in no way lacked higher culture. Nestorian philosophers and medical practitioners became the teachers of the great Arabian natural philosophers of the middle ages, and the latter obtained their knowledge of Greek learning from Syriac translations of the works of Greek thinkers.

Political conditions at the beginning of the middle ages favoured the Nestorian church, and the fact that the Arabs had conquered Syria, Palestine and Egypt, made it possible for her to exert an influence on the Christians in these countries. Of still more importance was the brisk commercial intercourse between central Asia and the countries of the Far East; for this led the Nestorians into China. The inscription of Si-egan-lu (before 781) proves a surprisingly widespread extension of the Christian faith in that country. That it also possessed adherents in southern Siberia we gather from the inscriptions of Semiryetchensk, and in the beginning of the 11th century it found its way even into Mongolia. Nowhere were the nations Christian, but the Christian faith was everywhere accepted by a not insignificant minority. The foundation of the Mongolian empire in the beginning of the 13th century did not disturb the position of the Nestorian church; but the revival of the Mahommedan power, which was coincident with the downfall of the Mongolian empire, was pregnant with disaster for her. The greater part of the Nestorianism was now swallowed up by Islam, so that only remnants of this once extensive church have survived until modern times.

The middle ages were far more disastrous for the Monophysites than for the Nestorians; in their case there was no alternation of rise and decline, and we have only a long period of gradual exhaustion to chronicle. Egypt was the home of Monophysitism, whence it extended also into Syria. It was due to the great Jacob of Edessa (Jacob Baradaeus, d. 578) that it did not succumb to the persecution by the power of the Orthodox Empire, and out of gratitude to him the Monophysite Christians of Syria called themselves Jacobites. The Arab conquest (after 635) freed the Jacobite church entirely from the oppression of the Orthodox, and thereby assured its continuance. The church, however, never attained any greater development, but on the contrary continued to lose adherents from century to century. While Jacob of Edessa is said to have ordained some 100,000 priests and deacons for his fellow-believers, in the 16th century the Jacobites of Syria were estimated at only 50,000 families.

The Monophysite church of Egypt had a like fate. At the time of the separation of the churches the Greeks here had retained faithful to Orthodoxy, the Copts to Monophysitism. Here too the Arab conquest (641) put an end to the oppression of the native Christians by the Greek minority; but this did not afford the Coptic church any possibility of vigorous development. It succumbed to the ceaseless alternation of toleration and persecution which characterized the Arab rule in Egypt, and the mass of the Coptic people became unfaithful to the Church. At the time of the conquest of the country by the Turks (1557) the Coptic church seems already to have fallen to the low condition in which the 19th century found it. Though at the time of the Arab conquest the Copts were reckoned at six millions, in 1820 the Coptic Christians numbered only about one hundred thousand, and it is improbable that their number can have been much greater at the close of the middle ages. Only in Abyssinia the daughter church of the Coptic church succeeded in keeping the whole people in the Christian faith. This fact, however, is the sole outcome of the history of a thousand years; a poor result, if measured by the standard of the rich history of the Western world, yet large enough not to exclude the hope of a new development.

II. The West. (a) The Early Middle Ages. The Catholic Church as influenced by the Foundation of the Teutonic States.—While the Eastern Church was stereotyping those peculiar characteristics which made her a thing apart, the Church of the West was brought face to face with the greatest revolution that Europe has ever experienced. At the end of the 6th century all the provinces of the Empire had become independent kingdoms, in which conquerors of Germanic race formed the dominant nationality. The remnants of the Empire showed an uncommonly tough vitality. It is true that the Teutonic states succeeded everywhere in establishing themselves; but only in England and in the erstwhile Roman Germany did the Roman nationality succumb to the Teutonic. In the other countries it not only maintained itself, but was able to assimilate the ruling German race; the Lombards, West Goths, Swabians, and even the Franks in the greater part of Gaul became Romanized. Consequently the position of the Christian Church was never seriously affected. This is the great fact which stands out at the beginning of the history of the Church in the middle ages. The continuity of the political history of Europe was violently interrupted by the Germanic invasions; but not that of the history of the Church. For, in view of the facts above stated, it was of small significance that in Britain Christianity was driven back into the western portion of the island still held by the Britons, and that in the countries of the Rhine and Danube a few bishoprics disappeared.

This was of the less importance, as the Church immediately made preparations to win back the lost territory. On the
frontier line of ancient and medieval times stands the figure of Gregory I., the incarnation as it were of the change that was taking place: half Father of the Church, half medieval pope. He it was who sent the monk Augustine to England, in order to win over the Anglo-Saxons to the Christian faith. Augustine was not the first preacher of the Gospel at Canterbury. A Frankish bishop, Liudhard, had laboured there before his time; but the mission of Augustine and his ordination as a bishop were decisive in the conversion of the country and the establishment of the Anglo-Saxon church. On the continent an extension of the Frankish supremacy towards the east had already led to the advance of Christendom. Not only were the bishoprics in the towns of the Rhine country re-established, but as the Franks colonized the country on both sides of the Main, they carried the Christian faith into the very heart of Germany. Finally, the dependence of the Swabian and Bavarian peoples on the Frankish empire paved the way for Christianity in those provinces also. Celtic monks worked as missionaries in this part of the country side by side with Franks. In England it had not been possible to bring the old British and the young Anglo-Saxon churches into friendly union; but in spite of this the Celts did not abstain from working at the common tasks of Christendom, and the continent has much to thank them for. When the first century of the middle ages came to an end the Church had not only reoccupied the former territory of the Empire, she had already begun to overstep its limits.

In so doing she had remained as of old and had yet become new. Creed and dogma, above all, remained unchanged. The doctrinal decisions of the ancient Church remained the indestructible canon of belief, and what the theologians of the ancient Church had taught was reverenced as beyond improvement. The entire form of divine worship remained therefore unaltered. Even where the Latin tongue was not understood by the people, the Church preserved it in the Mass and in the administration of the sacraments, in her exorcisms and in her benedictions. Furthermore, the organization of ecclesiastical offices remained unchanged: the division of the Church into bishoprics and the grouping together of bishoprics into metropolitans. Finally, the property and the whole social status of the Church and of the hierarchy remained unchanged, as did also the conviction that the perfection of the Christian life was to be sought and found in the monastic profession.

Nevertheless, the new conditions did exercise the strongest influence upon the character of the Church. The churches of the Lombards, West Goths, Franks and Anglo-Saxons, all counted themselves parts of the Catholic Church; but the Catholic Church had altered its condition; it lacked the power of organization, and split up into territorial churches. Under the Empire the ecumenical council had been looked upon as the highest representative organ of the Catholic Church; but the earlier centuries of the middle ages witnessed the convocation of no ecumenical councils. Under the Empire the bishop of Rome had possessed in the Church an authority recognized and protected by the State; respect for Rome and for the successor of Saint Peter was not forgotten by the new territorial churches, but it had altered in character; legal authority had become merely moral, and its wielder could exhort, warn, advise, but could not command.

On the other hand, the kings did command in the Church. They certainly claimed no authority over faith or doctrine, and they too respected doctrinal law; but they succeeded in asserting their rights to a practical share in the government of the Church. The clergy and laity of a diocese together elected their bishop, as they had done before; but no one could become a bishop against the will of the king, and the confirmation of their choice rested with him. The bishops continued to meet in synods as before, but the councils became territorial synods; they were called together at irregular intervals by the king, and their decisions obtained legal effect only by royal sanction.

In these circumstances the intrusion of Germanic elements into ecclesiastical law is easy to understand. This is most clearly recognizable in the case of churches which arose alongside the episcopal cathedrals. In the Empire all churches, and all the property of the Church, were at the disposal of the bishops; in Germanic countries, on the contrary, the territorial nobles were looked upon as the owners of churches built upon their lands, and these became "proprietary churches." The logical consequence of this was that the territorial nobles claimed the right of appointing clergy, and the enjoyment of the revenues of these churches derived from the land (tithe). Even a certain number of the monastic establishments came in this way into the possession of the feudal landowners, who nominated abbots and abbesses as they appointed the incumbents of their churches.

With these conditions, and with the diminution of the ascendency of town over country that resulted from the Teutonic conquests, is connected the rise of the parochial system in the country. The parishes were further grouped together into rural deaneries and archdeaconries. Thus the diocese, hitherto a simple unit, became an elaborately articulated whole. The bishopric of the middle ages bears the same name as that of the ancient Church; but in many respects it has greatness that is new.

This transformation of old institutions is the first great result of Germanic influence in the Christian Church. It continues to the present day in the universal survival of the parochial system.

In the middle ages the civilizing task of the Church was first exercised in England. This was the home of the English literature and theology of medieval times. Alcuin (d. 799) and the Venerable Bede (d. 735) were the first scholars of the period. England was also the home of Winfrid Bonifatius (d. 757). We are accustomed to look upon him chiefly as a missionary; but his completion of the conversion of the peoples of central Germany (Thuringians and Hessian) and his share in that of the Frisians, are the least part of his life-work. Of more importance is the fact that, in cooperation with the bishops of Rome, he carried out the organization of the church in Bavaria, and began the reorganization of the Frankish church, which had fallen into confusion and decay during the political disorders of the last years of the Merovingians. It was Boniface, too, who, with the aid of numerous English priests, monks and nuns, introduced the literary culture of England into Germany.

Pippin (d. 768) and Charlemagne (d. 814) built on the foundations laid by Winfrid. For the importance of Charlemagne's work, from the point of view of the Church, consists also, not so much in the fact that, by his conversion of the Saxons, the Avars and the Wends in the eastern Alps, he substantially extended the Church's dominions, as in having led back the Frankish Church to the fulfilment of her functions as a religious and civilizing agent. This was the purpose of his ecclesiastical legislation.

The principal means to this end taken by him was the raising of the status of the clergy. From the priests he demanded faithfulness in preaching and teaching, from the bishops the conscientious government of their dioceses. The monasteries, too, learned to serve the Church by becoming nurseries of literary and theological culture. For the purpose of carrying out his ideas Charlemagne gathered round him the best intellects of Europe. None was more intimately associated with him than the Anglo-Saxon Alcuin (d. 804); but he was only one among many. Besides him the Saxon Hrabanus, the Lombards Paulinus and Paulus Diaconus, the West Goth Theodulf and many Franks. Under their guidance theology flourished in the Frankish empire. It was as little original as that of Bede; for on the continent, too, scholars were content to think what those of old had thought before them. But in so doing they did not only repeat the old formulae; the ideas of the men of old sprang into new life. This is shown by the searching discussions to which the Adoptionist controversy gave rise. At the same time, the controversy with the Eastern Church over the adoration of images shows that the younger Western theology felt itself equal, if not superior to the Greek. This was in fact the case; for it knew how to treat the question, which divided the Greeks, in a more dispassionate and practical manner than they.

The second generation of Frankish theologians did not lag behind the first. Hrabanus of Fulda (who died archbishop of
Mainz in 856) was in the range of his knowledge undoubtedly Alcuin’s superior. He was the first learned theologian produced by Germany. His example, Abbot Walafrid Strabo of Reichenau (d. 849), was the author of the *Glossa Ordinaria*, a work which formed the foundation of biblical exposition throughout the middle ages. France was still more richly provided with theologians in the 9th century; her most prominent names are Hincmar, archbishop of Reims (d. 882), Bishop Prudentius of Troyes (d. 861), the monks Servatus Lupus (d. 865), Radbert Paschaisius (d. circa 866), and Ratramnus (d. after 868); and the last theologian who came into France from abroad, Johannes Scotus Erigena (d. circa 886). The theological method of all these was merely that of restatement. But the controversy about predestination, which, in the 9th century, Hincmar and Hrabanus fought out with the monk Gotschalk of Fulda, as well as the discussions that arose from the definition of the doctrine of transubstantiation of Radbert, enable us to gauge the intellectual energy with which theological problems were once more being handled.

Charlemagne followed his father’s policy in carrying out his ecclesiastical measures in close association with the bishops of Rome. He renewed the donation of Pippin, and as *Patrichius* he took Rome under his protection. From Pope Adrian I. he received the *Dionysos-Hadriana*, the Roman collection of material bearing on the ancient ecclesiastical law. But the Teutonic elements maintained their place in the law of the Frankish Church; and this was not altered by the fact that, since Christmas 800, the king of the Franks and Lombards had borne the title of Roman emperor. On the contrary, Rome itself was now for the first time affected by the predominance of the new empire; for Charlemagne converted the patriciate into effective serfdom, and the successor of St Peter became the chief metropolitan of the Frankish empire.

There were, indeed, forces tending in the contrary direction; and these were present in the Frankish empire. Evidence of this is given by the canon law forgeries of the 9th century: the *capitula* of Angelram, the *Capitularies* of Benedictus Levita (see *CAPITULARY*), and the great collection of the Pseudo-Isidorian Decretals. For the moment, however, this party met with no success. Of more importance was the fact that at Rome the old conditions, the old claims, and the old law were forgotten. Developing the ideas of Leo I., Gelasius I. and Gregory the Great, Nicholas I. (858–867) drew a picture of the divine right and unlimited power of the bishop of Rome, which anticipated all that the greatest of his successors were, centuries later, actually to claim. The time had not, however, yet come for the establishment of the papal world-dominion. For, while the power of Charlemagne’s successors was decaying, the papacy itself became involved in the confusion of the party strife of Italy and of the city of Rome, and was plunged in consequence into such an abyss of degradation (the so-called Pornocracy), that it was in danger of forfeiting every shred of its moral authority over Christendom.

(6) Central Period of the Middle Ages. Dominance of the Roman Spirit in the Church.—After the accession of the House of Saxony (919), the national ecclesiastical system, founded upon the principles of Carolingian law, developed in Germany with fresh energy. The union in 962 by Otto I. of the revived Empire with the German kingship brought the latter into uninterrupted contact with the papacy. The revelation of the antagonism between the German conception of ecclesiastical affairs and Roman views of ecclesiastical law was sooner or later ineluctable. This was most obvious in the matter of appointment to bishoprics. At Rome canonical election was alone regarded as lawful; in Germany, on the other hand, developments since the time of Charlemagne had led to the actual appointment of bishops being in the hands of the king, although the form of ecclesiastical election was preserved. For the transference of a bishopric a special legal form was evolved—that of investiture, the king investing the bishop elect with the see by delivering to him the ring and pastoral staff. No one found anything objectionable in this; investiture with a bishopric was parallel with the appointment by a territorial proprietor to a patronal church.

The practice customary in Germany was finally transferred to Rome itself. The desperate position of the papacy in the 11th century obliged Henry III. to intervene. When, on the 24th of December 1046, after three rival popes had been set aside, he nominated Suidgar, bishop of Bamberg, as bishop of Rome before all the people in St Peter’s, the papacy was bestowed in the same way as a German bishopric; and what had occurred in this case was to become the rule. By procuring the transference of the patriciate from the Roman people to himself Henry assured his influence over the appointment of the popes, and accordingly also nominated the successors of Clement II.

His intervention saved the papacy. For the popes nominated by him, Leo IX. in particular, were men of high character, who exercised their office in a loftier spirit than their corrupt predecessors. They abandoned many of the reforms for ecclesiastical reform. But was it possible for the relation between Empire and Papacy to remain what Henry III. had made it?

The original sources of this reform movement lay far back, in the time of the Carolingers. It has been pointed out how Charlemagne pressed the monks into the service of his civilizing aims. We admire this; but it is certain that he thereby alienated monasticism from its original ideals. These, however, had far too strong a hold upon the Roman world for a reaction against the new tendency to be long avoided. This reaction began with the reform of Benedict of Aniane (d. 821), the aim of which was to bring the Benedictine order back to the principles of its original rules. In the next century the reform movement acquired a fresh centre in the Burgundian monastery of Cluny. The energy of a succession of distinguished abbots and the disciples whom they inspired succeeded in bringing about the victory of the reforming ideas in the French monasteries; once more the rule of St Benedict controlled the life of the monks. A large number of the reformed monasteries attached themselves to the congregation of Cluny, thus assuring the influence of reformed monasticism upon the Church, and securing likewise its independence of the diocesan bishops, since the abbot of Cluny was subordinate of the pope alone. (See Cluny; Benedictines and Monasticism.) At the same time that Cluny began to grow into importance, other centres of the monastic reform movement were established in Upper and Lower Lorraine; and before long the activity of the Cluniac monks made itself felt in Italy. In Germany Poppo of Stavelot (d. 1048) was a successful champion of their ideas; in England Dunstan (d. 988 as archbishop of Canterbury) worked independently, but on similar lines. Every where the object was the same: the supreme obligation of the Rule, the renewal of discipline, and also the economic improvement of the monasteries. The reform movement had originally no connexion with ecclesiastical politics; but that came later when the leaders turned their attention to the abuses prevalent among the clergy, to the conditions obtaining in the Church in defiance of the ecclesiastical law. “Return to the canon law!” was now the battle-cry. In the Cluniac circle was coined the principle: *Canonica auctoritas Dei lex est*, canon law being taken in the Pseudo-Isidorian sense. The programme of reform thus included not only the extirpation of simony and Nicolaitism, but also the freeing of the Church from the influence of the State, the recovery of her absolute control over all her possessions, the liberty of the Church and of the hierarchy.

As a result, the party of reform placed itself in opposition to those ecclesiastical conditions which had arisen since the conversion of the Teutonic peoples. It was, then, a fact pregnant with the most momentous consequences that Leo IX. attached himself to the party of reform. For, thanks to him and to the men he gathered round him (Hildebrand, Humbert and others), their principles were established in Rome, and the pope himself became the leader of ecclesiastical reform. But the carrying out of reforms led at once to dissensions with the civil power, the starting-point being the attack upon simony. Originally, in accordance with Acts viii. 18 et seq., simony was held to be the purchase of ordination. In the 9th century the interpretation was extended to include all acquisition of
CHURCH HISTORY

341

ecclesiastical offices or benefices for money or money's worth. Since the
landed proprietors disposed of churches and convents, and the kings of
bishops and abbots, it became possible for them too to commit the sin of
simony; hence a final expansion, in the 11th century, of the meaning of the
term. The Pseudo-
Isidorian idea being that all lay control over things ecclesiastical
is wrong, all transfers by laymen of ecclesiastical offices or
benefices, even though no money changed hands in the process,
were now classed as simony (Humbert, Adversus Simoniocas,
1059–1058). Thus the lord who handed over a living was a
simonist, and so too was the king who invested a bishop. On
this question the battle began. The Church at first refrained
from contesting the rights of the landowners over their own
churches, and concentrated her attack upon investiture. In
1059 the new system of papal election introduced by Nicholas II.
ensured the occupation of the Holy See by a pope favourable to
the party of reform; and in 1078 Gregory VII. issued his pro-
hibition of lay investiture. In the years of conflict that followed
Gregory looked far beyond this point; he set his aim ever
higher; until, in the end, his idea was to concentrate all ecclesi-
astical power in the hands of the pope, and to raise the papacy
to the dominion of the world. Thus was to be realized the old
dream of Augustine: that of a Kingdom of God on earth under
the rule of the Church. But it was not given to Gregory to reach
this goal, and his successors had to return again to the tactics
of practical compromise. The settlement of 1111 may be said to have
embodied the only solution of the great question that was right
in principle, since it pronounced in favour of a clear distinction
between the spiritual and temporal spheres. However, a solution
that was right in principle proved impossible in practice, and the
long struggle ended in a compromise by the Concordat of Worms
(1122). The essential part of this was that the Empire accepted
the canonical election of bishops, and allowed the metropolitan
to confer the sacred office by gift of ring and pastoral staff;
while the Church acknowledged that the bishop held his temporal,
rights from the Empire, and was therefore to be invested with
them by a touch from the royal sceptre. A similar solution was
arrived at in England. Henry I. also renounced his claim to
bestow ring and pastoral staff, but kept the right of induction
into the temporalities (1106–1107). In France the demands of
the Church were successful to the same degree as in England
and Germany, but without any conflict. Thus the Germanic
element in the law regarding appointment to bishoprics was
eliminated. Somewhat later it disappeared also in the case of
the churches of less importance, patronal rights over these being
substituted for the former absolute ownership. The pontificate of
Alexander III. (1159–1181) decided this.

Since the time of Charlemagne Germanic influence had pre-
ponderated in the West, as is shown in the expansion of the
Church no less than in matters of ecclesiastical law. The whole
progress of Christianity in Europe from the 9th to the 12th
century was due—if we exclude Eastern Christendom—to the
Teutonic nations; neither the papacy nor the peoples of Latin
race were concerned in it. German priests and bishops carried
the Christian faith to the Czechs and the Moravians, laboured
among the Hungarians and the Poles, and won the wide district
between the Elbe and the Oder at once for Christianity and for
the German nation. Germany, too, was the starting-point for
the conversion of the Scandinavian countries, which was com-
pleted by English priests with the assistance of native princes.

But, even while the Teutonic peoples were thus taking the
lead, we can see the Latin races beginning to assert themselves.
The monastic reform movement was essentially Latin in origin;
and even more significant was the fact that scholasticism, the
new theology, had its home in the Latin countries. Aristotelian
dialectics had always been taught in the schools; and reason as
well as authority had been appealed to as the foundation of
theology; but for the theologians of the 9th and 10th centuries,
whose method had been merely that of restatement, ratio and
auctoritas were in perfect accord. Then Berengar of Tours
(d. 1088) ventured to set up reason against authority: by reason
the truth must be decided. This involved the question of the
relation in theology of authority and reason, and of whether the
theological method is authoritative or rational. To these ques-
tions Berengar gave no answer; he was ruined by his opposition
to Radbert's doctrine of transubstantiation. The Lombard
Anselm (d. 1109), archbishop of Canterbury, was the first to deal
with the subject. He took as his starting-point the traditional
belief; but he was convinced that whoever has experience of the
truths of the faith would be able to understand them. In
accordance with this principle he pointed out the goal of theology
and the way to its attainment: the function of theology is to
demonstrate dogmas sola ratione.

It was a bold conception—too bold for the medieval world, for
which faith was primarily the obligation to believe. It was easy,
therefore, to understand why Anselm's method did not become
the dominant one in theology. Not he, but the Frenchman
Abelard (d. 1142), was the creator of the scholastic method.
Abelard, too, started from tradition; but he discovered that the
statements of the various authorities are very often in the relation
of sic et non, yes and no. Upon this fact he based his pronounce-
ment as to the function of theology: it must employ the dialectic
method to reconcile the contradictions of tradition, and thus
to shape the doctrines of the faith in accordance with reason. By
teaching this method Abelard created the implements for the
erection of the great theological systems of the schoolmen of the
12th and 13th centuries. The summit of Abelard's goal, the
fruits of which were gathered by the scholars of Hales (d. 1245),
Alberius Magnus (d. 1280), Alexander of Hales, Thomas
Aquinas (d. 1275). They adventured a complete exposition of
Christian doctrine that should be altogether ecclesiastical and
at the same time altogether rational. In so doing they set to
work at the same time to complete the development of ecclesi-
stical dogma; the formulation of the Catholic doctrine of the
Sacraments was the work of scholasticism.

Canon law is the twin-sister of scholasticism. At the very
time when Peter Lombard was shaping his Sentences, the monk
Gratian of Bologna was making a new collection of laws. It was
not only significant that in the Concordia discordantium canonum
ecclesiastical laws, whether from authentic or forged sources,
were gathered together without regard to the existing civil law;
of even greater eventual importance was the fact that Gratian
taught that the contradictions of the canon law were to be
reconciled by the same method as that used by theology to
reconcile the discrepancies of doctrinal tradition. Thus Gratian
became the founder of the science of canon law, a science which,
like the scholastic theology, was entirely ecclesiastical and
entirely rational (see CANON LAW).

Like the new theology and the new science of law, the new
monasticism was also rooted in Latin soil. In the first of the new
orders, that of the Cistercians (1098), the old monastic
ideal set forth in the Rule of Benedict of Nursia still prevailed;
but in the constitution and government of the order new ideas
were at work. In the Premonstratensian order, however,
founded in 1120 by Norbert of Xanten, a new conception of
the whole function of monachism was introduced: the duty of
the priest-monk is not only to work out his own salvation,
but, by preaching and cure of souls, to labour for others. This
was the dominant idea of the order of friars preachers founded
in 1216, on the basis of the Premonstratensian rule, by Dominic
of Osma (see DOMINIC, SAINT, and DOMINICANS). It was also
the basis of the order of friars minor (Franciscans, q.v.), founded
in 1210. For the foundation of Francis of Assisi came into
existence as a society of itinerant preachers: no one was more
deeply convinced than Francis of the duty of working for others,
and his own mission was, as he said, to win souls. But with
this idea he fused another, namely, that it is the task of the monk
to imitate the humility and poverty of Jesus; and his order
thus became a mendicant order. From the earliest times the
monks had renounced all private property, and no individual
monk, but only the order to which he belonged, could acquire
possessions. For Francis this was not enough: he put "holy
poverty" in place of renunciation of private property, and
allowed neither monk nor monastery to have any possessions
whatever; for only thus is the following of Jesus complete. So
mighty was the impression made by the poverty of the Minorites, that the Dominicans promptly followed their example and likewise became mendicant.

This alone would serve to indicate the remarkable deepening of the religious life that had taken place in the Latin countries. Its beginning may be traced as early as the 11th century (Pietro Damian, q.e.), and in the 12th century the most influential exponent of this new position of the clergy was Bernard (q.e.) of Clairvaux, who had the bright idea of finding God by leading them to Christ. Contemporary with him were Hugh (q.e.) of St Victor and his pupil Richard (q.e.) of St Victor, both monks of the abbey of St Victor at Paris, the aim of whose teaching, based on that of the Pseudo-Dionysius, was a mystical absorption of thought in the Godhead and the surrender of self to the Eternal Love. Under the influence of these ideas, in part purely Christian and in part neo-platonic, piety gained in warmth and depth and became more personal; and though at first it flourished in the monasteries, and in those of the mendicant orders especially, it penetrated far beyond them and influenced the laity everywhere.

The new piety did not set itself in opposition either to the hierarchy or to the institutions of the Church, such as the sacraments and the discipline of the convents, nor did it reject those foreign elements (asceticism, worship of saints and the like) which had passed of old time into Christianity from the ancient world. Its temper was not critical, but aggressively practical. It led the Romance nations to battle for Christendom. In the 11th and 12th centuries the chivalry of Spain and southern France took up the struggle with the Moors as a holy war. In the autumn of 1096 the nobles of France and Italy, joined by the Norman barons of England and Sicily, set out to wrest the Holy Land from the unbelievers; and for more than a century the cry, “Christ’s land must be won for Christ,” exercised an unparalleled power in Western Christendom.

All this meant a mighty exaltation of the Church, which ruled the minds of men as she had hardly ever done before. Nor was it possible that the position of the bishop of Rome, the supreme head of the Western Church, should remain unaffected by it. Two of the most powerful of the German emperors, Frederick I. and his son Henry VI., struggled to renew and to maintain the imperial supremacy over the papacy. The close relations between northern Italy and the Empire, and the union of the sovereignty of southern Italy with the German crown, seemed to afford the means for keeping Rome in subjection. But Frederick I. fought a losing battle, and when at the peace of Venice (1177) he recognized Alexander III. as pope, he relinquished the hope of carrying out his Italian policy; while Henry VI. died at the early age of thirty-two (1197), before his far-reaching schemes had been realized.

The field was thus cleared for the full development of papal power. This had greatly increased since the Concordat of Worms, and reached its height under Innocent III. (1198-1216). Innocent believed himself to be the representative of God, and as such the supreme possessor of both spiritual and temporal power. He therefore claimed in both spheres the supreme administrative, legislative and judicial authority. Just as he considered himself entitled to appoint to all ecclesiastical offices, so also he invested the emperor with his empire and kings with their kingdoms. Not only did he despacht his decretales to the universities to form the basis of the teaching of the canon law and of the decisions founded upon it, but he considered himself empowered to annul civil laws. Thus he annulled the Great Charter in 1215. Just as the Curia was the supreme court of appeal in ecclesiastical causes, so also the pope threatened disobedient princes with deposition, e.g. the emperor Otto IV. in 1210, and John of England in 1212.

The old institutions of the Catholic Church were transformed to suit the new position of the pope. From 1123 onward there had again been talk of general councils; but, unlike those of earlier times, these were assemblies summoned by the pope, who confirmed their resolutions. The canonical election of bishops also continued to be discussed; but the old electors, i.e. the clergy and laity of the dioceses, were deprived of the right of election, this being now transferred exclusively to the cathedral chapters. The bishops kept their old title, but they described themselves accurately as “bishops by grace of the apostolic see,” for they administered their dioceses as plenipotentiaries of the pope; and as time went on even the Church’s criminal jurisdiction became more and more concentrated in the hands of the papacy.

The rule of the Church by the Roman bishop had thus become a reality; but the papal claim to supreme temporal authority proved impossible to maintain, although Innocent III. had apparently enforced it. The long struggle against Frederick II., carried on by Gregory IX. (1227-1241) and Innocent IV. (1243-1254), did not result in victory; no papal sentence, but only death itself, deprived the emperor of his dominions; and when Boniface VIII. (1294-1303), who in the bull Unam Sanctam (1302) gave the papal claims to universal dominion their classical form, quarreled with Philip IV. of France about the extension of the royal power, he could not but perceive that the national monarchy had become a force which it was impossible for the papacy to overcome.

(c) Close of the Middle Ages. Disintegration.—While the Church was raising to new heights of her power the great revolution began, which was to end in the disruption of that union between the Temporal and the Spiritual which, under her dominion, had characterized the life of the West. The Temporal now claimed its proper rights. The political power of the Empire, indeed, had been shattered; but this left all the more room for the vigorous development of national states, notably of France and England. At the same time intellectual life was enriched by a wealth of fresh views and new ideas, partly the result of the busy intercourse with the East to which the Crusades had given the first impetus, and which had been strengthened and extended by lively trade relations, partly of the revived study, eagerly pursued, of ancient philosophy and literature (see Renaissance). Old forms became too narrow, and vigorously growing national literatures appeared side by side with the universal Latin literature. The life of the Church, moreover, was affected by the economic changes due to the rise of the power of money as opposed to the old economic system based upon land.

The effects of these changes made themselves felt on all sides, in no case more strongly than in that of the papal claims to the supreme government of the world. Theoretically they were still unwaveringly asserted; indeed it was not till this time that they received their most uncompromising expression (Augustinus Triumphus, d. 1328; Alvarus Pelagius, d. 1352). After Boniface VIII., however, no pope seriously attempted to realize them; to do so had in fact become impossible, for from the time of their residence at Avignon (1305-1377) the popes were in a state of complete dependence upon the French crown. But even the curialistic met everywhere with opposition. In France Philip IV.’s jurists maintained that the temporal power was independent of the spiritual. In Italy, a little later, Dante championed the divine right of the emperor (De Monarchia, 1311). In Germany, Marsiglio of Padua and Jean of Jandun, the literary allies of the emperor Louis IV., ventured to define anew the nature of the civil power from the standpoint of natural law, and to assert its absolute sovereignty (Defensor pacis, c. 1352); while the Franciscan William of Occam (d. 1349) examined, also in Louis’ interests, into the nature of the relation between the two powers. He too concluded that the temporal power is independent of the spiritual, and is even justified in invading the sphere of the latter in cases of necessity.

While these thoughts were filling men’s minds, opposition to the papal rule over the Church was also gaining continually in strength. The reasons for this were numerous, first among them being the abuses of the papal system of finance, which had to provide funds for the vast administrative machinery of the Church; also the fact that there was a boundless abuse and arbitrary exercise of the right of ecclesiastical patronage (provisions, reservations); and further the ever-increasing traffic in dispensations, the abuse of spiritual punishments for worldly ends, and so forth. No means, however, existed of enforcing any
remedy until the papal schism occurred in 1378. Such a schism as this, so intolerable to the ecclesiastical sense of the middle ages, necessitated the discovery of some authority superior to the rival popes, and therefore able to put an end to their quarrelling. General councils were now once more called to mind; but these were no longer conceived as mere advisory councils to the pope, but as the highest representative organ of the universal Church, and as such ranking above the pope, and competent to demand obedience even from him. This was the view of the Germans Conrad of Geinhausen (d. 1390) and Heinrich of Langenstein (d. 1397), as also of the Frenchmen Pierre d'Ailly (d. 1426) and Jean Charlier Gerson (d. 1429). These all recognized in the convocation of a general council the means of setting bounds to the abuses in the government of the Church by an extensive reform. The council of Pisa (1409) separated without effecting anything; but the council of Constance (1414-1418) did actually put an end to the schism. The reforms begun at Constance and continued at Basel (1431-1449) proved, however, insufficient. Above all, the attempt to set up the general council as an ordinary institution of the Catholic Church failed; and the Roman papacy, restored at Constance, preserved its irresponsible and unlimited power over the government of the Church. (See Papacy; Constance, Council of, and Basel, Council of.)

Thus the attempt to reform the Church by means of councils failed; but this very failure led to the survival of the desire for reform. It was kept alive by the most various circumstances; in the first instance, the attitude of the European states. Thanks to his recognition by the powers, Pope Eugenius IV. (1431-1447) had been victorious over the council of Basel; but neither France nor Germany was prepared to forgo the reforms passed by the council. France secured its validity, as far as she herself was concerned, by the Pragmatic Sanction of Bourges (July 7, 1438); Germany followed with the Acceptation of Mainz (March 26, 1439). The theory of the papal supremacy held by the Curia was thus at least called in question.

The antagonism of the opposition parties was even more pronounced. The tendencies which they represented had been present when the middle ages were yet at their height; but the papacy, while at the zenith of its power, had succeeded in crushing the attacks made upon the creed of the Church by its most dangerous foes, the dualistic Cathari. On the other hand it had not been able to overcome the less radical opposition of the "Poor Man of Lyons" (Waldo, d. 1217), and even in the 15th century stray supporters of the Waldensian teaching were to be found in Italy, France and Germany, everywhere keeping alive mistrust of the temporal power of the Church, of her priesthood and her hierarchy. In England the hierarchy was attacked by John Wycliffe (d. 1384), its greatest opponent before Luther. Starting from Augustine's conception of the Church as the community of the elect, he protested against a church of wealth and power, a church that had become a political institution instead of a school of salvation, and against its head, the bishop of Rome. Wycliffe's ideas, conveyed to the continent, precipitated the outbreak of the Hussite storm in Bohemia. The council of Constance thought to quell it by condemnation of Wycliffe's teaching and by the execution of John Huss (1415). But in vain. The flame burst forth, not in Bohemia alone, where Huss's death gave the signal for a general rising, but also in England among the Lollards, and in Germany among those of Huss's persuasion, who had more points of agreement with the remnant of the Waldenses. (See Huss; Wycliffe; Lollards; Waldenses.)

This was open opposition; but there was besides another opposing force which, though it raised no noise of controversy, yet was far more widely severed from the views of the Church than either Wycliffe or Huss: this was the Renaissance, which began its reign in Italy during the 14th century. The Renaissance meant the emancipation of the secular world from the domination of the Church, and it contributed in so small measure to the rupture of the educated class with ecclesiastical tradition. Beauty of form alone was at first sought, and found in the antique; but, with the form, the spirit of the classical attitude towards life was revived. While the Church, like a careful mother, sought to lead her children, never allowed to grow up, safely from time into eternity, the men of the Renaissance felt that they had come of age, and that they were entitled to make themselves at home in this world. They wished to possess the earth and enjoy it by means of secular education and culture, and an impassable gulph yawned between their views of religion and morality and those of the Church.

This return to the ideals of antiquity did not remain confined to Italy, but the humanism of the northern countries presents no close parallel to the Italian renaissance. However much it agreed in admiration of the ancients, it differed absolutely in its preservation of the fundamental ideas of Christianity. But neither Reuchlin (d. 1522), Erasmus (d. 1536), Faber d'Espées (d. 1536), Thomas More (d. 1535), nor the numerous others who were their disciples, or who shared their views, were in the least degree satisfied with the conditions prevailing in the Church. Their ideal was a return to that simplicity of primitive Christendom which they believed they found revealed in the New Testament and in the writings of the early Fathers.

To this theology could not point the way. Since the time of Duns Scotus (d. 1308) theologians had been conscious of the discrepancy between Aristotelianism and ecclesiastical dogma. Faith in the infallibility of the scholastic system was thus shaken, and the system itself was destroyed by the revival of philosophic nominalism, which had been discredited in the 11th century by the realism of the great schoolmen. It now found a bold supporter in William of Ockam (q.v.), and through him became widely accepted. But nominalism was powerless to inspire theology with new life; on the contrary, its intervention only increased the inextricable tangle of the hairsplitting questions with which theology busied itself, and made their solution more and more impossible.

Mysticism, moreover, which had no lack of noteworthy supporters in the 14th and 15th centuries, and the various new departures in thought initiated by individual theologians such as Nicolaus Cusanus (d. 1464) and Wessel Gansfort (d. 1489), were not competent to restore to the Church what she had once possessed in scholasticism—that is to say, a conception of Christianity in which all Christendom recognized the convictions in which it lived and had its being.

This was all the more significant because Western Christendom in the 15th century was by no means irreligious. Men's minds were agitated by spiritual questions, and they sought salvation and the assurance of salvation, using every means prescribed by the Church: confession and the communion, indulgences and relics, pilgrimages and oblations, prayers and attendance at church; none of all these were condemned or held cheap. Yet the age had no inward peace.

After the failure of the attempts at reform by the councils, the guidance of the Church was left undisturbed in the hands of the popes, and they were determined that it should remain so. In 1450 Eugenius IV. set up in opposition to the council of Basel a general council summoned by himself, which met first at Ferrara and afterwards at Florence. Here he appeared to score a great success. The split between East and West had led in the 11th century to the rupture of ecclesiastical relations between Rome and Constantinople. This schism had lasted since the 16th of July 1054; but now a union with the Eastern Church was successfully accomplished at Florence. Eugenius certainly owed his success merely to the political necessities of the emperor of the East, and his union was forsworn destroyed owing to its repudiation by oriental Christendom; yet at the same time his decreals of union were not devoid of importance, for in them the pope reaffirmed the scholastic doctrine regarding the sacraments as a dogma of the Church, and he spoke as the supreme head of all Christendom.

This claim to the supreme government of the Church was to be steadily maintained. In the year 1512 Julius II. called together the fifth Lateran general council, which expressly recognized the subjectation of the councils to the pope (Leo X.'s bull Pastor Aeternum, of the 19th of December 1516), and also declared the constitution Unam Sanctam (see above) valid in law.
But the papacy that sought to win back its old position was itself no longer the same as of old. Eugenius IV.'s successor, Nicholas V. (1447-1455), was the first of the Renaissance popes. Under his successors the papacy became, at least in the eyes of the Italian princes, more like a princely court than a religious community. Innocent VIII., Alexander VI., Julius II. were in many respects remarkable men, but they were scarcely affected by the convictions of the Christian faith. The terrible tragedy which was consummated on the 23rd of May 1498 before the Palazzo Vecchio, in Florence, casts a lurid light upon the irreconcilable opposition in which the wearers of the papal dignity stood to medieval piety; for Girolamo Savonarola was in every fibre a loyal son of the medieval Church. Twenty years after Savonarola's death Martin Luther made public his theses against indulgences. The Reformation which thus began brought the disintegrating process of the middle ages to an end, and at the same time divided Western Catholicism in two. Yet we may say that this was its salvation; for the struggle against the papacy brought back to its old position the religious duties, and the council of Trent established medieval dogmas as the doctrine of modern Catholicism in contradiction to Protestantism. (See also PAPACY; RENAISSANCE; REFORMATION, and biographies of popes, &c.)

C. THE MODERN CHURCH

The issue in 1564 of the canons of the council of Trent marks a very definite epoch in the history of the Christian Church. Up till that time, in spite of the schism of East and West and of innumerable heresies, the idea of the Church as Catholic, not only in its faith but in its organization, had been generally accepted. From this conception the Reformers had, at the outset, no intention of departing. Their object had been to purify the Church of medieval accretions, and to restore the primitive model in the light of the new learning; the idea of rival "churches," differing in their fundamental doctrines and in their principles of organization, existing side by side, was as abhorrent to them as to the most rigid partisans of Roman centralization. The actual divisions of Western Christendom are the direct outcome of the Reformation period, but the rise of new national churches and the separation of the Reformation period than of the political forces with which they were associated and confused. When it became clear that the idea of doctrinal change would find no acceptance at Rome, the Reformers appealed to the divine authority of the civil power against that of the popes; and princes within their several states succeeded, as the result of purely political struggles and combinations, in establishing the form of religion best suited to their convictions or their policy. Thus over a great part of Europe the Catholic Church was split up into territorial or national churches, which, whatever the theoretical ties which bound them together, were in fact separate organizations, tending ever more and more to become isolated and self-contained units with no formal intercommunion, and, as the rivalry of nationalities grew, with increasingly little even of intercommunication.

It was not, indeed, till the settlement of Westphalia in 1648, after the Thirty Years' War, that this territorial division of Christendom became stereotyped, but the process had been going on for a hundred years previously; in some states, as in England and Scotland, it had long been completed; in others, as in South Germany, Bohemia and Poland, it was defeated by the political and missionary efforts of the Jesuits and other agents of the counter-Reformation. In any case, it received a vast impetus from the action of the council of Trent. With the issue of the Tridentine canons, all hope even of compromise between the "new" and the "old" religions was definitely closed. The anathema of the Roman Church had fallen upon all the fundamental doctrines for which the Reformers had contended and died; the right of free discussion within the limits of the creeds, which had given room for the speculations of the medieval philosophers, was henceforth curtailed and confined; and the definitions of the scholia of certain texts were for ever exalted by the authority of Rome into dogmas of the Church. The Latin Church, which, by combining the tradition of the Roman centralized organization with a great elasticity in practice and in the interpretation of doctrine, had hitherto been the moulding force of civilization in the West, is henceforth more or less in antagonism to that civilization, which advances in all its branches—in science, in literature, in art—to a greater or less degree outside of and in spite of her, until in its ultimate and most characteristic developments it falls under the formal condemnation of the pope, formulated in the famous Syllabus of 1864. Considered from the standpoint of the world outside, the Roman Church is, no less than the Protestant communities, merely one of the sects into which Western Christendom has been divided—the most important and widespread, it is true, but playing in the general life and thought of the world a part infinitely less important than that filled by the Church before the Reformation and one in no sense justifying her claim to be considered as the sole inheritor of the tradition of the pre-Reformation Church.

If this be true of the Roman Catholic Church, it is still more so of the other great communities and confessions which emerged from the controversies of the Reformation. Of these the Anglican Church held most closely to the tradition of Catholic organization; but she has never made any higher claim than to be one of the "three branches of the Catholic Church," a claim repudiated by Rome and never formally admitted by the Church of the East. The Protestant churches established on the continent, even where—as in the case of the Lutherans—they approximate more closely than the official Anglican Church to Roman doctrine and practice, make no such claim. The Bible is for them the sole rule of faith and practice; they make no claim to be part and parcel of that of the state. They are, in fact, the state in its religious aspect, and as such are territorial or national, not Catholic. This tendency has been common in the East also, where with the growth of racial rivalries the Orthodox Church has split into a series of national churches, holding the same faith but independent as to organization.

Yet further development, of comparatively recent growth, has been the formation of what are now commonly called in
Churchill's conscientious answer the 1763 was Memoir of spiritual organized was a church, but the church is a certain sense secondary to the individual. The believer may pass from one community to another without imperilling his spiritual life, or even establish a new church without necessarily incurring the reproach of schism. From this theory, powerful in Great Britain and her colonies, supreme in the United States of America, has resulted an enormous multiplication of sects.

It follows from the above argument that, from the period of the Reformation onward, no historical account of the Christian Church is complete and final until a new channel is opened. The stream of continuity has been broken, and divides into innumerable channels. The only possible synthesis is that of the Christianity common to all; as institutions, though they possess many features in common, their history is separate and must be separately dealt with. The history of the various branches of the Christian Church since the Reformation will therefore be found under their several titles (see ROMAN CATHOLIC CHURCH; ENGLAND, CHURCH OF; PRESBYTERIANISM; BAPTISTS, &c., &c.).

Churchill, Charles (1731–1764), English poet and satirist, was born in Vine Street, Westminster, in February 1731. His father, rector of Rainham, Essex, held the curacy and lecturership of St John's, Westminster, from 1733, and the son was educated at Westminster school, where he became a good classical scholar, and formed a close and lasting intimacy with Robert Lloyd. Churchill was entered at Trinity College, Cambridge, in 1749, but never resided. He had been refused at Oxford, ostensibly on the unlikely ground of lack of classical knowledge, but more probably because of a hasty marriage which he had contracted within the rules of the Fleet in his eighteenth year. He and his wife lived in his father's house, and Churchill was afterwards sent to the north of England to prepare for holy orders. He became curate of South Cadbury, Somersetshire, and, on receiving priest's orders (1756), began to act as his father's curate at Rainham. Two years later the elder Churchill died, and the son was elected to succeed him in his curacy and lecturership. His emoluments amounted to less than £100 a year, and he increased his income by teaching in a girls' school. He fulfilled his various duties with decorum for a while, but his marriage proved unfortunate, and he spent much of his time in dissipation in the society of Robert Lloyd. He was separated from his wife in 1761, and would have been imprisoned for debt but for the timely help of Lloyd's father, who had been an usher and was now a master of Westminster school.

Churchill had already done some work for the booksellers, and his friend Lloyd had had some success with a didactic poem, "The Actor." His intimate knowledge of the theatre was now turned to account in the Rosciad, which appeared in March 1761. This reckless and amusing satire described with the most disconcerting accuracy the faults of the various actors and actresses on the London stage. Its immediate popularity was no doubt largely due to its personal character, but its real vigour and raciness make it worth reading even now when the objects of Churchill's wit are many of them forgotten. The first impression was published anonymously, and in the Critical Review, conducted by Tobias Smollett, it was confidently asserted that the poem was the joint production of George Colman, Bonnell Thornton and Robert Lloyd. Churchill owned the authorship and immediately published an Apology addressed to the Critical Reviewers, which, after developing the subject that it is only the caste of authors that prey on their own kind, repeats the fierce attack on the stage. Incidentally it contains an enthusiastic tribute to Dryden, of whom Churchill was a not unworthy scholar. In the Rosciad he had given warm praise to Mrs Fritschard, Mrs Cibber and Mrs Clive, but no leading London actor, with the exception of David Garrick, had escaped censure, and in the Apology Garrick was clearly threatened. He deprecated criticism by showing every possible civility to Churchill, who became a terror to the actors. Thomas Davies wrote to Garrick attributing his blundering in the part of Cymbeline "to my accidentally seeing Mr Churchill in the pit, it rendering me confused and unmindful of my business." Churchill's satire made him many enemies, and inquiries into his way of life provided abundant matter for retort. In Night, an Epistle to Robert Lloyd (1761), he answered the attacks made on him, offering by way of defence the argument that any faults were better than hypocrisy. His scandalous conduct brought down the censure of the dean of Westminster, and in 1763 the protests of his parishioners led him to resign his offices, and he was free to wear his "blue coat with metal buttons" and much gold lace without remonstrance from the dean. The Rosciad had been refused by several publishers, and was finally published at Churchill's own expense. He received a considerable sum from the sale, and paid his old creditors in full, besides making an allowance to his wife.

He now became a close ally of John Wilkes, whom he regularly assisted with the North Briton. The Prophecy of Famine: A Scots Pastoral (1763), his next poem, was founded on a paper written originally for that journal. This violent satire on Scottish influence fell in with the current hatred of Lord Bute, and the Scottish place-hunters were as much alarmed as the actors had been. When Wilkes was arrested he gave Churchill a timely hint to retire to the country for a time, the publisher, Kearsley, having stated that he received part of the profits from the paper. His Epistle to William Hogarth (1763) was in answer to the caricature of Wilkes made during the trial. In it Hogarth's vanity and envy were attacked in an invective which Garrick quelled with a "shocking and barbarous." Hogarth retaliated by a caricature of Churchill as a bear in torn clerical bands hugging a pot of porter and a club made of lies and North Britons. The Dualist (1763) is a virulent satire on the most active opponents of Wilkes in the House of Lords, especially on Bishop Warburton. He attacked Dr Johnson among others in The Ghosts as "Pomposo, insolent and loud, Vain idol of a scribbling crowd." Other poems are "The Conference" (1763); "The Author" (1763), highly praised by Churchill's contemporaries; "Gotham" (1764), a poem on the duties of a king, didactic rather than satiric in tone; "The Candidate" (1764), a satire on John Montagu, fourth earl of Sandwich, one of Wilkes's bitterest enemies, whom he had already denounced for his treachery in the Dualist (bk. iii.) as "too infamous to have a friend"; "The Farewell" (1764); "The Times" (1764); "Independence," and an unfinished "Journey."

In October 1764 he went to Boulogne to join Wilkes. There he was attacked by a fever of which he died on the 4th of November. He left his property to his two sons, and made Wilkes his literary executor with full powers. Wilkes did little. He wrote an epitaph for his friend and about half a dozen notes on his poems, and Andrew Kippis acknowledges some slight assistance from him in preparing his life of Churchill for the Biographia Britonumc (1786). There is more than one instance of Churchill's generosity to his friends. In 1763 he found his friend Robert Lloyd in prison for debt. He paid a guinea a week for his better maintenance in the Fleet, and raised a subscription to set him free. Lloyd fell ill on receipt of the news of Churchill's death, and died shortly afterwards. Churchill's sister Patty, who was engaged to Lloyd, did not long survive him. William Cowper was his schoolfriend, and left many kindly references to him.

A partial collection of Churchill's poems appeared in 1763. They are now collected in Chalmers's edition of the English poets, and were edited (1804) by W. Tooke. This was reprinted in the Aldine edition (1844). There is a revised edition (1852) in the same series, The Poetical Works of Charles Churchill, with a Memoir by J. L. Heaney and copious notes by W. Tooke. For Churchill's biography,
CHURCHILL, LORD RANDOLPH HENRY SPENCER (1849-1895), English statesman, third son of John, seventh duke of Marlborough, by Frances, daughter of the third marquess of Londonderry, was born at Blenheim Palace, on the 13th of February 1849. His early education was conducted at home, and at Mr Tabor’s preparatory school at Cheam. In January 1863 he went to Eton, where he remained till July 1865. He was not specially distinguished either in school work or games while at Eton; his contemporaries describe him as a vivacious and rather unruly lad. In October 1867 he matriculated at Merton College, Oxford. He was fond of amusement, and had carried to Oxford an early taste for sport which he retained throughout life. But he read with some industry, and obtained a place in the class in jurisprudence and modern history in 1870. In 1874 he was elected to parliament in the Conservative interest for Woodstock, defeating Mr George Brodrick, a fellow, and afterwards warden, of Merton College. His maiden speech, delivered in his first session, made no impression on the House.

It was not till 1878 that he forced himself into public notice as the exponent of a species of independent Conservatism. He directed a series of furious attacks against some of the occupants of the front ministerial bench, and especially that “old gang” who were distinguished rather for the respectability of their private characters, and the unblemished purity of their Toryism, than for striking talent. Mr Slater-Booth (afterwards 1st Lord Basing), president of the Local Government Board, was the especial object of his ire, and that minister’s County Government Bill was fiercely denounced as the “crowning dishonour to Tory principles,” and the “supreme violation of political honesty.” The audacity of Lord Randolph’s attitude, and the vituperative fluency of his invective, made him the chief figure in some important events in the dissolution of the 1874 parliament. Though he was not as yet taken seriously. In the new parliament of 1880 he speedily began to play a more notable rôle. With the assistance of his devoted adherents, Sir Henry Drummond Wolff, Sir John Gorst and occasionally of Mr Arthur Balfour, and one or two others, he constituted himself at once the audacious opponent of the Liberal administration and the unsparing critic of the Conservative front bench. The “fourth party,” as it was nicknamed, was effective at first not so much in damaging the government as in awakening the opposition from the apathy which had fallen upon it after its defeat at the polls. Churchill roused the Conservatives and gave them a fighting issue, by putting himself at the head of the resistance to Mr Bradlaugh, the member for Northampton, who, though an avowed atheist or agnostic, was prepared to take the Parliamentary oath. Sir Stafford Northcote, the Conservative leader in the Lower House, was forced to take a strong line on this difficult question by the energy of the fourth party, who in this case clearly expressed the views of the bulk of the opposition. The long and acrimonious controversy over Mr Bradlaugh’s seat, if it added little to the reputation of the English legislature, at least showed that Lord Randolph Churchill was a parliamentary champion who added to his audacity much military skill and shrewdness. He continued to play a conspicuous part throughout the parliament of 1880–1885, dealing his blows with almost equal vigour at Mr Gladstone and at the Conservative front bench, some of whom members, and particularly Sir Richard Cross and Mr W. H. Smith, he assailed with especial virulence. From the beginning of the Egyptian embroilment Lord Randolph was emphatically open to almost every step taken by the government. He declared that the suppression of Arabi Pasha’s rebellion was an error, and the restoration of the khedive’s authority a crime. He called Mr Gladstone the “Moloch of Midlothian,” for whom torrents of blood had been shed in Africa. He was equally severe on the domestic policy of the administration, and was particularly bitter in his criticism of the Kilmarnock treaty and the rapprochement between the Gladstonians and the Parnellites.
in the demands made on the treasury by the ministers at the head of the naval and military establishments. It was commonly supposed that he expected his resignation to be followed by the unconditional surrender of the cabinet, and his restoration to office on his own terms. The sequel, however, was entirely different. The cabinet was reconstructed with Mr Goschen as chancellor of the exchequer (Lord Randolph had “forgotten Goschen,” as he is said to have remarked), and Churchill’s own career as a Conservative chief was practically closed.

He continued, for some years longer, to take a considerable share in the proceedings of parliament, giving a general, though decidedly independent, support to the Unionist administration. On the Irish question he was a very candid critic of Mr Balfour’s measures, and one of his later speeches, which recalled the acrimonious violence of his earlier period, was that which he delivered in 1890 on the report of the Parnell commission. He also fulfilled the promise made on his resignation by occasionally advocating the principles of economy and retrenchment in the debates on the naval and military estimates. In April 1889, on the death of Mr Bright, he was asked to come forward as a candidate for the vacant seat in Birmingham, and the result was a rather angry controversy with Mr Chamberlain, terminating in the so-called “Birmingham compact” for the division of representation of the Midland capital between Liberal Unionists and Conservatives. But his health was already precarious, and this, combined with the anxiety of his position, induced him to relax his devotion to parliament during the later years of the Salisbury administration. He bestowed much attention on society, travel and sport. He was an ardent supporter of the turf, and in 1889 he won the Oaks with a mare named the Abbesse de Jouarre. In 1891 he went to South Africa, in search both of health and relaxation. He travelled for some months through Cape Colony, the Transvaal and Rhodesia, making notes on the politics and economics of the countries, shooting lions, and recording his impressions in letters to a London newspaper, which were afterwards republished under the title of Men, Mines and Animals in South Africa. He returned with renewed energy, and in the general election of 1892 once more flung himself, with his old vigour, into the strife of parties. His seat at South Paddington was uncontested; but he was active on the platform, and when parliament met he returned to the opposition front bench, and again took a leading part in debate, attacking Mr Gladstone’s second Home Rule Bill with especial energy. But it was soon apparent that his powers were undermined by the inroads of disease. As the session of 1893 wore on his speeches lost their old effectiveness, and in 1894 he was listened to so much with interest as with pity. His last speech in the House was delivered in the debate on Uganda in June 1894, and was a painful failure. He was, in fact, dying of general paralysis. A journey round the world was undertaken as a forlorn hope. Lord Randolph started in the autumn of 1894, accompanied by his wife, but the malady made so much progress that he was brought back in haste from Cairo. He reached England shortly before Christmas and died in London on the 24th of January 1895.

Lord Randolph Churchill married, in January 1874, Jennie, daughter of Mr Leonard Jerome of New York, U.S.A., by whom he had two sons. In 1900 Lady Randolph Churchill married Mr G. Cornwallis-West, who was transferred to the Unionist administration.

His elder son, WINSTON CHURCHILL (1874 – ), was educated at Harrow, and after serving for a few years in the army and acting as a special correspondent in the South African War (being taken prisoner by the Boers, Nov. 15, 1899, but escaping on Dec. 12), was elected Unionist member of parliament for Oldham in October 1900. As the son of his father, his political future excited much interest. His views, however, as to the policy of the Conservative party gradually changed, and having during 1924–1925 taken an active part in assisting the Liberal party in parliament, he stood for N.W. Manchester at the general election (1906) and was triumphantly returned as a Liberal and free-trader. He was made under-secretary for the colonies in the new Liberal government. In this position he became as conspicuous in parliament as he had already become on the platform as a brilliant and aggressive orator, and no politician of the day attracted more interest or excited more controversy. He was promoted to cabinet rank as president of the Board of Trade in Mr Asquith’s government in April (1908), but was defeated at the consequent by-election in Manchester after a contest which aroused the keenest excitement. He was then returned for Dundee, and later in the year married Miss Clementine Hozier.

An interesting and authoritative biography of Lord Randolph, by his son Winston (who had already won his spurs as a writer in his River War, 1899, and other books on his military experiences), appeared in 1906; and a brief and intimate appreciation by Lord Rosebery, inspired by this biography, was published a few months later. Lord Randolph’s earlier speeches were edited, with an introduction and notes, by Louis Jennings (2 vols., London, 1889). See also T. H. S. Escott, Randolph Spencer Churchill (1895); H. W. Lucy, Diary of Two Parliaments (1892); and Mrs Cornwallis-West, The Reminiscences of Lady Randolph Churchill (i.e. of V. Churchill) (1908).

CHURCHILL (Mississippi or English), the name of a river of the province of Saskatchewan and district of Keewatin, Canada. It rises in La Loche (or Methy) lake, a small lake in 50° 30’ N. and 109° 30’ W., at an altitude of 1577 ft. above the sea, and flows E.N.E. to Hudson’s Bay, passing through a number of lake expansions. Its principal tributaries are the Beaver (350 m. long), Sandy and Reindeer rivers. Between Frog and Methy portages (480 m.) it formed part of the old voyageur route to the Peace, Athabasca, and Mackenzie. It is still navigated by canoes, but has many rapids. Its principal affluent, the Reindeer, discharges the waters of Reindeer Lake (1150 ft. above the sea, with an area of 2450 sq. m.) and Wolfassassin Lake (altitude, 1300 ft.). The Churchill is 925 m. long. Fort Churchill, at its mouth, is the best harbour in the southern portion of Hudson’s Bay. The portage of La Loche (or Methy), 134 m. in length, connects its head waters with the Clearwater river, a tributary of the Athabasca, draining into the Arctic Ocean.

CHURCHING OF WOMEN, the Christian ceremony of thanksgiving on the part of mothers shortly after the birth of their children. It no doubt originated in the Mosaic regulation as to purification (Lev. xii. 6). In ancient times the ceremony was usual but not obligatory in England. In the Greek and Roman Catholic Churches to-day it is imperative. The custom is first mentioned in the pseudo-Nicene Arabic canons. No ancient form of service exists, and that which figures in the English prayer-book of to-day dates only from the latter part of the 16th century. The usual date of a churching was the forty day after confinement, in accordance with the Biblical date of the presentment of the Virgin Mary and the Child Jesus at the Temple. It was formerly regarded as unlucky for a woman to leave her house to go out at all after confinement till she went to be churched. It was not usual for the churching service to be said in private houses. In Herefordshire it was not considered proper for the husband to appear in church at the service, or at all events in the same pew. In some parishes there was a special pew known as “the churching seat.” The words in the rubric requiring the woman to come “decently apparelled” refer to the times when it was thought unbecoming for a woman to come to the service with the elaborate head-dress then the fashion. A veil was usually worn, and in some parishes this was provided by the church, for an inventory of goods belonging to St Benet’s, Gracechurch Street, in 1560, includes “A churching cloth, fringed, white damask.”

The “convenient place,” which, according to the rubric, the woman must occupy, was in pre-Reformation times the church-door. In the first prayer-book of Edward VI., she was to be “nigh unto the quire door.” In the second of his books, she was to be “nigh unto the place where the Table standeth.” Bishop Wren’s orders for the diocese of Norwich in 1636 are “That women to be churched come and kneel at a side near the Communion Table without the rail, being veiled according to custom, and not covered with a hat.” In Devonshire churching was sometimes called “being uprose.” Churchings were formerly registered in some parishes. In pre-Reformation days it was the custom in England for women to carry lighted tapers when
being churched, in allusion to the Feast of the Purification of the Virgin (February 2nd), the day chosen by the Roman Catholic church for the blessing of the candles for the whole year (see CANDLES). At her churching a woman was expected to make some offering to the church, such as the chrisom or alb thrown over the child at christening.

**CHURCH RATE**, the name of a tax formerly levied in each parish in England and Ireland for the benefit of the parish church. Out of these rates were defrayed the expenses of carrying on divine service, repairing the fabric of the church, and paying the salaries of the officials connected with it. The church rates were made by the churchwardens, together with the parishioners duly assembled after proper notice in the vestry or the church. The rates thus made were recoverable in the ecclesiastical court, or, if the arrears did not exceed £10 and no questions were raised as to the legal liability, before two justices of the peace. Any payment not strictly recognized by law made out of the rate destroyed its validity. The church rate was a personal charge imposed on the occupier of land or of a house in the parish, and, though it was compulsory, much difficulty was found in effectually applying the compulsion. This was especially so in the case of Nonconformists, who had conscientious objections to supporting the Established Church; and in Ireland, where the population was preponderantly Roman Catholic, the grievance was especially felt and resented. The agitation over church rates led in 1868 to the passing of the Compulsory Church Rates Abolition Act. By this act church rates are no longer compulsory on the person rated, but are merely voluntary, and those who are not willing to pay them are excluded from inquiring into, objecting to, or voting in respect of their expenditure (s. 8).

**CHURCHWARDEN**, in England, the guardian or keeper of a church, and representative of the body of the parish. The name is derived from the original duty attached to the office,—that of the custody or guardianship of the fabric and furniture of the church,—which dates from the 14th century, when the responsibility of providing for the repairs of the nave, and of furnishing the utensils for divine service, was settled on the parishioners. Churchwardens are always lay persons, and as they may, like "artificial persons," hold goods and chattels and bring actions for them, they are recognized in law as quasi-corporations. Resident householders of a parish are those primarily eligible as churchwardens, but non-resident householders who are habitually occupiers are also eligible, while there are a few classes of persons who are either ineligible or exempted. The appointment of churchwardens is regulated by the 89th canon, which requires that the churchwardens shall be chosen by the joint consent of the ministers and parishioners, if it may be; but if they cannot agree upon such a choice, then the minister is to choose one, and the parishioners another. If, however, there is any special custom of the place, the custom prevails, and the most common custom is for the minister to appoint one, and the parishioners another, and this has been established by English statute, in the case of new parishes, by the Church Building and New Parishes Acts 1818-1884. There are other special customs recognized in various localities, e.g. in some of the larger parishes in the north of England a churchwarden is chosen for each township of the parish; in the old ecclesiastical parishes of London both churchwardens are chosen by the parishioners; in some cases they are appointed by the select vestry, or by the lord of the manor, and in a few exceptional cases are chosen by the outgoing churchwardens.

In general, churchwardens are appointed in Easter week, usually Easter Monday or Easter Tuesday, but in new parishes the first appointment must be within twenty-one days after the consecration of the church, or two calendar months after the formation of the parish, subsequent appointments taking place at the usual time for the appointment of parish officers. Each churchwarden returns, in the first week after election, within the ordinary declaration that he will execute his office faithfully.

The duties of churchwardens comprise the provision of necessities for divine service, so far as the church funds or voluntary subscriptions permit, the collecting the offertory of the congregation, the keeping of order during the divine service, and the giving of offenders into custody; the assignment of seats to parishioners; the guardianship of the movable goods of the church; the preservation and repair of the church and churchyard, the fabric and the fixtures; and the presentment of offences against ecclesiastical law.

In the episcopal church of the United States churchwardens discharge much the same duties as those performed by the churchwardens of the Established Church; their duties, however, are regulated by canons of the diocese, not by canons general. In the United States, too, the usual practice is for the parishes to elect both the churchwardens.

**CHURCHWARDEN, THOMAS** (c. 1520-1604), English author, was born at Shrewsbury about 1520, the son of a farmer. He received a good education, and, having speedily dissipated at court the money with which his father provided him, he entered the household of Henry Howard, earl of Surrey. There he remained for four years, learning something of the art of poetry from his patron; some of the poems he contributed later (1557) to *Songs and Sonettes* may well date from this early period. In 1541 he began his career as a soldier of fortune, being, he said, promised a place in the army on his way through nearly every campaign in Scotland and the Low Countries for thirty years. He served under the emperor Charles V. in Flanders in 1542, returning to England after the peace of Crécy (1544).

In the Scottish campaign of 1547 he was present at the barren victory of Pinkie, and in the next year was taken prisoner at Saint Monance, but aided by his persuasive tongue he escaped to the English garrison at Launder, where he was once more besieged, only returning to England on the conclusion of peace in 1550. A broadside entitled *Davy Dycars Dreame*, a short and seemingly alliterative poem in the manner of Piers Plowman, brought him into trouble with the privy council, but he was dismissed with a reprimand. This tract was the starting-point of a controversy between Churchyard and a certain Thomas Camel. The whole of the "Flying" was reprinted in 1560 as *The Contention betwixt Churchyard and Camel*.

In 1550 he went to Ireland to serve the lord deputy, Sir Anthony St Leger, who had been sent to pacify the country. Here Churchyard enriched himself at the expense, it is to be feared, of the unhappy Irish; but in 1552 he was in England again, trying vainly to secure a fortune by marriage with a rich widow. After this failure he departed once more to the wars to the siege of Metz (1552), and "trailing a pine" in the emperor's army, until he joined the forces under William, Lord Grey of Wilton, with whom he says he served eight years. Grey was in charge of the fortress of Gains, which was besieged by the duke of Guise in 1558. Churchyard arranged the terms of surrender, and was sent with his chief to Paris as a prisoner. He was not released at the peace of Cateau Cambresis for lack of money to pay his ransom, but he was finally set free on giving his bond for the amount of an engagement which he repudiated as soon as he was safely in England. He is not to be identified with the T. C. who wrote for the *Mirror for Magistrates* (ed. 1559), "How the Lord Mowbray... was banished... and after died miserable in exile," which is the work of Thomas Chaloner, but "Shore's Wife," his most popular poem, appeared in the 1563 edition of the same work, and to that of 1587 he contributed the "Tragedie of Thomas Wolfe." These are plain manly compositions in the seven-lined Chaucerian stanza. Repeated petitions to the queen for assistance produced at first fair words, and then no answer at all. He therefore returned to active service under Lord Grey, who was in command of an English army sent (1560) to help the Scottish rebels, and in 1564 he served in Ireland under Sir Henry Sidney. The religious disturbances in the Netherlands attracted him to Antwerp, where as the agent of William of Orange he allowed the insurgents to place him at their head, and was able to save much property from destruction. This action made him so hated by the mob that
he had to fly for his life in the disguise of a priest. In the next year he was sent by the earl of Oxford to serve definitely under the prince of Orange. After a year's service he obtained leave to return to England, and after many adventures and narrow escapes in a journey through hostile territory he embarked for Guernsey, and thence for England. His patron, Lord Oxford, disowned him, and the poet, whose health was failing, retired to Bath. He appears to have made a very unhappy marriage at this time, and returned to the Low Countries. Falling into the hands of the Spaniards he was recognized as having had a hand in the Antwerp disturbance, and was under sentence to be executed as a spy when he was saved by the intervention of a noble lady. This experience did not deter him from joining in the defence of Zutphen in 1572, but this was his last campaign, and the troubles of the remaining years of his life were chiefly domestic.

Churchyard was employed to devise a pageant for the queen's reception at Bristol in 1574, and again at Norwich in 1578. He had published in 1575 The firste parte of Churchyrade's Chippes, the modest title which he gives to his works. No second appeared, but there was a much enlarged edition in 1578. A passage in Churchyrade's Choise (1579) gave offence to Elizabeth, and the author fled to Scotland, where he remained for three years. He was only restored to favour about 1584, and in 1593 he received a small pension from the queen. The affectionate esteem with which he was regarded by the younger Elizabethan writers is expressed by Thomas Nashe, who says (Fourre Letters Confuted) that Churchyard's aged muse might well be "grandmother to our grandiloquentest poets at this present." Francis Meres (In Praise of Poets, 1598) mentions him in conjunction with many great names among "the most passionate, among us, to bewail and bemoan the perplexities of love." Spenser, in "Colin Clout's come home again," calls him with a spice of raillery "old Palaemon" who "sung so long until quite hoarse he grew." His writings, with the exception of his contributions to the Mirror for Magistrates, are chiefly autobiographical in character or deal with the wars in which he had a share. They are very rare, and have never been completely reprinted. Churchyard lived right through Elizabeth's reign, and was buried in St Margaret's church, Westminster, on the 4th of April 1604.

The extant works of Churchyard, exclusive of commendatory and occasional verses, include:—A lamentable and pitifull Description of the Life and Death, and the cruel and heinous warres, called Churchyard's Choise (1579), really a completion of the Chippes, and containing, like it, a number of detached pieces; A light Bondel of twelve Discourses, called Churchyarde Charges (1580); The Worth to the Antiquarious, a volume of prose and verse, inspired by Michael Drayton; Churchyard's Challenge (1593); A Musickall Consort of Heavenly harmonie ...... [omitted] Churchyard's Charite (1595); A True Discourse Historical of the succeeding Governors in the Netherlands (1602).

The chief authority for Churchyard's biography is his own "Tragicall Discourse of the unhappy man's life." (Churchyarde Chippes). George Chalmers published (1817) a selection from his works relating to Scotland, for which he wrote a useful life. See also an edition of the Chippes (ed. J. P. Collier, 1870), of the Worthies of Wales (Spenser Soc., 1876), and a notice of Churchyard by H. W. Admitt (Transactions of the Shropshire Archaeological and Nat. Hist. Soc., reprinted separately 1884).

CHURCHYARD, a piece of consecrated ground attached to a parochial church, and used as a burial place. It is distinguished from a cemetery (q.v.), which is also a place of burial, but is separate and apart from any parochial church. A cemetery in England is either the property of a private company, incorporated by special act of parliament, or of a local authority, and is subject to control, and is regulated by the Public Health Acts. The practice of burying in churches or churchyards is said to have been connected with the custom of praying for the dead, and it would appear that the earlier practice was burying in the church itself. In England, about the year 759, spaces of ground adjoining the churches were enclosed and appropriated to the burial of those who had been entitled to attend divine service in those churches.

The right to burial in the parish churchyard is a common law right, controlled in many points by the provisions of the law ecclesiastical. This double character is sufficient to explain the controversy which has so long raged round the subject of burials in England. Every man, according to the common law, has a right to be buried in his own churchyard, or, as it is sometimes put, in the churchyard of the parish where he dies. But the churchyard, as well as the church itself, is the freehold of the parson, who can in many respects deal with it as if it were a private estate. A statute of Edward I. (35, st. 2) speaks of the churchyard as the soil of the church, and the trees growing in the churchyard "as amongst the goods of the church, the which laymen have no authority to dispose," and prohibits "the parsons from cutting down such trees unless required for repairs."

Notwithstanding the consecration of the church and churchyard, and the fact that they are the parson's freehold, a right of way may be claimed through them by prescription. The right of burial may be subject to the payment of a fee to the incumbent, if such has been the immemorial custom of the parish, but not otherwise. The spirit of the ancient canons regarded such burial fees as of a simoniacal complexion, inasmuch as the consecrated grounds were among the res sacrae—a feeling which Lord Stowell says disappeared after the Reformation. No person can be buried in a church without the consent of the incumbent, except when the owner of a manor-house prescribes for a burying-place within the church as belonging to the manor-house. In the case of Res v. Taylor it was held that an information was grantable against a person for opposing the burial of a parishioner; but the court would not interpose as to the person's refusal to read the burial service because he never was baptized—that being matter for the ecclesiastical court. Strangers (or persons not dying in the parish) should not be buried, it appears, without the consent of the parishioners or churchwardens, "whose parochial right of burial is invaded thereby."

In Scotland the obligation of providing and maintaining the churchyard rests on the heritors of the parish. The guardianship of the churchyard belongs to the heritors and also to the kirk-session, either by delegation from the heritors, or in right of its ecclesiastical character. The right of burial appears to be strictly limited to parishioners, although an opinion has been expressed that any person dying in the parish has a right to be buried in the churchyard. The parishioners have no power of management. The presbytery may interfere to compel the heritors to provide due accommodation, but has no further jurisdiction. It is the duty of the heritors to allocate the churchyard. The Scottish law hesitates to attach the ordinary incidents of real property to the churchyard, while English law treats the ground as the parson's freehold. It would be difficult to say who is the legal owner of the soil. Various opinions appear to prevail, e.g., as to grass growing on the surface and minerals found beneath. The difficulty as to religious services does not exist. On the other hand, the religious character of the ground is hostile to many of the legal rights recognized by the English law.

See also Burial and Burial Acts; Cemetery.

CHURL (A.S. cœrl, cognate with the Ger. Kerl and with similar words in other Teutonic languages), one of the two main classes, corel and cœrl, into which in early Anglo-Saxon society the freemen appear to have been divided. In the course of time the status of the corel was probably reduced; but although his political power was never large, and in some directions his freedom was restricted, it hardly seems possible previous to the Norman Conquest to class him among the unfree. Some authorities, however, accept this view. At all events it is certain that the cœrl was frequently a holder of half a hectouf, and a person of the lower class in the Teutonic society. In Scotland he was a person of small means, and subject to the law of the kinsman. In Kent his wergild was fixed at two hundred shillings, or one-sixth of that of a thane, and he is undoubtedly the twelveoned man of Anglo-Saxon law. In Kent his wergild was considerably higher, and his status probably also, but his position in this kingdom is a matter of controversy. After the Norman Conquest the cœrls were reduced to a condition of servitude, and the word translates the villanus of Domesday Book, although it also covers classes other than the villani. The form corel soon became cherl, as in Hawelok the Dane (aute 1300) and several times in Chaucer,
and subsequently churl. Taking a less technical sense than the 
seord of Anglo-Saxon law, churl, or churl was used in general to 
mean a "man," and more particularly a "husband." In this 
short it was employed about 1000 in a translation of the New 
Testament to render the word σηχος (John iv. 16, 18). It was 
then employed to describe a "peasant," and gradually began to 
denote undesirable qualities. Hence comes the modern use of 
the word for a low-born or vulgar person, particularly one with 
an unpleasant, surly or miserly character.

See H. M. Chadwick, Studies on Anglo-Saxon Institutions (Cam-
bridge, 1905); F. Seebohm, Tribal Custom in Anglo-Saxon Law 

CHURN (O. Eng. cyrin; found in various forms in most 
Teutonic languages, cf. Dutch karn; according to the New 
English Dictionary not connected with "quern," a mill), a vessel 
in which butter is made, by shaking or beating the cream so as 
to separate the fatty particles which form the butter from the 
serous parts or buttermilk. Early churns were upright, and in 
shape resembled the cans now used in the transport of milk, 
to which the name "churn" is also given. The upright churn 
was worked by hand with a wooden "plunger"; later came a 
box-shaped churn with a "splasher" revolving inside and 
turned by a handle. The modern type of churn, in large dairies 
worked by mechanical means, either revolves or swings itself, 
thus reverting to the most primitive method of butter-making, 
the shaking or swinging of the cream in a skin-bag or a gourd. 
(See DAIRY.)

CHUSAN, the principal island of a group situated off 
the eastern coast of China, in 30° N. 122° E., belonging to 
the province of Cheh-kiang. It lies N.W. and S.E., and has a 
circumference of 51 m., the extreme length being 20, the 
extreme breadth 10, and the minimum breadth 6 m. The island is 
beautifully diversified with hill and dale, and well watered with 
numerous small streams, of which the most considerable is the 
Tung-kiang, falling into the harbour of Tingsha. Most of the 
surface is covered with cultivation, and nineteen-twentieths of 
the inhabitants are engaged in agriculture. Wherever it is 
possible to rear rice every other product is neglected; yet the 
quantity produced is not sufficient for the wants of the inhabi-
tants. Millet, wheat, sweet potatoes, yams and tares are also 
grown. The tea plant is found almost everywhere, and the 
cotton plant is largely cultivated near the sea. The capital, 
Tingsha, stands about half a mile from the southern shore, 
and is surrounded by a wall nearly 3 m. in circuit. The ditch 
outside the wall is interrupted on the N.W. side by a spur from a 
neighbouring hill, which projects into the town, and forms an easy 
access to an attacking force. The town is traversed by canals, 
and the harbour, which has from 4 to 8 fathoms water, is land-
locked by several islands. Temple (or Joss-house) Hill, which 
commands the town and harbour close to the beach, is 122 ft. 
high. The population of the entire island is estimated at 250,000, 
of which the capital contains about 40,000. Chusan has but few 
manufactures; the chief are coarse cotton stuffs and agricultural 
implements. There are salt works on the coast; and the 
fisheries employ a number of the inhabitants. In Tingsha a 
considerable business is carried on in carving and varnishing, 
and its silver wares are in high repute. The principal exports 
are fish, coarse black tea, cotton, vegetable tallow, sweet 
potatoes, and some wheat. Chusan was occupied by the Japanese 
during the Ming dynasty, and served as an important commercial 
entrepot. It was taken by the British forces in 1840 and 1841, 
and retained till 1840 as a guarantee for the fulfilment of the 
 stipulations of the treaty. It was also occupied by the British 
in 1860.

CHUTE (Fr. for "fall," of water or the like; pronounced as 
"shoot," with which in meaning it is identical), a channel or 
trough, artificial or natural, down which objects such as timber, 
coral or grain may slide from a higher to a lower level. The word 
is also used of a channel cut in a dam or a river for the passage 
of floating timber, and in Louisiana and on the Mississippi of 
a channel at the side of a river, or narrow way between an island 
and the shore. The "Water-Chute" or water tobogganing, is a 
Canadian pastime, which has been popular in London and else-
where. A steep wooden slope terminates in a shallow lake; down 
this run flat-bottomed boats which rapidly increase their velocity 
under the influence of the "chute," they dash into the water.

CHUTNEY, or CHUTNEE (Hindustani chutni), a relish 
or seasoning of Indian origin, used as a condiment. It is prepared 
from sweet fruits such as mangoes, raisins, &c., with acid flavour-
ing from tamarinds, lemons, limes and sour herbs, and with a 
hot seasoning of chillies, cayenne pepper and spices.

CHUVASHES, or TCHUVASHES, a tribe found in eastern Russia. 
They form about one-fourth of the population of the government 
of Kazan, and live in scattered communities throughout the 
governments of Simbirsk, Samara, Saratov, Orenburg and Perm. 
They have been identified with the Burtass of the Arab 
geographers, and many authorities think they are the descendants 
of the ancient Bulgars. In general they physically resemble 
the Finns, being round-headed, flat-featured and light-eyed, but 
they have been affected by long association with the Tatar element. 
In dress they are thoroughly Russianized, and they are nominally 
Christians, though they cling to many of the Old Shamanistic 
practices. They number some half a million. Their language 
belongs to the Tatar or Turkish group, but has been strongly 
influenced by the Finno-Ugrian idioms spoken round it.

See Schott, De Lingua Tchuvashiorum (Berlin, 1841).

CIALDINI, ENRICO (1811-1892), Italian soldier, politician 
and diplomatist, was born at Castelvetro, in Modena, on the 10th 
of August 1811. In 1831 he took part in the insurrection at 
Modena, fleeing afterwards to Paris, whence he proceeded to 
Spain to fight against the Carlists. Returning to Italy in 1848, 
he commanded a regiment at the battle of Novara. In 1859 he 
organized the Alpine Brigade, fought at Palestro at the head of 
the 4th Division, and in the following year invaded the Marches, 
won the battle of Castelfidardo, took Ancona, and subsequently 
directed the siege of Gaeta. For these services he was created 
duke of Gaeta by the king, and was assigned a pension of 10,000 
liro by parliament. In 1861 his intervention envenomed the 
Cavour-Garibaldi dispute, royal mediation alone preventing a 
duel between him and Garibaldi. Placed in command of the 
troops sent to oppose the Garibaldian expedition of 1862, he 
defeated Garibaldi at Aspromonte. Between 1862 and 1866 he 
held the position of lieutenant-royal at Naples, and in 1864 was 
created senator. On the outbreak of the war of 1866 he resumed 
command of an army corps, but dissensions between him and La 
Marmora prejudiced the issue of the campaign and contributed to 
the defeat of Custozza. After the war he refused the command 
of the General Staff, which he wished to render independent of 
the war office. In 1867 he attempted unsuccessfully to form a 
cabinet sufficiently strong to prevent the threatened Garibaldian 
incursion into the papal states, and two years later failed in a 
similar attempt, through disagreement with Lanza concerning 
the army estimates. On the 3rd of August 1870 he pleaded in 
favour of Italian intervention in aid of France, a circumstance 
which enhanced his influence when in July 1876 he replaced 
Nigras as ambassador to the French Republic. This position he 
held until 1882, when he resigned on account of the publication 
by Mancini of a despatch in which he had complained of arrogant 
treatment by M. Waddington. He died at Leghorn, on the 8th of 
September 1892.

CIBBER (or Cibert), CAIUS GABRiEL (1630-1700), Danish 
disculter, was born at Flensburg. He was the son of the king's 
cabinetmaker, and was sent to Rome at the royal charge while yet 
a youth. He came to England during the Protectorate, or during 
the first years of the Restoration. Besides the famous statues 
of Melancholy and Raving Madness ("great Cibber," he was 
laughed at by his contemporaries with Kenneth Cibber, produced 
the has-reliefs round the monument on Fish Street Hill. The 
several kings of England and the Sir Thomas Gresham executed 
by him for the Royal Exchange were destroyed with the building 
itself in 1838. Cibber was long employed by the fourth earl of 
Devonshire, and many fine specimens of his work are to be seen 
at Chatsworth. Under that nobleman he took up arms in 1688 
for William of Orange, and was appointed in return carver to the
CIBBER, COLLEY

king's closet. He died rich and, according to Horace Walpole, built the Danish church in London, where he lies buried beside his second wife, to whom he erected a monument. She was a Miss Colley of Glaisdon, grand-daughter of Sir Anthony Colley, and the mother of his son Colley Cibber.

CIBBER, COLLEY (1671–1757), English actor and dramatist, was born in London on the 6th of November 1671, the eldest son of Cæsus Gabriel Cibber, the sculptor. Sent in 1682 to the free school at Grantham, Lincolnshire, the boy distinguished himself by an aptitude for writing verse. He produced an "Oration" on the death of Charles II.—whom he had seen feeding his ducks in St James's Park.—and an "Ode" on the accession of James II. He was removed from school in 1687 on the chance of election to Winchester College. His father, however, had not then presented that institution with his statue of William of Wykeham, and the son was rejected, although through his mother he claimed to be of "founder's kin." The boy went to London, and indulged his passion for the theatre. He was invited to Chatsworth, the seat of William Cavendish, earl (afterwards duke) of Devonshire, for whom his father was then executing commissions, and he was on his way when the news of the landing of William of Orange was received; father and son met at Nottingham, and Colley Cibber was taken into Devonshire's company of volunteers. He served with the bloodless campaign that resulted in the coronation of the Prince of Orange, and on its conclusion presented a Latin petition to the earl imploring his interest. The earl did nothing for him, however, and he enrolled himself (1690) as an actor in Betterton's company at Drury Lane.

After playing "full three-quarters of a year" without salary, as was then the custom of all apprentice actors, he was paid ten shillings a week. His rendering of the little part of the chaplain in Otway's Orphan procured him a rise of five shillings; and a subsequent impersonation (1694) on an emergency, and at the author's request, of Lord Touchwood in The Double Dealer, advanced him, on Congreve's recommendation, to a pound a week. On this, supplemented by an allowance of £20 a year from his father, he contrived to live with his wife and family— he had married in 1693—and to produce a play, Love's Last Shift, or the Fool in Fashion (1696). Of this comedy Congreve said that it "had a great many things that were like wit in it"; and Vanbrugh honoured it by writing its Revenge as a sequel. Cibber played the part of Sir Novelty Fashion, and his performance as Lord Foppington, the same character renamed, in Vanbrugh's piece, established his reputation as an actor. In 1698 he was assailed, with other dramatists, by Jeremy Collier in the Short View. In November 1702 he produced, at Drury Lane, She Wou'd and She Wou'd Not; or the Kind Impostor, one of his best comedies; and in 1704, for himself and Mrs Oldfield, The Careless Husband, which Horace Walpole classed, with Cibber's Apology, as "worthy of immortality." In 1706 Cibber left Drury Lane for the Haymarket, but when the two companies united two years later he rejoined his old theatre through the influence of his friend Colonel Brett, a shareholder. Brett made over his share to Wilks, Estcourt and Cibber. Complaints against the management of Christopher Rich led, in 1709, to the leaving of the theatre, and Cibber, in the same year of old age, obtained the patent. After a series of intrigues Collier was bought out by Wilks, Doggett and Cibber, under whose management Drury Lane became more prosperous than it ever had been. In 1715 a new patent was granted to Sir Richard Steele, and Barton Booth was also added to the management. In 1717 Cibber produced the Nonjuror, an adaptation from Molière's Tartuffe; the play, for which Nicholas Rowe wrote an abusive prologue, ran eighteen nights, and the author received from George L., to whom it was dedicated, a present of two hundred guineas. Tartuffe became an English Catholic priest who incited rebellion, and there is little doubt that the Whig principles expressed in the Nonjuror led to Cibber's appointment as poet laureate (1730). It also provoked the animosity of the Jacobite and Catholic factions, and was possibly one of the causes of Pope's hostility to Cibber. Numerous "keys" to the Nonjuror appeared in 1718. In 1720 Drury Lane was closed for three days by order of the duke of Newcastle, ostensibly on account of the refusal of the patentees to submit to the authority of the lord chamberlain, but really (it is asserted) because of a quarrel between Newcastle and Steele, in which the former demanded Cibber's resignation. In 1726 Cibber pleaded the cause of the patentees against the estate of Sir Richard Steele before Sir Joseph Jekyll, master of the rolls, and won his case. In 1730 Mrs Oldfield died, and her loss was followed in 1732 by that of Wilks; Cibber now sold his share of the theatre, appearing rarely on the stage thereafter. In 1740 he published An Apology for the Life of Colley Cibber, Comedian. - with an *Historical View of the Stage during his Own Time.* "There are few," wrote Goldsmith, "who do not prefer a page of Montaigne or Colley Cibber, who candidly tell us what they thought of the world, and the world thought of them, to the more stately memoirs and transactions of Europe." But beside the personal interest, this book contains criticisms on acting of enduring value, and gives the best account there is of Cibber's contemporaries on the London stage. Samuel Johnson, who was no friend of Cibber, gave it grudging praise (see Boswell's Life of Johnson, ed. Birkbeck Hill, vol. iii. p. 72).

In 1742 Cibber was substituted for Theobald as the hero of Pope's Dunciad. Cibber had introduced some gag into the scenes in which he played the part of Bayes, referring to the ill-starred farse of Three Hours after Marriage (1717). This play was nominally by Gay, but Pope and Arbuthnot were known to have had a hand in it. Cibber refused to discontinue the offensive passage, and Pope revenged himself in satirical allusions in his printed correspondence, in the Epistle to Dr Arbuthnot and in the Dunciad. To these, Cibber replied with A Letter from Mr Cibber to Mr Pope, inquiring into the motives that might induce him in his satirical works to be so frequently fond of Mr Cibber's name (1742). Cibber scored with an "idle story of Pope's behaviour in a tavern" inserted in this letter, and gives an account of the original dispute over the Rehearsal. By the substitution of Cibber for Theobald as hero of the Dunciad, much of the satire lost its point. Cibber's faults certainly did not include dullness. A new edition contained a prefatory discourse, probably the work of Warburton, entitled "Richardus Aristarchus, or the Hero of the Poem," in which Cibber is made to look ridiculous from his own Apology. Cibber replied in 1744 with Another Occasional Letter . . . , and altogether he had the best of the argument. When he was seventy-four years old he made his last appearance on the stage as Pandulph in his own Papal Tyranny in the Reign of King John (Covent Garden, 15th of February 1745), a miserable paraphrase of Shakespeare's play. He died on the 11th of December 1757.

Cibber's reputation has suffered unduly from the depreciation of Pope and Johnson. "I could not bear such nonsense," said Johnson of one of Cibber's odes, "and I would not let him read it to the end." Fielding attacked Cibber's style and language more than once in Joseph Andrews and elsewhere. Nevertheless, Cibber possessed wit, unusual good sense and tact; and in the Apology he showed himself the most delicate and subtle critic of acting of his time. He was frequently accused of plagiarism, and more than once accused of unfair competition; but, although he have been ashamed of his Shakespearean adaptations, one of which, however, Richard III. (Drury Lane, 1700), kept its place as the acting version until 1821. Cibber is rebuked for his mutilation of Shakespeare by Fielding in the Historical Register for 1736, where he figures as Ground Ivy.

If Cibber had not as much wit as his predecessors, he displayed in his best plays abundant animation and spirit, free from the extreme coarseness of many of his contemporaries, and a thorough knowledge of the requirements of the stage. His most successful comedies kept their place in the acting repertoire for a long time. He was an excellent actor, especially in the rôle of the fashionable coxcomb. Horace Walpole said that as Bayes in The Rehearsal he made the part what it was intended to be, the burlesque of a great poet, whereas David Garrick degraded him to a "garrettewt."

The Apology was edited in 1822 by E. Bellchambers and in 1889
by R. W. Lowe, who printed with it other valuable theatrical books and pamphlets. It is also included in Hunt and Clarke's Autobiographies (1828). Cibber's Plays (Acted 1720), a ballad opera; and adaptations from Beaumont and Fletcher, Dryden, Molière and Corneille. A bibliography of the numerous skits on Cibber is to be found in Lowe's Bibliographical Account of English Theatrical Literature.

Colley Cibber's son, Theophilus Cibber (1703-1758), also an actor and playwright, was born on the 26th of November 1703. In 1734 he was acting-manager at the Haymarket, and he subsequently played at Drury Lane, Lincoln's Inn Fields and Covent Garden. His best impersonation was as Pistol, but he also distinguished himself in some of the fine-gentleman parts affected by his father. He was one of the ringleaders in the intrigues against John Higmore, who had bought a share in the patent of Drury Lane from Colley Cibber. Theophilus Cibber, with a number of other actors, succeeded from Drury Lane, and in thus depreciating the value of the patent, they (1753) obtained a considerable sum, acted with doubtful honesty. He contemplated the publication of an autobiography, but was effectually dissuaded by the appearance (1740) of a scathing account of his career by an unknown author, entitled An Apology for the Life of Mr T. . . . C. . . . supposed to be written by himself. In 1753 he began The Lives and Characters of the most Eminent Actors and Actresses of Great Britain and Ireland, but he went no further than the life of Barton Booth. He wrote some plays of no great merit. In 1753 appeared An Account of the Lives of the Poets of Great Britain and Ireland, with the name of "Mr Cibber" on the title page. The five volumes of Lives are chiefly based on the earlier works of Gerard Langbaine and Giles Jacob, and the MS. collections of Thomas Coxeter (1689-1747). The book is said to have been largely written by Robert Shiel, Dr Johnson's amanuensis. Theophilus Cibber perished by shipwreck on his way to Dublin to play at the Theatre Royal.

Susannah Maria Cibber (1714-1766), wife of Theophilus, was an actress of distinction. She was the daughter of a Covent Garden upholsterer, and sister of Dr Arne (1700-1778) the composer. Mrs Cibber had a beautiful voice and began her career in opera. She was the original Galatea in Handel's Acis and Galatea, and the contralto arias in the Messiah are said to have been written for her. She played Zarah in Aaron Hill's version of Voltaire's Zadre in 1736, and it was as a tragic actress, not as a singer, that her greatest triumphs were won. From Colley Cibber she learned a sing-song method of declamation. Her mannerisms, however, did not obscure her real genius, and she freed herself from them entirely when she began to act with Garrick, with whom she was associated at Drury Lane from 1753. She died on the 26th of January 1766. She married Theophilus Cibber in 1754, but lived with him about eight years, being separated for a considerable time. Mrs Cibber's fine acting are to be found in many contemporary writers, one of the most discriminating being in the Rosciad of Charles Churchill.

Colley Cibber's youngest daughter, Charlotte, married Richard Charke, a violinist, from whom she was soon separated. She began as an understudy to actresses in leading parts, but quarrelled with her manager, Charles Fleetwood, on whom she wrote a one-act skit, The Art of Management (1735). She also wrote two comedies and two novels of small merit, and an untrustworthy, but amusing Narrative of Life of . . . Charlotte Charke, . . . by herself (1755), reprinted in Hunt and Clarke's Autobiographies (1822).

CIBORIUM, a name in classical Latin for a drinking-vessel. It is the latinized form of the Greek κιβόριον, the cup-shaped seed-vessel of the Egyptian water-lily, the seeds or nuts of which were known as "Egyptian beans." In the early Christian Church the ciborium was a canopy over the altar (q.v.), supported on columns, and from it hung the receptacle in which was reserved the consecrated wafer of the Eucharist. The use of the word has probably been much influenced by the early false connexion with cibus, food, cf. Agatio, bishop of Pisa (quoted in Du Cange, Gloss. s. e.), Ciborium esse ad ferendos cibos." In the Eastern Church the columns rested on the altar itself, in the Western they reached the ground. The name was early transferred from the canopy to the vessel containing the reserved sacrament, and in the Western Church the canopy was known as a "baldaquin," Ital. baldacchino, from Baldacco, the Italian name of Bagdad, and hence applied to a rich kind of embroidered tapestry made there and much used for canopies, &c. At the present day it is usual in the Roman Church to use the term "pyx" (πυξ, properly a vessel made of boxwood) for the receptacle for the reserved sacrament used in administering the viaticum to the sick or dying. Medieval pyxes and ciboria are often beautiful examples of the goldsmith's, enameller's and metal-worker's craft. They take most usually the shape of a covered chalice or of a cylindrical box with conical or cylindrical cover surmounted by a cross. An exquisite ciborium fetched £600 at the sale of the Jerdone Braikenridge collection at Christie's in 1906. It is supposed to have come from Malmesbury Abbey, and is an early example of English make. It is of copper-gilt and ornamented with champlevé enamels, apple and chrysoprase green, scarlet, mauve and white, turquoise and lazuli, the flsh tints being of a pale jasper. Various subjects from the Old and New Testament, such as the sacrifice of Abel, the brazen serpent, the nativity, crucifixion and resurrection are represented on circular medallions on the outside. It is illustrated in colours in the catalogue of the exhibition of the Burlington Fine Arts Club, 1897.

CIBRARIO, Luigi, Count (1802-1870), Italian statesman and historian, descended from a noble but impoverished Piedmontese family, was born in Ussuglia on the 23rd of February 1802. He won a scholarship at the age of sixteen, and was teaching literature at eighteen. His verses to King Charles Albert, then prince of Carignano, on the birth of his son Victor Emmanuel, attracted the prince's attention and proved the beginning of a long intimacy. He entered the Sardinian civil service, and in 1824 was appointed lecturer on canon and civil law. His chief interest was the study of ancient documents, and he was sent to search the archives of Switzerland, France and Germany for cartularies relating to the history of Savoy. During the war of 1848, after the expulsion of the Austrians from Venice, Cibario was sent to that city with Colli to negotiate its union with Piedmont. But the proposal fell through when the news of the armistice between King Charles Albert and Austria arrived, and the two delegates were made the objects of a hostile demonstration. In October 1848 Cibario was made senator, and after the battle of Novara (March 1849), when Charles Albert abdicated and retired to a monastery near Oporto, Cibario and Count Giacinto di Collegno were sent as representatives of the senate to express the sympathy of that body with the fallen king. He reached Oporto on the 28th of May, and after being detained there for a month Cibario reached Turin just before the news of Charles Albert's death. In May 1852 he became minister of finance in the reconstructed d'Azeglio cabinet, and later minister of education in that of Cavour. In the same year he was appointed secretary to the order of SS. Maurizio and Lazzaro. It was he who in 1853 dictated the vigorous memorandum of protest against the confiscation by Austria of the property of Lombard exiles who had been naturalized in Piedmont. He strongly supported Cavour's Crimean policy (1853), and when General La Marmora departed in command of the expeditionary force and Cavour took the war office, Cibario was made minister for foreign affairs. He conducted the business of the department with great skill, and ably seconded Cavour in bringing about the admission of Piedmont to the congress of Paris on an equal footing with the great powers. On retiring from the foreign office Cibario was created count. In 1860 he acted as mediator between Victor Emmanuel's
CICADAS

Insects of the homopterous division of the Hemiptera, generally of large size, with the femora of the anterior legs toothed below, two pairs of large clear wings, and prominent auditory organs and opercular slits down each side of the thorax. The shrill song of the males, which in some cases may be heard in concert at a distance of a quarter of a mile or more. The vocal organs, of which there is a pair in the thorax, protected by an opercular plate, are quite unlike the sounding organs of other insects. Each consists in essence of a tightly stretched membranous or drum which is thrown into a state of rapid vibration by a powerful muscle attached to its inner surface and passing thence downwards to the floor of the thoracic cavity. Although no auditory organs have been found in the females, the song of the males is believed to serve as a sexual call. Cicadas are also noteworthy for their longevity, which so far is known surpasses that of all other insects. By means of a saw-like ovipositor the female lays her eggs in the branches of trees. Upon hatching, the young, which differ from the adult in possessing long antennae and a pair of powerful fossorial anterior legs, fall to the ground, burrow below the surface, and spend a prolonged subterranean larval existence feeding upon the roots of vegetation. After many years the larva is transformed into the pupa or nymph, which is distinguishable principally by the shortness of its antennae and the presence of wing pads. After a brief existence the pupa emerges from the ground, and, holding on to a plant stem by means of its powerful front legs, sets free the perfect insect through a slit along the median dorsal line of the thorax. In some cases the pupa upon emerging constructs a chimney of soil, the use of which is not known. In one of the best-known species, Cicada septemdecim, from North America, the life-cycle is said to extend over seventeen years. Cicadas are particularly abundant in the tropics, where the largest forms are found. They also occur in temperate countries, and were well known to the ancient Greeks and Romans. One species only is found in England, where it is restricted to the southern counties but is an insect not commonly met with.

CIGELY, Myrthkad odorata (natural order Umbelliferae), a perennial herb with a leafy hollow stem, 2 to 3 ft. high, much divided leaves, whitish beneath, a large sheathing base, and terminal umbels of small white flowers, the outer ones only of which are fertile. The fruit is dark brown, long (2 to 1 in.), narrow and beaked. The plant is a native of central and southern Europe, and is found in parts of England and Scotland in pastures, usually near houses. It has aromatic and stimulant properties and was formerly used as a pot-herb.

CICERO, the name of two families of ancient Rome. It may perhaps be derived from cicer (pulse), in which case it would be analogous to such names as Lentulius, Tubero, Piso. One family, of the plebeian Claudian gens, only a single member, Gaius Claudius Cicero, tribune in 454 B.C., is known. The other family was a branch of the Tullii, settled from an ancient period at Arpinum. This family, four of whose members are noticed specially below, did not achieve more than municipal eminence until the time of M. Tullius Cicero, the great orator.

i. Marcus Tullius Cicero (106-43 B.C.), Roman orator and politician, was born at Arpinum on the 3rd of January 106 B.C. His mother, Helvia, is said to have been of good family. His father was by some said to have been descended from Attius Tullius, the Volscian host of Coriolanus, while spiteful persons declared he to have been a fuller; in any case he was a Roman knight with property at Arpinum and a house in Rome. His health was weak, and he generally lived at Arpinum, where he devoted himself to literary pursuits. Cicero spent his boyhood partly in his native town and partly at Rome. The poet Archias, he says, first inspired him with the love of literature. He was much impressed by the teaching of Phaedrus, the Epicurean, at a period before he assumed the toga virilis; he studied dialectic under Didotus the Stoic, and in 88 B.C. attended the lectures of Philo, the head of the Academic school, whose devoted pupil he became. He studied rhetoric under Molo (Molon) of Rhodes, and law under the guidance of Q. Mucius Scaevola, the augur and jurist. After the death of the augur, he transferred himself to the care of Q. Mucius Scaevola, the ponifex maximus, a still more famous jurisconsult, nephew of the augur. His literary education at this period consisted largely of verse-writing and making translations from Greek authors. We know that he wrote an early poem named Pontius Glanum the subject of which is uncertain, and of translations of Xenophon's Oeconomica and the Phenomena of Aratus. Considerable fragments of the latter work are still extant. To this period also belongs his de Inventione rhetoricæ, of which he afterwards spoke lightly (de Orat. i. 5), but which enjoyed a great vogue in the middle ages. Cicero also, according to Roman practice, received military training. At the age of seventeen he served in the social war successively under Pompeius Strabo and Sulla (89 B.C.). In the war between Marius and Sulla has sympathies were with Sulla, but he did not take up arms (Sest. Rosc. 136, 142).

His forensic life begins in 81 B.C., at the age of twenty-five. A speech delivered in this year, pro Quinctio, is still extant; it is concerned with a technical point of law and has little literary merit. In the following year he made his celebrated defence of Sextus Roscius on a charge of parricide. He subsequently defended a woman of Arretium, whose freedom was impugned on the ground that Sulla had confiscated the territory of that town. Cicero then left Rome on account of his health, and travelled for two years in the East. He studied philosophy at Athens under various teachers, notably Antiochus of Ascalon, founder of the Old Academy, a combination of Stoicism, Platonism and Peripateticism. In Asia he attended the courses of Xenocrates, Dionysius and Menippus, and in Rhodes those of Posidonius, the famous Stoic. In Rhodes also he studied rhetoric once more under Molo, to whom he ascribes a decisive influence upon the development of his literary style. He had previously affected the florid, or Asiatic, style of oratory then current in Rome. The chief faults of this were excess of ornament, antithesis, alliteration and assonance, monotony of rhythm, and the insertion of words purely for rhythmical effect. Molo, he says, rebuked his youthful extravagance and he came home to Rome 'with a sense of great improvement'.

He returned to Rome in 77 B.C., and appears to have married at this time Terentia, a rich woman with a domineering temper, to whom many of his subsequent embarrassments were due. He engaged at once in forensic and political life. He was quaeator in 75, and was sent to Lillybaeum to supervise the corn supply. His connexion with Sicily led him to come forward in 70 B.C., when curule-acute elec, to prosecute Gaius Verres, who had oppressed the island for three years. Cicero seldom prosecuted, but it was the custom at Rome for a rising politician to

1 Brutus, § 316 "(Molon) dedit operam ... ut minus redundantis nos et supra fluentis juvenilium quadrum dicendii impudcitate et licentia reprimere et quasi extra ripas diffucentis coercescit."
2 According to Plutarch she urged her husband to take vigorous action against Catiline, who had compromised her half-sister Fabia, a vestal virgin; also to give evidence against Clodius, being jealous of his sister Clodia.
CICERO

win his spurs by attacking a notable offender (pro Caecio, 73). In the following year he defended Marcus (or Manius) Fonteius on a charge of extortion in Gaul, using various arguments which might equally well have been advanced on behalf of Verres himself. In 68 B.C. his letters begin, from which (and especially those to T. Pomponius Atticus, his "second self") we obtain wholly unique knowledge of Roman life and history. In 66 B.C. he was praetor, and was called upon to hear cases of extortion. In the same year he spoke on behalf of the proposal of Gaius Manlius to transfer the command against Mithradates from Lucullus to Pompey (de Lege Montiori), and delivered his clever but disingenuous defence of Aulus Cluentius (pro Cluentio). At this time he was a prospective candidate for the consulship, and was obliged by the hostility of the nobles towards "new men" to look for help wherever it was to be found. In 65 B.C. he even thought of defending Catiline on a charge of extortion, and delivered two brilliant speeches on behalf of Gaius Cornelius, tribune in 67 B.C., a leader of the democratic party. In 64 B.C. he lost his father and his son Marcus was born. The optimates finally decided to support him for the consulship in order to keep out Catiline, and he eagerly embraced the "good cause," his affection for which from this time onward never varied, though his actions were not always consistent.

The public career of Cicero henceforth is largely covered by the general articles of "Roma," "Hercules," and "The Republic," ad libitum. His consulship (63) was one of amazing activity, both administrative and oratorical. Besides the three speeches against Publius Rullus and the four against Catiline, he delivered a number of others, among which that on behalf of Gaius Rabirius is especially notable. The charge was that Rabirius (q.v.) had killed Saturninus in 100 B.C., and by bringing it the democrats challenged the right of the senate to declare a man a public enemy. Cicero, therefore, was fully aware of the danger which would threaten himself from his execution of the Catilinarian conspirators. He trusted, however, to receive the support of the nobles. In this he was disappointed. They never forgot that he was a "new man," and were jealous of the great house upon the Palatine which he acquired at this time. Caesar had made every possible effort to conciliate Cicero, but, when all overtures failed, allowed Publius Clodius to attack him. Cicero found himself deserted, and on the advice of Cato went into exile to avoid bloodshed. He left Rome at the end of March 58, and arrived on the 23rd of May at Thessalonica, where he remained in the deepest dejection until the end of November, when he went to Dyr Rachium (Durazzo) awaiting his recall. He left for Italy on the 4th of August 57, and on arriving at Brundisium (Brindisi) found that he had been recalled by a law passed by the comitia on the very day of his departure. On his arrival at Rome he was received with enthusiasm by all classes, but did not find the nobles at all eager to give him compensation for the loss of his house and villas, which had been destroyed by Clodius. He was soon encouraged by the growing coolness between Pompey and Caesar to attack the acts of Caesar during his consularship, and after his successful defence of Publius Sestius on the 10th of March he proposed on the 4th of April that the senate should on the 15th of May discuss Caesar's distribution of the Campanian land. This brought about the conference of Luca (Lucca). Cicero was again deserted by his supporters and threatened with fresh exile. He was forced to publish a "recantation," probably the speech de Provinciis Consularibus, and in a private letter says frankly, "I know that I have been a regular ass." His conduct for the next three years teems with inconsistencies which we may deplore but cannot pass over. He was obliged to defend in 54 Publius Vatinius, whom he had fiercely attacked during the trial of Sestius; also Aulus Gabinius, one of the consuls to whom his exile was due; and Rabirius Postumus, an agent of Gabinius. On the other hand, he made a violent speech in the senate in 55 against Lucius Piso, the colleague of Gabinius in 58. We know from his letters that he accepted financial aid from Caesar, but that he repaid the loan before the outbreak of the civil war. There is no doubt that he was easily deceived. He was always an optimist, and thought that he was bringing good influence to bear upon Caesar as afterwards upon Octavian. His actions, however, when Caesar's projects became manifest, sufficiently vindicated his honesty. During these unhappy years he took refuge in literature. The de Oratore was written in 55 B.C., the de Republica in 54, and the de Legibus at any rate begun in 52. The latter is famous for the murder of Clodius by T. Annius Milo on the Appian Way (on the 18th of January), which brought about the appointment of Pompey as sole consul and the passing of the special laws dealing with rioting and bribery. Cicero took an active part in the trials which followed, both as a defender of Milo and his adherents and as a prosecutor of the opposite faction. At the close of the year, greatly to his annoyance, he was sent to govern Cilicia under the provisions of Pompey's law (see Pompey and Rome: History). His reluctance to leave Rome, already shown by his refusal to take a province, after his praetorship and consulship, was increased by the inclination of his daughter Tuila, then a widow, to marry again. During his absence she married the profligate spendthrift, P. Cornelius Dolabella.

The province of Cilicia was a large one. It included, in addition to Cilicia proper, Isaraia, Lycaonia, Pisidia, Pamphylia and Cyprus, as well as a protectorate over the client kingdoms of Cappadocia and Galatia. There was also danger of a Parthian inroad. Cicero's legate was his brother Quintius Cicero (below), an experienced soldier who had gained great distinction under Caesar in Gaul. The fears of Parthian invasion were not realized, but Cicero, after suppressing a revolt in Cappadocia, undertook military operations against the hill-tribes of the Amanus and captured the town of Pindennissus after a siege of forty-six days. A supplicatio in his honour was voted by the senate. The early months of 50 were occupied by the administration of justice, chiefly at Laodicea, and by various attempts to alleviate the distress in the province caused by the exactions of his predecessor, Appius Claudius. He had to withstand pressure from influential persons (e.g. M. Brutus, who had business interests in his province), and refused to provide his friends with wild beasts for their games in Rome. Leaving his province on the earliest opportunity, he reached Brundisium on the 24th of November, and found civil war inevitable. He went to Rome on the 4th of January, but did not enter the city, since he aspired to a triumph for his successes. After the outbreak of war he was placed by Pompey in charge of the Campanian coast. After much irresolution he refused Caesar's invitations and resolved to join Pompey's forces in Greece. He was shocked by the ferocious language of his party, and himself gave offence by his bitter jests (Plut. Cíc. 38). Through illness he was not present at the battle of Pharsalus, but afterwards was ordered by the command by Cato the Younger at Corcyra, and was threatened with death by the young Cn. Pompeius when he refused to accept it. Thinking it useless to continue the struggle, he sailed to Brundisium, where he remained until the 12th of August 47, when, after receiving a kind letter from Caesar, he went to Rome. Under Caesar's dictatorship Cicero was not active. His voice was raised on three occasions only: once in the senate in 46 to praise Caesar's clemency to M. Claudius Marcellus (pro marcello), to plead in the same year before Caesar for Quintus Ligarius, and in 45 on behalf of Deiotaros, tetrach of Galatia, also before Caesar. He suffered greatly from family troubles at this period. In 46, his patience giving way, he divorced Terentia, and married his young and wealthy ward Pubilla. Then came the greatest grief

---

1 Caesar, at one time, offered him a place on the coalition, which on his refusal became a triumvirate (Att. ii. 3; 3; Prov. Cons. 41), and afterwards a post on his commission for the defence of the Campanian land, or a legato libera.
of his life, the death of Tullia, his beloved daughter. He shortly afterwards divorced Pudhilla, who had been jealous of Tullia's influence on him. This, however, was a chance event, for two years later he devoted himself wholly to literature. To this period belong several famous rhetorical and philosophical works, the Brutus, Orator, Partitones Oratoriae, Paraadoxa, Academica, de Finibus, Tusculan Disputations, together with other works now lost, such as his Laus Caelonis, Consolatio et Hortensius.

His repose was broken by Caesar's murder on the 15th of March 44, to which he was not a party. On the 17th of March he delivered a speech in the senate urging a general amnesty like that declared in Athens after the expulsion of the Thirty Tyrants. When it became apparent that the conspirators had only removed the despot and left the despotism, he again devoted himself to philosophy, and in an incredibly short space of time produced the de Natura Deorum, de Divinazione, de Fato, Catulo maior (or de Senectute), Laelius (or de Amicitia), and began his treatise de Officiis. To this period also belongs his lost work de Gloria. He then projected a journey to Greece in order to see his son Marcus, then studying at Athens, of whose behaviour he heard unfavourable reports. He reached Syracuse on the 1st of August, having during the voyage written from memory a translation of Aristotle's Topica. He was driven back by unfavourable winds to Leucopatra, and then, hearing better news, returned to Rome on the 21st of August. He was bitterly attacked by Marcus Antonius (Mark Antony) in the senate on the 1st of September for not being present there, and on the next day replied in his First Philippic. He then left Rome and devoted himself to the completion of the de Officiis, and to the composition of his famous Second Philippic, which was never delivered, but was circulated, at first privately, after Antony's departure from Rome to Cisalpine Gaul on the 26th of November.

Cicero returned to Rome on the 9th of December, and from that time forward led the republican party in the senate. His policy, stated briefly, was to make use of Octavian, whose name was all-powerful with the veterans, until new legions had been raised which would follow the republican commanders (Philol. xi. 39). Cicero pledged his credit for the loyalty of Octavian, who styled him "father" and affected to take his advice on all occasions (Epp. ad Brut. i. 17. 5). Cicero, an incapable optimist in politics, may have convinced himself of Octavian's sincerity. The breach, however, was bound to come, and the saying, maliciously attributed to Cicero, that Octavian was an excellent youth who must be praised and "sent to another place," neatly expresses the popular view of the situation. Cicero was sharply criticized by M. Junius Brutus for trucking to Octavian while showing irreconcilable enmity to Antony and Lepidus (ad Brut. i. 16. 4. i. 13. 9); but Brutus was safe in his province, and it is difficult to see what other course was open to a politician in Rome. It was usual in those days to bid a resolution to Hecuba on his amazing energy. He delivered his long series of Philippics at Rome, and kept up a correspondence with the various provincial governors and commanders, all short-sighted and selfish, and several of them half-hearted, endeavouring to keep each man in his place and to elaborate a common plan of operations. He was naturally included in the list of the proscribed, though it is said that Octavian fought long on his behalf, and was slain near Formiae on the 7th of December 43. He had a ship near in which he had previously attempted to fly, but being cast back by unfavourable winds he returned to his villa, saying, "Let me die in the country which I have often saved." His head and hands were sent to Rome and nailed to the rostra, after Fulvia, wife of Antony and widow of Clodius, had thrust a hairpin through the tongue.

Works.—The literary works of Cicero may be classed as: (a) rhetorical; (b) oratorical; (c) philosophical and (d) epistolary.

(i.) Rhetorical.—His chief works of this kind are: (a) de Oratore, a treatise in three books dedicated to his brother Quintus. The discussion is conducted in the form of a dialogue which is not entirely artificial, but which is, on the contrary, as natural as any in the history of the subject. Cicero's orators L. Crassus and M. Antonius. The first book deals with the studies necessary for an orator; the second with the treatment of the subject matter; the third with the form and delivery of a speech. Cicero says of this work in a letter (Fam. i. 9. 23) that it "does not deal in hackneyed rules and embraces the whole theory of oratory as laid down by Isocrates and Aristotle." (b) Brutus, or de claris oratoribus, a history of Roman eloquence containing much valuable information about his predecessors, drawn largely from the Chronicle (liber annalibus) of Atticus (§§ 14, 15). (c) Orator, dedicated to M. Brutus, sketching a portrait of the perfect and ideal orator, Cicero's last word on oratory. The sum of his conclusion is that the perfect orator must also be a perfect man. Cicero says of this work that he has "concentrated in it all his taste" (Fam. vi. 18. 4). The three treatises are intended to form a continuous series containing a complete system of Cicero's doctrine in rhetoric.

It will be convenient to mention here a feature of Ciceronian prose which has been thrown by recent inquiry. In the de Oratore, iii. 173 sqq., he considers the element of rhythm or metre in prose, and in the Orator (174-226) he returns to the same subject. He discusses it briefly, saying that there should be metrical in character, though it should not be entirely metrical, since this would be poetry (Orator, 226). Greek writers relied for metrical effect in prose on those feet which were not much used by Cicero. Aristotle says that they preferred the cletic -v-, which he says is the metrical equivalent of the paean. Demosthenes was especially fond of the cletic. Rhythm pervades the whole sentence but is most important at the end of or before a period. Greek writers attributed to the Romans an immense sensitivity to such points. We are told that an assembly was stirred to wild applause by a double trochee -v-v-. If the order were changed, Cicero says, the effect would be lost. The same rhythm should be found in the membra which compose the sentence. He quotes a passage from one of his own speeches in which any change in the order would destroy the rhythm. Cicero gives various clauses which his ears told him were neat or well-put, and shows that all also are those of Quintilian, whose examples were largely drawn from Cicero's writings. It was left for modern research to discover rules of harmony which the Romans obeyed unconsciously. Other investigators have shown Cicero's clementae are generally variations of some three or four forms in which the rhythm is trochaic. Dr Thaddeaus Zielinski of St Petersburg, after examining all the clauses in Cicero's speeches, finds that they are governed by a law. In every clause there is a basis followed by a cadence. The basis consists of a cletic or its metrical equivalent. This is followed by a cadence trochaic in character, but varying in length. The three favourite forms are (i) -v- -v- -v- -v-. (ii) -v- -v- -v- -v-. These form the basis of the class of the clementae (L), which are those in which a long syllable is resolved, as in verse, into two short syllables, e.g. -v- -v-. These two classes, V and L, include 86% of the clauses in the orations. Some rarer clauses which he treated of (orantes) introduce an added syllable. There remain two interesting forms, viz. S (=selectae), in which a spondee is substituted for a trochee in the cadence, e.g. -v-. This being done for special emphasis, and P (=passima), where a dactyl is so used, e.g. -v-. This being the herota clausulae condemned by Quintilian. Similar rules apply to the membra of the sentence, though in these the S and P forms are more frequent, harmony being restored in the clausula.

These results apply not only to the speeches but also to the (iii. 1. 21). This is a manual of rhetoric derived from Greek sources with additions of his own. Several fragments have been preserved from the Latin version. Cicero's juvenile work de Inventione appears to be drawn partly from this and partly from a treatise by Hermagoras. This is a slight production and does not require detailed notice. Other minor works written in later life, such as the Partitones Oratoriae, embrace also a treatise of rhetoric, in which instruction is given by Cicero to his son Marcus; the Topica, and an introduction to a translation of the speeches delivered by Demosthenes and Aeschines for and against Ctesiphon, state the general grounds on which Cicero's system of rhetoric, also need only be noticed.

3. Orator, § 214 "patris dictum sapiens temeritas filii compro-848ibivit—hoc dichoreo tantus clamor contionis excitatus est ut admirabile esse. Quaero, nonne id numerus efficere? Verborum ordinem invenisse licet: 'Cum enim' quam tarn eum erat erat vita."}

4. This theory is partly anticipated by Terentius Maurus (C. A.D. 290), who says of the cletic (v. 1440 sqq.):—

Plurium orantes decepti quando pauco in eterno
Obinent sedem beataem, terminet si clausulae attruent
Dactylus spondeus imam, nec trochaem respueo;
Plenius tractatur iste proa proa rhot混沌.
philosophical writings and the more elaborate letters, and with modifications to other rhetorical prose, e.g. that of Pliny and Seneca. Rhythm was avoided by Caesar who was an Atticist, and by Sallust who was an archaist. 'Livy's' practice is exactly opposite to that of Cicero, since he has used the maintained procedure for the Sallustian style. Cicero's saying that long syllables are more appropriate to history than to oratory. 1

(ii.) Speeches.—These were generally delivered before the senate or people, if political in character, and before jurors sitting in a quaestio, if judicial. The speech against Vatinius was an attack upon a witness under examination; that de Domino was made at the Pontifices; that pro C. Roburio persuendissimae reo in the course of a provocatio to the people; and those pro Ligario and pro rege Deiotario before Caesar. The five orations composing the Actio Secunda in Verrem were never spoken, but written after Verres had gone into exile. The Second Philippic was also not delivered but issued as a pamphlet. Cicero's speech for Milo at his trial was not a success, though, as Quintilian (ix. 2. 54) quotes from it, as taken down by shorthand reporters, an example of a rhetorical figure well used, it cannot have been such a failure as is alleged later writers. The extant speech was written by Cicero at his leisure. None of the other speeches are in the exact form in which they were delivered. Cicero's method was to construct a commentarius or skeleton of his speech, which he used when speaking. If he was pleased with a speech he then wrote it out for publication. Sometimes he omitted in the written speech a subject on which he had spoken. A record of this is sometimes preserved: e.g. “De Postumis criminiibus” (Mur. 51), “De teste Fufio” (Cael. 19). These commentarii were published by his freedman Tiro and are quoted by Asconius (ad Orat. in Toga Candida, p. 87).

Cicero in his speeches must have given all the privileges of an advocate. Sometimes he had a client; he naively confuses the straits to which he was put when defending Scamander (Cic. 51; cf. Phil. xiii. 26). He thought of defending Catiline, though he says that his guilt is clear as noon-day (Att. i. 1-2 and 2. 1). Sometimes the brief which he held at the moment compelled him to take a view of facts contrary to that which he had previously advocated. Thus in the pro Cæcina he alleges judicial corruption against a witness, Falculta, while in the pro Cluentio he contends that the offence was not proved (Cic. 28, Cic. 103). He says quite openly that “it is a great mistake to suppose that statements in his speeches express his real opinions” (Cic. 139). It is therefore idle to reproach him with inconsistencies, though these are sometimes very singular. Thus in the pro Cornelio he speaks with praise of Aulus Gabinius, while, in the pro Cluentio he has vouched for his proposal, proceeded to denounce him after the precedent set by Tiberius Gracchus (Asconius in Cornel. p. 71). In the pro Cluentio, 111, he contends that nothing is easier than for a new man to rise at Rome. In the pro Caecina he says that Catiline had in him undeveloped germs of the greatest virtues, and that it was the good in him that made him so dangerous (Cael. 12-14). He sometimes deliberately puts the case upon a wrong issue. In the pro Milone he says that either Milo must have lain in wait for Clodius or Clodius for Milo, leaving out of sight the truth, that the encounter was due to chance. He used to boast that he had cast dust into the eyes of the jury in the case of Cluentius (Quintil. ii. 17-21).

Cicero had a perfect mastery of all weapons wielded by a pleader in Rome. He was specially famous for his pathos, and for this reason, when several counsel were employed, always spoke last (Orat. 130). A splendid specimen of pathos is to be found in his account of the condemnation and execution of the Sicilian captives (Verr. (Act. ii.) v. 106-122). Much exaggeration was permitted to a Roman orator. Thus Cicero frequently speaks as if his client were to be put to death, though a criminal could always evade capital consequences by going into exile. His enemies scoffed at his “tear-drops.” He indulged in the more violent invective, which, though shocking to a modern reader, e.g. in his speeches against Vatinius and Piso, was not offensive to Roman taste (de Orat. ii. 216-290). He was much criticized for his jokes, and even Quintilian (ii. 17-21) regrets that he made so many in his speeches. He could never resist the temptation to make a pun. It must be remembered, however, that he was the great wit of the period. Caesar used to have a collection of Cicero's bon-mots brought to him. Cicero complains that all the jokes of the day were attributed to himself, including those made by very sorry jesters (Fam. vii. 32. 1). A fine specimen of sustained humour is to be found in his speech pro Murena, where he ridicules the jurists and the Stoics. He was also criticized for his vanity and perpetual references to his own achievements. His vanity, however, as has been admirably remarked, is essentially that of “the peacock, not of the gander,” and is redeemed by his willingness to raise a laugh at his own expense (Struachan-Davidson, p. 129). Some critics have impugned his legal knowledge, but probably without justice. It is true that he does not claim to be a great expert, though a pupil of the Scaevolae, and when in doubt would consult a jurist; also, that he frequently passes lightly over important points of law, but this was probably because he was conscious of a flaw in his case.

(iii.) Political and Philosophical Treatises.—These are generally written in the form of dialogues, in which the speakers sometimes belong to bygone times and sometimes to the present. The first method was known as that of Heraclides, the second as that of Aristotle (Att. xii. 19. 4). There is no reason to suppose that the speakers held the views with which Cicero credits them, or had such literary powers as would make them able to express such views (ib. xii. 12. 3). The political works are de Republica and de Legibus. The first was a dialogue in six books concerning the best form of constitution, in which the speakers are Scipio Africanus Minor and members of his circle. He tells us that he drew largely from Plato, Aristotle, Theophrastus and writings of the Peripatetics. The famous “Dream of Scipio” recalls the “Vision of Er” in Plato’s Republic (Book x. ad fin.). The de Legibus, a sequel to this work in imitation of Plato’s Laws, is drawn largely from Chrysippus.

Cicero as a philosopher belonged to the New Academy. The followers of this school were free to hear all arguments for and against, and to accept the conclusion which for the moment appeared most probable (Acad. ii. 131). Thus in the Tusculan Disputations v. he expresses views which conflict with de Finibus iv., and defends himself on the ground that as an Academic he is free to change his mind. He was much fascinated by the Stoic morality, and it has been noticed that the Tusculan Disputations and de Officiis are largely Stoic in tone. He has nothing but contempt for the Epicureans, and cannot forgive their neglect of literary style. As Cicero's philosophical writings have been severely attacked for want of originality, it is only fair to recollect that he resorted to philosophy as an anodyne when suffering from mental anguish, and that he wrote incredibly fast. He issued two editions of his Academicians. The first consisted of two books, in which Catulus and Lucullus were the chief speakers. He then rewrote his treatise in four books, making himself, Varro and Atticus the speakers. The Romans at this time had no manuals of philosophy or any philosophical writings in Latin apart from the poem of Lucretius and some unskillful productions by obscure Epicureans. Cicero set himself to supply this want. His works are confessedly in the main translations and compilations (Att. xii. 52. 3); all that he does is to turn the discussion into the form of a dialogue, to adapt it to Roman readers by illustrations from Roman history, and to invent equivalents for Greek technical terms. This is equally true of the political treatises. Thus, when Atticus criticized a strange statement in de Republic. ii. 8, that all the cities of the Peloponnese had access to the sea, he excuses himself by saying that he found it in Dicaearchus and copied it word for word (Att. vi. 2. 3). In the same passage he used an incorrect adjective, Philuntius for Philutius; he says that he had already corrected his own copy, but the mistake survives in the single palimpsest in which this work has been preserved. The only merits, therefore, which can be claimed for Cicero are that he invented a philosophical terminology for the Romans, and that he produced a
series of manuals which from their beauty of style have had enduring influence upon mankind.

The three books are the following:

De Finibus, on the Supreme Good. In Book i. L. Manlius Torquatus explains the Epicurean doctrine, which is refuted in ii. by Cicero. In iii. and iv. M. Porcius Cato sets forth the doctrine of the Stoics as derived by Cicero from Cato the Younger, that Antiochus of Ascalon; in v. M. Pupius Fisio explains the views of the Academicis and Peripatetics.

Tusculanae Disputationes, so-called from Cicero's villa at Tusculum in which the discussions in philosophical treatises and explanations of subjects treated are:—In Book i. the nature of death and the reasons for despising it; Book ii., the endurance of pain; Pain is not an evil; Book iii., wisdom makes a man insensible to sorrow; Book iv., wisdom makes all mental contest; Book v., virtue is sufficient to secure happiness. The materials are drawn largely from works of Dicacearchus.

De Deorurn Natura. The dialogue is placed in 77 B.C. In Book i. Velleius L. Valerius writes of the origin of the gods, the nature, the government of the world and providence. In Book ii. Cotta criticizes the views of Balbus. The statement of the Epicurean doctrine is also from the work of Phaedrus. In Book iv., the criticism of this from Posidonius. The Stoic teaching is drawn from Cleaneaus, Chrysippus and Zeno, and is criticized from the writings of Carneades and Cismachus.

De Officiis, addressed to his son Marcus. In this the form of dialogue was not employed. The material is chiefly drawn from Stoic sources, e.g. works of Panaetius in Books i. and ii., of Posidonius and Herophilus in Book iii.

The Academica, as they have come down to us, are a compilation from the two editions of this work. They consist of the second book from the first edition, and a portion of the first book from the second edition.

Cato maior, or de Senectute, a dialogue placed in 150 B.C. in which Cato, addressing Scipio and Laelius, sets forth the praises of old age. The idea is drawn from Aristo of Chios, and the materials largely derived from Xenophon and Plato.

Laelius, or de Amicitia, a dialogue between Laelius and his son-in-law, in which he sets forth the theory of friendship, speaking with special reference to the recent death of Scipio. Cicero here draws from a work of Theophratus on the same subject and from Aristo.

Letters. Those preserved are (1) ad Familiares, i.-xvi.; (2) ad Atticum, i.-xvi.; (3) ad Quintum, i.-iii.; ad Brutum, i.-ii. Seventy-three other books of letters were known to antiquity, e.g. to Caesar, to Pompey, to Octavian and to his son Marcus.

The collection includes nearly one hundred letters written by other persons. Thus, the eighth Book ad Fam. consists entirely of letters from Caelius to Cicero when in Cilicia. When writing to Atticus Cicero frequently sent copies of letters which he had received. There is a great variety in the style not only of Cicero's correspondents, but also of Cicero himself. Caelius writes in a breezy, school-boy style; the Latinity of Plancus is Ciceroian in character; the letter of Sulpicius to Cicero on the death of Tullia is a masterpiece of style; Matius writes a most dignified letter justifying his affectionate regard for Caesar's memory. There is an amazingly indiscreet letter of Quintus to his brother's freedman, Tiro, in which he says of the consuls-elect, Hirtilus and Fasena, that he would hesitate to put one of them in charge of a village on the frontier, and the other in that of the basement of a tavern (Fam. xvi. 27). Several of his correspondents contain long moralistic letters. Cicero labours to express himself in an awkward and laconic epistle, apologizing for its length. Metellus Celer is very rude, but gives himself away in every word. Antony writes bad Latin, while Cicero himself writes in various styles. We have such a cri de coeur as his few words to one of the conspirators after Caesar's murder, "I congratulate you. I rejoice for myself. I love you. I watch your interests; I wish for your love and to be informed what you are doing and what is being done" (Fam. vi. 15). When writing to Atticus he eschews all ornamentation, uses short sentences, colloquial idioms, rare diminutives and continually quotes Greek. This use of Greek tags and quotations is also found in letters to other intimate friends, e.g. Paetus and Caelius; also in letters written by other persons, e.g. Cassius to Cicero; Quintus to Tiro, and subsequently in those of Augustus to Tiberius. It is a feature of the colloquial style and often corresponds to the modern use of " slang." Other letters of Cicero, especially those written to persons with whom he was not quite at his ease or those meant for circulation, are composed in his elaborate style with long periods, parentheses and other devices for obscuring thought. These are throughout rhetorical in character, like his speeches and philosophical works.

We know from Cicero's own statements (Att. xvi. 5) that he thought of publishing some of his letters during his lifetime. On another occasion he jestingly charges Tiro with wishing to have his own letters included in the "volumes" (Fam. xvi. 17). It is obvious that Cicero could not have meant to publish his private letters to Atticus in which he makes confessions about himself, or those to Quintus in which he sometimes outsteps the limits of brotherly criticism, but was thinking of polished productions such as the letters to Lentulus Spinther or that to Lucceius which he describes as "very pretty" (Att. iv. 6. 4).

It is universally agreed that the letters ad Familiares were published by Tiro, whose hand is revealed by the fact that he suppresses all letters written by himself, and modestly puts at the end those written to him. That Cicero kept copies of his letters, or of many of them, we know from a passage in which, when addressing a friend who had inadvertently torn up a letter from him, he says that there was nothing to grieve about; he has himself a copy at home and can replace the loss (Fam. xvi. 1). Tiro may have obtained from Tertencia copies of letters written to him. It has been suggested that he may also have edited the letters to Quintus, as he could obtain them from members of the family. The letters ad Familiares were generally quoted in antiquity by books, the title being taken from the first letter, e.g. Cicero ad Varronem epistula Paetis.

While the letters ad Familiares were circulated at once, those to Atticus appear to have been suppressed for a considerable time. Cornelius Nepos (Att. 16) knew of their existence but distinguishes them from the published letters. Asconius (p. 87), writing under Claudius, never quotes them; though, when discussing Cicero's projected defence of Catiline, he could hardly have failed to do so, if he had known them. The first author who quotes them is Seneca. It is, therefore, probable that they were not published by Atticus himself, who died 32 B.C., though his hand may be seen in the suppression of all letters written by himself, but that they remained in the possession of his family and were not published until after about A.D. 60. At that date they could be published without expurgation of any kind, whereas in the letters ad Familiares the editor's hand is on one occasion (iii. 10. 11) manifest. Cicero is telling Appius, his predecessor in Cilicia, of the measures which he is taking on his behalf. There then follows a lacuna. It is obvious that Tiro thought the passage compromising and struck it out. In the letters to Atticus, on the other hand, we have Cicero's private journal, his confessions to the director of his conscience, the record of his moods from day to day, without alterations of any kind.

Cicero's letters are the chief and most reliable source of information for the period. It is due to them that the Romans of the day are living figures to us, and that Cicero, in spite of, or rather in virtue of his frailties, is intensely human and sympathetic. The letters (Att. iv. 5) are, without the frankest self-criticism, such as is not possible in the presence of his confessors, of his instinct as a pleader makes him try to justify himself. The historical value of the letters, therefore, completely transcends that of Cicero's other works. It is true that these are full of information. Thus we learn much from the de Legibus regarding the constitutional history of Rome, and much from the Brutus concerning the earlier orators. The speeches abound in details which may be accepted as authentic, either because there is no reason for misrepresentation or on account of their circumstantiality. Thus the Verrines are our chief source of information for the government of the provinces, the system of taxation, the powers of the governor. We hear from them of such interesting details as that the senate annul a judicial decision improperly arrived at by the governor, or that the college of tribunes could consider the status at Rome of a man affected by this decision (Verr. ii. ii. 95-100). We have unfolded to us the monstrous system by which the governor could fix upon a remote place
for the delivery of corn, and so compel the farmer to compound by a payment in money which the orator does not blame, on the ground that it is only proper to allow magistrates to receive corn wherever they wish (ib. iii. 100). From the speech pro Cluentio (145-154) we gain unique information concerning the condition of society in a country town, the extraordinary exemption of equites from prosecution for judicial corruption, the administration of domestic justice in the case of slaves examined by their owner (ib. 176-182). But we have always to be on our guard against misrepresentation, exaggeration and falsehood. The value of the letters lies in the fact that, in them we get behind Cicero and are face to face with the other dramatis personae; and we are all admitted behind the scenes and read the secret history of the times. One of the most interesting documents in the correspondence is a despatch of Caesar to his agent Oppius, written in great haste and in disjointed sentences. It runs as follows: “On the 9th I came to Brundisium. Pompey is at Brundisium. He sent Magius to me to treat of peace. I gave him a suitable answer” (Att. i. 13, Al.). In the de Bello civili, on the other hand, Caesar, who wishes to show that he did his best to make peace, after stating that he sent his captive Magius to negotiate, expresses mild surprise at the fact that Pompey did not send him back (Bell. Civ. i. 26). We hear of the extraordinary agreement made by two candidates for the consulship in Caesar’s interest with the sitting consuls of 54 B.C., which Cicero says he hardly ventures to put on paper. Under the terms of this the consuls, who were optimates, bound themselves to betray their party by securing, apparently fraudulently, the election of the candidates while they in turn bound themselves to procure two ex-consuls who would swear that they were present in the senate when supplies were voted for the consular provinces, though no meeting of the senate had been held, and three augurs who would swear that a lex curiata had been passed, though the comitia curiata had not been convened (Att. iv. 18, 3). But perhaps the most singular scene is the council of three great ladies presided over by Servilia at Antium, which decides the movements of Brutus and Cassius in June 44 B.C., when Cassius “looking very fierce—you would say that he was breathing fire and sword”—blustered concerning what he considered an insult, viz. a commission to supply corn which had been laid upon him. Servilia calmly remarks she will have the commission removed from the decree of the senate (Att. xv. 11, 2).

(v.) Miscellaneous.—It is not necessary to dwell upon the other forms of literary composition attempted by Cicero. He was a fluent versifier, and would write 500 verses in one night. Considerable fragments from a juvenile translation of Aratus have been preserved. His later poems upon his own consulship and his exile were soon forgotten except for certain lines which provoked criticism, such as the unfortunate verse: “O fortunatam natam me consule Romam.”

He wrote a memoir of his consulship in Greece and at one time thought of writing a history of Rome. Nepos thought that he would have been an ideal historian, but as Cicero ranks history with declamation and on one occasion with great naiveté asks Lucius Luccceius (q.v.), who was embarking on this task, to embroider the facts to his own credit, we cannot accept this criticism (Pam. vi. 2, 3).

(vi.) Authenticity.—The genuineness of certain works of Cicero has been attacked. It was for a long time usual to doubt the authenticity of the speeches post reditum and pro Marcello. Recent scholars consider them genuine. As their rhetorical structure corresponds more or less with the canons of authenticity formed by Zielinski from the other speeches, the question may now be considered closed.2 Absurd suspicion has been cast upon the later speeches in Catilinam and that pro Archia. An oration pridie quem in exstintumireti is certainly a forgery, as also a letter to Octavian. There is a “controversy” between Cicero and Sallust which is palpably a forgery, though a quotation from it occurs in Quintilian.3 Suspicion has been attached to the letters to Brutus, which in two of the twelfe letters (i. 15-17) is unreasonable since they somewhat resemble the style of suasoriae, or rhetorical exercises, but the latest editors, Tyrrell and Purser, regard these also as genuine.

Criticism. (i.) Ancient.—After Cicero’s death his character was attacked by various detractors, such as the author of the spurious Controversia put into the mouth of Sallust, and the calumniator from whom Dio Cassius (xiv. 1-28) draws the libellous statements which he inserts into the speech de senectute. With such critics, Asconius (in Tog. Cond. p. 95) well says that it is best to ignore them. His prose style was attacked by Pollio as Asatic, also by his son, Asinius Gallus, who was answered by the emperor Claudius (Suet. Cal. 60). The writers of the late age found fault with his prolixity,want of sparkle and epigram, and monotony of his clauseule.4 A certain Lucius Servilius gained notoriety by attacking his Latinity in a work styled Ciceronastix. His most devoted admirers were those who reprehended his orationes, such as Praetorius Pliny, who thought them insipid. They were satisfied with their humanistic rendering, a considerate success, and Quintilian (x. 1, 112), who regarded him as the perfect orator, and draws most of his illustrations from his works. At a later period his style fascinated Christian writers, notably Lactantius, the “Christian Cicero,” Jerome and S. Augustine, who drew freely from his rhetorical writings.

The first commentator upon Cicero was Asconius, a Roman senator living in the reign of Claudius, who wrote a commentary upon the speech de senectute, in which he expounds obscure historical points for the instruction of his sons (see Asconius). Passing over a number of grammatical and rhetorical writers who drew illustrations from Cicero, we may mention the Commentary of Victorinus, written in the century after the death of the orator, upon the works of Cicero (A.D. 480-524) upon the Topica. Among scholars may be mentioned the Scholiasta Bobiensis who is assigned to the 9th century, and a pseudo-Asconius, who wrote notes upon the Philippics dealing with grammatical points of criticism.

(ii.) Medieval Scholars.—In the middle ages Cicero was chiefly known as a writer on rhetoric and morals. The works which were most read were the De Inventione and Topica—though neither of these, as we have seen, is definitely prefixed as author. He was, however, supposed to be by Cicero—and among the moral works, the De Officis, and the Cato Maior. John of Salisbury (1110-1180) continually quotes from rhetorical and philosophical writings, but only once from Cicero. The “rhetorical” or “philosophical” works of Cicero, as they are called, are, however, a part of the training of a student, as the “rhetorical” or “philosophical” works of Quintilian. We have an interesting series of excerpts made by a priest named Hadoard, in the 9th century, taken from all the philosophical writings now preserved, also from the de Oratore.5

The other works of Cicero are seldom mentioned. The most popular speeches were those against Catiline, the Verrines, Caesarianae and Philippics, to which may be added the spurious Controversiae. They are larger in size than the speeches of Euthydichus, a canon of Corvey, who in 1146 procured from Hildesheim a MS. containing with the Philippics the speeches against Rullus, wishing to form a corpus of Ciceroan works.6 Gerbert (afterwards Pope Silvester II, 940-1003) was especially interested in the speeches, and in 1010 sent a copy to his student Egbert, with the request that he send it to him when journeying. The letters are rarely mentioned. The abbey of Lorsch possessed in the 9th century five MSS. containing “Letters of Cicero,” but those to Atticus are only mentioned once, in the catalogue of Cluny written in the 12th century.7 Letters of Cicero were known to Wibald of Corvey, also to Servatus Lupus, abbot of Ferrières (805-832), who prosecuted in the 9th century a search for MSS. which reminds us of the Italian humanists in the 15th century. A few MSS. devoted to Cicero’s works during this period. The earliest critic was Tiro, who, as we know from Aulus Gellius (i. 7, 1), corrected MSS. which were greatly valued as containing his recension. We have a very interesting series of cables, the Salsus, and in 861-862, of which the Stalitius Maximus states that he had corrected the text by the help of a MS. giving the recension of Tiro, which he had collated with five other ancient copies.8

It is interesting to notice that Servatus Lupus did similar work in the 9th century. Thus, writing to Ansalbro of Prüm, he says: “I will collate the letters of Cicero which you sent with the copy which I have received.”9

1 Markland and F. A. Wolf first rejected them.

2 In the speeches generally L-V = 86 %. In the de Domo the proportion is 88 and in the pro Marcello 87 %.

3 Quintil. iv. 1. 68. It is possible that the writer may have used a quotation preserved from a real speech by Quintilian.

5 Philologus (1886), Suppl. Bd. v.

6 Jaffé, Bibli. Germ. Roman. i. 326.

7 Delisle, Cabinet des MSS. ii. 459.

8 “Sallustii Maximus rursus emendavi ad Tironem et Laecaniun et dom. et alios veteres III.” He was a grammarian who lived at the end of the 2nd century.
which I have so as to elicit the true reading, if possible, by comparing the two. He asks another correspondent to supply him with a copy of the lost work of Cicero, or to investigate whether the indexes of manuscripts contain any record of it. 

Brunetto Latini (d. ca. 1294), the master of Dante, translated the Caesarianae into Italian. Dante himself appears to be acquainted with the Lacteus, Cato Maior, De Officiis, De Finibus, De Inveniuntibus, and Carminum Interpres. He mentions Cicero was a great name, but was studied by few. Petrarch himself sought for MSS. of Cicero with peculiar ardor. He found the speech pro Archia at Lille in 1333, and in 1345 at Verona made his famous discovery of the lost speech, his father, however, who had worshipped at the world Cicero as a man in place of the "god of eloquence" whom they had worshipped. Petrarch was under the impression in his youth that he once possessed Cicero's lost work de Gloria, but it is now known he had missunderstood the tamquam in the extant writings dealing with this subject. The letters ad Familiores were discovered towards the close of the 14th century at Verceil. The largest addition to the sum of Cicerean writings was made of the letters of Cicero Latinus in the course of his celebrated mission to the Council of Constance (1414-1417). He brought back no less than ten speeches of Cicero previously unknown to the Italians, viz. pro Sexto Roscio, pro Murena, pro Cæscio, de lege agraria i-iii, pro Rabirio perdulionis reo, pro Rabirio Postumo, pro Roscio Comodo, and in Pisonem. An important discovery was made at Lod in 1422 of a MS. which, in addition to complete copies of the de Oratore and Orator, hitherto known from manuscripts, contained the speeches of the provinciae. The second book of Cicero's letters to Brutus was first printed by Cratander of Basel in 1528 from a MS. obtained for him by Sichardus from the abbey of Lorsch. The first book, containing the Epistolae ad Familiores, a MS. written in the 9th century and now at Florence (Laur. xlix. 9). A similar fate overtook three other MSS. containing the letters to Atticus, independent of the Veronenses, viz. a mutilated MS. of the works of Cicero Latinus (the Cichorie in Latinus) in a MS. used by Cratander (C), and a French MS. (Z), generally termed Tournaisium from its owner, Jean de Tournes, a printer of Lyons, probably identical with No. 492 in the old Cluni catalogue, used by Crouzel, a doctor of Letters, with variants taken from an ancient MS. found at Noyon, and entered in the margin of a copy of the Lyons edition. The first MS. of the works of Brutus is not a copy, but was the work of Brutus himself, the only MS. of the first book of Brutus as a copyist. The book, which he termed his Crustellinas, may well be his copy of the Lyons edition of 1534 (number 8665 in the sale-catalogue of Baluze), which is described as "cum notis et emendationibus MSS. moni ejusdem Carlo." 

The oldest evidences now existing for any works of Cicero is to be found in palimpsests written in the 4th or 5th century. The most interesting of these, now in the Vatican (Lat. 5737), discovered by Anguria, is a MS. containing portions of Cicero's works. Parchments containing fragments of various orations was recently destroyed by the fire at the Vatican library. The works de Oratore and Orator are well represented by ancient MSS., the two best known being one at Avranches (Abrincensis 250) and a Harleian MS. (2376), both written in the 9th century. The Brutus is only known from 15th-century transcripts of the lost cod. Lodensis. 

The oldest of any speeches, or indeed of any work of Cicero's, apart from the palimpsests, belongs to the Chapter-house of St Peter's in Rome, and is known as the Tractatus Ciceralis pro Flacco and the Philippics. The earlier part of the MS. was written in the 8th century. The Paris library has two 9th-century MSS., viz. 774 A containing in Verrem (Act. ii), iv. and v., and 7796 containing the tab. reditum speeches, together with those pro Sesto, in Vatinium, de provincis consularibus, pro Balbo, pro Caelio. The only other 9th-century MS. of the speeches is in Lord Leicestirer's library at Holkham, No. 359. It originally belonged to Cluni and dates from the 9th century. It contains both the correct form and the corrupt form in Catilinam, pro Ligario, pro rege Dei et in Verrem (Act. ii). 

The speeches pro Sex. Roscio and pro Murena are only known from an ancient and illegible MS. discovered by Poggio at Cluny, No. 496 in the old catalogue, and now lost. The most faithful transcript was made in France (Paris, Lat. 14,749) before the MS. passed into the possession of Poggio by way of a corrupt transcript of the corrections, sometimes in facsimile. The speeches pro Roscio Comodo, pro Rabirio perdulionis reo and pro Rabirio Postumo are only known from Italian copies of the transcript (now lost) made by Poggio from the old French transcript. The lost speeches de Luctae, Cato Maior are found in a number of 9th-century MSS. A collection, consisting of de Natura deorum, de Divinatim, Timaeus, de Forte, Paradoxa, Laecullus (=Acad. Prior.) and de Legibus, is found in several uncial MSS. of the 5th or 6th century. Only one MS. of the Laetid is as old as the 10th century. 

The Academica Posterrora are said by editors to be found only in 15th-century MSS. A MS. in the Paris library (Lat. 6331) is, however, a transcript of the 9th-century MSS. 

For the letters ad Familiores our chief source of information is Laur. xlix. 9 (9th century), which contains all the sixteen books. There are independent MSS. written in France and Germany in the 11th and 12th centuries, but they are unconnected. There is no extant MS. of the letters to Atticus older than the 14th century, apart from a few leaves from a 12th-century MS. discovered at or near Würzburg in the last century. 

Very important has been attached to a Florentine MS. (Laur. xlix. 18) M, which until recently was supposed to have been copied by Petrarch himself from the lost Veronenses. It is now known not to be in the hand of Petrarch, but that it was still supposed to be the archetype of all Italian MSS. of the letters. Very important is the Basel transcript of the letters. It has been supposed that this was the archetype of the letters, which, however, been shown by Lehmakan that there is an independent group of Italian MSS. termed by him Σ, containing books i-vii. in a mutilated form, and probably connected with the MS. of Capra. These MSS. agree with Π against M, and the readings of Π are generally superior. 

BIBLIOGRAPHY.—It is impossible to mention more than a few works as the literature is so vast. (1) Historical.—J. L. Strachan-Dalton, Cicero (London, 1872). John W. Clark, Cicero et ses amis; Surising, Cicero de vitâ sua (Leiden, 1854); W. Warde Fowler, Social Life at Rome (1906); introductions to Tyrrell and Purser's edition of the letters. (2) Palaeographical.—G. J. Steuer, Die Handschriften der ciceronischen Schriften (Munich, 1860); Deschamps, Études sur le premier MS. de la Ciceronienne (Paris, 1872). (3) General.—Lehmakan, De Cicerois ad Atticum epistolae recensendas (Berlin, 1892); Anecdotum Oenoniensis, classical series, part vii., x. (3) Literary.—M. Schanze, Geschichte der römischen Literature, 1. 194-274 (München, 1890). (4) Linguistic.—C. Margue, Lexicon ad Oratoriale et Philosophical Works; Le Breton, Études sur la langue et la grammaire de Ciceron (Paris, 1891); Norden, Die antike Kunstprosa (Leipzig, 1898); Th. Zielesk, Das Clascholge in Ciceros Reden (Leipzig, 1904). Much information on points of Ciceronian idiom and language will be found in J. S. Reid's Academica (London, 1885) and Landgraf's Pro Sex. Roscio (Erlangen, 1884). (5) Legal.—A. H. J. Greenidge, The Legal Procedure of Cicero's time (Oxford, 1892). An important account of Cicero as a philosopher is given in the prefexe to Reid's edition of the Academica. (6) Editions (critical) of the complete works.—Balter-Haime (1845-1861); G. F. W. Müller (1880-1896); Oxford Classical Texts. 

2. Quintus Tullius Cicero, brother of the orator and brother-in-law of T. Pomponius Atticus, was born about 102 B.C. He was aedile in 67, praetor in 62, and for the three following years praepropeor in Asia, where, though he seems to have abstained from personal aggrandizement, his probity and ill-temper gained him an evil notoriety. After his return to Rome, he heartily supported the attempt to secure his brother's recall from exile, and was nearly murdered by gladiators in the pay of P. Claudius Pulcher. He distinguished himself as one of Julius Caesar's legates in the Gallic campaigns, served in Britain, and afterwards under his brother in Cilicia. On the outbreak of the civil war between Pompey and Caesar, Quintus, like Marcus, supported Pompey, but after Pharsalus he deserted and made peace with Caesar, largely owing to the intercession of Marcus. Both the brothers fell victims to the proscription which followed Caesar's death, Quintus being put to death in 43, some time before Marcus. His marriage with Pomponia was very unhappy, and he was much under the influence of his slave Staturis. Though trained on the same lines as Marcus he never spoke in public, and was said, "One orator in a family is enough," by Cicero. Though he is not a subject of consideration in literary, wrote epic poems, tragedies and annals, and translated plays of Sophocles. There are extant

* Anecdotum Oenoniensis, Classical Series, part x. (A. C. Clark).
four letters written by him (one to his brother Marcus, and three to his freedman Tiro) and a short paper, De Petitione Consulatus (on canvassing for the consulship), addressed to his brother in 64. Some consider this the work of a rhetorician of later date. A few hexameters by him on the twelve signs of the Zodiac are quoted by Augustus.

Cicero in several of his Letters (ed. Tyrrell and Purser) pro Sesto, 31; Caesar, Bell. Gall.; Appian, Bell. Civ., iv. 20; Dio Cassius, xl. 7, xlvii. 10: text of De Petit, Cons. in A. Eusner, Commentariolum Petitionis (1872), see also R. Y. Tyrrell in Hermathena, v. (1877), and A. Beltrami, De Commentariolino Petitionum O. Ciceroi vindicando (1892); G. Boissier, Cicero and His Friends (Eng. trans., 1897), especially pp. 235-241.

3. Marcus Tullius Cicero, only son of the orator and his wife Terentia, was born in 65 B.C. At the age of seventeen he served with Pompey in Greece, and commanded a squadron of cavalry at the battle of Pharsalus. In 45 he was sent to Athens to study rhetoric and philosophy, but abandoned himself to a life of dissipation. It was during his stay at Athens that his father dedicated the de Officis to him. After the murder of Caesar (44) he attracted the notice of Brutus, by whom he was offered the post of military tribune, in which capacity he rendered good service to the republican cause. After the battle of Philippi (42), he took refuge with Sextus Pompeius in Sicily, where the remnants of the republican forces were collected. He took advantage of the amnesty granted by the treaty of Misenum (39) to return to Rome, where he took no part in public affairs, but resumed his former dissipated habits. In spite of this, he received signal marks of distinction from Octavian, who not only nominated him augur, but accepted him as his colleague in the consulship (30). He had the satisfaction of carrying out the decree which ordered that all the statues of Antony should be demolished, and thus the "divine justice reserved the completion of Antony's punishment for the house of Cicero." (Plutarch.) He was subsequently appointed proconsul of Asia or Syria, but nothing further is known of his life. In spite of his debauchery, there is no doubt that he was a man of considerable education and no mean soldier, while Brutus, in a letter to his father (Ep. ad Brutum, ii. 3), even goes so far as to say that the son would be capable of attaining the highest honours without borrowing from the father's reputation.

See Plutarch, Cicero, Brutus; Appian, Bell. Civ., ii. 20; 51, iv. 20; Dio Cassius xlv. 15, xlvii. 18, li. 19; Cicero's Letters (ed. Tyrrell and Purser); G. Boissier, Cicero and His Friends (Eng. trans., 1897). pp. 104-107.

4. Quintus Tullius Cicero (c. 67-43 B.C.), son of Quintus Tullius Cicero, (brother of the orator). He accompanied his father Marcus to Egypt, and in the process of obtaining a divorce, repaid his kindness by informing Caesar of his intention of leaving Italy. After the battle of Pharsalus he joined his father in abusing his uncle as responsible for the condition of affairs, hoping thereby to obtain pardon from Caesar. After the death of Caesar he attached himself to Mark Antony, but, owing to some fancied slight, he deserted to Brutus and Cassius. He was included in the proscription lists, and was put to death with his father in 43. In his last moments he refused under torture to disclose his father's hiding-place. His father, who in his concealment was a witness of what was taking place, thereupon gave himself up, stipulating that he and his son should be executed at the same time.

See Cicero, ad Att. ii. 4. 6, 7, 3; xiv. 20, 5; Dio Cassius xlvii. 10.

Cicerone, a guide, one who conducts visitors to museums, galleries, &c., and explains matters of archaeological, antiquarian, historic or artistic interest. The word is presumably taken from Marcus Tullius Cicero, as a type of learning and eloquence. The New English Dictionary finds examples of the use earlier in English than Italian, the earliest quotation being from Addison's Dialogues on Medals (published posthumously 1726). It appears that the word was first applied to "learned antiquarians who show and explain to foreigners the antiquities and curiosities of the country" (quotation of 1762 in the New English Dictionary).

Cichlid (Cichlidae), a family of Ancthopterygian fishes, related to the perches and wrasses, and confined to the fresh and brackish waters of Central and South America, Africa, Syria, and India and Ceylon. It has recently assumed special importance through the large number of genera and species, many of them showing extraordinary modifications of the dentition, which have been discovered in tropical Africa, especially in the great lakes Victoria, Tanganyika and Nyasa. About 180 species are known from Africa (with Syria and Madagascar), 150 from America, and 3 from India and Ceylon. They were formerly known under the inappropriate name of Chromides.

These fish are further remarkable for their nursing habits. It was formerly believed that the male takes charge of the eggs, and later the young, by sheltering them in the mouth and pharynx. This may still be true of some of the American species, but a long series of recent observations have shown that this most efficacious parental care devolves invariably on the female in the African and Syrian species. We are now acquainted with a large number of species in which this extraordinary habit has been observed, the number having lately been greatly increased by the collections made in lakes Tanganyika and Victoria.

L. Lortet had described a fish from Lake Tiberias in which he believed he had observed the male take up the eggs after their deposition and retain them in his mouth and pharynx long after eclosion, in fact until the young are able to shift for themselves, and this fish he named Chromis paterfamilias. A. Günther had also ascribed the same sex to a fish from Natal, Chromis philander, observed by N. Abraham to have similar habits. G. A. Bouleneger has since had an opportunity to examine the latter specimen and found it to be a female, as in all other nursing individuals from various parts of Africa, previously observed by himself; whilst J. Pellegrin has ascertained the female sex of a specimen with eggs in the mouth presented to the Paris museum by Lortet as his Chromis paterfamilias (= Tilapia simonis). Further observations by Pellegrin on Tilapia galilaea and Pelmatochromis lateralis, by E. Schelleor on Paratilapia multicolor, have led to the same result.

It therefore remains unproven whether in any of the African Cichlidae the buccal "incubation," as it has been called by Pellegrin, devolves on the male; the instances previously adduced being unsupported by the only trustworthy evidence— an examination of the genital glands.

The relative size and number of the eggs thus taken charge of vary very much according to the species. Thus they may be moderately large and numerous (100 to 200) in Tilapia nilotica and galilaea, larger and only about 30 in number in Paratilapia multicolor, while in Trophus morio, a fish measuring only 110 mm., the eggs filling the mouth and pharynx measure 4 mm. in diameter and are only four in number, they being proportionally the largest Teleostome eggs known. In Paratilapia jeepferi, a fish measuring 75 mm., the eggs found in the pharynx were only about a dozen in number, and they measure 2.5 mm. in diameter. In Tilapia dardennii, which grows to a length of 240 mm., a score of eggs fills the mouth and pharynx, and each measures 5 to 6 mm. in diameter, an enormous size for so small a fish.

Pellegrin has made the interesting observation on Tilapia galilaea that while the eggs are developing in the bucco-pharyngeal cavity the ovarian eggs are rapidly growing towards maturity, so that a fresh deposition of ova may almost immediately follow the release of the young fishes from maternal care. (G. A. B.)

Cicisbeo (Ital.; of uncertain origin; perhaps an inversion of bel ceco, "beautiful chick (pea)," or from Fr. chicke beau, with same meaning), the term in Italy from the 17th century onwards for a danger about women. The cicisbeo was the professed gallant of a married woman, who attended her at all public entertainments, it being considered unfashionable for the husband to be escorting his lady.
of his birth, better known by the title given him by the Arabs as the Cid (El Seid, the lord), and El Campeador, the champion par excellence, was of a noble family, one of whose members in a former generation had been elected judge of Castile. The date of his birth cannot be fixed with any certainty, but it was probably between 1030 and 1040. As Rodrigo Diaz de Vivar he is first mentioned in a charter of Ferdinand I. of the year 1064. The legends which speak of the Cid as accompanying this monarch in his expeditions to France and Italy must be rejected as purely apocryphal. Ferdinand, a great and wise prince, under whom the tide of Moslem conquest was first effectually stemmed, on his deathbed, in 1065, divided his territories among his five children. Castile was left to his eldest son Sancho, Leon to Alphonso, Galicia to Garcia, Zamora and Toro to his two daughters Urraca and Elvira. The extinction of the western caliphate and the dispersion of the once noble heritage of the Ommyyads into numerous petty independent states, had taken place some thirty years previously, so that Castilian and Moslem were once again upon equal terms, the country being almost equally divided between them. On both sides was civil war, urged as fiercely as that against the common enemy, in which the parties sought allies indiscriminately among Christians and Mahomedans.

No condition of affairs could be more favourable to the genius of the Cid. He rose to great distinction in the war between Sancho of Castile and Sancho of Navarre, in which he won his name of Campeador, by slaying the enemy's champion in single combat. In the quarrel between Sancho and his brother Alphonso, Rodrigo Diaz espoused the cause of the former, and it was he who suggested the perfidious stratagem by which Sancho eventually obtained the victory and possession of Leon. Sancho having been slain in 1072, while engaged in the siege of Zamora, Alphonso returned from exile and occupied the vacant throne. One of the most striking of the passages in the Cid's legendary history is that wherein he is represented as forcing the new king to swear that he had no part in his brother's death; but there was cause enough without this for Alphonso's animosity against the man who had helped to despoil him of his patrimony. For a time the Cid, already renowned throughout Spain for his prowess in war, was even advanced by the king's favour and entrusted with high commissions of state. In 1074 the Cid was wedded to Ximena, daughter of the count of Oviedo, and granddaughter, by the mother's side, of Alphonso V. The original deed of the marriage-contract is extant. Some time afterwards the Cid was sent to Syria as an envoy to collect tribute from the Moslem Emir of the chief of the Cid's absence on a raid against the Moors to banish him from Castile.

Henceforth Rodrigo Diaz began to live that life of a soldier of fortune which has made him famous, sometimes fighting under the Christian banner, sometimes under Moorish, but always for his own hand. At the head of a band of 300 free lances he offered his services first to the count of Barcelona; then, failing him, to Moktadir, the Arab king of Saragossa, of the race of the Beni Houd. Under Moktadir, and his successors Mostamin and Mostain, the Cid remained for nearly eight years, fighting their battles against Mahomedan and Christian, when not engaged upon his own, and being admitted almost to a share of their royal authority. He made more than one attempt to be reconciled with Alphonso, but, his overtures being rejected, he turned his arms against the enemies of the Beni Houd, extending their dominions at the expense of the Christian states.
of Aragon and Barcelona, and harrying even the border lands of Castile. Among the enterprises of the Cid the most famous was that against Valencia, then the richest and most flourishing city of the peninsula, and an object of cupidity to both Christian and Moslem. The Cid appeared before the place at the head of an army of 7000 men, for the greater part Mahomedans. In vain did the Valencians implore succour from the emir of Cordova, and from their co-religionists in other parts of the peninsula. In defiance of an army which marched to the relief of the beleaguered city under Yusaf the Almoravide, the Cid took Valencia after a siege of nine months, on the 15th of June 1094—the richest prize which up to that time had been recovered from the Moors. The conditions of the surrender were all violated—the dead Ibn Djahhaff burnt alive, a vast number of the citizens who had escaped death by famine slaughtered, and the possessions divided among the Campeador's companions. In other respects the Cid appears to have used his victory mildly, ruling his kingdom, which now embraced nearly the whole of Valencia and Murcia, for four years with vigour and justice. At length the Almoravides, whom he had several times beaten, marched against him in great force, inflicting a crushing defeat at Cuenca upon the Cid's army, under his favourite lieutenant, Alvar Fanez. The blow was a fatal one to the aged and war-worn Campeador, who died of anger and grief in July 1099. His widow maintained Valencia for three years longer against the Moors, but was at last compelled to evacuate the city, taking with her the body of the Cid to be buried in the monastery of Sant Vicente Cardena, in the neighbourhood of Burgos. Here, in the centre of a small chapel, surrounded by his chief companions in arms, by Alvar Fanez Minaya, Pero Bermudez, Martin Antolinez and Pelaez the Asturian, were placed the remains of the mighty warrior, the truest of Spanish heroes, the embodiment of all the national virtues and most of the national vices. The bones have since been removed to the town hall of Burgos. Philip II. tried to get him canonized, but Rome objected, and not without reason.

Whatever were his qualities as a fighter, the Cid was but indifferent material out of which to make a saint,—a man who battled against Christian and against Moslem with equal zeal, who burnt churches and mosques with equal zest, who ravaged, plundered and slew as much for a livelihood as for any patriotic or religious purpose, and was just as much an adherent of a Mussulman as a Christian in his habits and his character. His true place in history is that of the greatest of the guerrilleros—the perfect type of that sort of warrior in which, from the days of Viriathus to those of Juan Diaz, El Empecinado, the soil of Spain has been most productive.

The Cid of romance, the Cid of a thousand battles, legends and dramas, the Cid as apotheosized in literature, the Cid invoked by good Spaniards in every national crisis, whose name is a perpetual and ever-present inspiration to Spanish patriotism, is a very different character from the historical Rodrigo Diaz—the freebooter, the rebel, the consorior with the infidels and the enemies of Spain. He is the Perfect One, the Born in a Happy Hour, “My Cid,” the invincible, the magnanimous, the all-powerful. He is the type of knightly virtue, the mirror of patriotic duty, the flower of all Christian chivalry. He is Roland and Bayard in one. In the popular literature of Spain he holds a place such as has no parallel in other countries. From an almost contemporary period he has been the subject of song; and he who was shamed by wandering minstrels in the 12th century has survived to be hymned in revolutionary odes of the 19th. In a barbarous Latin poem, written in celebration of the conquest of Almeria by Alphonso VII. in the year 1147, we have the bard testifying to the supereminenice of the Cid among his country's heroes:

"Ipsi Rodericus Mio Cid semper vocatus, De quo cantatur quod ab hostibus haud superatus, Qui dominat Mauros, comites domuit quoque nostrorum."

Within a hundred years of his death the Cid had become the centre of a whole system of myths. The Poema del Cid, written in the latter half of the 12th century, has scarcely any trace of a historical character. Already the Cid had reached his apotheosis, and Castilian loyalty could not consent to degrade him when banished by his sovereign:

"Dios, que buen vassallo si oliuese buen señor!"

cry the weeping citizens of Burgos, as they speed the exile on his way.

The Poem of the Cid is but a fragment of 3744 lines, written in a barbarous style, in rugged assonant rhymes, and a rude Alexandrine measure, but it glows with the pure fire of poetry, and is full of a noble simplicity and a true epic grandeur, invaluable as a living picture of the age. The ballads relating to the Cid, of which nearly two hundred are extant, are greatly inferior in merit, though some of them are not unsuited to be ranked with the best in this kind. Duran believes the greater part of them to have been written in the 16th century. A few betray, not only by the antiquity of their language than by their natural and simple tone, traces of an earlier age and a freer national life. They all take great liberties with history, thus belying the opinion of Sancho Panza that "the ballads are too old to tell lies." Such of them as are not genuine relics of the 17th century are either poetical versions of the leading episodes in the hero's life as contained in the Chronicle, that Chronicle itself having been doubtless composed out of still earlier legends as sung by the wandering juglares, or pure inventions of a later time, owing their inspiration to the romances of chivalry. In these last the ballad-mongers, not to let their native hero be outdone by the Amadises, and the Felixmartes, engage him in the most extravagant adventures—formerly singing was often done upon the king of France and upon the emperor, receiving embassies from the soldier of Persia, hearing the pope at Rome, and performing other feats not mentioned even in the Poem or the Chronicle. The last and the worst of the Cid ballads are those which betray by their frigid conceits and feeble mimicry of the antique the false taste and essentially unheroic spirit of the age of Philip II. As for the innumerable other poems, dramas and tales which have been founded on the legend of the Cid, from the days of Guillen de Castro and Diamante to those of Quintana and Trueba, they serve merely to prove the abiding popularity of the national hero in his native land.

The chief sources from which the story of the Cid is to be gathered are, first, the Latin chronicle discovered by Risco in the convent of San Isidro at Leon, proved by internal evidence to have been written before 1258; the Cronica General, composed by Alphonso X. in the second half of the 13th century, partly (so far as relates to the Cid) from the above-named Cronica, partly from Arabic histories, and partly from tradition; the Cronica del Cid, first published in 1512, by Juan de Velorado, abbot of the monastery of San Pedro at Cardena, which is a compilation from the last, interlaned with new fictitious matter in the manner of the Armadillos, and the Felixmartes, some of contemporary date, which are examined and their claims weighed in the second volume of Professor Dozy's Recherches sur l'Histoire politique et litteraire de l'Espagne pendant le moyen âge (Leiden, 1849). Huber, Muller, and Ferdinand Wolf are among the leading authorities in the history and literature of the Cid. M. Damas Hinard has published the poem, with a literal French translation and notes, and John Hookham Frere has rendered it into English with extraordinary spirit and fidelity. The largest collection of the Cid ballads is that of Durant, in the Romancero general, in two volumes, forming part of Rivadeneyra's Biblioteca de autores españoles.

H. E. W. CIDER, or Cyder (from the Fr. cidre, derived from the Lat. sidus, cideris, Gr. σιδήρον, Heb. shkir, strong drink), an alcoholic beverage made from apples. Cider and Perry (the corresponding beverage made from pears) are liquors containing from as little as 3% of alcohol to 7 or 8%, seldom more, and rarely as much, produced by the vinous fermentation of the expressed juice of apples and pears; but cider and Perry of prime quality can only be obtained from vintage fruit, that is, apples and pears grown for the purpose and unsuited for the most part for table use. A few table apples make good cider, but the best Perry is only to be procured from pears too harsh and astrangent for consumption in any other form. The making of Perry is in England confined, in the main, to the counties of Hereford, Worcester and Gloucester. These three counties, together with Somerset and Devon, constitute, too, the principal cider-making district of the country; but the
industry, which was once more widely spread, still survives in Norfolk, and has lately been revived in Kent, though, in both of these counties, much of the fruit used in cider-making is imported from the cider country and some from the continent. Speaking generally, the cider of Herefordshire is distinguished for its lightness and briskness, that of Somerset for its strength, and that of Devonshire for its lusciousness.

Cider used to be made in the south of Ireland, but the industry had almost become extinct until revived by the Department of Agriculture, which in 1904 erected a cider-making plant at Drogheda, Co. Louth, gave assistance to private firms at Dun- garvan, Co. Waterford, and Fermoy, Co. Cork, and provided a travelling mill and press to work in the South Riding of Co. Tipperary. The results have been highly satisfactory, a large quantity of good cider having been produced.

Inasmuch as English orchards are crowded with innumerable varieties of cider apples, many of them worthless, a committee composed of members of the Herefordshire Fruit-Growers' Association and of the Fruit and Chicrantherum Society was appointed in 1890 to make a selection of vintage apples and pears best suited to Herefordshire and the districts adjoining. The following is the list drawn up by the committee:

**Apples.**—Old Foxwhelp, Cherry Pearmain, Cowarne Red, Dymock Red, Eggleton Styre, Kingston Black or Black Taunton, Skyrme's Kernel, Spreading Redstreak, Carrion apple, Cherry Norman, Cummy Norman, Royal Wilding, Handsome Norman, Strawberry Norman, White Bache or Norman, Broad-leaved Norman, Argile Grise, Bramtôt, De Botvillé, Fréquin Audière, Medaille d'Or, the last five being French sorts introduced from Normandy about 1880, and now established in the orchards of Herefordshire.

**Pears.**—Taynton Squash, Barland, Oldfield, Moorcroft or Malvern Hill, Red-pea, Thurston's Red, Longland, Piot pear.

No equally authoritative selection has been made for the Somerset and Devon districts, but the following varieties of cider apples are held in good repute in those parts:—Kingston Black, Jersey Chisel, Hangdowns, Fair Maid of Devon, Woodbine, Duck's Bill, Slack-my-Girdle, Bottle Stopper, Golden Ball, Sugar-loaf, Red Cluster, Royal Somerset and Cadbury (believed to be identical with the Royal Wilding of Herefordshire). As a rule the best cider apples are of small size. "Petites pommes, gros cidre," say the French.

Cider and perry not being taxable liquors in England, it is impossible to estimate with even an approach to accuracy the amount of the annual production of them. In 1896 Mr Sampson, the then secretary of the National Association of English Cidermakers, in his evidence before the royal commission on agriculture, put it at 534 million gallons. Since that date the increased demand for these native wines has given such an impetus to the industry that this figure might with safety be doubled. In France official statistics are available, and these show not only that that country is the largest producer of cider (including perry) in the world, but that the output is yearly increasing. A great proportion, however, of what passes as cider in France is boisson, i.e. cider to which water has been added in the process of making or at a subsequent stage; while much of the perry is disposed of to the makers of champagne. Although some cider is made in sixty-five departments, by far the largest amount comes from the provinces of Normandy and Brittany. In Germany cider-making is a considerable and growing industry. Manufactories on a small scale exist in north Germany, as at Guben and Grünberg, but the centre of the industry is at Frankfurt-on-Main, Sachsenhausen and the neighbourhood, where there are five large and twenty-five small factories employing upwards of 100 hands. Large quantities of cider fruit are imported from foreign countries; and generally, the native-grown fruit used in Germany for cider-making consists of inferior and undersized table apples not worth marketing. The bottled cider for export is treated much like champagne, and is usually fortified and flavoured until, in the words of an accomplished French authority, M. Truelle, it becomes a hybrid between cider and white wine rather than pure cider.

The practice which formerly prevailed in England of making cider on the farm from the produce of the home orchards has within the last few years given place to a large extent to gift cider, and as in Germany and many parts of France, farmers now sell their fruit to owners of factories where the making of cider and perry is carried on as a business of itself. In these hand or horse power is superseded by steam and sometimes by electricity, as in the factory of E. Seigel in Grünberg, and the old-fashioned appliances of the farm by modern mills and presses capable of turning out large quantities of liquor. The clearing of the juice, too, which used to be effected by running it through bags, is in the factories accomplished more quickly by forcing it through layers of compressed cotton in a machine of German origin known as Lumley's filter. The actual process of cider and perry making is simple, and resembles that of making grape wine. The fruit is ground or crushed in machines of various construction, the latest and most powerful being of American origin. The resulting pomace is pressed for the extraction of the juice, which is then run into vats, where it undergoes fermentation, which, converting the saccharine ingredients into alcohol and carbonic acid gas, turns it into cider. Cider made from a judicious mixture of several varieties of apples is to be preferred to cider made from one variety only, inasmuch as it is less difficult to find the requisite degrees of richness, astringency and flavour in several varieties than in one; but the contrary is the case with pears, of which the most noted sorts, such as the Barland, the Taynton Squash and the Oldfield, produce the best perry when unmixed with other varieties. Some fining of an albuminous nature is generally requisite in order to clear the juice and facilitate its passage through the filter, but the less used the better. The simplest and cleanest is skim milk whipped to a froth and blended gradually with the cider as it is pumped into the mixing vat. Many nostrums are sold for the clearing of cider, but none is necessary and some are harmful.

Of late years the practice has largely obtained of using preservatives for the purpose of checking fermentation. The principal preservatives employed are salicylic and boracic acids and formalin. The two former are ineffective except in quantities likely to prove hurtful to health, while formalin, in itself a powerful and deleterious drug, though it stops fermentation, renders the liquor cloudy and undrinkable. Other foreign ingredients, such as saccharin and porcherine, both coal-tar derivatives—the latter a recent discovery of a French chemist, after whom it is named—are used by many makers, chiefly for the purpose of rendering bad and therefore unwholesome cider palatable and saleable. Provided that cider and perry be properly filtered, and attention paid to perfect cleanliness of vessels and appliances, there is no need of preservatives or sweeteners, and their use ought to be forbidden by law in England, as it is in most continental states. In the case of liquors to be consumed within their borders, though not, it is significant to note, in the case of liquors intended for exportation.

The wholesome properties of cider and perry when pure and unadulterated have been recognized by medical men, who recommend them as pleasant and efficacious remedies in affections of a gouty or rheumatic nature, maladies which, strange to say, these very liquors were once supposed to foster, if not actually to originate. Under a similar false impression the notion is general that hard rough cider is apt to cause diarrhœa, colic and kindred complaints, whereas, as a fact, disorders of this kind are conspicuous by their absence in those parts of the country where rough cider and perry constitute the staple drinks of the working-classes. This is especially the case in Herefordshire, which is said also to be the only county in England whence no instance of the occurrence of Asiatic cholera has ever been reported.

The importance which the cider industry has of late attained in England has been marked by the establishment of the National Fruit and Cider Institute at Long Ashton near Bristol. This institute, founded in 1903 at the instance of the Board of Agriculture, is supported by grants from the board, the Bath and West of England Society, the councils of the cider-producing...
CIENTFUEGOS—CIGNANI

counties of Hereford, Gloucester, Worcester, Monmouth, Devon and Somerset, and by subscription of members. The objects of the institute are the promotion of research into the causes of the changes which occur in cider and Perry during fermentation, with the view of imparting to these liquors a degree of exactitude hitherto unattainable; the adoption from time to time of improved machinery and methods in cider-making; the detection of adulteration; the giving of instruction in the principles and practice of cider-making; the publication of reports detailing the results of the researches undertaken at the institute; the testing and selection of the sorts of fruit best suited for vintage purposes; the propagation of useful varieties likely from neglect to go out of cultivation; and the conducting of experiments intended to the best systems of planting and protecting young fruit trees.

Fruit-growers who look to cider-making "as a means of utilizing windfalls and small and inferior apples of cooking and dessert varieties not worth sending to market" should be warned that it is as important to the cider industry that good cider only should be on sale as it is to the fruit-growing industry that good fruit only should be sent to market. The juice of the apple is naturally affected by the condition of the fruit itself, and if this be unripe, unsound or worm-eaten the cider made from it will be inferior to that made from full-grown, ripe and sound fruit. If such fruit be not good enough to send to market, neither will the cider made from it be good enough to place before the public. Nevertheless, it may furnish a sufficiently palatable drink for home consumption, and may therefore be so utilized. But when, as happens from time to time in fruit-growing districts, there is a glut, and even the best table fruit is not saleable at a profit, then, indeed, cider-making is a means of storing in a liquid form what would otherwise be left to rot on the ground; whilst if a proportion of vintage fruit were mixed therewith, a drink would be produced which would not discredit the cider trade, and would bring a fair return to the maker. (C. W. R. C.)

CIENTFUEGOS, NIGASIO ALVAREZ DE (1764-1809), Spanish poet and publicist, was born at Madrid on the 14th of December 1764. He studied with distinction at Salamanca, where he met the poet Melendez Valdés. His poems, published in 1778, immediately attracted attention. He was successively editor of the Gazeta and Mercurio, and was condemned to death for having published an article against Napoleon; on the petition of his friends, he was respited and deported to France; he died at Orthez early in the following year. His verses are modelled on those of Melendez Valdés; though not deficient in technique or passion, they are often disfigured by spurious sentimentality and by the flimsy philosophy of the age. Cienfuegos was blamed for an unsparring use of both archaisms and gallicisms. His plays, Pitaco, Zorraida, La Condesa de Castilla y Idomeno, four tragedies on the pseudo-classic French model, and Las Hermanas generosas, a comedy, are deservedly forgotten.

CIENTFUEGOS (originally FERNANDINA DE JAGUA), one of the principal cities of Cuba, in Santa Clara province, near the central portion of the S. coast, 195 m. E.S.E. of Havana. Pop. (1907) 30,100. Cienfuegos is served by the United railways and by steamers connecting with Santiago, Batanabé, Trinidad and the Isle of Pines. It lies about 6 m. from the sea on a peninsula in the magnificent landlocked bay of Jagua. Vessels drawing 16 ft. have direct access to the wharves. A circular railway about the water-front, wharves and warehouses facilitates the loading and unloading of vessels. The city streets are broad and regularly laid out. There is a handsome cathedral; and the Tomas Terry theatre (given to the city by the heirs of one of the millionnaire sugar planters of the jurisdiction), the governor's house (1841-1844), the military and government hospitals, market place and railway station are worthy of note. In the Cathedral Square (Plaza de Armas), embracing two city-squares, and shaded—the all the plazas of the island—with laurels and royal palms, are a statue of Isabel the Catholic, and two marble lions given by Queen Isabel II.; elsewhere there are statues of General Cloutet and Marshal Serrano, once captain-general. The city is lighted by gas and electricity, has an abundant water-supply, and cable connexion with Europe, the United States, other Antilles and South America. The surrounding country is one of the prettiest and most fertile regions in Cuba, varied with woods, rivers, rocky gulches, beautiful cascades and charming tropic vegetation. Several of the largest and finest sugar estates in the world are situated in the vicinity, including the Soledad (with a botanical experimental station maintained by Harvard University), the Terry and others—most of them connected with the city by good drive-ways. Cienfuegos is a centre of the sugar trade on the south coast; tobacco too is exported.

The bay of Jagua was visited by Columbus. The city was founded in 1819, with the aid of the Spanish government, by a Louisianian, General Luis de Cloutet; it was destroyed by a hurricane and was rebuilt in 1825. Many naturalized foreign Catholics, including Americans, were among the original settlers. The settlement was first named in honour of Ferdinand VII., and later in honour of Captain-General José Cienfuegos Jovellanos. The harbour was known from the earliest times, and has been declared by Mahan to be the most important of the Caribbean Sea for strategic purposes. In 1740-1745 a fortification called Nuestra Señora de los Angeles was erected at the entrance; it is still standing, on a steep bluff overlooking the sea, and is one of the most picturesque of the old fortifications of the island. On the 11th of May 1898 a force from two vessels of the United States fleet under Admiral Schley, searching for Cervera and blockading the port, cut two of three cables here (at Point Colorado, at the entrance of the harbour), and for the first time in the Spanish-American War the American troops were under fire.

CIEZA, a town of south-eastern Spain, in the province of Murcia, on the right bank of the river Segura, and on the Madrid-Cartagena railway. Pop. (1900) 13,626. Cieza is built in a narrow bend of the Segura valley, which is enclosed on the north by mountains, and on the south broadens into a fertile plain, producing grain, wine, olives, raisins, oranges and esparto grass. In the town itself there are flour and paper mills, sawmills and brandy distilleries. Between 1870 and 1900 local trade and population increased rapidly, owing partly to improved means of communication; and the appearance of Cieza is thoroughly modern.

CIGAR, the common term for tobacco-leaf prepared for smoking by being rolled into a short cylinder tapering to a point at the end which is placed in the mouth, the other end, which is lighted, being usually cut square (see TOBACCO). The Spanish cigarro is of doubtful origin, possibly connected with cigara, a cicada, from its resemblance to the body of that insect, or with cigarral, a word of Arabic origin meaning a pleasure garden. The explanation that it comes from a Cuban word for a certain species of tobacco is probably erroneous, since no native word of the kind is known. The diminutive, cigarette, denotes a roll of cut tobacco enclosed usually in thin paper, but sometimes also in tobacco-leaf or the husk of Indian corn.

CIGNANI, CARLO (1658-1719), Italian painter, was born of a noble family at Bologna, where he studied under Battista Cairo, and afterwards under Francesco Albani. Though an intimate friend of the latter, and his most famous disciple, Cignani was yet strongly and deeply influenced by the genius of Correggio. His greatest work, moreover, the "Assumption of the Virgin," round the cupola of the church of the Madonna della Fuco at Forli, which occupied him some twenty years, and is in some respects one of the most remarkable works of art of the 17th century, is obviously inspired from the more renowned fresco of Correggio in the cupola of the cathedral of Parma. Cignani had some of the defects of his masters; his elaborate finish, his audacious artificiality in the use of colour and in composition, mark the disciple of Albani; but he imparted to his work a more intellectual character than either of his models, and is not without other remarkable merits of his own. As a man Cignani was eminently amiable, unassuming and generous. His success, however, made him many enemies; and the envy of some of these is said to have impelled them to deface certain of his works.
CIGILI—CILICIA

He accepted none of the honours offered him by the duke of Parma and other princes, but lived and died an artist. On his removal to Forli, where he died, the school he had founded at Bologna was fain in some sort to follow its master. His most famous pictures, in addition to the Assumption already cited, are—"The Entry of Paul III. into Bologna"; the "Francois I. Touching for King's Evil"; a "Power of Love," painted under a fine ceiling by Agostino Carracci, on the walls of a room in the ducal palace at Parma; an "Adam and Eve" (at the Hague); and two of "Joseph and Potiphar's Wife" (at Dresden and Copenhagen). His son Felice (1600-1742) and nephew Paolo (1709-1764) were also painters.

CIGILI (or Crvoli), LODOVICO CARDI DA (1559-1613), Italian painter, architect and poet, was born at Cigoli in Tuscany. Educated under Alessandro Allori and Santi di Tito, he formed a peculiar style by the study at Florence of Michelangelo, Correggio, Andrea del Sarto and Pontormo. Assimilating more of the second of these masters than of all the others, he laboured for some years with success; but the attacks of his enemies, and intense application to the production of a wax model of certain anatomical preparations, induced an alienation of mind which affected him for three years. At the end of this period he visited Lombardy, whence he returned to Florence. There he painted an "Ecce Homo," in competition with Passignani and Caravaggio, which gained the prize. This work was afterwards taken by Bonaparte to the Louvre, and was restored to Florence in 1815. Other important pictures are—"St Peter Healing the Lame Man," in St Peter's at Rome; a "Conversion of St Paul," in the church of San Paolo fuori il Mura; and a "Story of Pyche," in fresco, at the Villa Borghese; a "Martyrdom of Stephen," which earned him the name of the Florentine Correggio, a "Venus and Satyr," a "Sacrifice of Isaac," a "Stigmata of St Francis," at Florence. Cigoli, who was made a knight of Malta at the request of Pope Paul III., was a good and solid draughtsman and the possessor of a rich and harmonious palette. He died, it is said, of grief at the failure of his last fresco (in the Roman church of Santa Maria Maggiore), which is rendered ridiculous by an abuse of perspective.

CILIA (plural of Lat. cilia, eyelash), in biology, the thread-like processes by the vibration of which many lowly organisms, or the male reproductive cells of higher organisms, move through water.

CILIATA (M. Pertz), one of the two divisions of Infusoria, characterized by the permanent possession of cilia or organs derived from these (ciliah, membranelles, &c.), and possessing a single mouth (except in the Opalinopidae, all parasitic). They are the most highly differentiated among the Protozoa.

CILICIA, in ancient geography, a district of Asia Minor, extending along the south coast from the Alara Su, which separated it from Pamphylia, to the Iasia Dagh (Mt. Amanus), which parted it from Syria. Its northern limit was the crest of Mt. Taurus. It was naturally divided into Cilicia Trachea, W. of the Lamas Su, and Cilicia Pedias, E. of that river.

Cilicia Trachea is a rugged mountain district formed by the spurs of Taurus, which often terminate in rocky headlands with small sheltered harbours,—a feature which, in classical times, made the coast a resort of pirates, and, in the middle ages, led to its occupation by Grecian and Venetian traders. The district is watered by the Geuk Su (Calycusinus and its tributaries), and is covered to a large extent by forests, which, still, as of old, supply timber to Egypt and Syria. There were several towns but no large trade centres. In the interior were Corcippus (Da Bazar), Olba (Uzunabarj), and, in the valley of the Calycadnus, Claudiopolis (Mut) and Germanopolis (Ermenek). On or near the coast were Coreacesium (Alaya), Selinus-Trajonapolis (Selinni), Anemourium (Anamur), Kelenderis (Kilindira), Seleucia ad Calycadnus (Seleukhe), Corcyra (Korghoz) and Eleusa-Sebaste (Ayash). Roads connected Laranda, north of the Taurus, with Kelenderis and Seleucia.

Cilicia Pedias included the rugged spurs of Taurus and a large plain, which consists, in great part, of a rich stoneless loam. Its eastern half is studded with isolated rocky c sands, which are
crowned with the ruins of ancient strongholds, and broken by the low hills that border the plain of Issus. The plain is watered by the Cydnus (Tarsus Chai), the Sarus (Sihun) and the Pyramus (Jilin), each of which brings down much silt. The Sarus now enters the sea almost due south of Tarsus, but there are clear indications that at one period it joined the Pyramus, and that the united rivers ran to the sea west of Kara-tash. Such appears to have been the case when Alexander's army crossed Cilicia. The plain is extremely productive, though now little cultivated. Through it ran the great highway, between the east and the west, on which stood Tarsus on the Cydnus, Adana on the Sarus, and Mopsuestia (Missis) on the Pyramus. North of the road between the two last places were Sisian-Flaviopolis (Sis), Anazarbus (Anazarba) and Hierapolis-Kastabala (Budrum); and on the coast were Soli-Pompeipolis, Mallus (Kara-tash), Aegae (Ayash), Issus, Baiae (Piyas) and Alexandria ad Issum (Alexandretta). The great highway from the west, on its long descent from the Anatolian plateau to Tarsus, ran through a narrow pass between walls of rock called the Cilician Gate, Gulek Boghaz. After crossing the low hills east of the Pyramus it passed through a monastery (Cilician) gate, Demir Kapu, and entered the plain of Issus. From that plain one road ran southward through a monastery (Syrian) gate to Alexandretta, and thence crossed Mt. Amanus by the Syrian Gate, Beilin Pass, to Antioc and Syria; and another ran northwards through a monastery (Amanian) gate, south of Toprak Kaleh, and crossed Mt. Amanus by the Amanian Gate, Baghche Pass, to North Syria and the Euphrates. By the last pass, which was apparently unknown to Alexander, Darius crossed the mountains prior to the battle of Issus. Both passes are short and easy, and connect Cilicia Pedias geographically and politically with Syria rather than with Asia Minor. Another important road connected Sisium with Cocysus and Melite. In Roman times Cilicia exported the goats'-hair cloth, Cilicum, of which some tent were made.

The Cilicians appear as Khilkik in Assyrian inscriptions, and in the early part of the first millennium b.c. were one of the four chief powers of western Asia. It is generally assumed that they had previously been subject to the Syro-Cappadocian empire; but, up to 1099 at all events, "Hittite" monuments had not been found in Cilicia; and we must infer that the "Hittite" civilizations which flourished in Cappadocia and N. Syria, communicated with each other by passes E. of Amanus, and not by the Cilician Gates. Under the Persian Empire Cilicia was apparently governed by tributary native kings, who bore a name or title gracecized as Syenesis; but it was officially included in the fourth satrapy by Darius. Xenophon found a queen in power, and no opposition was offered to the march of Cyrus. Similarly Alexander found the Gates open, when he came down from the plateau in 333 B.C.; and from these facts it may be inferred that the great pass was not under direct Persian control, but under that of a vassal power always ready to turn against its suzerain. After Alexander's death it was long a battle ground of rival marshals and kings, and for a time fell under Ptolemaic dominion, but finally under that of the Seleucids, who, however, never held effectually more than the eastern half. Cilicia Trachea became the haunt of pirates, who were subdued by Pompey. Cilicia Pedias became Roman territory in 103 B.C., and the whole was organized by Pompey, 64 B.C., and became a province which, for a short time, extended to and included part of Phrygia. It was reorganized by Caesar, 47 B.C., and about 27 B.C. became part of the province Syria-Cilicia-Phoenice. At first the western district was left independent under native kings or priest-dynasts, and a small kingdom, under Tarkondimotus, was left in the east; but these were finally united to the province by Vespasian, A.D. 74. Under Diocletian (circa 297), Cilicia, with the Syrian and Egyptian provinces, formed the Diocese Orientis. In the 7th century it was invaded by the Arabs, who held the country until it was reoccupied by Nicephorus II. in 965.

The Seljuk invasion of Armenia was followed by an exodus of Armenians southwards, and in 1058 Khupen, a relative of the last king of Ani, founded in the heart of the Cilician Taurus a small
CILLI—CIMABUE

CILLI, Ulrich, Count of (1406-1456), son of Frederick II., count of Cilli, and Elizabeth Franjevan. Of his youth we know nothing certain. About 1432 he married Catherine, daughter of George Brankovich, despot of Servia. His influence in the troubled affairs of Hungary and the Empire was considerable. It was the will of his father, together with whom he was made a prince of the Empire by the emperor Sigismund (1436). Hence feuds with the Habsburgs, wounded in their rights as overlords of Cilli, ending, however, in an alliance with the Habsburg king Albert II., who made Ulrich for a short while his lieutenant in Bohemia. After Albert’s death (1439) Ulrich took up the cause of his widow Elizabeth, and presided at the coronation of her infant son Ladislaus V. Posthumus (1440). A feud with the Hunyadis followed, embittered by John Hunyadi’s attack on George Brankovich of Servia (1444) and his refusal to recognize Ulrich’s claim to Bosnia on the death of Stephen Tvrtko (1443). In 1446 Hunyadi, now governor of Hungary, harried the Cilli territories in Croatia-Slavonia; but his power was broken at Kossosovo (1448), and Count Ulrich was able to lead a successful crusade, nominally in the Habsburg interest, into Hungary (1456). In 1452 he forced the emperor Frederick III. to hand over the boy king Ladislaus V. to his keeping, and became thus practically ruler of Hungary. In 1454 his power was increased by his succession to his father’s vast wealth; and in 1456 he was named by Ladislaus his lieutenant in Hungary. The Hunyadis now conspired to destroy him. On the 8th of November, in spite of warnings, he entered Belgrade with the king; the next day he was attacked by Laszlo Hunyadi and his friends, and done to death. With him died the male line of the counts of Cilli.

Count Ulrich’s ambition was boundless, his passions unbridled; but the hostile judgments passed by Aeneas Sylvius and other contemporaries upon him must be read with caution.

CILLI (Slovene, Celje), a town in Styria, Austria, 82 m. S. by W. of Graz by rail. Pop. (1900) 6743. It is picturesquely situated on the left bank of the river Sann, and still has remains of the old walls and towers, with which it was once surrounded. Memorials of a still earlier period in its history—Roman antiquities—are to be seen in the municipal museum, while its canals and sewers are also of Roman origin. These were discovered during the second half of the 19th century, and were in such a good state of preservation that after a few small repairs they are now utilized. The parish church, dating from the 14th century, with its beautiful Gothic chapel, is one of the most interesting specimens of medieval architecture. The so-called German church, in Romanesque style, belonged to the Minorite monastery, founded in 1241 and closed in 1868. The throne of the counts of Cilli is preserved here, and also the tombs of several members of the family. On the Schlossberg (130 ft.), situated to the S.E. of the town, are the ruins of the castle of Ober-Cilli, the former residence of the counts of Cilli. Ten miles to the N.W. of Cilli are situated the baths of Neuhaus, with indifferent thermal waters (117° F.), frequented by ladies. Not far from it is the ruined castle of Neuhaus, called since 1643 Schlangenburg, from which an extensive view of the neighbouring Alps is obtained.

Cilli is one of the oldest places in Styria, and was probably a Celtic settlement. It was taken possession of by the Romans in 15 B.C., and in A.D. 50 the emperor Claudius raised it to a Roman municipium and named it Claudia Celjea. It soon became one of the most flourishing Roman colonies, and possessed numerous great buildings, of which the temple of Mars was famous throughout the whole empire. It was incorporated with Aquileia, under Constantine; and towards the end of the 6th century it was destroyed by the invading Slavs. It had a period of exceptional prosperity from the middle of the 14th to the latter half of the 15th century, under the counts of Cilli, on the extinction of which family it fell to Austria. In the 16th century it suffered greatly both from revolts of the peasantry and from the Counter-Reformation, Protestantism having made many converts in the district, particularly among the nobles. See Glantschnigg, Celje (Cilli, 1892).

CIMABUE, Giovanni (1240 to about 1302), Italian painter, was born in Florence of a respectable family, which seems to have been municipium and named it Claudia Celja. He took to the arts of design by natural inclination, and sought the society of men of learning and accomplishment. Vasari, the historian of Italian painting, zealos for his own native state of Florence, has left us the generally current account of Cimabue, which later researchers have to a great extent invalidated. We cannot now accept his assertion that art, extinct in Italy, was revived solely by Cimabue, after he had received some training from Greek artists invited by the Florentine government to paint the chapel of the Gondi in the church of S. Maria Novella; for native Italian art was not then a nullity, and this church was only begun when Cimabue was already forty years old. Even Lanzi’s qualifying statement that Greek artists, although they did not paint the chapel of the Gondi, did execute rude decorations in a chapel below the existing church, and may thus have inspired Cimabue, makes little difference in the main facts. What we find, as the general upshot is that some Italian painters preceded Cimabue—particularly Guido di Siena and Giunta di Pisa; that he worked on much the same principle as they, and to a like result; but that he was nevertheless the most advanced master of his time, and, by his own works, and the training which he imparted to his mighty pupil Giotto, he left the art far more formed and more capable of growth than he found it (see Painting).

The undoubted admiration of his contemporaries would alone demonstrate the conspicuous position which Cimabue held, and deserved to hold. For the chapel of the Roccalla in S. Maria Novella he painted in tempera a colossal "Madonna and Child with Angels," the largest altarpiece produced up to that date;
before its removal from the studio it was visited with admiration by Charles of Anjou, with a host of eminent men and gentle ladies, and it was carried to the church in a festive procession of the people and trumpeters. Cimabue was at this time living in the Borgo Allegri, then outside the walls of Florence; the legend that the name Allegri (Joyous) was bestowed on the locality in consequence of their popular and convivial character is more attractive than accurate, for the name existed already.

Of this celebrated picture, one of the great landmarks of modern and sacred art, some details may be here given, which we condense from the 

*History of Painting in Italy* by Crowe and Cavalcaselle.

"The Virgin in a red tunic and blue mantle, with her feet resting on an open-worked stool, is sitting on a chair hung with a white drapery flowered in gold and blue, and covered by six angels kneeling in three ranks on her either side. A delicately emerald-green mantle, her head, and that of the infant Saviour on her lap, who is dressed in a white tunic, and purple mantle shot with gold. A dark-coloured frame surrounds the gilded oval picture, and is delicately enriched with an ornament interrupted at intervals by thirty medallions on gold ground, each of which contains the half-figure of a saint. In the face of the Madonna is a soft and melancholy expression; in the form of the infant, a certain freshness, animation and natural proportion; in the group, affection—but too rare at this period. There is sentiment in the attitudes of the angels, energetic men in some prophets, comparative clearness and soft harmony in the colours. A certain loss of balance is caused by the overweight of the Virgin and Child, who are placed on the right side. The figures are large. The features are the old ones of the 13th century; only softened, as regards the expression of the eye, by an exaggeration of elliptical form in the iris, and closeness of the curves of the lids. In the angels the absence of framework of the face and form caused may be more striking; yet their movements are more natural and pleasing than hitherto.

One indeed, to the spectator's right of the Virgin, combines more tender reverence in its glance than that which had yet been produced by Cimabue. The groups...a clear and carefully fused colour, and imparted to the forms some of the rotundity which they had lost. With him vanished the sharp contrasts of hard lights, half-tones and shadows."

In a general way, it may be said that Cimabue showed himself forcible in his paintings, as especially in heads of aged or strongly characterized men; and, if the then existing development of art had not been hindered by the struggles of the church, he might have had it in him to make the beautiful as well. He, according to Vasari, was the first painter who wrote words upon his paintings,—as, for instance, round the head of Christ in a picture of the Crucifixion, the words addressed to Mary, *Mulier ecce filius tuus.*

Other paintings still extant by Cimabue are the following:

In the academy of Arts in Florence, a "Madonna and Child," with eight angels, and some prophets in niches,—better than the Rucellai picture in composition and study of nature, but more archaic in type, and the colour now spoiled (this work was painted for the Badia of S. Trinita, Florence); in the National Gallery, London, a "Madonna and Child with Angels," which came from the Ugo Baldi collection, and had probably once been in the church of S. Croce, Florence; in the Louvre, a "Madonna and Child," with twenty-six medallions in the frame, originally in the church of S. Francesco, Pisa. In the lower church of the Basilica of S. Francesco at Assisi, Cimabue, successor of Giunta da Pisa, probably adorned the south transept,—painting a colossal "Virgin and Child between four Angels," above the altar of the Conception, and a large figure of St. Francis. In the upper church, north transept, he has the "Saviour Enthroned and some Angels," and on the central ceiling of the transept, the "Four Evangelists with Angels." Many other works in both the lower and the upper church have been ascribed to Cimabue, but with very scanty evidence; even the above-named can be assigned to him only as matter of probability. Numerous others which he indisputably did paint have perished,—for instance, a series (earlier in date than the Rucellai picture) in the Carmine church at Padua, which were destroyed by a fire.

From Assisi Cimabue returned to Florence. In the closing years of his life he was appointed capamaestro of the mosaics of the cathedral of Pisa, and was afterwards, hardly a year before his death, joined with Arnolfo di Cambio as architect for the cathedral of Florence. In Pisa he executed a Majesty in the apse,—"Christ in glory between the Virgin and John the Evangelist," a mosaic, now much damaged, which stamps him as the leading artist of his time in that material. This was probably the last work that he produced.

The debt which art owes to Cimabue is not limited to his own performances. He was the master of Giotto, whom (such at least is the tradition) he found a shepherd boy of ten, in the pastures of Vespignano, drawing with a coal on a slate the figure of a angel. Cimabue then took Giotto to Florence, and instructed him in the art; and after his death Giotto occupied a house which had belonged to his master in the Via del Cocomero. Another painter with whom Cimabue is said to have been intimate was Gaddo Gaddi.

It had always been supposed that the bodily semblance of Cimabue is preserved to us in a portrait—figure by Simon Memmi painted in the Cappella degli Spagnuoli, in S. Maria Novella,—a thin hooded face in profile, with small beard, reddish and pointed. This is, however, extremely dubious. Simone Martini of Siena (commonly called Memmi) was born in 1283, and would therefore have been about nineteen years of age when Cimabue died; it is not certain that he painted the work in question, or that the figure represents Cimabue. The Florentine master is spoken of by a nearly contemporary commentator on Dante (the so-called Anonimo, who wrote about 1334 as arrogante e scortuto) that, if any one, or if he himself, found a fault in any work of his, however cherished till then, he would abandon it in disgust. This, however, to a modern mind, looks more like an aspiring and fastidious desire for perfection than any such form of "arrogance and scorn" as blemishes a man's character. Giovanni Cimabue was buried in the cathedral of Florence, S. Maria del Fiore, with an epitaph written by one of the Nini:—

"Crediit ut Cimabos pictuarae castra tenere, Sic tenuit vivens; nunc tenet astra poli."

Here we recognize distinctly a parallel to the first clause in the famous triptich of Dante:

"Credette Cimabue nella pintura ma da sposarlo trovò poi Giotto il grido, Sì che la fama di colui s'oscura."

Besides Vasari, and Crowe and Cavalcaselle (re-edited by Langton), the following works may be consulted:—P. Angeli, *Storia della basilica d' Assisi;* Cole and Stillman, *Old Italian Masters (1802);* Mrs Ady, *Painters of Florence (1800).*

**CIMAROSA, DOMENICO** (1749-1801), Italian musical composer, was born at Avesa, in the kingdom of Naples, on the 17th of December 1749. His parents were poor, but anxious to give their son a good education; and after removing to Naples they sent him to a free school connected with one of the monasteries of that city. The organist of the monastery, Padre Polceno, was struck with the boy's intellect, and voluntarily instructed him in the elements of music, as also in the ancient and modern literature of his country. To his influence Cimarosa owed a free scholarship at the musical institute of Santa Maria di Loreto, where he remained for eleven years, studying chiefly the great masters of the old Italian school. Piccini, Sacchini and other musicians of repute are mentioned amongst his teachers. At the age of twenty-three Cimarosa began his career as a composer with a comic opera called *Le Stravaganzze del Conte*, first performed at the Teatro dei Fiorentini at Naples in 1772. The work met with approval, and was followed in the same year by *Le Passie di Stellidamba e di Zoroastro*, a farce full of humour and eccentricity. This work also was successful, and the fame of the young composer began to spread all over Italy. In 1774 he was invited to Rome to write an opera for the *stagione* of that year; and he there produced another comic opera called *L'Italiana in Londra*.

The next thirteen years of Cimarosa's life are not marked by any event worth mentioning. He wrote a number of operas for the various theatres of Italy, living temporarily in Rome, in Naples, or wherever else his vocation as a conductor of his works happened to call him. From 1784-1787 he lived at Florence, writing exclusively for the theatre of that city. The productions of this period of his life are very numerous, consisting of operas, both comic and serious, cantatas, and various sacred
compositions. The following works may be mentioned amongst many others:—Cato Maria; the three biblical operas, Assalone, La Giuda, e Il Sacrificio d’ Abramo; also Il Concerto di Pietra; and La Ballerina amante, a pretty comic opera first performed at Venice with enormous success.

About the year 1788 CIMAROSA went to St Petersburg by invitation of the empress Catherine II. At her court he remained for four years and wrote an enormous number of compositions, mostly of the nature of pièces d’occasion. Of most of these not even the names are on record. In 1792 CIMAROSA left St Petersburg, and went to Vienna at the invitation of the emperor Leopold II. Here he produced his masterpiece, Il Matrimonio segreto, which ranks amongst the highest achievements of light operatic music. In 1793 CIMAROSA returned to Naples, where Il Matrimonio segreto and other works were received with great applause. Amongst the works belonging to his last stay in Naples may be mentioned the charming opera Le Astaie femminili. This period of his life is said to have been embittered by the intrigues of envious and hostile persons, amongst whom figured his old rival Paisiello. During the occupation of Naples by the troops of the French Republic, CIMAROSA joined the liberal party, and on the return of the Bourbons, was, like many of his political friends, condemned to death. By the intercession of influential admirers his sentence was commuted into banishment, and he left Naples with the intention of returning to St Petersburg. But his health was broken, and after much suffering he died at Venice on the 11th of January 1801, of inflammation of the intestines. The nature of his disease led to the rumour of his having been poisoned by his enemies, which, however, a formal inquest proved to be unfounded. He worked till the last moment of his life, and one of his operas, Artiemonia, remained unfinished at his death.

CIMBRI, a Teutonic tribe who made their first appearance in Roman history in the year 113 B.C., when they defeated the consul Gnaeus Papirius Carbo near Noreia in the modern Carinthia. It was the common belief that they had been driven from their homes on the North Sea by inundations, but, whatever the cause of their migration, they had been wandering along the Danube for some years warring with the Celtic tribes on either bank. After the victory of 113 they passed westwards over the Rhine, threatening the territory of the Allobroges. Their request for land was not granted, and in 109 B.C. they defeated the consuls Marcus Junius Silanus in southern Gaul, but did not at once follow up the victory. In 105 they returned to the attack under their king Boiorix, and favoured by the dissensions of the Roman colonies. The consuls M. Annianus, Collatinus, Livius, and C. Idas, defeated them in detail and annihilated their armies at Arusio (Orange). Again the victorious Cimbri turned away from Italy, and, after attempting to reduce the Arverni, moved into Spain, where they failed to overcome the desperate resistance of the Celtiberian tribes. In 103 they marched back through Gaul, which they overran as far as the Seine, where the Belgae made a stout resistance. Near Rouen the Cimbri were reinforced by the Teutoni and two cantons of the Helvetii. Thereupon the host marched southwards by two routes, the Cimbri moving on the left towards the passes of the Eastern Alps, while the newly arrived Teutoni and their allies made for the western gates of Italy. In 102 B.C. the Teutoni and Ambrones were totally defeated at Aquae Sextiae by Marius, while the Cimbri succeeded in passing the Alps and driving Q. Lutatius Catulus across the Adige and Po. In 101 Marius overthrew them on the Raudine Plain near Vercellae. Their king Boiorix was killed and the whole army destroyed. The Cimbri were the first in the long line of the Teutonic invaders of Italy.

The original home of the Cimbri has been much disputed. It is recorded in the Monumentum Ancestrum that a Roman fleet sailing eastwards from the mouth of the Rhine (c. A.D. 5) received at the farthest point reached the submission of a people called Cimbri, who sent an embassy to Augustus. Several early writers agree in saying that the Cimbri occupied a peninsula, and in the map of Ptolemy Jutland appears as the Cimbri Chersonese. As Ptolemy seems to have regarded the district north of the Limfjord (Limfjord) as a group of islands, the territory of the Cimbri, the northernmost tribe of the peninsula, would be included in the modern county (Amt) of Aalborg. This was formerly called Himberseys or Himmerlaus, forms which may very well preserve their name, especially as the name Charydes, mentioned next to them in the Monumentum Ancestrum, appears to survive in the modern Hardeland. Possibly also the district across the Limfjord formerly called Thytyskell or Thylland may in the same way preserve the name of the Teutoni (q.v.). Strabo and other early writers relate a number of curious facts concerning the customs of the Cimbri, which are of great interest as the earliest records of the manner of life of the Teutonic nations.

CIMICIFUGA, in botany, a small genus of herbaceous plants, of the natural order Ranunculaceae, which is widely distributed in the north temperate zone. C. foetida, bugbane, is used as a preventive against vermin; and the root of a North American species, C. racemosa, known as black snakeroot, as an emetic.

CIMMERII, an ancient people of the far north or west of Europe, first spoken of by Homer (Odyssey, xi. 12-19), who describes them as living in perpetual darkness. Herodotus (iv. 11-13), in his account of Scythia, regards them as the early inhabitants of South Russia (after whom the Bosphorus Cimmerians [q.v.] and other places were named), driven by the Scyths along by the Caucasus into Asia Minor, where they maintained themselves for a century. But the Cimmerii are often mentioned in connection with the Thracian tribes who made their raids across the Hellespont, and it is quite possible that some Cimmerii took this route, having been cut off by the Scyths as the Alani (q.v.) were by the Huns. Certain it is that in the middle of the 7th century B.C., Asia Minor was ravaged by northern nomads (Herod. iv. 12), one body of whom is called in Assyrian sources Gimirrai and is represented as coming through the Caucasus. They were probably Iranian speakers, to judge by the few proper names preserved. The name has also been identified with the biblical Gomer, son of Japheth (Gen. x. 2, 3). To the north of the Euxine their main body was merged in the invading Scyths. Later writers identified them with the Cimbri of Jutland, who were probably Teutonized Celts, but this is a mere guess due to the similarity of name. The Homeric Cimmerii belong to an early part of the Odyssey in which the hero was conceived as wandering in the Euxine; these adventures were afterwards transferred to the western Mediterranean in accordance with a wider geographical outlook.

For the Cimmerian invasions described by Herodotus, see SCYTHIA; LYDIA; GYGES.

(C. E. H. M.)

CIMON [КИМОН] (c. 507-449), Athenian statesman and general, was the son of Miltiades (q.v.) and Hegesipyle, daughter of the Thracian prince Olorus. Miltiades died in disgrace, leaving unpaid the fine imposed upon him for his conduct at Paros. Cimon’s first task in life, therefore, was to remove the stain on the family name by paying this fine (about £13,000). In the second Persian invasion, especially at Salamis, and in the consolidation of the Delian League, he won a high reputation for courage and integrity. At first with Aristides, and afterwards as sole commander, he directed the Athenian contingent of the fleet; on the disgrace of Pausanias he practically commanded the entire Greek fleet and drove Pausanias from his retreat in Byzantium. Having captured Eion (at the mouth of the Strymon), he expelled the Persian garrisons from the entire seaboard of Thrace with the exception of Doriscus, and, having defeated the piratical Dolopians of Scyrodes (470), confirmed his popularity by transferring thence to Athens the supposed bones of the Attic hero Theseus. The bones were buried in Athens, and over the tomb the Theseum (temple) was erected. In 466 Cimon proceeded to liberate the Greek cities of Lycia and Pamphylia, and at the mouth of the Eurymedon he defeated the Persians decisively by land and sea.
The Persian danger was now over, and the immediate purpose of the Delian League was achieved. Already, however, Athens had introduced the policy of coercion which was to transform the league into an empire, a policy which, after the ostracism of Themistocles and the death of Aristides, must be attributed to Cimon, whose fundamental idea was the union of the Greeks against all outsiders (see DELIAN LEAGUE). Carystus was compelled to join the league; Naxos (c. 460) and Thasos (465-453), which had revolted, were compelled to accept the position of tributary allies. In 464 Sparta was involved in war with her Helots (principally of Messenian origin) and was in great difficulties. Cimon, then the most prominent man in Athens, persuaded the Athenians to send assistance, on the ground that Athens could not “stand without her yoke-fellow” and leave “Hellas lame.” The expedition was a failure, and Cimon was exposed to the attacks of the democrats led by Ephialtes. The history of this party struggle is not clear. The ordinary account is that Ephialtes during Cimon’s absence in Messenya destroyed the powers of the Areopagus (q.v.) and then obtained the ostracism of Cimon, who attempted to reverse his policy. Without going fully into the question, which is full of difficulty, it may be pointed out (i) that when the Messenian expedition started Cimon had twice within the preceding year triumphed over the opposition of Ephialtes, and (2) that presumably the Cimonian party was predominant until after the expedition proved a failure. It is therefore unlikely that, immediately after Cimon’s triumph in obtaining permission to go to Messenya, Ephialtes was able to attack the Areopagus with success. The probability is that when the expedition failed, Cimon was ostracized, and that then Ephialtes defeated the Areopagus, and also made a change in foreign policy by making alliances with Sparta’s enemies, Argos and Thessaly. This hypothesis alone explains the absence of any account of a third struggle between Cimon and Ephialtes over the Areopagus. The chronology would thus be: ostracism of Cimon, spring, 461; fall of the Areopagus and reversal of Philo-Laconian policy, summer, 461.

A more difficult question is involved in the date of Cimon’s return from ostracism. The ordinary account says that he was recalled after the battle of Tanagra (457) to negotiate the Five Years’ Truce (453 or 450). To ignore the unexplained interval of six or seven years is an uncritical expedient, which, however, has been adopted by many writers. Some maintaining that Cimon did return soon after 457, say that the truce which he arranged was really the four months’ truce recorded by Diodorus (on. 5.3). To this there are two main objections. 1. Cimon returned in 457, why does the evidence of antiquity connect his return specifically with the truce of 457? and (2) why does he after 457 disappear for six years and return again to negotiate the Five Years’ Truce and to command the expedition to Cyprus? It seems much more likely that he returned in 451, at the very time when Athens returned to his old policy of friendship with Sparta and war in the East against Persia (i.e. the Cyprus expedition). Thus it would appear that from 453 onwards there was a recrudescence of conservative influence, and that for four years (453-449) Pericles was not master in Athens (see PERICLES); this theory is corroborated by the fact that Pericles, in the alarm caused by the Egyptian failure of 454, was induced to remove the Delian treasury to Athens and to abandon his anti-Spartan policy of land empire.

Cimon died in Cyprus before the walls of Citium (449), and was buried in Athens. Later Attic orators speak in glowing terms of a “Peace” between Athens and Persia, which is sometimes connected with the name of Cimon and sometimes with that of one Callias. If any such peace was concluded, it cannot have been soon after the battle of the Eurymedon as Plutarch assumes. It can have been only after Cimon’s death and the evacuation of Cyprus (i.e. c. 448). It is only in this form that the view has been maintained logically in modern times. Apart from the fact that the peace is ignored by Thucydides and that the earliest reference to it is the passage in Isocrates (Paneg. 118 and 120), there are weighty reasons which render it improbable that any formal peace can have been concluded at that period between Athens and Persia (see further Ed. Meyer’s Forschungen, ii.).

Cimon’s services in connexion with the consolidation of the Empire rank with those of Themistocles and Aristides. He is described as genial, brave and generous. He threw open his house and gardens to his fellow-demesmen, and beautified the city with trees and buildings. But as a statesman he failed to cope with the new conditions created by the democracy of Cleisthenes. The one great principle for which he is memorable is that of the balance of power between Athens and Sparta, as respectively the naval and military leaders of a united Hellenas. It has been the custom to regard Cimon as an advocate of little culture and refinement. It is clear, however, from his desire to adorn the city, that he was by no means without culture and imagination. The truth is that, as in politics, so in education and attitude of mind, he represented the ideals of an age which, in the new atmosphere of democratic Athens, seemed to savour of rusticity and lack of education.

The lives of Cimon by Plutarch and Cornelius Nepos are uncritical; the conclusions above expressed are derived from a comparison of Plutarch, Cimon, 17, PERICLES, 10; Theopompus, fragm. 92; Andocides, de Pace, §§ 3, 4; Diodorus xi. 86 (the four months’ truce). See histories of Greece (e.g. Grote, ed. 1907, 1 vol.) also PERICLES; DELIAN LEAGUE, with works quoted. (J. M. M.)

Cimon of Cleonae, an early Greek painter, who is said to have introduced great improvements in drawing. He represented "figures out of the straight, and ways of representing faces looking back, up or down; he also made the joints of the body "broken up, and veins, watts, joints and doubtfuls in garments" (Pliny). All these improvements are such as may be traced in the drawing of early Greek med-figure in cases (see Greek Art).

CINCHONA, the generic name of a number of trees which belong to the natural order Rubiaceae. Botanically the genus includes trees of varying size, some reaching an altitude of 80 ft. and upwards, with evergreen leaves and deciduous stipules. The flowers are arranged in panicles, white or pinkish in colour, with a pleasant odour, the calyx being 5-toothed superior, and the corolla tubular, 5-lobed and fringed at the margin. The stamens are 5, almost concealed by the tubular corolla, and the ovary terminates in a fleshy disk. The fruit is an ovoid or sub-cylindrical capsule, splitting from the base, and held together at the apex. The numerous seeds are flat and winged all round. About 40 species have been distinguished, but of these not more than about a dozen have been economically utilized. The plants are natives of the western mountainous regions of South America, and their geographical range extending from 10° N. to 25° S. lat.; and they flourish generally at an elevation of from 5000 to 8000 ft. above sea-level, although some have been noted growing as high up as 11,000 ft., and others have been found down to 2600 ft. The trees are valued solely on account of their bark, which long has been the source of the most valuable febrifuge or antipyretic medicine, quinine (q.v.), that has ever been discovered. The earliest well-authenticated instance of the medicinal use of cinchona bark is found in the year 1638, when the countess of Chinchon (hence the name), the wife of the governor of Peru, was cured of an attack of fever by its administration. The medicine was recommended in her case by the cindorcer of Loxa, who was said himself to have practically experienced its supreme virtues eight years earlier. A knowledge of the bark was disseminated throughout Europe by members of the Jesuit brotherhood, whence it acquired the name generally known as Jesuits’ bark. Attributing to another account, this name arose from its value having been first discovered to a Jesuit missionary who, when prostrate with fever, was cured by the administration of the bark by a South American Indian. In each of the above instances the fever was no doubt malaria.

The procuring of the bark in the dense forests of New Granada, Ecuador, Peru and Bolivia is a work of great toil and hardship to the Indian cascarilleros or cascadores engaged in the pursuit. The trees grow isolated or in small clumps, which have to be searched out by the experienced cascarrillero, who laboriously cuts his way through the dense forest to the spot where he discovers
a tree. Having freed the stem from adhering parasites and twining plants, he proceeds, by beating and cutting oblong pieces, to detach the stem bark as far as is within his reach. The tree is then felled, and the entire bark of stem and branches secured. The bark of the smaller branches, as it dries, curls up, forming "quills," the thicker masses from the stems constituting the "flat" bark of commerce. The drying, packing and transport of the bark are all operations of a very dangerous description conducted under most disadvantageous conditions.

The enormous medicinal consumption of these barks, and the wasteful and reckless manner of procuring them in America long ago, caused serious and well-grounded apprehension that the native forests would quickly become exhausted. The attention of European communities was early directed to the necessity of securing steady and permanent supplies by introducing the more valuable species into localities likely to be favourable to their cultivation. The first actual attempt to rear plants was made in Algeria in 1840; but the effort was not successful. In 1854 the Dutch government seriously undertook the task of introducing the trees into the Island of Java, and an expedition for that purpose was fitted out on an adequate scale. Several hundreds of young trees were obtained, which a small proportion was speedily landed and planted in Java; and as the great attention the cultivation of cinchona plantations in that island became highly prosperous and promising.

The desirability of introducing cinchonas into the East Indies was urged in a memorial addressed to the East India Company between 1838 and 1842 by Sir Robert Christison and backed by Dr Forbes Royle; but no active step was taken till 1853, when, again on the motion of Dr Royle, some efforts to obtain plants were made through consular agents. In the end the question was seriously taken up, and Sir Clements R. Markham was appointed to head an expedition to obtain young trees from South America and convey them to India. The transference of the plants was attended with considerable difficulty, but in 1861 under his superintendence a consignment of plants was planted in a favourable situation in the Nilgiri Hills. For several years subsequently additional supplies of plants of various species were obtained from different regions of South America, and some were also procured from the Dutch plantations in Java. Now the culture has spread over a wide area in southern India, in Ceylon, on the slopes of the Himalayas, and in British Burma, and has become widely spread through the tropics generally. The species grown are principally Cinchona officinalis, C. Calisaya, C. succirubra, C. pitayensis, and C. Pahudiana, some agreeing with certain soils and climates better than others, while the yield of alkaloids and the relative proportions of the different alkaloids differ in each species. The official "bark" of the British Pharmacopoeia is that of Cinchona succirubra or red bark. It is imported in the form of quills or recurved pieces, with a rough brown outer surface and a deep red inner surface, forming a reddish brown uncoated powder, which has a bitter, astringent taste. The British Pharmacopoeia directs that the bark, when used to make the various medicinal preparations, shall contain not less than 5 nor more than 6% of total alkaloids, of which at least one-half is to be constituted by quinine and cinchonidine. The preparations of this bark are four: a liquid extract, standardized to contain 5% of total alkaloids; an acid infusion; a tincture standardized to contain 1% of total alkaloids; and a compound tincture which must possess one-half the alkaloidal strength of the last. The only purpose for which these preparations of cinchona bark should be used is to tonics; and even when this is the desired action there are many reasons why the alkaloid should be preferred, even though the recent introduction of standardization removes one of the chief objections to their use.

The pharmacology of red bark, independent as it is almost entirely upon the contained quinine, will be elaborated under Quinine. But the composition of cinchona bark is a matter of importance and interest. The bark contains, in the first place, five alkaloids, of which all but quinine may here be dealt with. Quinidine, C_{18}H_{21}NO_3, is isomeric with quinine, from which it differs in crystallizing in prisms instead of needles, in being dextro- and not laevorotatory, and in being insoluble in ammonia except in much excess. It has the formula C_{18}H_{21}NO_3, quinoline being methoxy cinchonine, i.e. C_{18}H_{21}O(C(==O)H)N=O. It occurs in inodorous, bitter, colourless prisms; unlike the two alkaloids already named, does not yield a green colour with chlorine water and ammonia; is not potassio- nor lithyo- nor acido-pris. When run through the Bertrand sulfuric acid, the product filtered, and excess of sodium hydroxide added thereto, quinine and quinidine are precipitated: on concentrating the mother liquor, cinchonine falls down, and on further concentration and addition of still more alkali, cinchonidine is thrown out. Yellow bark, which is not official, yields 5% of quinine, and pale bark about 10% of total alkaloids, of which hardly any is quinine, cinchonine and quinidine being its chief constituents. The bark of cinchonelate totals about 1% of cinchonine; of an unimportant alkaloid, conquinanine. In addition to the above, red bark contains quinic acid, C_{4}H_{6}O_5, which is closely allied to benzoic acid and is excreted in the urine as hippuric acid. There also occurs chinoic acid, derived from a glucoside chino, which occurs as such in the bark. Besides a trace of volatile oil which gives the bark its characteristic odour, and cinchona red (the bark pigment), there occurs about 2% of cinchina-tannic acid, closely allied to tannic acid and giving the bark its astringent property. Cinchona is never used, however, in order to obtain an astringent action.

The importance of recognizing the complex and inconstant constitution of cinchona bark lies, as in so many other instances in this—that the physician who employs it can have only a very imperfect knowledge of the drug he is using. The latest work on the action of these alkaloids has shown that cinchonine has a tendency to induce convulsions in certain patients, and that this action is a still more marked feature of cinchonidine and cinchonamine. Even small doses administered to epileptics increase the number of their attacks. They will probably be classified later among the convulsant poisons. The bark of cinchona has thus lost its action, now that definite active principles can be readily obtained and precisely studied, is almost entirely to be deprecated. Quinidine is almost as powerful an antiseptic to malaria as quinine; cinchonamine has about two-thirds the power; the other alkaloids are much weaker.

CINCINNATI, a city and the county-seat of Hamilton county, Ohio, U.S.A., on the Ohio river, opposite the mouth of the Licking, about 100 m. S.W. of Columbus, about 305 m. by rail S.E. of Chicago, and about 760 m. (by rail) W.S.W. of New York. Through the city flows Mill Creek, which empties into the Ohio. Pop. (1860) 206,908; (1870) 325,902, of whom 197,886 were of foreign parentage (i.e. either their fathers or mothers or both were foreign-born), 57,601 were foreign-born, and 14,482 were negroes; (1910) 635,597. The German is by far the most important of the foreign elements. In the large number of inhabitants of German descent, there were, in 1900, 107,152 of German parentage, and of the foreign-born 38,219 came from Germany.

Cincinnati is situated on the N. side of the river upon two terraces or plateaus—the first about 60 ft., the second from 100 to 150 ft., above low water—and upon hills which enclose these terraces on three sides in the form of an amphitheatre, rising to a height of about 400 ft. on the E. and of about 450 ft. on the W., and commanding magnificent views of the river, the valley, the numerous suburbs, and the more distant wooded hills. About half of the hill-enclosed plain lies S. of the river, and it is upon this southern half that Covington, Newport, Dayton, Ludlow and other Kentucky suburbs of Cincinnati are situated. Cincinnati has a river-frontage of about 14 m., extends back about 6 m. on the W. side in the valley of Mill Creek, and occupies a total area of about 44 sq. m. Since 1867 it has been connected with Covington by a wire suspension bridge designed by John A. Roebling, and rebuilt and enlarged in 1888. This bridge is 334 ft. long over the river (including the approaches, 2352 ft. long), with a height of 101 ft. above low water, and has a double wagon road and two ways for pedestrians. By two bridges there is direct communication with Newport; by one, that of the Cincinnati Southern railway, with Ludlow; and by one (Chesapeake & Ohio) see vol. v., p. 109

1 Previous census reports of the total population were as follows: (1810) 2540; (1820) 9642; (1830) 24,831; (1840) 46,384; (1850) 115,435; (1860) 161,044; (1870) 216,239; (1880) 225,139. In the territory within a radius of 10 m. of the United States government building there was in 1900 a population of about 480,000.
with West Covington. On the terraces the streets generally intersect at right angles, but on the hills their directions are irregular. To the “bottoms” (which have suffered much from floods) between Third Street and the river the manufacturing and wholesale districts are for the most part confined, although many of these interests are now on the higher levels or in the suburbs; the principal retail houses are on the higher levels N. of Third Street, and the handsomest residences are on the picturesque hills before mentioned, in those parts of the city, formerly separate villages, known as Avondale, Mt. Auburn, Clifton, Price Hill, Walnut Hills and Mt. Lookout. The main part of the city is connected with these residential districts by electric street railways, whose routes include four inclined-plane railways, namely, Mt. Adams (268 ft. elevation), Bellevue (900 ft.), Fairview (210 ft.), and Price Hill (350 ft.), from each of which an excellent panoramic view of the city and suburbs may be obtained. There are various suburbs, chiefly residential, in the Mill Creek valley, among them being Carthage, Hartwell, Wyoming, Lockland and Glendale. Other populous and attractive suburbs N. of the Ohio river are Norwood and College Hill.

Buildings, &c.—Brick, blue limestone, and a greyish buff freestone are the most common building materials, and the city has various buildings of much architectural merit. The chamber of commerce (completed 1880), designed by H. H. Richardson, is one of the finest public buildings in the United States. Its walls are of undressed granite, and it occupies a ground area of 100 by 120 ft. The United States government building (designed by A. B. Mullet, and built of Maine and Missouri granite) is a fine structure in classic style, 360 ft. long and 160 ft. wide, and 43 storeys high; its outer walls are faced with sawn freestone. It was erected in 1874-1885 and cost (including the land) $5,250,000. The city hall (322 ft. by 203 ft.), with walls of red granite and brown sandstone, is a massive and handsome building erected at a cost of $1,600,000. The county court house (rebuilt in 1887) is in the Romanesque style, and with the gable attached occupies an entire square. The Cincinnati hospital (completed 1869), comprising eight buildings grouped about a central court and connected by corridors, occupies a square of four acres. A new public hospital for the suburbs was projected in 1907. St. Peter’s (Roman Catholic) cathedral (begun 1839, consecrated 1844), Grecian in style, is a fine structure, with a graceful stone spire 224 ft. in height and a chime of 13 bells; it has as an altar-piece Murillo’s “St. Peter Liberated by an Angel.” The church of St. Francis de Sales (in Walnut Hills), built in 1888, has a bell, cast in Cincinnati, weighing fifteen tons, and said to be the largest swinging bell in the world. Several of the Protestant churches, such as the First Presbyterian (built 1835; steeple, including spire, 285 ft. high), Second Presbyterian (1872), Central Christian (1869), St. Paul’s Methodist Episcopal (1870), and St. Paul’s Protestant Episcopal (1857), are also worthy of mention, and in the residential suburbs there are many fine churches. Cincinnati is the seat of a Roman Catholic archbishopric and a Protestant Episcopal and Methodist Episcopal bishopric. The Masonic temple (195 ft. long and 100 ft. wide), in the Byzantine style, is four storeys high, and has two towers of 140 ft.; the building was completed in 1886 and has subsequently been remodelled. Among other prominent buildings are the Oddfellows’ temple (completed 1894), the public library, the art museum (1886), a Jewish synagogue (in Avondale), and the (Jewish) Plum Street temple (1886), Moorish in architecture. The Soldiers’, Sailors’ and Pioneers’ building (1907) is a beautiful structure, classic in design. The business houses are of stone or brick, and many of them are attractive architecturally; there are a number of modern office buildings from 15 to 20 storeys in height. There are also several large hotels and ten theatres (besides halls and auditoriums for concerts and public gatherings), the most notable being Springer music hall.

CINCINNATI

One of the most noted pieces of monumental art in the United States is the beautiful Tyler Davidson bronze fountain in Fountain Square (Fifth Street, between Walnut and Vine streets), the business centre of the city, by which (or within one block of which) all car lines run. The fountain was unveiled in 1871 and was presented to the city by Henry Probasco (1820-1902), a wealthy citizen, who named it in honour of his deceased brother-in-law and business partner, Mr Tyler Davidson. The design, by August von Krelling (1819-1876), embraces fifteen bronze figures, all cast at the royal bronze foundry in Munich, the chief being a female figure with outstretched arms, from whose fingers the water falls in a fine spray. This figure reaches a height of 45 ft. above the ground. The city has, besides, monuments to the memory of Presidents Harrison and Garfield (both in Garfield Place, the former an equestrian statue by Louis T. Ribisso, and the latter by Charles H. Niehaus); also, in Spring Grove cemetery, a monument to the memory of the Ohio volunteers who lost their lives in the Civil War. The art museum, in Eden Park, contains paintings by celebrated European and American artists, statuary, engravings, etchings, metal work, wood carving, textile fabrics, pottery, and an excellent collection in American ethnology and archaeology. The Cincinnati Society of Natural History (incorporated 1879) has a large library and a museum containing a valuable palaeontological collection, and bones and implements from the prehistoric cemetery of the mound-builders, at Madisonville, Ohio.

In 1898 Cincinnati had parks covering about 540 acres; there are numerous pleasant driveways both within the city limits and in the suburban districts, and several attractive resorts are within easy reach. Eden Park, of 214 acres, on Mount Adams, about 1 m. E. of the business centre and near the river, is noted for its natural beauty, greatly supplemented by the landscape-gardener’s skill, and for its commanding views. The ground was originally the property of Nicholas Longworth (1782-1863), a wealthy citizen and well-known horticulturist, who here grew the grapes from which the Catawba wine, introduced by him in 1828, was made. The park contains the art museum and the art academy. Its gateway, Elsinore, is a medieval reproduction; other prominent features are the reservoirs, which resemble natural lakes, and a high water tower, from which there is a delightful view. In Burnet Woods Park, lying to the N.E. of Eden and containing about 163 acres, are the buildings and grounds of the University of Cincinnati, and a lake for bathing and skating. The zoological gardens occupy 60 acres and contain a notable collection of animals and birds. Other pleasure resorts are the Lagoon on the Kentucky side (in Ludlow, Ky.), Chester Park, about 6 m. N. of the business centre, and Coney Island, about 10 m. up the river on the Ohio side. Washington (5-6 acres), Lincoln (10 acres), Garfield and Hopkins are small parks in the city. In 1907 an extensive system of new parks, parkways and boulevards was projected. Spring Grove cemetery, about 6 m. N.W. of Fountain Square, contains 600 acres picturesquely laid out on the park plan. It contains many handsome monuments and private mausoleums, and a beautiful mortuary chapel in the Norman style.

Water-System.—A new and greatly improved water-supply system for the city was virtually completed in 1907. This provides for taking water from the Ohio river at a point on the Kentucky side opposite the village of California, Ohio, and several miles above the discharge of the city sewers; for the carrying of the water by a gravity tunnel under the river to the Ohio side, the water being thence elevated by four great pumping engines, each having a daily capacity of 30,000,000 gallons, to settling basins, being then passed through filters of the American or mechanical type, and flowing thence by a gravity tunnel more than 4 m. long to the main pumping station, on the bank of the river, within the city; and for the pumping of the water thence, a part directly into the distributing pipes and a part to the principal storage reservoir in Eden Park.

Education.—Cincinnati is an important educational centre. The University of Cincinnati, originally endowed by Charles McMicken (d. 1858) and opened in 1873, occupies a number of

The most destructive floods have been those of 1832, 1847, 1883, 1884 and 1907; the highest stage of the water before 1904 was 71 ft. 2 in. in 1884, the lowest 1 ft. 11 in. in 1881.
handsome buildings erected since 1895 on a campus of 43 acres in Burnet Woods Park, has an astronomical observatory on the highest point of Mt. Lookout, and is the only strictly municipal university in the United States. The institution embraces a college of liberal arts, a college of engineering, a college of law (united in 1897 with the law school of Cincinnati College, then the only surviving department of that college, which was founded as Lancaster Seminary in 1839); a college of medicine (from 1819 to 1896 the Medical College of Ohio; the college occupies the site of the old M'Cliren homestead), a college for teachers, a graduate school, and a technical school (founded in 1886 and transferred to the university in 1901); while closely affiliated with it are the Clinical and Pathological School of Cincinnati and the Ohio College of Dentistry. With the exception of small fees charged for incidental expenses, the university is free to all students who are residents of the city; others pay $75 a year for tuition. It is maintained in part by the city, through public taxation, and in part by the income from endowment funds given by Charles M'Micken, Matthew Thoms, David Sinton and others. The government of the university is entrusted mainly to a board of nine directors appointed by the mayor. In 1899 it had a faculty of 144 and 1364 students. Lane Theological Seminary is situated in Walnut Hills, in the north-eastern part of the city; it was endowed by Ebenezer Lane and the Kemper family; was founded in 1839 for the training of Presbyterian ministers; had for its first president (1832–1852) Lyman Beecher; and in 1834 was the scene of a bitter contest between abolitionists in the faculty and among the students, led by Theodore Dwight Weld, and the board of trustees, who forbade the discussion of slavery in the seminary and so caused about four-fifths of the students to leave, most of them going to Oberlin College. The city has also Saint Francis Xavier College (Roman Catholic, established in 1831 and until 1840 known as the Athenaeum); Saint Joseph College (Roman Catholic, 1873); Mount St Mary's of the West Seminary (Roman Catholic, theological, 1842, at Cedar Point, Ohio); Hebrew Union College (1875), the leading institution in the United States for educating rabbis; the largely attended Ohio Mechanics' Institute (founded 1828), a private corporation not conducted for profit, its object being the education of skilled workmen, the training of industrial leaders, and the advancement of the mechanic arts (in 1907 there were in all departments 14,211 students, a large majority of whom were in the evening classes); an excellent art academy, modelled after that of South Kensington; the College of Music and the Conservatory of Music (mentioned below); the Miami Medical College (opened in 1852); the Pulte Medical College (homeopathic; coeducational; opened 1872); the Eclectic Medical Institute (chartered 1845); two women's medical colleges, two colleges of dental surgery, a college of pharmacy, and several business colleges. The public, district, and high schools of the city are excellent. The City (or public) library contained in 1906 301,380 vols. and 57,552 pamphlets; the University library (including medical, law and astronomical branches), 80,000 vols. (including the Robert Clarke collection, rich in Americana, and the library—about 5000 vols.—of the American Association for the Advancement of Science); the Young Men's Mercantile library, 70,000 vols.; and the Law library, 35,000 vols.; in addition, the Lloyd library and museum of botany and pharmacy, and the library of the Historical and Philosophical Society of Ohio (1831), which contains a valuable collection of rare books, pamphlets and manuscripts, are worthy of mention.

Art, &c.—The large German population makes the city noteworthy for its music. The first Sängferst was held in Cincinnati in 1849, and it met here again in 1850, when a new hall was built for its accommodation. Under the leadership of Theodore Thomas (1835–1905), the Cincinnati Musical Festival Association was incorporated, and the first of its biennial May festivals was held in 1873. In 1875–1876 was built the large Springer music hall, named in honour of Reuben R. Springer (1800–1884), its greatest benefactor, who endowed the Cincinnati College of Music (incorporated in 1878), of which Thomas was director in 1878–1885. Until his death Thomas was director of the May festivals also. The grounds for the music hall were given by the city and are perpetually exempt from taxation. The great organ in the music hall was dedicated at the third of the May festivals in 1878. The Sängferst met in Cincinnati for the third time in 1879, and its jubilee was held here in 1899. By 1880 the May festival chorus had become a permanent organization. The city has several other musical societies—the Apollo and Orpheus clubs (1881 and 1893), a Liederkranz (1886), and a United Singing Society (1896) being among the more prominent; and there are two schools of music—the Conservatory of Music and the College of Music.

The city has large publishing interests, and various religious (Methodist Episcopal and Roman Catholic) and fraternal periodicals, and several technical journals and trade papers are published here. The principal daily newspapers are the Enquirer, a Democratic journal, established in 1842 and conducted for many years after 1852 by Washington McLean (1816–1890), and then by his son, John Roll McLean (b. 1849); the Commercial Tribune (Republican; previously the Commercial-Gazette and still earlier the Commercial, founded in 1793, The Tribune being merged with it in 1896), the Times-Star (the Times established in 1836), and the Post, established in 1881 (both evening papers); and several influential German journals, including the Volksblatt (Republican; established 1836), and the Volksfreund (Democratic; established 1840).

Among the social clubs of the city are the Queen City Club, organized in 1874; the Phoenix Club, organized in 1856 and the leading Jewish club in the city; the Cuvier Club, organized in 1871 and originally an association of hunters and anglers for the preservation of game and fish; the Cincinnati Club, the Business Men's Club, the University Club, the Art Club, and the Literary Club, of the last of which many prominent men, including President Hayes, have been members. This club dates from 1849, and is said to be the oldest literary club in the country. There are various commercial and trade organizations, the oldest and most influential being the Cincinnati Chamber of Commerce and Merchants' Exchange, which dates from 1839.

Administration.—The city is governed under the municipal code enacted by the state legislature in 1902, for the provisions of which see Ohio.

Among the institutions are the City infirmary (at Hartwell, a suburb), which, besides supporting pauper inmates, affords relief to outdoor poor; the Cincinnati hospital, which is supported by taxation and treaties without charge all who are unable to pay; twenty other hospitals, some of which are charitable institutions; a United States marine hospital; the Longview hospital for the insane, at Carthage, 10 m. from the city, and belonging to Hamilton county, whose population consists largely of the inhabitants of Cincinnati; an insane asylum for negroes; six orphan asylums—the Cincinnati, two Protestant, two Roman Catholic, and one for negroes; a home for incurables; a day nursery; a fresh-air home and farm for poor children; the Franciscan Brothers' Protecory for boys; a children's home; two widows' homes; two old men's homes; several homes for indigent and friendless women; a foundling asylum; the rescue mission and home for erring women; a social settlement conducted by the University of Cincinnati; the house of refuge (1836) for "the reformation and education of homeless and incorrigible children under 16 years of age"; and a workhouse for adults convicted of minor offences.

Communications.—Cincinnati is a railway centre of great importance and has an extensive commerce both by rail and by river. It is served by the following railways: the Pittsburg, Cincinnati, Chicago & St Louis (Pennsylvania system), the Cleveland, Cincinnati, Chicago & St Louis (New York Central system), the Chicago, Cincinnati & Louisville, the Cincinnati, New Orleans & Texas Pacific (the lessee of the Cincinnati Southern railway, connecting Cincinnati and Chattanooga, Tenn., its line 1 The Cincinnati Southern railway is of especial interest in that it was built by the city of Cincinnati in its corporate capacity. Much
forming part of the so-called Queen & Crescent Route to New Orleans, the Erie, the Baltimore & Ohio South-Western (Baltimore & Ohio system), the Chesapeake & Ohio, the Norfolk & Western, the Louisville & Nashville, the Cincinnati, Hamilton & Dayton, the Cincinnati Northern (New York Central system), the Cincinnati & Muskingum Valley (Pennsylvania system), and the Cincinnati, Lebanon & Northern (Pennsylvania system). Most of these railways use the Union Station; the Pennsylvania and the Cincinnati, Hamilton & Dayton, have separate stations. The city's river commerce, though of less relative importance since the advent of railways, is large and brings to its wharves much bulky freight, such as coal, iron and lumber; it also helps to distribute the products of the city's factories; and the National government has done much to sustain this commerce by deepening and lighting the channel. Formerly there was considerable commerce with Lake Erie by way of the Miami & Erie Canal to Toledo; the canal was completed in 1830 and has never been entirely abandoned.

**Industries.**—Although the second city in population in the state, Cincinnati ranked first in 1900 as a manufacturing centre, but lost this pre-eminence to Cleveland in 1905, when the value of Cincinnati's factory product was $166,056,050, an increase of 17.2% over the figures for 1900. In the manufacture of vehicles, harness, leather, hardwood lumber, wood-working machinery, machine tools, printing ink, soap, pig-iron, malt liquors, whisky, shoes, clothing, cigars and tobacco, furniture, cooperage goods, iron and steel safes and vaults, and pianos, also in the packing of meat, especially pork, 1 it ranks very high among the cities of the Union. The well-known and beautiful Rookwood ware has been made in Cincinnati since 1880, at the Rookwood Pottery (on Mt. Adams), founded by Mrs Bellamy (Maria Longworth) Storer, named from her father's home near the city, the first American pottery to devote exclusive attention to art ware. The colours used were yellow, brown, green, and black, and the greeves and blues, followed by mat glazes and by "vellum" ware (first exhibited in 1904), a lustreless pottery, resembling old parchament, with its decoration painted or modelled or both. The clays used are exclusively American, much being obtained in Missouri. Among the more important manufactures of the city in 1905 were the following, with the value of the product for that year: clothing ($16,072,924), slaughtering and meat-packing products ($13,446,202), foundry and machine-shop products ($1,158,768), boots and shoes ($10,506,928), distilled liquors ($6,009,820), malt liquors ($7,702,693), and carriages and wagons ($6,323,803). 2

**History.**—Cincinnati was founded by some of the first settlers in that part of the North-West Territory which afterwards became the state of Ohio. It lies on part of the land purchased for himself and others by John Cleves Symmes (1742-1814) from the United States government in 1788, and the settlement was established near the close of the same year by immigrants chiefly from New Jersey and Kentucky. When the town was laid out early in 1789, John Filson, one of the founders, named it Lesant, 3 his city's trade had always been with the Southern states, and the urgent need of better facilities for this trade than the river and existing railway lines afforded led to the building of this road by the city. The work was carried on under the direction of a board of five on the site of the present Court House, in accordance with the so-called Ferguson Act passed by the Ohio legislature in 1869, and the railway was completed to Chattanooga in February 1880. For accounts of the building and the management of the railway, see J. H. Hollander, The Cincinnati Southern Railway; A Study in Municipal Activity (Baltimore, 1894), one of the Hopkins University Studies in Historical and Political Science; and The Founding of the Cincinnati Southern Railway, with an Autobiography of E. A. Petersen (Cincinnati, 1905).

1 Before 1863 Cincinnati was the principal centre in the United States for the slaughtering of hogs and the packing of pork. The industry began as early as 1820 and rapidly increased in importance, but after 1865 it was the least of all the industries.

2 These figures are from the U.S. census, and are of course for Cincinnati proper; some of the largest industrial establishments, however, are just outside the city limits—among these are manufactory of Ivory Soap Works), machine tools, electrical machinery and appliances, structural and architectural iron work, and office furnishings.

373 CINCINNATI (L for Licking; os, Latin for mouth; anti, Greek for opposite; and ville, French for town), but early in the next year Symmes caused the present name to be substituted in honour of the Order of the Cincinnati, General Arthur St Clair, the governor of the North-West Territory, being then president of the Pennsylvania State Society of the Cincinnati. St Clair arrived about the time the change in name was made, immediately erected Hamilton County, and made Cincinnati its seat of government; the territorial legislature also held its sessions here from the time of its first organization in 1799 until 1801, when it removed to Chillicothe. During the early years the Indians threatened the life of the settlement, and in 1780 Fort Washington, a log building for protection against the Indians, was built in the city; General Josiah Harmar, in 1790, and General St Clair, in 1791, made unsuccessful expeditions against them, and the alarm increased until 1794, when General Wayne won a decisive victory over the savages near the present site of the battle of Fallen Timbers, after which he secured their consent to the terms of the treaty of Greenville (1795). Cincinnati was incorporated as a village in 1802, received a second charter in 1815, was chartered as a city in 1819, and received its second city charter in 1827 and its third in 1833; since 1851 it has been governed nominally by general laws of the state, although by the state's method of classifying cities many acts for its government have been in reality special. When first incorporated its limits were confined to an area of 3 sq. m., but by annexations in 1849 and 1850 this area was doubled; in 1854 another square mile was added; in 1869 and 1870 large additions were made, which included the villages of Sedamsville, Price Hill, Walnut Hills, Mount Auburn, Clintonville, Corryville, Vernon, Mount Harrison, Barsville, Fairmount, West Fairmount, St Peters, Lick Run and Clifton Heights; in 1872 Columbus, which was settled a short time before Cincinnati, was added; in 1873 Cumminsville and Woodburn; in 1895 Avondale, Riverside, Clifton, Linwood and Westwood; in 1890 Rump, Bond Hill, Winton Place, Hyde Park and Evanston; in 1904 portions of Mill Creek township, and in 1905 a small tract in Mill Creek Valley.

In 1820 Mrs Frances Trollope established in Cincinnati, where she lived for a part of two years, a "Bazar," which as the principal means of carrying out her plan to benefit the town was entirely unsuccessful; a vivid but scarcely unbiased picture of Cincinnati in the early thirties is to be found in her Domestic Manners of the Americans (1831). In 1845 began the marked influx of Germans, which lasted in large degree up to 1860; they first limited themselves to the district "Over the Rhine" (the Rhine being the Miami & Erie Canal), in the angle north-east of the junction of Canal and Sycamore streets, but gradually spread throughout the city, although this "Over the Rhine" is still most typically German.

In the ten years preceding the Civil War the city was much disturbed by slavery disension—the industrial interests were largely with the South, but abolitionists were numerous and active, and the city was an important station on the "Underground Railroad," of which Dr Norton S. Townsend (1815-95) was conductor, and one of the stations was the home of Mrs Harriet Beecher Stowe, who lived in Cincinnati from 1832 to 1850, and gathered there much material embodied in Uncle Tom's Cabin. In 1834 came the Lane Seminary controversies over slavery previously referred to. In 1835 James G. Birney established here his anti-slavery journal, The Philanthropist, but his printing shops were repeatedly mobbed and his presses destroyed, and in January of 1836 his bold speech before a mob gathered at the court-house was the only thing that saved him from personal violence, as the city authorities had warned him that they had not sufficient force to protect him. At the time of the Civil War the city was strongly in sympathy with the North. In September 1862 the city was threatened by a Confederate force under General Kirby Smith, who led the advance of General Bragg's army (see American Civil War). On the 28th of March 1864 many of the citizens met at Music Hall to protest against the lax way in which the law was enforced, notably in the case of a recent murder, when the confessed
criminal had been found guilty of manslaughter only. An attack was made on the gaol by the lawless element outside the hall, but was futile,—the murderer having been removed by the authorities to Columbus. In its efforts to break into the gaol and court-house the mob was confronted by the militia, and bloodshed and loss of life resulted; during the rioting the court-house was fired by the mob and practically destroyed, and many valuable records were burned. Among the most important political conventions which have met in Cincinnati, including the national Democratic convention of 1856, the national Liberal-Republican convention of 1872, the national Republican convention of 1876, and the national Democratic convention of 1886,—by which, respectively, James Buchanan, Horace Greeley, R. B. Hayes and Winfield Scott Hancock were nominated for the presidency.

See C. T. Greve, Centennial History of Cincinnati and Representative Citizens (Chicago, 1904), the official municipal documents, the Annual Reports of the Cincinnati Chamber of Commerce, &c.

CINCI
can, [b.c. 519 b.c.], one of the heroes of early Rome, a model of old Roman virtue and simplicity. A persistent opponent of the plebeians, he resisted the proposal of Terentillus Arsa (or Harsa) to draw up a code of written laws applicable equally to patricians and plebeians. He was a man of principles, and lived and worked on his own small farm. The story that he became impoverished by paying a fine incurred by his son Caeso is an attempt to explain the needy position of so distinguished a man. Twice he was called from the plough to the dictatorships of Rome in 458 and 439. In 458 he defeated the Aequians in a single day, and after entering Rome in triumph with large spoils returned to his farm. The story of his success, related five times under different years, possibly rests on an historical basis, but the account given in Livy of the achievements of the Roman army is obviously incredible.

See Livy iii. 26-29; Dion. Halic. x. 23-25; Florus i. 11. For a critical examination of the story see Schweger, Römische Geschicht., bk. xxvii. 12; Sir G. Cornewall Lewis, Credibility of early Roman History, 2 vols., London, 1849; and W. Ille, History of Rome, i.; E. Pais, Storia di Roma, i. ch. 4 (1898).

CINDERELLA (i.e. little cinder girl), the heroine of an almost universal fairy-tale. Its essential features are (1) the persecuted maiden whose youth and beauty bring upon her the jealousy of her stepmother and sisters, (2) the intervention of a fairy or other supernatural instrument on her behalf, (3) the prince who falls in love with and marries her. In the English version, a translation of Perrault’s Cendrillon, the glass slipper which she drops on the palace stairs is due to a mistranslation of pantoufle en verre (a fur slipper), mistaken for verre. It has been suggested that the story originated in a nature-myth, Cinderella being the dawn, oppressed by the night-clouds (cruel relatives) and finally rescued by the sun (prince).

See Marian Rolfe Cox, Cinderella; Three Hundred and Forty-five Variants (1893); A. Lang, Perrault’s Popular Tales (1888).

CINEAS, a Thessalian, the chief adviser of Pyrrhus, king of Epirus. He studied oratory in Athens, and was regarded as the most eloquent man of his age. He tried to dissuade Pyrrhus from invading Italy, and after the defeat of the Romans at Heraclea (280 B.C.) was sent to Rome to discuss terms of peace. These terms, which are said by Appian (De Rebus Samniticiis, 10, 11) to have included the freedom of the Greeks in Italy and the restoration to the Bruttians, Apulians and Samnites of all that had been taken from them, were rejected chiefly through the vehement and patriotic speech of the aged Appius Claudius Caecus the censor. The withdrawal of Pyrrhus from Italy was demanded, and Cineas returned to his master with the report that Rome was a temple and its senate an assembly of kings. Two years later Cineas was sent to renew negotiations with Rome on easier terms. The result was a cessation of hostilities, and Cineas crossed over to Sicily, to prepare the ground for Pyrrhus’s campaign. Nothing more is heard of him. He is said to have made an epitome of the Tactica of Aeneas, probably referred to by Cicero, who speaks of a Cineas as the author of a treatise De Re Militari.

See Plutarch, Pyrrhus, 11-21; Justin xviii. 2; Eutropius ii. 12; Cicero, Ad Fam. ix. 25.

CINEMATOGRAPH, or KINEMATOGRAPH (from κινέω, motion, and γράφω, to depict), an apparatus in which a series of views representing closely successive phases of a moving object are exhibited in rapid succession, giving a picture which, owing to persistence of vision, appears to the observer to be in continuous motion. It is a development of the zoetrope or “wheel of life,” described by W. G. Horner about 1833, which consists of a hollow cylinder turning on a vertical axis and having its surface pierced with a number of slots. Round the interior is arranged a series of pictures representing successive stages of such a subject as a galloping horse, and when the cylinder is rotated an observer looking through one of the slots sees the horse apparently in motion. The pictures were at first drawn by hand, but photography was afterwards applied to their production. E. Muybridge about 1877 obtained successive pictures of a running horse by employing a row of cameras, the shutters of which were opened and closed electrically by the passage of the horse in front of them, and in 1883 E. J. Marey of Paris established a studio for investigating the motion of animals by similar photographic methods.

The modern cinematograph was rendered possible by the invention of the celluloid roll film (employed by Marey in 1890), on which the serial pictures are impressed by instantaneous photography, a long sensitized film being moved across the focal plane of a camera and exposed intermittently. In one apparatus for making the exposures a cam jerks the film across the field once for each picture, the slack being gathered in on a drum at a constant rate. In another four lenses are rotated so as to give four images for each rotation, the film travelling so as to present a new portion in the field as each lens comes in place. Sixteen to fifty pictures may be taken per second. The films are developed on large drums, within which a ruby electric light may be fixed to enable the process to be watched. A positive is made from the negative thus obtained, and is passed through an optical lantern, the images being thus successively projected through an objective lens upon a distant screen. For an hour’s exhibition 50,000 to 165,000 pictures are needed. To regulate the feed in the lantern a hole is punched in the film for each picture. These holes must be extremely accurate in position; when they wear the feed becomes irregular, and the picture dances or vibrates in an unpleasant manner. Another method of exhibiting cinematographic effects is to bind the pictures together in book form by one edge, and then release them from the other in rapid succession by means of the thumb or some mechanical device as the book is bent backwards. In this case the subject is viewed, not by projection, but directly, either with the unaided eye or through a magnifying glass.

Cinematograph films produced by ordinary photographic processes, being in black and white only, fail to reproduce the colouring of the subjects they represent. To some extent this defect has been remedied by painting them by hand, but this method is too expensive for general adoption, and moreover does not yield very satisfactory results. Attempts to adapt three-colour photography, by using simultaneously three films, each with a source of light of appropriate colour, and combining the three images on the screen, have to overcome great difficulties in regard to maintenance of register, because very minute errors of adjustment between the views on the films are magnified to an intolerable extent by projection. In a process devised by G. A. Smith, the results of which were exhibited at the Society of Arts, London, in December 1908, the number of colour records was reduced to two. The films were specially treated to increase their sensitivity to red. The photographs were taken through two colour filters alternately interposed in front of the film; both admitted white and yellow, but one, of red, was in addition interposed with the orange and red of the subject, and the other, of blue-green, with the green, blue-green, blue and violet. The camera was arranged to take not less than 16 pictures a second through each filter, or 32 a second in all. The positive transparency made from the negative thus obtained

1. I.e. the "curly-haired."
CINERARIA was used in a lantern so arranged that beams of red (composed of crimson and yellow) and of green (composed of yellow and blue) issued from the lens alternately, the mechanism presenting the pictures made with the red filter to the red beam, and those made with the green filter to the green beam. A supplementary shutter was provided to introduce violet and blue, to compensate for the deficiency in those colours caused by the necessity of cutting them out in the camera owing to the over-sensitiveness of the film to them, and the result was that the successive pictures, blending on the screen by persistence of vision, gave a reproduction of the scene photographed in colours which were sensibly the same as those of the original.

The cinematograph enables "living" or "animated pictures" of such subjects as an army on the march, or an express train at full speed, to be presented with marvellous distinctness and completeness of detail. Machines of this kind have been devised in enormous numbers and used for purposes of amusement under names (bioscope, biograph, kinetoscope, mutograph, &c.) formed chiefly from combinations of Greek and Latin words for life, movement, change, &c., with suffixes taken from such words as ξυπευτήν, to see, γράφου, to depict; they have also been combined with phonographic apparatus, so that, for example, the music of a dance and the motions of the dancer are simultaneously reproduced to ear and eye. But when they are used in public places of entertainment, owing to the extreme inflammability of the celluloid film and its employment in close proximity to a powerful source of light and heat, such as is required if the pictures are to show brightly on the screen, precautions must be taken to prevent, as far as possible, the heat rays from reaching it, and effective means must be provided to extinguish it should it take fire. The production of films composed of non-inflammable material has also engaged the attention of inventors.

See H. V. Hopwood, Living Pictures (London, 1899), containing a bibliography and a digest of the British patents, which is supplemented in the Optician, vol. xviii. p. 85; Eugène Trutat, La Photographie animée (1899), which contains a list of the French patents. For the camera see also PHOTOGRAPHY: Apparatus.

CINERARIA. The garden plants of this name have originated from a species of Senecio, S. cruentus (nat. ord. Compositae), a native of the Canary Isles, introduced to the royal gardens at Kew in 1777. It was known originally as Cineraria cruenta, but the genus Cineraria is now restricted to a group of South African species, and the Canary Island species has been transferred to the large and widespread genus Senecio. Cinerarias can be raised from seed or from leafy cuttings. For spring flowering in England the seeds are sown in April or May in well-drained pots or pans, in soil of three parts loam to two parts leaf-mould, with one-sixth sand; cover the seed thinly with fine soil, and press the surface firm. When the seedlings are large enough to handle, prick them out in pans or pots of similar soil, and when more advanced pot them singly in 4-in. pots, using soil a trifle less sandy. They should be grown in shallow frames facing the north, and, if so situated that the sun shines upon the plants in the middle of the day, they must be slightly shaded; give plenty of air, and never allow them to get dry. When well established with roots, shift them into 6-in. pots, which should be liberally supplied with manure water as they get filled with roots. In winter remove to a pit or house, where a little heat can be supplied whenever there is a risk of their getting frozen. They should stand on a moist bottom, but must not be subjected to cold draughts. When the flowering stems appear, give manure water at every alternate watering. Seeds sown in March, and grown on in this way, will be in bloom by Christmas if kept in a temperature of from 40° to 45° at night, with a little more warmth in the day; and those sown in April and May will succeed them during the early spring months, the latter set of plants being subjected to a temperature of 38° or 40° during the night. If grown much warmer than this, the Cineraria maggots will make its appearance in the leaves, tunnelling its way between the upper and lower surfaces and making whitish irregular markings all over. Such affected leaves must be picked off and burned. Green fly is a great pest on young plants, and can only be kept down by fumigating or vaporizing the houses, and spraying with a solution of quassia chips, soft soap and tobacco.

CINGOLI (anc. Cingulum), a town of the Marches, Italy, in the province of Macerata, about 14 m. N.W. direct, and 17 m. by road, from the town of Macerata. Pop. (901) 13,357. The Gothic church of S. Esuperoanzio contains interesting works of art. The town occupies the site of the ancient Cingulum, a town of Picenum, founded and strongly fortified by Caesar's lieutenant T. Labianus (probably on the site of an earlier village) in 63 b.c. at his own expense. Its lofty position (2900 ft.) made it of some importance in the civil wars, but otherwise little is heard of it. Under the empire it was a municipium.

CINNA, a Roman patrician family of the gens Cornelia. The most famous member is LUCIUS CORNELIUS CINNA, a supporter of Marius in his content with Sulla. After serving in the war with the Marsi as praetorian legate, he was elected consul in 87 b.c. Breaking the oath he had sworn to Sulla that he would not attempt any revolution in the state, Cinna allied himself with Marius, raised an army of Italians, and took possession of the city. Soon after his triumphal entry and the massacre of the friends of Sulla, by which he had satisfied his vengean, Marius died. L. Valerius Flaccus became Cinna's colleague, and on the murder of Placcus, Cn. Papirius Carbo. In 84, however, Cinna, who was still consul, was forced to advance against Sulla; but while embarking his troops to meet him in Thessaly, he was killed in a mutiny. His daughter Cornelia was the wife of Julius Caesar, the dictator; but his son, L. Cornelius Cinna, praetor in 44 b.c., nevertheless sided with the murderers of Caesar and publicly extolled their action.

The hero of Cornelle's tragedy CINNA (1649) was Cn. Lucinius Cinna, surnamed Magnus (after his maternal grandfather Pompey), who was magnanimously pardoned by Augustus for conspiring against him.

CINNA, GAIUS HELVIVUS, Roman poet of the later Ciceroan age. Practically nothing is known of his life except that he was the friend of Catullus, whom he accompanied to Bithynia in the suite of the praetor Memmius. The circumstances of his death have given rise to some discussion. Suetonius, Valerius Maximus, Appian and Dio Cassius all state that, at Caesar's funeral, a certain Helvius Cinna was killed by mistake for Cornelius Cinna; the conspirator. The last three writers mentioned above add that he was a tribune of the people, while Plutarch, referring to the affair, gives the further information that the Cinna who was killed by the mob was a poet. This points to the identity of Helvius Cinna the tribune with Helvius Cinna the poet. The only objection to this view is based upon two lines in the 8th elegy of Virgil, supposed to have been written in 45 b.c. Here reference is made to a certain Cinna, a poet of such importance that Virgil deprecates comparison with him; it is argued that the manner in which this Cinna, who could hardly have been any one but Helvius Cinna, is spoken of implies that he was then alive; if so, he could not have been killed in 44. But such an interpretation of the Virgilian passage is by no means absolutely necessary; the terms used do not preclude a reference to a contemporary no longer alive. It has been suggested that it was really Cornelius, not Helvius Cinna, who was slain at Caesar's funeral, but this is not borne out by the authorities. Cinna's chief work was a mythological epic poem called Smyrna, the subject of which was the incestuous love of Smyrna (or Myrrha) for her father Cinyras, treated after the manner of the Alexandrian poets. It is said to have taken nine years to finish. Prospicium Poetae, a send-off to [Asinius] Pollio, is also attributed to him. In so far as the Latin language of which so was obscure that they required special commentaries, his model appears to have been Parthenius of Nicaea.

See A. Weichert, Poetarum Latinarum Vitae (1830); L. Muller's edition of Catullus (1870), where the remains of Cinna's poems are printed; A. Kiessling, "De C. Helvio Cinna Poeta" in Commentationes Philologicae in honorem T. Mommsen (1878); O. Ribbeck, Geschichte der römischen Dichtung, i. (1887): Teuffel-Schwabe, Hist. of Roman Lit. (Eng. tr. 213, 2-5); Plessis, Poésie latine (1909).
CINNABAR (Ger. Zinnobert), sometimes written cinnabarite, a name applied to red mercuric sulphide (HgS), or native vermilion, the common ore of mercury. The name comes from the Greek κίνηστρα, used by Theophrastus, and probably applied to several distinct substances. Cinnabar is generally found in a massive, granular or earthy form, of bright red colour, but it occasionally occurs in crystals, with a metallic adamantine lustre. The crystals belong to the hexagonal system, and are generally of rhombohedral habit, sometimes twinned. Cinnabar presents a remarkable resemblance to quartz in its symmetry and optical characters. Like quartz it exhibits circular polarization, and A. Des Cloizeaux showed that it possessed fifteen times the rotatory power of quartz (see Polarization of Light). Cinnabar has higher refractive power than any other known mineral, its mean index for sodium light being 3.02, whilst the index for diamond—a substance of remarkable refraction—is only 2.42 (see Refraction). The hardness of cinnabar is 3, and its specific gravity 8.98.

Cinnabar is found in all localities which yield quicksilver, notably Almaden (Spain), New Almaden (California), Idria (Austria), Landsberg, near Ober-Moschel in the Palatinate, Ripa, at the foot of the Apuan Alps (Tuscany), then, and in the eastern Alps. Another important deposit is at Kiewel (Russia), and the province of Kweichow in China, whence very fine crystals have been obtained. Cinnabar is in course of deposition at the present day from the hot waters of Sulphur Bank, in California, and Steamboat Springs, Nevada.

Hepatic cinnabar is an impure variety from Idria in Carniola, in which the cinnabar is mixed with bituminous and earthy matter.

Metacinnabarite is a cubic form of mercuric sulphide, this compound being dimorphous. For a general description of cinnabar, see G. F. Becker's Geography of the Quicksilver Deposits of the Pacific Slope, U.S. Geol. Surv. Monographs, No. xii. (1885). (F. W. R.)*

CINNAMIC ACID, or PHENYLACRYLIC ACID, C₆H₅CHO or C₆H₅-CH:CH-COONa, an acid found in the form of its benzylic ester in Peru and Tolu balsams, in storax and in some gum-benzoins. It can be isolated by the reduction of phenyl propionic acid with zinc and acetic acid, by heating benal malonic acid, by the condensation of ethyl acetate with benzaldehyde in the presence of sodium ethylate or by the so-called "Perkin reaction"; the latter being the method commonly employed. In making the acid by this process benzaldehyde, acetic anhydride and anhydrous sodium acetate are heated for some hours to about 180°C, the resulting product is made alkaline with sodium carbonate, and any excess of benzaldehyde removed by a current of steam. The residual liquor is filtered and acidified with hydrochloric acid, when cinnamic acid is precipitated, C₆H₅CH₂O + CH₂COONa = C₆H₅CH:CH-COONa + H₂O. It may be purified by recrystallization from hot water. Considerable controversy has taken place as to the course pursued by this reaction, but the matter has been definitely settled by the work of R. Fittig and his pupils (Annalen, 1883, 216, pp. 106, 115; 1885, 227, pp. 55, 119), in which it was shown that the aldehyde forms an addition compound with the sodium salt of the fatty acid, and that the acetic anhydride plays the part of a dehydrating agent. Cinnamic acid crystallizes in needles or prisms, melting at 133°C; on reduction it gives phenyl propionic acid, C₆H₅CH₂CH₂COOH. Nitric acid oxidizes it to benzoic acid and acetic acid. Potash fusion decomposes it into benzoic and acetic acids. Being an unsaturated acid it combines directly with hydrochloric acid, hydrobromic acid, bromine, &c. On nitration it gives a mixture of ortho and para nitrocinnamic acids, the former of which is of historical importance, as by converting it into orthoanilinium phenyl propionic acid A. Baeyer was enabled to carry out the complete synthesis of indigo (q.v.). Reduction of orthoanilinium cinnamic acid gives orthoanilinium succinic acid, C₆H₄(NH₂)CH:CH-COONa, which is of theoretical importance, as it readily gives a quinoline derivative. An isomer of cinnamic acid known as alio-cinnamic acid is also known. For the oxy-cinnamic acids see Coumarin.

CINNAMON, the inner bark of Cinnamomum zeylanicum, a small evergreen tree belonging to the natural order Lauraceae, native to Ceylon. The leaves are large, ovate-oblong in shape, and the flowers, which are arranged in panicles, have a greenish colour and a rather disagreeable odour. Cinnamon has been known from remote antiquity, and it was so highly prized among ancient nations that it was regarded as a present fit for monarchs and other great potentates. It is mentioned in Exodus xxx. 23, where Moses is commanded to use both sweet cinnamon (Kinnamon) and cassia, and it is alluded to by Herodotus under the name κυπρικός, and by other classical writers. The tree is grown at Tellicherry, in Java, the West Indies, Brazil and Egypt, but the produce of none of these places approaches in quality that grown in Ceylon. Ceylon cinnamon of fine quality is a very thin smooth bark, with a light-yellowish brown colour, a highly fragrant odour, and a peculiarly sweet, warm and pleasing aromatic taste. Its flavour is due to an aromatic oil which it contains to the extent of from 0.5 to 1½%. This essential oil, as an article of commerce, is prepared by roughly pounding the bark, macerating it in sea-water, and then quickly distilling the whole. It is of a golden-yellow colour, with the peculiar odour of cinnamon and a very hot aromatic taste. It contains essentially of cinnamaldehyde, and by the absorption of oxygen as it ages, it becomes old it darkens in colour and develops resins compounds. Cinnamon is principally employed in cookery as a condiment and flavouring material, being largely used in the preparation of some kinds of chocolate and liqueurs. In medicine it acts like other volatile oils and has a reputation as a cure for colds. Being a much more costly spice than cassia, that comparatively harsh-flavoured substance is frequently substituted for or added to it. The two barks when whole are easily enough distinguished, and their microscopical characters are also quite distinct. When powdered bark is treated with tincture of iodine, little effect is visible in the case of pure cinnamon of good quality, but when cassia is present a deep-blue tint is produced, the intensity of the coloration depending on the proportion of the cassia.

CINNAMON-STONE, a variety of garnet, belonging to the lime-alumina type, known also as essonite or hessonite, from the Gr. Achem, "inferior," in allusion to its being less hard and less dense than most other garnet. It has a characteristic red colour, inclining to orange, much like that of hyacinth or jacinth. Indeed it was shown many years ago, by Sir A. H. Church, that many gems, especially engraved stones, commonly regarded as hyacinth, were really cinnamon-stone. The difference is readily detected by the specific gravity, that of hessonite being 3.64 to 3.69, whilst that of hyacinth (zircon) is about 4.6. Hessonite is rather a soft stone, its hardness being about that of quartz or 7, whilst the hardness of most garnet reaches 7.5. Cinnamon-stone comes chiefly from Ceylon, where it is found generally as pebbles, though its occurrence in its native matrix is not unknown.

CINNAMUS [KINNAMO], JOHN, Byzantine historian, flourished in the second half of the 12th century. He was imperial secretary (probably in this case a post connected with the military administration) to Manuel I. Comnenus (1143-1180), whom he accompanied on his campaigns in Europe and Asia Minor. He appears to have outlived Andronicus I., who died in 1185. Cinnamus was the author of a history of the period 1118-1176, which thus continues the Alexiad of Anna Comnena, and embraces the reigns of John II. and Manuel I., down to the unsuccessful campaign of the latter against the Turks, which ended with the disastrous battle of Myriokephalon and the rout of the Byzantine army. Cinnamus was probably an eye-witness of the events of the last ten years which he describes. The work breaks off abruptly; originally it no doubt went down to the death of Manuel, and there are indications that, even in its present form, it is an abridgment. The text is in a very corrupt state. The author's hero is Manuel; he is strongly impressed with the superiority of the East to the West, and is a determined opponent of the pretensions of the papacy. But he cannot be reproached with undue bias: he writes, with the
straightforwardness of a soldier, and is not ashamed on occasion to confess his ignorance. The matter is well arranged, the style (modelled on that of Xenophon) simple, and on the whole free from the usual florid boast of the Byzantine writers.

**CINNOLIN**, C$_3$H$_7$N$_2$, a compound isomeric with phthalazine, prepared by boiling dihydrocinnolin dissolved in benzene with freshly precipitated mercuric oxide. The solution is filtered and the hydrochloride of the base precipitated by alcoholic hydrochloric acid; the free base is obtained as an oil by adding caustic soda. It may be obtained in white silky needles, melting at 24–25° C. and containing a molecule of ether of crystallization by cooling the oil dissolved in ether. The free base melts at 39° C. It is a strong base, forming stable salts with mineral acids, and is easily soluble in water and in the ordinary organic solvents. It has a taste resembling that of chloral hydrate, and leaves a sharp irritation for some time on the tongue; it is also very poisonous (M. Busch and A. Raet, Berichte, 1857, 30, p. 521). Cinnolin derivatives are obtained from oxyquinolin, carboxylic acid, which is formed by digesting orthophenyl propionic acid diazo chloride with water. Oxyquinolin carboxylic acid on heating gives oxyquinolin, melting at 225°, which with phosphorus pentachloride gives chlorquinolin. This substance is reduced by iron filings and sulphuric acid to dihydrocinnolin.

The relations of these compounds are here shown:

```
\[

```

**CINO DA PISTOA** (1270–1336), Italian poet and jurist, whose full name was GUTTORCINO DE'SINIBALDI, was born in Pistoia, of a noble family. He studied law at Bologna under Dinus Muggelenus (Dino de Rossonis: d. 1303) and Franciscus Accursius, and in 1307 is understood to have been assessor of civil causes in his native city. In that year, however, Pistoia was disturbed by the Guelph and Ghibelline feud. The Ghibelines, who had for some time been the stronger party, being worsted by the Guelphs, Cino, a prominent member of the former faction, had to quit his office and the city of his birth. Pitechino, a stronghold on the frontiers of Lombardy, was yet in the hands of Filippo Vergiolesi, chief of the Pistoian Ghibelines; Selvaggia, his daughter, was beloved by Cino (who was probably already the husband of Margherita degli Ugli); and to Pitechino did the lawyer-poet betake himself. It is uncertain how long he remained at the fortress; it is certain, however, that he was not with the Vergiolesi at the time of Selvaggia's death, which happened three years afterwards (1310), at the Monte della Sambuca, in the Apennines, whither the Ghibelines had been compelled to shift their camp. He visited his mistress' grave on his way to Rome, after some time spent in travel in France and elsewhere, and to this visit is owing his finest sonnet. At Rome Cino held office under Louis of Savoy, sent thither by the Ghibelline leader Henry of Luxemburg, who was crowned emperor of the Romans in 1312. In 1313, however, the emperor died, and the Ghibelines lost their last hope. Cino appears to have thrown up his party, and to have returned to Pistoia.

Thereafter he devoted himself to law and letters. After filling several high judicial offices, a doctor of civil law of Bologna in his forty-fourth year, he lectured and taught from the professor's chair at the universities of Treviso, Siena, Florence and Perugia in succession; his reputation and success were great, his judicial experience enabling him to travel out of the routine of the schools. In literature he continued in some sort the tradition of Dante during the interval dividing that great poet from his successor Petrarch. The latter, besides celebrating Cino in an obituary sonnet, has coupled him and his Selvaggia with Dante and Beatrice in the fourth capitolio of his Trionfi d'Amore.

Cino, the master of Bartolus, and of Joanna Andrease the celebrated canonist, was long famed as a jurist. His commentary on the statutes of Pistoia, written within two years, is said to have great merit; while that on the code (Lectura Cino Pistoia super codicis, Pavia, 1483; Lyons, 1526) is considered by Savigny to exhibit more practical intelligence and more originality of thought than are found in any commentary on Roman law since the time of Accursius. As a poet he also distinguished himself greatly; he was the friend and correspondent of Dante's later years, and possibly of his earlier also, and was certainly, with Guido Cavalcanti and Durante da Maiano, one of those who replied to the famous sonnet A ciascun' alma presa e gentil core of the Vita Nuova. In the treatise De Vulgari Eloquio Dante refers to him as one of "those who have most sweetly and subtly written poems in modern Italian," but his works, printed at Rome in 1550, do not altogether justify the praise. Strained and rhetorical as many of his outcries are, however, Cino is not without moments of true passion and fine natural eloquence. Of these qualities the sonnet in memory of Selvaggia, Io fui in sull' alto e in sul beato monte, and the canzone to Dante, Avegnaché di omaggio più per tempo, are interesting examples.

The text-book for English readers is D. G. Rossetti's Early Italian Poets (Oxford, 1866), which gives a complete account of Cino's life and work; but also some admirably translated specimens of his verse—the whole wrought into significant connexion with that friendship of Cino's which is perhaps the most interesting fact about him. See also Ciampi, Vita e poesie di messer Cino da Pistoia (Pisa, 1813).

**CINQ-MARS, HENRI COIFFIER RÚZÉ D'EFFAIT, MARQUIS DE** (1620–1692), French courtier, was the second son of Antoine Coiffer Ruzé, marquis d'Effait, marshal of France (1581–1672), and was introduced to the court of Louis XIII. by Richelieu, who had been a friend of his father and who hoped he would counteract the influence of the queen's favourite Mlle. de Hautefort. Owing to his handsome appearance and agreeable manners he soon became a favourite of the king, and was made successively master of the wardrobe and master of the horse. After distinguishing himself at the siege of Arras in 1640, Cinq-Mars wished for a high military command, but Richelieu opposed his pretensions and the favourite talked rashly about overthrowing the minister. He was probably connected with the abortive rising of the count of Soissons in 1641; however that may be, in the following year he formed a conspiracy with the duke of Bouillon and others to overthrow Richelieu. This plot was under the nominal leadership of the king's brother, the Prince of Orange. The plans of the conspirators were aied by the illness of Richelieu and his absence from the king, and at the siege of Narbonne Cinq-Mars almost induced Louis to agree to banish his minister. Richelieu, however, recovered, became acquainted with the attempt of Cinq-Mars to obtain assistance from Spain, and laid the proofs of his treason before the king, who ordered his arrest. Cinq-Mars was brought to trial, admitted his guilt, and was condemned to death. He was executed at Lyons on the 12th of September 1642. It is possible that Cinq-Mars was urged to engage in this conspiracy by his affection for Louise Marie de Gonzaga (1612–1667), afterwards queen of Poland, who was a prominent figure at the court of Louis XIII.; and this tradition forms part of the plot of Alfred de Vigny's novel Cinq-Mars.

See Le P. Griffet, Histoire de Louis XIII.; A. Bazin, Histoire de Louis XIV. (1846); L. D'ASTARACE, Frontrailles, Relations des choses particulières de la cour pendant la faveur de M. de Cinq-Mars.

**CINQUECENTO** (Italian for five hundred; short for 1500), in architecture, the style which became prevalent in Italy in the century following 1500, now usually called "16th-century work." It was the result of the revival of classic architecture known as Renaissance, but the change had commenced already a century earlier, in the works of Ghiberti and Donatello in sculpture, and of Brunelleschi and Alberti in architecture.

**CINQUE PORTS**, the name of an ancient jurisdiction in the south of England, which is still maintained with considerable modifications and diminished authority. As the name implies,
the ports originally constituting the body were only five in number—Hastings, Romney, Hythe, Dover and Sandwich; but to these were afterwards added the "ancient towns" of Winchelsea and Rye with the same privileges, and a good many other places, both corporate and non-corporate, which, with the title of limb or member, held a subordinate position. To Hastings were attached the corporate members of Pevensey and Seaford, and the non-corporate members of Bulverhythe, Petit Iam (Yham or Higham), Hydeny, Bekebourn, Northney and Grenche or Grange; to Romney, Lydd, and Old Romney, Dengemarsh, Orwellstone, and Bremehill or Promehill; to Dover, Folkstone and Faversham, and Margate, St John's, Goresend (now Birchington), Birchington Wood (now Woodchurch), St Peter's, Kingsdown and Ringwould; to Sandwich, Fordwich and Deal, and Walmer, Ramsgate, Reculver, Stonor (Estanor), Sarre (or Serre) and Brightlingsea (in Essex). To Rye was attached the corporate member of Tenterden, and to a Hythe the non-corporate member of West Hythe. The jurisdiction thus extends along the coast from Seaford in Sussex to Birchington near Margate in Kent; and it also includes a number of inland districts, at a considerable distance from the ports with which they are connected. The non-incorporated members are within the municipal jurisdiction of the ports to which they are attached; but the corporate members are as free within their own liberties as the individual ports themselves.

The incorporation of the Cinque Ports had its origin in the necessity for some means of defending along the southern seaboard of England, and in the lack of any regular navy. Up to the reign of Henry VII they had to furnish the crown with nearly all the ships and men that were needful for the state; and for a long time after they were required to give large assistance to the permanent fleet. The oldest charter now on record is one belonging to the 6th year of Edward I; and it refers to previous documents of the time of Edward the Confessor and William the Conqueror. In return for their services the ports enjoyed extensive privileges. From the Conquest or even earlier they had, besides various lesser rights—(1) exemption from tax and tallage; (2) soc and soc, or full cognizance of all criminal and civil cases within their liberties; (3) tol and team, or the right of receiving toll and the right of compelling the person in whose hands stolen property was found to name the person from whom he received it; (4) bledwit and redwit, or the right to punish shedders of blood and those who were seized in an attempt to escape from justice; (5) pillory and tumbrel; (6) infangtenheof and outfangtenheof, or power to imprison and execute felons; (7) mundbryce (the breaking into or violation of a man's mund or property in order to erect banks or dikes as a defence against the sea); (8) waives and strays, or the right to appropriate lost property or cattle not claimed within a year and a day; (9) the right to seize all flotsam, jetsam, or lign, or, in other words, whatever of value was cast ashore by the sea; (10) the privilege of being a gild with power to impose taxes for the common weal; and (11) the right of assembling in portmote or parliament at Shipway or Shipway Cross, a few miles west of Hythe (but afterwards at Dover), the parliament being empowered to make by-laws for the Cinque Ports, to regulate the Yarmouth fishery, to hear appeals from the local courts, and to give decision in all cases of treason, sedition, illegal coinage or concealment of treasure trove.

The ordinary business of the ports was conducted in two courts known respectively as the court of brotherhood and the court of brotherhood and guestling,—the former being composed of the mayors of the seven principal towns and a number of jurats and freemen from each, and the latter including in addition the mayors, baillifs and other representatives of the corporate members. The court of brotherhood was formerly called the brotheryceld, broadal or brodhull; and the name guestling seems to owe its origin to the fact that the officials of the "members" were at first in the position of invited guests.

The highest office in connexion with the Cinque Ports is that of the lord warden, who also acts as governor of Dover Castle, and has a maritime jurisdiction (vide infra) as admiral of the ports. His power was formerly of great extent, but he has now practically no important duty to exercise except that of chairman of the Dover harbour board. The emoluments of the office are confined to certain insignificant admiralty droits. The patronage attached to the office consists of the right to appoint the judge of the Cinque Ports admiralty court, the registrar of the Cinque Ports and the marshal of the court; the right of appointing salvage commissioners at each Cinque Port and the appointment of a deputy to act as chairman of the Dover harbour board in the absence of the lord warden. Walmer Castle was for long the official residence of the lord warden, but, since the resignation of Lord Curzon in 1903, ceased to be so used, and those portions of it which are of historic interest are now open to the public. George, prince of Wales (lord warden, 1903-1907), was the first lord warden of royal blood since the office was held by George, prince of Denmark, consort of Queen Anne.

Admiralty Jurisdiction.—The court of admiralty for the Cinque Ports exercises a co-ordinate but not exclusive admiralty jurisdiction over persons and things found within the territory of the Cinque Ports. The limits of its jurisdiction were declared at an inquisition taken at the court of admiralty, held by the seadise at Dover in 1682, to extend from Shore Beacon in Essex to Redcliff, near Seaford, in Sussex; and with regard to salvage, they comprise all the sea between Seaford in Sussex to a point five miles off Cape Grizine on the coast of France, and the coast of Essex. An older inquisition of 1536 is given by R.G. Marsden in his Select Pleas of the Court of Admiralty, II. xxx. The court is an ancient one. The judge sits as the official and commissary of the lord warden, just as the judge of the high court of admiralty sat as the official and commissary of the lord high admiral. And, as the office of lord warden is more ancient than the office of lord high admiral (The Lord Warden v. King in his office of Admiralty, 1831, 2 Hagg. Admy. Rep. 438), it is probable that the Cinque Ports court is the more ancient of the two.

The jurisdiction of the court has been, in one matter of mere antiquarian curiosity, unaffected by statute. It exercises only, therefore, such jurisdiction as the high court of admiralty exercised, apart from restraining statutes of 1389 and 1391 and enabling statutes of 1840 and 1861. Cases of collision have been tried in it (the "Vivid," 1 Asp. Maritime Law Cases, 601). But salvage cases (the "Clarisse," Swaby, 129; the "Marie," Law. Rep. 7 P. D. 203) are the principal cases now tried. It has no prize jurisdiction. The one case in which jurisdiction has been given to it by statute is to enforce forfeitures under the statute of 1538.

Dr (afterwards the Right Hon. Robert Joseph) Phillimore succeeded his father as judge of the court from 1855 to 1875, being succeeded by Mr Arthur Cohen, K.C. As Sir R. Phillimore was also the last judge of the high court of admiralty, from 1867 (the date of his appointment to the high court) to 1875, the two offices were, probably for the first time in history, held by the same person. Dr Phillimore's patent had a grant of the "place or office of judge official and commissary of the court of admiralty of the Cinque Ports, and their members and appurtenances, and to be assistant to my lieutenant of Dover castle in all such affairs and business concerning the said court of admiralty wherein yourself and assistance shall be requisite and necessary." Of old the court sat sometimes at Sandwich, sometimes at other ports. But the regular place for the sitting of the court has for a long time been, and still is, the aisle of St James's church, Dover. For convenience the judge often sits at the royal courts of justice. The office of marshal in the high court is represented in this court by a serjeant, who also bears a silver oar. There is a registrar, as in the high court. The appeal is to the king in council, and is heard by the judicial committee of the privy council. The court can hear appeals from the Cinque Ports salvage commissioners, such appeals being final (Cinque Ports Act 1821). Actions may be transferred to it, and appeals made to it, from the county courts in all cases arising within the jurisdiction of the Cinque Ports as defined by that act. At the solemn installation of the lord warden the judge as the next principal officer installs him.
CINTRA—CIPRIANI

The Cintra Ports from the earliest times claimed to be exempt from the jurisdiction of the admiral of England. Their early charters do not, like those of Bristol and other seaports, express this exemption in terms. It seems to have been derived from the general words of the charters which preserve their liberties and privileges.

The lord wardens’ claim to prize was raised in, but not finally decided by, the high court of admiralty in the “Ooster Ems,” 1 C. Rob. 284, 1783.

See S. Jeake, Charters of the Cintra Ports (1728); Boys, Sandwich and Cintra Ports; Knocker, Grand Court of Shipway (1862); M. Burrows, Cintra Ports (1895); F. M. Huesler, Cintra Ports (1900); Indices of the Great White and Black Books of the Cintra Ports (1905).

CINTRA, a town of central Portugal, in the district of Lisbon, formerly included in the province of Estremadura; 17 m. W.N.W. of Lisbon by the Lisbon-Caçem-Cintra railway, and 6 m. N. by E. of Cape da Roca, the westernmost promontory of the European mainland. Pop. (1900) 5914. Cintra is magnificently situated on the northern slope of the Serra da Cintra, a rugged mountain mass, largely overgrown with pines, eucalyptus, cork and other forest trees, above which the principal summits rise in a succession of bare and jagged grey peaks; the highest being Cruz Alta (1772 ft.), marked by an ancient stone cross, and commanding a wonderful view southward over Lisbon and the Tagus estuary, and north-westward over the Atlantic and the plateau of Mafra. Few European towns possess equal advantages of position and climate; and every educated Portuguese is familiar with the verses in which the beauty of Cintra is celebrated by Byron in Childe Harold (1812), and by Camoens in the national epic Os Lusíadas (1572). One of the highest points of the Serra is surmounted by the Palacio da Pena, a fantastic imitation of a medieval fortress, built on the site of a Hieronymite convent by the prince consort Ferdinand of Saxe-Coburg (d. 1883); while an adjacent part of the range is occupied by the Castelo dos Mouros, an extensive Moorish fortification, containing a small ruined mosque and a very curious set of ancient cisterns. The lower slopes of the Serra are covered with the gardens and villas of the wealthier inhabitants of Lisbon, who migrate hither in spring and stay until late autumn.

In the town itself the most conspicuous building is a 14th-15th-century royal palace, partly Moorish, partly dehased Gothic in style, and remarkable for the two immense conical chimneys which rise like towers in the midst. The 15th-century Palacio de Seteas, built in the French style then popular in Portugal, is said to derive its name (“Seven Afts”) from a sevenfold echo; here, on the 22nd of August 1808, was signed the convention of Cintra, by which the British and Portuguese allowed the French army to evacuate the kingdom without molestation. Beside the road which leads for 3½ m. W. to the village of Collares, celebrated for its wine, is the Penha Verde, an interesting country house and chapel, founded by Joao de Castro (1500–1548), fourth viceroy of the Indies. De Castro also founded the convent of Santa Cruz, better known as the Convento de Cortiga or Cork convent, which stands at the western extremity of the Serra, and owes its name to the cork panels which formerly lined its walls. Beyond the Penha Verde, on the Collares road, are the palace and park of Montserrat. The palace was originally built by William Beckford, the novelist and traveller (1760–1844), and was purchased in 1856 by Sir Francis Cook, an Englishman who afterwards obtained the Portuguese title viscount of Montserrat. The palace, which contains a valuable library, is built of pure white stone, in Moorish style; its walls are elaborately sculptured. The park, with its tropical luxuriance of vegetation and its variety of lake, forest and mountain scenery, is by far the finest example of landscape gardening in the Iberian Peninsula, and probably among the finest in the world. The high-lying lakes, which overlook the Atlantic, are as perfect as any in England and there is one reservoir containing a whole wood of giant tree-ferns from New Zealand. Other rare plants have been systematically collected and brought to Montserrat from all parts of the world by Sir Francis Cook, and afterwards by his successor, Sir Frederick Cook, the second viscount.

The Praia das Maçãs, or “beach of apples,” in the centre of a rich fruit-bearing valley, is a favourite sea-bathing station, connected with Cintra by an extension of the electric tramway which runs through the town.

CIPEDH (Latin for Cypari), or CIPESDHI, was the symbol of a cipher (see CRYPTOGRAPHY), or even for shorthand (q.v.), and also in elementary education for doing simple sums (“cifpering”).

CIPUS (Lat. for a “post” or “stake”), in architecture, a low pedestal, either round or rectangular, set up by the Romans for various purposes such as military or mile stones, boundary posts, &c. The inscriptions on some in the British Museum show that they were occasionally funeral memorials.

CIPRIANI, GIOVANNI BATTISTA (1727–1782), Italian painter and engraver, Pistoiese by descent, was born in Florence in 1727. His first lessons were given him by an Englishman, Ignatius Heckford or Hugford, and under his second master, Antonio Domenico Gabbiani, he became a very clever draughtsman. He was in Rome from 1750 to 1755, where he became acquainted with Sir William Chambers, the architect, and Joseph Wilton, the sculptor, whom he accompanied to England in August 1755. He had already painted two pictures for the abbey of San Michele in Pelago, Pistoia, which had brought him reputation, and on his arrival in England he was patronized by Lord Tilney, the duke of Richmond and other noblemen. His acquaintance with Sir William Chambers no doubt helped him on, for when Chambers designed the Albany in London for Lord Holland, Cipriani painted a ceiling for him. He also painted part of a ceiling in Buckingham Palace, and a room with poetical subjects at Standlynch in Wiltshire. Some of his best and most permanent work was, however, done at Somerset House, built by his friend Chambers, upon which he lavished infinite pains. He not only prepared the decorations for the interior of the north block, but, says Joseph Baretti in his Guide through the Royal Academy (1780), “did the whole of the carvings in the various fronts of Somerset Place—representing Bacon’s bronze figures —were of course never finished drawings made by Cipriani.” These designs include the five masks forming the keystones on the arches on the courtyard side of the vestibule, and the two above the doors leading into the wings of the north block, all of which are believed to have been carved by Nollekens. The grotesque groups flanking the main doorways on three sides of the quadrangle and the central doorway on the terrace appear also to have been designed by Cipriani. The apartments in Sir William Chambers’s stately palace that were assigned to the Royal Academy, into which it moved in 1780, owed much to Cipriani’s graceful, if manured, pencil. The central panel of the library ceiling was painted by Sir Joshua Reynolds, but the four compartments in the coves, representing Allegory, Fable, Nature and History, were Cipriani’s. These paintings still remain at Somerset House, together with the emblematic painted ceiling, also his work, of what was then the library of the Royal Society. It was natural that Cipriani should thus devote himself to adorning the apartments of the academy, since he was an original member (1768) of that body, for which he designed the diploma so well engraved by Bartolozzi. In recognition of his services in this respect the members presented him in 1769 with a silver cup with a commemorative inscription. He was much employed by the publishers, for whom he made drawings in pen and ink, sometimes coloured. His friend Bartolozzi engraved most of them. Drawings by him are in both the British Museum and Victoria and Albert Museum. His best autograph engravings are “The Death of Cleopatra,” after Benvenuto Cellini; “The Descent of the Holy Ghost,” after Gabbiani; and portraits for Hollis’s memoirs, 1785. He painted allegorical designs for George III’s state coach—which is still in use—in 1783, and repaired Verrio’s paintings at Windsor and Hubback’s ceiling in the Banqueting House at Whitehall. If his pictures were courageous and productive, his treatment of children was usually exceedingly happy. Some of his most pleasing work was that which, directly or indirectly, he executed for the decoration of furniture. He designed many groups of nymphs and amorini and medallion subjects to form
the centre of Pergolesi's hands of ornament, and they were continually reproduced upon the elegant satin-wood furniture which was growing popular in his later days and by the end of the 18th century, became a rage. Sometimes these designs were inlaid in marqueterie, but most frequently they were painted upon the satin-wood by other hands with delightful effect, since in the whole range of English furniture there is nothing more enchanting than really good finished satin-wood pieces. There can be little doubt that some of the beautiful furniture designed by the Adams was actually painted by Cipriani himself. He also occasionally designed handles for drawers and doors. Cipriani died at Hammersmith in 1785 and was buried at Chelsea, where Bartolozzi erected a monument to his memory. He had married an English lady, by whom he had two sons.

**CIRCAR**, an Indian term applied to the component parts of a **sabah** or province, each of which is administered by a deputy-governor. In English it is principally employed in the name of the **Northern Circars**, used to designate a now obsolete division of the Madras presidency, which consisted of a narrow strip of territory lying along the western side of the Bay of Bengal from 15° 40' to 20° 17' N. lat. These Northern Circars were five in number, Chichaco, Rajahmundry, Ellore, Kondapalli and Guntur, and their total area was about 30,000 sq. m. The district corresponds in the main to the modern districts of Kistna, Godavari, Vizagapatam, Ganjam and a part of Nellore. It was first invaded by the Mahomedans in 1471; in 1541 they conquered Kondapalli, and nine years later they extended their conquests over all Guntur and the districts of Masulipatam. But the invaders appear to have acquired only an imperfect possession of the country, as it was again wrested from the Hindu princes of Orissa about the year 1571, during the reign of Ibrahim, of the Kuth Shahi dynasty of Hyderabad or Golconda. In 1687 the Circars were added, along with the empire of Hyderabad, to the extensive empire of Aurangzeb. Salabat Jang, the son of the nizam ul mulk Asaf Jah, who was indebted for his elevation to the throne to the French East India Company, granted them in return for their services the district of Kondavid or Guntur, and soon afterwards the other Circars. In 1759, by the conquest of the fortress of Masulipatam, the dominion of the maritime provinces on both sides, from the river Gundlakamma to the Chikla lake, was necessarily transferred from the French to the British. But the latter left them under the hukum to protect them from the incursions of the town and fortress of Masulipatam, which were retained by the English East India Company. In 1765 Lord Clive obtained from the Mogul emperor Shah Alam a grant of the five Circars. Hereupon the fort of Kondapalli was seized by the British, and on the 12th of November 1766 a treaty of alliance was signed with Nizam Ali by which the Company, in return for the grant of the Circars, undertook to maintain troops for the nizam's assistance. By a second treaty, signed on the 1st of March 1768, the nizam acknowledged the validity of Shah Alam's grant and resigned the Circars to the Company, receiving as a mark of friendship an annuity of £50,000. Guntur, as the personal estate of the nizam's brother Basalat Jang, was excepted during his lifetime under both treaties. He died in 1762, but it was not till 1780 that Guntur came under British administration. Finally, in 1823, the claims of the nizam over the Northern Circars were bought outright by the Company, and they became a British possession.

**CIRCASSIA**, a name formerly given to the north-western portion of the Caucasus, including the district between the mountain range and the Black Sea, and extending to the north of the central range as far as the river Kuban. Its physical features are described in the article on the Russian province of KUBAN, with which it approximately coincides. The present article is confined to a consideration of the ethnographical relations and characteristics of the people, their history being treated under CAUCASIA.

The Cherkesses or Circassians, who gave their name to this region, of which they were until lately the sole inhabitants, are a peculiar race, differing from the other tribes of the Caucasus in origin and language. They designate themselves by the name of Adighheh, that of Cherkesses being a term of Russian origin. By their long-continued struggles with the power of Russia, during a period of nearly forty years, they attracted the attention of the other nations of Europe in a high degree, and were at the same time an object of interest to the student of the history of civilization, from the strange mixture which their customs exhibited of chivalrous sentiment with savage customs. For this reason it may be still worth while to give a brief summary of their national characteristics and manners, though these may be regarded as in great measure things of the past.

In the patriarchal simplicity of their manners, the mental qualities with which they were endowed, the beauty of form and regularity of feature by which they were distinguished, they surpassed most of the other tribes of the Caucasus. At the same time they were remarkable for their warlike and intrepid character, their independence, their hospitality to strangers, and that love of country which they manifested in their determined resistance to an almost overwhelming power during the period of a long and desolating war. The government under which they lived was a peculiar form of the feudal system. The free Circassians were divided into three distinct ranks, the princes or pshi, the nobles or work (Tanar naslen), and the peasants or kokoll. Like the inhabitants of the other regions of the Caucasus, they were also divided into numerous families, tribes or clans, some of which were very powerful, and carried on war against each other with great animosity. The slaves, of whom a large proportion were prisoners of war, were generally employed in the cultivation of the soil, or in the domestic service of some of the principal chiefs.

The will of the people was acknowledged as the supreme source of authority; and every free Circassian had a right to express his opinion in those assemblies of his tribe in which the questions of peace and war, almost the only subjects which engaged their attention, were brought under deliberation. The princes and nobles, the leaders of the people in war and their rulers in peace, were only the administrators of a power which was delegated to them. As they had no written laws, the administration of justice was regulated solely by custom and tradition, and in those tribes professing Mahomedanism by the precepts of the Koran. The most aged and respected inhabitants of the various clans or villages frequently sat in council, and the decisions were received without a murmur by the contending parties. The Circassian princes and nobles were professedly Mahomedans; but in their religious services many of the ceremonies of their former heathen and Christian worship were still preserved. A great part of the people had remained faithful to the worship of their ancient gods—Shible, the god of thunder, of war and of justice; Tlep, the god of fire; and Secceres, the god of water and of winds. Although the Circassians are said to have possessed minds capable of the highest cultivation, the arts and sciences, with the exception of poetry and music, were completely neglected. They possessed no written language. The wisdom of their sages, the knowledge they had acquired, and the memory of their warlike deeds were preserved in verses, which were repeated from mouth to mouth and descended from father to son.

The Circassian was confined to riding, fencing, shooting, hunting, and such exercises as were calculated to strengthen his frame and prepare him for a life of active warfare. The only intellectual duty of the atalik or instructor, with whom the young men lived until they had completed their education, was that of teaching them to express their thoughts shortly, quickly and appropriately. One of their marriage ceremonies was very strange. The young man who had been approved by the parents, and had paid the stipulated price in money, horses, oxen, or sheep for his bride, was expected to come with his friends fully armed, and to carry her off by force from her father's house. Every free Circassian had unlimited right over the lives of his wife and children. Although polygamy was allowed by the laws of the Koran, the custom of the country forbade it, and the Circassians were generally faithful to the
marriage bond. The respect for superior age was carried to such an extent that the young brother used to rise from his seat when his father, who was in the apartment, and was silent when he spoke. Like all the other inhabitants of the island, the Circassians were distinguished for two very opposite qualities: the most generous hospitality and implacable vindictiveness. Hospitality to the stranger was considered one of the most sacred duties. Whatever was his rank in life, all the members of the family rose to receive him on his entrance, and conduct him to the principal seat in the apartment. The host was considered responsible with his own life for the security of his guest, upon whom, even although his deadliest enemy, he would inflict no injury while under the protection of his roof. The chief who had received a stranger was also bound to grant him an escort of horse to conduct him in safety on his journey, and confide him to the protection of those nobles with whom he might be on friendly terms. The law of vengeance was no less binding on the Circassian. The individual who had slain any member of a family was pursued with implacable vengeance by the relatives, until his crime was expiated by death. The murderer might, indeed, secure his safety by the payment of a certain sum of money, or by carrying off from the house of his enemy a newly-born child, bringing it up as his own, and restoring it when its education was finished. In either case, the family of the slain individual might discontinue the pursuit of vengeance without any stain upon its honour. The man closely followed by his enemy, who, on reaching the dwelling of a woman, had merely touched her hand, was safe from all other pursuit so long as he remained under the protection of her roof. The opinions of the Circassians regarding theft resembled those of the ancient Spartans. The commission of the crime was not considered so disgraceful as its discovery; and the punishment of being compelled publicly to restore the stolen property to its original possessor, amid the derision of his tribe, was much dreaded by the Circassian who would glory in a successful theft. The greatest stain upon the Circassian character was the custom of the merchants, who, in order to fulfill faithfully the duties of their children, the Circassian father being always willing to part with his daughters, many of whom were bought by Turkish merchants for the harems of Eastern monarchs. But no degradation was implied in this transaction, and the young women themselves were generally willing partners in it. Herds of cattle and sheep constituted the chief riches of the inhabitants. The princes and nobles, from whom the members of the various tribes held the land which they cultivated, were the proprietors of the soil. The Circassians carried on little or no commerce, and the state of perpetual warfare in which they lived prevented them from cultivating any of the arts of peace.

CIRCE (Gr. Kípros), in Greek legend, a famous sorceress, the daughter of Helios and the ocean nymph Perse. Having murdered her husband, the prince of Colchis, she was expelled by her subjects and placed by her father on the solitary island of Aeaean on the coast of Italy. She was able by means of drugs and incantations to change human beings into the forms of wolves or lions, and with these beings her palace was surrounded. Here she was found by Odyssey and his companions; the latter she changed into swine, but the hero, protected by the herb moly (molybōs), which he had received from Hermes, not only forced her to restore them to their original shape, but also gained her love. For a year he relinquished himself to her endearments, and when he determined to leave, she instructed him how to sail to the land of shades which lay on the verge of the ocean stream, in order to learn his fate from the prophet Teiresias. Upon his return she also gave him directions for avoiding the dangers of the journey home (Homer, Odyssey, x.-xii.; Hyginus, Fab. 125). The Roman poets associated her with the most ancient traditions of Latium, and assigned her a home on the promontory of Circei (Virgil, Aeneid, vii. 40). The metamorphoses of Scylla and of Picus, king of the Ausonians, by Circe, are narrated in Ovid (Metamorphoses, xiv.).

The Myth of Kirke, by R. Brown (1885), in which Circe is explained as a moon-goddess of Babylonian origin, contains an exhaustive summary of facts, although many of the author’s speculations may be proved untenable (review by H. Bradley in Academy, January 19, 1884); see also J. E. Harrison, Myth of the Odyssey (1882); C. Seeliger in W. H. Roscher’s Lexikon der Mythologie.

CIRCEI MONS (mod. Monte Circeo), an isolated promontory on the S.W. coast of Italy, about 80 m. S.E. of Rome. It is a ridge of limestone about 35 m. long by 1 x m. wide at the base, running from E. to W. and surrounded by the sea on all sides except the N. The land to the N. of it is 53 ft. above sea-level, while the summit of the promontory is 1775 ft. The origin of the name is uncertain: it has naturally been connected with the legend of Circe, and Victor Bérard (in Les Phéniciens et l’Odysée, ii. 261 seq.) maintains in support of the identification that Alain, the Greek name for the island of Circe, is a faithful transliteration of a Semitic name, meaning “island of the hawk,” of which yapni Kipper is the translation. The difficulty has been raised, especially by geologists, that the promontory ceased to be an island at a period considerably later than the time of Homer; but Procopius very truly remarked that the promontory has all the appearance of an island until one is actually upon it. Upon the E. end of the ridge of the promontory are the remains of an enceinte, forming roughly a rectangle of about 200 by 100 yds. of very fine polygonal work, on the outside, the blocks being very carefully cut and jointed and right angles being intentionally avoided. The wall stands almost entirely free, as at Arpinum—polygonal walls in Italy are as a rule embanking walls—and increases considerably in thickness as it descends. The blocks of the inner face are much less carefully worked both here and at Arpinum. It seems to have been an acropolis, and contains no traces of buildings, except for a subterranean cistern, circular, with a beehive roof of converging blocks. The modern village of S. Felice Circeo seems to occupy the site of the ancient town, the area of which stood on the mountain top, for its medieval walls rest upon ancient walls of Cyclopean work of less careful construction than those of the citadel, and enclosing a area of 200 by 150 yds. Circei was founded as a Roman colony at an early date—according to some authorities in the time of Tarquinius Superbus, but more probably about 300 B.C. The existence of a previous population, however, is very likely indicated by the revolt of Circei in the middle of the 4th century B.C., so that it is doubtful whether the walls described are to be attributed to the Romans or the earlier Volscian inhabitants. At the end of the republic, however, or at latest at the beginning of the imperial period, the city of Circei was no longer at the E. end of the promontory, but on the E. shores of the Lago di Paola (a lagoon—now a considerable fishery—separated from the sea by a line of sandhills and connected with it by a channel of Roman date: Steiner speaks of it as a small harbour) one mile N. of the W. end of the promontory. Later, as a case of a Roman town, belonging to the 1st and 2nd centuries, extending over an area of some 600 by 500 yds, and consisting of fine buildings along the lagoons, including a large open piscina or basin, surrounded by a double portico, while farther inland are several very large and well-preserved water-reservoirs, supplied by an aqueduct of which traces may still be seen. An inscription speaks of an amphitheatre, of which no remains are visible. The transference of the city did not, however, mean the abandonment of the E. end of the promontory, on which stand the remains of several very large villas. An inscription, indeed, cut in the rock near S. Felice, speaks of this part of the promontarium Veneris (the only case of the use of this name) as belonging to the city of Circei. On the S. and N. sides of the promontory there are comparatively few buildings, while at the W. end there is a sheer precipice to the sea. The town only acquired municipal rights and became the seat of the Social War, and was a place of little importance, except as a seaside resort. For its villas Circeo compares it with Antium, and probably both Tiberius andDomitian possessed residences there. The beetroot and oysters of Circei had a certain reputation. The view from the highest summit of the promontory (which is occupied by ruins of a platform attributed with great probability to a temple of Venus or Circe) is remarkable; the whole mountain is covered with fragrant
CIRCLE

shrub. From any point in the Pompeii Marshes or on the coast-line of Latium the Circian promontory dominates the landscape in the most remarkable way.

CIRCLE (from the Lat. circulus, the diminutive of circuitus, a ring; the cognate Gr. word is kíkós, generally used in the form kíkón), a plane curve definable as the locus of a point which moves so that its distance from a fixed point is constant. The form of a circle is familiar to all; and we proceed to define certain lines, points, &c., which constantly occur in studying its geometry. The fixed point in the preceding definition is the "centre" (C in fig. 1); the constant distance, e.g., CG, the "radius." The circle itself is sometimes termed the "circle's circumference." Any line through the centre and terminated at both extremities by the curve, e.g., AB, is a "diameter"; any other line similarly terminated, e.g., EF, a "chord." Any line drawn from an external point to cut the circle in two points, e.g., DEF, is termed a "secant"; if it touches the circle, e.g., DG, it is a "tangent." Any portion of the circumference terminated by two points, e.g., AD (fig. 2), is termed an "arc"; and the plane figure enclosed by a chord and arc, e.g., ABD, is termed a "segment." If the chord be a diameter, the segment is termed a "semi-circle." The figure included by two radii and an arc is a "sector," e.g., ECF (fig. 2). "Concentric circles" are, as the name obviously shows, circles having the same centre; the figure enclosed by the circumferences of two concentric circles is an "annulus" (fig. 3), and of two non-concentric circles a "lune," the shaded portions in fig. 4; the clear figure is sometimes termed a "lens."

The circle was undoubtedly known to the early civilizations, its simplicity specially recommending it as an object for study. Euclid defines it (Book I. def. 15) as "a plane figure enclosed by one line, all the straight lines drawn to which from one point within the figure are equal to one another." In the succeeding three definitions the centre, diameter and the semicircle are defined, while the third postulate of the same book demanded the possibility of describing a circle for every "centre" and "distance."

Having employed the circle for the construction and demonstration of several propositions in Books I. and II. Euclid devotes his third book entirely to theories and problems relating to the circle, and certain lines and angles, which he defines in introducing the propositions. The fourth book deals with the circle in its relations to inscribed and circumscribed triangles, quadrilaterals and regular polygons. Reference should be made to the article GEOMETRY: Euclidean, for a detailed summary of the Euclidean treatment, and the elementary properties of the circle.

Analytical Geometry of the Circle.

In the article GEOMETRY: Analytical, it is shown that the general equation to a circle in rectangular Cartesian co-ordinates is

\[ x^2 + y^2 + 2gx + 2fy + c = 0, \]

e.g., in the general equation of the second degree the co-efficients of \( x^2 \) and \( y^2 \) are equal, and of \( xy \) zero. The co-ordinates of its centre are \(-g/e, -f/e\); and its radius is \((g^2 + f^2)^{1/2}\). The equations to the chord, tangent and normal are readily derived by the ordinary methods.

Consider the two circles:

\[ x^2 + y^2 + 2gx + 2fy + c = 0, \]
\[ x^2 + y^2 + 2g'x + 2f'y + c' = 0. \]

Obviously these equations show that the curves intersect in four points, two of which lie on the intersection of the line, \( 2(x - g')x + 2(f' - f)y + c - c' = 0 \), the radical axis, with the circles, and at angles \( 90^\circ \) to this line, the other two where \( x = g + x' \) and \( y = f + y' \). The circle is defined by the equation \( x^2 - 2gx + y^2 - 2fy + c = 0 \) or \( (x - g)^2 + (y - f)^2 = r^2 \), where \( r = \sqrt{c + g^2 + f^2} \). The chord joining the two points of contact lies along the line \( x = g + x' \) and \( y = f + y' \).

In various systems of triangular co-ordinates the equations to circles specially related to the triangle of reference assume comparatively simple forms; consequently they provide elegant algebraical demonstrations of properties concerning a triangle and the circles intimately associated with its geometry. In this article the equations to the more important circles—the circumscribed, inscribed, escribed, self-conjugate—will be given; reference should be made to the article TRIANGLE for the consideration of other circles (nine-point, Brocard, Lemoine, &c.); while in the article GEOMETRY: Analytical, the principles of the different systems are discussed.

The equation to the circumscribed circle is readily deduced from the fact that the circle is the only curve which intersects the line infinity in the circular points.

Consider the equation

\[ a+y+a+y+b+c = 0 \]

This obviously represents a conic passing through the circular points, i.e., a circle. If we compare (1) with the general equation of the second degree

\[ ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0, \]

we readily see that this equation represents a circle we must have

\[ -hac = a^2 + b^2 - 2bc = c^2 + a^2 - 2ac = a^2 - b^2 - 2ab \]

The corresponding equations in area co-ordinates are readily derived by substituting \( x/a, y/b, z/c \) for \( x, y, z \) respectively in the above equations. The equation of the circumcircle is then seen to be

\[ x^2 + y^2 = a^2 + b^2 - 2bc = c^2 + a^2 - 2ab = a^2 - b^2 - 2ab \]

Comparing this equation with the equation of the circumcircle, we see that the general equation of the second degree must represent a circle.

\[ (t^2 - 2tu)/a^2 = (w^2 - 2vw)/b^2 = (x^2 - 2ux)/c^2 \]

In tangential \( (p, q, r) \) co-ordinates the inscribed circle has for its equation \( (s-a)(r + s) + (s-b)(p + s) + (s-c)(p + q) = 0 \), being equal to \( s(a + b + c - t) \); an alternative form is \( q(r + s)(p + s) + c(1 - p - q - r) \).

Tangential co-ordinates.

The equation to a circle in tangential co-ordinates is \( (s-a)(r + s) + (s-b)(p + s) + (s-c)(p + q) = 0 \), or \( r(s-a) + p(s-b) + q(s-c) = 0 \), with centre \( -a-b-c \). The equation of the circumcircle is \( r + q + p = 0 \), while the equation of the incircle is \( r + q + p = 0 \). The general equation to a circle in tangential co-ordinates is therefore the condition that the co-ordinates of the circle be neither equal or zero; i.e., if \( (p, q, r) \), \( (p', q', r') \) be the ordinates of the circle and the centre, we have \( (p + q + r) = 0 \), which makes the equation homogeneous
by the relation \(2(\rho-p) (\rho-r) = 4\rho^2\) (see GEOMETRY: Analytical, which is generally written \(ap, bq, cr) \equiv 4\Delta\) we can obtain \(ap+pq-rs = 0\). The accents being dropped, and \(p, q, r\) regarded as co-ordinates. This equation, which may be more conveniently written \(ap, bq, cr) = (ap+pq-rs)\), obviously requires \(p, q, r = 0\), and radius \(2\sqrt{\lambda} = \lambda + r\). If we make \(x = y = a = 0\), it is infinite, and we obtain \(ap, bq, cr) = 0\) as the equation to the circular points.

### Systems of Circles.

#### Centres and Circle of Similitude.

The “centres of similitude” of two circles may be defined as the intersections of the common tangents to the two circles, the direct common tangents giving rise to the “external centre”, the transverse tangents to the “internal centre.” It may be readily shown that the external and internal centres are the points where the line joining the centres of the two circles is divided externally and internally in the ratio of their radii.

The circle on the line joining the internal and external centres of similitude as diameter is named the “circle of similitude.” It may be shown to be the locus of the vertex of the triangle which has for its base the distance between the centres of the circles and the ratio of the remaining sides equal to the ratio of the radius of the two circles.

With a system of three circles it is readily seen that there are six centres of similitude, viz. two for each pair of circles, and it may be shown that these lie three by three on four lines, named the “axes of similitude.” The collinear centres are the three sets of one external and two internal centres, and the three external centres.

#### Coaxal Circles.

A system of circles is coaxal when the locus of the points from which tangents to the circles are equal is a straight line. Consider the case of two circles, and in the first place suppose them to intersect in two real points A and B. Then by Euclid lii. 36 it is seen that the line joining the points A and B is the locus of the intersection of equal tangents, for if P be any point on AB and PC and PD the tangents to the circles, then PA = PB = PC = PD, and therefore PC = PD. Furthermore it is seen that AB is perpendicular to the line joining the centres, and divides it in the ratio of the squares of the radii. The line AB is termed the “radical axis.” A system coaxal with the two given circles is readily constructed by describing circles through the common points on the radical axis and any third point; the minimum circle of the system is obviously that which has the common chord of intersection for diameter, the maximum is the radical axis—considered as a circle of infinite radius. In the case of two non-intersecting circles it may be shown that the radical axis has the same metrical relations to the line of centres.

There are several methods of constructing the radical axis in this case. One of the simplest is: Let P and P’ (fig. 5) be the points of contact of a common tangent; drop perpendiculars PL, P’L from P and P’ to OO’, the joining the centres, then the radical axis bisects LL’ (at X) and is perpendicular to OO’. To prove this let AB, AB’ be the tangents from any point on the line AX. Then by Euclid VII. 23, if XOX’ = 0, then AX = P’L = AX’ = AX – DX’ = OQ’ + PD’ = DX’. Therefore AB’ = AX’ – DX’ + PD’. Similarly AB = AX – DX + PD. Since PD = PD’, it follows that AB = AB’. To construct circles coaxal with the two given circles, draw the tangent, say XR, from X, the point where the radical axis intersects the line of centres, to one of the given circles, and with centre X and radius XR describe a circle. Then circles having the intersections of tangents to this circle and the line of centres for centres, and the lengths of the tangents as radii, are members of the coaxal system.

In the case of non-intersecting circles, it is seen that the minimum circles of the coaxal system are a pair of points I and I’, where the orthogonal circle to the system intersects the line of centres; these points are named the “limiting points.” In the case of a coaxal system having real points of intersection the limiting points are imaginary. Analytically, the Cartesian equation to a coaxal system can be written in the form \(a'x^2 + y^2 + 2ax + 2kx = 0\), where a varies from member to member, while k is a constant. The radical axis is \(x = o\), and it may be shown that the length of the tangent from a point \((o, k)\) is \(\sqrt{2 (k^2 – a^2)}\), i.e. it is independent of a, and therefore of any particular member of the system. The circles intersect in real or imaginary points according to the lower or upper sign of \(k^2\), and the limiting points are real for the upper sign and imaginary for the lower sign.

The fundamental properties of coaxal systems may be summarized:

1. The centres of circles forming a coaxal system are collinear.
2. A coaxal system having real points of intersection has imaginary limiting points.
3. A coaxal system having imaginary points of intersection has real limiting points.
4. Every circle through the limiting points cuts all circles of the system orthogonally.
5. The limiting points are inverse points for every circle of the system.

The theory of centres of similitude and coaxal circles affords elegant demonstrations of the famous problem: To describe a circle to touch three given circles. This problem, also termed the “Apollonian problem,” was demonstrated with the aid of conic sections by Apollonius in his book on Contacts of Tangents; geometrical solutions involving the conic sections were also given by Adrianus Romanus, Viceta, Newton and others. The earliest analytical solution appears to have been given by the princess Elizabeth, a pupil of Descartes and daughter of Frederick V. John Casey, professor of mathematics at the Catholic university of Dublin, has given elementary demonstrations founded on the theory of similitude and coaxal circles which are reproduced in his Sequel to Euclid; an analytical solution by Gergonne is given in Salmon’s Conic Sections. Here we may notice that there are eight circles which solve the problem.

### Mensuration of the Circle.

All exact relations pertaining to the mensuration of the circle involve the ratio of the circumference to the diameter. This ratio, invariably denoted by \(\pi\), is constant for all circles, but it does not admit of exact arithmetical expression, being of the nature of an incommensurable number. Very early in the history of geometry it was known that the circumference and area of a circle of radius \(r\) could be expressed in the forms \(2\pi r\) and \(\pi r^2\).

The exact geometrical evaluation of the second quantity, viz. \(\pi r^2\), which, in reality, is equivalent to determining a square equal in area to a circle, engaged the attention of mathematicians for many centuries. The history of these attempts, together with modern contributions to our knowledge of the value and nature of the number \(\pi\), is given below (Squaring of the Circle).

The following table gives the values of this constant and several expressions involving it:

<table>
<thead>

</table>

Useful fractional approximations are \(22/7\) and \(355/113\). A synopsis of the leading formula connected with the circle will now be given.

1. Circle—Data: radius = \(r\). Circumference = \(2\pi r\). Area = \(\pi r^2\).
2. Arc and Sector—Data: radius = \(r\); \(\theta\) = circular measure of angle subtended at centre by arc; \(c\) = chord of arc; \(\alpha\) = chord of semi-arc; \(\chi\) = chord of quarter-arc.
Exact formulae are: \( \text{Arc} = 2\pi \theta \), where \( \theta \) may be given directly, or indirectly by the relation \( c = 2a \sin \frac{\theta}{2} \). Area of sector \( = \frac{1}{2} \theta r^2 \).

Approximate formulae are: \( \text{Arc} = \frac{3}{2}(4a - c) \) (Huygen’s formula); \( \text{Arc} = \frac{1}{2}(c - 400c + 250c) \).

3. Segment. - Data: \( a, \theta, c, a, \) as in (2); \( h = \text{height of segment, i.e. distance of mid-point of arc from chord.} \)

Exact formulae are: \( \text{Area} = \frac{1}{2}a^2(\theta - \sin \theta) = \frac{1}{2}c^2 - \frac{1}{2}c \theta \cot \theta = \frac{1}{2}h^2 - \frac{1}{2}h \cot \theta \). If \( h = \text{given, we can use} \ c + 4h = 8ah, 2h = c \tan \theta \) to determine \( \theta \).

Approximate formulae are: \( \text{Area} = \frac{1}{2}(4c + 8c)h; \frac{1}{2}(c + 8h)h; \frac{1}{2}(c + 2\pi - a)h \) being the true length of the arc.

From these results the mensuration of any figure bounded by circular arcs and straight lines can be determined, e.g. the area of a lune or meniscus is expressible as the difference or sum of two segments, and the circumference as the sum of two arcs. (C. E.*)

Squaring of the Circle.

The problem of finding a square equal in area to a given circle, like all problems, may be increased in difficulty by the imposition of restrictions; consequently under the designation there may be embraced quite a variety of geometrical problems. It has to be noted, however, that, when the “squaring” of the circle is especially spoken of, it is almost always tacitly assumed that the restrictions are those of the Euclidean geometry.

Since the area of a circle equals that of the rectilinear triangle whose base has the same length as the circumference and whose altitude equals the radius (Archimedes, Κώδικα του προστάτου, prop. 1), it follows that, if a straight line could be drawn equal in length to the circumference, the required square could be found by an ordinary Euclidean construction; also, it is evident that, conversely, if a square equal in area to the circle could be obtained it would be possible to draw a straight line equal to the circumference. Rectification and quadrature of the circle have thus been, since the time of Archimedes at least, practically identical problems. Again, since the circumferences of circles are proportional to their diameters—a proposition assumed to be true from the dawn almost of practical geometry—the rectification of the circle is seen to be transformable into finding the ratio of the circumference to the diameter. This correlative numerical problem and the two purely geometrical problems are inseparably connected historically.

Probably the earliest value for the ratio was 3. It was so among the Jews (1 Kings vii. 23, 26), the Babylonians (Oppert, Journ. asiatique, August 1872, October 1874), the Chinese (Biot, Journ. asiatique, June 1841), and probably also the Greeks. Among the ancient Egyptians, as would appear from a calculation in the Rhind papyrus, the number \( \frac{11}{7}, \) i.e. 3.1605, was at one time in use.\(^1\) The first attempts to solve the purely geometrical problem appear to have been made by the Greeks (Anaxagoras, &c.),\(^2\) one of whom, Hippocrates, doubtless raised hopes of a solution by his quadrature of the so-called meniscus or lune.\(^3\)

[The Greeks were in possession of several relations pertaining to the quadrature of the lune. The following are among the more interesting. In fig. 6, ABC is a luneosceles triangle right angled at C, ADB is the semicircle described on AB as diameter, AEB the circular arc described with centre C and radius CA = CB. It is easily shown that the areas of the lune ADDBEA and the triangle ABC are equal. In fig. 7, ABC is any triangle]

\(^1\)Eisenlohr, Ein math. Handbuch d. alten Ägypter, übers. u. erklärt (Leipzig, 1877); Rotlet, Bull. de la Soc. Math. de France, vii. pp. 139-149.

\(^3\)Tannery, Bull. des sc. math. [2], x. pp. 213-226.

...
The next to advance the calculation was Francisco Vieta. By finding the perimeter of the inscribed and that of the circumscribed regular polygon of 393216 sides, he proved that the ratio was >3.1415926535 and <3.1415926537, so that its value became known (in 1579) correctly to 16 fractional places. The theorem for angle-hsection which Vieta used was not that of Archimedes, but that which would now appear in the form \(1 \cos \theta = 2 \sin \frac{\theta}{2}\). With Vieta, by reason of the advance in arithmetic, the style of treatment becomes more strictly trigonometrical; indeed, the *Universales Inscriptiones*, in which the calculation occurs, would now be called plane and spherical trigonometry, and the accompanying *Canon mathematicus* a table of sines, tangents and secants. Further, in comparing the labours of Archimedes and Vieta, the effect of increased power of symbohoical expression is very noticeable. Archimedes's process of unending cycles of arithmetical operations could at best have been expressed in his time by a "rule" in words; in the 16th century it could be condensed into a "formula." Accordingly, we find in Vieta a formula for the ratio of diameter to circumference, viz. the intermediate product:

\[
\sqrt{\frac{1}{2} + \sqrt{\frac{1}{2} + \sqrt{\frac{1}{2} + \sqrt{\frac{1}{2} + \ldots}}}}
\]

From this point onwards, therefore, no knowledge whatever of geometry was necessary in any one who aspired to determine the ratio to any required degree of accuracy; the problem being reduced to an arithmetical computation. Thus in connexion with the subject a genus of workers became possible who might be styled "\(\pi\)-computers or circle-squarers"—a name which, if it connotes anything uncomplimentary, does so because of the almost entirely fruitless character of their labours. Passing over Adriaan van Roomen (Adriaen Romanus) of Louvain, who published the value of the ratio correct to 15 places in his *Ideae mathematica* (1595), we come to the notable computer Ludolph van Ceulen (d. 1610), a native of Germany, long resident in Holland. His book, *Van den Circel* (Delft, 1596), gave the ratio correct to 20 places, but he continued his calculations as long as he lived, and his best result was published on his tombstone in St Peter's church, Leiden. The inscription, which is not now to be in existence, is in part as follows:

"... Qui in vita sua multo labore circumferentiae circuli proximam rationem ad diametrum inventivit sequentem:

\[
\text{quando diam. est} \quad \text{circuit. circumferentiae plus est}
\]

\[
\text{quam} \quad 314159265358979323846264338327950288
\]

"... et minus

\[
\text{quam} \quad 314159265358979323846264338327950288
\]

This gives the ratio correct to 35 places. Van Ceulen's process was essentially identical with that of Vieta. Its numerous root extractions amply justify a stronger expression than "multo labore," especially in an epitaph. In Germany the "Ludolphische Zahl" (Ludolph's number) is still a common name for the ratio. Up to this point the credit of most that had been done may be set down to Archimedes. A new departure, however, was made by Willebrord Snell of Leiden in his *Cyclometria*, published in 1621. His achievement was a closely approximate geometrical solution of the problem of rectification (see fig. 9): ABC being a semicircle whose centre is O, and AC the arc to be rectified, he produced AB to D, making BD equal to the radius, joined DC, 

1 Vieta, Opera math. (Leiden, 1649); Marie, *Histoire des sciences math. iii. 27 seq. (Paris, 1884).

3 Kastner, *Genck. d. Math. i. (Göttingen, 1706-1800).*

4 See *Les Délits de Leide* (Leiden, 1712); or de Haan, *Maastricht. Math. ii. 24-26.*

5 For minute and lengthy details regarding the quadrature of the circle in the Low Countries, see de Haan, "Bouwstenen voor de geschiedenis, &c. &c." in *Versl. en Medeedel. d. K. Akad. van Wetens. ix., x., xi., xii. (Amsterdam); also his "Notice sur quelques quadratures, &c. &c." in *Bull. di bibliogr. e storia delle sci. mat. e fis. vii.* 99-144.

6 to any Archimedes, but could produce a stronger result than Vieta. The *Canon mathematicus* (see fig. 10) so that BD was equal to \(r\), he produced it only so far that, when the extremity \(D\) was joined with \(C\), the part \(D\)F outside the circle was equal to \(r\); in other words, by a non-Euclidean construction he dissected the angle \(AOC\), for it is readily seen that, since \(FD' = FO = OC\), the angle \(FOB = AOC\). This couplet of constructions is as important from the calculator's point of view as it is interesting geometrically. To compare it on this score with the fundamental proposition of Archimedes, the latter must be put into a form similar to Snell's. AMC being an arc of a circle (see fig. 11) whose centre is \(O\), AC its chord, and HK the tangent drawn at the middle point of the arc and bounded by OA, OC produced, then, according to Archimedes, AMC < HK, but > AC. In modern trigonometrical notation the propositions to be compared stand as follows:

\[
2 \tan \frac{\theta}{2} > 2 \sin \frac{\theta}{2} \quad \text{(Archimedes)}
\]

\[
\tan \frac{\theta}{2} + 2 \sin \frac{\theta}{2} > \frac{1}{2} \cos \theta \quad \text{(Snell)}
\]

It is readily shown that the latter gives the best approximation to \(\theta\); but, while the former requires for its application a knowledge of the trigonometrical ratios of only one angle (in other words, the ratios of the sides of only one right-angled triangle), the latter requires the same for two angles, \(\theta\) and \(\phi\)."
Archimedes, we may direct our attention either to the infinite series of geometrical operations or to the corresponding infinite series of arithmetical operations. Denoting the number of units in AB by \( \ell \), we can express \( \beta \beta \), \( \beta \beta \beta \) in terms of \( \ell \), and the identity \( A_n = AB + B_n + B_n \beta + B_n \beta + \ldots \) gives us at once the expression for the index of the circumference by means of an infinite series. The proof of the correctness of the construction is seen to be involved in the following theorem, which serves likewise to throw new light on the subject: --AB being any straight line whatever, and the above construction being made, then AB is the diameter of the circle circumscribed by the square ABCD (self-evident), \( A_1 \beta \beta \) is the diameter of the circle circumscribed by the square ABCD (self-evident), \( A_1 \beta \beta \beta \) being the diameter of the circle circumscribed by the regular 8-gon having the same perimeter as the square, \( A_1 \beta \beta \beta \) is the diameter of the circle circumscribed by the regular 16-gon having the same perimeter as the square, and so on. Essentially, therefore, Descartes's process is that known later as the process of isoperimeters, and often attributed wholly to Schwab.  

In 1655 appeared the *Arithmetica Infinitorum* of John Wallis, where numerous problems of quadrature are dealt with, the curves being now represented in Cartesian co-ordinates, and algebra playing an important part. In a very curious manner, by viewing the circle \( y = (1-x^2)^{\frac{1}{2}} \) as a member of the series of curves \( y = (1-x^2)^n \), \( y = (1-x^2)^{n+1} \), \( \ldots \), he led to the proposition that four times the reciprocal of the ratio of the circumference to the diameter, i.e., \( \frac{1}{2\pi} \), is equal to the infinite product

\[
\frac{3 \cdot 3 \cdot 5 \cdot 5 \cdot 7 \cdot 7 \cdot \cdots}{2 \cdot 4 \cdot 6 \cdot 8 \cdot 10 \cdot \cdots}
\]

and, the result having been communicated to Lord Brouncker, the latter discovered the equally curious equivalent continued fraction

\[
\frac{1 + \frac{1^2}{2 + \frac{3^2}{2 + \frac{5^2}{2 + \ldots}}}}{2}
\]

The work of Wallis had evidently an important influence on the next notable personality in the history of the subject, James Gregory, who lived during the period when the higher algebraic analysis was coming into power, and whose genius helped materially to develop it. He had, however, in a certain sense one eye fixed on the past and the other towards the future. His first contribution was a variation of the method of Archimedes. The latter, as we know, calculated the perimeters of successive polygons, passing from one polygon to another of double the number of sides; in a similar manner Gregory calculated the areas. The general theorems which enabled him to do this, after a start had been made, are

\[
A_n = \sqrt{A_{n-1}} \times A_n \quad \text{(Snell's Cylom.)}
\]

\[
A_n = \frac{2A_n}{A_{n-1}} = \frac{2A_n}{A_n + A_{n+1}} \quad \text{(Gregory)}
\]

where \( A_n \), \( A_n' \) are the areas of the inscribed and the circumscribed \( n \)-gons respectively. He also gave approximate rectifications of circular arcs after the manner of Huygens, and what is very notable, he made an ingenious and, according to J. E. Montuclis, successful attempt to show that quadrature of the circle by a Euclidean construction was impossible.  

Besides all this, however, and far beyond in importance, was his use of infinite series. This merit he shares with his contemporaries N. Mercator, Sir I. Newton and G. W. Leibnitz, and the exact dates of discovery are a little uncertain. As far as the circle-square functions are concerned, it would seem that Gregory was the first (in 1670) to make known the series for the arctan in terms of the tangent, the series for the tangent in terms of the arc, and the secant in terms of the arc; and in 1669 Newton showed to Isaac Barrow a little treatise in manuscript containing the series for the arc in terms of the sine, for the sine in terms of the arc, and for the cosine in terms of the arc. These discoveries formed an epoch in the history of mathematics generally, and had, of course, a marked influence on future investigations regarding circle-quadrature. Even among the mere computers the series

\[
\theta = \tan \theta - \frac{1}{3} \tan^3 \theta + \frac{1}{5} \tan^5 \theta - \ldots
\]

specially known as Gregory's series, has ever since been a necessity of their calling.

The calculator's work having now become easier and more mechanical, calculation went on apace. In 1699 Abraham Sharp, on the suggestion of Edmund Halley, took Gregory's series, and, putting \( \tan \theta = \frac{1}{3} \), found the ratio equal to

\[
\frac{\sqrt{2}}{\sqrt{3}} \left( 1 + \frac{1}{3} + \frac{1}{5} + \frac{1}{7} + \frac{1}{9} + \ldots \right)
\]

from which he calculated it correct to 71 fractional places.  

About the same time John Machin calculated it correct to 100 places, and, what was of more importance, gave the ratio the rapidly converging expression

\[
\frac{16}{5} \left( 1 + \frac{1}{3} + \frac{1}{5} + \frac{1}{7} + \frac{1}{9} + \ldots \right) = 4 \left( 1 + \frac{1}{3} + \frac{1}{5} + \frac{1}{7} + \frac{1}{9} + \ldots \right)
\]

which long remained without explanation.  

Fauquet de Lagny, still using the 100th place, advanced to the 127th place.  

Leonhard Euler took up the subject several times during his life, effecting mainly improvements in the theory of the various series.  

With him, apparently, began the usages of denoting by \( \pi \) the ratio of the circumference to the diameter.

The most important publication, however, on the subject in the 18th century was a paper by J. H. Lambert, read before the Berlin Academy in 1761, in which he demonstrated the irrationality of \( \pi \). The general test of irrationality which he established is that, if

\[
a_1, a_2, a_3, \ldots, b_1, b_2, \ldots
\]

be an intermediate continued fraction, \( a_1, a_2, \ldots, b_1, b_2, \ldots \) be integers, \( a_1/b_1, a_2/b_2, \ldots \) be proper fractions, and the value of every one of the intermediate continued fractions \( b_1 = \ldots, a_2, b_3 = \ldots \ldots \ldots \ldots \ldots \) be < 1, then the given continued fraction represents an irrational quantity. If this be applied to the right-hand side of the identity

\[
\tan \frac{m}{n} = m + \frac{m^2}{n - m^2 - \ldots}
\]

it follows that the tangent of every arc commensurable with the radius is irrational, so that, as a particular case, an arc of 45°, having its tangent rational, must be incommensurable with the radius; that is to say, \( \pi/4 \) is an incommensurable number.

This incontestable result had no effect, apparently, in repressing the \( \pi \)-computers. G. von Vega in 1789, using series like Machin's, viz. Gregory's series and the identities

\[
\pi/4 = 5 \tan^{-1} 2 = 2 \tan^{-1} 2 = 4 \tan^{-1} 2 (Euler, 1779), \quad \pi/4 = 2 \tan^{-1} 2 + 2 \tan^{-1} 2 (Hutton, 1770)
\]

neither of which was nearly so advantageous as several found by Charles Hutton, calculated \( \pi \) correct to 136 places. This achievement was anticipated or outdone by an unknown calculator, whose manuscript was seen in the Radcliffe library, Oxford, by Baron von Zach towards the end of the century, and contained the ratio correct to 152 places. More astonishing still have been the deeds of the \( \pi \)-computers of the 19th century.

By these computers Machin's identity, or identities analogous to it, e.g.

\[ \frac{\pi}{4} = \tan^{-1} \frac{1}{10} + \tan^{-1} \frac{1}{20} + \tan^{-1} \frac{1}{30} \]  

(Dase, 1844), 

\[ \frac{\pi}{4} = 4 \tan^{-1} \frac{1}{5} + \tan^{-1} \frac{1}{239} + \tan^{-1} \frac{1}{427} \]  

(Rutherford), 

and Gregory's series were employed.

A much less wise class than the π-computers of modern times are the pseudo-circle-squarers, or circle-squarers technically so called, that is to say, persons who, having obtained by illegitimate means a Euclidean construction for the quadrature or a finitely expressible value for π, insist on using faulty reasoning and defective mathematics to establish their assertions. Such persons have flourished at all times in the history of mathematics; but the interest attaching to them is more psychological than mathematical.

It is of recent years that the most important advances in the theory of circle-quadrature have been made. In 1873 Charles Hermite proved that the base e of the Napierian logarithms cannot be a root of a rational algebraical equation of any degree.

To prove the same proposition regarding π is to prove that a Euclidean construction for circle-quadrature is impossible. For in such a construction every point of the figure is obtained by the intersection of two straight lines, a straight line and a circle, or two circles; and as this implies that, when a unit of length is introduced, numbers employed, and the problem transformed into one of algebraic geometry, the equations to be solved can only be of the first or second degree, it follows that the equation to which we must be finally led is a rational equation of even degree. Hermite did not succeed in his attempt on π; but in 1882 F. Lindemann, following exactly in Hermite's steps, accomplished the desired result. (See also Trigonometry.)

CIRCEVILLE, a city and the county-seat of Pickaway county, Ohio, U.S.A., about 26 m. S. by S. of Columbus, on the Scioto river and the Ohio Canal. Pop. (1800) 6556; (1800) 6691 (531 negroes); (1810) 6714. It is served by the Cincinnati & Muskingum Valley (Pennsylvania lines) and the Norfolk & Western railways, and by the Scioto Valley electric line. Circleville is situated in a farming region, and its leading industries are the manufacture of straw boards and agricultural implements, and the canning of sweet corn and other produce. The city occupies the site of prehistoric earth-works, from one of which, built in the form of a circle, it derived its name. Circleville, first settled about 1806, was chosen as the county-seat in 1810. The court-house was built in the form of an octagon at the centre of the circle, and circular streets were laid out around it; but this arrangement proved to be inconvenient, the court-house was destroyed by fire in 1841, and at present no trace of the ancient landmarks remains. Circleville was incorporated as a village in 1814, and was chartered as a city in 1853.

CIRCUIT (Lat. circuitus, from circum, round, and ire, to go), the act of moving round; so circumference, or anything encircling or encircled. The word is particularly known as a law term, signifying the periodical progress of a legal tribunal for the purpose of carrying out the administration of the law in the several provinces of a country. It has long been applied to the journey or progress which the judges have been in the habit of making through the several counties of England, to hold courts and administer justice, where recourse could not be had to the king's court at Westminster (see Assize).

In England, by sec. 23 of the Judicature Act 1875, power was conferred on the crown, by order in council, to make regulations respecting circuits, including the discontinuance of any circuit, and the formation of any new circuit, and the appointment of the place at which assizes are to be held on any circuit. Under this power an order of council, dated the 5th of February 1876, was made, whereby the circuit system was remodelled. A new circuit, called the North-Eastern circuit, was created, consisting of Newcastle and Durham taken out of the old Northern circuit, and York and Leeds taken out of the Midland circuit. Oakham, Leicester and Northampton, which had belonged to the Norfolk circuit, were added to the Midland. The Norfolk circuit and the Home circuit were abolished and a new South-Eastern circuit was created, consisting of Huntingdon, Cambridge, Ipswich, Norwich, Chelmsford, Hertford and Lewes, taken partly out of the old Norfolk circuit and partly out of the Home circuit. The counties of Kent and Surrey were left out of the circuit system, the assizes for these counties being held by the judges remaining in London. Subsequently Maidstone and Guildford were united under the revived name of the Home circuit for the purpose of the summer and winter assizes, and the assizes in these towns were held by one of the judges of the Western circuit, who, after disposing of the business there, rejoined his colleague in Exeter. In 1809 this arrangement was abolished, and Maidstone and Guildford were added to the South-Eastern circuit. Other minor changes in the assize towns were made, which it is unnecessary to particularize. Birmingham first became a circuit town in the year 1884, and the work there became, by arrangement, the joint property of the Midland and Oxford circuits. There are alternative assize towns in the following counties, viz.:—On the Western circuit, Salisbury and Devizes for Wiltshire, and Wells for Somerset; On the South-Eastern, Ipswich and Bury St Edmunds for Suffolk; on the North Wales circuit, Welshpool and Newtown for Montgomery; and on the South Wales circuit, Cardiff and Swansea for Glamorgan.

According to the arrangements in force in 1909 there are four assizes in each year. There are two principal assizes, viz. the autumn assizes, beginning in January, and the summer assizes, beginning at the end of May. At these two assizes criminal and civil business is disposed of in all the circuits. There are two other assizes, viz. the autumn assizes and the Easter assizes. The autumn assizes are regulated by acts of 1876 and 1877 (Winter Assizes Acts 1876 and 1877), and orders of council made under the former act. They are held for the whole of England and Wales, but for the purpose of these assizes the work is to a large extent "grouped," so that not every county has a separate assize. For example, on the South-Eastern circuit Huntingdon
Circuit

is grouped with Cambridge; on the Midland, Rutland is grouped with Lincoln; on the Northern, Westmorland is grouped with Cumberland; and the North Wales and South Wales circuits are united, and no assizes are held at some of the smaller towns. At these assizes criminal business only is taken, except at Manchester, Liverpool, Swansea, Birmingham and Leeds. The Easter assizes are held in April and May on two circuits only, viz. at Manchester and Liverpool on the Northern and at Leeds on the North-Eastern. Both civil and criminal business is taken at Manchester and Liverpool, but criminal business only at Leeds.

Other changes were made, with a view to preventing the complete interruption of the London sittings in the common law division by the absence of the judges on circuit. The assizes were so arranged as to commence on different dates in the various circuits. For example, the summer assizes begin in the South-Eastern and Western circuits on the 20th of May; in the Northern circuit on the 28th of June; in the Midland and Oxford circuits on the 16th of June; in the North-Eastern circuit on the 6th of July; in the North Wales circuit on the 7th of July; and in the South Wales circuit on the 11th of July. Again, there has been a continuous development of what may be called the single-judge system. In the early days of the new order the members of the court of appeal and the judges of the chancery division shared the circuit work with the judges in the common law division. This did not prove to be a satisfactory arrangement. The assize work was not familiar and was congenial to the chancery judges, who had but little training or experience to fit them for it. Arrears increased in chancery, and the appeal court was shorn of much of its strength for a considerable part of the year. The practice was discontinued in or about the year 1884. The appeal and chancery judges were relieved of the duty of going on circuit, and an arrangement was made by the treasury for making an allowance for expenses of circuit to the common law judges, on whom the whole work of the assizes was thrown. In order to cope with the assize work, and at the same time keep the common law sittings going in London, an experiment, which had been previously tried by Lord Cairns and Lord Cross (then home secretary) and discontinued, was revived. Instead of two judges going together to each assize town, it was arranged that one judge should go by himself to certain selected places—practically, it may be said, to all except the more important provincial centres. The only places to which two judges now go are Exeter, Winchester, Bristol, Manchester, Liverpool, Nottingham, Stafford, Birmingham, Newcastle, Durham, York, Leeds, Chester, and Cardiff or Swansea.

It could scarcely be said that, even with the amendments introduced under orders in council, the circuit system was altogether satisfactory or that the last word had been pronounced on the subject. In the first report of the Judicature Commission, dated March 25th, 1869, p. 17 (Parl. Papers, 1868-1869), the majority report that "the necessity for holding assizes in every county without regard to the extent of the business to be transacted in such county leads, in our judgment, to a great waste of judicial strength and a great loss of time in going from one circuit town to another, and causes much unnecessary cost and inconvenience to those whose attendance is necessary or customary at the assizes." And in their second report, dated July 3rd, 1872 (Parl. Papers, 1872, vol. xix.), they dwell upon the advisability of grouping or a discontinuance of holding assizes in several counties, for example, Rutland and Westmorland, where it is manifestly an idle waste of time and money to have assizes. It is thought that the grouping of counties which has been effected for the autumn assizes might be carried still further and applied to all the assizes; and that the system of holding the assizes alternately in one of two towns within a county might be extended to two towns in adjoining counties, for example, Gloucester and Worcester. The facility of railway communication renders this reform comparatively easy, and reforms in this direction have been approved by the judges, but ancient custom and local patriotism, interests, or susceptibility bar the way. The

Assizes and Quarter Sessions Act 1908 contributed something to reform by dispensing with the obligation to hold assizes at a fixed date if there is no business to be transacted. Nor can it be said that the single-judge system has been altogether a success. When there is only one judge for both civil and criminal work, he properly takes the criminal business first. He can fix only approximately the time when he can hope to be free for the civil business. If the calendar is exceptionally heavy or one or more of the criminal cases prove to be unexpectedly long (as may easily happen), the civil business necessarily gets squeezed into the short residue of the allotted time. Suitors and their solicitors and witnesses are kept waiting for days, and after all perhaps it proves to be impossible for the judge to take the case, and a "remanet" is the result. It is the opinion of persons of experience that the result has undoubtedly been to drive to London much of the civil business which properly belongs to the provinces, and caused a drain on the funds. The law thus at once to increase the burden on the judges and juries in London, and to increase the costs of the trial of the actions sent there. Some persons advocate the continuous sittings of the high court in certain centres, such as Manchester, Liverpool, Leeds, Newcastle, Birmingham and Bristol, or (in fact) a decentralization of the judicial system. There is already an excellent court for chancery cases for Lancashire in the county palatine court, presided over by the vice-chancellor, and with a local bar which has produced many men of great ability and even eminence. The Durham chancery court is also capable of development. Another suggestion has been made for continuous circuits throughout the legal year, so that a certain number of the judges, according to a rota, should be continuously in the provinces while the remaining judges did the London business. The value of this suggestion would depend on an estimate of the number of cases which might thus be tried in the country in relief of the London list. This estimate it would be difficult to make. The opinion has also been expressed that it is essential in any changes that may be made to retain the occasional administration by judges of the high court of criminal jurisdiction, both in populous centres and in remote places. It promotes a belief in the importance and dignity of justice and the care to be given to all matters affecting a citizen's life, liberty or character. It also does something, by the example set by judges in country districts, to check any tendency to undue severity of sentences in offences against property.

Counsel are not expected to practise on a circuit other than that to which they have attached themselves, unless they receive a special retainer. They are then said to "go special," and the fee in such a case is one hundred guineas for a king's counsel, and fifty guineas for a junior. It is customary to employ one member of the circuit on the side on which the counsel comes special. Certain rules have been made by the judges in council for regulating the practice as to retainers on circuit. (1) A special retainer must be given for a particular assize (a circuit retainer will not, however, make it compulsory upon counsel retained to go the circuit, but will give the right to counsel's services should he attend the assize and the case he entered for trial); (2) if the venue is changed to another place on the same circuit, a fresh retainer is not required; (3) if the action is not tried at the assize for which the retainer is given, the retainer must be renewed for every subsequent assize until the action is disposed of, unless a brief has been delivered; (4) a retainer may be given for a future assize, without a retainer for an intervening assize, unless notice of trial is given for such intervening assize. There are also various regulations enforced by the discipline of the circuit bar.
nine judicial circuits, divided as follows: 1st circuit, Maine, Massachusetts, New Hampshire, Rhode Island; 2nd circuit, Connecticut, New York, Vermont; 3rd circuit, Delaware, New Jersey, Pennsylvania; 4th circuit, Maryland, North Carolina, South Carolina, Virginia, West Virginia; 5th circuit, Alabama, Florida, Georgia, Louisiana, Mississippi, Texas; 6th circuit, Kentucky, Michigan, Ohio, Tennessee; 7th circuit, Illinois, Indiana, Wisconsin; 8th circuit, Arkansas, Colorado, Oklahoma, Iowa, Kansas, Minnesota, Missouri, Nebraska, New Mexico, North Dakota, South Dakota, Utah, Wyoming; 9th circuit, Alaska, Arizona, California, Idaho, Montana, Nevada, Oregon, Washington, and Hawaii. A circuit court of appeals is made up of three judges of the circuit court, the judges of the district courts of the circuit, and the judge of the Supreme Court allotted to the circuit.

In Scotland the judges of the supreme criminal court, or in Scotland of justice, form also three separate circuit courts, consisting of two judges each; and the country, with the exception of the Lothians, is divided into corresponding districts, called the Northern, Western and Southern circuits. On the Northern circuit, courts are held at Inverness, Perth, Dundee and Aberdeen; on the Western, at Glasgow, Stirling and Inveraray; and on the Southern, at Dumfries, Jedburgh and Ayr.

Ireland is divided into the North-East and the North-West circuits, and those of Leinster, Connaught and Munster.

**CIRULAR NOTE**, a documentary request by a bank to its foreign correspondents to pay a specified sum of money to a named person. The person in whose favour a circular note is issued is furnished with a letter (containing the signature of an official of the bank and the personal name) called a letter of indication, which is usually referred to in the circular note, and must be produced on presentation of the note. Circular notes are generally issued against a payment of cash to the amount of the notes, but the notes need not necessarily be cashed, but may be returned to the banker in exchange for the amount for which they were originally issued. A forged signature on a circular note conveys no right, and as it is the duty of the payer to see that payment is made to the proper person, he cannot recover the amount of a forged note from the banker who issued the note. (See also LETTER OF CREDIT.)

**CIRCULUS IN PROBANDO** (Lat. for "circle in proving"), in logic, a phrase used to describe a form of argument in which the very fact which one seeks to demonstrate is used as a premise, i.e., as part of the evidence on which the conclusion is based. This argument is one form of the fallacy known as *petitio principii*, "begging the question." It is most common in lengthy arguments, the complicated character of which enables the speaker to make his hearers forget the data from which he began. (See FALLACY.)

**CIRCUMCISION** (Lat. *circum", round, and coedere, to cut"), the cutting off of the foreskin. This surgical operation, which is commonly prescribed for purely medical reasons, is also an initiation or religious ceremony among Jews and Mahomedans, and is a widespread institution in many Semitic races. It remains, with Jews, a necessary preliminary to the admission of proselytes, except in some Reformed communities. The origin of the rite among the Jews is in Genesis (xvii.) placed in the age of Abraham, and at all events it must have been very ancient, for flint stones were used in the operation (Exodus iv. 25; Joshua v. 2). The narrative in Joshua implies that the custom was introduced by him, not that it had merely been in abeyance in the Wilderness. At Gilgal he "rolled away the reproach of the Egyptians" by this operation. It is well established that whereas the Egyptians practised circumcision the Jews in the land of the Pharaohs did not, and hence were regarded with contempt. It was an old theory (Herodotus ii. 36) that circumcision originated in Egypt; at all events it was practised in that country in ancient times (Ebers, *Egypten und die Bücher Mosis*, i. 278-282), and the same is true at the present day. But it is not generally thought probable that the Hebrews derived the rite directly from the Egyptians. As Driver puts it (Genesis, p. 190): "It is possible that, as Dillmann and Nowack suppose, the peoples of N. Africa and Asia who practised the rite adopted it from the Egyptians, but it appears in so many parts of the world that it must at any rate in these cases have originated independently." In another biblical narrative (Exodus iv. 25) Moses is subject to the divine anger because he had not made himself "a bridegroom of blood," that is, had not been circumcised before his marriage.

The rite of circumcision was practised by all the inhabitants of Palestine with the exception of the Philistines. It was an ancient custom among the Arabs, being presupposed in the Koran. The only important Semitic peoples who most probably did not follow the rite were the Babylonians and Assyrians (Sayce, *Babil. and Assyrians*, p. 47). Modern investigations have brought to light many instances of the prevalence of circumcision in various parts of the world. These facts are collected by Andree and Pless, and go to prove that the rite is not only spread through the Mahomedan world (Turks, Persians, Arabs, etc.), but also is practised by the Christian Abyssinians and the Copts, as well as in central Australia and in America. In central Australia (Spencer and Gillen, pp. 212-286) circumcision with a stone knife must be undergone by every youth before he is reckoned a full member of the tribe or is permitted to enter on the married state. In other parts, too (e.g. Loango), uncircumcised man may marry. Circumcision was known to the Aztecs (Bancroft, *Native Races*, vol. iii.), and is still practised by the Caribs of the Orinoco and the Tacunas of the Amazon. The method and period of the operation vary in important particulars. Among the Jews it is performed in infancy, when the male child is eight days old. The child is named at the same time, and the ceremony is elaborate. The child is carried in to the godfather (*sandek*), a hebraized form of the Gr. σάνδεκος, "godfather," post-class, who places the child on a cushion, which he holds on his knees throughout the ceremony. The operator (mohel) uses a steel knife, and pronounces various benedictions before and after the rite is performed (see S. Singer, *Authorised Daily Prayer Book*, pp. 304-307; an excellent account of the domestic festivities and spiritual joys associated with the ceremony among medieval and modern Jews may be read in S. Schechter's *Studies in Judaism*, first series, pp. 351 seq.). Some tribes in South America and elsewhere are said to perform the rite on the eighth day, like the Jews. The Mazequas do it between the first and second months. Among the Bedouins the rite is performed on children of three years, amid dances and the selection of brides (Doughty, *Arabia Deserta*, i. 340); among the Somalis the age is seven (Reinisch, *Somalisprache*, p. 110). But for the most part the tribes who perform the rite carry it out at the age of puberty. Many facts bearing on this point are given by B. Stade in *Zeitschrift für die alteste Wissenschaft*, vi. (1886) pp. 132 seq.

The significance of the rite of circumcision has been much disputed. Some see in it a tribal badge. If this be the true origin of circumcision, it must go back to the time when men went about naked. Mutilations (tattooing, removal of teeth and so forth) were tribal marks, being partly sacrifices and partly means of recognition (see MUTILATION). Such initiatory rites were often frightful ordeals, in which the neophyte's courage was severely tested (Robertson Smith, *Religion of the Semites*, p. 310). Some regard circumcision as a substitute for far more serious rites, including even human sacrifice. Utilitarian explanations have also been suggested. Sir R. Burton (Memoirs *Anthrop. Soc. I.* 318) held that it was introduced to promote fertility, and the claims of cleanliness have been put forward (following Philo's example, see ed. Mangey, ii. 210). Most modern scholars, however, consider that circumcision (which in many tribes is performed on both sexes) is primarily an initiatory rite, and an essential preparation for connubium. It was in Robertson Smith's words "originally a preliminary to marriage, and so a ceremony of introduction to the full prerogative of manhood," the transfer to infancy among the Jews being a later change. On this view, the decisive Biblical reference would be the Exodus passage (iv. 25), in which Moses is represented as being in danger of his life because he had neglected the proper preliminary to marriage. In Genesis, on the other hand, circumcision is an

are still, and now afford the only instance from which an idea of the ancient circi in Rome can be obtained. It was traced to Caracalla, till the discovery of an inscription in 1825 showed it to be the work of Maxentius. Old topographers speak of six circi, but two of these appear to be imaginary, the Circus Florae and the Circus Sallustii.

Circus races were held in connexion with the following public festivals, and generally on the last day of the festival, if it extended over more than one day:—(1) The Consulalia, August 21st, December 15th; (2) Equitaria, February 27th, March 14th; (3) Ludi Romani, September 4th-10th; (4) Ludi Plebeii, November 4th-17th; (5) Cerilia, April 12th-19th; (6) Ludi Apollinares, July 6th-13th; (7) Ludi Megalenses, April 4th-10th; (8) Floralia, April 28th-May 3rd.

In addition to Smith's Dictionary of Antiquities (3rd ed., 1890), see articles in Daremberg and Saglio's Dictionnaire des antiquités, Pauly-Wissowa's Realencyclopaedie der klassischen Altertumswissenschaft, iii. 2 (1899), and Marquardt, Römische Staatsverwaltung, ii. (2nd ed., 1885), p. 504. For existing remains see works quoted under Rome: Archaeology.

2. The Modern Circus.—The "circus" in modern times is a form of popular entertainment which has little in common with the institution of classical Rome. It is frequently nomadic in character, the place of the permanent building known to the ancients as the circus being taken by a tent, which is carried from place to place and set up temporarily on any site procurable at country fairs or in provincial towns, and in which spectacular performances are given by a troupe employed by the proprietor. The centre of the tent forms an arena arranged as a horse-ring, strewn with tan or other soft substance, where the performances take place, the seats of the spectators being arranged in ascending tiers around the central space as in the Roman circus. The traditional type of exhibition in the modern travelling circus consists of feats of horsemanship, such as leaping through hoops from the back of a galloping horse, standing with one foot on each of two horses galloping side by side, turning somersaults from a springboard over a number of horses standing close together, or accomplishing acrobatic tricks on horseback. These performances, by male and female riders, are varied by the introduction of horses trained to perform tricks, and by drolleries on the part of the clown, whose place in the circus is as firmly established by tradition as in the pantomime.

The popularity of the circus in England may be traced to that kept by Philip Astley (d. 1814) in London at the end of the 18th century. Astley was followed by Ducrow, whose feats of horsemanship had much to do with establishing the traditions of the circus, which were perpetuated by Hengler's and Sanger's celebrated shows in a later generation. In America a circus-actor named Ricketts is said to have performed before George Washington in 1780, and in the first half of the 19th century the establishments of Purdy, Welch & Co., and of van Amburgh gave a wide popularity to the circus in the United States. All former circus-proprietors were, however, far surpassed in enterprise and resource by P. T. Barnum (q.v.), whose claim to be the possessor of "the greatest show on earth" was no exaggeration. The influence of Barnum, however, brought about a considerable change in the character of the modern circus. In arenas too large for speech to be easily audible, the traditional comic dialogue of the clown assumed a less prominent character, while the vastly increased wealth of stage properties relegated to the background the old-fashioned equestrian feats, which were replaced by more ambitious acrobatic performances, and by exhibitions of skill, strength and daring, requiring the employment of immense numbers of performers and often of complicated and expensive machinery. These tendencies are, as is natural, most marked in shows given in permanent buildings in large cities, such as the London Hippodrome, which was built as a combination of the circus, the menagerie and the variety theatre, where wild animals such as lions and elephants from time to time appeared in the ring, and where convulsions of nature such as floods, earthquakes and volcanic eruptions have been produced with an extraordinary wealth of realistic display. At the Hippodrome in Paris—unlike its London namesake, a circus of the true classical type in which the arena is entirely surrounded by the seats of the spectators—chariot races after the Roman model were held in the latter part of the 19th century, at which prizes of considerable value were given by the management.

CIRENCESTER (traditionally pronounced Ciceter), a market town in the Cirencester parliamentary division of Gloucestershire, England, on the river Churn, a tributary of the Thames, 93 m. W.N.W. of London. Pop. of urban district (1901) 7556. It is served by a branch of the Great Western railway, and there is also a station on the Midland and South-Western Junction railway. This is an ancient and prosperous market town of picturesque old houses clustering round a fine parish church, with a high embattled tower, and a remarkable south porch with parvis. The church is mainly Perpendicular, and among its numerous chapels that of St Catherine has a beautiful roof of fan-tracery in stone dated 1508. Of the abbey founded in 1117 by Henry I. there remain a Norman gateway and a few capitals. There are two good museums containing mosaics, inscriptions, carved and sculptured stones, and many smaller remains, for the town was the Roman Corinium or Durocoronium Dobanorum. Little trace of Corinium, however, can be seen in situ, except the amphitheatre and some indications of the walls. To the west of the town is Cirencester House, the seat of Earl Bathurst. The first Lord Bathurst (1634–1713) devoted himself to beautifying the site, famed in Roman times as the amphitheatre of Oakley Park, which he planted and adorned with remarkable artificial ruins. This nobleman, who became baron in 1711 and earl in 1722, was a patron of art and literature no less than a statesman; and Pope, a frequent visitor here, was allowed to design the building known as Pope's Seat, in the park, commanding a splendid prospect of woods and avenues. Swift was another appreciative visitor. The house contains portraits by Lawrence, Gainsborough, Romney, Lely, Reynolds, Hopner, Kneller and many others. A mile west of the town is the Royal Agricultural College, incorporated by charter in 1845. Its buildings include a chapel, a dining hall, a library, a lecture theatre, laboratories, classrooms, private studies and dormitories for the students, apartments for resident professors, and servants' offices; also a museum containing a collection of anatomical and pathological preparations, and mineralogical, botanical and geological specimens. The college farm comprises 500 acres, 450 of which are arable; and on it are the well-appointed farm-buildings and the veterinary hospital. Besides agriculture, the course of instruction at the college includes chemistry, natural and mechanical philosophy, natural history, mensuration, surveying and drawing, and other subjects of practical importance to the farmer, proficiency in which is tested by means of sessional examinations. The industries of Cirencester comprise various branches of agriculture. It has connexion by a branch canal with the Thames and Severn canal.

Corinium was a flourishing Romano-British town, at first perhaps a cavalry post, but afterwards, for the greater part of the Roman period, purely a civilian city. At Chedworth, 7 m. N.E., is one of the most noteworthy Roman villas in England. Cirencester (Circensaecester, Cyreucester, Cyringceaster) is described in Domesday as ancient demesne of the crown. The manor was given to William I. to William Fitzosborn; on reverting to the crown it was given in 1189, with the township, to the Augustinian abbey founded here by Henry I. The struggle of the townsfolk to prove that Cirencester was a borough probably began in the same year, when they were amerced for a false presentment. Four inquisitions during the 13th century supported the abbot's claims, yet in 1343 the townsfolk declared in a chancery bill of complaint that Cirencester was a borough distinct from the manor, belonging to the king but usurped by the abbot, who since 1308 had abated their court of provosty. Accordingly they produced a copy of a forged charter from Henry I. to the town; the court ignored this and the abbot obtained a new charter and a writ of supersedeas. For their success against the earls of Kent and Salisbury Henry IV. in 1403 gave the townsfolk a gild merchant, although two
inquisitions reiterated the abbot's rights. These were confirmed in 1408-1409 and 1413; in 1418 the charter was annulled, and in 1427 parliament declared that Cirencester was not corporate. After several unsuccessful attempts to re-establish the guild merchant, the government in 1592 was vested in the bailiff of the lord of the manor. Cirencester became a parliamentary borough in 1572, retaining two members, but was deprived of representation in 1583. Besides the "new market" of Domesday Book the abbots obtained charters in 1215 and 1253 for fairs during the octaves of All Saints and St Thomas the Martyr. The wool trade gave these great importance; in 1341 there were ten wool merchants in Cirencester, and Leland speaks of the abbots' cloth-mill, while Camden calls it the greatest market for wool in England.

CIRILLO, DOMENICO (1739-1799), Italian physician and patriot, was born at Grumo in the kingdom of Naples. Appointed while yet a young man to a botanical professorship, Cirillo went some years afterwards to England, where he was elected fellow of the Royal Society, and to France. On his return to Naples he was appointed successively to the chair of practical and theoretical medicine. He wrote voluminously and well on scientific subjects and secured an extensive medical practice. On the French occupation of Naples and the proclamation of the Parthenopean republic (1799), Cirillo, after at first refusing to take part in the new government, consented to be chosen a representative of the people and became a member of the legislative commission, of which he was eventually elected president. On the abandonment of the republic by the French (June 1799), Cardinal Ruffo and the army of King Ferdinand IV. returned to Naples, and the Republicans withdrew, ill-armed and inadequately provisioned, to the forts. After a short siege they surrendered on honourable terms, life and liberty being guaranteed them by the signatures of Ruffo, of Foote, and of Micheroux. But the arrival of Nelson changed the complexion of affairs, and he refused to ratify the capitulation. Secure under the British flag, Ferdinand and his wife, Caroline of Austria, showed themselves eager for revenge, and Cirillo was involved with the other republicans in the vengeance of the royal family. He asked Lady Hamilton (wife of the British minister to Naples) to intercede on his behalf, but Nelson wrote in reference to the petition: "Domenico Cirillo, who had been the king's physician, might have been saved, but that he chose to play the fool and lie, denying that he had ever made any speeches against the government, and saying that he only took care of the poor in the hospitals" (Nelson and the Neapolitan Jacobins, Navy Records Society, 1903). He was condemned and hanged on the 29th of October 1799. Cirillo, whose favourite study was botany, and who was recognized as an entomologist by Linnaeus, left many books, in Latin and Italian, all of them treating of medical and scientific subjects, and all of little value now. Exception must, however, be made in favour of the Virtù morali dell' Asino, a pleasant philosophical pamphlet remarkable for its double charm of sense and style. He introduced many medical innovations into Naples, particularly inoculation for smallpox.

See C. Giglioli, Naples in 1799 (London, 1903); L. Conforti, Napoli nel 1799 (Naples, 1889); C. Tivaroni, L' Italia durante il dominio francese, vol. ii, pp. 179-204. Also under NAPLES; NELSON and FERDINAND IV. OF NAPLES.

CIRQUE (Lat. cīrus, ring), a French word used in physical geography to denote a semicircular crater-like amphitheatre at the head of a valley, or in the side of a glaciated mountain. The valley cirque is characteristic of calcareous districts. In the Chiltern Hills especially, and generally along the chalk escarpments, a flat-bottomed valley with an intermittent stream winds into the hill and ends suddenly in a cirque. There is an excellent example at Ivinghoe, Buckinghamshire, where it appears as though an enormous flat-bottomed scoop had been driven into the hillside and dragged outwards to the plain. In all cases it is found that the valley floor consists of hard or impervious rock above which lies a permeable or soluble stratum of considerable thickness. In the case of the chalk hills the upper strata are very porous, and the descending water with atmospheric and humous acids in solution has great solvent power. During the winter this upper layer becomes saturated and some of the water drains away along joints in the escarpment. An underground stream is thus developed carrying a great deal of material in solution, and in consequence the ground above slowly collapses over the stream, while the cirque at the head, where the stream issues, gradually works backward and may pass completely through the hills, leaving a gap of which another drainage system may take possession. In the limestone country of the Cotswold Hills, many small intermittent tributary streams are headed by cirques, and some of the longer dry valleys have springs issuing from beneath their lower ends, the dry valleys being collapsed areas above underground streams not yet revealed. In this case the pervious limestone is underlain by beds of impervious clay. There are many in the Jura Mountains. The Cirque de St Sulpice is a fine example where the impervious bed is a marly clay.

The origin of the glacial cirque is entirely different and is studied by D. J. Lyell in his Journal of Geological (ii. No. 7, 1849) to be due to basal sapping and erosion under the bergschrund of the glacier. In this he is supported by G. K. Gilbert in the same journal, who produces some remarkable examples from the Sierra Nevada in California, where the mountain fragments have been left behind "like a sheet of dough upon a board after the biscuit tin has done its work"; so that above the head of the glaciers "the rock detail is rugged and splintered but its general effect is that of a great symmetrical arc." Descending one of the bergschrund of Mt. Lyell to a depth of 150 ft., Johnson found a rock floor covered with ice and blocks of rock and the rock face a literally vertical cliff "much riven, its fracture planes outlining sharp angular masses in all stages of displacement and dislodgment." Judging from these facts, he interprets the deep valleys with cirques at their head in formerly glaciated regions where at the head there is a "reversed grade" of slope, as due to ice-erosion at valley-heads where scour is impossible at the sides of the mountain but strongest under the glacier head where the ice is deepest. The opponents of ice-erosion nevertheless recognize the very frequent occurrence of glacial cirques often containing small lakes such as that under Cader Idris in Wales, or at the head of Little Timber Creek, Montana, and numerous examples in Alpine districts.

CIRTA (mod. Constantine, q.v.), an ancient city of Numidia, in Africa, in the country of the Massyli. It was regarded by the Romans as the strongest position in Numidia, and was made by them the converging point of all their great military roads in that country. By the early emperors it was allowed to fall into decay, but was afterwards restored by Constantine, from whom it took its modern name.

CISSEY, ERNEST LOUIS OCTAVE COURTOUT DE (1821-1882), French general, was born at Paris on the 23rd of September 1821, and when 21 years old passed through St Cyr, entered the army in 1832, becoming captain in 1835. He saw active service in Algeria, and became chef d'escadron in 1849 and lieutenant-colonel in 1850. He took part as a colonel in the Crimean War, and after the battle of Inkerman received the rank of general of brigade. In 1863 he was promoted general of division. When the Franco-German War broke out in 1870, de Cissey was given a divisional command in the Army of the Rhine, and he was included in the surrender of Bazaine's army at Metz. He was released from captivity only at the end of the war, and on his return was at once appointed by the Versailles government to a command in the army engaged in the suppression of the Commune, a task in the execution of which he displayed great rigour. From July 1871 de Cissey sat as a deputy, and he had already become minister of war. He occupied this post several times during the period of the reorganization of the French army. In 1880, whilst holding the command of the XI. corps at L'Nantes, he was accused of having relations with a certain Baroness Kaula, who was said to be a spy in the pay of Germany, and
he was in consequence relieved from duty. An inquiry subsequently held resulted in de Cissey's favour (1881). He died on the 11th of June 1882 at Paris.

CISSOID (from the Gr. κισσός, ivy, and εἴδος, form), a curve invented by the Greek mathematician Diocles about 180 B.C., for the purpose of constructing two mean proportions between two given lines, and in order to solve the problem of duplicating the cube. It was further investigated by John Wallis, Christian Huygens (who determined the length of any arc in 1657), and Pierre de Fermat (who evaluated the area between the curve and its asymptote in 1661). It is constructed in the following manner. Let AB be a semicircle, BT the tangent at B, and APT a line cutting the circle in P and BT at T; take a point Q on AT so that AQ always equals PT; then the locus of Q is the cissoid.

Sir Isaac Newton devised the following mechanical construction. Take a rod LMN bent at right angles at M, such that MN = AB; let the leg LM always pass through a fixed point O on AB produced such that OA = CA, where C is the middle point of AB, and cause N to travel along the line perpendicular to AB at C; then the midpoint of MN traces the cissoid. The curve is symmetrical about the axis of x, and consists of two infinite branches asymptotic to the line BT and forming a cusp at the origin. The cartesian equation, when A is the origin and AB = 2a, is

\[ y^3(x+2a-x) = x^3; \]

the polar equation is \( r = 2a \sin \theta \tan \theta. \)

The cissoid is the first positive pedal of the parabola \( y^2 + 8ax = 0 \) for the vertex, and the inverse of the parabola \( y^2 = 8ax \), the vertex being the centre of inversion, and the semi-latus rectum the constant of inversion. The area between the curve and its asymptote is \( 3\pi a^2 \), i.e. three times the area of the generating circle.

The term cissoid has been given in modern times to curves generated in similar manner from other figures than the circle, and the form described above is distinguished as the cissoid of Diocles.

A cissoid angle is the angle included between the concave sides of two intersecting curves; the convex sides include the sistroid angle.

CIS-SULEJ STATES, the southern portion of the Punjab, India. The name, now obsolete, came into use in 1809, when the Sikh chiefs south of the Sutlej passed under British protection, and was generally applied to the country south of the Sutlej and north of the Delhi territory, bounded on the E. by the Himalayas, and on the W. by Sisra district. Before 1846 this territory as independent, the chiefs being subject merely to control from a political officer stationed at Umballa, and styled the agent of the governor-general for the Cis-Sutej states. After the first Sikh War the full administration of the territory became vested in this officer. In 1849 occurred the annexation of the Punjab, when the Cis-Sutlej states commissionership, comprising the districts of Umballa, Ferozepore, Ludhiana, Thanesar and Simla, was incorporated with the new province. The name continued to be applied to this division until 1862, when, owing to Ferozepore having been transferred to the Lahore, and a part of Thanesar to the Delhi division, it ceased to be appropriate. Since then, the tract remaining has been known as the Umballa division. Patiali, Jind and Nabha were appointed a separate political agency in 1817. Excluding Bahawalpur, for which there is no political agent, and Chamba, the other states are grouped under the commissioners of Jullundur and Delhi, and the superintendent of the Simla hill states.

CIST (Gr. κίστη, Lat. cista, a box; cf. Ger. Kiste, Welsh kistvaen, stone-coffin, and also the Eng. form "chest"), in Greek archaeology, a wicker-work receptacle used in the Eleusinian and other mysteries to carry the sacred vessels; also, in the archaeology of prehistoric man, a coffin formed of flat stones placed edgeways with another flat stone for a cover. The word is also used for a sepulchral chamber cut in the rock (see Coffin). "Cistern," the common term for a water-tank, is a derivation of the same word (Lat. cisterna; cf. "cave" and "cavern").

CISTERCIANS, otherwise GREY or WHITE MONKS (from the colour of the habit, over which is worn a black scapular or apron). In 1098 St Robert, born of a noble family in Champagne, at first a Benedictine monk, and then abbot of certain hermits settled at Molesme near Châtillon, being dissatisfied with the manner of life and observance there, migrated with twenty of the monks to a swampy place called Citeaux in the diocese of Châlons, not far from Dijon. Count Odo of Burgundy here built them a monastery, and they began to live a life of strict observance according to the letter of St Benedict’s rule. In the following year Robert was compelled by papal authority to return to Molesme and Alberic succeeded him as abbot of Citeaux and held the office till his death in 1109, when the Englishman St Stephen Harding became abbot, until 1134. For some years the new institute seemed little likely to prosper; few novices came, and in the first years of Stephen’s abbacy it seemed doomed to failure. In 1112, however, St Bernard and thirty others offered themselves to the monastery, and a rapid and wonderful development at once set in. The next three years witnessed the foundation of the four great “daughter-houses of Citeaux” — La Ferté, Pontigny, Clairvaux and Morimond. At Stephen’s death there were over 30 Cistercian houses; at Bernard’s (1154) over 280; and by the end of the century over 500; and the Cistercian influence in the Church more than kept pace with this material expansion, so that St Bernard saw one of his monks ascend the papal chair as Eugenius III.

The keynote of Cistercian life was a return to a literal observance of St Benedict’s rule; St Benoît’s rule literal may be seen from the controversy between St Bernard and Peter the Venerable, abbot of Cluny (see Maitland, Dark Ages, § xxii.). The Cistercians rejected alike all mitigations and all developments, and tried to reproduce the life exactly as it had been in St Benedict’s time, indeed in various points they went beyond it in austerity. The most striking feature in the reform was the return to manual labour, and especially to field-work, which became a special characteristic of Cistercian life. In order to make time for this work they cut away the accretions to the divine office which had been steadily growing during three centuries, and in Cluny and the other Black Monk monasteries had come to exceed greatly in length the regular canonical office: one only of these accretions did they retain, the daily recitation of the Office of the Dead (Edm. Bishop, Origin of the Primer, Early English Text Society, original series, 109, p. xxx).

It was as agriculturists and horse and cattle breeders that, after the first flush of their success and before a century had passed, the Cistercians exercised their chief influence on the progress of civilization in the later middle ages: they were the great farmers of those days, and many of the improvements in the various farming operations were introduced and propagated by them; it is from this point of view that the importance of their extension in northern Europe is to be estimated. The Cistercians at the beginning renounced all sources of income arising from benefices, tithes, tolls and rents, and depended for their income wholly on the land. This developed an organized system for selling their farm produce, cattle and horses, and notably contributed to the commercial progress of the countries of western Europe. Thus by the middle of the 13th century the export of wool by the English Cistercians had become a feature in the commerce of the country. Farming operations on so extensive a scale could not be carried out by the monks alone, whose choir and religious duties took up a considerable portion of their time; and so from the beginning the system of lay brothers was introduced on a large scale. The lay brothers were recruited from the peasantry and were simple uneducated men, whose function consisted in carrying out the various field-works and plying all sorts of useful trades; they formed a body
CISTERCIANS

of men who lived alongside of the choir monks, but separate from them, not taking part in the canonical office, but having their own fixed round of prayer and religious exercises. A lay brother was never ordained, and never held any office of superiority. It was by this system of lay brothers that the Cistercians were able to play their distinctive part in the progress of European civilization. But it often happened that the number of lay brothers became excessive and out of proportion to the resources of the monasteries, there being sometimes as many as 200, or even 300, in a single abbey. On the other hand, at any rate in some countries, the system of lay brothers in course of time worked itself out; thus in England by the close of the 14th century it had shrunk to relatively small proportions, and in the 15th century the régime of the English Cistercian houses tended to approximate more and more to that of the Black Monks.

The Cistercian polity calls for special mention. Its lines were adumbrated by Alberic, but it received its final form at a meeting of the abbeys in the time of Stephen Harding, when was drawn up the Carta Caritatis (Migne, Prolat. Lat. clxvi. 1377), a document which arranged the relations between the various houses of the Cistercian order, and exercised a great influence also upon the future course of western monachism. From one point of view, it may be regarded as a compromise between the primitive Benedictine system, whereby each abbey was autonomous and isolated, and the complete centralization of Cluny, whereby the abbot of Cluny was the only true superior in the body. Citeaux, on the one hand, maintained the independent organic life of the houses—each abbey had its own abbot, elected by its own monks; its own community, belonging to itself and not to the order in general; its own property and finances administered by itself, without interference from outside. On the other hand, all the abbey houses were subjected to the general chapter, which met yearly at Citeaux, and consisted of the abbots only; the abbot of Citeaux was the president of the chapter and of the order, and the visitor of each and every house, with a predominant influence and the power of enforcing everywhere exact conformity to Citeaux in all details of the exterior life—observance, chant, customs. The principle was that Citeaux should always be the model to which all the other houses had to conform. In case of any divergence of view at the chapter, the side taken by the abbot of Citeaux was always to prevail (see F. A. Gasquet, Sketch of Monastic Constitutional History, pp. xxxiv-xxxviii, prefixed to English trans. of Montalembert's Monks of the West, ed. 1893).

By the end of the 12th century the Cistercian houses numbered 500; in the 13th a hundred more were added; and in the 15th, when the order attained its greatest extent, there were close on 750 houses: the larger figures sometimes given are now recognized as apocryphal. Nearly half of the houses had been founded, directly or indirectly, from Clairvaux, so great was St Bernard's influence and prestige; indeed he has come almost to be regarded as the founder of the Cistercians, who have often been called Bernardines. The order was spread all over western Europe,—chiefly in France, but also in Germany, England, Scotland, Ireland, Sweden, Poland, Hungary, Italy and Sicily, Spain and Portugal,—where some of the houses, as Alcobaca, were of almost incredible magnificence. In England the first foundation was Furness (1127), and many of the most beautiful monastic buildings of the country, beautiful in themselves and beautiful in their sites, were Cistercian,—as Tintern, Rievaulx, Byland, Fountains. A hundred were established in England in the next hundred years, and then only one more up to the Dissolution of Monasteries (see table and map in F. A. Gasquet's English Monastic Life, or Catholic Dictionary, art. "Cistercians").

For a hundred years, till the first quarter of the 13th century, the Cistercians supplanted Cluny as the most powerful order and the chief religious influence in western Europe. But then in turn their influence began to wane, chiefly, no doubt, because of the rise of the mendicant orders, who ministered more directly to the needs and ideas of the new age. But some of the reasons of Cistercian decline were internal. In the first place, there was the permanent difficulty of maintaining in its first fervour a body embracing hundreds of monasteries and thousands of monks, spread all over Europe; and as the Cistercian very raison d'être consisted in its being a "reform," a return to primitive monachism, with its field-work and severe simplicity, any failure to live up to the ideal worked the worst disaster among Cistercians than among mere Benedictines, who were intended to live a life of self-denial, but not of great austerity. Relaxations were gradually introduced in regard to diet and to simplicity of life, and also in regard to the sources of income, rents and tolls being admitted and benefices incorporated, as was done among the Benedictines; the farming operations tended to produce a commercial spirit; wealth and splendour invaded many of the monasteries, and the choir monks abandoned field-work.

The later history of the Cistercians is largely one of attempted revivals and reforms. The general chapter for long battled bravely against the invasion of relaxations and abuses. In 1335 Benedict XII., himself a Cistercian, promulgated a series of regulations to restore the primitive spirit of the order, and in the 15th century various popes endeavoured to promote reforms. All these efforts at a reform of the great body of the order proved unavailing; but local reforms, producing various semi-independent offshoots and congregations, were successfully carried out in many parts in the course of the 15th and 16th centuries. In the 17th another great effort at a general reform was made, promoted by the pope and the king of France; the general chapter elected Richelieu (commendatory) abbot of Citeaux, thinking he would protect them from the threatened reform. In this they were disappointed, for he threw himself wholly on the side of reform. So great, however, was the resistance, and so serious the disturbances that ensued, that the attempt to reform Citeaux itself and the general body of the houses had again to be abandoned, and only local projects of reform could be carried out. In 1558 had arisen the reformed congregation of the Fulloins, which spread widely in France and Italy, and in the latter country under the name of "Improved Bernardines." The French congregation of Sept-Fontaines (1654) also deserves mention. In 1663 de Rancé reformed La Trappe (see Trappists).

The Reformation, the ecclesiastical policy of Joseph II., the French Revolution, and the revolutions of the 19th century, almost wholly destroyed the Cistercians; but some survived, and since the beginning of the last half of the 19th century there has been a considerable recovery. They are at present divided into three bodies: (1) the Common Observance, with about 30 monasteries and 800 choir monks, the large majority being in Austria-Hungary; they represent the main body of the order and follow a mitigated rule of life; they do not carry on field-work, but have large secondary schools, and are in manner of life little different from fairly observant Benedictine Black monks; of late years, however, signs are not wanting of a tendency towards a return to older ideas; (2) the Middle Observance, embracing some dozen monasteries and about 150 choir monks; (3) the Strict Observance, or Trappists (q.v.), with nearly 60 monasteries, about 1600 choir monks and 2000 lay brothers.

In all there are about 100 Cistercian monasteries and about 4700 monks, including lay brothers. There have always been a large number of Cistercian nuns; the first nunnery was founded at Tart in the diocese of Langres, 1125; at the period of their widest extent there are said to have been 500 nunneries, and the communities were very large. The nuns were devoted to contemplation and also did field-work. In Spain and France certain Cistercian abbesses had extraordinary privileges. Numerous reforms took place among the nuns. The best known of all Cistercian convents was probably Port-Royal (q.v.), reformed by Angélique Arnaud and associated with the story of the Jansenist controversy. After all the troubles of the 19th century there still exist 100 Cistercian nunneries with 3000 nuns, choir and lay; of these, 15 nunneries with 900 nuns are Trappist.

Accounts of the beginnings of the Cistercians and of the primitive life and spirit will be found in the lives of St Bernard, the best
whereof is that of Abbé E. Vaccandard (1895); also in the Life of St Stephen Harding, in the English Saints. See also Henry Collins (one of the Oxford Movement, who became a Cistercian), Spiritu and Morale of the Cistercian Order (1866), for the facts are related in Helyot, Hist. des ordres religieux (1792), v. cc. 33-46, vi. cc. 1, 2. Useful sketches, with references to the literature, are supplied in Herzog, Realencyklopddie (ed. 3), art. "Cistercians"; Weitzer, "Cistercienserorden"; Max Heimburcher, Orden und Kongregationen (1896), i. §§ 33, 34. Prof. Brewer's discriminating, yet on the whole sympathetic, Preface to vol. iv. of the Works of the Crusus Cambrensis (Rolls Series of Chronicles and Manuscripts) is very instructive. Denis Murphy's Triumphalia Monasterii S. Crucis (1891) contains a general sketch, with a particular account of the Irish Cistercians. (E. C. B.)

CITATION (Lat. citare, to cite), in law, a summons to appear, more particularly applied in England to process in the probate and divorce division of the high court. In the ecclesiastical courts, citation was a method of commencing a probate suit, answering to a writ of summons at common law, and it is now in English probate practice an instrument issuing from the principal probate registry, chiefly used when a person, having the superior right to take a grant, delays or declines to do so, and another having an inferior right desires to obtain a grant; the party having the prior right is cited to appear and either to renounce the grant or show cause why it should not be decreed to the citator. In divorce practice, when a petitioner has filed his petition and affidavit, he or she now, by a citation, i.e. a command drawn in the name of the sovereign and signed by one of the registrars of the court, calling upon the alleged offender to appear and make answer to the petition. In Scots law, citation is used in the sense of a writ of summons. The word in its more general literary sense means the act of quoting, or the referring to an authority in support of an argument.

CîTEAUX, a village of eastern France, in the department of Côte d'Or, 16 m. S.S.E. of Dijon by road. It is celebrated for the great abbey founded by Robert, abbot of Molesme, in 1098, which became the headquarters of the Cistercian order. The buildings which remain date chiefly from the 18th century and are of little interest. The church, destroyed in 1792, used to contain the tombs of the earlier dukes of Burgundy.

CITHAERON, now called from its pine forests Elatea, a famous mountain range (4620 ft.) in the south of Bocotia, separating that state from Megaris and Attica. It was famous in Greek mythology, and is frequently mentioned by the great poets, especially by Sophocles. It was on Cithaeron that Actaeon was changed into a stag, that Pentheus was torn to pieces by the Bacchantes whose orgies he had been watching, and that the infant Oedipus was exposed. This mountain, too, was the scene of the mythic rites of Dionysus, and the festival of the Daedala in honour of Hera. The carriage-road from Athens to Thebes crosses the range by a picturesque defile (the pass of Dryoscephalae, "Oak-heads"), which was at one time guarded on the Attic side by a strong fortress, the ruins of which are known as Gyphito-kastro ("Gipsy Castle"). Plataea is situated on the north slope of the mountain, and the strategy of the battle of 479 B.C. was considerably affected by the fact that it was necessary for the Greeks to keep their communications open by the passes (see PLATAEA). The best known of these is that of Dryos- cephalae. A good road has been the direct route from Athens to Thebes. Two other passes, farther to the west, were crossed by the roads from Plataea to Athens and to Megara respectively. (E. Gr.)

CITHARA (Assyrian chetara; Gr. κιθάρα; Lat. cithara; perhaps Heb. kīnār, kīnōr), one of the most ancient stringed instruments, traced back to 1700 B.C. among the Semitic races, in Egypt, Assyria, Asia Minor, Greece and the Roman empire, whence the use of it spread over Europe. The main feature of the Greek kithara, its shallow sound-chest, being the most important part of it, is also that in which developments are most noticeable; its contour varied considerably during the many musical ages, but the characteristic in respect of which it fore-shadowed the precursors of the violin family, and by which they were distinguished from other contemporary stringed instruments of the middle ages, was preserved throughout in all European descendants bearing derived names. This characteristic box sound-chest (fig. 1) consisted of two resonating tables, either flat or delicately arched, connected by ribs or sides of equal width. The cithara may be regarded as an attempt by a more skilful craftsman or race to improve upon the lyre (q.v.), while retaining some of its features. The construction of the cithara can fortunately be accurately studied from two actual specimens found in Egypt and preserved in the museums of Berlin and Leiden. The Leiden cithara (fig. 2), which forms part of the d'Anastasy Collection in the Museum of Antiquities, is in a very good state of preservation. The sound-chest, in the form of an irregular square (17 cm. X 17 cm.), is hollowed out of a solid block of wood from the base, which is open; the little bar, seen through the open base and measuring 23 cm. (1 in.), is also of the same piece of wood. The arms, one and one long, are fixed to the body by means of wooden pins; they are glued as well for greater strength. W. Fleyte, through whose courtesy the sketch was revised and corrected, states that there are no indications on the instrument of any kind of bridge or attachment for strings except the little half-loop of iron wire which passes through the base from back to front. To this the strings were probably attached, and the little bar performed the double duty of sound-post and support for strengthening the tail-piece and enabling it to resist the tension of the strings. The oblique transverse bar, rendered necessary by the increasing length of the strings, was characteristic of the Egyptian cithara, 1 whereas the Asiatic and Greek instruments were generally constructed with horizontal bars resting on arms of equal length, the pitch of the strings being varied by thickness and tension, instead of by length. (For the Berlin cithara see LYRE.)

The number of strings with which the cithara was strung varied from 4 to 19 or 20 at different times; they were added less for the purpose of increasing the compass in the modern sense than to enable the performer to play in the different modes of the Greek musical system. Terpander is credited with having increased the number of strings to seven; Euclid, quoting him as his authority, states that "loving no more Egyptian Cithara from Thebes, Museum of Antiquities, Leiden.

1 A drawing of an Egyptian cithara, similar to the Leiden specimen, may be seen in Champollion, Monuments de l'Egypte et de la Nubie, ii. pl. 175.
with a rigid plectrum. Loudness of accent and great brilliancy of tone, however, can only be obtained by the use of the plectrum.

Quotations from the classics abound to show what was the practice of the Greeks and Romans in this respect. The plectrum was held in the right hand, with elbow outstretched and palm bent forwards, and the strings were plucked with the straightened fingers of the left hand. Both methods were used with intention according to the dictates of art for the sake of the variation in tone colour obtainable thereby.

The strings of the cithara were either knotted round the transverse tuning bar itself (zugon) or to rings threaded over the bar, which enabled the performer to increase or decrease the tension by shifting the knots or rings; or else they were wound round pegs, knobs or pins fixed to the zugon. The other end of the strings was attached to a tail-piece after passing over a flat bridge, or the two were combined in the curious high box tail-piece which acted as a bridge. Plutarch states that this contrivance was added to the cithara in the days of Cepion, pupil of Terpander. These boxes were hinged in order to allow the lid to be opened for the purpose of securing the strings to some contrivance concealed therein. It is a curious fact that no sculptured cithara provided with this box tail-piece is represented with strings, and in many cases there could never have been any, for the hand and arms are visible across the space that would be filled by the strings, which are always carved in a solid block.

Like the lyre the cithara was made in many sizes, conditioned by the pitch and the use to which the instrument was to be put. These instruments may have been distinguished by different names; the pectis, for instance, is declared by Sappho (2nd fragment) to have been small and shrill; the phorminx, on the other hand, seems to have been identical with the cithara.

The Greek kithara was the instrument of the professional singer or citharoedes (citharaeis) and of the instrumentalist or citharist (citharistes), and thus served the double purpose of (1) accompanying the voice—a use placed by the Greeks far above mere instrumental music—in epic recitations and rhapsodies, in odes and lyric songs; and (2) of accompanying the dance; it was also used for playing solos at the national games, at receptions and banquets and at trials of skill. The costume of the citharoedes and citharist was rich and recognized as being distinctive; it varied but little throughout the ages, as may be deduced from a comparison of representations of the citharoedes on a coin and on a Greek vase of the best period (fig. 4). The costume consisted of a palla or long tunic with sleeves embroidered with gold and girt high above the waist, falling in graceful folds to the feet. This palla must not be confounded with the mantle of the same name worn by women. Over one shoulder, or hanging down the back, was the purple chlamys or cloak, and on his brow a golden wreath of laurels. All the citharoedes bear instruments of the type here described as the cithara, and never one of the lyre type. The records of the citharoedes extend over more than thirteen centuries and fall into two natural divisions: (1) The mythological period. approximately from the 13th century B.C. to the first Olympiad, 776 B.C.; and (2) the historical period to the days of Ptolemy, A.D. 161. One of the very few authentic Greek odes extant is a Pythian ode by Pindar, in which the phorminx of Apollo is mentioned; the solo is followed by a chorus of citharoedes. The scope of the solemn games and processions, called Panaethenae, held every four years in honour of the goddess Athena, which originally consisted principally of athletic sports and horse and chariot races, was extended under Peisistratus (c. 540 B.C.), and the celebration made to include contests of singers and instrumentalists, recitations of portions of the Iliad and Odyssey, such as are represented on the frieze of the Parthenon (in the Elgin Room at the British Museum) and later on friezes by Phidias. It was at the same period that the first contests for solo-playing on the cithara (aepartris) and for solo aulos-playing were instituted at the 8th Pythian Games. One of the principal items at these contests for aulos and cithara was the Nomos Pythikos, descriptive of the victory of Apollo over the python and of the defeat of the monster.

The Pythian Games survived the classic Greek period and were continued under Roman sway until about A.D. 394. Not only were these games held at Delphi, but smaller contests, called Pythia, modelled on the great Pythian, were instituted in various provinces of the empire, and more especially in Asia Minor.

The games lasted for several days, the first being devoted to music. To the games at Delphi came musicians from all parts of the civilized world; and the Spaniards, at the beginning of our era, had attained to such a marvellous proficiency in playing the cithara, an instrument which they had learnt to know from the Phoenician colonists before the conquest by the Romans, that some of their citharoedes easily carried off the honours at the musical contests. The consul Metellus was so charmed with the music of the Spanish competitors that he sent some to Rome for the festivals, where the impression created was so great that the Spanish citharoedes obtained a permanent footing in Rome. Aulus Gallus (Necro. Att. i.) describes an incident at a banquet which corroborates this statement.

The degeneration of music as an art among the Romans, and its gradual degradation by association with the sensual amusements of corrupt Rome, nearly brought about its extinction at the end of the 4th century, when the condemnation of the Church closed the theatres, and the great national games came to an end. Instrumental music was banished from civil life and from religious rites, and thenceforth the slender threads which connect the musical instruments of Greeks and Romans with those of the barbarians were almost entirely broken.

See Pausanias x. 7, 14 et seq.

the middle ages must be sought among the unconverted barbarians of northern and western Europe, who kept alive the traditions taught them by conquerors and colonists; but as civilization was in its infancy with them the instruments sent out from their workshops must have been crude and primitive. Asia, the cradle of the cithara, also became its foster-mother; it was among the Greeks of Asia Minor that the several steps in the transition from cithara into guitar\(^1\) (q.v.) took place.

The first of these steps produced the rota (q.v.), by the construction of body, arms and transverse bar in one piece. The Semitic races used the rota at a very remote period (1700 B.C.), as we know from a fresco at Beni-Hasan, dating from the reign of Senwosri II., which depicts a procession of strangers bringing tribute; among them is a bearded musician of Semitic type bearing a rota which he holds horizontally in front of him in the Assyrian manner, and quite unlike the Greeks, who always played the lyre and cithara in an upright position. A unique specimen of this rectangular rota was found in an Alamanic tomb of the 5th or 6th century at Oberflacht in the Black Forest. The instrument was clasped in the arms of an armed knight; it is now preserved in the Völker Museum in Berlin. This old German rota is an exact counterpart of instruments pictured in illuminated MSS. of the 8th century, and is derived from the cithara with rectangular body, while from the cithara with a body having the curve of the lower half of the violin was produced a rota with the outline of the body of the guitar. Both types were common in Europe until the 14th century, some played with a bow, others twanged by the fingers, and bearing indifferently both names, cithara and rota. The addition of a fingerboard, stretching like a short neck from body to transverse bar, leaving on each side of the finger-board space for the hand to pass through in order to stop the strings, produced the crwth or cithar (q.v.), and brought about the reduction in the number of the strings to three or four. The conversion of the rota into the guitar (q.v.) was an easy transition effected by the addition of a long neck to a body derived from the oval rota. When the bow was applied the result was the guitar or troubadour fiddle. At first the instrument called cithara in the Latin versions of the Psalms was glossed clarin, cline in Anglo-Saxon, but in the 11th century the same instrument was rendered horpan, and in French and English harpe or harp, and our modern versions have retained this translation. The cittern (q.v.), a later descendant of the cithara, although preserving the characteristic features of the cithara, the shallow sound-chest with ribs, adopted the pear-shaped outline of the Eastern instruments of the lute tribe.

\section*{CITIAH (Gr. \\textit{Kiion}), the principal Phoenician city in Cyprus, situated at the north end of modern Larnaca, on the bay of the same name on the S.E. coast of the island. Converging currents from E. and W. meet and pass seaward off Cape Kití a few miles south, and greatly facilitated ancient trade. To S. and W. the site is protected by lagoons, the salt from which was one of the sources of its prosperity. The earliest remains near the site go back to the Mycenaean age (c. 1400–1100 B.C.) and seem to mark an Aegean colony;\(^2\) but in historic times Citium is the chief centre of Phoenician influence in Cyprus. That this was still a recent settlement in the 7th century is suggested by an allusion in a list of the allies of Assur-bani-pal of Assyria in 668 B.C. to a King Damasus of Karthagadasi (Phoenician for "New-town"), where Citium would be expected. A Phoenician dedication to "Baal of Lebanon" found here, and dated also to the 7th century, suggests that Citium may have belonged to Tyre. The biblical name Kittim, derived from Citium, is in fact used quite generally for Cyprus as a whole;\(^3\) later also for Greeks and Romans in general.\(^4\) The discovery here of an official monument of Sargon II. suggests that Citium was the administrative centre of Cyprus during the Assyrian protectorate (709–668 B.C.);\(^5\) during the Greek revolts of 500, 386 foll. and 352 B.C., Citium led the side loyal to Persia and was besieged by an Athenian force in 449 B.C.; its extensive necropolis proves that it remained a considerable city even after the Greek cause triumphed with Alexander. But like other cities of Cyprus, it suffered repeatedly from earthquake, and in medieval times when its harbour became silted the population moved to Larnaca, on the open roadstead, farther south. Harbour and citadel have now quite disappeared, the latter having been used to fill up the former shortly after the British occupation; some gain to health resulted, but an irreparable loss to science. Traces remain of the circuit wall, and of a sanctuary with tripod cista-cotta offerings; the large necropolis yields constant loot to illicit excavators.

\section*{CITIZEN (a form corrupted in Eng., apparently by analogy with "denizen," from O. Fr. citéain, mod. Fr. citoyen), etymologically the inhabitant of a city, cité or ciélas (see Citty), and in English the term still used primarily of persons possessing civic rights in a borough; thus used also of a townman as opposed to a countryman. The more extended use of the word, however, is not corresponding to a ciélas, gives "citizen" the meaning of one who is a constituent member of a state in international relations and as such has full national rights and owes a certain allegiance (q.v.) as opposed to an "alien"; in republican countries the term is then commonly employed as the equivalent of "subject" in monarchies of feudal origin. For the rules governing the obtaining of citizenship in this latter sense in the United States and elsewhere see NATURALIZATION.

\section*{CITOLE, also spelled SYTOLE, CYTHOLE, GYTOLE, &c. (probably a Fr. diminutive form of cithara, and not from Lat. cista, a box), an obsolete musical instrument of which the exact form is uncertain. It is frequently mentioned by poetical writers of the 13th to the 15th centuries, and is found in Wycliffe's Bible (1350) in 2 Samuel vi. 5, "Harpis et sitos et tympane." The Authorized Version has "psaltries," and the Vulgate "lyrae." It has been supposed to be another name for the psaltery (q.v.), a box-shaped instrument often seen in the illuminated manuscripts of the Middle Ages.

\section*{CITRUS ACID, Acidum citricum, or Oxycitricusidic Acid, C\(_6\)H\(_8\)O\(_7\) (CO)\(_2\)H, a tetrahydroxytrivial acid, first obtained in the solid state by Karl Wilhelm Scheele, in 1784, from the juice of lemons. It is present also in oranges, citrons, currants, gooseberries and many other fruits, and in several bulbs and tubers. It is made on a large scale from lime or lemon juice, and also by the fermentation of glucose under the influence of \\textit{Citrómyces plesserium}, C. glaber and other ferment. Lemon juice is fermented for some time to free it from mucilage, then boiled

\section*{K.S.}
and filtered, and neutralized with powdered chalk and a little milk of lime; the precipitate of calcium citrate so obtained is decomposed with dilute sulphuric acid, the solution filtered, evaporated to remove calcium sulphate and concentrated, preferably in vacuum pans. The acid is thus obtained in colourless rhombic prisms of the composition \(\text{Ca}_2\text{H}_4\text{O}_6\cdot\text{H}_2\text{O}\). Crystals of a different form are deposited from a strong boiling solution of the acid. About 20 gallons of lemon juice should yield about 10 lb of crystallized citric acid. The acid may also be prepared from the juice of unripe gooseberries. Calcium citrate must be manufactured with care to avoid an excess of chalk or lime, which would precipitate constituents of the juice that cause the fermentation of the citrate and the production of calcium acetate and carbonate.

The synthesis of citric acid was accomplished by L. E. Grimaux and P. Adam in 1881. Glycerin when treated with hydrochloric acid gives propenyl dichlorhydrin, which may be oxidized to \(\text{CH}_2\text{ClC} = \text{CH}_2\text{Cl}\). This compound combines with hydrocyanic acid to form a nitrile which hydrolyses to dichlorhydroxy iso-butyric acid. Potassium cyanide reacts with this acid to form the corresponding dinitril, which is converted by hydrochloric acid into citric acid. This series of operations proves the constitution of the acid. A. Haller and C. A. Held synthesized the acid from ethyl chlor-acetoacetate (from chlorine and acetoacetic ester) by heating with potassium cyanide and saponifying the resulting nitrile. The acetone dicarboxylic acid, \(\text{CO}(<\text{CH}_3\text{})_2\text{CO}<\) is obtained and it then decomposes to yield citric acid on hydrolysis.

Citric acid has an agreeable sour taste. It is soluble in 4\% of its weight of cold, and in half its weight of boiling water, and dissolves in alcohol, but not in ether. At 150° C. it melts, and on the continued application of heat boils, giving off its water of crystallization. At 175° C. it is resolved into water and aconitic acid, \(\text{C}_6\text{H}_6\text{O}_6\), a substance found in \(\text{Equisetum fluviatile}\), monkshood and other plants. A higher temperature decomposes this body into carbon dioxide and itaconic acid, \(\text{C}_6\text{H}_6\text{O}_5\), again, by the expulsion of a molecule of water, yields citraconic anhydride, \(\text{C}_4\text{H}_6\text{O}_6\). Citric acid digested at a temperature below 40° C. with concentrated sulphuric acid gives off carbon monoxide and forms acetone dicarboxylic acid. With fused potash it forms potassium oxalate and acetate. It is a strong acid, and dissolved in water decomposes carbonates and attacks iron and zinc.

The citrates are a numerous class of salts, the most soluble of which are those of the alkaline metals; the citrates of the alkaline earth metals are insoluble. Citric acid, being tribasic, forms either basic monometa, acid dimetals or neutral trimetallic salts; thus, mono-, di- and tri-potassium and sodium citrates are known. On warming citric acid with an excess of lime-water a precipitate of calcium citrate is obtained which is redissolved as the liquid cools.

The impurities occasionally present in commercial citric acid are salts of potassium and sodium, traces of iron, lead and copper derived from the vessels used for its evaporation and crystallization, and free sulphuric, tartaric and even oxalic acid. Tartaric acid, which is sometimes present in large quantities as an adulterant in commercial citric acid, may be detected in the presence of the latter, by the production of a precipitate of acid potassium tartrate when potassium acetate is added to a cold solution. Another mode of separating the two acids is to convert them into calcium salts, which are then treated with a perfectly neutral solution of cupric chloride, soluble cupric citrate and calcium chloride being formed, while cupric tartrate remains undissolved. Citric acid is also distinguished from tartaric acid by the fact that an ammonia solution of silver tartrate produces a brilliant silver mirror when boiled, whereas silver citrate is reduced only after prolonged ebullition.

Citric acid is used in calico printing, also in the preparation of effervescing draughts, as a refrigerant and dialogogue, and occasionally as an antiscorbutic, instead of fresh lemon juice. In the form of lime juice it has long been known as an antidiote for scurvy. Several of the citrates are much employed as medicines, the most important being the scale preparations of iron. Of these iron and ammonium citrate is much used as a haematinic, and as it has hardly any tendency to cause gastric irritation or constipation it can be taken when the ordinary forms of iron are inadmissible. Iron and quinine citrate is used as a bitter stomachic and tonic. In the blood citrates are oxidized into carbonates; they therefore act as remote alcalis, increasing the alkalinity of the blood and thereby the general rate of chemical change within the body (see Acetic Acid).

**CITRON**, a species of Citrus (C. medica), belonging to the tribe Auranthaceae, of the botanical natural order Rutaceae; the same genus furnishes also the orange, lime and shaddock. The citron is a small evergreen tree or shrub growing to a height of about 10 ft.; it has irregular straggling spiny branches, large pale-green broadly oblong, slightly serrate leaves and generally unisexual flowers purplish without and white within. The large fruit is ovate or oblong, protuberant at the tip, and from 5 to 6 in. long, with a rough, furrowed, adherent rind, the inner portion of which is thick, white and fleshy, the outer, thin, greenish-yellow and very fragrant. The pulp is sub-acid and edible, and the seeds are bitter. There are many varieties of the fruit, some of them of great weight and size. The Madras citron has the form of an oblate sphere; and in the "fingered citron" of China the lobes are separated into finger-like divisions formed by separation of the constituent carpels, as occurs sometimes in the orange.

The citron-tree thrives in the open air in China, Persia, the West Indies, Madeira, Sicily, Corsica, and the warmer parts of Spain and Italy; and in conservatories it is often seen in more northerly regions. Sir Joseph Hooker (Flora of British India, i. 514) regards it as a native of the valleys at the foot of the Himalaya, and of the Khasia hills and the Western Ghauts; Dr Bonavia, however, considers it to have originated in Cochín China or China, and to have been introduced into India, whence it spread to Media and Persia. It was described by Theophrastus as growing in Media, three centuries before Christ, and was early known to the ancients, and the fruit was held in great esteem by them; but they seem to have been acquainted with no other member of the Auranthaceae, the introduction of oranges and lemons into the countries of the Mediterranean being due to the Arabs, between the 10th and 12th centuries. Josephus tells us that "the law of the Jews required that at the feast of tabernacles every one should have branches of palm and citron-tree" (Antiq. xiii. 13. 6); and the Hebrew word "appach", rendered "apples" and "apple-tree" in Cant. ii. 3, 5, Prov. xxv. 11, Kc., probably signifies the citron-tree and its fruit. Oribasius in the 4th century describes the fruit, accurately distinguishing the three parts of it. About the 3rd century the tree was introduced into Italy; and, as Gallesio informs us, it was much grown at Salerno in the 11th century. In China citrons are placed in apartments to make them fragrant. The rind of the citron yields two perfumes, oil of cedra and oil of citron, isomeric with oil of turpentine; and when candied it is much esteemed as a dessert and in confectionery. The lemon (q.v.) is now generally regarded as a subspecies Limonum of Citrus medica.

Bonavia, The Cultivated Oranges and Lemons, etc., of India and Ceylon (1890).

**CITTADELLA**, a town of Venetia, Italy, in the province of Padua, 20 m. N.W. by rail from the town of Padua; 160 ft. above sea-level. Pop. (1901) town, 3616; commune, 9686. The town was founded in 1220 by the Pisans to counterbalance the fortification of Castelfranco, 8 m. to the E., in 1218 by the Trevisans, and retains its well-preserved medieval walls, surrounded by a wet ditch. It was always a fortress of importance, and in modern times is a centre for the agricultural produce of the district, being the junction of the lines from Padua to Bassano and from Vicenza to Treviso.

**CITTÀ DELLA PIEVE**, a town and episcopal see of Umbria, Italy, in the province of Perugia, situated 1666 ft. above the sea,
3 m. N.E. of its station on the railway between Chiusi and Orvieto. Pop. (1901) 8383. Etruscan tombs have been found in the neighbourhood, but it is not certain that the present town stands on an ancient site. It was the birthplace of the painter Pietro Vannuci (Perugino), and possesses several of his works, but none of the first rank.

CITTÀ DI CASTELLO, a town and episcopal see of Umbria, Italy, in the province of Perugia, 38 m. E. of Arezzo by rail (18 m. direct), situated on the left bank of the Tiber, 945 ft. above sea-level. Pop. (1901) of town, 6096; of commune, 26,885. It occupies, as inscriptions show, the site of the ancient Tifernum Tiberium, near which Pliny had a villa (Epist. v. 6; cf. H. Winnefeld in Jahrbuch des deutschen archäologischen Institutes, vi. Berlin, 1891, 203), but no remains exist above ground. The town was devastated by Totila, but seems to have recovered. We find it under the name of Castrum Felicitatis at the end of the 8th century. The bishopric dates from the 7th century. The town went through various political vicissitudes in the middle ages, being subject now to the emperor, now to the Church, until in 1468 it came under the Vitelli: but when they died out it returned to the allegiance of the Church. It is built in the form of a rectangle and surrounded by walls of 1518. It contains fine buildings of the Renaissance, especially the palaces of the Vitelli, and the cathedral, originally Romanesque. The 12th-century altar front of the latter in silver is fine. The Palazzo Comunale is of the 14th century. Some of Raphael's earliest works were painted for churches in this town, but none of them remains there. There is, however, a small collection of pictures.

See Magherini Graziani, L'Arte a Città di Castello (1897).

CITTÀ VECCHIA, or CITTÀ NOTABILE, a fortified city of Malta, 7 m. W. of Valletta, with which it is connected by railway. Pop. (1901) 7715. It lies on high, sharply rising ground which affords a view of a large part of the island. It is the seat of a bishop, and contains an ornate cathedral, overthrown by an earthquake in 1693, but rebuilt, which is said by an acceptable tradition to occupy the site of the Roman city, which was destroyed by the Gothic invaders in the 7th century. The cathedral, dedicated to the Virgin, contains several fine works of art, and is one of the principal objects of interest in the town. The cemetery of the church is an ancient one, and contains many interesting monuments. The town is situated on a hill, and possesses a fine view of the sea and the surrounding country.

Città Vecchia was called Civitas Melita by the Romans and oldest writers, Medina (i.e. the city) by the Saracens, Notabile (locale notable, et insignis corona regiae, as it is called in a charter by Alphonsus, 1428) under the Sicilian rule, and Città Vecchia (old city) by the knights. It was the capital of the island till its supersession by Valletta in 1570.

See also MALTA.

CITÉ (also Cithern, Cithron, Cythren, Citharen, &c.; Fr. citre, cître, cithre, guitare allemande ou anglaise; Ger. Cithar, Zither (mit Hals, with neck); Ital. cetera, cetero), a medieval stringed instrument with a neck terminating in a grotesque and twanged by fingers or plectrum. The popularity of the cittern was at its height in England and Germany during the 16th and 17th centuries. The cittern consisted of a pear-shaped body similar to that of the lute but with a flat back and sound-board joined by ribs. The neck was provided with a fretted finger-board; the head was curved and surmounted by a grotesque head of a woman or of an animal. The strings were of wire in pairs of unisons, known as courses, usually four in number in England. A peculiarity of the cittern lay in the tuning of the courses, the third course known as bass being lower than the fourth and tenor.

According to Vincentio Gallei (the father of the great astronomer) Città di Castello was the birthplace of the cittern. Several lesson books for this popular instrument were published during the 17th century in England. A very rare book (of which the British Museum does not possess a copy), The Cithern Schoole, written by Anthony Holborne in 1597, is mentioned in Sir P. Leycester's manuscript commonplace book dated 1666. "For the little Instrument called a Psaltirne Anthony Holborne and Tho. Robinson were most famous of any before them and have both of them set out a booke of Lessons for this Instrument. Holborne has composed a Basse-parte for the Viole to play unto the Psaltirne with those Lessons set out in his booke. These lived about Anno Domini 1600." Thomas Robinson's New Cithern Lessons with perfect tunings for the same from Fourre course of strings to Fourteen course, &c. (printed London, 1609, by William Barley), contains illustrations of both kinds of instruments. The fourteen-course cittern was also known in England as Bijuga; the seven courses in pairs were stretched over the finger-board, and the seven single strings, fastened to the grotesque head, were stretched as in the lyre à viole alongside the neck; all the strings rested on the one flat bridge near the tail-piece. Robinson gives instructions for learning to play the cittern and for reading the tablature. John Playford's Musicke's Delight on the Cithren (London, 1666) also contains illustrations of the instrument as well as of the viol da Gamba and Pochette; he claims to have revived the instrument and restored it to what it was in the reign of Queen Mary.

The cittern probably owed its popularity at this time to the ease with which it might be mastered and used to accompany the voice; it was one of four instruments generally found in barbers' shops, the others being the gittern, the lute and the virginals. The customers while waiting took down the instrument from its peg and played a merry tune to pass the time.

We read that when Konstantijn Huygens came over to England and was received by James I. at Bagshot, he played to the king on the cittern (cithara), and that his performance was duly appreciated and applauded. He tells us that, although he learnt to play the barbiton in a few weeks with skill, he had lessons from a master for two years on the cittern. On the occasion of a third visit he witnessed the performance of some fine musicians and was astonished to hear a lady, mother of twelve, singing in divine fashion, accompanying herself on the cittern; one of these artists he calls Lamius, the British Orpheus, whose performance was really enchanting.

Michael Praetorius gives various tunings for the cittern as follows in his Syntagma Musicum (1615). See also M. Meissner, Harmonie universelle (Paris, 1636), livre ii. prop. xv., which gives different accordances.

From Thomas Robinson's New Cithern Lessons, 1609.

Four-course Cittern.
construction and in the derivation of the name were the gittern and the guitar, so often confused with the cittern. It is evident that the kinship of cittern and guitar was formerly recognized, for during the 18th century, as stated above, the cittern was known as the English guitar to distinguish it from the Spanish guitar. The grotesque head, popularly considered the characteristic feature of the cittern, was probably added in the 12th century at a time when this style of decoration was very noticeable in other musical instruments, such as the cornet or Zink, the *Platorspiel*, the chainer of the bagpipe, &c. The cittern of the middle ages was also to be found in oval shape. From the 13th century representations of the pear-shaped instrument abound in miniatures and carvings.4

A very clearly drawn cittern of the 14th century occurs in a MS. treatise on astronomy (Sloane MS. 3983, Brit. Mus.) translated from the Persian of Abu'mazar into Latin by Georgius Zonhari Zopari Penduli, priest and philosopher, with a prologue and numerous illustrations by his own hand; the cittern is here called *giga* in an inscription at the side of the page.

References to the cittern are plentiful in the literature of the 16th and 17th centuries. Robert Fludd3 describes it thus: "Citrone quaque quatuor tandem chordas duplicatas habet esque cupreas et ferrae de quibus aliquid dicemus quo loco." Others are given in the *New English Dictionary*, "Cittern," and in Godfrey's *Dict. de l'anc. langue fran. du 16*° au 18*° siècle. (K. S.)

**CITY** (through Fr. *cité*, from Lat. *citius*). In the United Kingdom, strictly speaking, "city" is an honorary title, officially applied to those of some municipal importance (such as episcopal sees, or great industrial centres), have by traditional usage or royal charter acquired the right to the designation. In the United Kingdom the official style of "city" does not necessarily involve the possession of municipal power greater than those of the ordinary boroughs, nor indeed the possession of a corporation at all (e.g. Ely). In the United States and the British colonies, on the other hand, the official application of the term "city" depends on the kind and extent of the municipal privileges possessed by the corporations, and charters are given raising towns to the rank of cities. Both in France and England the word is used to distinguish the older and central nucleus of some of the large towns, e.g. the *Cité* in Paris, and the "square mile" under the jurisdiction of the lord mayor which is the "City of London."

In common usage, however, the word implies no more than a somewhat vague idea of size and dignity, and is loosely applied to any large centre of population. Thus while, technically, the City of London is quite small, London is yet properly described as the largest city in the world. In the United States this use of the word is still more loose, and any town, whether technically a city or not, is usually so designated, with little regard to its actual size or importance.

It is clear from the above that the word "city" is incapable of any very clear and inclusive definition, and the attempt to show that historically it possesses a meaning that clearly differentiate it from "town" or "borough" has led to some controversy. As the translation of the Greek *polis* or Latin *citius* it involves the ancient conception of the state or "city-state," i.e. of the state as not too large to prevent its government through the body of the citizens assembled in the agora, and is applied only to the place where the people, in their conception both the word and its dignified connotation are without doubt historically derived. On the occupation of Gaul the Gallic states and tribes were called *citici* by the Romans.

---

*Historia urbisqve Cosmi* (Oppenheim, ed. 1617), i. 226.
and subsequently the name was confined to the chief towns of the various administrative districts. These were also the seats of the bishops. It is thus affirmed that in France from the 5th to the 15th century the name civitas or cité was confined to such towns as were episcopal sees, and Du Cange (Gloss. s.v. civitas) defines that word as urbs episcopalis, and states that other towns were termed castra or oppida. How far any such distinction can be sharply drawn may be doubted. With regard to England no definite line can be drawn between those towns to which the name civitas or cité is given in medieval documents and those, called burgh or boroughs (see J. H. Round, Pennal England, p. 158; F. W. Maitland, Domesday Book and After, p. 183). It was, however, maintained by Coke and Blackstone that a city is a town incorporate which is or has been the see of a bishop. It is true, indeed, that the actual sees in England all have a formal right to the title; the boroughs erected into episcopal sees by Henry VIII. thereby became "cities"; but towns such as Thetford, Sherborne and Dorchester are never so designated, though they are regularly incorporated and were once episcopal sees. On the other hand, it has only been since the latter part of the 19th century that the official style of "city" has, in the United Kingdom, been conferred by royal authority on certain important towns which were not episcopal sees, Birmingham in 1889 being the first to be so distinguished. It is interesting to note that London, besides 27 boroughs, now contains two cities, one (the City of London) outside, the other (the City of Westminster) included in the administrative county.

For the history of the origin and development of modern city government see Borough and Commune: Medieval.

CIUDAD BOLÍVAR, an inland city and river port of Venezuela, capital of the state of Bolívar, on the right bank of the Orinoco river, 240 m. above its mouth. Pop. (1891) 11,686. It stands upon a small hill about 187 ft. above sea-level, and faces the river where it narrows to a width of less than half a mile. The city is largely built upon the hillside. It is the seat of the bishopric of Guayana (founded in 1790), and is the commercial centre of the great Orinoco basin. Among its noteworthy edifices are the cathedral, federal college, theatre, masonic temple, market, custom-house, and hospital. The mean temperature is 83°. The city has a public water-supply, a tramway line, telephone service, subfluvial cable communication with Soledad near the mouth of the Orinoco, where connexion is made with the national land lines, and regular steamship communication with the lower and upper Orinoco. Previous to the revolution of 1901–3 Ciudad Bolívar ranked fourth among the Venezuelan custom-houses, but the restrictions placed upon transit trade through West Indian ports have made her a dependency of the La Guaira custom-house to a large extent. The principal exports from this region include cattle, horses, mules, tobacco, cacao, rubber, tonka beans, bitters, hides, timber and many valuable forest products. The town was founded by Mendoza in 1764 as San Tomás de la Nueva Guayana, but its location at this particular point on the river gave it to the popular name of Angostura, the Spanish term for "narrow." This name was used until 1849, when that of the Venezuelan liberator was bestowed upon it. Ciudad Bolívar played an important part in the struggle for independence and was for a time the headquarters of the revolution. The town suffered severely in the struggle for its possession, and the political disorders which followed greatly retarded its growth.

CIUDAD DE CURA, an inland town of the state of Aragua, Venezuela, 55 m. S.W. of Caracas, near the Lago de Valencia. Pop. (1891) 12,198. The town stands in a broad, fertile valley, between the sources of streams running southward to the Guárico river and northward to the lake, with an elevation above sea-level of 1598 ft. Traffic between Puerto Cabello and the Guárico plains has passed through this town since early colonial times, and has made it an important commercial centre, from which hides, cheese, coffee, cacao and beans are sent down to the coast for export; it bears a high reputation in Venezuela for commercial enterprise. Ciudad de Cura was founded in 1730, and suffered severely in the war of independence.

CIUDAD JUAREZ, formerly El Paso del Norte, a northern frontier town of Mexico, in the state of Chihuahua, 1223 m. by rail N.N.W. of Mexico City. Pop. (1895) 6071. Ciudad Juárez stands 3800 ft. above sea-level on the right bank of the Rio Grande del Norte, opposite the city of El Paso, Texas, with which it is connected by two bridges. It is the northern terminus of the Mexican Central railway, and has a large and increasing transit trade with the United States, having a custom-house and a United States consulate. It is also a military post with a small garrison. The town has a straggling picturesque appearance, a considerable part of the habitations being small adobe or brick cabins. In the fertile neighbouring district cattle are raised, and wheat, Indian corn, fruit and grapes are grown; wine and brandy being made. The town was founded in 1681–1682; its present importance is due entirely to the railway. It was the headquarters of President Juárez in 1865, and was renamed in 1883 because of its devotion to his cause.

CIUDAD PORFIRIO DíAZ, formerly Piedras Negras, a northern frontier town of Mexico in the state of Coahuila, 1008 m. N. by W. from Mexico City, on the Rio Grande del Norte, 720 ft. above sea-level, opposite the town of Eagle Pass, Texas. Pop. (1900, estimate) 5000. An international bridge connects the two towns, and the Mexican International railway has its northern terminus in Mexico at this point. The town has an important transfer trade with the United States, and is the centre of a fertile district devoted to agriculture and stock-raising. Coal is found in the vicinity. The Mexican government maintains a custom-house and military post here. The town was founded in 1849.

CIUDAD REAL, a province of central Spain, formed in 1833 of districts taken from New Castle, and bounded on the N. by Toledo, E. by Albacete, S. by Jaén and Cordova and W. by Badajoz. Pop. (1900) 321,580; area, 7620 sq. m. The surface of Ciudad Real consists chiefly of a level or slightly undulating plain, with low hills in the north-east and south-west; but along the south-western frontier the Sierra de Alcudia rises in two parallel ridges on either side of the river Alcudia, and is continued in the Sierra Madrona on the east. The river Guadiana drains almost the entire province, which it traverses from east to west; only the southernmost districts being watered by tributaries of the Guadalquivir. Numerous smaller streams flow into the Guadiana, which itself divides near Herencia into two branches, which, of the northern known as the Giguela, the southern as the Zurrera. The eastern division of Ciudad Real forms part of the region known as La Mancha, a flat, thinly-peopled plain, clothed with meagre vegetation which is often ravaged by locusts. La Mancha (q.v.) is sometimes regarded as coextensive with the whole province. Severe drought is common here, although some of the rivers, such as the Jabalon and Azuer, issue fully formed from the chalky soil, and from their very sources give an abundant supply of water to the numerous mills. Towards the west, where the land is higher, there are considerable tracts of forest. The climate is oppressively hot in summer, and in winter the plains are exposed to violent and bitterly cold winds; while the cultivation of grain, the vine and the olive is further impeded by the want of proper irrigation, and the general barrenness of the soil. Large flocks of sheep and goats find pasture in the plains; and the swine which are kept in the oak and beech forests furnish bacon and hams of excellent quality. Coal is mined chiefly at Puertollano, lead in various districts, mercury at Almadén. There are no great manufacturing towns. The roads are insufficient and ill-kept, especially in the north-east where they form the sole means of communication; and neither the Guadiana nor its tributaries are navigable. The main railway from Madrid to Lisbon passes through the capital, Ciudad Real, and through Puertollano; farther east, the Madrid-Línares line passes through Manzanares and Valdepeñas. Branch railways also connect the capital with Manzanares, and Valdepeñas with the neighbouring town of La Calzada. The principal towns, Alcázar de San Juan (11,499), Almadén (7375), Almodóvar del Campo (12,529), Ciudad Real (15,255), Manzanares (11,229) and Valdepeñas (21,015), are described in
CIUDAD REAL—CIVILIS

sepahare articles. Almagro (1794) and Daimiel (11,825), in the district of La Mancha known as the Campo de Calatrava, belonged in the later middle ages to the knightsly Order of Calatrava, which was founded in 1158 to keep the Moors in check. Almagro was long almost exclusively inhabited by monks and knights, and contains several interesting churches and monasteries, besides the castle of the knights, now used as barracks. Almagro is further celebrated for its lace, Daimiel for its medicinal salts. Tomelloso (13,920) is one of the chief market towns of La Mancha. Education is very backward, largely owing to the extreme poverty which has frequently brought the inhabitants to the verge of famine. (See also CASTILE.)

CIUDAD REAL, the capital formerly of La Mancha, and since 1833 of the province described above; 107 m. S. of Madrid, on the Madrid-Hadajos-Lisbon and Ciudad Real-Maham operatives railways. Pop. (1900) 15,255. Ciudad Real lies in the midst of a wide plain, watered on the north by the river Guadiana, and on the south by its tributary the Jabalon. Apart from the remnants of its 15th-century fortifications, and one Gothic church of immense size, built without aisles, the town contains little of interest; its public buildings—town-hall, barracks, churches, hospital and schools—being in no way distinguished above those of other provincial capitals. There are no important local manufactures, and the trade of the town consists chiefly in the weekly sales of agricultural produce and live-stock. Ciudad Real was founded by Alphonso X. of Castile (1252–1284), and fortified by him as a check upon the Moorish power. Its original name of Villarreal was changed to Ciudad Real by John VI. in 1430. During the Peninsular War a Spanish force was defeated here by the French, on the 27th of March 1809.

CIUDAD RODRIGO, a town of western Spain, in the province of Salamanca, situated 8 m. E. of the Portuguese frontier, on the right bank of the river Agueda, and the railway from Salamanca to Coimbra in Portugal. Pop. (1900) 8930. Ciudad Rodrigo is an episcopal see, and was for many centuries an important frontier fortress. Its cathedral dates from 1190, but was restored in the 15th century. The remains of a Roman aqueduct, the foundations of a bridge across the Agueda, and other remains, seem to show that Ciudad Rodrigo occupies the site of a Roman settlement. It was founded in the 12th century by Count Rodrigo Gonzalez, from whom its name is derived. During the Peninsular War, it was captured by the French under Marshal Ney, in 1810; but on the 15th of January 1812 it was retaken by the British under Viscount Wellington, who, for this exploit, was created earl of Wellington, duke of Ciudad Rodrigo, and marques of Torres Vedras, in Portugal.

CIVERCHIO, VINCENZO, an early 16th-century Italian painter, born at Crema. There are altar-pieces by him at Brescia, and at Crema the altar-piece at the duomo (1500). His "Birth of Christ" is in the Brera, Milan; and at Lovere are other of his works dating from 1539 and 1540.

CIVET, or properly CIVET-CAT, the designation of the more typical representatives of the mammalian family Viverridae (see CARNIVORA). Civets are characterized by the possession of a deep pouch in the neighbourhood of the genital organs, into which the substance known as civet is poured from the glands by which it is secreted. This fatty substance is at first semifluid and yellow, but afterwards acquires the consistency of pomade and becomes darker. It has a strong musky odour, exceedingly disagreeable to those unaccustomed to it, but "when properly diluted and combined with other scents it produces a very pleasing effect, and possesses a much more floral fragrance than musk, indeed it would be impossible to imitate some flowers without it." The African civet (Viverra civetta) is from 2 to 3 ft. in length, exclusive of the tail, which is half the length of the body, and stands from 10 to 12 in. high. It is covered with long hair, longest on the middle line of the back, where it is capable of being raised or depressed at will, of a dark-grey colour, with numerous transverse black bands and spots. In habits it is chiefly nocturnal, and by preference carnivorous, feeding on birds and the smaller quadrupeds, in pursuit of which it climbs trees, but it is said also to eat fruits, roots and other vegetable matters. In a state of captivity the civet is never completely tamed, and only kept for the sake of its perfume, which is obtained in largest quantity from the male, especially when in good condition and subjected to irritation, being scraped from the pouch with a small spoon usually twice a week. The zibeth (Viverra zibetha) is a widely distributed species extending from Arabia to Malabar, and throughout several of the larger islands of the Indian Archipelago. It is smaller than the true civet, and wants the dorsal crest. In the wild state it does great damage among poultry, and frequently makes off with the young of swine and sheep. When hunted it makes a determined resistance, and emits a scent so strong as even to sicken the dogs, who nevertheless are exceedingly fond of the sport, and cannot be got to pursue any other game while the stench of the civet remains in their noses. In the market it becomes comparatively tame, and yields civet in considerable quantity. In preparing this for the market it is usually spread out on the leaves of the pepper plant in order to free it from the hairs that have become detached from the pouch. On the Malabar coast this species is replaced by V. civettina. The small Indian civet or rasse (Viverricula malaccensis) ranges from Madagascar through India to China, the Malay Peninsula, and the islands of the Archipelago. It is almost 3 ft. long including the tail, and prettily marked with dark longitudinal stripes, and spots which have a distinctly linear arrangement. The perfume, which is extracted in the same way as in the two preceding species, is highly valued and much used by the Javanese. Although this animal is said to be an expert climber it usually inhabits holes in the ground. It is frequently kept in captivity in the East, and becomes tame. Fossil remains of extinct civets are found in the Miocene strata of Europe.

CIVIDALE DEL FRIULI (anc. Forum Iulii), a town of Venetia, Italy, in the province of Udine, 10 m. E. by rail from the town of Udine; 453 ft. above sea-level. Pop. (1901) town, 4143; commune, 9061. It is situated on the river Natisone, which forms a picturesque ravine here. It contains some interesting relics of the art of the 8th century. The cathedral of the 15th century contains an octagonal marble canopy with sculptures in relief, with a font below it belonging to the 8th century, but altered later. The high altar has a fine silver altar front of 1185. The museum contains various Roman and Lombard antiquities, and valuable MSS. and works of art in gold, silver and ivory formerly belonging to the cathedral chapter. The small church of S. Maria in Valle belongs to the 8th century, and contains some decorations in which probably belong to the 11th or 12th century. The fine 15th-century Ponte del Diavolo leads to the church of S. Martino, which contains an altar of the 8th century with relics executed by order of the Lombard king Ratchis. At Cividale were born Paulus Diaconus, the historian of the Lombards in the time of Charlemagne, and the actress Adelaide Ristori (1822–1906).

The Roman town (a municipium) of Forum Iulii was founded either by Julius Caesar or by Augustus, no doubt at the same time as the construction of the Via Iulia Augusta, which passed through Utina (Udine) on its way north. After the decay of Aquileia and Iulium Carnicum (Zuglio) it became the chief town of the district of Friuli and gave its name to it. The patriarchs of Aquileia resided here from 773 to 1031, when they returned to Aquileia, and finally in 1238 removed to Udine. This last change of residence was the origin of the antagonism between Cividale and Udine, which was only terminated by their surrender to Venice in 1419 and 1420 respectively.

CIVILIS, CLAUDIUS, or more correctly, JULIUS, leader of the Batavian revolt against Rome (A.D. 69–70). He was twice imprisoned on a charge of rebellion, and narrowly escaped execution. During the disturbances that followed the death of Nero, he took up arms under pretence of siding with Vespasian and induced the inhabitants of his native country to rebel. The Batavians, who had rendered valuable aid under the early emperors, had been well treated in order to attach them to the cause of Rome. They were exempt from tribute, but were obliged to supply a large number of men for the army, and the
burden of conscription and the oppressions of provincial governors were important incentives to revolt. The Batavians were immediately joined by several neighbouring German tribes, the most important of whom were the Frisians. The Roman garrisons near the Rhine were driven out, and twenty-four ships captured. Two legions under Mummius Lupercus were defeated at Castra Vetera (near the modern Xanten) and surrounded. Eight cohorts of Batavian veterans joined their countrymen, and the troops sent by Vespasian to the relief of Vetera threw their lot with them. The result of these accessions to the forces of Civilis was a rising in Gaul. Hordeonius Flaccus was murdered by his troops (70), and the whole of the Roman forces were induced by two commanders of the Gallic auxiliaries—Julius Classicus and Julius Tutor—to revolt from Rome and join Civilis. The whole of Gaul thus practically declared itself independent, and the foundation of a new kingdom of Gaul was contemplated. The prophetess Velleda predicted the complete success of Civilis and the fall of the Roman Empire. But disputes broke out amongst the different tribes and rendered co-operation impossible; Vespasian, having successfully ended the civil war, called upon Civilis to lay down his arms, and on his refusal resolved to take strong measures for the suppression of the revolt. The arrival of Petullius Cerialis with a strong force averted the Gauls and mutinous troops into submission; Civilis was defeated at Augusta Treverorum (Trier, Trèves) and Vespasian, having forced the withdrawal of the Batavians, he finally came to an agreement with Cerialis whereby his countrymen obtained certain advantages, and resumed amicable relations with Rome. From this time Civilis disappears from history.

The chief authority for the history of the insurrection is Tacitus, Historiae, i. v, whose account breaks off at the beginning of Civilis's speech to Cerialis; see also Josephus, Bellum Judaeicum, vii. There is a monograph by E. Meyer, Der Freiheitskrieg der Bataver unter Civilis (1856); see also Merivale, Hist. of the Romans under the Empire, ch. 58; H. Schiller, Geschichte der römischen Kaiserzeit, bk. ii. ch. 2, § 54 (1885).

CIVILIZATION. The word "civilization" is an obvious derivative of the Lat. civis, a citizen, and civilitas, pertaining to a citizen. Etymologically speaking, then, it would be putting no undue strain upon the word to interpret it as having to do with the entire period of human progress since mankind attained sufficient intelligence and social unity to develop a system of government. But in practice "civilization" is usually interpreted in a somewhat narrower sense, as having application solely to the most recent and comparatively brief period of time that has elapsed since the most highly developed races of men have used systems of writing. This restricted usage is probably explicable, in part at least, by the fact that the word, though distinctly modern in origin, is nevertheless older than the interpretation of social evolution that now finds universal acceptance. Only very recently has it come to be understood that primitive societies vastly antedating the historical period had attained relatively high stages of development and fixity, socially and politically. Now that this is understood, however, nothing but an arbitrary and highly inconvenient restriction of meanings can prevent us from speaking of the citizens of these early societies as having attained certain stages of "civilization." It will be convenient, then, in outlining the successive stages of human progress here, to include under the comprehensive term "civilization" those long earlier periods of "savagery" and "barbarism" as well as the more recent period of higher development to which the word "civilization" is sometimes restricted.

Adequate proof that civilization as we now know it is the result of a long, slow process of evolution was put forward not long after the middle of the 19th century by the students of palaeontology and of prehistoric archaeology. A recognition of the fact that primitive man used implements of chipped flint, of polished stone, and of the softer metals for successive ages, before he attained a degree of technical skill and knowledge that would enable him to smelt iron, led the Danish archaeologists to classify the stages of human progress under these captions: the Rough Stone Age; the Age of Polished Stone; the Age of Bronze; and the Age of Iron. These terms acquired almost universal recognition, and they retain popularity as affording a very broad outline of the story of human progress. It is obviously desirable, however, to fill in the outlines of the story more in detail. To some extent it has been possible to do so, largely through the efforts of ethnologists who have studied the social conditions of existing races of savages. A recognition of the principle that, broadly speaking, this progress has everywhere been achieved along the same lines and through the same sequence of changes, makes it possible to interpret the past history of the civilized races of to-day in the light of the present-day conditions of other races that are still existing under social and political conditions of a more primitive type. Such races as the Maoris and the American Indians have furnished invaluable information to the student of social evolution; and the knowledge thus gained has been extended and fortified by the ever-expanding researches of the palaeontologist and ethnologist.

Thus it has become possible to present with some confidence a picture showing the successive stages of human development during the long dark period when our prehistoric ancestor was advancing along the toilsome and tortuous but on the whole always uprising path from lowest savagery to the stage of relative civilization at which we find him at the so-called "dawnings of history." That he was for long ages a savage before he attained sufficient culture to be termed, in modern phraseology, a barbarian, admits of no question. Equally little in doubt is it that other long ages of barbarism preceded the final ascent to civilization. The precise period of time covered by these successive "Ages" is of course only conjectural; but something like one hundred thousand years may perhaps be taken as a safe minimal estimate. At the beginning of this long period, the most advanced race of men must have thought of as a promiscuous company of pre-troglobylic mammals, at least partially arboreal in habit, living on uncooked fruits and vegetables, and possessed of no arts and crafts whatever—nor even of the knowledge of the rudest implement. At the end of the period, there emerges into the more or less clear light of history a large-brained being, living in houses of elaborate construction, supplying himself with diverse luxuries through the aid of a multitude of elaborate handicrafts, associated with his fellows under the sway of highly organized governments, and satisfying aesthetic needs through the practice of pictorial and literary arts of a high order. How was this amazing transformation brought about?

If an answer can be found to that query, we shall have a clue to all human progress, not only during the prehistoric but also during the historic periods; for we may well believe that recent progress has not departed from the scheme of development impressed on humanity during that long apprenticeship. Ethnologists believe that an answer can be found. They believe that the metamorphosis from beast-like savage to cultured civilian may be proximally explained (certain potentialities and attributes of the species being taken for granted) as the result of accumulated changes that found their initial impulses in a half-dozen or so of practical inventions, technological and social, and that, for the most part, were cumulative. Confessedly it supplies only a proximal, not a final, analysis of the forces impelling mankind along the pathway of progress. But it has the merit of tangibility; it presents certain highly important facts of human history vividly: and it furnishes a definite and fairly satisfactory basis for marking successive stages of incipient civilization.

In outlining the story of primitive man's advancement, upon such a basis, we may follow the scheme of one of the most philosophical of ethnologists, Lewis H. Morgan, who made a provisional analysis of the prehistoric period that still remains among the most satisfactory attempts in this direction. Morgan divides the entire epoch of man's progress from bestiality to civilization into six successive periods, which he names respectively the Older, Middle and Later periods of Savagery, and the Older, Middle and Later periods of Barbarism. Crucial developments.
The first of these periods, when mankind was in the lower status of savagery, comprises the epoch when articulate speech had not been developed. Our ancestors of this epoch inhabited a necessarily restricted tropical territory, and subsisted upon raw nuts and fruits. They had no knowledge of the uses of fire. All existing races of men had advanced beyond this condition before the opening of the historical period. The Middle Period of Savagery began with a knowledge of the uses of fire. This wonderful discovery enabled the developing race to extend its habitat almost indefinitely, and to include flesh, and in particular fish, in its regular dietary. Man could now leave the forests, and wander along the shores and rivers, migrating to climates less enervating than those to which he had previously been confined. Doubtless he became an expert fisher, but he was as yet poorly equipped for hunting, being provided, probably, with no weapon more formidable than a crude hatchet and a roughly fashioned spear. The primitive races of Australia and Polynesia had not advanced beyond this middle status of savagery when they were discovered a few generations ago. It is obvious, then, that in dealing with the further progress of nascent civilization we have to do with certain favoured portions of the race, which sought out new territories and developed new capacities while many tribes of their quondam peers remained static and hence by comparison seemed to retrograde.

The next great epochal discovery, in virtue of which a portion of the race advanced to the Upper Status of Savagery, was that of the bow and arrow,—a truly wonderful implement. The possessor of this device could bring down the fleetest animal and could defend himself against the most predatory. He could provide himself not only with food but with materials for clothing and for tent-making, and thus could migrate at will back from the seas and large rivers, and far into inhospitable but invigorating temperate and sub-Arctic regions. The meat diet, now for the first time freely available, probably contributed, along with the stimulating climate, to increase the physical vigour and courage of this highest savage, thus urging him along the paths of progress. Nevertheless many tribes came thus far and no further, as witness the Athapascons of the Hudson's Bay Territory and the Indians of the valley of the Columbia.

We now come to the marvellous discovery that enabled our ancestor to make such advances upon the social conditions of his forbears as to entitle him, in the estimate of his remote descendants, to be considered as putting savagery behind him and as entering upon the Lower Status of Barbarism. The discovery in question had to do with the practice of the art of making pottery (see Ceramics). Hitherto man had been possessed of no permanent utensils that could withstand the action of fire. He could not readily boil water except by some such cumbersome method as the dropping of heated stones into a wooden or skin receptacle. The effect upon his dietary of having at hand earthen vessels in which meat and herbs could be boiled over a fire must have been momentous. Various meats and many vegetables become highly palatable when boiled that are almost or quite inedible when merely roasted before a fire. Bones, sinews and even hides may be made to give up a modicum of nutriment in this way; and doubtless barbaric man, before whom starvation always loomed threateningly, found the crude pot an almost perennial refuge. And of course its use as a cooking utensil was only one of many ways in which the newly discovered mechanism exerted a civilizing inducement.

The next great progressive movement, which carried man into the Middle Status of Barbarism, is associated with the domestication of animals in the Eastern hemisphere, and with the use of irrigation in cultivating the soil and of adobe bricks and stone in architecture in the Western hemisphere. The dog was probably the first animal to be domesticated, but the sheep, the ox, the camel and the horse were doubtless added in relatively rapid succession, so soon as the idea that captive animals could be of service had been clearly conceived. Man now became a herdsman, no longer dependent for food upon the precarious chase of wild animals. Milk, procurable at all seasons, made a highly important addition to his dietary. With the aid of camel and horse he could traverse wide areas hitherto impassable, and come in contact with distant peoples. Thus commerce came to play an extended rôle in the dissemination of both commodities and ideas. In particular the nascent civilization of the Mediterranean region fell heir to numerous products of farther Asia,—gums, spices, oils, and most important of all, the cereals. The cultivation of the latter gave the finishing touch to a comprehensive and varied diet, while emphasizing the value of a fixed abode. For the first time it now became possible for large numbers of people to form localized communities. A natural consequence was the elaboration of political systems, which, however, proceeded along lines already suggested by the experience of earlier epochs. All this tended to establish and emphasize the idea of nationality, based primarily on blood-relationship; and at the same time to develop within the community itself the idea of property,—that is to say, of valuable or desirable commodities which have come into the possession of an individual through his enterprise or labour, and which should therefore be subject to his voluntary disposal. At an earlier stage of development, all property had been of communal, not of individual, ownership. It appears, then, that our mid-period barbarian had attained—if the verbal contradiction be permitted—a relatively high stage of civilization.

There remained, however, one master craft of which he had no conception. This was the art of smelting iron. When, ultimately, his descendants learned the wonderful secrets of that art, they rose in consequence to the Upper Status of Barbarism. This culminating practical invention, it will be observed, is one of the great discoveries with which we have to do that was not primarily concerned with the question of man's food supply. Iron, to be sure, has abundant uses in the same connexion, but its most direct and obvious utilities have to do with weapons of war and with implements calculated to promote such arts of peace as house-building, road-making and the construction of vehicles. Wood and stone could now be fashioned as never before. Houses could be built and cities walled with unexampled facility; to say nothing of the making of a multitude of minor implements and utensils hitherto quite unknown, or at best rare and costly. Nor must we overlook the aesthetic influence of edged implements, with which wood and stone could readily be sculptured when placed in the hands of a race that had long been accustomed to scratch the semblance of living forms on bone or ivory and to fashion crude images of clay. In a word, man, the "tool-making animal," was now for the first time provided with tools worthy of his wonderful hands and yet more wonderful brain.

Thus through the application of one revolutionary invention after another, the most advanced races of men had arrived, after long ages of effort, at a relatively high stage of development. A very wide range of experiences had enabled man to evolve a complex body politic, based on a fairly secure social basis, and his brain had correspondingly developed into a relatively efficient and stable organ of thought. But as yet he had devised no means of communicating freely with other people at a distance except through the medium of verbal messages; nor had he any method by which he could transmit his experiences to posterity more securely than by fugitive and fallible oral traditions. A vague symbolization of his achievements was preserved from generation to generation in myth-tale and epic, but he knew not how to make permanent record of his history. Until he was provided with tools of graphic signs. In other words, a system of writing was developed. Man thus achieved a virtual conquest over time.
CIVILIZATION

as he had earlier conquered space. He could now transmit the record of his deeds and his thoughts to remote posterity. Thus he stood at the portals of what later generations would term secure history. He had graduated out of barbarism, and become in the narrower sense of the word a civilized being. Henceforth, his knowledge, his poetical dreams, his moral aspirations might be recorded in such form as to be read not merely by his contemporaries but by successive generations of remote posterity. The inspiring character of such a message is obvious. The validity of making this great culminating intellectual achievement the test of "civilized" existence need not be denied. But we should all comprehend the character of the message which the earlier generations of civilized beings transmit to us from the period which we term the "dawning of history"—did we not hear constantly in mind the long series of progressive stages of "savagery" and "barbarism" that of necessity preceded the final stage of "civilization" proper. The achievements of those earlier stages afforded the secure foundation for the progress of the future. A multitude of minor arts, in addition to the important ones just outlined, had been developed; and for a long time civilized man was to make no other epochal addition to the list of accomplishments that came to him as a heritage from his barbaric progenitor. Indeed, even to this day the list of such additions is not a long one, nor, judged in the relative scale, so important as might at first thought be supposed. Whoever considers the subject carefully must admit the force of Morgan's suggestion that man's achievement of barbarism, considered in their relation to the sum of human progress, "transcend, in relative importance, all his subsequent works."

Without insisting on this comparison, however, let us ask what discoveries and inventions man has made within the historical period that may fairly be ranked with the half-dozen great epochal achievements that have been put forward as furnishing the keys to all the progress of the prehistoric periods. In other words, let us sketch the history of progress during the ten thousand years or so that have elapsed since man learned the art of writing, adapting our sketch to the same scale which we have already applied to the unnumbered millenniums of the prehistoric period. The view of world-history thus outlined will be a very different one from what might be expected by the student of national history; but it will present the essentials of the progress of civilization in a suggestive light.

Without pretending to fix an exact date,—which the historical records do not permit,—we may assume that the most advanced race of men elaborated a system of writing not less than six thousand years before the beginning of the Christian era. Holding to the terminology already suggested for the earlier periods, we may speak of man's position during the ensuing generations as that of the First or Lowest Status of civilization. If we review the history of this period we shall find that it extends unbroken over a stretch of at least four or five thousand years. During the early part of this period such localized civilizations as those of the Egyptians, the Sumerians, the Babylonians and the Hittites rose, grew strong and passed beyond their meridian. This suggests that we must now admit the word "civilization" to yet another definition, within its larger meaning: we must speak of "a civilization," as that of Egypt, of Babylonia, of Assyria, and we must understand thereby a localized phase of society bearing the same relation to civilization as a whole that a wave hears to the ocean or a tree to the forest. Such other localized civilizations as those of Phoenicia, Carthage, Greece, Rome, Byzantium, the Sasanids, in due course waxed and waned, leaving a tremendous imprint on national history, but creating only minor and transitory ripples in the great ocean of civilization. Progress in the elaboration of the details of earlier methods and inventions took place as a matter of course. Some nation, probably the Phoenicians, gave a new impetus to the art of writing by developing a phonetic alphabet; but this achievement, remarkable as it was in itself, added nothing fundamental to human capacity. Literatures had previously flourished through the use of hieroglyphic and syllabic symbols; and the Babylonian syllabics continued in vogue throughout western Asia for a long time after the Phoenician alphabet had demonstrated its intrinsic superiority.

Similarly the art of Egyptian and Assyrian and Greek was but the elaboration and perfection of methods that barbaric man had practised away back in the days when he was a cave-dweller. The weapons of warfare of Greek and Roman were the spear and the bow and arrow that their ancestors had used in the period of savagery, aided by sword and helmet dating from the upper period of barbarism. Greek and Roman government at their best were founded upon the system of genetics that barbaric man had profoundly studied,—as witness, for example, the federal system of the barbaric Iroquois Indians now existing in America before the coming of Columbus. And if the Greeks had better literature, the Romans better roads and larger cities, than their predecessors, these are but matters of detailed development, the like of which had marked the progress of the more important arts and the introduction of less important ancillary ones in each antecedent period. The axe of steel is no new implement, but a mere perfecting of the axe of chipped flint. The Iliad represents the perfecting of an art that unnumbered generations of barbarians practised before their camp-fires.

Thus for six or seven thousand years after man achieved civilization there was rhythmic progress in many lines, but there came no great epochal invention to usher in a new ethnic period. Then, towards the close of what we may call the prehistoric ages, there appeared in rapid sequence three or four inventions and a great scientific discovery that, taken together, were destined to change the entire aspect of European civilization. The inventions were gunpowder, the mariner's compass, paper and the printing-press, three of which appear to have been brought into Europe by the Moors, whether or not they originated in the remote East. The scientific discovery which must be coupled with these inventions was the Copernican demonstration that the sun and not the earth is the centre of our planetary system. The generations of men that found themselves (1) confronted with the revolutionary conception of the universe given by the Copernican theory; (2) supplied with the new means of warfare provided by gunpowder; (3) equipped with an undreamed-of guide across the waters of the earth; and (4) enabled to promulgate knowledge with unexampled speed and cheapness through the aid of paper and printing-press—such generations of men might well be said to have entered upon a new ethnic period. The transition in their mode of thought and in their methods of practical life was as great as can be supposed to have resulted, in an early generation, from the introduction of iron, or in a yet earlier from the invention of the bow and arrow. So the Europeans of about the 15th century of the Christian era may be said to have entered upon the Second or Middle Status of civilization.

The new period was destined to be a brief one. It had compassed only about four hundred years when, towards the close of the 18th century, James Watt gave to the world the perfected steam-engine. Almost contemporaneously Arkwright and Hargreaves developed revolutionary processes of spinning and weaving by machinery. Meantime James Hutton and William Smith and their successors on the one hand, and Erasmus Darwin, François Lamarck, and (a half-century later) Charles Darwin on the other, turned men's ideas topsy-turvy by demonstrating that the world as the abiding-place of animals and man is enormously old, and that man himself instead of deteriorating from a single perfect pair six thousand years removed, has ascended from bestiality through a slow process of evolution extending over hundreds of centuries. The revolution in practical life and in the mental life of our race that followed these inventions and this new presentation of truth probably exceeded in suddenness and in its far-reaching effects the metamorphosis effected at any previous transition from one ethnic period to another. The men of the 19th century, living now in the period that may be termed the Upper Status.
of civilization, saw such changes effected in the practical affairs of their everyday lives as had not been wrought before during the entire historical period. Their fathers had travelled in vehicles drawn by horses, quite as their remoter ancestors had done since the time of higher barbarism. It may be doubted whether there existed in the world in the year 1800 a postal service that could compare in speed and efficiency with the express service of the Romans of the time of Caesar; far less was there a telegraph service that could compare with that of the ancient Persians. Nor was there a ship sailing the seas that a Phoenician trireme might not have overhauled. But now within the lifetime of a single man the world was covered with a network of steel rails on which locomotives drew gigantic vehicles, laden with passengers at an hourly speed almost equaling Caesar's best journey of a day; over the land and under the seas were stretched wires along which messages coursed from line to line, as the waters of the earth were made to teem with gigantic craft propelled without sail or oar at a speed which the Phoenician captain of three thousand years ago and the English captain of the 18th century would alike have held incredible.

There is no need to give further details here of the industrial revolutions that have been achieved in this newest period of Social and political organization. Civilization, since in their broader outlines at least they are familiar to every one. Nor need we dwell upon the revolution in thought whereby man has for the first time been given a clear inkling as to his origin and destiny. It suffices to point out that such periods of fermentation of ideas as this suggests have probably always been concomitant with those outbursts of creative genius that gave the world the practical inventions upon which human progress has been conditioned. The application of the receptivity to new ideas is pre-requisite to the form of discovery as to the other. Nor, it may be added, can either form of idea become effective for the progress of civilization except in proportion as a large body of any given generation are prepared to receive it. Doubtless here and there a dreamer played with fire, in a literal sense, for generations before the utility of fire as a practical aid to human progress came to be recognized in practice. And—to seek an illustration at the other end of the scale—we know that the advanced thinkers of Greece and Rome believed in the antiquity of the earth and in the evolution of man two thousand years before the coming of Darwin. We have but partly solved the mysteries of the progress of civilization, then, when we have pointed out that each tangible stage of progress owed its initiative to a new invention or discovery of science. To go to the root of the matter we must needs explain how it came about that a given generation of men was in mental mood to receive the new invention or discovery.

The pursuit of this question would carry us farther into the realm of communal and racial psychology—to say nothing of the realm of conjecture—that comports with the purpose of this article. It must suffice to point out that alertness of mind—that all mentality—is, in the last analysis, a reaction to the influences of the environment. It follows that man may subject himself to new influences and thus give his mind a new stimulus by changing his habitat. A fundamental secret of progress is revealed in this fact. Man probably never would have evolved from savagery had he remained in the Tropics where he doubtless originated. But successive scientific inventions enabled him, as has been suggested, to migrate to distant latitudes, and thus more or less involuntarily to become the recipient of new creative and progressive impulses. After migrations in many directions had resulted in the development of divers races, each with certain environments, due to its unique environment, there was opportunity for the application of the principle of environmental stimulus in an indirect way, through the mingling and physical intermixture of one race with another. Each of the great localized civilizations of antiquity appears to have owed its prominence in part at least—perhaps very largely—to such intermingling of two or more races. Each of these civilizations began to decay soon as the nation had remained for a considerable number of generations in its localized environment, and had practically ceased to receive accretions from distant races at approximately the same stage of development. There is a suggestive lesson for present-day civilization in that thought-compelling fact. Further evidence of the application of the principle of environmental stimulus, operating through changed habitat and racial intermixture, is furnished by the virility of the colonial peoples of our own day. The receptiveness to new ideas and the rapidity of material progress of Americans, South Africans and Australians are proverbial. No one doubts, probably, that one or another of these countries will give a new stimulus to the progress of civilization, through the promulgation of some great epochal discovery, in the not distant future. Again, the value of racial intermixture is shown yet nearer home in the long-continued vitality of the British nation, which is explicable, in some measure at least, by the fact that the Celtic element held aloof from the Anglo-Saxon element century after century sufficiently to maintain racial integrity, yet mingled sufficiently to give and receive the fresh stimulus of "new blood." It is interesting in this connexion to examine the map of Great Britain with reference to the birthplaces of the men named above as being the originators of the inventions and discoveries that made the close of the 18th century memorable as ushering in a new ethnic era. It may be added that these names suggest yet another element in the causation of progress: the fact, namely, that, however necessary racial receptivity may be to the dynamic upheaval of a new ethnic era, it is after all individual genius that applies its detonating spark.

Without further elaboration of this aspect of the subject it may be useful to recapitulate the analysis of the evolution of civilization above given, prior to characterizing it from another standpoint. It appears that the entire period of human progress up to the present may be divided into nine periods which, if of necessity more or less arbitrary, yet are not without certain warrant of logic. They may be defined as follows: (1) The Lower Period of Savagery, terminating with the discovery and application of the uses of fire. (2) The Middle Period of Savagery, terminating with the invention of the bow and arrow. (3) The Upper Period of Savagery, terminating with the invention of pottery. (4) The Lower Period of Barbarism, terminating with the domestication of animals. (5) The Middle Period of Barbarism, terminating with the discovery of the process of smelting iron ore. (6) The Upper Period of Barbarism, terminating with the development of a system of writing meeting the requirements of literary composition. (7) The First Period of Civilization (proper) terminating with the introduction of gunpowder. (8) The Second Period of Civilization terminating with the invention of a practical steam-engine. (9) The Upper Period of Civilization, which is still in progress, but which, as will be suggested in a moment, is probably nearing its termination.

It requires but a glance at the characteristics of these successive epochs to show the ever-increasing complexity of the inventions that delimit them and of the conditions of life that they connote. Were we to attempt to characterize in a few phrases the entire story of achievement thus outlined, we might say that during the three stages of Savagery man was attempting to make himself master of the geographical climates. His unconscious ideal was, to gain a foothold and the means of subsistence in every zone. During the three periods of Barbarism the ideal of conquest was extended to the beasts of the field, the vegetable world, and the mineral contents of the earth's crust. During the three periods of Civilization proper the ideal of conquest has become still more intellectual and subtle, being now extended to such abstractions as an analysis of speech-sounds, and to such intangibles as expanding gases and still more elusive electric currents: in other words, to the forces of nature, no less than to tangible substances. Hand in hand with this growing complexity of man's relations with the external world has gone a like increase of complexity in the social and political organizations that characterize man's relations with his fellow-

CIVILIZATION
men. In savagery the family expanded into the tribe; in barbarism the tribe developed into the nation. The epoch of civilization proper is aptly named, because it has been a time in which citizenship, in the narrower national significance, has probably been developed to its apogee. Throughout this period, in every land, the highest virtue has been considered to be patriotism,—by which must be understood an instinctive clinging to the nation of every individual to defend even with his life the interests of the nation into which he chances to be born, regardless to whether the national cause in which he struggles be in any given case good or bad, right or wrong. The communal judgment of this epoch pronounces any man a traitor who will not uphold his own nation even in a wrong cause—and the word “traitor” marks the utmost brand of ignominity.

But while the idea of nationality has thus been accentuated, there has been a never-ending struggle within the bonds of the nation itself to adjust the relations of one citizen to another. The ideas that might make right, that the strong man must dominate the weak, that leadership in the community properly belongs to the man who is physically most competent to lead—these ideas were a perfectly natural, and indeed an inevitable, outgrowth of the conditions under which man fought his way up through savagery and barbarism. Man in the first period of civilization inherited these ideas, along with the conditions of life that were their concomitants. So throughout the periods when the oriental civilizations of Egypt and Babylonia and Assyria and Persia were dominant, a despotic form of government was accepted as the natural order of things. It does not appear that any other form was ever considered as a practicality. A despot might indeed be overthrown, but only to make way for the coronation of another despot. A little later the Greeks and Romans modified the conception of a heaven-sent individual monarch; but they went no further than to substitute a heaven-favoured community, with specially favoured groups (Patricii) within the community. With this, national egoism reached its climax; for each people regarded its own citizens as the only exemplars of civilization, openly branding all the rest of the world as “barbarians,” fit subjects for the exaction of tribute or for the imposition of the bonds of actual slavery. During the middle ages there was a reaction towards individualism as opposed to nationalism; but the entire system of feudalism, with its clearly recognized conditions of over-lordship and of vassaldom, gave expression, no less clearly than oriental despotism and classical “democracy” had done, to the idea of individual inequality; of divergence of moral and legal status based on natural inheritance. Thus this idea, a reminiscence of barbarism, maintained its dominance throughout the first period of civilization.

But gunpowder, marking the transition to the second period of civilization, came as a great levelling influence. With its aid the weakest peasant might prove more than a match for the most powerful knight. Before its assaults the castle of the lord ceased to be an impregnable fortress. And while gunpowder thus levelled down the power of the mighty, the printing-press levelled up the intelligence, and hence the power and influence of the lowly. Meantime the mariner’s compass opened up new territories beyond the seas, and in due course men of lowly origin were even taken into wealth and power through commercial pursuits, thus tending to break in upon the established social order. In the colonial territories themselves all men were subjected more or less to the same perils and dependent upon their own efforts. Success and prominence in the community came not as a birthright, but as the result of demonstrated fitness. The great lesson that the interests of all members of a community are, in the last analysis, mutual could be more clearly distinguished in these small colonies than in larger and older bodies politic. Through various channels, therefore, in the successive generations of this middle period of civilization, the idea gained ground that intelligence and moral worth, rather than physical prowess, should be the test of greatness; that it is incumbent on the strong in the interests of the body politic to protect the weak; and that, in the long run, the best interests of the community are conserved if all its members, without exception, are given moral equality before the law. This idea of equal rights and privileges for all members of the community—for each individual “the greatest amount of liberty consistent with a like liberty of every other individual”—first found expression as a philosophical doctrine towards the close of the 18th century; at which time also tentative efforts were made to put it into practice. It may be said therefore to represent the culminating ideological doctrine of the middle period of civilization,—the ideal towards which all the influences of the period had tended to impel the race.

It will be observed, however, that this ideal of individual equality within the body politic in no direct wise influences the status of the body politic itself as the centre of a localized civilization that may be regarded as in a sense antagonistic to all other similarly localized civilizations. If there were any such influence, it would rather operate in the direction of accentuating the patriotism of the member of a democratical community, as against that of the subject of a despot, through the sense of personal responsibility developed in the former. The developments of the middle period of civilization cannot be considered, therefore, to have tended to decrease the spirit of nationality, with its concomitant penalty of what is sometimes called provincialism. The history of this entire period, as commonly presented, is largely made up of the records of international rivalry, electrically culminating in bitterly contested wars. It was only towards the close of the epoch that the desirability of free commercial intercourse among nations began to find expression as a philosophical creed through the efforts of Quesnay and his followers; and the doctrine that both parties to an international commercial transaction are gainers thereby found its first clear expression in the year 1776 in the pages of Condillac and of Adam Smith.

But the discoveries that ushered in the third period of civilization were destined to work powerfully from the outset for the breaking down of international barriers, though, of course, their effects would not be at once manifest. Thus the substitution of steam power for water power, besides giving a tremendous impetus to manufacturing in general, mapped out new industrial centres in regions that nature had supplied with coal but not always with other raw materials. To note a single result, England became the manufacturing centre of the world, drawing its raw materials from every corner of the globe; but in so doing it ceased to be self-supporting as regards the production of food-supplies. While growing in national wealth, as a result of the new inventions, England has therefore lost immeasurably in national self-sufficiency and independence; having become in large measure dependent upon other countries both for the raw materials without which her industries must perish and for the food to maintain the very life of her people.

What is true of England in this regard is of course true in greater or less measure of all other countries. Everywhere, thanks to the new mechanisms that increase industrial efficiency, there has been an increasing tendency to specialization; and since the manufacturer must often find his raw materials in one part of the world and his markets in another, this implies an ever-increasing intercommunication and interdependence between the nations. This spirit is obviously fostered by the new means of transportation by locomotive and steamship, and by the electric communication that enables the Londoner, for example, to transact business in New York or in Tokio with scarcely an hour’s delay; and that puts every one in touch at to-day’s breakfast table with the happenings of the entire world. Thanks to the new mechanisms, national isolation is no longer possible; globe-trotting has become a habit with thousands of individuals of many nations; and Oréent and Occident, representing civilizations that for thousands of years were almost absolutely severed and mutually oblivious of each other, have been brought again into close touch for mutual education and betterment. The Western mind has learned with amazement that the aforetime Terra Incognita of the far East has nurtured a gigantic civilization having ideals in many ways far different from our own. The Eastern mind has proved itself capable, in
CIVILIZATION

self-defence, of absorbing the essential practicalities of Western civilization within a single generation. Some of the most important practical world-civilization of the immediate future depends upon the mutual relations of these two long-separated communities, branched at some early stage of progress to opposite hemispheres of the globe, but now brought by the new mechanisms into daily and even hourly communication.

While the new conditions of the industrial world have thus tended to develop a new national outlook, there has come about, as a result of the scientific discoveries already referred to, a no less significant broadening of the mental and spiritual horizons. Here also the trend is away from the narrowly egoistic and towards the cosmopolitan view. About the middle of the 19th century Dr Pritchard declared that many people debated whether it might not be permissible for the Australian settlers to shoot the natives as food for their dogs; some of the disputants arguing that savages were barbaric, barbaric, barbaric of the pale of human brotherhood. To-day the thesis that all mankind are one brotherhood needs no defence. The most primitive of existing aborigines are regarded merely as brethren who, through some defect or neglect of opportunity, have lagged behind in the race. Similarly the defective and criminal classes that make up so significant a part of the population of even our highest present-day civilizations, are no longer regarded with anger or contempt, as beings who are suffering just punishment for wilful transgressions, but are considered as pitiful victims of hereditary and environmental influences that they could neither choose nor control. Insanity is no longer thought of as demoniac possession, but as the most lamentable of diseases.

The changed attitude towards savage races and defective classes affords tangible illustrations of a fundamental transformation of point of view which doubtless represents the most important result of the operation of new scientific knowledge in the course of the 19th century. It is a transformation that is only partially effected as yet, to be sure; but it is rapidly making headway, and when fully achieved it will represent, probably, the most radical metamorphosis of mental view that has taken place in the entire course of the historical period. The essence of the new view is this: to recognize the universality and the invariability of natural law; stated otherwise, to understand that the word "supernatural" involves a contradiction of terms and has in fact no meaning. Whoever has grasped the full import of this truth is privileged to sweep mental horizons wider by far than ever opened to the view of any thinker of an earlier epoch. He is privileged to forecast, as the sure heritage of the future, a civilization freed from the last ghost of superstition—an Age of Reason in which mankind shall at last find refuge from the hosts of occult and invisible powers, the fearsome galaxies of deities and demons, which hitherto have haunted him thus far at every stage of his long journey through savagery, barbarism and civilization. Doubtless here and there a thinker, even in the barbaric eras, may have realized that these ghosts that so influenced the everyday lives of his fellows were but children of the imagination. But the certainty that such is the case could not have come with the force of demonstration even to the most clear-sighted thinker until 19th-century science had investigated with penetrating vision the realm of molecule and atom; had revealed the awe-inspiring principle of the conservation of energy; and had offered a comprehensible explanation of the evolution of one form of life from another, from monad to man, that did not presuppose the intervention of powers more "supernatural" than those that operate about us everywhere to-day.

The stupendous import of these new truths could not, of course, make itself evident to the generality of mankind in a single generation, when opposed to superstitions a thousand generations' standing. But the new knowledge has made its way more expeditiously than could have been anticipated; and its effects are seen on every side, even where its agency is scarcely recognized. As a single illustration, we may note the familiar observation that the entire complex of orthodox teaching of religion has been more altered in the past fifty years than in two thousand years before. This of course is not entirely due to the influence of physical and biological science; no effect has a unique cause, in the complex sociological scheme. Archaeology, comparative philology and textual criticism have also contributed their share; and the comparative study of religions has further tended to broaden the outlook and to make for universality, as opposed to insularity, of view. It is coming to be more and more widely recognized that all theologies are the reflex of the more or less faulty knowledge of the times in which they originate: that the true and abiding purpose of religion should be the practical betterment of humanity—the advancement of civilization in the best sense of the word; and that this end may perhaps be best subserved by different systems of theology, adapted to the varied genius of different times and divers races. Wherefore there is not the same enthusiastic desire to-day that found expression a generation ago, to impose upon the world a fixed pattern of religious belief. Instead, that word is humbling for the religions that seems to them alien to their manner of thought, unsuited to their needs and less distinctly ethical in teaching than their own religions.

Such are but a few of the illustrations that might be cited from many fields to suggest that the mind of our generation is becoming receptive to a changed point of view that augurs the coming of a new ethical era. If one may be permitted to enter very tentatively the field of prophecy, it seems not unlikely that the great revolutionary invention which will close the third period of civilization and usher in a new era is already being evolved. It seems not over-hazardous to predict that the air-ship, in one form or another, is destined to be the mechanism that will give the new impetus to human civilization; that the next era will have as one of its practical ideals the conquest of the air; and that this conquest will become a factor in the final emergence of humanity from the insularity of nationalism to the broad view of cosmopolitanism, towards which, as we have seen, the tendencies of the present era are verging. That the gap to be covered is a vastly wide one no one need be reminded who recalls that the civilized nations of Europe, together with America and Japan, are at present accustomed to spend more than three hundred million pounds each year merely that they may keep armaments in readiness to fly at one another's throats should occasion arise. Formidable as these armaments now seem, however, the developments of the not very distant future will probably make them quite obsolete; and sooner or later, as science develops yet more deadly implements of destruction, the time must come when communal intelligence will rebel at the suicidal folly of the international attitude that characterized, for example, the opening decade of the 20th century. At some time, after the first period of cosmopolitanism shall be ushered in as a tenth ethnic period, it will come to be recognized that there is a word fraught with fuller meanings even than the word "man". That word is humanity. The enlightened generation that realizes the full implications of that word will doubtless marvel that their ancestors of the third period of civilization should have risen up as nations and slaughtered one another by thousands to settle a dispute about a geographical boundary. Such a procedure will appear to have been quite as barbarous as the cannibalistic practices of their yet more remote ancestors, and distinctly less rational, since cannibalism might sometimes save its practitioners from starvation, whereas warfare of the civilized type was a purely destructive agency.

Equally obvious must it appear to the cosmopolite of some generation of the future that quality rather than mere numbers must determine the efficiency of any given community. Race suicide will then cease to be a bugbear; and it will no longer be considered rational to keep up the census at the cost of propagating low orders of intelligence, to feed the ranks of paupers, defectives and criminals. On the contrary it will be thought fitting that man should become the conscious arbiter of his own racial destiny to the extent of applying whatever laws of heredity he knows or may acquire in the interests of his own species, as he has long applied them in the case of domesticated animals. The survival and procreation of the unfit will then cease to be a menace to the progress of civilization. It does not follow that
CIVILIZATION

All men will be brought to a dead level of equality of body and mind, nor that individual competition will cease; but the average physical mental status of the race will be raised immeasurably through the virtual elimination of that vast company of defectives which to-day constitutes so threatening an obstacle to racial progress. There are millions of men in Europe and America to-day whose whole mental equipment—despite the fact that they have been taught to read and write—is far more closely akin to the average of the Upper Period of Barbarism than to the highest standards of their own time; and these undeveloped or atavistic persons have on the average more offspring than are produced by the more highly cultured and intelligent among their contemporaries. "Race suicide" is thereby prevented, but the progress of civilization is no less surely handicapped. We may well believe that the cosmopolite of the future, aided by science, will find rational means to remedy this strange illogicality. In so doing he will exercise a more consciously purposeful function, and perhaps a more directly potent influence, in determining the line of human progress than he has hitherto attempted to assume, notwithstanding the almost infinitely varied character of the experiments through which he has worked his way from savagery to civilization.

All these considerations tend to define yet more clearly the ultimate goal towards which the progressive civilization of past and present appears to be tending. The contemplation of this goal brings into view the idea of a vastly suggestive evolutionary cycle. For it appears that the social condition of cosmoplite man, so far as the present day view can predict it, will represent a state of things, magnified to world-dimensions, that was curiously adumbrated by the social system of the earliest savage. At the very beginning of the journey through savagery, mankind, we may well believe, consisted of a limited tribe, representing no great range or variety of capacity, and an almost absolute identity of interests. Thanks to this community of interests,—which was fortified by the recognition of blood-relationship among all members of the tribe,—a principle which we now define as "the greatest ultimate good to the greatest number" found practical, even if unwitting, recognition; and therein lay the germ of all the moral development of the future. But obvious identity of interests could be recognized only so long as the tribe remained very small. So soon as its numbers became large, patent diversities of interest, based on individual selfishness, must appear, to obscure the larger harmony. And as savage man migrated hither and thither, occupying new regions and thus developing new tribes and ultimately a diversity of races," all idea of community of interests, as between race and race, must have been absolutely banished. It was the obvious and patent fact that each race was more or less at rivalry, in disharmony, with all the others. In the hard struggle for subsistence, the expansion of one race meant the downfall of another. So far as any principle of "greatest good" remained in evidence, it applied solely to the members of one's own community, or even to one's particular phratry or gens.

Barbaric man, thanks to his conquest of animal and vegetable nature, was able to extend the size of the unified community, and hence to develop through diverse and intricate channels the application of the principle of "greatest good" out of which the idea of right and wrong was elaborated. But quite as little as the savage did he think of extending the application of the principle beyond the bounds of his own race. The laws with which he gave expression to his ethical conceptions applied, of necessity, to his own people alone. The gods with which his imagination peopled the world were local in habitat, devoted to the interests of his race only, and at enmity with the gods of rival peoples. As between nation and nation, the only principle of ethics that ever occurred to him was that might makes right. Civilized man for a long time advanced but slowly upon this view of international morality. No Egyptian or Babylonian or Hebrew or Greek or Roman ever hesitated to attack a weaker nation on the ground that it would be wrong to do so. And few indeed are the instances in which even a modern nation has judged an international question on any other basis than that of self-interest. It was not till towards the close of the 19th century that an International Peace Conference gave tangible witness that the idea of fellowship of nations was finding recognition; and in the same recent period history has recorded the instance of a powerful nation vanquishing a weaker one without attempting to exact at least an indemnifying tribute.

But the citizen of the future, if the auguries of the present prove true, will be able to apply principles of right and wrong without reference to national boundaries. He will understand that the interests of the entire human family are, in the last analysis, common interests. The census through which he attempts to estimate "the greatest good of the greatest number" must include, not his own nation merely, but the remotest member of the human race. On this universal basis must be founded that absolute standard of ethics which will determine the relations of cosmoplite man with his fellows. When this ideal is attained, mankind will again represent a single family, as it did in the day when our primeval ancestors first entered on the pathway of progress; but it will be a family whose habitat has been extended from the narrow glade of some tropical forest to the utmost habitable confines of the globe. Each member of this family will be permitted to enjoy the greatest amount of liberty consistent with the like liberty of every other member; but the interests of the few will everywhere be recognized as subservient to the interests of the many, and such recognition of mutual interests will establish the practical criterion for the interpretation of international affairs.

But such an extension of the altruistic principle by no means presupposes the elimination of egotistic impulses—of individualism. On the contrary, we must suppose that man at the highest stages of culture will be, even as was the savage, a seeker after the greatest attainable degree of comfort for the least necessary expenditure of energy. The pursuit of this ideal has been from first to last the ultimate impelling force in nature urging man forward. The only change has been a change in the interpretation of the ideal, an altered estimate as to what manner of things are most worth the purchase-price of toil and self-denial. That the things most worth the having cannot, generally speaking, be secured without such toil and self-denial, is a lesson that began to be inculcated while man was a savage, and that has never ceased to be reiterated generation after generation. All that final test of progressive civilization that a given effort shall produce a larger amount of average individual comfort. That is why the great inventions that have increased man's efficiency as a worker have been the necessary prerequisites to racial progress. Stated otherwise, that is why the industrial factor is everywhere the most powerful factor in civilization; and why the economic interpretation is the most searching interpretation of history at its every stage. It is the basal fact that progress implies increased average working efficiency—a growing ratio between average effort and average achievement—that gives sure warrant for such a prognostication as has just been attempted concerning the future industrial unification of our race. The efforts of civilized man provide him, on the average, with a marvellous range of comforts, as contrasted with those that rewarded the most strenuous efforts of savage or barbarian, to whom present-day necessities would have been undreamed-of luxuries. But the ideal ratio between effort and result has by no means been achieved; nor will it have been until the inventive brain of man has provided a civilization in which a far higher percentage of citizens will find the life-vocations to which they are best adapted by nature, and in which, therefore, the efforts of the average worker may be directed with such vigour, enthusiasm and interest as can alone make for true efficiency; a civilization adjusted to such an economic balance that the average man may live in reasonable comfort without heart-breaking strain, and yet accumulate a sufficient surplus to ensure ease and serenity for his declining days. Such, seemingly, should be the normal goal of progressive civilization. Doubtless mankind in advancing towards that goal will institute many changes that could by no possibility be
foretold; but (to summarize the views just presented) it seems a safe augury from present-day conditions and tendencies that the important lines of progress will include (1) the organic betterment of the race through wise application of the laws of heredity; (2) the lessening of international jealousies and the consequent minimizing of the drain upon communal resources that attends a military régime; and (3) an ever-increasing movement towards the industrial and economic unification of the world. (H.S.W.)

AUTHORITIES.—A list of works dealing with the savage and barbarous periods of human development will be found appended to the article ANTHROPOLOGY. Special reference may be had to A History of Early History of Mankind (1865), Primitive Culture (1871) and Anthropology (1881); Lord Avebury's Prehistoric Times (new edition, 1900) and Origin of Civilization (new edition, 1902); A. H. Keane's Map of Mankind and Press and Providence (1859); and Lewis H. Morgan's Ancient Society (1877). The earliest attempt at writing a history of civilization which has any value for the 20th-century reader was F. Guizot's in 1828-1830, a handy English translation by William Hazlitt be included in Boling's Standard Library as the title of The History of Civilization. The earlier lectures, delivered at the Old Sorbonne, deal with the general progress of European civilization, whilst the greater part of the work is an account of the growth of civilization in France. Guizot's attitude is somewhat antiquated, but this book still has usefulness as a storehouse of facts. T. H. Buckle's famous work, The History of Civilization in England (1857-1861), though only a gigantic unfinished introduction to the history of his own country, holds a place in the history literature on account of the new method which it introduced, and has given birth to a considerable number of valuable books on similar lines, such as Lecky's History of European Morals and Politics (1870), and of Nationalities (1883). J. W. Draper's History of the Intellectual Development of Europe (1861) undertook, from the American stand-point, "the labours of arranging the evidence offered by the intellectual history of Europe in accordance with physical, material and moral principles, in order to illustrate the orderly progress of civilization." Its objective treatment and wealth of learning still give it great value to the student. Since the third quarter of the 19th century it may be said that all serious historical works of a general nature have been written as a history of the world, as displayed in all countries and ages, and a bibliography of the works bearing on the subject would be extensive with the catalogue of a complete historical library. Special mention, however, may be made of two important works, of which the first was Pearson's National Life and Character (1893); Benjamin Kidd's Social Evolution (1894) and Principles of Western Civilization (1902); Edward Eggleston's Transit of Civilization (1901); C. Beignobos's Histoire de la civilisation (1887); C. Faulmann's Illustrirte Kulturgeschichte (1881); G. Ducoudray's Histoire de la civilisation (1886); J. von Hallward's Kulturgeschichte (1896); J. Lippert's Kulturgeschichte der Menschheit (1886); O. Henne-am-Rhine's Kulturgeschichte der Vergangenheit, Gegenwart und Zukunft (1890); G. Kürth's Origines de la civilisation moderne (1886). The vast collection of modern works on sociology, from Herbert Spencer onwards, should also be consulted; see bibliography attached to the article Sociology. The history of the subject is based on what has been written about the world in the articles of the present edition of the Ency. Brit. are planned, makes the whole work itself in essentials the most comprehensive history of civilization in existence.

CIVIL LAW, a phrase which, with its Latin equivalent jus civilis, has been used in a great variety of meanings. Jus civilis was sometimes used to distinguish that portion of the Roman law which was the proper or ancient law of the city or state of Rome from the jus gentium, or the law common to all the nations comprising the Roman world, which was incorporated with the former through the agency of the praetorian edicts. This historical distinction remained as a permanent principle of division in modern times. The first propositions of the Institutes of Justinian is the following:—"Jus gentium quaedam vel gentium ita divinditur. Omnes populi qui legibus et moribus reguntur partim suo proprio, partim cum omnium hominum jure utuntur; nam quod quisque populos ipsi jus constituit, id ipsius civitatis proprium est, vocaturque jus civilis quasi jus proprium ipsius civitatis. Quod vero naturalis ratio inter omnes homines constituit, id apud omnes pereaque custoditur, vocaturque jus gentium quasi jus gentium gentes utuntur." The jus gentium of this passage is elsewhere identified with jus naturale, so that the distinction comes to be one between civil law and natural or divine law. The municipal or private law of a state is sometimes described as civil law in distinction to public or international law. Again, the municipal law of a state may be divided into civil law and criminal law. The phrase, however, is applied par excellence to the system of law created by the genius of the Roman people, and handed down by them to the nations of the modern world (see Roman Law). The civil law in this sense would be distinguished from the local or national law of modern states. The civil law in this sense is further to be distinguished from that adaptation of its principles to ecclesiastical purposes which is known as the canon law (q.v.).

CIVIL LIST, the English term for the account in which are contained all the expenses immediately applicable to the support of the British sovereign's household and the honour and dignity of the crown. An annual sum is settled by the British parliament at the beginning of the reign on the sovereign, and is charged on the consolidated fund. But it is only from the reign of William IV. that the sum thus voted has been restricted solely to the personal expenses of the crown. Before his accession many charges properly belonging to the ordinary expenses of government had been placed on the civil list. The history of the civil list dates from the reign of William and Mary. Before the Revolution no distinction had been made between the expenses of government in time of peace and the expenses relating to the personal dignity and support of the sovereign. The ordinary revenues derived from the hereditary revenues of the crown, and from certain taxes voted for life to the king at the beginning of each reign, were supposed to provide for the support of the sovereign's dignity and the civil government, as well as for the public defence in time of war. The accession of William and Mary, however, brought into existence the expenditure touching the government of the country or its defence, which would go to swell his privy purse. But with the Revolution a step forward was made towards the establishment of the principle that the expenses relating to the support of the crown should be separated from the ordinary expenses of the state. The evils of the old system under which no appropriation was made of the ordinary revenue granted to the crown for life had been made manifest in the reigns of Charles II. and James II.; it was their control of these large revenues that made them so independent of parliament. Moreover, while the civil government and the defences suffered, the king could use these revenues as he liked. The parliament of William and Mary fixed the revenue of the crown in time of peace at £1,200,000 per annum; of this sum about £500,000 was appropriated towards the "civil list." But from this the sovereign was to defray the expenses of the civil service and the payment of pensions, as well as the cost of the support of the royal household and his own personal expenses, which it was from this that the term "civil list" arose, to distinguish it from the statement of military and naval charges. The revenue voted to meet the civil list consisted of the hereditary revenues of the crown and a part of the excise duties. Certain changes and additions were made in the sources of revenue thus appropriated between the reign of William and Mary and the accession of George III., when a different system was adopted. Generally speaking, however, the sources of revenue remained as settled at the Revolution.

Anne had the same civil list, estimated to produce an annual income of £700,000. During her reign a debt of £1,200,000 was incurred. This debt was paid by parliament and charged on the civil list itself. George I. enjoyed the same revenue by parliamentary grant, in addition to an annual sum of £1,200,000 on the aggregate fund. A debt of £1,000,000 was incurred, and discharged by parliament in the same manner as Anne's debt had been. To George II. a civil list of £800,000 as a minimum was granted, parliament undertaking to make up any deficiency if the sources of income appropriated to its service fell short of that sum. Thus in 1746 a debt of £456,000 was paid by parliament on the civil list. On the accession of George III. a change was made in the system of the civil list. Hitherto the sources of revenue appropriated to the service of the civil list had been settled on the crown. If these revenues exceeded the sum they were computed to produce annually, the surplus went to the king. George III., however, surrendered the life-interest in the hereditary revenues and the excise duties hitherto voted to defray
the civil list expenditure, and any claim to a surplus for a fixed amount. The king still retained other large sources of revenue which were not included in the civil list, and were free from the control of parliament. The revenues from which the civil list had been definitively associated towards the support of the Royal family. From this £500,000 the king’s household and the honour and dignity of the crown were to be supported, as well as the civil service offices, pensions and other charges still laid on the list.

During the reign of George III. the civil list played an important part in the history of the struggle on the part of the king to establish the royal ascendency. From the revenue appropriated to its service came a large portion of the money employed by the king in creating places and pensions for his supporters in parliament, and, under the colour of the royal bounty, bribery was practised on a large scale. No limit was set to the amount applicable to the pensions charged on the civil list, so long as the sum granted could meet the demand; and there was no principle on which the grant was regulated. Secret pensions at the king’s pleasure were paid out of it, and in every way the independence of parliament was menaced; and though the more legitimate expenses of the royal household were diminished by the king’s penurious style of living, and though many charges not directly connected with the king’s personal expenditure were removed, the amount was constantly increased, and applications were made from time to time to parliament to pay off debts incurred, and thus opportunity was given for criticism. In 1760 a debt of £13,521 was paid off in arrears; and in spite of the demand for accounts and for an inquiry into the cause of the debt, the ministry succeeded in securing this vote without granting such information. All attempts to investigate the civil list were successfully resisted, though Lord Chatham went so far as to declare himself convinced that the funds were expended in corrupting members of parliament.

Again, in 1777, an application was made to parliament to pay off £618,340 of debts; and in view of the growing discontent Lord North no longer dared to withhold accounts. Yet, in spite of strong opposition and free criticism, not only was the amount voted, but also a further £100,000 per annum, thus raising the civil list to an annual sum of £600,000.

In 1779, at a time when the expenditure of the country and the national debt had been enormously increased by the American War, the general dissatisfaction found voice in parliament, and the abuses of the civil list were specially singled out for attack. Many petitions were presented to the House of Commons praying for its reduction, and a motion was made in the House of Lords in the same sense, though it was rejected. In 1780 Burke brought forward his scheme of economic reform, but his name was already associated with the growing desire to remedy the evils of the civil list by the publication in 1769 of his pamphlet on "The Causes of the Present Discontent." In this scheme Burke freely animadverts on the profusion and abuse of the civil list, criticizing the useless and obsolete offices and the offices performed by deputy. In every department he discovers jobbery, waste and peculation. His proposal was that the many offices should be reduced and consolidated, that the pension list should be brought down to a fixed sum of £50,000 per annum, and that pensions should be conferred only to reward merit or fulfill real public charity. All pensions were to be paid at the exchequer. He proposed also that the civil list should be divided into classes, an arrangement which later was carried into effect. In 1780 Burke succeeded in bringing in his Establishment Bill; but though at first it met with considerable support, and was even read a second time, Lord North’s government defeated it in committee. The next year the bill was again introduced into the House of Commons, and Pitt made his first speech in its favour. The bill was, however, lost in the second reading.

In 1782 the Rockingham ministry, pledged to economic reform, came into power; and the Civil List Act 1782 was introduced and carried with the express object of limiting the patronage and influence of ministers, or, in other words, the ascendancy of the crown over parliament. Now, did the act effect the abolition of a number of useless offices, but it did not touch points on the issue of secret service money, and made provision for a more effectual supervision of the royal expenditure. As to the pension list, the annual amount was to be limited to £95,000; no pension to any one person was to exceed £1200, and all pensions were to be paid at the exchequer, thus putting a stop to the secret pensions payable during pleasure. Moreover, pensions were only to be bestowed in the way of royal bounty for persons in distress or as a reward for merit. Another very important change was made by this act: the civil list was divided into classes, and a fixed amount was to be appropriated to each class. The following were the classes:

1. Pensions and allowances of the royal family.
2. Payment of salaries of lord chancellor, speaker and judges.
3. Salaries of ministers to foreign courts resident at the same.
4. Approved bills of tradesmen, artificers and labourers for any article supplied and work done for His Majesty’s service.
5. Menial servants of the household.
6. Pension list.
7. Salaries of all other places payable out of the civil list revenues.
8. Salaries and pensions to treasurer and commissioners of the treasury and of the chancellor of the exchequer.

Yet debt was still the condition of the civil list down to the end of the reign, in spite of the reforms established by the Rockingham ministry, and notwithstanding the removal from the list of many charges unconnected with the king’s personal expenses. The debts discharged by parliament between 1782, the date of the passing of the Civil List Act, and the end of George III.’s reign, amounted to £2,300,000. In all, during his reign £3,598,061 of debt owing by the civil list was paid off.

With the regency the civil list was increased by £70,000 per annum, and a special grant of £100,000 was settled on the prince regent. In 1782 the annual amount was settled at £1,083,777, including the establishment of the king now insane; though the civil list was relieved from some annuities payable to the royal family. Nevertheless, the fund still continued charged with such civil expenses as the salaries of judges, ambassadors and officers of state, and with pensions granted for public services. Other reforms were made as regards the definition of the several classes of expenditure, while the expenses of the royal household were henceforth to be audited by a treasury official—the auditor of the civil list. On the accession of George IV. the civil list, freed from the expenses of the late king, was settled at £845,727. On William IV. coming to the throne a sum of £510,000 per annum was fixed for the service of the civil list. The king at the same time surrendered all the sources of revenue enjoyed by his predecessors, apart from the civil list, represented by the hereditary revenues of Scotland—the Irish civil list, the duties of the crown, the admiralty, the 4½% duties, the West India duties, and other casual revenues hitherto vested in the crown, and independent of parliament. The revenues of the duchy of Lancaster were still retained by the crown.

In return for this surrender and the diminished sum voted, the civil list was relieved from all the charges relating rather to the civil government than to the support of the dignity of the crown and the royal household. The future expenditure was divided into five classes, and a fixed annual sum was appropriated to each class. The pension list was reduced to £75,000. The king resisted an attempt on the part of the select committee to reduce the salaries of the officers of state on the grounds that this touched his prerogative, and the ministry of Earl Grey yielded to his remonstrance.

The civil list of Queen Victoria was settled on the same principles as that of William IV. A considerable reduction was made in the aggregate annual sum voted, from £11,000 to £3.500, and the pension list was separated from the ordinary civil list. The civil list proper was divided into the following five classes, with a fixed sum appropriated to each:
In addition the queen might, on the advice of her ministers, grant pensions up to £3,000 per annum. In accordance with a resolution of the House of Commons of February 18th, 1834, “to such persons as have just claims on the sovereign’s licence or who, by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science and attainments in literature and art, have merited the gracious consideration of the sovereign and the gratitude of their country.” The service of these pensions increased the annual sum devoted to support the dignity of the crown and the expenses of the household to about £409,000. The list of pensions must be laid before parliament within thirty days of 20th June. Thus the civil list was reduced in amount, and relieved from the very charges which gave it its name as distinct from the statement of military and naval charges. It now really only dealt with the support of the dignity and honour of the crown and the royal household. The arrangement was most successful, and during the last three reigns there was no application to parliament for the discharge of debts incurred on the civil list.

The death of Queen Victoria rendered it necessary that a renewed provision should be made for the civil list; and King Edward VII., following former precedents, placed unreservedly at the disposal of parliament his hereditary revenues. A select committee of the House of Commons was appointed to consider the provisions of the civil list for the crown, and to report also on the question of grants for the honourable support and maintenance of Her Majesty the Queen and the members of the royal family. The committee in their conclusions were guided to a considerable extent by the actual civil list expenditure during the last ten years of the late reign, and made certain recommendations which, without undue interference with the sovereign’s personal arrangements, tended towards increased efficiency and economy in the support of the sovereign’s household and the honour and dignity of the crown. On their report was based the Civil List Act 1911, which established the new civil list. The system that the hereditary revenues should as before be paid into the exchequer and be part of the consolidated fund was maintained. The amount payable for the civil list was increased from £385,000 to £470,000. In the application of this sum the number of classes of expenditure to which separate amounts were to be appropriated was increased from five to six. The following was the new arrangement of classes:—1st class, Their Majesties’ privy purse, £110,000; 2nd class, salaries of His Majesty’s household and retired allowances, £125,000; 3rd class, expenses of His Majesty’s household, £193,000; 4th class, works (the interior repair and decoration of Buckingham Palace and Windsor Castle), £20,000; 5th class, royal bounty, alms and special services, £3,500; 6th class, unappropriated, £8,000. The system relating to civil list pensions, established by the Civil List Act 1897, continued to apply, but the pensions were not regarded as chargeable on the civil list for the civil list. The committee also advised that the maintenance of the Buckhounds should not be continued; and the king, on the advice of his ministers, agreed to accept their recommendation. The maintenance of the royal hunt thus ceased to be a charge on the civil list. The annuities of £8,000 to the prince of Wales, of £10,000 to the princess of Wales, and of £18,000 to His Majesty’s three daughters, were not included in the civil list, though they were conferred by the same act. Other grants made by special acts of parliament to members of the royal family were also excluded from it; these were £6000 to the princess Christian of Schleswig-Holstein, £6000 to the princess Louise (duchess of Argyll), £25,000 to the duchess of Connaught, £6000 to the duchess of Albany, £6000 to the princess Beatrice (Henry of Battenberg), and £5000 to the duchess of Mecklenburg-Strelitz.

It may be interesting to compare with the British civil list the corresponding figures in other countries. These are as follows, the figures being those, for convenience, of 1905. Spain, £280,000, exclusive of allowances to members of the royal family; Portugal, £97,333, in addition to £133,333 to the queen-consort—total pensions for the royal family, £1,167,000; Italy, £602,000, for the queen which was deducted £16,000 for the children of the deceased Prince Amadeo, duke of Aosta, £16,000 to Prince Tommaso, duke of Genoa, and £40,000 to Queen Margherita; Belgium, £140,000; Netherlands, £50,000, with, in addition, £1,000,000, the sum which is annually paid for the upkeep of the royal palaces; Germany, £770,500 (Kronkolations Renten) to the sovereign and hereditary princes, and £106,666 for the private property (Kronfideikommiss und Schatzuligkeiten), the revenue from which contributed to the expenditure of the court and the members of the royal family. Denmark, £58,500, in addition to £6000 to the heir-apparent; Norway, £38,885; Sweden, £72,700; Greece, £52,000, which included £4000 each from Great Britain, France and Russia; Austria-Hungary, £941,666, made up of £385,500 as emolument of the royalties of Hungary, £248,000 for the revenues of Austria, and £354,166 as king of Hungary out of the revenues of Transylvania, £24,000; Rumania, £47,000, in addition to revenues from certain crown lands; Servia, £46,000; Bulgaria, £40,000, besides £30,000 for maintenance of palaces, &c.; Montenegro, £9,300; Russia had no civil list, the sovereign having all the revenue from the crown domains (actual amount unknown, but supposed to amount to over £4,000,000); the president of the French Republic had a salary of £24,000 a year, with a further £24,000 for expenses; and the president of the United States had a salary of $50,000 (from 1905, $75,000).

CIVIL SERVICE, the generic name given to the aggregate of all the public servants, or paid civil administrators and clerks, of a state. It is the machinery by which the executive, through the various administrations, carries on the central government of the country.

British Empire.—The appointments to the civil service until the year 1855 were made by nomination, with an examination not sufficient to form an intellectual or even a physical test. It was only after much consideration and almost years of discussion that the nomination system was abandoned. Various commissions reported on the civil service, and orders in council were issued. Finally in 1855 a qualifying examination of a stringent character was instituted, and in 1870 the principle of competition in examinations was adopted as a general rule. On the report of the Playfair Commission (1876), an order in council was issued dividing the civil service into an upper and lower division. The order in council directed that a lower division should be constituted, and men and boy clerks holding permanent positions replaced the temporary assistants and writers. The "temporary" assistant was not found to be advantageous to the service. In December 1886 a new class of assistant clerks was formed to replace the men copyists. In 1887 the Ridley Commission reported on the civil service establishment. In 1890 two orders in council were issued based on the reports of the Ridley Commission, which sat from 1886 to 1890. The first order constituted what is now known as the second division of the civil service. The second order in council concerned the officers of the 1st class, and provision was made for the possible promotion of the second division clerks to the first division after eight years' service.

The whole system is under the administration of the civil service commissioners, and power is given to them, with the approval of the treasury, to prescribe the subjects of examination, limits of age, &c. The age is fixed for compulsory retirement at sixty-five. In exceptional cases a prolongation of five years is within the powers of the civil service commissioners. The examination for 1st class clerkships is held concurrently with that of the civil service of India and Eastern cadetships in the colonial service. Candidates can compete for all three or for two. In addition to the intellectual test the candidate must fulfil the conditions of age (22 to 24), must present recommendations as to character, and pass a medical examination. This examination approximates closely to the university type of education. Indeed, there is little chance of success except for candidates who have had a successful university career, and frequently, in addition, special preparation by a private teacher. The subjects include the language and literature of England, France, Germany, Italy, and Latin America, Sanskrit and Arabic, mathematics (pure and applied), natural science (chemistry, physics, zoology, &c.), history (English, Greek, Roman and general modern), political economy and
economic history, mental and moral philosophy, Roman and
English law and political science. The candidate is obliged to
reach a certain standard of knowledge in each subject before
any marks at all are allowed him. This rule was made to prevent
success by mere cramming, and to ensure competent knowledge
on the basis of real study.

The maximum scale of the salaries of clerks of Class I. is as
follows:—3rd class, £200 a year, increasing by £50 a year to
£500; 2nd class, £600, increasing by £25 a year to £800; 1st
class, £850, increasing by £50 a year to £1000. Their pensions
are fixed by the Superannuation Act 1850, 23 Vict. c. 26—

"To any person who shall have served ten years and upwards,
and under eleven years, an annual allowance of sixtieths of the
annual salary and emoluments of his office:
"For ten years and under two years, an annual allowance of
sixtieths of such salary and emoluments:

In like manner a further addition to the annual allow-
one of sixtieths in respect of each additional year of such service,
employed in London, in at least two of the是一种, and every
annual allowance of forty-sixtieths may be granted; and no addi-
tions shall be made in respect of any service beyond forty years.

The "ordinary annual holidays allowed to officers" (1st class)
shall not exceed thirty-six week-days during each of their first
ten years of service and forty-eight week-days thereafter.

In Council, 15th August 1890.

Within that maximum heads of departments have now, as
they have hitherto had, an absolute discretion in fixing the annual
leave."

 Sick leave can be granted on full salary for not more than six
months, on half-salary for another six months.

The scale of salary for 2nd division clerks begins at £70 a year,
increasing by £5 to £100; then £100 a year, increasing by £7. 10s.
to £150; and then £150 a year, increasing by £10 to £250. The
highest is £300 to £500. Advancement in the 2nd division to
the higher ranks depends on merit, not seniority. The ordinary
annual holiday of the 2nd division clerks is 14 working days
for the first five years, and 21 working days afterwards. They
can be allowed sick leave for six months on full pay and six months
on half-pay. The subjects of their examination are: (1) hand-
writing and orthography, including copying MS.; (2) arithmetic;
(3) Business composition; (4) English composition; (5) transla-
tion of returns; (6) book-keeping and shorthand writing; (6) geo-

ogy and English history; (7) Latin; (8) French; (9) German;
(10) elementary mathematics; (11) inorganic chemistry
with elements of physics. Not more than four of the subjects
(4) to (11) can be taken. The candidate must be between the
ages of 17 and 20. A certain number of the places in the 2nd
division were reserved for the candidates from the boy clerks
appointed under the old system. The competition is severe, only
about one out of every ten candidates being successful. Can-
didates are allowed a choice of departments subject to the
exigencies of the services.

There is also a class of boy copyists who are almost entirely
employed in Dublin and Edinburgh, and very seldom, in some provincial towns. The subjects of their examination are: Obligatory—handwriting and orthography, arithmetic and
English composition. Optional—(any two of the following): (1) copying MS.; (2) geography; (3) English history; (4) translation
from one of the following languages—Latin, French or German;
(5) Euclid, bk. i. and ii., and algebra, up to and including simple
equations; (6) rudiments of chemistry and physics. Candidates
must be between 15 and 18. They have no claims to superannuation or compensation on retirement. Boy copyists are not
retained after the age of 20.

Candidates for the civil service of India take the same
examination as for 1st class clerks. Candidates successful in
the examination must subsequently spend one year in England.
They receive for that year £150 if they elect to live at one of the
universities or colleges approved by the secretary of state for
India. They are submitted to a final examination in the following
subjects—Indian Penal Code and the Code of Criminal Procedure,
the principal vernacular language of the province to which they
are assigned, the Indian Evidence Act (these three subjects are
compulsory), either Hindu and Mahomedan Law, or Sanskrit,
Arabic or Persian, Burmese (for Burma only). A candidate may
not take Arabic or Sanskrit both in the first examination and in
the final. They must also pass a thorough examination in riding.
On reaching India their salary begins at 400 rupees a month.
They may take, as leave, one-fourth of the time on active service in periods strictly limited by regulation. After 25 years'
service (of which 21 must be active service) they can retire on a
pension of £1000 a year. The unit of administration is the district.
At the head of the district is an executive officer called either
Collector or Collector and Magistrate. In most provinces he is responsible to the commissioner, who in turn may consult directly
with the provincial government. The Indian civilian after four
years' probation in both branches of the service is called upon
to elect whether he will enter the revenue or judicial department,
and this choice as a rule is held to be final for his future work.

Candidates for the Indian Forest Service have to pass a compet-
titive examination, one of the compulsory subjects being German
or French. They have also to pass a severe medical examination,
the physicians being selected in their powers of vision and hearing. They must be
between the ages of 18 and 21. They are required to pass a three years' course, with a final examination, seven
terms of the course at an approved school of forestry, the rest of
the time receiving practical instruction in continental European
forests. On reaching India they start as assistant conservators at
380 rupees a month. The highest salary, that of inspector-general
of forests, in the Indian Forest Service is 2650 rupees a month.

The Indian Police Service is entered by a competitive examination
with the same requirements, with the exception that special subjects such as German and botany are not included.
The candidates are limited in age to 19 and 21. They must pass a
riding examination. A free passage is given them. They are
allowed to take examinations for probationers, but not for
service, as the qualifying examination is much more difficult than
the police examinations. Both these departments follow the general rules for Indian services.

The civil service also includes student interpreters for
China, Japan and Siam, and for the Ottoman dominions, Persia,
Greece and Morocco. Both these classes of student interpreters
are selected by open competition. Their object is to supply the
consular service in the above-named countries with persons
having a thorough knowledge of the language of the country in
which they serve.

In the first case, China, Japan, &c., they learn their language in
the country itself, receiving £200 as probations. Then they be-
come assistants in a consulate. The highest post is that of consul-
general. In the case of student interpreters for the Ottoman do-
iminions, Persia, Greece and Morocco, the successful candidates learn
their languages at Oxford. Turkish is taught gratuitously, but
they pay the usual fees for other languages. At Oxford they receive
a salary of £70 a year for two years. On leaving Oxford they become assistants under the embassy at Constantinople, the legations at Tehran, Athens or Morocco, or at one of H.B.M. consulates. As assistants they receive £150 a year. The consul, the highest post to which
they may advance, receives £450 a year.

The civil services of Ceylon, Hong-Kong, the Straits Settlements,
and the Malay Peninsula are supplied by the Eastern cadetships.
The limits of age for the examination are 18 and 24. The cadets
are required to learn the native language of the colony or
dependency to which they are assigned. In the case of the Straits
Settlements and Malay cadets they may have to learn Chinese or
Tamil, as well as the native language. The salaries are: passed
cadets receive £200 a year; probationers £150. At the end of five
years' service they receive from 12,000 to 18,000 rupees per annum.
They are allowed three months' vacation on full pay in two years, and leave of
absence on half-pay after six years' service, or before that if
necessary. They can retire for ill-health after ten years with
fifteen-sixtieths of their annual salary. Otherwise they can add
one-sixtieth of their annual salary to their pension for every
additional year's service up to thirty-five years' service.

In spite of the general rule of open competition, there are still
a few departments where the system of nomination obtains,
accompanied by a severe test of knowledge, either active or
implied. Such are the foreign office, British Museum, and board of
education.

The employment of women in the civil service has been
principally developed in the post office. Women are employed
in the post office as female clerks, counter clerks, telegraphists,
returners, sorters and post-mistresses all over the United King-
dom. The board of agriculture, the customs and the India office
employ women. The department of agriculture, the board of
education generally, the local government board, all to a certain
extensive use of women, whilst in the home office there are an increasing number of women inspectors of workshops and factories.

In 1851 the postmaster-general took a decided step in favour of female employment, and with the consent of the treasury instituted female clerkships. Female clerks do not come into contact with the public. Their duties were purely clerical, and entirely in the accountant's department at the savings bank. Their leave is one month per annum; their pension is on the ordinary civil service scale. The examination is competitive; the subjects are handwriting and arithmetic, English composition, geography, English history, French or German. Candidates must be between the ages of 18 and 20. Whether unmarried or widows they must resign on marriage. The class of girl clerks takes the same subjects in a competitive examination. They must be between the ages of 16 and 18; they serve only in the Savings Bank department. If competent they can pass on to female clerkships. The salaries of the female clerkships range from £200 to £500 per annum, with the chance of advancement to higher posts.

United States.—Civil service reform, like other great administrative reforms, began in America in the latter half of the 19th century. Personal and partisan government, with all the entangled evils of the patronage system, culminated in Great Britain during the reign of George III, and was one of the efficient causes of the American revolution. Trevelyan characterizes the use of patronage to influence legislation, and the giving of colonial positions as sinnerces to the privileged classes and personal favourites of the administration, by saying, "It was a system which, as its one achievement of the first order, brought about the American War, and made England sick, once and for all, of the very name of personal government." It was natural that the founders of the new government in America, after breaking away from the mother-country, should strive to avoid the evils which had in a measure brought about the revolution. Their intention that the administrative officers of the government should hold office during good behaviour is manifest, and was given thorough and practical effect by every administration during the first forty years of the life of the government. The constitution fixed no term of office in the executive branch of the government except those of president and vice-president; and Madison, the expounder of the constitution, held that the wanton removal of a meritorious officer was an impeachable offence. Not until nine years after the passage of the Four Years' Tenure of Office Act in 1820 was there any material departure from this traditional policy of the government. This act (suggested by an appointing officer who wished to use the power it gave in order to secure his own nomination for the presidency, and passed without debate and apparently without any adequate conception of its full effect) opened the doors of the service to all the evils of the "spoils system." The foremost statesmen of that period were not slow to perceive the baleful possibilities of this legislation. Jefferson, Cabinet officers, Benton and many others being recorded as condemning and deploiting in the strongest terms. The transition to the "spoils system" was not, however, immediate, and for the next nine years the practice of reappointing all meritorious officers was practically universal; but in 1829 this practice ceased, and the act of 1820 lent the sanction of law to the system of proscriptions which followed, which was a practical application of the theory that "to the victor belong the spoils of the enemy." In 1836 the provisions of this law, which had at first been confined mainly to officers connected with the collection of revenue, were extended to include also all postmasters receiving a compensation of $1000 per annum or more. It rapidly became the practice to regard all these appointments as political, and the transaction of the public business as for the advancement of political ends. The revenue service from being used for political purposes merely came to be used for corrupt purposes as well, with the result that in one administration frauds were practised upon the government to the extent of $75,000,000. The corrupting influences permeated the whole body politic. Political retainers were selected for appointment not on account of their ability to do certain work but because they were followers of certain politicians; these "public servants" acknowledged no obligation except to those politicians, and their public duties, if not entirely disregarded, were negligently and inefficiently performed. Thus grew a saturnalia of spoils and corruption which culminated in the assassination of a president.

Acute conditions, not theories, give rise to reforms. In the congressional election of November 1882, following the assassination of President Garfield as an incident in the operation of the spoils system, the voice of the people commanding reform was unmistakable. Congress assembled in December 1882, and during the same month a bill looking to the improvement of the civil service began to be discussed in the Senate for nearly two years, was finally taken up and passed by that body. In the debate upon this bill its advocates declared that it would "vastly improve the whole civil service of the country," which they characterized as being at that time "inefficient, expensive and extravagant, and in many instances corrupt." 1

This bill passed the Senate on the 27th of December 1882, and the House on the 4th of January 1883, and was signed by the president on the 16th of January 1883, coming into full operation on the 16th of July 1883. It is now the national civil service law. The fundamental principles of this law are:—(1) selection by competitive examination for all appointments to the "classified service," with a period of probationary service before absolute appointment; (2) apportionment among the states and territories, according to population, of all appointments in the departmental service above the grade of the lowest grade of clerks in the same service, and (3) freedom of all the employees of the government from any necessity to contribute to political campaign funds or to render political services. For putting these principles into effect the Civil Service Commission was created, and penalties were imposed for the solicitation or collection from government employees of contributions for political purposes, and for the use of official positions in coercing political action. The commission, in addition to its regular duties of aiding in the preparation of civil service rules, of regulating and holding examinations, and certifying the results thereof for use in making appointments, and of keeping records of all changes in the service, was given authority to investigate and report upon any violations of the act or rules. The "classified" service to which the act applies has grown, by the action of successive presidents in progressively including various branches of the service within it, from 13,924 positions in 1883 to some 86,000 (in round numbers) in 1900, constituting about 40% of the entire civil service of the government and including practically all positions above the grade of mere laborer or workman to which appointment is not made directly by the president with the consent of the Senate. The very large class to which the act is expressly applicable, and which has been partly brought within its provisions by executive action, is that of fourth-class postmasters, of whom there are between 70,000 and 80,000 (about 15,000 classified in 1900).

In order to provide registers of eligibles for the various grades of positions in the classified service, the United States Civil Service Commission holds annually throughout the country about 300 different kinds of examinations. In the work of preparing these examinations and of marking the papers of competitors in them the commission is authorized by law to avail itself, in addition to its own corps of trained men, of the services of the scientific and other experts in the various executive departments. In the work of holding the examinations it is aided by about 1000 local boards of examiners who are the local representatives throughout the country and are

1 See Senate Report No. 276, 47th Congress, 1st session; also U.S. Civil Service Commission's Third Report, p. 16 et seq., Tenth Report, pp. 736, 737, and Fifteenth Report, pp. 483, 484.

The progressive classification of the executive civil service, showing the growth of the merit system, is discussed, with statistics, in the U.S. Civil Service Commission's 'Statistical Report,' pp. 129-137.

A revision of this discussion, with important additions, appears in the Seventeenth Report.
located at the principal post offices, custom houses and other

government offices, being composed of three or more Federal
employees in those offices. About 50,000 persons annually

compete in these examinations, and about 10,000 of those who

are successful receive appointments through regular certification.

Persons thus appointed, however, must serve six months "on

probation" before their appointment can be made absolute.

At the end of this probation, if his service has not been satis-

factory, the appointee is simply dropped; and the fact that less

than 1% of those appointed prove thus deficient on trial is high

testimony to the practical nature of the examinations held by

the commission, and to their aptness for securing persons qualified

for all classes of positions.

The effects of the Civil Service Act within the scope of its

actual operation have amply justified the hopes and promises of

its advocates. After its passage, absentee holders of lucrative

appointments were required to report for duty or to sever their

connexion with the service. Improved methods were adopted

in the departments, and superfluous and useless work was no

longer devised in order to provide a show of employment and a

locus standi for the parasites upon the public service. Individual

clerks and clerks of departments, and by reason of the new conditions were

enabled, to do more and better work; and this, coupled with the

increase in efficiency in the service on account of new blood

coming in through the examinations, made possible an actual

decrease in the force required in many offices, notwithstanding

the natural growth in the amount of work to be done. Experi-

ence proves that the desire to create new and unnecessary positions was in direct proportion to the power to control them,

for which the act has taken away this power of control the desire

had disappeared naturally. There is no longer any desire on the

part of heads of departments to increase the number or salaries of classified positions which would fall by law within the

civil service rules and be subject to competitive examinations.

Thus the promises of improvement and economy in the service

have been fulfilled.

The chief drawback to the full success of the act within its

intended scope of operation has been the withholding of certain positions in the service from the application of the

vital principle of competition. The Civil Service Act contemplated no exceptions, within the limits to which it was made applicable, to the general principle of competition upon merit

for entrance to the service. In framing the first civil service

rules, however, in 1883, the president, yielding to the pressure

of the heads of some of the departments, and against the

urgent protest of the Civil Service Commission, excepted from the

requirement of examination large numbers of positions in the

higher grades of the service, chiefly fiduciary and administrative positions such as cashiers, chief clerks and chiefs of division.

These positions being thus continued under the absolute control of the appointing officer, the effect of their exception from examination was to retain just that much of the old or "spoils

system within the nominal jurisdiction of the new or "merit"

system. Even more: under the old system, while appointments

from the outside had been made regardless of fitness, still these appointments had been made in the lower grades, the higher positions being filled by promotion within the service, usually of the most competent, but under the new system with its exceptions, while appointments to the lower grades were filled on the basis of merit, the pressure for spoils at each change of administration forced inexperienced, political or personal favourites in at the top. This blocked promotions and demoralized the service. Thus, while the general effect of the act was to limit very greatly the number of

vicious appointments, at the same time the effect of these

exceptions was to confine them to the upper grades, where the
demoralizing effect of each upon the service would be a maximum.

By constant efforts the Civil Service Commission succeeded in

having position after position withdrawn from this excepted

class, until by the action of the president, on the 6th of May 1896,

it was finally reduced almost to a minimum. By subsequent

presidential action, however, on the 29th of May 1899, the excepted class was again greatly extended.

A further obstacle to the complete success of the merit system, and one which prevents the carrying forward of the reform to

the extent to which it has been carried in Great Britain, is

inherent in the Civil Service Act itself. All postmasters who receive compensation of $1000 or more per annum, and all

collectors of customs and collectors of internal revenue, are appointed by the president and confirmed by the Senate, and are therefore, by express provision of the act, not " required to be classified." The universal practice of treating these offices as political agencies instead of as administrative business offices is therefore not limited by the act. Such officers are active in political work throughout the country, and their official position adds greatly to their power to affect the political prospects of the leaders in their districts. Accordingly the Senate, from being, as originally intended, merely a confirming body as to these officers, has become in a large measure, actually if not formally, a nominating body, and holds with tenacity to the power thus acquired by the individual senators. Thorough civil service reform requires that these positions also, and all those of fourth-class postmasters (partly classified by order of

1st Dec. 1908), be made subject to the merit system, for in them is the real remaining stronghold of the spoils system. Even

though all their subordinates be appointed through examination, it will be impossible to carry the reform to ultimate and complete

success so long as the officers in charge are appointed mainly for political reasons and are changed with every change-of administration.

The purpose of the act to protect the individual employees in the service from the rapacity of the "political barons" has been measurably, if not completely, successful. The power given the Civil Service Commission, to investigate and report upon violations of the law, has been used to bring to light such abuses as the levying of political contributions, and to set the machinery of the law in motion against them. While comparatively few actual prosecutions have been brought about, and although the penalties imposed by the act for this offence have been but seldom inflicted, still the publicity given to all such cases by the commission's investigations has had a wholesome deterrent effect. Before the passage of the act, positions were as a general rule held upon a well-understood lease-tenure, the political contributions for them being as securely and as certainly collected as any rent. Now, however, it can be said that these forced contributions have almost entirely disappeared. The efforts which are still made to collect political funds from government employees in evasion of the law are limited in the main to persuasion to make "voluntary" contributions, and it has been possible so to limit and obstruct these efforts that their practical effect upon the character of the service is now very small.

The same evils that the Federal Civil Service Act was designed to remedy exist to a large degree in many of the state government offices, and are especially aggravated in the administra-

tion of the local governments of some of the larger cities. The chief, if not the only, test of fitness for office in many cases has been partly loyalty, honesty and capacity being seldom more than secondary considerations. The result has been the fostering of dishonesty and extravagance, which have brought weakness and gross corruption into the administration of the local governments. In consequence of this there has been a constantly growing tendency, among the more intelligent class of citizens, to demand that honest business methods be applied to local public service, and that appointments be made on the basis of intelligence and capacity, rather than of party allegiance. The movement for the reform of the civil service of cities is going hand in hand with the movement for general municipal reform, those reformers regarding the merit

1For the scope of these exceptions, see Civil Service Commission's Fourteenth Report, pp. 12-14.

State examination.
system of appointments as not merely the necessary and only safe bulwark to preserve the results of their labors, but also as the most efficient means for bringing about other reforms. Hence civil service reform is given a leading position in all programmes for the reform of state and municipal governments. This has undoubtedly been due, in the first instance, at least, to the success which attended the application of the merit system to the Federal service, municipal and state legislation following in the wake of the national civil service law. In New York an act similar to the Federal Civil Service Act was passed on the 4th of May 1883, and in 1894 the principles of the merit system were introduced by an amendment into the state constitution, and made applicable to cities and villages as well. In Massachusetts the merit system was introduced by the act of 1888; and in its general features was based upon the Federal act and the New York act. Similar laws were passed in Illinois and Wisconsin in 1895, and in New Jersey in 1908; the laws provide for the adoption of the merit system in state and municipal government. In New Orleans, La., and in Seattle, Wash., the merit system was introduced by an amendment to the city charter in 1896. The same result was accomplished by New Haven, Conn., in 1897, and by San Francisco, Cal., in 1899. In still other cities the principles of the merit system have been enacted into law, in some cases applying to the entire service and in others to only a part of it.

The application of the merit system to state and municipal governments has proved successful wherever it has been given a fair trial.1 As experience has fostered public confidence in the system, and at the same time shown those features of the law which are most vulnerable, and the best means for fortifying them, numerous and important improvements upon the pioneer act applying to the Federal service have been introduced in the more recent legislation. This is particularly true of the acts now in force in New York (passed in 1899) and in Chicago. The power of the commission to enforce these acts is materially greater than the power possessed by the Federal commission. In making investigations they are not confined to taking the testimony of voluntary witnesses, but may administer oaths, and compel testimony and the production of books and papers where necessary; and in taking action they are not confined to the making of a report of the findings in their investigations, but may themselves, in many cases, take final judicial action. Further than this, the payment of salaries is made dependent upon the certificate of the commission that the appointments of the incumbents were made in accordance with the civil service law and rules. Thus these commissions have absolute power to prevent irregular or illegal appointments by refractory appointing officers. Their powers being so much greater than those of the national commission, their action can be much more drastic in most cases, and they can go more directly to the heart of an existing abuse, and apply more quickly and effectually the needed remedy.

Upon the termination of the Spanish-American War, the necessity for the extension of the principles of the merit system to the new territories, the responsibility for whose government the results of this war had thrown upon the United States, was realized. By the acts providing for civil government in Porto Rico (April 12th, 1900) and Hawaii (April 30th, 1900), the provisions of the Civil Service Act and Rules were applied to those islands. Under this legislation the classification applies to all positions which are analogous to positions in the Federal service, those which correspond to positions in the municipal and state governments being considered as local in character, and not included in the classification.

On the 19th of September 1900 the United States Philippine Commission passed an act "for the establishment and maintenance of an efficient and honest civil service in the Philippine Islands." This act, in its general features, is based upon the national civil service law, but includes also a number of the stronger points to be found in the state and municipal law mentioned above. Among these are the power given the civil service board to administer oaths, summon witnesses, and require the production of official records; and the power to stop payment of salaries to persons illegally appointed. Promotions are determined by competitive examinations, and are made throughout the service, as there are no excepted positions. A just right of preference in local appointments is given to natives. The president of the Philippine commission in introducing this bill said: "The purpose of the United States government . . . in these islands is to secure for the Filipino people as honest and as efficient a government as may be possible. . . . It is the hope of the commission that the system of appointment be applied in such a manner that the lowest ranks to reach the highest, under a tenure based solely upon merit." Judging by past experience it is believed that this law is well adapted to accomplish the purpose above stated.

For fuller information upon the details of the present workings of the merit system in the Federal service, recourse should be had to the publications of the U.S. Civil Service Commission, which are to be found in the public libraries in all the principal cities in the United States, or which may be had free of charge upon application to the commission. The Manual of Examinations, published semi-annually, gives full information as to the character of the examinations held by the commission, together with the dates and places for the holding of those examinations. The Annual Reports of the commission contain full statistics of the results of its work, together with comprehensive statements as to the difficulties encountered in the examination of results achieved, and the recommendations of the commission thereupon. In the Fifteenth Report, pp. 443-485, will be found a very valuable historical compilation from original sources, upon the "practice of the presidents in appointments and removals in the executive branch of the Government for a series of years," and the same report, pp. 511-517, is a somewhat comprehensive bibliography of "civil service" in periodical literature in the 19th century, brought down to the end of 1898. See also C. R. Fish, The Civil Service and the Patronage (New York, 1903).

In most European countries the civil service is recruited on much the same lines as in the United Kingdom and the United States, that is, either by examination or by nomination or by both. In some countries the examinations are made possible for all classes, as in France, holders of university degrees get special privileges, such as being put at the head of the list, or going up a certain number of places; or, as in Germany, many departmental posts are filled by examinations, combined with competitive examinations, either at school or university. In the publications of the United States Department of Labour and Commerce for 1904-1905 will be found brief details of the systems adopted by the various foreign countries for appointing their civil service employees.

CIVITA CASTELLANA (anc. Falerii, q.v.), a town and episcopal see of the province of Rome, 45 m. by rail from the city of Rome (the station is 5 m. N.E. of the town). Population (1901) 5,265. The cathedral of S. Maria possesses a fine portico, erected in 1295 by Laurentius Romanus, his son Jacobus and his grandson Cosmas. In the crypt are the tombs of several bishops and mosaic decorations: the interior was modernized in the 18th century, but has some fragments of cosmestesque ornamentation. The citadel was erected by Pope Alexander VI. from the designs of Antonio da Sangallo the elder, and enlarged by Julius II. and Leo X. The lofty bridge by which the town is approached belongs to the 18th century. Mount Soratte lies about 6 m. to the south-west.

CIVITA VECchia, a seaport town and episcopal see of Italy, in the province of Rome, 50 m. N.W. by rail and 35 m. direct from the city of Rome. Pop. (1871) 8,143; (1901) 17,830. It is the ancient Centum Cellae, founded by Trajan. Interesting descriptions of it are given by Pliny the Younger (Epist. vi. 37) and Rutilius Namat. i. 237. The modern harbour works rest on the ancient foundations, and near it the cemetery of detached columns of the Cluseum Vetuvianum and a lamp-stand found (Corp. Insr. Lat. vol. xi., Berlin, 1888, pp. 3350 seq.). Remains of an aqueduct and other Roman buildings are preserved; the imperial family had a villa here. Procopius mentions it in the 6th century as a strong and populous place, but it was destroyed in 875 by the Saracens. Leo IV. erected a new city for the inhabitants on the site where they had taken refuge, about 8 m. N.N.E. of Civita Vecchia towards the hills, near La Farnesina, where its ruins may still be seen; the city walls and some of the streets and buildings may be traced, and an inscription

1 In the U. S. Civil Service Commission's Fifteenth Report, pp. 489-502, the "growth of the civil service reform in states and cities" is historically treated, briefly, but with some thoroughness.

CLACTON-ON-SEA, a watering-place in the Harwich parliamentary division of Essex, England, 10 m. E.N.E. from London, by a branch from the Chelmsford and the Great Eastern Railway; served also by steamers from London in the summer months. Pop. of urban district (1901) 7456. Clay cliffs of slight altitude rise from the sandy beach and face south-eastward. In the neighbourhood, however, marshes fringe the shore. The church of Great Clacton, at the village 15 m. inland, is Norman and later, and of considerable interest. Clacton is provided with a pier, promenade and marine parade; and is the seat of various convalescent and other homes.

CLADEL, LÉON (1833-1892), French novelist, was born at Montauban (Tarn-et-Garonne) on the 25th of March 1833. The son of an artisan, he studied law at Toulouse and became a solicitor's clerk in Paris. He made a reputation in a limited circle by his first book, _Les Martyrs ridicules_ (1862), a novel for which Charles Baudelaire, whose literary disciple Cladel was, wrote a preface. He then returned to his native district of Quercy, where he produced a series of pictures of peasant life in _Éral le domestique_ (1865), _Le Nommé Qouel_ (1868) and other volumes. Returning to Paris he published the two novels which are generally acknowledged as his best work, _Le Beauscassi_ (1869) and _La Fête votive de Saint Barthélemy Porte-glaive_ (1872). _Une Maudite_ (1876) was judged dangerous to the public morals and cost its author a month's imprisonment. Other works by Cladel are _Les Va-nu-pieds_ (1873), a volume of short stories; _N'a qu'un ail_ (1882), _ Urbains et ruraux_ (1884), _Gueux de marque_ (1887), and the posthumous _Juive errante_ (1897). He died at Sèvres on the 20th of July 1892.

See _La Vie de Léon Cladel_ (Paris, 1898), by his daughter Judith Cladel, a containing also an article on Edmund Gurney, a complete list of his works, and of the critical articles on his work.

CLAFLIN, HORACE BRIGHAM (1811-1888), American merchant, was born in Milford, Massachusetts, on the 18th of December 1811. He was educated at Milford Academy, became a clerk in his father's store in Milford, and in 1831, with his brother Aaron and his brother-in-law Samuel Daniels, succeeded to his father's business. In 1832 the firm opened a branch store in Worcester, Mass., and in 1833 Horace B. Claflin and Daniels secured the sole control of this establishment and restricted their dealing to dry goods. In 1843 Claflin removed to New York City and became a member of the firm of Bulkley & Clafin, whose dry goods merchants. In 1851 and in 1864 the firm was reorganized, being designated in these respective years as Clafin, Mellin & Company and H. B. Clafin & Company. Under Clafin's management the business increased so rapidly that the sales for a time after 1865 probably exceeded those of any other mercantile house in the world. Though the firm was temporarily embarrassed at the beginning of the Civil War, on account of its large business interests in the South, and during the financial panic of 1873, the promptness with which Mr Clafin met these crises and paid every dollar of his liabilities greatly increased his reputation for business ability and integrity. He died at Fordham, New York, on the 14th of November 1885.

CLAIRVAUX (or CLAIRMOT), ALEXIS CLAUDE (1713-1765), French mathematician, was born on the 13th or 7th of May 1713, at Paris, where his father was a teacher of mathematics. Under his father's tuition he made such rapid progress in mathematical studies that in his thirteenth year he read before the French Academy an account of the properties of four curves which he had then discovered. When only sixteen he finished a treatise, _Recherches sur les courbes à double courbure_, which, on its publication in 1737, presented his admission into the Academy of Sciences, although even then he was below the legal age. In 1736, together with Pierre Louis Maupertuis, he took part in the expedition to Lapland, which was undertaken for the purpose of estimating a degree of the meridian, and on his return he published his treatise _Théorie de la figure de la terre_ (1743). In this work he promulgated the theorem, known as "Clairaut's theorem," which connects the gravity at points on the surface of a rotating ellipsoid with the compression and the centrifugal force at the equator (see EARTH, _Figure of the_). He obtained an ingenious approximate solution of the problem of the three bodies; in 1750 he gained the prize of the St Petersburgh Academy for his essay _Théorie de la lune_; and in 1759 he calculated the perihelion of Halley's comet. He also detected singular solutions in differential equations of the first order, and of the second and higher degrees. Clairaut died at Paris, on the 17th of May 1765.

CLAIRON, LA (1723-1803), French actress, whose real name was CLAIRE JOSEPH HIPPOLYTE LERIS, was born at Condé sur l'Escart, Hainaut, on the 25th of January 1723, the natural daughter of any army sergeant. In 1736 she made her first stage appearance at the Comédie Italienne, in a small part in Marivaux's _L'Ile des esclaves_. After several years in the provinces she returned to Paris. Her life, meanwhile, had been decidedly irregular, even if not to the degree indicated by the libellous pamphlet _Histoire de la demeure Cramelle, dite Frédélion, actrice de la Comédie de Rouen, écrite par elle-même_ (The Hague, 1746), or to be inferred from the disingenuousness of her own Mémoires d'Hippolyte Clain (1798); and she had great difficulty in obtaining an order to make her _début_ at the Comédie Française. Succeeding, however, at last, she had the courage to select the title-role of _Phèdre_ (1743), and she obtained a veritable triumph. During her twenty-two years at this theatre, dividing the honours with her rival Mlle Dumesnil, she filled many of the classical rôles of tragedy, and created a great number of parts in the plays of Voltaire, Marmontel, Saurin, de Belloy and others. She retired in 1766, and trained pupils for the stage, among them Mlle Raucourt. Goldsmith called Mlle Clain "the most perfect female figure I have ever seen on any stage," (_The Bee_, 2nd No.; and Garrick, while recognizing her unwillingness or inability to make use of the inspiration of the instant, admitted that "she has everything that art and a good understanding with great natural spirit can give her.") CLAIRVOYANCE, a village of north-eastern France, in the department of Aube, 40 m. S.E.S. of Troyes on the Eastern railway to Belfort. Clairvaux (Clara Vallis) is situated in the valley of the Aube on the eastern border of the Forest of Clairvaux. Its celebrity is due to the abbey founded in 1115 by St Bernard, which became the centre of the Cistercan order. The buildings (see Abbey) belong for the most part to the 18th century, but there is a large storehouse which dates from the 12th century. The abbey, suppressed at the Revolution, now serves as a prison, containing on an average 800 inmates, who are employed in agricultural and industrial occupations. Clairvaux has iron-works and agricultural significance.

CLAIRVOYANCE (Fr. for "clear-seeing"). a technical term in psychological research, properly equivalent to lucidity, a supernormal power of obtaining knowledge in which no part is played by (a) the ordinary processes of sense-perception or (b) supernatural communication with other intelligences or a discarnate. The word is also used, sometimes qualified by the word telepathic, to mean the power of gaining supernormal knowledge from the mind of another (see Telepathy). It is further commonly used by spiritualists to mean the power of seeing spirit forms, or, more vaguely, of discovering facts by some supernormal means.

Lucidity.—Few experiments have been made to test the existence of this faculty. If communications from discarnate minds are regarded as possible, there are no means of distinguishing facts obtained in this way from facts obtained by independent clairvoyance. In practice no evidence has been obtained pointing to the possession by a discarnate spirit of knowledge not possessed by any living person (see Mesmerism). As explanation of the few successful experiments in independent clairvoyance we have the choice of two interpretations: (1) lucidity; (2) telepathy from living persons; (3) hyperesthesia. The second possibility was overlooked in Richet's diagram experiments; it cannot be assumed that a picture put into an envelope and not consciously recalled has been in reality forgotten. Similarly the clairvoyant diagnosis of diseases may depend on knowledge gained telepathically from the patient, who may be subliminally aware of diseased states of the body. The most elaborate experiments are by Prof. Richet with a hypnotized subject who succeeded in
naming twelve cards out of sixty-eight. But no precautions were taken against hyperaesthesia further than enclosing the card in a second envelope. There is a power possessed by a certain number of people, of naming a card drawn by them or held in the hand face downwards, so that there is no normal knowledge of its suit and number. Few thorough trials have been made; but it seems to point to some kind of hyperaesthesia rather than to clairvoyance. In the Richet experiments even if the envelopes excluded hyperaesthesia of touch on the part of the medium, there may have been subliminal knowledge on Prof. Richet's part of the card which he put in the envelope. The experience known as the déféru has sometimes been explained as due to clairvoyance.

Telepathic Clairvoyance.—For a discussion of this see Telepathy and Crystal-Gazing. It may be noted here that some curious relation seems to exist between apparently telepathic acquisition of knowledge and the arrival of a letter, newspaper, &c., from which the same knowledge could be directly gained. We are confronted with a similar problem in attempting an explanation of the power of mediums to state correctly facts relating to objects placed in their hands. Of a somewhat different character is retrocognition (q.v.), where the knowledge in many cases, if telepathic, must be derived from a discarnate mind.

Clairvoyance, as a term of spiritualism, with its correlative clairaudience, is the name given to the power of seeing and hearing discarnate spirits of dead relatives and others, with whom the living are said to be surrounded. More vaguely it includes the power of gaining knowledge, either through the spirit world or by means of psychometry (i.e. the supernormal acquisition of knowledge about owners of objects, writers of letters, &c.). Some evidence for these latter powers has been accumulated by the Society for Psychical Research, but in many cases the piecing together of normally acquired knowledge, together with shrewd guessing, suffices to explain the facts, especially where the investigator has had no special training for his task.

See Richet, Experientielle Studien (1891); also in Proc. S.P.R. vi. 66. For a criticism see N. W. Thomas, Thought Transference, pp. 44-48. For Clairvoyance in general see F. W. H. Myers, Human Personality, and in Proc. S.P.R. xi. 534 et seq.

CLAMECY,—CLAN

CLAMECY, a town of central France, capital of an arrondissement in the department of Nièvre, at the confluence of the Yonne and Beuvron, and on the Canal du Nivernais, 46 m. N.N.E. of Nevers on the Paris-Lyon railway. Pop. (1906) 4455. Its principal building is the church of St Martin, which dates chiefly from the 14th and 15th centuries. The tower and façade are of the 16th century. The chévet, which is surrounded by an aisle, is rectangular—a feature found in few French churches. Of the old castle of the counts of Nevers, vaulted cellars alone remain. A church in the suburb of Bethlehem, dating from the 12th and 13th centuries, now serves as part of an hotel. The public institutions include the sub-prefecture, tribunals of first instance and of commerce and a communal college. Among the industrial establishments are saw-mills, fulling-mills and flour-mills, tanneries and manufactories of boots and shoes and chemicals; and there is considerable trade in wine and cattle and in wood and charcoal, which is conveyed principally to Paris, by way of the Yonne.

In the early middle ages Clamecy belonged to the abbey of St Julian at Auxerre; in the 11th century it passed to the counts of Nevers, one of whom, Hervé, enfranchised the inhabitants in 1213. After the capture of Jerusalem by Saladin in 1218, Clamecy became the seat of the bishops of Bethlehem, who till the Revolution resided in the hospital of Panthenor, bequeathed by William IV., count of Nevers. On the coup d'état of 1851 an insurrection broke out in the town, and was repressed by the new authorities with great severity.

CLAN (Gaelic clann, O. Ir. cland, connected with Lat. planta, shoot or scion, the ancient Gaelic or Goidelic substituting k for p), a group of people united by common blood, and usually settled in a common habitat. The clan system existed in Ireland and the Highlands of Scotland from early times. In its strictest sense the system was peculiar to those countries, but, in its wider meaning of a group of kinsmen forming a self-governing community, the system as represented by the village community has been shown by Sir H. Maine and others to have existed at one time or another in all lands.

Before the use of surnames and elaborate written genealogies, a tribe in its definite sense was called in Celtic a tuath, a word of wide affinities, from a root tu, to grow, to multiply, existing in all European languages. When the tribal system began to be broken up by conquest and by the rise of towns and of territorial government, the use of a common surname furnished a new bond for keeping up a connexion between kindred. The head of a tribe or smaller group of kindred selected some ancestor and called himself his Ua, grandson, or as it has been anglicized, O', e.g. Ua Conchobhair (O' Connor), Ua Sualleabhain (O'Sullivan). All his kindred adopted the same name, the chief using no fore-name however. The usual mode of distinguishing a person before the introduction of surnames was to name his father and grandfather, e.g. Owen, son of Donal, son of Dermot. This naturally led some to form their surnames with Mac, son, instead of Ua, grandson, e.g. Mac Carthaigh, son of Carthach (Mac Carty), Mac Ruaidhri, son of Rory (Mac Rory). Both methods have been followed in Ireland, but in Scotland Mac came to be exclusively used. The adoption of such genealogical surnames fostered the notion that all who bore the same surname were kinsmen, and hence the genealogical term clann, which properly means the descendants of some progenitor, gradually became synonymous with tuath, tribe. Like all purely genealogical terms, clann may be used in the limited sense of a particular tribe governed by a chief, or in that of many tribes claiming descent from a common ancestor. In the latter sense it was synonymous with sti, stol, seed e.g. Siol Alpine, a great clan which included the smaller clans of the Macgregors, Grants, Mackinnons, Macnabes, Macphries, Macquaries and Macaulays.

The clan system in the most archaic form of which we have any definite information can be best studied in the Irish tuath, or tribe. This consisted of two classes: (1) tribemen, and (2) a miscellaneous class of slaves, criminals, strangers and their descendants. The first class included tribemen by blood in the male line, including all illegitimate children acknowledged by their fathers, and tribemen by adoption or sons of tribewomen by strangers, foster-sons, men who had done some signal service to the tribe, and lastly the descendants of the second class after a certain number of generations. Each tuath had a chief called the tuathain, the word cognate with the Gaulish rìg-s or rix, the Latin reg-s or rex, and the Old Norse rik-ir. The tribemen formed a number of communities, each of which, like the tribe itself, consisted of a head, ceann fine, his kinsmen, slaves and other retainers. This was the fine, or sept. Each of these occupied a certain part of the tribe-land, the arable part being cultivated under a system of co-tillage, the pasture land co-grazed according to certain customs, and the wood, bog and mountains forming the marchland of the sept being the unrestricted common land of the sept. The sept was in fact a village community.

What the sept was to the tribe, the homestead was to the sept. The head of a homestead was an aire, a representative freeman capable of acting as a witness, compurgator and bail. These were very important functions, especially when it is borne in mind that the tribal homestead was the home of many of the kinsfolk of the head of the family as well as of his own children. The descent of property being according to a gavel-kind custom, it constantly happened that when an aire died the share of his property which each member of his immediate family was entitled to receive was not sufficient to qualify him to be an aire. In this case the family did not divide the inheritance, but remained together as "a joint and undivided family," one of the members being elected chief of the family or household, and in

1 The following account of the Irish clan-system differs in some respects from that in the article on Brehon Laws (q.v.); but it is retained here in view of the authority of the writer and the admitted obscurity of the whole subject.

(Ed. E.B.)
this capacity enjoyed the rights and privileges of an aire. Sir H. S. Maine directed attention to this kind of family as an important feature of the early institutions of all Indo-European nations. Beside the "joint and undivided family," there was another kind of family which we might call the "joint family." This was a partnership composed of three or four members of a sept whose individual wealth was not sufficient to qualify each of them to an estate, but whose joint wealth qualified one of the co-partners as head of the joint family to be one.

So long as there was abundance of land each family grazed its cattle upon the tribe-land without restriction; unequal increase of wealth and growth of population naturally led to its limitation, each head of a homestead being entitled to graze an amount of stock in proportion to his wealth, the size of his homestead, and his acquired position. The arable land was no doubt appotted annually at first; gradually, however, some of the richer families of the tribe succeeded in evading this exchange of allotments and converting part of the common land into an estate in sevraity. Septs were at first colonies of the tribe which settled on the march-land; afterwards the conversion of part of the common land into an estate in sevraity enabled the family that acquired it to become the paramount family of a tribal area.

The residence of the chief, however, takes place within a sept without dividing it; in other words, several members of the sept might hold part of the land of the sept as separate estate. The possession of land in sevraity introduced an important distinction into the tribal system—it created an aristocracy. An aire whose family held the same land for three generations was called a flath, or lord, of which rank there were several degrees according to their wealth in land and chattels. The aires whose wealth consisted in cattle only were called bó-aíres, or cow-aíres, of whom there were also several grades, depending on their wealth in stock. When a bó-aire had twice the wealth of the lowest class of flath he might enclose part of the land adjoining his house as a lawn; this was the first step towards his becoming a flath. The relations which subsisted between the flath and the bó-aíres formed the most curious part of the Celtic tribal system, and threw a flood of light on the origin of the feudal system. Every tribesman without exception owed ceiltisimh to the ríg, or chief, that is, he was bound to become his ceile, or vassal. This consisted in paying the ríg a tribute in kind, for which the ceile was entitled to receive a proportionate amount of stock without having to give any bond for their return, giving him service, e.g. in building his dun, or stronghold, reaping his harvest, keeping his roads clean and in repair, killing wolves, and especially service in the field, and doing him homage three times while seated every time he made his return of tribute.

Paying the “calpe” to the Highland chiefs represented this kind of vassalage, a colpach or heifer being in many cases the amount of food-rent paid by a free or saer ceile. A tribesman might, however, if he pleased, pay a higher rent on receiving more stock together with certain other chattels for which no rent was chargeable. In this case he entered into a contract, and was therefore a bond or eanch ceile. No one newly accepted stock on these terms, nor could be so without the consent of his sept, and he might free himself at any time from his obligation by returning what he had received, and the rent due thereon.

What every one was bound to do to his ríg, or chief, he might do voluntarily to the flath of his sept, to any flath of the tribe, or even to one of another tribe. He might also become a bond ceile. In either case he might renounce his ceilleship by returning a greater or lesser amount of stock than what he had received according to the circumstances under which he terminated his vassalage. In cases of disputed succession to the chiefship of a tribe the rival claimants were always anxious to get as many as possible to become their vassal. Hence the anxiety of minor chiefs, in later times in the Highlands of Scotland, to induce the clansmen to pay the “calpe” when there happened to be a doubt as to who was entitled to be chief.

The effect of the custom of gavel-kind was to equalize the wealth of each and leave no one wealthy enough to be chief. The “joint and undivided family” and the formation of “joint families,” or gilds, was one way of obviating this result; another way was the custom of tanistry. The headship of the tribe was practically confined to the members of one family; this was also the case with the headship of a sept. Sometimes a son succeeded his father, but the rule was that the eldest, or almost the eldest, capable member of the geilfne, that is, the relatives of the actual chief to the fifth degree, was selected during his lifetime to be his successor—generally the eldest surviving brother or son of the preceding chief. The man selected as successor to a chief of a tribe, or chieftain of a sept, was called the tanist, and should be “the most experienced, the most noble, the most wealthy, the wisest, the most learned, the most truly popular, the most powerful to oppose, the most steadfast in case of losses.” In addition to these qualities he should be free from personal blemishes and deformities and of fit age to lead his tribe or sept, as the case may be, to battle.

So far as selecting the man of the geilfne who was supposed to possess all those qualities, the office of chief of a tribe or chieftain of a sept was elective, but as the geilfne was represented by four persons, together with the chief or chieftain, the election was practically confined to one of the four. In order to support the dignity of the chief or chieftain a certain portion of the tribe or sept land was attached as an apanage to the office; this land, with the duns or fortified residences upon it, went to the successor, but a chief’s own property might be gavelled. This custom of tanistry applied at first probably to the selection of the successors of a ríg, but was gradually so extended that even a bó-aire bad a tanist.

A sept might have only one flath, or lord, connected with it, or might have several. It sometimes happened, however, that a sept might be so broken and reduced as to have not even one man qualified to rank as a flath. The rank of a flath depended upon the number of his ceileers, that is, upon his wealth. The flath of a sept, and the highest when there was more than one, was ceann fene, or head of the sept, or as he was usually called in Scotland, the chieftain. He was also called the geilfne, or head of the geilfne, that is, the kinsmen to the fifth degree from among whom should be chosen the tanist, and who, according to the custom of gavel-kind, were the immediate heirs who received the personal property and were answerable for the liabilities of the sept. The flath of the different septs were the vassals of the ríg, or chief of the tribe, and performed certain functions which were no doubt at first individual, but in time became the hereditary right of the sept. One of those was the office of maer, or steward of the chief’s rents, &c.; and another that of aire tuisí, leading aire, or tuaisceach, a word cognate with the Latin duc-ers or duc, and Anglo-Saxon here-tog, leader of the “here,” or army. The tuaisceach was leader of the tribe in battle; in later times the term seems to have been extended to several offices of rank. The cedet of a Highland clan was always called the tuaisceach, which has been translated captain; after the conquest of Wales the same term, tywysog, was used for a ruling prince. Slavery was very common in Ireland and Scotland; the explanation here given of geilfne is different from that given in the introduction to the third volume of the Ancient Laws of Ireland, which was followed by Sir H. S. Maine in his account of it in his Early History of Institutions, and which the present writer believed to be erroneous.

It should also be mentioned that illegitimacy was not a bar. The issue of “handfast” marriages in Scotland were entitled to be chiefs, and even sometimes claimed under feudal law.

This office is of considerable importance in connection with early Scottish history. In the history of a great tribe (mor tuath), such as of Ross, Moray, Marr, Buchan, &c., is called a mor maer, or great maer. Sometimes the same person is called king also in these annals. Thus Finlaidh, or Finlay, son of Ruadhri, the son of Shakespear, whose territory was in the Annals of Ulster, and also Ruadhri Mor in the Annals of Tighernach. The term is never found in Scottish charters, but it occurs in the Book of the Abbey of Deir in Buchan, now in the library of the university of Aberdeen. The Gaelic kings and their successors obviously regarded the chiefs of the great tribes in question merely as their maers, while their tribesmen only knew them as kings. From these “mor-maerships,” which corresponded with the ancient mor tuaths, came most, if not all, the ancient Scottish earldoms.

2 It should also be mentioned that illegitimacy was not a bar. The issue of "handfast" marriages in Scotland were entitled to be chiefs, and even sometimes claimed under feudal law.

This office is of considerable importance in connection with early Scottish history. In the history of a great tribe (mor tuath), such as of Ross, Moray, Marr, Buchan, &c., is called a mor maer, or great maer. Sometimes the same person is called king also in these annals. Thus Finlaidh, or Finlay, son of Ruadhri, the son of Shakespear, whose territory was in the Annals of Ulster, and also Ruadhri Mor in the Annals of Tighernach. The term is never found in Scottish charters, but it occurs in the Book of the Abbey of Deir in Buchan, now in the library of the university of Aberdeen. The Gaelic kings and their successors obviously regarded the chiefs of the great tribes in question merely as their maers, while their tribesmen only knew them as kings. From these "mor-maerships," which corresponded with the ancient mor tuaths, came most, if not all, the ancient Scottish earldoms.
in the former slaves constituted a common element in the stipends or gifts which the higher kings gave their vassal sub-reguli. Female slaves, who were employed in the houses of chiefs and flaiths in grinding meal with the hand-mill or quern, and in other domestic work, must have been very common, for the unit or standard for estimating the wealth of a bo-aire, bloodlines, &c., was called a cumhal, the value of which was three cows, but which literally meant a female slave. The descendants of those slaves, prisoners of war, forfeited hostages, refugees from other tribes, broken tribesmen, &c., gathered round the residence of the &g and flaiths, or squatted upon their marchlands, forming a motley band of retainers which made a considerable element in the population, and one of the chief sources of the wealth of chiefs and flaiths. The other principal source of their income was the food-rent paid by ceiles, and especially by the daer or bond ceiles, who were hence called biathachs, from biad, food. A flaith, but not a &g, might, if he liked, go to the house of his ceile and consume his food-rent in the house of the latter.

Under the influence of feudal ideas and the growth of the modern views as to ownership of land, the chiefs and other lords of clans claimed in modern times the right of best owning the tribe-land as turecc, instead of stock, and receiving rent not for cattle and other chattels as in former times, but proportionate to the extent of land given to them. The turecc-land seems to have been at first given upon the same terms as turcoreg-stock, but gradually a system of short leases grew up; sometimes, too, it was given on mortgage. In the Highlands of Scotland ceiles who received turecc-land were called "taksman." On the death of the chief or lord, his successor either bestowed the land upon the same person or gave it to some other relative. In this way in each generation new families came into possession of land, and others sank into the mass of mere tribemen. Sometimes a "taksman" succeeded in acquiring his land in perpetuity, by gift, marriage or purchase, or even by the "strong hand." The universal prevalence of exchangeable allotments, or the rundale system, shows that down to even comparatively modern times some of the land was still recognized as the property of the tribe, and was cultivated in village communities.

The chief governed the clan by the aid of a council called the sobaid (sath, a prop), but the chief exercised much power, especially over the miscellaneous body of non-tribemen who lived on his own estate. This power seems to have extended to life and death. Several of the flaiths, perhaps, all heads of sects, also possessed somewhat extensive powers of the same kind.

The Celtic dress, at least in the middle ages, consisted of a kind of shirt reaching to a little below the knees called a lenn, a jacket called an inar, and a garment called a brat, consisting of a single piece of cloth. This was apparently the garb of the aires, who appear to have been further distinguished by the number of colours in their dress, for we are told that while a slave had clothes of one colour, a rige tuacht, or chief of a tribe, had five, and an ollamh and a superior king six. The breeches was also known, and cloaks with a cowl or hood, which buttoned up tight in front. The lenn is the modern kilt, and the brat the plaid, so that the dress of the Irish and Welsh in former times was the same as that of the Scotch Highlanders.

By the abolition of the heritable jurisdiction of the Highland chiefs, and the general disarmament of the clans by the acts passed in 1747 after the rebellion of 1745, the clan system was practically broken up, though its influence still lingers in the more remote districts. An act was also passed in 1747 for forbidding the use of the Highland garb; but the injustice and impiety of such a law being generally felt it was afterwards repealed. (W. K. S.)

CLANRICARDE, Ulick de Burgh (Boure or Burke), 1st Earl of (d. 1544), styled MacWilliam, and Ne-gan or Na-Cean (i.e. "of the Heads," "having made a mount of the heads of men slain in battle which he covered up with earth"), was the son of Richard or Richard de Burgh, lord of Clanricarde, by a daughter of Madden of Portumna, and grandson of Ulick de Burgh, lord of Clanricarde (1467-1487), the collateral heir male of the earls of Ulster. On the death of the last earl in 1333, his only child Elizabeth had married Lionel, duke of Clarence, and the earldom became merged in the crown, in consequence of which the dc Burghs abjured English laws and sovereignty, and chose for their chiefs the sons of Sir William, the "Red" earl of Ulster's brother, the elder William taking the title of MacWilliam Eighter (Uachtar, i.e. Upper), and becoming the ancestor of the earls of Clanricarde, and his brother Sir Edmond that of MacWilliam Oughter (Ochtar, i.e. Lower), and founding the family of the earls of Mayo. In 1641 the earl of Clarence was over as lord-lieutenant to Ireland to enforce his claims as husband of the heir general, but failed, and the chiefs of the de Burghs maintained their independence of English sovereignty for several generations. Ulick de Burgh succeeded to the headship of his clan, exercised a quasi-royal authority and held vast estates in county Galway, in Connaught, including Loughry, Dunkellin, Killtartan (Hilltaraght) and Athenry, as well as Clare and Leitrim. In March 1541, however, he wrote to Henry VIII., lamenting the degeneracy of his family, "which have been brought to Irish and disobedient rule by reason of marriage and nursing with those Irish, sometime rebels, near adjoining to me," and placing himself and his estates in the king's hands. The same year he was present at Dublin, when the act was passed making Henry VIII. king of Ireland. In 1543, in company with other Irish chiefs, he was ordered to go to Greenwich, to receive the English insignia of knighthood and be instructed in English manners and to suppress Irish names, received a regrant of the greater part of his estates with the addition of other lands, was confirmed in the captainship and rule of Clanricarde, and was created on the 1st of July 1543 earl of Clanricarde and baron of Dunkellin in the peerage of Ireland, with unusual ceremony. "The making of McWilliam earl of Clanricarde made all the country during his time quiet and obedient," states Lord Chancellor Cusack in his review of the state of Ireland in 1553. He did not live long, however, to enjoy his new English dignities, but died shortly after returning to Ireland about March 1544. He is called by the annalist of Loch Cé "a haughty and proud lord," who reduced many under his yoke, and by the Four Masters "the most illustrious of the English in Connaught." Clanricarde married (1) Grany or Grace, daughter of Mulrone O'Carroll, "prince of Ely," by whom he had Richard or Ricardo "the tall," who succeeded him as 2nd earl of Clanricarde (grandfather of the 4th earl, whose son became marquess of Clanricarde), this alliance being the only one declared valid. After parting with his first wife he married (2) Honora, sister of Ulick de Burgh, from whom he also parted. He married (3) Mary Lynch, by whom he had John, who claimed the earldom in 1568. Other sons, according to Burke's Peerage, were Thomas "the Athlete," shot in 1545, Redmond "of the Broom" (d. 1593), and Edmund (d. 1597). See also Annals of Ireland by the Four Masters (ed. by O. Connell, 1846), p. 132 note, and reign of Henry VIII.; Annals of Loch Cé (Reyn Br. Medit. Anti Scriptores) (54) (1871); Hist. Mem. of the O'Briens, by J. O. Donoghue (1860), pp. 190, 510; Ireland under the Tudors, by R. Bagwell, vol. i.; State Papers, Ireland, Carew MSS. and Gairdner's Letters and Papers of Henry VIII.; Cotton MSS. Brit. Mus. Titus B xi. f. 388. (D. G. C.)
asserted, was hastened by the harshness of the lord-lieutenant.

Nevertheless at the crisis his loyalty never wavered. Alone of the Irish Roman Catholic nobility to declare for the king, he returned to Ireland, took up his residence at Portumna, kept Galway, of which he was governor, neutral, and took measures for the defence of the county and for the relief of the Protestants, making "his house and town a refuge, nay, even a hospital for the distressed English." In 1643 he was one of the commissioners appointed by the king to confer with the Irish confederates, and urged the wisdom of a cessation of hostilities in a document which he publicly distributed. He was appointed commander of the English forces in Connaught in 1644, and in 1646 was created a marquess and a privy councillor. He supported the same year the treaty between Charles I. and the confederates, and endeavoured after its failure to persuade Preston, the general of the Irish, to agree to a peace; but the latter, being advised by Rinuccini, the papal nuncio, refused in December. Together with Ormonde, Clanricarde opposed the nuncio's policy; and the royalist inhabitants of Galway having through the latter's influence rejected the cessation of hostilities, arranged with Lord Inchiquin in 1648, he besieged the town and compelled its acquiescence. In 1649 he reduced Sligo.

On Ormonde's departure in December 1650 Clanricarde was appointed deputy lord-lieutenant, but he was not trusted by the Roman Catholics, and was unable to stem the tide of the parliamentarians' success. In 1653 he opposed the offer of Charles, duke of Lorraine, to supply money and aid on condition of being acknowledged "Protector" of the kingdom. In May 1652 Galway surrendered to the parliament, and in June Clanricarde signed articles with the parliamentary commissioners which allowed his departure from Ireland. In August he was excepted from pardon for life and estate, but by permits, renewed from time to time by the council, he was enabled to remain in England for the rest of his life, and in 1653 £500 a year was settled upon him by the council of state in consideration of the protection which he had given to the Protestants in Ireland at the time of the rebellion. He died at Somerhill in Kent in 1657 or 1658 and was buried at Tunbridge.

The "great earl," as he was called, supported Ormonde in his desire to unite the English royalists with the more moderate Roman Catholics on the basis of religious toleration under the authority of the sovereign, against the papal scheme advocated by Rinuccini, and in opposition to the parliamentary and Puritan policy. By the author of the Aphoristical Discovery, who represents the opinion of the native Irish, he is denounced as the "masterpiece of the treasonable faction," "a foe to his king, nation and religion," and by the duke of Lorraine as "a traitor and a base fellow"; but there is no reason to doubt Clarendon's opinion of him as "a person of unquestionable fidelity . . . and of the most eminent constancy to the Roman Catholic religion of any man in the three kingdoms," or the verdict of Hallam, who describes him "as perhaps the most unsullied character in the annals of Ireland."

He married Lady Anne Compton, daughter of William Compton, 1st earl of Northampton, but had issue only one daughter. On his death, accordingly, the marquessate and the English peerage of Inchiquin, the Irish titles reverting to his cousin Richard, 6th earl, grandson of the 3rd earl of Clanricarde. Henry, the 12th earl (1742–1792), was again created a marquess in 1780, but the marquessate expired at his death without issue, the earldom going to his brother. In 1825 the 14th earl (1802–1874) was created a marquess; he was ambassador at St Petersburg, and later postmaster-general and lord privy seal, and married George Canning's daughter. His son (b. 1832), who achieved notoriety in the Irish land agitation, succeeded him as 2nd marquess.

CLANWAVE, SIR THOMAS, the name of an English poet first mentioned in the history of English literature by F. S. Ellis in 1896, when, in editing the text of The Book of Cupid, God of Love, or The Cuckoo and the Nightingale, for the Kelmscott Press, he stated that Professor Skeat had discovered that at the end of the best of the MSS. the author was called Clanwove. In 1897 this information was confirmed and expanded by Professor Skeat in the supplementary volume of his Clarendon Press Chaucer (1894–1897). The beautiful romance of The Cuckoo and the Nightingale was published by Thynne in 1532, and was attributed by him, and his successors, down to the days of Henry Bradshaw, to Chaucer. It was due to this error that for three centuries Chaucer was supposed to be identified with the major of Woodstock, and even painted, in fanciful pictures, as lying "Under a maple that is fair and green, Before the chamber-window of the Queen At Wodestock, upon the green-lee leaf."

But this queen could only be Joan of Navarre, who arrived in 1403, three years after Chaucer's death, and it is to the spring of that year that Professor Skeat attributes the composition of the poem. Sir Thomas Clanwove was of a Herefordshire family, settled near Wigmore. He was a prominent figure in the courts of Richard II. and Henry IV., and is said to have been a friend of Prince Hal. He was one of those who "had begun to mell of Lollardy, and drink the gall of herecy." He was one of the twenty-five knights who accompanied John Beaufort (son of John of Gaunt) to Barbary in 1390.

The date of his birth is unknown, and his name is last mentioned in 1404. The historic and literary importance of The Cuckoo and the Nightingale is great. It is the work of a poet who had studied the prosody of Chaucer with more intelligent care than either Occleve or Lydgate, and who therefore found a very important link between the 14th and 15th centuries in English poetry. Clanwove writes with a surprising delicacy and sweetness, in a five-line measure almost peculiar to himself. Professor Skeat points out a unique characteristic of Clanwove's versification, namely, the unprecedented freedom with which he employs the suffix of the final -e, and rather avoids than seeks elision. The Cuckoo and the Nightingale was imitated by Milton in his sonnet to the Nightingale, and was rewritten in modern English by Wordsworth. It is a poem of so much individual beauty, that we must regret the apparent loss of everything else written by a poet of such unusual talent.

CLAPAREDE, JEAN LOUIS RENÉ ANTOINE ÉDOUARD (1832–1870), Swiss naturalist, was born at Geneva on the 24th of April 1832. He belonged to a French family, some members of which had taken refuge in that city after the revocation of the Edict of Nantes. In 1852 he began to study medicine and natural science at Berlin, where he was greatly influenced by J. Müller and J. G. Ehrenberg, the former being at that period engaged in his important researches on the Echinoderms. In 1855 he accompanied Müller to Norway, and there spent two months on a desolate reef that he might obtain satisfactory observations. The latter part of his stay at Berlin he devoted, along with J. Lachmann, to the study of the Infusoria and Rhizopods. In 1857 he obtained the degree of doctor, and in 1862 he was chosen professor of comparative anatomy at Geneva. In 1859 he visited England, and in company with W. B. Carpenter made a voyage to the Hebrides; and in 1863 he spent some months in the Bay of Biscay. On the appearance of Darwin's work on the Origin of Species, he adopted his theories and published a valuable series of articles on the subject in the Recueil Géneral (1861). During 1865 and 1866 ill-health rendered him incapable of work, and he determined to pass the winter of 1866–1867 in
CLAPPERTON—CLARE

Naples. The change of climate produced some amelioration, and his energy was attested by two elaborate volumes on the Annelidae of the gulf. He again visited Naples with advantage in 1868; but in 1870, instead of recovering as before, he grew worse, and on the 31st of May he died at Siena on his way home. His Recherches sur la structure des annélides sédiéraires were published posthumously in 1873.

CLAPPERTON, HUGH (1788–1827), Scottish traveller in West-Central Africa, was born in 1788, the son of William, Dunfrieshire, where his father was a surgeon. He gained some knowledge of practical mathematics and navigation, and at thirteen was apprenticed on board a vessel which traded between Liverpool and North America. After having made several voyages across the Atlantic he was impressed for the navy, in which he soon rose to the rank of midshipman. During the Napoleonic wars he saw a good deal of active service, and at the storming of Port Louis, Mauritius, in November 1810, he was first in the breach and hauled down the French flag. In 1814 he went to Canada, was promoted to the rank of lieutenant, and to the command of a schooner on the Canadian lakes. In 1817, when the flotilla on the lakes was dismantled, he returned home on half-pay.

In 1820 Clapperton removed to Edinburgh, where he made the acquaintance of Walter Oudney, M.D., who aroused in him an interest in African travel. Lieut. G. F. Lyon, R.N., having returned from an unsuccessful attempt to reach Bornu from Tripoli, the British government determined on a second expedition to that country. Dr Oudney was appointed by Lord Bathurst, then colonial secretary, to proceed to Bornu as consul with the object of promoting trade, and Clapperton and Major Dixon Denham (q.v.) were added to the party. From Tripoli, early in 1822, they set out southward to Murzuk, and from this point Clapperton and Oudney visited the Ghai oasis. Kuka, the capital of Bornu, was reached in February 1823, and Lake Chad seen for the first time by Europeans. At Bornu the travellers were well received by the sultan; and after remaining in the country till the 14th of December they again set out for the purpose of exploring the course of the Niger. At Murmur, on the road to Kano, Oudney died (January 1824). Clapperton continued his journey alone through Kano to Sokoto, the capital of the Fula empire, where by order of Sultan Bello he was obliged to stop, though the Niger was only five days' journey to the west. Worn out with his travel he returned by way of Zaria and Katsena to Kuka, where he again met Denham. The two travellers then set out for Tripoli, reached on the 26th of January 1825. An account of the travels was published in 1826 under the title of Narrative of Travels and Discoveries in Northern and Central Africa in the years 1822–1824.

Immediately after his return Clapperton was raised to the rank of commander, and sent out with another expedition to Africa, the sultan Bello of Sokoto having professed his eagerness to open up trade with the west coast. Clapperton landed at Badagry in the Bight of Benin, and started overland for the Niger on the 7th of December 1825, having with him his servant Richard Lander (q.v.), Captain Pearce, R.N., and Dr Morrison, navy surgeon and naturalist. Before the month was out Pearson and Morrison were dead of fever. Clapperton continued his journey, and, passing through the Yoruba country, in January 1826 he crossed the Niger at Bussa, the spot where Mungo Park had died twenty years before. In July he arrived at Kano. Thence he went to Sokoto, intending afterwards to go to Bornu. The sultan, however, detained him, and being seized with dysentery he died near Sokoto on the 13th of April 1827.

CLAPPERTON was the first European to make known from personal observation the semi-civilized Haussa countries, which he visited soon after the establishment of the Sokoto empire by the Fula. In 1829 appeared the Journal of a Second Expedition into the Interior of Africa, &c., by the late Commander Clapperton, to which was prefixed a biographical sketch of the explorer by his uncle, Lieut.-colonel S. Clapperton. Lander, who had brought back the journal of his master, also published Records of Captain Clapperton's Last Expedition to Africa ... with the subsequent Adventures of the Author (2 vols., London, 1830).

CLAUDUB (Fr. claquer, to clap the hands), an organized body of professional applauders in the French theatres. The hiring of persons to applaud dramatic performances was common in classical times, and the emperor Nero, when he acted, had his performance greeted by an encomium chanted by five thousand of his soldiers, who were called Augustals. The recollection of this gave the 16th-century French poet, Jean Daurat, an idea which has developed into the modern claudeur. Buying up a number of tickets for a performance of one of his plays, he distributed them gratuitously to those who promised publicly to express their approbation. It was not, however, till 1820 that a M. Sauton seriously undertook the systematization of the claudeur, and opened an office in Paris for the supply of claudeurs. By 1830 the claudeur had become a regular institution. The manager of a theatre sends an order for any number of claudeurs. These people are usually under a chef de claude, whose duty it is to judge where their efforts are needed and to start the demonstration of approval. This takes several forms. Thus there are commissaires, those who learn the piece by heart, and call the attention of their neighbours to its good points between the acts. The rieurs are those who laugh loudly at the jokes. The pleureurs, generally women, weep tears, by holding their handkerchiefs to their eyes. The chatouilleurs keep the audience in a good humour, while the bisers simply clap their hands and cry bis! bis! to secure encore.

CLAURA, SAINT (1104–1253), foundress of the Franciscan nuns, was born of a knightly family in Assisi in 1104. At eighteen she was so impressed by a sermon of St Francis that she was filled with the desire to devote herself to the kind of life he was leading. She obtained an interview with him, and, to test her resolution he told her to dress in penitential sackcloth and beg alms for the poor in the streets of Assisi. Clara readily did this, and Francis, satisfied as to her vocation, told her to come to the Portuinula arrayed as a bride. The friars met her with lighted candles, and at the foot of the altar Francis shored off her hair, received her vows of poverty, chastity and obedience, and invested her with the Franciscan habit, 1212. He placed her for a couple of years in a Benedictine convent in Assisi, until the convent at St Damian's, close to the town, was ready. Her two younger sisters, and, after her father's death, her mother and many others joined her, and the Franciscan nuns spread widely and rapidly (see CLARES, POOR). The relations of friendship and sympathy between St Clara and St Francis were very close, and there can be no doubt that she was one of the truest heirs of Francis's inmost spirit. After his death Clara threw herself wholly on the side of those who opposed mitigations in the rule and manner of life, and she was one of the chief upholders of St Francis's primitive idea of poverty (see Franciscans). She was the close friend of Brother Leo and the other "Companions of St Francis," and they assisted at her death. For forty years she was abbess at St Damian's, and the great endeavour of her life was that the rule of the nuns should be purged of the foreign elements that had been introduced, and should become wholly conformable to St Francis's spirit. She lived just long enough to witness the fulfilment of her great wish, a rule designed especially for them by the pope two days before her death on the 11th of August 1253.

The sources for her life are to be found in the Bollandists' Acta Sanctorum on the 11th of August, and sketches in such Lives of the Saints as Alban Butler's. See also Wetzer und Welte, Kirchenlexicon (2nd ed.), art. "Clara." (E. C. B.)

CLARE, the name of a famous English family. The ancestor of this historic house, "which played," in Freeman's words, "so great a part alike in England, Wales and Ireland," was Count Godfrey, eldest of the illegitimate sons of Richard the Fearless, duke of Normandy. His son, Count Gilbert of Brionne, had two sons, Richard, lord of Bienlaine and Orbec, and Baldwin, lord of Le Sap and Meules, both of whom accompanied the Conqueror to England. Baldwin, known as "De Meules" or "of Exeter," received the hereditary shrievalty of Devon with great estates in the West Country, and left three sons, William, Robert and Richard, of whom the first and last were in turn
sirens of Devon. Richard, known as “de Biemfaite,” or “of Tunbridge,” or “of Clare,” was the founder of the house of Clare.

Richard derived his English appellation from his strongholds at Tunbridge and at Clare, at both of which his castle-mounds still remain. The latter, on the borders of Essex and Suffolk, was the head of his great “honour” which lay chiefly in the eastern counties. Appointed joint justiciar in the king’s absence abroad, he took a leading part in suppressing the revolt of 1075. By his wife, Roehsa, daughter of Walter Giffard, through whom great Giffard estates afterwards came to his house, he left five sons and two daughters. Roger was his heir in Normandy, Walter founded Tintern Abbey, Richard was a monk, and Robert, receiving the forfeited fee of the Baynards in the eastern counties, founded, through his son Walter, the house of Fitz-Walter (extinct 1432), of whom the most famous was Robert Fitz-Walter, the leader of the barons against King John. Of this house, spoken of by Jordan Fantosme as “Clarensus,” the Daventry of Daventry (extinct 1380) and Fawsleys of Fawsley (extinct 1392) were cadets. One of Richard’s two daughters married the famous Walter Tiber.

Gilbert, Richard’s heir in England, held his castle of Tunbridge against William Rufus, but was wounded and captured. Under Henry I, who favoured the Clares, he obtained a grant of Cardigan, and carried his arms into Wales. Dying about 1115, he left four sons, of whom Gilbert, the second, inherited Chesh- stow, with Nether-Gwent, from his uncle, Walter, the founder of Tintern, and was created earl of Pembroke by Stephen about 1138; he was father of Richard Strongbow, earl of Pembroke (q.v.). The youngest son Baldwin fought for Stephen at the battle of Lincoln (1141) and founded the priories of Bourne and Deeping on lands acquired with his wife. The eldest son, Richard, who was slain by the Welsh on his way to Cardigan in 1135 or 1136, left two sons Gilbert and Roger, of whom Gilbert was created earl of Hertfordshire by Stephen.

It was probably because he and the Clares had no interests in Hertfordshire that they were loosely and usually styled the earls of (de) Clare. Dying in 1152, Gilbert was succeeded by his brother Roger, of whom Fitz-Stephen observes that “nearly all the nobles of England were related to the earl of Clare, whose sister, the most beautiful woman in England, had long been desired by the king” (Henry II.). He was constantly fighting the Welsh for his family possessions in Wales and quarrelled with Becket over Tunbridge Castle. In 1173 or 1174 he was succeeded by his son Richard as third earl, whose marriage with Amlca, daughter and co-heir of William, earl of Gloucester, was destined to raise the fortunes of his house to their highest point. He and his son Gilbert were among the “barons of the Charter,” Gilbert, who became fourth earl in 1217, obtained also, early in 1218, the earldom of Gloucester, with its great territorial “Honour,” and the lordship of Glamorgan, in right of his mother; “from this time the house of Clare became the acknowledged head of the baronage.” Gilbert had also inherited through his father his grandfather’s “Honour of St Hilary” and a moiety of the Giffard fief; but the vast possessions of his house were still further swollen by his marriage with a daughter of William (Marshall), earl of Pembroke, through whom his son Richard succeeded in 1245 to a fifth of the Marshall lands including the Kilkenny estates in Ireland. Richard’s successor, Gilbert, the “Red” earl, died in 1295, the most powerful subject in the kingdom.

On his death his earldoms seem to have been somewhat mysteriously deeded to have passed to his widow Joan, daughter of Edward I; for her second husband, Ralph de Monthermer, was summoned to parliament in right of them from 1299 to 1306. After her death, however, in 1307, Earl Gilbert’s son and heir name-sake was summoned in 1308 as Earl of Gloucester and Hertford, though only sixteen. A nephew of Edward II and brother-in-law of Gaweston, he played a somewhat wavering part in the struggle between the king and the barons. Guardian of the realm in 1311 and regent in 1313, he fell gloriously at Bannockburn (June 24th, 1314), when only twenty-three, rushing on the enemy “like a wild boar, making his sword drunk with their blood.”

The earl was the last of his mighty line, and his vast possessions in England (in over twenty counties), Wales and Ireland fell to his three sisters, of whom Elizabeth, the youngest, wife of Sir William de Burgh, obtained the “Honour of Clare” and transmitted it to her son William de Burgh, 3rd earl of Ulster, whose daughter brought it to Lionel, son of King Edward III., who was thereupon created duke of Clare, a title associated ever since with the royal house. The “Honour of Clare,” vested in the crown, still preserves a separate existence, with a court and steward of its own.

Clare College, Cambridge, derived its name from the above Elizabeth, “Lady of Clare,” who founded it as Clare Hall in 1347.

Clare County in Ireland derives its name from the family, though whether from Richard Strongbow, or from Thomas de Clare, a younger son, who had a grant of Thomond in 1276, has been deemed doubtful.

Clareneux of Arms, an officer of the Heralds’ College, derives his style, through Clarence, from Clare.

CLARE, JOHN (1703-1864), English poet, commonly known as “the Northamptonshire Peasant Poet,” the son of a farm labourer, was born at Helpstone near Peterborough, on the 13th of July 1703. At the age of seven he was taken from school to tend sheep and geese; four years later he began to work on a farm, attending in the winter evenings a school where he is said to have learnt some algebra. He then became a pot-boy in public-house and fell in love with Mary Joyce, but her father, a prosperous farmer, forbade her to meet him. Subsequently he was gardener at Burghley Park. He enlisted in the militia, tried camp life with gypsies, and worked as a lime burner in 1817, but in the following year he was obliged to accept parish relief. Clare had bought a copy of Thomson’s Seasons out of his scanty earnings and had begun to write poems. In 1819 a bookseller at Stamford, named Drury, lighted on one of Clare’s poems, The Setting Sun, written on a scrap of paper enclosing a note to his predecessor in the business. He befriended the author and introduced his poems to the notice of John Taylor, of the publishing firm of Taylor & Hussey, who issued the Poems Descriptive of Rural Life and Scenery in 1820. This book was highly praised, and in the next year his Village Minstrel and other Poems were published. He was greatly patronized; fame, in the shape of curious visitors, broke the tenor of his life, and the convivial habits that he had formed were indulged more freely. He had married in 1826, and an annuity of 15 guineas from Lord Exeter, in whose service he had been, was supplemented by subscription, and he became possessed of £50 annually, a sum far beyond what he had ever earned, but new wants made his income insufficient, and in 1825 he was nearly penniless. The Shepherd’s Calendar (1827) met with little success, which was not increased by his Hawking it himself. As he worked again on the fields his health temporarily improved; but he soon became seriously ill. Lord Fitzwilliam presented him with a new cottage and a piece of ground, but Clare could not settle in his new home. Gradually his mind gave way. His last and best work, the Rural Muse (1831), was noticed by “Christopher North” alone. He had for some time shown symptoms of insanity; and in July 1837 he was removed to a private asylum, and afterwards to the Northampton general lunatic asylum, where he died on the 20th of May 1844. Clare’s descriptions of rural scenes show a keen and loving appreciation of nature, and his love-songs and ballads charm by their genuine feeling; but his vogue was no doubt largely due to the interest aroused by his humble position in life.
CLARE, LORD

See the Life of John Clare, by Frederick Martin (1865); and Life and Remains of John Clare, by J. L. Cherry (1873), which, though not so complete, contains some of the poet's asylum verses and verse fragments.

CLARE, JOHN FITZGIBBON, 1st Earl of (1749-1803), lord chancellor of Ireland, was the second son of John Fitzgibbon, who had abandoned the Roman Catholic faith in order to pursue a legal career. He was educated at Trinity College, Dublin, where he was highly distinguished as a classical scholar, and at Christ Church, Oxford, where he graduated in 1770. In 1772 he was called to the Irish bar, and quickly acquired a very lucrative practice; he also inherited his father's large fortune on the death of his elder brother. In 1774 he entered the Irish House of Commons as member for Dublin University, and at first gave a general support to the popular party led by Henry Grattan (q.v.). He was, however, from the first, hostile to that part of Grattan's policy which aimed at removing the disabilities of the Roman Catholics; he endeavoured to impede the Relief Bill of 1778 by raising difficulties about its effect on the Act of Settlement. He especially distrusted the priests, and many years later explained that his life-long resistance to all concession to the Catholics was based on his "unalterable opinion" that "a conscientious Popish ecclesiastic never will become a well-attacked subject to a Protestant state, and that the Popish clergy must always have a commanding influence on every member of that communion." As early as 1780 Fitzgibbon began to separate himself from the popular or national party, by opposing Grattan's declaration of the Irish parliament's right to independence. There is no reason to suppose that in this change of view he was influenced by corrupt or personal motives. His cast of mind naturally inclined to authority rather than to democratic liberty; his hostility to the Catholic claims, and his distrust of parliamentary reform as likely to endanger the connexion of Ireland with Great Britain, made him a sincere opponent of the aims which Grattan had in view. In reply, however, to a remonstrance from his constituents Fitzgibbon promised to support Grattan's policy in the future, and described the claim of Great Britain to make laws for Ireland as "a daring usurpation of the rights of a free people."

For some time longer there was no actual breach between him and Grattan. Grattan supported the appointment of Fitzgibbon as attorney-general in 1783, and in 1785 the latter highly eulogized Grattan's character and services to the country in a speech in which he condemned Flood's volunteer movement. He also opposed Flood's Reform Bill of 1784; and from this time forward he was in fact the leading spirit in the Irish government, and the stiffest opponent of all concession to popular demands. In 1784 the permanent committee of revolutionary reformation in Dublin, of whom Napper Tandy was the most conspicuous, invited the sheriffs of counties to call meetings for the election of delegates to attend a convention for the discussion of reform; and when the sheriff of the county of Dublin summoned a meeting for this purpose Fitzgibbon procured his imprisonment for contempt of court, and justified this procedure in parliament, though Lord Erskine declared it grossly illegal. In the course of the debates on Pitt's commercial propositions in 1785, which Fitzgibbon supported in masterly speeches, he referred to Curran in terms which led to a duel between the two lawyers, when Fitzgibbon was accused of a deliberation in aiming at his opponent that was contrary to etiquette. His antagonism to Curran was life-long and bitter, and after he became chancellor his hostility to the famous advocate was said to have driven the latter out of practical life. In January 1787 Fitzgibbon introduced a bill for repression of the Whiteboy outrages. It was supported by Grattan, who, however, procured the omission of a clause enacting that any Roman Catholic chapel near which an illegal oath had been tendered should be immediately demolished. His influence with the majority in the Irish parliament defeated Pitt's proposed reform of the tithe system in Ireland, Fitzgibbon refusing even to grant a committee to investigate the subject. On the regency question in 1790 Fitzgibbon, in opposition to Grattan, supported the doctrine of Pitt in a series of powerful speeches which proved him a great constitutional lawyer; he intimated that the choice for Ireland might in certain events rest between complete separation from England and legislative union; and, while he exclaimed as to the latter alternative, "God forbid that I should ever see that day!" he admitted that separation would be the worse evil of the two.

In the same year Lord Lifford resigned the chancellorship, and Fitzgibbon was appointed in his place, being raised to the peerage as Baron Fitzgibbon. His removal to the House of Lords greatly increased his power. In the Commons, though he had exercised great influence as attorney-general, his position had been secondary; in the House of Lords and in the privy council he was little less than despotic. "He was," says Lecky, "by far the ablest Irishman who had adopted without restriction the doctrine that the Irish legislature must be maintained in a condition of permanent and unvarying subjection to the English executive." But the English ministry were now embarking on a policy of conciliation in Ireland. The Catholic Relief Bill of 1793 was forced on the Irish executive by the cabinet in London, but it passed rapidly and easily through the Irish parliament. Lord Fitzgibbon, while accepting the bill as inevitable under the circumstances that had arisen, made a most violent though exceedingly able speech against the principle of concession, which did much to destroy the conciliatory effect of the measure; and as a consequence of this act he began persistently to urge the necessity for a legislative union. From this date until the union was carried, the career of Fitzgibbon is practically the history of Ireland. True to his inveterate hostility to the popular claims, he was opposed to the appointment of Lord Fitzwilliam (q.v.) as viceroy in 1793, and was probably the chief influence in procuring his recall; and it was Fitzgibbon who first put it into the head of George III. that the king would violate his coronation oath if he consented to the admission of Catholics to parliament. When Lord Camden, Fitzwilliam's successor in the viceroyalty, arrived in Dublin on the 31st of March 1795, Fitzgibbon's carriage was violently assaulted by the mob, and he himself was wounded; and in the riots that ensued his house was also attacked. But as to impress upon the Catholics the hopelessness of their case, the government who had made Fitzgibbon a viscount immediately after his attack on the Catholics in 1793 now bestowed on him a further mark of honour. In June 1795 he was created earl of Clare. On the eve of the rebellion he warned the government that while emancipation and reform might be the objects aimed at by the better classes, the mass of the disaffected had in view "the separation of the country from her connexion with Great Britain, and a fraternal alliance with the French Republic." Clare advocated stringent measures to prevent an outbreak; but he was neither cruel nor in moderate, and was inclined to mercy in dealing with individuals. He attempted to save Lord Edward Fitzgerald (q.v.) from his fate by giving a friendly warning to his friends, and promising to facilitate his escape from the country; and Lord Edward's aunt, Lady Louisa Conolly, who was conducted to his death-bed in prison by the chancellor in person, declared that "nothing could exceed Lord Clare's kindness." His moderation and humanity after the rebellion was extolled by Cornwallis. He threw his great influence on the side of clemency, and it was through his intervention that Oliver Bond, when sentenced to death, was reprieved; and that an arrangement was made by which Arthur O'Connor, Thomas Emmet and other state prisoners were allowed to leave the country.

In October 1798 Lord Clare, who since 1793 had been convinced of the necessity for a legislative union if the connexion between Great Britain and Ireland was to be maintained, and it was determined that the union must be enforced by Catholic emancipation, crossed to England and successfully pressed his views on Pitt. In 1799 he induced the Irish House of Lords to throw out a bill for providing a permanent endowment of Maynooth. On the 10th of February 1800 Clare in the House of Lords moved the resolution approving the union in a long and powerful speech, in which he reviewed the history of Ireland since the Revolution, attributing the evils of recent years to the independent constitution of 1782, and speaking of Grattan...
in language of deep personal hatred. He was not aware of the assurance which Cornwills had been authorized to convey to the Catholics that the union was to pave the way for emancipation, and when he heard of it after the passage of the act he complained that Pitt and Castlereagh had deceived him. After the union Clare became more violent than ever in his opposition to the policy of concession in Ireland. He died on the 28th of January 1802; his funeral in Dublin was the occasion of a riot organized "by a gang of about fourteen persons under orders of a leader." His wife, in compliance with his death-bed request, destroyed all his papers. His two sons, John, (1792-1851) and Richard Hobart (1793-1864), succeeded in turn to the earldom, which became extinct on the death of the latter, whose only son, John Charles Henry, Viscount Fitzgibbon (1829-1854), was killed in the charge of the Light Brigade at Balaklava.

Lord Clare was in private life an estimable and even an amiable man; many acts of generosity are related of him; the determination of his character swayed other wills to his purpose, and his courage was such as no danger, no obloquy, no public hatred or violence could disturb. Though not a great orator like Flood or Grattan, he was a skilful and ready debater, and he was by far the ablest Irish supporter of the union. He was, however, arrogant, overbearing and intolerant to the last degree. He was the first Irishman since the Revolution to hold the office of lord chancellor of Ireland. "Except where his furious personal antipathies and his un govnerable arrogance were called into action, he appears to have been," says Lecky, "an able, upright and energetic judge"; but as a politician there can be little question that Lord Clare's bitter and unceasing resistance to reasonable measures of reform did infinite mischief in the history of Ireland, by inflaming the passions of his countrymen, driving them into rebellion, and perpetuating their political and religious divisions.

**CLARE**, a county in the province of Munster, Ireland, bounded N. by Galway Bay and Co. Galway, E. by Lough Derg, the river Shannon, and counties Tipperary and Limerick, S. by the estuary of the Shannon, and W. by the Atlantic Ocean. The area is 852,389 acres, or nearly 1332 sq. m. Although the surface of the country is hilly, and in some parts even mountainous, it nowhere rises to a great elevation. Much of the western baronies of Moyarta and Ibrickan is composed of bog land. Bogs are frequent also in the mountainous districts elsewhere, except in the limestone barony of Burren, in the habitants of some parts of which supply themselves with turf from the opposite shores of Connemara. Generally speaking, the eastern parts of the county are mountainous, with tracts of rich pasture-land interspersed; the west abounds with bog; and the north is rocky and best adapted for grazing sheep. In the southern part, along the banks of the Fergus and Shannon, are the bands of rich low grounds called cocaisses, of various breadth, indenting the land in a great variety of shapes. They are composed of deep rich loam, and are distinguished as the black cocaisses, adapted for tillage, and the blue, used more advantageously as meadow land. The coast is in general rocky, and occasionally bold and precipitous in the extreme, as may be observed at the picturesque cliffs of Moher within a few miles of Ennistimon and Lissadown, which rise perpendicularly at O'Brien's Tower to an elevation of 534 ft. The coast of Clare is intersected with several bays, the chief of which are Ballyvaghan, Liscannor and Malbay; but from Black Head to Loop Head, that is, along the entire western boundary of the county formed by the Atlantic, there is no safe harbour except Liscannor Bay. Malbay takes its name from its dangers to navigators, and the whole coast has been the scene of many fatal disasters. The county possesses only one large river, the Fergus; but nearly 100 m. of its boundary-line are washed by the river Shannon, which enters the Atlantic Ocean between this river and Lough Corrib. The number of bays and creeks on both sides of this great river render its navigation safe in every wind; but the passage to and from Limerick is often tedious, and the port of Kilrush has from that cause gained in importance. The river Fergus is navigable from the Shannon to the town of Clare, which is the terminating point of its natural navigation, and the port of all the central districts of the county.

There are a great number of lakes and tarns in the county, of which the largest are Loughs Mucknagagh, Graney, Atedaun and Dromore; but they are more remarkable for beauty than for size or utility, with the exception of the extensive and navigable Lough Derg, formed by the river Shannon between this county and Tipperary. The salmon fishery of the Shannon, both as a sport and as an industry, is famous; the Fergus also holds salmon, and there is much good trout-fishing in the lakes for which Ennis is a centre, and in the streams of the Atlantic seaboard. Clare is a county which, like all the western counties of Ireland, repays visitors in search of the pleasures of seaside resorts, sport, scenery or antiquarian interest. Yet, again like other western counties, it was long before it was rendered accessible. Communications, however, are now satisfactory.

**Geology.**—Upper Carboniferous strata cover the county west of Ennis, the coast-seCTIONS in them being particularly fine. Shales and sandstones alternating with sandstone and limestone. This stratum is now thrown into striking folds. The Carboniferous Limestone forms a barren terraced country, often devoid of soil, through the Burren in the north, and extends to the estuary of the Fergus and the Shannon. On the east, the folding has brought up two bold masses of Old Red Sandstone, with Silurian cores. Slieve Bernagh, the more southerly of these, rises to 1746 ft. above Killaloe, and the hilly country here traversed by the Shannon is in marked contrast with the upper course of the river through the great limestone plain.

**Minerals.**—Although metals and minerals have been found in many places throughout the county, they do not often show themselves in sufficient abundance to induce the application of capital for their extraction. The principal metals are lead, iron and manganese. The Milltown lead mine in the barony of Tulia is probably one of the oldest mines in Ireland, and formerly, if the extent of the ancient excavations may be taken as a guide, there must have been a very rich deposit. Copper pyrites occurs in several parts of Burren, but in small quantity. Coal exists at Labasheeda on the right bank of the Shannon, but the few and thin seams are not productive. The nodules of clay-ironstone in the strata that overlie the limestone were mined and smelted down to 1750. Within half a mile of the Milltown lead mine are immense natural vaulted passages of limestone, through which the river Airdsullas winds a singular course. The lower limestone of the eastern portion of the county has been found to contain several very large deposits of argentiferous galena, easily quarried, are procured near Kilrush, and thinner flags near Ennistimon. Slates are quarried in several places, the best being those of Broadford and Killaloe, which are nearly equal to the finest procured in Wales. A species of very fine black marble is obtained near Ennis; it takes a high polish, and is free from the white spots with which the black Killkenny marble is marked.

The mineral springs, which are found in many places, are chiefly chalybeate. That of Lisdoonvarna, a sulphur spa, about 8 m. from Ennistimon, has been celebrated since the 18th century for its medicinal qualities, and now attracts a large number of visitors annually. It rises 9 m. by road N. of Ennistimon. There are chalybeate springs of less note at Kilkishen, Burren, Broadfoot, Lehinch, Kilkee, Kilrush, Killaladyart, and near Milltown Malbay. Springs called by the people "holy" or "blessed" wells, generally mineral waters, are common; but the belief in the power of performing cures in invertebrate maladies is nearly extinct.

**Watering-places.**—The Atlantic Ocean and the estuary of the Shannon afford many situations admirably adapted for summer bathing-places. Among the most frequented of these localities are Milltown Malbay, with one of the best beaches on the western coast; and the neighbouring Spanish Point (named from the scene of the wreck of two ships of the Armada); Lehinch, about
2 m. from Ennistimon on Liscannor Bay, and near the interesting cliffs of Moher, has a magnificent beach. Kilkee is the most fashionable watering-place on the western coast of Ireland; and Kilrush on the Shannon estuary is also favoured.

**Industries.**—The soil and surface of the county are in general better adapted for grazing than for tillage, and the acreage devoted to the former consequently exceeds three times that of the latter. Agriculture is in a backward state, and not a fifth of the total area is under cultivation, while the acreage shows a decrease even in the principal crops of oats and potatoes. Cattle, sheep, poultry and pigs, however, all receive considerable attention. Owing to the mountainous nature of the county nearly one-seventh of the total area is quite barren.

The ancient dioceses of Killaloe and Limerick, although flannels and friezes are made for home use, and hosery of various kinds, chiefly coarse and strong, is made around Ennistimon and other places. There are several fishing stations on the coast, and cod, haddock, ling, sole, turbot, ray, mackerel and other fish abound, but the rugged nature of the coast and the tempestuous sea greatly hinder the operations of the fishermen. Near Pooldoody is the great Burren oyster bed called the Red Bank, where a large establishment is maintained, from which a constant supply of the excellent Red Bank oysters is furnished to the Dublin and other large markets. Crabs and lobsters are caught on the shores of the Bay of Galway in every creek from Black Head to Ardry. In addition to the Shannon salmon fishery mentioned above, eels abound in every rivulet, and form an important article of consumption.

The Great Southern & Western railway line from Limerick to Sligo intersects the centre of the county from north to south. From Ennis on this line the West Clare railway runs to Ennistimon on the coast, where it turns south and follows the coast by Milltown Malbay to Kilkee and Kilrush. Killaloe in the east of the county is the terminus of a branch of the Great Southern & Western railway.

**Population and Administration.**—The population (126,244 in 1891; 112,334 in 1901; almost wholly Roman Catholic and rural) shows a decrease among the most serious of the Irish counties, and the emigration returns are proportionately heavy. The principal towns, all of insignificant size, are Ennis (pop. 5903, the county town), Kilrush (4179), Kilkee (1661) and Killaloe (885); but several of the smaller settlements, as resorts, are of more than local importance. The county, which is divided into 11 baronies, contains 79 parishes, and includes the Protestant diocese of Killaloe, the greater part of Killaloe, and a very small portion of the diocese of Limerick. It is within the Roman Catholic dioceses of Killaloe and Limerick. The assizes are held at Ennis, and quarter sessions here and at Ennistimon, Killaloe, Kilrush and Tulla. The county is divided into the East and West parliamentary divisions, each returning one member.

**History.**—This county, together with part of the neighbouring district, was anciently called Thomond, that is, North Munster, and formed part of the monarchy of the celebrated Brian Boru lime, who held his court at Kincoor near Killaloe, where his palace was situated on the banks of the Shannon. The site is still distinguished by extensive earthen ramparts. Settlements were effected by the Danes, and in the 13th century by the Anglo-Normans, but without permanently affecting the possession of the district by its native proprietors. In 1543 Murrough O’Brien, after disposing of his nephew and vainly attempting a rebellion against the English rule, proceeded to England and submitted to Henry VIII., resigning his name to the chief of the Roman Catholic dioceses of Killaloe and Limerick. The assurance was held at Ennis, and quarter sessions here and at Ennistimon, Killaloe, Kilrush and Tulla. The county is divided into the East and West parliamentary divisions, each returning one member.

**Claremont—Clarence.**

**Claremont, a city of Sullivan county, New Hampshire, U.S.A., situated in the W. part of the state, bordering on the Connecticut river. Pop. (1890) 5555; (1900) 6496 (1442 foreign-born); (1910) 7250. Area, 6 sq. m. It is served by two branches of the Boston & Maine railway. In Claremont is the first school library (1873), housed in a Carnegie building (1904). The Stevens high school is richly endowed by the gift of Paran Stevens, a native of Claremont. The city contains several villages, the principal being Claremont, Claremont Junction and West Claremont. Sugar river, flowing through the city into the Connecticut and falling 223 ft. within the city limits, furnishes good water-power. Among the manufactures are woolen and cotton goods, paper, mining and quarrying machinery, rubber goods, linens, shoes, wood trim and pearl buttons. The first settlement here was made in 1762, and a township was organized in 1764; in 1908 Claremont was chartered as a city. It was named from Claremont, Lord Clive's country place.

**Clarence, Dukes of.** The early history of this English title is identical with that of the family of Clare (q.v.), Earls of Gloucester, who are sometimes called earls of Clare, of which word Clare is a later form. The first duke of Clarence was Lionel, 1st earl (q.v.), while the second duke was created duke in 1562, and whose wife Elizabeth was a direct descendant of the Clares, the "Honour of Clare" among being among the lands which she brought to her husband. When Lionel died without sons in 1368 the title became extinct; but in 1412 it was revived in favour of Thomas (see below), the second son of Henry IV. The third creation of a duke of Clarence took place in 1491, and was in favour of George (see below), brother of the King Edward IV. When this duke, accused by
the king, was attainted and killed in 1478, his titles and estates were forfeited. There appears to have been no other creation of a duke of Clarence until 1789, when William, third son of George III., was made a peer under this title. Having merged in the crown when William became king of Great Britain and Ireland in 1830, the title of duke of Clarence was again revived in 1890 in favour of Albert Victor (1864-1892), the elder son of King Edward VII., then prince of Wales, only to become extinct for the fifth time on his death in 1892.

LIONEL OF ANTPWERP, DUKE OF CLARENCE (1338-1368), third son of Edward III., was born at Antwerp on the 29th of November 1338. Betrothed when a child to Elizabeth (d. 1363), daughter and heir of William de Burgh, 3rd earl of Ulster (d. 1332), he was married to her in 1352; but before this date he had entered nominally into possession of her great Irish inheritance. Having been named as his father's representative in England in 1345 and again in 1346, Lionel was created earl of Ulster, and joined an expedition into France in 1355, but his chief energies were reserved for the affairs of Ireland. Appointed governor of that country, he landed at Dublin in 1361, and in November of the following year was created duke of Clarence, while his father made an abortive attempt to secure for him the crown of Scotland. His efforts to secure an effective authority over his Irish lands were only moderately successful; and after holding a parliament at Kilkenny, which asserted the claims of King Edward, in 1367, he threw up his task in disgust and returned to England. About this time a marriage was arranged between Clarence and Violante, daughter of Galeazzo Visconti, lord of Pavia (d. 1378); the enormous dowry which Galeazzo promised with his daughter being exaggerated by the rumour of the time. Journeying to fetch his bride, the duke was received in great state both in France and Italy, and was married to Violante at Milan in June 1368. Some months were then spent in festivities, during which Lionel was taken ill at Alba, where he died on the 7th of October 1368. His only child Philippa, a daughter by his first wife, married in 1368 Edmund Mortimer, 3rd earl of March (1351-1361), and through this union Clarence became the ancestor of Edward IV. The poet Chaucer was at one time a page in Lionel's household.

THOMAS, DUKE OF CLARENCE (c. 1388-1421), who was nominally lieutenant of Ireland from 1401 to 1413, and was in command of the English fleet in 1405, acted in opposition to his elder brother, afterwards King Henry V., and the Beauforts during the later part of the reign of Henry IV.; and was for a short time at the head of the government, leading an unsuccessful expedition into France in 1412. When Henry V., however, became king in 1413 no serious dissensions took place between the brothers, and as a member of the royal council Clarence took part in the preparations for the French war. He was with the English king at Harfleur, but not at Agincourt, and shared in the expedition of 1417 into Normandy, during which he led the assault on Caen, and distinguished himself as a soldier in other similar undertakings. When Henry V. returned to England in 1421, the duke remained in France as his lieutenant, and was killed at Beaugé whilst rashly attacking the French and their Scottish allies on the hills above the river. Henry left no legitimate issue, and the title again became extinct.

GEORGE, DUKE OF CLARENCE (1440-1478), younger son of Richard, duke of York, by his wife Cicely, daughter of Ralph Nevill, 1st earl of Westmorland, was born in Dublin on the 21st of October 1440. Soon after his elder brother became king as Edward IV. in March 1461, he was created duke of Clarence, and his youth was no bar to his appointment as lord-lieutenant of Ireland in the following year. Having been mentioned as a possible husband for Mary, daughter of Charles the Bold, afterwards duke of Burgundy, Clarence came under the influence of Richard Nevill, earl of Warwick, and in July 1469 was married at Calais to the earl's elder daughter Isabella. With his father-in-law he then acted in a disloyal manner towards the king. Both supported the rebels in the north of England, and when their treachery was discovered Clarence was deprived of his office as lord-lieutenant and fled to France. Returning to England with Warwick in September 1470, he witnessed the restoration of Henry VI., when the crown was settled upon himself in case the male line of Henry's family became extinct. The good understanding, however, between Warwick and his son-in-law was not lasting, and Clarence was soon secretly reconciled with Edward. The public reconciliation between the brothers took place when the king was besieging Warwick in Coventry, and Clarence then fought for the Yorkists at Barnet and Tewkesbury. On 4th April 1471 Clarence appears to have seized the whole of the vast estates of the earl, and in March 1472 was created by right of his wife earl of Warwick and Salisbury. He was consequently greatly disturbed when he heard that his younger brother Richard, duke of Gloucester, was seeking to marry Warwick's younger daughter Anne, and was claiming some part of Warwick's lands. A violent quarrel between the brothers ensued, but Clarence was unable to prevent Gloucester from marrying, and in 1474 the king interfered to settle the dispute, dividing the estates between his brothers. In 1477 Clarence was again a suitor for the hand of Mary, who had just become duchess of Burgundy. Edward objected to the match, and Clarence, jealous of Gloucester's influence, left the court. At length Edward was convinced that Clarence was aiming at his throne. The duke was taken from his house in London, and in 1478 the statute of Kilkenny was renewed. He had slain one of the king; had received oaths of allegiance to himself and his heirs; had prepared for a new rebellion; and was in short incorrigible. Both Houses of Parliament passed the bill of attainder, and the sentence of death which followed was carried out on the 17th or 18th of February 1478. It is uncertain what share Gloucester had in his brother's death; but soon after the event the rumour gained ground that Clarence had been drowned in a butt of malmsey wine. Two of the duke's children survived their father: Margaret, countess of Salisbury (1473-1541), and Edward, earl of Warwick (1475-1499), who passed the greater part of his life in prison and was beheaded in November 1499.

CLARENCE, EDWARD HYDE, 1ST EARL OF (1609-1674), English historian and statesman, son of Henry Hyde of Dinton, Wiltshire, a member of a family for some time established at Norbury, Cheshire, was born on the 18th of February 1609. He entered Magdalen Hall, Oxford, in 1622 (having been refused a demipension at Magdalen College), and graduated B.A. in 1626. Intended originally for holy orders, the death of two elder brothers made him his father's heir, and in 1625 he entered the Middle Temple. At the university his abilities were more conspicuous than his industry, and at the bar his time was devoted more to general reading and to the society of eminent scholars and writers than to the study of law treatises. This wandering from the beaten track, however, was not without its advantages. In later years Clarendon declared "next the immediate blessing and providence of God Almighty " that he " owed all the little he knew and the little good that was in him to the friendships and conversation . . . of the most excellent men in their several kinds that lived in that age." These included Ben Jonson, Selden, Waller, Hales, and especially Lord Falkland; and from their influence and the wide reading in which he indulged, he doubtless drew the solid learning and literary talent which afterwards distinguished him.

In 1629 he married his first wife, Anne, daughter of Sir George Ayliffe, who died six months afterwards; and secondly, in 1634, Frances, daughter of Sir Thomas Aylesbury, Master of Requests. In 1633 he was called to the bar, and obtained quickly a good position and practice. His marriages had gained for him influential friends, and in December 1634 he was made keeper of the wits and rolls of the common pleas; while his able conduct of the petition of the London merchants against Portland earned Laud's approval. He was returned to the Short Parliament

1 Life, i. 25.
in 1640 as member for Wooton Bassett. Respect and veneration for the law and constitution of England were already fundamental principles with Hyde, and the flagrant violations and perversions of the law which characterized the twelve preceding years of absolute rule drove him into the ranks of the popular party. He served on numerous and important committees, and his parliamentary action was directed chiefly towards the support and restoration of the law. He assailed the jurisdiction of the earl marshal's court, and in the Long Parliament, in which he sat for Saltash, renewed his attacks and practically effected its suppression. In 1641 he served on the committees for inquiring into the status of the councils of Wales and of the North, distinguished himself by a speech against the latter, and took an important part in the proceedings against the judges. He supported Strafford's impeachment, and did not vote against the attainder, subsequently making an unsuccessful attempt through Essex to avert the capital penalty.\(^1\) Hyde's allegiance, however, to the church of England was as staunch as his support of the law, and was soon to separate him from the popular faction. In February 1642 he opposed the reception of the London petition against episcopacy, and in May the project for unity of religion with the Scots, and the bill for the exclusive support of the clergy from secular office. He showed especial interest in his opposition to the Root and Branch Bill, and, though made chairman of the committee on the bill on the 11th of July in order to silence his opposition, he caused by his successful obstruction the failure of the measure. In consequence he was summoned to the king's presence, and encouraged in his attitude, and at the beginning of the second session was regarded as one of the king's ablest supporters in the Commons. He considered the claims put forward at this time by parliament as a violation and not as a guarantee of the law and constitution. He opposed the demand by the parliament to choose the king's ministers, and also the Grand Remonstrance, to which he wrote a reply published by the king.

He now definitely though not openly joined the royal cause, and refused office in January 1642 with Colepeper and Falkland in order to serve the king's interests more effectually. Charles undertook to do nothing in the Commons without their advice. Nevertheless a few days afterwards, without their knowledge and by the advice of Lord Digby, he attempted the arrest of the five members, a resort to force which reduced Hyde to despair, and which indeed seemed to show that things had gone too far for an appeal to the law. He persevered, nevertheless, in his legal policy, to which Charles after the failure of his project again returned, joined the king openly in June, and continued to compose the king's answers and declarations in which he appealed to the "known Laws of the land" against the arbitrary and illegal acts of a seditious majority in the parliament, his advice to the king being "to shelter himself wholly under the law... presuming that the king and the law together would have been strong enough for any encounter." Hyde's appeal had great influence, and gained for the king's cause half the nation. It by no means, however, met with universal support among the royalists, Hobbes jeering at Hyde's love for "mixed monarchy," and the courtiers expressing their disapproval of the "spirit of accommodation" which "wounded the regality." It was destined to failure owing principally to the invincible distrust of Charles created in the parliament leaders, and to the fact that Charles was simultaneously carrying on another and an inconsistent policy, listening to very different advisers, such as the queen and Digby, and resolving on measures (such as the attempt on Hull) without Hyde's knowledge or approval.

War, accordingly, in spite of his efforts, broke out. He was expelled the House of Commons on the 11th of August 1642, and was one of those excepted later from pardon. He showed great activity in collecting loans, was present at Edgehill, though not as a combatant, and followed the king to Oxford, residing at All Souls College from October 1642 till March 1645. On the 22nd of February he was made a privy councillor and knighted, and on the 3rd of March appointed chancellor of the exchequer. He was an influential member of the "Junto" which met every week to discuss business before it was laid before the council. His aim was to gain over some of the leading Parliamentarians by personal influence and personal considerations, and at the Universal Association in January 1645 where he acted as principal manager on the king's side, while remaining firm on the great political questions such as the church and the militia, he tried to win individuals by promises of places and honours. He promoted the assembly of the Oxford parliament in December 1643 as a counterpoise to the influence and status of the Long Parliament. Hyde's policy and measures, however, all failed. They had been weakly and irregularly supported by the king, and were fiercely opposed by the military party, who were jealous of the civil influence, and were urging Charles to trust to force and arms alone and eschew all compromise and concessions. Charles fell now under the influence of persons devoid of all legal and constitutional scruples, sending to Glamorgan in Ireland "those strange powers and instructions inexcusable to justice, piety and prudence.\(^2\) Hyde's influence was much diminished, and on the 4th of March 1646, the king left the king for Bristol as one of the guardians of the prince of Wales and governors of the royal household. He was appointed to mediate between the council and the army paralysed the proceedings, and lost, according to Hyde, the finest opportunity since the outbreak of the war of raising a strong force and gaining substantial victories in that part of the country. After Hopton's defeat on the 16th of February 1646, at Torrington, Hyde accompanied the prince, on the 4th of March, to Scilly, and on the 17th of April, for greater security, to Jersey. He strongly disapproved of the prince's removal to France by the queen's order and of the schemes of assistance from abroad, refused to accompany him, and signed a bond to prevent the sale of Jersey to the French supported by Jermyn. He opposed the projected sacrifice of the church to the Scots and the grant by the king of any but personal or temporary concessions, declaring that peace was only possible "upon the old foundations of government in church and state." He was especially averse to Charles's tampering with the Irish Romanists. "Oh, Mr Secretary," he wrote to Nicholas, "those stratagems have given me more sad hours than all the misfortunes in war which have befallen the king and look like the effects of God's anger towards us."\(^3\) He refused to compound for his own estate. While in Jersey he resided first at St Helier and afterwards at Elizabeth Castle with Sir George Carteret. He composed the first portion of his History kept and in touch with events by means of an enormous correspondence. In 1648 he published A Full answer to an infamous and traitorous Pamphlet... , a reply to the resolution of the parliament to present no more addresses to the king and a vindication of Charles. On the outbreak of the second Civil War Hyde left Jersey (26th of June 1648) to join the queen and prince at Paris. He landed at Dieppe, sailed from that port to Dunkirk, and thence followed the prince to the Thames, where Charles had met the fleet, but was captured and robbed by a privateer, and only joined the prince in September after the latter's return to the Hague. He strongly disapproved of the king's concessions at Newport. When the army broke off the treaty and brought Charles to trial he endeavoured to save his life, and after the execution drew up a letter to the several European sovereigns invoking their assistance to avenge it. Hyde strongly opposed Charles II.'s ignominious surrender to the Covenanters, the alliance with the Scots, and the Scottish expedition, desiring to accomplish whatever was possible there through Montrose and the royalists, and inclined rather to an attempt in Ireland. His advice was not followed, and he gladly accepted a mission with Cottington to Spain to obtain money from the Roman Catholic powers, and to arrange an alliance between Owen O'Neill and Ormonde for the recovery of Ireland, arriving at Madrid on the 26th of November 1649. The defeat, however, of Charles at Dunbar, and the confirmation of Cromwell's ascendency, influenced the Spanish government

against them, and they were ordered to leave in December 1650. Hyde arrived at Antwerp in January 1651, and in December rejoined Charles at Paris after the latter's escape from Worcester. He now became one of his chief advisers, accompanying him in his change of residence to Cologne in October 1654 and to Bruges in 1658, and was appointed lord chancellor on the 13th of January 1658. His influence was henceforth maintained in spite of the intrigues of both Romanists and Presbyterians, as well as the violent and openly displayed hostility of the queen, and was employed unremittingly in the endeavour to keep Charles faithful to the church and constitution, and in the prevention of unwise concessions and promises which might estrange the general body of the royalists. His advice to the king was to wait upon the turn of events; that all his activity was to consist of carefully avoiding to do anything that might do him hurt and to expect some blessed conjuncture." In 1656, during the war between England and Spain, Charles received offers of help from the latter power provided he could gain a port in England, but Hyde discouraged small isolated attempts. He expected much from Cromwell's death. The same year he made an alliance with the Levellers, and was informed of their plots to assassinate the protector, without apparently expressing any disapproval. He was well supplied with information from England, and guided the action of the royalists with great ability and wisdom during the interval between Cromwell's death and the Restoration, urged patience, and advocated the obstruction of a settlement between the factions contending for power and the fomentation of their jealousies, rather than premature designs.

The Restoration was a complete triumph for Hyde's policy. He lays no stress on his own great part in it, but it was owing to him that the Restoration was a national one, by the consent and invitation of parliament representing the whole people and not through the medium of one powerful faction enforcing its will upon a minority, and that it was not only a restoration of Charles but a restoration of the monarchy. By Hyde's advice concessions to the inconvenient demands of special factions had been avoided by referring the decision to a "free parliament," and the declaration of Breda reserved for parliament the settlement of the questions of amnesty, religious toleration and the proprietorship of forfeited lands.

Hyde entered London with the king, all attempts at effecting his fall having failed, and immediately obtained the chief place in the Restoration, retaining the chancellorship of the exchequer till the 13th of May 1660, when he surrendered it to Lord Ashley. He took his seat as speaker of the House of Lords and in the court of chancery on the 1st of June 1660. On the 3rd of November 1660 he was made Baron Hyde of Hindon, and on the 20th of April 1661 Viscount Comberly and earl of Clarendon, receiving a grant from the king of £20,000 and at different times of various small estates and Irish rents. The marriage of his daughter Anne to James, duke of York, celebrated in secret in September 1660, at first alarmed Clarendon on account of the public hostility he expected thereby to incur, but finding his fears unfounded he acquiesced in its public recognition in December, and thus became related in a special manner to the royal family and the grandfather of two English sovereigns.

Clarendon's position was one of great difficulties, but at the same time of splendid opportunities. In particular a rare occasion now offered itself of settling the religious question on a broad principle of comprehension or toleration; for the monarchy had been restored not by the supporters of the church alone but largely by the influence and aid of the nonconformists and also of the Roman Catholics, who were all united at that happy moment by a common loyalty to the throne. Clarendon appears to have approved of comprehension but not of toleration. He had already in April 1660 sent to discuss terms with the leading Presbyterians in England, and after the Restoration offered bishops to several, including Richard Baxter. He drew up the royal declaration of October, promising limited episcopacy and a revised prayer-book and ritual, which was subsequently thrown out by parliament, and he appears to have anticipated some kind of settlement from the Savoy Conference which sat in April 1661. The failure of the latter proved perhaps that the differences were too great for compromise, and widened the breach. The parliament immediately proceeded to pass the series of narrow and tyrannical measures against the dissenters known as the Clarendon Code. The Corporations Act, obliging members of corporations to denounce the Covenant and take the sacrament according to the Anglican usage, became law on the 20th of December 1661, the Act of Uniformity enforcing the use of the prayer-book on ministers, as well as a declaration that it was unlawful to bear arms against the sovereign, on the 19th of May 1662, and these were followed by the Conventicle Act in 1664 suppressing conventicles and by the Five-Mile Act in 1665 forbidding ministers who had refused subscription to the Act of Uniformity to teach or reside within 5 miles of a borough. Clarendon appears to have reluctantly acquiesced in these civil measures rather than to have originated them, and to have endeavoured to mitigate their injustice and severity. He supported the continuance of the tenure by presbyterian ministers of livings not held by Anglicans and an amendment in the Lords allowing a pension to those deprived, earning the good name of Baxter and the nonconformists. On the 17th of March 1662 he introduced into parliament a declaration enabling the king to dispense with the Act of Uniformity in the case of ministers of merit. But once committed to the narrow policy of intolerance, Clarendon was inevitably involved in all its consequences. His characteristic respect for the law and constitution rendered him hostile to the general policy of indulgence, which, though the favourite project of the king, he strongly opposed in the Lords, and in the end caused its withdrawal. He declared that he could have wished the law otherwise, but when it was passed, he thought it absolutely necessary to see obedience paid to it without any connivance. Charles was greatly angered. It was believed in May 1663 that the intrigues of Bennet and Buckingham, who seized the opportunity of ingratiating themselves with the king by zealously supporting the indulgence, had secured Clarendon's dismissal, and in July Bristol ventured to accuse him of high treason in the parliament; but the attack, which did not receive the king's support, failed entirely and only ended in the banishment from court of its promoter. Clarendon's opposition to the court policy in this way acquired a personal character, and he was compelled to identify himself more completely with the intolerant measures of the House of Commons. Though not the originator of the Conventicle Act or of the Five-Mile Act, he has recorded his approval, and he ended by taking alarm at plots and rumours and by regarding the great party of nonconformists, through whose co-operation the monarchy had been restored, as a danger to the state whose "faction was their religion."

Meanwhile Clarendon's influence and direction had been predominant in nearly all departments of state. He supported the exception of the actual regicides from the Indemnity, but only ten out of the twenty-six condemned were executed, and Clarendon, with the king's support, prevented the passing of a bill in 1661 for the execution of thirteen more. He upheld the Act of Indemnity against all the attempts of the royalists to upset it. The conflicting claims to estates were left to be decided by the law. The confiscations of the usurping government accordingly were cancelled, while the properly executed transactions

4. Anne Hyde (1637-1671), eldest daughter of the chancellor, was the mother by James of Queen Mary and Queen Anne, besides six other children, including four sons who all died in infancy. She became a Roman Catholic in 1670 shortly before her death, and was buried in the vault of Mary, queen of Scots, in Henry VII's chapel in Westminster Abbey.
5. See Hist. MSS. Comm.: Various Collections, ii. 118, and MSS. of Duke of Somerset, 94.
between individuals were necessarily upheld. There can be little doubt that the principle followed was the only safe one in the prevailing confusion. Great injustice was indeed suffered by individuals, but the proper remedy of such injustice was the benevolence of the king, which there is too much reason to believe proved inadequate and partial. The settlement of the church lands which was directed by Clarendon presented equal difficulties and involved equal hardships. In settling Scotland Clarendon's aim was to make that kingdom dependent upon England and to uphold the Cromwellian union. He proposed to establish a council at Whitehall to govern Scottish affairs, and showed great zeal in endeavouring to restore episcopacy through the medium of Archbishop Sharp. His influence, however, ended with the ascendency of Lauderdale in 1663. He was, to some extent at least, responsible for the settlement in Ireland, but, while anxious for an establishment upon a solid Protestant basis, urged "temper and moderation and justice" in securing it. He supported Ormonde's wise and enlightened Irish administration, and in particular opposed persistently the prohibition of the import of Irish cattle into England, incurring thereby great unpopularity. He showed great anxiety as to the settlement of the Irish clergy, and allowed them the freedom of religion. He was a member of the council for foreign plantations, and one of the eight lords proprietors of Carolina in 1663; and in 1664 sent a commission to settle disputes in New England. In the department of foreign affairs he had less influence. His policy was limited to the maintenance of peace "necessary for the reducing [the king's] own dominions into that temper of subjection and obedience as they ought to be in." In 1664 he demanded, on behalf of Charles, French support, and a loan of £50,000 against disturbance at home, and thus initiated that ignominious system of pensions and dependence upon France which proved so injurious to English interests later. But he was the promoter neither of the sale of Dunkirk on the 27th of October 1663, the author of which seems to have been the earl of Sandwich, nor of the Dutch War. He attached considerable value to the possession of the former, but when its sale was decided he conducted the negotiations and effected the bargain. He had zealously laboured for peace with Holland, and had concluded a treaty for the settlement of disputes on the 4th of September 1662. Commercial and naval jealousies, however, soon involved the two states in hostilities. Cape Corso and other Dutch possessions on the coast of Africa, and New Amsterdam in America, were seized by squadrons from the royal navy in 1664, and hostilities were declared on the 22nd of February 1665. Clarendon now gave his support to the war, asserted the extreme claims of the English crown over the British seas, and contemplated fresh cessions from the Dutch and an alliance with Sweden and Spain. According to his own account he initiated the policy of the Triple Alliance, but it seems clear that his inclination towards France continued in spite of the intervention of the latter state in favour of Holland; and he took part in the negotiations for ending the war by an undertaking with Louis XIV. implying in a neutrality with the last two powers and colonies. The crisis in this feebly foreign policy and in the general official mismanagement was reached in June 1667, when the Dutch burnt several ships at Chatham and when "the roar of foreign guns were heard for the first and last time by the citizens of London."74

The whole responsibility for the national calamity and disgrace, and for the ignominious peace which followed it, was unjustly thrown on the shoulders of Clarendon, though it must be admitted that the disjointed state of the administration and want of control over foreign policy were largely the causes of the disaster, and for these Clarendon's influence and obstruction of official reforms were to some extent answerable. According to Sir William Coventry, whose opinion has weight and who acknowledges the chancellor's fidelity to the king, while Clarendon "was so great at the council board and in the administration of matters, there was no room for anybody to propose any remedy to what was remiss . . . . he managing all things with that greatness which will now be removed." He disapproved of the system of boards and committees instituted during the Commonwealth, as giving too much power to the parliament, and regarded the administration by the great officers of state, to the exclusion of pure men of business, as the only method compatible with the dignity and security of the monarchy. The lowering of the prestige of the privy council, and its subordination first to the parliament and afterwards to the military faction, he considered as one of the chief causes of the fall of Charles I. He aroused a strong feeling of hostility in the Commons by his opposition to the appropriation of supplies in 1665, and to the audit of the war accounts in 1666, as "an introduction to a commonwealth" and as "a new encroachment," and by his high tone of prerogative and authority, while by his advice to Charles to prorogue parliament he incurred their resentment and gave colour to the accusation that he had advised the king to govern without parliaments. He was unpopular among all classes, among the royalists on account of the Act of Indemnity, among the Presbyterians because of the Act of Uniformity. It was said that he had invented the maxim that "the king should buy and reward his enemies and do little for his friends, because they are his already." Every kind of maladministration was currently ascribed to him, of designs to govern by a standing army, and of corruption. He was credited with having married Charles purposely to a barren queen in order to raise his own grandchildren to the throne, with having sold Dunkirk to France, and his magnificent house in St James's was nicknamed "Dunkirk House," while on the day of the Dutch attack on Chatham the mob set up a gibbet at his gate and broke his windows. He had always been exceedingly unpopular at court, and kept severely aloof from the revels and licence which reigned there. Evelyn names the buffoons and the maids to whom he was an eyesore. He was intensely disliked by the royal mistresses, whose favour he did not condescend to seek, and whose presence and influence were often the subject of his reproaches. A party of younger men of the king's own age, more congenial to his temperament, and eager to drive the old chancellor from power and to succeed him in office, had for some time been endeavouring to undermine his influence by ridicule and intrigue. Surrounded by such general and violent animosity, Clarendon's only hope could be in the support of the king. But the chancellor had early and accurately gauged the nature and extent of the king's attachment to him, which proceeded neither from affection nor gratitude but "from his aversion to be troubled with the intricacies of his affairs," and in 1661 he had resisted the importunities of Ormonde to resign the great seal for the lord treasurership with the rank of "first minister," "a title newly translated out of French into English," on account of the obloquy this position would incur and the further dependence which it entailed upon the inconstant king. Charles, long weary of the old chancellor's rebukes, was especially incensed at this time owing to his failure in securing Francis Stuart (the Earl of Bute) (Stuart) for his service and disappointment which he attributed to Clarendon, and was now alarmed by the hostility which his administration had excited. He did not scruple to sacrifice at once the old adherent of his house and fortunes. "The truth is," he wrote Ormonde, "his behaviour and humour was grown so inapplicable to myself and all the world else that I could no longer endure it, and it was impossible for me to live with it and do these things with the Parliament that must be done, or the government will be lost." By the direction of Charles, James advised Clarendon to resign before the meeting of parliament, but in an interview with the king on the 20th of August Clarendon refused to deliver up the seal unless dismissed, and urged him not to take a step ruinous to the interests both of the chancellor

himself and of the crown. He could not believe his dismissal was really intended, but on the 30th of August he was deprived of the great seal, for which the king received the thanks of the parliament on the 16th of October. On the 12th of November his imprisonment, consisting of various charges of arbitrary government, corruption and maladministration, was brought up to the Lords, but the latter refused to order his committal, on the ground that the Commons had only accused him of treason in general without specifying any particular charge. Clarendon wrote humbly to the king asking for pardon, and that the prosecution might be prevented, but Charles had openly taken part against him, and, though desiring his escape, would not order or assist his departure for fear of the Commons. Through the bishop of Hereford, however, on the 29th of November a personal interview between Clarendon and the king was promised; though not during his absence suffer in his honour or fortune. Clarendon embarked the same night for Calais, where he arrived on the 2nd of December. The Lords immediately passed an act for his banishment and ordered the petition forwarded by him to parliament to be burnt.

The rest of Clarendon's life was passed in exile. He left Calais for Rouen on the 25th of December, returning on the 21st of January 1668, visiting the baths of Bourbon in April, thence to Avignon in June, residing from July 1668 till June 1671 at Montpellier, whence he proceeded to Moulins and to Rouen again in May 1674. His sudden banishment entailed great personal hardships. His health at the time of his flight was much impaired, and on arriving at Calais he fell dangerously ill; and Louis XIV., anxious at this time to gain popularity in England, sent him peremptory and repeated orders to quit France. He suffered severely from gout, and during the greater part of his exile could not walk without the aid of two men. At Evreux, on the 23rd of April 1668, he was the victim of a murderous assault by English sailors, who attributed to him the non-payment of their wages, and who were on the point of despatching him when he was rescued by the guard. For some time he was not allowed to see any of his children; even correspondence with him was rendered treasonable by the Act of Banishment; and it was not apparently till 1671, 1673 and 1674 that he received visits from his sons, the younger, Lawrence Hyde, being present with him at his death.

Clarendon bore his troubles with great dignity and fortitude. He found consolation in religious duties, and devoted a portion of every day to the composition of his Contemplations on the Psalms, and of his moral essays. Removed effectually from the public scene, and from all share in public politics, turned his attention once more to the past and finished his History and his Autobiography. Soon after reaching Calais he had written, on the 17th of December 1667, to the university of Oxford, desiring as his last request that the university should believe in his innocence and remember him, though there could be no further mention of him in their public devotions, in their private prayers. In 1668 he wrote to the duke and duchess of York to remonstrate on the report that they had turned Roman Catholic, to the former urging “You cannot be without zeal for the Church to which your blessed father made himself a sacrifice,” adding that such a change would bring a great storm against the Romanists. He entertained to the last hopes of obtaining leave to return to England. He asked for permission in June 1671 and in August 1674. In the dedication of his Brief View of Mr Hobbes's Book Leviathan he repeats “the hope which sustains my weak, decayed spirits that your Majesty will at some time call to your remembrance my long and incorruptible fidelity to your person and your service”; but his petitions were not even answered or noticed. He died at Rouen on the 9th of December 1674. He was buried in Westminster Abbey at the foot of the steps at the entrance to Henry VII.'s chapel. He left two sons, Henry, 2nd earl of Clarendon, and Lawrence, earl of Rochester, his daughter Anne, duchess of York, and a third son, Edward, having predeceased him. His male descendants became extinct on the death of the 4th earl of Clarendon and 2nd earl of Rochester in 1753, the title of Clarendon being revived in 1776 in the person of Thomas Villiers, who had married the granddaughter and heir of the last earl.

As a statesman Clarendon had obvious limitations and failings. He brought to the consideration of political questions an essentially legal but also a narrow mind, conceiving the law, “that great and admirable mystery,” and the constitution as fixed, unchangeable and sufficient for all time, in contrast to Pym, who regarded them as living organisms capable of continual development and evolution; and he was incapable of comprehending and governing the new conditions and forces created by the civil wars. His character, however, and therefore to some extent his career, bear the indelible marks of greatness. He left the popular cause at the moment of its triumph and the Protestant party in France. He refused to act degraded by licence and self-indulgence, he maintained his self-respect and personal dignity regardless of consequences, and in an age of almost universal corruption and self-seeking he preserved a noble integrity and patriotism. At the Restoration he showed great moderation in accepting rewards. He refused a grant of 10,000 acres in the Fens from the king on the ground that it would create an evil precedent, and amused Charles and James by his indignation at the offer of a present of £10,000 from the French minister Fouquet, the only present he accepted from Louis XIV. being a set of books printed at the Louvre. His income, however, as lord chancellor was very large, and Clarendon maintained considerable state, considering it due to the dignity of the monarchy that the high officers should carry the external marks of greatness. The house built by him in St James's was one of the most magnificent ever seen in England, and was filled with a collection of portraits, chiefly those of contemporaries, statesmen and men of letters. It cost Clarendon £50,000, involved him deeply in debt and was considered one of the chief causes of the "gust of envy" that caused his fall. He is described as “a fair, ruddy, fat, middle-statured, handsome man,” and his appearance was stately and dignified. He expected deference from his inferiors, and one of the chief charges which he brought against the party of the young politicians was the want of respect with which they treated himself and the lord treasurer. His industry and devotion to public business, of which proofs still remain in the enormous mass of his state papers and correspondence, were exemplary, and were rendered all the more conspicuous by the negligence, inferiority in business, and frivolity of his successors. As lord chancellor Clarendon made no great impression in the court of chancery. His early legal training had long been interrupted, and his political preoccupations probably rendered necessary the delegation of many of his judicial duties to others. According to Speaker Onslow his decrees were always made with the aid of two judges. Burnet praises him, however, as “a very good chancellor, only a little too rough but very impartial in the administration of justice,” and Pepys, who saw him presiding in his court, perceived him to be “a most able and ready man.”

According to Evelyn, “though no considerable lawyer” he was “one who kept up the fame and substance of things in the nation with . . . solemnity.” He made good appointments to the bench and issued some important orders for the reform of abuses in his court. As chancellor of Oxford University, to which office he was elected on the 27th of October 1666, Clarendon promoted the restoration of order and various educational reforms. In 1753 his manuscripts were left to the university by his great-grandson Lord Cornbury, and in 1668 the money gained by publication was spent in erecting the Clarendon Laboratory, the profits of the History having provided in 1713 a building for the university press adjoining the Sheldonian theatre, known since the removal of the press to its present quarters as the Clarendon Building.

Clarendon had risen to high office largely through his literary and oratorical gifts. His eloquence was greatly admired by

Evelyn and Pepys, though Burnet criticises it as too copious. He was a great lover of books and collected a large library, was well read in the Roman and in the contemporary histories both foreign and English, and could appreciate Carew, Ben Jonson, and Cowley. As a writer and historian Clarendon occupies a high place in English literature. His great work, the *History of the Rebellion*, is composed in the grand style. A characteristic feature is the wonderful series of well-known portraits, drawn with great skill and liveliness and especially praised by Evelyn and by Macaulay. The long digressions, the lengthy sentences, and the numerous parentheticals do not accord with modern taste and usage, but it may be observed that these often follow more closely the natural involutions of the thought, and express the argument more clearly, than the short disconnected sentences now generally employed, while in rhythm and dignity Clarendon's style is immeasurably superior. The composition, however, of the work as a whole is totally wanting in proportion, and the book is overloaded with state papers, misplaced and tedious in the narrative. In considering the accuracy of the history it is important to remember the dates and circumstances of the composition of its various portions. The published *History* is mainly a compilation of two separate original manuscripts, the first being the history proper, written between 1646 and 1648, with the advantage of a fresh memory and the help of various documents and authorities, and ending in March 1644, and the second being the *Life*, extending from 1609 to 1666, but composed long afterwards in exile and without the aid of papers between 1668 and 1670. The value of any statement, therefore, in the published *History* depends chiefly on whether it is taken from the *History proper* or the *Life*. In 1671 these two manuscripts were united by Clarendon with certain alterations and modifications making Books i.-vii. of the published *History*, while Books viii.-xv. were written subsequently, and, being composed for the most part without materials, are generally inaccurate, with the notable exception of Book ix., made up from two narratives written at Jersey in 1648, and containing very little from the *Life*. Sincerity, however, is the great defect of the parts of the *History*. The inaccuracies are due not to wilful misrepresentation, but to failure of memory and to the disadvantages under which the author laboured in exile. But they lessen considerably the value of his work, and detract from his reputation as chronicler of contemporary events, for which he was specially fitted by his practical experience in public business, a qualification declared by himself to be the "genius, spirit and soul of an historian." In general, Clarendon, like many of his contemporaries, failed signally to comprehend the real issues and principles at stake in the great struggle, laying far too much stress on personalities and never understanding the real aims and motives of the Presbyterian party. The work was first published in 1702-1704 from a copy of a transcript made by Clarendon's secretary, with a few unimportant alterations, and was the object of a violent attack by John Oldmixon for supposed changes and omissions in Clarendon and Whitelocke compared (1727) and again in a preface to his *History of England* (1730), repelled and refuted by John Burton in the *Genuineness of Lord Clarendon's History Vindicated* (1744). The history was first published from the original in 1826; the best edition being that of 1888 edited by W. D. Macray and issued by the Clarendon Press. The *Lord Clarendon's History . . . Compeletated*, a supplement containing portraits and illustrative papers, was published in 1717, and *An Appendix to the History*, containing a life, speeches and various pieces, in 1724. *The Sutherland Clarendon* in the Bodleian library at Oxford contains several thousand portraits and illustrations of the *History, The Life of Edward, earl of Clarendon . . . [and the] Continuation of the History . . .*, the first consisting of that portion of the Life not included in the *History*, and the second of the account of Clarendon's administration and exile in France, begun in 1672, was published in 1730, the *History of the Reign of King Charles II. from the Restoration . . .* published about 1755, being a suppertitious edition of this work, of which the latest and best edition is that of the Clarendon Press of 1857.

Clarendon was also the author of the *Difference and Disparity between the Estate and Condition of George, duke of Buckingham and Robert, earl of Essex*, a youthful production vindicating Buckingham, printed in *Reliquiae Wottonianae* (1672), i. 184; *Aimadogensis.* On a speculative Fanaticism (1674); *A Brief View of the dangerous errors in Mr. Hobbes's book entitled "Leviathan" (1676); *The History of the Rebellion and Civil War in Ireland* (1719); *A Collection of Several Pieces of Edward, earl of Clarendon*, containing reprints of speeches from the journals of the House of Lords and of the History of the Rebellion in Ireland (1727); *A Collection of Several Tracts containing his Vindication in answer to his impeachment, Reflections upon several Christian Duties, Two Dialogues on Education and on the want of Respect due to age, and Contemplations on the Psalms* (1727); *Religion and Policy* (1811); *Essays moral and entertaining on the various faculties and passions of the human mind* (1815, and in British Prose Writers, 1819, vol. i.); *Speeches in Rushworth's Collections* (1692), pt. iii. vol. i. 320, 333; *Declarations and Manifests* (Clarendon being the author of nearly all on the king's side between March 1642 and March 1645, the first being the answer to the Grand Remonstrance in January 1642, but not of the answer to the XIX. Propositions or the apology for the King's attack upon Brentford) in the published *History, Rushworth's Collections*, E. Husband's *Collections of Ordinances and Declarations* (1646), *Old Parliamentary History* (1751-1762), *Somers Tracts*, State Tracts, Harleian Miscellanies, *Thomasson Tracts* (Brit. Mus.), E. 157 (14); and a large number of anonymous pamphlets aimed against the parliament, including *Transcendent and Multiplieed Rebellion and Treason* (1645), *A Letter from a True and Lawful Member of Parliament . . . to one of the Lords of his Highness's Council (1656), and Two Speeches made in the House of Peers on Monday 19th Dec. [1642] . . . (Somers Tracts, Scott, vi. 570); *Second Thoughts* (n.d., in favour of a limited toleration) is ascribed to him in the Catalogue in the British Museum; *A Letter . . . to one of the Chief Ministers of the Nonconforming Party . . .* (Samur, 7th May 1674) has been attributed to him by Sir Henry Stuteville.

Clarendon's correspondence amounting to over 100 volumes, is in the Bodleian library at Oxford, and other letters are to be found in Additional MSS, in the British Museum. Selections have been published under the title of *State Papers Collected by Edward, earl of Clarendon* (Clarendon State Papers) between 1767 and 1786, and the collection has been calendared up to 1657 in 1869, 1872, 1876. Other letters of Clarendon are to be found in Lister's *Life of Clarendon*, iii.; *Nicholas Papers* (Camed Soc., 1886); *Diary of J. Evelyn, appendix*; Sir R. Fanshaw's *Original Letters* (1724); *Warburton's Life of Prince Rupert* (1849); *Barwick's Life of Barwick* (1724); *Hist. MSS. Comm. 10th Rep. pt. vi. pp. 193-216, and in the Harleian Miscellanies.

**Bibliography.**—Clarendon's autobiographical works and Letters enumerated above, and the MS, Collection in the Bodleian Library. The Lives of Clarendon by T. H. Lister (1838), and by C. H. Firth in the *Dict. of Nat. Biography* (with authorities there collected), completely supersede all earlier accounts including that in *Lives of All the Lord Chancellors* (1708), in Macaulay's *Lives of British Statesmen* (1807), and in the different Lives by Wood in *Athenae Oxonienses* (Bliss), iii. 1018; while those in J. H. Brown's *Lives of the Prime Ministers of England* (1858), in *Lodge's Portraits*, in *Lady Masham's Letters*, in *The Gentleman's Magazine*, in *The British Magazine* (1745), in *Foss's Judges*, supply no further information. In *Historical Inquiries respecting the Character of Edward Hyde, earl of Clarendon*, various charges against Clarendon were collected by G. A. Ellis (1827) and E. W. S. Cornell, with an edition by J. H. Brown by *Clarendon's Contemporaries of the Lord Clarendon* (1852), i. preface pt. i. For criticisms of the *History* see Gardiner's *Civil Wars* (1893), iii. 121; *Ranke's Hist. of England*, vi. 3-19; Die Politik Karls des Ersten, c. 1561-1583, Das Fürstenleben, dt. von C. G. Schütz (1863); *The Best of the Best* in the *Dict. of Nat. Biog*. by C. H. Firth, and especially a series of admirable articles by the same author in the *Eng. Hist. Review* (1904). CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS

4TH EARL OF (in the Villiers line) (1800–1879), English diplomatist and statesman, was born in London on the 12th of January 1800. He was the eldest son of Hon. George Villiers (1759–1827), youngest son of the 1st earl of Clarendon (second creation), by Theresa, only daughter of the first Lord Boringdon, and granddaughter of the first Lord Grantham. The earldom of the lord chancellor Clarendon became extinct in the Hyde line by the death of the 4th earl, his last male descendant. Jane Hyde, countess of Essex, the sister of that nobleman (she died in 1724), left two daughters; of these the eldest, Lady Charlotte, became heiress of the Hyde family. She married Thomas Villiers (1709–1786), second son of the 2nd earl of Jersey, who served with distinction as English minister in Germany, and in 1776 the earldom of Clarendon was revived in his favour. The connexion with the Hyde family made him at first a somewhat remote. But a portion of the pictures and plate of the great chancellor was preserved to this branch of the family, and remains at The Grove, their family seat at Hertfordshire. The 2nd and 3rd ears were sons of the 1st, and, neither of them having sons, the title passed, on the death of the 3rd earl (John Charles) in 1838, to their younger brother’s son.

Young George Villiers entered upon life in circumstances which gave small promise of the brilliancy of his future career. He was well born; he was heir presumptive to an earldom; and his mother was a woman of great energy, admirable good sense, and high feeling. But the means of his family were contracted; his education was desultory and incomplete; he had not the advantages of a training either at a public school or in the House of Commons. He went up to Cambridge at the early age of sixteen, and entered St John’s College on the 20th of June 1816. In 1820, as the eldest son of an earl’s brother with royal descent, he was enabled to take his M.A. degree under the statutes of the university then in force. In the same year he was appointed attaché to the British embassy at St Petersburg, where he remained three years, and gained that practical knowledge of diplomacy which was of so much use to him in after-life. He had received from nature a singularly handsome person, a polished and engaging address, a ready command of languages, and a remarkable power of composition.

Upon his return to England in 1823 he was appointed to a commissionership of customs, an office which he retained for about ten years. In 1831 he was despatched to France to negotiate a commercial treaty, which, however, led to no result. On the 16th of August 1833 he was appointed minister at the court of Spain. Ferdinand VII died within a month of his arrival at Madrid, on 29th September 1833, and the Infanta Isabella, then in the third year of her age, was placed by the old Spanish law of female inheritance on her contested throne. Don Carlos, the late king’s brother, claimed the crown by virtue of the Salic law of the House of Bourbon which Ferdinand had renounced before the birth of his daughter. Isabella II. and her mother Christina, the queen regent, became the representatives of constitutional monarchy, Don Carlos of Catholic absolutism. The conflict which had divided the despotic and the constitutional powers of Europe since the French Revolution of 1830 broke out into civil war in Spain, and by the Quadruple Treaty, signed on the 22nd of April 1834, France and England pledged themselves to the defence of the constitutional thrones of Spain and Portugal. For six years Villiers continued to give the most active and intelligent support to the Liberal government of Spain. He was accused, though unjustly, of having favoured the revolution of La Granja, which drove Christina, the queen mother, out of the kingdom, and raised Espartero to the regency. He undoubtedly supported the chiefs of the Liberal party, such as Espartero, against the intrigues of the French court; but the object of the British government was to establish the throne of Isabella on a truly national and liberal basis and to avert those complications, dictated by foreign influence, which eventually proved so fatal to that princess. Villiers received the grand cross of the Bath in 1836 in acknowledgment of his services, and succeeded, on the death of his uncle, to the title of earl of Clarendon; in the following year, having left Madrid, he married Katharine, eldest daughter of James Walter, first earl of Verulam.

In January 1840 he entered Lord Melbourne’s administration as lord privy seal, and from the death of Lord Holland in the autumn of that year Lord Clarendon also held the office of chancellor of the duchy of Lancaster until the dissolution of the ministry in 1841. Deeply convinced that the maintenance of a cordial understanding with France was the most essential condition of peace and of a liberal policy in Europe, he reluctantly concurred in the measures proposed by Lord Palmerston for the expulsion of the pasha of Egypt from Syria; he strenuously advocated, with Lord Holland, a more conciliatory policy towards France; and he was only restrained from sending in his resignation by the dislike he felt to break up a cabinet he had long served as a member.

The interval of Sir Robert Peel’s great administration (1841–1846) was to the leaders of the Whig party a period of repose; but Lord Clarendon took the warmest interest in the triumph of the principles of free trade and in the repeal of the corn-laws, of which his brother, Charles Pelham Villiers (q.v.), had been one of the earliest champions. For this reason, upon the formation of Lord John Russell’s first administration, Lord Clarendon accepted the office of president of the Board of Trade. Twice in his career the governor-generalship of India was offered him, and once the governor-generalship of Canada;—these he refused from reluctance to withdraw from the politics of Europe. But in 1847 a sense of duty compelled him to take a far more laborious and uncongenial appointment. The desire of the cabinet was to abolish the lord-lieutenancy of Ireland, and Lord Clarendon was prevailed upon to accept that office, with a view to transform it ere long into an Irish secretariat of state. But he had not been many months in Dublin before he acknowledged that the difficulties then existing in Ireland could only be met by the most vigilant and energetic authority, exercised on the spot. The crisis was one of extraordinary peril. Agrarian crimes of horrible atrocity had increased threefold. The Catholic clergy were openly disaffected. This was the second year of the Irish famine, and extraordinary measures were required to regulate the bounty of the government and the nation. In 1848 the revolution in France let loose fresh elements of discord, which culminated in an abortive insurrection, and for a lengthened period Ireland was a prey to more than her wonted symptoms of disaffection and disorder. Lord Clarendon remained viceroy of Ireland till 1852, and left behind him permanent marks of improvement. His services were expressly acknowledged in the queen’s speech to both Houses of Parliament on the 5th of September 1853, when the most signal services of Lord Clarendon were obtained that honour; and he was made a knight of the Garter (retaining also the grand cross of the Bath by special order) on the 23rd of March 1849.

Upon the formation of the coalition ministry between the Whigs and the Peelites, in 1853, under Lord Aberdeen, Lord Clarendon became foreign minister. The country was already “drifting” into the Crimean War, an expression of his own which was never forgotten. Clarendon was not responsible for the policy which brought war about; but when it occurred he employed every means in his power to stimulate and assist the war departments, and above all he maintained the closest relations with the French. The tsar Nicholas had speculated on the impossibility of the sustained joint action of France and England in council and in the field. It was mainly by Lord Clarendon atWhitehall and by Lord Raglan before Sevastopol.
that such a combination was rendered practicable, and did eventually triumph over the enemy. The diplomatic conduct of such an alliance for three years between two great nations jealous of their military honour and fighting for no separate political advantage, tried by excessive hardships and at moments on the verge of defeat, was certainly one of the most arduous duties ever performed by a minister. The result was due in the main to the confidence with which Lord Clarendon had inspired the emperor of the French, and to the affection and regard of the empress, whom he had known in Spain from her childhood.

In 1856 Lord Clarendon took his seat at the congress of Paris convoked for the restoration of peace, as first British pleni-
potentiary. It was the first time since the appearance of Lord Castlereagh at Vienna that a secretary of state for foreign affairs had been present in person at a congress on the continent. Lord Clarendon’s first care was to obtain the admission of Italy to the council chamber as a belligerent power, and to raise the barrier which still excluded Prussia as a neutral one. But in the general anxiety of all the powers to terminate the war there was no small danger that the objects for which it had been undertaken would be abandoned or forgotten. It is due entirely to the firmness of Lord Clarendon that the principle of the Congress was not checked by the difficulty, and he secured that the Russian attempt to trick the allies out of the cession in Bessarabia was defeated, and that the results of the war were for a time secured. The congress was eager to turn to other subjects, and perhaps the most important result of its deliberations was the celebrated Declaration of the Maritime Powers, which abolished privateering, defined the right of blockade, and limited the right of capture to enemy’s property in enemy’s ships. Lord Clarendon has been accused of an abandonment of what are termed the belligerent rights of Great Britain, which were undoubtedly based on the old maritime laws of Europe. But he acted in strict conformity with the views of the British cabinet, and the British cabinet adopted those views because it was satisfied that it was not for the benefit of the country to adhere to practices which exposed the vast mercantile interests of Britain to depredation, even by the cruisers of a secondary maritime power, and which, if vigorously enforced against neutrals, could not fail to embroil her with every maritime state in the world.

Upon the reconstitution of the Whig administration in 1859, Lord John Russell made it a condition of his acceptance of office under Lord Palmerston that the foreign department should be placed in his own hands, which implied that Lord Clarendon should be excluded from office, as it would have been inconsistent alike with his dignity and his tastes to fill any other post in the government. The consequence was that from 1859 till 1864 Lord Clarendon remained out of office, and the critical relations arising out of the Civil War in the United States were left to the guidance of Earl Russell. But he re-entered the cabinet in May 1864 as chancellor of the duchy of Lancaster; and upon the death of Lord Palmerston in 1865, Lord Russell again became prime minister, when Lord Clarendon returned to the foreign office, which was again confided to him for the third time upon the formation of Mr Gladstone’s administration in 1868. To the last moment of his existence, Lord Clarendon continued to devote every faculty of his mind and every instant of his life to the public service; and he expired surrounded by the boxes and papers of his office on the 27th of June 1870. No man owed more to the influence of a generous, unselfish and liberal disposition. If he had rivals he never ceased to treat them with the consideration and confidence of friends, and he cared but little for the ordinary prizes of ambition in comparison with the advancement of the cause of peace and progress.

He was succeeded as 3rd earl by his eldest son, EDWARD HYDE VILLIERS (b. 1846), who became lord chamberlain in 1900.

CLARENDRON, HENRY HYDE, 2nd Earl of (1638-1769). English statesman, eldest son of the first earl, was born on the 2nd of June 1638. He accompanied his parents into exile and assisted his father, 2nd Earl of CLARENDRON, in 1660. He was returned to parliament for Wiltshire as Lord Cornbury. He became secretary in 1662 and lord chamberlain to the queen in 1665. He took no part in the life of the court, and on the dismissal of his father became a vehement opponent of the administration, defended his father in the impeachment, and subsequently made effective attacks upon Buckingham and Arlington. In 1671 he was appointed by his father’s death, and in 1679 was made a privy councillor. He was not included in Sir W. Temple’s council of that year, but was reappointed in 1680. In 1682 he supported Halifax’s proposal of declaring war on France. On the accession of James in 1685 he was appointed lord privy seal, but shortly afterwards, in September, was removed from this office to that of lord-lieutenant of Ireland. Clarendon was embarrassed in his estate, and James required a willing agent to carry out his design by upsetting the Protestant government and the Act of Settlement. Clarendon arrived in Dublin on the 4th of January 1686. He found himself completely in the power of Tyrconnel, the commander-in-chief; and though, like his father, a staunch Protestant, elected this year high steward of Oxford University, and detesting the king’s policy, he obeyed his orders to introduce Roman Catholics into the council and on the bench, and clung to office till after the dismissal of his brother, the earl of Rochester, in January 1687, when he was recalled and succeeded by Tyrconnel. He now supported the church in its struggle with James, opposed the Declaration of Indulgence, wrote to Mary an account of the resistance of the bishops, and visited and advised the latter in the Tower. He had no share, however, in inviting William to England. He assured James in September that the Church would be loyal, advised the calling of the parliament, and on the desertion of his son, Lord Cornbury, to William on the 14th of November, expressed to the king and queen the most poignant grief. In the council held on the 27th, however, he made a violent and unseasonable attack upon James’s conduct, and on the 1st of December set out to meet William, joined him on the 3rd at Berwick near Salisbury, and was present at the conference at Hungerford on the 8th, and again at Windsor on the 16th. His wish was apparently to effect some compromise, saving the crown for James. According to Burnet, he advised sending James to Breda, and according to the duchess of Marlborough to the Tower, but he himself denies these statements. He opposed vehemently the settlement of the crown upon William and Mary, voted for the regency, and refused to take the oaths of the new sovereigns, remaining a non-juror for the rest of his life. He subsequently retired to the country, engaged in cabals against the government, associated himself with Richard Graham, Lord Preston, and organizing a plot against William, was arrested on the 24th of June 1690 by order of his niece, Queen Mary, and placed in the Tower. Liberated on the 19th of August, he immediately recommenced his intrigues. On Preston’s arrest on the 31st of December, a compromising letter from Clarendon was found upon him, and he was named by Preston as one of his accomplices. He was examined before the privy council and again imprisoned in the Tower on the 4th of January 1691, remaining in confinement till the 3rd of July. This closed his public career. In 1702, on Queen Anne’s accession, he presented himself at court, “to talk to his niece,” but the queen refused to see him till he had taken the oaths. He died on the 31st of October 1709, and was buried in Westminster Abbey.

His public career had been neither distinguished nor useful, but it seems natural to ascribe its failure to small abilities and to the conflict between personal ties and political convictions which drew him in opposite directions, rather than, following Macaulay, to motives of self-interest. He was a man of some literary taste, a fellow of the Royal Society (1664), the author of The History and Antiquities of the Cathedral Church of Winchester ... continued by C. Gale (1713), and he collaborated with his brother Rochester in the publication of his father’s History (1702-1704). He

married (i) in 1660, Theodosia, daughter of Lord Capel, and (2) in 1679, Flower, daughter of William Backhouse of Swallowfield in Berkshire, and widow of William Bishop and of Sir William Backhouse, Bart. He was succeeded by his only son, Edward (1661-1724), as 3rd earl of Clarendon; and, the latter having no surviving son, the title passed to Henry, 2nd earl of Rochester (1672-1753), at whose death without male heirs it became extinct in the Hyde line.

**CLARENDON, CONSTITUTIONS OF**, a body of English laws issued at Clarendon in 1164, by which Henry II. endeavoured to settle the relations between Church and State. Though they purported to declare the usages on the subject which prevailed in the reign of Henry I. they were never accepted by the clergy, and were formally renounced by the king at Avranches in September 1173. Some of them, however, were in part at least, as they all purported to be, declaratory of ancient usage and remained in force after the royal renunciation. Of the sixteen provisions the one which provoked the greatest opposition was that which declared in effect that criminal clerks were to be summoned to the king’s court, and from there, after formal accusation and defence, sent to the proper ecclesiastical court for trial. If found guilty they were to be degraded and sent back to the king’s court for punishment. Another provision, which in spite of all opposition obtained a permanent place in English law, declared that all suits even between clerk and clerk concerning advowsons and presentations should be tried in the king’s court. By other provisions appeals to Rome without the licence of the king were forbidden. None of the clergy were to leave the realm, nor were the king’s tenants-in-chief and ministers to be excommunicated or their lands interdicted without the royal permission. Pleas of debt, whether involving a question of good faith or not, were to be in the jurisdiction of the king’s courts. Two most interesting provisions, to which the clergy offered no opposition, were: (1) if a dispute arose between a clerk and a layman concerning a tenement which the clerk claimed as free-alms (frankmolinois) and the layman as a lay-fee, it should be determined by the recognition of twelve lawful men before the king’s justice whether it belonged to free-alms or lay-fee, and if it were found to belong to free-alms then the plea was to be held in the ecclesiastical court, but if to lay-fee, in the court of the king or of one of his magnates; (2) a declaration of the procedure for election to bishoprics and royal abbey, generally considered to state the terms of the settlement made between Henry I. and Anselm in 1107.

**CLARES, POOR**, otherwise *Clarisses*, Franciscan nuns, so called from their frounness, St Clara (q.v.). She was professed by St Francis in the Portluncula in 1212, and two years later she and her first companions were established in the convent of St Damian’s at Assisi. The nuns formed the “Second Order of St Francis,” the friars being the “First Order,” and the Tertiaries (q.v.) the “Third.” Before Clara’s death in 1253, the Second Order had spread all over Italy and into Spain, France and Germany. In England they were introduced c. 1293 and established in London, outside Aldgate, where their name of Missoresse survives in the Minorites; there were only two other English houses before the Dissolution. St Francis gave the nuns no rule, but only a “Form of Life” and a “Last Will,” each only five lines long, and coming to no more than an inculcation of his idea of evangelical poverty. Something more than this became necessary as soon as the institute began to spread; and during Francis’s absence in the East, 1219, his supporter Cardinal Hugolino composed a rule which made the Franciscan nuns practically a species of unduly strict Benedictines, St Francis’s special characteristics being eliminated. St Clara made it her life work to have this rule altered, and to get the Franciscan character of the Second Order restored; in 1247 a “Second Rule” was approved which went a long way towards satisfying her desires, and finally in 1253 a “Third,” which practically gave what she wanted. This rule has come to be known as the “Rule of the Clares”; it is one of great poverty, seclusion and austerity of life. Most of the convents adopted it, but several clung to that of 1247. To bring about conformity, St Bonaventure, while general (1264), obtained papal permission to modify the rule of 1253, somewhat mitigating its austerities and allowing the convents to have fixed incomes,—thus assimilating them to the Conventual Franciscans as opposed to the Spirituals. This rule was adopted in many convents, but many more adhered to the strict rule of 1253. Indeed a counter-tendency towards a greater strictness set in, and a number of reforms were initiated, introducing an appalling austerity of life. The most important of these, the Concrete, were the work of the Colette (q.v.), and the Capucines (c. 1540; see CAPUCHINS). The half-dozen forms of the Franciscan rule for women here mentioned are still in use in different convents, and there are also a great number of religious institutes for women based on the rule of the Tertiaries. By the term “Poor Clares” the Coletine nuns are now commonly understood; there are various convents of these nuns, as of other Franciscans, in England and Ireland. Franciscan nuns have always been very numerous; there are now about 150 convents of the various observances of the Second Order, in every part of the world, besides innumerable institutions of Tertiaries.

**CLARET (from the Fr. vin clarét, mod. clairet, wine of a light clear colour, from Lat. clarius, clear), the English name for the red Bordeaux wines. The term was originally used in France for light-yellow or light-red wines, as distinguished from the vins rouges and the vins blancs; later it was applied to red wines generally, but is rarely used in French, and never with the particular English meaning (see WINE).**

**CLARETIE, JULES ARSENE ARNAUD (1840- ), French man of letters and director of the Théâtre Français, was born at Limoges on the 3rd of December 1840. After studying at the lycée Bonaparte in Paris, he became an active journalist, achieving great success as a dramatic critic to the *Figaro* and to the *Opinion nationale*. He was a newspaper correspondent during the Franco-German War, and during the Commune acted as staff-officer in the National Guard. In 1885 he became director of the Théâtre Français, and was a notable guardian of its administration. He was elected a member of the Academy in 1888, and took his seat in February 1890, being received by Ernest Renan. The long list of his works includes *Histoire de la révolution de 1789-1791* (new ed., 5 vols., 1875-1878); *CinQ ans après*; *l’Alsace et la Lorraine depuis l’annexion* (1876); some annual volumes of reprints of his articles in the weekly press, entitled *La Vie à Paris*; *La Vie moderne au théâtre* (1868-1869); *Molière, sa vie et son œuvre* (1871); *Histoire de la littérature française, 900-1900* (2nd ed. 1905); *Candidat* (1887), a novel of contemporary life; *Bichanteau, comédien français* (1896); several plays, some of which are based on novels of his own—*Les Muscadins* (1874), *Le Régiment de Champagne* (1877), *Les Mirabeau* (1879), *Monsieur le ministre* (1883), and others; and the opera, *La Navarraise*, based on his novel *La Cigarette*, and written with Henri Calvi to the music of Massenet. *La Navarraise* was first produced at Covent Garden (June 1894) with Mme Calvé in the part of Anaïs. His *Oeuvres complètes* were published in 1897-1904.

**CLARI, GIOVANNI CARLO MARIA**, Italian musical composer, chapel-master at Pistoia, was born at Pisa about the year 1660. The time of his death is unknown. He was the most celebrated pupil of Colonna, chaplain of St. Petronio, at Bologna. He became maestro di cappella at Pistoia about 1712, at Bologna in 1720, and at Pisa in 1736. He is supposed to have died about 1745. The works by which Clari distinguished himself pre-eminently are his vocal duets and trios, with a *basso continuo*, published between 1740 and 1747. These compositions,
which combine graceful melody with contrapuntal learning, were much admired by Cherubini. They appear to have been admired by Handel also, since he did not hesitate to make appropriations from them. Clari composed one opera, Il Savo dilettante, produced at Bologna in 1695, and a large quantity of church music, several specimens of which were printed in Novello's Fitzwilliam Music.

**CLARINA**, a comparatively new instrument of the wood-wind class (although actually made of metal), a hybrid possessing characteristics of both oboe and clarinet. The clarina was invented by W. Heckel of Biebrich-am-Rhein, and has been used since 1891 at the Festspielhaus, Bayreuth, in Tristan und Isolde, as a substitute for the Holz trompete made according to Wagner's instructions. The clarina has been found more practical and more effective in producing the desired tone-colour. The clarina is a metal instrument with the conical bore and fingering of the oboe and the clarinet single-reed mouthpiece. The compass of the instrument is as shown, and it stands in the key of Bb. Like the clarinet, the clarina is a transposing instrument, for which the music must be written in a key a tone higher than that of the composition. The apertures resulting from the combination of conical bore and single-reed mouthpiece has in the lowest register affinities with the cor anglais, in the middle with the saxophone, and in the highest with the clarinet. Other German orchestras have followed the example of Bayreuth. The clarina has also been found very effective as a solo instrument.

**CLARINET**, or Clarinet (Fr. clarinette; Ger. Clarinette, Klarinett; Ital. clarinetto, clarinettino), a wood-wind instrument having a cylindrical bore and played by means of a single-reed mouthpiece. The word "clarinet" is said to be derived from clarinett, a diminutive of clarino, the Italian for (1) the soprano trumpet, (2) the highest register of the instrument, (3) the trumpet played musically without the brace of the martial instrument. The word "clarionet" is similarly derived from clarion, the English equivalent of clarino. It is suggested that the name clarinet or clarinett was bestowed on account of the resemblance in timbre between the high registers of the clarino and clarinet. By adding the speaker-hole to the old chalumeau, J. C. Denner gave it an additional compass based on the overflowing of the harmonic twelfth, and consisting of an octave and a half of harmonics, which received the name of clarino, while the lower register retained the name of chalumeau. There is something to be said also in favour of another suggested derivation from the Italian clarinina, the name for reed instruments and the equivalent for tibia and aulos. At the beginning of the 18th century in Italy clarinetta, the diminutive of clarino, would be masculine, whereas clarinetta or clarinetta would be feminine, as in Doppelmayer's account of the invention written in 1730. The word "clarinet" is sometimes used in a generic sense to denote the whole family, which consists of the clarinet, or descendant corresponding to the violin, oboe, &c.; the alto clarinet in E, the basset horn in F (q.t.); the bass clarinet (q.t.), and the pedal clarinet (q.t.).

The modern clarinet consists of five (or four) separate pieces; (1) the mouthpiece; (2) the bulb; (3) the upper middle joint, or left-hand joint; (4) the lower middle joint, or right-hand joint 2; (5) the bell; which (the bell excepted) when joined together, form a tube with a continuous cylindrical bore, 2 ft. or more in length, according to the pitch of the instrument. The mouthpiece, including the beating or single-reed common to the whole clarinet family, has the appearance of a beak with the point bevelled off and thinned at the edge to correspond with the end of the reed shaped like a spatula. The under part of the mouthpiece (fig. 2) is flattened in order to form a table for the support of the reed which is adjusted thereon with great nicety, allowing just the amount of play requisite to set in vibration the column of air within the tube.

The mouthpiece, which is subject to continual fluctuations of dampness and dryness, and to changes of temperature, requires to be made of a material having great powers of resistance, such as corus wood, ivory or vulcanite, which are mostly used for the purpose in England. A longitudinal aperture r in. long and 1/2 in. wide, communicating with the bore, is cut in the table and covered by the reed. The aperture is thus closed except towards the point, where, for the distance of 1/2 to 1/4 in., the reed is thinned and the table curves backwards towards the point, leaving a gap between the ends of the mouthpiece and of the reed of 1 mm. or about the thickness of a sixpence for the B flat clarinet. The curve of the mouthpiece and the size of the gap are therefore of considerable importance. The reed is cut from a joint of the Arundo donax or sativa, which grows wild in the regions bordering on the Mediterranean. A flat strip of the reed is cut, flattened on one side and thinned to a very delicate edge on the other. At first the reed was fastened to the table by means of many turns of a fine waxed cord. The metal band adjusted by means of two screws, known as the "figurate," was introduced about 1817 by Ivan Müller. The reed is set in vibration by the breath of the performer, and being flexible it beats against the table, opening and closing the gap at a rate depending on the rate of the vibrations it sets up in the air column, this rate varying according to the length of the column as determined by opening the lateral holes and keys. A cylindrical tube played by means of a reed has the acoustic properties of a stopped pipe, i.e. the fundamental tone produced by the tube is an octave lower than the corresponding tone of an open pipe of the same length, and overblows a twelfth; whereas tubes having a conical bore like the oboe, and played by means of a reed, speak as open pipes and overblow an octave. This forms the fundamental difference between the instruments of the oboe and clarinet families. Wind instruments depending upon lateral holes for the production of their scale must either have as many holes pierced in the bore as they require notes, or make use of the property possessed by the air-column of dividing into harmonics or partials of the fundamental tone. Twenty to twenty-two holes is the number generally accepted as the practical limit for the clarinet; beyond that number the fingering and mechanism become too complicated. The compass of the clarinet is therefore extended through the medium of the harmonic overtones. In stopped pipes a node is formed near the mouthpiece, and they are therefore only able to produce the uneven harmonics, such as the 1st, 3rd, 5th, 7th, &c., corresponding to the fundamental, and the diatonic intervals of the 5th one octave above, and of the 3rd and 7th two octaves above the fundamental. By pressing the reed with the lip near the base where it is thicker and stiffer, and increasing the pressure of the breath, the air-column is forced to divide and to sound the
CLARINET

harmonics, a principle well understood by the ancient Greeks and Romans in playing upon the aulos and tibia. 1 This is easier to accomplish with the reed alone, because the bow has no effect. In the clarinet, however, the tube is of wide diameter, such as that of the modern clarinet, it would not be possible by this means alone to do justice to the tone of the instrument or to the music now written for it. The bore of the aulos was very much narrower than that of the clarinet.

In order to facilitate the production of the harmonic notes on the clarinet, a small hole, closed by means of a key and called the "speaker," is bored near the mouthpiece. By means of this small hole the air-column is placed in communication with the external atmosphere, a ventral segment is formed, and the air-column divides into three equal parts, producing a triple number of vibrations resulting in the third note of the harmonic series, at an interval of a twelfth above the fundamental. 2 In a wind instrument with lateral holes the fundamental note corresponds to any particular hole is produced when all the holes below that hole are open and itself and all above it are closed, the effective length of the resonating tube being shortened as each of the closed holes is successively uncovered. In order to obtain a complete chromatic scale on the clarinet at least eighteen holes are required. This series produces with the bell-note a succession of nineteen semitones, giving the range of a twelfth and known as the fundamental scale or chalumeau register, so called, no doubt, because it was the compass (without chromatic semitones) of the more primitive predecessor of the clarinet, known as the chalumeau, which must not be confounded with the shawm or schalmei of the middle ages.

The fundamental scale of the modern clarinet in C extends from C1 to C6. The next octave and a half is obtained by opening the speaker key, whereby each of the fundamental notes is reproduced a twelfth higher; the bell-note thus jumps from E to Bb, the first key gives instead of F its twelfth C#, and so on, extending the compass to F6, which ends the natural compass of the instrument, although a skilful performer may obtain another octave by cross-fingering. The names of the holes and keys on the clarinet are derived not from the notes of the fundamental scale, but from the name of the twelfth produced by overblowing with the speaker key open; hence the first key near the bell is known not as the E key but as the B#. The use of the speaker key forms the greatest technical difficulty in playing the clarinet, on account of the tendency to do double duty, and raising the lever of the speaker key simultaneously. In a clarinet designed by Richard Carle this difficulty was ingeniously overcome by placing the left thumb-hole towards the front, and closing it by a thumb-lever or with a ring acting as the first key of the Bb of the bassoon, the hand thus leaving the thumb free to work the speaker key alone.

There is good reason to think that the ancient Greeks understood the advantage of a speaker-hole, which they called striga, for facilitating the production of harmonics on the aulos. The credit of the discovery of this interesting fact is due to A. A. Howard, 3 of Harvard University; it explains many passages in the classics which before were obscure. (See AULOS.) Plutarch relates 4 that Telephanes of Megara was so incensed with the syrinx that he never allowed his instrument-makers to place one on any of his aulos; he even went so far as to absent himself, principally on account of the syrinx, from four of the Olympic games. Telephanes was a great virtuoso, who scorned the use of a speaker-hole, being able to obtain his harmonics on the aulos by the mere control of lips and teeth. The modern clarinet has from thirteen to nineteen keys, some being normally open and others closed. In order to understand why, when once the idea of adding keys to the chalumeau had been conceived, the number rose so slowly, keys being added one or two at a time by makers of various nationalities at long intervals, it is necessary to consider the effect of boring holes in the side of a cylindrical tube. If it were possible to proceed from an absolute theoretical basis, there would be but little difficulty; there are, however, practical reasons which make this a matter of great difficulty. According to V. Mahillon, 5 the theoretical length of a Bb clarinet (French pitch diapason normal A = 435 vibrations), is 39 cm. when the internal diameter of the bore measures exactly 1.4 cm. Any increase in the diameter of the cylindrical bore for a given length of tube shortens the pitch of the note in the same way a decrease lowers it. A bore narrow in proportion to the length facilitates the production of the harmonics, which is no doubt the reason why the aulos was made with a very narrow diameter, and produced such deep tones. In proportion to its length. In determining the position of the holes along the tube, the thickness of the wood to be pierced must be taken into consideration, for the length of the passage from the main bore to the outer air adds to the length of the resonating tube. However, the length of the clarinet tube is reckoned as a closed one, only half the extra length must be taken into account. When placed in its correct theoretical position, a hole should have its diameter equal to the diameter of the main bore, which is the ideal condition for producing the fundamental. A smaller bore, altering its position by placing it nearer the mouthpiece. These laws, which were likewise known to the Greeks and Romans, 6 had to be rediscovered by experience in the 18th and 19th centuries, during which the mechanism of the key system was repeatedly improved. Due consideration having been given to these points, it will also be necessary to remember that the stopping of the seventh holes leaves only the two little fingers (the thumb of the right hand being in the position of the thumb-hole) engaged in supporting the instrument free at all times for key service, the other fingers doing duty when momentarily disengaged. The fingering of the clarinet is the most difficult of any instrument in the family of woodwind instruments, for it does not permit all four octaves of its compass. Once mastered, however, it is the same for all clarinets, the music being always written in the key of C.

The actual tonality of the clarinet is determined by the diatonic scale produced when, starting with keys untouched and finger and thumb-holes closed, the fingers are raised one by one from the holes. In the Bb clarinet, the real sounds thus produced are being part of the scale of Bb major. By the closing of two open keys the lower Eb and D are added.

The following are the various sizes of clarinets with the key proper to each:

- Eb, a minor third above the Bb clarinet.
- Bb, a tone below
- The high F, 4 tones above
- The D, 1 tone above
- The low G, a fourth below
- The A, a minor third below
- The Bb 1 semitone below
- The alto clarinet in Eb, a fifth below the Bb clarinet.
- The tenor or bassett horn, in F, a fifth below the C clarinet.
- The bass clarinet in Eb, an octave below the bass clarinet.
- The pedal clarinet in Bb, an 8th below the bass clarinet.
- The clarinets in Bb and A are used in the orchestra; those in C and Eb are in military bands.

History.—Although the single beating-reed associated with the instruments of the clarinet family has been traced in ancient Egypt, the double reed, characteristic of the oboe family, being of simpler construction, was probably of still greater antiquity. An ancient Egyptian pipe found in a mummy-case and now preserved in the museum at Turin was found to contain a beating-reed sunk 3 in. below the end of the pipe, which is the principle of the drone. It would appear that the double chalumeau, called arghoul (q.v.) by the modern Egyptians, was known in ancient Egypt, although it was not perhaps in common use. The Musée Guimet possesses a copy of a fresco from the tombs at Saqqarah (executed under the direction of Mariette Bey) assigned to the 4th or 5th dynasty, on which is shown a concert with dancing; the instruments used are two harps, the long oblique flute "nay," blown from the end without any mouthpiece or embouchure, and an instrument identified as an arghoul.

4 R. Macrobert, Geschichte des Instruments, ii. 4. 5 "nec securus probamus in tibibus de quarum foraminibus vicinibus infanti oris sonus acutus emititur, de longinquis autem et termino proximos, graviori item acutior per patentiora foraminis, gravior per angusta."
5 See Victor Loret, L'Egypte au temps des Pharaons—la musique, la science, et l'art (Paris, 1889), illustration p. 139 and p. 145. The author gives no information about this fresco except that it is in the
from its resemblance to the modern instrument of the same name. This is believed to be the only illustration of the ancient double chalumeau yet found in Egypt, with the single exception of a hieroglyph occurring also once only, i.e., the sign read As-it, consisting of a cylindrical pipe with a beak mouthpiece bound round with a cord tied in a bow. The bow is taken to indicate the double parallel pipes bound together; the same sign without the bow occurs frequently and is read Ma-it, and is considered to be the generic name for reed wind instruments. The beating-reed was probably introduced into classic Greece from Egypt or Asia Minor. A few ancient Greek instruments are extant, five of which are in the British Museum. They are as nearly cylindrical as would be the natural growing reed itself. The probability is that both single and double reeds were at times used with the Greek aulos and the Roman tibia. V. Mahillon and A. A. Howard of Harvard have both obtained facsimiles of actual instruments, some found at Pompeii and now deposited in the museum in Naples, and others in the British Museum. Experiments made with these instruments, whose original mouthpieces have perished, show that with pipes of such narrow diameter the fundamental scale and pitch are the same whether sounded by reed or by double reed, but the modal vibrations of the two are different, the single reed giving the pure tone quality. The subject is more fully discussed in the article AUTOLOID. The Roman tibia, if monuments can be trusted, sometimes had a beak-shaped mouthpiece, as for instance that attached to a pipe discovered at Pompeii, or that shown in a scene on Trajan's column. It is probable that when, at the decline of the Roman empire, instrumental music was placed by the church under a ban—and the tibia more especially from its association with every form of licence and moral depravity—this instrument, sharing the common fate, survived chiefly among itinerant musicians who carried it into western Europe, where it was preserved from complete extinction. An instrument of difficult technique requiring an advanced knowledge of acoustics was not, however, likely to flourish or even to be understood among nations whose culture was as yet in its infancy.

The tide of culture from the Byzantine empire filtered through to the south and west, leaving many traces; a fresh impetus was received from the east through the Arabs; and later, as a result of the Crusades, the prototype of the clarinet, together with the practical knowledge necessary for making the instrument and playing upon it, may have been re-introduced through any one or all of these sources. However this may be, the instrument was during the Carolingian period identified with the tibia of the Romans until such time as the new western civilization ceased to be content to go back to classical Rome for its models, and began to express itself, at first naively and awkwardly, as the 11th century dawned. The name then changed to the derivatives of the Greek kalamos, assuming an almost bewildering variety of forms, of which the commonest are chalumele, chalumeau, schalmey, schalmeyne, shawm, calemele, calemale. The derivation of the name seems to point to a Byzantine dating of the double reed, but the modulated vibration of single reed instruments which formed the prototype of both oboe and clarinet, but it must not be forgotten that the instruments with a conical bore—more especially those played by a reed—are primarily of Asiatic origin. At the beginning of the 13th century Musée Guimet. It is probably identical with the second of the mural paintings described on p. 190 of Petit guide illustré au Musée Guimet, par L. de Millière.

6 J. A. U. Scheler's Trouveres belges.

in France, where the instrument remained a special favourite until it was displaced by the clarinet, the chalumeau is mentioned in some of the early romances—"Tabars et chalemaux et estrumens sonner" (Aye d'Avignon, v. 4137); "Greles et chélimiais et bruinaus bruins" (Gui de Bourgogne, v. 1374), &c. By the end of the 15th century, the German equivalent Schalmei appears in the literature of that country—"Prusñen und Schalmeyen schol macht niematen dar Meister welt" (Fresnen dienst, 492, fol. 5, Ulrich von Lichtenstein). The schalmei or shawm is frequently represented in miniatures from the 13th century, but it must have been known long before, since it was at that period in use as the chantor of the bag-pipe (g.p.), a fully-developed complex instrument which presupposes a separate previous existence for its component parts.

We have no reason to suppose that any distinction was drawn between the single and double reed instruments during the early middle ages—if indeed the single reed was then known at all—for the derivatives of kalamos were applied to a variety of pipes. The first clear and unmistakable drawing yet found of the single reed occurs in Mersenne's Harmonie universelle (p. 283), where the primitive reed pipe is shown with the beating-reed fixed inside the tube of the instrument itself, by making a lateral slit and then stretching a little strip of reed towards a knot. Mersenne calls this the simplest form of chalumeau or wheat-stalk (tuay de bhir). It is evident that no significance was then attached to the form of the vibrating reed, whether single or double, for Mersenne and other writers of his time call the chanters of the musette and cornemuse chalmeaux whether they are of cylindrical or of conical bore. The difference in timbre produced by the two kinds of reeds was, however, understood, for Mersenne states that a special kind of cornemuse was used in concert with the hautbois de Pileau (an oboe whose double reed was enclosed in an air chamber) and was distinguished from the shepherd's cornemuse by having double reeds throughout, whereas the drones of the latter instrument were furnished with beating reeds. It is therefore evident that as late as 1636 (the date at which Mersenne wrote) in France the word "chalmeau" was not applied to the instrument transformed some sixty years later into the clarinet, nor was it applied exclusively to any one kind of pipe except when acting as the chantor of the bagpipe, and that independently of any structural characteristics. The clarinet was still called chalmeau in 1737, Of the instrument which has been looked upon as the chalmeau, there is but little trace in Germany or in France at the beginning of the 17th century. A chalumeau with beak mouthpiece and characteristic short cylindrical tube pierced with six holes figures among the musical instruments used for the triumphal procession of the emperor Maximilian I., commemorated by a fine series of plates, engraved on wood by Hans Burgkmair, the friend and colleague of A. Dürer. On the same plate (No. 70) are five schalmeyes with double reeds and five chalmeaux with single-reed beak mouthpieces; the latter instruments were in all probability made in the Netherlands, which excelled from the 12th century in the manufacture of all musical instruments. Notched reed instrument, with the exception of the regal (q.v.), is figured by S. Virdung, in his Agricola (1517). A good idea of the primitive chalmeau may be gained from a reproduction of one of the few specimens from the 16th or 17th century still extant, which belonged to Césare Snoeck and was exhibited at the Royal Military Exhibition in London in 1890. The tube is stopped at the mouthpiece end by a natural joint of
the reed, and a tongue has been detached just under the joint; there are six finger-holes and one for the thumb. An instrument almost identical with the above, but with a rudimentary bell, and showing plainly the detached tongue, is figured by Jost Amman in 1589. A plate in Diderot and d’Alembert’s Encyclopédie shows a less primitive instrument, outwardly cylindrical and having a separate mouthpiece joint and a clarinet reed but no keys. A chalumeau without keys, but consisting apparently of three joints—mouthpiece, main tube and bell,—is figured on the title-page of a musical work dated 1690; it is very similar to the one represented in fig. 3, except that only six holes are visible.

In his Bio-higraphical notice of J. Christian Denner (1655-1797), J. G. Doppelmayer states that at the beginning of the 18th century “Denner invented a new kind of pipe, the so-called clarinet, which greatly delighted lovers of music; he also made great improvements in the stock or rackett-fagottos, known in the olden time and finally also in the chalumeaux.” It is probable that the improvements in the chalumeau to which Doppelmayer alludes without understanding them consisted (a) in giving the mouthpiece the shape of a beak and adding a separate reed tongue as in that of the modern clarinet, unless this change had already taken place in the Netherlands, the country which the unremittting labours of E. van der Straeten have revealed as the lead in Europe from the 14th to the 16th century in the construction of musical instruments of all kinds; (b) in the boring of two additional holes for A and B near the mouthpiece and covering them with two keys; (c) in replacing the long cylindrical mouthpiece joint by a bulb, thus restoring one of the characteristic features of the tibia, known chalumeaux in existence, two being in the Bavarian national museum at Munich, the one in high A, in a bad state of preservation, the second in C, marked J. C. Denner, of which V. Mahillon has made a facsimile for the museum of the Brussels Conservatoire. There are two keys and eight holes; the first consists of two small holes on the same level giving a semitone if only one be closed. If the thumb-key be left open, the sounds of the fundamental scale (shown in the black notes below) rise a twelfth to form the second register (the white notes before keys were added, by partially uncovering the hole for the thumb?"

The Berlin museum possesses an early clarinet with two keys, marked J. B. Oberlender, derived from the Snoek collection. Paul de Wit’s collection has a similar specimen. The Brussels Conservatoire possesses clarinets with two keys by Flemish makers, G. A. Rottenburgh and J. B. Willems; the latter, with a small bulb and bell, is in G a fifth above the C clarinet. The next improvements in the clarinet, made in 1720, are due to J. Denner, probably a son of J. C. Denner. They consisted in the addition of a bell and in the removal of the speaker-hole and key nearer the mouthpiece, involving the reduction of the diameter of the hole. The effect of this change of position was to turn the B♭ into B♭, for J. Denner introduced into the hole, nearly as far as the axis of the bore, a small metal drainage tube for the moisture of the breath. In the modern clarinet, the same result is attained by raising this little tube slightly above the surface of the main tube, placing a key on the top of it, and bending the lever. In order to produce the missing B♭, J. Denner lengthened the tube and pierced another hole, the low E, covered by an open key with a long lever which, when closed, gives the desired B♭ as its twelfth, thus forming a connexion between the two registers. A clarinet with three keys, of similar construction (about 1750), marked J. W. Kenigsperger, is preserved in the Bavarian national museum, at Munich. Another in B♭ marked Lindner belongs to the collection at Brussels. About the middle of the 18th century, the number of keys was raised to five, some say by Barthold Fritz of Brunswick (1697-1766), who added keys for C♯ and D♯.

According to Altenburg the E♭ or D♯ key is due to the virtuoso Joseph Beer (1744-1811). The sixth key was added about 1790 by the celebrated French virtuoso Xavier Lefèbure (or Lefèvre), and produced C♯-flat.

Anton Stradler and his brother, both clarinetists in the Vienna court orchestra and instrument-makers, are said to have lengthened the tube of the B♭ clarinet, extending the compass down to C (real sound B♭). It was for the Stadler brothers that Mozart wrote his quintet for strings, with a fine obligato for the clarinet in A (1789), and the clarinet concerto with orchestra in 1791.

This, then, was the state of the clarinet in 1810 when Ivan Müller, then living in Paris, carried the number of keys up to thirteen, and made several structural improvements already mentioned, which gave us the modern instrument and inaugurated a new era in the construction and technique of the clarinet. Müller’s system is still adopted in principle by most clarinet makers. The instrument was successively improved during the 19th century by the Belgian makers Bachmann, the elder Sax, Albert and C. Mahillon, whose invention in 1862 of the C key with double action is now generally adopted. In Paris the labours of Lefebure, Buffet-Crampon, and Gomins are pre-eminent. In 1842 H. E. Kloß conceived the idea of adapting to the clarinet the ingenious mechanism of movable rings, invented by Boehm for the flute, and he entrusted the execution of this innovation to Buffet-Crampon; this is the type of clarinet generally adopted in French orchestras. From this adaptation has sprung the erroneous notion that Kloß’s clarinet was constructed according to the Boehm system; Kloß’s lateral divisions of the tube do not follow those applied by Boehm to the flute.

In England the clarinet has also passed through several progressive stages since its introduction about 1770, and first of all..."
CLARK, SIR A.—CLARK, F. E. 441

all at the hands of Cornelius Ward. The principal improvements were due to Richard Carte, who took out a patent in 1858 for an improved Boehm clarinet which possessed some claim to the name, since Boehm’s principle of boring the holes at theoretically correct intervals and of venting the holes by means of open holes below was carried out. Carte made several modifications of his original patent, his chief endeavour being to so dispose the key-work as to reduce the difficulties in fingering. By the extension of the principle of the ring action, the work of the third and little fingers of the left hand was simplified and the fingering of certain difficult notes and shakes greatly facilitated. Messrs Rudall, Carte & Company have made further improvements in the clarinet, which are embodied in Klussmann’s patent (fig. 4); these consist in the introduction of the duplicate G♯ key, a note which has hitherto formed a serious obstacle to perfect execution. The duplicate key, operated by the third or second finger of the right hand, releases the fourth finger of the left hand. The old G♯ is still retained and may be used in the usual way if desired. The body of the instrument is now made in one joint, and the position of the G♯ hole is mathematically correct, whereby perfect intonation for C♯, G♯ and F♯ is secured. The improvements were made in Paris by Messrs Evette & Schaeffer and by M. Paradis, 2 a clarinet-player in the band of the Garde Républicaine, and very great improvements in boring and in key mechanism were effected by Albert of Brussels (see fig. 1).

The clarinet appears to have received appreciation in the Netherlands earlier than in its own native land. According to W. Altenburg (op. cit. p. 11), 3 a MS. is preserved in the cathedral at Antwerp of a mass written by A. J. Faber in 1720, which is scored for a clarinet. Johann Mattheson, 4 Kapellmeister at Hamburg, mentions clarinet music in 1713, although no known record appears to have handed down the instrument. Joh. Christ. Bach scored for the clarinet in 1753 in his opera Orione performed in London, and Rameau had already employed the instrument in 1751 in a theatre for his pastoral entitled Acante et Céphise. 5 The clarinet was formally introduced into the orchestra in Vienna in 1767, 6 Gluck having contented himself with the use of the chalumeau in Orfeo (1762) and in Alceste (1767). 7 The clarinet had already been adopted in military bands in France in 1755, where it very speedily completely replaced the oboe. One of Napoleon Bonaparte’s bands is said to have had no less than twenty clarinets.

For further information on the clarinet at the beginning of the 19th century, consult the Methods by Ivan Müller and Xavier Lefebure, and Joseph Frocklich’s admirable work on the instruments of the orchestra; and Gottfried Weber’s articles in Ersch and Grüber’s Encyclopædia. See also Basset Horn; Bass Clarinet and Pedal Clarinet.

CLARK, SIR ANDREW, Bart. (1826–1893), British physician, was born at Aberdeen on the 28th of October 1826. His father, who also was a medical man, died when he was only a few years old. After attending school in Aberdeen, he was sent by his guardians to Dundee and apprenticed to a druggist; then returning to Aberdeen he began his medical studies in the university of that city. Soon, however, he went to Edinburgh, where in the extra-academical school he had a student’s career of the most brilliant description, ultimately becoming assistant to J. Hughes Bennett in the pathological department of the Royal Infirmary, and assistant demonstrator of anatomy to Robert Knox. But symptoms of pulmonary phthisis brought his academic life to a close, and in the hope that the sea might benefit his health he joined the medical department of the navy in 1848. Next year he became pathologist to the Haslar hospital, where T. H. Huxley was one of his colleagues, and in 1853 he was the successful candidate for the newly-instituted post of curator to the museum of the London hospital. Here he intended to devote all his energies to pathology, but circumstances brought him into active medical practice. In 1854, the year in which he took his doctor’s degree at Aberdeen, the post of assistant-physician to the hospital became vacant and he was prevailed upon to apply for it. He was fond of telling how his phthisical tendencies gained him the appointment. “He is only a poor Scotch doctor,” it was said, “with but a few months to live; let him have it.” He had it, and two years before his death publicly declared that of those who were on the staff of the hospital at the time of his selection he was the only one remaining alive. In 1854 he became a member of the College of Physicians, and in 1858 a fellow, and then went in succession through all the offices of honour the college has to offer, ending in 1888 with the presidency, which he continued to hold till his death. From the time of his selection as assistant physician to the London hospital, his fame rapidly grew until he became a fashionable doctor with one of the largest practices in London, counting among his patients some of the most distinguished men of the day. The great number of persons who passed through his consulting-room every morning rendered it inevitable that to a large extent his advice should become stereotyped and his prescriptions often reduced to mere stock formulae, but in really serious cases he was not to be surpassed in the skill and carefulness of his diagnosis and in his attention to detail. In spite of the claims of his practice he found time to produce a good many books, all written in the precise and polished style on which he used to pride himself. Doubtless owing largely to personal reasons, lung diseases and especially fibroid phthisis formed his favourite theme, but he also discussed other subjects, such as renal incaucacity, anaemia, constipation, &c. He died in London on the 6th of November 1893, after a paralytic stroke which was probably the result of persistent overwork.

CLARK, FRANCIS EDWARD (1837— ), American clergyman, was born of New England ancestry at Aylmer, Province of Quebec, Canada, on the 12th of September 1851. He was the son of Charles C. Symmes, but took the name of an uncle, the Rev. E. W. Clark, by whom he was adopted after his father’s death in 1853. He graduated at Dartmouth College in 1873 and at Andover Theological Seminary in 1876, was ordained in the Congregational ministry, and was pastor of the Williston Congregational church at Portland, Maine, from 1876 to 1883, and of the Phillips Congregational church, South Boston, Mass., from 1883 to 1887. On the 2nd of February 1881 he founded at Portland the Young People’s Society of Christian Endeavor, which, beginning as a small society in a single New England church, developed into a great Interdenominational organization, which in 1908 had 70,761 societies and more than 3,500,000 members scattered throughout the United States, Canada, Great Britain and Ireland, Australia, South Africa, India, and China. After 1887 he devoted his time entirely to the extension of this work, and was president of the United Societies of Christian Endeavor and of the World’s Christian Endeavor Union, and editor of the Christian Endeavor World (originally The Golden Rule). Among his numerous publications are The Children and the Church (1882); Looking Out on Life (1883); Young People’s Prayer Meetings (1884); Some Christian Endeavor Saints (1886); World Wide Endeavor (1895); A New Way Round an Old World (1900).
CLARK, G. R.—CLARK, J. L.

Sec W. H. English, Conquest of the Country north-west of the River Ohio, 1778-1783, and Life of George Rogers Clark (2 vols., Indianapolis and Kansas City, 1896), an accurate and detailed work, which represents an immense amount of research among both printed and manuscript sources. Clark's own accounts of his expeditions, and other interesting documents, are given in the appendix to this work.

CLARK, William (1770-1838), the well-known explorer, was the youngest brother of the foregoing. He was born in Caroline county, Virginia, on the 1st of August 1770. At the age of fourteen he removed with his parents to Kentucky, settling in the hills of the Ohio (Louisville). He entered the United States army as a lieutenant of infantry in March 1792, and served under General Anthony Wayne against the Indians in 1794. In July 1796 he resigned his commission on account of ill-health. In 1804-1806, with Meriwether Lewis (q.v.), he commanded the famous exploring expedition across the continent to the mouth of the Columbia river, and was commissioned second lieutenant in March 1804 and first lieutenant in January 1806. In February he again resigned from the army. He then served for a few years as brigadier-general of the Louisiana territorial militia, as Indian agent for "Upper Louisiana," as territorial governor of Missouri in 1813-1820, and as superintendent of Indian affairs at St Louis from 1822 until his death there on the 1st of September 1838.

CLARK, Sir James (1725-1807), English physician, was born at Cullen, Banffshire, and was educated at the grammar school of Fordyce and at the universities of Aberdeen and Edinburgh. He served for six years as a surgeon in the army; then spent some time in travelling on the continent, in order to investigate the mineral waters and the climate of various health resorts; and for seven years he lived in Rome. In 1826 he began to practise in London. In 1835 he was appointed physician to the duchess of Kent, becoming physician in ordinary to Queen Victoria in 1837. In 1838 he was created a baronet. He published The Influence of Climate in Chronic Diseases, containing valuable meteorological tables (1829), and a Treatise on Pulmonary Consumption (1835).

CLARK, John Bates (1847-1919), American economist, was born at Providence, Rhode Island, on the 26th of January 1847. Educated at Brown University, Amherst College, Heidelberg and Zurich, he was appointed professor of political economy at Carleton College, Minnesota, in 1877. In 1881 he became professor of history and political science in Smith College, Massachusetts; in 1892 professor of political economy in Amherst College. He was appointed professor of political economy at Columbia University in 1895. Among his works are: The Philosophy of Wealth (1883); Wages (1889); Capital and its Earnings (1898); The Control of Trusts (1901); The Problem of Monopoly (1904); and Essentials of Economic Theory (1907).

CLARK, Josiah Latimer (1822-1898), English engineer and electrician, was born on the 10th of March 1822 at Great Marlow, Bucks. His first interest was in chemical manufacturing, but in 1848 he became assistant engineer at the Menai Straits bridge under his elder brother Edwin (1814-1894), the inventor of the Clark hydraulic lift-graving dock. Two years later, when his brother left, he became engineer to the Great Western Railway. When the English Electric Telegraph Company, he again acted as his assistant, and subsequently succeeded him as chief engineer. In 1854 he took out a patent "for conveying letters or parcels between places by the pressure of air and vacuum," and later was concerned in the construction of a large pneumatic despatch tube between the general post office and Euston station, London. About the same period he was engaged in experimental researches on the propagation of the electric current in submarine cables, on which he published a pamphlet in 1855, and in 1859 he was a member of the committee which was appointed by the government to consider the numerous failures of submarine cable enterprises. Latimer Clark paid much attention to the subject of electrical measurement, and besides designing various improvements in method and apparatus and inventing the Clark standard cell, he took a leading part in the movement for the systematization of electrical standards, which was inaugurated by the paper which he and Sir
C. T. Bright read on the question before the British Association in 1861. With Bright also he devised improvements in the insulation of submarine cables. In the latter part of his life he was a member of several firms engaged in laying submarine cables, in manufacturing electrical appliances, and in hydraulic engineering. He died in London on the 30th of October 1858. Besides professional papers, he published an Elementary Treatise on Electrical Measurement (1868), together with two books on astronomical subjects, and a memoir of Sir W. F. Cooke.

CLARK, THOMAS (1801-1867), Scottish chemist, was born at Ayr on the 31st of March 1801. In 1826 he was appointed lecturer on chemistry at the Glasgow mechanics' institute, and in 1831 he took the degree of M.D. at the university of that city. Two years later he became professor of chemistry in Marischal College, Aberdeen, but was obliged to give up the duties of that position in 1845 through ill-health, though nominally he remained professor till 1860. His name is chiefly known in connexion with his process for softening hard waters, and his water tests, patented in 1841. The last twenty years before his death at Glasgow on the 24th of November 1867 were occupied with the study of the historical origin of the Gospels.

CLARK, WILLIAM GEORGE (1831-1878), English classical and Shakespearian scholar, was born at Barford Hall, Darlington, in March 1831. He was educated at Sedbergh and Shrewsbury schools and Trinity College, Cambridge, where he was elected fellow after a brilliant university career. In 1857 he was appointed public orator. He travelled much during the long vacations, visiting Spain, Greece, Italy and Poland. His Peleponnesus (1858) was an important contribution to the knowledge of the country at that time. In 1853 Clark had taken orders, but left the Church in 1870 after the passing of the Clerical Disabilities Act, of which he was one of the promoters. He also resigned the public oratorship in the same year, and in consequence of illness left Cambridge in 1873. He died at York on the 6th of November 1878. He bequeathed a sum of money to his old college for the foundation of a lectureship in English literature. Although Clark was before all a classical scholar, he published little in that branch of learning. A contemplated edition of the works of Aristophanes, a task for which he was singularly fitted, was never published. He visited Italy in 1868 for the express purpose of examining the Ravenna and other MSS., and on his return began the notes to the Askarians, but they were left in too incomplete a state to admit of publication in book form even after his death (see Journal of Philology, viii., 1879).

He established the Cambridge Journal of Philology, and cooperated with B. H. Kennedy and James Riddell in the production of the well-known Sabiniana Corolla. The work by which he is best known is the Cambridge Shakespeare (1863-1866), containing a collation of early editions and selected emendations, edited by him at first with John Glover and afterwards with W. Aldis Wright. Gasparo (1853) gives an account of his tour in Spain; his visits to Italy at the time of Garibaldi's insurrection, and to Poland during the insurrection of 1863, are described in Vacation Tourists, ed. F. Galtoun, i. and iii.

A. J. C. M. Turner's notes to the Aeschylus (1879) describes Clark as 'the most accomplished and versatile man he ever met': see also notices by W. Aldis Wright in Academy (Nov. 23, 1878); R. Burn in Athenaeum (Nov. 16, 1878); The Times (Nov. 8, 1878); Notes and Queries, i. 330 (1879), iv. 156 (1880).

CLARKE, ADAM (1767-1837) British Nonconformist divine, was born at Moybeg, Co. Londonderry, in Ireland, in 1760 or 1762. After receiving a very limited education he was apprenticed to a linen manufacturer, but, finding the employment uncongenial, he resumed school-life at the institution founded by Wesley at Kingswood, near Bristol. In 1782 he entered on the duties of the ministry, being appointed by Wesley to the Bradford (Wiltshire) circuit. His popularity as a preacher was very great, and his influence in the denomination is indicated by the fact that he was three times (1806, 1814, 1822) chosen to be president of the conference. He served twice on the London circuit, the second period being extended considerably longer than the rule allowed, at the special request of the British and Foreign Bible Society, who had employed him in the preparation of their Arabic Bible. Though ardent in his pastoral work, he found time for diligent study of Hebrew and other Oriental languages, undertaken chiefly with the view of qualifying himself for the great work of his life, his Commentary on the Holy Scriptures (8 vols., 1810-1826). In 1802 he published a Bibliographical Dictionary in six volumes, to which he afterwards added a supplement. He was selected by the Records Commission to re-edit Rymer's Foederer, a task which after ten years' labour (1809-1818) he had to resign. He also wrote Memoirs of the Wesleys Family (1823), and edited a large number of religious works. Honours were showered upon him (he was M.A., L.L.D. of Aberdeen), and many distinguished men in church and state were his personal friends. He died in London on the 16th of August 1832.

His Miscellaneous Works were published in 13 vols. (1836), and a Life (3 vols.) by his son, J. B. B. Clarke, appeared in 1833.

CLARKE, SIR ANDREW (1824-1902), British soldier and administrator, son of Colonel Andrew Clarke, of Co. Donegal, Ireland, governor of West Australia, was born at Southsea, England, on the 27th of July 1824, and educated at King's school, Canterbury. He entered the Royal Military Academy, Woolwich, and obtained his commission in the army in 1844 as second lieutenant in the Royal Engineers. He was appointed to his father's staff in West Australia, but was transferred to be A.D.C. and military secretary to the governor of Tasmania; and in 1849 he went to New Zealand to take part in the Maori War, and for some years served on Sir George Grey's staff. He was then made surveyor-general in Victoria, took a prominent part in framing its new constitution, and held the office of minister of public lands during the first administration (1855-1857). He returned to England in 1857, and in 1863 was sent on a special mission to the West Coast of Africa. In 1864 he was appointed director of works for the navy, and held this post for nine years, being responsible for great improvements in the naval arsenals at Chatham, Portsmouth and Plymouth, and for fortifications at Malta, Cork, Bermuda and elsewhere. In 1873 he was made K.C.M.G., and became governor of the Straits Settlements, where he did most valuable work in consolidating British rule and ameliorating the condition of the people. From 1875 to 1880 he was minister of public works in India; and on his return to England in 1881, holding then the rank of lieutenant-colonel in the army, he was first appointed commandant at Chatham and then inspector-general of fortifications (1882-1886). Having attained the rank of lieutenant-general and been created G.C.M.G., he retired from official life, and in 1886 and 1893 unsuccessfully stood for parliament as a supporter of Mr Gladstone. During his last years he was agent-general for Victoria. He died on the 29th of March 1902. Both as a technical and strategical engineer and as an Imperial administrator Sir Andrew Clarke was one of the ablest and most useful public servants of his time; and his contributions to periodical literature, as well as his official memoranda, contained valuable suggestions on the subjects of imperial defence and imperial consolidation which received too little consideration at a period when the home governments were not properly alive to their importance. He is entitled to remembrance as one of those who first inculcated, from a wide practical experience, the views of imperial administration and its responsibilities, which in his last years he saw accepted by the bulk of his countrymen.

CLARKE, CHARLES COWDEN (1878-1877), English author and Shakespearian scholar, was born at Enfield, Middlesex, on the 15th of December 1877. His father, John Clarke, was a schoolmaster, among whose pupils was John Keats. Charles Clarke taught Keats his letters, and encouraged his love of poetry. He knew Charles and Mary Lamb, and afterwards became acquainted with Shelley, Leigh Hunt, Coleridge and Hazlitt. Clarke became a music publisher in partnership with Alfred Novello, and married in 1828 his partner's sister, Mary Victoria (1809-1898), the eldest daughter of Vincent Novello. In the year after her marriage Mrs Cowden Clarke began her valuable Shakespeare concordance, which was eventually
clarke, edward george (1831— ), English lawyer and politician, son of J. G. Clarke of Moorgate Street, London, was born on the 15th of February 1841. In 1859 he became a writer in the India office, but resigned in the next year, and became a law reporter. He obtained a Tancred law scholarship in 1861, and was called to the bar at Lincoln's Inn in 1864. He joined the home circuit, became Q.C. in 1880, and a bencher of Lincoln's Inn in 1882. In November 1877 he was successful in securing the acquittal of Chief-Inspector Clarke from the charge brought against certain Scotland Yard officials of conspiracy to defeat justice, and his reputation was assured by his defence of Patrick Stewart in the Peuge murder case (1877), and of Mrs Routley against the charge of poisoning her husband (1886). Among other notable cases he was counsel for the plaintiff in the libel action brought by Sir William Gordon-Cumming (1890) against Mr and Mrs Lyckett Green and others for slander, charging him with cheating in the game of baccarat (in this case the prince of Wales, afterwards Edward VII, gave evidence), and he appeared for Dr Jameson, Sir John Willoughby and others when they were tried (1890) under the Foreign Enlistment Act. He was knighted in 1886. He was returned as Conservative member for Southwark at a by-election early in 1888, but failed to retain his seat at the general election which followed a month or two later; he found a seat at Plymouth, however, which he retained until 1900. He was solicitor-general in the Conservative administration of 1886—1893, but declined office under the Unionist government of 1895 when the law officers of the crown were debarred from private practice. The most remarkable, perhaps, of his speeches in the House of Commons was his reply to Mr Gladstone on the second reading of the Home Rule Bill in 1893. In 1899 differences which arose between Sir Edward Clarke and his party on the subject of the government's South African policy led to his resigning his seat. At the general election of 1906 he was returned as a Conservative member for the city of London, but he offended a large section of his constituents by a speech against tariff reform in the House of Commons on the 12th of March, and shortly afterwards resigned his seat on grounds of health. He published a Treatise on the Law of Extradition (4th ed., 1903), and also three volumes of his political and forensic speeches.
secretary of the Unitarian Association and, in 1867-1871 professor of natural religion and Christian doctrine at Harvard. From the beginning of his active life he wrote freely for the press. From 1836 until 1839 he was editor of the Western Messenger, a magazine intended to carry to readers in the Mississippi Valley simple statements of "liberal religion," involving what were then the most radical appeals as to national duty, especially the abolition of slavery. The magazine is now of value to collectors because it contains the earliest printed poems of Ralph Waldo Emerson, who was Clarke’s personal friend. Most of Clarke’s earlier published writings were addressed to the immediate need of establishing a larger theory of religion than that espoused by people who were still trying to be Calvinists, people who maintained what a good American phrase calls "hard-shelled churches." But it would be wrong to call his work controversial. He was always declaring that the business of the Church is Eirenic and not Polemic. Such books as Orthodoxy: Its Truths and Errors (1866) have been read more largely by members of orthodox churches than by Unitarians. In the great moral questions of his time Clarke was a fearless and practical advocate of the broadest statement of human rights. Without caring much what company he served in, he could always be seen and heard, a leader of unflinching courage, in the front rank of the battle. He published but few verses, but at the bottom he was a poet. He was a diligent and accurate scholar, and among the books by which he is best known is one called Ten Great Religions (2 vols., 1871-1883). Few Americans have done more than Clarke to give breadth to the published discussion of the subjects of literature, ethics and religious philosophy. Among his later books are Every-Day Religion (1886) and Sermons on the Lord’s Prayer (1888). He died at Jamaica Plain, Mass., on the 8th of June 1888.

His Autobiography, Diary and Correspondence, edited by Edward Everett Hale, was published in Boston in 1891. (E. E. H.)

CLARKE, JOHN SLEEPER (1833-1890), American actor, was born in Baltimore, Maryland, on the 3rd of September 1833, and was educated for the law. He made his first appearance in Boston as Frank Hardy in Paul Pry in 1851. In 1859 he married Asia Booth, daughter of Junius Brutus Booth, and he was associated with his brother-in-law Edwin Booth in the management of the Winter Garden theatre in New York, the Walnut Street theatre in Philadelphia and the Boston theatre. In 1867 he went to London, where he made his first appearance at the St James’s as Major Wellington de Boots in Stirling Coynes’s Everybody’s Friend, rewritten for him and called The Widow’s Hunt. His success was so great that he remained in England for the rest of his life, except for four visits to America. Among his favourite parts were Toodles, which ran for 200 nights at the Strand, Dr Pangloss in The Heir-at-law, and Dr Ollapod in The Poor Gentleman. He managed several London theatres, including the Haymarket, where he preceded the Bankcroft. He retired in 1895, and died on the 24th of September 1895. His two sons also were actors.

CLARKE, MARCUS ANDREW HISOLOP (1846-1881), Australian author, was born in London on the 24th of April 1846. He was the only son of William Hislop Clarke, a barrister of the Middle Temple who died in 1863. He emigrated forthwith to Australia, where his uncle, James Langton Clarke, was a county court judge. He was at first a clerk in the bank of Australasia, but showed no business ability, and soon proceeded to learn farming at a station on the Wimmera river, Victoria. He was already writing stories for the Australian Magazine, when in 1867 he joined the staff of the Melbourne Argus through the introduction of Dr Robert Lewins. He also became secretary (1872) to the trustees of the Melbourne public library and later (1876) assistant librarian. He founded in 1868 the Yorick Club, which soon numbered among its members the chief Australian men of letters. The most famous of his books is For the Term of His Natural Life (Melbourne, 1874), a powerful tale of an Australian penal settlement, which originally appeared in serial form in a Melbourne paper. He also wrote The Peripatetic Philosopher (1869), a series of amusing papers reprinted from The Austral-
Meanwhile he had been presented by Bishop Moore to the rectory of Drayton, near Norwich. As Boyle lecturer, he dealt in 1704 with the Being and Attributes of God, and in 1705 with the Evidences of Natural and Revealed Religion. These lectures, first printed separately, were afterwards published together under the title of A Discourse concerning the Being and Attributes of God, the Obligations of Natural Religion, and the Truth and Certainty of the Christian Revelation, in opposition to Hobbes, Spinoza, the author of the Oracles of Reason, and other Deniers of Natural and Revealed Religion.

In 1706 he wrote a refutation of Dr Henry Dodwell's views on the immortality of the soul, and this drew him into controversy with Anthony Collins. He also wrote at this time a translation of Newton's Optics, for which the author presented him with £500. In the same year he published a work on the rectory of St Benet's, William's Wharf, London. Soon afterwards Queen Anne appointed him one of her chaplains in ordinary, and in 1709 presented him to the rectory of St James's, Westminster. He then took the degree of doctor in divinity, defending as his thesis the two propositions: Nullum fidei Christianae dogma, in Sacris Scripturis traditum, est recte rationis dissentientum, and Sine actioam humanae libertate nulla potest esse religio.

During the same year, at the request of the author, he revised Whiston's English translation of the Apostolical Constitutions.

In 1712 he published a carefully punctuated and annotated edition (folio 1702, octavo 1709) of Caesar's Commentaries, with elegant engravings, dedicated to the duke of Marlborough. During the same year he published his celebrated treatise on The Scripture Doctrine of the Trinity. It is divided into three parts. The first contains a collection and exegesis of all the texts in the New Testament relating to the doctrine of the Trinity; in the second the doctrine is set forth at large, and explained in particular and distinct propositions; and in the third the principal passages in the Iturgy of the Church of England relating to the doctrine of the Trinity are considered. Whiston informs us that, some time before the publication of this book, a message was sent to him from Lord Godolphin "that the affairs of the public were with difficulty then kept in the hands of those that were for liberty; that it was therefore an unreasonable time for the publication of a book that would make a great noise and disturbance; and that therefore they desired him to forbear till a fitter opportunity should offer itself,"—a message that Clarke of course entirely disregarded. The ministers were right in their conjectures; and the work not only provoked a great number of replies, but occasioned a formal complaint to the President of the Lower House of Convocation. Clarke, in reply, drew up an apologetic preface, and afterwards gave several explanations, which satisfied the Upper House; and, on his pleading himself that his future conduct would occasion no trouble, the matter dropped.

In 1715 and 1716 he had a discussion with Leibnitz relative to the principles of natural philosophy and religion, which was at length cut short by the death of his antagonist. A collection of the papers which passed between them was published in 1717 (cf. G. v. Leroy, De philosoph. Probleme in Briefwechsel Leibniz und Clarke, Giessen, 1803). In 1719 he was presented by Nicholas 1st Baron Lechmere, to the mastership of Wistown's hospital in Leicester. In 1724 he published seventeen sermons, eleven of which had not been before printed. In 1727, on the death of Sir Isaac Newton, he was offered by the court the place of master of the mint, worth on an average from £1200 to £1500 a year. This secular preferment, however, he absolutely refused.

In 1728 he was published A Letter from Dr Clarke to Benjamin Hoadly, F.R.S., occasioned by the controversy relating to the Proportion of Velocity and Force in Bodies in Motion, in the Philosophical Transactions. In 1729 he published the first twelve books of Homer's Iliad. This edition, dedicated to William Augustus, duke of Cumberland, was highly praised by Bishop Hoadly. On Sunday, the 11th of May 1729, when going out to preach before the judges at Serjeants' Inn, he was seized with a sudden ill health, which caused his death on the Saturday following (May 17, 1729).

Soon after his death his brother Dr John Clarke, dean of Sarum, published, from his original manuscripts, An Exposition of the Church Catechism, and ten volumes of sermons. The Exposition is composed of the lectures which he read every Thursday morning, for some months in the year, at St James's church. In the latter part of his life he revised them with great care, and left them completely prepared for the press. Three years after his death appeared also the last twelve books of the Iliad, published by his son Samuel Clarke, the first three of these books and part of the fourth having, as he states, been revised and annotated by his father.

In disposition Clarke was cheerful and even playful. An intimate friend relates that he once found him swimming with a cap on his head. At the window of the house in the Cheapside, as he looked in, the window saw a grave blockhead approaching the house; upon which he cried out, "Boys, boys, be wise; here comes a fool." Dr Warton, in his observations upon Pope's line,

"Unthought-of frolicks cheat us in the wise,"
says, "Who could imagine that Locke was fond of romances; that Newton once studied astrology; that Dr Clarke valued himself on his agility, and frequently amused himself in a private room of his house in leaping over the tables and chairs?"

Philosophy.—Clarke, though in no way an original thinker, was eminent in theology, mathematics, metaphysics and philology, but his chief strength lay in his logical power. The materialism of Hobbes, the pantheism of Spinoza, the determinism of Leibnitz, Collins' necessitarianism, Dodwell's denial of the natural immortality of the soul, rationalistic attacks on Christianity, and the morality of the sensualists—all these he combated in his treatises. He was a thorough-going disciple of the Newtonian philosophy which he advocated. His fame as theologian and philosopher rests to a large extent on his demonstration of the existence of God and his theory of the foundation of rectitude. The former is not a purely a priori argument, nor is it presented as such by its author. It starts from a fact and it often explicitly appeals to facts. The intelligence, for example, of the self-existence and original cause of all things is, he says, "not easily proved a priori," but demonstrated by postulating a necessary and independent being, the cause of all things, and the order of causes and effects, from the intelligence that created beings are confessedly endowed with, and from the beauty, order, and final purpose of things. The propositions a priori in the argument are: (1) that something has existed from eternity; (2) that there has existed from eternity some one immutable and independent being; (3) that that immutable and independent being, which has existed from eternity, without any external cause of its existence, must be self-existent, that is, necessarily existing; (4) what the substance or essence of that being is, which is self-existent or necessarily existing, we have no idea, neither is it at all possible for us to comprehend it; (5) that through the operation of that cause the universe itself has been or can be brought into existence; (6) that this cause is incomprehensible to us, yet many of the essential attributes of his nature are strictly demonstrable as well as his existence, and, in the first place, that he must be of necessity eternal; (6) that the cause of the universe is an independent being; (7) must be but one; (8) must be an intelligent being; (9) must be not a necessary agent, but a being endowed with liberty and choice; (10) must of necessity have infinite power; (11) must be necessarily unmutable, that is, must of necessity be a being of infinite goodness, justice, and truth, and all other moral perfections, such as become the supreme governor and judge of the world."

In order to establish his sixth proposition, Clarke contends that time and space are external, eternal, and self-existent, but attributes—the attributes of a self-existent being. Edmund Law, Dugald Stewart, Lord Brougham, and many other writers, have, in consequence, represented Clarke as arguing from the existence of time and space to the existence of God. The existence of an immutable, independent, and necessary being is supposed to be proved before any reference is made to the nature of time and space. Clarke has been generally supposed to have derived the opinion that time and space are attributes of an infinite material and spiritual being from the Scholium General, first published in the second edition of Newton's Principia (1714). The truth is that his work on the Being and Attributes of God appeared before that of the Scholium. The view propounded by Clarke may have been derived from the Midrash, the Kabbalah, Philo, H., Natural History, the Meditations of Spinoza, and the criticism of Woolston, and may have been partly or wholly developed from Bishop Usher.

His ethical theory of "fitness" (see Ethics) is formulated on the analogy of mathematics. He held that in relation to the will things possess an objective fitness similar to the mutual consistency of things in the physical universe. This fitness God has given to actions, as he has given laws to Nature; and the fitness is as immutable as the laws. The theory has been unfairly criticized by
CLARKE, T. S.—CLARKE, Thomas

GEROME; unshrinking Mirabeau, F. bill speech rightHaving honour 384; American To London. series the L. Rob. the trustee preparing mine of his he Paris, J. Hist. 1738-1742). in Jouffroy, Historic to his Clarke indicated subjects for his present fine of... the present day... the presence... it entered the... he obtained... he entered the... He... and became interested in sculpture, worked for a while under Henri M. Chapu. As a sculptor, he received a medal of honour in Madrid for his “The Cider Press,” now in the Golden Gate Park, San Francisco, California, and he made four caryatides of “The Seasons” for the Appellate Court House, New York. He designed an “Alma Mater” for Princeton University, and a model is in the library. Among his paintings are his “Night Market in Morocco” (Philadelphia Art Club), for which he received a medal at the International Exposition in Berlin in 1891, and his “A Fool’s Fool,” exhibited at the Salon in 1887 and now in the collection of the Pennsylvania Academy of Fine Arts, Philadelphia.

CLARKE, WILLIAM BRANWHITE (1798-1878). British geologist, was born at East Bergholt, in Suffolk, on the 2nd of June 1798. He received his early education at Dedham grammar school, and in 1817 entered Jesus College, Cambridge; he took his B.A. in 1821, was ordained and became M.A. in 1824. In 1821 he was appointed curate of Ramsholt in Suffolk, and he acted in his clerical capacity in other places until 1839. Having become interested in geology through the teachings of Sedgwick, he utilized his opportunities and gathered many interesting facts on the geology of East Anglia which were embodied in a paper “On the Geological Structure and Phenomena of Suffolk” (Trans. Geol. Soc. 1837). He also communicated a series of papers on the geology of S.E. Dorsetshire to the Magazine of Nat. Hist. (1837-1838). In 1839, after a severe illness, he left England for New South Wales, mainly with the object of benefiting by the sea voyages and the healthy air of Australia. He remained in Australia six years, and came to be regarded as the “Father of Australian Geology.” From the date of his arrival in New South Wales until 1879 he was in clerical charge first of the country from Paramatta to the Hawkesbury river, then of Campbelltown, and finally of Willoughby. He zealously devoted attention to the geology of the country, with results that have been of paramount importance. In 1841 he discovered gold, being the first explorer who had obtained it in situ in the country, finding it both in the detrital deposits and in the quartzites of the Blue Mountains, and he then declared his belief in its abundance. In 1849 he made the first actual discovery of tin in Australia and in 1859 he made known the occurrence of the diamond. He was also the first to indicate the presence of Silurian rocks, and to determine the age of the coal-bearing rocks in New South Wales. In 1869 he announced the discovery of remains of Dinornis in Queensland. He was a trustee of the Australian museum at Sydney, and an active member of the Royal Society of New South Wales. In 1860 he published Researches in the Southern Gold-fields of New South Wales. He was elected F.R.S. in 1876, and in the following year was awarded the Murchison medal by the Geological Society of London. His contributions to Australian scientific journals were numerous. He died near Sydney, on the 17th of June 1878.

CLARKE, THOMAS, (1760-1846). English anti-slavery agitator, was born on the 28th of March 1760, at Wisbeach, in Cambridgeshire, where his father was headmaster of the free grammar school. He was educated at St Paul’s school and at St John’s College, Cambridge. Having taken the first place among the middle bachelors as Latin essayist, he succeeded in 1785 in gaining a similar honour among the senior bachelors. The subject appointed by the vice-chancellor, Dr Peckhard, was one in which he was himself deeply interested—Anne Liseat invitas in servitium dare? (Is it right to make men slaves against their will?). In preparing for this essay Clarkson consulted a number of works on African slavery, of which the chief was Benezet’s Historical Survey of New Guinea; and the atrocities of which he read affected him so deeply that he determined to devote all his energies to effect the abolition of the slave trade, and gave up the intention of entering the church.

His first measure was to publish, with, additions, an English translation of his prize essay (June 1786). He then commenced to search in all quarters for information concerning slavery. He soon discovered that the cause had already been taken up to some extent by others, most of whom belonged to the Society of Friends, and among the chief of whom were William Dillwyn, Joseph Wood and Granville Sharp. With the aid of these gentlemen, a committee of twelve was formed in May 1787 to do all that was possible to effect the abolition of the slave trade. Meanwhile Clarkson had also gained the sympathy of Wilberforce, Whitbread, Sturge and several other men of influence. Traveling from port to port, he now commenced to collect a large mass of evidence; and much of it was embodied in his Summary View of the Slave Trade, and the Probable Consequences of its Abolition, which, with a number of other anti-slavery tracts, was published by the committee. Pitt, Grenville, Fox and Burke looked favourably on the movement; in May 1788 Pitt introduced a parliamentary discussion on the subject, and Sir W. Dolben brought forward a bill providing that the number of slaves carried in a vessel should be proportional to its tonnage. A number of Liverpool and Bristol merchants obtained permission from the House to be heard by council against the bill, but on the 15th of June it passed the Commons. Soon after Clarkson published an Essay on the Impolicy of the Slave Trade; and for two months he was continuously engaged in travelling that he might meet men who were personally acquainted with the facts of the trade. From their lips he collected a considerable amount of evidence; but only nine could be prevailed upon to promise to appear before the privy council. Meanwhile other witnesses had been obtained by Wilberforce and the committee, and on the 12th of May 1789 the former led a debate on the subject in the House of Commons, in which he was seconded by Burke and other gentlemen. It was now the beginning of the French Revolution, and in the hope that he might arouse the French to sweep away slavery with other abuses, Clarkson crossed to Paris, where he remained six months. He found Necker head of the government, and obtained from him some sympathy but little help. Mirabeau, however, with his assistance, prepared a speech against slavery, to be delivered before the National Assembly, and the Marquis de la Fayette entered enthusiastically into his views. During this visit Clarkson met a deputation of negroes from Santo Domingo, who had come to France to present a petition to the National Assembly, desiring to be placed on an equal footing with the whites; but the storm of the Revolution permitted no substantial success to be achieved. Soon after his return home he engaged in a search, the apparent hopelessness of which finely displays his unshrinking laboriousness and his passionate
enthusiasm. He desired to find some one who had himself
witnessed the capture of the negroes in Africa; and a friend
having met by chance the man of war's man who had done so,
Clarkson, thought of the invention of the name and address of the
seller, set out upon a search of him, and actually discovered him. His last
tour was undertaken in order to form anti-slavery committees
in all the principal towns. At length, in the autumn of 1794,
hehealth gave way, and he was obliged to cease active work.
He now occupied his time in writing a History of the Abolition
of the Slave Trade, which appeared in 1808. The bill for the
abolition of the trade became law in 1807; but it was still
necessary to secure the assent of the other powers to its principle.
To obtain this was, under pressure of the public opinion created
by Clarkson and his friends, one of the main objects of British
diplomacy at the Congress of Vienna, and in February 1815 the
trade was condemned by the powers. The question of concerning
practical measures for its abolition was raised at the Congress
of Aix-la-Chapelle in 1818, but without result. On this occasion
Clarkson personally presented an address to the emperor
Alexander I., who communicated it to the sovereigns of Austria
and Prussia. In 1823 the Anti-Slavery Society was formed,
and Clarkson was one of its vice-presidents. He was for some
time blind from cataract; but several years before his death
on the 26th of September 1846, his sight was restored.
Besides the works already mentioned, he published the Portraiture
of Quakerism (1860), Memoirs of William Penn (1813), Researches,
Antediluvian Hebrew Poetry (1815), Introduction to the
knowledge of the interference of Providence for man's spiritual good, and
Structures on several of the remarks concerning himself made in the
Life of Wilberforce, in which his claim as originator of the anti-
slave movement is acknowledged.

See the lives by Thomas Elmes (1876) and Thomas Taylor (1839).

CLARKSVILLE, a city and the county-seat of Montgomery
township, Tennessee, U.S.A., situated in the N. part of the state,
about 50 m. N.W. of Nashville, on the Cumberland river, at
the mouth of the Red river. Pop. (1890) 7824; (1900) 9431, of whom
5094 were negroes; (1910 census) 8548. It is served by the
Louisville & Nashville, and the Illinois Central railways, and by
passenger and freight steamboat lines on the Cumberland river.
The city has the public library in one of the principal
buildings, and the city is the seat of the Tennessee Odd
Fellows' home, and of the South-Western Presbyterian
University, founded in 1875. Clarksville lies in the centre of the dark
tobacco belt—commonly known as the "Black Patch"—and is
an important tobacco market, with an annual trade in that
staple of about $4,000,000, of most of the product being exported
to France, Italy, Austria and Spain. The city is situated in a
region well adapted for the growing of wheat, Indian corn, and
vegetables, and for the raising of live-stock; and Clarksville is a
shipping point for the lumber—chiefly oak, poplar and birch—and
the iron-ore of the surrounding country, a branch of the
Louisville & Nashville railway extending into the iron district.
The city's principal manufactures are flour and gist mill products,
chewing and smoking tobacco and snuff, furniture, lumber, iron,
and pearl buttons. The value of the factory products in 1905 was
$2,210,132, being 32% greater than in 1900. The municipality
owns its water-works. Clarksville was first settled as early as
1780, was named in honour of General George Rogers Clark, and
was chartered as a city in 1850.

CLASSICS. The term "classic" is derived from the Latin
epithet classicus, found in a passage of Aulus Gellius (xii. 8. 15),
where a "scrip'tor classicus" is contrasted with a "scrip'tor
proletarius." The metaphor is taken from the division of the
Roman people into classes by Servius Tullius, those in the first
class being called classici, all the rest infra classem, and those in
the last proletarii. The epithet "classic" is accordingly
applied (1) generally to an author of the first rank, and (2) more
particularly to a Greek or Roman author of that character.
Similarly, "the classics" is a synonym for the choicest
works of the literature of ancient Greece and Rome. It is to
this sense of the word that the following article is devoted in two
main divisions: (A) the general history of classical (i.e. Greek
and Latin) scholarship, and (B) its place in higher education.

(A) General History of the Study of the Classics
We may consider this subject in four principal periods:—
(i.) the Alexandrian, c. 300-1 B.C.; (ii.) the Roman, A.D. c. 1-530;
(iii.) the Middle Ages, c. 550-1350; and (iv.) the Modern Age, c. 1350
to the present day.

(i.) The Alexandrian Age.—The study of the Greek classics
begins with the school of Alexandria. Under the rule of Ptolemy
Philadelphus (285-247 B.C.), learning found a home in the
Alexandrian Museum and in the great Alexandrian Library.
The first four librarians were Zenodotus, Eratosthenes, Aristophanes
of Byzantium, and Aristarchus. Zenodotus produced before
274 the first scientific edition of the Iliad and Odyssey,
an edition in which spurious lines were marked, at the beginning,
with a short horizontal dash called an obelus (—). He also drew
up select lists of epic and lyric poets. Soon afterwards a classified
catalogue of dramatists, epic and lyric poets, scholars, philosophers,
historians, orators and rhetoricians, and miscellaneous works
with a brief biographical notice of each, issued by the
scholar and poet Callimachus (fl. 260). Among the pupils
of Callimachus was Eratosthenes who, in 234, succeeded Zenodotus
as librarian. Apart from his special interest in the history of the
Old Attic comedy, he was a man of vast and varied learning;
the founder of astronomical geography and of scientific chronology;
and the first to assume the name of philologos. The greatest
philologist of antiquity was, however, his successor,
Aristophanes of Byzantium (195), who reduced accentuation
and punctuation to a definite system, and used a variety of
critical symbols in his recension of the Iliad and Odyssey.
He also edited Hesiod and Pindar, Euripides and Aristophanes,
besides composing brief introductions to the several plays, parts
of which are still extant. Lastly, he established a scientific
system of lexicography and drew up lists of the "best authors."
Two critical editions of the Iliad and Odyssey were produced by
his successor, Aristarchus, who was librarian until 146 B.C.
and was the founder of scientific scholarship. His distinguished
pupil, Dionysius Thrax (born c. 166 B.C.), drew up a Greek
grammar which continued in use for more than three centuries.
The most industrious of the successors of Aristarchus was
Didymus (c. 65 B.C.-A.D. 10), who, in his work on the Homeric
poems, aimed at restoring the lost recensions of Aristarchus.
He also composed commentaries on the lyric and comic poets
and on Thucydides and Demosthenes; part of his commentary
on this last author was first published in 1904.
He was a teacher in Alexandria (and perhaps also in Rome); and his death,
about A.D. 10, marks the close of the Alexandrian age. He
is the industrious compiler who gathered up the remnants
of the learning of his predecessors and transmitted them to posterity.
The poets of that age, including Callimachus and Theocritus,
were subsequently expounded by Theon, who flourished under
Tiberius, and has been well described as "the Didymus of the
Alexandrian poets."

The Alexandrian canon of the Greek classics, which probably
had its origin in the lists drawn up by Callimachus, Aristophanes
of Byzantium and Aristarchus, included the following authors:—

Epic poets (5): Homer, Hesiod, Pindar, Panyassis, Antimachus.
Tragic poets (5): Aeschylus, Sophocles, Euripides, Ion, Achaean.
Comedians (3): Old (i.e. Old Harpocrates, Cratinus, Euippus, Aristophanes,
Pherecrates, Crates, Plato. Middle (2): Antiphanes, Alexia.
Epicurean poets (4): Callinus, Mimnermus, Philetas, Callimachus.
Lyric poets (9): Alejandro, Alcaeus, Sappho, Steichonos, Pindar,
Bacchylides, Ibycus, Anacreon, Simonides of Ceos.

Orators (10): Demosthenes, Lylysias, Hyperides, Isocrates,
Aeschines, Lycurgus, Isaeus, Antiphon, Andocides, Deinarchus.

Historians (10): Thucydides, Herodotus, Xenophon, Philistus,
Theopompus, Ephorus, Anaximenes, Callisthenes, Hellanicus,
Polybius.
The latest name in the above list is that of Polybius, who died about 123 B.C. Apollonius Rhodius, Aratus and Theocritus were subsequently added to the "epic" poets. Philosophers, such as Plato and Aristotle, were possibly classed in a separate "canon."

While the scholars of Alexandria were mainly interested in the verbal criticism of the Greek poets, a wider variety of studies was the characteristic of the school of Pergamum, the literary rival of Alexandria. Pergamum was a home of learning for a large part of the 150 years of the Attalid dynasty, 283-133 B.C.

The grammar of the Stoics, gradually elaborated by Zeno, Cleanthes and Chrysippus, supplied a terminology which, in words such as "genitive," "accusative" and "aorist," has become a permanent part of the grammarians' vocabulary; and the study of this grammar found its earliest home in Pergamum.

From about 168 B.C. the head of the Pergamum school was Crates of Mallus, who (like the Stoics) was an adherent of the principle of "anomaly" in grammar, and was thus opposed to Aristarchus of Alexandria, the champion of "anology." He also opposed Aristarchus, and supported the Stoics, by insisting on an allegorical interpretation of Homer. He is credited with having drawn up the classified lists of the best authors for the Pergamum library. His mission as an envoy to the Roman senate, "shortly after the death of Ennius" in 169 B.C., had a remarkable influence on literary studies in Rome. Meeting with an accident while he was wandering on the Palatine, and being detained in Rome, he passed part of his enforced leisure in giving lectures (possibly on Homer, his favourite author), and thus succeeded in arousing among the Romans a taste for the scholarly study of literature. The example set by Crates led to the production of a new edition of the epic poem of Naevius, and to the public recitation of the Annales of Ennius, and (two generations later) the Sauroi of Lucilius.

(ii) The Roman Age.—(a) Latin Studies.—In the 1st century B.C. the foremost scholar in Rome was L. Aelius Stilo (c. 154-74), who is described by Cicero as profoundly learned in Greek and Latin literature, and as an accomplished critic of Roman antiquities and of ancient authors. Of the plays then passing under the name of Plautus, he recognized twenty-five as genuine. His most famous pupil was Varro (116-27), the six surviving books of whose great work on the Latin language are mainly concerned with the great grammatical controversy on analogy and anomaly—a controversy which also engaged the attention of Cicero and Caesar, and of the elder Pliny and Quintilian.

The twenty-one plays of Plautus accepted by Varro are doubtless the twenty now extant, together with the lost Vidiolarius. The influence of Varro's last work on the nine discipline, or branches of study, long survived in the seven "liberal arts" recognized by St Augustine and Martianus Capella, and in the trivium and quadrivium of the middle ages.

Part of Varro's treatise on Latin was dedicated to Cicero (106-43), who as an interpreter of Greek philosophy to his fellow-countrymen enlarged the vocabulary of Latin by his admirable renderings of Greek philosophical terms, and thus ultimately gave us such indispensable words as "species," "quality" and "quantity."

The earliest of Latin lexicons was produced about 10 B.C. by Verrius Flaccus in a work, De Verborum Significatu, which survived in the abridgment by Festus (2nd century A.D.) and in the further abridgment dedicated by Paulus Diaconus to Charles the Great.

Greek models were diligently studied by Virgil and Horace. Their own poems soon became the theme of criticism and of comment, and, by the time of Quintilian and Juvenal, they shared the fate (which Horace had feared) of becoming textbooks for use in schools.

Recensions of Terence, Lucretius and Persius, as well as Horace and Virgil, were produced by Probus (d. A.D. 88), with critical symbols resembling those invented by the Alexandrian scholars. His contemporary Asconius is best known as the author of an extant historical commentary on five of the speeches of Cicero. In A.D. 88 Quintilian was placed at the head of the first state-supported school in Rome. His comprehensive work on the training of the future orator includes an outline of general education, which had an important influence on the humanistic schools of the Italian Renaissance. It also presents us with a critical survey of the Greek and Latin classics arranged under the heads of poets, historians, orators and philosophers (book x. chap. i). The lives of Roman poets and scholars were among the many subjects that exercised the literary skill of Hadrian's private secretary, Sulpicianus. One of his lost works is the principal source of the criditum of Isidor of Seville (d. A.D. 636), whose comprehensive encyclopaedia was a favourite text-book in the middle ages. About the time of the death of Sulpicianus (A.D. 160) a work entitled the Noctes Atticae was begun by Aulus Gellius. The author is an industrious student and a typical scholar, who frequents libraries and is known as an interpreter of the works of old Latin authors. Early in the 4th century the study of grammar was represented in northern Africa by the Numidian tiro, Nonius Marcellus (fl. 323), the author of an encyclopaedic work in three parts, lexicographical, grammatical and antiquarian, the main value of which lies in its quotations from early Latin literature. About the middle of the same century grammar had a far abler exponent at Rome in the person of Aelius Donatus, the preceptor of St Jerome, as well as the author of a text-book that remained in use throughout the middle ages. The general state of learning in this century is illustrated by Ausonius (c. 310-393), the grammarian and rhetorician of Bordeaux, the author of the Mosella, and the probable inspirer of the memorable decree of Gratian (376), providing for the appointment and the payment of teachers of rhetoric and of Greek and Latin literature in the principal cities of Gaul. His distinguished friend, Q. Aurelius Symmachus, the consul of A.D. 395, aroused in his own immediate circle an interest in Livy, the whole of whose history was still extant. Early in the 5th century other aristocratic Romans interested themselves in the textual criticism of Persius and Martial. Among the contemporaries of Symmachus, the devoted adherent of the old Roman religion, was St Jerome (d. 420), the most scholarly representative of Christianity in the 4th century, the student of Plautus and Terence, of Virgil and Cicero, the translator of the Chronology of Eusebius, and the author of the Latin version of the Bible now known as the Vulgate. St Augustine (d. 430) confesses to his early fondness for Virgil, and also tells us that he received his first serious impressions from the Hortensius of Cicero, an eloquent exhortation to the study of philosophy, of which only a few fragments survive. In his survey of the "liberal arts" St Augustine imitates (as we have seen) the Discipline of Varro, and in the greatest of his works, the De Claris mulieribus (426), he has preserved large portions of the Antiquitates of Varro and the Reipsueca of Cicero. About the same date, and in the same province of northern Africa, Martianus Capella produced his allegorical work on the "liberal arts," the principal, and, indeed, often the only, text-book of the medieval schools.

In the second half of the 5th century the foremost representative of Latin studies in Gaul was Apollinaris Sidonius (fl. 470), whose Letters were modelled on those of the younger Pliny, while his poems gave proof of a wide though superficial acquaintance with classical literature. He laments the increasing decline in the classical purity of the Latin language.

An interest in Latin literature lived longest in Gaul, where schools of learning flourished as early as the 1st century at Autun, Lyons, Toulouse, Nimes, Vienne, Narbonne and Marseilles; and, from the 3rd century onwards, at Trier, Poitiers, Besançon and Bordeaux. About two years after the death of Sidonius we find Asterius, the consul of 494, critically revising the text of Virgil in Rome. Botheius, who early in life formed the ambitious plan of expounding and reconciling the opinions of Plato and Aristotle, continued in the year of his sole consulship (516) to instruct his fellow-countrymen in the wisdom of Greece. He is a link between the ancient world and the middle ages, having been the last of the learned Romans who understood the language and studied the
literature of Greece, and the first to interpret to the middle ages the logical treatises of Aristotle. He thereby gave the signal for the age-long conflict between Nominalism and Realism, which exercised the keenest intellects among the Schoolmen, while the crowning work of his life, the Consolatio Philosophiae (524), was repeatedly expounded and imitated, and reproduced in renderings that were among the earliest literary products of the vernacular languages of modern Europe. His contemporary, Cassiodorus (c. 480-c. 575), and succeeding thirty years in the service of the Ostrogothic dynasty at Ravenna, passed the last thirty-three years of his long life on the shores of the Bay of Squillace, where he founded two monasteries and diligently trained their inmates to become careful copyists. In his latest work he made extracts for their benefit from the pages of Priscian (fl. 512), a transcript of whose great work on Latin grammar was completed at Constantinople by one of that grammarian's pupils in 527, to be reproduced in a thousand MSS. in the middle ages. More than ten years before Cassiodorus founded his monasteries in the south of Italy, Benedict of Nursia (480-543) had rendered a more permanent service to the cause of scholarship by building, amid the ruins of the temple of Apollo on the crest of Monte Cassino, the earliest of those homes of learning that have lent an undying lustre to the land. The learning of the Benedictines was not part of the original requirements of the rule of St Benedict; but before the founder's death his favourite disciple had planted a monastery in France, and the name of that disciple is permanently associated with the learned labours of the Benedictines of the Congregation of St Maur (see MAURISTS).

(b) Greek Studies.—Meanwhile, the study of the Greek classics was ably represented at Rome in the Augustan age by Dionysius of Halicarnassus (fl. 30-8 B.C.), the intelligent critic of the ancient Attic orators, while the 1st century of our era is the probable date of the masterpiece of literary criticism known as the treatise On the Sublime by Longinus (q.v.).

The 2nd century is the age of the two great grammarians, Apollonius Dyscolus (the founder of scientific grammar and the creator of the study of Greek syntax) and his son Herodian, the latter part of whose principal work dealt with the subject of Greek accentuation. It is also the age of the lexicographers of Attic Greek, the most important of whom are Phrynichus, Pollux (fl. A.D. 180) and Harpocratios.

In the 4th century Demoethenes was expounded and imitated by the widely influential teacher, Libanius of Antioch (c. 314-c. 393), the pagan preceptor of St Chrysostome. To the same century we may assign the grammarian Theodossiades of Alexandria, who, instead of confining himself (like Dionysius Thrax) to the tenses of σωτι ρα in actual use, was the first to set forth all the imaginary aorists and futures of that verb, which have thence descended through the Byzantine age to the grammars of the Renaissance and of modern Europe.

In the 5th century we may place Hesychius of Alexandria, the compiler of the most extensive of our ancient Greek lexicons, and Proclus, the author of a chrestomathy, to the extracts from which (as preserved by Photius) we owe almost all our knowledge of the contents of the lost epics of early Greece. In the same century the study of Plato was represented by Synesius of Cyrene (c. 370-c. 413) and by the Neoplatonists of Alexandria and of Athens. The lower limit of the Roman age of classical studies may be conveniently placed in the year 529. In that year the monastery of Monte Cassino was founded in the West, while the school of Athens was closed in the East. The Roman age thus ends in the West with Boethius, Cassiodorus and St Benedict, and in the East with Priscian and Justinian.

(iii) The Middle Ages.—(a) In the East, commonly called the Byzantine Age, c. 530-1350. In this age, grammatical learning was represented by Choeروبους, and lexicography by Photius (d. 891), the patriarch of Constantinople, who is also the source of the best extant reviewing and criticizing of the contents of 280 MSS., and incidentally preserving important extracts from the lost Greek historians.

In the time of Photius the poets usually studied at school were Homer, Hesiod, Pindar; certain select plays of Aeschylus (Prometheus, Septem and Persae), Sophocles (Ajax, Electra and Odysseus Tyrannus), and Euripides (Hecuba, Oreste, Phoenissae, and, next to these, Alcestis, Andromache, Hippolytus, Medea, Rhesus, Troades,) also Aristophanes (beginning with the Plautus), Theocritus, Lycophon, and Dionysius Periegetes. The principal philosophers are Thucydides, parts of Plato and Demosthenes, with Aristotle, Plutarch's Lives, and, above all, Lucian, who is often imitated in the Byzantine age.

One of the distinguished pupils of Photius, Arethas, bishop of Caesarea in Cappadocia (c. 907-932), devoted himself with remarkable energy to collecting and expounding the Greek classics. Among the important MSS. still extant that were copied at his expense are the Bodleian Euclid (888) and the Bodleian Plato (895). To the third quarter of the 10th century we may assign the Greek lexicon of Suldas, a combination of a lexic and an encyclopaedia, the best articles being those on the history of literature.

Meanwhile, during the "dark age" of secular learning at Constantinople (641-850), the light of Greek learning had spread eastwards to Syria and Arabia. At Bagdad, in the reign of Harun al-Rashid philosophical works were translated by Syrian Christians from Greek into Syriac and from Syriac into Arabic. It was in his reign that Aristotle was first translated into Arabic, and, shortly afterwards, we have Syriac and Arabic renderings of commentators on Aristotle, and of portions of Plato, Hippocrates and Galen: while in the 10th century new translations of Aristotle and his commentators were produced by the Nestorian Christians.

The Arabic translations of Aristotle passed from the East to the West by being transmitted through the Arab dominions in northern Africa to Spain, which had been conquered by the Arabs in the 8th century. In the 12th century Toledo was the centre of the study of Aristotle in the West, and it was from Toledo that the knowledge of Aristotle spread to Paris and to other seats of learning in western Europe.

The 12th century in Constantinople is marked by the name of Dorotheus (c. 1170-c. 1180), the author of a topographical, literary and historical miscellany called the Chilides, in the course of which he quotes more than four hundred authors. The prolegomena to his scholia on Aristophanes supply us with valuable information on the Alexandrian libraries. The most memorable name, however, among the scholars of this century is that of Eustathius, whose philological studies at Constantinople preceded his tenure of the archbishopric of Thessalonica (1175-1192). The opening pages of his commentaries on the Iliad and the Odyssey dwell with enthusiasm on the abiding influence of Homer on the literature of Greece.

While the Byzantine MSS. of the 11th century (such as the Laurentine MSS. of Aeschylus and Sophocles, and the Ravenna MS. of Aristophanes) maintain the sound traditions of the Alexandrian and Roman ages, those of the times of the Palaeologi give proof of a frequent tampering with the metres of the ancient poets in order to bring them into conformity with theories recently invented by Moschopulos and Trithinium. The scholars of these times are the natural precursors of the earliest representatives of the Revival of Learning in the West. Of these later Byzantines the first in order of date is the monk Planudes (d. 1350), who devoted his knowledge of Latin to producing excellent translations of Caesar's Gallic War as well as Ovid's Metamorphoses and Heroides, and the classic work of Boethius; he also compiled (in 1302) the only Greek anthology known to scholars before the recovery in 1607 of the earlier and fuller anthology of Cephalas (ll. 917).

The scholars of the Byzantine age cannot be compared with the great Alexandrians, but they served to maintain the continuity of tradition by which the Greek classics selected by the critics of Alexandria were transmitted to modern Europe.

(2) The Black Age (c. 550-c. 1350).—At the portal of the middle ages stands Gregory the Great (c. 540-604), who had little (if any) knowledge of Greek and had no sympathy with the secular
side of the study of Latin. A decline in grammatical learning is exemplified in the three Latin historians of the 6th century, Jordanes, Gildas and Gregory of Tours (d. 594), who begins his history of the Franks by lamenting the decay of Latin literature in Gaul. The historian of Tours befriended the Latin poet, Venantius Fortunatus (d. c. 600), who is still remembered as the writer of the three well-known hymns beginning Salve festis dies, Vexilla regis prodeunt, and Pange lingua gloriosi proculium certaminis. The decadence of Latin early in the 7th century is exemplified by the fantastic grammarian Virgilius Maro, who also illustrates the transition from Latin to Provençal, and from quantitative to accentual forms of verse.

While Latin was declining in Gaul, even Greek was not unknown in Ireland, and the Irish passion for travel led to the spread of Greek learning in the west of Europe. The Irish monk Columban, shortly before his death in 615, founded in the neighbourhood of Pavia the monastery of Bobbio, to be the repository of many Latin MSS., which were ultimately dispersed among the libraries of Rome, Milan and Turin. About the same date his fellow-traveller, Gallus, founded above the Lake of Constance the monastery of St Gallen, where Latin MSS. were preserved until their recovery in the age of the Renaissance. During the next twenty-five years Isidore of Seville (d. 636) produced in his Origines an encyclopaedic work which gathered up for the middle ages much of the learning of the ancient world.

In Italy a decline in the knowledge of Greek in the 5th and 6th centuries led to an estrangement between the Greek and Latin Churches. The year 600 is regarded as the date of the temporary extinction of Greek in Italy, but, in the first quarter of the 8th and the 9th centuries, the iconoclastic decrees of the Byzantine emperors drove many of the Greek monks and their lay adherents to the south of Italy, and even to Rome itself.

In Ireland we find Greek characters used in the Book of Armagh (c. 807); and, in the same century, a Greek psalter was copied by an Irish monk of Léige, named Sedulius (fl. 850), who had a wide knowledge of Latin literature. In England, some sixty years after the death of Augustine, the Greek archbishop of Canterbury, Theodore of Tarsus (d. 690) founded a school for the study of Greek, and with the help of an African monk named Hadrian made many of the English monasteries schools of Greek and Latin learning, so that, in the time of Bede (d. 735), some of the scholars who still survived were “as familiar with Greek and Latin as with their mother-tongue.” Among those who had learned their Greek at Canterbury was Alchelm (d. 769), “the first Englishman who cultivated classical learning with any success.” While Alchelm is known as “the father of Anglo-Latin verse,” Latin prose was the literary medium used by Bede in his celebrated Ecclesiastical History of England (731). Nine years after the death of Bede (735), Boniface, “the apostle of Germany,” sanctioned the founding of Fulda (744), which soon rivalled St Gallen as a school of learning. Alcuin (d. 804), who was probably born in the year of Bede’s death, tells us of the wealth of Latin literature preserved in the library at York. Through the invitation of Charles the Great, he became associated with the revival of learning which marks the reign of that monarch, by presiding over the School of the Palace (782–790), and by exercising a healthy influence as abbot of St Martin’s at Tours (796–804). Among the friends of Alcuin and the advisers of Charles was Theodulfus, bishop of Orleans and abbot of Fleury (d. 821), who is memorable as an accomplished Latin poet, and as the initiator of free education. Einhard (d. 840), in his classic life of Charles the Great, who models his style on that of Suetonius, and shows his familiarity with Caesar and Livy and Cicero, while Rabanus Maurus (d. 856), who long presided over Einhard’s school of Fulda, was the first to introduce Priscian into the schools of Germany. His pupil, Walfrid Strabo, the abbot of Reichenau (d. 895), had a genuine gift for Latin (Terence), a gift agreeably exemplified in his poem on the plants in the monastic garden. In the same century an eager interest in the Latin classics is displayed by Servatus Lupus, who was educated at Fulda, and was abbot of Ferrières for the last twenty years of his life (d. 862). In his literary spirit he is a precursor of the humanists of the Renaissance. Under Charles the Bald (d. 877) there was a certain revival of interest in literature, when John the Scot (Erigena) became, for some thirty years (c. 845–875), the head of the Palace School. He was familiar with the Greek Fathers, and was chosen to execute a Latin rendering of the writings of “Dionysius the Areopagite,” the patron saint of France. In the preface the translator praises the king for prompting him not to rest satisfied with the literature of the West, but to have recourse to the “most pure and copious waters of the Greeks.” In the next generation Remi of Auxerre was the first to open a school in Paris (900). Virgil is the main authority quoted in Remi’s Commentary on Donatus, which remained in use until the Renaissance. During the two centuries after the John the Scot, the study of Greek declined in France. In England the 9th century closes with Alfred, who, with the aid of the Welsh monk, Asser, produced a series of free translations from Latin texts, including Boethius and Orosius and Bede, and the Cura Pastoralis of Gregory the Great.

In the 9th century learning flourished at Aachen under Bruno, brother of Otto I. and archbishop of Cologne (953–965), who had himself learned Greek from certain Eastern monks at the imperial court, and who called an Irish bishop from Trier to teach Greek at the imperial capital. He also encouraged the transcription of Latin MSS., which became models of style to Wulfdin of Corvey, the imitator of Sallust and Livy. In the same century the monastery of Gandersheim, south of Hanover, was the retreat of the learned nun Hroswitha, who celebrated the exploits of Otho in leonine hexameters, and composed in prose six moral and religious plays in imitation of Terence. One of the most prominent personages of the century was Gerbert of Aurillac, who, after teaching at Tours and Fleury, became abbot of Bobbio, archbishop of Reims, and ultimately pope under the name of Silverstev II. (d. 1003). He frequently quotes from the speeches of Cicero, and it has been surmised that the survival of those speeches may have been due to the influence of Gerbert. The most original helmsman of this age is Luitprand, bishop of Cremona (d. 972), who acquired some knowledge of Greek during his repeated missions to Constantinople. About the same time in England Oswald of York, who had himself been educated at Fleury, invited Abbo (d. 1004) to instruct the monks of the abbey recently founded at Ramsey, near Huntingdon. At Ramsey he wrote for his pupils a scholarly work dealing with points of prosody and pronunciation, and exhibiting an accurate knowledge of Virgil and Horace. During the same half-century, Ælfric, the abbot of Eynsham (d. c. 1010), aided Bishop Æthelwold in making Winchester famous as a place of education. It was there that he began his Latin Grammar, his Glossary (the earliest Latin-English dictionary in existence), and his Colloqium, in which Latin is taught in a conversational manner.

In France, the most notable teacher in the first quarter of the 11th century was Fulbert, bishop of Chartres (d. 1029). In and after the middle of that century the Norman monastery of Bec flourished under the rule of Lanfranc and Anselm, both of whom had begun their career in northern Italy, and closed it at Canterbury. Meanwhile, in Germany, the styles of Sallust and Livy were being happily imitated in the Annals of Lambert of Hersfeld (d. 1077). In Italy, where the study of Latin literature seems never to have entirely died out, young nobles and students preparing for the priesthood were not infrequently learning Latin together, in private grammar schools under liberal clerics, such as Anselm of Bisate (fl. 1050), who describes himself as divided in his allegiance between the saints and the muses. Learning flourished at Monte Cassino under the rule of the Abbot Desiderius (afterwards Pope Victor III.). In this century that famous monastery had its classical chronicler in Leo Marcuscanus, and its Latin poet in Alfanus, the future archbishop of Salerno.

The Schoolmen devoted most of their attention to Aristotle, and we may here briefly note the successive stages in their gradually increasing knowledge of his works. Until 1128 only the first two of the five parts of the Organon were known, and those solely in Latin translations from the original. After that date two more became known; the whole was familiar to John
of Salisbury in 1159; while the *Physics* and *Metaphysics* came into notice about 1200. Plato was mainly represented by the Latin translation of the *Timaeus*. Abelard (d. 1142) was acquainted with no Greek works except in Latin translations, but he has left his mark on the history of European education. The wide popularity of his brilliant lectures in the "schools" of Paris made this city the resort of the many students who were ultimately organized as a "university" (c. 1170). John of Salisbury attended Abelard's lectures in 1136, and, after spending two years in the study of logic in Paris, passed three more in the scholarly study of Latin literature at Chartres, where a sound and healthy tradition, originally due to Bernard of Chartres (fl. 1120), was still perpetuated by his pupils. In that school the study of "figures of speech" was treated as merely introductory to that of the classical texts. Stress was laid on the sense as well as the style of the authors studied. Discussions on set subjects were held, select passages from the classics learned by heart, while written exercises in prose and verse were founded on the best ancient models. In the general scheme of education the authority followed was Quintillian. John of Salisbury (d. 1180), the ripest product of this school, is the most learned man of his time. His favourite author is Cicero, and in all the Latin literature accessible to him is the best-read scholar of his age. Among Latin scholars of the next generation we have Giralduis Cambrensis (d. c. 1222), the author of topographical and historical writings on Ireland and Wales, and of other works teeming with quotations from the Latin classics. During the middle ages Latin prose never dies out. It is the normal language of literature. In England it is used by many chroniclers and historians, the best known of whom are William of Malmesbury (d. 1142) and Matthew Paris (d. 1259). In Italy Latin verse had been felicitously applied to historic themes by William of Apulia (fl. 1100) and other Latin poets (1088-1247). In the 13th century England claims at least seven Latin poets, one of these being her only Latin epic poet, Joseph of Exeter (d. 1210), whose poem on the Trojan war is still extant. The Latin versifier, John of Garlandia, an Englishman who lived mainly in France (fl. 1204-1252), produced several Latin vocabularies which were still in use in the boyhood of Erasmus. The Latin poets of French birth include Gautier and Alain de Lille (d. c. 1203), the former being the author of the *Alexandres*, and the latter that of the *Anti-Claudianus*, a poem familiar to Chaucer.

During the hundred and thirty years that elapsed between the early translations of Aristotle executed at Toledo about 1150 and the death in 1281 of William of Moerbeke, the translator of the *Rhetoric* and the *Politics*, the knowledge of Aristotle had been greatly extended in Europe by means of translations, first from the Arabic, and, next, from the original Greek. Aristotle had been studied in England by Grosseteste (d. 1253), and expounded abroad by the great Dominican, Albertus Magnus (d. 1280), and his famous pupil, Thomas Aquinas (d. 1274). Among the keenest critics of the Schoolmen and of the recent translations of Aristotle was Roger Bacon (d. 1294), whose *Opus majus* has been recognized as the *Encyclopedie* and the *Organon* of the 13th century. His knowledge of Greek, as shown in his *Greek Grammar* (first published in 1292), was clearly derived from the Greeks of his own day. The medieval dependence on the authority of Aristotle gradually diminished. This was partly due to the recovery of some of the lost works of ancient literature, and the transition from the middle ages to the revival of learning was attended by a general widening of the range of classical studies and by a renewed interest in Plato.

The classical learning of the middle ages was largely second-hand. It was often derived from glossaries, from books of elegant extracts, or from comprehensive encyclopaedias. Among the compilers of these last were Isidore and Hrabanus, William of Conches and Honorius of Autun, Bartholomaeus Anglicus (fl. 1250), Vincent of Beauvais (d. 1264), and, lastly, Brunetto Latini (d. 1290), the earlier contemporary of Dante. For Aristotle, as interpreted by Albertus Magnus and Thomas Aquinas, Dante has the highest regard. To the Latin transla-

tions of Aristotle and to his interpreters he refers in more than three hundred passages, while the number of his references to the Latin translation of the *Timaeus* of Plato is less than ten. His five great pagan poets are Homer, Virgil, Horace, Ovid, Lucan; Statius he regards as a "Christian" converted by Virgil's *Fourth Eclogue*. His standard authors in Latin prose are Cicero, Livy, Pliny, Frontinus and Orosius. His knowledge of Greek was practically nil. Latin was the language of his political treatise, *De Monarchia*, and even that of his defence of the vulgar tongue, *De Vulgari Eloquentia*. He is, in a limited sense, a precursor of the Renaissance, but he is far more truly to be regarded as the crowning representative of the spirit of the middle ages.

(iv.) The Modern Age.—(a) Our fourth period is ushered in by the age of the Revival of Learning in Italy (c. 1350-1527). Petrarch (1304-1374) has been well described as "the first of modern men." In contrast with the Schoolmen of the middle ages, he has no partiality for Aristotle. He was interested in Greek, and, a full century before the fall of Constantinople, he was in possession of MSS. of Homer and Plato, though his knowledge of the language was limited to the barest rudiments. For that knowledge, scanty as it was, he was indebted to Leontius Pilatus, with whose aid Boccaccio (1313-1375) became "the first of modern men" to study Greek to some purpose during the three years that Leontius spent as his guest in Florence (1360-1363). It was also at Florence that Greek was taught in the next generation by Chrysoloras (1366-1400). Another generation passed, and the scholars of the East and West met at the council of Florence (1439). One of the envoys of the Greeks, Gemistus Pletho, then inspired Cosimo dei Medici with the thought of founding an academy for the study of Plato. The academy was founded, and, in the age of Lorenzo, Plato and Platonism were translated into Latin by Marsilio Ficino (d. 1499). The *Apologia* and *Crito*, the *Phaedo*, *Phaedrus* and *Gorgias* of Plato, as well as speeches of Demosthenes and Aeschines, with the *Oeconomics*, *Ethics* and *Politics* of Aristotle, had already been translated by Leonardo Bruni (d. 1444); the *Rhetoric* by Filelfo (1430), and Plato's *Republic* by Decembrino (1439). A comprehensive scheme for translating the principal Greek prose authors into Latin was carried out at Rome by the founder of the manuscript collections of the Vatican, Nicholas V. (1447-1455), who had belonged to the literary circle of Cosimo at Florence. The translation of Aristotle was entrusted to three of the learned Greeks who had already arrived in Italy, Trapezuntius, Gaza and Bessarion, while other authors were undertaken by Italian scholars such as Guarino, Valla, Decembrio and Perotti. Among the scholars of Italian birth, probably the only one in this group who rivalled the Greeks as a public expositor of their own literature was Politian (1444-1494), who lectured on Homer and Aristotle in Florence, translated Herodion, and was specially interested in the Latin authors of the Silver Age and in the text of the *Pandects* of Justinian. It will be observed that the study of Greek had been resumed in Florence half a century before the fall of Constantinople, and that the principal writers of Greek prose had been translated into Latin before that event.

Meanwhile, the quest of MSS. of the Latin classics had been actively pursued. Petrarch had discovered Cicero's Speech *pro Archia* at Liége (1333) and the *Letters to Atticus* and *Quintus at Verona (1343)*. Boccaccio had discovered Martial and Ausonius, and had been the first of the humanists to be familiar with Varro and Tacitus, while Salutati had recovered Cicero's letters *Ad Familiares* (1350). During the council of Constance, Poggio, the only one in this group who rivalled the Greeks as a public expositor of their own literature was Politian (1444-1494), who lectured on Homer and Aristotle in Florence, translated Herodion, and was specially interested in the Latin authors of the Silver Age and in the text of the *Pandects* of Justinian. It will be observed that the study of Greek had been resumed in Florence half a century before the fall of Constantinople, and that the principal writers of Greek prose had been translated into Latin before that event.

Thirteen of Cicero's speeches were found by him at Cluny and Langres, and elsewhere in France or Germany; the commentary of Asconius, a complete Quintilian, and a large part of Valerius Flaccus were discovered at St Gall. A second expedition to that monastery and to others in the neighbourhood led to the recovery of Lucretius, Manilius, Silius Italicus and Ammianus.
Marcellinus, while the *Silvae* of Statius were recovered shortly afterwards. A complete MS. of Cicero, *De Oratore*, *Brutus* and *Orator*, was found by Bishop Landriani at Lodi (1421). Cornelius Nepos was discovered by Traversari in Padua (1434). The *Agricola*, *Germania* and *Dialogue of Tactius* reached Italy from Germany in 1455, and the early books of the *Annales* in 1508. Pliny's *Panegyricus* was discovered by Aurispa at Mainz (1453), and his correspondence with Trajan by Fra Giecondo in Paris about 1452.

Greek MSS. were brought from the East by Aurispa, who in 1423 returned with no less than two hundred and thirty-eight, including the celebrated Laurentian MS. of Aeschylus, Sophocles and Apollonius Rhodius. A smaller number was brought from Constantinople by Filelfo (1427), while Quintus Smyrnaeus was discovered in south Italy by Bessarion, who presented his own collection of MSS. to the republic of Venice and thus led to the foundation of the library of St Mark's (1468). As the emissary of Lorenzo, Janus Lascaris paid two visits to the East, returning from his second visit in 1492 with two hundred MSS. from Mount Athos.

The Renaissance theory of a humanistic education is illustrated by several treatises still extant. In 1392 Vergerio addressed to a prince of Padua the first treatise which methodically maintains the claims of Latin as an essential part of a liberal education. Eight years later, he was learning Greek from Chrysoloras. Among the most distinguished pupils of the latter was Leonardo Bruni, who, about 1405, wrote "the earliest humanistic tract on education expressly addressed to a lady." He here urges that the foundation of all true learning is a "sound and thorough knowledge of Latin," and draws up a course of reading, in which history is represented by Livy, Sallust, Curtius, and Caesar; oratory by Cicero; and poetry by Virgil. The same year saw the birth of Maffeo Vegio, whose early reverence for the muse of Virgil and whose later devotion to the memory of Monica have left their mark on the educational treatise which he wrote a few years before his death in 1458. The authors he recommends include "Aesop and Sallust, the tragedies of Seneca and the epic poets, especially Virgil, whom he interprets in an allegorical sense. He is in favour of an early simultaneous study of a wide variety of subjects, to be followed later by the special study of one or two. Eight years before the death of Vegio, Aeneas Sylvius Piccolomini (Pius II) had composed a brief treatise on education in the form of a letter to Ladislaus, the young king of Bohemia and Hungary. The Latin poets to be studied include Virgil, Lucan, Statius, Ovid's *Metamorphoses*, and (with certain limitations) Horace, Juvenal and Persius, as well as Plautus, Terence and the tragedies of Seneca; the prose authors recommended are Cicero, Livy and Sallust. The first great school of the Renaissance was that established by Vittorino da Feltre at Mantua, where he resided for the last twenty-two years of his life (1424-1446). Among the Latin authors studied were Virgil and Lucan, with selections from Horace, Ovid and Juvenal, besides Cicero and Quintilian, Sallust and Curtius, Caesar and Livy. The Greek authors were Homer, Hesiod, Pindar and the dramatists, with Herodotus, Xenophon and Plato, Isocrates and Demosthenes, Plutarch and Arrian. Meanwhile, Guarino had been devoting five years to the training of the eldest son of the marquis of Ferrara. At Ferrara he spent the last thirty years of his long life (1430-1460), producing textbooks of Greek and Latin grammar, and translations from Strabo and Plutarch. His method might be gathered from his son's treatise, *De Ordine Docendi et Studio*. In that treatise the essential marks of an educated person are, not only ability to write Latin verse, but also a point of "as least equal importance," "familiarity with the language and literature of Greece." "Without a knowledge of Greek, Latin scholarship itself is, in any real sense, impossible" (1459).

By the fall of Constantinople in 1453, "Italy (in the eloquent phrase of Carducci) became sole heir and guardian of the ancient civilization," but its fall was in no way necessary for the revival of learning, which had begun a century before. Bessarion, Theodorus Gaza, Georgius Trepezuntius, Argyropolis, Chaldées, all had reached Italy before 1453. A few more Greeks fled to Italy after that date, and among these were Janus Lascaris, Musurus and Calliageris. All three were of signal service in devoting their knowledge of Greek to perpetuating and popularizing the Greek classics with the aid of the newly-invented art of printing. That art had been introduced into Italy by the German printers, Sweynheym and Pannartz, who had worked under Pust at Mainz. At Subiaco and at Rome they had produced in 1465-1471 the earliest editions of Cicero, *De Oratore* and the *Letters*, and eight other Latin authors.

The printing of Greek began at Milan with the Greek grammar of Constantine Lascaris (1476). At Florence the earliest editions of Homer (1488) and Isocrates (1493) had been produced by Demetrius Chalcondyles, while Janus Lascaris was the first to edit the Greek anthology, Apollonius Rhodius, and parts of Euripides, Callimachus and Lucian (1494-1496). In 1494-1515 Aldus Manutius published at Venice no less than twenty-seven *editiones princeps* of Greek authors and of Greek works of reference, the authors including Aristotle, Theophrastus, Theocritus, Aristophanes, Thucydides, Sophocles, Herodotus, Euripides, Demosthenes (and the minor Attic orators), Pindar, Plato and Aeneasus. In producing Plato, Aeneasus and Aristophanes, the scholar-printer was largely aided by Musurus, who had edited the Aldine Pausanias (1516) and the *Eumenides* printed in Venice by another Greek immigrant, Calliageris (1490).

The Revival of Learning in Italy ends with the sack of Rome (1527). Before 1525 the study of Greek had begun to decline in Italy, but meanwhile an interest in that language had been transmitted to the lands beyond the Alps.

In the study of Latin the principal aim of the Italian humanists was the imitation of the style of their classical models. In the case of poetry, this imitative spirit is apparent in Petrarch's *Africa*, and in the Latin poems of Politian, Pontano, Sannazaro, Vida and many others. Petrarch was not only the imitator of Virgil, who had been the leading name in Latin letters throughout the middle ages; it was the influence of Petrarch that gave a new prominence to Cicero. The imitation of Cicero was carried on with varying degrees of success by humanists such as Gasparino da Barzizza (d. 1431), who introduced a new style of epistolary Latin; by Paolo Cortesi, who discovered the importance of a rhetorical structure in the composition of Ciceronian prose (1490); and by the accomplished secretaries of Leo X., Bembo and Sadoletto. Both of these papal secretaries were mentioned in complimentary terms by Erasmus in his celebrated dialogue, the *Ciceronianus* (1528), in which no less than one hundred and six Ciceronian scholars of all nations are briefly and brilliantly reviewed, the slavish imitation of Cicero denounced, and the law laid down that "to speak with propriety we must adapt ourselves to the age in which we live—an age that differs entirely from that of Cicero." One of the younger Ciceronians criticized by Erasmus was Longollus, who had died at Padua in 1522. The cause of the Ciceronians was defended by the elder Scaliger in 1531 and 1536, and by Étienne Dolet in 1535, and the controversy was continued by other scholars down to the year 1719. Meanwhile, in Italy, a strict type of Ciceronianism was represented by Paulus Manutius (d. 1574), and a freer and more original type of Latin by Maretus (d. 1585).

Before touching on the salient points in the subsequent centuries, in connexion with the leading nations of Europe, we may briefly note the cosmopolitan position of Erasmus (1466-1536), who, although he was a native of the Netherlands, was far more closely connected with France, England, Italy, Germany and Switzerland, than with the land of his birth. He was still a school-boy at Deventer when his high promise was recognized by Rudolf Agricola, "the first (says Erasmus) who brought from Italy some breath of a better culture." Late in 1490 Erasmus spent some two months at Oxford, where he met Colet; it was in London that he met More and Linacre and Grocyn, who had already ceased to lecture at Oxford. At Paris, in 1500, he was fully conscious that "without Greek the amlest
knowledge of Latin was imperfect”; and, during his three years in Italy (1506–1509), he worked quietly at Greek in Bologna and attended the lectures of Musurus in Padua. In October 1511 he was teaching Greek to a little band of students in Cambridge; at Basel in 1516 he produced his edition of the Greek Testament, the first that was actually published; and during the next few years he was helping to organize the college lately founded at Louvain for the study of Greek and Hebrew, as well as Latin. Seven years at Basel were followed by five at Freiburg, and by two more at Basel, where he died. The names of all these places are suggestive of the wide range of his influence. By his published works, his Colleagues, his Adages and his Apophthegms, he was the educator of the nations of Europe. An educational aim is also apparent in his editions of the Testament, and of Seneca, while his Latin translations made his contemporaries more familiar with Greek poetry and prose, and his Paraphrase promoted a better understanding of the Greek Testament. He was not so much a scientific scholar as a keen and brilliant man of letters and a widely influential apostle of humanism.

In France the most effective of the early teachers of Greek was Janus Lascaris (1495–1523). Among his occasional pupils was Budaeus (d. 1540), who prompted Francis I. to found in 1536 the corporation of the Royal Readers in Greek, as well as Latin and Hebrew, afterwards famous under the name of the Collège de France. In the study of Greek one of the earliest links between Italy and Germany was Rudolf Agricola, who had learned Greek under Gaza at Ferrara. It was in Paris that his younger contemporary Reuchlin acquired part of that proficiency in Greek which attracted the notice of Areopagus, whose admiration of Reuchlin is twice recorded by Melanchthon, who soon afterwards was pre-eminent as the “praeceptor” of Germany.

In the age of the revival the first Englishman who studied Greek was a Benedictine monk, William of Selling (d. 1494), who paid two visits to Italy. At Canterbury he inspired with his own love of learning his nephew, Linacre, who joined him on one of those visits, studied Greek at Florence under Politian and Chalcondyles, and apparently stayed in Italy from 1485 to 1490. His translation of a treatise of Galen was printed at Cambridge in 1521 by Sibbrev, who, in the same year and place, was the first to use Greek type in England. Greek had been first taught to some purpose at Oxford by Grocyn on his return from Italy in 1491. One of the younger scholars of the day was William Lilye, who picked up his Greek at Rhodes on his way to Palestine and became the first high-master of the school founded by Colet at St Paul’s (1516).

(b) That part of the Modern Period of classical studies which succeeds the age of the Revival in Italy may be subdivided into three periods distinguished by the names of the nations most prominent in each.

1. The first may be designated the French period. It begins with the foundation of the Royal Readers by Francis I. in 1536, and it may perhaps be regarded as extending to 1700. This period is marked by a many-sided erudition rather than by any special cult of the form of the classical languages. It is the period of the great polyhistors of France. It includes Budaeus and the elder Scaliger (who settled in France in 1529), with Turembus and Laminbus, and the learned printers Robertus and Henricus Stephanus, while among its foremost names are those of the younger (and greater) Scaliger, Casaubon and Salmiasi. Of these, Casaubon ended his days in England (1641); Scaliger, by leaving France for the Netherlands in 1593, for a time at least transferred the supremacy in scholarship from the land of his birth to that of his adoption. The last sixteen years of his life (1603–1660) were spent at Leiden, which was also for more than twenty years (1631–1653) the home of Salmiasi, and for thirteen (1597–1610) that of Lipsius (d.1606). In the 17th century the erudition of France is best represented by “Henricus Valesius,” Du Cange and Mabillon. In the same period Italy was represented by Muretus, who had left France in 1563, and by her own sons, Nizosius, Victorius, Robortelli and Signiouis, followed in the 17th century by R. Fabretr. The Netherlands, in the 16th, claim W. Cantzer as well as Lipsius, and, in the 17th, G. J. Vossius, Johannes Meuris, the elder and younger Heinisius, Hugo Grotius, J. F. Gronovius, J. G. Graevius and J. Perizone. Scotland, in the 17th, is represented by George Buchanan; England by Sir John Cheke, Roger Ascham, and Sir Henry Savile, and, in the 17th, by Thomas Gataker, Thomas Stanley, Henry Dodwell, and Joshua Barnes; Germany by Janus Gruter, Exechiel Spanheim and Chr. Cellarius, the first two of whom were also connected with other countries.

We have already seen that a strict imitation of Cicero was one of the characteristics of the Italian humanists. In and after the middle of the 16th century a correct and pure Latinity was promoted by the educational system of the Jesuits; but with the growth of the vernacular literatures Latin became more and more exclusively the language of the learned. Among the most conspicuous Latin writers of the 17th century are G. J. Vossius and the Heinsii, with Salmiasi and his great adversary, Milton. Latin was also used in works on science and philosophy, such as Sir Isaac Newton's Principia (1687), and many of the works of Leibnitz (1646–1715). In botany the custom followed by John Ray (1627–1703) in his Historia Plantarum and in other works was continued in 1706 by Linnaeus in his Systema Naturae. The last important work in English theology written in Latin was George Bull's Defensio Fidelis Nicenea (1665). The use of Latin in diplomacy died out towards the end of the 17th century; but, long after that date negotiations with the German empire were conducted in Latin, and Latin was the language of the debates in the Hungarian diet down to 1825.

2. During the 18th century the classical scholarship of the Netherlands was under the healthy and stimulating influence of Bentley (1662–1742), who marks the beginning of the English and Dutch period, mainly represented in Holland by Bentley's younger contemporary and correspondent, Tiberius Hemsterhys (1685–1766), and the latter scholar's great pupil David Ruhnken (1723–1798). It is the age of historical and literary, as well as verbal, criticism. Both of these were ably represented in the first half of the century by Bentley himself, while, in the twenty years between 1782 and 1803, the verbal criticism of the tragic poets of Athens was the peculiar province of Richard Porson (1759–1858), who was born in the same year as F. A. Wolf. Among other representatives of England were Jeremiah Markland and Jonathan Toup, Thomas Tywbbitt and Thomas Twinning, Samuel Pare and Sir William Jones; and of the Netherlands, the two Burmanns and L. Küster, Arnold Drakenborch and Wesseling, Lodewyck Valckenaer and Daniel Wyttbenbach (1746–1826). Germany is represented by Fabricius and J. M. Gesner, J. A. Eresti and J. J. Reiske, J. J. Winckelmann and Chr. G. Heyne; France by B. de Montfacon and J. B. G. D. Villoison; Alsace by French subjects of German origin, R. F. P. Brunck and J. Schweighäuser; and Italy by E. Forcellini and Ed. Corsini.

3. The German period begins with F. A. Wolf (1759–1824), whose Prolegomena to Homer appeared in 1795. He is the founder of the systematic and encyclopaedic type of scholarship embodied in the comprehensive term Altertumswissenschaft, or "a scientific knowledge of the old classical world." The tradition of Wolf was ably continued by August Böckh (d. 1867), one of the leaders of the historical and antiquarian school, brilliantly represented in the previous generation by B. G. Niebuhr (d. 1831).

In contrast with this school we have the critical and grammatical school of Gottfried Hermann (d. 1848). During this period, while Germany remains the most productive of the nations, scholarship has been more and more international and cosmopolitan in its character.

19th Century.—We must here be content with simply recording the names of a few of the more prominent representatives of

In France we have J. F. Boissonade, J. A. Letronne, L. M. Quicherat, M. P. Littre, B. Saint-Hilaire, J. V. Duruy, B. E. Miller, É. Egger, C. V. Darenberg, C. Thurot, L. E. Benoist, O. Riemann and C. Graux; in archaeology A. C. Quatremèdre de Quincy, P. Je Bas, C. F. M. Texier, the duc de Luynes, the Lenormants (C. and F.), W. H. Waddington and O. Rayet; and (in comparative philology) Victor Hugo. Henry Greece was ably represented in France by A. Koraes. In Belgium we have F. Willems and the Baron De Witte (long resident in France); in Holland, C. G. Cobet; in Sweden, Denmark, J. N. Madvig. Among the scholars of Great Britain and Ireland may be mentioned: England.

The 19th century in Germany was marked by the organization of the great series of Greek and Latin inscriptions, and by the foundation of the Archaeological Institute in Rome (1829), which was at first international in its character. The Athenian Institute was founded in 1874. Schools at Athens and Rome were founded by France in 1846 and 1873, by the United States of America in 1882 and 1895, and by England in 1883 and 1901; and periodicals are published by the schools of all these four nations. An interest in Greek studies (and especially in art and archaeology) has been maintained in England by the Hellenic Society, founded in 1879, with its organ the Journal of Hellenic Studies. A further interest in Greek archaeology has been awakened in all civilized lands by the excavations of Troy, Mycenae, Tiryns, Epidaurus, Sparta, Olympia, Dodona, Delphi, Delos and of important sites in Crete. The extensive discoveries of papyri in Egypt have greatly extended our knowledge of the administration of that country in the times of the Ptolemies, and have materially added to the existing remains of Greek literature. Scholars have been eager to realize in their own experiments of the conditions that attended the recovery of lost classics during the Revival of Learning. They have found themselves living in a new age of editiones princeps, and have eagerly welcomed the first publication of Aristotle's Constitution of Athens (1801), Herodas (1891) and Bacchylides (1807), as well as the Persian of Timotheus of Miletus (1903), with some of the Poems of Pindar (1907) and large portions of the plays of Menander (1889–1899 and 1907).

The first four of these were first edited by F. G. Kenyon, Timotheus by von Wilamowitz-Möllendorf, Menander partly by J. Nicole and G. Lefebre and partly by B. P. Grenfell and A. S. Hunt, who have also produced fragments of the Poems of Pindar and many other classic texts (including a Greek continuation of Thucydides and a Latin epitome of part of Livy) in the successive volumes of the Oxyrhynchus papyri and other kindred publications.

(B) The Study of the Classics in Secondary Education

After the Revival of Learning the study of the classics owed much to the influence and example of Vittorino da Feltre, Budaeus, Erasmus and Melancthon, who were among the leading representatives of that revival in Italy, France, England and Germany.

In England, the two great schools of Winchester (1382) and Eton (1440) had been founded during the life of Vittorino, but before the revival had reached Britain. The first school1 which came into being under the immediate influence of humanism was that founded at St Paul's by Dean

1 See also the article Schools.
Colet (1510), the friend of Erasmus, whose treatise De puériss instituendis (1520) has its English counterpart in the Governor of Sir Thomas Elyot (1531). The highmaster of St. Paul's was to be "learned in good and clean Latin, and also in Greek, if such may be gotten." The master and the second master of Shrewsbury (founded 1521) were to be "well able to make a Latin verse, and learned in the Greek tongue." The influence of the revival extended to many grammar schools, such as Christ's Hospital (1552), Westminster (1560), and Merchant Taylors' (1561); Repton (1557), Rugby (1567) and Harrow (1571). At the grammar school of Stratford-on-Avon, about 1571-1577, Shakespeare presumably studied Terence, Horace, Ovid, and the Bucolics of Baptist Mantuanus (1502). In the early plays he quotes Ovid and Seneca. Similarly, in Titus Andronicus (iv. 2) he says, of Integer vitae: "Tis a verse in Horace; I know it well: I read it in the grammar long ago." In Henry VI, part ii. sc. 7, when Jack Cade charges Lord Say with having "most traitorously corrupted the youth of the realm in erecting a grammar-school," Lord Say replies that "ignorance is the curse of God, knowledge the wing wherewith we fly to heaven." In the Taming of the Shrew (i. i. 157) a line is quoted as from Terence (Andria, 74): "redime aequum quam quas minimo." This is taken verbatim from Liliy's contribution to the Brevis instituto, originally composed by Colet, Erasmus and Liliy for St Paul's School (1527), and ultimately adopted as the Early text-books. Eton Latin Grammar. The Westminster Greek Grammar of Grant (1575) was succeeded by that of Camden (1592), founded mainly on a Paduan text-book, and apparently adopted in 1596 by Sir Henry Savile at Eton, where it long remained in use as the Eton Greek Grammar, while at Westminster itself it was superseded by that of Busby (1663). The text-books to be used at Harrow in 1590 included Hesiod and some of the Greek orators and historians. In one of the Paston Letters (i. 301), an Eton boy of 1468 quotes two Latin verses of his own composition. Nearly a century later, New Year's Day, 1566, forty-four boys of the school presented Latin verses to Queen Elizabeth. The school's former tutor, Roger Ascham, in his Scholemaster (1570), argues with his Strasbourg friend, J. Sturm, in making the imitation of the Latin classics the main aim of instruction. He is more original when he insists on the value of translation and retranslation for acquiring a mastery over Latin prose composition, and when he protests against compelling boys to converse in Latin too soon. Ascham's influence is apparent in the Positions of Mulcaster, who in 1581 insists on instruction in English before admission to a grammar-school, while he is distinctly in advance of his age in urging the foundation of a special college for the training of teachers.

Cleland's Institution of a Young Nobleman (1607) owes much to the Italian humanists. The author follows Ascham in protesting against compulsory Latin conversation, and only slightly modifies his predecessor's method of teaching Latin prose. When Latin grammar has been mastered, he bids the teacher lead his pupil "into the sweet fountain and spring of all Arts and Science," that is, Greek learning which is "as profitable for the understanding as the Latin tongue for speaking." In the study of ancient history, "deeds and not words" are the prime interest. "In Plutarch pleasure is so mixed and confounded with profit, that I esteem the reading of him as a paradise for a curious spirit to walk in at all time." Bacon in his Advancement of Learning (1605) notes it as "the first distemper of learning when men study words and not matter" (i. iv. 3); he also observes that the Jesuits "have much quickened and strengthened the state of learning" (i. vi. 13). He is on the side of reform in education; he waves the humanist aside with the words: "estimatus est viva doctrina." Milton, in his Tractate on Education (1644), advances further on Bacon's lines, protesting against the length of time spent on instruction in language, denouncing merely verbal knowledge, and recommending the study of a large number of classical authors for the sake of their subject.

matter, and with a view to their bearing on practical life. His ideal place of education is an institution combining a school and a university. Sir William Petty, the economist (1623-1687), urged the establishment of erasitās literaria for instruction of a purely practical kind. Locke, who had been educated at Winchester and had lectured on Greek at Oxford (1661-1662) and afterwards on French at Westminster School, for the scheme which he unfolded in his Thoughts on Education (1695). With Locke, the moral and practical qualities of virtue and prudence are of the first consideration. Instruction, he declares, is but the least part of education; his aim is to train, not men of letters or men of science, but practical men armed for the battle of life. Latin was, above all, to be learned through use, with as little grammar as possible, but with the reading of easy Latin texts, and with no repetition, no composition. Greek he absolutely proscribes, reserving a knowledge of that language to the learned and the lettered, and to professional scholars.

Throughout the 18th century and the early part of the 19th, the old routine went on in England with little variety, and with no sign of expansion. The range of studies was widened, however, at Rugby in the 1760s and 1770s, by Thomas Arnold, whose interest in ancient history and geography, as a compulsory part of classical learning, is attested by his edition of Thucydides; while his influence was still further extended when those who had been trained in his traditions became head masters of other schools.

During the rest of the century the leading landmarks are the three royal commissions known by the names of their chairmen: (1) Lord Clarendon's on nine public schools, Eton, Winchester, Westminster, Charterhouse, Harrow, Rugby, Shrewsbury, St Paul's and Merchant Taylors' (1861-1864), resulting in the Public Schools Act of 1868; (2) Lord Tauntion's on 782 endowed schools (1864-1867), followed by the act of 1869; and (3) Mr Bryce's on secondary education (1894-1895).

A certain discontent with the current traditions of classical training found expression in the Essays on a Liberal Education (1867). The author of the first essay, C. S. Parker, closed his review of the reforms instituted in Germany by the universities of Berlin and France by adding that in England there had been but little change. The same volume included a critical examination of the "Theory of Classical Education" by Henry Sidgwick, and an attack on compulsory Greek and Latin verse composition by F. W. Farrar. The claims of verse composition have since been judiciously defended by the Hon. Edward Lyttelton (1897), while a temperate and effective restatement of the case for the classics may be found in Sir Richard Jebb's Romanes Lecture on Humanism in Education (1890).

The question of the position of Greek in secondary education has from time to time attracted attention in connexion with the requirement of Greek in Residencies at Oxford, and in the Previous Examination at Cambridge.

In the Cambridge University Reporter for November 9, 1870, it was stated that "in order to provide adequate encouragement for the study of Modern Languages and Natural Science, the commissioners for endowed schools had determined on the establishment of modern schools of the first grade in which Greek would be excluded. The commissioners feared that, so long as Greek was a sine qua non at the universities, these schools would be cut off from direct connexion with the universities, while the universities would in some degree lose their control over a portion of the higher culture of the nation. On the 9th of March 1871 a syndicate recommended that, in the Previous Examination, French and German (taken together) should be allowed in place of Greek; on the 27th of April this recommendation (which only affected candidates for honours or for medical degrees) was rejected by 51 votes to 48. The other proposals and votes relating to Greek in the Previous Examination in 1870-1873, 1878-1880, and 1891-1892 are set forth in the Cambridge University Reporter for November 11, 1904, pp. 202-205. In November 1903 a syndicate was
appointed to consider the studies and examinations of the university; their report of November 1904 on the Previous Examination was fully discussed, and the speeches published in the Referee for December 17, 1904. In the course of the discussion Sir Richard Jebb drew attention to the statistics collected by the master of Emmanuel, Mr W. Chawner, showing that, out of 86 head masters belonging to the Head Masters’ Conference whose replies had been published, “about 50 held the opinion that the exemption from Greek for all candidates for a degree would endanger or altogether extinguish the study of Greek in the vast majority of schools, while about 21 head masters held a different opinion.” On the 3rd of March 1905 a proposal for accepting either French or German as an alternative for either Latin or Greek in the Previous Examination was rejected by 1559 to 1025 votes, and on the 26th of May 1906 proposals distinguishing between students in letters and students in science, and (inter alia) requiring the latter to take either French or German for either Latin or Greek in the Previous Examination, were rejected by 746 to 241.

Meanwhile, at Oxford a proposal practically making Greek optional with all undergraduates was rejected, in November 1902, by 189 votes to 166; a preliminary proposal permitting students of mathematics or natural science to offer one or more modern languages in lieu of Greek was passed by 164 to 162 in February 1904, but on the 29th of November the draft of a statute to this effect was thrown out by 200 to 164. In the course of the controversy three presidents of the Royal Society, Lord Kelvin, Lord Lisier and Sir W. Huggins, expressed the opinion that the proposed exemption was not beneficial to science students.

Incidentally, the question of “compulsory Greek” has stimulated a desire for greater efficiency in classical teaching. In December 1903, a year before the most important of the public discussions at Cambridge, the Classical Association was founded in London. The aim of that association is “to promote the development, and maintain the well-being, of classical studies, and in particular (a) to impress upon public opinion the claim of such studies to an eminent place in the national scheme of education; (b) to improve the practice of classical teaching by free discussion of its scope and methods; (c) to encourage investigation and call attention to new discoveries; (d) to create opportunities of friendly intercourse and co-operation between all lovers of classical learning in this country.”

The question of the curriculum and the time-table in secondary education has occupied the attention of the Classical Association, the British Association and the Education Department of Scotland. The general effect of the recommendations already made would be to begin the study of foreign languages with French, and to postpone the study of Latin to the age of twelve and that of Greek to the age of thirteen. At the Head Masters’ Conference of December 1907 a proposal to lower the standard of Greek in the entrance scholarship examinations of public schools was lost by 10 votes to 16, and the “British Association report” was adopted with reservations in 1908. In the case of secondary schools in receipt of grants of public money (about 700 in England and 100 in Wales in 1907-1908), “the curriculum and time-table must be approved by the Board of Education.” The Board has also a certain control over the curriculum of schools under the Endowed Schools Acts and the Charitable Trusts Acts, and also over that of schools voluntarily applying for inspection with a view to being recognized as efficient.

Further efficiency in classical education has been the aim of the movement in favour of the reform of Latin pronunciation. In 1871 this movement resulted in Munro and Palmer’s Syllabus of Latin Pronunciation. The reform was carried forward at University College, London, by Professor Key and by Professor Robinson Ellis in 1873, and was accepted at Shrewsbury, Marlborough, Liverpool College, Christ’s Hospital, Dulwich, and the City of London school. It was taken up anew by the Cambridge Philological Society in 1886, by the Modern Languages Association in 1901, by the Classical Association in 1904-1905, and the Philological Societies of Oxford and Cambridge in 1906. The reform was accepted by the various bodies of head masters and assistant masters in December 1906-January 1907, and the proposed scheme was formally approved by the Board of Education in February 1907.

H. D. Rouse in The Year’s Work in Classical Studies (1907 and 1908), chap. i.; J. P. Postgate, How to pronounce Latin (Appendix B, on “Recent Progress”), (1907). For further bibliographical details see pp. 875-890 of Dr Karl Breul’s “Grossbritannien” in Baumeister’s Handbuch, i. ii. 737-892 (Munich, 1897).

2. In France it was mainly with a view to promoting the study of the corporation of Royal Readers was founded by Francis I. in 1530 at the prompting of Budea. In the university of Paris, which was originally opposed to this innovation, the statutes of 1508 prescribed the study of Homer, Hesiod, Pindar, Theocritus, Plato, Demosthenes and Isocrates (as well as the principal Latin classics), and required the production of three exercises in Greek or Latin in each week.

From the middle of the 16th century the elements of Latin were generally learned from unattractive abridgments of the grammar of the Flemish scholar, van Pauteren or Despautère (d. 1520), which, in its original folio editions of 1537-1538, was an excellent work. The unhappy lot of those who were compelled to learn their Latin from the current abridgments was lamented by a Port-Royalist in a striking passage describing the gloomy forest of the pays de Despauvère (Guyot, quoted in Sainte-Beuve’s Port-Royal, iii. 426). The first Latin grammar written in French was that of Père de Condren of the Oratoire (c. 1642), which was followed by the Port-Royal Méthode latine of Claude Lancelot (1644), and by the grammar composed by Bossuet for the dauphin, and also used by Fénelon for the instruction of the duc de Bourgogne. In the second half of the 17th century the rules of grammar were simplified, and the time withdrawn from the practice of composition (especially verse composition) transferred to the explanation and the study of authors.

Richelieu, in 1640, formed a scheme for a college in which Latin was to have a subordinate place, while room was to be found for the study of history and science, Greek, and French and modern languages. Bossuet, in educating the dauphin, added to the ordinary classical routine represented by the extensive series of the “Delphic Classes” the study of history and of science. A greater originality in the method of teaching the ancient languages was exemplified by Fénelon, whose views were partially reflected by the Abbé Fleury, who also desired the simplification of grammar, the diminution of composition, and even the suppression of Latin verse. Of the ordinary teaching of Greek in his day, Fleury wittily observed that most boys “learned just enough of that language to have a pretext for saying that the rest of their lives that Greek was a subject easily forgotten.”

In the 18th century Rollin, in his Traité des études (1726), agreed with the Port-Royalists in demanding that Latin grammars should be written in French, that the rules should be simplified and explained by a sufficient number of examples, and that a more important place should be assigned to translation than to composition. The supremacy of Latin was the subject of a long series of attacks in the same century. Even at the close of the previous century the brilliant achievements of French literature had prompted La Bruyère
though in Des ouvrages de l'esprit (about 1680), “We have at last thrown off the yoke of Latinism”); and, in the same year, Jacques Spon claimed in his correspondence the right to use the French language in discussing points of archaeology.

Meanwhile, in 1593, notwithstanding the opposition of the university of Paris, the Jesuits had succeeded in founding the •

The Jesuits.

Collegium Claramontanum. After the accession of Henry IV they were expelled from Paris and other important towns in 1594, and not allowed to return until 1609, when they found themselves confronted once more by their rival, the university of Paris. They opened the doors of their schools to the Greek and Latin classics, but they represented the ancient masterpieces dismembered from their original historic environment, as impersonal models of taste, as isolated standards of style. They did much, however, for the cultivation of original composition modelled on Cicero and Virgil. They have been charged with paying an exaggerated attention to form, and with neglecting the subject-matter of the classics. This neglect is attributed to their anxiety to avoid the “pagan” element in the ancient literature. Intensely conservative in their methods, they kept up the system of using Latin in their grammars (and in their oral instruction) long after it had been abandoned by others.

The use of French for these purposes was a characteristic of the “Little Schools” of the Jansenists of Port-Royal (1634-1660). The text-books prepared for them by Lancelot included not only the above-mentioned Latin grammar (1644) but also the Méthode grecque of 1655 and the Jardin des racines grecques (1657), which remained in use for two centuries and largely superseded the grammar of Clemardus (1630) and the Tirocinium of Père Labbé (1648). Greek began to decline in the university about 1650, at the very time when the Port-Royalists were aiming at its revival. During the brief existence of their schools their most celebrated pupils were Tillelume and Racine.

The Jesuits, on the other hand, claimed Cornelle and Molière, as well as Descartes and Bossuet, Fontenelle, Montesquieu and Voltaire. Of their Latin poets the best-known were Denis Petau (d. 1652), René Rapin (d. 1687) and N. F. Sanadon (d. 1733). In 1762 the Jesuits were suppressed, and more than one hundred schools were thus deprived of their teachers. The university of Paris, which had prompted their suppression, and the parliament, which had carried it into effect, made every endeavour to replace them. The university took possession of the Collegium Claramontanum, then known as the Collège Louis-le-Grand, and transformed it into an école normale. Many of the Jesuit schools were transferred to the congregations of the Oratoire and the Benedictines, and to the secular clergy. On the eve of the Revolution, out of a grand total of 562 classical schools, 384 were in the hands of the clergy and 178 in those of the congregations.

The expulsion of the Jesuits gave a new impulse to the attacks directed against all schemes of education in which Latin held a prominent position. At the moment when the university of Paris was, by the absence of its rivals, placed in complete control of the education of France, she found herself driven to defend the principles of classical education against a crowd of assailants. All kinds of devices were suggested for expediting the acquisition of Latin; grammar was to be set aside; Latin was to be learned as a “living language”; much attention was to be devoted to acquiring an extensive vocabulary; and, “to save time,” composition was to be abolished. To facilitate the reading of Latin texts, the favourite method was the use of interlinear translations, originally proposed by Locke, first popularized in France by Dumarsais (1729), and in constant vogue down to the time of the Revolution.

France.

"L'esprit classique n'est pas... incompatible avec l'esprit moderne. A cette époque, en effet, il est le culte de la raison claire et libre, la recherche de la beauté harmonieuse et simple dans toutes les manifestations de la pensée."

By the scheme introduced in these memorable terms the course of seven years is divided into two cycles, the first cycle (of four years) having two parallel courses: (1) without Greek or Latin, and (2) with Latin, and with optional Greek at the beginning of the third year. In the second cycle (of three years) those who have been learning both Greek and Latin, and those who have been learning neither, continue on the same lines as before; while those who have been learning Latin only may either (1) discontinue it in favour of modern languages and science, or (2) continue it with either.

As an alternative to the second cycle, which normally ends in the examination for the baccalauréat, there is a shorter course, mainly founded on modern languages and applied science and ending in a public examination without the baccalauréat. The baccalauréat, however, has been condemned by the next minister, M. Briand, who prefers to crown the course with the award of a school diploma (1907).

3. The history of education in Germany since 1500 falls into three periods: (a) the age of the Revival of Learning and the Reformation (1500-1560), (b) the age of French influence (1560-1728), and (c) the age of French classical influence (1728-1800).

(a) During the first twenty years of the 16th century the reform of Latin instruction was carried out by setting aside the old medieval grammars, by introducing new manuals of classical literature, and by prescribing the study of classical authors and the imitation of classical models. In all these points the lead was first taken by south Germany, and by the towns along the Rhine down to the Netherlands. The old schools and universities were being quietly interpenetrated by the new spirit of humanism, when the sky was suddenly darkened by the clouds of religious conflict. In 1525-1535 there was a marked depression in the classical studies of Germany. Erasmus, writing to W. Pirckheimer in 1526, exclaims: "Wherever the spirit of Luther prevails, learning goes to the ground." Such a fate was, however, averted by the intervention of Melanchthon (d. 1560), the *praeparator Germaniae*, who was the embodiment of the spirit of the new Protestant type of education, with its union of evangelical doctrine and humanistic culture. Under his influence, new schools rapidly rose into being at Magdeburg, Eisleben and Nuremberg (1521-1526). During more than forty years of academic activity he not only provided manuals of Latin and Greek grammar and many other text-books that long remained in use, but he also formed for Germany a well-trained class of learned teachers, who extended his influence throughout the land. His principal ally as an educator and as a writer of text-books was Camerarius (d. 1574). Precepts of style, and models taken from the best Latin authors, were the means whereby a remarkable skill in the imitation of Cicero was attained at Strassburg during the forty-four years of the headmastership of Johannes von Sturm (d. 1589), who had himself been influenced by the *De disciplinis* of J. L. Vives (1531), and in all his teaching aimed at the formation of a *septens alque eloquentes pedes*. Latin continued to be the living language of learning and of literature, and a correct and elegant Latin style was regarded as the mark of an educated person. Greek was taught in all the great schools, but became more and more confined to the study of the Greek Testament. In 1550 it was proposed in Brunswick to banish all "profane" authors from the schools, and in 1589 a competent scholar was instructed to write a sacred epic on the kings of Israel as a substitute for the works of the "pagan" poets. In 1637, when the doubts of Scaliger and Heinsius as to the authenticity of the Greek Testament prompted the rector of Hamburg to introduce the study of classical authors, any reflection on the style of the Greek Testament was bitterly resisted.

The Society of Jesus was founded in 1540, and by 1600 most of the teachers in the Catholic schools and universities of Germany were Jesuits. The society was "dissolved" in 1773, but survived its dissolution. In accordance with the *Ratio Studiorum* of Aquaviva (1590), which long remained unaltered and was only partially revised by J. Roothaan (1832), the main subjects of instruction were the *literae humaniores diversarum linguarum*. The chief place among these was naturally assigned to Latin, the language of the society and of the Roman Church. The Latin grammar in use was that of The Jesuit rector of the school at Lisbon, Alvarez (1572). As in the Protestant schools, the principal aim was the attainment of eloquentia. A comparatively subordinate place was assigned to Greek, especially as the importance attributed to the Vulgate weakened the motive for studying the original text. It was recognized, however, that Latin itself (as Vives had said) was "in no small need of Greek," and that, "unless Greek was learnt in boyhood, it would hardly ever be learnt at all."

The text-book used was the *Institutiones linguae Graecae* of the German Jesuit, Jacob Gretser, of Ingolstadt (c. 1590), and the reading in the highest class included portions of Demosthenes, Isocrates, Plato, Thucydides, Homer, Hesiod, Pindar, Gregory of Nazianzus, Basil and Chrysostom. The Catholic and Protestant schools of the 16th century succeeded, as a rule, in giving a command over a correct Latin style and a taste for literary form and for culture. Latin was still the language of the lawcourts and of a large part of general literature. Between Luther and Lessing there was no great writer of German prose.

In the early part of the period 1600-1728, while Latin continued to hold the foremost place, it was ceasing to be Latin of the strictly classical type. Greek fell still further into the background; and Homer and Demosthenes gradually gave way to the Greek Testament. Between 1600 and 1775 there was a great gap in the production of new editions of the principal Greek classics. The spell was only partially broken by J. A. Ernesti's *Homer* (1750 f.) and Chr. G. Heyne's *Pindar* (1773 f.).

The peace of Westphalia (1648) marks a distinct epoch in the history of education in Germany. Thenceforth, education became more modern and more secular. The long wars of religion in Germany, as in France and England, were followed by a certain indifference as to disputed points of theology. But the modern and secular type of education that now supervened was opposed by the Pietism of the second half of the 17th century, represented at the newly-founded university of Halle (1694) by A. H. Francke, the professor of Greek (d. 1727), whose influence was far greater than that of Chr. Cellarius (d. 1707), the founder of the first philological *Seminar* (1697). Francke's contemporary, Chr. Thomasius (d. 1728), was never weary of attacking scholarship of the old humanistic type and everything that savoured of antiquarian pedantry, and it was mainly his influence that made German the language of university lectures and of scientific and learned literature. A modern education is also the aim of the general introduction to the *nova methodus* of Leibnitz, where the study of Greek is recommended solely for the sake of the Greek Testament (1666). Meanwhile, Ratichius (d. 1633) had in vain pretended to teach Hebrew, Greek and Latin in the space of six months (1612), but he had the merit of maintaining that the study of a language should begin with the study of an author. Comenius (d. 1672) had proposed to teach Latin by drilling his own...
pupils in a thousand graduated phrases distributed over a hundred instructive chapters, while the Latin authors were banished because of their difficulty and their "organism" (1831). One of the catchwords of the day was to insist on a knowledge of things instead of a knowledge of words, on "realism" instead of "verbalism."

Under the influence of France the perfect courtier became the ideal in the German education of the upper classes of the 17th and 18th centuries. A large number of aristocratic schools (Ritter-Akademi) were founded, beginning with the Collegium Illustre of Tübingen (1586) and ending with the Hohe Karlschule of Stuttgart (1775). In these schools the subjects of study included mathematics and natural sciences, geography and history, and modern languages (especially French), with riding, mathematics; Latin assumed a subordinate place, and classical composition in prose or verse was not considered a sufficiently courtly accomplishment. The youthful aristocracy were thus withdrawn from the old Latin schools of Germany, but the aristocratic schools vanished with the dawn of the 19th century, and the ordinary public schools were once more frequented by the young nobility.

(c) The Modern Period.—In the last third of the 18th century two important movements came into play, the "naturalism" of Rousseau and the "new humanism." While Rousseau sought his ideal in a form of education and of culture that was in close accord with nature, the German apostles of the new humanism were convinced that they had found that ideal completely realized in the old Greek world. Hence the aim of education was to make young people thoroughly Greek, to fill them with the "Greek" spirit, with courage and keenness in the quest of truth, and with a devotion to all that was beautiful. The link between the naturalism of Rousseau and the new humanism is to J.G. Herder, whose passion for all that is Greek inspires him with almost a hatred of Latin. The new humanism was a kind of revival of the Renaissance, which had been retarded by the Reformation in Germany and by the Counter-Reformation in Italy, or had at least been degraded to the dull classicism of the schools. The new humanism agreed with the Renaissance in its unreserved recognition of the old classical world as a perfect pattern of culture. But, while the Renaissance aimed at reproducing the Augustan age of Rome, the new humanism found its golden age in Athens. The Latin Renaissance in Italy aimed at recovering and verbally imitating the ancient literature; the Greek Renaissance in Germany sought inspiration from the creative originality of Greek literature. How to producing an original literature, was the problem that had its effect on the schools by discouraging the old classical routine of verbal imitation, and giving a new prominence to Greek and to German. The new humanism found a home in Göttingen (1783) in the days of J. M. Gesner and C. G. Heyne. It was represented at Leipzig by Gesner's successor, Ernesti (d. 1781); and at Halle by F. A. Wolf, who in 1783 was appointed professor of education by Zedlitz, the minister of Frederick the Great. In literature, its leading names were Winckelmann, Lessing and Voss, and Herder, Goethe and Schiller. The tide of the new movement had reached its height about 1800. Goethe and Schiller were convinced that the old Greek world was the highest revelation of humanity; and the universities and schools of Germany were reorganized in this spirit by F. A. Wolf and his illustrious pupil, Wilhelm von Humboldt. In 1809-1810 Humboldt was at the head of the education under the Prussian Minister of Education; and in 1810 he gave, in the brief interval of a year and a half, a general system of education the direction which it followed (with slight exceptions) throughout the whole century. In 1810 the examen pro facultate docendae first made the profession of a schoolmaster independent of that of a minister of religion. The new scheme drawn up by J. W. SAVERNIEN recognized four principal co-ordinated branches of learning: Latin, Greek, German, mathematics. All four were studied throughout the school, Greek being begun in the fourth of the nine classes, that corresponding to the English "third form." The old Latin school had only one main subject, the study of Latin style (combined with a modicum of Greek). The new gymnasium aimed at a wider education, in which literature was represented by Latin, Greek and German, by the side of mathematics and natural science, history and religion. The uniform employment of the term Gymnasium for the highest type of a Prussian school dates from 1812. The leaving examination (Abgangsprüfung), instituted in that year, required Greek translation at sight, with Greek prose composition, and ability to speak and to write Latin. In 1818-1840 the leading spirit on the board of education was Johannes Schulze, and a complete and comprehensive system of education continued to be the ideal kept in view. Such an education, however, was found in practice to involve a prolongation of the years spent at school and a correspondingly later start in life. It was also attacked on the ground that it led to "overwork." This attack was partially met by the scheme of 1837. Schulze's period of prominence in Berlin closely corresponded to that of Herbart at Königsberg (1809-1833) and Göttingen (1833-1841), who insisted that for boys of eight to twelve there was no better text-book than the Greek Odyssey, and this principle was brought into practice at Hanover by his distinguished pupil, Ahrens.

The Prussian policy of the next period, beginning with the accession of Friedrich Wilhelm IV. in 1840, was to lay a new stress on religious teaching, and to obviate the risk of overwork resulting from the simultaneous study of all subjects by the encouragement of specialization in a few. Ludwig Wiese's scheme of 1836 insisted on the retention of Latin verse as well as Latin prose, and showed less favour to natural science, but it awakened little enthusiasm, while the attempt to revive the old humanistic Gymnasium led to a demand for schools of a more modern type, which issued in the recognition of the Realgymnasium (1859).

In the age of Bismarck, school policy in Prussia had for its aim an increasing recognition of modern requirements. In 1875 Wiese was succeeded by Bonitz, the eminent Aristotelian scholar, who in 1849 had introduced mathematics and natural science into the schools of Austria, and had substituted the wide reading of classical authors for the prevalent practice of speaking and writing Latin. By his scheme of 1882 natural science recovered its former position in Prussia, and the hours assigned in each week to Latin were diminished from 86 to 77. But neither of the two great parties in the educational world was satisfied; and great expectations were aroused when the question of reform was taken up by the German emperor, William II., in 1890. The result of the conference of December 1890 was a compromise between the retention of a majority of its members and the forward policy of the emperor. The scheme of 1892 reduced the number of hours assigned to Latin from 77 to 62, and laid special stress on the German essay; but the modern training given by the Realgymnasium was still unrecognized as an avenue to a university education. A conference held in June 1900, in which the speakers included Mommsen and von Wilamowitz, Harnack and DIeLs, was followed by the "Kiel Decree" of the 26th of November. In that decree the emperor urged the equal recognition of the classical and the modern Gymnasium, and emphasized the importance of giving more time to Latin and to English in both. In the teaching of Greek, "useless details" were to be set aside, and special care devoted to the connexion between ancient and modern culture, while, in all subjects, attention was to be paid to the classic precept: maulum, non maritum.
writers of Rome, and being thus introduced to the intellectual life and culture of the ancient world"; and, in Greek, "to give them a sufficient knowledge of the language with a view to their obtaining an acquaintance with some of the Greek classical works which are distinguished both for their interest and for their usefulness in the intellectual life and culture of Ancient Greece." In consequence of these changes Greece is now studied by a smaller number of boys, but with better results, and a new lease of life has been won for the classical Gymnasium.

Lastly, by the side of the classical Gymnasium, we now have the "German Reform Schools" of two different types, that of Altona (dating from 1878) and that of Frankfurt-on-the-Main (1892). The leading principle in both is the postponement of the time for learning Latin. Schools of the Frankfort type take French as their only foreign language in the first three years of the course, and aim at achieving in six years as much as has been achieved by the Gymnasium in nine; and it is maintained that, in six years, they succeed in mastering a larger amount of Latin literature than was attempted a generation ago, even in the best Gymnasium of the old style. It may be added that in all the German Gymnasium, whether reformed or not, more time is given to classics than in the corresponding schools in England.

Jahrhunderts" (Stuttgart, 1904); O. Stelzner, Durchführung des prussischen Schulreform in ganz Deutschland (Duisburg, 1904); J. Schipper, "Alte Bildung und moderne Cultur" (Vienna, 1901); Papers by M. E. Sadler: (1) Problems in Prussian Secondary Education ("Special Reports of Education, 1898") (2) "Prussian Education in Germany and Elsewhere" (Special Reports of Board of Education, vol. 9, 1902); J. L. Paton, "The Teaching of Classics in Prussian Secondary Schools" (on "German Reform Schools") in The Teaching of Classics in Germany and in the United States (New York, 1899); and (among earlier English publications) Matthew Arnold's Higher Schools and Universities in Germany (1874, reprinted from Schools and Universities on the Continent, 1865).

In the United States of America the highest degree of educational development has been subsequent to the Civil War. The study of Latin begins in the "high schools," the average age of admission being fifteen and the normal course extending over four years. Among classical teachers an increasing number would prefer a longer course extending over six years for Latin, and at least three for Greek, and some of these would assign to the elementary school the first two of the proposed six years of Latin study. Others are content with the late learning of Latin and prefer that it should be preceded by a thorough study of modern languages (see Prof. B. I. Wheeler, in Baumeister's Handbuch, 1897, ii. 2, pp. 583-586).

It was mainly owing to a pamphlet issued in 1871 by Prof. G. M. Lane, of Harvard, that a formal announcement of Latin was adopted in all the colleges and schools of the United States. Some misgivings on this reform found expression in a work on the Teaching of Latin, published in 1873 by Prof. C. E. Bennett of Cornell in 1901, a year in which it was estimated that in use by more than 96% of the Latin pupils in the secondary schools.

Some important statistics as to the number studying Latin and Greek in the secondary schools were collected in 1900 by a committee of twelve educational experts representing all parts of the Union, with a view to a uniform course of instruction being pursued in all classical schools. They had the advantage of the co-operation of Dr W. T. Harris, the U.S. commissioner of education, and they were able to report that, in all the five groups into which they had divided the states, the number of pupils pursuing the study of Latin and Greek showed a remarkable advance, especially in the most progressive states of the middle west. The number learning Latin had increased from 100,144 in 1800 to 314,516 in 1890-1900, and those learning Greek from 12,869 to 24,369. Thus the number learning Latin at the later date was three times, and the number learning Greek twice, as many as those learning Latin or Greek ten years previously. But the total number in 1900 was 630,048; so that, notwithstanding this proof of progress, the number learning Greek in 1900 was only about one twenty-fifth of the total number, while the number learning Latin was as high as half.

The position of Greek as an "elective" or "optional" subject (notably at Harvard), an arrangement regarded with approval by some eminent educational authorities and with regret by others, probably has some effect on the high schools in the small number of those who learn Greek, and in their lower rate of increase, as compared with those who learn Latin. Some evidence as to the quality of the study of those languages in the schools is supplied by English commissioners in the Reports of the Mosely Commission. Thus Mr Papillon considered that, while the teaching of English literature was admirable, the average standard of Latin and Greek teaching and attainment in the upper classes was "below that of an English public school"; he felt, however, that the secondary schools of the United States had a "greater variety of the curriculum to suit the practical needs of life," and that they existed, not "for the select few," but "for the whole people" (pp. 250 f.).

CLASSIFICATION (Lat. classis, a class, probably from the root cal-, cla-, as in Gr. κλάξω, clamor), a logical process, common to all the special sciences and to knowledge in general, consisting in the collection under a common name of a number of objects which are alike in one or more respects. The process consists in observing the objects and abstracting from their various qualities that characteristic which they have in common. This characteristic constitutes the definition of the "class" to which they are regarded as belonging. It is this process by which we arrive first at "species" and then at "genus," i.e. at all scientific generalization. Individual things, regarded as such, constitute a mere aggregate, unconnected with one another, and so far unexplained; scientific knowledge consists in systematic classification. Thus if we observe the heavenly bodies individually we can state merely that they have been observed to have certain motions through the sky, that they are luminous, and the like. If, however, we compare them one with another, we discover that, whereas all partake in the general movement of the heavens, some have a movement of their own. Thus we arrive at a system of classification according to motion, by which fixed stars are differentiated from planets. A further classification according to other criteria gives us stars of the first magnitude and stars of the second magnitude, and so forth. We thus arrive at a systematic understanding expressed in laws by the application of which accurate forecasts of celestial phenomena can be made. Classification in the strict logical sense consists in discovering the casual interrelations between the objects; it thus differs from the so-called "artificial" classification, which is the preparation, e.g. of statistics for particular purposes, administrative and the like.

Of the systems of classification adopted in physical science, only one requires treatment here, namely, the classification of
the sciences as a whole, a problem which has from the time of Aristotle attracted considerable attention. Its object is to delimit the spheres of influence of the positive sciences and show how they are mutually related. Of such attempts three are specially noteworthy, those of Francis Bacon, Augustine Comte and Herbert Spencer.

Bacon's classification is based on the subjective criterion of the various faculties which are specially concerned. He thus distinguished History (natural, civil, literary, ecclesiastical) as the province of memory, Philosophy (including Theology) as that of reason, and Poetry, Fables and the like, as that of imagination. This classification was made the basis of the *Encyclopédie*. Comte adopted an entirely different system based on an objective criterion. Having first enunciated the theory that all science passes through three stages, theoretical, metaphysical and positive, he neglects the two first, and divides the last according to the "things to be classified," in view of their real affinity and natural connections, into six, in order of decreasing generality and increasing complexity—mathematics, astronomy, physics, chemistry, physiology and biology (including psychology), and sociology. This he conceives to be not only the logical, but also the historical, order of development, from the abstract and purely deductive to the concrete and inductive. Sociology is thus the highest, most complex, and most positive of the sciences. Herbert Spencer, condemning this division as both incomplete and theoretically unsound, adopted a three-fold division into (1) *abstract* science (including logic and mathematics) dealing with the universal forms under which all knowledge of phenomena is possible, (2) *abstract-concrete* science (including mechanics, chemistry, physics), dealing with the elements of phenomena themselves, i.e. laws of forces as deducible from the persistence of forces; and (3) *concrete* science (e.g. astronomy, biology, sociology), dealing with "phenomena themselves in their totalities," the universal laws of the continuous redistribution of forces by Evolution and Dissolution.

Beside the above three systems several others deserve brief mention. In Greece at the dawn of systematic thought the physical sciences were few in number; none the less philosophers were not agreed as to their true relation. The Platonic school adopted a triple classification, physics, ethics and dialectics; Aristotle's system was more complicated, nor do we know precisely how he subdivided his three main classes, theoretical, practical and poetical (i.e. technical, having to do with *topics*, creative). The second class covered ethics and politics, the latter of which was often regarded by Aristotle as including ethics; the third includes the useful and the imaginative sciences; the first includes metaphysics and physics. As regards pure logic Aristotle sometimes seems to include it with metaphysics and physics, sometimes to regard it as ancillary to all the sciences.

Thomas Hobbes (Leydenian) drew up an elaborate paradigm of the sciences, the first stage of which was a dichotomy into "Naturall Philosopy" ("consequences from the accidents of bodies natuarall") and "Politiques and Civill Philosophy" ("consequences from accidents of Politique bodies"). The former by successive subdivisions is reduced to eighteen special sciences; the latter is subdivided into the rights and duties of sovereign powers, and those of the subject.

Jeremy Bentham and A. M. Ampère both drew up elaborate systems based on the principle of dichotomy, and beginning from the distinction of mind and body. Bentham invented an artificial terminology which is rather curious than valuable. The science of the body was Somatology, that of the mind Pneumatology. The former includes Posology (science of quantity, mathematics) and Piloology (science of quality); Posology includes Morphology (geometry) and Alegomorphie (arithmetic). See further Bentham's *Chemicalis* and works quoted under Bentham, Jeremy.

Carl Wundt criticized most of these systems as taking too little account of the real facts, and preferred a classification based on the standpoint of the various sciences towards their subject-matter. His system may, therefore, be described as conceptional. It distinguishes philosophy, which deals with facts in their widest universal relations, from the special sciences, which consider facts in the light of a particular relation or set of relations. All these systems have a certain value, and are interesting as throwing light on the views of those who invented them. It will be seen, however, that none can lay claim to unique validity. The *fundamenta divisionis*, though in themselves more or less logical, are quite arbitrarily chosen, generally as being germane to a preconceived philosophical or scientific theory.

**Clastidium** (mod. Casteggio), a village of the Anamares, in Gallia Cispadana, on the Via Postumia, 5 m. E. of Iria (mod. Voghera) and 31 m. W. of Placentia. Here in 222 B.C. M. Claudius Marcellus defeated the Gauls and won the *spolia opima*; in 218 Hannibal took it and its stores of corn by treachery. It never had an independent government, and not later than 190 B.C. was made part of the colony of Placentia (founded 210). In the Augustan division of Italy, however, Placentia belonged to the 8th region, Aemilia, whereas Iria certainly, and Clastidium possibly, belonged to the 9th, Liguria (see Th. Mommsen in *Corp. Inscript. Lat.* vol. v. Berlin, 1877, p. 828). The remains visible at Clastidium are scanty; there is a fountain (the Fontana d'Annibale), and a Roman bridge, which seems to have been constructed of tiles, not of stone, was discovered in 1857, but destroyed.

See C. Giuliani, *Casteggio, notizie storiche II. Avanzi di antichità* (Voghera, 1893).

**Clauber, Johann** (1622–1665), German philosopher, was born at Solingen, in Westphalia, on the 24th of February 1622. After travelling in France and England, he studied the Cartesian philosophy under John Raey at Leiden. He became (1649) professor of philosophy and theology at Herborn, but subsequently (1651), in consequence of the jealousy of his colleagues, accepted an invitation to a similar post at Duisburg, where he died on the 31st of January 1665. Clauber was one of the earliest teachers of the new doctrines in Germany and an exact and methodical commentator on his master's writings. His theory of the connexion between the soul and the body is in some respects analogous to that of Malebranche; but he is not therefore to be regarded as a true forerunner of Occasionalism, as he uses "Occasion" for the stimulus which directly produces a mental phenomenon, without postulating the intervention of God (H. Müller, *J. Clauber und seine Stellung im Cartesianismus*). His view of the relation of God to his creatures is held to foreshadow the pantheism of Spinoza. All creatures exist only through the continuous creative energy of the Divine Being, and are no more independent of his will than are our thoughts independent of us,—or rather less, for there are thoughts which force themselves upon us whether we will or not. For metaphysics Clauber suggested the names *ontosophy* or *ontology*, the latter being afterwards adopted by Wolff. He also devoted considerable attention to the German languages, and his researches in this direction attracted the favourable notice of Leibnitz. His chief works are: *De conjunctione animae et corporis humani; Exercitationes centum de cognitione Dei et nostri; Logica velus et nova; Initiantio philosophi, seu Dublatius Cartesiani;* a commentary on Descartes' *Meditations*; and *Ars etymologica Teutonom.* A collected edition of his philosophical works was published at Amsterdam (1691), with life by H. C. Hennin; see also E. Zeller, *Geschichte der deutschen Philosophie seit Leibnitz* (1873).

**Claude, Jean** (1619–1687), French Protestant divine, was born at La Sauvetat-du-Dropt near Agen. After studying at Montauban, he entered the ministry in 1645. He was for eight years professor of theology in the Protestant college of Nimes; but in 1661, having successfully opposed a scheme for re-uniting Catholics and Protestants, he was forbidden to preach in Lower Languedoc. In 1662 he published a book similar to that which he had lost; but after four years he was removed from this also. He next became pastor at Charenton near Paris, where he engaged in controversies with Pierre Nicole (*Réponse aux deux traités intitulés la persévérance de la foi*, 1665), Antoine Arnauld (*Réponse au livre de M. Arnauld, 1670*), and J. B. Bossuet (*Réponse au livre de M. l'évêque de Meaux, 1683*).
On the revocation of the edict of Nantes he fled to Holland, and received a pension from William of Orange, who commissioned him to write an account of the persecuted Huguenots (Plaîntes des protestants cruellement opprimés dans le royaume de France, 1686). The book was translated into English, but by order of James II, both the translation and the original were publicly burnt by the common hangman on the 5th of May 1686, as containing seditious (accused of) "anti-Catholic" (anti-French"). Other works by him were Réponse au livre de P. Nouet sur l'exasseur (1668); Œuvres posthumes (Amsterdam, 1688), containing the Traité de la composition d'un sermon, translated into English in 1778.

CLAUDE OF LORRAINE, or CLAUDE GELÉE (1600–1682), French landscape-painter, was born of very poor parents at the village of Chamous in Lorraine. When it was discovered that he made no progress at school, he was apprenticed, it is commonly said, to a pastry-cook, but this is extremely dubious. At the age of twelve, being left an orphan, he went to live at Freiburg on the Rhine with an elder brother, Jean Gelée, a wood-carver of moderate merit, and under him he designed arabesques and foliage. He afterwards returned to Rome to seek his fortune, but his despondency and ignorance of the language, he failed to obtain permanent employment. He next went to Naples, to study landscape painting under Godfrey Waals, a painter of much repute. With him he remained two years; then he returned to Rome, and was domesticated until April 1625 with another landscape-painter, Augustin Tassi, who hired him to grind his colours and to do all the household drudgery. His master, hoping to make Claude serviceable in some of his greatest works, advanced him in the rules of perspective and the elements of design. Under his tuition the mind of Claude began to expand, and he devoted himself to artistic study with great eagerness. He exerted his utmost industry to explore the true principles of painting by an incessant examination of nature; and for this purpose he made his studies in the open fields, where he very frequently remained from sunrise till sunset, watching the effect of the shifting lights upon the landscape. He generally sketched whatever he thought beautiful or striking, marking every tinge of light with a similar colour; from these sketches he perfected his landscapes. Leaving Tassi, he made a tour in Italy, France and a part of Germany, including his native Lorraine, suffering numerous misadventures by the way. Karl Dervent, painter to the duke of Lorraine, kept him as assistant for a year; and he painted at Nancy the architectural subjects on the ceiling of the Carmelite church. He did not, however, relish this task, and in 1627 returned to Rome. Here, painting two landscapes for Cardinal Bentivoglio, he earned the protection of Pope Urban VIII. and from about 1637 he rapidly rose into celebrity. Claude was acquainted not only with the facts, but also with the laws of nature; and the German painter Joachim von Sandrat relates that he used to explain, as they walked together through the fields, the causes of the different aspects of the landscapes. His at different hours of the day, from the reflections or refractions of light, or from the morning and evening dews or vapours, with all the precision of a natural philosopher. He elaborated his pictures with great care; and if any performance fell short of his ideal, he altered, erased and repainted it several times over.

His skies are aerial and full of lustre, and every object harmoniously illuminated. His distances and colouring are delicate, and his tints have a sweetness and variety till then unexampled. He frequently gave an uncommon tenderness to his finished tree by glazing. His figures, however, are very indifferent; but he was so conscious of his deficiency in this respect, that he usually engaged other artists to paint them for him, among whom were Courtois and Filippo Lauri. Indeed, he was wont to say that he sold his landscapes and gave away his figures. In order to avoid a repetition of the same subject, and also to detect the very numerous spurious copies of his works, he made tinted outline drawings (in six paper books prepared for this purpose) of all those pictures which were transmitted to different countries; and on the back of each drawing he wrote the name of the purchaser. These books he named Libri di diverti. This valuable work (now belonging to the duke of Devonshire) has been engraved and published, and has always been highly esteemed by students of the art of landscape. Claude, who had suffered much from gout, died in Rome at the age of eighty-two, on the 21st (or perhaps beclouded) of July 1682, leaving his wealth, which was considerable, between his only surviving relatives, a nephew and an adopted daughter (unto). Many choice specimens of his genius may be seen in the National Gallery and in the Louvre; the landscapes in the Altieri and Colonna palaces in Rome are also of especial celebrity. A list has been printed showing no less than 92 examples in the various public galleries of Europe. He himself regarded a landscape which he painted in the Villa Madama, being a cento of various views with great abundance and variety of leafage, and a composition of Esther and Ahasuerus, as his finest works; the former he refused to sell, although Clement IX. offered to cover its surface with gold pieces. He etched a series of twenty-eight landscapes, fine impressions of which are greatly prized. Full of amenity, and deeply sensitive to the graces of nature, Claude was a man of refined sense and delicate sensibilities, and he must always be accounted a prime leader in that forerun of art, in his day a great enlarger and refiner of its province.

Claude was a man of amiable and simple character, very kind to his pupils, a patient and unwearied worker; in his own sphere of study, his mind was stored (as we have seen) with observation and knowledge, but he continued an unlettered, man till his death. Famous and highly patronized though he was in all his later years, he seems to have been very little known to his brother artists, with the single exception of Sandrart. This painter is the chief direct authority for the facts of Claude’s life (Academia Artis Pictoriae, 1683); Baldinucci, who obtained information from some of Claude’s immediate survivors, relates various incidents to a different effect (Notizie dei professori del disegno). See also Victor Cousin, Sur Claude Gelée (1853); M. F. Sweetser, Claude Lorrain (1878); Lady Dilke, Claude Lorrain (1884); (W. M. R.)

CLAUDET, ANTOINE FRANCOIS JEAN (1707–1867), French photographer, was born at Lyons on the 12th of August 1797. Having acquired a share in L. J. M. Daguerre’s invention, he was one of the first to practise daguerreotype portraiture in England, and he improved the sensitising process by using chloride in addition to iodine, thus gaining greater rapidity of action. In 1848 he produced the photographometer, an instrument designed to measure the intensity of photogenic rays; and in 1849 he brought out the focimeter, for securing a perfect focus in photographic portraiture. He was elected a fellow of the Royal Society in 1853, and in 1858 he produced the stereomonomoscope, in reply to a challenge from Sir David Brewster. He died in London on the 27th of December 1867.

CLAUDIANUS, CLAUDIUS, Latin epic poet and panegyrist, flourished during the reign of Arcadius and Honorius. He was an Egyptian by birth, probably an Alexandrian, but it may be conjectured from his name and his mastery of Latin that he was of Roman extraction. His own authority has been assumed for the assertion that his first poetical compositions were in Greek, and that he had written nothing in Latin before a.d. 395; but this seems improbable, and the passage (Carm. Min. xlii. 13) which is taken to prove it does not necessarily bear this meaning. In that year he appears to have come to Rome, and made his debut as a Latin poet by a panegyric on the consulship of Olybrius and Probinus, the first brothers not belonging to the imperial family who had ever simultaneously filled the office of consul. This piece proved the precursor of the series of panegyrical poems which compose the bulk of his writings. In Birt’s edition a complete chronological list of Claudian’s poems is given, and also in J. B. Bury’s edition of Gibbon (iii. app. i. p. 485), where the dates given differ slightly from those in the present article.

In 396 appeared the encomium on the third consulship of the emperor Honorius, and the epic on the downfall of Rufinus, the
Claudian's poem appears to have obtained his patronage, or rather perhaps that of his wife Serena, by whose interposition the poet was within a year or two enabled to contract a wealthy marriage in Africa (Epist. 2). Previously to this event he had produced (398) his panegyric on the fourth consulship of Honorius, his epithalamion on the marriage of Honorius to Stilicho's daughter, Maria, and his poem on the Gildonic war, celebrating the resurrection of a revolt in Africa. To these succeeded his piece on the consulship of Manlius Theodorus (399), the unfinished or mutilated invective against the Byzantine prime minister Eutropius in the same year, the epics on Stilicho's first consulship and on his repulse of Alaric (400 and 403), and the panegyric on the sixth consulship of Honorius (404). From this time all trace of Claudian is lost, and he is generally supposed to have perished with his patron Stilicho in 408. It may be conjectured that he must have died in 404, as he could hardly otherwise have omitted to celebrate the greatest of Stilicho's achievements, the destruction of the barbarian host led by Radagaisus in the following year. On the other hand, he may have survived Stilicho, as in the dedication to the second book of his epic on the Rape of Proserpina (which Birt, however, assigns to 395-397), he speaks of his disuse of poetry in terms hardly calculated to dispel the suspicion which he dispelled during his patron's lifetime. From the manner in which Augustine alludes to him in his De civitate Dei, it may be inferred that he was no longer living at the date of the composition of that work, between 415 and 428.

Besides Claudian's chief poems, his lively Fescennines on the emperor's marriage, his panegyric on Serena, and the Gigantomachia, a fragment of an unfinished Greek epic, may also be mentioned. Several poems expressing Christian sentiments are undoubtedly spurious. Claudian's paganism, however, neither prevented his celebrating Christian rulers and magistrates nor his enjoying the distinction of a court laureate. It is probable that he was nominally a Christian, like his patron Stilicho and Ausonius, although at heart attached to the old religion. The very decided statements of Orosius and Augustine as to his heathenism may be explained by the pagan style of Claudian's political poems. We have his own authority for his having been honoured by a bronze statue in the forum, and Pompianus Lactus discovered in the 17th century an inscription (C.I.L. vi. 1710) on the pedestal, which, formerly considered spurious, is now generally regarded as genuine.

The position of Claudian—the last of the Roman poets—is unique in literature. It is sufficiently remarkable that, after nearly three centuries of torpor, the Latin muse should have experienced any revival in the age of Honorius, nothing less than amazing that this revival should have been the work of a foreigner, most surprising of all that a just and enduring celebrity should have been gained by official panegyrics on the generally uninteresting transactions of an inglorious epoch. The first of these particulars bespeaks Claudian's taste, rising superior to the prevailing barbarism, the second his command of language, the third his rhetorical skill. As remarked by Gibbon, "he was endowed with the rare and precious talent of raising the meanest, of adorning the most barren, and of diversifying the most similar topics." This gift is especially displayed in his poem on the downfall of Rufinus, where the punishment of a public malefactor is exalted to the dignity of an epical subject by the magnificence of diction and the ostentation of supernatural machinery. The noble exordium, in which the fate of Rufinus is propounded as the vindication of divine justice, places the subject at once on a dignified level; and the council of the infernal powers has afforded a hint to Tasso, and through him to Milton. The inevitable monotony of the panegyrics on Honorius is relieved by just and brilliant extolation on the duties of a sovereign. His celebration of Stilicho's victories Claudian found a subject most congenial to his taste, such as the description of the flight of Alaric, and of Stilicho's arrival at Rome, and the felicitous parallel between his triumphs and those of Marius, rank among the brightest ornaments of Latin poetry. Claudian's panegyric, however lavish and regardless of veracity, is in general far less offensive than usual in his age, a circumstance attributable partly to his more refined taste and partly to the genuine merit of his patron Stilicho. He is a valuable authority for the history of his times, and is rarely to be convicted of serious inaccuracy in his facts, whatever may be thought of the colouring he chooses to impart to them. He was animated by true patriotic feeling, in the shape of a heavy and noble use of Greek source and symbol of law, order and civilization. Outside the sphere of actual life is less successful; his Rape of Proserpina, though the beauties of that poem are as great as usual, betrays his deficiency in the creative power requisite for dealing with a purely ideal subject. This denotes the orator rather than the poet, and in general it may be said that his special gifts of vivid natural description, and of copious illustration, derived from extensive but not cumbersome erudition, are fully as appropriate to eloquence as to poetry. In the general cast of his mind and character of his writings, and especially, in his faculty for bestowing enduring interest upon occasional themes, we may fairly compare him with Dryden, remembering that while Dryden excelled in the energy of a vigorous and fast-developing language, Claudian was cramped by an artificial diction, confined to the literary class.

Claudius was the second of the Tiberius in the family which flourished at Vezzola in 482; the editions of J. M. Gesner (1750) and P. Burmann (1760) are still valuable for their notes. The first critical edition was that of L. Leep (1876–1879), now superseded by the exhaustive work of T. Birt, together with his own commentary in Monumenta Germaniae Historica, xi. (1879); smaller ed. founded on this by J. Koch, Teubner series, 1893. There is a separate edition with commentary and verse translation of It Ratto di Proserpina, by L. Carces de Diez (1886); the satire In Conclusione, by T. Birt in Zeitschrift für die ältere deutsche Literaturwissenschaft, iii. 2 (1890); also J. H. E. Creas, Claudian as an Historian (1908), the "Cambridge Historical Essay" for 1906 (No. 17); T. Hodgkin, Claudian, the last of the Roman Poets (1875).

**Claudius** [Tiberius Claudius Drusus Nero Germanicus], Roman emperor A.D. 41–54, son of Drusus and Antonia, nephew of the emperor Tiberius, and grandson of Livia, the wife of Augustus, was born at Lugdunum (Lyons) on the 1st of August 10 B.C. During his boyhood he was treated with contempt, owing to his weak and timid character and his natural infirmities; the fact that he was regarded as little better than an imbecile saved him from death at the hands of Caligula. He chiefly devoted himself to literature, especially history, and until his accession he took no real part in public affairs, though Caligula honoured him with the dignity of consul. He was four times married: to Plautia Urgulanilla, whom he divorced because he suspected her of designs against his life; to Aelfa Petina, also divorced; to the infamous Valeria Messallina (q.v.), and to his niece Agrippina.

In A.D. 41, on the murder of Caligula, Claudius was seized by the praetorians, and declared emperor. The senate, which had entertained the idea of restoring the republic, was obliged to acquiesce. One of Claudius's first acts was to grant amnesty for all except Cassius Chaerea, the assassin of his predecessor, and one or two others. After the discovery of a conspiracy against his life in 42, he fell completely under the influence of Messallina and his favourite freedmen Pallas and Narcissus, who must be held responsible for acts of cruelty which have brought undeserved odium upon the emperor. There is no doubt that Claudius was a liberal-minded man of kindly nature, anxious for the welfare of his people. Humane regulations were made in regard to freedmen, slaves, widows and orphans; the police system was admirably organized; commerce was put on a sound footing; the provinces were governed in a spirit of liberality; the rights of citizens and admission to the senate were extended to communities outside Italy; the laws of the Tiberius Claudius delivered (in the year 43) in the senate in support of the petition of the Aeduan that their senators should have the jus potendorum honorum (claim of
admission to the senate and magistracies) at Rome has been partly preserved on the fragment of a bronze tablet found at Lyons in 1524; an imperial edict concerning the citizenship of the Anaunians (15th of March 40) was found in the southern Tyrol in 1864 (C.I.L. v. 5050). Claudius was especially fond of building. He completed the great aqueduct (Aqua Claudia) begun by Caligula, drained the Lacus Fucinus, and built the harbour of Ostia. Nor were his military operations unsuccessful. Mauretania was made a Roman province; the conquest of Britain was begun; his distinguished general Domitius Corbulo (q.v.) gained considerable successes in Germany and the East. The intrigues of Narcissus caused Messallina to be put to death by order of Claudius, who took as his fourth wife his niece Agrippina, a woman as criminal as any of her predecessors. She prevailed upon him to set aside his own son Britannicus in favour of Nero, her son by a former marriage; and in 54, to make Nero's position secure, she put the emperor to death by poison. The apotheosis of Claudius was the subject of a lumpsum by Seneca called apokolokyntos, the "punctumification" of Claudius.

Claudius was a prolific writer, chiefly on history, but his work has mostly been lost. He wrote (in Greek) a history of Carthage and a history of Etruria: (in Latin) a history of Rome from the death of Caesar, an autobiography, and an essay in defence of Cicero against the attacks of Asinius Gallus. He also introduced three new letters into the Latin alphabet: J for the consonantal V, ʃ for BS and PS, f for the intermediate sound between I and U.

Schiller, Geschichte der römischen Kaiserzeit, i. pt. 1; H. Furneaux's ed. of the Annales of Tacitus (introduction).

CLAUDIUS, the name of a famous Roman gens. The by-form Clodius, in its origin a mere orthographical variant, was regularly used for certain Claudii in late republican times, but otherwise the two forms were used indifferently. The gens contained a patrician and a plebeian family; the chief representatives of the former were the Pulchri, of the latter the Marcelli (see Marcellus). The following members of the gens deserve particular mention.

1. Appius Sabinus Inregillensis, of Regillensis, called from Regillum or (Regilli) in Sabine territory, founder of the Claudian gens. His original name was Attus or Attius Claudius. About 504 B.C. he settled in Rome, where he and his followers formed a tribe. In 495 he was consul, and his cruel enforcement of the laws of debtor and creditor, in opposition to his milier colleague, P. Servilius Priscus, was one of the chief causes of the "cessation" of the plebs to the Sacred Mount. On several occasions he displayed his hatred of the people, although it is stated that he subsequently played the part of mediator.

Suetonius, Tibertis, i; Livy ii. 16-29; Dion. Halicr. v. 40, vi. 23, 24.

2. Claudius, Appius, surnamed Crassus, a Roman patrician, consul in 471 and 451 B.C., and in the same and following year one of the decemvirs. At first he was conspicuous for his aristocratic pride and bitter hatred of the plebeians. Twice they refused to fight under him, and fled before their enemies. He retaliated by decimating the army. He was banished, but soon returned, and again became consul. In the same year (451) he was made one of the decemviri who had been appointed to draw up a code of written laws. When it was decided to elect decemvirs for another year, he who had formerly been looked upon as the champion of the aristocracy, suddenly came forward as the friend of the people, and was himself re-elected together with several plebeians. But no sooner was the new office in hand, than it treated both patricians and plebeians with equal violence, and refused to resign at the end of the year. Matters were brought to a crisis by the affair of Virginia. Enamoured of the beautiful daughter of the plebeian centurion Virginia, Claudius attempted to seize her by an abuse of justice. One of his clients, Marcus Claudius, swore that she was the child of a slave belonging to him, and had been stolen by the childless wife of the centurion. Virginia was summoned from the army, and on the day of trial was present to expose the conspiracy. Nevertheless, judgment was given according to the evidence of Marcus, and Claudius commanded Virginia to be given up to him. In despair, her father seized a knife from a neighbouring stall and plunged it in her side. A general insurrection was the result; and the people seceded to the Sacred Mount. The decemvirs were finally compelled to resign and Appius Claudius died in prison, either by his own hand or by that of the executioner. For a discussion of the character of Appius Claudius, see Mommsen's appendix to vol. i. of his History of Rome. He holds that Claudius was never the leader of the patrician party, but a patrician demagogue who ended by becoming a tyrant to patricians as well as plebeians. The decemvirs, one of the triumphs of the plebs, could hardly have been abolished by that body, but would naturally have been overthrown by the plebeians. The revolution which ruined Claudius was a return to the rule of the patricians represented by the Horatii and Valerii. Livy iii. 32-58; Dion. Halicr. x. 59, xi. 3.

3. CLAUDIUS, Appius, surnamed CAECUS, Roman patrician and author. In 312 B.C. he was elected censor without having passed through the office of consul. His censorship—which he retained for five years, in spite of the lex Aemilia which limited the tenure of that office to eighteen months—was remarkable for the actual or attempted achievement of several great constitutional changes. He filled vacancies in the senate with men of low birth, in some cases even the sons of freedmen (Diod. Sic. xx. 36; Livy ix. 30; Suetonius, Claudius, 24). His most important political innovation was the abolition of the old free birth, freehold basis of suffrage. He enrolled the freedmen and landless citizens both in the centuries and in the tribes, and, instead of assigning them to all the four urban tribes, he distributed them through all the tribes and thus gave them practical control of the elections. In 304, however, Q. Fabius Rullianus limited the landless and poorer freedmen to the four urban tribes, thus annulling the effect of Claudius's arrangement. Appius Claudius transferred the charge of the public worship of Hercules in the Forum Boarium from the Potitian gens to a number of public slaves. He further invaded the exclusive rights of the patricians by directing his secretary Gnaeus Flavius (whom, though a freedman, he made a senator) to publish the legis actions (methods of legal practice) and the list of dies fasti (or days on which legal business could be transacted). Lastly, he gained enduring fame by the construction of a road and an aqueduct, which—a thing unheard of before—he called by his own name (Livy ix. 29; Frontinus, De Aquis, 115; Diod. Sic, xx. 36). In 297 he was elected consul for the first time. In 298 he was interrex; in 296, as consul, he led the army in Sardinia, and although, with his colleague, he gained a victory over the Etruscans and Samnites, he does not seem to have specially distinguished himself as a soldier (Livy x. 19). Next year he was praetor, and he was once dictator. His character, like his namesake the decemvir's is not easy to define. In spite of his political reforms, he opposed the admission of the plebeians to the consulship and priestly offices; and, although these reforms might appear to be democratic in character and calculated to give preponderance to the lowest class of the people, his probable aim was to strengthen the power of the magistrates (and lessen that of the senate) by founding it on the popular will, which would find its expression in the urban inhabitants and could be most easily influenced by the magistrate. He was already blind and too feeble to walk, when Cinesas, the minister of Pyrrhus, visited him, but so vigorously did he oppose every concession that all the eloquence of Cinesas was in vain, and the Romans forgot past misfortunes in the inspiration of Claudius's patriotism (Livy x. 13; Justin xviii. 27; Plutarch, Pyrrhus, 19). The story of his blindness, however, may be merely a method of
CLAUDIUS, M. A.—CLAUSEL

accounting for his cognomen. Tradition regarded it as the punishment of his transference of the cult of Hercules from the Poritis.

Appius Claudius Caecus is also remarkable as the first writer mentioned in Roman literature. His speech against peace with Pyrrhus was the first that was transmitted to writing, and thereby laid the foundation of prose composition. He was the author of a collection of aphorisms in verse mentioned by Cicero (of which a few fragments remain), and of a legal work entitiled De Usurpatio

ionibus. It is very likely also that he was concerned in the drawing up of the Legis Actiones published by Flavius. The famous dictum "Every man is the architect of his own fortune," is attributed to him. He also interested himself in grammatical questions, distinguished the sounds R and S in writing, and did away with the letter Z.

See Mommsen's appendix to his Roman History (vol. i.); treatises by W. Siebert (1863) and F. D. Gerlach (1872), dealing especially with the censorship of Claudius.

4. CLAUDIUS, PUBLIUS, surnamed PULCHER, son of (3). He was the first of the gens who bore this surname. In 249 he was consul and appointed to the command of the fleet in the first Punic War. Instead of continuing the siege of Lilybaeum, he decided to attack the Carthaginians in the harbour of Drepanum, and was completely defeated. The disaster was commonly attributed to Claudius's treatment of the sacred chickens, which refused to eat before the battle. "Let them drink then," said the consul, and ordered them to be thrown into the sea. Having been recalled and ordered to appoint a dictator, he gave another instance of his high-handedness by nominating a subordinate official, M. Claudius Glicia, but the nomination was at once overruled. Claudius himself was accused of high treason and heavily fined. He must have died before 246, in which year his sister Claudia was fined for publicly expressing a wish that her brother Publius could rise from the grave to lose a second fleet and thereby diminish the number of the people. It is supposed that he committed suicide.

Livy, Epit., 19; Polybius i. 49; Cicero, De Divinatione, i. 16, ii. 8; Valerius Maximus i. 4, viii. 1.

5. CLAUDIUS, APPILIUS, surnamed PULCHER, Roman statesman and author. He served under his brother-in-law Lucullus in Asia (72 B.C.) and was commissioned to deliver the ultimatum to Tigranes, which gave him the choice of war with Rome or the surrender of Mithradates. In 57 he was praetor, in 56 pro-praetor in Sardinia, and in 54 consul with L. Domitius Ahenobarbus. Through the intervention of Pompey, he became reconciled to Cicero, who had been greatly offended because Claudius had indirectly opposed his return from exile. In this and certain other transactions Claudius seems to have acted from avaricious motives,—a result of his early poverty. In 53 he entered upon the governorship of Cilicia, in which capacity he seems to have been rapacious and tyrannical. During this period he carried on a correspondence with Cicero, whose letters to him form the third book of the Epistolae ad Familiares. Claudius resented the appointment of Cicero as his successor, avoided meeting him, and even issued orders after his arrival in the province. On his return to Rome Claudius was impeached by P. Cornelius Dolabella on the ground of having violated the sovereign rights of the people. This led him to make advances to Cicero, since it was necessary to obtain witnesses in his favour from his old province. He was acquitted, and a charge of bribery against him also proved unsuccessful. In 50 he was censor, and expelled many of the members of the senate, amongst whom the historian Sallust on the ground of immorality. His connexion with Pompey brought upon him the enmity of Caesar, at whose march on Rome he fled from Italy. Having been appointed by Pompey to the command in Greece, in obedience to an ambiguous oracle he crossed over to Euboea, where he died about 48, before the battle of Pharsalus. Claudius was of a distinctly religious turn of mind, as is shown by the interest he took in sacred buildings (the temple at Eleusis, the sanctuary of Amphairos at Oropus). He wrote a work on augury, the first book of which he dedicated to Cicero. He was also extremely superstitious, and believed in invocations of the dead. Cicero had a high opinion of his intellectual powers, and considered him a great orator (see Orelli, Onomasticon Tullianum).

A full account of all the Claudii will be found in Pauly-Wissowa's Realencyclopdie der klassischen Altertumswissenschaft, iii. 2 (1899).

CLAUDIUS, MARCUS AURELIUS, surnamed GOTHICUS, Roman emperor a.d. 161-180, belonged to an obscure Illyrian family. On account of his military ability he was placed in command of an army by Decius; and Valerian appointed him general on the Illyrian frontier, and ruler of the provinces of the lower Danube. During the reign of Gallienus, he was called to Italy in order to crush Aureolus; and on the death of the emperor (268) he was chosen as his successor, in accordance, it was said, with his express desire. Shortly after his accession he routed the Alamanni on the Lacus Benacus (some doubt is thrown upon this); in 269 a great victory over the Goths at Naissus in Moesia gained him the title of Gothicus. In the following year he gave the plague at Sirmium, in his fifty-sixth year. He enjoyed great popular glory, and appears to have been a man of ability and character.

His life was written by Trebillius Pollio, one of the Scriptores Historiae Augustae; see also Zosimus i. 40-43, the histories of Th. Bernhardt and H. Schiller, and special dissertations by A. Duncer on the life of Claudius (1868) and the defeat of the Alamanni (Arnamem des Vereins fSr nassauische Altertumskunde, 1879); Homo, De Claudio Gothicus (1900); Pauly-Wissowa, Realencyclopdie, ii. 2458 B. (R. Niese).

CLAUDIUS, MATTHIAS (1740-1815). German poet, otherwise known by the nom de plume of Asatts, was born on the 18th of August 1740 at Reinfeld, near Lübeck, and studied at Jena. He spent the greater part of his life in the little town of Wandsbeck, near Hamburg, where he earned his first literary reputation by editing from 1771 to 1775, a newspaper called the Wandsbecker Bote (Wandsbeck Messenger), in which he published a large number of prose essays and poems. They were written in pure and simple German, and appealed to the popular taste; in many there was a vein of extravagant humour or even burlesque, while others were full of quiet meditation and solemn sentiment. In his later days, perhaps through the influence of Klopstock, with whom he had formed an intimate acquaintance, Claudius became strongly pietistic, and the graver side of his nature showed itself. In 1814 he removed to Hamburg, to the house of his son-in-law, the publisher Friedrich Christoph Perthes, where he died on the 21st of January 1815.

Claudius's collected works were published under the title of Abhau's opuscula, oder Sämtliche Werke des Wandsbecker Boten (8 vols., 1775-1812; 13th edition, by C. Redich, 2 vols., 1902). His biography has been written by Wilhelm Herbst (4th ed., Hamburg, 1835); also M. Schneidereit, M. Claudius, seine Weltanschauung und Lebensweisheit (1898).

CLAUSEL (more correctly CLAUZEL), BERTRAND, COUNT (1772-1842), marshal of France, was born at Mirepoix (Arriege) on the 12th of December 1772, and served in the first campaign of the French Revolutionary Wars as one of the volunteers of 1791. In June 1795, having distinguished himself repeatedly in the war on the northern frontier (1792-1793) and the fighting in the eastern Pyrenees (1793-1794), Clausel was made a general of brigade. In this rank he served in Italy in 1798 and 1799, and in the disastrous campaign of the latter year he won great distinction at the battles of the Trebbia and of Novi. In 1802 he served in the expedition to S. Domingo. He became a general of division in December 1802, and after his return to France he was in almost continuous military employment there until in 1806 he was sent to the army of Naples. Soon after this Napoleon made him a grand officer of the Legion of Honour. In 1808-1809 he was with Marmont in Dalmatia, and at the close of 1809 he was appointed to a command in the army of Portugal under Masséné.

Clausel took part in the Peninsular campaigns of 1810 and 1811, including the Torres Vedras campaign, and under Marmont he did excellent service in re-establishing the discipline, efficiency and mobility of the army, which had suffered severely in the retreat from Torres Vedras. In the Salamanca campaign (1812) the result of Clausel's work was shown in the marching powers
of the French, and at the battle of Salamanca, Clausewitz, who had succeeded to the command on Marmont being wounded, and had himself received a severe wound, drew off his army with the greatest skill, the retreat on Burgos being conducted in such a way that the pursuers failed to make the slightest impression, and had themselves in the end to retire from the siege of Burgos (1812). Early in 1813 Clausewitz was made commander of the Army of the North in Spain, but he was unable to avert the great disaster of Vittoria. Under the supreme command of Soult he served through the rest of the Peninsula War with unvarying distinction. On the first restoration in 1814 he submitted unwillingly to the Bourbons, and when Napoleon returned to France, he hastened to join him. During the Hundred Days he was in command of an army defending the Pyrenean frontier. Even after Waterloo he long refused to recognize the restored government, and he escaped to America, being condemned to death in absence. He took the first opportunity of returning to aid the Liberals in France (1820), sat in the chamber of deputies from 1821 to 1829, and after the revolution of 1830 was at once given a military command. At the head of the army of Algeria Clausewitz made a successful campaign, but he was soon recalled by the home government, which desired to avoid complications in Algeria. At the same time he was made a marshal of France (February 1831). For some four years thereafter he urged his Algerian policy upon the chamber of deputies, and finally in 1835 was reappointed commander-in-chief. But after several victories, including the taking of Mascara in 1835, the marshals met with a severe repulse at Constantine in 1836. A change of government in France was primarily responsible for the failure, but public opinion attributed it to Clausewitz, who was recalled in February 1837. He thereupon retired from active service, and, after vigorously defending his conduct before the deputies, he ceased to take part in public affairs. He lived in complete retirement up to his death at Secourrieu (Garonne) on the 21st of April 1832.

CLAUSEN, PRINCE OF KARLSBAD. Clausewitz, the prince, was born in London, the son of a decorative artist. He attended the design classes at the South Kensington schools from 1869-1873 with great success. He then worked in the studio of Edwin Long, R.A., and subsequently in Paris under Bouguereau and Robert-Fleury. He became one of the foremost modern painters of landscape and of peasant life, influenced to a certain extent by the impressionists with whom he shared the view that light is the real subject of landscape art. His pictures excel in rendering the appearance of things under flickering outdoor sunlight, or in the shady shelter of a barn or stable. His "Girl at the Gate" was acquired for the nation by the Chantrey Trustees and is now at the National Gallery of British Art (Tate Gallery). He was elected associate of the Royal Academy in 1895, and as professor of painting gave a memorable series of lectures to the students of the schools,—published as Six Lectures on Painting (1904) and Aims and Ideals in Art (1906).

CLAUSEWITZ, KARL VON (1780-1831), Prussian general and military writer, was born at Burg, near Magdeburg, on the 1st of June 1780. His family, originally Polish, had settled in Germany at the end of the previous century. Entering the army in 1792, he first saw service in the Rhine campaigns of 1793-1794, receiving his commission at the siege of Mainz. On his return to garrison duty he set to work so zealously to remedy the defects in his education caused by his father's poverty, that in 1801 he was admitted to the Berlin Academy for young officers, then directed by Scharnhorst. Scharnhorst, attracted by his pupil's industry and force of character, paid special attention to his training, and profoundly influenced the development of his mind. In 1803, on Scharnhorst's recommendation, Clausewitz was made "adjutant" (aide-de-camp) to Prince August, and he served in this capacity in the campaign of Jena (1806), being captured along with the prince by the French at Preuza. A prisoner in France and Switzerland for the next two years, he returned to Prussia in 1809; and for the next three years, as a departmental chief in the ministry of war, as a teacher in the military school, and as military instructor to the crown prince, he assisted Scharnhorst in the famous reorganization of the Prussian army. In 1810 he married the countess Marie von Britth. See the outbreak of the Russian war in 1812, Clausewitz, like many other Prussian officers, took service with his country's nominal enemy. This step he justified in a memoir, published for the first time in the Leben Gneisenau's by Petz (Berlin, 1869). At first adjutant to General Phull, who had himself been a Prussian officer, he served later under Pahlen at Witepsk and Smolensk, and from the final Russian position at Kaluga he was sent to the army of Wittgenstein. It was Clausewitz who negotiated the convention of Tauroggen, which separated the cause of Yorck's Prussians from that of the French, and began the War of Liberation (see YORCK, BARON VON WARTENBURG; also Blumenthal's Die Konvention von Tauroggen, Berlin, 1901). As a Russian officer he superintended the formation of the Landwehr of east Prussia (see STEIN, BARON VON), and in the campaign of 1813 served as chief of staff to Count Wallmoden. He conducted the fight at Göhrde, and after the armistice, with Gneisenau's permission, published an account of the campaign (Der Feldzug von 1812 bis zum Waffenstillstand, Leipzig, 1813). This work was long attributed to Gneisenau himself. After the peace of 1814 Clausewitz re-entered the Prussian service, and in the Waterloo campaign was present at Ligny and Wavre as General Thielmann's chief of staff. This post he retained till 1818, when he was promoted major-general and appointed director of the Allgemeine Kriegsschule. Here he remained till 1830 he was made chief of the 3rd Artillery Inspection at Breslau. Next year he became chief of staff to Field-marshal Gneisenau, who commanded an army of observation on the Polish frontier. After the dissolution of this army Clausewitz returned to his artillery duties; but on the 18th of November 1831 he died at Breslau of cholera, which had proved fatal to his chief also, and a little previously, to his old Russian commander Diebitsch on the other side of the frontier. His collected works were edited and published by his widow, who was aided by some officers, personal friends of the general, in her task. Of the ten volumes of Hinterlassene Werke über Krieg und Kriegführung (Berlin, 1832-1837, later edition called Clausewitz's Gesammte Werke, Berlin, 1874) the first three contain Clausewitz's masterpiece, Vom Kriege, an exposition of the philosophy of war which is absolutely unrivalled. He produced no "system of strategy, and his critics styled his work "negative" and asked "Qu'a-t-il fondé?" What he had "founded" was that modern strategy which, by its hold on the Prussian mind, carried the Prussian arms to victory in 1866 and 1870 over the "systematic" strategists Kräsmön and Bazaine, and his philosophy of war became, not only in Germany but in many other countries, the essential basis of all serious study of the art of war. The English and French translations (Graham, On War, London, 1873; Neumann, La Guerre, Paris, 1849-1852; or Varth, Théorie de la grande guerre, Paris, 1899), with the German original, place the work at the disposal of students of most nationalities. The remaining volumes deal with military history: vol. 4, the Italian campaign of 1796-97; vols. 5 and 6, the campaign of 1799 in Switzerland and Italy; vol. 7, the wars of 1812, 1813 to the armistice, and 1814; vol. 8, the Waterloo Campaign; vols. 9 and 10, papers on the campaigns of Gustavus Adolphus, Turenne, Luxemburg, Münnich, John Sobieski, Frederick the Great, Ferdinand of Brunswick, &c. He also wrote Über das Leben und den Charakter von Scharnhorst (printed in Ranke's Historisch-politischer Zeitschrift, 1832). A manuscript on the catastrophe of 1806 long remained unpublished. It was used by v. Höpflner in his history of that war, and eventually published by the General Staff in 1888 (French translation, 1903). Letters from Clausewitz to his wife were published in Zeitschrift für preussische Landeskunde (1876). His name is borne by the 26th Field Artillery regiment of the German army.
CLAUSIUS—CLAVICYTHERIUM

CLAUSIUS, RUDOLF JULIUS EMMANUEL (1822–1888), German physicist, was born on the 2nd of January 1822 at Köslin, in Pomerania. After attending the Gymnasium at Stettin, he studied at Berlin University from 1840 to 1844. In 1848 he took his degree at Halle, and in 1850 was appointed professor of physics in the royal artillery and engineering school at Berlin. Late in the same year he delivered his inaugural lecture as Privatdocent in the university. In 1855 he became an ordinary professor at Zürich Polytechnic, accepting at the same time a professorship in the university of Zürich. In 1867 he moved to Würzburg as professor of physics, and two years later was appointed to the same chair at Bonn, where he died on the 24th of August 1888. During the Franco-German War he was at the head of an ambulance corps composed of Bonn students, and received the Iron Cross for the services he rendered at Vionville and Tchâtelvoute. The work of Clausius, who was a mathematical rather than an experimental physicist, was concerned with many of the most abstruse problems of molecular physics. By his restatement of Carnot’s principle he put the theory of heat on a truer and sounder basis, and he deserves the credit of having made thermodynamics a science; he enunciated the second law, in a paper contributed to the Berlin Academy in 1850, in the well-known form, “Heat cannot of itself pass from a colder to a hotter body.” His results he applied to an exhaustive development of the theory of the steam-engine, laying stress in particular on the conception of entropy. The kinetic theory of gases owes much to his labours, Clerk Maxwell calling him its principal founder. It was he who raised it, on the basis of the dynamical theory of heat, to the level of a theory, and he carried out many numerical determinations in connexion with it, e.g. of the mean free path of a molecule. To Clausius also was an important advance in the theory of electrolysis, and he put forward the idea that molecules in electrolytes are continually interchanging atoms, the electric force not causing, but merely directing, the interchange. This view found little favour until 1887, when it was taken up by S.A. Arrhenius, who made it the basis of the theory of electrolytic dissociation. In addition to many scientific papers he wrote Die Potentialfunktion und das Potential, 1864, and Abhandlungen über die mechanische Wärmetheorie, 1864-1867.

CLAUSTHAL, or KLAUSTHAL, a town of Germany, in the Prussian Harz, lying on a bleak plateau, 1860 ft. above sea-level, 50 m. by rail W.S.W. of Halberstadt. Pop. (1905) 8565. Clausthal is the chief mining town of the Upper Harz Mountains, and practically forms one town with Zellerfeld, which is separated from it by a small stream, the Zellbach. The streets are broad and spacious, offering opportunity for improvement having been given by fires in 1844 and 1854; the houses are mostly of wood. There are an Evangelical and a Roman Catholic church, and a gymnasion. Clausthal has a famous mining college with a mineralogical museum, and a disused mint. Its chief mines are silver and lead, but it also smelts copper and a little gold. Four or five sanatoria are in the neighbourhood. The museum of the Upper Harz is at Zellerfeld.

Clausthal was founded about the middle of the 11th century in consequence probably of the erection of a Benedictine monastery (closed in 1431), remains of which still exist in Zellerfeld. At the beginning of the 16th century the dukes of Brunswick made a new settlement here, and under their directions the mining, which had been begun by the monks, was carried on more energetically. The first church was built at Clausthal in 1570. In 1864 the control of the mines passed into the hands of the state.

CLAVECIN, the French for clavisymbal or harpsichord (Ger. Clavicymbel or Dokkenklavier), an abbreviation of the Flemish clavisinbal and Ital. clavicimbalo, a keyboard musical instrument in which the strings were plucked by means of a plectrum consisting of a quill mounted upon a jack. See PIANOFORTE; HARPSCORD.

CLAVICEMBALO, or Gravicembalo (from Lat. clavis, key, and cymbalum, cymbal; Eng. clavicymbal, clavisymbal; Flemish, clavisinbal; Span. claviscibanos), a keyboard musical instrument with strings plucked by means of small quill or leather plectra. “Cymbal” (Gr. κύμβαλον, from κύμβα, a hollow vessel) was the old European term for the dulcimer, and hence its place in the formation of the word. See PIANOFORTE; SPINET; VIRGINAL.

CLAVICHORD, or CLARICHORD (Fr. manichorde; Ger. Clavichord; Ital. manichordio; Span. mancorio), a medieval stringed keyboard instrument, a forerunner of the pianoforte (q.v.), its strings being set in vibration by a blow from a brass tangent instead of a hammer as in the modern instrument. The clavichord, derived from the dulcimer by the addition of a keyboard, consisted of a rectangular case, with or without legs, often very elaborately ornamented with paintings and gilding. The earliest instruments were small and portable, being placed upon a table or stand. The strings, of finely drawn brass, steel or iron wire, were stretched almost parallel with the keyboard over the neck of the instrument or soundboard. Vents on the soundboard bridges, often three in number, and wound as in the piano round wrest or tuning pins set in a block at the right-hand side of the soundboard and attached at the other end to hitch pins. The bridges served to direct the course of the strings and to conduct the sound waves to the soundboard. The scaling, or division of the strings determining their vibrating length, was effected by the position of the tangents. These tangents, small wedge-shaped blades of brass, beaten out at the top, were inserted in the end of the arm of the keys. As the latter were depressed by the fingers the tangents rose to strike the strings and stop them at the proper length from the belly-bridge. Thus the string was set in vibration between the point of impact and the belly-bridge just as long as the key was pressed down. The key being released, the vibrations were instantly stopped by a list of cloth acting as damper and interwoven among the strings behind the line of the tangents.

There were two kinds of clavichords—the fretted or gebunden and the fret-free or bund-frei. The term “fretted” was applied to those clavichords which, instead of being provided with a string or set of strings in unison for each note, had one set of strings acting for three or four notes, the arms of the keys being twisted in order to bring the contact of the tangent into the acoustically correct position under the string. The “fret-free” were chromatically-scaled instruments. The first bund-frei clavichord is attributed to Daniel Faber of Crailsheim in Saxony about 1720. This important change in construction increased the size of the instrument, each pair of unison strings requiring a key and tangent of its own, and led to the introduction of the system of tuning by equal temperament upheld by J. S. Bach. Clavichords were made with pedals. 1 (K.S.)

CLAVICYTHERIUM, a name usually applied to an upright spinet (q.v.), the soundboard and strings of which were vertical instead of horizontal, being thus perpendicular to the keyboard; but it would seem that the clavicytherium proper is distinct from the upright spinet in that its strings are placed horizontally. In the early clavicytherium there was, as in the spinet, only one string (of gut) to each key, set in vibration by means of a small quill or leather plectrum mounted on a jack which acted as in the spinet and harpsichord (q.v.). The clavicytherium or keyed spinet.

1 The words clavicorde, clavicordo and claviciordio, respectively French, Italian and Spanish, were applied to a different type of instrument, the spinet (q.v.).

Clavie—Clavijo, R. G. de

Clavie or cetera, names which in the 14th and 15th centuries had been applied somewhat indiscriminately to instruments having strings stretched over a soundboard and plucked by fingers or plectrum, was probably of Italian or possibly of South German origin. Sebastian Virdung, writing early in the 16th century, describes the clavicymbium as a new invention, having gut strings, and gives an illustration of it. (See Pianoforte.) A certain amount of uncertainty exists as to its exact construction, due to the extreme rarity of unrestored specimens extant, and to the almost total absence of trustworthy practical information.

In a unique specimen with two keyboards dating from the 16th or 17th century, which is in the collection of Baron Alexandre Kraus, what appear to be vibrating strings stretched over a soundboard perpendicular to the keyboard are in reality the wires forming part of the mechanism of the action. The arrangement of this mechanism is the distinctive feature of the clavicytherium, for the wires, unlike the strings of the upright spinet, increase in length from left to right, so that the upright harpsichord has its higher side over the treble of the keyboard instead of over the bass. The vibrating strings of the clavicytherium in the Kraus Museum are stretched horizontally over two kinds of psalteries fixed one over the other. The first, serving as a kind of frame for the second, is a narrow trapézoidal shape, and lies over the keyboards; it has 30 wire strings in pairs of unisons corresponding to the 15 lowest keys. The second psaltery resembles the kanoun of the Arabs, and has 36 strings in courses of 3 unisons corresponding to the next 12 keys, and 88 very thin strings in courses of 4, completing the 40 keys; the compass thus has a range of four octaves from C to C. The quills of the jacks belonging to the two keyboards are of different length and thickness. The jacks, which work as in the spinet, are attached to the perpendicular wires, disposed in two parallel rows, one for each keyboard.

There is a very fine specimen of the so-called clavicytherium (upright spinet) in the Donaldson museum of the Royal College of Music, London, acquired from the Correr collection at Venice in 1885. The instrument is undated, but A. J. Hipkins placed it early in the 16th or even at the end of the 15th century. There is German writing on the inside of the back, referring to some agreement at Ulm. The case is of pine-wood, and the natural keys of box-wood. The jacks have the early steel springs, and in 1885 traces were found in the instrument of original brass spectra, all of which point to a very early date. A learned Italian, Nicolò Vincentino, living in the 16th century, describes an archicembalo of his own invention, at which the performer had to stand, having four rows of keys designed to obtain a complete mesotonic pure third tuning. This was an attempt to reintroduce the ancient Greek musical system. This instrument was probably an upright harpsichord or clavicembalo.

For the history of the clavicytherium considered as a forerunner of the pianoforte see Pianoforte. (K. S.)

Clavie, Burning the, an ancient Scottish custom still observed at Burghhead, a fishing village on the Moray Firth, near Forres. The "clavie" is a bonfire of casks split in two, lighted on the 12th of January, corresponding to the New Year of the Christian calendar, and of the similar English "hallow" by a huge nail (Lat. datus; hence the term). It is then filled with tar, lighted and carried flaming round the village and finally up to a headland upon which stands the ruins of a Roman altar, locally called "the Douro." It here forms the nucleus of the bonfire, which is built up of split casks. When the burning tar-barrel falls in pieces, the people scramble to get a lighted piece with which to kindle the New Year's fire on their cottage hearth. The charcoal of the clavie is collected and is put in pieces up the cottage chimneys, to keep spirits and witches from coming down.

Clavière, Étienne (1735-1793), French financier and politician, was a native of Geneva. As one of the democratic leaders there he was obliged to flee to take refuge in England, upon the armed interference of France, Saratoga and Bigorneau in favour of the aristocratic party. There he met other Swiss, among them Marat and Étienne Dumont, but their schemes for a new Geneva in Ireland—which the government favoured—were given up when Necker came to power in France, and Clavière, with most of his comrades, went to Paris. There in 1789 he and Dumont allied themselves with Mirabeau, secretly collaborating for him on the Courrier de Provence and also in preparing the speeches which Mirabeau delivered as his own. It was mainly by his use of Clavière that Mirabeau sustained his reputation as a financier. But Clavière also published some pamphlets under his own name, and through these and his friendship with J. P. Brissot, whom he had met in London, he became minister of finance in the Girondist ministry, from March to the 12th of June 1792. After the 10th of August he served again as minister of finance in the provisional executive council, though with but indifferent success. He shared in the fall of the Girondists, was arrested on the 2nd of June 1793, but somehow was left in prison until the 8th of December, when, on receiving notice that he was to appear on the next day before the Revolutionary Tribunal, he committed suicide.

Clavijo, Ruy Gonzalez de (d. 1412), Spanish traveller of the 15th century, whose narrative is the first important one of its kind contributed to Spanish literature, was a native of Madrid, and belonged to a family of some antiquity and position.

On the return of the ambassadors Pelayo de Sotomayor and Hernan Sanchez de Palazuelos from the court of Timur, Henry III. of Castille determined to send another embassy to the new lord of Western Asia, and for this purpose he selected Clavijo, Gomez de Salazar (who died on the outward journey), and a master of theology named Fray Alonso Paez de Santa Maria. They sailed from St. Mary Port near Cadiz on the 22nd of May 1493, touched at the Balearic Isles, Gaeta and Rhodes, spent some time at Constantinople, sailed along the southern coast of the Black Sea to Trebizond, and proceeded inland by Erzerum, the Ararat region, Tabriz, Sultanieh, and Meshed, to Samarkand, where they were well received by the conqueror. Their return was at last accomplished, in part after Timur's death, and with countless difficulties and dangers, and they landed in Spain on the 1st of March 1406. Clavijo proceeded at once to the court, at that time in Alcalà de Henares, and served as chamberlain till the king's death (in the spring of 1406-1407); he then returned to Madrid, and lived there in opulence till his own death on the 2nd of April 1412. He was buried in the chapel of the monastery of St. Francis, which he had rebuilt at great expense.

There are two leading MSS. of Clavijo's narrative—(a) London, British Museum, Additional MSS. 16,613; fols. 1-125, v.; (b) London, British Museum, Add. MS. 15,455; fols. 1-455. (See illustration by William Gah in A. J. Hipkins' Musical Instruments, Histories, Rare and Unique (1888).)
He was 1821 the 1839 joined the Kentucky; system.

bravery. hot throughout of himself October

In 1810. form

In 1862 returned to London, where he remained until 1869. In 1873 he was a leading candidate for the vice-presidential nomination. In 1856 he was sent by President Lincoln as minister to Russia; in 1862 he returned to America to accept a commission as major-general of volunteers, but in March 1863 was reappointed to his former post at St Petersburg, where he remained until 1869. Disapproving of the Republican policy of reconstruction, he left the party, and in 1872 was one of the organizers of the Liberal-Republican revolt, and was largely instrumental in securing the nomination of Horace Greeley for the presidency. In the political campaigns of 1876 and 1880 he supported the Democratic candidate, but rejoined the Republican party in the campaign of 1884. He died at Whitehall, Kentucky, on the 22nd of July 1905.

See his autobiography, \textit{The Life, Memoirs, Writings, and Speeches of Cassius Marcellus Clay} (Cincinnati, 1896); and \textit{The Writings of Cassius Marcellus Clay} (edited with a "Memoir" by Horace Greeley. New York, 1848).

\textbf{CLAY, CHARLES} (1801–1803), English surgeon, was born at Bredbury, near Stockport, on the 27th of December 1801. He began his medical education as a pupil of Kinder Wood in Manchester (where he used to attend John Dalton's lectures on chemistry), and in 1821 went to Edinburgh to continue his studies there. Qualifying in 1823, he began a general practice in Ashton-under-Lyne, but in 1839 removed to Manchester to practise as an operative and consulting surgeon. It was there that, in 1824, he first performed the operation of ovariotomy with which his name is associated. On this occasion it was perfectly successful, and when in 1856 he published an analysis of 111 cases he was able to show a mortality only slightly above 30%. Although his merits in this matter have sometimes been denied, his claim to the title "Father of Ovartomy" is now generally conceded, and it is admitted that he deserves the credit not only of having shown how that operation could be made a success, but also of having played an important part in the advance of abdominal surgery for which the 19th century was conspicuous. In spite of the claims of a heavy practice, Clay found time for the pursuit of geology and archaeology. Among the books of which he was the author were a volume of \textit{Geological Sketches of Manchester} (1839) and \textit{A History of the Currency of the Isle of Man} (1840), and his collections included over a thousand editions of the Old and New Testaments and a remarkably complete series of the silver and copper coins of the United States. He died at Poulton-le-Fylde near Preston, in the 19th of September 1863.

\textbf{CLAY, FREDERIC} (1838–1889), English musical composer, the son of James Clay, M.P., who was celebrated as a player of whist and a writer on that subject, was born in Paris on the 3rd of August 1838. He studied music under W. B. Molique in Paris and Moritz Hauptmann at Leipzig. With the exception of a few songs and two cantatas, \textit{The Knights of the Cross} (1866) and \textit{Lalla Rookh} (1877), the latter of which contained his well-known song "I'll sing thee songs of Arabry," his compositions were all written for the stage. Clay's first public appearance was made with an opera entitled \textit{Court and Cottage}, the libretto of which was written by Tom Taylor. This was produced at Covent Garden in 1862, and was followed by \textit{the Waxwork} (1862), \textit{the Merry Duchess} (1883) and \textit{The Golden Ring} (1883), the latter written for the reopening of the Alhambra, which had been burned to the ground the year before, showed an advance upon his previous work, and rendered all the more regrettable the stroke of paralysis which crippled his physical and mental energies during the last few years of his life. He died at Great Marlow on the 24th of November 1889.

\textbf{CLAY, HENRY} (1777–1852), American statesman and orator, was born in Hanover county, Virginia, on the 12th of April 1777, and died in Washington on the 29th of June 1852. Few public characters in the United States have been the subject of more heated controversy. His enemies denounced him as a pretender, a selfish intriguer, and an abandoned profligate; his supporters placed him among the sages and sometimes even among the saints. He was an arranger of measures and leader of political forces, not an originator of ideas and systems. His public life covered nearly half a century, and his name and fame rest entirely upon his own merits. He achieved his success despite serious obstacles. He was tall, rawboned and awkward; his early instruction was scant; but he "read books," talked well, and so, after his admission to the bar at Richmond, Virginia, in 1797, and his removal next year to Lexington, Kentucky, he quickly acquired a reputation and a lucrative income from his law practice.

Thereafter, until the end of his life, and in a field where he met, as either friend or foe, John Quincy Adams, Gallatin, Madison, Monroe, Webster, Jackson, Calhoun, Randolph and Benton, his political activity was wellnigh ceaseless. At the age of twenty-two (1799), he was elected to a constitutional convention in Kentucky; at twenty-six, to the Kentucky legislature; at twenty-nine, while yet under the age limit of the United States constitution, he was appointed to an unexpired term (1806–1807) in the United States Senate, where, contrary to custom, he at once plunged into business, as though he had been there all his life. He again served in the Kentucky legislature.
subsequently confessed his serious doubts of the policy of his interference.

He was only twenty-two, when, as an opponent of slavery, he vainly urged an emancipation clause for the new constitution of Kentucky, and he never ceased regretting that its failure put his state, in improvements and progress, behind its free neighbours. In 1820 he congratulated the new South American republics on having abolished slavery, but the same year the threats of the Southern states to destroy the Union led him to advocate the "Missouri Compromise," which, while keeping slavery out of all the rest of the territory acquired by the "Louisiana Purchase" north of Missouri's southern boundary line, permitted it in that state. Then, greeted with the title of "The Great Pacificator" as a reward for his success, he retired temporarily to private life, with a larger stock of popularity than he had ever had before. Although at various times he had helped to strengthen the law for the recovery of fugitive slaves, declining as secretary of state to aid Great Britain in the further suppression of the slave trade, and demanding the return of fugitives from Canada, yet he heartily supported the colonizing of the slaves in Africa, because slavery was the "deepest stain upon the character of the country," opposition to which could not be repressed except by "blowing out the moral lights around," and "eradicating from the human soul the light of reason and the law of liberty." When the slave power became more aggressive in 1831, Clay defended the right of petition for the abolition of slavery in the District of Columbia, and opposed Calhoun's bill forbidding the use of the mails to "abolition" newspapers and documents. He was lukewarm toward recognizing the independence of Texas, lest it should aid the increase of slave territory, and generally favoured the freedom of speech and press as regards the question of slavery; yet his various concessions and compromises resulted, as he himself declared, in the abolitionists denouncing him as a slaveholder, and the slaveholders as an abolitionist. In 1839, only twelve months after opposing the pro-slavery demands, he prepared an elaborate speech, in order "to set himself right with the South," which, before its delivery, received pro-slavery approval. While affirming that he was "no friend of slavery" he held abolition and the abolitionists responsible for the hatred, strife, disruption and carnage that menaced the nation. In response, Calhoun referred to him a most hearty welcome, and assigned him a place on the bench of the penitents. Being a candidate for the presidency Clay had to take the insult without wincing.

It was in reference to this speech that he made the oft-quoted remark that he "would rather be right than be president." While a candidate for president in 1844, he opposed in the "Raleigh letter" the annexation of Texas on many grounds except that of its increasing the slave power, thus displeasing both the men of anti-slavery and those of pro-slavery sentiments. In 1847, after the conquest of Mexico, he made a speech against the annexation of that country or the acquiring of any foreign territory for the spread of slavery. Although in 1849 he again vainly proposed emancipation in Kentucky, he was unanimously elected to the United States Senate, where in 1850 he temporarily pacified both sections of the country by successfully offering, as it is called, "peace, concord and harmony of these states," a measure or set of measures usually known as the "Compromise of 1850." It admitted California as a free state, organized Utah and New Mexico as Territories without reference to slavery, and enacted a more efficient fugitive slave law. In spite of great physical weakness he made several earnest speeches in behalf of these measures to save the Union.

Another conspicuous feature of Clay's public career was his absorbing and rightful, but constantly ungratified, ambition to be president of the United States. His name in connexion therewith was mentioned comparatively early, and in 1824, with W. H. Crawford, Andrew Jackson, and John Quincy Adams, he was a candidate for that office. There being no choice by the people, and the House of Representatives having elected Adams, Clay was accused by Jackson and his friends of making a corrupt bargain whereby, in payment of his vote and influence
for Adams, he was appointed secretary of state. This made Jackson Clay's lifelong enemy, and ever after kept Clay busy explaining and denying the allegation. In 1832 Clay was unanimously nominated for the presidency by the National Republicans; Jackson, by the Democrats. The main issue was the policy of continuing the United States Bank, which in 1811 Clay had opposed, but in 1816 and always subsequently warmly favoured. A majority of the voters approved of Jackson's fight against what Clay had once denounced as a dangerous and unconstitutional monopoly. Clay made the mistake of supposing that he could arouse popular enthusiasm for a moneyed corporation in its contest with the great military "hero of New Orleans." In 1839 he was a candidate for the Whig nomination, but by a secret ballot his enemies defeated him in the party convention, held in December of that year, and nominated William Henry Harrison. The result threw Clay into paroxysms of rage, and he violently complained that his friends always used him as their candidate when he was sure to be defeated, and betrayed him when he or any one could have been elected. In 1844 he was nominated by the Whigs against James K. Polk, the Democratic candidate. By an audacious fraud that represented him as an enemy, and Polk as a friend of protection, Clay lost the vote of Pennsylvania; and he lost the vote of New York by his own letter abating the force of his previous opposition to the annexation of Texas. Even his enemies felt that his defeat by Polk was almost a national calamity. In 1848, Zachary Taylor, a Mexican War hero, and hardly even a convert to the Whig party, defeated Clay for the nomination, Kentucky herself deserting her " favourite son."

Clay's quick intelligence and sympathy, and his irreproachable conduct in youth, explain his precocious prominence in public affairs. In his persuasiveness as an orator and his charming personality lay the secret of his power. He had early trained himself in the art of speech-making; in the forest, the field and the prison, and even the school-room. By the time his voice was declared to be the finest musical instrument that they ever heard. His eloquence was in turn majestic, fierce, playful, insinuating; his gesticulation natural, vivid, large, powerful. In public he was of magnificent bearing, possessing the true oratorical temperament, the nervous exaltation that makes the orator feel and appear a superior being, transfixing his thought, passion and will into the mind and heart of the listener; but his imagination frequently ran away with his understanding, while his imperious temper and ardent combativeness hurried him and his party into disadvantageous positions. The ease, too, with which he outshone men of vastly greater learning lured him from the task of intense and arduous study. His speeches were characterized by skill of statement, ingenious grouping of facts, fervent diction, and ardent patriotism; sometimes by biting sarcasm, but also by superficial research, half-knowledge and an unwillingness to reason a proposition to its logical results. In private, his never-failing courtesy, his agreeable manners and a noble and generous heart for all who needed protection against the powerful or the lawless, endeared him to hosts of friends. His popularity was as great and as inexhaustible among his neighbours as among his fellow-citizens generally. He pronounced upon himself a just judgment when he wrote: "If any one desires to know the leading and paramount object of my public life, the preservation of this Union will furnish him the key."

CLAY (from L. calx, a word common in various languages to Teutonic languages, cf. Ger. Kies), commonly defined as a fine-grained, almost impalpable substance, very soft, more or less coherent when dry, plastic and retentive of water when wet; it has an "earthy" odour when breathed upon or moistened, and consists essentially of hydrous aluminium silicate with various impurities. Of clay are formed a great number of rocks, which collectively are known as "clay-rocks" or "pelitic rocks" (from Gr. πελις, clay), e.g. mudstone, shale, slate: these exhibit in greater or less perfection the properties above described according to their freedom from impurities. In nature, clays are rarely free from foreign ingredients, many of which can be detected with the unaided eye, while others may be observed by means of the microscope. The commonest impurities are:—

(1) organic matter, humus, &c. (exemplified by clay-soils with an admixture of peat, oil shales, carbonaceous shales); (2) fossils (such as plants in the shales of the Liassic and Coal Measures, shells in clays of all geological periods and in fresh water marls); (3) carbonate of lime (rarely altogether absent, but abundant in marls, cement-stones and argillaceous limestones); (4) sulphide of iron, as pyrite or marcasite (when finely diffused, giving the clay a dark grey-blue colour, which weathers to brown—e.g. London Clay; also as nodules and concretions, e.g. Gault); (5) oxides of iron (staining the clay bright red when ferric oxide, red ochre; yellow when hydrous, e.g. yellow ochre); (6) sand or detrital silica (forming loams, arenaceous clays, argillaceous sandstones, &c.). Less frequently present are the following—rock salt (Triassic clays, and marls of Cheshire, &c.); gypsum (London Clay, Triassic clays); dolomite, phosphate of lime, vivianite (phosphate of iron), oxides of manganese, copper ores (e.g. Kupferschiefer), wavellite and amber. As the impurities increase in amount the clay rocks pass gradually into argillaceous sands and sandstones, argillaceous limestones and dolomites, shaly coals and clay ironstones.

Natural clays, even when most pure, show a considerable range of composition, and hence cannot be regarded as consisting of a single mineral; clay is a rock, and has that variability which characterizes all rocks. Of the essential properties of clay some are merely physical, and depend on the minute size of the particles. If any rock be taken (even a piece of pure quartz) and crushed to a very fine powder, it will show some of the peculiarities of clays; for example, it will be plastic, retentive of moisture, impermeable to water, and will shrink to some extent if the moist mass be kneaded, and then allowed to dry. It happens, however, that many rocks are not disintegrated to this extreme degree by natural processes, and weathering invariably accompanies disintegration. Quartz, for example, has little or no cleavage, and is not attacked by the atmosphere. It breaks up into fragments, which become rounded by attrition, but after they reach a certain minuteness are borne along by currents of water or air in a state of suspension, and are not further reduced in size. Hence sands are more coarse grained than clays. A great number of rock-forming minerals, however, possess a good cleavage, so that when bruised they split into thin fragments; many of these minerals decompose somewhat readily, yielding secondary minerals, which are comparatively soft and have a scaly character, with eminently perfect cleavages, which facilitate splitting into exceedingly thin plates. The principal substances of this description are kaolin, muscovite and chlorite. Kaolin and muscovite are formed principally after felspar (and the felspars are the commonest minerals of all crystalline rocks); also from nepheline, leucite, scapolite and a variety of other rock-forming minerals. Chlorite arises from biotite, augite and hornblende. Serpentine, which may be fibrous or scaly, is a secondary product of olivine and certain pyroxenes. Clays consist essentially of the above ingredients (although serpentine is not known to take part in them to any extent, it is closely allied to chlorite). At the same time other substances are produced as decomposition goes on. They are principally finely divided quartz, epidote, zoisite, rutile, limonite, calcite, pyrites, and very small particles of these are rarely absent from clay minerals. These fine-grained materials are at first mixed with broken and more or less weathered rock fragments and coarser mineral particles in the soil and subsoil, but by the action of wind and rain they are swept away and deposited in distant situations. "Loess" is a fine calcareous clay, which has been wind-borne, and subsequently laid down on the margins of dry steppes and deserts. Most clays are water-borne, having been carried from the surface of the land by
rain and transported by the brooks and rivers into lakes or the sea. In this state the fine particles are known as ‘mud.’ They are deposited where the currents are checked and the water becomes very still. If temporarily laid down in other situations they are ultimately lifted again and removed. A little clay, stirred up with water in a glass vessel, takes hours to settle, and even after two or three days some remains in suspension; in fact, it has been suggested that in such cases the clay forms a sort of ‘colloidal solution’ in the water. Traces of dissolved salts, such as common salt, gypsum or alum, greatly accelerate deposition. For these reasons the principal gathering places of fine pure clays are deep, still lakes, and the sea bottom at considerable distances from the shore. The coarser materials settle nearer the land, and the shallower portions of the sea floor are strewn with gravel and sand, except in occasional depressions and near the mouths of rivers where mud may gather. Farther out the great mud deposits begin, extending from 50 to 200 m. from the land, according to the amount of sediment brought in, and the rate at which the water deepens. A girdle of mud accumulations encircles all the continents. These sediments are fine and tenacious; their principal components, in addition to clay, are quartz, feldspar (usually micaceous), mica, hornblende, felspar and iron compounds. Their typical colour is blackish-blue, owing to the abundance of sulphuric hydrogen; when fresh they have a sulphurous odour, when weathered they are brown, as their iron is present as hydrous oxides (limonite, &c.). These deposits are tenant from numerous forms of marine life, and the sulphur they contain is derived from decomposing organic matter. Occasionally water-logged plant debris is mingled with the mud. In a few places a red colour prevails, the iron being mostly oxidized; elsewhere the muds are green owing to abundant glauconite. Traced landwards the muds become more sandy, while on their outer margins they grade into the abysmal deposits, such as the globigerina ooze (see OCEAN AND OCEANOGRAPHY). Near volcanoes they contain many volcanic minerals, and around coral islands they are often in large part calcareous.

Microscopic sections of some of the more coherent clays and shales may be prepared by saturating them with Canada balsam by long boiling, and slicing the resultant mass in the same manner as one of the harder rocks. They show that clay rocks contain abundant very small grains of quartz (about 0-01 to 0-05 mm. in diameter), with often felspar, tourmaline, zircon, epidote, rutile and more or less calcite. These may form more than one-third of an ordinary shale; the greater part, however, consists of still smaller scales of other minerals (0-01 mm. in diameter and less than this). Some of these are recognizable as pale yellowish and white mica; others seem to be chlorite, the remainder is perhaps kaolin, but, owing to the minute size of the flakes, they yield very indistinct reactions to polarized light. They are also often stained with iron oxide and organic substances, and in consequence their true nature is almost impossible to determine. It is certain, however, that the finer-grained rocks are richest in alumina, and in combined water, hence the inference is clear that kaolin or some other hydrous aluminium silicate is the dominating constituent. These results are confirmed by the mechanical analysis of clays. This process consists in finely pulverizing the soil or rock, and levigating it in vessels of water. A series of powders is obtained progressively finer according to the time required to settle to the bottom of the vessel. The clay is held to include those particles which have less than 0-005 mm. diameter, and contains a higher percentage of alumina than any of the other ingredients.

As might be inferred from the differences they exhibit in other respects, clay rocks vary greatly in their chemical composition. Some of them contain much iron (yellow, blue and red clays); others contain abundant calcium carbonate (calcareous clays and marls). Pure clays, however, may be found almost quite free from these substances. Their silica ranges from about 60 to 45% varying in accordance with the amount of quartz and alkali-felspar present. It is almost always more than would be the case if the rock consisted of kaolin mixed with muscovite. Alumina is high in the finer clays (18 to 30%), and they are the most alumious of all sediments, except bauxite. Magnesia is never absent, though its amount may be less than 1%; it is usually contained in minerals of the chlorite group, but partly also in dolomite. The alkalis are very interesting; often they form 5 or 10% of the whole rock; they indicate abundance of white micas or of undecomposed particles of felspar. Some clays, however, such as fireclays, contain very little potash or soda, while they are rich in alumina; and it is a fair inference that hydrated aluminous silicates, such as kaolin, are well represented in these rocks. There are, in fact, a few clays which contain about 45% of alumina, that is to say, more than in pure kaolin. It is probable that these are related to bauxite and certain kinds of laterite.

A few of the most important clay rocks, such as china-clay, brick-clay, red-clay and shale, may be briefly described here.

China-clay is white, friable and earthy. It occurs in regions of granite, porphyry and syenite, and usually occupies funnel-shaped cavities of no great superficial area, but of considerable depth. It consists of very fine scaly kaolin, larger, shining plates of white mica, grains of quartz and particles of semi-decomposed felspar, tourmaline, zircon; other materials may have formed part of the granite. These clays are produced by the decomposition of the granite by acid vapours, which are discharged after the igneous rock has solidified ("fumarole or pneumatolytic action"). Fluorine and its compounds are often supposed to have been among the agencies which produce this change, but more probably carbonic acid played the principal rôle. The felspar decomposes into kaolin and quartz, its alkalis are for the most part set free and removed in solution, but are partly retained in the white mica which is constantly found in crude china-clays. Semi-decomposed varieties of the granite are known as china-stone. The kaolin may be washed away from its original site, and deposited in hollows or lakes to form beds of white clay, such as pipe-clay; in this case it is always more or less impure. Yellow and pinkish varieties of china-clay and pipe-clay contain a small quantity of oxide of iron. The best known localities for china-clay are Cornwall, Limoges (France), Saxony, Bohemia and China; it is found also in Pennsylvania, N. Carolina and elsewhere in the United States.

Fire-clays include all those varieties of clay which are very refractory to heat. They must contain little alkalis, lime, magnesia and iron, but some of them are comparatively rich in silica. Many of the clays which pass under this designation belong to the Carboniferous period, and are found underlying seams of coal. Either by rapid growth of vegetation, or by subsequent percolation of organic solutions, most of the alkalis and the lime have been carried away.

Any argillaceous material, which can be used for the manufacture of bricks, may be called a brick-clay. In England, Kimmeridge Clay, Lias clays, London Clay and pulverized shale and slate are all employed for this purpose. Each variety needs special treatment according to its properties. The true brick-clays, however, are superficial deposits of Triassic or Quaternary age, and occur in hollows, filled-up lakes and deserted stream channels. Many of them are derived from the glacial boulder-clays, or from the washing away of the finer materials contained in older clay formations. They are always very impure.

The red-clay is an abyssal formation, occurring in the sea bottom in the deepest part of the oceans. It is estimated to cover over fifty millions of square miles, and is probably the most extensive deposit which is in course of accumulation at the present day. In addition to the reddish or brownish argillaceous matrix it contains fresh or decomposed crystals of volcanic minerals, such as felspar, augite, hornblende, olivine and pumiceous or palagonitic rocks. These must either have been ejected by submarine volcanoes or drifted by the wind from active vents, as the fine ash discharged by Krakatoa was wafted over the whole globe. Larger rounded lumps of pumice, found in the clay, have probably floated to their present situations, and sank when decomposed, all their cavities becoming filled.
CLAY CROSS—CLAYTON

with sea water. Crystals of zeolites (phillipsite) form in the red-clay as radulate, nodular groups. Lumps of manganese oxide, with a black, shining outer surface, are also characteristic of this deposit, and frequently encrust pieces of pumice or animal remains. The only fossils of the clay are radiolaria, sharks' teeth and the ear-bones of whales, precisely those parts of the skeleton of marine creatures which are hardest and can longest survive exposure to sea-water. Their comparative abundance shows how slowly the clay gathers. Small rounded spherules of iron, believed by some to be meteoric dust, have also been obtained in some numbers. Among the rocks of the continents nothing exactly the same as this remarkable deposit is known to occur, though fine dark clays, with manganese nodules, are found in many localities, accompanied by other rocks which indicate deep-water conditions of deposit.

Another type of red-clay is found in caves, and is known as cave-earth or red-earth (terra rossa). It is fine, tenacious and bright red, and represents the insoluble and thoroughly weathered impurities which are left behind when the calcareous matter is removed in solution by carbonated waters. Similar residual clays sometimes occur on the surface of areas of limestone in hollows and fissures formed by weathering.

Boulder-clay is a coarse unstratified deposit of fine clay, with more or less sand, and boulders of various sizes, the latter usually marked with glacial striations.

Some clay rocks which have been laid down by water are very uniform through their whole thickness, and are called mud-stones. Others split readily into fine leaflets or laminae parallel to their bedding, and the structure is accentuated by the presence of films of other materials, such as sand or vegetable debris. Laminated clays of this sort are generally known as shales; they occur in many formations but are very common in the Carboniferous. Some of them contain much organic debris, and when distilled yield paraffin oil, wax, compounds of ammonia, &c. In these oil-shales there are clear, globular, yellow bodies which seem to be resinous. It has been suggested that the admixture of large quantities of decomposed fresh-water algae among the original mud is the origin of the paraffins. In New South Wales, Scotland and several parts of America such oil-shales are worked on a commercial scale. Many shales contain great numbers of ovoid or rounded septarian nodules of clay ironstone. Others are rich in pyrites, which, on oxidation, produces sulphuric acid; this attacks the aluminous silicates of the shale and forms aluminium sulphate (alum shale). The limy shales of Whitby contain blocks of semi-mineralized wood, or jet, which is black with a resinous lustre, and a fibrous structure. The laminated structure of shales, though partly due to successive very thin sheets of deposit, is certainly dependent also on the vertical pressure exerted by masses of superincumbent rock; it indicates a transition to the fissile character of clay slates.

CLAY CROSS, an urban district in the Chesterfield parliamentary division of Derbyshire, England, near the river Amber, on the Midland railway, 5 m. S. of Chesterfield. Pop. (1901) 8,358. The Clay Cross Colliery and Ironworks Company, whose mines were for a time leased by George Stephenson, employ a great number of hands.

CLAYMORE (from the Gaelic claidheachm bhr, “great sword”), the old two-edged broadsword with cross hilt, of which the guards were usually turned down, used by the Highlanders of Scotland. The name is also wrongly applied to the single-edged basket-hilted sword adopted in the 16th century and still worn as the full-dress sword in the Highland regiments of the British army.

CLAYS, PAUL JEAN (1819-1900), Belgian artist, was born at Bruges in 1819, and died at Brussels in 1900. He was one of the most esteemed marine painters of his time, and early in his career he substituted a sincere study of nature for the extravagant and artificial conventionality of most of his predecessors. When he began to paint, the sea was considered by continental artists as worth representing only under its most tempestuous aspects. Artists cared only for the stirring drama of storm and wreck, and they clung still to the old-world tradition of the romantic school. Clays was the first to appreciate the beauty of calm waters reflecting the slow procession of clouds, the glories of sunset illuminating the sails of ships or gilding the tarred sides of heavy fishing-boats. He painted the peaceful life of rivers, the poetry of wide estuaries, the regulated stir of roadsteads and ports. And while he thus broke away from old traditions he also threw off the trammels imposed on him by his master, the marine painter Theodore Gudin (1862-1880). Endeavouring only to give truthful expression to the nature that delighted his eyes, he sought to render the limpid salt atmosphere, the weight of waters, the transparency of moist horizons, the gem-like sparkling of the sky. A Fleming in his feeling for colour, he set his palette with clean strong hues, and their powerful harmonies were in striking contrast with the rusty, smoky tones then in favour. If he was not a “luminist” in the modern use of the word, he deserves at any rate to be classed with the founders of the modern naturalistic school. This conscientious and healthy interpretation, to which the artist remained faithful, without any important change, to the end of an unusually long and laborious career, attracted those minds which aspired to be bold, and won over those which were moderate. Clays soon took his place among the most famous Belgian painters of his generation, and his pictures, sold at high prices, are to be seen in most public and private galleries. We may mention, among others, “The Beach at Ault,” “Boats in a Dutch Port,” and “Dutch Boats in the Flushing Roads,” the last in the National Gallery, London. In the Brussels Gallery picture “The Port of Antwerp” “Coast near Ostend,” and a “Calm on the Scheldt”; in the Antwerp museum, “The Meuse at Dordrecht”; in the Pinakotheck at Munich, “The Open North Sea”; in the Metropolitan Museum of Fine Arts, New York, “The Festival of the Freedom of the Scheldt at Antwerp in 1863”; in the palace of the king of the Belgians, “ Arrival of Queen Victoria at Ostend in 1857”; in the Bruges academy, “Port of Feurugdo, Portugal.” Clays was a member of several Academies, Belgian and foreign, and of the Order of Leopold, the Legion of Honour, &c.

See Camille Lemonnier, Histoire des Beaux-Arts (Brussels, 1887). (O. M.*

CLAYTON, JOHN MIDDLETON (1796-1856), American politician, was born in Dagsborough, Sussex county, Delaware, on the 24th of July 1796. He came of an old Quaker family long prominent in the political history of Delaware. He graduated at Yale in 1815, and in 1819 began to practise law at Dover, Delaware, where for a time he was associated with his cousin, Thomas Clayton (1778-1854), subsequently a United States senator and chief-justice of the state. He soon gained a large practice. He became a member of the state House of Representatives in 1824, and from December 1826 to October 1828 was secretary of state of Delaware. In 1829, by a combination of anti-Jackson forces in the state legislature, he was elected to the United States Senate. Here his great oratorical gifts gave him a high place as one of the ablest and most eloquent opponents of the administration. In 1831 he was a member of the Delaware constitutional convention, and in 1835 he was returned to the Senate as a Whig, but resigned in the following year. In 1837-1839 he was chief justice of Delaware. In 1843 he again entered the Senate, where he opposed the annexation of Texas and the Mexican War, but advocated the active prosecution of the latter once it was begun. In March 1849 he became secretary of state in the cabinet of President Zachary Taylor, to whose nomination and election his influence had contributed. His brief tenure of the state portfolio, which terminated on the 22nd of July 1850, soon after Taylor's death, was notable chiefly for the negotiation with the British minister, Sir Henry Lytton Bulwer, of the Clayton-Bulwer Treaty (q.v.). He was once more a member of the Senate from March 1853 until his death at Dover, Delaware, on the 9th of November 1856. By his contemporaries Clayton was considered one of the ablest debaters and orators in the Senate.

See the memoir by Joseph P. Comegys in the Papers of the Historical Society of Delaware, No. 4 (Wilmington, 1882).
CLAYTON-BULWER TREATY—CLAY-WITH-FLINTS

The Clayton-Bulwer Treaty, a famous treaty between the United States and Great Britain, negotiated in 1850 by John M. Clayton and Sir Henry Lytton Bulwer (Lord Dalling), in consequence of the situation created by the project of an interoceanic canal across Nicaragua, each signatory being jealous of the activities of the other in Central America. Great Britain had large and indefinite territorial claims in three regions—Belize or British Honduras, the Mosquito Coast and the Bay Islands. On the other hand, it had been negotiated, and Great Britain had, the clause binding both not to "occupy" any part of Central America or the Mosquito Coast necessitated the abandonment of such territory as Great Britain was already actually occupying or exercising dominion over; and the United States demanded the complete abandonment of the British protectorate over the Mosquito Indians. It seems to be a just conclusion that when in 1852 the Bay Islands were erected into a British "colony" this was a flagrant infraction of the treaty; that as regards American arguments were decidedly stronger, and more correct, than British; and that as regards the Mosquito question, inasmuch as a British protectorate certainly has been recognized by the treaty, to demand its absolute abandonment was unwarranted, although to satisfy the treaty Great Britain was bound materially to weaken it.

In 1859-1860, by British treaties with Central American states, the Bay Islands and Mosquito questions were settled nearly in accord with the American contentions. But by the same treaties Belize was accorded limits much greater than those contended for by the United States. This settlement the latter power accepted without cavil for many years.

Until 1866 the policy of the United States was consistently for inter-oceanic canals open equally to all nations, and unequivocally neutralized; indeed, until 1860 there was practically no official divergence from this policy. But in 1860-1864 a very different trend began. For the United States might jointly repudiate at will the Clayton-Bulwer Treaty. The new policy was based on national self-interest. The arguments advanced on its behalf were quite indefensible in law and history, and although the position of the United States, in 1850-1860, was in general the stronger in history, law and political ethics, that of Great Britain was even more conspicuously the stronger in the years 1880-1884. In 1885 the former government reverted to its traditional policy, and the Hay-Pauncefote Treaty of 1902, which replaced the Clayton-Bulwer Treaty, adopted the rule of neutralization for the Panama Canal.

CLAY-WITH-FLINTS, in geology, the name given by W. Whitaker in 1881 to a peculiar deposit of stiff red, brown or yellow clay containing unworn whole flints as well as angular shattered fragments, also with a variable admixture of rounded flint, quartz, quartzite and other pebbles. It occurs "in sheets or patches of various sizes over a large area in the south of England, from Hertfordshire on the north to Sussex on the south, and from Kent on the east to Devon on the west. It almost always lies on the surface of the Upper Chalk, but in Dorset it passes on to the Middle and Lower Chalk, and in Devon it is found on the Chert-Beds of the Selbornian group." (A. J. Jukes-Browne, "The Clay-with-Flints, its Origin and Distribution," Q.J.G.S., vol. lixi., 1906, p. 132.) Many geologists have supposed, and some still hold, that the Clay-with-Flints is the residue left by the slow solution and disintegration of the Chalk by the processes of weathering; on the other hand, it is generally held that the deposit very likely contains materials foreign to the Chalk, derived either from the Tertiary rocks or from overlying drift. In the paper quoted above, Jukes-Browne ably summarizes

1 The islands were ceded to Honduras. The Mosquito Coast was received under a declared rule limited by an attempted British protectorate over the Indians, who were given a reservation and certain peculiart rights. They were left free to accept full Nicaraguan rule at will. This they did in 1894. It was argued, e.g., that the "general principle" of that engagement was contingent on the prior realization of its "particular object," which had failed, and the treaty had determined as a special contract; moreover, none of the additional treaties to embody the "general principle" had been negotiated, and Great Britain had not even offered co-operation in the protection and neutrality-guarantee of the Panama railway built in 1850-1855, so that her rights had lapsed; certain engagements of the treaty she had violated, and therefore the whole treaty was voidable, &c.
the evidence against the view that the deposit is mainly a Chalk residue, and brings forward a good deal of evidence to show that many patches of the Clay-with-Flints lie upon the same plane and may be directly associated with Reading Beds. He concludes "that the material of the Clay-with-Flints has been chiefly and almost entirely derived from Eocene clay, with addition of some flints from the Chalk; that its presence is an indication of the previous existence of Lower Eocene Beds on the same site and nearly at the same relative level, and, consequently, that comparatively little Chalk has been removed from beneath it. Finally, I think that the tracts of Clay-with-Flints have been much more extensive than they are now" (loc. cit. p. 159).

It is noteworthy that the Clay-with-Flints is developed over an area which is just beyond the limits of the ice sheets of the Glacial epoch, and the peculiar conditions of late Pliocene and Pleistocene times, involving heavy rains, snow and frost, may have had much to do with the mingling of the Chalk and Chalky material. Besides the occurrence in surface patches, Clay-with-Flints is very commonly to be observed descending in "pipes" often to a considerable depth into the Chalk; here, if anywhere, the residual chalk portion of the deposit should be found, and it is surmised that a thin layer of very dark clay with darkly stained flints, which appears in contact with the sides and bottom of the pipe, may represent all there is of insoluble residue.

A somewhat similar deposit, a "conglomérat de silex" or "argile à silex," occurs at the base of the Eocene on the southern and western borders of the Paris basin, in the neighbourhood of Chartres, Thimerais and Sancerrois. (J. A. H.)

CLAZOMENAE (mod. Kôllmân), an ancient town of Ionia and a member of the Ionian Dodecapolis (Confederation of Twelve Cities), on the Gulf of Smyrna, about 20 m. W. of that city. Though not in existence before the arrival of the Ionians in Asia, its original founders were largely settlers from Phlius and Cleonea. It stood originally on the isthmus connecting the mainland with the peninsula on which Erythrae stood; but the inhabitants, alarmed by the encroachments of the Persians, removed to one of the small islands of the bay, and there established their city. This island was connected with the mainland by Alexander the Great by means of a pier, the remains of which are still visible. During the 5th century it was for some time subject to the Athenians, but about the middle of the Peloponnesian war (412 B.C.) it revolted. After a brief resistance, however, it again acknowledged the Athenian supremacy, and repelled a Lacedaemonian attack. Under the Roman empire Clazomenae was included in the province of Asia, and enjoyed an immunity from taxation. The site is still marked out, in the neighbourhood of Vourla, but nearly every portion of its ruins has been removed. It was the birthplace of the philosopher Anaxagoras. It is famous for its painted terra-cotta sarcophagi, which are the finest monuments of Ionian painting in the 6th century B.C. (E. Gr.)

CLEANTHES (c. 301-232 or 252 B.C.), Stoic philosopher, born at Assos in the Troad, was originally a boxer. With but four drachmae in his possession he came to Athens, where he listened first to the lectures of Crates the Cynic, and then to those of Zeno, the Stoic, supporting himself meanwhile by working all night as water-carrier to a gardener (hence his nickname Φαιδοναγας). His power of patient endurance, or perhaps his slowness, earned him the title of "the Ass"; but such was the esteem awakened by his high moral qualities that, on the death of Zeno in 263, he became the leader of the school. He continued, however, to support himself by the labors of his own hands. Among his pupils were his successor, Chrysippos, and Antigonus, king of Macedon, from whom he accepted 2000 minae. The manner of his death was characteristic. A dangerous ulcer had compelled him to fast for a time. Subsequently he continued his abstinence, saying that, as he was already half-way on the road to death, he would not trouble to retrace his steps. Cleanthes produced very little that was original, though he wrote some fifty works, of which fragments have come down to us. The principal is the large portion of the Hymn to Zeus which has been preserved in Stobaeus. He regarded the sun as the abode of God, the intelligent providence, or (in accordance with Stoical materialism) the vivifying fire or aether of the universe. Virtue, he taught, is life according to nature; but pleasure is not according to nature. He originated a new theory as to the individual existence of the human soul; he held that the degree of its vitality after death depends upon the degree of its vitality in this life. The principal fragments of Cleanthes's works are contained in Diogenes Laertius and Stobaeus; some may be found in Cicero and Seneca.

See G. C. Mohinke, Kleanthes der Sokrates (Greifswald, 1814); C. Wachsmuth, Commentationes de Zeneo Citiensi et Cleante Assio (Berlin, 1874-1875); A. C. Pearson, Fragments of Zeno and Cleanthes (Camb., 1891); article by E. Wellmann in Ersch and Gruber's Allgemeine Enzyklopädie; K. Hirzel, Untersuchungen zu Ciceros philosophischen Schriften, ii. (1889), containing a vindication of the originality of Cleanthes; A. B. Krische, Forschungen auf dem Gebiete der alten Philosophie (1840); also works quoted under STOICS.

CLEARCHUS, the son of Rhamphias, a Spartan general and condottiere. Born about the middle of the 5th century B.C., Clearchus was sent with a fleet to the Hellespont in 411 and became governor (ἀρχων) of Byzantium, of which town he was prokynēs. His severity, however, made him unpopular, and in his absence the gates were opened to the Athenian besieging army under Alcibiades (409). Subsequently appointed by the ephors to settle the political dissensions then rife at Byzantium and to protect the city and the neighbouring Greek colonies from Thracian attacks, he made himself tyrant of Byzantium, and, when declared an outlaw and driven thence by a Spartan force, he fled to Cilicia. In the "expedition of the ten thousand" undertaken by Cyrus to dethrone his brother Artaxerxes Mnemon, Clearchus led the Peloponnesians, who formed the right wing of Cyrus's army at the battle of Cunaxa (401). On Cyrus's death Clearchus assumed the chief command and conducted the retreat, until, being treacherously seized with his fellow generals by Tissaphernes, he was handed over to Artaxerxes and executed (Thuc. viii. 39, 30; Xen. Hellenica, i. 3. 15-19; Anabasis, i. ii.; Diodorus xiv. 19. 19-20). In character he was a typical product of the Spartan educational system. He was a warrior to the finger-tips (πολέμιος καὶ φιλόπολιος ἐγκράτης. Xen. Anab. ii. 6. 1), and his tireless energy, unflattering courage and strategic ability made him an officer of no mean order. But he seems to have had no redeeming touch of refinement or humanity.

CLEARFIELD, a borough and the county-seat of Clearfield county, Pennsylvania, U.S.A., on the W. branch of the Susquehanna river, in the W. central part of the state. Pop. (1890) 2248; (1900) 5081; (1910) 6851. It is served by the New York Central & Hudson River, the Pennsylvania, and the Buffalo, Rochester & Pittsburg railways. The borough is about 1105 ft. above sea-level, in a rather limited space between the hills, which command picturesque views of the narrow valley. The river runs through the borough. Coal and fireclay abound in the vicinity, and these, with leather, iron, timber and the products of the fertile soil, are the bases of its leading industries. Before the arrival of the whites the place had been cleared of timber (whence its name), and in 1805 it was chosen a site for the county-seat of the newly erected county and laid out as a town; in 1840 it was incorporated as a borough.

CLEARING-HOUSE, the general term for a central institution employed in connexion with large and interrelated businesses for the purpose of facilitating the exchange of payments. Banking.—The London Clearing-House was established between 1750 and 1770 as a place where the clerks of the bankers of the city of London could assemble daily to exchange with one another the cheques drawn upon and bills payable at their respective houses. Before the clearing-house existed, each banker had to send a clerk to the places of business of all the other bankers in London to collect the sums payable by them in respect of cheques and bills; and it is obvious that much
time was consumed by this process, which involved the use of an unnecessary quantity of money and corresponding risks of safe carriage. In 1775 a room in Change Alley was settled upon as a common centre of exchange; this was afterwards removed to Post Office Court, Lombard Street. This clearing centre was at first confined to the bankers—at that time and long afterwards exclusively private bankers—doing business within the city, and the bankers in the west end of the metropolis used some one or other of the city banks as their agent in clearing. When the joint-stock banks were first established, the jealousy of the existing banks was powerful enough to exclude them altogether from the use of the Clearing-House; and it was not until 1854 that this feeling was removed so as to allow them to be admitted.

At first the Clearing-House was simply a place of meeting, but it came to be perceived that the sorting and distribution of cheques, bills, &c., could be more expeditiously conducted by the appointment of two or three common clerks to whom each banker’s clerk could give all the instruments of exchange he wished to collect, and from whom he could receive all those payable at his own house. The payment of the balance settled the transaction, but the arrangements were afterwards so perfected that the balance is now settled by means of transfers made at the Bank of England between the Clearing-House account and those of the various banks, the Clearing-House, as well as each banker using it, having an account at the Bank of England. The use of the Clearing-House was still further extended in 1858, so as to include the settlement of exchanges between the country banks of England. Before that time each country banker receiving cheques on other country banks sent them to those other bankers by post (supposing they were not carrying on business in the same place), and requested that the amount should be paid by the London agent of the banker on whom the cheques were drawn to the London agent of the banker remitting them. Cheques were thus collected by correspondence, and each remittance involved a separate payment in London. Since 1858, accordingly, a country banker sends cheques on other country banks to his London correspondent, who exchanges them at the Clearing-House with the correspondents of the bankers on whom they are drawn.

The Clearing-House consists of one long room, lighted from the roof. Around the walls and down the centre are placed desks allotted to the various banks, according to the amount of their business. The desks are arranged alphabetically, so that the clerks may lose no time in passing round the room and delivering their “charges” or batches of cheques to the representatives of the various banks. There are three clearings in London each day. The first is at 10.30 A.M., the second at noon, and the third at 2.30 P.M. It is the busiest of all, and continues until five minutes past four, when the last delivery must be made. The three clearings were, in 1907, divided into town, metropolitan and country clearings, each with a definite area. All the clearing banks have their cheques marked with the letters “T,” “M” and “C,” according to the district in which the issuing bank is situated. Every cheque issued by the clearing banks, even though drawn in the head office of a bank, goes through the Clearing-House.

The amount of business transacted at the Clearing-House varies very much with the seasons of the year, the busiest time being when dividends are paid and stock exchange settlements are made, but the volume of transactions averages roughly from 200 to 300 million sterling a week, and the yearly clearances amount to something like £2,500,000,000. There are provincial clearing-houses at Manchester, Liverpool, Birmingham, Newcastle-on-Tyne, Leeds, Sheffield, Leicester and Bristol. There are also clearing-houses in most of the large towns of Scotland and Ireland. In New York and the other large cities of the United States there are clearing-houses providing accommodation for the various banking institutions (see Banks and Banking).

The progress of banking on the continent of Europe has been slow in comparison with that of the United Kingdom, and the use of cheques is not so general, consequently the need for clearing-houses is not so great. In France, too, the greater proportion of the banking business is carried on through three banks only, the Banque de France, the Société Générale and the Crédit Lyonnais, and a great part of their transactions are settled at their own head offices. But at the same time large sums pass through the Paris Chambre de Compensation (the clearing-house), established in 1872.

There are clearing-houses also in Berlin, Hamburg and many other European cities.

Railways.—The British Railway Clearing-House was established in 1842, its purpose, as defined by the Railway Clearing-House Act of 1850, being to settle and adjust the receipts arising from railway traffic within, or partly within, the United Kingdom, and passing over more than one railway within the United Kingdom, booked or invoiced at throughout rates or fares.” It is an independent body, governed by a committee which is composed of delegates (usually the chairman or one of the directors) from each of the railways that belong to it. Any railway company may be admitted a party to the clearing-system with the assent of the committee, may cease to be a member at a month’s notice, and may be expelled if such expulsion be voted for by two-thirds of the delegates present at a specially convened meeting. The cost of maintaining it is defrayed by contributions from the companies proportional to the volume of business passed through it by each. It has two main functions. (1) When tickets for passengers or goods are booked through between stations belonging to different railway companies at an inclusive charge for the whole journey, it distributes the money received in due proportions between the companies concerned in rendering the service. To this end it receives, in the case of passenger traffic, a monthly return of the tickets issued at each station to stations on other lines, and, in the case of goods traffic, it is supplied by both the sending and receiving stations (when these are on different companies’ systems) with abstracts showing the character, weight, &c., of the goods that have travelled between them. By the aid of these particulars it allocates the proper share of the receipts to each company, having due regard to the distance over which the traffic has been carried on each line, to the terminal services rendered by each company, to any incidental expenses to which it may have been put, and to the existence of any special agreements for the division of traffic. (2) To avoid the inconvenience of a change of train at points where the lines of different companies meet, passengers are taken, and goods and minerals generally, carried in through vehicles from their starting-point to their destination. In consequence, vehicles belonging to one company are constantly forming part of trains that belong to, and run over the lines of, other companies, which thus have the temporary use of rolling stock that does not belong to them. By the aid of a large staff of “number takers” who are stationed at junctions all over the country, and whose business is to record particulars of the vehicles which pass through these junctions, the Clearing-House follows the movements of vehicles which have left their owners’ line, ascertains how far they have run on the lines of other companies, and debits each of the latter with the amount it has to pay for their use. This charge is known as “mileage”; another charge which is also determined by the Clearing-House is “demurrage,” that is, the amount exacted from the detaining company if a vehicle is not returned within a prescribed time. These functions the Clearing-House accumulates a long series of credits to, and debits against, each company; these are periodically added up and set against each other, with the result that the accounts between it and the companies are finally settled by the transfer of comparatively small balances. It also distributes the money paid by the post-office to the railways on account of the conveyance of parcel-post traffic, and through its lost luggage department many thousands of articles left in railway carriages are every year returned to their owners. Its situation in London further renders it a convenient meeting-place for several “Clearing-House Conferences” of railway officials, as of the general managers, the goods managers, and the superintendents of the line, held four times a year for the consideration of questions in which all the companies are interested. The Irish Railway
CLEAT—CLEFT PALATE

Clearing-House, established in 1848, has its headquarters in Dublin, and was incorporated by act of parliament in 1866.

General.—The principle of clearing adopted by banks and railways has been applied with considerable success in other businesses.

In 1874 the London Stock Exchange Clearing-House was established for the purpose of settling transactions in stock, the clearing being effected by balance-sheets and tickets; the balance of stock to be received or delivered is shown on a balance-sheet sent in by each member, and the items are then cancelled against one another and tickets issued for the balances outstanding.

The New York Stock Exchange Clearing-House was established in 1892. The settlements on the Paris Bourse are cleared within the Bourse itself, through the Compagnie des Agents de Change de Paris.

In 1888 a society was formed in London called the Beetroot Sugar Association for clearing bargains in beetroot sugar. For every 500 bags of sugar of a definite weight which a broker sells, he issues a filière (a form something like a dock-warrant), giving particulars as to the ship, the warehouse, trade-marks, &c. The filière contains also a series of transfer forms which are filled up and signed by each successive holder, so transferring the property to a new purchaser. The new purchaser also fills up a coupon attached to the transfer, quoting the date and hour of sale. This coupon is detached by the seller and retained by him as evidence to determine any liability through subsequent delay in the delivery of the sugar.

Any purchaser requiring delivery of the sugar forwards the filière to the clearing-house, and the officials then send on his name to the first seller who tenders him the warrant direct. These filières pass from hand to hand within a limit of six days, a stamp being affixed on each transfer as a clearing-house fee. The difference between each of the successive transactions is adjusted by the clearing-house to the profit or loss of the seller.

The London Produce Clearing-House was established in 1888 for regulating and adjusting bargains in foreign and colonial produce. The object of the association is to guarantee both to the buyer and the seller the fulfilment of bargains for future delivery. The transactions on either side are allowed to accumulate during a month and an adjustment made at the end by a settlement of the final balance owing. On the same lines are the Caisse de Liquidation at Havre and the Waaren Liquidations Casse at Hamburg. The Cotton Association also has a clearing-house at Liverpool for clearing the transactions which arise from dealings in cotton.

Authorities.—W. Howarth, Our Clearing System and Clearing Houses (1895); J. G. Cannon, Clearing-houses, their History, Methods and Administration (1901); H. T. Easton, Money, Exchange and Banking (1905); and the various volumes of the Journal of the Institute of Bankers.

CLEAT (a word common in various forms to many Teutonic languages, in the sense of a wedge or lump, cf. "cloot" and "clot"), a wedge-shaped piece of wood fastened to ships' masts and elsewhere to prevent a rope, collar or the like from slipping, or to act as a step; more particularly a piece of wood or metal with double or single horns used for belaying ropes. A "cleat" is also a wedge fastened to a ship's side to catch the shores in a launching cradle or dry dock. "Cleat" is also used in mining for the vertical cleavage-planes of coal.

CLEATOR MOOR, an urban district in the Epworth parliamentary division of Cumberland, England, 4 m. S.E. of Whitehaven, served by the Furness, London & North-Western and Cleator & Workington Junction railways. Pop. (1901) 8120.

The town lies between the valleys of the Ehen and its tributary the Dub Beck, in a district rich in coal and iron ore. The mining of these, together with blast furnaces and engineering works, occupies the large industrial population.

CLEAVERS, or GOOSE-GRASS, Galium aparine (natural order Rubiaceae), a common plant in hedges and waste places, with a long, weak, straggling, four-sided, green stem, bearing whorls of 6 to 8 narrow leaves, ½ to 2 in. long, and, like the angles of the stem, rough from the presence of short, stiff, downwardly-pointing, hooked hairs. The small, white, regular flowers are borne, a few together, in axillary clusters, and are followed by the large, bispadic, two-celled fruit, which, like the rest of the plant, readily clings to a rough surface, whence the common name. The plant has a wide distribution throughout the north temperate zone, and is also found in temperate South America.

CLEBURNE, a town and the county-seat of Johnson county, Texas, U.S.A., 25 m. S. of Fort Worth. Pop. (1890) 3728; (1900) 7493, including 611 negroes; (1910) 10,504. It is served by the Gulf, Colorado & Santa Fé, the Missouri, Kansas & Texas, and the Trinity & Brazos Valley railways. It is the centre of a prosperous farming, fruit and stock-raising region, has large railway repair shops, flour-mills, cotton gins and foundries, a canning factory and machine shops. It has a Carnegie library, the Cleburne Academy (1846), and three Baptist churches (guris). The town was named in honour of Patrick Ronayne Cleburne (1838-1864), a major-general of the Confederate army, who was of Irish birth, practised law in Helena, Arkansas, served at Shiloh, Perryville, Stone River, Chickamauga, Missionary Ridge, Ringgold Gap, Jonesboro and Franklin, and was killed in the last-named battle; he was called the "Stonewall of the West."

CLECKHEATON, an urban district in the Spen Valley parliamentary division of the West Riding of Yorkshire, England, 5½ m. S. by E. of Bradford, on the Lancashire & Yorkshire, Great Northern and London & North-Western railways. Pop. (1901) 13,524. A chamber of commerce has held meetings here since 1878. The industries comprise the manufacture of woollens, blankets, flannel, wire-card and machinery.

CLEETHORPES, a watering-place of Lincolnshire, England; within the parliamentary borough of Grimsby, 3 m. S.E. of that town by a branch of the Great Central railway. Pop. of urban district of Cleethorpe with Thruscote (1901) 15,578.

Cleethorpes faces eastward to the North Sea, but its shore of fine sand, affording good bathing, actually belongs to the estuary of the Humber. There is a pier, and the sea-wall extends for about a mile, forming a pleasant promenade. The suburb of New Clec connects Cleethorpes with Grimsby. The church of the Holy Trinity and St Mary is principally Norman of various dates, but work of a date apparently previous to the Conquest appears in the tower. Cleethorpes is greatly favoured by visitors from the midland counties, Lancashire and Yorkshire.

CLEF PALATE and HARE-LIP, in surgery. Cleft Palate is a congenital cleftage, or incomplete development in the roof of the mouth, and is frequently associated with hare-lip. The infant is prevented from sucking, and an operation is necessary. Cleft-palate is often a hereditary defect. The most favourable time for operating is between the age of two weeks and three months, and if the cleft is closed at this early date, not only are the nutrition and general development of the child greatly improved, but the voice is probably saved from much of the unpleasant tone which is usually associated with a defective roof to the mouth and is apt to persist even if a cleft has been successfully operated on later in childhood. The greatest advance which has been made in the operative treatment of cleft palate is due to the teaching of Dr Truman W. Brophy, who adopted the ingenious plan of thrusting together to the middle line of the mouth the halves of the palate which nature had unfortunately left apart. But, as noted above, this operation must, to give the best results, be undertaken in the earliest months of infancy. After the cleft in the palate has been effectually dealt with, the hare-lip can be repaired with ease and success.

Hare-lip.—In the hare the splitting of the lip is in the middle line, but in the human subject it is on one side, or on both sides of the middle line. This is accounted for on developmental grounds: a cleft in the exact middle line is of extremely rare occurrence. Hare-lip is often associated with cleft palate. Though we are at present unable to explain why development should so frequently miss the mark in connexion with the formation of the lip and palate, it is unlikely that maternal impressions have anything to do with it. As a rule, the supposed "fright" comes long after the lips are developed. They are completely formed by the ninth week. Heredity has a powerful influence
in many cases. The best time for operating on a hare-lip depends upon various circumstances. Thus, if it is associated with cleft palate, the surgery is best performed in the first six months of life. A child will probably be several months old before the lip is operated on. If the infant is in so poor a state of nutrition that it appears unsuitable for surgical treatment, the operation must be postponed until his condition is sufficiently improved. But, assuming that the infant is in fair health, that he is taking his food well and thriving on it, that he is not troubled by vomiting or diarrhoea, and that the hare-lip is not associated with a defective palate, the sooner it is operated on the better. It may be successfully done even within a few hours of birth. When a hare-lip is unassociated with cleft palate, the infant may possibly be enabled to take the breast within a short time of the gap being closed. In such a case the operation may be advisedly undertaken within the first few days of birth. The case being suitable, the operation may be conveniently undertaken at any time after the tenth day.

CLEISTHENES, the name of two Greek statesmen, (1) of Athens, (2) of Sicily, of whom the first is far the more important.

1. Cleisthenes, the Athenian statesman, was the son of Myagoras and Agariste, daughter of Cleisthenes of Sicily. He thus descended, through his father, to the noble family of the Alcmaeonidae (q.v.), who bore upon them the curse of the Cylonian massacre, and had been in exile during the rule of the Peisistratids. In the hope of washing out the stigma, which damaged their prestige, they spent the latter part of their exile in carrying out with great splendour the contract given out by the Amphicyon for the rebuilding of the temple of Delphi (destroyed by fire in 548 B.C.). By building the pronoas of Parian marble instead of limestone as specified in the contract, they acquired a high reputation for piety; the curse was consigned to oblivion, and their reinstatement was imposed by the oracle itself upon the Spartan king, Cleomenes (q.v.). Cleisthenes, to whom this far-seeing atonement must probably be attributed, had also on his side (1) the malcontents in Athens who were disgusted with the growing severity of Hippias, and (2) the oligarchs of Sparta, partly on religious grounds, and partly owing to their hatred of tyranny. Aristotle’s Constitution of Athens, however, treats the alliance of the Peisistratids with Argos, the rival of Sparta in the Peloponnesian, as the chief ground for the action of Sparta (c. 19). In c. 513 B.C. Cleisthenes invaded Attica, but was defeated by the tyrant’s mercenaries at Leipsydrium (S. of Mt. Parnes). Sparta then, in tardy obedience to the oracle, threw off her alliance with the Peisistratids, and, after one failure, expelled Hippias in 511–510 B.C., leaving Athens once again at the mercy of the powerful families.

Cleisthenes, on his return, was in a difficulty; he realized that Athens would not tolerate a new tyrant, nor were the other nobles willing to accept him as leader of a constitutional oligarchy. It was left for him to “take the people into partnership” as Peisistratus had in a different way done before him. Solon’s reforms had failed, primarily because they left unimpaired the power of the great landed nobles, who, in their several districts, doubled the roles of landlord, priest and patriarch. This evil of local influence Peisistratus had concealed by satisfying the nominally sovereign people that in him they had a sufficient representative. It was left to Cleisthenes to adopt the remaining remedy of giving substance to the form of the Solonian constitution. His first attempts roused the aristocrats to a last effort; Isagoras appealed to the Spartans (who, though they disliked tyranny, had no love for democracy) to come to his aid. Cleisthenes retired on the arrival of a herald from Cleomenes, reviving the old question of the curse; Isagoras thus became all-powerful and expelled seven hundred families. The democrats, however, the archonship of Isagoras in 508 is important as showing that Cleisthenes was not able so far failed to secure the support of a majority in Athens. There is evidence for supposing that the election of Isagoras was procured by Cleomenes; all the evidence points to its having been brought about in the ordinary way. Probably, therefore, Cleisthenes did not take the people thoroughly into partnership till after the spring of 508.

rose, and after besieging Cleomenes and Isagoras in the Acropolis, led them under a safe-conduct, and brought back the exiles.

Among the reforms in the CLEISTHENES it is stated that he was able to establish the period of his ascendency is a blank, nor are we told when and how it came to an end. It is clear, however—and it is impossible in connexion with the Pan-hellenic patriotism to which Athens laid claim, to overrate the importance of the fact—that Cleisthenes, hard pressed in the war with Boeotia, Euboea and Sparta (Herod. v. 73 and foll.), sent ambassadors to ask the help of Persia. The story, as told by Herodotus, that the ambassadors of their own accord agreed to give “earth and water” (i.e. submission) in return for Persian assistance, and that the Celaecctes subsequently disavowed their action as unauthorized, is scarcely credible. Cleisthenes (1) was in full control and must have instructed the ambassadors; (2) he knew that any help from Persia meant submission. It is practically certain, therefore, that he (cf. the Alcmaeonids and the story of the shield at Marathon) was the first to “medize” (see Curtius, History of Greece). Probably he had hoped to persuade the Celaecctes that the agreement was a mere form. Aelian says that he himself was a victim to his own device of ostracism (q.v.); this, though apparently inconsistent with the Constitution of Athens (c. 22), may perhaps indicate that his political career ended in disgrace, a hypothesis which is explicable on the ground of this act of treachery in respect of the attempted Persian alliance. Whether to Cleisthenes are due the final success over Boeotia and Euboea, the planting of the 4000 cleruchs on the Lebentene Plain, and the policy of the Aeginetan War (see AEGINA), in which Athens borrowed ships from Corinth, it is impossible to determine. The eclipse of Celaecctes in all records is of one of the most curious facts in Greek history. It is also curious that we do not know in what official capacity Cleisthenes carried his reforms. Perhaps he was given extraordinary ad hoc powers for a specified time; conceivably he used the ordinary mechanism. It seems clear that he had fully considered his scheme in advance, that he broached it before the last attack of Isagoras, and that it was only after the final expulsion of Isagoras and his Spartan allies that it became possible for him to put it into execution.

Cleisthenes aimed at being the leader of a self-governing people; in other words he aimed at making the democracy actual. He realized that the dead-weight which held the democracy down was the influence on politics of the local religious unit. Therefore his prime object was to dissociate the clans and the phratries from politics, and to give the democracy a totally new electoral basis in which old associations and vested interests would be split up and become ineffective. It was necessary that no man should govern a pocket-constituency merely by virtue of his religious, financial or ancestral prestige, and that there should be created a new local unit with administrative powers of a democratic character which would galvanize the lethargic voters into a new sense of responsibility and independence. His first step was to abolish the four Solonian tribes and create ten new ones.

Each of the new tribes was subdivided into “demes” (roughly “townships”); this organization did not, except politically, supersede the system of clans and phratries whose old religious significance remained untouched. The new tribes, however, though geographically arranged, did not represent local interests. Further, the tribe names were taken from legendary heroes (Cecrops, Pandionis, Aegeus recalled the storied kings of Attica), and, therefore, contributed to the idea of a national unity; even Ajax, the eponym of the tribe Aeantis, though not Attic, was famous as an ally (Herod. v. 66) and ranked as a national hero. Each tribe had its shrine and its particular heraldr, which, however, was free from local association and the dominance of particular

---

The explanation given for this step by Herodotus (v. 67) is another example of his skill in drawing a picture. He compared Cleisthenes of Sicce (see below), bent on humiliating the Dorian Sparta by giving opprobrious names to the Dorian tribes, with his grandson, whose endeavours was to elevate the very persons whose tribal organization he replaced, is clearly absurd.
families. This national idea Cleisthenes further emphasized by setting up in the market-place at Athens a statue of each tribal hero.

The next step was the organization of the deme. Within each tribe he grouped ten demes (see below), each of which had

1) its hero and its chapel, and 2) its census-list kept by the demarch. The demarch (local governor), who was elected popularly and held office for one year, presided over meetings affecting local administration and the provision of crews for the state-navy, and was probably under a system of scrutiny like the dokimasia of the state-magistrates. According to the Aristotelian Constitution of Athens, Cleisthenes further divided Attica into three districts, Urban and Suburban, Inland (Mesogaios), and Maritime (Paralia), each of which was subdivided into ten trittyes; each tribe had three trittyes in each of these districts. The problem of establishing this decimal system in connexion with the demes and trittyes is insoluble. Herodotus says that there were ten demes to each tribe (Δηκα ἀπὸ τῶν φύλων); but each tribe was composed of three trittyes, one in each of the three districts. Since the deme was, as will be seen, the electoral unit, it is clear that in tribal voting the object of ending the old threefold schism of the Plain, the Hill and the Shore was attained, but the relation of deme and trittyes is obviously of an unsymmetrical kind. The Constitution of Athens says nothing of the ten-deme-to-each-tribe arrangement, and there is no sufficient reason for supposing that the demes originally were exactly a hundred in number. We know the names of 168 demes, and Polemon (3rd century B.C.) enumerated 173. It has been suggested that the demes did originally number exactly a hundred, and that new demes were added as the population increased. This theory, however, presupposes that the demes were originally equal in numbers. In the 4th and 4th centuries this was certainly not the case; the number of demesmen in some cases was only one hundred or two hundred, whereas the deme Acharnae is referred to as a "great part" of the whole state, and is known to have furnished three thousand hoplites. The theory is fundamentally at fault, inasmuch as it regards the deme as consisting of all those resident within its borders. In point of fact membership was hereditary, not residential; Demosthenes "of the Paeanian deme" might live where he would without severing his deme connexion. Thus the increase of population could be no reason for creating new demes. This distinction in a deme between demesmen and residents belonging to another deme (the ἐγκαταστέων), who paid a deme-tax for their privilege, is an important one. It should further be noted that the demes belonging to a particular tribe do not, as a fact, appear always in three separate groups; the tribe Aeneas consisted of Phalerum and eleven demes in the district of Marathon; other tribes had demes in five or six groups. It must, therefore, be admitted that the problem is insoluble for want of data. Nor are we better equipped to settle the relation between the Cleisthenian division into Urban, Maritime and Inland, and the old divisions of the Plain, the Shore and the Upland or Hill. The "Maritime" of Cleisthenes and the old "Shore" are certainly not coincident, nor is the "Inland" identical with the "Upland."

Lastly, it has been asked whether we are to believe that Cleisthenes invented the demes. To this the answer is in the negative. The demes were undoubtedly primitive divisions of Attica; Herodotus (ix. 73) speaks of the Dioscuri as ravaging the demes of Decelea (see R. W. Macan ad loc.) and we hear of opposition between the city and the demes. The most logical conclusion perhaps is that Cleisthenes, while he did create the demes which Athens itself comprised, did not create the country demes, but merely gave them definition as political divisions. Thus the city itself had six demes in five different tribes, and the other five tribes were represented by the demes of Attica and the Peiraeus. It is clear that in the Cleisthenian system there was one great source of danger, namely that the residents in and about Athens must always have had more weight in elections than those in distant demes. There can be little doubt that the preponderating influence of the city was responsible for the unwieldiness of the later imperial policy. The problem of this era is the franchise reform of Cleisthenes. Aristotle in the Politics (ii. 2. 1375 b) says that Cleisthenes created new citizens by enrolling in the tribes "many resident aliens and emancipated slaves." But the Aristotelian Constitution of Athens asserts that he gave "citizenship to the masses." These two statements are not compatible. It is perfectly clear that Cleisthenes is to be regarded as a democrat, and it would have been no blight to the people merely to confer a boon on aliens and slaves. Moreover, a revision of the citizen-roll (diapæsphismus) had recently taken place (after the end of the tyranny) and a great many citizens had been struck off the roll as being of impure descent (ὑπὸ τῶν ἀνέννυσθαν ἀνδρῶν). This class had existed from the time of Solon, and, through fear of political extinction by the oligarchs, had been favourable to Peisistratus. Cleisthenes may have enfranchised aliens and slaves, but it seems certain that he must have dealt with these free Athenians who had lost their rights. Now Isagoras presumably did not carry out this revision of the roll (diapæsphismus); as "the friend of the tyrants" (so Ath. Pol. 20; by Meyer, Busolt and others contest this) he would not have struck a blow at a class which favoured his own views. A reasonable hypothesis is that Cleisthenes was the originator of the measure of expulsion, and that he now changed his policy, and strengthened his hold on the democracy by reinstating the disfranchised in much larger numbers. The new citizens, whoever they were, must, of course, have been enrolled also in the (hitherto exclusive) phratri lists and the deme-rolls.

The Bouli (q.e.) was reorganized to suit the new tribal arrangement, and was known henceforward as the Council of the Five Hundred, fifty from each tribe. Its exact constitution is unknown, but it was certainly more democratic than the Solonian Four Hundred. Further, the system of ten tribes led in course of time to the construction of boards of ten to deal with military and civil affairs, e.g. the Strategoi (see STRATEGUS), the Apodectes, and others. Of these the former cannot be attributed to Cleisthenes, but on the evidence of Androtion it is certain that it was Cleisthenes who replaced the Colacretae by the Apodectae ("receivers"), who were controllers and auditors of the finance department, and, before the council in the council-chamber, received the revenues. The Colacretae, who had done this work before, remained in authority over the internal expenses of the Prytaneeum. A further change which followed from the new tribal system was the reconstitution of the army; this, however, probably took place about 501 B.C. and cannot be attributed directly to Cleisthenes. It has been said that the deme became the local political unit, replacing the naucracy (q.v.). But the naucraces still supplied the fleet, and were increased in number from forty-eight to fifty; if each naucracy still supplied a ship and two mounted soldiers as before, it is interesting to learn that, only seventy years before the Peloponnesian War, Athens had but fifty ships and a hundred horse.

The device of ostracism is the final stone in the Cleisthenian structure. An admirable scheme in theory, and, at first, in practice, it deteriorated in the 5th century into a mere party tool.

2 It should be observed that there are other translations of the difficult phrase ἔσοντα τὸν μὲν ἀνθρώπον, μηδὲν τὸν θηρίον. 3 Colacretae were very ancient Athenian magistrates; either (1) those who "cut up the joints" in the Prytaneeum (κακὰ, κεῖσαν) or (2) those who "collected the joints" (κακὰ, ἐκέρασαν) or (3) who "collected the jointless" (κακὰ, ἐγείρασαν) which were levied on public sales, and sometimes for the pay of the Prytaneeum. These officials were again important in the time of Aristophanes (Wasps, 693, 724; Birds, 1541), and they presided over the payment of the dicasts instituted by Pericles. They are not mentioned, however, though they may have existed after 403 B.C. At Sicyon also magistrates of this name are found.

3 It is, however, more probable that the right reading of the passage is ἐξετάσατο instead of δοκά, which would give a cavalry force in early Athens of 480, a reasonable number in proportion to the total fighting strength. The diapæsphismus.
weapon, and in the case of Hyperbolus (417) became an absurdity. In conclusion it should be noticed that Cleisthenes was the founder of the Athens which we know. To him was due the spirit of nationality, the principle of liberty duly apportioned and controlled by centralized and decentralized administration, which prepared the ground for the rich developments of the Golden Age with its triumphs of art and literature, politics and philosophy. It was Cleisthenes who organized the structure which, for a long time, bore the heavy burden of the Empire against impossible odds, the structure which the very different genius of Pericles was able to beautify. He was the first to appreciate the unique power in politics, literature and society of an organized public opinion.

2. Cleisthenes of Sicyon (c. 600-570), grandfather of the above, became tyrant of Sicyon as the representative of the conquerors, as the archon of one of the inhabitants. He emphasized the destruction of Dorian predominance by giving ridiculous epithets to their tribal units, which from Hyllies, Dymanes and Pamphyli become Hynae ("Swine-men"), Coiraetea ("Pigmen") and Oneatae ("Ass-men"). He also attacked Dorian Argos, and suppressed the Homeric "rhapsodists" who sang the exploits of Dorian heroes. He championed the cause of the Delphic oracle against the town of Crissa (Sirrho) in the Sacred War (c. 590). Crissa was destroyed, and Delphi became one of the meeting-places of the old amphictyony of Anthea, henceforward often called the Delphic amphictyony. The Pythagian games, largely on the initiative of Cleisthenes, were re-established with new magnificence, and Cleisthenes won the first chariot race in 582. He founded Pythian games at Sicyon, and possibly built a new Sicyonian temple at Delphi. His power was so great that when he offered his daughter Agariste in marriage of the sons of the Delphic tribesmen fell upon Megacles, the Alcmoseon. The story of the rival woers with the famous retort, "Hippocleides don't care," is told in Herod. vi. 125; see also Herod. v. 67 and Thuc. i. 18.

Cleisthenes is also the name of an Athenian, pilloried by Aristophanes (Clouds, 354; Thesm. 574) as a fop and a profligate. (J. M. J.)

CLEITARCHUS, one of the historians of Alexander the Great, son of Deinon, also an historian, was possibly a native of Egypt, or at least spent a considerable time at the court of Ptolemy Lagus. Quintilian (Instit. x. 1. 74) credits him with more ability than trustworthiness, and Cicero (Brutus, 11) accuses him of giving a fictitious account of the death of Thimoclesio. But there is no doubt that his history was very popular, and much used by Diodorus Siculus, Quintus Curtius, Justin and Plutarch, and the authors of the Alexander romances. His unnatural and exaggerated style became proverbial. The fragments, some thirty in number, chiefly preserved in Aelian and Strabo, will be found in C. Müller's Scriptoris Rerum Alexandri Magni (in the Didot Arrian, 1846;) monographs by C. Raun, De Clitarcho Diodoris, Curtii, Justini etuctore (1868), and F. Reuss, "Hellenistische Beiträge" in Rhein. Mus. xxii. (1908), pp. 58-78.

CLEITRAL (Gr. κλείτρα, an enclosed or shut-up place), an architectural term applied to a covered Greek temple, in contradistinction to hypaethral, which designates one that is uncovered; the roof of a cleitral temple completely covers it.

CLEITOR, or Clitor, a town of ancient Greece, in that part of Arcadia which corresponds to the modern eparchy of Kalavryta in the nomes of Elis and Achaea. It stood in a fertile plain to the south of Mt Chelmos, the highest peak of the Aroanian Mountains, and not far from a stream of its own name, which joined the Aranios, or Katsana. In the neighbourhood was a fountain, the waters of which were said to deprive those who drank from it of the taste of wine. The town was a place of considerable importance in Arcadia, and its inhabitants were noted for their love of liberty. It extended its territory over several neighbouring towns, and in the Theban war fought against Orchomenus. It joined the other Arcadian cities in the foundation of Megalopolis. As a member of the Achaean league it was besieged by the Aetolians in 220 B.C., and was on several occasions the seat of the federal assemblies. It coined money up to the time of Septimius Severus. The ruins, which bear the common name of Paleopolis or Old City, are still to be seen about 3 m. from a village that preserves the ancient designation. The greater part of the walls which enclose an area of about a mile and several of the semi-circular towers with which they were strengthened can be clearly made out; and there are also remains of three Doric temples and a small theatre.

CLEDALON, WILLIAM (1667?-1689). Scottish poet and soldier, son of Thomas Cleland, gamekeeper to the marquis of Douglas, was born about 1661. He was probably brought up on the marquis's estate of Dalmore in Lanarkshire, and was educated at St Andrews University. Immediately on leaving college he joined the army of the Covenanters, and was present at Drumclog, where, says Robert Wodrow, some attributed to Cleland the manœuvre which led to the victory. He also fought at Bothwell Bridge. He and his brother James were described in a royal proclamation of the 16th of June 1679 among the leaders of the insurgents. He escaped to Holland, but in 1685 was again in Scotland in connexion with the abortive invasion of the earl of Argyll. He escaped once more, to return in 1688 as agent for William of Orange. He was appointed lieutenant-colonel of the Cameronian regiment raised from the minority of the western Covenanters who consented to serve under William III. The Covenanters were entrusted with the defence of Dunkeld, which they held against the fierce assault of the Highlanders on the 26th of August. The repulse of the Highlanders before Dunkeld ended the Jacobite rising, but Cleland fell in the struggle. He wrote A Collection of several Poems and Verses composed upon various occasions (published posthumously, 1697). Of "Hullo, my fance, whither wilt thou go?" only the last nine stanzas are by Cleland. His poems have small literary merit, and are written, not in pure Lowland Scots, but in English with a large admixture of Scottish words. The longest and most important of them are the "mock poems" "On the Expedition of the Highland Host who came to destroy the western shires in winter 1678" and "On the clergy when they met to consult about taking the Test in the year 1681."

An Exact Narrative of the Battle of Dunkeld ... collected from several officers of the regiment ... appeared in 1689.

CLEMATIS, in botany, a genus of the natural order Ranunculaceae, containing nearly two hundred species, and widely distributed. It is represented in England by Clema: tis Vitalba, "old man's beard" or "traveller's joy," a common plant on chalky or light soil. The plants are shrubby climbers with generally compound opposite leaves, the stalk of which is sensitive to contact like a tendril, becoming twisted round suitable objects and thereby giving support to the plant. The flowers are arranged in axillary or terminal clusters; they have no petals, but white or coloured, often very large sepals, and a somewhat definite number of stamens and carpels. They contain no honey, and are visited by insects for the sake of the pollen, which is plentiful. The fruit is a head of achenes, each bearing the long-bearded persistent style, suggesting the popular name. This feathery style is an important agent in the distribution of the seed by means of the wind. Several of the species, especially the large-flowered ones, are favourite garden plants, well adapted for covering trellises or walls, or trailing over the ground. Many garden forms have been produced by hybridization; among the best known is C. Jackmannii, due to Mr George Jackman of Woking. Further information may be obtained from The Clema: tis as a Garden Flower, by Thomas Moore and George Jackman. See also Clema: tis, N: urary of Gardening, i. (1885) and Supplements.
CLEMENCEAU, GEORGES (1841– ), French statesman, was born at Moulireon-en-Paredes, Vendée, on the 28th of September 1841. Having adopted medicine as his profession, he settled in 1860 in Montmartre; and after the revolution of 1870 he had become sufficiently well known to be nominated mayor of the 18th arrondissement of Paris (Montmartre)—an unruly district over which it was a difficult task to preside. On the 8th of February 1871 he was elected as a Radical to the National Assembly for the department of the Seine, and voted against the peace preliminaries. The execution, or rather murder, of Generals Lecomte and Clément Thomas by the communists on 18th March, which he vainly tried to prevent, brought him into collision with the central committee sitting at the hôtel de ville, and they ordered his arrest, but he escaped; he was accused, however, by various witnesses, at the subsequent trial of the murderers (November 30th), of not having intervened when he might have done, and though he was cleared of this charge it led to a duel, for his share in which he was prosecuted and sentenced to a fine and a fortnight's imprisonment.

Meanwhile, on the 20th of March 1871, he had introduced in the National Assembly at Versailles, on behalf of his Radical colleagues, the bill establishing a Paris municipal council of eighty members; but he was not returned himself at the elections of the 26th of March. He tried with the other Paris mayors to mediate between Versailles and the hôtel de ville, but failed, and accordingly resigned his mayoralty and his seat in the Assembly, and temporarily gave up politics; but he was elected to the Paris municipal council on the 23rd of July 1871 for the Clignancourt quarter, and retained his seat till 1876, passing through the offices of secretary and vice-president, and becoming president in 1875. In 1876 he stood again for the Chamber of Deputies, and was elected for the 18th arrondissement. He joined the Extreme Left, and his energy and mordant eloquence speedily made him the leader of the Radical section. In 1877, after the Seize Mai (see France: History), he was one of the republican majority who denounced the Broglie ministry, and he took a leading part in resisting the anti-republican policy of which the Seize Mai incident was a symptom, his demand in 1879 for the indictment of the Broglie ministry bringing him into particular prominence. In 1880 he started his newspaper, La Justice, which became the principal organ of Parisian Radicalism; and from this time onwards throughout M. Grévy's presidency his reputation as a political critic, and as a destroyer of ministries who yet would not take office himself, rapidly grew. He led the Extreme Left in the Chamber. He was an active opponent of M. Jules Ferry's colonial policy and of the Opportunists party, and in 1885 it was his use of the Tongking disaster which principally determined the fall of the Ferry cabinet. At the elections of 1885 he advocated a strong Radical programme, and was returned both for his old seat in Paris and for the Var, selecting the latter. Refusing to form a ministry to replace the one he had overthrow, he supported the Right in keeping M. Freycinet in power in 1886, and was responsible for the inclusion of General Boulanger in the Freycinet cabinet as war minister. When Boulanger (q.v.) showed himself as an ambitious pretender, Clemenceau withdrew his support and became a vigorous combatant against the Boulanger movement, though the Radical press and a section of the party continued to patronize the general.

By his exposure of the Wilson scandal, and by his personal plain speaking, M. Clemenceau contributed largely to M. Grévy's resignation of the presidency in 1887, having himself declined Grévy's request to form a cabinet on the downfall of that of M. Rouvier; and he was primarily responsible, but for his followers to vote neither for Floquet, Ferry nor Freycinet, for the election of an "outsider" as president in M. Carnot. He had arrived, however, at the height of his influence, and several factors now contributed to his decline. The split in the Radical party over Boulangerism weakened his hands, and its collapse made his help unnecessary to the moderate republicans. A further misfortune occurred in the Panama affair, Clemenceau's relations with Cornelius Herz leading to his being involved in the general suspicion; and, though he remained the leading spokesman of French Radicalism, his hostility to the Russian alliance so increased his unpopularity that in the election for 1893 he was defeated for the Chamber, after having sat in it continuously since 1876. After his defeat for the Chamber, M. Clemenceau confined his political activities to journalism, his career being further overclouded—so far as any immediate possibility of regaining his old ascendancy was concerned—by the long-drawn-out Dreyfus case, in which he took an active and honourable part as a supporter of M. Zola and an opponent of the anti-Semitic and Nationalist campaign. In 1900 he withdrew from La Justice to found a weekly review, Le Bloc, which lasted until March 1902. On the 6th of April 1902 he was elected senator for the Var, although he had previously continually demanded the suppression of the Senate. He sat with the Socialist Radicals, and vigorously supported the Combes ministry. In June 1903 he undertook the direction of the journal L'Aurore, which he had founded. In it he led the campaign for the revision of the Dreyfus affair, and for the separation of Church and State.

In March 1906 the fall of the Rouvier ministry, owing to the riots provoked by the inventories of church property, at last brought Clemenceau to power as minister of the interior in the Sarrien cabinet. The strike of miners in the Pas de Calais after the disaster at Courrières, leading to the threat of disorder on the 1st of May 1906, obliged him to employ the military; and his attitude in the matter alienated the Socialist party, from which he definitely broke in his notable reply in the Chamber to Jean Jaurès in June 1906. This speech marked him out as the strong man of the day in French politics; and when the Sarrien ministry resigned in October, he became premier. During 1907 and 1908 his premiership was notable for the way in which the new entente with England was cemented, and for the successful part which France played in European politics, in spite of difficulties with Germany and attacks by the Socialist party in connexion with Morocco (see France: History). But on July 20th, 1909, he was defeated in a discussion in the Chamber on the state of the navy, in which bitter words were exchanged between him and Delcassé; and he at once resigned, being succeeded as premier by M. Briand, with a reconstructed cabinet.

CLEMENCIN, DIEGO (1765–1834), Spanish scholar and politician, was born on the 27th of September 1765, at Murcia, and was educated there at the Colegio de San Fisligencio. Abandoning his intention of taking orders, he found employment at Madrid in 1788 as tutor to the sons of the countess-duchess de Benavente, and devoted himself to the study of archaeology. In 1807 he became editor of the Gazeta de Madrid, and in the following year he was condemned to death by Murcia for publishing a patriotic article; he fled to Cadiz, and under the Junta Central held various posts from which he was dismissed by the reactionary government of 1814. During the liberal régime of 1820–1823 Clemencin took office as colonial minister, was exiled till 1827, and in 1833 published the first volume of his edition (1833–1836) of Don Quijote. Its merits were recognized by his appointment as royal librarian, but he did not long enjoy his triumph: he died on the 30th of July 1834. His commentary on Don Quijote owes something to John Bowle, and is disfigured by a patronizing, carping spirit; nevertheless it is the most valuable work of its kind, and is still unsuperseded. Clemencin is also the author of an interesting Elogio de la reina Isabel la Católica, published as the sixth volume of the Memorias of the Spanish Academy of History, to which body he was elected on the 20th of September 1818.

CLEMENT (Lat. Clemens, i.e. merciful; Gr. Κλήμης), the name of fourteen popes and two anti-popes. 

CLEMENT I., generally known as Clement of Rome, or Clements Romanus (flor. c. A.D. 96), was one of the "Apostolic Fathers," and in the lists of bishops of Rome is given the third or fourth place—Peter, Linus, (Anencletus), Clement. There is no ground for identifying him with the Clement of Phil. iv. 3. He may have been a freedman of T. Flavius Clemens, who was consul
with his cousin, the Emperor Domitian, in a.d. 95. A 9th-century tradition says he was martyred in the Crimea in 102; earlier authorities say he died a natural death; he is commemorated on the 23rd of November. In The Shepherd of Hermas (q.v.) (Vis. 11. iv. 3) mention is made of one Clement whose office it is to communicate with other churches, and this function agrees well with what we find in the letter to the church at Corinth, by which Clement is best known. Whilst being on our guard against reading later ideas into the title "bishop" as applied to Clement, there is no reason to doubt that he was one of the chief personalities in the Christian community at Rome, where since the time of Paul the separate house congregations (Rom. xvi.) had been united into one church officered by presbyters and deacons (Clem. 40–42). The letter in question was occasioned by a dispute in the church of Corinth, which had led to the ejection of several presbyters from their office. It does not contain Clement's name, but is addressed by "the Church of God which sojourneth in Rome to the Church of God which sojourneth in Corinth." But there is no reason for doubting the universal tradition which ascribes it to Clement, or the generally accepted date, c. a.d. 96. No claim is made by the Roman Church to interfere on any ground of superior rank; yet it is noteworthy that in the earliest time the church of Corinth, which can safely date, the church in the imperial city comes forward as a peacemaker to compose the troubles of a church in Greece. Nothing is known of the cause of the discontent; no moral offence is charged against the presbyters, and their dismissal is regarded by Clement as high-handed and unjustifiable, and as a revolt of the younger members of the community against the elder. After a laudatory account of the past conduct of the Corinthian Church, he enters upon a denunciation of vices and a praise of virtues, and illustrates his various topics by copious citations from the Old Testament scriptures. Thus he paves the way for his tardy rebuke of present disorders, which he reserves until two-thirds of his epistle is completed. Clement is exceedingly discursive, and his letter reaches twice the length of the Epistle to the Hebrews. Many of his general exhortations are but very indirectly connected with the practical issue to which the epistle is directed, and it is very probable that he was drawing largely upon the homiletical material with which he was accustomed to edify his fellow-Christsians at Rome.

This view receives some support from the long liturgical prayer at the close, which almost certainly represents the intercession used in the Roman eucharists. But we must not allow such a theory to blind us to the true wisdom with which the writer defers his censure. He knows that the roots of the quarrel lie in a wrong condition of the church's life. His general exhortations, courteously expressed in the first person plural, are directed towards a wide reformation of manners. If the wrong spirit can be exorcised, there is hope that the quarrel will end in a general desire for reconciliation. The most permanent interest of the epistle lies in the conception of the grounds on which the Christian ministry rests according to the view of a prominent teacher before the 1st century has closed. The orderliness of nature is appealed to as evidence of the will and wisdom of its Creator. The orderliness of Old Testament worship bears a like witness; everything is duly fixed by God; high priests, priests and Levites, and the people in the people's place. Similarly in the Christian dispensation all is in order due. "The apostles preached the gospel to us from the Lord Jesus Christ; Jesus Christ was sent from God. Christ then is from God, and the apostles from Christ. . . . They appointed their first-fruits, having tested them by the Spirit, as bishops and deacons of those who should believe. . . . Our apostles knew through our Lord Jesus Christ that there would be strife about the name of the bishop's office. For this cause therefore, having received perfect foreknowledge, they appointed the aforesaid, and afterwards gave a further injunction (eγουσίης) now has the further evidence of the Latin legem) that, if these should fall asleep, other approved men should succeed to their ministry. . . . It will be no small sin in us if we eject from the bishop's office those who have offered the gifts blamelessly and holyly," (c.c. xiii. xlv.)

Clement's familiarity with the Old Testament points to his being a Christian of long standing rather than a recent convert. We learn from his letter (i. 7) that the church at Rome, though suffering persecution, was firmly held together by faith and love, and was exhibiting its unity in an orderly way; the Epistle to the Hebrews, and by the 4th century this usage had spread to other churches. We even find it attached to the famous Alexandrian MS. (Codex A) of the New Testament, but this does not imply that it ever reached canonical rank. For the mass of early Christian literature that was gradually attached to his name see Clementine Literature.

The epistle was published in 1633 by Patrick Young from Cod. Alexandrinus, in which a leaf near the end was missing, so that the great prayer (cc. iv.-lxxv.) remained unknown. In 1875 (six years after J. B. Lightfoot's first edition) Brynennhe (q.e.) published a complete text of the MS. in Constanztinopilita (1875), from which in 1883 he gave us the Didaché. In 1876 R. L. Benson first published a complete Syriac text in a MS. recently obtained by the University library at Cambridge. Lightfoot made use of these new materials in an Appendix (1877); his second edition, on which he had been at work at the time of his death, came out in 1890. This must remain the standard edition, notwithstanding Dom Morin's most interesting discovery of a Latin version (1894), which was probably made in the 3rd century. It is a valuable addition to the authorities for the text. Its evidence is used in a small edition of the epistle by R. Knopf (Leipzig, 1899). See also W. Wrede, Unterrichtungsworter der ersten Clemensbriefe (1891), and the text edited by the Delitzsch-Hauck's Realenzyklopedie, vol. I'. (A. J. G.; J. A. R.)

Clement II (Suiderg) became pope on the 25th of December 1046. He belonged to a noble Saxon family, was bishop of Bamberg, and chancellor to the emperor Henry III., to whom he was indebted for his elevation to the papacy upon the abdication of Gregory VI. He was the first pope placed on the throne by the power of the German emperors, but his short pontificate was only signalized by the convocation of a council in which decrees were enacted against simony. He died on the 9th of October 1047, and was buried at Bamberg. (L. D.)

Clement III. (Paolo Scolari), pope from 1187 to 1191, a Roman, was made cardinal bishop of Palestrina by Alexander III. in 1180 or 1181. On the 19th of December 1187 he was chosen at Pisa to succeed Gregory VIII. On the 31st of May 1188 he concluded a treaty with the Romans which removed difficulties of long standing, and in April 1189 he made peace with the emperor Frederick I. Barbarossa. He settled a controversy with William of Scotland concerning the choice of the archbishop of St. Andrews; the 22nd of March 1188 removed the Scottish church from under the legatine jurisdiction of the archbishop of York, thus making it independent of all save Rome. In spite of his conciliatory policy, Clement angered Henry VI. of Germany by bestowing Sicily on Tancred. The crisis was acute when the pope died, probably in the latter part of March 1191.

Clement IV. (Guil Foulques), pope from 1265 to 1268, son of a successful lawyer and judge, was born at St Gilles-sur-Rhône. He studied law, and became a valued adviser of Louis IX. of France. He married, and was the father of two daughters, but after the death of his wife he took orders. In 1257 he became bishop of Le Puy; in 1259 he was elected archbishop of Narbonne; and on the 24th of December 1261 Urban IV. created him cardinal bishop of Sabina. He was appointed legate in England on the 22nd of November 1263, and after his return was elected pope at Perugia on the 5th of February 1265. On the 26th of February he invested Charles of Anjou with the kingdom of Sicily; but subsequently he came into conflict with Charles, especially after the death of Manfred in February 1266. To the cruelty and avarice of Charles he opposed a generous humanity. When Conradin, the last of the Hohenstaufen, appeared in Italy the pope excommunicated him and his supporters, but it is improbable that he was in the remotest degree
Clement V. (Bertrand de Gouth), pope from 1305 to 1314, was born of a noble family about 1262. After studying the arts at Toulouse and law at Orleans and Bologna, he became a canon of Bordeaux and then vicar-general to his brother the archbishop of Lyons, who in 1294 was created cardinal bishop of Albano. Bertrand was made a chaplain to Boniface VIII., who in 1305 nominated him bishop of Comines (Haute Garonne), and in 1309 translated him to the archbishopric of Bordeaux. Because he attended the synod at Rome in 1302 in the controversy between France and the Pope, he was considered a supporter of Boniface VIII., yet was by no means unfavourably regarded at the French court. At Perugia on the 5th of June 1305 he was chosen to succeed Benedict XI.; the cardinals by a vote of ten to five elected one neither an Italian nor a cardinal, in order to end a conclave which had lasted eleven months. The chronicler Villani relates that Bertrand and Pope John XXII. made at St Jean d'Angely in Saintonge this may be dismissed as gossip, but it is probable that the future pope had to accept certain conditions laid down by the cardinals. At Bordeaux Bertrand was formally notified of his election and urged to come to Italy; but he caused his coronation to take place at Lyons on the 14th of November 1305. From the beginning Clement V. was subservient to French interests. Among his first acts was the creation of nine French cardinals. Early in 1306 he modified or explained away those features of the bulls Clerici Laicos and Unam sanctam which were particularly offensive to the king. Most of the year 1306 he spent at Bordeaux because of ill-health; subsequently he resided at Poitiers and elsewhere, and in March 1309 the entire papal court settled at Avignon, an imperial fief held by the king of Sicily. Thus began the seventy years “ Babylonian captivity of the Church.” On the 13th of October 1313 Clement crowned the last of all the Knights Templar in France, and on the 13th the breaking of a storm conjured up by royal jealousy and greed. From the very day of Clement’s coronation the king had charged the Templars with heresy, immorality and abuses, and the scruples of the weak pope were at length overcome by apprehension lest the State should not wait for the Church, but should proceed independently against the alleged heretics, as well as by the royal threats of pressing the accusation of heresy against the late Boniface VIII. In pursuance of the king’s wishes Clement summoned the council of Venice (see VIENNE, COUNCIL OF), which was unable to conclude that the Templars were guilty of heresy. The pope abolished the order, however, as it seemed to be in bad repute and had outlived its usefulness. Its French estates were granted to the Hospitaliers, but actually Philip IV. held them until his death. In his relations to the Empire Clement was an opportunist. He refused to use his full influence in favour of the candidacy of Charles of Valois, brother of Philip IV., lest France become too powerful; and recognized Henry of Luxembourg, whom his representatives crowned emperor at the Lateran in 1312. When Henry, however, came into conflict with Robert of Naples, Clement supported Robert and threatened the emperor with ban and interdict. But the crisis passed with the unexpected death of Henry, soon followed by that of the pope on the 20th of April 1314 at Roquemaure-sur-Rhône. Though the sale of offices and oppressive taxation which disgraced his pontificate may in part be explained by the desperate condition of the papal finances and by his saving up gold for a crusade, nevertheless he indulged in unbecoming showing. Showing favouritism toward his family and his nation, he brought untold disaster on the Church.

Clement VII. (Giulio de' Medici), pope from 1523 to 1534, was the son of Giuliano de' Medici, assassinated in the conspiracy of the Pazzi at Florence, and of a certain Fioretta, daughter of Antonia. Being left an orphan he was taken into his own house by Lorenzo the Magnificent and educated with his sons. In 1494 Giulio went with them into exile; but, on Giovanni's restoration to power, returned to Florence, of which he was made archbishop by his cousin Pope Leo X., a special dispensation being granted on account of his illegitimate birth, followed by a formal declaration of the fact that his parents had been secretly married and that he was therefore legitimate. On the 23rd of September 1523 the pope conferred on him the title of cardinal and made him legate at Bologna. During the reign of the pleasure-loving Leo, Cardinal Giulio had practically the whole papal government in his hands and displayed all the qualities of himself as administrator; and when, on the death of Adrian VI.—whose election he had done most to secure—he was chosen pope (Nov. 18, 1523), his accession was hailed as the dawn of a happier era. It soon became clear, however, that the qualities which had made Clement an excellent second in command were not equal to the exigencies of supreme power at a time of peculiar peril and difficulty.

Though free from the grosser vices of his predecessors, a man of taste, and economical without being avaricious, Clement VII. was essentially a man of narrow outlook and interests. He failed to understand the great spiritual movement which was convulsing the Church; and instead of bending his mind to the problem of the Reformation, he from the first subordinated the cause of Catholicism and of the world to his interests as an Italian prince and a Medici. Even in these purely secular affairs, moreover, his timidity and indecision prevented him from pursuing a consistent policy; and his ill fortune, or his lack of judgment, placed him, as long as he had the power of choice, ever on the losing side.

Clement's accession at once brought about a political change in favour of France; yet he was unable to take a strong line, and wavered between the emperor and Francis I., concluding a treaty of alliance with the French king, and then, when the crushing defeat of Pavia had shown him his mistake, making his peace with Charles (April 1, 1525), only to break it again by countenancing Girolamo Morone's League of Freedom, of which the aim was to assert the independence of Italy from foreign powers. On the betrayal of this conspiracy Clement made a fresh submission to the emperor, only to follow this, a year later, by the Holy League of Cognac with Francis I. (May 22, 1526). Then followed the imperial invasion of Italy and Bourbon's sack of Rome (May 1527) which ended the Augustan age of the papal city in a horror of fire and blood. The pope was besieged in the castle of St. Angelo, compelled on the 6th of June to ransom himself with a payment of 400,000 scudi, and kept in confinement until, on the 26th of November, he accepted the emperor's terms, which besides money payments included the promise to convene a general council to deal with Lutheranism. On the 6th of December Clement escaped, before the day fixed for his liberation, to Orvieto, and at once set to work to establish peace. After the signature of the treaty of Cambrai on the 3rd of August 1529 Charles met Clement at Bologna and received from him the imperial crown and the iron crown of Lombardy. The pope was now restored to the greater part of his temporal power; but for some years it was exercised in subservience to the emperor. During this period Clement was mainly occupied in urging Charles to arrest the progress of the Reformation in Germany and in efforts to elude the emperor's demand for a general council, which Clement persistently refused to discuss on the ground that his legitimate power was not recognized. It was due to his dependence on Charles V., rather than to any conscientious scruples, that Clement evaded Henry VIII.'s demand for the nullification of his marriage with Catherine of Aragon, and so brought about the breach between England and Rome. Some time before his death, however, the dynastic interests of his family led him once more to a rapprochement with France. On the 9th of June 1531 an agreement was

See N. Valois, La France et le grand schisme d'Occident (Paris, 1896). (N. V.)
signed for the marriage of Henry of Orleans with Catherine de’ Medici; but it was not till October 1533 that Clement met Francis at Marseilles, the wedding being celebrated on the 27th.

But his friendly policy in the public mind, could take effect, Clement died, on the 29th of September 1540.

(W. A. F.)

Clement VIII. (Agostino Musi58), antipope from 1425 to the 26th of July 1429, was a canon at Barcelona until elected at Perugia by three cardinals whom the stubborn antipope478, previously named one of his cardinals. Clement was immediately recognized by Alphonso V., of Aragon, as his nominee and hostile to Pope Martin V. on account of the latter’s opposition to his claims to the kingdom of Naples, though his recognition was not met with the joy of the cardinals, who regarded him as the candidate of the Antipope. Clement immediately recognized by Alphonso V., of Aragon, as his nominee and hostile to Pope Martin V. on account of the latter’s opposition to his claims to the kingdom of Naples, but abdicated as soon as an agreement was reached between Alphonso and Martin through the exertions of Cardinal Pierre de Foix, an able diplomat and relation of the king. Clement spent his last years as bishop of Majorca, and died on the 28th of December 1446.

Clement VIII. (Ippolito Aldobrandini), pope from 1592 to 1605, was born at Fano, in 1535. He became a jurist and filled several important offices. In 1585 he was made a cardinal, and on the 30th of January 1592 he was elected pope, to succeed Innocent IX. While not hostile to Philip II., Clement desired to emancipate the papacy from undue Spanish influence, and to that end cultivated closer relations with France. In 1595 he granted absolution to Henry IV., and so removed the last objection to the acknowledgment of his legitimacy. The peace of Vervins (1598), which marked the end of Philip’s opposition to Henry, was mainly the work of the pope. Clement also entertained hopes of recovering England. He corresponded with James I. and with his queen, Anne of Denmark, a convert to Catholicism. But James was only half in earnest, and, besides, dared not risk a breach with his subjects. Upon the failure of the line of Este, Clement claimed the succession of Ferrara and reincorporated it into the States of the Church. He remonstrated against the exclusion of the Jesuits from France, and obtained their readmission. But in their doctrinal controversy with the Dominicans (see Molina, Luis) he refrained from a decision, being unwilling to offend either party. Under Clement the publication of the revised edition of the Vulgate, begun by Sixtus V., was finished; the Breviary, Missal and Pontifical received certain corrections; the Index was expanded; the Vatican library enlarged; and the Collegium Clementinum founded. Clement was an unblushing nepotist; three of his nephews he made cardinals, and to one of them gradually surrendered the control of affairs. But on the other hand among those whom he promoted to the cardinalate were such men as Baronius, Bellarmine and Toledo. During this pontificate occurred the burning of Giordano Bruno for heresy; and the tragedy of the Council of Trent. Clement died on the 5th of March 1605, and was succeeded by Leo XI.

See the contemporary life by Ciacconius, Vitae et res gestae summorum Pontificum. Rom. (Rome, 1601-1602); Francolinii, Ippolito Aldobrandini, che fu Clemente VIII. (Perugia, 1867); Ranke’s excellent sketch, Popes (Eng. trans. Austin), ii. 234 seq.; v. Reumont, Gesch. der Stadt Rom, iii. 2, 599 seq.; Brosch, Gesch. des Kirchenstaates (1880), i. 201 seq.

Clement IX. (Giulio Rospigliosi) was born in 1600, became successively auditor of the Rota, archbishop of Tarsus in paribus, and cardinal, and was elected pope on the 20th of June 1667.

Clement IX. (Giulio Rospigliosi) was born in 1600, became successively auditor of the Rota, archbishop of Tarsus in paribus, and cardinal, and was elected pope on the 20th of June 1667. He accepted a temporary agreement of the Jansenists controversy; was instrumental in concluding the peace of Nijmegen (1678); reached a long-standing breach between the Holy See and Portugal; aided Venice against the Turks, and laboured unceasingly for the relief of Crete, the fall of which hastened his death on the 9th of October 1669.

Clement X. (Emilio Altieri) was born in Rome, on the 13th of July 1590. Before becoming pope, on the 29th of April 1670 he had been auditor in Poland, governor of Ancona, and nuncio in Naples. His advanced age induced him to resign the control of affairs to his adopted nephew, Cardinal Paluzzi, who embroiled the papacy in disputes with the resident ambassadors, and incurred the enmity of Louis XIV., thus provoking the long controversy over the regalia (see Innocent XI.). Clement died on the 24th of July 1700.

See Guarnacci, Vitae et res gestae Pontif. Rom. (Rome, 1751), (contin. of Ciacconius), i. 1 seq.; Palazzi, Gesta Pontific. Rom. (Venice, 1687-1688), iv. 655 seq.; and Ranke, Popes (Eng. trans. Austin), iii. 172 seq.

Clement XI. (Giovanni Francesco Albani), pope from 1700 to 1721, was born in Urbino, on the 22nd of July 1649, received an extraordinary education in letters, theology and law, filled various important offices in the Curia, and finally, on the 23rd of November 1700, succeeded Innocent XII. as pope. His private life and his administration were blameless, but it was his misfortune to reign in troublous times. In the war of Devotion Succession he would willingly have remained neutral, but found himself between two fires, forced first to recognize Philip V., then driven by the emperor to recognize the Archduke Charles. In the peace of Utrecht he was ignored; Sardinia and Sicily, Parma and Piacenza, were disposed of without regard to papal claims. When he quarrelled with the duke of Savoy, and revoked his investiture rights in Sicily (1715), his interdict was treated with contempt. The prestige of the papacy had hardly been lower within two centuries. About 1702 the Jansenist controversy broke out afresh. Clement reaffirmed the infallibility of the pope, in matters of fact (1705), and, in 1713, issued the bull Unigenitus, condemning 191 Jansenistic propositions extracted from the Moral Reflections of Pasquier Quesnel. The rejection of this bull by certain bishops led to a new party division and a further prolonging of the controversy (see Jansenism and Quesnel, Pasquier). Clement also forbade the practice of the Jesuit missionaries in China of "accommodating" their teachings to pagan notions or customs, in order to win converts. Clement was a polished writer, and a generous patron of art and letters. He died on the 19th of March 1721.

Soc. romana di storia patria, vols. 21, 22, 23 (1898-1900), and the extended bibliography in Herzenröther, Allg. Kirchengesch. (1880), iii. 506.

(T. F. C.)

Clement XII. (Lorenzo Corsini), pope from 1730 to 1740, succeeded Benedict XIII., on the 12th of July 1730, at the age of seventy-eight. The rapidly Catholic Corso Corsini, who had detailed Benedict, was at once brought to justice and forced to disgorge his dishonest gains. Politically the papacy had sunk to the level of pitiful helplessness, unable to resist the aggressions of the Powers, who ignored or coerced it at will. Yet Clement
entertained high hopes for Catholicism; he laboured for a union with the Greek Church, and was ready to facilitate the return of the Protestants of Saxony. He deserves well of posterity for his services to learning and art; the restoration of the Arch of Constantine; the enrichment of the Capitoline museum with antique marbles and inscriptions, and of the Vatican library with oriental manuscripts (see Assemani); and the embellishment of the city with many buildings. He died on the 6th of February 1740, and was succeeded by Benedict XIV.

Clement XIII. (Cado della Torre Rezzonico), pope from 1730 to 1740, was born in Venice, on the 7th of March 1699; filled various important posts in the Curia, became cardinal in 1737, bishop of Fadua in 1743, and succeeded Benedict XIV. as pope on the 6th of July 1738. He was a man of upright, moderate and pacific intentions, but his pontificate of eleven years was anything but tranquil. The Jesuits had fallen upon evil days; in 1758 Pombal expelled them from Portugal; his example was followed by the Bourbon countries—France, Spain, the Two Sicilies and Parma (1764–1768). The order turned to the pope as its natural protector; but his protests (cf. the bull Apostolicum passendi munus, 7th of January 1765) were unheeded (see Jesuits). A clash with Parma occurred to aggrava their troubles. The Bourbon kings espoused their relative's quarrel, seized Avignon, Benevento and Ponte Corvo, and united in a peremptory demand for the suppression of the Jesuits (January 1766). Dr. Giuseppe Ganganelli, a papal statesman, Clement consented to call a Consultory to consider the step. The pope, on the eve of the day set for its meeting he died (2nd of February 1769), not without suspicion of poison, of which, however, there appears to be no conclusive evidence.

A contemporary account of Clement was written by Augustin de Andréss y Sobriñas, . . . el nacimiento, estudios y empleos de . . . Clem. XIII. (Madrid, 1759). Ravignan's Clement XIII. e Clem. XIV. (Paris, 1854) is partisan but free from rancour; and appends many interesting documents. See also the bibliographical note under Clement XIV. infra.; and the extended bibliography in Hergenröther, Allg. Kirchengesch. (1880), iii. 509. (T. F. C.)

Clement XIV. (Lorenzo Ganganelli), pope from 1769 to 1774, son of a physician of St. Arcangelo, near Rimini, was born on the 31st of October 1705; entered the Franciscan order at the age of fourteen, was consecrated bishop of Terracina, and at the age of sixty was created cardinal. As regent of the college of S. Bonaventura, Rome, he came under the notice of Benedict XIV., who conceived a high opinion of his talents and made him consulter of the Inquisition. Upon the recommendation of Ricci, general of the Jesuits, Clement XIII. made him a cardinal; but, owing to his disapproval of the pope's policy, he found himself out of favour and without influence. He concurred following the death of Clement XIII. was the most momentous of at least two centuries.

The pope of the Jesuits hung in the balance; and the Bourbon princes were determined to have a pope subservient to their hostile designs. The struggle was prolonged three months. At length, on the 19th of May 1769, Ganganelli was chosen, not as a declared enemy of the Jesuits, but as being least objectionable to each of the contending factions. The charge of simony was inspired by Jesuit hatred; there is absolutely no evidence that Ganganelli pledged himself to suppress the order. The outlook for the papacy was dark; Portugal was talking of a patriarchy; France held Avignon; Naples held Ponte Corvo and Benevento; Spain was ill-affected; Parma, defiant; Venice, aggressive; Poland meditating a restriction of the rights of the nuncio. Clement realized the imperative necessity of conciliating the powers. He suspended the public reading of the bull In Coena Domini, so obnoxious to civil authority; resumed relations with Portugal; revoked the monitorium of his predecessor against Parma. But the powers were bent upon the destruction of the Jesuits, and they had the pope at their mercy. Clement looked abroad for help, but found none. Even María Theresa, his last hope, suppressed the order in Austria.

Tempering and partial concessions were of no avail. At last, convinced that the peace of the Church demanded the sacrifice, Clement signed the brief Dominus ac Redemptor, dissolving the order, on the 21st of July 1773. The powers at once gave substantial proof of their satisfaction; Benevento, Ponte Corvo, Avignon and the Venetians were restored to the Holy See. But it would be unfair to accept this as evidence of a bargain. Clement had formerly indignantly rejected the suggestion of such an exchange of favours.

There is no question of the legality of the pope's act; whether he was morally culpable, however, continues to be a matter of bitter controversy. On the one hand, the suppression is denounced as a base surrender to the forces of tyranny and irreligion, and an infamy to the name of the order. Who reaped its just punishment of remorse; on the other hand, it is as ardently maintained that Clement acted in full accord with his conscience, and that the order merited its fate by its own mischievous activities which made it an offence to religion and authority alike. But whatever the guilt or innocence of the Jesuits, and whether their suppression were ill-advised or not, there appears to be no ground for impeaching the motives of Clement, or of doubting that he had the approval of his conscience. The stories of his having swooned after signing the brief, and of having lost hope and even reason, are too absurd to be entertained. The decline in health, which set in shortly after the suppression, and his death (on the 22nd of September 1774) proceeded from wholly natural causes. The testimony of his physician and of his confessor ought to be sufficient to discredit the oft-repeated story of slow poisoning (see Duhur, Jesuiten Pofeln, 4th ed., 1904, pp. 69 seq.).

The suppression of the Jesuits builds so large in the pontificate of Clement that he has scarcely been given due credit for his praiseworthy attempt to reduce the burdens of taxation and to reform the financial administration, nor for his liberal encouragement of art and learning, of which the museum Pio-Clementino is a lasting monument.

No pope has been the subject of more diverse judgments than Clement XIV. Zealous defenders credit him with all virtues, and bless him as the instrument divinely ordained to restore the peace of the Church; virulent detractors charge him with ingratitude, cowardice and double-dealing. The truth is at neither extreme. Clement's was a deeply religious and poetical nature, animated by a lofty and refined spirit. Gentleness, equanimity and benevolence were native to him. He cherished high purposes and desired great things; yet, he instantaneously shrank from conflict; he lacked the resoluteness and the sterner sort of courage that grapples with a crisis.

Caraccioli's Vie de Clément XIV (Paris, 1775), (freq. translated), is incomplete, uncritical and too laudatory. The middle of the 19th century saw quite a spirited controversy over Clement XIV.: St head, in his Histoire de la chute des Jésuites (Paris, 1846), represented Clement as lamentably, almost culpably, weak; Creteau-Joly, in his Histoire de la Comp. de Jésus (Paris, 1843–1845), and his Clément XIV et les Jésuites (Paris, 1847), was outspoken and bitter in his condemnation; this provoked Theiner's Gesch. des Pontifikats Clemens XIV. (Leipzig, 1851). Lejard based his book upon original documents to which, as custodian of the Vatican archives, the author had freest access; Creteau-Joly replied with Le Pape Clément XIV; Lettres au P. Théiner (Paris, 1852). Ravi- gnan in his Clement XIII. e Clement XIV. (Paris, 1854) is a weak, half-hearted apology for Clement XIV. See also v. Reumont, Ganganelli, Pape Clément XIV. (Berlin, 1847); and Reinirding, Clemens XIV. u. d. Aufhebung der Gesellschaft Jesu (Augsburg, 1854). The letters of Clement have frequently been printed; the genuineness of Caraccioli's collection (Paris, 1776; freq. translated) has been questioned, but most of the letters are now generally accepted as genuine; see also Clemens XIV. Ep. et Brevia, ed. Theiner (Paris, 1850). An excellent edition of Clement's letters can be found in Hergenröther, Allg. Kirchengesch. (1880), iii. 510 seq.

CLEMENT OF ALEXANDRIA (Clemens Alexandrinus), Greek Father of the Church. The little we know of him is mainly derived from his own works. He was probably born about A.D. 150 of heathen parents in Athens. The earliest writer after himself who gives us any information with regard to him is Eusebius. The only points on which his works now extant inform us are his date and his instructors. In the Stromateis,
while attempting to show that the Jewish Scriptures were older than any writings of the Greeks, he invariably brings down his dates to the death of Commodus, a consequence which at once suggests that he wrote in the reign of the emperor Severus, from 193 to 211 A.D. (see Strom. lib. i. cap. xxi. 140, p. 403, Potter's edition). The whole of this passage, however, is based on conjecture, and the evidence is therefore doubtful (Strom. lib. i. cap. i. p. 137, P.).

"This treatise," he says, speaking of the Stromateis, "has not been confined merely to display, but memoranda are treasured up in it for my old age, that it may be a remedy for forgetfulness,—an image, truly, and an outline of those clear and living discourses, and those men truly blessed and noted for their abilities, whose praise I have not included among them, for I was in Greece, the Ionian, the other was in Magna Graecia; the one of them was from Cœle Syria, the other from Egypt; but there were others in the East, one of whom belonged to the Assyrians, but the rest were not so distinguished, but the names of them are not written down by the hand of the Roman, whose mission is to the West, in which I met was first in power. On falling in with him I found, rest having tracked him while he lay concealed in Egypt. He was in truth the Sicilian bee, and, plucking the flowers of the philosophical gardens, produced a wonderfully pure knowledge in the souls of the listeners."

Some have supposed that in this passage seven teachers are named, others that there are only five, and various conjectures have been hazarded as to what persons were meant. The one only about whom conjecture has any basis for speculating is the last, for Eusebius states (II. E. v. 11) that Clement made mention of Pantaenus as his teacher in the Hypotyposes. The reference in this passage is plainly to one whom he might well designate as his teacher.

To the information which Clement here supplies subsequent writers add little. By Eusebius and Photius he is called Titus Flavius Clemens, and "the Alexandrian" is added to his name. E. Cl. Ch. 3, 4. It seems that as some said Clement was an Alexandrian, others that he was an Athenian (Hist. Eccl. iv. 19. 4), and a modern writer imagined that he reconciled this discrepancy by the supposition that he was born at Athens, but lived at Alexandria. We know nothing of his conversion except that he passed from heathenism to Christianity. This is expressly stated by Eusebius (Proc. Evangel. lib. ii. cap. 2), though it is likely that Eusebius had no other authority than the works of Clement. These works, however, warrant the inference. They show a singularly minute acquaintance with the ceremonies of pagan religion, and there are indications that Clement himself had been initiated in some of the mysteries (Proptet. cap. ii. sec. 14, p. 13, P.). There is no means of determining the date of his conversion. He attained the position of presbyter in the church of Alexandria (Eus. H. E. vi. 11, and Jerome, De Vir. Ill. 38), and became perhaps the assistant, and certainly the successor of Pantaenus in the catechetical school of that place. Among his pupils were Origen (Eus. II. E. vi. 2) and Celsumus (ib. viii. 1), who, in Jerusalem (Eus. II. E. vi. 14), long continued in Alexandria, and whose names where he died, are all matters of pure conjecture. The only further notice of Clement that we have in history is a letter written in 211 by Alexander, bishop of Jerusalem, to the Antiochians, and preserved by Eusebius (H. E. vi. 11). The words are as follows:—"This letter I sent through Clement, the blessed presbyter, a man virtuous and tried, whom ye know and will come to know completely, who being here by the providence and guidance of the Ruler of all strengthened and increased the church of the Lord." A statement of Eusebius in regard to the persecution of Severus in 202 (H. E. vi. 3) would render it likely that Clement left Alexandria on that occasion, and went to Palestine, originally a Jew. The last of the works which have been preserved, and which are certainly only the fragments of his work which he produced, is the Paideuma, or Outlines, in eight books. (Note 2.)

"Who is the Right Man that is Saved?" (2) Eight Books of Stromateis, Adumbrations or Outlines. (v) On the Passover, Discourses on Fasting. (vii) On Slander. (viii) Exhortation to Patience, or to the Newly Baptised. (x) The Kaikan (καίκαν), the Rule of the Church, or to those who Judeaize, a work dedicated to Alexander, bishop of Jerusalem.

Of these, the first four have come down to us complete, or nearly complete. The first three form together a progressive introduction to Christianity corresponding to the stages through which the believer passes in his development. The fourth, which is the Hortalory Address to the Greeks is an appeal to them to give up the worship of their gods, and to devote themselves to the worship of the one living and true God. Clement exhibits the absurdity and immoral- ity of paganism, with regard to the pagan deities, the cruelties perpetrated in their worship, and the utter uselessness of bowing down before images made by hands. He at the same time acquaints the Greeks that their own greatest philosophers and poets recognized the divinity of the Lord Jesus Christ. Sometimes he speaks of the nature of God, but that fuller light had been thrown on this subject by the Hebrew prophets. He replies to the objection that it was not right to abandon the customs of their forefathers, and points them to Christ as their only safe guide to God. The Paideuma is divided into three books. In the first Clement discusses the necessity for and the true nature of the Paideuma, and shows how Christ as the Logos acted as Paideuma, and still acts. In the second and third books Clement enters into particulars, and explains how the Christian following the Logos or Reason ought to behave in the various circumstances of life—in eating, drinking, furnishing a house, in dress, in the relations of social life, in the care of his property, and similar matters—and ends with a formal description of the life of a Christian. Appended to the Paideuma are two hymns, which, in all probability, the production of Clement, though some have conjectured that they were portions of the service of a church, and that the first, which is a hymn to the body, bedclothes (ἐρυδικά) were kept. The phrase was used as a title by Origen and others, and is equivalent to our "miscellanies." It is difficult to give a brief account of the varied contents of the book. Sometimes it is a commentary on the Gospels, sometimes a Book of Church History, sometimes a Book of homily, sometimes poetry, entering into the minute most critical and chronological details; but one object runs through all, and this is to show what the true Christian Gnostic is, and what is his relation to the philosophy. Sometimes it contains a history of the church, the first seven are complete. The eighth now extant is really an incomplete treatise on logic. Some critics have rejected this book as spurious, since its matter is so different from that of the rest. Others, however, are disposed to regard it as genuine, and it is in general held as having its own ideas of orthodoxy. Both Eusebius and Photius describe the work. It was a short commentary on all the books of the Scripture, including some of the apocryphal works, such as the Epistle of James, and the Revelation of the Holy Apostle of John; and in the closing language of the impiety of some opinions in the book (Bibl. cod. roth. p. 89 a Bekker), but his statements are such as to prove conclusively that he must have had a corrupt copy, or read very carelessly, or grossly misunderstood Clement. Notes in Latin on the first edition of Peter, the epistle of Jude, and the first two of John have come down to us; but whether they are the translation of Cassiodorus, or indeed a translation of Clement's work at all, is a matter of dispute.

The treatise on the Passover was occasioned by a work of Melito on the same subject. Two fragments of this treatise were given by Petavius, and are contained in the modern editions.

"Nothing of this kind can be found in the Ecclesiastical Canon from any external testimony. Clement himself often mentions the Ἕλληνωμενικα κανόνες, and defines it as the agreement and harmony of the law and the prophets with the covenant delivered at the church of Christ (Strom. lib. ii. cap. 125, p. 863). But no doubt this was the subject of the treatise. Jerome and Photius call the work Ecclesiastical Canons, but this seems to be a mistake. Of the other treatises mentioned by Eusebius and Jerome nothing is known. The only genuine work by Clement, quoted by Antonius Melissa, is most probably taken from the treatise on the Sevenfold Wisdom. Besides the treatises mentioned by Eusebius, fragments of treatises on Providence and the Soul have been preserved. Mention is also made of a work by Clement on the Prophet Amos, and another on Definitions. In addition to these Clement often speaks of his intention to write on certain subjects, but it may well be doubted whether in most cases, if not all, he intended to devote separate treatises to

Zahn thinks we have part of them in the Adumbrations Clem. Alex. in epistolam canonicam (Codex Liniun, 96, sec. ii.). They were perhaps intended as a completion of the preceding course.
Christ was the end to which all that was true in philosophies pointed. Christ himself was the Logos, the Reason. God the Father was ineffable. The Son alone can manifest Him fully. He is the Reason that prevades the universe, that brings out all goodness, that guides all good men. It was through possessing somewhat of this Reason that the philosophers attained to any truth and goodness; but in Christians he dwells more fully and guides them through all the perplexities of life. Photius, probably on a careless reading of Clement, argued that he could not have believed in a real incarnation. But the words of Clement are quite precise and their meaning indisputable. The real difficulty attaches not to the Second Person, but to the First. The Father in Clement's mind becomes the Absolute of the philosophers, that is to say, not the Father at all, but the Monad, the one point devoid of all attributes. He believed in an eternal Son of God who was the Reason and Wisdom of God; and he believed that this Son of God really became incarnate though he speaks of him almost invariably as the Word, and attaches little value to his human nature. The object of his incarnation and death was to free man from his sins, to lead him into the path of wisdom, and thus in the end elevate him to the position of a god. But man's salvation was to be gradual. It began with faith, passed from that to love, and ended in full and complete knowledge. There could be no faith without knowledge. But the knowledge is imperfect, and the Christian was to do many things in simple obedience without knowing the reason. But he has to move upwards continually until he at length does nothing that is evil, and he knows fully the reason and object of what he does. He thus becomes the true Gnostic, but he can become the true Gnostic only by contemplation and by the practice of what is right. He has to free himself from the power of passion. He has to give up all thoughts of pleasure. He must prefer goodness in the midst of torture to evil with unlimited pleasure. He has to resist the temptations of the body, keeping it under strict control, and with the eye of the soul undimmed by corporeal wants and impulses, contemplate God the supreme good, and live a life according to reason. In other words, he must strive after likeness to God as he reveals himself in his Reason or in Christ. Clement thus looks entirely at the enlightened moral elevation to which Christianity raises man. He believed that Christ instructed men before he came into the world, and he therefore viewed heathenism with kindly eye. He was also favourable to the pursuit of all kinds of knowledge. All enlightenment tended to lead up to the truths of Christianity, and hence knowledge of every kind not evil was its handmaid. Clement had at the same time a strong belief in evolution or development. The world went through various stages in preparation for Christianity. The man goes through various stages before he can reach Christian perfection. And Clement conceived that this development took place not merely in this life, but in the future through successive grades. The Jew and the heathen had the gospel preached to them in the world below by Christ and his apostles, and Christians will have to pass through processes of purification and trial after death before they reach knowledge and perfect bliss.

The beliefs of Clement have caused considerable difference of opinion among modern scholars. He sought the truth from whatever quarter he could get it, believing that all that is good comes from God, wherever it be found. He belongs therefore to no school of philosophers. He calls himself an Eclectic. He was in the main a Neoplatonist, drawing from that school his doctrines of the Monad and his strong tendency towards development. For him, the worship of the Logos was free from Stoicism. Aristotelian features may be found but are quite subordinate. But Clement always regards the articles of the Christian creed as the axioms of a new philosophy. Daench had tried to show that he was Neoplatonic, and Reinkens has maintained that he was essentially Aristotelian. His mode of viewing Christianity does not fit into any classification. It is the result of the period in which he lived, of his wide culture and the simplicity and noble purity of his character.
the study is not smoothed by simplicity of style. Clement professed to despise rhetoric, but was himself a rhetorician, and his style is turgid, involved and difficult. He is singularly simple in his character. In discussing marriage he refuses to use any but the plainest language, which is with him a falsehood. But he is temperate in his opinions and the practical advices in the second and third books of the Paedagogae are remarkably sound and moderate. He is not always very critical, and he is passionately fond of allegorical interpretations, but these were the faults of his age.

All early writers speak of Clement in the highest terms of laudation, and he certainly ought to have been a saint in any Church that reveres saints. But Clement is not a saint in the Roman Church. He was a saint up till the time of Benedict XIV., who read Photius on Clement, believed him, and struck the Alexandrian's name out of the calendar. But many Roman Catholic writers, though they yield a practical obedience to the papal decision, have adduced good reason why it should be reversed (Cognat, p. 451).

CLEMENT, F. — CLEMENTINE LITERATURE.

LITERATURE. — A copious bibliography will be found in Harnack, Chronologie, vol. ii., or in Bardenhewer, Gesch. der altl. Litt. Either of these will supply the names of works upon Clement's biblical text, his use of Stoic writers, his quotations from heathen writers, and his relation to heathen philosophy. A valuable book is de Faye, Clem. d'Alex. (1885). For his theological position see Harnack, Dogmen-geschichte; Hort, Six Lectures on the Ante-Nicene Fathers; Westcott, "Clem. of Alex." in Dict. Christ. Biog.; Bigg, Christian Platonism of Alex. (1886). A book on Clement's relation to Mysticism is wanted.

CLEMENT, FRANÇOIS (1714—1793), French historian, was born at Béze, near Dijon, and was educated at the Jesuit College at Dijon. At the age of seventeen he entered the society of the Benedictines of Saint Maur, and worked with such intense application that at the age of twenty-five he was obliged to take a protracted rest. He now resided in Paris, where he wrote the 11th and 12th vols. of the Histoire littéraire de la France, and edited (with Dom Brial) the 12th and 13th vols. of the Recueil des historiens des Gaules et de la France. The king appointed him on the committee which was engaged in publishing charters, diplomas and other documents connected with French history (see Xavier Charmes, Le Comité des travaux historiques et scientifiques, vol. i., 1886, passim); and the Academy of Inscriptions chose him as a member (1785). Dom Clément also revised the Art de diriger des opéras d'église, edited in 1750 by Dom Clémentin. Three volumes with the Indexes appeared from 1783 to 1792. He was engaged in preparing another volume including the period before the Christian era, when he died suddenly of apoplexy, at the age of sixty-nine. The work was afterwards brought down from 1770 to 1827 by Julien de Courcelles and Fortia d'Urban.

CLEMENT, JACQUES (1567—1580), murderer of the French king Henry III., was born at Sorbon in the Ardennes, and became a Dominican friar. Civil war was raging in France, and Clément became an ardent partisan of the League; his mind appears to have become unhinged by religious fanaticism, and he talked of exterminating the heretics, and formed a plan to kill Henry III. His project was encouraged by some of the heads of the League; he was assured of temporal rewards if he succeeded, and of eternal bliss if he failed. Having obtained letters for the king, he left Paris on the 31st of July 1580, and reached the school, the headquarters of Henry, who was besieging Paris. On the following day he was admitted to the royal presence, and presenting his letters he told the king that he had an important and confidential message to deliver. The attendants then withdrew, and while Henry was reading the letters Clément mortally wounded him with a dagger which had been concealed beneath his cloak. The assassin was at once killed by the attendants who rushed in, and Henry died early on the following day. Clément's body was afterwards quartered and burned. This deed, however, was viewed with far different feelings in Paris and by the partisans of the League, the murderer being regarded as a martyr and extolled by Pope Sixtus V., who given his canonization was discussed by the Church fathers. But he is temperate in his opinions and the practical advices in the second and third books of the Paedagogae are remarkably sound and moderate. He is not always very critical, and he is passionately fond of allegorical interpretations, but these were the faults of his age.

All early writers speak of Clement in the highest terms of laudation, and he certainly ought to have been a saint in any Church that reveres saints. But Clement is not a saint in the Roman Church. He was a saint up till the time of Benedict XIV., who read Photius on Clement, believed him, and struck the Alexandrian's name out of the calendar. But many Roman Catholic writers, though they yield a practical obedience to the papal decision, have adduced good reason why it should be reversed (Cognat, p. 451).

CLEMENTI, MUZIO (c. 1751—1832), Italian pianist and composer, was born at Rome between 1750 and 1752. His father, a jeweller, encouraged his son's early musical talent. Buroni and Cordellini were his first masters, and at the age of nine Clementi's theoretical and practical studies had advanced to such a degree that he was able to win the position of organist at a church. He continued his studies under Santarelli and Carpani, and at the age of fourteen wrote a mass which was performed in public. About 1766 Beckford, the author of Vathek, persuaded Clementi to follow him to England, where the young composer lived in retirement at one of the country seats of his protector in Dorsetshire until 1770. In that year he first appeared in London, where his success both as composer and pianist was rapid and brilliant. In 1777 he was for some time employed as conductor of the Italian opera, but he soon afterwards left London for Paris. Here also his concerts were crowded by enthusiastic audiences, and the same success accompanied Clementi on a tour about the year 1780 to southern Germany and Austria. At Vienna, which he visited between 1781 and 1782, he was received with high honour by the emperor Joseph II., in whose presence he met Mozart, and fought a kind of musical duel with him. His technical skill proved to be equal if not superior to that of his rival, who on the other hand infinitely surpassed him by the passionate beauty of his interpretation. It is worth noting that one of the finest of Clementi's sonatas, that in B flat, shows an exactly identical opening theme with Mozart's overture to the Flauto Magico.

In May 1782 Clementi returned to London, where for the next twelve years he continued his lucrative occupations of fashionable teacher and performer and composed a great number of works. He took shares in the pianoforte business of a firm which went bankrupt in 1800. He then established a pianoforte and music business of his own, under the name of Clementi & Co. Other members were added to the firm, including Collard and Davis, and the firm was ultimately taken over by Messrs Collard alone. Amongst his pupils on the pianoforte during this period may be mentioned John Field, the composer of the celebrated Nocturnes. In his company Clementi paid, in 1804, a visit to Paris, Vienna, St Petersburg, Berlin and other cities. While he was in Berlin, Meyerbeer became one of his pupils. He also revisited his own country after an absence of more than thirty years. In 1810 Clementi returned to London, but refused to play again in public, devoting the remainder of his life to composition. Several symphonies belong to this time, and were played with much success at contemporary concerts, but none of them seem to have been published. His intellectual and musical faculties remained unimpaired until his death, on the 9th of March 1832, at Evesham, Worcestershire.

Of Clementi's playing in his youth, Moscheles wrote that it was "marked by a most beautiful legato, a supple touch in lively passages, and a most unfailing technique." Mozart may be said to have closed the old and Clementi to have founded the newer school of technique on the piano. Amongst Clementi's compositions the most remarkable are sixty sonatas for pianoforte, and the great collection of Études called Gradus ad Parnassum.

CLEMENTINE LITERATURE, the name generally given to the writings which at one time or another were fathered upon Pope Clement I. (q.v.), commonly called Clemens Romanus, who was early regarded as a disciple of St Peter. They are for the most part a species of the larger pseudo-Petrine genus. Chief amongst them are: (1) the so-called St Paul and Epistle; (2) two Epistles on Virginity; (3) the Homilies and Recognitions; (4) the Apostolical Constitutions (q.v.); and (5) five epistles forming part of the Forged Decretals (see DECRETALS). The present article deals mainly with the third group, to which the title "Clementine literature" is usually confined, owing to the stress
laid upon it in the famous Tübingen reconstruction of primitive Christianity, in which it played a leading part; but later criticism has lowered its importance as its true date and historical relations have been progressively ascertained. (1) and (2) became "Clementine" only by chance, but (3) was so originally by literary device or fiction, the cause at work also in (4) and (5). But while in all cases the suggestion of Clement's authorship came ultimately from his prestige as writer of the genuine Epistle of Clement (see Clement i.), both (3) and (4) were due to this idea as operative on Syrian soil; (3) is a secondary formation based on (3) as known to the West.

(1) The "Second Epistle of Clement."—This is really the earliest extant Christian homily (see Apostolic Fathers). Its tradition relates it to Clement of Rome, but with Christian repentance, with a view to obedience to Christ's precepts as the true confession and homage which He requires. Its special charge is: "Preserve the flesh pure and the soul (i.e. baptism) unstained" (viii. 6). But the peculiar way in which it enforces its morals in terms of the Platonic contrast between the spiritual and sensuous worlds, as archetype and temporal manifestation, suggests a special local type of theology which must be taken into account in fixing its provenance. This theology, the fact that the preacher seems to quote the Gospel according to the Egyptians (in ch. xii. and possibly elsewhere) as if familiar to his hearers, and indeed its literary affinities generally, all point to Alexandria as the original home of the homily, at a date about 120-140 (see Zeit. f. N. T. Wissenschaft, vii. 123 ff.). Neither Corinth (as Lightfoot) nor Rome (as Harnack, who assigns it to Bishop Soter, c. 166-174) satisfies all the internal conditions, while the Eastern nature of the external evidence and the homily's quasi-canonical status in the Codex Alexandrinus strongly favour an Alexandrine origin.

(2) The Two Epistles to Virgins, i.e. to Christian celibates of both sexes. These are known in their entirety only in Syrian, and were first published by Wetstein (1752), who held them genuine. This view is now generally discarded, even by Roman Catholics like Funk, their best recent editor (Paires Apost., vol. ii.). External evidence begins with Epiphanius (Haer. xxx. 15) and Jerome (Ad Jovin. i. 12); and the silence of Eusebius tells heavily against their existence before the 4th century, at any rate as writings of Clement. The Monophysite Timothy of Alexandria (A.D. 457) cites one of them as Clement's, while Antiochus of St. Sabba (c. A.D. 620) makes copies but unacknowledged extracts from both in the original Greek. There is no trace of their use in the West. Thus their Syrian origin is manifest, the more so that in the Syrian MS. they are appended to the New Testament, like the better-known epistles of Clement in the Codex Alexandrinus. Indeed, judging from another Syrian MS. of earlier date, which includes the latter writings in its canon, it seems that the Epistles on Virginity gradually replaced the earlier pair in certain Syrian churches—even should Lightfoot be right in doubting if this had really occurred by Epiphanius's day (S. Clement of Rome, i. 412).

Probably these epistles did not originally bear Clement's name at all, but formed a single epistle addressed to ascetics among an actual circle of churches. In that case they, or rather it, may date from the 3rd century in spite of Eusebius's silence, and are not pseudo-Clementine in any real sense. It matters little whether or not the false ascription was made before the division into two implied already by Epiphanius (c. A.D. 357). Special occasion for such a hortatory letter may be discerned in its polemic against intimate relations between ascetics of opposite sex, implied to exist among its readers, in contrast to usage in the writer's own locality. Now we know that spiritual unions, prompted originally by highstrung Christian idealism as to a religious fellowship transcending the law of nature in relation to sex, did exist between persons living under vows of celibacy during the 3rd century in particular, and not least in Syria (cf. the case of Paul of Samosata, c. 265, and the Synod of Ancyra in Galatia, c. 314). It is natural, then, to see in the original epistle a protest against the dangers of such spiritual boldness (cf. "Subintroductae" in Herzog-Hauck's Realencyclopaedie), prior perhaps to the famous case at Antioch just noted. Possibly it is the feeling of south Syria or Palestine that here expresses itself in remonstrance against usages prevalent in north Syria. Such a view finds support also in the New Testament canon implied in these epistles.

(3) [a] The Epistle of Clement to James (the Lord's brother). This was originally part of (3) [b], in connexion with which its origin and date are discussed. But as known to the West through Rufinus's Latin version, it was quoted as genuine by the synod of Vaison (A.D. 442) and throughout the middle ages. It became "the starting point of the most momentous and gigantic of medieval forgeries, the Isidorian Decretals," "where it stands at the head of the pontifical letters, extended to more than twice its original length." This extension perhaps occurred during the 5th century. On any rate, the letter in this form, along with a "second epistle to James" (on the Eucharist, church furniture, &c.), dating from the early 6th century, had separate currency long before the 9th century, when they were incorporated in the Decretals by the forger who raised the Clementine epistles to five (see Lightfoot, Clement, i. 414 ff.).

(3) [b] The "Homilies" and "Recognitions."—"The two chief extant Clementine writings, differing considerably in some respects in doctrine, are both evidently the outcome of a peculiar speculative type of Judaistic Christianity, for which the most characteristic name of Christ was 'the true Prophet.' The framework of both is a narrative purporting to be written by Clement (of Rome) to St. James, the Lord's brother, describing at the beginning his own conversion and the circumstances of his first acquaintance with St. Peter, and then a long succession of incidents, dialogues and disputes, leading up to a romantic recognition of Clement's father, mother and two brothers, from whom he had been separated since childhood. The problems discussed under this fictitious guise are with rare exceptions fundamental problems for every age; and whatever may be thought of the positions maintained, the discussions are hardly ever feeble or trivial. Regarded simply as mirroring the past, few, if any, remains of Christian antiquity present us with so vivid a picture of the working of men's minds under the influence of the new leaven which had entered into the world." (Hort, Clem. Recog., p. xiv.)

The indispensable preliminary to a really historic view of these writings is some solution of the problem of their mutual relations. The older criticism assumed a dependence of one upon the other, and assigned one or both to the latter part of the 2nd century. Recent criticism, however, builds on the principle, which emerges still more strongly from external and internal evidence (see Salmon in the Dict. of Christian Biography), that both used a common basis. Our main task, then, is to define the nature, origin and date of the parent document, and if possible its own literary antecedents. Towards the solution of this problem two contributions of prime importance have recently been made. The earlier of these is by F. J. A. Hort, and was delivered in the form of lectures as far back as 1884, though issued posthumously only in 1901; the other is the elaborate monograph of Dr Hans Waatz (1904).

Criticism.—(i.) External Evidence as to the Clementine Romance. The evidence of ancient writers really begins, not with Origen, but with Eusebius of Caesarea, who in his Ecd. Hist. iii. 38, writes as follows: "Certain men have quite lately brought forward as written by him (Clement) other verbose and lengthy writings, containing dialogues of Peter, forsooth, and Apion, whereof not the slightest mention is to be found among the ancients, for they do not even preserve in purity the stamp of the Apostolic orthodoxy." Apion, the Alexandrine grammian

1 Dr Armitage Robinson, in his edition of the Philolecta (extracts made c. 358 by Basil and Gregory from Origen's writings), proved that the passage cited below is simply introduced as a parallel to an extract of Origen's; while Dom Chapman, in the Journal of Theol. Studies, iii. 436 ff., made it probable that the passages in Origen's Comm. on Matthew akin to those in the Opus Imperf. in Mal. are insertions in the former, which is extant only in a Latin version. Subsequently he suggested (Zeitsch. f. N. T. Wissenschaft, ix. 33 f.) that the passage in the Philolecta is due not to its authors but to an early editor, since it is the only citation not referred to Origen.
and foe of Judaism, whose criticism was answered by Josephus, appears in this character both in *Homilies and Recognitions*, though mainly in the former (iv. 6-vii. 5). Thus Eusebius implies (1) a spurious Clementine work containing matter found also in our *Homilies* at any rate; and (2) its quite recent origin. Next we note that an extract in the *Philolaia* is introduced as follows: "...in the Apocrypha he sometimes says words in harmony with these on the present problem, in conversation with his father at Laodicea in the *Circuits*, speaks a very necessary word for the end of arguments touching this matter, viz. those things which seem to have proceeded from *genesis* (=astrological destiny), in the fourteenth book." The extract answers to *Recognitions*, x. 10-13, but it is absent from our *Homilies*. Here we observe that (1) the extract agrees this time with *Recognitions*, not with *Homilies*; (2) its framework is that of the Clementine romance found in both; (3) the tenth and last book of *Recognitions* is here parallel to book xiv. of a work called *Circuits* (*Periodoi*).

This last point leads on naturally to the witness of Epiphanius (c. 375), who, speaking of Ebionites or Judaizing Christians of various sorts, and particularly the Essene type, says (Haer. xxx. 15) that "they use certain other books likewise, to wit, the so-called *Circuits* of Clement, falsifying their contents, though leaving a few genuine things." Here Epiphanius simply assumes that the Ebionite *Circuits of Peter* was based on a genuine work of the same scope, and goes on to say that the spurious elements are proved such by contrast with the tenor of Clement's "encyclical epistles" (i.e. those to virgins, (2) above); for these enjoin virginity (celibacy), and praise Elijah, David, Samson, and all the prophets, whereas the Ebionite *Circuits* favour marriage (even in Apostles) and depreciate the prophets between Moses and Christ, "the true Prophet." "In the Circuits, then, they adapted the whole to their own views, representing Peter falsely in many ways, as that he was daily baptized for the sake of purification, as these also do; and they say that he likewise abstained from animal food and meat, as they themselves also do." Now all the points here noted in the *Circuits* can be traced in our *Homilies and Recognitions*, though toned down in different degrees.

The witness of the Ariazionian *Opus Imperfectum in Matthaeum* (c. 400) is in general similar. Its usual form of citation is "Peter in Clement" (*apud Clementem*). This points to "Clement" as a brief title for the Clementine *Periodoi*, a title actually found in a Syrac MS. of A.D. 414 which contains large parts of *Recognitions* and *Homilies*, and twice used by Rufinus, e.g. when he proposes to inscribe his version of the *Recognitions* "Rufinus Clements." Rufinus in his preface to this work—in which for the first time we meet the title *Recognitionis*—observes that there are two editions to which the name applies, two collections of books differing in some points but in many respects containing the same narrative. This he remarks in explanation of the order of his version in some places, which he feels may strike his friend Gautendius as unusual, the inference being that the other edition was the better known one, although it lacked "the transformation of Simon" (i.e. of Clement's father into Simon's likeness), which is common to the close both of our *Recognitions* and *Homilies*, and so probably belonged to the *Circuits*. We may assume, too (e.g. on the basis of our Syrac MS.), that the Greek edition of the *Recognitionis* actually used by Rufinus was much nearer the text of the *Periodoi* of which we have found traces than we should imagine from its Latin form.

So far we have no sure trace of our *Homilies* at all, apart from the Syrac version. Even four centuries later, Photius, in referring to a collection of books called both *Acts of Peter* and the *Recognition of Clement*, does not make clear whether he means *Homilies or Recognitions or either." "In all the copies which we have seen (and they are not a few) after those different epistles (viz. Peter to James and 'Clement to James,' prefixed, the one in some MSS. the other in others) and titles, we found without variation the same treatise, beginning, I, Clement, &c." But it is not clear that he had read more than the opening of these MSS. The fact that different epistles are prefixed to the same work leads him to conjecture "that there were two editions made of the *Acts of Peter* (his usual title for the collection), but in course of time the one perished and that of Clement prevailed." This is interesting as anticipating a result of modern criticism, as will appear below. The earliest probable reference to our *Homilies* occurs in a work of doubtful date, the pseudo-Athanasian *Synepsis*, which mentions "Clementines, whence came by selection and rewriting the true and inspired form." Here too we have the first sure trace of an expurgated recension, made with the idea of recovering the genuine form assumed, as earlier by Epiphanius, to lie behind an unorthodox recension of Clement's narrative. As, moreover, the extant *Epitome* is based on our *Homilies*, it is natural to suppose it was also the basis of earlier orthodox recensions, one or more of which may be used in certain Florilegia of the 7th century and later. Nowhere do we find the title *Homilies* given to any form of the Clementine collection in antiquity.

(ii.) The Genesis of the Clementine Literature. It has been needful to cite so much of the evidence proving that our *Homilies* and *Recognitions* are both recensions of a common basis, at first known as the *Circuits of Peter* and later by titles connecting it rather with *Clement's* works, its forefather in its present form, and also for the historical problems touching (a) the contents and origin of the primary Clementine work, and (b) the conditions under which our extant recensions of it arose.

(a) The *Circuits of Peter*, as defined on the one hand by the epistle of Clement to James originally prefixed to it and by patristic evidence, and on the other by the common element in our *Homilies and Recognitions*, may be conceived as follows. It contained accounts of Peter's teachings and discussions at various points on a route beginning at Caesarea, and extending northwards along the coast-lands of Syria as far as Antioch. During this tour he meets with persons of typically erroneous views, which it was presumably the aim of the work to refute in the interests of true Christianity, conceived as the final form of divine revelation—a revelation given through true prophecy embodied in a succession of persons, the chief of whom were Moses and the prophet whom Moses foretold, Jesus the Christ. The prime exponent of the spurious religion is Simon Magus. A second protagonist of error, this time of Gentile philosophic criticism directed against fundamental Judaism, is Apion, the notorious anti-Jewish Alexandrine grammarian of Peter's day; while the rôle of umpire of astrological fatalism (Genesis) is played by Faustus, father of Clement, with whom Peter and Clement debate at Laodicea. Finally, all this is already embedded in a setting determined by the romance of Clement and his lost relatives, "recognition" of whom forms the débutement of the story.

There is no reason to doubt that such, roughly speaking, were the contents of the Clementine work to which Eusebius alludes slightly, in connexion with that section of it which had to his eye least verisimilitude, viz. the dialogues between Peter and Apion. Now Eusebius believed the work to have been of quite recent and suspicious origin. This points to a date about the last quarter of the 3rd century; and the prevailing doctrinal tone of the contents, as known to us, leads to the same result. The standpoint is that of the peculiar Judaizing or Ebionite Christianity due to persistence among Christians of the tendencies known among pre-Christian Jews as Essene. The Essenes, while clinging to what they held to be original Mosaicism, yet conceived and practised their ancestral faith in ways which showed distinct traces of syncretism, or the operation of influences foreign to Judaism proper. They thus occupied an ambiguous position on the borders of Judaism. Similarly Christian Essenism was syncretist in spirit, as we see from its best-known representatives, the Ebiasites, of whom we first hear about 220, when a certain Alcibiades of Apamea in Syria (some 60 m. south of Antioch) brought to Rome the Book of *He rules*—the manifesto of their distinctive message (Hippol. *Philos. ix.* 13)—and again some twenty years later, when Origen refers to one of their leaders as having lately arrived at Caesarea (Euseb. vi. 38).
CLEMENTINE LITERATURE

The first half of the 3rd century was marked, especially in Syria, by a strong tendency to syncretism, which may well have stirred certain Christian Essenes to fresh propaganda. Writing after the Book of Helkai, representing also another species of the same genus, would take shape. Much may have been some of the pseudo-apostolic Acts to which Epiphanius alludes as in use among the Ebionites of his own day: and such was probably the nucleus of our Clementine writings, the Periodoi of Peter.

Harnack (Chronologie, ii. 522 f.), indeed, while admitting that much (e.g. in Homilies, viii. 5-7) points the other way, prefers the view that even the Circuits were of Catholic origin (Chapman, as above, says Arrian, soon after 325), regarding the syncretistic Jewish-Christian features in it as due either to its earlier basis or to an instinct to preserve continuity of manner (e.g. absence of explicit reference to Paul). Hortal, on the contrary, assumes as author "an Ingenious Helkait.... perhaps stimulated by the example of the many Encratite Periodoi" (p. 411) in thinking about A.D. 200.

Only it must not be thought of as properly Ebcharist, since it knew no baptism distinct from the ordinary Christian one. It seems rather to represent a later and modified Essene Christianity, already half-Catholic, such as would suit a date after 250, in keeping with Eusebius's evidence. Confirmation of such a date is afforded by the silence of the Syrian Didascalia, itself perhaps dating from about 250, as to any visit of Simon Magus to Caesarea, in contrast to the reference in its later form, the Apostolical Constitutions (c. 350-400), which is plainly coloured (vi. 9) by the Clementine story. On the other hand, the Didascalia seems to have been evoked partly by Judaizing propaganda in north Syria. If, then, it helps to date the Periodoi as after 250, it may also suggest as place of origin one of the large cities lying south of Antioch, say Laodicea (itself on the coast about 30 m. from Apamea), where the Clementine story reaches its climax. The intimacy of local knowledge touching this region implied in the narrative common to Homilies and Recognitions is notable, and tells against an origin for the Periodoi outside Syria (e.g. in Rome, as Hortal and Harnack hold, but Lightfoot disapproves, Clem. i. 55 f., 64,100, cf. Hortal, p. 131). Further, though the curtain even in it fell on Peter at Antioch itself (our one complete MS. of the Homilies is proved by the Epitome, based on the Homilies, to be here abridged), the interest of the story culminates at Laodicea.

If we assume, then, that the common source of our extant Clementines arose in Syria, perhaps c. 265, it had also a written source or sources which we can trace? Though Hortal doubts it, most recent scholars (e.g. Watz, Harnack) infer the existence of at least one source, "Preachings (Kerygmata) of Peter," containing no reference at all to Clement. Such a work seems implied by the title of Peter to James and its appended adjuration, prefixed in our MSS. to the Homilies along with the epistle of Clement to James. Thus the later work aimed at superseding the earlier, much as Photius suggests (see above). It was, then, to these "Preachings of Peter" that the most Ebionite features, and especially the anti-Pauline allusions (e.g. in Homilies in particular), originated. The fact, however, that these were not more completely suppressed in the later work, proves that it, too, arose in circles of kindred, though largely modified, Judaico-Christian sentiment (cf. Homilies, viii., e.g. ch. 8). The differences of standpoint may be due not only to lapse of time, and the emergence of new problems on the horizon of Syrian Christianity generally, but also to change in locality and in the degree of Greek culture represented by the two works. A probable date for the "Preachings" used in the Periodoi is c. 200.1

1 While Hortal and Watz say c. 200, Harnack says c. 260. The reign of Gallienus (260-268) would suit the tone of its references to the Roman emperors. Cb. Chapman, "On the Neo-Platonic philosophy of revelation by visions and dreams which it may contain.

2 Even Watz agrees to this, though he argues back to a yet earlier anti-Pauline (rather than anti-Marcionite) form, composed in Caesarea, c. 135.

If the home of the Periodoi was the region of the Syrian Laodicea, we can readily explain most of its characteristics. Photius refers to the "excellences of its language and its learning"; Watz describes the aim and spirit of its content as those of an apology for Christianity against heresy and paganism, in the widest sense of the word, written in order to win over both Jews (cf. Recognitions, i. 53-70) and pagans, but mainly the latter. In particular it had in view persons of culture, as most apt to be swayed by the philosophical tendencies in the sphere of religion prevalent in that age, the age of neo-Platonism. It was in fact designed for propaganda among religious seekers in a time of singular religious restlessness and varied inquiry, and, above all, for use by catechumens (cf. Ep. Clem. 2, 13) in the earlier stages of their preparation for Christian baptism. To such its formal setting would be specially adapted, as falling in with the literary habits and tastes of the period; while its doctrinal peculiarities would least give offence in a work of the aim and character just described.

As regards the sources of the narrative part of the Periodoi, it is possible that the "recognition" motif was a literary commonplace. The account of Peter's journeys was no doubt based largely on local Syrian tradition, perhaps as already embodied in written Acts of Peter (so Watz and Harnack), but differing from the Western type, e.g. in bringing Peter to Rome long before Nero's reign. As for the allusions, more or less indirect, to St Paul behind the figure of Simon, as the arch-enemy of the truth—allusions which first directed attention to the Clementines in the last century—there can be no doubt as to their presence, but only as to their origin and the degree to which they are so meant in Homilies and Recognitions. There is certainly "an application to Simon of words used by or of St Paul, or of claims made by or in behalf of St Paul" (Hortal), especially in Homilies (ii. 17 f., xi. 35, xvii. 10), where a consciousness also of the double reference must still be present, though this does not seem to be the case in Recognitions (as Rufinus's Latin). Such covert reference to Paul must designedly have formed part of the Periodoi, yet as adopted from its more bitterly anti-Pauline basis, the "Preachings of Peter" (cf. Homilies, ii. 17 f. with Ep. Pet. ad Joc. 2), which probably shared most of the features of Ebionite Essensism as described by Epiphanius xxx. 15 f. (including the qualified dualism of the two kingdoms—the present one of the devil, and the future one of the angelic Christ—which appears also in the Periodoi, cf. Ep. Clem. ad Joc. 1 fn.).

(b) That the Periodoi was a longer work than either our Homilies or Recognitions is practically certain; and its mere bulk may well, as Hortal suggests (p. 88), have been a chief cause of the changes of form. Yet Homilies and Recognitions are abridgments made on different principles and convey rather different impressions to their readers. "The Homilies care most for doctrine," especially philosophical doctrine, "and seem to transpose very freely for doctrinal purposes" (e.g. matter in xvi.-xix. is placed at the end for effect, while xx. 1-10 gives additional emphasis to the Homilies' theory of evil, perhaps over against Manichaeism). "The Recognitions care most for the story," as a means of religious edification, "and have preserved the general framework much more nearly." They arose in different circles: indeed, save the compiler of the text represented by the Syriac MS. of 411 A.D., "not a single ancient writer shows a knowledge of both books in any form." But Hortal is hardly right in suggesting that, while Homilies arose in Syria, Recognitions took shape in Rome. Both probably arose in Syria (so Lightfoot), but in circles varying a good deal in religious standpoint.2 Homilies was a sort of second edition, made largely in the spirit of its original and perhaps in much the same locality, with a view to maintaining and propagating the doctrines of a semi-Judaico-Christianity (Cf. Watz, p. 74) if not a generation or two after the Periodoi appeared. The Recognitions, in both recensions, as is shown by the fact that it was read in the original with general admiration not only by Rufinus but also by others in the West, was more Catholic in tone and aimed chiefly at

Dom Chapman maintains that the Recognitions (c. 370-390,) even attack the doctrine of God in the Homilies or their archetype.
commending the Christian religion over against all non-Christian rivals or gnostic perversions. That is, more than one effort of this sort had been made to adapt the story of Clement's *Recognitiones* to general Christian use. Later the *Homilies* underwent further adaptation to Catholic feeling even before the Epitome, in its two extant forms, was made by more drastic methods of expurgation. One kind of adaptation at least is proved to have existed before the end of the 4th century, namely a selection of certain discourses from the *Homilies* under special headings, following on *Recognitiones*, i-iii, as seen in a Syriac MS. of A.D. 411. As this MS. contains transcriptional errors, and as its archetype had perhaps a Greek basis, the *Recognitiones* may be dated c. 350-375 (its Christology suggested to Rufinus an Ariantism like that of Eunomius of Cyzicus, c. 362), and the *Homilies* prior even to 350. 

The first three booklets represented by the two blocks make rather dating precarious.

**Summary.**—The Clementine literature throws light upon a very obscure phase of Christian development, that of Judaeo-Christianity, and proves that it embraced more intermediate types, between Ebionism proper and Catholicism, than has generally been realized. Incidentally, too, its successive forms illustrate many matters of belief and usage among Syrian Christians generally in the 3rd and 4th centuries, notably their apocryphal and catechetical needs and methods. Further, it discusses, as Hort observes, certain indestructible problems which much early Christian theology passes by or deals with rather perfunctorily; and it does so with a freshness and reality which, as we compare the original 3rd-century basis with the conventional manner of the Epitome, we see to be not unconnected with origin in an age as yet free from the trammels of formal orthodoxy. Again it is a notable specimen of early Christian pseudography, and one which had manifold and far-reaching results.

Finally the romance to which it owed much of its popular appeal, became, through the medium of Rufinus's Latin, the parent of the late medieval legend of Faust, and so the ancestor of a famous type in modern literature.

**Literature.—For a full list of this down to 1904 see Hans Waiz, "Die Pseudoklementinen (Texte u. Untersuchungen zur Gesch. der altchrist. Literatur, neue Folge, Bd. x, Hefte 4), and A. Harnack, *Chronologie der altchrist. Literatur* (1904), ii. 5181. In English, besides Hort's work, there are articles by G. Salmon, in *Dict. of Christ. Bibl.*, C. Bigg, *Studia Biblica*, i., A. C. Headlam, *Journal of Theol. Studies*, iii. (J. V. B.)

CLEOBULUS, one of the Seven Sages of Greece, a native and tyrant of Lindus in Rhodes. He was distinguished for his strength and his handsome person, for the wisdom of his sayings, the acuteness of his riddles and the beauty of his lyric poetry. Diogenes Laërtius quotes a letter in which Cleobulus invites Solon to take refuge with him against Peisistratus; which would imply that he was alive in 650 B.C. He is said to have advanced views as to female education, and he was the father of the wise Cleobuline, whose riddles were not less famous than his own (Diogenes Laërtius i. 89-93).

See F. G. Mullach, *Fragmenta Philosophorum Graecorum*, i.

CLEOMENES (Χλεώμης), the name of three Spartan kings of the Agiad line.

Cleomenes I. was the son of Anaxandrides, whom he succeeded about 820 B.C. His chief exploit was his crushing victory near Tyris over the Argives, some 6000 of whom he burned to death in a sacred grove to which they had fled for refuge (Herodotus vi. 76-82). This secured for Sparta the undisputed hegemony of the Peloponnese. Cleomenes' interposition in the politics of central Greece was less successful. In 510 he marched to Athens with a Spartan force to aid in expelling the Peisistratidae, and subsequently returned to support the oligarchical party, led by Isagoras, against Cleisthenes (q.v.). He expelled seven hundred families and transferred the government from the council to three hundred of the oligarchs, but being blockaded in the Acropolis he was forced to capitulate. On his return home he collected a large force with the intention of making Isagoras despot of Athens, but the opposition of the Corinthian allies and of his colleague Demaratus caused the expedition to break up after reaching Eleusis (Herod. v. 64-76; Aristotle, *Ath. Pol.* 19, 20). In 491 he went to Aegina to punish the island for its submission to Darius, but the intrigues of his colleague once again rendered his mission abortive. In revenge Cleomenes accused Demaratus of illegitimacy and secured his deposition in favour of Leotychides (Herod. vi. 50-73). But when it was discovered that he had bribed the Delphian priestess to substantiate his charge he was himself obliged to flee; he went first to Thessaly and then to Arcadia, where he attempted to foment an anti-Spartan rising. About 488 B.C. he was recalled, but shortly afterwards, in a fit of madness, he committed suicide (Herod. vi. 74, 75).

Cleomenes seems to have received scant justice from the hands of historians, as Pausanias (vii. 3, 4) does little more than condense Herodotus's narrative.

In spite of some failures, largely due to Demaratus's jealousy, Cleomenes strengthened Sparta in the position, won during his father's reign, of champion and leader of the Hellenic race; it was to him, for example, that the Ionian cities of Asia Minor first applied for aid in their revolt against Persia (Herod. v. 49-51).

For the chronology see J. Wells, *Journal of Hellenic Studies* (1905), p. 193 ff., who assigns the Argive expedition to the outset of the reign, whereas nearly all historians have dated it in or about 495 B.C.

Cleomenes II. was the son of Cleombratus I., brother and successor of Agesipolis II. Nothing is recorded of his reign save the fact that it lasted for nearly sixty-one years (370-309 B.C.).

Cleomenes III., the son and successor of Leomidas II., reigned about 235-210 B.C. He made a determined effort to reform the social condition of Sparta along the lines laid down by Agis IV., whose widow Agatia he married; at the same time he aimed at restoring Sparta's hegemony in the Peloponnese.

After twice defeating the forces of the Achaean League in Arcadia, near Mount Lycaeum and at Leucstra, he strengthened his position by assassinating four of the ephors, abolishing the ephorate, which had usurped the supreme power, and banishing some eighty of the leading oligarchs. The authority of the council was also curtailed, and a new board of magistrates, the *patronomoi*, became the chief officers of state. He appointed his own brother Euclides as his colleague in succession to the Euryponid Archidamus, who had been murdered. His social reforms included a redistribution of land, the remission of debts, the restoration of the old system of training (λειτουργία) and theadmission of picked perioci into the citizen body. As a general Cleomenes did much to revive Sparta's old prestige. He defeated the Achaean at Dyme, made himself master of Argos, and was eventually joined by Corinth, Phlius, Epidaurus and other cities. But Aratus, the champion of the new order, could not brook to be a Spartan at the head of the Achaean league called in Antigonus Doson of Macedonia, and Cleomenes, after conducting successful expeditions to Megalopolis and Argos, was finally defeated at Sellasia, to the north of Sparta, in 222 or 221 B.C. He took refuge at Alexandria with Ptolemy Euergetes, but was arrested by his successor, Ptolemy Philopator, on a charge of conspiracy. Escaping from prison he tried to raise a revolt, but the attempt failed and to avoid capture he put an end to his life. Both as general and as politician Cleomenes was one of Sparta's greatest men, and with him perished her last hope of recovering her ancient supremacy in Greece.

See Polybius ii. 45-70, v. 35-39, viii. 1; Plutarch; *Cleomenes*; *Aratus*, 35-46; *Philopoemen*, s. 6; Pausanias ii. 97; Gehlert, *De Cleomenes* (Leipzig, 1883); Helm, *History of Greece*, iv. cc. 10, 15. (M. N. T.)

CLEON (d. 422 B.C.), Athenian politician during the Peloponnesian War, was the son of Cleaenetus, from whom he inherited a lucrative tannery business. He was the first prominent representative of the commercial class in Athenian politics. He came into notice first as an opponent of Pericles, to whom his advanced ideas were naturally unacceptable, and in his opposition somewhat curiously found himself acting in concert with the aristocrats, who equally hated and feared Pericles. During the dark days of 430, after the unsuccessful expedition of Pericles to
Peloponnesus, and when the city was devastated by the plague, Cleon headed the opposition to the Periclean régime. Pericles was accused by Cleon of maladministration of public money, with the result that he was actually found guilty (see Grote’s *Hist. of Greece*, abridg’d ed., 1907, p. 406, note 1). A revulsion of feeling, however, soon took place. Pericles was innoculated, and Cleon now for a time fell into the background. The death of Pericles (429) left the field clear for him. Hitherto he had only been a vigorous opposition speaker, a trenchant critic and accuser of state officials. He now came forward as the professed champion and leader of the democracy, and, owing to the moderate abilities of his rivals and opponents, he was for some years undoubtedly the foremost man in Athens. Although rough and unpolished, he was gifted with natural eloquence and a powerful voice, and knew exactly how to work upon the feelings of the people. He strengthened the hand of the poorer classes by his measure for trebling the pay of the jurymen, and this he did at the very moment when the two extreme views so frequently brought into collision were fairly held by J. Beloch, *Die attische Politik seit Perikles* (Leipzig, 1884), and *Griechische Geschicht*, i. p. 537; and by A. Holm, *Hist. of Greece*, ii. (Eng. tr.), ch. 23, with the notes.

**CLEOPATRA**, the regular name of the queens of Egypt in the Ptolemaic dynasty after Cleopatra, daughter of the Seleucid Antiochus the Great, wife of Ptolemy V., Epiphanes. The best known was the daughter of Ptolemy XIII. Auletes, born 69 or 68 B.C. At the age of seventeen she became queen of Egypt jointly with her younger brother Ptolemy Dionysus, whose wife, in accordance with Egyptian custom, she was compelled to become. A few years afterwards, deprived of all royal authority, she withdrew into Syria, and made preparation to recover her rights by force of arms. At this juncture Julius Caesar followed Pompey into Egypt. The personal fascinations of Cleopatra induced him to undertake a war on her behalf, in which Ptolemy lost his life, and she was replaced on the throne in conjunction with a younger brother, of whom, however, she soon rid herself by poison. In Rome she lived openly with Caesar as his mistress until his assassination, when, aware of her unpopularity, she returned at once to Egypt. Subsequently she became the ally and mistress of Mark Antony (see ANTONIUS). Their connexion was highly unpopular at Rome, and Octavian (see AUGUSTUS) declared war upon them and defeated them at Actium (31 B.C.). Cleopatra took to flight, and escaped to Alexandria, where Antony joined her. Having no prospect of ultimate success, she accepted the proposal of Octavian that she should assassinate Antony, and enticed him to join her in a mausoleum which she had built in order that “they might die together.” Antony committed suicide, in the mistaken belief that she had already done so, but Octavian refused to yield to the charms of Cleopatra who put an end to her life, by applying an asp to her bosom, according to the common tradition, in the thirty-ninth year of her age (29th of August, 30 B.C.). With her ended the dynasty of the Ptolemies, and Egypt was made a Roman province. Cleopatra had three children by Antony, and by Julius Caesar, as some say, a son, called Caesarion, who was put to death by Octavian. In her type of queen characteristic of the Macedonian dynasties stands in the most brilliant light. Impeccable will, masculine boldness, relentless ambition like hers had been exhibited by queens of her race in the old Macedonian days before Philip and Alexander. But the last Cleopatra was perhaps the most special intellectual endowment. She surprised her generation, and could not fail to speak the many tongues of her subjects. There may have been an individual quality in her luxurious profligacy, but then her predecessors had not had the Roman lords of the world for wooers.

For the history of Cleopatra see ANTONIUS, MARCUS; CAESAR, GAIUS JULIUS; PTOLEMY. The life of Anthony by Plutarch is our main authority; it is upon this that Shakespeare’s *Antony* and *Cleopatra* is based. Her life is the subject of monographs by Stahr (1879, *an apologia*), and Houssaye, *Aspasia, Cléopâtre*, &c. (1879).

**CLEPSYDRA** (from Gr. κλεψυδρα, to steal, and ἕβω, water), the chronometer of the Greeks and Romans, which measured time by the flow of water. In its simplest form it was a short-necked earthenware globe of known capacity, pierced at the bottom with several small holes, through which the water escaped or “stole away.” The instrument was employed to set a limit to the speeches in courts of justice, hence the phrases *aquam dare*, to give the advocate speaking time, and *aquam perdere*, to waste time. Smaller clepsydræ of glass were very early used in place of the **APPEARANCES**. As the length of the hour varied according to the season of the year, the clepsydræ, as arrangements, for of which we have no clear account, were necessary to obviate this and other defects. For instance, the flow of water varied with the temperature and pressure of the air, and secondly, the rate of flow became less as the vessel emptied itself. The latter defect was remedied by keeping the level of the water in the clepsydra uniform, the volume of that discharged being noted. Plato is said to have invented a complicated clepsydra to indicate the

**Vermischte Schriften** (Leipzig, 1843); C. Thirlwall, *Hist. of Greece*, ch. 21; E. Curtius, *Hist. of Greece* (Eng. tr., iii. p. 112); J. Schwartz, *Die Demokratie* (Leipzig, 1882); H. Delbrück, *Die Strategie des Perikles* (Berlin, 1890); J. Meyer, *Forschungen zur Altertumskunde, Antiquitäten* (Leipzig, 1890). It is likely that the people of that time knew the two extremes views of the Athenians with an easy means of livelihood. The notorious fondness of the Athenians for litigation increased his power; and the practice of “sycophancy” (raking up material for false charges; see SYCOPHANT), enabled him to remove those who were likely to endanger his ascendancy. Having no further use for his former aristocratic associates, he broke off all connexion with them, and thus felt at liberty to attack the secret combinations for political purposes, the oligarchical clubs to which they mostly belonged. Whether he also introduced a property-tax for military purposes, and even held a high position in connexion with the treasury, is uncertain. His ruling principles were an inveterate hatred of the nobility, and an equal hatred of Sparta. It was mainly through him that the opportunity of concluding an honourable peace (in 425) was lost, and in his determination to see Sparta humbled he misled the people as to the extent of the resources of the state, and dazzled them by promises of future benefits.

In 427 Cleon gained an evil notoriety by his proposal to put to death indiscriminately all the inhabitants of Mytilene, which had put itself at the head of a revolt. His proposal, though accepted, was, fortunately for the credit of Athens, rescinded, although, as it was, the chief leaders and prominent men, numbering about 1000, fell victims. In 425, he reached the summit of his fame by capturing and transporting to Athens the Spartans who had been blockaded in Sparta (see PYLOS). Much of the credit was probably due to the military skill of his colleague Demosthenes; but it must be admitted that it was due to Cleon’s determination that the Ecclesia sent out the additional force which was needed. It was almost certainly due to Cleon that the tribute of the allies was doubled in 425 (see DELIAN LEAGUE). In 422 he was sent to capture Amphipolis, but was outgeneralled by Brasidas and killed. His death removed the chief obstacle to an arrangement with Sparta, and in 421 the peace of Nicias was concluded (see PELOPONNESIAN WAR).

The character of Cleon is represented by Aristophanes and Thucydides in an extremely unfavourable light. But neither can be considered an unprejudiced witness. The poet had a grudge against Cleon, who had accused him before the senate of having ridiculed (in his *Babyloniad*) the policy and institutions of his country in the presence of foreigners and at the time of a great national war. Thucydides, a man of strong oligarchical prejudices, had also been prosecuted for military incapacity and exiled by a decree proposed by Cleon. It is therefore likely that Cleon has had less than justice done to him in the portraits handed down by these two writers.

hours of the night as well as of the day. In the clerestory or hydraulic clock of Ctesibus of Alexandria, made about 135 B.C., the movement of water-wheels caused the gradual rise of a little figure, which pointed out the hours with a little stick on an index attached to the machine. The clerestory is said to have been known to the Egyptians. There was one in the Tower of the Winds at Athens; and the turret on the south side of the tower is supposed to have contained the cistern which supplied the water.

See Marquardt, Das Privatleben der Römer, l. (2nd ed., 1886), p. 792; G. Bilfinger, Die Zeitsmesser der antiken Völker (1886), and Die antiken Stundenmärsche (1886).

CLERGY

CLERGY, or CLERESTORY (Ital. chiaro piano, Fr. claire-vole, claire étage, Ger. Lichtgaden), in architecture, the upper storey of a nave of a church, of the walls of which rise above the aisles and are pierced with windows (“clerc” being simply “clear,” in the sense of “lighted”). Sometimes these windows are very small, being mere quatrefoils or spherical triangles. In large buildings, however, they are important objects, both for beauty and utility. The windows of the clerestories of Norman work, even in large churches, are of less importance than in the later styles. In Early English they became larger; and in the Decorated they are more important still, being lengthened as the triforium diminishes. In Perpendicular work the latter often disappears altogether, and in many later churches, both in France and England, and in many churches in Norfolk and Suffolk, the clerestories are close ranges of windows. The term is equally applicable to the Egyptian temples, where the lighting of the hall of columns was obtained over the stone roofs of the adjoining aisles, through slits pierced in vertical slabs of stone. The Romans also in their baths and palaces employed the same method, and probably derived it from the Greeks; in the palaces at Crete, however, light-wells would seem to have been employed.
